DEDICATION AND ACKNOWLEDGMENTS

This book is dedicated to generations of soyfoods makers and researchers, and soybean growers in Japan.

Part of the enjoyment of writing a book lies in meeting people from around the world who share a common interest, and in learning from them what is often the knowledge or skills acquired during a lifetime of devoted research or practice. We wish to give deepest thanks...

Of the many libraries and librarians who have been of great help to our research over the years, several stand out:

University of California at Berkeley: John Creaser, Lois Farrell, Norma Kobzina, Ingrid Radkey.

Northern Regional Library Facility (NRLF), Richmond, California: Martha Lucero, Jutta Wiemhoff, Scott Miller, Virginia Moon, Kay Loughman.

Stanford University: Molly Molloy, who has been of special help on Slavic-language documents.

National Agricultural Library: Susan Chapman, Kay Derr, Carol Ditzler, John Forbes, Winnifred Gelenter, Henry Gilbert, Kim Hicks, Ellen Knollman, Patricia Krug, Sarah Lee, Veronica Lefebvre, Julie Mangin, Ellen Mann, Josephine McDowell, Wayne Olson, Mike Thompson, Tanner Wray.

Library of Congress: Ronald Jackson, Ronald Roache.

Lane Medical Library at Stanford University.

Contra Costa County Central Library and Lafayette Library: Carole Barksdale, Kristen Wick, Barbara Furgason, Sherry Cartmill, Linda Barbero.

Harvard University's Five Botanical Libraries (especially Arnold Arboretum Library): Jill Gelmers Thomas.

French translation: Martine Liguori of Lafayette, California, for ongoing, generous, and outstanding help since the early 1980s.

Japanese translation and maps: Akiko Aoyagi Shurtleff.

Loma Linda University, Del E. Webb Memorial Library (Seventh-day Adventist): Janice Little, Trish Chapman.

We would also like to thank our co-workers and friends at Soyinfo Center who, since 1984, have played a major role in collecting the documents, building the library, and producing the SoyaScan database from which this book is printed:

Irene Yen, Tony Jenkins, Sarah Chang, Laurie Wilmore, Alice Whealey, Simon Beaven, Elinor McCoy, Patricia McKelvey, Claire Wickens, Ron Perry, Walter Lin, Dana Scott, Jeremy Longinotti, John Edelen, Alex Lerman, Lydia Lam, Gretchen Muller, Joyce Mao, Luna Oxenberg, Joelle Bouchard, Justine Lam, Joey Shurtleff, Justin Hildebrandt, Michelle Chun, Olga Kochan, Loren Clive, Marina Li, Rowyn McDonald, Casey Brodsky, Hannah Woodman, Elizabeth Hawkins, Molly Howland, Jacqueline Tao, Lynn Hsu, Brooke Vittimberga, Tanya Kochan.

Special thanks to Tom and Linda Wolfe of Berwyn Park, Maryland. And to Lorenz K. Schaller of Ojai, California.

■ For outstanding help on this book about Japan we thank: Mr. & Mrs. Kinjiro Aoyagi, Toshio Arai, Linda Barber, Alfred Birnbaum, Steve Earle, Hideo Ebine, Danji Fukushima, Naomichi Ishige, Makiko Kageura, Goro Kanatsugi, Wataru Kawamura, Akiyoshi Kazama,Yoshiko Kojima, Yasuo Kumoda, Michio and Aveline Kushi, Harry W. Miller, Tsutomu Mochizuki, Yuzaburo Mogi, Kiku Murata, Masahiro Nakano, Teruo Ohta, Jean Pearce, Rustono, Scott Sawyers, Wataru Takai, Kazuhiro Takamine, Yasuko Torii, Kanji Tsuchiya, Luisa Velez, Hidekazu Watanabe,Tokuji Watanabe, Masaaki Yasuda, Tamotsu Yokotsuka,

■ Finally our deepest thanks to Tony Cooper of San Ramon, California, who has kept our computers up and running since Sept. 1983. Without Tony, this series of books on the Web would not have been possible.

This book, no doubt and alas, has its share of errors. These, of course, are solely the responsibility of William Shurtleff.

■ This bibliography and sourcebook was written with the hope that someone will write a detailed and well-documented history of this subject.

INTRODUCTION

Brief chronology of soybeans and soyfoods in Japan.

701 CE – The *Taihō Ritsuryō* [Taiho Law Codes], by Emperor Monmu, which some regard as Japan's first constitution, is the earliest document seen that mentions soyfoods (and by implication soybeans) in Japan. It is also the earliest document outside of China to mention fermented black soybeans (FBS), which it calls "*kuki*" or "*shi*." These law codes established the *Hishio Tsukasa*, or Bureau for the Regulation of *Hishio* Production, Trade and Taxation. The *Hishio Tsukasa*, located in the Imperial Palace, was an annex of the emperor's kitchen, where *hishio* was made. Using methods very similar to those developed in China, it transformed soybeans into *hishio* (which resembled Chinese *jiang*), fermented black soybeans (*kuki* or *shi*), and *misho* (an ancestor of miso; the term "miso" had not yet been coined). These foods and seasonings were consumed at the Imperial Household (Shurtleff & Aoyagi 1978, p. 219). FBS are again mentioned in Japan in 718, 730, and 923.

In 675 the first prohibition of meat eating in Japan was promulgated by Emperor Tenmu. Similar decrees, based on the Buddhist prohibition of killing, were issued repeatedly by emperors during the eighth and ninth centuries. Soyfoods gradually began to supply the savory flavor and protein that formerly had come from meat. Not until the 1860s did meat-eating resume in Japan, and not until after World War II did it become part of Japanese culture (Ishige 2001, p. 52-55, 146-153).

712 CE – The mythical story of the origin of the soybean in Japan is told in the *Kojiki* (Record of Ancient Matters).

720 CE – The mythical story of the origin of the soybean in Japan is told again in the *Nihon Shoki / Nihongi* (Chronicles of Early Japan).

725 CE – The *Harima no Kuni Fudoki* [Geography and Culture of Harima province], from Japan, is the first document that mentions koji outside of China. It states that by the early 8th century in Japan, koji was being made using airborne koji molds.

741 CE – Two new Buddhist temples are added to each feudal domain (*kuni*) in Japan: Kokubunji is for monks and Kokubunniji is for nuns. It is said that from this time, fermented black soybeans (*tera nattō*, or *shiokara nattō*) spread throughout Japan. They are made from soybean koji, which is soaked in salted water and dried.

760 CE – The *Manyōshū* (Collection of Japan's Earliest Songs and Poems) (from 350-759 CE) mentions koji – the 2nd earliest Japanese work to do so.

794 CE – The capital of Japan is relocated to Kyoto from Nara. The Heian period (794-857) begins.

901-08 CE – The modern word for *miso* first appears in Japan in the *Sandai Jitsuroku*.

927 CE – The *Engishiki* is completed by Fujiwara no Tokihira (871-811) and others. In this book it is written: "In the feudal domain of Omi 60 koku of soybeans [1 koku = 47.6 gallons or 180 liters], in the domain of Tanba 30 koku, in the domain of Harima 20 koku, in the domain of Misa 10 koku, and in the domain of Iyo 10 koku are recommended (*susumu*)." It seems that the soybean was now an important crop in Japan.

1051-1083 – The origin of natto is obscure. According to legend, it was discovered accidentally in northeast Japan by Minamoto (Hachimantaro) Yoshiie when warm, cooked soybeans, placed in a rice-straw sack on the back of a horse, turned into natto. The warmth of the horse (106 deg. F.) helped the fermentation; natto prefers 104 deg. F.

1058-1068 – The word "natto" first appears in Japan, but it refers to "salty natto" (*shiokara nattō*) (fermented black soybeans) rather than to "sticky soybeans" (*itohiki natto*). In about 1068 salty natto are first mentioned in Japan in the book *Shin Sarugakki*, [New Monkey Play Story: A humorous novel…] by Fujiwara no Akihara (lived 989-1066).

1183 Jan. – Tofu is first mentioned in Japan in the Diary of Hiroshige Nakaomi.

1192 – The Kamakura period and shogunate begins as Minamoto no Yoritomo (1147-1199) becomes the first head shogun. The seat of power has been moved from Kyoto (where the emperor resides) to far-away Kamakura, near today's Tokyo.

1228 – The Buddhist monk Kakushin returns to Japan from Song / Sung dynasty China having learned the method for making fermented Kinzanji miso. While fermenting the miso in Japan, he discovers that the liquid (tamari) which gathers on the bottom of the vats can be used as a tasty seasoning. This tamari is considered to be the first soy sauce in Japan.

1275 July 26 – Edamamé (green vegetable soybeans in the pods) are first mentioned in Japan (or worldwide) in a letter

Copyright © 2014 by Soyinfo Center

from Nichiren, the Japanese Buddhist saint. In a letter to Mr. Takahashi, one of the parishioners at his temple, he says "Thank you for the edamamé."

1288-1292 – Tamari-style shoyu is first sold from Yuasa in the Kishu area (in today's Wakayama prefecture).

1405 Dec. 19 – Natto (*itohiki natto*) is first mentioned in the diary of Noritoki Fujiwara; it is called *itohiki daizu* ("stringy soybeans").

1450 – The word "natto," referring to *itohiki-natto*, is next used in Japan in the *Shojin Gyorui Monogatari*. This is a funny story about foods that are depicted as people and a battle for rank between vegetarian and nonvegetarian foods. Natto, called "Natto Taro" or "Natto Taro Itogasane" (the last word meaning "many threads") is given a high rank.

1540? – *Mame no ko*, the early Japanese word for roasted soy flour, first appears in the *Nyōbō Shitsukegaki* [Women's Book of Manners] – according to the *Nihon Kokugo Daijiten.*

1542 Jan. 1 – *Mame no ko* appears again in the *Tamon-in Nikki* [Tamon-in Diary].

1587 June 19 – Kinako, the modern Japanese word for roasted whole soy flour, first appears in the *Sotan Chakai Kondate Nikki* [Master Sotan's Tea Ceremony Cookery Menu Diary] – in the morning menu.

1603 – *Vocabulario da Lingoa de Iapam* [Vocabulary of the Language of Japan], a Japanese-Portuguese dictionary, is compiled and published by Jesuit missionaries in Nagasaki, Japan. There are entries for:

Abura ague [Abura-agé, deep-fried tofu pouches]

Amazaqe [Amazake], a still-bubbling fermented liquid that has not yet completely become sake; or sweet sake.

Azzuqi or azzuqui [azuki beans].

Cabe [Kabe]. Same as tofu.

Côji [Koji], a yeast [sic] used in Japan to make sake, or mixed with other things

Daizzu [Daizu, whole dry soybeans].

Dengacu [Dengaku]. Dancing monks or skewered tofu spread with miso and broiled.

Fanben [Hanben]. A type of food which is made by broiling tofu and simmering it with miso.

Icchô. A way of counting some types of food, such as tofu.

Miso. A kind of mixture which is made with *graos* [grains, seeds, kernels], rice, and salt to season Japanese soups.

Misocoxi [*Misokoshi*], a bamboo strainer used for straining miso.

Misoya, a shop that sells miso.

Misoyaqijiru [*Miso-yaki-jiru*], a type of soup (Xiru) made with tofu and finely sliced daikon radish.

Misôzzu, which should properly be called Zosui, is a healing food made from vegetables, rice, miso, etc.

Nattô, a type of food made by a brief boiling of grains / seeds [graos], which are then put into an incubation chamber (muro).

Nattôjiru, a soup (*Xiru*) made from natto.

Tamari, a very savory liquid taken from miso which can be used for seasoning foods [when cooking] or at table.

Tôfu* – Taufu. A type of food. It is made into the shape of a cheese by crushing soybeans.

Tôfuya – Taufuya, a shop which makes and sells that cheese-like thing (tofu), which is made by grinding soybeans that have been soaked in water until they are soft.

Vdondôfu [Udon-dôfu]. Tofu which is made like udon (Japanese-style wheat noodles) and cooked.

Xôyu [Shoyu, or soy sauce], a liquid which corresponds to vinegar except that it is salty. It is used for seasoning foods. It is also called *sutate*.

Yudôfu – Yudaufu: A food made from thinly sliced tofu, served next to a *kakejiru*-type sauce [which is then poured over the top].

1605 –Tokugawa Ieyasu in Japan commands the monks at Daifukuji temple to make Hamana Natto – a type of fermented black soybeans, later known as Hamanatto (Saito 1985, p. 14-16).

1633 – The Tokugawa shogunate (upset at Portuguese Christian missionaries intent on making converts and instigating revolts) adopts a policy of national isolation which continues for 221 years until 1854. In 1639 the Portuguese are expelled. This leaves only the Dutch among the Europeans still trading with Japan.

1639 – By this time the Japanese had so successfully closed their doors to the outside world that subsequently Japan all but dropped out of the consciousness of Europeans. The only important exception was the annual Dutch vessel from the East Indies to the Dutch trading post on the island of Hirado, then Deshima in Nagasaki harbor.

1641 – The Dutch and their representatives are moved from Hirado to the tiny artificial island of Deshima / Dejima built by the shogunate in Nagasaki harbor, where they were kept as virtual prisoners. During this time Japan maintained contact with only two other nations: China and Korea. Chinese merchants were also allowed to trade at Nagasaki, but under strict controls.

1647 Oct. 16 – Japanese soy sauce (shoyu) is now being exported from Nagasaki, Japan, by the Dutch East India Company. In the earliest known handwritten letter (in Dutch)

Copyright © 2014 by Soyinfo Center

it is called *soije* (*Int. Comptoir Nagasaekij*). The Dutch merchants who exported shoyu in kegs from Japan did their best to spell it as it sounded – phonetically. Here is how that spelling evolved – based on documents now at Soyinfo Center; each appears in this book:

1647 Oct. – soije
1651 June – sooje
1652 July – soij
1652 Aug. – soije
1652 Oct. – soije
1652 Oct. – zoije
1654 July – soijo
1655 Aug. – soija
1656 March – soeije
1657 Aug. – soija
1659 Aug. – soija
1660 June – soije
1665 Feb. – soija
1669 Feb. – soija
1669 Feb. – soija
1674 Nov. – sooij
1675 Nov. – soija
1676 March – soija
1676 June – soija
1678 Nov. – soija
1680 June – soije

Note: The words "soy," "soya" and "soja," and the term "soy sauce" came into English from the Japanese word *shōyu* via the Dutch. Thus, the name of the soybean was derived from the name of the sauce made from it.

1661 – Kikkoman traces its origins to this date when the Takanashi and Mogi families constructed breweries and started brewing soy sauce (Fruin 1983).

1712 – Englebert Kaempfer, a German who lived in Japan, is the first European to give detailed descriptions of how miso and shoyu are made in Japan – in his landmark Latin-language book *Amoenitatum exoticarum politico-physico-medicarum* [Exotic novelties, political, physical, medical, Vol. 5, p. 834-35]. He also mentions koji (which he calls *koos*), but he does not understand what it is, how it functions, or how it is made.

1727 – Miso is first mentioned in an English-language publication, *The History of Japan*, by Englebert Kaempfer. He spells it "*Midsu*, a mealy Pap, which they dress their Victuals withal, as we do butter."

1750 Dec. – Soy sauce first reaches North America – arriving first in New York Harbor bearing the name "India Soy." It was made in Japan and exported by the Dutch East India Co. to Amsterdam; from there it made its way to New York.

1797 – The *Nihon Sankai Meisan Zue* [Illustrations of Japanese Products of Land and Sea] contains the earliest known illustration of koji being made in Japan; the koji is then shown being made into sake.

1804 – San Jirushi starts making tamari shoyu and miso in Kuwana, Japan. The company name was changed in 1909 from 'Minato-ya' to 'Sato Shinnosuke Shoten' and finally to 'San-Jirushi Brewing Corporation' in 1963 (Earle 1988).

1853 July 8 – A fleet of ships headed by Commodore Matthew Perry (USA) arrives in Japan to "open" Japan to trade with the West. For the previous 220 years, during the Tokugawa period (1600-1868) the ruling shoguns had initiated a policy of self-imposed isolation (*sakoku*) or exclusion to keep out foreign influences.

1867 – *A Japanese and English Dictionary* (*1st edition*), by James C. Hepburn, is published. Many soy-related words and terms appear. * = word first appears in English in this dictionary:
Amazake *
Daidz [Daizu]
Go – Beans mashed into paste.
Gokoku – The five cereals, incl. beans.
Hirodz * [Hirodzu, Hiryozu]
Kinako *
Kiradz * [Kiradzu, Kirazu = okara]
Koji *
Mame
Mame no ko
Miso
Natto *
Nigari
Sh'taji * [Shitaji = woman's word for soy sauce]
Shoyu *
Tofu *
Yuba *
Yu-dofu

1868 Sept. 12 – The Meiji Restoration in Japan begins. Formal coronation of the emperor Meiji. He is the first emperor of Japan with real power since 1192 – during which time the military shoguns had held the real power. Oct. 23 – The name of his era is changed to Meiji. Nov. 6. The capital of Japan is moved from Kyoto to Edo, and Edo is renamed Tokyo.

1871 July – A brewing tax (*jōzō-zei*) and patent tax are levied on clear sake (*seishu*), unclear sake (*dakushu*), and shoyu. But in 1875 the two taxes on shoyu are discontinued because shoyu is considered one of the necessities of life.

Copyright © 2014 by Soyinfo Center

1873 May – The Japanese government exhibits soybeans at the exposition in Vienna, Austria. Also at this expo, Kikkoman uses glass bottles for their shoyu for the first time.

1878 – The first official government statistics on soybean cultivation in Japan start to be compiled. This year the area is 411,200 hectares and production is 211,700 metric tons [tonnes; the yield is 514 kg/ha].

1890 Dec. – Jokichi Takamine arrives in Chicago, Illinois, and (working closely with both his wife's parents), establishes the Takamine Ferment Co. and becomes involved in a project (with the "whisky trust") to replace malt with koji in the manufacture of whisky in order to increase the yield of whisky per bushel of corn and decrease the cost of making whisky.

1891 Feb. 28 – The first article about the work of Jokichi Takamine that mentions "diastase" (a starch-digesting enzyme now, called amylase) or "koji" (the source of enzymes in making Japanese sake, soy sauce, miso, and amazake) is published. These enzymes "convert starch into sugar," which (in the absence of salt) can then be fermented into alcohol.

It also states that "Mr. Takamine has patented his new process in Europe and the United States" and that he has just entered into a contract with the Distillers' and Cattle Feeders' Company (whisky trust) of Peoria, Illinois (*Peoria Herald*, p. 8).

1894 Feb. 23 – Jokichi Takamine applies for his earliest patent (U.S. Patent No. 525,823) which contains the word "enzyme" (or enzymes") or the terms "diastatic enzyme" or "taka-koji" or "tane-koji" in connection with koji. This is the first patent on a microbial enzyme in the United States. This enzyme "possesses the power of transforming starch into sugar." This patent was issued on 11 Sept. 1894. It was the key patent in the production of Taka-diastase, a digestive enzyme.

"Takamine, in 1894, was probably the first to realize the technical possibilities of enzymes from molds and to introduce such enzymes to industry" (Underkofler 1954, p. 98).

1895 April 17 – The Treaty of Shimonoseki ends the Sino-Japanese War (1894-95); Japanese victory establishes Japan as a regional power. China is obliged to cede Taiwan (Formosa), the nearby Pescadores Islands, and the Kwantung Peninsula in South Manchuria to Japan; recognize Korea's independence; pay 200 million taels indemnity; open more ports; and negotiate a commercial treaty. The latter, signed in 1896, gave Japan all the privileges that the Western powers had in China and added the further privilege of carrying on 'industries and manufactures,' using the cheap labor in the treaty ports. The Kwantung Peninsula (southern Manchuria) soon became an important source of soybeans for Japan.

1901 – Crushing of soybeans starts in Japan. Owada Seisakusho of Tsuruga, Fukui prefecture, Japan, starts making soy oil and soybean cakes using the press method (*assaku-ho*).

1901 – Nakahara Kota is issued a patent on his process for making dried-frozen tofu indoors in a freezer (*jinko kôri-dofu*). This makes it possible to produce a good-quality product year round. This year there are 453 makers of dried-frozen tofu in Nagano. Nagano prefecture encouraged production of this product during the Russo-Japanese War as a side home industry.

1905 Sept. 5 – The Treaty of Portsmouth ends the Russo-Japanese War (Feb. 1904-1905). In a mere 50 years Japan had transformed itself from an isolated underdeveloped country with no industrial base into a modern nation, a major military and industrial power. The victorious Japanese move into Korea. The treaty gave Japan the Russian lease on the Kwantung Peninsula and the Russian-built South Manchurian Railway as far north as Changchun. This event won for Japan full status as a world power and equality with the nations of the West. In its victory over Russia, Japan became the first non-white or non-Western nation to defeat a white or Western nation in a war.

1905 – At about this time, soybean cake (*daizu kasu*) passes fish cake to become the main fertilizer for crops in Japan.

1906 April – Katayama, in Japan, reports that he has made "A condensed vegetable milk" from soy-beans.

1906 Aug. – "On the microorganisms of natto," by S. Sawamura is published in a scientific journal in Japan. He found two bacteria in natto. He was the first to isolate *Bacillus natto* Sawamura from natto, to give that name to the newly-discovered microorganism, and to show that it was responsible for the natto fermentation.

1906 – Soybeans and soybean cake are first successfully exported from Manchuria to Japan. During 1906 the exports were 16,130 tons of beans and 64,520 tons of cake, and in 1907, 17,359 tons of beans and 26,605 tons of cake. In Japan the bean cake was used as a fertilizer (Maynard 1911; Turner 1914).

1907 March – Nisshin Mamekasu is founded (initial capitalization is 3,000,000 yen). The next year its soybean crushing plant in Dairen, Manchuria, starts to operate. In 1918 the company merged with Matsushita Mamekasu to become Nisshin Seiyu K.K.

Copyright © 2014 by Soyinfo Center

1907 – Korea becomes a Japanese protectorate.

1910 – Japan forcibly annexes Korea as a province called Chōsen. Japan will continue to exercise rather harsh control over Korea until 1945, including importing a large percentage of the soybeans grown in Korea.

1912 – Dr. Shinsuke Muramatsu of the Morioka College of Agriculture publishes "On the Preparation of Natto" in English. He found that three *Bacillus* species or strains produced fine natto with strong viscosity and good aroma at 45°C, but that *Bacillus* No. 1 produced the best product; he recommended its use as a pure culture. He concluded by giving the first nutritional analysis of fresh natto and of natto that was several days old. Soon Dr. Muramatsu started producing his "College Natto" at the College of Agriculture. His students helped to make and sell it, as a source of income, and it became very popular.

1914 – The Mogi Saheiji family in Noda starts to sell shoyu in 1-sho bottles (1 *sho* = 1.805 liters or 3.81 pints). Before this time a ceramic sake bottle (*tokkuri*) was used.

1917 Dec. – Eight Mogi and Takanashi family companies, the leading shoyu producers in the Noda area, merge to form Noda Shoyu Co., Ltd., a company with capital of ¥7 million and the predecessor of Kikkoman Corporation.

1918 March – Arao Itano of Japan is the world's first person to conceive of making an ice cream from soy. In an article titled "Soy beans as human food," in the *Massachusetts Agricultural Experiment Station Bulletin* No. 182 he states "Vegetable butter, ice cream, oil (table use) and lard (cooking): The manufacture of these articles from soy beans needs further investigation."

1919 – Dr. Jun Hanzawa, of Hokkaido University's Department of Agriculture, published the first of three key reports which helped to bring natto production in Japan out of the "Dark Ages." Serving simultaneously as a microbiologist, and extension worker, and a pilot plant operator, Dr. Hanzawa began by making a pure-culture bacterial inoculum for natto; this enabled commercial natto manufacturers, for the first time, to discontinue the use of rice straw as a source of inoculum. Secondly, disliking the use of rice straw even as a wrapper, he developed a simple, low-cost method for packing, incubating, and selling natto wrapped in paper-thin sheets of pine wood (*kyōgi*) or small boxes of pine veneer (*oribako*). A third important improvement followed shortly; the development of a new incubation room design (*bunka muro*), which had an air vent on the ceiling and substantially decreased the natto failure rate. These three developments laid the basis for modern industrial, sanitary, scientific natto manufacture. Commercial natto makers filled his classes and he worked as a consultant for them. Like Dr. Muramatsu before him, Dr. Hanzawa sold his "University Natto" from his research lab, promoting it as a rival to cheese. He was given the appellation of "the father of modern natto production," and he was given the honor of addressing the emperor of Japan on the subject of natto.

1920 – Soybean production in Japan peaks at about 548,000 metric tons per year, as Japan begins to import more and more low-cost soybeans from Manchuria and Korea. As a result, soybeans become unprofitable for Japanese farmers and they tend to grow soybeans mainly for their own home use. Soybean production in Japan continues to fall until 1945 – near the end of World War II.

1922 April – The oil production department of Suzuki Shokai [which went bankrupt in 1922] becomes independent and founds Hohnen Oil Co., Ltd. (*Hohnen Seiyu*).

1923 Sept. – The Great Kanto / Tokyo Earthquake (*Kanto Daishinsai*) strikes. 70% of the miso factories in the area are burned down, causing a shortage of miso. But miso makers in other parts of Japan use this opportunity to ship their miso to Tokyo, and the people of Tokyo come to realize the good taste of miso made elsewhere in Japan.

1925 – Soybean meal begins to be used as a protein source in livestock and poultry feeds to supplement the traditional fish meal (Kitamura 1965).

1926 – Nakazawa Ryoji, a famous Japanese microbiologist, becomes the first Japanese to study or write about tempeh. In April and May of 1926 (following preliminary investigations in 1912 and 1924) Nakazawa took a research trip to Java and Sumatra and carefully collected (in sterile containers) 59 samples of soy tempeh and onchom from various markets and small manufacturers. He published his findings in the April 1928 issue of *Nippon Nogeikagaku Kaishi.*

1929 Feb. 18 – P.H. Dorsett (age 67) and W.J. Morse (age 45) leave Washington, DC, by train, for a 2-3 year expedition to the Orient. Two of the main goals of the expedition are to collect soybean varieties and soybean products, and learn as much as possible about growing and processing soybeans in Japan, Korea, Manchurian, and China. The group sails for Japan on March 1 aboard the *President Grant*. They arrive in Tokyo on March 18, set up headquarters there, and spend most of the first year in Japan. At the end of each day they type up their notes and add original photographs to their trip report.

Major accomplishments of the expedition:

■ **(1) Soybean varieties**: They collect and send back to the USA 4,451 soybean varieties (PI numbers) of which 986 (22.2%) were still in the USDA germplasm collection in

Copyright © 2014 by Soyinfo Center

1981 (R. Bernard, 1981). However none of these are major ancestors of soybean varieties grown in 1972 (National Research Council, 1972, Chap. 13).

■ **(2) Soybean products**: Morse collects, Dorsett photographs, they describe and send back more than 300 soybean products.

■ **(3) Trip report**: The typewritten Log of the Dorsett-Morse Expedition to East Asia, which fills 17 volumes and contains more than 8,818 pages plus about 3,200 glossy black-and-white photo prints, is now at the USDA National Agricultural Library (Beltsville, Maryland), in the Rare and Special Collections.

■ **(4) Vegetable-type soybeans / Edamame**: Morse discovers a new type of soybean. He realizes that Japanese think of vegetable-type soybeans (which are grown by horticulturists and home gardeners, and eaten as a green vegetable – e*damame*) as completely different from regular soybeans (*daizu*). He collects more than 100 different edamame varieties, and they soon become popular in the United States (Lloyd & Burlison 1939; Cates 1939).

1931 Sept. 18 – The Manchurian Incident (also called the Mukden Incident) is used by the Japanese as an excuse for occupying all of Manchuria. For Japan, "the prize" in Manchuria is soybeans, soybean cake and soybean oil, which they export to Japan.

1941 Dec. 7 – Japanese aircraft attack Pearl Harbor. The United States enters World War II.

1945 Sept. 2 – Surrender of Japan after World War II. The documents of unconditional surrender are signed on board the battleship *USS Missouri* in Tokyo Harbor. Japan's empire is broken up. Manchoukuo (Manchuria) and Formosa (Taiwan) are returned to China. Korea is divided into north and south; South Korea declares independence in May 1948 as the Republic of Korea with Seoul as its capital. The island of Sakhalin reverts to the Soviet Union

The United States now stands astride the world as the only remaining great power. General Douglas MacArthur, as Supreme Commander for the Allied Powers (SCAP) in Japan, and his staff helped Japan to rebuild itself (to the amazement of most Japanese), institute democratic government, and chart a new course that ultimately made Japan one of the world's leading industrial powers.

1945 – Soybean production in Japan drops to the lowest level since record-keeping began – 170,000 metric tons per year. The next year it starts to rise and continues to rise until 1952 (521,000 tonnes) when rapidly increasing soybean imports from the USA cause Japanese production to enter a long, steady decline.

1948 Oct. 10 – Since the end of World War II, Japan has imported only 42,569 tons of soybeans (Kurakake 1948).

1950 June 25 – Outbreak of the Korean War between North and South Korea. Soybean imports from China to Japan come to a complete stop (Hirano 1952).

1951 – From about this time, the number of natto makers in Japan increases rapidly. Natto consumption begins to spread southward from the northeast prefectures (*Tohoku chiho*).

1956 Jan. – There are now in Japan about 50,000 tofu shops, 6,000 soy sauce plants, 5,000 miso shops, and 3,000 oil mills (Strayer 1956, p. 8).

1956 April – The Japan American Soybean Institute (JASI) is established in Tokyo with Shizuka Hayashi as its first director and most of its funding from USDA's Foreign Agricultural Service (FAS). It has only one objective: To increase the market for U.S. soybeans and soybean products in Japan. With its earlier major sources of inexpensive soybeans in Manchuria and Korea now gone, Japan quickly becomes a major importer of U.S. soybeans. However Japanese makers of soyfoods constantly complain, year after year, of the poor quality of U.S. soybeans (too much foreign matter, broken soybeans, weed seeds, etc.).

1957 June – Kikkoman International Inc. (KII), a soy sauce sales company, is established in San Francisco, California, in the United States. KII imports Kikkoman Shoyu from Japan and markets it in the USA.

1957 – Japan's first commercial soymilk, sold in bottles, named *Tônyu*, is introduced by the Ueda Tofu Shop in Hachioji, Tokyo. Dr. Harry Miller is the inspiration for and helps to establish the shop.

1959 – The first instant miso soup is introduced by Yamajirushi Miso in Nagano. It contains dried green onions, wakame, dried tofu [probably dried-frozen tofu], etc.

1960 – Soybean imports rise to 1,128,000 metric tons (tonnes) topping 1,000,000 tonnes for the first time.

1960 – Per capita consumption of shoyu drops to 13.7 kg. It has now fallen below 14 kg/person. Japan is moving toward a more Western-style diet, with bread replacing rice and with more total protein, animal protein, meat, and fat.

1961 July 1 – The tax on imported soybeans is removed.

1962 – A new natto container made of Styrofoam (*PHP yoki, happo suchiroru*) is invented.

1963 Jan. – William Brandemuhl (an American) arrives

Copyright © 2014 by Soyinfo Center

in Japan to begin 15 months of field research on soybean realization. In June 1963 he is joined by Tomoko Arai, his bride to be, who helps him greatly. Their resulting book (now published *only* on Google Books), containing many photos, gives a detailed record of soyfoods in Japan at this time.

1964 Oct. – Noda Shoyu Co., Ltd., is renamed Kikkoman Shoyu Co., Ltd.

1965 – Per capita miso consumption drops to 7.8 kg, falling below 8 kg/person.

1966 – At about this time meat analogs, based on modern soy protein products, start to be sold commercially in Japan.

1966 – Soybean imports rise to 2,168,467 tonnes, passing the 2 million tonne mark for the first time. Production of soybeans in Japan drops below 200,000 tonnes for the first time. Japan now produces only 9% of the soybeans it consumes.

1966 May – Kikkoman starts to sell low-salt shoyu.

1968 July – Shizuka Hayashi retires as managing director of the Japanese American Soybean Institute in Tokyo after 12 years of service. Scott Sawyers takes over as country director in Japan for the American Soybean Association.

1968 – Bottling of Kikkoman Soy Sauce for the American market begins at the Leslie Foods plant in Oakland, California.

1969 March – Nineteen major food manufacturers in Japan join to form the New Protein Food Council, which will make meat alternatives based on modern soy protein products and wheat gluten.

1969 – Annual per capita consumption of soy oil in Japan rises to 3.2 kg, passing the 3 kg mark for the first time. In 1960 it was 1.2 kg/person.

1960s – In Japan, soymilk slowly increases in popularity. New manufacturers are: Nihon Tanpaku Kogyo (1962). College Health Foods (later renamed San-iku Foods) in Chiba prefecture with its Soyalac (1969, also inspired and aided by Dr. Harry Miller). Luppy Tanpaku (House Shokuhin) in Saitama prefecture with its Luppy soymilk (1969).

1972 March – Kikkoman Foods, Inc. (KFI), is established in Walworth, Wisconsin (USA) for the purpose of manufacturing soy sauce and teriyaki sauce. The grand opening and ribbon-cutting is on 21 June 1973, with the governor of Wisconsin present.

1973 June 27 – President Richard Nixon sets new regulations for soybean exports from the USA. This comes as a huge shock to the Japanese – and causes them to look to other soybean suppliers, such as Brazil, to diversify their sources.

1978 – Soybean imports rise to 4,260,000 tonnes, topping 4 million tonnes for the first time. This is 4.5 times as much soybean imports as 20 years earlier.

1979 – Tofu production continues to rise, reaching 1,114,000 tonnes, and topping 1.1 million tonnes (metric tons) for the first time.

1980 – Production of natto reaches 153,000 tonnes, up 33% compared with 10 years ago (when it was 115,000 tonnes). This is largely a reflection of the health food movement in Japan.

1980 Oct. – Kikkoman Shoyu Co., Ltd. is renamed Kikkoman Corporation – the company's present name.

1981 Feb. – Morinaga Tofu starts to be imported and sold in the USA from Japan.

1981 June – Japan's first soymilk ice cream is made by Kibun in Tokyo.

1981 Nov. – The Ministry of Agriculture and Forestry in Japan announces a Japanese Agricultural Standard (JAS) for soymilk. The soymilk boom in Japan starts; the total yen value of the soymilk by all major Japanese manufacturers is 5,000 million yen. The boom peaks in 1983.

1982 – Annual per capita consumption of soy oil in Japan rises to 5.1 kg, passing the 5 kg mark for the first time. In 1960 it had been 1.2 kg/person.

1983 June – Torigoe Seifun, Japan's fifth-largest flour miller, starts production of tempeh. This is the earliest known commercial tempeh ever made in Japan.

1983 July – At the NNFA show in Denver, Eden Foods surprises the natural foods industry by launching designed-for-America Edensoy in plain and carob flavors. Made in Japan by Marusan-Ai and exported by Muso, it is packed in a 6-ounce retort pouch. Sales of Edensoy soon skyrocket.

1983 Nov. 19 – House Shokuhin Kogyo, a major Japanese food company, invests $2.5 million in Hinode Tofu Co. in Los Angeles as part of a joint venture to expand tofu production.

Copyright © 2014 by Soyinfo Center

1983 – The soymilk boom in Japan peaks this year at 116,724 kiloliters (kl.). By 1986 it has fallen to 43,392 kl, which is only 37% of the peak.

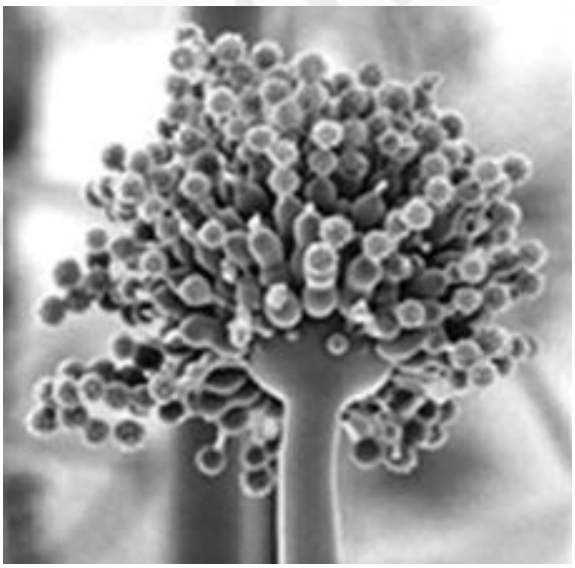
1985 Sept. – Tofu Time Inc. (founded by David Mintz, maker of Tofutti) enters into an agreement with Daiei, Inc., Japan's largest ice cream retailer, to export $350,000 worth of Tofutti to Japan. Daiei also plans to open three Tofutti Shops in Tokyo within the next 6 months.

1994 – Yamasa Corporation (the world's 2nd largest manufacturer of soy sauce after Kikkoman) opens a plant making shoyu in Salem, Oregon. The shoyu is first shipped in April 1995.

1996 April – Kikkoman establishes Kikkoman Foods Europe B.V., Europe's first soy sauce manufacturer, located in Hoogezand-Sappemeer, in the Netherlands.

1997 March – Kikkoman holds a ground-breaking ceremony for its second U.S. soy sauce production plant in the United States, in Folsom, California. Shipments start in Oct. 1998. Kikkoman's U.S. production of soy sauce rose from 1.59 million gallons in 1973 to 23.81 million gallons in 1993.

2005 Nov. Yamasa Corporation purchases San Jirushi Corp. and San-J International of Kuwana, Japan, and Richmond, Virginia.



ABOUT THIS BOOK

This is the most comprehensive book ever published about the history of soybeans and soyfoods in Japan. It has been compiled, one record at a time over a period of 35 years, in an attempt to document the history of this interesting subject. It is also the single most current and useful source of information on this subject.

This is one of more than 100 books compiled by William Shurtleff and Akiko Aoyagi, and published by the Soyinfo Center. It is based on historical principles, listing all known documents and commercial products in chronological order. It features detailed information on:

- 92 different document types, both published and unpublished.
- 10,285 published documents - extensively annotated bibliography. Every known publication on the subject in every language.
- 899 unpublished archival documents.
- 634 original Soyinfo Center interviews and overviews never before published, except perhaps in our books.
- 334 commercial soy products.

Thus, it is a powerful tool for understanding the development of this subject from its earliest beginnings to the present.

Each bibliographic record in this book contains (in addition to the typical author, date, title, volume and pages information) the author's address, number of references cited, original title of all non-English language publications together with an English translation of the title, month and issue of publication, and the first author's first name (if given). For most books, we state if it is illustrated, whether or not it has an index, and the height in centimeters.

All of the graphics (labels, ads, leaflets, etc) displayed in this book are on file, organized by subject, chronologically, in the Soyinfo Center's Graphics Collection.

For commercial soy products (CSP), each record includes (if possible) the product name, date of introduction, manufacturer's name, address and phone number, and (in many cases) ingredients, weight, packaging and price, storage requirements, nutritional composition, and a description of the label. Sources of additional information on each product (such as advertisements, articles, patents, etc.) are also given.

A complete subject/geographical index is also included.

ABBREVIATIONS USED IN THIS BOOK

A&M = Agricultural and Mechanical
Agric. = Agricultural or Agriculture
Agric. Exp. Station = Agricultural Experiment Station
ARS = Agricultural Research Service
ASA = American Soybean Association
Assoc. = Association, Associate
Asst. = Assistant
Aug. = August
Ave. = Avenue
Blvd. = Boulevard
bu = bushel(s)
ca. = about (circa)
cc = cubic centimeter(s)
Chap. = Chapter
cm = centimeter(s)
Co. = company
Corp. = Corporation
Dec. = December
Dep. or Dept. = Department
Depts. = Departments
Div. = Division
Dr. = Drive
E. = East
ed. = edition or editor
e.g. = for example
Exp. = Experiment
Feb. = February
fl oz = fluid ounce(s)
ft = foot or feet
gm = gram(s)
ha = hectare(s)
i.e. = in other words
Inc. = Incorporated
incl. = including
Illust. = Illustrated or Illustration(s)
Inst. = Institute
J. = Journal
J. of the American Oil Chemists' Soc. = Journal of the American Oil Chemists' Society
Jan. = January
kg = kilogram(s)
km = kilometer(s)
Lab. = Laboratory
Labs. = Laboratories
lb = pound(s)
Ltd. = Limited
mcg = microgram(s)
mg = milligram(s)
ml = milliliter(s)
mm = millimeter(s)
N. = North
No. = number or North
Nov. = November
Oct. = October
oz = ounce(s)
p. = page(s)
photo(s) = photograph(s)
P.O. Box = Post Office Box
Prof. = Professor
psi = pounds per square inch
R&D = Research and Development
Rd. = Road
Rev. = Revised
RPM = revolutions per minute
S. = South
SANA = Soyfoods Association of North America
Sept. = September
St. = Street
tonnes = metric tons
trans. = translator(s)
Univ. = University
USB = United Soybean Board
USDA = United States Department of Agriculture
Vol. = volume
V.P. = Vice President
vs. = versus
W. = West
°C = degrees Celsius (Centigrade)
°F = degrees Fahrenheit
> = greater than, more than
< = less than

HOW TO MAKE THE BEST USE OF THIS DIGITAL BOOK - SEARCH IT

Most Important Thing: The **KEY** to using this digital book, which is in PDF format, is to **SEARCH IT** using Adobe Acrobat Reader: For those few who do not have it, Google: **Acrobat Reader** - then select the **free** download for your type of computer.

Click on the link to this book and wait for the book to load completely and hourglass by cursor to disappear (4-6 minutes).

Type [Ctrl+F] to "Find." A white search box will appear near the top right of your screen.
Type in your search term, such as Kikkoman or ice cream.
You will be told how many times this term appears, then the first one will be highlighted.
To go to the next occurrence, click the down arrow, etc.

For those using a Mac without Acrobat Reader: Safari is often the default browser. Click "Edit" in the toolbar at top. In the dropdown click "Find," then click "Find..." again. A search bar will open across top of screen with a search box at right. In this box type a word or phrase you would like to search, such as Kikkoman or ice cream. Click "Done" then scroll through the various matches in the book.

Chronological Order: The publications and products in this book are listed with the earliest first and the most recent last. Within each year, references are sorted alphabetically by author. If you are interested in only current information, start reading at the back, just before the indexes.

A Reference Book: Like an encyclopedia or any other reference book, this work is meant to be searched first - to find exactly the information you are looking for - and then to be read.

How to Use the Index: A subject and country index is located at the back of this book. It will help you to go directly to the specific information that interests you. Browse through it briefly to familiarize yourself with its contents and format.

Each record in the book has been assigned a sequential number, starting with 1 for the first/earliest reference. It is this number, not the page number, to which the indexes refer. A publication will typically be listed in each index in more than one place, and major documents may have 30-40 subject index entries. Thus a publication about the nutritional value of tofu and soymilk in India would be indexed under at least four headings in the subject and country index: Nutrition, Tofu, Soymilk, and Asia, South: India.

Note the extensive use of cross references to help you: e.g. "Bean curd. See Tofu."

Countries and States/Provinces: Every record contains a country keyword. Most USA and Canadian records also contain a state or province keyword, indexed at "U.S. States" or "Canadian Provinces and Territories" respectively. All countries are indexed under their region or continent. Thus for Egypt, look under Africa: Egypt, and not under Egypt. For Brazil, see the entry at Latin America, South America: Brazil. For India, see Asia, South: India. For Australia see Oceania: Australia.

Most Important Documents: Look in the Index under "Important Documents -."

Organizations: Many of the larger, more innovative, or pioneering soy-related companies appear in the subject index – companies like ADM / Archer Daniels Midland Co., AGP, Cargill, DuPont, Kikkoman, Monsanto, Tofutti, etc. Worldwide, we index many major soybean crushers, tofu makers, soymilk and soymilk equipment manufacturers, soyfoods companies with various products, Seventh-day Adventist food companies, soy protein makers (including pioneers), soy sauce manufacturers, soy ice cream, tempeh, soynut, soy flour companies, etc.

Other key organizations include Society for Acclimatization (from 1855 in France), American Soybean Association, National Oilseed/Soybean Processors Association, Research & Development Centers (Peoria, Cornell), Meals for Millions Foundation, and International Soybean Programs (INTSOY, AVRDC, IITA, International Inst. of Agriculture, and United Nations). Pioneer soy protein companies include Borden, Drackett, Glidden, Griffith Labs., Gunther, Laucks, Protein Technologies International, and Rich Products.

Soyfoods: Look under the most common name: Tofu, Miso, Soymilk, Soy Ice Cream, Soy Cheese, Soy Yogurt, Soy Flour, Green Vegetable Soybeans, or Whole Dry Soybeans. But note: Soy Proteins: Isolates, Soy Proteins: Textured Products, etc.

Industrial (Non-Food) Uses of Soybeans: Look under "Industrial Uses ..." for more than 17 subject headings.

Copyright © 2014 by Soyinfo Center

Pioneers - Individuals: Laszlo Berczeller, Henry Ford, Friedrich Haberlandt, Artemy A. Horvath, Englebert Kaempfer, Mildred Lager, William J. Morse, etc. Soy-Related Movements: Soyfoods Movement, Vegetarianism, Health and Dietary Reform Movements (esp. 1830-1930s), Health Foods Movement (1920s-1960s), Animal Welfare/ Rights. These are indexed under the person's last name or movement name.

Nutrition: All subjects related to soybean nutrition (protein quality, minerals, antinutritional factors, etc.) are indexed under Nutrition, in one of more than 70 subcategories.

Soybean Production: All subjects related to growing, marketing, and trading soybeans are indexed under Soybean Production, e.g., Soybean Production: Nitrogen Fixation, or Soybean Production: Plant Protection, or Soybean Production: Variety Development.

Other Special Index Headings: Browsing through the subject index will show you many more interesting subject headings, such as Industry and Market Statistics, Information (incl. computers, databases, libraries), Standards, Bibliographies (works containing more than 50 references), and History (soy-related).

Commercial Soy Products (CSP): See "About This Book."

SoyaScan Notes: This is a term we have created exclusively for use with this database. A SoyaScan Notes Interview contains all the important material in short interviews conducted and transcribed by William Shurtleff. This material has not been published in any other source. Longer interviews are designated as such, and listed as unpublished manuscripts. A transcript of each can be ordered from Soyinfo Center Library. A SoyaScan Notes Summary is a summary by William Shurtleff of existing information on one subject.

"**Note**:" When this term is used in a record's summary, it indicates that the information which follows it has been added by the producer of this database.

Asterisks at End of Individual References:

1. An asterisk (*) at the end of a record means that Soyinfo Center does not own that document. Lack of an asterisk means that Soyinfo Center owns all or part of the document.

2. An asterisk after eng (eng*) means that Soyinfo Center has done a partial or complete translation into English of that document.

3. An asterisk in a listing of the number of references [23* ref] means that most of these references are **not** about soybeans or soyfoods.

Documents Owned by Soyinfo Center: Lack of an * (asterisk) at the end of a reference indicates that the Soyinfo Center Library owns all or part of that document. We own roughly three fourths of the documents listed. Photocopies of hard-to-find documents or those without copyright protection can be ordered for a fee. Please contact us for details.

Document Types: The SoyaScan database contains 135+ different types of documents, both published (books, journal articles, patents, annual reports, theses, catalogs, news releases, videos, etc.) and unpublished (interviews, unpublished manuscripts, letters, summaries, etc.).

Customized Database Searches: This book was printed from SoyaScan, a large computerized database produced by the Soyinfo Center. Customized/personalized reports are "The Perfect Book," containing exactly the information you need on any subject you can define, and they are now just a phone call away. For example: Current statistics on tofu and soymilk production and sales in England, France, and Germany. Or soybean varietal development and genetic research in Third World countries before 1970. Or details on all tofu cheesecakes and dressings ever made. You name it, we've got it. For fast results, call us now!

BIBLIO: The software program used to produce this book and the SoyaScan database, and to computerize the Soyinfo Center Library is named BIBLIO. Based on Advanced Revelation, it was developed by Soyinfo Center, Tony Cooper and John Ladd.

History of Soybeans and Soyfoods: Many of our digital books have a corresponding chapter in our forthcoming scholarly work titled History of Soybeans and Soyfoods (4 volumes). Manuscript chapters from that book are now available, free of charge, on our website, www.soyinfocenter.com and many finished chapters are available free of charge in PDF format on our website and on Google Books.

About the Soyinfo Center: An overview of our publications, computerized databases, services, and history is given on our website.

HISTORY OF SOYBEANS AND SOYFOODS IN JAPAN, AND IN JAPANESE COOKBOOKS AND RESTAURANTS OUTSIDE JAPAN (701 CE TO 2014)

1. Emperor Monmu. 701 AD. Taihô ritsuryô [The Taiho Law Codes]. Japan. [Jap]*

• ***Summary:*** This is the earliest document seen (Jan. 2014) concerning soybeans, soybean products, or miso in Japan. Although it does not specifically mention soybean cultivation, the soybeans used to make the various fermented soy products described below must have been grown in Japan. This document also contains the earliest date seen for soybeans in Japan, or (by inference) the cultivation of soybeans in Japan (A.D. 701).

Shurtleff and Aoyagi (1976. *The Book of Miso,* p. 216; 1983. *The Book of Miso,* 2nd ed., p. 219): One of Japan's earliest constitutions, the *Taihô Ritsuryô* established the *Hishio Tsukasa,* or Bureau for the Regulation of Hishio Production, Trade, and Taxation in A.D. 701; it went into effect in 702. The Hishio Tsukasa, located in the Imperial Palace, was an annex of the emperor's kitchen (*kunaicho daizenshoku*), where hishio was made. Using methods very similar to those developed in China, it transformed soybeans into high- and low-quality *hishio* (which resembled Chinese *jiang*), fermented black soybeans (*kuki* or *shi*), and *misho* (an ancestor of miso; the word "miso" had not yet been coined). These foods and seasonings were consumed at the Imperial Household.

Note: This is the earliest Japanese document seen (Nov. 2011) that mentions *kuki,* an early type of Japanese fermented black soybeans / salted fermented soybeans.

Yokotsuka (1986, p. 198) states that the "Taiho-Law (701) mentioned soybean-hishio, miso, kuki (same as shi), taremiso, usu-dare, and miso-damari." But in a letter (June 1988) to William Shurtleff, who questioned the correctness of this, he stated, "This was a serious mistake. I am fully aware that there is no description of filtered soy sauce in the *Taiho Ritsuryo.* I should have written:

"Taiho-Law (701): Sho-shi and miso

"Taremiso, usudare, miso-damari (1300-1500)

"Ekirinbon-setsuyoshu (1598): Shoyu."

Usudaré and *miso-damari* were apparently liquid soy sauces. *Usu-daré* means a thin taré, where *taré* is a typically thick seasoning sauce. Miso-damari is the liquid that separates or is separated from miso, often forming a pool in the upper surface of the vat.

Reischauer and Fairbank (1960, p. 481-82) notes: "The Law Codes. The details of the administrative system which the Japanese borrowed from China can best be learned from the law codes they compiled on the basis of the Chinese models... The very concept of law was a new idea. Hitherto the Japanese had had only the unwritten precepts of the Shinto religion... The first code seems to have been compiled under Tenchi, but the most famous was the Taiho Code of 701."

2. Kojiki [Kojiki: Record of ancient matters]. 712 AD. Japan. [Jap]

• ***Summary:*** This is Japan's oldest chronicle. The mythical story of the origin of the soybean in Japan is as follows, from Philippi's 1968 translation (p. 87): "Chapter 18. Opo-ge-tu-pime produces food and is killed by Susa-no-wo. Again, [Susa-no-wo-no-mikoto] asked food of Opo-ge-tu-pime-no-kami. Then Opo-ge-tu-pime took various viands out of her nose, her mouth, and her rectum, prepared them in various ways, and presented them to him. Thereupon Paya-susa-no-wo-no-mikoto, who had been watching her actions, thought that she was polluting the food before offering it to him and killed Opo-ge-tu-pime-no-kami. In the corpse of the slain deity there grew [various] things: in her head there grew silkworms; in her two eyes there grew rice seeds; in her two ears there grew millet; in her nose there grew red beans [lit. "small beans," probably azuki]; in her genitals there grew wheat; and in her rectum there grew soy beans. Then Kami-musubi-mi-oya-no-mikoto ['Divine Generative Force Deity'] had these taken and used as seeds." Note: This is the earliest Japanese-language document seen (Jan. 2005) that mentions azuki beans.

Concerning the book, Reischauer and Fairbank (1960, p. 464-65) note: "The 'Kojiki' and 'Nihon Shoki.' The most important materials bearing on Japanese origins and the formation of the Japanese state are the early native records, but this is not for reasons of accuracy. The *Kojiki* (*Record of Ancient Matters*) was compiled only in 712 and the *Nihon shoki* (*History of Japan,* also known as the *Nihongi*) in 720. Influenced by eighth century concepts, the authors of these works obviously reshaped Japanese mythology and historical traditions to enhance the prestige and power of the ruling family and to create a false picture of long centralized rule and a respectable antiquity comparable to that of China. Although reasonably reliable on the later periods, their accounts of the early centuries are almost worthless as history...

"The accounts of early history in the *Kojiki* and *Nihon shoki* were woven together out of a variety of myths, legends, genealogies, vague historical memories, and borrowings from Chinese philosophy and history. Frequently the two books flatly contradict each other, of the *Nihon shoki* offers a series of variants of a myth or tradition." In the Japanese creation myth, the first deities to emerge were a sister and brother, Izanami and Izanagi, who, descending to earth, gave birth to the islands of Japan and a number of

© Copyright Soyinfo Center 2014

other deities, including a Sun Goddess called Amaterasu [also called Amaterasu-omikami, the Shinto Sun Goddess], and a male deity named Susa-no-o (also called Susa-no-wo). The Japanese state was said to be founded in 660 B.C. in Yamato, the area centering around the Nara Plain, a short distance inland from Osaka. The founder of the imperial line was said to be Jimmu, the "Divine Warrior."

Note: Historically, the Yamato emperors lived in the 5th century A.D. "Since their direct lineal descendants still occupy the Japanese throne, the Japanese imperial family is by far the oldest ruling line on earth."

"The Kojiki is written partly in Chinese, partly in Chinese characters used phonetically to represent individual syllables of Japanese names or words, and partly in Chinese characters used to express the meaning of whole Japanese words. The result, naturally, is extremely difficult to read. The *Kojiki* deals largely with early myths and legends and dwindles to little more than genealogies for the rulers traditionally dated between 488 and 628.

"The *Nihon shoki,* by contrast, is written in pure Chinese and becomes increasingly more detailed as it approaches its terminal date of 689."

Concerning azuki, the *Kojiki* states that when the god *Susano no Mikoto* came to earth, he killed a man and azuki sprang from the man's nose.

Harlan (1992, p. 45) notes that the source of soybeans suggests flatulence. Note: This is the earliest document seen (July 2012) suggests flatulence in connection with soybeans.

Concerning azuki beans, Lumpkin & McClary (1994, p. 37, based on Hoshikawa 1985) write: "The *Kojiki* states that when the god *Susano no Mikoto* came to earth, he killed a man and azuki sprang from the man's nose..."

3. Fujiwara, Fuhito. 718 AD. Yôryô ritsuryô [Yoryo ritsuryo]. Japan. [Jap]*

• ***Summary:*** According to Ichiyama (1968) an early reference to hishio, perhaps a soy-based product, appeared in this book. It mentioned various types of chiang and fermented black soybeans, plus *misho,* the second character of which was *chiang.* Address: Japan.

4. Nihon shoki (or Nihonshoki, or Nihongi) [Nihon shoki: Chronicles of early Japan]. 720 AD. Japan. [Jap]

• ***Summary:*** The second version of the mythical story of the origin of the soybean in Japan, following that told in the Kojiki (A.D. 712) is as follows, from a note in Philippi's 1968 translation of the *Kojiki* (p. 404-05): "Ama-terasu-opo-mi-kami [also called Amaterasu-omikami, the Shinto Sun Goddess], hearing that a deity called Uke-moti-no-kami [a food deity] dwelt in the Central Land of the Reed Plains, sent Tuku-yomi-no-mikoto [the moon god] to inquire after her.

"When Tuku-yomi-no-mikoto arrived there, Uke-moti-no-kami took rice, fish, and meat from her mouth, and, placing them on tables, offered them to him. At this he became angry and killed her, then returned and reported this matter.

"Then Ama-terasu-opo-mi-kami rebuked the moon deity and vowed never to set eyes on him again. For ever after she dwelt one day and one night apart from him. [A mythological explanation for the rotation of sun and moon.]

"When Ama-terasu-opo-mi-kami sent a messenger to see, in the dead Uke-moti-no-kami's head there had come into being cattle and horses, on her forehead millet, on her eyebrows silk-worms, in her eyes Deccan grass [MJ *hie;* also panic grass], in her belly rice, and in her genitals wheat, soy beans, and red beans [probably azuki].

"When these were taken and presented to Ama-terasu-opo-mi-kami, she rejoiced and caused these things to be used by mortal men for their livelihood. [Asahi ed., I, 86-87; Aston, I, 32-33.]"

For a background on this book, see *Kojiki* (A.D. 712). For other English translations see Aston (1896, 1972; p. 32-33).

5. Tôdaiji shôsôin monjo [Documents in the Shosoin imperial treasury at Todaiji temple in Nara]. 730-748 AD. Japan. [Jap]*

• ***Summary:*** Sato (1963, p. 27), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the earliest Japanese document seen on the subject. He gives the date as Tenpyo 2 (730 A.D.). It is written entirely in Chinese characters (*Kanbun*).

Ichiyama (1968) says this is a collection of documents, not just one. "In 730 AD taxes were being paid on miso and *hishio,* in 731 on *kuki, arabishio,* and *richio."*

Shinryû Sekine, in his book *A Study on Eating Habits in the Nara Period* (1969, 1974) quotes from the *Shosoin-monjo,* a document preserved in the Shosoin, the storehouse at the Todai-ji temple in Nara. From the phrase "... to obtain liquid out of brewed or fermented soybeans..." in the document, Sekine says: It is clear in those days that *sho* in those days was liquid.

Shurtleff and Aoyagi (1983. *The Book of Miso,* 2nd ed., p. 219): "The most detailed information to date on the early relatives of miso and the first clear reference to a soybean hishio appeared in the Todaiji Shosoin documents, written between 730 and 748, and still preserved in excellent condition in the Imperial Treasury of the Shosoin, connected with Nara's Todaiji temple. It records that in 730 taxes were being paid on hishio and on misho (a variety of hishio and an early relative of miso). A document from the next year mentions the same foods again. A document written prior to 748 clearly referred to soybean hishio (Ichiyama 1968)."

6. Manyôshû [Man'yoshu: Collection of Japan's earliest songs and poems]. 760 AD. Japan. For translations see Pierson 1929 and Honda 1967. [Jap]*

• ***Summary:*** The earliest poems in this extraordinary work

© Copyright Soyinfo Center 2014

were written in AD 315. In most poems Japanese words are elaborately spelled out with Chinese characters used phonetically.

Sato (1963, p. 29), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the second earliest Japanese document seen on the subject. It was published in year 3 of Tenpyo Hoji (760 A.D.) and the pertinent information is in Volume (Kan) 16. It is written entirely in Chinese characters (Kanbun).

Shurtleff and Aoyagi (1983. The Book of Miso, 2nd ed., p. 219): "One of the first references to this hishio appears in the *Man'yoshu,* an extraordinary collection of thousands of Japan's earliest songs and poems recorded from as early as the year 315 A.D. and compiled circa 760. In most of the poems, the Japanese words are elaborately spelled out with Chinese characters used phonetically. The character for hishio (chiang) appears in scroll 16 in a poem by Imiki Okimaru (686-707), a humorous bard who improvised at banquets for the court nobility. We and Pierson (1929) translate this as:

"I want to eat red snapper (*tai*)

"With a dressing of minced garlic and vinegar-hishio

"So do not offer me a leek soup.

"Another poem describes two comic crabs happily making themselves into crab hishio seasoned with pounded elm bark. Mention is also made of hishio containing wild game and deer meat. Unfortunately we are not told exactly what type of product this hishio was nor how it differed from miso and chiang, yet it is now generally believed that all of these products were well known at this period among the nobility and, to a lesser extent, the common people."

Yokotsuka (1986, p. 198) states that the *Manyo-shu* (350-759 A.D.) mentioned Koji (mold-cultured cereals) and Hishio (same as chiang, made from fish, meat, or soybeans). If that is true, this would be the earliest Japanese-language document seen (June 2012) that refers to koji.

7. Omi, Mifune. 785 AD. Tang Da He Shang Dong Zheng Zhuan [Biography of the great monk from the T'ang dynasty who traveled to the East]. China. [Chi]*

• ***Summary:*** Wade-Giles reference: *T'ang Ta He Shang Tung Cheng Chuan.* Tang dynasty. Williams (1988): The monk discussed is Chien Chên (Jap. Ganjin, who lived A.D. 688-763), who was blinded while traveling to Japan to teach Buddhism. The author, Omi, lived A.D. 722-785 in Japan, wrote this work in Classical Chinese, probably between A.D. 763 and 783. New editions of the work have been published in 1936 and 1979.

Concerning Ganjin, Shurtleff and Aoyagi write in *The Book of Miso* (1976. p. 216): "One of the most colorful chapters in the history of miso concerns the great Chinese Buddhist master Ganjin. The founder of the Japanese Ritsu or 'precepts' sect and of the well-known Toshodaiji temple in Nara, Ganjin spent over 11 years trying to reach Japan. After being blocked by pirates, shipwrecks, and storms, and having lost his eyesight during one of his 6 attempted crossings, he finally succeeded in 754 at the age of 66. The records of his ship's cargo show that in addition to 185 monks, sailors, and craftsmen, he brought 100,000 gallons of 'sweet kuki.' Later records show that this same fermented soybean food was prepared at his temple, carried by foot to Kyoto, and peddled there in the streets.

"Although Ganjin's sweet kuki was related to miso, it was probably more a preserved food than a seasoning, similar to today's Daitokuji natto. Nevertheless, Ganjin is often said to have brought the first prototype of Japanese miso from China, and if we take this sweet kuki to be the original Japanese miso, then he was clearly its transmitter. But records show that something called 'miso' was already being sold in Nara's markets more than 20 years before Ganjin's arrival. Hence, some scholars have concluded that the popular 'Ganjin theory' probably reflects more of a desire on the part of early miso makers and Buddhist priests to link their new product to Ganjin's lofty reputation than to historical fact."

H.T. Huang (2000, p. 317). There are two popular theories about how tofu was transmitted from China to Japan. The first theory holds that it was brought from China by the delegation of Buddhist monks headed by the master Kanshin (Jianzhen; W.-G. Chien Chên), who arrived in A.D. 754. While this view is certainly plausible, there is as yet no documentary evidence to support it.

Note 1. This is the earliest document seen (March 2003) concerning an early foreign traveler in Japan (Chien Chên; Jap. Ganjin) in connection with soybeans.

Note 2. This is the earliest document seen (April 2001) that is a biography of a person involved with soyfoods (fermented black soybeans) or soybeans.

8. Kiyohara Natsuno. 834 AD. Reigekai or Ryôgekai [Reigekai or Ryogekai]. Japan. [Jap]*

• ***Summary:*** Sato (1963, p. 8), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the fifth earliest Japanese document seen on the subject. The pertinent information is in volume 1 (Teninrei). It was completed in the 10th year of the Tencho era (834 A.D.). It is written entirely in Chinese characters (Kanbun).

9. Endo Hoju. 843 AD. Zoku Nihon kôki [Continuation of the Nihon Koki]. Japan. July. [Jap]*

• ***Summary:*** Sato (1963, p. 29), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the fourth earliest Japanese document seen on the subject. It was published in the 7th month of the 9th year of the Jowa era (July of 843 A.D.). It is written entirely in Chinese characters (Kanbun).

10. Koji dan [Stories about ancient things]. 886 AD. Japan.

© Copyright Soyinfo Center 2014

[Jap]*
• ***Summary:*** Sato (1963, p. 8), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the seventh earliest Japanese document seen on the subject. It was published in the second year of the Ninna era (886 A.D.). It is written entirely in Chinese characters (Kanbun). Not clear are 2 shinsetsu. 49 Koko. Mitsutaka.

11. Nichinichi Ju (Monk). 893 AD. Shinsen jikyô [Newly selected character mirror dictionary]. Japan. [Jap]*
• ***Summary:*** Sato (1963, p. 31), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the eighth earliest Japanese document seen on the subject. It was published in the 4th year of Kampyo [Kanpyo]. It is written entirely in Chinese characters (Kanbun).

12. Sagawaka Doshin (Michimasa?). 893 AD. Ruiju Kokushi [Ruiju Kokushi]. Japan. [Jap]*
• ***Summary:*** Sato (1963, p. 29), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the third earliest Japanese document seen on the subject. It was published in Kanpyo 4 (173 saii, Nen soshin). It is written entirely in Chinese characters (*Kanbun*).

13. Ogura Yoshiyuki. 901-908 AD. Sandai jitsuroku [Three generations of real records]. Japan. Widely circulated in manuscript form by 886 A.D. [Jap]*
• ***Summary:*** Note: This is the earliest document seen, and the earliest Japanese-language document seen, (March 2011) that contains the modern word miso. This is also the earliest document seen (Jan. 2009) concerning the etymology of miso. It portrays miso as a truly Japanese food, rather than a Chinese import. Ichiyama (1968), however, shows that the modern characters for miso are not in it, but in *Fuso Ryakuki.* Sato (1963, p. 30), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the sixth earliest Japanese document seen on the subject. It comes from the *Shoin Zashin Kobai Shinko,* published in the first year of Teikan, by Daizen Tenzashin. It is written entirely in Chinese characters (Kanbun).

Shurtleff & Aoyagi (1983. *The Book of Miso,* 2nd ed., p. 220): "At the beginning of the Heian period, the word 'miso' suddenly began to be written with a new combination of characters, which is used to this day. The character for 'mi' meant 'flavor' and the one for 'so' meant 'throat.' The second character was, itself, a Japanese invention and is presently used in no other words. It first appeared in an official Japanese document in 806 in connection with a food called *enso,* a salt seasoning... We may well inquire why the Japanese of this period deliberately invented a new character to replace the character chiang (hishio) that had been used during the previous two centuries, and why they introduced the character meaning 'flavor' into the combination. It seems likely that by this time the Japanese had so thoroughly transformed chiang into a food suited to their own culture and tastes, that they felt it deserved a uniquely Japanese name. In fact, the *Sandai Jitsuroku* portrays miso as a truly Japanese food rather than as simply a Chinese import. But there were broader cultural changes too behind the change in characters. In 894, at the beginning of the Heian period, Japan essentially cut off contact with the outside world, and began an extended period of assimilating and transforming Chinese cultural imports. During this period, Japan also developed the *hiragana* and *katakana* writing styles, which were completed in the 10th century. It was as part of this larger cultural transformation that the change in miso and its characters took place."

Saito (1985, p. 13): "The Chinese character *so* in the present word *miso* appeared for the first time in the *Sandai Jitsuroku* (858-887).

Fukushima (1989, p. 9): "The first appearance of the present word 'miso' was in the *Nihon-Sandai- Jitsuroku,* a history book by M. Sugiwara, Y. Minamoto, T. Fujiwara, and Y. Okura, published in 901 AD in Japan."

14. Minamoto no Shitagau. 923 AD. Wamyô ruijûshô (Wamyôshô) [General encyclopaedic dictionary. 10 vols.]. Japan. [Jap]*
• ***Summary:*** Heian period. This is a collection of Japanese names, by subject.

Needham (1986, p. 590) cites this as: Minamoto no Shitagau. +934. *General Encyclopaedic Dictionary.*

Shurtleff & Aoyagi (1983. *The Book of Miso,* 2nd ed., p. 221): "Some scholars believe that the pronunciation 'miso' originated in the *Wamyosho* (also called *Wamyo Ruijusho*), the earliest dictionary of the Japanese language, encyclopedic in scale and written between 903 and 938 by Minamoto no Shitagau. It was modeled after Chinese dictionaries and listed many types of hishio including ones pronounced *miso, misho,* and *kara hishio.* It also mentioned fermented black soybeans."

J.R. Wang and Y.H. Lee (1976) in "Traditional soybean foods in Korea" state that: "Since an old Japanese literature [document], *Hwameyruitsuroku* [*Wamyô Ruijusho;* Collections of Japanese Names, by Subject], of Heyan [Heian] records that 'Maljang (Meju) is a Korean soy sauce and paste' and a record on Maljang was also observed in the ruins of Nara, it is evident that soy sauce and paste were introduced from Korea to Japan during the Nara period (645-793 A.D.)."

Sato (1963, p. 33), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the tenth earliest Japanese document seen on the subject. See section 16 (Shoume/Anbai). The selections were made during the Encho period then published more than 700 years later in about 1615, during the Genwa era. It is written

© Copyright Soyinfo Center 2014

entirely in Chinese characters (*Kanbun*).

Note: This is the earliest document seen concerning soybeans or soybean products in Korea. It seems very likely that soybeans were also being grown in Korea by this time, but this is not stated.

15. Fujiwara, Tadahira; et al. comp. 927 AD. Engi shiki [Law codes of the Engi period]. Japan. 50 volumes. See vols. 23, 33, 39, 42. Japanese summary by Kawakami 1978, p. 207-08. [Jap]

• ***Summary:*** Compilation of this book started in 905 and was completed in 927. Containing the earliest known information on production of hishio and miso in Japan, it lists 10 types of miso and hishio. The word *miso* is written in 5 different ways. Sato (1963, p. 31), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the ninth earliest Japanese document seen on the subject. It was published in the 7th year of the Engi era. It is written entirely in Chinese characters (*Kanbun*).

Shurtleff & Aoyagi (1983. *The Book of Miso,* 2nd ed., p. 221): "The earliest Japanese document to contain information about the production of miso and hishio was the *Engi Shiki,* an elaboration of old law codes, compiled in about 927 by Fujiwara Tokihira and others. In it we are told that miso was a fermented food with soybeans as its main ingredient, but it also contained rice, rice koji, wheat, salt, and saké. The *Engi Shiki* gave detailed information about the Hishio Tsukasa government bureau, stated that hishio was given to the Emperor's civil and military officials as part of their annual wage, and listed at least ten different types of miso and hishio. Among these, the word 'miso' was written using at least five different character combinations, all of which were pronounced 'miso,' or perhaps occasionally 'mishio.'

"It is not always clear whether each of these names refers to a different food, or whether the name of a single variety was simply being written with different character combinations. The book gives the amounts of basic raw materials used in preparing numerous different types of miso and hishio, but most of the quantities appear quite inaccurate and cannot be used experimentally to make the products they describe.

"Although notebooks dating from as early as the 8th century reveal that miso was bought and sold in the marketplaces of the former capital at Nara, the first shops specializing in its sale are said to have originated in about 925 in the new capital at Kyoto. The *Engi Shiki* records the presence of a miso retail shop in Kyoto's western market and a hishio outlet in the eastern market. Moreover, 50 other shops are reported to have carried hishio, and 32 miso, as one among numerous other foods. Thus by the middle of the 10th century, it seems that hishio and miso were becoming basic staples."

Gotoh (1984, p. 136) states: "Engishiki (completed 927 AD) which described in detail the regulations on crop products (for example, exchange rates of soybeans with bundles of rice and barley for yearly tribute), stated that the Kinki, Chugoku, and Shikoku districts [all located in southwest Japan, from Kyoto to just north of Kyushu] were the main soybean production areas." He gives a good map of Japan showing these three regions.

Lumpkin and Konovsky (1991, p. 121, citing Igata 1977) state that *"Aomame* [meaning "green soybeans"] is mentioned in the *Engishiki,* a guide to the conduct of government and religious affairs, published in 927 A.D." [Heian period].

Iino (1999, p. 14): "The *Engishiki,* the legal code of the Heian era, which provides details on the implementation of ancient laws, offers examples on the use and provision of *sho / hishio.* It seems that *sho* was a daily necessity up to this period. Iino adds: "The Chinese character *sho* was pronounced *hishio* in Japanese and meant fermented soybeans... No clue as to the original recipe for *sho* can be found, with one exception in 'General Instructions and Recipes,' part of the *Daizen-ge* in the *Engishiki.* This recipe states that *sho* made to present to the emperor consists of soybeans, malted rice [koji?], glutinous rice, wheat, liquor and salt. It tells us the proportions of ingredients and the amount of the resulting *sho* but provides no further details."

There is a debate among scholars as to whether *sho* was a liquid or more like a mash (*moromi*). One part of the *Engishiki* mentions *'sho* dregs.' It seems likely that the dregs remained after the liquid was filtered off. "In the *Engishiki,* liquid *sho* and *sho* dregs were used for pickling gourds, wax gourds, turnips, and eggplant. The *Engishiki* also refers to some foods that are very likely *sho*-pickled fish, such as crucian carp, blowfish, and sardines." Many kinds of *sho*-pickles were available during this era.

"Mash-style *sho:* When used as a seasoning for processed food, *sho* was probably prepared in mash-like form, not as a liquid. It is not very difficult to prepare liquid *sho:* all you have to do is filter out or extract the mash-like *sho.* Doing so, however, severely reduces the efficiency of the process. The *Engishiki* states that the amount of liquid *sho* produced was less than a third of the total amount of ingredients used. The *Daizen* and *Naizen* in the *Engishiki* also indicate that large quantities of *sho* were used for provisions, workers' meals and feasts, as well as for many kinds of pickles. It is impossible to think that all this *sho* was of the labor-consuming, wasteful liquid type. Besides, *sho* dregs without liquid after filtering lack the taste and quality that are necessary."

Note: This is the earliest document seen (July 2007) that mentions sake in Japan.

Japanese summary by Kawakami 1978, p. 215-16. [Jap]

17. The legendary early discovery of natto in Japan by Hachiman-taro Yoshiie (Early event). 1051-1083.
• ***Summary:*** The origin of natto in Japan is obscure. This is the most famous legend of that origin.

In "Chronology of Soybeans," by Akio Saito (1985. *Daizu Geppo* (*Soybean Monthly News*). Jan. p. 12-14–in Japanese) we read: In the year A.D. 1083, stringy natto (*itohiki natto*) is discovered accidentally in Oshu (Oshû, northeast Japan) during the conquest of Oshu by Minamoto (Hachimantaro) Yoshiie (lived 1041-1108). It is said that the natto was made when cooked soybeans were placed in a [rice-straw] sack strapped over the back of a horse. The warmth of the horse helped the fermentation. There are so many legends like this one in the northeast prefectures (*Tohoku Chiho*) of Japan that it seems possible that natto was originally made there.

In the book *Nattô kenkô-hô* [*The natto way to good health*], by Ohta Teruo (1975, Tokyo: Futaba Books. 242 p.–in Japanese) there is a chronology of natto. One page 223 we read under the year A.D. 1051: Hachimantaro Yoshiie's natto legend started. *Oshû Kaido* became known as the "natto road." More details and conjecture about the "Natto Road" are given on p. 37-39. Since ancient times, there have been many legends concerning the origin and development of natto. These legends are centered in Oshû, in the cold northeast provinces (*Tôhoku Chihô*) of Japan, which, in the eleventh century, was just north of the area controlled by the Japanese government. A man named Hachimantaro Yoshiie was the hero of two wars: The Zenkunen War of 1051 and the Gosannen War of 1083. When the weather was very cold, the crops were often poor. The government tried to collect taxes and the peasants threatened not to pay or to revolt. To apprehend those who refused taxes, and prevent the insurrection from spreading, the government sent in Minamoto no Yoriyoshi Yoshiie. Following the Oshu Road (*Oshû Kaido*) he led his soldiers and horses northward. The horses were fed cooked soybeans and straw. The war dragged on. The story goes that one night Yoshiie planned to attack the enemy. He made a camp and cooked soybeans but suddenly he was attacked, so he quickly put the cooked soybeans in a rice-straw bag (*tawara*), slung the bag over a horse's back, and escaped. The next day, when the bag was opened, the soybeans–as if by magic–had turned to stringy natto–which had a distinctive fragrance and aroma. The four conditions necessary for making natto had been present: Cooked soybeans, rice straw, warmth, and moisture (heat and sweat from the horse's body). The bacteria that caused the fermentation were found naturally on rice straw.

During the Gosannen war, the peasants who revolted were in Kiyohara. This time Yoshiie made the natto deliberately. A poet and popular figure who was respected and intelligent, he recognized that natto was a good food–not simply spoiled soybeans. It made him and his soldiers feel strong. He considered it a portable "war food" that could be made with little effort while he was on a campaign.

Nagai and Tamang (2010, p. 194-95) retell the legend like this: "The most famous legend of the origin of *natto* is that of Yoshiie's. In 1083, Hachiman-taro Yoshiie, the chief of a samurai legion, stayed at a house on the course of conquering the northern area of Japan. His retainer boiled soybeans for horses and wrapped the remaining soybeans with straws [sic]. The wrapped soybeans were fermented, after being tied to the back of a horse, that produced a viscous material on the soybeans. The retainer ate the soybeans and found it [sic] tasted very delicious. The fermented soybean food was *natto.*"

Note: Japanese natto scholars and historians find these legends interesting, but are quick to add that they are not supported by any documentary evidence. We have never been able to determine when this legend was first committed to writing.

18. Fujiwara no Akihira. 1058-1068. Tamatsukuri komachi sôsui-sho: Shin sarugakuki [New monkey play story: A humorous novel about the Uemon family in Nishi-kyo]. Japan. Japanese summary by Kawakami 1978, p. 220-22, and by Naomichi Ishige. Undated. [Jap]
• ***Summary:*** *Sarugaku* is a funny story or play, the origin of Noh and Kyogen dramas. Written in Chinese (*Kanbun*).

Ito (1976) and Iwadare (1976) both say that the word for salty natto [fermented black soybeans] first appeared in 1286 in this book. This document is said to contain an early reference to fermented black soybeans. Kawakami (1978) in his half-page summary of the book makes no mention of natto or of soynuts. Two books, Motoyama's *Inshoku Jiten* (1958) and Zenkoku Natto's *Natto Enkakushi* (1975) give the date of this book as A.D. 1286. The fermented soyfood mentioned in this book is not *itohiki-nattô,* but a type of spring (or crab) salty natto (*shiokara nattô*), fermented with a mold rather than a bacterium, and thus in the family of fermented black soybeans.

Kawakami and Eiichi (1985) in *Daizu ryôri kotoba no rekishi* ["History of soyfoods terminology in Japan"] (p. 35, 39) state that the word "irimamé" (dry roasted soybeans) first appears in the *Shin Saru Gakki* [New and Funny Lewd Stories], a book published in Japan during the Heian period in about A.D. 1058-1065. *Sarugaku* (*Saru* means "monkey") is a kind of comedy containing some obscene stories that make it especially entertaining. It is found in the collected works titled *Gunsho Ruiju no Sarugakki* which states (volume 136, p. 344) "Sakana wa Irimame," which means that irimame is used as a food to serve with saké (*o-tsumami*). The story is about a woman who loved saké.

Ohta (1986) says: The earliest document known to have mentioned the word "natto" is the *Shin Sarugaku Shiyu,* written by A. Fujiwara in 1068; yet no description was given

© Copyright Soyinfo Center 2014

of the method for making this natto.

Fujiwara no Akihira lived 989-1066.

Note: This is the earliest document seen (Dec. 2012) that mentions dry roasted soybeans for food use, or the Japanese word for such soybeans, *Irimame / irimamé.*

Letter (e-mail) from Naomichi Ishige, Japanese food historian and expert on natto. 2008. Nov. 16. "The author of the book you asked about was Fujiwara Akihira, and its title was *Shin-sarugaku-ki* (in English: "New sarugaku story"). The book is supposed to have be written during 1058-1065.

"Sarugaku is a kind of show consisting mostly of music, singing, dancing, acrobatics, etc. This show was popular among people during the Heian period (794-1185) in Japan. *Shin-sarugaku-ki* first commentated on Sarugaku, and then introduced a man watching sarugaku one night. The story described the whole family of this man, so it became encyclopaedic information about the life of ordinary people in Kyoto at that time.

"This is the first book which used the word *natto* to refer to "salty natto" [fermented black soybeans]. However, salty natto itself has existed from ancient times in Japan; it was called *kuki.*

"Concerning the origin of the word 'natto': According to the widely held theory, the character pronounced *na* originated from *nasso,* which refers to a temple's kitchen. *To* means 'beans.' Monks ate lots of natto because they were (and still are) vegetarians. Thus *natto,* which means 'beans of a temple's kitchen,' became used among people.

"I once wrote about natto as a food in Southeast Asia and East Asia. I shall send photocopies to you." Address: Japan.

19. The word *natto* first appears in Japan, but it refers to "salty natto" (*shiokara natto* [fermented black soybeans]) rather than to "sticky natto" (*itohiki natto*) (Early event). 1058-1068.

• ***Summary:*** Letter (e-mail) from Naomichi Ishige, Japanese food historian and expert on natto. 2008. Nov. 16. "The author of the book you asked about was Fujiwara Akihira, and its title was *Shin-sarugaku-ki* (in English: 'New sarugaku story'). The book is supposed to have be written during 1058-1065.

"This is the first book which used the word *natto* to refer to 'salty natto' [fermented black soybeans]. However, salty natto itself has existed from ancient times in Japan; it was called *kuki."*

Note: This is the earliest English-language document seen (Nov. 2011) that uses the term "salty natto" or the term "shiokara natto" to refer to fermented black soybeans.

"Concerning the origin of the word 'natto': According to the widely held theory, the character pronounced *na* originated from *nasso,* which refers to a temple's kitchen. *To* means 'beans.' Monks ate lots of natto because they were (and still are) vegetarians. Thus *natto,* which means 'beans of a temple's kitchen,' became used among people."

20. Tôji ruiki [Toji ruiki]. 1080. Japan. [Jap]*

• ***Summary:*** Mentions many types of chiang (Ichiyama 1968).

21. Nakaomi, Hiroshige. 1183. Nakaomi Hiroshige nikki [Diary of Hiroshige NAKAOMI]. Entry for January 2. Unpublished manuscript. Japanese summary by Kawakami 1978. [Jap]

• ***Summary:*** This diary was written during the Heian period by a Shinto priest (*kannushi*) of the Kasuga jinja (shrine) in Nara, Japan. The date of the entry, 2 Jan. 1183, is that measured by the old almanac. The diary entry stated that "one type of *shunkin* tofu" was included in the offerings at the shrine's altar.

Note: This is the earliest document seen (April 2013) that mentions tofu in Japan, or tofu in any country outside of China; the document was discovered by the great Japanese food historian Osamu SHINODA (1971).

Saito (1985) states: 1183–Tofu is first mentioned in a document from the Great Kasuga Shrine (*Kasuga Taisha*) in Nara. The characters used to write the word tofu then were different from the characters used today. It seems that this tofu was very hard.

There are four interesting points about this first mention: (1) The word "tofu" was written with characters different from those used today. The first character, pronounced *to* (rhymes with the "toe" on your foot), means "T'ang" as in "T'ang dynasty," and the second character, pronounced *fu,* meanings a "sign, mark, charm, or amulet"; (2) The tofu appears at a Shinto shrine rather than, as expected, at a Buddhist temple, and especially a temple with strong influence from China; (3) The tofu is used, not as a food, but as an offering at the altar. A similar mention appears in the annals of the same shrine on the same date one year later, but this time the reference is to "one type of *sokuan* tofu" (Note: The meanings of the terms *shunkin* and *sokuan* are not clear); (4) The date, January 2, is during the coldest time of the year, when the tofu would stay fresh longest. Address: Nara, Japan.

22. Buddhist monk Kakushin returns to Japan during the Sung dynasty from China having learned how to make Kinzanji miso (Early event). 1228.

• ***Summary:*** In *The Book of Miso,* by Shurtleff and Aoyagi (1976, p. 219-20) we read: "The origins of modern shoyu can be traced more clearly to the mid 1200s when the Japanese priest Kakushin [1207-1298] returned from China, having learned there the technique for preparing Kinzanji miso. Establishing himself at Kokoku-ji temple near the town of Yuasa (in today's Wakayama prefecture, just south of Osaka), he began to teach the local people both Buddhist meditation and the method for preparing his miso specialty.

© Copyright Soyinfo Center 2014

According to non-documented oral tradition, he soon discovered that the liquid which settled to the bottom of the miso kegs made an excellent seasoning, so he decided to alter the process slightly by increasing the proportion of water in the basic mixture. After the regular fermentation period, the excess liquid was ladled off and briefly heated to stop fermentation... Kakushin's creation, too, came to be known as *tamari,* deriving its name from the verb *tamaru,* meaning 'to accumulate,' as 'water accumulates into ponds,' and by 1260 it was being produced for home consumption in the nearby towns of Yuasa and Hiromachi... By 1290, the first Yuasa tamari was said to have been sold commercially, and soon even poets began to sing the praises of this new delicacy, calling it *murasaki* or 'deep purple,'..."

In "Chronology of Soybeans," by Akio Saito (1985. *Daizu Geppo* (*Soybean Monthly News*)**.** Jan. p. 12-14–in Japanese) we read: 1228–The Buddhist monk Kakushin returned from Sung dynasty China having learned the method for making fermented Kinzanji miso. While fermenting the miso, he discovers that the liquid which gathers on the bottom of the vats can be used as a tasty seasoning. This tamari is considered the first soy sauce in Japan. Kinzanji miso is a type of *namémiso* (Finger Lickin' Miso) made from roasted soybeans and barley koji. To these are added eggplant, white melon (*shiro uri*), etc., and the mixture is fermented.

23. Tsutsumi Chûnagon monogatari [A collection of 11th century short stories of Japan]. 1250. Japan. [Jap]*
• ***Summary:*** According to the *Nihon Kokugo Daijiten* the earliest known appearance of the word *irimame* was in the *Tsutsumi Chûnagon Monogatari,* which appeared in Japan during the period mid-11th to mid-13th century. Address: Japan.

24. Nichiren, Saint. 1275. Re: Thank you for edamamé. In: *Nichiren Shonin Gosho Zenshu* (*The Collected Writings of Saint Nichiren*)**.** [Jap]*
• ***Summary:*** In the year 1275 Saint Nichiren (*Nichiren Shônin*) was living at Mount Minobu (*Minobu-san;* the headquarters of the Nichiren sect, in Yamanashi prefecture near the town of Minobu, about 80 miles west southwest of Tokyo). He received many gifts from his followers or devotees. He wrote down the name of each gift and the amount given, then sent a very courteous thank you letter to each of the gift givers. These letters are published in a book titled *Nichiren Shonin Gosho Zenshu* (*The Collected Writings of Saint Nichiren*)**.** In the letter dated 26 July 1275 he wrote to a Mr. Takahashi: "Thank you for the edamamé."

Note 1. This letter was first cited by Kawakami and Kimura (1985). They believe that this is the earliest known document that contains the term *edamamé* (characters: branch + beans), which in English are also called "green vegetable soybeans" or "green soybeans in pods."

Note 2. This is the earliest document seen (June 2009) worldwide concerning green vegetable soybeans or edamamé in Japan; it may well be the earliest document seen (June 2009) that clearly mentions green vegetable soybeans worldwide–as an earlier Chinese poem is not clear.

Note 3. This is also the earliest document seen (June 2009) that contains the word "edamamé," or that concerns the etymology of green vegetable soybeans. Address: Japan.

25. Tamari-style shoyu is sold commercially from Yuasa in the Kishu area of Japan (in today's Wakayama prefecture) (Early event). 1290.
• ***Summary:*** *The Book of Miso,* by Shurtleff and Aoyagi (1976, p. 219-20) states that when the Japanese priest Kakushin returned from China [in 1228], he established himself at Kokoku-ji temple, near the town of Yuasa. By 1260 tamari "was being produced for home consumption in the nearby towns of Yuasa and Hiromachi... By 1290, the first Yuasa tamari was said to have been sold commercially, and soon even poets began to sing the praises of this new delicacy, calling it *murasaki* or 'deep purple,' a synonym for the finest shoyu, used to this day." A nine-line poem about tamari follows.

In "Chronology of Soybeans," by Akio Saito (1985. *Daizu Geppo* (*Soybean Monthly News*)**.** Jan. p. 12-14–in Japanese) we read: 1228–The Buddhist monk Kakushin returns to Japan from Sung dynasty China having learned the method for making fermented Kinzanji miso. While fermenting the miso in Japan, he discovers that the liquid which gathers on the bottom of the vats can be used as a tasty seasoning. This tamari is considered the first soy sauce in Japan...

1288-1292–Tamari-style shoyu is sold from Yuasa in the Kishu area (in today's Wakayama prefecture).

26. Saito, Akio. 1292. [Chronology of soybeans, 122 B.C. to A.D. 1292] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Jan. p. 12-14. [Jap; eng+]
• ***Summary:*** 122 B.C.–It is said that Lord Liu An of Huai-nan (*Wainan O Ryuan*) invented tofu. Therefore it is sometimes called "Wainan."

300 A.D.–By this time in Japan people are using fermented foods such as kuki, sake, vinegar, sushi, and hishio made from herbs (*kusa-bishio*) and grains (*koku-bishio*)**.** Kuki is a bean-based product related to miso, natto, or tamari.

630 A.D.–Igunami no Otasuki is sent as a student from Japan to T'ang dynasty China (*Kentoshi*)**.** It is thought that foods like tofu were brought back to Japan by such student monks when they returned [but there are no records of this].

701 A.D.–The Taiho Law Codes (*Taiho Ritsuryo*) are established, and they call for the establishment of the Hishio Tsukasa (Bureau for the Regulation of Production, Trade, and Taxation of Hishio and Misho), located in

© Copyright Soyinfo Center 2014

the Imperial Palace as an annex to the emperor's kitchen (*daizenshoku*). Soybeans were definitely used to make these fermented foods and seasonings such as hishio (like Chinese chiang), fermented black soybeans (*shi, kuki*), and misho (a forerunner of miso; the term "miso" had not yet been coined).

741 A.D.–Two new Buddhist temples are added to each feudal domain (*kuni*): Kokubunji is for monks and Kokubunniji is for nuns. It is said that from this time, fermented black soybeans (*tera nattô,* or *shiokara nattô*) spread throughout Japan. They are made from soybean koji, which is soaked in salted water and dried.

794–The capital of Japan is relocated to Kyoto from Nara. The Heian period (794-857) begins.

794-1190–Salted pickles (*shio-zuke*), hishio pickles (*hishio-zuke*), miso pickles (*miso-zuke*), and sake lees pickles (*kasu-zuke*) are eaten. The pickles were made by various methods. But only during and after the Muromachi period (1338-1573) were the various pickles made often.

802–Sakanoue no Tamuramaro (758-811) recommends that farmers in Tanzawa grow soybeans as an emergency food.

840–Each feudal domain (*kuni*) is encouraged to plant millet, barnyard millet, barley, wheat, soybeans, azuki beans, and sesame seeds.

901–The Chinese character *so* in the present word *miso* appears for the first time in the *Sandai Jitsuroku.*

927–The *Engishiki* is completed by Fujiwara no Tokihira (871-811) and others. In this book it is written: "In the feudal domain of Omi 60 koku of soybeans [1 koku = 47.6 gallons or 180 liters], in the domain of Tanba 30 koku, in the domain of Harima 20 koku, in the domain of Misa 10 koku, and in the domain of Iyo 10 koku are recommended (*susumu*). It seems that the soybean was an important crop in those days. Soybeans, rice, wheat, sake, and salt are given as the raw materials for making misho (a product resembling miso). The places famous for making misho are Omi, Hida, Yamato, etc. There are 27 misho shops in the Nishi no Kyo area of Kyoto. It is stated in the *Engishiki* that in order to make 1.5 koku of hishio you need 3 koku of soybeans, 1.5 koku of salt, 0.15 koku each of rice, wheat, and sake, and 0.043 koku of non-glutinous rice (*uruchi-mai*). Hishio at that time would seem to resemble today's kidamari; it would seem to have been very salty.

1068?–Salty natto (*shiokara nattô;* probably fermented black soybeans) appears for the first time in the book *Shin Sarugakki,* by Fujiwara no Akihira (lived 989-1066). In this book the lifestyle, manners, and customs of the time are described.

1083–Stringy natto (*itohiki nattô*) is discovered accidentally in Oshu (northeast Japan) during the conquest of Oshu by Minamoto (Hachimantaro) Yoshiie (lived 1041-1108). It is said that the natto was made when cooked soybeans were placed in a sack strapped over the back of a horse. The warmth of the horse caused the fermentation. There are so many legends like this on in the northeast prefectures (*Tohoku Chiho*) of Japan that it seems possible that natto was originally made there.

1183–Tofu is first mentioned in a document from the Great Kasuga Shrine (*Kasuga Taisha*) in Nara. The characters used to write the word tofu then were different from the characters used today. It seems that this tofu was very hard.

Note: See Diary of Hiroshige NAKAOMI, entry of 1183.

1192–The Kamakura period and shogunate begins as Minamoto no Yoritomo (1147-1199) becomes the first head shogun.

1228–The Buddhist monk Kakushin returns to Japan from Sung dynasty China having learned the method for making fermented Kinzanji miso. While fermenting the miso in Japan, he discovers that the liquid which gathers on the bottom of the vats can be used as a tasty seasoning. Note 1. This tamari is considered the first soy sauce in Japan. Kinzanji miso is a type of *namémiso* (Finger Lickin' Miso) made from roasted soybeans and barley koji. To these are added eggplant, white melon (*shiro uri*), etc., and the mixture is fermented.

1288-1292–Tamari-style shoyu is sold from Yuasa in the Kishu area (in today's Wakayama prefecture).

Note 2. This document contains the earliest clear date seen for the cultivation of soybeans in Japan (A.D. 802, and 840), and for the appearance of the term "tamari" in Japan (1228).

Note 3. This is the earliest document seen (Sept. 2000) that mentions sesame seeds (802 A.D.). Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

27. Kagenki [Kagenki treasure at Horyuji temple in Nara]. 1338. Entry of July 26. First cited by Kawakami 1985. Unpublished manuscript. [Jap]
• ***Summary:*** This document, which was in *Gunsho Ruiju,* mentions "taufu-jiru," pronounced "toufu-jiru." Kawakami says this is the second oldest reference to tofu in Japan. Address: Nara, Japan.

28. Kagen ki [Record of the Kagen era (1305-1364)]. 1338. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to in the form of *taufu-jiru.*

Note 1. According to Osamu Shinoda (1968), this is the earliest document seen that refers to tofu in Japan.

Note 2. Kagen is the name of a Japanese era when ran from 1303 to 1306. The Kagen-ki which started in 1305–during the Kagen era–covers the period 1305-1364. Address: Japan.

29. Gion shigyô nikki [Diary of an official at Gion-sha].

© Copyright Soyinfo Center 2014

1350. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to as *Mori.*

Note 1. According to Osamu Shinoda (1968), this is the 2nd earliest document seen that refers to tofu in Japan.

Note 2: Gion-sha is today's Yasaka Shrine in Kyoto. Address: Japan.

30. Shijô ryôri-sho [Cookbook of the Shijo School]. 1384. Japan. [Jap]*
• ***Summary:*** This book mentioned "tare-miso," "usu-tare," and "tare usu," which are soy sauces similar to tamari.

31. Fujiwara Noritoki. 1405. Noritoki-kyô ki [Diary of the nobleman Noritoki FUJIWARA]. Entry of Dec. 19. Japanese summary by Kawakami 1978, p. 225-26. [Jap]
• ***Summary:*** Kawakami (1978) in his one-page summary of this work (which contains 3 volumes (*satsu*), 783 pages) makes no mention of natto. He does say, however, that this book discusses *shiro-zake* (white sake).

However Kawakami and Kimura (1985) state that this diary contains the earliest known reference to natto. They state: What we now call natto (*itohiki-nattô*) was written as *itohiki daizu* ("string-pulling soybeans") in the old days. It was written like that in the entry for 19 Dec. 1405 in the *Noritoki-kyo ki* (*Diary of Noritoki Fujiwara*), which is the earliest document seen (Jan. 2012) that mentions natto. The author's name was FUJIWARA Noritoki, but he was usually called Yamashina Noritoki because this nobleman's family, which lived on land they owned in Yamashina near Kyoto, kept their diary for five generations. This Yamashina family was in charge of the supplies department for the Imperial Court (*Chotei*), and all supplies that went to the Court had to pass through this family, which recorded them in detail. Another diary was kept by the family's manager (*banto*), and it is even more detailed, containing all of the prices of the goods ordered, and including wages paid to laborers, carpenters, etc. Therefore it is also a very useful book.

Letter (e-mail) from Naomichi Ishige, Japanese natto expert. 2007. March 20. This photocopy is from the late Kozo Kawakami (1995, p. 21). The large section on *itohiki nattô* states that the second earliest known appearance of this food is found in the *Noritoki kyo-ki,* which mentions itohiki-daizu ("string-pulling soybeans") in the entry for 19 Dec. 1405. This diary was written by TAMASHINA Noritoki, who was an aristocrat.

Note 1. This is the earliest document seen (Jan. 2012) that mentions natto (*itohiki nattô*), which it calls *itohiki daizu.*

Note 2. This is the earliest Japanese-language document seen (Dec. 2011) that uses the term *itohiki daizu* to refer to natto.

Note 3. Kozo Kawakami was born in 1898. Address: Japan.

32. Inryôken nichiroku [Daily record of Inryôken]. 1437. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to in the form of *dengaku.*

Note: According to Osamu Shinoda (1968), this is the 3rd earliest document seen that refers to tofu in Japan. Address: Japan.

33. Ise no Jôshin. 1445? Sôgo daisô-shi [Sôgo daisô-shi]. Japan. Undated. [Jap]*
• ***Summary:*** K. Tsuchiya (Soymilk, 1982, p. 30) states that in this book, written in about 1417-1473, there is a section on cooking *unohana* (okara). Tsuchiya thinks this soup was similar to today's soymilk except that the okara had not been removed. The author was the ancestor of Ise no Teijô, who lived during the Tokugawa (Edo) period and wrote that the word *Tofu-kan* should actually be pronounced *Tofu-ko,* and that it means "soup" (*shiru*). When the last character is pronounced "kan" it means "yokan." Note: Could Mr. Tsuchiya be confusing Manpukuji's *tofukan* (hard tofu) with the word *tofukan* (written with different characters) that means soymilk? Address: Japan.

34. Nijo, Yoshimoto. 1450. Shôjin gyorui monogatari Shôjin gyorui monogatari [A comic tale of the great war between vegetarian foods and animal foods]. Japan. 79 p. Japanese summary by Kawakami 1978. [Jap]
• ***Summary:*** Some say that the author was Yoshimoto NIJO (lived 1320-88), but Kawakami thinks that the work was more likely written a little later, in the mid-Muromachi period (the period ran from 1338 to 1573). The original handwritten copy has been lost but the published copy (79 pages) still exists.

This is a funny story about foods that are depicted as people. There are different fish people, Suri-dofu (grated tofu), Natto Taro (or Natto Taro Itogasane; the last name means "many threads"), etc. The story explains that vegetarian foods and fishes got together at the high ranking samurai's place. A red snapper that showed up late was placed at a lower ranking seat below the vegetarian foods. Natto Taro was placed next to the top samurai. The red snapper got upset and called on the fish, shellfish, poultry, and meats to attack the vegetarian (*shojin*) foods. Some animal names weren't even foods.

Letter from Naomichi Ishige, Japanese natto expert. 2007. Jan. 17. This monogatari contains the 2nd earliest known reliable reference to natto in Japan.

Note 1. This is the 2nd earliest document seen (Jan. 2012) and the 2nd earliest reliable Japanese-language document seen that mentions natto. This is also the 2nd earliest document seen (Dec. 2011) concerning the etymology of natto. For more details see: M. Hirano. 1990. *Nattô bunka-kô* [Thoughts on the culture and history of natto]. *Shoku no Kagaku* (*Food Science Journal*) No. 144. p.

© Copyright Soyinfo Center 2014

16-22 (see p. 21).

Note: This is the earliest document seen (July 2002) concerning soyfoods and vegetarianism in Japan.

35. Jinson Daisôjô ki [Record of Jinson Daisôjô]. 1457. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to as *tôfu.*

Note: According to Osamu Shinoda (1968), this is the 4th earliest document seen that refers to tofu in Japan, and the earliest that refers to it by the name still used today, *tôfu.* Address: Japan.

36. Oogusa ryôri-sho [Cookbook of the Ogusa School]. 1467-1614. Japan. [Jap]*
• ***Summary:*** Developed by one of Kyoto's two leading cooking school families. It mentioned soy sauce frequently.

37. Oyudono no Ue no nikki [Diary of Oyudono no Ue]. 1477. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to in the form of *oden.*

Note: According to Osamu Shinoda (1968), this is the 5th earliest document seen that refers to tofu in Japan, and the earliest that refers to it in connection with oden. Address: Japan.

38. Gohôkôin Konoe Masaie ki [Record of Gohôkôin Konoe Masaie]. 1479. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to as *shirakabe.*

Note: According to Osamu Shinoda (1968), this is the 6th earliest document seen that refers to tofu in Japan, and the earliest that refers to it as *shirakabe.* Address: Japan.

39. Ninagawa Chikamoto ki [Record of Ninagawa Chikamoto]. 1483. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to as *shirakabe.*

Note: According to Osamu Shinoda (1968), this is the 7th earliest document seen that refers to tofu in Japan, and the 2nd earliest that refers to it as *shirakabe.* Address: Japan.

40. Jurin-in naifu ki [Daily record of Jurin-in]. 1484. Japan. [Jap]*
• ***Summary:*** In this document, Jurin-in is the name of a court nobleman. According to Kawakami & Kimura (1985), this is the earliest document seen that mentions *nimame* (sweet simmered black soybeans) in Japan. Nimame appears in the entry for 12 May 1484. They ate nimame on that day. Although black soybeans are not specifically mentioned, the dish must have been made from black soybeans. Nimame is still a popular New Year's dish in Japan. Address: Japan.

41. Shoken nichiroku [Daily record of Shoken]. 1486. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to as *dengaku.*

Note: According to Osamu Shinoda (1968), this is the 8th earliest document seen that refers to tofu in Japan, and the 2nd earliest that refers to it in the form of *dengaku.* Address: Japan.

42. Inryôken nichiroku [Daily record of Inryôken]. 1487. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to in the form of *mura dengaku.*

Note: According to Osamu Shinoda (1968), this is the 9th earliest document seen that refers to tofu in Japan, and the earliest that refers to it in the form of *mura dengaku.* Address: Japan.

43. Honcho bunsho 1487. Japan [Jap]*
• ***Summary:*** Yokotsuka (1985, p. 205) states: According "to such books as *Honcho bunsho* (AD 1487), *Shijoryu hochosho* (AD 1489) and others (AD 1504, 1537), Taremiso or Usudare seems to have been the name for the liquid drained off or press-filtered from the boiled mixture of miso or *sho* [*hishio*] and salt water." But the word *shoyu* (written with the same characters as *chiang-yu* [*jiangyou*] in Chinese) did not appear in any of these books. Address: Japan.

44. Rokuon nichiroku [Daily record kept by supervisory priests (*soroku*) at a subtemple of the Zen Buddhist temple Shokokuji in Kyoto]. 1489. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to as *tôfu.*

Note: According to Osamu Shinoda (1968), this is the 10th earliest document seen that refers to tofu in Japan, and the 2nd earliest that refers to it as *tôfu.* Address: Japan.

45. Tajimi Teiken. 1489. Shijôryû hôchôsho [Cookbook of the Shijo school?]. Japan. [Jap]*
• ***Summary:*** This famous cookbook mentioned "tare miso," "usu tare," and "surimiso."

Yokotsuka (1985, p. 205) states: According "to such books as *Honcho-bunsho* (AD 1487), *Shijoryu-hochosho* (AD 1489) and others (AD 1504, 1537), Taremiso or Usudare seems to have been the name for the liquid drained off or press-filtered from the boiled mixture of miso or *sho* [*hishio*] and salt water." But the word *shoyu* (written with the same characters as *chiang-yu* [*jiangyou*] in Chinese) did not appear in any of these books.

46. Shichijû-ichiban shokunin-zukushi uta awase [Seventy-one matching poems / songs concerning Japanese craftsmen. 3 vols.]. 1500. Japan. [Jap]*
• ***Summary:*** A woodblock print titled "Tofu seller" (*Tofu uri*) shows a Japanese woman seated in the seiza position (on her heels) on the ground behind a short table (about 4 inches high, 4½ feet long, and 14 inches wide). On the table is one

© Copyright Soyinfo Center 2014

large cake of tofu (about 10 inches square and 3 inches high) and four smaller pieces (each about 6 inches square and 1 inch high).

47. Oogusaden yori soden no kikigaki [The Ogusaden and Soden cookbook?]. 1504. Japan. [Jap]*

48. Iseno, Teijo. 1525? Teikun ôrai [Teikun ôrai]. Japan. [Jap]*
• ***Summary:*** Ohta (1975, p. 226) states that this book was written during the Muromachi (Ashikaga) period [ca. 1336-1573] in Japan. It contains recipes for using fermented black soybeans (*shiokara nattô*).

K. Tsuchiya (Soymilk, 1982, p. 30) states that in this book, written during the Muromachi (Ashikaga) period in Japan, the word *tofu-kan* appears in the section titled *Shojin Ryori* (Buddhist Vegetarian Cookery). That word used to mean "tofu soup" but it actually refers to what Japanese today call soymilk (*tônyû*).

Toyo Shinpo. 1983. Jan. 1. "Tonyu no rekishi wa furui" [Soymilk has a long history]. Based on new book by Kanji Tsuchiya.

49. Tsuneatsu Hôin nikki [Diary of Tsuneatsu Hôin]. 1532. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to as *taufu.*

Note: According to Osamu Shinoda (1968), this is the 11th earliest document seen that refers to tofu in Japan, and the 3rd earliest that refers to it as *tôfu.* Address: Japan.

50. ôkusa-ke ryôri-sho [The house of okusa cookbook]. 1532. Japan. [Jap]*
• ***Summary:*** According to Yokotsuka (1980), the word *shoyu,* written with the characters used today, was first used in a cooking book in this work. The next major event with shoyu in Japan was when a brewer in Noda sent tamari to Kawanakajima.

This book also contains a detailed recipe for making Natto Miso Soup (*nattô-jiru,* a special type of miso soup that contains diced natto), which became popular during this period.

Letter (e-mail) from Naomichi Ishige, Japanese natto expert. 2007. March 20. The title of this book is *ôkusa-ke ryôri-sho.* The "nattô" used to make nattô-jiru (natto miso soup) is actually kuki, or fermented black soybeans (*shiokara natto, tera natto*)*;* it is not *itohiki nattô.* This cookbook was reprinted in a modern version in 1932 (Dec. 15) in Tokyo by Zokugunsho-rui Ju Kanseikai (Ohta Yoshimara [person]).

Note: This is the earliest document seen (Dec. 2011) that mentions *nattô-jiru* [Natto Miso Soup] or miso soup of any type.

51. Shishinki [Record of my heart; diary kept by a priest (1496-1564)]. 1534. Japan. [Jap]*
• ***Summary:*** In this document, tofu is referred to in the form of *tengaku.*

Note 1. According to Osamu Shinoda (1968), this is the 12th earliest document seen that refers to tofu in Japan, and the earliest that refers to it as *tengaku.*

Note 2. This record is related to Ishiyama Hongan-ji, the primary fortress of the Ikkô-ikki, mobs of warrior monks and peasants who opposed samurai rule. It was established in 1496, at the mouth of the Yodo River, on the coast of the Seto Inland Sea–near today's Osaka. In use from 1532 to 1580, it was finally demolished in 1580 by Oda Nobunaga. Address: Japan.

52. Rokuon nichiroku [Early Japanese dairies kept by head priest at Rokuon-in temple in Kyoto]. 1536. Japan. [Jap]*
• ***Summary:*** Iino (2001, p. 22-23) states: "The next [actually the first real] reference to shoyu is an entry in the *Rokuon-nichiroku* for June 28, 1536, in which the writer mentions preparing shoyu. An entry for the previous day mentions preparing *hishio,* which suggests that shoyu and *hishio* were prepared separately. In addition, an entry for August 14 of the same year mentions putting *sho* in a cask, as if it were intended as a gift.

"Tou-miso prepared at the Tamon-in was usually ready for consumption in about sixty days; the koji being incubated in the latter half of June, followed by the addition of brine within a week after incubation, and the refining process in the middle of August7. This sho referred to in the *Rokuon-nichiroku* was probably the end product of the batch of shoyu prepared on June 28."

"The *Rokuon-nichiroku* consists of a collection of diaries kept by the head priest at the Rokuon-in temple, a smaller temple within the larger Shokokuji temple. The Rokuon-in was located in the center of Kyoto, then the nation's capital, while the Tamon-in was in Nara. Because of its location, the Rokuon-in was likely to have been influenced by Chinese culture earlier than the Tamon-in, and may well have begun manufacturing soy sauce before the Tamon-in, and give the name shoyu to it. In any event, it is apparent that soy sauce was already being manufactured in Japan by the middle of the sixteenth century."

"An entry in the *Rokuon-nichiroku* for September 8, 1599 mentions a breakfast menu that included a dish of *matsutake* mushrooms simmered in soy sauce. Subsequent entries also refer to dishes made by simmering various foods in soy sauce."

Note: This diary contains (as of April 2012) the earliest known written (but unpublished) reference to word "shoyu" in Japan. Address: Japan.

53. Nyôbô shitsukegaki [Women's book of manners]. 1540? Japan. [Jap]*
• ***Summary:*** According to the *Nihon Kokugo Daijiten* [Shogakukan Unabridged Dictionary of the Japanese

© Copyright Soyinfo Center 2014

Language, 2nd ed.] the earliest known appearance of the word *okabe,* meaning "tofu" was in the *Nyôbô Shitsukegaki,* a work produced toward the end of the Muromachi period. The entry explains that this is a *nyôbô kotoba* that means "woman's word."

Concerning the idea of *nyôbô kotoba,* the *Encyclopedia of Japan* (Kodansha, 1993; an English-language work) states: "A group of special feminine words originally created and used by court ladies (*nyôbô*) of the imperial household in the Muromachi period (1333-1568) to achieve a certain euphemistic elegance when discussing food and other mundane matters among themselves."

Again, according to the *Nihon Kokugo Daijiten* [Great Japanese Encyclopedia] the earliest known appearance of the word *mame no ko* (written in hiragana) was also in the *Nyôbô Shitsukegaki.*

Kawakami and Kimura (1985) state at "Kinako" (p. 36): The earliest known word for kinako was *mamenoko,* a word or term mentioned in the *Onna no Shitsukegaki* (Women's Book of Manners). They cannot find that book anywhere; it may be in the *Gunsho ruijû* [Great collection of old documents. 670 vols. Published in 1819]. In that latter book we read: *Mame no ko o ba kinako to mosu* (*Mame no ko* is also called kinako). Note: This may well be the earliest document seen (Nov. 2012) that mentions roasted soy flour, which it calls *mame no ko.* Address: Japan.

54. Iida Ichirobei of Shimôsa makes tamari shoyu and sends it to the Takeda family in Koshu. This is the beginning of Noda Shoyu (Early event). 1558.

• ***Summary:*** In *The Book of Miso,* by Shurtleff and Aoyagi (1976, p. 221-22), in the section titled "The development of shoyu," we read: "The area of Shimousa, about 30 miles northwest of Tokyo and already famous as a center of miso production, was to become the birthplace of the product now known as shoyu. In 1561, in the town of Noda, Iida Ichiro Heibei made a new variety of tamari-shoyu from hishio and presented it to the samurai Takeda Shingen, already known for his interest in miso. The flavorful product soon became known by its elegant name: Kawanakajima Goyo Tamari-Shoyu. It was first produced commercially in Shimousa in 1574."

In "Chronology of Soybeans," by Akio Saito (1985. *Daizu Geppo* (*Soybean Monthly News*). Jan. p. 12-14–in Japanese) we read:

1558–Iida Ichirobei of the feudal domain of Shimôsa (*Shimôsa no kuni;* today's Noda city in Chiba prefecture) makes tamari shoyu, called Kawanaka-jima Goyo Tamari, and sends it to the Takeda family in Koshu. This is the beginning of Noda Shoyu. It is said that the taste of shoyu gave a great boost to the energy of Takeda's army. At about this same time Takeda Shingen (lived 1521-1573) starts to use dried-frozen tofu (*kori-dofu*) for his army in Kawanaka-jima after tasting the delicious kori-dofu from Sahtobei?

55. Tokitsugu kyôki [Diary of Tokitsugu Yamashina]. 1559. Japan. Japanese summary by Kawakami 1978. [Jap]

• ***Summary:*** This diary contains (as of April 2012) the 2nd earliest known written (but unpublished) reference to word "shoyu" in Japan. One volume mentions *shirozake* (white sake, close relative of Amazake).

The diaries of five Yamashina family members are famous in Japan. The first word in each diary title is the given name of that family member; *kyoki* means "diary." The Noritoki Kyoki (1405-1410) is 3 volumes, 783 pages. The Norioki Kyoki (1410-1417) including one of the former volumes is 27 pages. The Tokikuni Kyoki (1474-1493) is 4 volumes plus 1 unfinished, 1,125 pages. The Tokitsugu Kyoki (1527-1571) is 6 volumes, 2,801 pages. The Tokitsune Kyoki (1576-1600) is 10 books, with total pages not given.

Iino (2001, p. 23) states: "Later [after the *Rokuon-nichiroku*], an entry in the *Tokitsugu-kyoki* for August 27, 1559 mentions putting *shoyuu* in a small cask for use as a gift. There is a strong likelihood that the *sho* and *shoyuu* placed into casks for use as gifts were not *tare-miso* [a by-product of the miso-making process], but were in fact soy sauce."

56. Hôchô kikigaki [Transcribed instructions for cooking]. 1560-1580. Published in the *Gunsho Ruijû.* Japanese summary by Kawakami, p. 136. [Jap]

• ***Summary:*** A *hôchô* is a Japanese kitchen knife; *kikigaki* means "listening and writing." According to Kawakami and Kimura (1985, p. 36-37) the term *shiokara nattô* ("salty natto") appears in the work titled *Gunsho Ruiju* [compiled about 1819-20] (*Katsuji-hon,* page 344, lower section, line 5). The authors think this is the earliest document that mentions *tera nattô* or non-stringy natto [fermented black soybeans]. But after that time, the same food appears to be called *ko no daizu* or *kaori no daizu* ("fragrant soybeans"), and that term first appeared in the *Hôchô Kikigaki,* a cookbook that was published about 1560-1580 and that is part of the *Gunsho Ruiju* (Katsuji-hon, page 800, upper section, line 6).

This book also gives recipes using *tare miso,* made by mixing miso and water. Mentions chiang.

Also contains a very early possible footnote reference to soybean sprouts, *Moyashitaru mame.*

Note: If this footnoted term does refer to soybean sprouts, this is the earliest Japanese-language document seen (Jan. 2013; and the earliest nonChinese-language document seen) that mentions soy sprouts.

57. Seiryô-ki [Agronomy in Japan]. 1560. Japan. [Jap]*

• ***Summary:*** Goto (1984, p. 136) states: "Seiryôki (published around 1560) which is the oldest Japanese book of agronomy, identified two types of soybeans, namely summer and autumn types." Address: Japan.

© Copyright Soyinfo Center 2014

58. Matsuya Hisamasa. 1561. Nattô-jiru [Natto miso soup]. In: Matsuya Hisamatsu chakai-ki [Three-generation diary of the Matsuya family's tea ceremonies]. Sept. 5. Compiled by Hisashige Kaiki. Japanese summary by Kawakami 1978, p. 261. [Jap]*

• ***Summary:*** Concerning *natto-jiru* (natto soup): Kawakami and Kimura (1985) state that in the olden days in Japan, people used natto in a soup (*nattô-jiru*), which was quite popular. However these two authors think that the *natto* used in this soup was probably fermented black soybeans (*kuki, shiokara natto, tera natto*) rather than *itohiki* natto. This is the 2nd earliest document seen (Jan. 2012) that mentions *nattô-jiru.* It is mentioned in the entry for 5 Sept. 1561. Mr. Matsuya was a rich merchant in the Nara area. His family kept their diary for three generations. Address: Japan.

59. Nôin Eshun. 1568. Tamon-in nikki [Tamon-in diary]. Nara, Japan. See entry for May 21 and Oct. 25. English-language summary by Kodama & Yoshizawa 1977, p. 427. Japanese summary by Kawakami 1978, p. 222. [Jap; eng]

• ***Summary:*** This diary was kept from about 1539 to 1596 (58 years) at the Tamon-in monastery inside the Kofuku-ji temple in Nara City, Japan.

Concerning soy sauce: Iino (2001, p. 23) states: "By the second half of the sixteenth century, shoyu was being written using the same characters as those used today. An entry in the *Tamonin-nikki* for October 25, 1568 mentions taking shoyu to Choinbo, a Buddhist monk. This appears to be the first time the contemporary characters were used. An entry in the same diary for August 24, 1582 uses different characters to refer to soy sauce. By this stage it seems that the Tamon-in had also started using the term shoyu when referring to *tou-miso."*

Iino (2003, p. 9): In this diary shoyu made from a second pressing of the moromi (*niban shoyu*) is referred to as *tou-miso niban* (second tou-miso) and its production is discussed. This can be seen in several places, including the entry for the date of the 17th year of Tenmon (1548) Jan. 1.

Concerning natto: Letter (e-mail) from Naomichi Ishige, Japanese natto expert. 2007. March 30. The entry for 21 May 1568 mentions *netaru-natto.* The entry was written by Nôin Eshun, who was the chief priest at Tamon-in, a monastery that belonged to Kofuku-ji in Nara. Kawakami et al. (1978) understood *netaru natto* to mean what we now call *itohiki natto.*

Note 1. This is the earliest Japanese-language document seen (Jan. 2012) that uses the term *netaru natto* to refer to natto.

Kawakami and Kimura (1985) state at "Kinako" (p. 36): The *Tamon-in nikki* is the diary of a monk in Nara. On 1 Jan. 1542–New Years day, *mamenoko* [kinako, roasted whole soy flour] is mentioned. A few years before the Edo period (1600-1867) the word *kinako* began to be used. As you know, you cannot make roasted soy flour without roasting the soybeans first. If you roast them, then grind them in a quern or grinding stones (*ishiusu*), it is easy to make kinako. But at that time grinding stones were very rare and precious. But if you had them, it was not hard to make kinako.

This diary also describes in detail a heating method to kill the microorganisms in saké (Japanese rice wine). It was almost identical with the process invented by Pasteur in France in 1865 (300 years later) for low-temperature pasteurization of wine and milk. The Japanese process was later used on soy sauce.

60. A feudal lord who controls the port of Nagasaki in Kyushu is converted to Christianity. As a gift of thanks, he cedes Nagasaki to the Jesuits (Early event). 1580.

• ***Summary:*** Alessandro Valignano (1539-1606) was an Italian Jesuit missionary who was a leader in the introduction of Catholicism to East Asia, especially Japan. In 1584 he wrote "Historia del Principo y Progresso de la Compania de Jesus en las Indias Orientales (1542-64)" which states: In 1580 the daimyo who controlled the port of Nagasaki was converted to Christianity. As a gift, he ceded the port to the Society of Jesus (Jesuits). Under Jesuit control, Nagasaki would grow from a small fishing village with one street to an international trading port rivaling Goa or Macao in influence.

61. Konko chômi-shû [Present and old cooking collections]. 1580. Publisher unknown. 276 p. Handwritten. Japanese summary by Kawakami 1978, p. 46. [Jap]

• ***Summary:*** The year 1580 was the year the book was copied. The actual year it was written is unknown. It is a sort of encyclopedia of cooking, and includes 17 varieties of sake, 3 varieties each of hishio and miso, plus a tofu section... and much more.

62. Allesandro Valignano, a Jesuit, later says he bought miso in Japan (Early event). 1583.

• ***Summary:*** Valignano (1539-1606) was an Italian Jesuit missionary who was a leader in the introduction of Catholicism to East Asia, especially Japan. He first visited Japan from 1579 to 1582, when he developed a strategy for the introduction of Christianity. His luxurious life and authoritarian attitudes were criticized by members of the mendicant orders such as the Franciscans and Dominicans. He emphasized study of the Japanese language and culture, and required that all new missionaries spend at least two years in a language course and do their best to learn Japanese customs and manners. He was a great admirer of the Japanese people and envisioned a future when Japan would be one of the leading Christian countries in the world. He famously wrote that the Japanese "excel not only all the other Oriental peoples, they surpass the Europeans as well" (Alessandro Valignano, 1584, "Historia del Principo y Progresso de la Compania de Jesus en las Indias Orientales

© Copyright Soyinfo Center 2014

(1542-64)").

In order to finance the Jesuit seminaries, schools, and printing presses, the missions needed money. The local daimyo curried favor with the Jesuit administration in hopes of having Portuguese trading ships visit their local port more often. In 1580 the daimyo who controlled the port of Nagasaki was converted to Christianity. As a gift, he ceded the port to the Society of Jesus (Jesuits). Under Jesuit control, Nagasaki would grow from a small fishing village with one street to an international trading port rivaling Goa or Macao in influence. In all, Valignano made three visits to Japan: 1579-1582, 1590-1592, and 1598-1603.

In 1954 his *Sumario de las cosas de Japón* (*1583*)*. Adiciones del Sumario de Japón* (*1592*)*. Editados por José Luis Alvarez-Taladriz* [Summary of the things of Japan (1583). Additions to the Summary of Japan (1592), edited by José Luis Alvarez-Taladriz], was published.

In the 1st book, on page 93, the author mentions that he bought the necessary provisions, rice, miso, dried fish, etc. Footnote 240 gives a long definition of *misso* (sic, miso) in Italian from *Saverio Orientale,* by Bernardino Ginnaro (1641, Naples).

63. Matsuya Hisamasa. 1587. Uba [Yuba]. In: Matsuya Hisamatsu chakai-ki [Three-generation diary of the Matsuya family's tea ceremonies]. Jan. 24. Compiled by Hisashige Kaiki. Japanese summary by Kawakami 1978, p. 261. [Jap]*
• ***Summary:*** Concerning yuba–the film that forms atop soymilk when it is heated: According to Kawakami (1978), the entry in this diary for 24 Jan. 1587 contains the earliest known reference to *uba* (yuba) in Japanese. Kawakami and Kimura (1985) repeat this information.

Note: This is the earliest document seen (Oct. 2012) worldwide that mentions yuba, which is calls *uba.* Note that it is from Japan rather than China. Address: Japan.

64. Sotan. 1588. Sotan Chakai Kondate Nikki [Master Sotan's Tea Ceremony Cookery Menu Diary]. Japan. [Jap]*
• ***Summary:*** According to Kawakami and Kimura (1985, p. 36-37), the term *ko no daizu* or *kaori no daizu* apparently refers to salted non-stringy natto (tera natto or fermented black soybeans). It appeared in the *Sotan Chakai Kondate Nikki* (*Master Sotan's Tea Ceremony Cookery Menu Diary*)*,* in the morning menu for 19 March 1588.

According to Kawakami and Kimura (1985, p. 36), in this diary, on 19 June 1587, in the morning menu, kinako is mentioned; it is an unexpectedly new food.

Note: This may well be the earliest document seen (Nov. 2012) that contains the word *kinako,* which it uses to refer to roasted whole soy flour.

65. Francesco Carletti of Florence later says he saw miso in Japan (Early event). 1597.
• ***Summary:*** Carletti, a 16th century Florentine merchant (lived 1573-1636), set out from Seville, Spain with his father in 1594, on what was intended to be a relatively brief slave trading voyage but eventually became a circumambulation of the globe. In June 1597 he arrived in Nagasaki, Japan, where he saw miso soup–and crucified Christians. After losing most of the wealth he had accumulated by astute trading, he finally returned to Florence, Italy in July 1606. There he was welcomed at the court of Ferdinando de' Medici [lived 1549-1609], Grand Duke of Tuscany, to whom he made the first verbal reports of his experiences, which later were written down as the *Ragionamente* (Chronicles). Thus, he didn't actually write about miso until after July 1606. Scholars generally agree that the best copy is a 17th century manuscript titled *I Viaggi di Francesco Carletti* in the Biblioteca Angelica in Rome (Codice 1331; T.3.22). A much-polished and heavily edited version was published in 1701.

In 1964 Herbert Weinstock's English-language translation of the Roman version was published as *My Voyage Around the World.* On page 110 Carletti says the following about the rice miso (he calls it *"misol"*) which he saw in Japan in 1597.

"They prepare various sorts of dishes from fish, which they flavor with a certain sauce of theirs which they call *misol.* It is made of a sort of bean that abounds in various localities, and which–cooked and mashed and mixed with a little of that rice from which they make the wine already mentioned [saké, p. 100-01], and then left to stand as packed into a tub–turns sour and all but decays, taking on a very sharp, piquant flavor. Using a little at a time, they give flavor to their foods, and they call *shiro* [sic, probably *shiru* but possibly shoyu] what we would call a potage [soup] or gravy. They make this as I have said, of vegetables and fruit and fish all mixed together, and even some game, and they eat it with rice, which serves them as bread and is cooked simply in water and served in certain wooden bowls lacquered with red lacquer, eating it very cleanly and never touching it with their hands. For they eat everything by using two small sticks..."

Note: This is the earliest document seen (June 2009) concerning soy in connection with (but not yet in) Italy.

66. Ekirinbon setsuyôshû [Early Japanese dictionary]. 1597. Japan. [Jap]*
• ***Summary:*** This dictionary contains (as of April 2012) the earliest known published reference to shoyu (soy sauce) in Japan, written with the characters used today. Prior to this, other characters were used: Hishio / chiang, mame-bishio, etc. Written by a Japanese priest between 1469 and 1503, it was widely circulated in manuscript form and used by the common people. Modern rendering by Kawakami 1978, p. 220. It also mentions amazake and ko (the early term for amazake).

Note: This is the earliest Japanese-language document seen (June 2012) that mentions amazake, which it calls

© Copyright Soyinfo Center 2014

"amazake" and "ko." This is also the earliest document seen (March 2001) concerning the etymology of amazake.

Yokotsuka (1985, p. 205; 1986, p. 198) gives the title and date as "Ekirinbon-Setsuyoshu (1598)" and notes that the word shoyu [written with the same Chinese characters as chiang-yu / jiangyou, the Chinese word for soy sauce] first appeared in this book.

Akio Saito (1985) states that this book was published in 1521.

Fukushima (1989, p. 9): "The word 'shoyu' first appeared in *Ekirinbon-Setsuyoshu,* a Japanese dictionary published in 1597 during the Muromachi period."

Iino (2001, p. 23): "Next [after the *Tamonin-nikki* entries of 1568 and 1582] we find an entry for shoyu (using contemporary characters) in the *Ekirinbon-setsuyoshu* (1597). The oldest of these dictionary-like *setsuyoshu* is thought to be the *Bunmeibon-setsuyoshu.* Following its publication, similar volumes appeared successively, but none of these contains any reference to shoyu. The entry in the *Ekirinbon-setsuyoshu* appears to be the first reference to shoyu in a *setsuyoshu.* By this stage it seems clear that soy sauce was in common use, both in name and in practice."

67. Saito, Akio. 1599. [Chronology of soybeans in Japan, 1336 to 1599, the Ashikaga/Muromachi period] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Jan. p. 14. [Jap; eng+]

• ***Summary:*** 1350–Dengaku (Oden) is mentioned in the records of the Gion shrine in Kyoto.

1444 June–The present characters for "tofu" appear in the *Kagakushu* encyclopedia.

1450–The suribachi (a serrated earthenware grinding bowl or mortar) becomes popular among the common people, therefore miso soup becomes popular.

1469–In the feudal domain of Sanuki (*Sanuki no kuni*) the Sakade Salt Farm (*Sakade Enden*) starts operation.

1500–In the published collection of Japanese poems and songs titled *Shichijû-ichiban shokunin-zukushi uta awase,* there is a drawing of a lady in a black kimono and white headband sitting cross legged on a low platform on a street and selling large and small pieces of cut tofu.

1521–The present characters for the word "shoyu appear for the first time in the book *Ekirinbon Setsuyoshu.*

1526–In a memorandum by Munenaga is written: "Late in the night, sitting by the sunken open-hearth fireplace together, and eating many Dengaku tofu" (*Yo mo fuke, irori-be ni hiza o narabe, Dengaku tofu o do kasanari.*) It seems that at the end of the Muromachi period, people spread miso on tofu, grilled it over a fire, then ate it.

1535–In Kishu (today's Wakayama prefecture), Akagiri Umataro? (Zenuemon/Yoshiuemon?) starts selling Yuasa Shoyu, which is derived from Kinzanji miso.

1558–Iida Ichirobei of the feudal domain of Shimôsa (*Shimôsa no kuni;* today's Noda city in Chiba prefecture) makes tamari shoyu, called Kawanaka-jima Goyo Tamari, and sends it to the Takeda family in Koshu. This is the beginning of Noda Shoyu. It is said that the taste of shoyu gave a great boost to the energy of Takeda's army. At about this same time Takeda Shingen (lived 1521-1573) starts to use dried-frozen tofu (*kori-dofu*) for his army in Kawanaka-jima after tasting the delicious kori-dofu from Sahtobei?

1559–The book *Tokitsugu Kyoki* by Yamashina Tokitsugu (lived 1507-1579) states that Tokitsugu sent a small keg of shoyu to Nagahaki kyoku. It seems that at the end of the Muromachi period, shoyu is becoming popular.

1560 May–Oda Nobunaga (who lived 1434-1582) wins the war over Imagawa Yoshimoto (1519-1560) in Okehazama. At about this time people start use the technique of frying to prepare the side dishes to their meals (*fukushoku-hin*) for the first time.

1573-91–Shoyu making starts on the island of Shodo-shima.

1574–Tanaka Chobei of the feudal domain of Shimousa (today's Chiba prefecture) Ichikawa starts making shoyu.

1587–Maruo Magouemon of Hanshu Tatsuno makes shoyu using Mikazuki soybeans.

1591–Akagiri Saburobei of Yuasa in Kishu-han (today's Wakayama prefecture) starts to use Shoyu Kaisen, a ship of at least 200 koku [9,520 gallons] capacity to transport his shoyu to other feudal domains (*kuni*) for sale.

1594–The term *koma-dofu* appears in the Rokuon Diary of Ginkakuji. "Rokuon" means "deer garden." *Koma-dofu* is a very firm tofu which originated in Korea.

Note. This is the earliest document seen (April 2013) that mentions firm tofu. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

68. Companhia de Iesus [Society of Jesus (Jesuit)]. 1603. Vocabulario da lingoa de Iapam, com a declaraçáo em Portugues, feito por alguns padres, eirmaós da Companhia de Iesu [Vocabulary of the language of Japan, with definitions in Portuguese, produced by some fathers and brothers of the Society of Jesus]. Nagasaki, Japan. 403 p. [Por; Jap]

• ***Summary:*** At the bottom of the title page is written: "Com licença do ordinario, & Superiores em Nangasaqui no Collegio de Iapam da Companhia de Iesus. Anno M.D. CIII." The "Licença" or license by Francisco Pasio is dated 2 Jan. 1603. A romanized version of each Japanese word is given, followed by a brief explanation in Portuguese. In Japanese, this book is known as *Nippo Jisho, Nagasaki-ban.* In 1960, Iwanami Shoten published a facsimile edition in Japan, titled *Nippo Jisho: Vocabulario da lingoa de Iapam,* compiled by Tadao Doi (822 p., 22 cm), then in 1980 they published a Japanese translation (xxxiv + 862 p., 27 cm). Kawakami (1978) has summarized some soy-related portions. Iwai (1953, p. 11) notes that this dictionary was compiled by Joao Rodrigues–but this is controversial.

Soy-related terms in this dictionary, and a translation

© Copyright Soyinfo Center 2014

of their definitions from Portuguese, through Japanese, into English, are as follows:

Abura ague. 1. Abura agueno mono. Abura-agé [deep-fried tofu] or abura-agé mono. Things which are deep-fried in oil. Note 1. This is the earliest document seen (April 2013) that mentions fried tofu.

Aburidôfu. Slice tofu, which is made from beans like raw cheese, broil in a fire.

Amazaqe [Amazake], a still-bubbling fermented liquid that has not yet completely become sake; or sweet sake. Note 2. This is the earliest Portuguese-language or Western-language document seen (June 2012) that mentions amazake, which it calls "Amazaque."

Azzuqi or azzuqui [azuki beans]. *"Hus feijoes pequenos como lentilhas"* means "Beans that resemble green peas (endo). Azzuqigai is rice porridge (o-kayu) that contains azuki beans. Azzukimochi is mochi that contains azuki beans. Note 3. This is the earliest European-language document or Portuguese-language document seen (Jan. 2005) that mentions azuki beans, which it calls *Azzuqi* or *Azzuqui.*

Cabe [Kabe]. Same as tofu. A type of food which is made from ground beans. This is a woman's word. Note 4. This is the earliest document seen (April 2013) that uses the word "cabe" (or "kabe") to refer to tofu.

Côji [Koji], a yeast [sic] used in Japan to make sake, or mixed with other things. Note 5. This is the earliest European-language document seen (June 2012) that mentions koji.

Daizzu [Daizu]. Mame. Graos, ou feijoes de Iapao [grain, seed, kernel, or Japanese beans].

Dengacu [Dengaku]. Dancing monks (Bôzos). Or tofu which is skewered, and on top of each slice is spread miso; then it is broiled. Note 6. This is the earliest document seen (April 2013) that mentions Dengaku, a type of delicious broiled / grilled tofu seasoned with miso.

Fanben [Hanben]. A type of food which is made by broiling tofu and simmering it with miso.

Icchô. A way of counting some types of food, such as tofu.

Miso. A kind of mixture which is made with *graos* [grains, seeds, kernels], rice, and salt to season Japanese soups.

Note 7. This is the earliest European-language (or Portuguese-language) document seen (March 2009) that mentions miso, which it calls *Miso.*

Misocoxi [*Misokoshi*], a bamboo strainer used for straining miso. Note 8. This is the earliest document seen (March 2011) that mentions a *misokoshi.*

Misoya, a shop that sells miso.

Misoyaqijiru [*Miso-yaki-jiru*], a type of soup (*Xiru*) made with tofu and finely sliced daikon radish. Note that the word tofu was written as "Tofus" in the dictionary but should be written "Tôfus."

Misôzzu, which should properly be called Zosui, is a healing food made from vegetables, rice, miso, etc. and served to those who are old, weak, or sick. Another meaning of this term is a type of porridge [*kayu*] containing a mixture of rice, vegetables, and other things.

Nattô, a type of food made by a brief boiling of grains / seeds [*graos* is the word used, but soybeans are actually employed], which are then put into an incubation chamber (muro).

Nattôjiru, a soup (*Xiru*) made from natto. Note 9. This is the earliest Portuguese-language document seen (Jan. 2012) that mentions *natto* or *Nattôjiru.* However recall that the "natto" used in Nattôjiru may well be fermented black soybeans.

Saqe (sake, saké).

Tamari, a very savory liquid taken from miso which can be used for seasoning foods [when cooking] or at table. Note 10. This is the earliest document seen (April 2012) that mentions tamari.

Tôfu*–Taufu. A type of food. It is made into the shape of a cheese by crushing soybeans. * Note: The sound of the Japanese character for bean (mame) is "tou." But at that time "taufu" was the typical pronunciation. In other documents it is the same, for example the *Iitsugu Kyoki* (Iitsugu Diary) written during the Tensho period (1573-1586), with entries in 1588, 1591, and 1600. Sometimes they used the characters for "T'ang" (as T'ang dynasty in China) and "cloth," although they were also pronounced as "taufu." In this 1603 Portuguese dictionary there appear a number of tofu terms written in the "open sound form" (kaionke): Cabe [Kabe = wall], Dengacu [Dengaku], Fanben, Icchô [One cho or cake of tofu], Vdondôfu, and Yudofu. One exception is the term Aburidôfu.

Tôfuya–Taufuya, a shop which makes and sells that cheese-like thing (tofu), which is made by grinding soybeans that have been soaked in water until they are soft.

Vdondôfu [Udon-dôfu]. Tofu which is made like udon (Japanese-style wheat noodles) and cooked.

Xôyu [Shoyu, or soy sauce], a liquid which corresponds to vinegar except that it is salty. It is used for seasoning foods. It is also called *sutate.* The character *su* means "bamboo mat" [as in "sudare"] and the character *taté* means "to stand up." Note 11. This is the earliest Portuguese-language document seen (April 2012) that mentions shoyu or soy sauce, which it calls Xôyu.

Yudôfu–Yudaufu: A food made from thinly sliced tofu, served next to a *kakejiru*-type sauce [which is then poured over the top].

The following terms are not mentioned: Agé (but abura-agé is), Daitokuji natto, Edamame (or Eda mame or Yeda mame), Fu (or gluten or wheat gluten), Hamanatto or Hamana-natto, Hiya-yakko, Kinako, Koya-dofu (or Kori-dofu), Okara, Soi*, Soj*, Shoyu, Tonyu, Unohana, Yaki-dofu, Yuba, Zoy*.

© Copyright Soyinfo Center 2014

Note 12. This is the earliest dictionary of the Japanese language compiled by Europeans. It is also the earliest document seen (Feb. 2001) concerning soybeans or soybean products in connection with (but not yet in) Europe or Portugal, and the first such document to mention miso or natto.

Note 13. This is the earliest European-language (or Portuguese-language) document seen that mentions tofu, which it calls *Cabe, Tôfu,* or *Taufu.*

Michael Cooper (1974, p. 222-23), in his excellent biography of Rodrigues, states that in the preface to this celebrated work, the "compilers promised to produce shortly a supplement containing additional terms and words inadvertently admitted from the dictionary. The supplement appeared the following year, and the Bodleian Library, Oxford, possesses a copy of both the *Vocabulario* and its supplement bound together in one volume. The dictionary runs a formidable total of 330 folios, while the supplement extends to 71 more folios, each page carrying two columns of text. The value of this great dictionary, containing a total of 32,798 entries, is considerable." "Whether or not Joao Rodrigues had a hand in the compilation of the *Vocabulario* is still a debatable point... Thus until further evidence appears, the identity of the principal European collaborators must remain conjectural." Address: Nagasaki College of Japan.

69. Rodrigues, Joao. 1604-1608. Arte da lingoa de Iapam [The art of the language of Japan]. Nagasaqui [Nagasaki], Japan: Collegio de Iapao da Companhia de Iesu. 239 leaves. [Por]*

• ***Summary:*** This is the second major dictionary published by Jesuit priests in Japan. Doi (1980) notes that the 1603 dictionary was developed to help the priests understand dialects, lower-class speech, and the confessions of the local common people. The 1604 dictionary focused on the speech of the upper classes and more educated people. Thus the 1603 dictionary collected words the priests needed to understand, while the 1604 dictionary collected those that they wanted to use. The author (whose name has also been written Padre Iaao Rodriguez) lived 1561-1634 (or 1558-1633). A reprint was published in 1969 in Tokyo by Bunkashobô Hakubunsha (479 p.).

In the book *Treatise on Epistolary Style: Joao Rodriguez on the Noble Art of Writing Japanese Letters,* by Jeroen Pieter Lamers (2002, Center for Japanese Studies, Univ. of Michigan, Ann Arbor), Lamers states that this is a grammar (not a dictionary), and is a treasure trove of valuable information on language use in the early 1600s, especially in polite Japanese society. The 1604 work has three main divisions, including syntax and styles of writing. Address: Nagasaki College of Japan.

70. Saris, John. 1613. [Log of trip to Japan] (Log–unpublished). Unpublished log. [Eng]

• ***Summary:*** On 29 Aug. 1613, while in Japan (near Shizuoka), Saris wrote: "Of Cheese [probably tofu] they haue plentie. Butter they make none, neither will they eate any Milke, because they hold it to bee as bloud [blood], nor tame beasts."

Note 1. This log was first published in 1900 as follows: Satow, E.M. 1900. "The voyage of Captain John Saris to Japan, 1613." *Works Issued by the Hakluyt Society* (*London*)*. Series 2.* 5:126. Saris probably wrote this in Japan in August 1613 as he was traveling by land from Hirado (an island off northwest Kyushu) to Shizuoka, where he would meet Japan's ruler, Ieyasu. His traveling companions included William Adams (the first Englishman to arrive in Japan–by boat in April 1600), 10 other Englishmen, and an escort of 7 Japanese guards to protect them (Samurai William, by Giles Milton, 2002, p. 167-71).

Note 2. This is the second earliest document seen (Feb. 2004) on soy by a European–but note that Saris does not mention soy, presumably because he did not realize that their "Cheese" was made from soybeans. It is the second earliest document seen (April 2013) by a European that mentions tofu (though it is not mentioned by name) or any other soyfood.

Note 3. This is the earliest English-language document seen (April 2013) that mentions tofu, or that uses the word "cheese" to refer to tofu, or that mentions tofu in connection with Japan.

Note 4. This is the earliest document seen (Feb. 2004) concerning soy or tofu in connection with (but not yet in) England.

71. **Product Name:** [Higeta Shoyu].
Foreign Name: Higeta Shôyu.
Manufacturer's Name: Choshi Shoyu.
Manufacturer's Address: Choshi, Japan.
Date of Introduction: 1616.
Ingredients: Soybeans, wheat, water.
Wt/Vol., Packaging, Price: Keg
How Stored: Shelf stable.
New Product–Documentation: Chamberlain, Basil Hall; Mason, W.B. 1901. Handbook for travellers in Japan: Including the whole empire from Yezo to Formosa. 6th ed., revised. London: John Murray; Yokohama, Shanghai, Hongkong, Singapore: Kelly & Walsh, Ltd. ix + 577 + 94 p. In the ads at the back is a full page advertisement (p. 49) for "Higeta Soy, manufactured by G. Tanaka, Chôshi, Shimôsa, Japan." An illustration shows the Higeta trade mark. "Higeta Soy dates from 1615 A.D. (Second year of Genwa). Higeta Soy is honoured with the distinguished patronage of the Imperial Household. Higeta Soy was awarded the superior medal at the World's Fair at Chicago, and gold and other superior medals by the Home Exhibitions.

Fruin, W. Mark. 1984. "History of Higeta Shoyu Co."

© Copyright Soyinfo Center 2014

4060 Amaranta Dr., Palo Alto, California 94306. 4 p. May 15. Unpublished manuscript. Higeta shoyu is one of the oldest brands of soy sauce in Eastern Japan, tracing its history back to the Hamaguchi brothers who migrated at the beginning of the 17th century from Hiromura in Wakayama prefecture (across the river from Yuasa, the birthplace of shoyu in Japan) to Choshi on the eastern tip of the Miura Peninsula, which curves around the top of Tokyo Bay. The Black Current, which runs northward from Wakayama to Choshi, carried the Hamaguchi brothers' ships. They had the foresight to transport shoyu from its place of origin in western Japan to the newly opened vistas in the 17th century of Tokyo and the Kanto plain hinterland.

Around 1615 the elder of the two Hamaguchi brothers established Hiroya, a food distribution company in Tokyo (then Edo), while the younger brother ventured into the manufacture of Yuasa shoyu. For the next several centuries, Yamasa was noted as a good but local shoyu, indistinguishable from other local brands except for the access to the Tokyo market, which it enjoyed through Hiroya.

In 1914 the elder Hamaguchi joined with two other Choshi families, Tanaka Genba and Fukui Kichibei, to form the Higeta Shoyu Co. Ltd. Each family continued to produce their own brands of shoyu but around 1925 Higeta, which had been Tanaka Genba's brand, became the sole company brand. An ambitious plan of expansion of expansion was drafted to leapfrog Higeta over Yamasa its local rival.

Akio Saito. 1985. [Chronology of soybeans in Japan]. *Daizu Geppo* (Soybean Monthly News). Jan. p. 14-16. 1616– Tanaka Genba of Kamiusa no Kuni is advised to make tamari shoyu as a side business by Sanagi Kyurouemon of Settsu. The latter runs a sake factory and has a wholesale seafood products shop in Edo. This is the beginning of Choshi Shoyu and Higeta Shoyu.

1895–Around this time the number of small shoyu makers decreased dramatically as Kikkoman, Yamasa, and Higeta increasingly used advanced industrialized methods.

Note: This is one of the earliest brands of commercial soy sauce seen made by any company in Japan. This is also the earliest known commercial soy product made in Japan.

72. Anrakuan, Sakuden. 1623. Seisuishô [Laughs to banish sleep]. Japan. [Jap]*

• ***Summary:*** Orie Endô (2006, p. 38) states: There are also examples of men using words such as *murasaki, himojii,* and *okabe* in a collection of popular common stories called *Seisuishô* (1623).

Note: The author's name is not a real Japanese name; it is made up and humorous.

73. Vliet, Jeremias van. 1637. [Re: Request for provisions]. Letter to Nicolaes Coeckenbacker, head of Dutch office at Firando [Hirado Island, near Nagasaki, Kyushu, southern Japan], June 11. p. 555-65 See p. 565. Handwritten, with signature. [Dut]

• ***Summary:*** This request includes: 10 pots of sugarloaf, 50 candlesticks dismantled into parts, 50 lacquered plates with legs and gilded flowers, 10 Kegs Murasaki to hawk among the Moors (*10 Balien Moersackjen om onder de Mooren te venten*). Note 1. Murasaki (literally "purple") is an ancient poetic synonym for soy sauce.

Bibliographic reference in Dutch: NA, VOC 1125, overgekomen brieven en papieren (11-6-1637) 555vo-565vo. The letter is a contemporary hand-written copy, written in a letter-book for the administration on Deshima.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 1125 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 1125].

Note 2. This is the earliest Dutch-language document seen (April 2012) that uses the word "Moersackjen" [murasaki] to refer to soy sauce.

Note 3. The Dutch word for "murasaki" also appears in at least two other letters written requesting provisions during the late 1630s, but in each case "murasaki" seems to be a solid, ordered in units of pieces or bales (such as indigo), as follows: (1) 1638 May 5. NFJ 277, p. 319. Letter from the prince of Tonkin to the president of the VOC settlement at Firando. "8 pieces of murasaki or violet (*8 stucx mourasacquij ofte violeth*). (2) 1638 July 15. NFJ 277, p. 472. Letter from Henrick Nachtegael in Siam to the honourable mister president Nicolaes Couckenbacker at Firando. "Twenty bales of murasaki to sell and use as a present (*Twintich baelen moersacquij om te vercoopen ende te verschencken*).

Note 4. Assuming "Moersackjen" refers to soy sauce: This is the earliest document seen (Feb. 2012) concerning soybean products (soy sauce) in Siam. This document contains the earliest date seen for soybean products in Siam (1637); soybeans as such have not yet been reported. Address: In India at the office in Siam (*India op het comptoir Siam*).

74. Ginnaro, Bernardino. 1641. Saverio Orientale, o vero Istorie de Cristiani [Oriental Xavier, or the true history of Christianity]. Naples, Italy. With engraved title page and folded map. [Ita]*

• ***Summary:*** In Book 1, Chapter 13, p. 49, is a description of miso and miso soup (*shiru*). *"Misso: che è una pasta ammassata ri riso, faivoli, o vero ceci corroti, con frumento cotto, e notabile quantità di sale, che per lungo tempo si conserva, e ridotta poscia in polvere, rende el brodo ove si mescola simile alla salamoia, da cui vene sluzzicato P appetito di mangiare il riso."*

Note: This is the earliest Italian-language document seen

© Copyright Soyinfo Center 2014

(March 2009) that mentions miso, which it calls *Misso.*

75. Kebukisô [Hair blows like grass]. 1643. Japan. [Jap]*
• ***Summary:*** The second earliest known reference to Kori-dofu (dried-frozen tofu) appeared in this work.

76. Ryôri monogatari yorozu kikigaku [Many tales of cooking I have heard and recorded]. 1643. Japan. [Jap]*
• ***Summary:*** This famous printed book by an unknown author is the earliest Japanese book that specialized in cooking. Therefore it was widely quoted in many subsequent cookbooks. Recipes include miso soup and taremiso.

Some Japanese authors cite the Japanese title as simply *Ryôri monogatari* however the eminent scholar T. Yokotsuka (1985, p. 206) cites it as *Ryôri monogatari yorozu kikigaku.*

The names of the volumes include *Ryôri Taikan, Nihon Ryôri Taikan, Zokugun Shoruiju Inshokubu, Shokumotsu Koza.*

Note: This is the earliest document seen (April 2013) worldwide, and the earliest Japanese-language document seen (April 2013) that mentions dried-frozen tofu or frozen tofu, which it calls *kôri-dôfu.* Miyashita, who cited this early reference, gave the book's date as 1624.

Concerning shoyu: Iino (2001, p. 21) contains a "Table of ingredients used in *tou-miso* and shoyu during the Edo period." The entry for *Ryori Monogatari* (compiled in 1643) states that *Masaki shoyu* is made from the following ingredients: Soybean 19.6%. Wheat / barley 22.5%. Salt 15.7%. Water 39.2%.

In the section on "Foods, Sake," is a section on "Quick preparation of amazake. Wash 1 *sho* (1.8 liters) of cooked and dried glutinous rice (*domyoji*) in hot water and drain. Mix in 1 sho of koji and 1.5 sho of water; grind in a suribachi very well. Strain in a strainer (*suino*), then simmer in a pot, while stirring. It will become good amazake. Adding white sugar is good."

In the section titled "Man Kiki Gaki" is a description of "How to make Shirokawa Amazake. Crack by grinding 3 sho white rice, steam well and cool. Mix in 5 sho of koji, 5 sho of water, and knead well. Strain in a strainer (*suino*). Discard the pulp and keep the liquid to make amazake. Mix it occasionally. In summer it takes 3 days and in winter 5 days until it is ready."

77. **Product Name:** [Hatcho Miso].
Foreign Name: Hatchô Miso.
Manufacturer's Name: Hayakawa Kyuemon Shoten (Also called Hatcho Miso Kakkyu Goshi-kaisha).
Manufacturer's Address: Aza, Okan-dori 69, Hatcho-cho, Okazaki-shi, Aichi-ken 444, Japan.
Date of Introduction: 1645.
New Product–Documentation: Kaneko. 1972. Hatcho Miso; Shurtleff & Aoyagi. 1983. The Book of Miso. 2nd ed. p. 223, 256. The company claims that it was established in 1362, but other evidence indicates that it was established in the late 1500s or 1600s.

Letter from Tsuneo Hayakawa. 1992. March 17. He is studying the company's early history. Most early documents, written during the Edo period (1868-1912) state that the company was established in 1645. A death register, which had been kept in the Buddhist temple where his ancestors' tombs stand, supports this view.

Note: This is the earliest known commercial soy product (with a brand name) made in Japan (July 2012; one of two products).

78. **Product Name:** [Unknown brand of shoyu].
Manufacturer's Name: Unknown shoyu company.
Manufacturer's Address: Choshi, Chiba-ken, Japan.
Date of Introduction: 1645.
New Product–Documentation: Ad in The East. 1968. Fruin. 1984. History of Five Japanese Shoyu Companies. Soya Bluebook. 1987. p. 94. Address: Kakigaracho 1-23-8, Nihonbashi, Chuo-ku, Tokyo 103, Japan.

Note 1. This is the earliest known commercial soy product made in Japan (July 2012; one of two products).

Note 2. This is the earliest record seen (July 2011) concerning the ancestor of Yamasa Shoyu.

Note 3. The Yamasa Corporation USA website (printed 3 July 2011) under "Company history," states: "In 1645, company founder Gihei Hamaguchi began brewing soy sauce in Choshi, Japan, under the Yamasa name." "Yamasa Corporation began exports of soy sauce to the U.S. over 130 years ago" (i.e., before 1881).

Note 4. The early history of the company now named Yamasa Shoyu is shrouded in mist. We can find no early document which states that the name "Yamasa Shoyu" existed before 1854. And at that time it was the name of a brand of shoyu, not the name of a company.

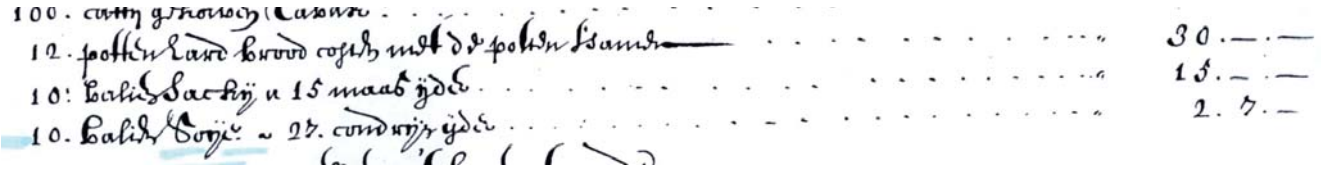
79. In't Comptoir Nagasaekij [In the office of Nagasaki]. 1647. Letter to Taiwan / Formosa, Oct. 16. Unpaginated. Handwritten, with signature. [Dut]
• ***Summary:*** Shipped and loaded in the sailing ship (*fluijtschip*) the *Zwarte Beer* [literally "black bear"] sailing from this place with a Bill of Lading of the chiefs [of this office] to Taiwan (*Taijoan*) in consignment send to the honorable Pieter Antonisz, Maritime (*Overwater*), President of the Island of Formosa (*Eijlants Formosa*).

The list of provisions sent includes: "12 pots of hard bread costs together with the pots–f 30:--:--. 10 kegs (*balien / taru*) of sake (*sackij*) of 15 *maas* a piece–f 15:--:--. 10 kegs (*balien*) of Soy [sauce] at 27 *condrijn* a piece–f 2:-7:--.

Bibliographic reference in Dutch: NA, NFJ 847, Journal (16-10-1647).

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 847. Boekhoudkundig journaal

© Copyright Soyinfo Center 2014



[National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 847. Journal of bookkeeping].

Note 1. This is the earliest Dutch-language document seen (April 2012) that clearly mentions shoyu or soy sauce, which it calls *Soije.*

Note 2. A *maas* and a *condrijn* are old units of Asiatic currency of account used in China and Japan. The VOC glossary says: 1 *maas* = 7 or 8 stuivers, but in Siam 1 *maas* = 9 stuiver. A *condrijn* is smaller than a *maas.* The symbol "f" stands for guilder, the basic Dutch monetary unit. "f 2:07:8" is read "two guilders, 7 stuivers and 6 pennigen." One gulden (singular of guilder) = 20 stuivers. One stuiver = 12 pennigen.

Note 3. In 1624 the Dutch established their first trading post on Formosa. They had their colonial capital at Tayoan City (source of the modern name "Taiwan," and site of present day Anping).

Note 4. This is the earliest document seen (July 2007) concerning involvement by the Dutch or the Dutch East India Co. (VOC) with soyfoods (soy sauce) or soybeans.

Note 5. This is the earliest document seen (April 2012) concerning soy sauce trade (imports or exports). In this case exported from Japan to today's Taiwan.

Note 6. This factory (trading post) on Deshima Island in Japan was owned by the Honorable Dutch East India Company (VOC). Deshima was a small island in Nagasaki harbor, on Japan's southernmost main island of Kyushu. In 1600 the Dutch first made contact with Japan when the Dutch ship *De Liefde* drifted ashore in Usuki Bay in northeastern Kyushu. Many of the original 110 crewmembers had died and only 6 of those remaining could walk ashore unassisted. Two of the survivors went on to earn important places in Japanese history: William Adams and Jan Joosten.

In 1616 European ships were limited to the two ports of Nagasaki and Hirado (an island off the northwest coast of Kyushu, just northwest of Nagasaki).

In 1633 the Tokugawa shogunate (upset at Portuguese Christian missionaries intent on making converts and instigating revolts) adopted a policy of national isolation which continued for 221 years until 1854.

In 1639 the Portuguese were expelled. This left only the Dutch among the Europeans still trading with Japan and their representatives were moved in 1641 from Hirado to the tiny artificial island of Deshima / Dejima built by the shogunate in Nagasaki harbor, where they were kept as virtual prisoners. During this time Japan maintained contact with only two other nations: China and Korea. Chinese merchants were also allowed to trade at Nagasaki, but under strict controls.

By 1639 the Japanese had so successfully closed their doors to the outside world that subsequently Japan all but dropped out of the consciousness of Europeans. The only important exception was the annual Dutch vessel from the East Indies to the Dutch trading post on the island of Deshima in Nagasaki harbor.

During the 1600s and 1700s, the Dutch expanded their network of trading posts throughout Asia, they continued to order provisions from Japan via their tiny but very important trading post at Deshima. Address: Deshima, Nagasaki, Japan.

80. Teitoku bunshû [Collected writings of Mr. Teitoku]. 1648-1651. Japan. [Jap]*
• ***Summary:*** The third earliest known reference to Kori-dofu (dried-frozen tofu) appeared in this work.

81. Yorozu kikigaki hiden [Secrets of things heard and written]. 1650. Japan: Publisher unknown. 102 p. 2 volumes. Japanese summary by Kawakami 1978, p. 158. [Jap]
• ***Summary:*** Within the 54 sections, 34 sections concern food preparation, preservation, etc. Includes how to make shoyu, natto, dried-frozen tofu (kori-dofu), and miso. Between 1650-1673, nine printings were made. Each successive publication became more compact and more popular.

82. Nattô monogatari [The story of natto]. 1650? Japan. [Jap]*
• ***Summary:*** Contains a recipe for Natto Miso Soup (*Nattô Jiru*).

Note: Recall that this *Natto Jiru* may well be made with fermented black soybeans rather than itohiki natto.

83. Craijers, E. Hendrick; Westerwolt, Volckerus; Momme, Hendrick. 1651. [Re: Request for silver]. Letter to Pieter Sterthenius, president of the Deshima factory [Nagasaki, Kyushu, southern Japan], June 30. p. 48-52. See p. 52. Handwritten, with signature. [Dut]
• ***Summary:*** This request for silver includes: 10 bales of flour, 4 bales of buckwheat, 6 kegs of sake (*sackje*), 8 kegs of soy [sauce] (*balien* [*taru*] *sooje*), 24 little hams, 4 jars of hard bread,... 8 kegs of pickled vegetables (*kônomoro* [*kô-no-mono*]), 4 books of paper, 6 kegs of soy [sauce] (*moersackien* [*murasaki*]*;* a poetic synonym for soy sauce), 12 boxes of marmalade.

van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 284 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 284].

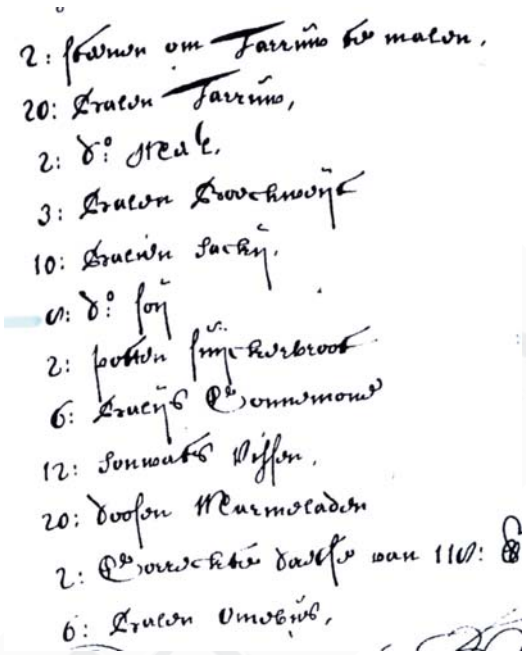
Note 1. This is the earliest Dutch-language document seen (April 2012) that uses the word "sooje" to refer to soy sauce.

Note 2. About the recipient: In *Pieter van Dam's Beschryvinghe van de Oostindische Compagnie,* by F.W. Stapel is an entry for Pieter Sterthenius. He was Council of Justice in Batavia and thereafter in 1651 for one year president of the Dutch merchant settlement in Japan. From 1655 to 1658 he was director of Bengal. In 1658 he went back home to the Netherlands as commander of the return fleet. This letter is a contemporary handwritten copy, in a letter-book for the administration on Deshima. It was sent on the ship *Coninck van Polen.* Address: Supreme merchant and head of the settlement at Siam (*Oppercoopman en opperhooft des comptoirs Siam*).

84. Creijers, Henrick; Westerwolt, Volckerus; Rijck, Jan van. 1652. [Re: Request for Japanese silver to keep the commerce going]. Letter to Adriaen van der Burch, director of commerce at the Deshima factory [Nagasaki, Kyushu, southern Japan], July 3. p. 73-77. See p. 77. Handwritten, with signature. [Dut]

• ***Summary:*** This request for silver and provisions includes: Two stones to grind wheat, 20 bales of wheat,... 3 bales of buckwheat, 10 kegs of sake (*balien sackij*), 8 kegs of soy [sauce] (*balien soij*), 2 pots sugarloaf, 6 kegs of pickled vegetables (*kônomoro* [*kô-no-mono*]), 12 *sonwats vissen* (*sonquat* = Japanese New Year), 20 boxes of marmalade, 6 bales umeboshi (*omebus;* salted or pickled plums).

Bibliographic reference in Dutch: NA, NFJ 285, ontvangen brieven (3-7-1652) 73-77. On microfilm.



Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 285 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 285].

Note 1. This is the earliest Dutch-language document seen (April 2012) that uses the word "soij" to refer to soy sauce. The pronunciation of this word is remarkably similar to that of "soy."

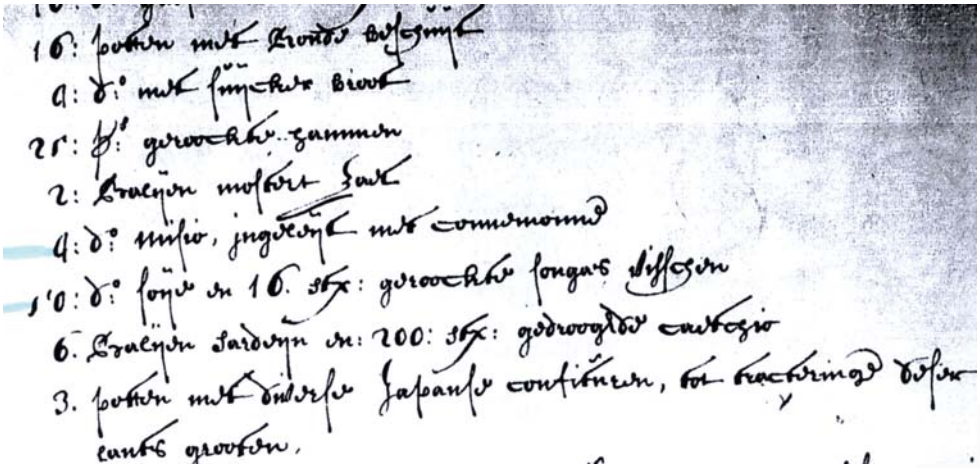
Note 2. Henrick Creijers = Hendrick Craijers.

Note 3. This is the earliest document seen (May 2010) that clearly mentions soybean products (soy sauce) in Siam. This document contains the earliest clear date seen for soybean products in Siam (1652); soybeans as such have not yet been reported. Address: Siam.

85. Keijser, Jacob; Grevenraet, Joannes; Brummel, Luder; Baron, Henrick. 1652. [Re: Request for provisions for the settlement]. Letter to Adriaen van der Burch, director of commerce at the Deshima factory [Nagasaki, Kyushu, southern Japan], Aug. 14. p. 93-100. See p. 98-99. Handwritten, with signature. [Dut]

• ***Summary:*** This request includes: 80 to 90 kegs of good sake (*balijen goede sackij*). 50 piculs of wheat meal. 150 bales of white rice for the settlement and the ships. 70 bales of little beans (*boontjens*) for the settlement and the ships. 40 bales of peanuts (*cadjangh*) for the settlement and the ships. 10 bales of barley for the settlement and the ships. 16 pots of round rusk. 4 pots with sugarloaf. 25 piculs of smoked hams. 2 kegs of mustard seed. 4 kegs of miso (*misio*). preserved with pickled vegetables (*connemonne* [*kô-no-mono*]). 15 kegs soy [sauce] (*soije*) and 16 pieces of

© Copyright Soyinfo Center 2014



dried katsuo (*caetchio* [*katsuobushi*]). 2 pots with various Japanese candied fruits to treat native leaders. As much rice as they need before they are back in Japan, because wheat is expensive in Tonkin.

Bibliographic reference in Dutch: NA. NFJ 285, ontvangen brieven (14-8-1652) 93-100. On microfilm.

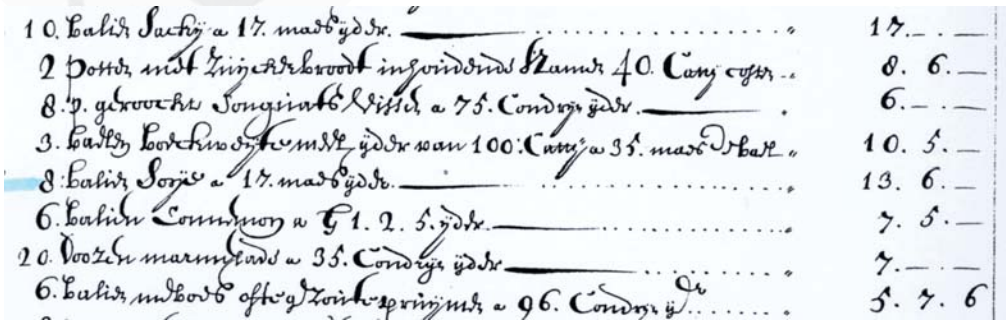
Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 285 [National Archives. Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 284].

Note 1. Henrick Creijers = Hendrick Craijers. Note 2. 1 picul is about 125 pounds, the amount a man can carry with a yoke.

Note 3. This is the earliest Dutch-language document seen (March 2009) that mentions miso, which it calls "misio."

Note 4. This is the earliest document seen (May 2010) concerning soybean products (soy sauce) in Tonkin [in today's Vietnam]. This document contains the earliest date seen for soybean products in Tonkin [in today's Vietnam] (1952); soybeans as such have not yet been reported. Address: Written on the ship Taiwan moored on the river of Tonkin [in today's north Vietnam] before the bar.

86. In't Comptoir Nagasaekij [In the office of Nagasaki]. 1652. Letter to Taiwan / Formosa, Oct. 22. Unpaginated. Handwritten, with signature. [Dut]



• ***Summary:*** Shipped and loaded in the sailing ship (*fluijtschip*) the *Trouw* [literally "faithful / true"] sailing from this place with a Bill of Lading of the skipper Christiaen de Groeve and the second merchant Mijndert Messteecker to Tayoan (*Taoijan*) in consignment send to the honorable Nicoales Verburgh [Island of Formosa].

The list of provisions sent includes: "12 kegs (*balien*) of sake (*sackij*) of 17 *maas* a piece–f 17:--:--. 8 kegs (*balien*) of Soy [sauce] (*Soije*) at 27 *maas* a piece–f 13:-6:--. 6 kegs umeboshi (*mebos* [salt pickled plums]) of 96 *condrijn* a piece–f 5:-7:-6.

Bibliographic reference in Dutch: NA, NFJ 851, Journal (22-10-1652).

The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 286].

Note: About the sender: In *Pieter van Dam's Beschryvinghe van de Oostindische Compagnie,* by F.W. Stapel is an entry for Cornelius Ceasar. In 1609 he was born in Goes, a commune in Zeeland province, southwest Netherlands. By 1635 he was already a merchant in the VOC service. In 1636 and 1637 he was a merchant in Quinam [Cochin China]. Then he was a merchant in Taiwan and in Japan. In 1641 he became supreme merchant. From 1646-1651 he was back in Holland. In 1651 he became Council of Justice in Batavia. From 1653 to 1656 he was Governor of Formosa. In 1657 he died in Batavia. This letter is a contemporary handwritten copy, in a letter-book for the administration on Deshima. Address: Governor of Taiwan and the Council of Formosa.

89. Coijett, Fredrick; Schedel, Fredrick; Dammans, R.; Alphen, Pieter van; Pedel, Thomas. 1655. [Re: List of provisions ordered]. Letter to Honourable Leonard Winnix on Deshima (Nagasaki, Japan), Aug. 3. p. 1-13. See p. 8. Handwritten, with signature. [Dut]

• ***Summary:*** In this letter (p. 8) is an order for provisions: 12 Japanese hams. 25 bales of white stamped rice. 6 kegs of good pickled vegetables (*connemon* [*kô-no-mono*]). 4 kegs of miso (*Balijen Miso*). 4 kegs of soy [sauce] (*Soija*). 4 bales of buckwheat. 8 Japanese room-mats (*camermatten*). 5 to 6 ordinary tea kettles.

Bibliographic reference in Dutch: NA, NFJ 287, ontvangen brieven (3-8-1655) 1-13. On microfilm.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 287 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 287].

Note: This is the earliest Dutch-language document seen (April 2012) that uses the word "Soija" to refer to soy sauce. This soon becomes by far the most widely used spelling of "soy sauce" in Dutch; of the 11 letters that mention soy sauce (and that we have seen) written in the 21 years between Aug. 1657 and Nov. 1678, all but one ask for "Soija." "Soije" was a distant second. Address: Fort Zeeland (Casteel Zeelandia) on Taiwan.

90. Sterthemius, Pieter. 1656. [Re: Order for provisions]. Letter to E. Joan Boucheljon, head of the Deshima factory [Nagasaki, Kyushu, southern Japan], March 8. Unpaginated. Handwritten, with signature. [Dut]

• ***Summary:*** Order for: 8 little kegs of good soy [sauce] (*8 balietges goede soeija*), 2 kegs of pickled vegetables (*connemonne* [*kô-no-mono*]), 2 kegs of good sake (*sackje*),... 2 sake kettles (*sackie ketels*).

Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 355. The pages are not numbered]. This letter is written in a letter-book for the administration on Deshima.

Note 1. This is the earliest Dutch-language document seen (April 2012) that uses the word *soeije* to refer to soy sauce or shoyu.

Note 2. This trading post was established by the Portuguese in 1537, by the English at Hooghly in 1651, and by the Dutch at Chinsura in 1656; the towns were united as Hooghly-Chinsura in 1865.

Note 3. This is the earliest document seen (Nov. 2010) concerning soybean products (soy sauce) in India. This document contains the earliest date seen for soybean products in India (1656); soybeans as such have not yet been reported.

Note 4. About the sender: From 1655 to 1658, Pieter Sterthemius was director of the VOC's Bengal settlement. On 17 December 1659 he went back home to the Netherlands as a commander of nine ships.

About the recipient: In *Pieter van Dam's Beschryvinghe van de Oostindische Compagnie,* by F.W. Stapel the entry for E. Joan Boucheljon appears under Jan Boucheljon. In 1641 he left Holland and sailed as an assistant writer to Asia. He worked mostly in Japan, where he was head of the VOC settlement on Deshima. Three times (in 1655, 1657, and 1659) he was a member of the Council of Justice in Batavia. In Holland, he was known as someone with a good reputation. On 24 Jan. 1661 he returned home to Holland as commander of two ships: the *Kalf* and the Venenburg. Address: Director of the Bengal Settlement [on the Hooghly {Hooghly-Cinsura} in today's West Bengal, northeastern India, on the Hugli River].

91. Indijck, Hendricq; Kettingh, Pieter; Stouthart, Adrien. 1657. [Re: Order for provisions]. Letter to the Deshima factory [Nagasaki, Kyushu, southern Japan], July 8. p. 5-9 See p. 9. Handwritten, with signature. [Dut]

• ***Summary:*** "For the provision of this settlement [Cambodia] we request... 20 kegs sake (*sackie*), with drinking utensils / accessories, a little soy [sauce] (*wat soija*), and vegetable pickles (connemonne [kô-no-mono]) to treat the Japanese and other merchants from time to time."

Bibliographic reference in Dutch: NA, NFJ 288, ontvangen brieven (8-7-1657) 41. On microfilm.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 288 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 288].

Note 1. This is the earliest document seen (Feb. 2012) concerning soybean products (soy sauce) in Cambodia; soybeans as such have not yet been reported.

Note 2. About the sender: In *Pieter van Dam's Beschryvinghe van de Oostindische Compagnie,* by F.W. Stapel is an entry for Hendricq Indijck. He was supreme merchant in Cambodia and after that he became, three times, head of the trading post in Japan. In Cambodia he was succeeded by Pieter Kettingh. This letter is a contemporary handwritten copy, in a letter-book for the administration on Deshima. The letter was received on 10 Aug. 1657 by the yacht (*jacht*) *Erasmus.* Address: Head (*Opperhofd*), Dutch factory in Cambodia.

92. Coijett, Fredrick; Schedel, Fredrick; Dammans, Reijnier; Pedel, Thomas; Valentijn, Jacobus. 1657. [Re: List of provisions ordered]. Letter to [illegible] on Deshima (Nagasaki, Japan), Aug. 3. p. 1-5. See p. 4. Handwritten, with signature. [Dut]

• ***Summary:*** In this letter (p. 8) is an order for provisions: With the return ships, you must send for the use of this settlement and otherwise the following: 10 to 12,000 bales of new rice. 500 bales of wheat. 800 pairs of cotton dress coats for the for the slaves of the factory based on the model / pattern sent with the skipper of the *Domburgh / Domburg;* they must be more suitable than the last ones. 150 piculs [1 picul = about 125 lb] of good Japanese tobacco, to fill all cargo space available. 20 bales of white stamped rice. 8 hams. 6 kegs of pickled vegetables (*connemonne* [*kô-no-mono*]). 6 kegs of good sake (*sackie*). 3 kegs of miso (*missouw*). 3 kegs of soy [sauce] (*soija*). 2 pairs of scales [for weighing] with their accessories.

Note: This is the earliest Dutch-language document seen (March 2009) that uses the word "missouw" to refer to miso.

Bibliographic reference in Dutch: NA, NFJ 288, ontvangen brieven (8-7-1657) 1-5. On microfilm. Received 19 July 1657. Sent with the ship *Domburgh / Domburg.*

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 288 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 288]. Address: Fort Zeeland (Casteel Zeelandia) on Taiwan.

93. Tosa, Mitsunobu. 1657. Shichijû-ichiban shokunin-zukushi uta awase [Seventy-one matching poems / songs concerning Japanese craftsmen. 3 vols.]. Japan. [Jap]*

• ***Summary:*** A woodblock print titled "Sellers of tofu and somen noodles" (*Tofu to somen uri*) shows two Japanese women. At the lower right, one woman is seated in the seiza position (on her heels) on the floor or ground behind a short table (about 4 inches high, 4½ feet long, and 14 inches wide). She is wearing a dark kimono and a white head-tie. On the table is one large cake of tofu (about 10 inches square and 3 inches high) and four smaller pieces (each about 6

The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 291]. Address: Siam.

97. **Product Name:** [Shoyu].
Foreign Name: Shôyu.
Manufacturer's Name: Takanashi Hyozaemon XIX.
Manufacturer's Address: Noda, Japan.
Date of Introduction: 1661.
Ingredients: Soybeans, wheat, water.
Wt/Vol., Packaging, Price: Bottle.
New Product–Documentation: Noda Shoyu K.K. (Morio ICHIYAMA, ed.). 1955. Noda Shoyu Keizai Shiryo. Noda: Noda Shoyu Research Dept. p. 1.

Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. p. 1, 16, 18, 21. "Takanashi Hyôzaemon XIX, whose descendants help manage Kikkoman today, began brewing shoyu, or natural soy sauce, in 1661 in the town of Noda... Using a work force of twenty that included fifteen contract laborers, he produced 3,000 gallons his first year."

Note: This is the earliest commercial soy sauce seen made by any company that later became Kikkoman. Although Kikkoman states on the label of each bottle of its soy sauce that the company originated in 1630, we can find no evidence indicating such an early date. The first shoyu made by a member of the Mogi family dates from the 1760s.

98. **Product Name:** [Miso].
Foreign Name: Miso.
Manufacturer's Name: Mogi Shichizaemon I.
Manufacturer's Address: Noda, Japan.
Date of Introduction: 1662.
New Product–Documentation: Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. p. 16. In 1662 Mogi Shichizaemon started with the manufacture of miso, the rice or soybean paste similar to shoyu in fermentation technology. This is the earliest known soyfood product made by a member of the Mogi family, whose descendants now run Kikkoman.

99. Verdonck, -. 1664. [Re: Order for provisions]. Letter to the Deshima factory [Nagasaki, Kyushu, southern Japan], Aug. Handwritten, with signature. [Dut]
• ***Summary:*** Order for some small kegs of soy [sauce].

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); inventaris nummer 295 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); record number 295]. Address: Head (*Opperhofd*), Dutch factory in Tonking [Tonkin, in today's northern Vietnam].

100. Speelman, Cornelis; Lange, Pieter de; Huijberts, Pieter; Carpentier, Roelant de. 1665. [Re: Request for copper and provisions]. Letter to E. Jacob Gruijse, supreme merchant and head of the Council (*oppercoopman end opperhooft en aen den Raet*) at the Deshima factory [Nagasaki, Kyushu, southern Japan], Feb. 28. Unpaginated. Handwritten, with signature. [Dut]
• ***Summary:*** This request includes: 2,500 chests of copper. 60 kegs of Japanese camphor. No tea because we do not like it and it is very foul. 1,500 pieces of porcelain after the specifications of last year, but the bowls were much too coarse; they must be snow-white. 6 to 8 kegs of soy [sauce] (*balities Soija*) and 2 to 3 kegs pickled vegetables (*connemonne* [*kô-no-mono*]). As many walking canes (*rottangs*) as last year if they are beautiful.

Bibliographic reference in Dutch: NA, NFJ 295, ontvangen brieven (28-2-1665). On microfilm.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 295 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 295]. Address: In the Company's castle Geldria at Pulicat / Palghat (*Casteel Geldria tot Paliacatta*) (in today's Tamil Nadu, Coromandel Coast, southeastern India).

101. Maetsuyker, Joan. 1668. [Re: Request for a decision concerning private merchandise]. Letter to Heren XVII ("17 Lords," leaders of the Dutch East India Company, VOC), Netherlands, Dec. 19. [Dut]

• ***Summary:*** The Governor-General and the Council in Batavia requested a decision from the "Heren XVII" about private merchandise from Japan imported into Batavia. Mostly this private merchandise consists of saké (*sacky*), murasaki [soy sauce], (*moersacky*), pickled vegetables (*connemonne* [*kô-no-mono*]), etc. This merchandise is imported in little quantities, but with great frequency. The Governor-General and the Council in Batavia advises the Heren XVII to permit this private merchandise, because small quantities were imported... so there is no disadvantage to the VOC. They are goods sent by people in Japan to their friends in Batavia.

Bibliographic reference in Dutch: W. Ph. Coolhaas, Generale Missiven van Gouverneurs-Generaal en Raden aan Heren XVII, RGP grote serie deel 3 ('s-Gravenhage 1968) 663. The pages with the quotation is folio 274v-275v.

Note 1. This is the earliest letter seen that mentions "murasaki" written to the Heren XVII or to the Netherlands.

Note 2. If *moersacky* refers to soy sauce, this is the 2nd earliest document seen (April 2012) concerning soybean products (soy sauce) in Indonesia; soybeans as such have not yet been reported. Address: Governor-General in Batavia [today's Jakarta, Indonesia].

102. Shiomisaka, Baian (Umean). 1668. Ryôri anbai-shû [Collected cooking instructions]. Japan: Publisher unknown. 120 p. Japanese summary by Kawakami 1978, p. 159. [Jap]

• ***Summary:*** The 21 sections include sections on miso (there are many miso soups) and tofu. Perhaps miso soup became popular at about this time.

103. Pavilioen, Anthonio; Caulier, Jaques; Carpentier, Roelant d'; Broeck, Pieter van den; Duijcker, Hendrick; Outhoorn, Hendrick van; Sonhuis, Johan B.; Huijsman, Johannes. 1669. [Re: Order for provisions]. Letter to Governor-General Joan Maetsuyker [Maasuijcker] and the Councillors of the [Dutch East] Indies [Heren Raden van Indië] in Batavia [Dutch East Indies], Feb. 1. p. 424-35. See p. 433r. Handwritten, with signatures. [Dut]

• ***Summary:*** This order for provisions includes: "30 kegs sake (*sakkij*), 12 kegs of soy [sauce] (*balije soija*), 12 kegs of miso (*missoe*)."

Bibliographic reference in Dutch: NA, VOC 1270, OBP (1-2-1669) 424r-435vo. On microfilm. This letter is part of the correspondence in the series *Overgekomen Brieven en Papieren* (OBP)–letters and papers sent from Batavia and other factories to the headquarters of the VOC in the Netherlands. This is an important and voluminous part of the VOC archive.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.02; inventaris nummer 1270, 424r t/m 435va. [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.02; record number 1270].

About the sender: In *Pieter van Dam's Beschryvinghe van de Oostindische Compagnie,* by F.W. Stapel is an entry for Anthonio Paviljoen. From 1659 to 1665 he was commander of Jaffanapatnam in Ceylon. From 1665 to 1676 he was governor (head) of the VOC's settlements on the Coromandel Coast, along the east coast of southern India. From 1668 he was extraordinary councillor and from 1676 to 1678 ordinary councillor of the Council of the Indies (*Heren Raden van Indië*). In 1678 he was fired by the Heren XVII.

Nagapatnam (Now {2007} usually spelled Nagapattinam, formerly Negapatnam, Nagappattinam), which was one of these settlements on the Coromandel Coast, in today's southeast Tamil Nadu, 160 miles (275 km) south of Madras. It was occupied by the Dutch from 1660 to 1781.

About the recipient: In 1635 Joan Maetsuyker was appointed pensionary (*pensionaris*) to the Council of Justice of Batavia, in 1646 councillor of the Council of the Indies, from 1646 to 1650 governor of Ceylon and from 1653 to 1678 governor-general.

Note 3. Paliacatta (also spelled Paliacatte; today's Pulicat), long the chief Dutch settlement and headquarters of the VOC factories on the Coromandel Coast, was a Dutch post from 1610. Pulicat was a small walled town on the coast. At its center was the Dutch Fort Geldria, with its permanent garrison of soldiers, and its cannon and armory to protect the various Company trading posts along the Coromandel Coast. Inside the fortress was the governor's two-story residence, magnificent and solidly constructed. Pulicat became British in 1825. It is located in today's Tamil Nadu, at the south end of Pulicat Lake.

This letter has been collated into Casteel Geldria (Fort Geldria) in Palliacatta on 1 Nov. 1670 by Joannes Huijsman, the secretary. Address: Fort Geldria, Palliacatta / Paliacatta [in today's southern India].

104. Veliers, Joan; Tierens, Jacob; Indijck, Dirck; Schellinger, Gerrit; Noortman, Pieter. 1669. [Re: Arrival of Honorable Dutch East India Company ships in Bengal]. Letter to Governor-General Joan Maetsuijcker [Maetsuyker] and Council in Batavia [Dutch East Indies], Feb. 11. p. 1697r to 1704vo. See p. 1698r. Handwritten, with signature. [Dut]

• ***Summary:*** Mentions the arrival of Hon. Dutch East India Company (VOC) ships in Hooghly, Bengal. The cargo contains large quantities of gold, bar-copper and tin, plus 15 pairs of porcelain bottles (*flessen*), 6 pairs of water pots, 6 pairs of *Jacquans,* 12 kegs of sake (*sackij*), 8 kegs of soy [sauce] (*balien Soija*), 4 pairs of lacquered leather canisters

© Copyright Soyinfo Center 2014

(*Cannassers,* made of basket wicker), 50 pairs of lacquered inkpots, 2 kegs of mum (a kind of beer brewed in Brunswick, Germany), 1 little elephant 147 cm (4.8 feet) high.

Bibliographic reference in Dutch: NA, VOC 1273, OBP (11-2-1669) 1967r-1704vo. On microfilm. The letter is written in a letter-book for the administration of the 'Heren XVII' (the directors of the VOC in the Netherlands). The letter is in a manifest (list of cargo) of the ships Rammekens, Buiksloot, Zwarte Leeuw, Zwaan and Tulp. Special attention: This letter is written to give the governor-general information about the cargo received in Bengal from Japan. The ships transported their cargo from Japan via the Strait of Malacca (between the southern Malay Peninsula and the island of Sumatra) to Bengal.

Location: Nationaal Archief, Den Haag, De Archieven van de Verenigde Oost-Indische Compagnie (VOC); inventaris nummer 1273 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch East India Company (VOC); record number 1274].

Note 1. This trading post was established by the Portuguese in 1537, by the English at Hooghly in 1651, and by the Dutch at Chinsura in 1656; the towns were united as Hooghly-Chinsura in 1865.

Note 2. This is the earliest document seen (July 2006) concerning soybean products (soy sauce) in Bengal (a former part of British India, as of Oct. 2010 divided between India and Bangladesh. Hooghly is now in West Bengal, India). This document contains the earliest date seen for soybean products in Bengal (Feb. 1669); soybeans as such have not yet been reported.

Note 3. About the recipient: In 1635 Joan Maetsuijcker (usually spelled Maetsuyker) was appointed pensionary (*pensionaris*) to the Council of Justice at Batavia, and in 1646 councillor of the Council of the Indies (Heren Raden van Indië). From 1646 to 1650 he was governor of Ceylon and from 1653 to 1678 he was governor-general. Address: Director, Hooghly [Hooghly-Cinsura in today's West Bengal, northeastern India, on the Hugli River].

105. Pavilioen, Anthonio; Meersche, Jacob van der; Welsingh, Isaac; Exbusier, Jacob; Buijtendijck, Reijnier van; Hervendoncq, Joris. 1670. [Re: Order for goods from Batavia for use by the Honorable Dutch East India Company in Nagapatnam]. Letter to Governor-General Joan Maatsuijcker [Maetsuyker] and the Councillors of the Indies [Heren Raden van Indië] in Batavia [Dutch East Indies], Feb. 13. p. 550r to 574r. See p. 572r. Handwritten, with signatures. [Dut]

• ***Summary:*** On p. 572r (the recto {front} of folio {page} 572) we read: "Our order for commodities and other items for the use of the Honorable Company. Gold from Japan and from other places with which Coromandel has commerce each year. A list of merchandise: 8 little pints (*pintjes*) of fine oil of cloves, cinnamon, mace, etc. 12 *leggers* (a legger is a large keg of 400 liters capacity) of Spanish wine. 20 kegs of Mum. 2 kegs of good Dutch butter. 20 leggers of wine-vinegar. 9 aums (an aum is a keg of 153.6 liters capacity) of good olive oil. 30 kegs of sake (*Zakkij*) from Japan. 12 kegs of soy [sauce] (*baliën Soija*) from Japan. 6 kegs of miso (*missoe*) from Japan.

Bibliographic reference in Dutch: NA, VOC 1274, BBP (13-7-1670) 550r-574r. On microfilm.

This letter has been collated into Casteel Geldria (Fort Geldria, the headquarters of the VOC factories on the Coromandel Coast) in Palliacatta on 1 Nov. 1670 by Joannes Huijsman, the secretary. The letter is part of a thick bundle of correspondence in the series *Overgekomen Brieven en Papieren* (Letters and papers sent from Batavia and other factories to the headquarters of the VOC in the Netherlands).

This long letter is about management and commerce. The first three folios discuss ships that have arrived. Two folios deal with a political question in the area around Masulipatnam. Folios 552 to 562 discuss merchandise supplied from several districts to Nagapatnam by ship and from the interior, and commerce problems in some districts. Folio 563 is about the weight of the coin used in Pulicat. Folio 565 is about timber. Etc.

Location: Nationaal Archief, Den Haag, De Archieven van de Verenigde Oost-Indische Compagnie (VOC); toegangsnummer 1.04.02: inventaris nummer 1274, folios 550-574 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch East India Company (VOC); inventory number 1.04.02: record number 1274, folios / pages 550-574].

Note: This is the earliest document seen (May 2010) that clearly mentions soybean products (soy sauce and miso) in Indonesia; soybeans as such have not yet been reported. Address: Fortified town of Nagapatnam [in today's southern India].

106. [List of goods to be provided from the various Dutch factories in Asia]. 1671. Colombo. Dec. 20. Unpublished manuscript. [Dut]

• ***Summary:*** An order from Japan for the year 1672 for the table of the Governor. Includes 12 kegs of soy [sauce].

Location: Nationaal Archief, Den Haag, De Archieven van de Verenigde Oost-Indische Compagnie (VOC); inventaris nummer 13511 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch East India Company (VOC); record number 13511]. On microfilm.

Note 1. Colombo, a seaport in the Sinhalese kingdom, was settled by Arabs in the 8th century AD, occupied in 1517 by the Portuguese, captured in 1656 by the Dutch, then taken over in 1796 by the English, who first called the island Ceylon.

Note 2. This is the earliest document seen (Nov. 2010) concerning soybean products (soy sauce) in Ceylon;

© Copyright Soyinfo Center 2014

soybeans as such have not yet been reported. Address: Colombo [in today's Sri Lanka].

107. Maetsuyker, Joan. 1674. [Re: List of ships ready to sail for the Netherlands]. Letter to Heren XVII ("17 Lords," leaders of the Dutch East India Company, VOC), Netherlands, Nov. 18. [Dut]

• ***Summary:*** The ship named "Sticht Uijtrecht" will sail for the chamber of Amsterdam. Private merchandise of Willem van Achterveld, sergeant: Includes: 2 crates [with bottles] Spanish wine and mum. 1 crate of brandy. 1 little barrel of soy [sauce] (*1 vaatie met sooij*)**...**

Bibliographic reference in Dutch: NA, VOC 1297, OBP (18-11-1674) f.142r.

Note: This is the earliest Dutch-language document seen (April 2012) that uses the word "sooij" to refer to soy sauce.

Location: Nationaal Archief, Den Haag, De Archieven van de VOC; toegangsnummer 1.04.02; inventaris nummer 1297 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the VOC; access number 1.04.02; record number 1297]. Address: Governor-General in Batavia [today's Jakarta, Indonesia].

108. Governor General and Council of the Indies (*Indië*)**.** 1675. Generale missive [General missive]. Letter to Heren XVII [directors of the VOC] in the Netherlands, autumn. 3 p. Handwritten. [Dut]

• ***Summary:*** "Specification of the goods which several persons take along with them on the ships for the respective chambers of Amsterdam, Zealand, Delft, Rotterdam and Enkhuizen. Homeward shipped on request and permitted by the Governor General and the Council of the Indies with written decree to take along with them the following goods."

"The ship *Ternate* for the chamber of Amsterdam." Note 1. For some ships, lists of private goods are mentioned. But soy [sauce] is mentioned only in the list of private goods for Joan Putmans, the merchant on the ship ternate. On folio / page 225 we read: "2 chests (*kelders*) with Japanese porcelain pots in one of them and candy or candied fruit in the other. 1 chest (*kelder*) with Japanese Soy [sauce] (*Japanse Soija*)**,** 25 pots with *atchian / atchiar* [maybe atjar pickles] and diverse candied fruit, 1 picul tea [1 picul = about 125 lb], 20 catties bird nests in a little basket of cane / canister" [1 catty = 625 gm]."

Note 2. The goods owned by Joan Putmans are being shipped as "private trade freight" (Japanese: *waki nimotsu*) rather than as "official trade freight" (*motokata / compania nimotsu*)**.** It is not known how much soy sauce he was shipping or in what type of containers it was packaged. Dutch research Herman Ketting, PhD thinks there is a good chance that Putmans used the soy for himself or gave it to friends and relatives in the Netherlands.

Note 3. About the sender: The Governor and the Council of the Indies send a General Letter for the Heren XVII with every homeward bound fleet. This letter is a contemporary handwritten copy. The letter is written in a letter-book for the administration of the Heren XVII, who are the administrators of the Dutch East India Co. (VOC).

Note 3. Herman Ketting, who found this letter, writes (16 July 2007): "So far as I can see now, the cargo lists in the General Missive are the only lists of the VOC, which mentioned the soy [sauce] shipped yearly to the Netherlands. They were made for the Heren XVII and the administration of the VOC-chambers. So I think the soy loaded in the ships bound for the Netherlands, actually arrived in the Netherlands."

Note 4. If this soy sauce did actually arrive in the Netherlands, this would be the earliest document seen (July 2007) showing soy sauce in the Netherlands, or in Europe.

Bibliographic reference in Dutch: NA, VOC 1307, Generale Missiven (najaar 1675) 224r.-226r.

Location: Nationaal Archief, Den Haag, Archieven van de Verenigde Oost-Indische Compagnie (VOC); toegangsnummer 1.04.21; inventaris nummer 1307 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 1307]. Address: Batavia [today's Jakarta, Indonesia].

109. Hase, François de; Fentsel, Herman Pit, Jan. 1676. [Re: Order for provisions]. Letter to Joan Camphuijs, chief merchant and director (*oppercoopman en opperhooft*) and to the Council of the Company of Merchants in Japan [Deshima factory, Nagasaki, Kyushu, southern Japan], March 17. Unpaginated. Handwritten, with signature. [Dut]

• ***Summary:*** We request Your Excellency to send with the return ships via the Straits of Malacca... lacquered ware. Also: "50 usual hams. 6 kegs of miacose sake *sackie***.** 4 kegs of soy sauce (*Soija*)**.** 3 kegs of pickled vegetables (*connemon* [*kô-no-mono*])**.** 2 kegs *mineranskij* (*ameneranskij?*)**.** 2 kegs of umeboshi (*mebos* [salt pickled plums]). Note: This means that the soy sauce was also sent via Malacca to Bengal.

Bibliographic reference in Dutch: NA, NFJ 307, ontvangen brieven (17-3-1676). On microfilm.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 307 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 307].

Note: This trading post was established by the Portuguese in 1537, by the English at Hooghly in 1651, and by the Dutch at Chinsura in 1656; the towns were united as Hooghly-Chinsura in 1865. Address: Director, Hooghly [Hooghly-Cinsura in today's West Bengal, northeastern India, on the Hugli River] (Houglij in Bengalen).

110. Hoorn, J. van. 1676. [Re: Order for provisions]. Letter to the Deshima factory [Nagasaki, Kyushu, southern Japan], June 30. Unpaginated Handwritten, with signature. [Dut]
• ***Summary:*** "General request for merchandise and necessities, which are required from Japan this year for several settlements in Asia as for the fatherland (*vaderlandt / patria*).

For Batavia: 100 kegs of several provisions such as: 40 kegs sake (*sackij*), 20 kegs soy [sauce] (*Soija*), 15 kegs pickled vegetables (*connemon* [*konmono*]), 10 kegs salted, pickled plums (*meboos* [*umeboshi*]), 10 kegs miso (*missauw*).

For Ceylon (*Chijlon*): 48 kegs of provisions as follows: 20 kegs of good sake, 12 kegs soy [sauce] (*Soija*), 8 kegs pickled vegetables, 4 kegs salted, pickled plums [*umeboshi*], 4 kegs *ameneranskij*.

Note 1. This is the earliest document seen (June 2010) concerning soybean products (soy sauce) in Ceylon; soybeans as such have not yet been reported.

For Coromandel (*Choromandel*): As many kegs of Japanese provisions as is specified hereafter for Bengal.

For Bengal: 17 kegs of provisions as: 6 kegs sake, 4 kegs soy [sauce], 3 kegs pickled vegetables, 2 kegs *Ammeneranskij*, 2 kegs salted, pickled plums [*umeboshi*].

For Malacca: Provisions: 2 kegs each of Soy (*Soija*), pickled vegetables, miso (*missouw*), salted, pickled plums [umeboshi], and *ameneranskij*.

Note 2. This is the earliest document seen (May 2010) concerning soybean products (soy sauce) in today's Malaysia. This document contains the earliest date seen for soybean products in Malaysia (June 1676); soybeans as such have not yet been reported.

For Surat (*Zuratta*): 9 kegs of provisions such as sake, pickled vegetables, and soy [sauce] (*Soija*).

Bibliographic reference in Dutch: NA, NFJ 307, ontvangen brieven (30-6-1676). On microfilm.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 355 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 355. The pages are not numbered]. This letter is written in a letter-book for the administration on Deshima.

Note 3. It seems that soy [sauce] is always mentioned in lists of provisions for the table of VOC governors or directors, and their guests; this was written in one letter (see Coijet 1659, Aug. 7).

Note 4. This is a special letter. Part of it contains information from a letter written in the Netherlands by the directors in Holland (Heren XVII). The rest of the information comes from settlements in Asia and was collected and written in Batavia, then sent to Japan. Address: Batavia castle (Batavia in't Kasteel) [today's Jakarta, Indonesia].

111. Breving, Abert; Haas, Dirk de; Schim, Isaac; Bank, C. 1678. [Re: Unable to comply with order for provisions]. Letter to Rijcklof van Goens, Governor-General and the Council of the [Dutch East] Indies in Batavia [today's Jakarta, Indonesia], Nov. 4. Unpaginated. Handwritten, with signature. [Dut]
• ***Summary:*** There was a request from governor-general Rijckloff van Goens in Batavia to transport Sake (*Sakki*) and Soy [sauce] (*Soija*) in waterproof vats, so that the liquids will be well preserved. Albert Brevinck in Japan answers: "That is impossible because we are lacking good vats (*vaten*). For this reason we request that you send vats of first rate quality to Japan. This year we will send the sake for Batavia and Ceylon in good double-walled kegs (*balien*) to help preserve the sake."

Bibliographic reference in Dutch: NA, NFJ 309, verzonden brieven (4-11-1678). On microfilm.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 309 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 309. The pages are not numbered]. This letter is written in a letter-book for the administration on Deshima.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); inventaris nummer 309 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); record number 309].

Note: About the sender: In *Pieter van Dam's Beschryvinghe van de Oostindische Compagnie,* by F.W. Stapel is an entry for Albert Breving under Albert Brevinck. In 1671 he was already head of the settlement in Japan, but after that he was transferred to Tonkin. From 1677 to 1679 he was again head of the settlement in Japan. In 1681 he was Council of Justice and he refused a request to once again become head of the settlement in Japan.

About the recipient: Rijckloff van Goens lived 1619-1682. In 1631 he began his VOC service. In 1655 he was back at home in the Netherlands. In 1656 he was appointed to extraordinary Council of the [Dutch East] Indies, In 1660 he became governor of Ceylon. From 1675 to 1678 he was director-general in Batavia, and after that until 1681 he was governor-general. He died in Nov. 1682 at home in the Netherlands. Source: *Bewind en belied bij de VOC... 1672-1702,* by Femme S. Gaastra (Zutphen 1989). Address: Nagasaki [Japan].

112. Locke, John. 1679. Journal. In: Lord [Peter] King, ed. 1829. The Life of John Locke, with Extracts from his Correspondence, Journals, and Common-place Books. xi +

© Copyright Soyinfo Center 2014

407 p. See p. 133-34. 28 x 23 cm. [Eng]

• ***Summary:*** This section of Locke's journal, written in 1679, was not published until 1829. In the section titled "Extracts from the Journal of Locke," it is noted by Lord King that in 1679 John Locke wrote in his journal directions for some foreigner about to visit England. Among his description of the foods and condiments which ought to be enjoyed in London, Locke noted: "Puddings of several sorts and creams of several fashions, both excellent, but they are seldom to be found, at least in their perfection, at common eating-houses. Mango and saio are two sorts of sauces brought from the East Indies."

Note 1. The word "saio" almost certainly refers to *shoyu* and was cited as such by both Yule and Burnell in Hobson-Jobson (1886, p. 651, "Soy") and the *Oxford English Dictionary* (1919, "Soya"). If so, this is the earliest English-language document seen (April 2012) that mentions soy sauce, which it calls *saio.*

Note 2. This is the earliest document seen (Feb. 2012) concerning soybean products (soy sauce) in England, or in the East Indies; soybeans as such have not yet been reported.

Note 3. This is the earliest document seen (Oct. 2003) concerning soy sauce in international trade–imported to England, perhaps from British India, to which it was shipped–probably from Japan. Yet the big question is: How did the soy sauce get to British India and where was it made?

John Locke was an English philosopher who lived 1632-1704. After his death, "his papers, correspondence, and manuscripts, came into the possession of Sir Peter King, his near relation and sole executor." Lord King, the 7th baron, lived 1776-1833.

The *Oxford English Dictionary* defines East Indies as "A geographical term, originally including Hindustan, Further India, and the islands beyond [including today's Indonesia]. Opposed to the West Indies or Central American Islands, and now usually restricted to the Malay archipelago." The term was used as early as 1598.

Webster's New Geographical Dictionary (1988) defines East Indies as "1. also East India. Collective name, applied loosely and vaguely, to India, Indochina, and the Malay Archipelago. 2. In better usage, politically, the Republic of Indonesia, formerly the Netherlands East Indies. See Indies. But some writers used to include the islands of the Malay Archipelago."

Talk with Ted Hymowitz. 2003. Sept. 4. Early imports of soy sauce to England were transported in amphoras (resembling the ancient Greek jars or vases); they were sealed with wax at the top. Address: London.

113. Goens, R. van; Speelman, Cornelius; Both, Balthasar; Hurrt, Anth.; Blom, Dirk; Outhoorn, W. van; Camphuijs, Joan. 1680. [Re: Sending sake and soy sauce in casks and pots]. Letter to the Deshima factory [Nagasaki, Kyushu, southern Japan], June 30. Unpaginated. Handwritten, with signature. [Dut]

• ***Summary:*** Van Goens etc. request that the sake (*sakij*) and soy [sauce] (*soije*) be poured into well-made casks before shipping. They advise for sake and soy [sauce] as well as for pickled vegetables (*konnemon* [*kô-no-mono*]), umeboshi (*mebos*, [salt pickled plums]), etc. to send them in pots (*potten*). Every pot must be placed in a keg and the space between the pot and the keg must be filled up with straw, so there is no danger of the pots breaking in the kegs.

Van Goens etc. will send pots made in the Netherlands for the shipping of the sake and soy. At Coromandel [on the coast of southeast India] the merchants are annoyed at the bad quality of the sake in the kegs; this is caused by the native wood of which the kegs are made.

Another summary (by Cynthia Viallé): "Batavia informs Deshima that it is sending Dutch tubs to hold the sake and soy [sauce]. The tubs should be cleaned first and prepared to contain the sake and soy."

An appendix to this letter: For Batavia: Four aums of Soy [sauce] in aums and half aums [Note: 1 aum is a measure of capacity (a barrel) of about 177 liters]. Twenty pots put in kegs with pickled vegetables (*konnemon*) and miso (*missou*). Twelve pots of umeboshi as before with fruits. If possible we want them as good as the Japanese send to their friends who live in Batavia, because those are better than the fruits they usually send to us.

For Coromandel: 6 quarter kegs of miso (*missouw*). 10 kegs of Soy [sauce] (*Zoija*). 10 kegs of pickled vegetables. 12 double kegs of saké (*Zackij*). 10 kegs of *omenaranski* [meaning unclear], 4 kegs of umeboshi.

For Ceylon [today's Sri Lanka]: 15 single kegs of Soy [sauce]. 6 double kegs of saké (*sackij*). 12 kegs of pickled vegetables. 20 kegs of umeboshi. 12 kegs *omenaranski* [meaning unclear], 6 kegs of miso (*missouw*).

Bibliographic reference in Dutch: NA, NFJ 311, ontvangen brieven (30-6-1680). On microfilm. The first page of this letter is torn off.

About the sender: Rijckloff van Goens lived 1619-1682. In 1631 he began his service (as a boy) in the VOC (Dutch East India Company). In 1655 he returned home to the Netherlands. In 1656 he was appointed to the extraordinary Council of India (the Dutch East Indies). From 1660 he was governor of Ceylon. From 1675-1678 he was director-general in Batavia, and after that until 1681 he was governor-general. He died in Nov. 1682 at home in the Netherlands.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); inventaris nummer 311 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); record number 311]. Address: In the castle (*kasteel*) Batavia [today's Jakarta, Indonesia].

114. [Manifest (cargo-list) of goods imported to Batavia in 1681 by two Chinese junks]. 1681. Colombo. p. 860r-61r.

© Copyright Soyinfo Center 2014

See p. 860r. Feb. 7 and 28. Unpublished manuscript. [Dut]
• ***Summary:*** Two Chinese trading junks had arrived from Japan in 1681. On Feb. 7, the junk of captain Quanjock arrived with: 22 straw Calmus (Sweet flag) roots... 1 wicker basket (*canasser*) of medicine and one of tea, 681 kegs and pots containing pickled vegetables (*connemon* [*kô-no-mono*]), soy [sauce] (*soij*) and miso (*missoij*).

Note: This is the earliest Dutch-language document seen (March 2009) that uses the word "missoij" to refer to miso.

On Feb. 28 the junk of captain Lunsincqua arrived with: 40 little bureaus. 5 double kegs and 6 single kegs of camphor. 200 kegs and pots containing chestnuts (*carthanjen*), soy [sauce] (*Zoija*), and pickled vegetables (*connemon* [*kô-no-mono*]).

Bibliographic reference in Dutch: NA, VOC 1354, OBP (7 and 28-2-1681) 860r-861r. On microfilm. This letter is part of the correspondence in the series *Overgekomen Brieven en Papieren* (OBP)–letters and papers sent from Batavia and other factories to the headquarters of the VOC in the Netherlands. This is an important and voluminous part of the VOC archive.

Location: Nationaal Archief, Den Haag, De Archieven van de Verenigde Oost-Indische Compagnie (VOC); inventaris nummer 1354, folio 860 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch East India Company (VOC); record number 1354, folio / page 860]. On microfilm. Address: Colombo [in today's Sri Lanka].

115. Schinne, Isaac van; Cansius, Hendrik; Jonge, Constantin Ranst de; Buijtenhem, Hendrik van; Sweers, Balthasar; Dijck, Pieter van. 1681. [Re: Sending provisions]. Letter to the Governor-General and the Council in Batavia [today's Jakarta, Indonesia], Oct. 31. Handwritten, with signature. [Dut]
• ***Summary:*** The Deshima factory is sending 1,000 pairs of cotton stockings, all the porcelain, also the soy [sauce] (*Soija*), saké (*Sackij*), miso (*Misou*), pickled vegetables (*Konnemon* [*Kô-no-mono*]), and umeboshi (*Mebos* [salt pickled plums]), all of the best quality we can get, just as you ordered.

Note: This is the earliest Dutch-language document seen (March 2009) that uses the word "Misou" to refer to miso.

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 312 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 312]. Address: Deshima factory, Nagasaki [Japan].

116. Aizu-nôsho [Aizu-nosho]. 1684. Japan. [Jap]*
• ***Summary:*** Goto (1984, p. 136) states: "Aizu-nôsyo (1684)... described in detail the characteristics of many cultivars, and various cultivation practices, namely ridging and intercropping with barley." Address: Japan.

117. Hishikawa, Moronobu. 1685. Wakoku shoshoku e-zukushi [Various Japanese occupations described in pictures]. Japan. [Jap]*
• ***Summary:*** One woodblock print shows a Japanese man carrying two water-filled wooden tubs of tofu suspended by 4 ropes at each end of a shoulder pole. He is selling tofu, probably in Kyoto. To his left is walking a kimono-clad woman, with a similar wooden tub (covered with a cloth but probably containing tofu) atop her head. She probably bought the tofu from him. Both people are bare footed. The caption says: "Please eat tofu. I came all the way from Nara."

118. Kurokawa Dôyû. 1686. Yôshû fushi [Topography of Yamashiro near Kyoto, based on Yoshu in ancient China]. Kyoto: Shorin Mohe. 10 volumes. Japanese summary by Kawakami 1978, p. 266. [Jap]
• ***Summary:*** OCLC / WorldCat cites this book as follows: Title: Yôshû fushi. Author: Dôyû Kurokawa (who died in 1691). Publisher: [Kyoto]: Shorin Mohe. Year of publication [1686]. Available in Japanese in Microform or microfilm.

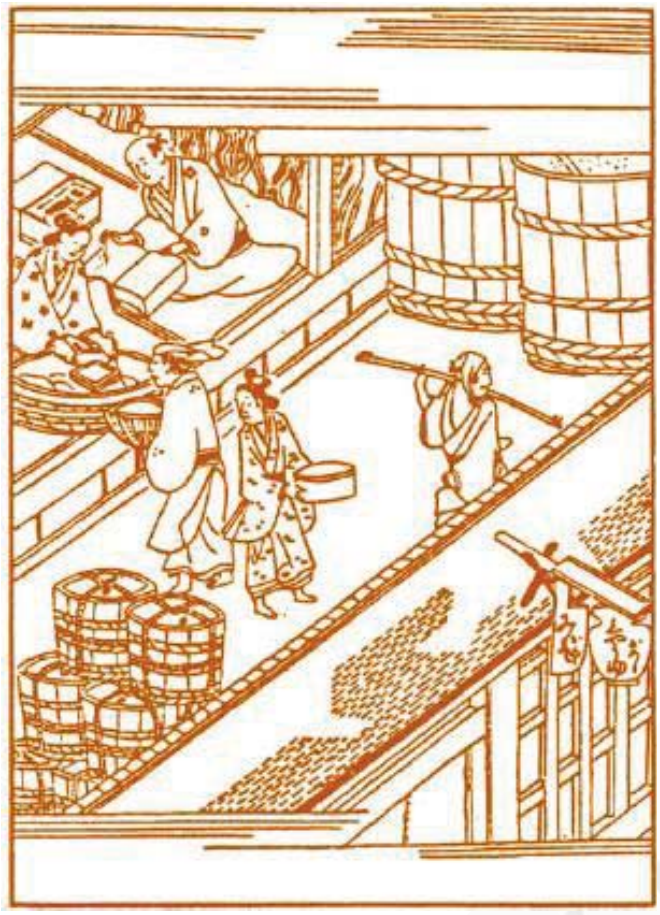
Describes shoyu making.

Yokotsuka (1985, p. 205) states: "And in a book (*Yoshu-fushi,* AD 1686), shoyu was defined as a common Shi-ju (Shi-tche in Chinese)..." Note: "Shi" refers to fermented black soybeans." Therefore the juice from *shi* would be similar to today's tamari, which is soy sauce made with little or no wheat.

Fukushima (1989, p. 9) states that the *Yoshu-Fushi* (Kurokawa, 1682) describes miso and shoyu. Yokotsuka (1991, p. 332) states: "The method of preparing salted and unsalted *douchi* [fermented black soybeans] is described in the book *Yoshufushi* (1686) and elsewhere.

Iino (2003, p. 8) quotes from this 1684 book: "... though *Sakai-joyu* (Sakai soy sauce) was once available only from liquor shops in Izumi (modern-day Osaka) and remains very popular, soy sauce is now made by liquor shops in Kyoto, as well as made by hand at home making the purchase of *Sakai-joyu* unnecessary." "In the first half of the Edo Period (17th century), soy sauce was made in all regions of Japan and could be purchased anywhere. In addition, soy sauce was made by hand in the large majority of houses"–This is made clear by this references in this book. "The method for making soy sauce is first recorded in the *Yôshu Fushi.* The method described calls for a malt to be made from boiled soybeans and roasted barley. Salt and water are added to the malt and the entire mixture placed in a large barrel. The mixture is to be stirred two or three times a day with a pole resembling an oar. After a minimum of 70 days, the *moromi* (dregs [mash]) is to be placed in a sack cloth. A stone is to be placed on top of the sack and the liquid squeezed out. This liquid can then be boiled with other ingredients to create a variety of

© Copyright Soyinfo Center 2014



dishes." Iino then comments: "This explanation shows us that the method for producing soy sauce varied little form the way it is made today, though rather than wheat, barley was used and heat was not applied to the extracted liquid."

119. Rakka Yajin Danshoken. 1686. Shogei shokan: Ryôri no bu [A small sample of various skills: Cookery section]. Japan: Nakamura Magobei in Kyoto, Honya Kiyobei in Edo (Tokyo), and Okada Saburo in Osaka. 66 p. Japanese summary by Kawakami 1978. [Jap]
• ***Summary:*** Pronunciation of the author's name is not clear. This book contains many interesting recipes but almost all were copied from the *Ryôri Monogatari* (1643) and the *Edo Ryôri-shu.* It describes methods for making Maruyama Hishio and tamari, plus a rich miso soup recipe. It is not clear whether or not he copied these recipes.

120. Nihon Saiji-ki 1687. Japan. [Jap]*
• ***Summary:*** Iino (2003, p. 8) states that this 1687 book mentions the shoyu production process, noting that barley was used in place of rice. Iino comments: "It seems that it took some time for wheat to be established as the proper mate for soybeans in the production of soy sauce." Address: Japan.

121. Nihon saijiki 1687. Japan. [Jap]*
• ***Summary:*** Iino (2001, p. 21) contains a "Table of ingredients used in *tou-miso* and shoyu during the Edo period." The entry for *Nihon saijiki* (compiled in 1687) states that *Shoyu* is made from the following ingredients: Soybean 19.2%. Wheat / barley 19.2%. Salt 19.2%. Water 42.3%. Address: Japan.

122. Hyakushô-denki [Farmers' record]. 1688. Japan. [Jap]*
• ***Summary:*** Goto (1984, p. 136) states: "Hyakusyô-denki (around 1688) described in detail the characteristics of many cultivars, and various cultivation practices, namely ridging and intercropping with barley."

Note: Recent editions have apparently been published in Japanese in 1970 and 1977. Address: Japan.

123. Saikaku Ihara. 1688. Nihon Eitaigura Japan. [Jap]*
• ***Summary:*** Iino (2003, p. 8) states that in this 1688 book, the author "presents two stories about the makers of soy sauce. The first story is that a small miso and soy sauce manufacturer in Echigen Tsuruga thought that by using his talents to produce a product at low cost, he could enlarge his business. However, as his business grew, customers dwindled, feeling out of place in the large establishment. In the end, his business failed. The second story is about the soy sauce merchant Kiheiji who walked around town selling his soy sauce from wooden buckets attached to a pole carried on his shoulders. In these two stories, Saikaku discusses the selling of soy sauce from the point of view of a large merchant as well as that of one who sells soy sauce from door to door."

An illustration shows a slanting overhead view of the inside of a shop where soy sauce and miso are sold retail. The small sign hanging outside above the door reads: Soy Sauce and Miso Retailer. Address: Japan.

124. Wakan shôjin ryôri-sho [Japanese-Chinese vegetarian cookbook]. 1688. Japan. [Jap]*
• ***Summary:*** The fourth earliest known reference to Kori-dofu (dried-frozen tofu) appeared in this work.

125. Gôrui nichiyo ryôri-sho (or ryôri shinan-sho) [The recipe book with mixed variety for daily use]. 1689. Nishimura Hanbei (Edo), Nishimura Nishimura Ichiroemon and Nakagawa Moheibei (Kyoto). 5 volumes. Japanese summary by Kawakami 1978. [Jap]
• ***Summary:*** Other names for this book are *Gorui Nichiyo Ryôri Shinan-sho, Ryôri Shinan-sho,* and *Ryôri-sho.* The author is unknown. Fermented foods (*jozo shokuhin*) are included in volume 1, and tofu in volume 3. Unlike a typical recipe book, this one contains many descriptions of methods and processes for making foods. The book also contains detailed recipes for making and serving natto, plus a history of natto.

© Copyright Soyinfo Center 2014

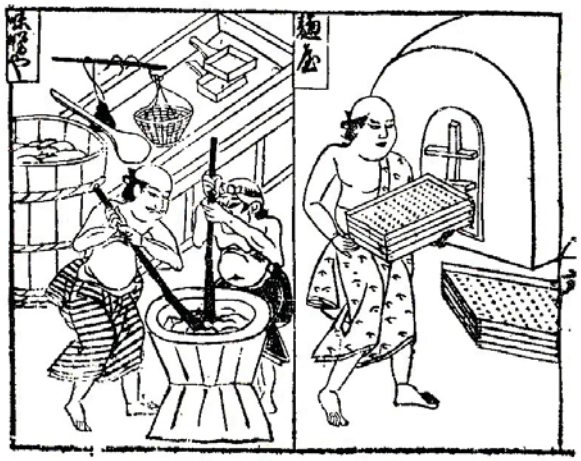
126. Jinrin kinmô zui Jinrin kinmô zui [Illustrated encyclopedia of life in the Edo period]. 1690. Kyoto, Japan. Reprinted in 1990 by Heibonsha (Tokyo); edited by Asakura, Haruhiko. [Jap]

• ***Summary:*** The following page numbers refer to the 1990 reprint edition published in Tokyo by Heibonsha. The compiler of this remarkable work is unknown. At the bottom of almost every page (up to p. 293) are one or two half-page illustrations. Pages 317-31 are footnotes, followed by a syllabary index (a e u e o, ka ki ku ke ko).

The original edition was divided into seven volumes, including: 2. Noh drama. 3. Producers (farmers, woodcutters, fishermen, etc.). 4. Merchants (sellers). 5. Craftspeople. 6. Various and other jobs. 7. Entertainers. At the end is a long section of footnotes and annotations.

Page 121. The illustration is titled *Kuzune-hori* (Digging kuzu root). Yoshino kuzu is the best known in Japan.

Page 142. Shoyu is a famous product of Sakai. Produced in Osaka and Sakai, it is shipped to various places (no illustration).



Page 144. The right illustration is titled *Koji-shi* (Koji maker). Miso makers, manju (steamed bun) makers, and many others use koji. The illustration shows a man carrying four koji trays (*koji-bune*) filled with koji; he is about to put them into the incubation room (*muro,* which has a rounded top) where the koji will ferment. The text mentions a "thin board" (*usuita*), which may be a second type of koji tray, shown on the ground at right, lacking either one or both ends. The volume of koji is measured by the standardized size of the koji tray.

Page 144. The left illustration is titled *Miso-ya* (Miso shop). It shows two men mixing or pounding something (either koji, cooked soybeans and water before fermentation, or miso after fermentation) in a wooden mortar (*usu, suribachi*) using long wooden spatulas or pestles. They use a wooden spatula (*sekkai*) as their store sign. Behind the men to the left is a vat of fermenting miso with stones on top for pressure. Two wooden scoops in a rectangular wooden "boat" are used for scooping and measuring koji, cooked soybeans, and/or salt. The text says: "Miso makes a good seasoning and helps keep people healthy. A day cannot go by without it."

Page 152. The illustration, titled *Kome-ya* (Rice shop), shows a man unloading a bale of rice (wrapped in rice straw) from the back of his horse. Nearby is a rice merchant, standing on a low platform near two other bales of rice. The text notes that the shop sells the "five grains" (*go-koku*), which include soybeans (*daizu*).

Page 160. The left illustration, titled *Yakidofu-shi* (Grilled tofu man), shows a man making grilled tofu over a rectangular brazier. In his right hand is a fan, with which he fans the coals beneath several cakes of tofu. In his left hand is a skewer with two prongs that pierce a cake of tofu.

© Copyright Soyinfo Center 2014

In front of his brazier is a wooden pail, which may be used to store cakes of tofu in water. At the front left is a sloping tray on which slices of tofu are drained. The maker of grilled tofu can found in market places, temple gatherings, festivals, and wherever people gather around. Note: This is the earliest Japanese-language document seen (April 2013) that mentions grilled tofu, which it calls *yaki-dôufu.*

Page 162. The illustration, titled *Ko-ya* (Flour shop), shows three people turning a large hand-turned stone mill in which various types of flour (including soy flour, *daizu no ko,* which is probably roasted soy flour {kinako}) are ground. Ropes from the ceiling hold up the t-shaped end of a push-pull device used to help turn the heavy upper stone.

Page 166. The right half of the illustration (not shown) is titled *Seller of Tataki natto in Kyoto.* To make this natto, dice stringy (*itohiki*) natto finely, then shape into a thin, flat square. Mix in finely chopped greens and tofu. It is an inexpensive, fast food. It is sold by walking street vendors from the end of September until February, especially at Tomikoji-dori, Shijo-agaru machi (probably in Kyoto).

The other illustration shows two men in front of a shop. Each is carrying a shoulder pole on one shoulder; from each end are suspended containers used to hold food. Each is also wearing straw sandals (*waraji*). The man on the right carries containers that are shaped like boxes with the long edges oriented vertically. A sliding panel may be used to open each box. Inside are either utensils and the ingredients for making tataki-natto, or bowls of tataki-natto ready to eat.

Note: This is the earliest document seen (Jan. 2012) that contains the word *itohiki* or the term "Tataki natto" in connection with natto,

Page 225. The left half of the illustration is titled *Horo miso,* which is a kind of miso. The character for *Ho* means "law" or "dharma." The man on the left has cylindrical wooden containers (*magemono,* shaped like traditional Japanese steamers) suspended from each end of his shoulder pole. Atop each is a bamboo mat (*sudaré*). The text states: This miso is made with black soybeans (*kuro mame*). The men who sell it all wear orange robes dyed with persimmons. They never put down the merchandise. Its container was covered and they carried it using a shoulder pole to keep it clean. When they had to put it down, they placed it with one side leaning against something. If anyone stepped over it, the seller demanded that that person buy it. To make *horo miso,* cook black soybeans, then drain off and squeeze out the liquid. The result is a very firm miso with a low water content. Originally it was used in temples, but later it came to be used by the common people.

Note: Naomichi Ishige, a scholar of and expert on Japanese food history, writes (personal communication, March 2008): "To make *horo miso,* mix miso, minced walnut, sesame, and Japanese *sansho* pepper, then saute the mixture with vegetable oil in a pan. People eat *horo miso* with rice, or have it as a relish when they drink sake.

"In the *Jinrin kinmo zui,* the reason tataki natto is thin and formed is because people thought that type of natto could be easily dissolved in miso soup. However, its rectangular shape does not relate to the way of cooking.

© Copyright Soyinfo Center 2014

"I am not sure how the peddler in the picture put his goods in a box that he carried. I only imagine that he wrapped a rectangular tataki-natto in a bamboo sheath and stored it in the box.

"When peddlers began to sell granulated itohiki natto, they put the itohiki-natto into a bamboo basket. They ladled up the quantity needed by a rice scoop (*shamoji*) and sold it. Or, they wrapped the itohiki-natto in a straw parcel and sold the parcel." See also letter about natto history from Ishige sensei to Shurtleff, dated 16 March 2008.

Page 225. The right illustration is titled *Tofu-shi* (Tofu maker). The text states: Among the craftsmen, tofu makers rise the earliest each morning. Some sell deep fried tofu pouches (*aburaagé*). The book *Kuni Hana Manyoki* mentions the places named Maruyama and Reizan where the craftsmen lived. There may have been a lot of tofu makers who lived in this area. The illustration shows a tofu maker in his shop, sitting at the end of a firm pole used as a lever press to press the soymilk out of the okara in the pressing sack (which is placed on a rack) into the wooden vat below. It will then be curded to make tofu. Also visible in the tofu shop are a wooden tofu forming box with 3 holes in each side, and four hanging *noren* curtains.

Page 291. The illustration is titled *Yaku-harai* (Driving out bad luck). The text mentions *setsubun* (the annual festival on the evening of the last day of winter, just before the first day of spring, also celebrated by some as New Year's Eve–according to the old lunar calendar) and roasted soybeans (*iri-mamé / iri-mame*). On the evening of setsubun, Japanese wished to be cleansed of all bad spirits and bad luck. So they scattered roasted soybeans (with coins?) and cried out a slogan wishing for long life. This kept them very busy. Note: New Year's Eve and Day are not traditional Japanese concepts; they were imported from China and the West during the 20th century. Address: Japan.

127. Matsuo Bashô mentions *mamenoko* (*kinako*) in a haiku poem (Early event). 1690. [Jap]

• ***Summary:*** The poem (in Romanization) reads as follows:

"Niawashi ya.

"Mamenoko meshi ni.

"Sakura-gari."

Translation: "Suitable it is / Rice covered with kinako / for hunting cherry blossoms."

Note: This poem appears in the book *Cherry Blossom Epiphany,* by Robin T. Gill (2007, p. 47). It is not clear when Basho wrote this, but it was before 1694, when he died.

The same poem appears in the book *The Essential Bashô,* compiled and edited by Sam Hamill (1999, 184 p.).

It also appears in *Basho's Haiku: Selected Poems by Matsuo Basho,* compiled and edited by David Landis Barnhill (2004, 331 p.).

Makiko Kageura (e-mail of 1 Oct. 2012), a young Japanese Haiku poet, says that Bashô wrote this poem in about Genroku 3 = 1690, at Iga-Ueno (Iga Ueno) located in Iga city, Mie prefecture, Japan.

128. Haikai, zôdanshû [Comic / unorthodox, collections of various topics]. 1692. Japan. [Jap]*

• ***Summary:*** According to the *Nihon Kokugo Daijiten* [Japanese Language Dictionary], this is the earliest known Japanese document that contains the word *kirazu,* referring to the dietary fiber remaining after making tofu or soymilk.

Thanks to Toshie Marra of the University of California, Librarian for the Japanese Collection, C.V. Starr East Asian Library.

Note. This is the earliest Japanese-language document seen (June 2013) that mentions okara, which it calls *kirazu.*

129. Onna chôhô-ki 1692. Japan. [Jap]*

• ***Summary:*** According to Ryoichi Iino (2003, p. 10) the term *oshidashi* was used in this book to indicate / refer to soy sauce.

130. Yaoya-shû [Collection of various things]. 1693. Japan: Publisher unknown. Volumes 1-3 have 54, 48, and 46 pages respectively. Japanese summary by Kawakami 1978, p. 152. [Jap]

• ***Summary:*** The three parts of the book discuss (1) processing foods, (2) cooking, and (3) mochi and confectionery (*kashi*). This is mostly a copy of *Gorui Nichiyo Ryôri Shinan-sho,* but the sequence of the material and the wording has been changed. Some new things have been added. Includes discussions of Nara Horin Miso, quick production of shoyu, and quick preparation of amazake, and Ukeire Tofu. It is not known what the latter is.

© Copyright Soyinfo Center 2014

131. Hitomi, Hitsudai. 1695. [Honcho shokukan. See Pen chao shih chien]. [Chi]*
• ***Summary:*** Yokotsuka (1985, p. 206; 1986, p. 198) cites this as *"Honcho Shokukan* (1692)" but apparently does not cite it in his bibliography in either case.

The Japanese title can be translated as "Japan's food dictionary" or "Our country's food model." Written during the Edo period, the book is mostly about tea. The section about sushi states: Mix fish meat into cold rice, then mix in a little vinegar.

132. Hitomi, Hitsudai. 1695. Pen chao shih chien / Ben zhao shi jian [A mirror of food in this dynasty. 12 vols.]. Osaka?: Hiranoya Katsuzaemon. 22 cm. Widely referred to as *Honchô Shokkan* in Japanese. Modern rendering by Morohashi 1955, trans. p. 13. Complete modern translation into Japanese by Isao Shimada (1976; Tokyo: Heibonsha). [Chi]*
• ***Summary:*** This book, written by a Japanese man in Japan, yet entirely in Chinese, contains early references to yuba, frozen tofu, natto, shoyu, and miso. When Japanese read the Chinese characters for yuba, *doufu-lao,* they pronounce them *tôfu no uba. Lao* or *uba* means "old woman" or "wet nurse."

The book states that the word "natto" is derived from *nassho,* meaning "temple kitchen" or literally "place of offering, perhaps because the food was offered to Buddha before being offered to the monks." It also contains the earliest known written mention of natto's medicinal or healing effects, together with recipes for preparing natto miso soup (*natto-jiru*).

Note: Recall that this *natto-jiru* may well be made with fermented black soybeans rather than itohiki natto.

Saito (1985, p. 15-16) notes: "In 1695 Dr. Hitomi Hitsudai, a Japanese physician, age 74, writes the *Honcho Skokkan* and talks about the good and bad points of daily foods from his medical viewpoint. The 12 volume book is written entirely in Chinese. He writes: 'Soybean: Makes one feel calm, relaxes the stomach, and is good for the intestines. Miso: One should not be without it. Natto: Makes one feel calm, conditions the stomach, enhances a good appetite, and detoxifies poisons. Tofu: Nowadays tofu in Edo is pretty good. Among the various types, Nishiki-dofu and Kezo-in-dofu are famous... But it cannot compete with the tofu made in Kyoto. Shoyu: Inactivates any poisoning from eating food, drinking alcohol, or taking medicine.' The above is taken from the translation into Japanese by Shimada Isao."

T. Yokotsuka (1985, p. 206; 1986, p. 198) cites this as *Honcho Shokukan* (1692) but apparently does not cite it in his bibliography in either case.

Needham (1986, p. 581) cites this as *Pên Ts'ao Shih Chien* (Materia Medica in Tasteful Verse, by Chu Lun). Ch'ing dynasty. 1739. Partly translated by Swingle. But Needham does not discuss its content.

Fukushima (1989, p. 9) states that the *Honcho-Shokkan* (Hitomi, 1695) describes miso and shoyu.

Concerning shoyu: Iino (2001, p. 21) contains a "Table of ingredients used in *tou-miso* and shoyu during the Edo period." The entry for *Honcho-shokukan* (compiled in 1695) states that *Shoyu* is made from the following ingredients: Soybean approximately 22%. Wheat / barley approx. 22%. Salt approx. 22%. Water approx. 34%.

Iino (2003, p. 8) states: "In the first half of the Edo Period (17th century), soy sauce was made in all regions of Japan and could be purchased anywhere. In addition, soy sauce was made by hand in the large majority of houses"– This is made clear by a reference in this 1695 book (*Honchô-Shokkan*), which also mentions the shoyu production process, noting that barley was used in place of wheat. On p. 9 Iino adds that detailed instructions for making *niban shoyu* (soy sauce from a second pressing of the moromi with salt water) are also described in this book. Iino then comments: "It is clear that with the beginning of soy sauce production, use was also made of the dregs [shoyu presscake] to make *niban shoyu."*

133. Endo Genkan. 1696. Chanoyu kondate shinan [Instructions concerning menus for tea ceremony cookery]. Yamaoka Shirobei (Kyoto) and Maedaya Tokubei (Edo). 8 volumes averaging 70 pages per volume. Japanese summary by Kawakami 1978, p. 100. [Jap]
• ***Summary:*** For each day of the month various menus are given with descriptions on how to make them for tea ceremony cookery. Contains the first appearance of awase-joyu, using shoyu. A second edition was published in 1837 by Nakamura Sanshido in Osaka.

134. Miyazaki, Yasusada. 1696. Nôgyô-zensho [Encyclopedia of agriculture in Japan. 2 vols.]. Kyoto?, Japan. Re-issued in 1978 as vols. 12-13 of Nihon Nôsho Zenshu. Published in Tokyo by Nôsan Gyoson Bunka Kyokai. [Jap]*
• ***Summary:*** Saito (1985, p. 16): "There are various kinds of soybeans. They come in four colors: Yellow, white, black, and green (*aoi*). There are large and small, round shaped, flat, or of various other shapes. Also there is the *tsuru daizu* (vine soybean = wild soybean). It is from this document that we now know how many different varieties of soybeans were cultivated at that time."

135. Ovington, John. 1696. A voyage to Suratt, in the year, 1689. Giving a large account of that city, and its inhabitants, and of the English factory there. London: Printed for Jacob Tonson. 606 p. See p. 385, 397. See also Oxford University Press edition (1929), edited by H.G. Rawlinson. A voyage to Surat in the year 1689. p. 231. [Eng]
• ***Summary:*** Concerning soy sauce: In the chapter on "The English Factory at Surat," at the section on "Several Sorts of Indian Dishes," the author is describing Palau [rice pilaf],

© Copyright Soyinfo Center 2014

baked fowl, and beef or mutton cabob roasted on a spit, seasoned with sweet herbs and basted with oil and garlic. He concludes: "Bambou and Mangoe Achar [pickle], Souy the choicest of all Sawces, are always ready to whet the Appetite."

Note 1. This is the earliest English-language document seen (April 2012) that uses the word "Souy" to refer to soy sauce.

Note 2. This soy sauce was probably made in Japan and shipped from there to India in wooden kegs or vats. In 1796 Thunberg states that Japanese shoyu was shipped to India in vats. Noda Shoyu (1955) states: "According to Dr. Iwao, whose source of information was the Japanese-Dutch Hague Archives in the Netherlands (*Waran Haagu Bunshokan.* Probably Nederlandse Vereiniging van Bibliothecarissen, Documentalisten en Literatuuronderzoekers (NVB)), in 1668 the Japanese sent 12 kegs of shoyu to Coromandel, India (a coastal region of southeast India on the Bay of Bengal), in 1670 to the island of Ceylon, in 1677 to Coromandel again, in 1679 and 1681 to Surat in northwest India and to Coromandel..."

Concerning the peanut or groundnut: Page 77 states: "Sometimes they feast with a little Fish, and that with a few Pindars [peanuts or groundnuts] is esteemed a splendid banquet. These Pindars are sown under ground, and grown there without sprouting above the surface." Note 3. This is the earliest document seen (Jan. 2005) that mentions the peanut, or that uses the word "Pindars" to refer to peanuts. This is also the earliest citation in the *Oxford English Dictionary* for pindars (also spelled pinda, pinder, pindal, pinda, or pindel). In the Congo, the term is *mpinda.* It was carried by negroes to America and was used in the West Indies and southern USA for the peanut or groundnut. Note 4. This is the earliest document seen (Sept. 1996) that mentions both soybeans and peanuts.

Note 5. *Webster's New Geographical Dictionary* (1988) defines Surat (also formerly spelled "Suratte") as a city in southeast Gujarat on the coast of western India, on the Tapti River near its mouth 150 miles north of Bombay. It was a chief seaport of India by the late 1500s. In 1608 an English factory was established there, the first in India and the beginning of the British Empire in India. Surat was the seat of British Indian government until 1687. It began to decline in the early 1800s. A photo (frontispiece) facing the title page shows "Surat: The fort from the river bridge."

The subtitle reads: "Likewise a description of Madeira, St. Jago, Annobon, Cabenda and Malemba (upon the coast of Africa), St. Helena, Johanna, Bombay, the city of Muscatt, and its inhabitants in Arabia Felix [the Arabian Peninsula], Mocha, and maritime towns upon the Red-Sea, the Cape of Good Hope, and the island Ascention [Ascension]. To which is added an Appendix, containing: I. The history of a late revolution in the Kingdom of Golconda [in south central India]. II. A description of the Kingdoms of Arraacan and Pegu. III. An account of the coins of the Kingdom of India, Persia, Golconda, &c. IV. Observations concerning the silk worms.

Note 6. Ovington lived 1653-1731. First cited by Yule & Burnell (1886, p. 651; and 1903, p. 859), and the *Oxford English Dictionary* (1919, Soy).

Note 7. The Coromandel Coast in southeast India extends from Point Calimere northwards to the mouths of the Krishna River; to the east is the Bay of Bengal. It has a low shoreline with no good harbors, and is beaten by heavy seas year-round, but especially during the northeastern monsoon (October to April). The chief ports are (as of 1999) Nellore, Madras, Pondicherry, Cuddalore, Tranquebar, and Nagapattinam. Address: M.A. Chaplain to his Majesty.

136. Honkan shokkan [Japanese model cookbook?]. 1697. Japan. [Jap]*

137. Nôgaku-zensho [Complete book of farming]. 1697. Japan. Reprinted in 1979-81 by Sôgô Shinteiban (Tokyo; 7 vols). [Jap]*
• ***Summary:*** Goto (1984, p. 136) states: "Nôgaku-zensyo (1697) outlined the principles and practices of soybean management already widely applied, and mention was made of vegetable beans (*Edamame*) [green vegetable soybeans]." Address: Japan.

138. Saito, Akio. 1699. [Chronology of soybeans in Japan, 1600 to 1699, the early Tokugawa/Edo period] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Jan. p. 14-16. [Jap; eng+]
• ***Summary:*** 1600–Komakabe?, the name of a type of tofu, appears in the *Diary of Oyudono no Kami* (*Oyudono Kami no Nikki*). The very firm tofu called *kata-dofu* that is presently sold in Kochi prefecture (on the southern part of the island of Shikoku) originated from Komakabe.

1601–Daté Masamune (DAH-tay Mah-sah-MU-nay; lived 1567-1636) of Sendai establishes the Goenso-gura and starts making miso. This is the first time that an organized method has ever been used to make miso in Japan. The purpose of this is to make miso for the army and to store salt. According to some theories, the date was 1645 rather than 1601.

1603–In *Nippo Jisho,* a Japanese-Portuguese dictionary, tofu (called "taufu") is mentioned. It says that tofu is a food that is made from powdered / ground beans and that looks like freshly made cheese.

1605–Tokugawa Ieyasu commands the monks at Daifukuji temple to make Hamana Natto. Note 1. This is the earliest document seen (Nov. 2011) that mentions "Hamana Natto" (or "Hamanatto," regardless of capitalization). This document contains the earliest date seen for Hamanatto–1605! Note 2. This is the earliest document seen (Nov. 2011) stating that Hamanatto [fermented black

© Copyright Soyinfo Center 2014

soybeans] were made at Daifukuji temple in Hamamatsu.

1616–Tanaka Genba of Kamiusa no Kuni is advised to make tamari shoyu as a side business by Sanagi Kyurouemon of Settsu. The latter runs a sake factory and has a wholesale seafood products shop in Edo. This is the beginning of Choshi Shoyu and Higeta Shoyu.

1619–At about this time shoyu in quantity is brought from the Kyoto-Osaka area (*Kansai*) to Edo by Taru Kaisen and Hishigaki Kaisen. Note 1. A "Kaisen" is a ship that has a carrying capacity of at least 200 koku (= 9,520 gallons or 36,000 liters). That shoyu is regarded as the best quality and it soon takes over the entire Edo shoyu market.

1624-1644–Konpura Nakama (The union of merchants who go to Dejima / Deshima, an island in Nagasaki Bay) starts to export shoyu through the Dutch East India Company (*Higashi Indo Gaisha*) to Europe and Southeast Asia. It is said that in Europe this shoyu even reached the dining table of Louis XIV. Note 2. This document contains the earliest date seen for soybean products (shoyu) in Europe and Southeast Asia (probably Indonesia, 1644); soybeans as such had not yet been reported by that date. [Question: What is the source of these two dates?]

1626–Sendai Han (*daimyo* domain) starts to monopolize the selling of salt for the first time in the history of Japan. Because of this, all other Hans start to do likewise. Makabeya Ichibei of Kokubunji-cho in Sendai starts to sell Sendai Miso. He continues to sell his miso to the Han government for several generations.

1642–Because of famines in various provinces (*kuni*), the people were advised to eat coarse grains (*zakkoku*) and banned from eating rice. The sale of tofu, udon (wheat noodles), soba (buckwheat noodles), and *manju* (steamed glutinous rice cakes with a sweet azuki-jam filling) were also prohibited.

1645–The Ako Han starts a salt farm. Hatcho miso starts to be made in Mikawa, Okazaki. Hamaguchi Gihei of Hiromura in Kishu goes to Choshi and starts making shoyu. This is the beginning of Yamasa Shoyu.

1649 Feb.–The Tokugawa government (*bakufu*) passes a law to control the lives of farmers. Called Kanno Jorei (*Keian no Ofuregaki*), it states that farmers must plant soybeans and azuki beans between their rice fields and farms. Azé-mame (soybeans grown on the raised footpaths between rice fields) may have started from this forceful edict.

1652 May–Various farmers in Waksa, Kohama-han, Enshiki-gun? protest the heavy soybean tax increase. The farmland tax is often paid with soybeans. The leaders of the protest are killed.

1657 Jan. 18-19–A large fire (called *Sodefuri Kaji*) burned Edo (today's Tokyo). Laborers came from throughout Japan to reconstruct the city. To feed them, many sellers of pre-cooked, ready-to-eat food sprung up in Edo.

1666–Maruo Magouemon? Chotoku? of Hanshu Tatsuno makes Usukuchi Shoyu (light-colored soy sauce). After this, Tatsuno Shoyu's main product becomes Usukuchi Shoyu.

1681–The government bans the withholding or monopolizing of crops (such as rice, barley, or soybeans) following a year with a bad harvest.

1695–Dr. Hitomi Hitsudai, a Japanese physician, age 74, writes the *Honcho Skokkan* and talks about the good and bad points of daily foods from his medical viewpoint. The 12 volume book is written entirely in Chinese. He praises the therapeutic virtues of soybeans, miso, natto, tofu, and shoyu. A translation into Japanese was later made by Shimada Isao.

1695–At about this time, tofu is sold by vendors sitting by the road. We do not know for sure when tofu was first sold by walking street vendors, but it is guessed that this may have taken place in about 1837-1853 when the book *Morisada Manko* was written by Kitagawa Morisada.

1696–There is famine throughout Japan. In eastern Japan, especially in Tsugaru Han, half of the population dies of starvation.

1696–One of the greatest scholars of agriculture during the Edo period, Miyazaki Yasusada (1623-1697), write *Nôgyo Zensho* (Encyclopedia of Agriculture). In it he described the many different colors, sizes, and shapes of soybeans cultivated at that time.

1697–Koikuchi shoyu, similar to the type made today, starts to be made from tamari shoyu in Choshi.

1698–After a big fire in Edo, sellers of Dengaku (skewered grilled tofu with a sweet miso topping) start to appear. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

139. Carletti, Francesco. 1701. Ragionamenti di Francesco Carletti Fiorentino sopra le cose da lui vedute ne'suoi viaggi si dell'Indie Occidentali, e Orientali come d'altri paesi..., 1594-1606 [Chronicles of his voyage around the world]. Florence, Italy: Stamperia di Giuseppe Manni, per il Carlieri. 395 p. See Part II, p. 26. 18 cm. [Ita]

• ***Summary:*** Carletti lived 1573?-1636. This is a much-polished and heavily edited version of his original Chronicles. This book is divided into two main parts. Part I is titled "First account: The West Indies" (p. 1-166). In Part II, titled "Second account: The East Indies," the pagination starts over again at page 1, and miso is mentioned on page 26. More specifically: In the chapter titled "First chronicle of the East Indies," Carletti states that he arrived in Japan in June 1597 at Nagasaki. On page 26 he discusses rice miso, which he calls *"misol."*

In Italian, the sentence reads: *"Di questo Pesce ne fanno ancora molt' altre sorte di vivande, le quali assaporano con una certa lor salsa, che chiamano Misol, fatta d' una sorta di Fagiuoli, de quali abbondano;"* For details see the 1606 entry for Francesco Carletti.

Note: This is the earliest Italian-language document seen (March 2009) that uses the word "misol" to refer to miso. Address: Florence, Italy.

140. Kaki hyôshi 1702. Japan. [Jap]*
• ***Summary:*** According to the *Nihon Kokugo Daijiten* the earliest known appearance of the word *mamemaki* was in the *Kyaki Hyôshi,* which appeared in Japan in 1702. Address: Japan.

141. **Product Name:** [Silken Tofu].
Foreign Name: Kinugoshi-dôfu.
Manufacturer's Name: Sasa-no-Yuki.
Manufacturer's Address: Tokyo, Japan.
Date of Introduction: 1703.
New Product–Documentation: Shurtleff & Aoyagi. 1975. *The Book of Tofu.* p. 307. Based on a 1973 interview with the owner. This is the world's oldest known existing tofu shop. All of the tofu they make and serve is silken tofu.

Was the tofu they made and served when they opened in 1703 named "Sasa-no-yuki" or was it also referred to as kinugoshi? Whatever it was called, this is the earliest known silken tofu in Japan.

142. Chikamatsu Monzaemon. 1703. Sonezaki no shinchû [The love suicides at Sonezaki]. Japan. [Jap]*
• ***Summary:*** Iino (2003, p. 9): In this 1703 book, Chikamatsu's first novel set in current times, "the hero, Tokubei, is an apprentice in the Hirano soy sauce shop. He instructs an employee to make the rounds of regular customers carrying casks of *kijoyu"* [raw / unheated soy sauce]. Iino comments: "With such an explanation, it seems that this soy sauce must have been pure and undiluted, even though diluted soy sauce was also being made" [at this time in history]. Address: Japan.

143. Sherard, William. 1704. [Autograph observations on the first two volumes of John Ray's Historia Plantarum. 2 vols. in 1]. See p. 438. Unpublished manuscript. [Eng]*
• ***Summary:*** Some of the notes from this unpublished manuscript (cited in The Compleat Herbal) were incorporated into John Ray's 1704 work titled *Historia Plantarum, Vol. 3, Supplementum,* which see. John Ray lived 1627-1705.

Note: Tournefort in *The Compleat Herbal* (1730, p. 481; published in London), states: "81. Phaseolus Japonicus fructo albo, ex quo Soia conficiunct Japoneses." He cites his source as "D. Sherard. Raii Supp. 438," then translates the Latin as "Japanese Kidney bean with a white fruit, out of which the Japanese make their Soia."

Concerning this document, an article by B. Daydon Jackson in the *Journal of Botany* 12:129-38 (1874) titled "A sketch of the life of William Sherard," states: "In 1700 Sherard was appointed tutor to Henry, second Duke of Beaufort... Sherard stayed here for about two years, until his Grace was eighteen, busy getting new seeds and plants for the garden, in which the Dowager Duchess took the keenest interest, and which then stood second to none in the kingdom, and helping Ray, now in a weak state of health, to revise his MSS. for the concluding volume of the 'Historia Plantarum,' to which he contributed 'over a thousand plants.' A part of his additions in his own handwriting is preserved in the Botanical Department of the British Museum."

Stafleu and Cowan in Taxonomic Literature (1976-88) note: Sherard, a British botanist, lived 1659-1728. He studied law at Oxford (St. John's College, B.C.L. 1683), botany in Paris (under J.P. Tournefort, 1686-1688) and Leiden (Netherlands, with P. Hermann 1688-1689). He was in Ireland 1690-1694; D. C.L. Oxford 1694; Consul at Smyrna [Izmir, Turkey] 1702-1716; collecting in Greece and Asia Minor; founded a chair of Botany at Oxford of which J.J. Dillenius was the first occupant.

144. Dale, Samuel. 1705. Pharmacologiæ, seu manuductionis ad materiam medicam supplementum:... [Pharmacology, or a food as a supplement to medicines:...]. Londini (London): Sam. Smith & Benja. Walford. 12 + 389 p. + 67 p. See p. 183-84. 16 cm. See also 1751, Ed. 5, p. 238. [95* ref. Lat]
• ***Summary:*** The information on soy sauce appears in Section XIX, titled "De Herbis flore papilionaceo seu Leguminosis: De Leguminosis Scandentibus," under the heading "I. De Phaseolo. Pag. 318 pro 2da Specie Phaseoli adde."

Page 184 states "3. Soia *Offic.* [probably Officinarum] Phaseolus Japonicus ex quo Japonesium Soia, qui intinctus species est, conficitur *Herm.* Species Phaseoli parvi albi, è Japonia allata, è qua conficiunt condimentum *Ketchup* dictum, duum generum, liquidum nimirum & solidum.

Hujus notitiam debemus Botanico erudito D. *Paulo Hermanno* nuper defuncto, qui eam doctissimo amico nostro D. *Gulielmo Sherrard* [Sherard], LL.D. communicavit, sub titulo suprascripto, unde nos habuimus.

English translation: "I. About Phaseolus. Page 318 for two species of Phaseolus [See Note 1 below]. 3. Soy sauce which is kept in stock at the pharmacist's [apothecary's or druggist's or chemist's] laboratory. The Japanese bean from which Japanese soy sauce is made. The latter is a kind of dip. The bean is the Hermann-type [see Paul Hermann, below] of a small white bean brought from Japan; from it they make a condiment called *Ketchup* [Ketjap, Kecap], of two kinds, one clearly liquid and one solid. I owe the notice of this to the erudite Paul Hermann, recently deceased. He communicated this to our most learned friend D. Gulielmo Sherard LLD, under the title written above, whence we have gotten it."

Note 1. The term "Soia" was first used by John Ray (Joannis Raii) in his *Historia Plantarum,* published 1704 in London in 1704 by Smith and Walford, who also published Samuel Dale's Book. On page 438 Ray states: "28. Phaseolus *Japonicus* fructo albo, ex quo *Soia* conficiunt *Japonenses* D. *Sherard."*

Note 2. This is the earliest Latin-language document seen (April 2012) that mentions soy sauce, which it calls

© Copyright Soyinfo Center 2014

Soia.

Note 3. This is the earliest document seen (April 2003) that uses the word "papilionaceo" (or any related word starting with the prefix "papilion" which means "butterfly" in Latin) in connection with the soybean.

Note 4. This passage by Dale raises several questions. (1) It is not clear what sentence starting with "Page 318..." means, since there is nothing related to Phaseolus on page 318 of this book or of any other book we know of published before 1705. (2) Both Dale and Ray refer to Sherard as their source, yet we do not know to which document by Sherard they are referring. (3) Paul Hermann first published information about the soybean in 1717 in his *Musaeum Zeylanicum.* How did he know about the soybean in 1705, and in what way did he communicate this information to Sherard, who then communicated it to Dale? (4) It is not clear what the term Soia *offic.* refers to and is an abbreviation of. Note that Linnaeus (1747) miswrites this as "Soja officinarum" (this was the first time that the term "Soja" was used in connection with the soybean) but gives the page as 238. The author's name on the title page is written "Samuelis Dale." He lived 1659?–1739.

Note 5. Talk with Prof. Ted Hymowitz, Univ. of Illinois. 2006. Sept. 1. This document shows clearly and irrefutably that Dale considered *Ketchup* to be a type of soy sauce; he listed it "taxonomically" under soy. Soia *Offic.* is a pre-Linnean taxonomic name, not a pharmaceutical name. It is curious that "soy" is not listed in the 1710 edition of this book. However the Soia entry in 1718 edition is exactly the same as is this 1705 first edition. Address: England.

145. Dampier, William. 1705. Voyage round the world. The supplement of the voyage round the world, describing the countreys of Tonquin, Achin, Malacca, &c. their product, inhabitants, manners, trade, policy, &c. London: Printed for James Knapton, at the Crown in St. Paul's Church Yard. See vol. II. Part I, p. 26-28. See also 1729 and 1906 editions. [Eng]

• ***Summary:*** The passage on soy sauce, written by Captain Dampier in 1688 (as indicated by a note in the margin reading "An. 1688"), makes this the earliest document seen (April 2012) that contains the word "soy," used to refer to what is now called "soy sauce." He begins by describing the process used by the natives in Tonquin (Tonkin, today's northern Vietnam) for using shrimps, small fish, salt, and water to make what is today called nuoc-mam in an earthen vessel or jar. "The masht Fish that remains behind is called *Balachaun,* and the liquor pour'd off is called *Nuke-Mum.* The poor people eat the *Balachaun* with their Rice. 'Tis rank scented, yet the taste is not altogether unpleasant; but rather savory, after one is a little used to it. The *Nuke-Mum* is of a pale brown colour, inclining to grey; and pretty clear. It is also very savory, and used as a good sauce for Fowls, not only by the Natives, but also by the *Europeans,* who esteem it equal with *Soy.* I have been told that *Soy* is made partly with a Fishy composition, and it seems most likely by the taste: tho a Gentleman of my acquaintance, who was very intimate with one that sailed often from *Tonquin* to *Japan,* from whence the true *Soy* comes, told me, that it is made only with Wheat, and a sort of Beans mixt with Water and Salt."

Note 1. This is the earliest English-language document seen (Jan. 2000) that mentions soy sauce in connection with Japan.

Note 2. First cited by Yule and Burnell (1886, p. 651. They cite the 1729 London ed.; and 1903, p. 858), and the *Oxford English Dictionary* (1919, Soy). Dampier lived 1652-1715.

About this book: It was first published in 1697 in London. A second edition was published the same year, a third edition (corrected) in 1698-1703. Tonquin refers to northern Vietnam, called Tonquin when it was part of French Indochina. Achin is today's Aceh (Atjeh), a region on the northern tip of Sumatra, Indonesia, whose main town is Banda Aceh (formerly Kutaranja). Malacca is a coastal town in today's Malaysia on the Straight of Malacca near Sumatra. This document contains no clear reference to soya in Tonquin (today's North Vietnam). Address: London.

146. Kôka-shunjû [Koka-shunjyu]. 1707. Japan. [Jap]*

• ***Summary:*** Goto (1984, p. 136) states: *"Kôka-shunjyû* (1707) described special types of soybeans, such as boiled soybeans (*Nimame*). This book also described how to grow soybeans on dikes or levees between paddy fields." Address: Japan.

147. Yamato hongusa 1708. Japan. [Jap]*

• ***Summary:*** Iino (2003, p. 8) states that in the section titled *Shauyu* (another term for shoyu or soy sauce), this 1708 book "states that soy sauce can be made from either soybeans and barley and soybeans and wheat." Address: Japan.

148. Kaibara, Ekiken. 1709. Yamato honzô [Japanese materia medica. 2 vols.]. Japan. 23 cm. Reprinted in 1932-1936 by Shunyôdô in Tokyo. [Jap]*

• ***Summary:*** The author, Ekiken Kaibara, lived 1630-1714. Nagata (1960, p. 75) states that E. Kaibara (1709, *Yamato Honzô*) described that autumn soybeans of high quality had been produced in Omi province–today's Shiga prefecture.

Kotzsch (1981, p. 43) states: "Another probable influence on Ishitsuka [the founder of macrobiotics in Japan] was Kaibara Ekken, a philosopher and writer and a popularizer of Confucian thought and ethics, who lived from 1630 to 1714. He wrote on a wide variety of subjects, including philosophy, education, ethics and natural history. His work *Yôjôkun* (*Rules for the Nourishing of Life*) is a practical manual of hygiene and health care... While Ishitsuka does not cite it in his own work, nor does Ohsawa

© Copyright Soyinfo Center 2014

mention it in his autobiography, it most likely had an influence on Ishitsuka's thought."

Adachi (1982) notes that tamari (written with the characters for bean + oil) was mentioned.

Saito (1985) notes: "Kaibara Ekken (1630-1714) writes *Yamato Honso,* in which he discusses the shapes and use of the 1,362 products from Japan, China, and other countries. He notes that among the five crops (*go-koku*), soybeans are the second most widely produced after rice."

Kotzsch (1985, p. 18) noted: "In case of illness one should first try fasting or a very simple diet as a cure. If that fails then acupuncture, moxibustion (burning pellets of plant fiber on the appropriate *tsubo,* key energy spots) and herbal remedies may be tried as a last resort."

Note: This is the earliest document seen (Jan. 2009) connected with macrobiotics.

149. Tôryu setsuyô ryôri taizen [Our school's big book of cooking]. 1711-1715. Japan. [Jap]*

• ***Summary:*** The sixth earliest known reference to Kori-dofu (dried-frozen tofu) appeared in this work.

150. Lockyer, Charles. 1711. Account of the trade in India: Containing rules for good government in trade... London: Printed for the author, and sold by Samuel Crouch. [12] + 340 p. See p. 128-29. 19 cm.

• ***Summary:*** Mr. Lockyer visited Sumatra, Canton, and India during the early 18th century. In Chapter 5, titled "Canton in China," he gives precautions to observe when buying each of various goods there: "Soy comes in Tubs from *Jappan* [Japan], and the best Ketchup [soy sauce] from *Tonqueen;* yet good of both sorts, are made and sold very cheap in *China.* Buy none but what is right, which you are likelier to meet with among the Merchants than Shop-keepers. The best way is to agree by the Catty; for the Tubs are seldom or never full: But if they will not hearken to it, try which are the heaviest, and refuse all that are not likely to contain the Quantity they ought; draw it off immediately, and secure it in Bottles: Therefore in your Passage thither save as many as you can; for I know not a more profitable commodity.

Note 1. *Tonqueen* refers to Tonkin, which is the northern part of today's (Feb. 2010) Vietnam. France assumed sovereignty over all of Vietnam after the Sino-French War (1884-1885). The French colonial government then divided Vietnam into three different administrative territories. They named the territories: Tonkin (in the north), Annam (in the center), and Cochinchina (in the south). The great majority of the Vietnamese regarded their country as a single land and fought for much of the next 90 years to achieve unification.

Note 2. A catty is a Chinese unit of weight; 1 catty = 1.33 lb. weight avoirdupois.

151. Terajima Ryôan. comp. 1711. Wakan sansai zue [Collection of Japanese and Chinese diagrams and drawings of all things]. Japan. 40 books, 106 sections. Japanese summary by Kawakami 1978, p. 269. Translation into modern Japanese titled *Wakan Sansai Zukai* published by Heibonsha in Toyo Pocket Library series. [Jap; eng+]

• ***Summary:*** This is Japan's oldest encyclopedia, written in *kanbun,* the Japanese transcription of Chinese writing. It is a Japanese compilation, which originated in Japan and is not a Japanese translation of a Chinese work. When cited in Chinese, the title in pinyin is: *Hehan sanchai tuhui* (W.-G. *Ho Han San Ch'ai T'u Hui*). The author's nickname (*aza*) is Shojun; his artist's name (*go*) is Kyorindo. The work contains many illustrations, although they were generally primitive and not very accurate.

In volume 105 (*Jozorui*), which is about brewing and fermented foods, a clear distinction is made between miso, shoyu, and tamari.

The section on yuba states: "Tofu film is made on the surface while making tofu. It looks like yellow paper. If you stir too much, the film will not form properly. If you wish to obtain the film, add coagulant and boil the milk. The wrinkled look of the film resembles (the skin of) an old woman. If you remove too much film, the yield of tofu decreases and the tofu becomes hard to eat." Yuba is referred to as *doufu-pi,* the present Chinese term. When the text notes that yuba "resembles (the skin of) an old woman," it seems to imply that the earlier term *lao* or *uba* was used because of

© Copyright Soyinfo Center 2014

the similarity of yuba and an old woman's face.

T. Yokotsuka (1985, p. 206) cites this as *"Wakan sansaizue* (1715)" but apparently does not cite it in his bibliography.

Fukushima (1989, p. 9) states that the *Wakan Sansai Zue* (Narushima, 1712) describes miso and shoyu.

Ebine (1989, p. 91-93) gives the date of this work as 1712, and states that volume 105 describes the preparation of "tama-misho" using broad beans (*Vicia faba; Japanese: soramame*), and a "whitish misho" using soybeans. For each of these Ebine gives a flowchart. Rice or barley are soaked in water, steamed, and fermented to make rice koji, which is mixed with salt, and then the salted koji is mixed with broad beans that have been cooked and dehulled. The mixture is formed into balls, which are wrapped with rice straw, hung under the rafters over a fireside for several weeks, crushed in a mortar, then mixed with water to make tama-misho. To make whitish misho from soybeans and rice: 10 parts of soybeans are soaked in water, dehulled by brushing, and cooked. The hulls are first removed from the cooker, then the cooked beans are removed, formed into balls, and the balls are sliced. Meanwhile, about 14 parts of rice are polished, soaked in water, steamed, cooled, and allowed to mold spontaneously to yield 16 parts of rice koji. The rice koji, sliced soybean balls, and 1.3 parts of salt are mixed, pounded, packed into vats, and fermented for 10 days to yield the whitish misho.

C.N. Li (1958): Making Fermented Products, Fermented black soybean sauce (*shizhi;* W.-G. *shih chih*). Note: Shih is often used at meals to harmonize the five flavors. People used to use it during this dynasty. Nowadays, if people do not use chiang, they do not use shih; they use soy sauce (*chiang-yu*), not fermented black soybean sauce (*shizhi*).

Modern rendering by Morohashi (1955). He translated p. 5 (roasted flour), p. 17 (fermented black soybean sauce). Confection of soy flour and *ame = Ame chimaki.* In "Making Fermented Foods." Morohashi (1955) translated p. 5. *tou i* (*mame ame*). In: vol. 10, p. 63.

Concerning shoyu: Iino (2001, p. 21) contains a "Table of ingredients used in *tou-miso* and shoyu during the Edo period." The entry for *Wakan-sansai-zue* (compiled in 1712) states that *Shoyu* is made from the following ingredients: Soybean 18.2%. Wheat / barley 28.2%. Salt 19.2%. Water 45.5%.

Iino (2003, p. 8) notes that this 1712 book "states that soy sauce made from wheat is suitable for the public and soy sauce made from barley is of low quality." Iino comments (p. 8-9): "Put simply, the soy sauce sold in shops was made from wheat because that made from barley was inferior.

On the same page, Iino shows a full page reproduction of the page titled "shoyu" in this book. It gives: "An explanation of soy sauce production with an illustration of the proper sort of barrel to be used." Iino notes (p. 9): "Another method for producing soy sauce requires a heating process. The *Wakan Sansai Zue* states: '... Squeeze the *moromi* to extract the oil [sic, liquid]. If the color is light, the flavor will not be good. Boil the oil [liquid], place it in a pail and leave it over night to darken the color and improve the flavor. Mix the dregs [presscake] again with salt water and extract the oil [liquid]. This [second pressing] is called *niban shoyu* (second soy sauce), and the flavor is very much inferior.'"

152. Kaempfer, Engelbert. 1712. Amoenitatum exoticarum politico-physico-medicarum, fasculi v. [Exotic novelties, political, physical, medical. Vol. 5]. Lemgoviae, Germany: W.W. Meyerei. See p. 834-35, 837-40. Illust. p. 838. Reprint of original edition published in 1983 by Steiner (Wiesbaden). [Lat]

• ***Summary:*** This is Kaempfer's first major work, his most famous, and his first to mention the soybean. Kaempfer was born on 16 September 1651 at Lemgo, Germany. [Lemgo is presently a city in North Rhine-Westphalia, 44 miles southwest of Hannover.] He lived and traveled in Japan from 23 September 1690 to November 1692 and made many interesting observations. This book, written in Latin, was published in Lemgo in 1712, some 16 years after his homecoming. The fifth fascicle of the 900 page book, which contains a description of the plants of Japan, includes a full-page illustration (drawing; p. 838), by Kaempfer, of a soybean plant with details of the flower parts and their names. This is the earliest illustration of a

豆大 *Daídſu,* vulgo & literatis; & ob excellentiam *Mame*, i. e. legumen, dictus. Phaſeolus erectus, ſiliquis Lupini, fructu piſi majoris candido.

Phaſeolus priori ſimilis, ſed tetrapedalis & plenior, caule erigitur tortè ramoſo, inæqualiter tereti & hirſuto; *Folia* exhibens phaſeoli hortenſis, dorſo aſperiùs piloſo. *Floſculos* menſe Auguſto intra ſinus foliorum explicat uni pediculo inſidentes pluſculos, in albo cœruleos, pumilos, floribus Ervi pares, vexillo petalisque rectis, vix expanſis: Quos *ſiliquæ* excipiunt copioſæ ſeſcunciales, pilo longo aſperæ, ſiliquis Lupini fl. lut. ſimiles, ſemina continentes duo, rariùs tria, piſo hortenſi formâ magnitudine & ſapore paria, quadantenus tamen compreſſa, umbilico badio. Hoc

soybean plant published in the Western world. Also contains a description of the plant, and descriptions of how to make miso and shoyu. He called the soybean "Daídsu" and wrote the Chinese characters before the romanized name in the sequence "zu" "dai" from left to right. The actual Japanese spelling is "daizu."

Note 1. This the earliest published European document about the soybean and the earliest one that links the soybean and products made from it (miso and shoyu / soy sauce).

Note 2. This is the earliest document seen (May 2012) written by a European or Westerner in which Chinese characters are used to write the name of the soybean or related products.

Kaempfer's description of the soybean in Latin (p. 837-40; see next page) begins: "Daídsu, vulgo & literatis; & ob excellentiam *Mame,* i.e. legumen, dictus. Phaseolus erectus, siliquis Lupini, fructu pisi majoris candido..."

Translated into English, this reads: "Daidsu–as people and scientists call it, is also called 'mame' for its excellence. An upright bean, a leguminous plant like the lupin, with whitish fruit somewhat larger than peas. A bean, similar to the afore-mentioned, but four feet high and with more branches and leaves, with upright stem, irregular branches and with hairs. It stretches forth leaves like the garden bean, but with more pubescence on the under side of the leaf. In the month of August it bears on pedicels in the axil of the leaves several bluish white flowers with a large standard, which resemble those of lentils. These tiny blossoms are followed by pods measuring 1½ inches long, which are covered with heavy hairs (pubescence) resembling those of the yellow lupin. The pods contain two, and more rarely three seeds, similar to garden peas in size, shape and taste, but laterally somewhat compressed, and with a chestnut brown eye (hilum).

"This legume supplies to the Japanese kitchen vital elements, for they make from it the following: 1–A kind of pap that they call miso, which is added to dishes instead of butter. Butter is unknown under this strip of heaven. 2–And then the famous so-called shoyu (*Sooju*), a sauce which is poured over if not all dishes, at least over all cooked and fried meals. I add the processing methods for both.

"To make miso, one takes one measure of mame or phaseolus Daidsu (phaseolorum *Daids*) which is cooked with water for a long time and then brayed or ground and mixed into a soft pap. Under continued braying, common salt is added, in summer four parts, in winter three. If less salt is added, one gets the product quicker, but shelf life is shorter. After reducing has been repeated, one mixes the pap with *koos* [he probably meant koji] or dehulled rice (Oryza), and mixes the total by repeated braying. This rice in preparation has been boiled a little in the steam of unsalted water. One lets the mixture cool down and remain in a warm cellar one or two days and nights to ripen. This mixture, which has the texture of a pap or spread, is put into a bowl that recently contained the popular *sacki,* a rice wine. Before using, one lets the bowl stand one or two months untouched. Koos lends to the product an agreeable taste, and its production requires, like that of the Germans' 'polenta,' the experienced hand of the master. Those therefore who make it are held in high esteem, and they sell it ready made.

Note 3. This is the earliest Latin-language document seen (March 2009) (and the earliest document published in Europe) that mentions miso, which it calls *Miso.* It is also the earliest document seen (March 2009) that compares miso to butter.

"To make shoyu (*Sooju*) one uses the same beans just as thoroughly cooked. And *muggi,* which is barley or wheat fermented (with wheat the product becomes darker) which has been coarsely ground. One mixes equal units with ordinary salt, or only one unit with half of it. The beans are blended with the prepared grain, and one lets the mixture stand in a warm place under cover a day and a night for fermentation. Then the salt is added, one stirs the mass and mixes with water, normally two units to half. When this has been done, the well covered mass is stirred once (better two or three times) the next day and each subsequent day by means of an oven rake. This work is continued for two or three months, then the mass compressed and filtered and the liquid preserved in wooden containers. The older it becomes, the clearer and better it will be. The squeezed mass is again filled up with water and newly stirred and some days after treatment pressed again.

Note 4. This is the earliest document seen (April 2012) that uses the word *koos* to refer to koji, or that uses the word *Sooju* to refer to shoyu (soy sauce).

Paragraph 3 reads as follows in the original Latin: "Hoc legumen in coquina Japonicâ utramque replet paginam; Ex

Idem fructu nigricante, pumilo medicinali; cujus grana tria vel quatuor in pulverem redacta propinantur aſthmaticis.

eo namque conficitur: tum puls *Miso* dicta, quæ ferculis pro consistentiâ & butyri loco additur, butyrum enim hôc coelô res ignota est; tum *Sooju* dictumcelebre embamma, quod nisi ferculis, certè frictis & assatis omnibus affunditur. Utriusque conficiendi modum appono:"

On page 834 Kaempfer lists the Gokoku (five chief cereal grains): *come* [*kome*], Oryza in genere: quinque grana Japoniis *go kokf* secundum excellentiam dicuntur: *come,* Oryza; o muggi, Hordeum; *ko muggi,* Triticum; *daidsu,* Phaseoli facie Lupini [Soja hispida]; *sjodsu* seu *adsuki,* Phaseoli vulgaribus similes [Adzuki, azuki, or Phaseolus radiatus, L.].

On page 836 are botanical descriptions, each with 1-2 Chinese characters (read from right to left), of: Broad beans (*Sora mame*), sword beans (*Natta mame* [*nata mame*]), peanuts (*Nankin mame or Nankino*), and cowpeas (*Sasagi* [*sasage*], *Shiro Sasangi*).

On p. 837 is a detailed botanical description (in Latin) of the azuki bean, starting with a Chinese character: "Too, vulgo Atsuki [Adzuki], Phaseolus hirsutus..." Note 5. This is the earliest Latin-language document seen (Jan. 2005) that mentions azuki beans, which it calls *sjodsu, adsuki,* or *atsuki.*

On page 840 are shorter descriptions (in Latin) of "Siuku, vulgo Kuro mame [Black soybean], i.e. Phaseoli nigri. Phaseoli Daidsu species sive varietas, fructo nigro," and "Katz, vulgo Kudsu [Kudzu], Kudsu Kádsura."

Note 6. This is the earliest document seen concerning soya in connection with (but not yet in) Germany. Other early authors to cite it were Linnaeus (1747, p. 222, and 1753, p. 727), Osbeck (1771, p. 253), Linnaeus (1772, p. 171), de Candolle (1885, p. 331), Yule & Burnell (1886, p. 651), and Blasdale (1899).

Note 7. This is the earliest document seen (June 2001) by or concerning Englebert Kaempfer in connection with soybeans.

Note 8. This is the earliest document seen (Sept. 2003) that mentions lupins.

Note 9. This is the earliest document seen (May 2003) that mentions both lentils and soybeans.

An illustration, which is thought to show Engelbert Kaempfer riding on a horse in Japan, was sent to Soyfoods Center by Herr Deubel of Germany. Address: Lemgo, Germany.

• ***Summary:*** 1724 April 29–This entry describes the return trip, largely by ship, from Edo to Nagasaki. Departing from Itami, they passed Nishinomiya and arrived at Hyôgo, where they went ashore and visited a little temple named Sjacote, which means "ladle." After they had dined, the village elder "showed us his sake distillery and his soy press which had a large capacity." Address: Opperhoofd (Chief of the Dutch factory), Deshima, Nagasaki, Japan.

158. Kaempfer, Engelbert. 1727. The history of Japan,... Its metals, minerals, trees, plants, animals, birds and fishes;... Together with a description of the Kingdom of Siam 1690-1692. (translated by J.G. Scheuchzer from the original edition of April 1727. 2 vols.). London: Printed for the translator. See vol. I, book I, chapter IX, p. 121-22. [1 ref. Eng]
• ***Summary:*** In Chapter IX, "Of the fertility of the country as to plants," the section titled *Gokokf* [*Goku-fu*] ("five grains," p. 121-22) states: "The chief produce of the Fields, which contributes most to the sustenance of Life, is by the Japanese comprehended under the name of *Gokokf,* that is, the *five Fruits of the Fields.* 'Tis by their good or bad growth they estimate the value of the Ground, the fruitfulness of the Year, and the wealth of the Possessor. They make up the chief dishes at their meals, and make good the want there is of Flesh-meat, which Custom and Religion forbid them to eat." Note 1. This is the earliest English-language document seen (Dec. 2003) that uses the term "Flesh-meat" to refer to meat.

The five grains (*Gokokf*) are: (1) *Kome* or Rice (from which "they brew a sort of strong fat Beer, call'd *Sacki*..."). (2) *Oomugi* or Barley. "They feed their Cattle and Horses with it: Some dress their Victuals with the Flower [Flour], and make Cakes of it." (3) *Koomuggi* or Wheat. (4) *Daidsu* or Daidbeans. (5) *"Adsuki* [azuki] or *Sodsu* [shôzu, shôdzu = small + bean] that is Sobeans" [azuki].

Concerning soybeans: "4. *Daidsu,* that is, *Daidbeans,* is a certain sort of Beans, about the bigness of Turkish Pease, growing after the manner of Lupins. They are next to the Rice in use and esteem. Of the Meal of these Beans is made what they call *Midsu,* a mealy Pap, which they dress their Victuals withal, as we do with Butter. What they call *Soeju,* is also made of it, which is a sort of an *Embamma,* as they call it, which they eat at meals to get a good stomach. This *Soeju* is exported by the Dutch, and brought even into *Holland.* I have describ'd their way of making it in my *Amoenitates Exoticae.* p. 839. where the Plant it self bearing these beans is figur'd and describ'd."

Note 2. *Midsu* clearly refers to miso, and *Soeju* to shoyu. This is the earliest English-language document seen (March 2009) that mentions miso, or miso in connection with Japan. It is also the earliest English-language document seen (March 2009) that compares miso with butter. *Midsu* has almost the same pronunciation (phonetics), and the same etymology and meaning as the today's word "miso." Since spelling did not become fixed until the 18th century, this could be considered the earliest occurrence of "miso" in an English-language document.

Note 3. This is the earliest English-language document seen (April 2012) that uses the word *Soeju* to refer to soy sauce. It is clearly Kaempfer's spelling of the Japanese word *shoyu.*

The author continues (p. 121-22): "5. *Adsuki* or *Sodsu,* that is Sobeans. They grow likewise after the manner of Lupins, and are black, not unlike *Lentils,* or the Indian *Cajan.* The flower [flour] is bak'd with sugar into *Mansje* [*Manju*] and other Cakes."

Note 4. This is the earliest English-language document seen (March 2006) that clearly mentions azuki beans. It is also the earliest English-language document seen (March 2006) that uses the word "Adsuki" or the word "Sodsu" to refer to azuki beans. Cooked and mashed or ground dry into flour are mixed with sugar to make *an* or "sweetened azuki bean paste." This is used as a filling for the popular steamed Japanese sweet bun named *manju.*

Besides the several sorts of *Gokokf* just mentioned, the following Plants are comprehended under the same name: *Awa,* Indian Corn, (*Panicum Indicum Tabern*)*, Kibi,* or *Milium vulgare nostras, Millet: Fije,* or *Panicum vulgare juba minore semine nigricante:* And in general all sorts of Corn and *Mami* [Mamé = beans], that is pease and pulse. Azuki beans, though usually red, also occasionally have black or white seedcoats.

In the Introduction to this book, the translator explains that it was first published in English, after Dr. Kæmpfer's death in 1716, thanks to Sir Hans Sloane, who purchased all of Kæmpfer's plates, drawings, and manuscript memoirs as they were about "to be disposed of." Sloane added them to his library, which the translator believes is "the completest of its kind in Europe," with an extensive collection of Books of Physik, Natural History and Travels." "This History of Japan was by the Author divided into five Books."

Note 5. Kaempfer lived 1651-1716. John Gaspar Scheuchzer lived 1702-1729. His first translation was this one, in 1727. The title page states that the original was

© Copyright Soyinfo Center 2014

"Written in High-Dutch by Engelberus Kaempfer, M.D., Physician to the Dutch Embassy to the Emperor's Court; and translated from his Original Manuscript, never before printed, by J.G. Scheuchzer, F.R.S. and a member of the College of Physicians, *London.* With the Life of the Author, and an Introduction. Illustrated with many copper plates."

Note 6. In 1986 a 3 volume edition was published in Glasgow, Scotland by James Maclehose and Sons. This book contains no mention of soybeans in Siam (Thailand).

Note 7. This is the earliest English-language document seen (Nov. 2007) that mentions Lupins (or "lupin" or "lupine" or "lupines").

Note 8. This is the earliest English-language document seen (Dec. 2000) that mentions the *Goku-fu* or "five grains" and includes the soybean among them.

Note 9. This is the earliest English-language document seen (June 2008) that mentions lentils; it compares them with adsuki [azuki] beans. Address: M.D., Physician to the Dutch Embassy to the Emperor's Court [in Japan].

159. Three great historical stages in the transformation of ketjap into ketchup (Early event). 1728. Compiled by William Shurtleff of Soyinfo Center.

• ***Summary:*** The two words sets of "ketjap" and "ketchup, catsup, catchup" and their corresponding seasonings have histories that are intertwined and difficult to separate.

So far as we can tell, the Indonesian word "ketjap" meant, and still means, "Indonesian-style soy sauce." It was a fermented food based on soybeans. The etymology of the word probably traces its origin to southern China, where it can refer to various kinds of sauces.

The transformation from "ketjap" to "ketchup" began in about 1728. Before this time, both products were fermented soybean condiments from Asia. Since the mid-1600s, soy sauce had been imported from Asia to Europe. Initially, Japanese shoyu (soy sauce) was imported from the port of Nagasaki in Japan to the Netherlands by the Dutch East India Co. The Dutch, who purchased *shoyu* eventually standardized the name as "Soy." In 1750 this "Soy" was first imported into the United States.

Neither the Dutch nor the European and American consumers of "Soy" had any idea of how this sauce was made in Japan, but they knew it was expensive and tasty. So they began to see if they could make it in Europe–using European ingredients. Their initial experiments focused on using vinegar seasoned with mushrooms or walnuts. They were unaware of soybeans at the time and had no access to them, So the first big change was the European ketchup was made without soybeans. The second big change was that European ketchup not a fermented product–although it was aged. The third big change was that the European products were lower-cost imitations, trying to match the flavor and aroma, color and consistency of a more expensive imported product, by trial and error. The fourth big change was the change in name; shoyu (from Japan) was called "Soy" and "ketjap" (probably from Java) was called "ketchup," "catsup," "catchup, etc.

One interesting hint of the basic similarity of Soy and ketchup was the way they were list in advertisements (usually retail ads) in Europe and the United States. Even though 20-50 items might appear in the ad, Soy and ketchup would almost always be listed together, one below the other in the list.

Over the period of about 250 years Soy remained basically the same product, whereas "ketchup" evolved in major ways. The early ketchups were rarely associated with the tomato, yet today the word "ketchup" is generally understood to mean "tomato ketchup."

160. Kaempfer, Engelbert. 1729. De beschryving van Japan: Behelsende een verhaal van den ouden en tegenwoordigen staat en regeering van dat ryk... [The history of Japan]. In 's Gravenhage; En t' Amsterdam: P. Gosse en J. Neaulme: Balthasar Lakeman. vi + 50 + 500 p. Illust. (engravings, XLV double leaves of plates). 36 cm. [Dut]*

Martyn] from the original Latin. With large additions, from Ray, Gerard, Parkinson, and others. Vol. II. London: Printed for J. Walthoe... See p. 481. No. 81. Reproduced from John Ray 1704. [2 ref. Lat; Eng]

• ***Summary:*** "80. Phaseolus Japonicus niger. Butyri vices supplens Deysumisi boondi, *D. Sherard. Raii Supp.* 438. *Black Japanese Kidney-bean supplying the place of Butter."*

Note 1. This citation and the one that follows were reproduced from William Sherard's 1704 unpublished manuscript titled *Autograph observations on the first two volumes of John Ray's Historia Plantarum* (2 volumes in 1), p. 438. But Tournefort made a small error in transcribing Ray's text. Ray actually wrote *Deysu-Misi-boondi* D. *Sherard.* This text almost certainly refers to "Daizu-Miso-beans," thus stating that black soybeans are used to make miso. Early Europeans occasionally considered miso to be a type of butter.

"81. Phaseolus Japonicus fructo albo, ex quo *Soia* conficiunt Japoneses, *D. Sherard. Raii Supp.* 438." *Japanese kidney bean with a white fruit, out of which the* Japanese *make their* Soia.

Note 2. This is the 2nd earliest English-language document seen (Feb. 2006) that uses the term "Kidney-bean" (or kidney bean) or the term "Japanese Kidney-bean"

to refer to the soybean. Address: France.

162. Isei teikin ourai [Encyclopedia in question and answer format]. 1730? Japan. Author unknown. Japanese summary by Kawakami 1978, p. 206. Undated. [Jap]
• ***Summary:*** One theory says this book was written by Kokan Shiren (pr? d. 1346), but it was probably written later. In this book, yuba is called *tofu uwamono* (literally 'tofu upper substance').

163. Miyake, Yarai. 1732. Mankin sangyo bukuri [How to produce daily household necessities]. Japan: 6 volumes (satsu). Japanese summary by Kawakami 1978, p. 258. [Jap]
• ***Summary:*** Volume 6, which is about food and drink, emphasizes methods of production, and describes how to make shoyu, sake, vinegar, konnyaku, and many other foods. The book was also known under the title *Machikata Bantaku Shobai Shiho Taisei* ("All houses in the town area business method collection").

T. Yokotsuka (1985, p. 206) cites this as *"Mankin sangyo bukuri* (1731)" but does not cite it in his bibliography.

Fukushima (1989, p. 9) states that the *Mankin-Sangyotai* (Miyake, 1732) describes how to make miso and shoyu.

Iino (2003, p. 9) states that the *Mankin Sugiwai-bukuro* (1732) discusses only the soy sauce production method using wheat (not barley) and soybeans. Iino comments: "With the beginning of the 19th century, the large bulk of soy sauce seems to have been produced using wheat." In column 2 of page 9 he adds that this books also gives a description of the method for making *kijoyu* (raw / unheated soy sauce). Iino then comments that from this description we learn that, "while *kijoyu* was very flavorful and could be kept for a long time, the high cost of production made selling *kijoyu* difficult. Therefore a blend of approximately 7-8 liters of *modoshi* [modoki = imitation?, a dilutor?] for every 18 liters of moromi was being sold." Address: Kyoto, Japan.

164. Charlevoix, Pierre Francois Xavier de. 1736. Histoire et description generale du Japon: Ou l'on trouvera ce qu'on a pu apprendre de la nature & des productions du pays... & l'examen de tous les auters, qui ont ecrit sur le meme sujet... 2 v. [History and general description of Japan... Including the examination of all the authors who have written on the same subject. 2 vols.]. Paris: Chez Julien-Michel Gandouin [and 4 others]. Illust. Index. 26 cm. [Fre]*
• ***Summary:*** Peanut = Arachide, cacahuete. Other writers on soy: 1696–poids jaunes, pois jaunes, soui or soi / 1790–Dolic du Japon, bouillie, miso, soja, sooju / 1796–Dolichos Soy, dolic bean, daidsou, feves de dolic, miso. Pierre Charlevoix lived 1682-1761. Address: Jesuit father.

165. Ship Enckhuizen in Nagasaki loaded with soy [sauce]. 1737. *
• ***Summary:*** Herman Ketting is working with William Shurtleff, trying to find when the Dutch East India Company (VOC) first imported soy sauce from Japan to the Netherlands. Ketting writes (20 June 2007): The citation gives the following information: On 13 October 1737 a ship named Enckhuizen (which we know was in Asia at that time) was in Nagasaki loaded with 75 double barrels of Soy [sauce] marked with a "Z." The 75 Barrels were shipped from Nagasaki to Batavia, the VOC's headquarters. Of this total, 35 barrels were bound for mainland Holland [Netherlands].

This was surely not the first shipment of soy [sauce] to Holland, because I have sent you some information about the ship Westerwik which lay off the Cape of Good Hope [South Africa] with some tainted soy the same year. In the meantime I have found a letter sent to Holland which informed the Herren XVII that soy is being sent to Holland in June 1737. If you like, I will send you this information [from the General Missives] in the usual format.

166. Ship Westerwijk lying off the Cape of Good Hope with a cargo of tainted soy [sauce]. 1738. *
• ***Summary:*** Herman Ketting is working with William Shurtleff, trying to find when the Dutch East India Company (VOC) first imported soy sauce from Japan to the Netherlands. Ketting writes (4 June 2007): Most important is perhaps the record about the Ship Westerwijk (1738) lying off the Cape of Good Hope [South Africa] with a cargo of tainted soy [sauce]. This record has a distinctive inventory number (VOC 9149) and therefore is probably more extensive than the other records. So it may contain some references to soy being imported to Asia from Holland.

167. Governors General and the Council of the Indies (Indië). ed. 1739. Generale missiven [General missives]. In: Willem P. Coolhaas and Jurrien van Goor, comp. 2004. Generale Missiven van Gouveneurs-General en Raden aan Heren XVII der Verenigde Oostindische Compagnie: Deel X: 1737-1743. 's-Gravenhage: Nijhoff. Book X. 1159 p. (Letters to the Heren XVII of the Dutch East India Company). [Dut]
• ***Summary:*** On page 253 (31 Jan. 1739) "zoya" is mentioned twice and "Japans soja" once: "Ship *Enkhuyzen / Enkhuisen / Enckhuizen.* Soy [sauce] (*Zoya*) for Hoorn and Enkhuizen f139:12:-8."

"Ship *Schellack.* 4 chests (kelders) of Soy sauce for Delft and Rotterdam f139:12:-8."

"With the fleet of 1739 in total, 36 chests (kelders) of Japanese Soy (*Japanse soja*) f 1231:--:--.

Note 1. Enthuizen, Hoorn, Delft, and Rotterdam were harbor towns and early "chambers" (*kamers*) of the Dutch East India Co. (VOC), from which overseas trade with the East Indies was conducted. The other two early chambers were Amsterdam and Zeeland.

Note 2. The symbol "f" stands for guilder, the basic

© Copyright Soyinfo Center 2014

Dutch monetary unit. "f 2:07:8" is read "two guilders, 7 stuivers and 6 pennigen." One gulden (singular of guilder) = 20 stuivers. One stuiver = 12 pennigen.

Note 3. This is the earliest Dutch-language document seen (April 2012) in which the word *Zoya* is used to refer to soy sauce.

Note 4. The General Missives are letters written by the Governors General and the Council of the Dutch East Indies (*Indië*) and sent to the Heren XVII [the directors of the VOC] in the Netherlands. Items in the General Missives are the demand for men and materials for Indies, the number and quality of ships in the Indies, questions about management and information concerning the cargo sent with the fleet to the Netherlands. Address: Batavia, Netherlands.

168. Valckenier, A. 1739. [Re: Merchandise loaded from Batavia, Dutch East Indies]. Letter to Heren XVII ("17 Lords," leaders of the Dutch East India Company, VOC), Netherlands, Jan. 31. p. 2000-01 [Dut]

• ***Summary:*** Loaded merchandise is listed according to their place of origin. For example merchandise from Coromandel.

Batavia's collection: 11,500 pounds of tin from Malacca. f. 3942:-4:-. 30,500 pounds of copper, Japanese, by staffs, f. 13,944:12:-. 36 crates with bottles of Japanese soy sauce (*Zoija Japance*) f. 1231:16:-8. 45,000 pounds of spiaulter (an alloy / mixture of lead and tin) f. 150,606:-6:-8. 4,209 pounds of black ebony f. 90:-3:-.

Bibliographic reference in Dutch: NA, VOC 2422, OBP (21 Jan. 1739) 2001vo.

Location: Nationaal Archief, Den Haag, De Archieven van de VOC; toegangsnummer 1.04.02; inventaris nummer 2422 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the VOC; access number 1.04.02; record number 2422].

Note 1. The symbol "f." stands for guilder, the basic Dutch monetary unit. "f 2:07:8" is read "two guilders, 7 stuivers and 6 pennigen." One gulden (singular of guilder) = 20 stuivers. One stuiver = 12 pennigen.

Note 2. A. Valckenier was Governor General in Batavia from 1737 to 1741.

Note 3. An alloy of lead and tin is commonly called either old pewter, tin pewter, or solder. Address: Governor-General, and the Councils of the Indies, in Batavia [today's Jakarta, Indonesia].

169. De vergadering van het Haags Besogene [Meeting of the Haags Besogene]. 1740. The Hague, Netherlands. Unpaginated. [Dut]

• ***Summary:*** The meeting of the Haags Besogene starts 20 Oct. 1740. The committee works on the 24th four-year (quadrennial) account of the Dutch East India Co (VOC).

Monday, 24 Oct. 1740, in the morning. Proceeding with the reading and control of the delivery books to be sold and delivered goods and merchandise, from 1 June 1737 until 15 May 1738, item from 16 May 1738 until 15 May 1739, and finally from 16 May 1739 until 31 May 1740.

Monday, 24 Oct. 1740, after midday. Started with the reading and control of the accounts and merchandise, which on 17 May 1736 were stockpiled in the warehouse of this chamber [Amsterdam] and four years ago were received from the [Dutch East] Indies (Indië [Batavia]). Items that since 31 May 1736 were delivered from the stock according to the journal of bookkeeping and the ledger and the part of the stock lying unsold in the Company's warehouses:... Japanese Soy [sauce] (*Japanse Soija*)*;* received as before–30 kelders. Note 1. A kelder is a chest; in this case it contains bottles of soy sauce.

Bibliographic reference in Dutch: NA, VOC 4472, Haags Besogene (20 t/m 24-10-1740).

Location: Nationaal Archief, Den Haag, De Archieven van de Verenigde Oost-Indische Compagnie (VOC); toegangsnummer 1.04.21; inventaris nummer 4472. Notulen van het Haags Besogene [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch East India Co. (NFJ); access number 1.04.21; record number 4472. Notes of the Haags besogene].

Note 2. This is the earliest document seen (June 2007) showing soy sauce in the Netherlands. This document contains the earliest date seen for soy in the Netherlands (31 May 1736).

Note 3: The Haags Besogne prepared the meetings of the Heren XVII [the 17 directors who made the most important decisions]. To prepare those meetings, the Haags Besogne had to deal with the letters received from Batavia and the chambers in Holland and Zealand. The Haags Besogne also controlled the different bookkeeping journals, and they saw every letter, report or bookkeeping document in the administration of the VOC; they made many abridgements of or notes about them. On the basis of the findings, the Haags Besogne gave advice to the Heren XVII. After that. the Heren XVII made their decisions. So we can found in the archive of the Haags Besogne some information from books or sources which are lost. There is only one problem: there is no index to or register on the notes of the Haags Besogne. So a researcher must be familiar with the notes of the Haags Besogne. Address: The Hague, Netherlands.

170. White's China and Flint-Glass Warehouse. 1744. Classified ad: To be sold at seven pence per pound,... *Daily Advertiser* (*London*)**.** May 16. p. [5], col. 2.8.

• ***Summary:*** "Where likewise is sold at the lowest Prices,... Japan and Chinese Soy [sauce], India Ink and Fans, the finest Havanna [Havana, Cuba] and Spanish Snuffs, Lavender, Orange-Flower, Hungary, Honey, and Sanspareil Waters, &c."

Note: This is the earliest English-language document seen (April 2012) that uses the term "Chinese Soy" to refer to soy sauce. Address: Opposite the King's Arms Tavern in

© Copyright Soyinfo Center 2014

New Bond-street [London].

171. Ellis, William. 1744. The modern husbandman: or, The practice of farming. Vol. 3 of 4. Containing the months of July, August and September. London: Printed for and sold by T. Osborne. See p. 117-18. [Eng]
• ***Summary:*** The chapter titled "Of potatoes" states (p. 117-18) that there are many ways to cook and serve them: "A Third Way. Others, when they are boiled, have a Sauce ready to put over them, made with Butter, Salt, and Pepper; others use Gravy Sauce, others Ketchup, some eat them boiled with only Pepper and Salt, others cut the large ones in Slices, and fry them with Onions, or stew them with Salt, Pepper, and Ale, or Water."

Note: Vol. 1 is Jan. to March. Vol. 2 is April to June. Vol. 3. July to Sept. Vol. 4 is Oct. to Dec.

172. Brouwer, David. 1744. Diary. In: Leonard Blussé, Cynthia Viallé, et al, eds. 2004. The Deshima Diaries Marginalia, 1740-1800. Tokyo: Japan-Netherlands Institute. xl + 898 p. See p. 50, 63 (#180).
• ***Summary:*** 1744 Oct. 7–"The *compradoors* asked whether I wanted to buy the regular provisions. I replied that I was willing to buy provisions at the prices they charged others. They replied that the *sake* they supplied us was especially brewed for the Company and that the barrels of soy [sauce] given to us are bigger than the regular ones. I ordered provisions amounting to 1,903 taels or f3,806." Address: Opperhoofd (Chief of the Dutch factory), Deshima, Nagasaki, Japan.

173. Notulen van het Haags Besogene [Notes of meeting of the Haags Besogene]. 1744. The Hague, Netherlands. Unpaginated. Oct. 19-22. [Dut]
• ***Summary:*** Monday 19 Oct. 1744. The committee starts to work on the 25th four-year (quadrennial) account [of the Dutch East India Co (VOC)] and has agreed to come together for that purpose during the morning from 9 until 12 and after midday from 3:30 until 5:30 p.m...

Thursday 22 Oct. 1744. Started with the reading and control of the account of goods and merchandise which on 31 May 1740 were stockpiled in the warehouse of this chamber [Amsterdam] and which 4 years ago were received from the Indies (*Indië* [Batavia]). Items that according to the journal of bookkeeping and the ledger have been delivered from the stock since that time and the part of the stock from 15 May 1744 has lain unsold in the Company's warehouses. The findings are stated below:

"... Japanese Soy [sauce] (*Japanse Soija*)*:* from the years 1738 and 1739 were stockpiled–30 kelders. Added to this, received from the Indies (*Indië*) during the past four years–61 kelders.

Total in stock as of 15 May 1744–91 kelders. Note 1. A kelder is a chest; in this case it contains bottles of soy sauce.

Bibliographic reference in Dutch: NA, VOC 4472, Haags Besogene (19 t/m 22-10-1744).

Location: Nationaal Archief, Den Haag, De Archieven van de Verenigde Oost-Indische Compagnie (VOC); toegangsnummer 1.04.21; inventaris nummer 4472. Notulen van het Haags Besogene [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch East India Co. (NFJ); access number 1.04.21; record number 4472. Notes of the Haags besogene].

Note 2. A careful examination (by a Dutch PhD researcher at the Hague) of the records VOC shipments arriving in Holland from Batavia finds no evidence that soy sauce was delivered to intermediaries for the Dutch or other markets. For goods such as pepper, sugar, coffee and tea, the Haags Besogne always noted how much was delivered. But for soy sauce they did not. Therefore the soy sauce was probably consumed by VOC directors and their servants.

Note 3. Soy was delivered by VOC ships and stored in VOC warehouses. The inspectors of the warehouses never mentioned that this soy had been delivered to a private merchant. Our reached his conclusion after comparing the note about soy and, for example, a note about pepper. Address: The Hague, Netherlands.

174. [Re: Journal of the first bookkeeper in Amsterdam. Items purchased from the VOC]. 1745. Amsterdam, Netherlands. p. 222 [Dut]
• ***Summary:*** In Amsterdam, 31 March 1745. The following persons purchased Soy [sauce] worth a total of f. 1456:-9:- (*aan Soija guldens*).

Entry No. 250: About 70 crates with bottles (*fleskelders*) sold and delivered at several prices as before folio 189.

Entry No. 321: Sacharias Tielman, according to the delivery book fo. 189, 20 crates with bottles, f430:-9:-.

Entry No. 103 [in ledger]: Nicolaas Fremjin, 20 crates with bottles, f421:-8:-.

Entry No. 311: Jan Leonard Apol, 10 crates with bottles, f207:-4:-.

Entry No. 78: Blote and Knibbe, 10 crates with bottles, f202:-4:-.

Entry No. 367: Jacob Gudmanson, 10 crates with bottles, f194:-4:-.

Total: 70 crates with bottles, f1456:-9:-.

Bibliographic reference in Dutch: NA, VOC 7145, journaal van de opperboekhouder (31 maart 1745) 222.

Location: Nationaal Archief, Den Haag, De Archieven van de VOC; toegangsnummer 1.04.02; inventaris nummer 7154 [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the VOC; access number 1.04.02; record number 7154.].

Note 1. This is the earliest document seen (Jan. 2012) that gives a price for soy sauce; that price is in Dutch guilders. We are not told the volume of each bottle or how many bottles per crate.

© Copyright Soyinfo Center 2014

Note 2. The symbols "f" and "f." stand for guilder, the basic Dutch monetary unit. "f2:07:8" is read "two guilders, 7 stuivers and 6 pennigen." One gulden (singular of guilder) = 20 stuivers. One stuiver = 12 pennigen.

Note 3. Items records above are not all that a person or persons purchased. For example, Blote and Knibbe bought, in addition to soy [sauce], cloves, coffee, tea, brown pepper, cinnamon, borax, gum resin, and gum olibanum [for incense].

Note 4. The journal of the first bookkeeper is arranged by product type, whereas the ledger of the first bookkeeper is arranged by the surname of the buyer. Address: Amsterdam.

175. Notulen van het Haags Besogene [Notes of meeting of the Haags Besogene]. 1748. The Hague, Netherlands. Unpaginated. Oct. 25. [Dut]

• ***Summary:*** Started with the reading and control of the account of goods and merchandise, which on 15 May 1744 are stockpiled in the warehouses of this chamber [Amsterdam] and which have been received during the last four years from the Indies (*Indië* [Batavia]). Items that according to the journal of bookkeeping and the ledger have been delivered from the stock since 31 May 1748 and that part of the stock lying unsold in the Company's warehouses.

"... Soy [sauce] (*Soija*)*:* According to the list closed on 15 May 1744 were stockpiled–91 kelders. And received from the Indies (*Indien*) during the past four years–72 kelders."

Total: 163 kelders. Note 1. A kelder is a chest; in this case it contains bottles of soy sauce.

"From that is delivered during this time: 106 chests (kelders).

"On account of the filling of half empty bottles (*flessen*) and broken bottles: 4 chests (kelders).

"For the benefit of inns and yachts used: 2 chests (kelders). Total: 163 chests (kelders) [So the books balance].

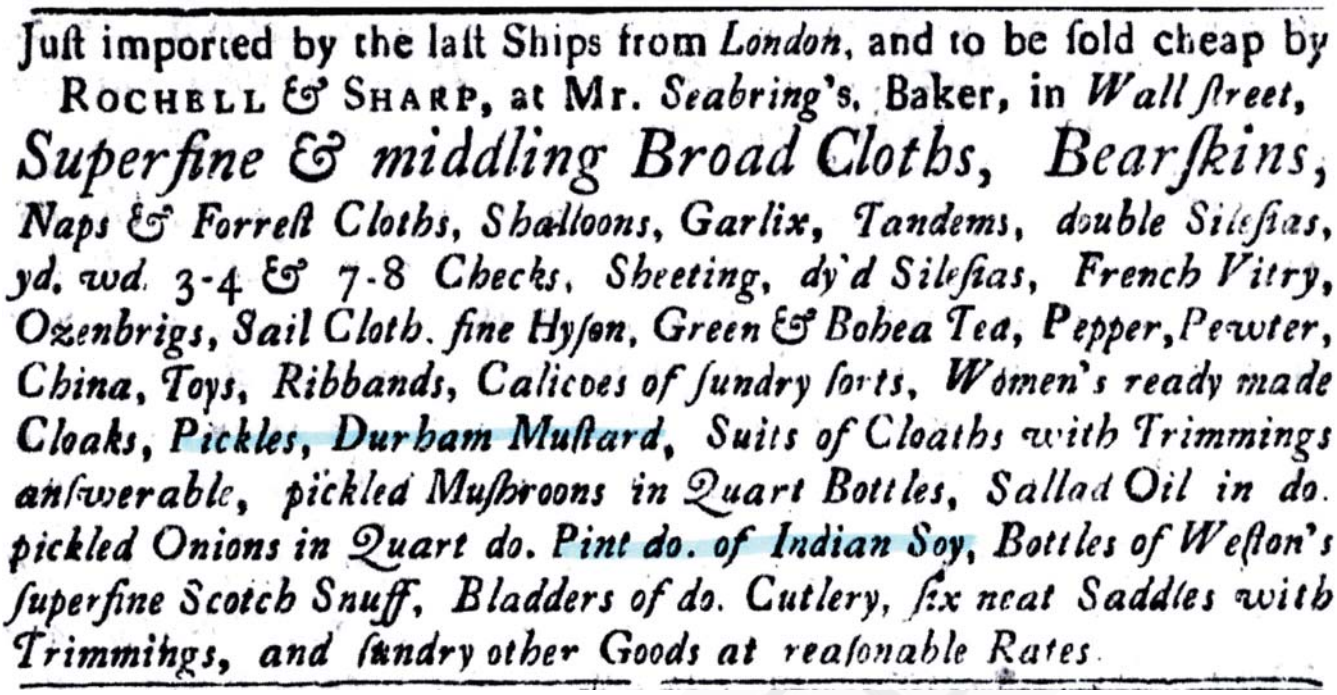
Pickles, Durham Mustard,... pickled Mushrooms in Quart Bottles, Sallad Oil in do. [ditto = same] pickled Onions in Quart do. Pint do. of Indian Soy [sauce], Bottles of Weston's superfine Scotch Snuff..."

This ad also appeared in this newspaper on 24 Dec. 1750, p. 3 and 7 Jan. 1751, p. 4.

Note 1. This is the earliest document seen (Aug. 2012) concerning soybean products (soy sauce) in the British colonies of North America (now the United States), or in New York. This document contains the earliest date seen for soybean products in the British colonies of North America or in New York (Dec. 1750); soybeans as such have not yet been reported. At least 66 different ads for soy sauce appeared in New York City newspapers before 1800!

Note 2. This is the earliest English-language document seen (April 2012) that uses the term "Indian Soy" to refer to soy sauce; it was probably imported from the Indies, the East Indies, or India. To date, 103 documents in the SoyaScan database contain the term "Indian Soy" (regardless of capitalization) but only the earliest ones have been given the keyword for "India." The term "Indian Soy" was the earliest name given to soy sauce imported to the British colonies of North America. But what does it mean? Where was it made? It was probably typical Japanese-style soy sauce

© Copyright Soyinfo Center 2014



Juſt imported by the laſt Ships from *London*, and to be ſold cheap by ROCHELL & SHARP, at Mr. *Seabring's*, Baker, in *Wall ſtreet*, *Superfine & middling Broad Cloths, Bearſkins, Naps & Forreſt Cloths, Shalloons, Garlix, Tandems, double Sileſias, yd. wd. 3-4 & 7-8 Checks, Sheeting, dy'd Sileſias, French Vitry, Ozenbrigs, Sail Cloth. fine Hyſon, Green & Bohea Tea, Pepper, Pewter, China, Toys, Ribbands, Calicoes of ſundry ſorts, Women's ready made Cloaks, Pickles, Durham Muſtard, Suits of Cloaths with Trimmings anſwerable, pickled Muſhroons in Quart Bottles, Sallad Oil in do. pickled Onions in Quart do. (*shoyu*), made in Japan and exported from there by the Dutch East India Company (VOC), probably via Batavia (today's Jakarta), to Amsterdam–where it was purchased at auction by merchants who brought it by sailing ship to North America.

Note 3. This is the earliest document seen (July 2006) that mentions Durham Mustard, a famous product made in the city of Durham, in northern England. "In 1720 Mrs. Clements discovered a method for extracting the full flavour from mustard seed by grinding the seed in a mill and subjecting to similar processes used in the making of flour from wheat" (Durham city website).

180. Mogi family rules to live by (16 article creed) and poem written (Early event). 1750? Undated.

• ***Summary:*** "Make strong morals your foundation, and focus on money last.

"Don't forget your foundation.

"Strive for harmony in your family.

"Avoid luxury: a simple life is a virtuous life.

"Do the job that you were born to do, and only that job.

"Treat a loss and a big gain the same.

"Competition can help you get ahead, but do not compete unfairly or to an extreme.

"Make your main meal boiled rice and barley and one bowl of miso soup.

"Eat the same food as your servants.

"Be strict with yourself, but be kind to your servants.

"Keep your personal expenses low.

"Use the rest of your money for the good of the community to a level in keeping with your circumstances.

"Keep track of your finances, and save money for the unexpected.

"Have a family reunion twice a year. At these reunions, don't judge your family members based on their income, but rather on their character.

"Family Creed Poem by Tadataka

"Tie this scroll up tightly and keep these words in your heart.

"Even if you work and it is not enough, it is your job.

"If you work hard, there will be happiness."

Source: University of Massachusetts at Amherst website. http://www.umass.edu/fambiz/ articles/values_culture/ kikkoman.html.

Ira Bryck adds: "I have had the Creed of the Mogi Family on this website (Umass-Amherst) for several years.

"Recently, a researcher from Japan let me know of a much older creed, plus a family creed poem, predating the one I had, written in an older Japanese, comparable to Shakespearean English, as he described it. I list that older one below. I am told it is similar in style to a commonly used Samurai creed. Many thanks to Aragorn Quinn, UMass graduate language student, for his fine translation, and to Irene Starr for finding Aragorn; and to Machie Uemura for bringing this all to my attention."

181. Oogimachi, Kinmichi [pseudonum: Hakugyoku Ou]. 1750? Hakugyoku Ou tôfu ki [Hakugyoku Ou's record of tofu]. Japan. Undated. [Jap]

• ***Summary:*** The caption of this striking illustration of two Japanese women in kimonos states (in Japanese): *Mizuchaya to Tofuchaya.* This can be translated as "Water Tea House and Tofu Tea House." The woman on the right is making dengaku using skewered pieces of tofu over a charcoal brazier.

© Copyright Soyinfo Center 2014

水茶屋と豆腐茶屋

This illustration comes from a book that is hard to pin down; we are not even sure that such a book exists. The illustration appears in the book titled *Tôfu no Hon* [The book of tofu], by Koryû Abe and Shigemitsu Tsuji (1974, Tokyo, p. 7, in Japanese). On page 6 they cite the source (somewhat vaguely) as the source we cite above, and give the date as mid-Edo period. The Edo (or Tokugawa) period lasted from 1600 to 1867.

Abe and Tsuji state (p. 6) that the above ancient book mentions *Niken Jaya* ("two tea houses") and their tofu (Gion-dofu) and Dengaku. *Hakugyoku* means "white jewel" and *Ou* means "old man / man's."

They then make things more confusing by stating: According to *Sejidan,* written by Kikuoka Senryo of the mid-Edo period, Gion-dofu was made for the first time at these two tea houses (*Niken Jaya*), which were located to the east and west of the tall wooden gate in Kyoto's Gion section (*Gion Rômon*). That was the start of the Kyoto Water Tea House (*Kyo Mizu Chaya*). The two tea houses were named Fuji-ya (the eastern Niken Jaya) and Nakamura-ya (the western Niken Jaya). In those old days they sold tofu. Today only Nakamuraya exists, but its name is now Nakamura-ro.

A Japanese website named Union Catalog of Early Japanese Books (http://base1.nijl.ac.jp) lists some 20 documents by Hakugyoku Ou (the pronunciation of his name is shown in furigana = hiragana written next to the Chinese characters / kanji), but no dates are given. Unfortunately the book about tofu cited above is not mentioned among the 20.

According to *The Book of Tofu,* by Shurtleff and Aoyagi (1975, p. 307): The Nakamura-ro restaurant, which is said to be "the oldest of all existing Japanese restaurants, began about 400 years ago as a simple tea shop serving travelers, pilgrims, and townspeople who came to pay homage at the revered Yasaka Shrine in Kyoto's Gion Quarter. Over the centuries, the shop grew into a restaurant and became famous for its 'Gion-dofu.'... The present master and head chef, Mr. Shigemitsu Tsuji, is famous throughout Japan as a cook, lecturer, and author." An illustration by Aoyagi of the interior of Nakamura-ro appears from the time she and Shurtleff visited the restaurant in about 1973. Address: Japan.

182. Kondate [Menus]. 1751-1781. Publisher unknown. 100 p. Japanese summary by Kawakami 1978, p. 47. [Jap]
• ***Summary:*** The menus, by an unknown author, are for tea ceremony cooking. Mentions *Higo-dofu,* which is tofu shaped like a piece of macaroni (hollow tube).

• ***Summary:*** 1752 April 28–"I was amazed by what they told me because they know that they cannot keep it a secret from me if the junk is from Batavia [Jakarta]. As soon as they had left, I asked about the Japanese who had told the story of it being a junk from Batavia. The first slave brought him. I asked him where the junk was from and he replied from Jacatra [Jakarta] and that it carried only *miso* beans [i.e., soybeans used to make miso]... The Japanese coolie told me that there was no truth to his story about the junk."

1752 May 1–"Several apprentices clarified the story about the junk. The Chinese farmers have been mistaken for female slaves. They wear a different type of clothes. I asked Jûemon why the junk was being unloaded because I could not imagine that the government would accept a cargo of *miso* and other beans as tradable goods. Japan produces enough *miso* beans itself. He replied that the cargo will be sold out of compassion for the Chinese farmers." Address: Opperhoofd (Chief of the Dutch factory), Deshima, Nagasaki, Japan.

186. Notulen van het Haags Besogene [Notes of meeting of the Haags Besogene]. 1752. The Hague, Netherlands. Unpaginated. Oct. 19. [Dut]
• ***Summary:*** On the first page of notes of the meeting concerning the stock in the warehouses we read:

"Thursday, 19 Oct. 1752: Started with the reading and control of the account of goods and merchandise, which on 31 May [1752] were stockpiled in the warehouses of this chamber [Amsterdam] and which have been received during the last four years from the Indies (*Indië* [Batavia]). Items that according to the journal of bookkeeping and the ledger have been delivered from the stock since 31 May 1752 and that part of the stock lying unsold in the Company's warehouses.

"... Japanese Soy [sauce] (*Japanse Soija*)*:* According to the list closed on 31 May 1748 were stockpiled–51 *kelders.* And received from the Indies (*Indien*) during the past four years–51 *kelders."*

Total: 102 *kelders.* Note 1. A kelder is a chest; in this case it contains bottles of soy sauce.

"From that is delivered during this time: 39 chests (kelders).

"According to the list closed on 31 May 1752, in stock: 45 chests (kelders).

"Provided for consumption in inns and yachts: 3 chests (kelders).

"In disuse, broken and empty: 15 chests (kelders). Total: 102 chests (kelders) [So the books balance].

• ***Summary:*** Lists the cargo on six vessels, including (p. 199): "26 Futailles Soya de Japan" [26 kegs of soy (sauce) from Japan].

Note: The various reference to the word *Soye* concern silk, not soy sauce.

193. Ekeberg, Karl Gustaf. 1764. Om Chinesiska Soyan [On Chinese soy sauce]. *Kongliga Vetenskaps Academiens Handlingar* (*Transactions of the Royal Academy of Sciences, New Series, Stockholm*) 25:38-40. Jan/March. [Swe; eng+]
• ***Summary:*** A detailed description in Swedish of how the Chinese make soy sauce, written with the intent that Europeans would start making it themselves.

"The natives of nearly all of the Indies (India) use for their cooking a sauce which they have prepared in advance. This sauce serves the purpose of both economizing and making the food better tasting. The inhabitants of the Moluccan Islands [later part of Indonesia] and the islands lying around the Strait prepare, by rotting of small fish, a sauce which in taste and smell doesn't differ much from anchovies, rather than [using] the soy [sauce] that more recently has become known in Europe.

"The Chinese, who are not inferior to any other people of the world when it comes to home economy or the ability to imitate what they have seen, although not the inventors of soy sauce themselves, have tried to imitate their neighbors the Japanese, whose soy sauce surpasses that of the Chinese,

© Copyright Soyinfo Center 2014

be it more in price than in taste (goodness). They favor using it in the preparation of several dishes, and especially for dipping meat, fish, and vegetables into, lavishly and differently from other sauces.

"I have the honour to herewith to describe how Chinese soy sauce is prepared, because it has come to be used by us and we ought to be able to produce it ourselves.

"I have previously remarked in a short account of Chinese home economics in the country, that they have a type of small bean called Pactau ["white bean" = white soybean] among their grains. It differs only in size from the Caravance bean (*Caravancer*) usually used as nourishment on board during the voyage home. These Pactau beans are the main ingredient of the soy sauce, and since both types of beans resemble one another fairly closely in taste, and since the Caravance beans do not differ very much from our Turkish beans (*Turkika Boner*), I do not doubt that soy sauce could be prepared from the latter [Turkish beans], if not from our own field-beans. The Chinese prefer, when short of their Pactau beans, to prepare the sauce from a type of lesser blackish-green bean, which they call Hactau. Our native beans ought to be tried, therefore, in case the crop of Pactau beans, imported for experimenting, should fail.

"Thirty-five pounds [actually skalpund; 1 skalpund = 425 gm] of these beans, are cleaned then boiled for 2 or 3 hours in a covered kettle in clean water over a slow fire, until they can be easily mashed between the fingers. Water is added little by little so that the beans do not burn. The beans are removed and spread out on wide, shallow containers (trays) so that the water can run off, and while they are still damp they are rolled in a fine flour (which is ground from the same kind of bean) until they are covered on all sides. They are then placed on smaller trays or loosely woven mats and stacked one and a half inches (literally "thumbs"), one above the other, then placed in an open and loosely woven basket, which is wrapped in a mat or cloth, so that they can ferment and grow moldy during a period of three or four days. Then the cloth is removed and air let in, so that they should become withered and somewhat dried by the time they are left in strong solar heat (or in any other warm area) so that they can dry until they become so hard that they shatter when hit with a hammer and the pieces fly around.

"The flour and the mold are now separated from the beans by rubbing them between the hands. Then the beans are placed in a large or several smaller jars (earthen vessels) and covered with a clear (salt) pickling brine, prepared from 20 pounds of nice clean salt and 100 pounds of clean spring water. The vessels are placed open in the sun during the day, but are closed at night to keep out the cold and the dampness. Otherwise they are placed in a warm area for six whole weeks, to draw [until their whole substance has been well extracted]. When it is observed that the pickling brine has become dark brown and strong, it is poured off, and brought to a boil several times to increase the strength. Some people add sugar, ginger and other spices to it, according to taste, while it is cooking. They then let the sauce stand with the spices for a few days, before the spices are removed by straining."

Note 1. The author, Carl Gustaf Ekeberg (written like this on title page) lived 1716-84. He was captain of a ship in the Swedish East India Company's service. He arrived in Canton on 24 August 1766, but had previously visited in 1762. Beckmann (1798, p. 344) gives an English translation of the latter half of this document, starting at "Thirty-five pounds..." Note 2. This is the earliest Swedish-language document seen that uses the term *Caravancer* to refer to soybeans.

Note 3. This is the earliest document seen (July 2001) stating that sugar and/or spices are sometimes added to soy sauce during the last stage of processing.

Note 4. This is the earliest journal article seen (Oct. 2001) that mentions soy.

Note 5. This periodical started publication in 1739 in Stockholm. Address: Captaine vid Ostindiska Compagniet (Captain with the East India Company).

194. **Product Name:** [Shoyu. Brand named Jôjû Shoyu in 1772].
Foreign Name: Shôyu.
Manufacturer's Name: Takanashi Hyozaemon XXII (Renamed Mogi Hyozaemon in 1764).
Manufacturer's Address: Noda, Japan.
Date of Introduction: 1764.
New Product–Documentation: Noda Shoyu K.K. (Morio ICHIYAMA, ed.). 1940. Noda Shoyu K.K. Nijunen-shi [Twenty-year history of Noda Shoyu, Inc.]. p. 473. The Jôjû brand of shoyu (of which the logo is shown) was introduced in Anei 1 (1772).

Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. p. 18. "In 1764 the eldest son of Takanashi Hyozaemon, now the XXII, married the daughter of Mogi Shichizaemon V. As was often the case when marriage was tied to business, he married into her family, assuming her family's name an occupation. In the year of their marriage, 1764, the adopted son-in-law (*muko-yôshi*) and his bride established a shoyu factory on the advice and with the financial support of the bridegroom's natural family, the Takanashis, who had been making shoyu in Noda since 1661. This was the first Mogi family to venture into shoyu manufacture, but two years later, in 1766, the bride's father, Mogi Shichizaemon, whose ancestors had established the first Mogi household in Noda in 1630, added the manufacture of shoyu to the manufacture of miso, which his family had begun in 1662." Fruin (p. 73) says that by 1909 this shoyu was sold under the Kamigata brand, but Ken Mogi of Kikkoman says that Kamigata (the brand introduced by Takanashi Hyozaemon in Anei 1 = 1772) should be pronounced Jôjû, not Kamigata.

195. Diderot, Denis. 1765. Encyclopédie, ou dictionnaire raisonné des sciences, des arts et des métiers: Soui, ou soi [Encyclopedia, or rational / systematic dictionary of the sciences, arts, and trades/crafts: Soy]. Paris: Briasson. See vol. 15, p. 403. Published from 1751-1765 in 17 volumes or fascicles. [Fre]

• ***Summary:*** "Soui, or soi, singular masculine (Cuisine) is a type of sauce that the Japanese prepare, and which is very much sought after by the peoples of Asia, and by the Dutch, which import it from Japan. It is a type of extract or of liquid which goes well with all types of meats, and above all with partridge and ham. Then one adds to it mushroom sauce, lots of salt, pepper, ginger, and other spices which give it a very strong flavor, and which help to prevent the resulting sauce (*liqueur*) from spoiling. It will keep for many years in bottles that are well corked, and a small quantity of this liquid mixed with ordinary sauces, enhances them and gives them a very agreeable flavor. The Chinese also make soy (souï), but that of the Japanese is regarded as superior. It is said that the reason for this is that the meats are much more succulent in Japan than in China."

The text in French reads: *"SOUI, ou SOI, s.m.* (*Cuisin.*) *c'est une espece de sauce que les Japonnois préparent, & qui est très recherchée par les peuples de l'Asie, & par les Hollandois qui en apportent de ce pays; c'est une espece d'extrait ou de suc qui se tire de toute sorte de viandes, & sur-tout des perdrix & du jambon. On y joint du suc de champignons, beaucoup de sel, de poivre, de gingembre, & d'autres épiceries qui lui donnent un goût très fort, & qui contribuent à empêcher que cette liqueur ne se corrompe. Elle se garde pendant un grand nombre d'annés dans des bouteilles bien bouchées, & une petite quantité de cette liqueur mêlée avec les sucs ordinaires, les releve, & leur donne un goût très-agréable. Les Chinois font aussi du souï, mais on regarde celui du Japon comme supérieur; ce qui vient, dit-on, de ce que les viandes sont beancoup* [*sic, beaucoup*] *plus succulentes au Japon qu'à la Chine."*

Note 1. Diderot, the French encyclopedist, lived 1713-1784.

Note 2. This is the 2nd earliest French-language document seen (Jan. 2010) that refers to soybeans or soyfoods.

Note 3. This is the earliest French-language document seen (April 2012) that uses the words *le Soui* or *le soi* to refer to soy sauce. The text seems to imply that soy sauce had been introduced to France by this time, however we cannot be sure of this. If that were the case, this would be the earliest document seen (Jan. 2010) concerning soybean products (soy sauce) in France; soybeans as such have not yet been reported.

Note 4. This is the earliest Western-language document seen (Feb. 2004) that recommends adding seasonings (such as mushroom sauce, salt, pepper, ginger, or other spices) soy sauce to enhance its flavor. This idea may have been a French innovation.

Note 5. The earliest publication seen that cites this early document (Diderot 1765) was by Shigeru Otsuka, in his book *A Journey into the World of Shoyu* (1987, p. 75). But 14 years earlier, in his chapter titled "All About Shoyu" in *The Kikkoman Way of Fine Eating* (1973, p. 10), when discussing how Europeans got to know about shoyu, he wrote: "It was the great misfortune of the Portuguese that they did not know it. The Dutch traders that followed them, however, did notice shoyu, and began to export it to Europe. It was about 100 years later that Louis XIV of France began to prize shoyu as a secret ingredient in the luxurious court fare of the time." Note that Louis XIV reigned from 1643 to 1715, more than 50 years before Diderot wrote this passage. We know of no document which states that Louis XIV ever used shoyu. And when we asked Mr. Otsuka for his source concerning Louis XIV's use of shoyu, he was unable to give any source. Dr. Yokotsuka of Kikkoman (1983) thinks the original source was Dr. Obata. Address: France.

196. **Product Name:** [Shoyu].
Foreign Name: Shôyu.
Manufacturer's Name: Horikiri Monjiro.
Manufacturer's Address: Nagareyama (near Noda), Japan.
Date of Introduction: 1766.
New Product–Documentation: Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. p. 18. In 1766 Horikiri Monjirô from Nagareyama began making shoyu. "His wife was the second daughter of Mogi saheiji III, who would himself begin soy sauce brewing in a few more years."

197. **Product Name:** [Shoyu].
Foreign Name: Shôyu.
Manufacturer's Name: Mogi Shichizaemon V.
Manufacturer's Address: Noda, Japan.
Date of Introduction: 1766.
New Product–Documentation: Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. p. 18. "In 1764 the eldest son of Takanashi Hyozaemon, now the XXII, married the daughter of Mogi Shichizaemon V. As was often the case when marriage was tied to business, he married into her family, assuming her family's name an occupation. In the year of their marriage, 1764, the adopted son-in-law (*muko-yôshi*) and his bride established a shoyu factory on the advice and with the financial support of the bridegroom's natural family, the Takanashis, who had been making shoyu in Noda since 1661. This was the first Mogi family to venture into shoyu manufacture, but two years later, in 1766, the bride's father, Mogi Shichizaemon, whose ancestors had established the first Mogi household in Noda in 1630, added the manufacture of shoyu to the manufacture of miso, which his family had begun in 1662."

198. Ryorikata banhô [Many methods for cooks]. 1766? Japan: Publisher unknown. 60 p. Japanese summary by Kawakami 1978, p. 165. [Jap]*
• ***Summary:*** This manual, by an unknown author, describes how to make various foods, rather than how to prepare recipes. It discusses shoyu, barley hishio, Kinzanji miso, kiku hishio (it is not known what "kiku" means), hishio, natto, toko miso, uzu-miso, and amazake.

199. Kastens, Herman Christiaan. 1767. Diary. In: Leonard Blussé, Cynthia Viallé, et al, eds. 2004. The Deshima Diaries Marginalia, 1740-1800. Tokyo: Japan-Netherlands Institute. xl + 898 p. See p. 311-12 (#73, 77).
• ***Summary:*** In the section titled "Diary kept by Deputy Christ during the absence of Kastens," at 1767 April 9–"A small *wangkang* without its top mast, which had stranded off the island of Koshiki on 25 January, arrived in the roadstead. It had departed from the Chinese harbor of Zoesio on November 17 last year. It was destined for Lionton. Its cargo consisted merely of 56,200 *ganting miso* beans [soybeans used to make miso] and 9,000 catties of oil."

Note: A *ganting / gantung* is a measure of weight. It is not clear what kind of oil this is.

1767 May 6–"Today the *wangkang* which arrived here on 9 April got a top mast. It sold part of its cargo of *miso* beans to cover its expenses." Address: Opperhoofd (Chief of the Dutch factory), Deshima, Nagasaki, Japan.

200. Stork, William. 1769. A description of East-Florida, with a journal, kept by John Bartram of Philadelphia, botanist to His Majesty for the Floridas; upon a journey from St. Augustine up the River St. John's, as far as the lakes. With explanatory botanical notes... The third edition, much enlarged and improved. London: Sold by W. Nicoll; and T. Jeffries. [4], viii, 40, [2], xii, 35, [1] p. Illust. maps. 30 cm. [2 ref]
• ***Summary:*** This book is divided into two parts, each of which is paginated separately. At the beginning of the 2nd part is "The introduction to the journal" of John Bartram. When talking about the importance of new plants and naturalists to the American colonies he states (p. ii): "I cannot touch upon this subject without mentioning Mr. John Ellis, Fellow of the Royal Society, and agent for West-Florida... It is to this very ingenious gentleman that I am indebted for the following catalogue of plants that may be useful in America, in which, to avoid confusion in the botanical names, Mr. Ellis hath given both the generical and the specifick or trivial names of the plants, with the page referred to in the celebrated Dr. Linnaeus's 2nd edition of his Species of Plants..."

There follows (p. iii on) a 4-column table in which numerous plants are listed under the following column headings: (1) The "Latin names"–genus and species. (2) "2d Ed. Lin. Sp."–The page on which this plant is mentioned in the 2nd ed. of Linnaeus' *Species Plantarum.* (3). English names. (4) Observations.

On p. v we read: "Dolichos soja Linn. Lin. Sp. 1023. A kind of kidbean called Daidsu. Used for making Soye* or Indian Ketchup. See Kaempfer, Amoenitatis, 837.

"* The method of preparing East-India Soye or India Ketchup. Take a certain measure, for instance a gallon, of that sort of kidney-beans, called Daidsu by the Japonese, and Caravances by the Europeans; let them be boiled till they are soft; also a gallon of bruised wheat or barley, (but wheat makes the blackest Soye) and a gallon of common salt. Let the boiled caravances be mixed with the bruised wheat, and be kept covered close a day and a night in a warm place, that it may ferment. Then put the mixture of the caravances and wheat, together with the gallon of salt, into an earthen vessel, with two gallons and a half of common water, and cover it up very close. The next day stir it about well with a battering machine or mill (Rutabulum) for several days, twice or thrice a day, in order to blend it more thoroughly together. This work must be continued for two or three months, then strain off and press out the liquor, and keep it for use in wooden vessels; the older it is the clearer it will be, and of so much more value. After it is pressed out, you may pour on the remaining mass more water, then stir it about violently, and in some days after you may press out more Soye."

Note 1. This is the earliest American document seen (Dec. 2005) that uses the term "Dolichos soja" or the word "Daidsu" or "kidbean" to refer to the soybean.

Note 2. This is the earliest English-language document seen (April 2012) that uses the word "Soye" to refer to soy sauce, or the term "East-India Soye" or the term "India Ketchup" to refer to soy sauce from the East Indies, probably the Dutch East Indies (today's Indonesia). The ideas that soy sauce is a type of ketchup, and that this soy sauce comes from the Indies (India) are extremely interesting in trying to understand the origin of the word "ketchup" (regardless of spelling) and the early relationship between soy [sauce] and ketchup.

Note 3. This is the earliest English-language document seen (April 2012) that uses the term "bruised wheat or barley" in connection with the process for making soy sauce. This term and this descriptive recipe would be repeated in more than 20 publications–even though the recipe will not work, since it contains no koji, and many must have wondered just how they are supposed to make "bruised wheat or barley."

Note 4. John Ellis (ca. 1705-1776), an Irish naturalist living in London, was active in studying the plants of the American colonies and in introducing new plants to them. He was also a commercial agent, representing a number of American colonies in London. In 1769 Ellis was the commercial agent for West Florida in London. Notice that his is a list of plants "that may be useful in America." He does

© Copyright Soyinfo Center 2014

not say they are already growing in America.

Note 5. Ellis does not mention koji (grains or beans covered with a white mycelium of *Aspergillus* mold), and does not understand its importance in making soy sauce. Kaempfer, from whom Ellis got his instructions for preparing soy sauce, did not mention koji either in connection with soy sauce. However Kaempfer did mention *koos* (by which he probably meant koji), in the previous paragraph of his 1712 classic, in which he described how to make miso.

Note 6. This is the earliest English-language document seen (March 2006) that uses the word "Caravances" (using this or any related spelling) to refer to soybeans.

Note 7. Also included in Ellis's catalog are: Safflower, *Sesamum Orientale* [sesame seeds], locust tree or St. John's Bread (*Ceratonia Siliqua*), true opium poppy, tallow tree of China, true rhubarb, sago palm-tree, true bamboo cane, East India mango-tree, paper mulberry tree, arnotto [anatto], etc.

Note 8. This is the earliest English-language document seen (Aug. 2007) that uses the word "Sesamum" or the term *Sesamum Orientale* to refer to sesame seeds, or that gives their scientific name; it says (p. iii): "Latin name: *Sesamum Orientale.* 2d Ed. L. Sp. [2nd edition of Linnaeus' *Species plantarum*]*:* p. 883. English names: Oyly grain. Observations: Propagated in the Levant [countries of the eastern Mediterranean] for oyl, which does not soon grow rancid by keeping."

Note 9. William Stork, a German botanist and member of the Royal Society (London), had this treatise published in London as a promotion of Florida as an attractive place for settlers by describing the climate, soil, flora, and fauna. He emphasized its agricultural potential for cultivating rice, cotton, silk, sugar, and other profitable crops. According to Prof. Ted Hymowitz (March 2006), Stork lived in St. Augustine, Florida, in 1765, and then went to England. Address: [England].

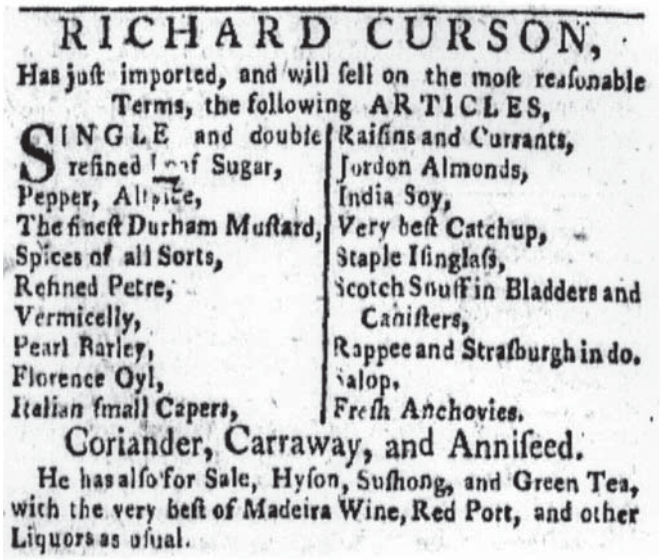
201. Curson (Richard). 1770. Classified ad: Has just imported and will sell on the most reasonable terms, the following articles,... *New-York Gazette; and the Weekly Mercury* (*New York City*)**.** Nov. 26. p. 3.

• ***Summary:*** "... Single and double refined Loaf Sugar, Pepper, Allspice, the finest Durham Mustard,... Vermicelly [Vermicelli], Pearl Barley, Florence Oyl, Italian small Capers, Raisins and Currants, Jordon [Jordan] Almonds, India Soy [sauce], very best Catchup, Staple Isinglass,..."

Note 1. This is the earliest document seen (May 2012) in which both soy sauce ("India Soy") and Catchup appear in the same shipment and ad in the British colonies of North America; they also appear one right after the other in the ad.

Note 2. This ad also appeared in the Dec. 3 (p. 4), Dec. 10 (p. 3), Dec. 17 (Supplement p. 1), and Jan. 7 (1771, Supplement p. 1) issues of this newspaper.

Note 3. "Florence Oyl" refers to olive oil.



RICHARD CURSON,
Has just imported, and will sell on the most reasonable Terms, the following ARTICLES,
SINGLE and double refined Loaf Sugar,
Pepper, Allspice,
The finest Durham Mustard,
Spices of all Sorts,
Refined Petre,
Vermicelly,
Pearl Barley,
Florence Oyl,
Italian small Capers,
Raisins and Currants,
Jordon Almonds,
India Soy,
Very best Catchup,
Staple Isinglass,
Scotch Snuff in Bladders and Canisters,
Rappee and Strasburgh in do.
Salop,
Fresh Anchovies.
Coriander, Carraway, and Anniseed.
He has also for Sale, Hyson, Sushong, and Green Tea, with the very best of Madeira Wine, Red Port, and other Liquors as usual.

202. Ellis, John. 1770. Directions for bringing over seeds and plants, from the East-Indies and other distant countries, in a state of vegetation: Together with a catalog of such foreign plants as are worthy of being encouraged in our American colonies for the purposes of medicine, agriculture and commerce. London: Printed and sold by L. Davis. 41 p. 25 cm. [1 ref]

• ***Summary:*** In this, his first booklet, Ellis tells how to pack seeds to prevent them from spoiling on long sea voyages. He depended especially on packing the seeds in beeswax. One page (26) is a 4-column table in which numerous plants are listed under the following column headings: (1) The "Latin names"–genus and species. (2) "2d Ed. Lin. Sp."–The page on which this plant is mentioned in the 2nd ed. of Linnaeus' *Species Plantarum.* (3). English names. (4) Observations.

The last entry is: "Dolichos soja Linn. Lin. Sp. 1023. A kind of kidney-bean called Daidsu. Used for making Soye* or India Ketchup. See Kæmp. Amoenitat. [Kaempfer Amoenitatis], 837.

"* The method of preparing East-India Soye or India Ketchup.

Take a certain measure, for instance a gallon, of that sort of kidney-beans, called Daidsu by the Japonese, and Caravances by the Europeans; let them be boiled till they are soft; also a gallon of bruised wheat or barley, (but wheat makes the blackest Soye) and a gallon of common salt. Let the boiled caravances be mixed with the bruised wheat, and be kept covered close a day and a night in a warm place, that it may ferment. Then put the mixture of the caravances and wheat, together with the gallon of salt, into an earthen vessel, with two gallons and a half of common water, and cover it up very close. The next day stir it about well with a battering machine or mill (Rutabulum) for several days, twice or thrice a day, in order to blend it more thoroughly together. This work must be continued for two or three months, then strain off and press out the liquor, and keep it for use in wooden

© Copyright Soyinfo Center 2014

vessels; the older it is the clearer it will be, and of so much more value. After it is pressed out, you may pour on the remaining mass more water, then stir it about violently, and in some days after you may press out more Soye."

Note 1. This information by Ellis, in a different context but in identical form and with only a few words changed, first appeared in Stork 1769.

Note 2. John Ellis (ca. 1705-1776), an Irish naturalist living in London, who was active in studying the plants of the American colonies and in introducing new plants to them. He was also a commercial agent, representing a number of American colonies in London.

203. Ellis, John. 1771. A catalogue of such foreign plants as are worthy of being encouraged in our American colonies for the purposes of medicine, agriculture and commerce. Philadelphia, Pennsylvania. From a pamphlet by John Ellis, F.R.S. Presented by the Honorable Thomas Penn, Esq. to the American Philosophical Society thro' the hands of Samuel Powell, Esq. See p. 255-66. 25 cm. *

• ***Summary:*** Note 1. This pamphlet is mentioned in the minutes of the "Early proceedings of the American Philosophical Society for the Promotion of Useful Knowledge" on 1770 Oct. 19. However Ellis is not mentioned as its author (Lesley 1884, p. 58). It was then published in the Transactions of the American Philosophical Society, held at Philadelphia, for Promoting Useful Knowledge, 1771 (or 1772), i, 255-66 (See p. 259, Dolichos soja Linn.).

Note 2. John Ellis (ca. 1705-1776), an Irish naturalist living in London, was active in studying the plants of the American colonies and in introducing new plants to them. He was also a commercial agent, representing a number of American colonies in London. He may have published this pamphlet in England.

204. Eckeberg, Charles Gustavus [Ekeberg, Karl Gustaf]. 1771. A short account of the Chinese husbandry. In: Peter [Per] Osbeck. 1771. A Voyage to China and the East Indies... Translated from the German by John Reinhold Forster. Vol. 2. London: Printed for Benjamin White. 367 p. See p. 267-317. [Eng]

• ***Summary:*** For details, see Osbeck 1771. Address: Captain of a ship in the Swedish East India Company's service.

205. Osbeck, Per. 1771. A voyage to China and the East Indies, by Peter Osbeck ... Together with a voyage to Suratte, by Olof Toreen ... and an account of the Chinese husbandry, by Captain Charles Gustavus Eckeberg. Translated from the German by John Reinhold Forster. Vol. 1. London: Benjamin White. See vol. 1, p. 73, 77, 218, 253, 304-05. Original edition published in 1757 in Swedish. [Eng]

• ***Summary:*** Note 1. All of the following passages were written in 1751.

In Canton, China: "Fish cut to pieces were carried about for sale on little tables, which hung on poles as described above: the same was done with bacon, and *Fdaufu* [tofu], a dish which is like our sweet cheese, but which was prepared of *Chinese* beans (*Dolichos Chinensis*)*"* (p. 218).

China: "Soya, or the *Tyong-yao* [*jiangyou*] of the *Chinese,* (*Dolichos Soja* Linn.) the *Japan Soya* is better and dearer than the *Chinese.* For its preparation see *Kæmph.* Amoen. p. 839. and likewise *Soja Dolichos, Flor. Zeylan.* 354. It was sold the katty for three kanderins" (p. 253).

Note 2. This is the earliest English-language document seen (Feb. 2007) that uses the word "Soya" in connection with the soybean or with soy sauce.

Note 3. This is the earliest English-language document seen (April 2012) that uses the word "Japan Soya" to refer to soy sauce, probably made in Japan. As of Feb. 2012, the term "Japan Soya" (referring to soy sauce) appears in this database three times from 1771 to 1907.

"Fdau-fu, or *Tou-fu* [tofu], which has been mentioned on page 218, was sold by pieces in several places. The *Chinese* shewed me a sort of small pease, which they call *U-ang-teo* [huangdou = "yellow bean"], and of which cheese [tofu] is said to be made, though the name gives reason to conjecture that it has been made from *Tao,* which are the *Chinese* beans, or *Callvanses."* (p. 305).

Note 4. This is the earliest English-language document seen (April 2013) that uses the word "Fdaufu" (or "fdou-fu"), or the term *Tou-fu* to refer to tofu.

Non-soy: "Spain, March the 6th, 1751. On my arrival at Cadiz [a seaport and province in southwest Spain], I saw the *Hedysarum coronarium,* or French honey suckle, in plenty. The Spaniards call it *Soya,* and the French *Saint Foin* (Note: What we call St. Foin in England is *Hedysarum Onobrychis;* the *Hedysarun Coronarium* is planted for ornament in our gardens); it was brought to town in great bundles as food for the cattle (p. 77).

Note 5. This plant called Soya in Spain is probably not the soybean.

"Callvanses (*Dolichos Sinensis*) (Footnote: *caule erecto ramosissimo, pendunculis erectis multifloris, leguminibus pendulis; Chinensibus Tao*)**.** They are planted on dry hills, and treated like dwarf kidney beans. They do not grow high, and therefore do not much want to be supported; this however is done in some places, and especially where they stand in the open fields... These beans are of the smallest kind, and are quite white except the germen [hilum], which is black, but white in the middle. The *Europeans* buy them in great quantities, and make use of them in their return from China instead of pease. They have thin husks and are very palatable. A katty, which answers to a pound we use for grocery, was sold for two kandarin, or about three stivers" (p. 304). [Note 6. According to *Index Kewensis* and *Hortus III, Dolichos sinensis* (later named *Vigna sinensis* and now named *Vigna unguiculata subsp. sesquipedalis*) is the yard-

© Copyright Soyinfo Center 2014

long bean or asparagus bean, a subspecies of the cowpea.]

"Lack-Tao [Luk Taw or mung bean] (Footnote: *Phaseolus Max, Mungo Persarum*) is the *Chinese* name of another sort of beans, or pease, which are much less than our wild vetches. The plant itself grows like the former... With these pease they feed the parrots. Among the many seeds which I brought to *Sweden,* was a kind of small green pease, which was so nicely eat up by the worms at my arrival, that nothing but the husks were left, which served as a nidus [nest or breeding place] to the little beetles, with which they were almost filled" (p. 304-05).

The author: Peter Osbeck, a Swede, lived 1723-1805. He was a pupil of the great Linnaeus and he generally used botanical terms used by Linnaeus. In 1750 he set out on a journey to China as chaplain to a Swedish East Indiaman, *The Prince Charles,* which visited Java and southern China, and returned to Gothenburg, Sweden, on 26 June 1752. Osbeck was a zealous naturalist and brought home a rich collection of natural objects, chiefly Chinese specimens, for during his long stay at Whampoa and Canton he had ample opportunity to collect. All of his collections he placed in the hands of Linnaeus, who described the plants in his *Species Plantarum,* published a year after Osbeck's return. Osbeck's original account of his voyage appeared in 1757 in his native language, Swedish, titled *Dagbok öfver en ostindisk resa.*

The book: Linnaeus is indebted to this book for the greater part of the Chinese plants and animals he described. All of the 244 Chinese specimens collected by Osbeck belong to the neighborhood of Canton. Most of the plants Linnaeus knew from China were those collected by Osbeck, but Linnaeus seems to have been under the mistaken impression that Osbeck's plants came from India, a place that Osbeck never visited. Strangely, most of the systematic botanists who compiled general systematic works on botany after Linnaeus (Lamarck, Willdenow, Sprengel, de Candolle, Kunth, etc.) incorrectly referred to Linnaeus rather than to his source, Osbeck (Bretschneider 1880, p. 88-91).

Bretschneider (1880, p. 116) notes: "The third account of Swedish naturalists in China translated by John Reinhold Forster, is a treatise on *Chinese Husbandry* by Charles Gust. Eckeberg. Eckeberg was Captain of a Ship in the Swedish E.I. [East India] Company's service. We know from Sparrmann's brief account of his voyage to China that Eckeberg was captain of the Navarcha and that his ship arrived in Canton Aug. 24 in 1766. It was at this place that Eckeberg made his observations on Chinese husbandry, on which subject he subsequently published a very interesting account, of which I shall give an abstract. It seems that Eckeberg had previously visited Canton, about 1762."

Note 7. This is the earliest English-language document seen (Oct. 2010) that uses the word "husbandry" in connection with animals. Address: A Swede and pupil of Linnaeus, he traveled in China, arriving in 1751.

206. Shinsen ryôri kondate bunruishû [Newly selected and collected cooking menus, divided by category]. 1772-1780. Japan. [Jap]*
• ***Summary:*** The ninth earliest known reference to Kori-dofu (dried-frozen tofu) appeared in this work.

207. Inaho. 1772. Gakutaiko Japan. [Jap]*
• ***Summary:*** According to the *Nihon Kokugo Daijiten* [Japanese Language Dictionary], this is the earliest known Japanese document that contains the word *okara,* referring to the dietary fiber remaining after making tofu or soymilk.

Thanks to Toshie Marra of the University of California, Librarian for the Japanese Collection, C.V. Starr East Asian Library.

208. **Product Name:** [Kihaku Shoyu].
Foreign Name: Kihaku Shôyu.
Manufacturer's Name: Mogi Shichirouemon.
Manufacturer's Address: Noda, Japan.
Date of Introduction: 1772.
New Product–Documentation: Noda Shoyu K.K. (Morio ICHIYAMA, ed). 1940. Noda Shoyu K.K. Nijunen-shi [Twenty-year history of Noda Shoyu, Inc.]. p. 467. The Kihaku brand of shoyu (of which the logo is shown) was introduced in Anei 1 (1772).

Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. p. 18. "By 1768 the first of this series of marriage-business alliances, that of Takanashi Hyôzaemon's son to Mogi Shichizaemon's daughter, was recognized as a separate household in the Mogi line. By 1772 Mogi Shichirôuemon, head of the newly formed Kashiwa household, had accumulated enough know-how, experience, and capital to disassociate himself formally from his paternal household and establish himself as an independent householder and shoyu brewer. By 1781, therefore, when a shoyu manufacturing guild was established in Noda, two of the original seven members were Mogis (Shichizaemon and Shichirôuemon); by 1782, one year later, Mogi Saheiji, head of the oldest branch of the Mogi line, had added shoyu fermentation to his already established ventures in grain sales and miso manufacture, making the Mogi's proportion of representation in the guild three out of seven. By 1822 two more Mogi families had been added, and a Mogi majority within the guild was secured." Page 73 notes that by 1909 the four major brands manufactured by the Noda shoyu cartel were Kikkoman, Kihaku, Kamigata (Joju), and Kushigata. Page 96-97 describes the struggle between the Kikkoman and Kihaku brands as the one to represent the new Noda Shoyu Co.

209. Ellis, John. 1772. A catalogue of such foreign plants as are worthy of being encouraged in our American colonies for the purposes of medicine, agriculture, and commerce. *Transactions of the American Philosophical Society* 1:255-

© Copyright Soyinfo Center 2014

66. See p. 259. (Held at Philadelphia, for Promoting Useful Knowledge). [1 ref]
• ***Summary:*** A facsimile copy of a catalogue by John Ellis is reproduced in the *Transactions of the American Philosophical Society, Held at Philadelphia for Promoting Useful Knowledge.* It begins: "From a pamphlet by John Ellis, F.R.S. [Fellow of the Royal Society]. Presented by the Honorable Thomas Penn, Esq; to the American Philosophical Society thro' the Hands of Samuel Powell, Esqr."

In the section title 'Foreign plants' (p. 327), numerous plants are listed in a 4-column table: The Latin name, the page on which it is mentioned in the 2nd ed. of Linnaeus' Species Plantarum, the English names, and observations.

"Dolichos soja Linn. Lin. Sp. 1023. A kind of kidbean called Daidsu. Used for making Soye* or Indian Ketchup. See Kaempfer, Amoenitat.

"* The method of preparing East-India Soye or India Ketchup. Take a certain measure, for instance a gallon, of that sort of kidney-beans, called Daidsu by the Japonese, and Caravances by the Europeans; let them be boiled till they are soft; also a gallon of bruised wheat or barley, (but wheat makes the blackest Soye) and a gallon of common salt. Let the boiled caravances be mixed with the bruised wheat, and be kept covered close a day and a night in a warm place, that it may ferment. Then put the mixture of the caravances and wheat, together with the gallon of salt, into an earthen vessel, with two gallons and a half of common water, and cover it up very close. The next day stir it about well with a battering machine or mill (*Rutabulum*) for several days, twice or thrice a day, in order to blend it more thoroughly together. This work must be continued for two or three months, then strain off and press out the liquor, and keep it for use in wooden vessels; the older it is the clearer it will be, and of so much more value. After it is pressed out, you may pour on the remaining mass more water, then stir it about violently, and in some days after you may press out more Soye."

Note 1. This is the earliest American document seen that uses the term "Dolichos soja" or the word "Daidsu" to refer to the soybean.

Note 2. John Ellis (ca. 1705-1776), an Irish naturalist living in London, was active in studying the plants of the American colonies and in introducing new plants to them. He was also a commercial agent, representing a number of American colonies in London. In 1770 Ellis was the commercial agent for West Florida in London.

Note 3. Ellis does not mention koji (grains or beans covered with a white mycelium of Aspergillus mold), and does not understand the importance of koji in making soy sauce.

Note 4. This document was first cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished.

Note 5. Also included in the catalog are: Safflower, *Sesamum Orientale* [sesame seeds], locust tree or St. John's Bread (*Ceratonia Siliqua*), true opium poppy, tallow tree of China, true rhubarb, sago palm-tree, true bamboo cane, East India mango-tree, paper mulberry tree, arnotto [anatto], etc.

Note 6. This is the earliest English-language document seen (July 2003) that refers to sesame seeds or gives their scientific name; it says (p. 256): "Latin name: *Sesamum Orientale.* 2d Ed. L. Sp. [2nd edition of Linnaeus' *Species plantarum*]*:* p. 883. English names: Oily grain. Observations: Propagated in the Levant [countries of the eastern Mediterranean] for oil, which does not soon grow rancid by keeping."

210. Agricola Sylvan. 1776. Article XIV. To make Soy or India Ketchup. *The Farmer's Magazine, and Useful Family Companion. Consisting of Practical Essays,... on the Different Branches of Husbandry,...* 1(7):268. Oct. London: Printed for R. Snagg,... [2 ref]
• ***Summary:*** "Boil a gallon of that sort of kidney-beans, called Daidsu by the Japonese, and Caravances by the Europeans, (the *Dolichos Soja* of Linnæus, Sp. Plant. 1023–Kæmp. Amoenit. 837) till they are soft; then take the caravances, and mix with them a gallon of bruised wheat, or barley, (but wheat makes the blackest Soy) and a little common salt, and let the whole be kept closely covered for a day and a night in a warm place to ferment; then put the mixture into an earthen vessel with ten quarts of water, and cover it up very close. The next day stir it about very well with a battering machine or mill, twice or thrice, in order to blend it more thoroughly together, and continue this for two or three months, when the liquor must be strained and pressed out, and kept in wooden or glass vessels for use; the older it is, the clearer it will be, and consequently of more value. After it is pressed out, more water may be added to the mass, and having stirred it about violently as before, for some days, more Soy may be pressed out."

Note: This is an annual periodical. "Agricola Sylvan" is a pseudonym. Address: Gentleman.

211. Long (Joshua). 1779. Classified ad: New Minorca honey, very fine and cheap;... *Morning Chronicle and London Advertiser* (*England*). April 13. p. [1], col. 3.7.
• ***Summary:*** Also "... real Russia Rein Deer [Reindeer] Tongues, very fine new Olives, genuine Japan Soy [sauce], Cheroquee Sauce [Cherokee Sauce], cold drawn Castor Oil, real French Mareschall Powder,...

Note 1. This is the earliest document seen (April 2012) that uses the term "genuine Japan soy" to refer to soy sauce.

Note 2. This is the earliest document seen (Oct. 2010) that uses the term "Cheroquee Sauce."

Note 3. Although we searched the Web and old French dictionaries, and consulted a French translator, we have been unable (May 2011) to determine the meaning of "real French Mareschall Powder." Address: Warehouse, No. 73, Cheapside, London.

212. Encyclopaedia Britannica; or, A dictionary of arts, sciences, &c. On a plan entirely new: by which, the different sciences and arts are digested in the form of distinct treatises or systems, comprehending the history, theory, and practice of each, according to the latest discoveries and improvements... 2nd ed.: Dolichos. 1779. Edinburgh: Printed for J. Balfour and Co. 10 volumes publ. 1778-1783. See vol. 4, p. 2511-12.

• ***Summary:*** "Dolichos... 2. The soja is a native of Japan, where it is termed *daidsu;* and, from its excellence, *mame;* that is, 'the legumen or pod,' by way of eminence. It grows with an erect, slender, and hairy stalk, to our height of about four feet. The leaves are like those of the garden kidney-bean (*See *Phaseolus*). The flowers are of a bluish white, and produced from the bosom of the leaves, and succeeded by bristly hanging pods resembling those of the yellow lupine, which commonly contains two, sometimes three, large white seeds. There is a variety of this kind with a small black fruit, which is used in medicine. Kempfer [Kaempfer] affirms that the seeds of this when pounded and taken inwardly, give relief in the asthma."

Note. This is the earliest English-language document seen (June 2013) which mentions whole soybeans, or which mentions black soybeans, or which states that black soybeans are used in medicine–apparently in Japan.

"This legumen is doubly useful in the Japanese kitchens. It serves for the preparation of a substance named *miso,* that is used as butter; and likewise a pickle celebrated among them under the name of *sooju* or *soy* [sauce]. To make the first, take a measure of mame, or the beans produced by the plant: after boiling them for a considerable time in water, and to a proper degree of softness, they beat or bray them into a softish pulse [pulp?]; incorporating with it, by means of repeated braying, a large quantity of common salt, four measures in summer, in winter three. The less salt that is added, the substance is more palatable; but what it gains in point of taste, is loses in durability. They then add to this mixture a certain preparation of rice, to which they give the name of *koos* [koji] and, having formed the whole into a compost, remove it into a wooden vessel which had lately contained their common ale or beverage named *sacki.* In about two months it is fit for use. The koos give it a grateful taste; and the preparing of it, like the polenta of the Germans, requires the skilful hand of an experienced master. For this reason there are certain people who make it their sole business to prepare the koos, and who sell it ready made for the purpose of making miso: a substance which cannot fail to be greatly valued in those countries, where butter from the milk of animals is unknown. To make sooju, or soy, they take equal quantities of the same beans boiled to a certain degree of softness; of muggi, that is corn, whether barley or wheat, roughly ground; and of common salt. Having properly mixed the beans with the pounded corn, they cover up the mixture, and keep it for a day and a night in a warm place, in order to ferment; then, putting the mass into a pot, they cover it with the salt, pouring over the whole two measures and a half of water. This compound substance they carefully stir at least once a-day, if twice or thrice the better, for two or three months: at the end of which time, they filtrate and express the mass, preserving the liquor in wooden vessels. The older it is, the better and the clearer; and if made of wheat instead of barley, greatly blacker. The first liquor being removed, they again pour water upon the remaining mass; which, after stirring for some days, as before, they express a second time, and thus obtain an inferior sort of soy."

Note 1. The descriptions of how to make miso and soy sauce are based on those of Englebert Kaempfer, published in 1712 in Latin in his book *Amoenitatum exoticarum...* and first written in Japan in 1690-92.

Note 2. This is the earliest English-language document seen (March 2009) that contains the word *miso.* While some miso (though usually described as a paste) has a consistency like butter, and a few types have a yellow color resembling that of butter, the Japanese have never used miso like butter. Rather they use it as a base for soups, sauces, and stews. The misunderstanding that miso "is used as butter" probably comes from the following statement by Englebert Kaempfer in his book *The history of Japan...* (1727). "Of the Meal of these Beans is made what they call *Midsu,* a mealy Pap, which they dress their Victuals withal, as we do with Butter." Concerning its etymology, the word "miso" seems to have come into English from the German *Midsu,* and into German from the Japanese *miso.*

Note 3. This is the earliest English-language document seen (April 2012) that uses the word "sooju" to refer to shoyu or soy sauce. Kaempfer used the same term (written *Sooju*) in 1712 in his book *Amoenitatum exoticarum...* which was written in Latin.

Note 4. This is also the earliest English-language document seen (Oct. 2006) that uses the term "the soja" as a singular noun to refer to the soybean.

Note 5 This is the earliest document seen (Dec. 2002) which states that soybeans can be used to give relief from asthma or other allergic conditions. Address: Edinburgh, Scotland.

213. **Product Name:** [Shoyu: Named Kikkoman Shoyu in 1784].
Foreign Name: Kikkôman Shôyu.
Manufacturer's Name: Mogi Saheiji.
Manufacturer's Address: Noda, Japan.
Date of Introduction: 1782.
New Product–Documentation: Noda Shoyu K.K. (Morio ICHIYAMA, ed). 1940. Noda Shoyu K.K. Nijunen-shi [Twenty-year history of Noda Shoyu, Inc.]. p. 466. The Kikkôman brand of shoyu (of which the logo is shown) was introduced in Tenmei/Temmei 2 (1784).

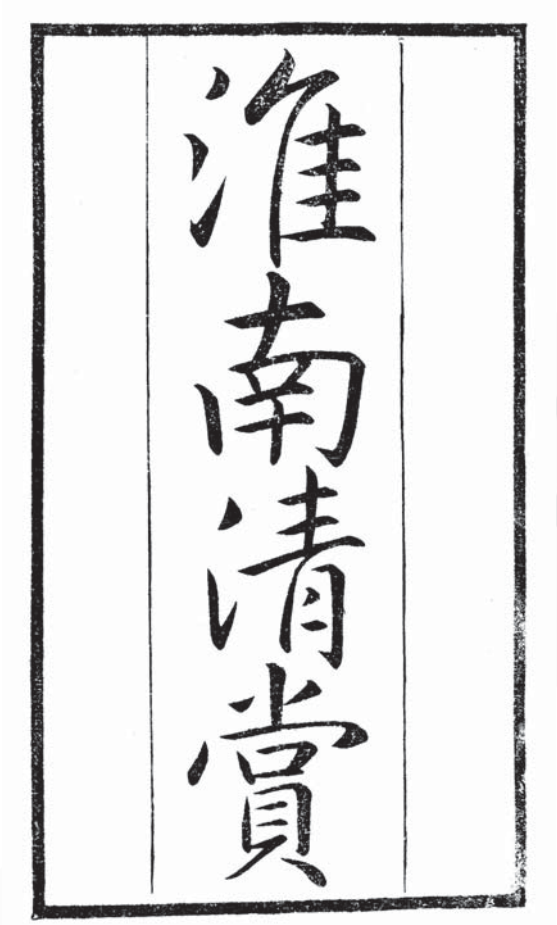
Fruin, W. Mark. 1983. Kikkoman: Company, Clan, and Community. p. 18. By 1782 "Mogi Saheiji, head of the oldest branch of the Mogi line, had added shoyu fermentation to his already established ventures in grain sales and miso manufacture, making the Mogi's proportion of representation in the [Noda shoyu manufacturing] guild three out of seven."

214. Ka, Hitsujun. 1782. Tôfu hyakuchin [One hundred rare and favorite tofu recipes]. Edo: Yamazaki Kinbe; Osaka: Fujiwara Zenshichiro (Kochiya Moheibei). 9 + 31 leaves. Illust. 21 cm. Photoreproduction of original edition. Edited by Abe Koryu, with rendering into modern Japanese. Tokyo: Shinshu Shorin. 280 p. Publ. 1971. Japanese summary by Kawakami 1978. [Jap]

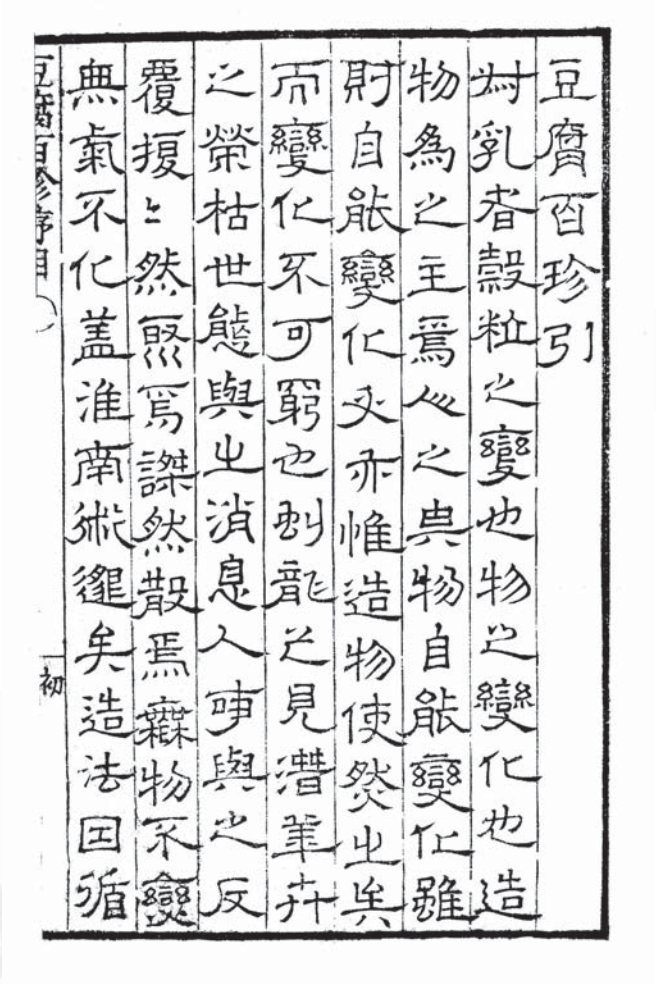


淮南清賞

•***Summary:*** Containing many beautiful illustrations (wood block prints), this is Japan's earliest and most famous book on tofu. Several pages look like this.

In Japanese, the first reads *Wainan seisho,* which might be translated: [Tofu is] The pure and excellent thing from Wainan [Huainan].

This is the earliest Japanese document seen (May 2002) with the word "tofu" in the title, or that contains illustrations of tofu; it mentions dried-frozen tofu as well. Because of



豆腐百珍引
物為之主焉其與物自能變化雖
財自能變化又亦惟造物使然也
而變化不可窮也則龍之見潛革
之榮枯世態與也消息入神與之
覆掩之然慇懃誘然散焉蘇物不變
無窮不化蓋淮南術邇矣造法因循

its immediate success, a second volume (*Tofu Hyakuchin Zokuhen*) was published the next year. Devoted solely to tofu cuisine and combining the virtues of a travel and restaurant guide with those of a cookbook, the two books introduced the Japanese people to about 230 varieties of (or general recipes for) tofu cuisine served in the different provinces. It is still widely quoted. Abe (1971, 1974) has published a modern facsimile edition, nicely illustrated.

Illustrations (black-and-white wood-block prints on unnumbered pages) show (see next pages)::

(1) A village (2-page spread) seen from a distance with people appearing very small. (2) Five Japanese ladies in kimonos cutting tofu, grilling it to make *dengaku* over a low charcoal stove, and serving it on plates.

Note: This is the world's first book written entirely about tofu, or about soybeans or soyfoods.

215. Bryant, Charles. 1783. Flora diætetica: Or history of esculent plants, both domestic and foreign. In which they are accurately described, and reduced to their Linnæan generic and specific names. With their English names annexed, and ranged under eleven general heads. London: B. White. 379 p. See p. 297, 300-01. [2 ref]

• ***Summary:*** In Chapter VII. Leguminous plants. Section I. Pods and seeds of herbaceous plants (p. 297), there is a listing for "3. Dolichos soja. East India Kidney Bean." Pages 300-01 contain full details: "Dolichos soja. Indian Kidney Bean. Lin. Sp. pl. 1023. This is a perennial and a native of India. It sends up an erect, slender, hairy stalk, to the height of about four feet, furnished with leaves much like those of the Common Kidney Bean, but more hairy underneath. The flowers are produced in erect racemi, at the bosoms of the leaves; they are of the pea-kind, of a bluish white color, and are succeeded by pendulous, hairy pods, resembling those of the Yellow Lupine, each containing three or four oval, white seeds, a little larger than peas.

"This plant is much cultivated in Japan, where it is called *Daidsu,* and where the pods supply their kitchens for various purposes; but the two principal are with a sort of butter, termed *Miso,* and a pickle, called *Sooju* or *Soy* [sauce].

"The Miso is made by boiling a certain quantity of the beans for a considerable time in water, till they become very soft, when they are repeatedly brayed with a large quantity of salt, till all is incorporated. To this mass they add a certain preparation of rice, named Koos [probably koji; Kaempfer introduced this term in 1712], and having well blended the whole together, it is put into a wooden vessel, where in about 2 months it becomes fit for use, and serves the purposes of butter. The manner of preparing the Koos is a kind of secret business, and is in the hands of some certain people only, who sell the Koos about the streets, to those who make Miso.

"In order to prepare Sooju they take equal quantities of beans, wheat, or barley-meal, and boil them to a pulp, with common salt. As soon as this mixture is properly incorporated, it is kept in a warm place for twenty-four hours to ferment; after which the mass is put into a pot, covered with salt, and a quantity of water poured over the whole. This is suffered to stand for two or three months, they never failing to stir it well at least once a day, if twice or thrice it will be the better; then the liquor is filtered from the mass, and preserved in wooden vessels, to be used as occasions require. This liquor is excellent for pickling anything in, and the older it is the better."

Note 1. Bryant's account is largely based on that of Engelbert Kaempfer in his book *Amoenitatum Exoticarum,* written in Japan in 1690-92, and published in 1712. Bryant's book has an excellent, extensive index. It is the earliest English-language document seen (May 2006) that contains a detailed botanical description of the soybean.

Note 2. This is the earliest document seen (Oct. 2010) concerning soybeans (but only wild perennial relatives of soybeans) in India; cultivated soybeans have not yet been reported.

Note 3. This is the earliest English-language document seen (April 2009) that uses the term "East India Kidney Bean" (singular or plural, regardless of capitalization or hyphenation) to refer to the soybean.

Note 4. This is the earliest English-language document seen (March 2009) that uses the term "a sort of butter" to refer to miso.

Also discusses: Several species of edible seaweeds [sea vegetables]: "13. *Fucus saccharinus–Sweet Fucus or Sea Belts. Lin. Sp. pl.* [*Species plantarum*] *1630. Fucus alatus sive phafnagoides. Bauh. Pin. 364* [*Caspar Bauhin. 1623. Pinax Theatri Botanici*].

"14. Fucus palmatus–Handed Fucus. Lin. Sp. pl. 1630.

"15. Fucus digitatus–Fingered Fucus. Hud. Flo. Ang. 579 [*William Hudson. 1762, 1798. Flora Anglica*]. *Fucus arboreus polyschides edulis. Bauh. Pin.*

"16. Fucus esculentus–Edible Fucus Hud. Flo. Ang. 578 (p. 90-91, 100-01).

"39. *Ulva lactuca* or Green laver. Lin. Sp. pl. 1632. *Muscus marinus lactucæ similis. Bauh. Pin. 364* (p. 117-18).

Amaranthus oleraceus or Esculent Amaranth from India (p. 119). *Arachis hypogæa* or American Ground Nut [Peanut] (p. 298-99). *Cicer arietinum* or Chich Pea [Chick Pea] (p. 299; it "grows naturally among the corn in Spain and Italy, and it is much cultivated in these places for the table... It is much cultivated in Barbary [the Mediterranean coast of north

© Copyright Soyinfo Center 2014

Africa], by the name of *Gravances,* and is counted one of their best sorts of pulse"). *Ervum lens* or Lentil (p. 301-02; it "is a common weed in the cornfields of France... *Lentils* are a strong, flatulent food, very hard of digestion, and therefore seldom used now but to boil in soups, in order to thicken them"). *Lotus tetragonolobus* or Square-podded Pea [Winged Bean]. Lotus ruber, siliqua angulosa Bauh. Pin. 332 (p. 302-03). *Lupinus albus* or White Lupine (p. 303-04). *Ceratonia siliqua* or Carob tree (St. John's bread, p. 309-10). Coffea Arabica or Arabian coffee (p. 311). Coffea occidentalis or American coffee (p. 311-12). *Coix lacryma Jobi* or Job's tears (p. 332). *Polygonum fagopyrum* or Buck Wheat (p. 343). Ginkgo or Maiden-hair tree (p. 377-78). Bread fruit tree (378-79). Some of these are described in detail in separate records.

Note 5. This is the earliest Western document seen (Jan. 2005) that discusses sea vegetables (p. 117-18).

Note 6. This is the earliest document seen (June 2006) that mentions *Coix lacryma Jobi* or Job's tears.

Note 7. This is the earliest English-language document seen (June 2008) that gives a scientific name for lentils (*Ervum lens*).

Note 8. This is the earliest English-language document seen (June 2008) that mentions the chick pea (which it calls "Chich Pea") or gives its scientific name (*Cicer arietinum*).

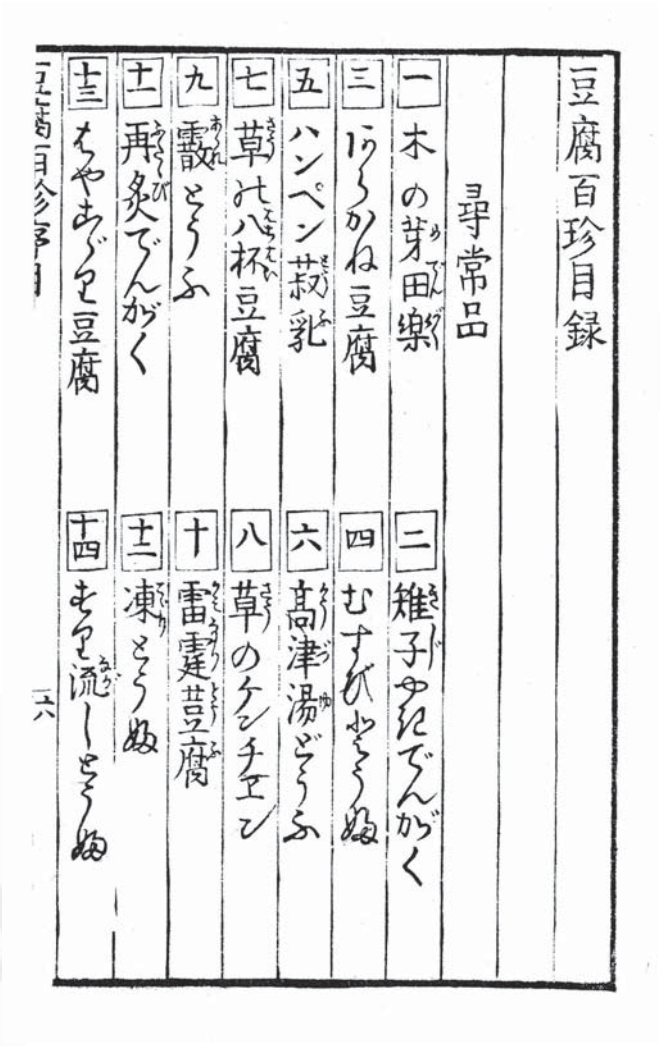
Note 9. This is the earliest English-language document seen (June 2012) that mentions koji, which it calls Koos.

Near the front of the book, a section titled "Terms explained" (xiii-xvi) is a glossary that gives concise definitions of the following botanical terms: Annual, biennial, perennial, sessile, serrated, crenated, pinnated or winged, peduncle, spike, spicula, panicle, spadix, racemus, umbel, calyx, catkin, petal, glume, arista or awn, floret, germen or seed bud, pericarpum, capsule, stamina, styles, stigma, summit. Address: Norwich, England.

216. Ka, Hitsujun. 1783. Tôfu hyakuchin zokuhen [One hundred rare and favorite tofu recipes: Sequel]. Osaka: Kochiya Moheibei. 280 p. (40 cho). Photoreproduction of original edition. Edited by Abe Koryu, with rendering into modern Japanese. Tokyo: Shinshu Shorin. 280 p. Publ. 1971. Japanese summary by Kawakami 1978. [Jap]

• ***Summary:*** The second volume of the popular *Tofu Hyakuchin,* which see.

Beautiful illustrations (black-and-white wood-block prints on unnumbered pages) show: (1) A lady in a kimono kneeling on her right knee in front of a low table on which are piled cakes of tofu. With a knife in her right hand, she is about to cut the tofu. (2) A restaurant in a temple with various people seated and walking. (3) A busy city street with people walking and eating in restaurants, whose fronts are open to the street, and whose names appear on a little cloth sign (*noren*) hanging from the eves. (4) "Dengaku Hoshi"–A Buddhist priest balancing on a single stilt called a "heron's



leg." (5) A hand holding a Japanese-style vegetable knife cutting a large block of tofu rested in an L-shaped wooden support; this helps in cutting the tofu into thin slices / sheets. (6) A specially-shaped long wooden box (*tsukidashi*) having about the same cross section as that of a block of tofu, with a handle on one end, a screen over the opposite exit end, and a wooden pusher, which is used to push a block of tofu into the box and through the screen, thereby creating tofu noodles, similar to those called *tokoroten* made from a block of gelled *tengusa / gelidium* seaweed.

Masaaki Yasuda states in "Fermented tofu, tofuyo" (2011, p. 302): "The earliest known reference to fermented tofu in Japan comes from Osaka. In 1883, Ka Hitsu Jun published the famous book, *Tofu Hyaku Chin Zokuhen* (The Sequel to One Hundred Favorite Tofu Recipes). In this book, 'red tofu' and the other fermented tofu, 'tofu-ji,' were introduced. According to the book, how to make the red tofu was a family secret, and few details on its production were provided. The other description was clearly of Chinese style red furu, because the materials not only included red koji from China, shiro zake (white sake, Chinese distilled liquor

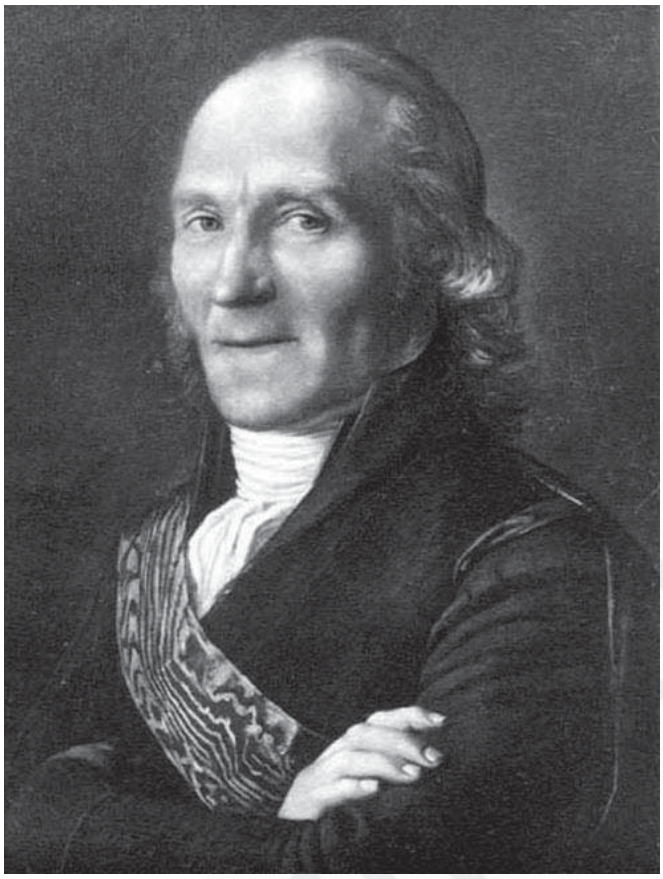
named 'Bai-Jiu'), *sansho* (Japanese spice, this spice seems to be used instead of chili), but also refer to it as tofu-ji and use the same method of preparation."

217. Thunberg, Karl Peter. 1784. Flora Iaponica, sistens plantas insularum Iaponicarum... [The flora of Japan, setting forth the plants of the Japanese islands]. Lipsiae (Leipzig), in bibliopolio I.G. Muelleriano. lii + 417 p. See p. 279, 282-83, 377-78. [Lat]



• ***Summary:*** In the chapter titled "Diadelphia. Decandria," within the genus Dolichos is listed D. Soja (p. 282). After a botanical description in Latin, the last paragraph reads: *"Soja Iaponensium, quae Kitjap chinesium praefertur e seminibus huius praeparatur, et plurima fercula atque embemmata tantum non omnia ingreditur, viceque Salis marini contusi fungitur."*

In the chapter on "Kaempfer's Illustrations" (*Kaempfervs Illvstratvs*) are listed (p. 377): *Coix lachryma* [Job's tears] (834). Soba (buckwheat noodles, 835). *Sesamum orientale* (sesame seeds, 835). On page 838: Atsuki (azuki, 837). Dolichos soja–Daidsu (837). Kudzu (840).

Karl Peter Thunberg lived 1743-1828.

Talk with Prof. Ted Hymowitz of the University of Illinois. 1995. March 24. The Japanese recently (and finally) published a Japanese-language edition of Thunberg. They found his illustrations in Russia in Maximowicz's collection.

An excellent old illustration of "Carolus Pet. Thunberg" is found on page 1 in the book *Miscellaneous Papers Regarding Japanese Plants* (1935; 562 p.). Address: Sweden.

218. Tôfu hyakuchin yôroku [One hundred and rare and favorite tofu recipes, additional record]. 1784. Nishimura Ichirouemon and Nakagawa Toshiro (Heian, Horikawa), Fujio Zenshichi (Osaka, Koribashi). 50 p. Japanese summary by Kawakami 1978, p. 117. [Jap]

• ***Summary:*** There was a book called Toka-shu ("Collection of Bean Flowers") that appeared from an unknown author during the Edo period (1600-1868). A bookstore owner in Osaka bought that book and showed it to Ka Hitsujun, the author of the *Tofu Hyakuchin.* They decided to publish the book under the name *Tofu Hyakuchin Yoroku.* They bought the wood blocks in 1784 but did not actually publish the book until 1788. The contents of the book is like the *Tofu Hyakuchin* except that it has recipes of the Edo-period style.

219. Long (Joshua). 1785. Classified ad: Just arrived, a Parcel of fine French Pomatums, hard and soft... *Times* (*London*). April 28. p. 1, col. 4. RiceVerm

• ***Summary:*** "... also West India Pickles of all Sorts; the same from the East Indies, as mangoes, Limes, Pickalilly, and Mountain cabbage; Lemon Pickle, Lime Juice, Lime Rob, &c... Vermicelli and Maccaroni [Macaroni], Lock Soy, &c. real Japan Soy [sauce], Kian Pepper [Cayenne Pepper], and real East India Currie Powder."

"N.B. An exceeding fine Parcel of real cold drawn Castor Oil."

Note 1. This is the earliest document seen (April 2012) that uses the term "real Japan Soy" to refer to soy sauce.

Note 2. This is the 2nd earliest document seen (April 2012) that uses the term "Lock Soy." Notice that in this list of items advertised, "Lock Soy" comes immediately after "Vermicelli and Macaroni." Most early publications that describe "Lock Soy," starting with *A Voyage to Cochinchina, in the Years 1792 and 1793,* by John Barrow (published 1806, p. 315) state that it is type of rice vermicelli; made in today's south central Vietnam (Cochinchina around Da Nang) and in China. In Cochinchina it is perfectly transparent, whereas "The Chinese Lock-soy is opaque." It (apparently) does not contain any ingredient made from the soybean.

Letter (e-mail) from Andrea Nguyen, Vietnamese-born food writer from Santa Cruz, California. 2010. May 4. Lock Soy could well be Soi Loc–a type of noodle made from tapioca in the area of Da Nang, Vietnam. Squiggly and chewy, it resembles worms. Soy is a misspelling of *soi,* which means "strands." Loc refers to "tapioca." If this explanation is correct, it used mostly with sweets and does not contain any soy ingredients.

As of May 2011, the term "Lock Soy" appears in this

© Copyright Soyinfo Center 2014

database 17 times from 1760 to 1911.

Note 2. This is also the earliest document seen (Aug. 2011) that uses the term "real Japan soy" to refer to soy sauce. As of Feb. 2007, the term "Japan Soy" (referring to soy sauce) appears in this database 42 times from 1785 to 1873.

Note 3. This is also the earliest document seen (Dec. 2005) in the *Times* (London) that uses the term "Soy" (with or without capitalization) to refer to soy sauce.

Pomatum is a synonym for "pomade," a perfumed ointment, especially a fragrant hair dressing. Address: No. 73, Cheapside, London.

220. Bryant, Charles. 1785. Carl Bryant's Verzeichniss der zur Nahrung dienenden so wohl einheimischen als auslandischen Pflanzen. 2 v. [Flora diaetetica: Or history of esculent plants, both domestic and foreign. 2 vols.]. Leipzig: Bey Weidemanns Erben und Reich. See Vol. I, Part I (Erster Theil), p. 478-80. 21 cm. [Ger]

• ***Summary:*** This is largely a German translation of Engelbert Kaempfer's book *Amoenitatum Exoticarum,* written in Japan in 1690-92, and published in 1712.

The section titled "Dolichos Soja. *Indian Kidney Bean. Linn.* Spec. plant. 1023.–Sojabohne" (p. 478-80) discusses the soybean (also called "Daidsu") and various soy products, including miso, koji (*Koos*), and soy sauce (*Der Sooju*).

Note 1. This is the earliest German-language document seen (March 2009) that mentions miso, which it calls "Miso." The actual text reads: "... *aber macht man Suppen und eine Art Butter daraus, welche Miso heisst,...*"

Note 2. This is the earliest German-language document seen (April 2012) that mentions soy sauce, which it calls "Sooju" or "Soy." The actual text reads: *"Dieser lezten Bereitung legt man den Namen Sooju oder Soy bei." "Der Sooju wird folgender Gestalt zubereitet;..."*

The chapter on legumes (p. 474-75) also discusses: (1) Arrachis Hypogaea. American ground nut. (2) Cicer arietinum. The chich pea, or Garavances. French: Pois Chiche. (3) Dolichos Soja. East Indian kidney beans. Sojabohne.

Note 3. The term "East Indian" probably refers to the Dutch East Indies–today's Indonesia.

(4) Ervum Lens. Lentil. (5) Lotus edulis. (6) Lotus tetragonolobus. Square podded crimson pea. Spargelerbsen. Viereckiger Schotenklee. (7) Lupinus albus. (8) Phaseolus vulgaris. Common kidney bean. French: Faseole. Haricot commun blanc. (9) Pisum sativum. (10) Pisum Americanum. (11) Pisum maritimum. 12. Vicia Faba. Common garden bean

Note 3. Charles Bryant died 1799. Address: Norwich.

221. Sake shoyu denjuki [Information about sake and shoyu]. 1785. Japan [Jap]*

• ***Summary:*** Yokotsuka (1985, p. 206), who cites this book as "*Sake shoyu denjuki* (1785)," states that it is about the development of and formulas for commercial shoyu during the Edo period. Address: Japan.

222. Shôyu denjuki [A record of initiation into shoyu]. 1785. Japan. [Jap]*

• ***Summary:*** Early book on shoyu production.

223. Powell (William). 1786. Classified ad: Assortment of groceries to be sold... *Connecticut Journal* (*New Haven*). June 14. p. 3.

• ***Summary:*** "At the store formerly occupied by Mr. Joseph Howell... Mersailles [Marseilles] and Florence sweet Oil. Japan Soy [sauce]. English Kitchup."

Note 1. This is the earliest document seen (March 2011) concerning soybean products (soy sauce) in Connecticut; soybeans as such have not yet been reported.

Note 2. This is the earliest document seen (June 2007) that contains the term "Florence sweet oil," suggesting that this sweet oil might be olive oil. Address: Head of the Long-Wharf.

224. Bankes, Thomas. 1788. A new and authentic system of universal geography, antient and modern: All the late important discoveries made by the English, and other... Vol. 1 of 2. London: Printed for C. Cooke. 623 p. See p. 122.

• ***Summary:*** In the chapter on Japan, Section IV states (p. 122): "Their articles of exportation are wrought silk and cotton, rice, soy, Japan ware, porcelain, gold, silver, copper,..."

Other titles: "New, Royal, and Authentic System of Universal Geography..." Address: Rev., Vicar of Dixton, Monmouthshire [Wales].

225. Burgess. 1789. Classified ad: For families going into the country. Delicacies for the table. *Times* (*London*). July 27. p. 1, col. 2.

• ***Summary:*** "To the Curious in Fish Sauce and Gravies. Burgess's new invented Sauce Picante, to eat with all kinds of cold meats, and directions given for using it. His Original and Superior Essence of Anchovies, so much approved of for Anchovy Sauce. Also the finest flavoured Gorgona Anchovies, for bread and butter, and for making Sandwiches, &c."

"Japan Soy [sauce], and Lemon Pickle. Fine Capoot Capers." Also many types of hams, tongues, pickles and vinegar.

This ad also appeared in the Aug. 3 issue (p. 1, col. 2). Address: No. 107, Corner of Savoy Steps [London].

226. *SoyaScan Notes.* 1789. Terms used in the *Times* (London) to refer to soy sauce (Overview). 23 Jan. 2007. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** In descending order of frequency, terms with

© Copyright Soyinfo Center 2014

two or more appearances are: Japan Soy–10. Lock Soy (probably a type of rice vermicelli, not soy sauce)–8. India Soy–5. China Lock Soy (probably vermicelli)–2. Lack Soy (probably rice vermicelli)–1. China Lack Soy (probably rice vermicelli)–1.

Note: The prevalence of the term "Japan Soy" indicates (1) That this type of soy sauce was probably most popular, and (2) That it was probably purchased from Dutch merchants; they were the only Europeans allowed to trade with Japan during the 1780s.

227. Ellis, John. 1789. A catalog of such foreign plants as are worthy of being encouraged in our American colonies for the purposes of medicine, agriculture and commerce. *Transactions of the American Philosophical Society* 1:325-36. See p. 327. (Held at Philadelphia, for Promoting Useful Knowledge. Second edition corrected). [1 ref]
• ***Summary:*** "From a pamphlet by John Ellis, F.R.S. [Fellow, Royal Society]. Presented by the Honorable Thomas Penn, Esq. to the American Philosophical Society through the hands of Samuel Powell, Esq."

"Dolichos soja Linn. Sp. 1023. A kind of kidbean called Daidsu. Used for making Soye* or Indian Ketchup. See Kaempfer, Amoenitat.

"* The method of preparing East-India Soye or India Ketchup. Take a certain measure, for instance a gallon, of that sort of kidney-beans, called Daidsu by the Japonese, and Caravances by the Europeans; let them be boiled till they are soft; also a gallon of bruised wheat or barley (but wheat makes the blackest Soye) and a gallon of common salt. Let the boiled caravances be mixed with the bruised wheat, and be kept covered close a day and a night in a warm place, that it may ferment. Then put the mixture of the caravances and wheat, together with the gallon of salt, into an earthen vessel, and with two gallons and a half with common water, and cover it up very close. The next day stir it about well with a battering machine or mill (*Rutabulum*) for several days, twice or thrice a day, in order to blend it more thoroughly together. This work must be continued for two or three months, then strain off and press out the liquor, and keep it for use in wooden vessels; the older it is the clearer it will be, and of so much more value. After it is pressed out, you may pour on the remaining mass more water, then stir it about violently, and in some days after you may press out more Soye."

Note: In 1770 Ellis was the commercial agent for West Florida in London. His first book, published in 1770, was titled *Directions for Bringing Over Seeds and Plants... with a Catalogue of Such Foreign Plants as are Worthy of Being Encouraged in Our American Colonies...* It told how to pack seeds (often in beeswax) to prevent them from spoiling on long sea voyages.

First cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished. \

228. **Product Name:** [Kimbue Soy Sauce].
Foreign Name: Kimbue Shôyu.
Manufacturer's Name: Fueki Shoyu Co. Ltd.
Manufacturer's Address: 660 Kamiigusa, Kawashima-cho, Hiki-gun, Saitama prefecture, Japan.
Date of Introduction: 1789.
New Product–Documentation: Product with Label (Soken Gentle Tamari) purchased at Open Sesame in Lafayette, California. 1991. Feb. 16. "Low Sodium Wheat Free Soy Sauce." Since 1789. Ingredients: Whole soybeans, well water, sea salt. "Soken Gentle Tamari... is brewed by the Kimbue Co., makers of fine soy sauce for over 200 years."

Note: Kimbue is not the name of a company, but rather of a brand of Japanese soy sauce. As of Dec. 1991, Kimbue is made by: Mr. Toyohiko Fueki, Fueki Shoyu Co. Ltd., 660 Kamiigusa, Kawashima-cho, Hiki-Gun, Saitama-ken, Japan. Phone: 0492-97-0041.

• ***Summary:*** In the section titled "The arrival of the *Zuiderberg,"* at 1790 Sept. 1–"The five men went aboard... I ordered *sake* and soy for the Company." Address: Opperhoofd (Chief of the Dutch factory), Deshima, Nagasaki, Japan.

232. Lamarck, Jean Baptiste... de. 1790. Dictionnaire encyclopédique méthodique. Botanique. Vol. 2. Dolic du Japon, Dolichos soja Lin. [Systematic and encyclopedic dictionary. Botany. Vol. 2. The Soybean, Dolichos soja]. Paris: Chez Laporte, Imprimeur-Libraire. 774 p. See p. 299. [1 ref. Fre]
• ***Summary:*** Plants are listed by French names. The author lists the soybean under Dolic. as follows: "28. Dolic du Japon, *Dolichos soja. Lin. Dolichos caule erecto flexuos, racemis axillaribus eredis, leguminibus pendulis hispidis subdispermis.* Lin. Thunb. Fl. Jap. 282.

"Phaseolus erectus, siliquis Lupini, fructu pisi majoris candido. Kæmpf. Amoen Exot. 837. t. 838. Japonicè; daidsu s. mame. Phaseolus Japonicus. Raj. Suppl. 438. nº. 28 [John Ray. 1704. *Historia plantarum. Vol. 3. Supplementum.* See p. 438].

The original French reads: "Sa tige est droite, haute d'un pied & demi, striée ou cannelée dans sa partie supérieure, & abondamment chargée de poils rousseâtres. Ses feuilles sont composées de trois folioles ovales, obtuses, velues, molles, soutenues sur des pétioles communs velus & striés. Les fleurs font petites, purpurines, disposées dans les aisselles des feuilles sur des grappes droites, velues, & fort courtes. Les gousses sont longues d'un pouce & demi, pendantes, un peu comprimées, pointues, dispermes, & couvertes de poils rousseâtres fort abondans. Cette plante croît au Japon, dans les Indes orientales, & est cultivée au Jardin du Roi. Les Japonois préparent avec ses semences une sorte de bouillie qui leur tient lieu de beurre, & dont ils font une sauce fameuse, qui se sert avec les viandes rôties; ils nomment la bouillie *miso,* & la sauce *sooja* ou *soja.*"

In English, this means: "Its stalk is straight, a foot and a half high, striped or fluted in its upper part and abundantly covered with reddish or russet hairs. Its leaves are comprised of 3 oval leaflets, obtuse (rounded at the free end), hairy, soft, several leaves are borne on petioles that are hairy and striped. The flowers are small, purplish, arranged on the axils of the leaves, in straight clusters which are hairy and very short. The pods are an inch and a half long, pendant, slightly compressed (not round), pointed, dispermes, and covered with very abundant reddish hairs. This plant grows in Japan and the East Indies, and is cultivated at the Royal Garden (*Jardin du Roi*)**.** It is an annual, and I have seen a living plant specimen. Using its seeds, the Japanese prepare a sort of paste [miso], which they use in place of butter, and that is also used to make a famous sauce, which is served with roasted meats. They call the paste *miso* and the sauce *sooja* or *soja.*

Note 1. This is the earliest (and only) French-language document seen (Jan. 2010) that uses the term *"Dolic du Japon"* (regardless of capitalization or hyphenation) to refer to the soybean.

Note 2. This is the earliest French-language document seen (April 2012) that uses the term *la sauce soja* to refer to soy sauce.

Note 3. Merrill stated incorrectly that Lamarck called the soybean "Phaseolus max" following Linnaeus. Address: Former officer in the Regiment de Beaujolais, Royal Academy of Sciences.

233. Loureiro, Joao de. 1790. Flora Cochinchinensis: sistens plantas in regno Cochinchina nascentes. Tomus II. [The flora of Cochin China, setting forth the plants in the kingdom of Cochin China. Vol. 2.]. Ulyssipone [Lisbon], Portugal. p. 433-884. See p. 441-42, 522-24. 27 cm. [Lat]
• ***Summary:*** In the section titled "Diadelphia. Decandria" (p. 441-42) we read: "Sp. 13. Dolichos Soja, Dau nanh. Hoam téu [huang-tou = yellow bean]. Writing in Latin, he gives a botanical description of the plant, describes its habitat as Cochin China and China, and cites as sources Thunberg, Kaempfer, and Rumphius. Then he adds: "Uses: These seeds, having been boiled or lightly toasted, are quite acceptable to both the stomach and the palate. From them is made the famous Japanese soy sauce called Soia, which the Chinese and Cochin Chinese frequently use for cooking food and stimulating the appetite. There is also produced a white food resembling coagulated milk (*lactis coagulati*) and called Teu hu or Tau hu [tofu] by the Chinese; it is the most widely used food among them. Although it is rather bland by itself, if the appropriate condiments are added, it becomes a food which is neither unpleasant nor unhealthy."

The author: Ioannis (Joao) de Loureiro was born in Portugal in 1715. Somewhere between 1735 and 1743 he arrived in Cochin China (today's Vietnam) as a Jesuit missionary. Living at Hué, the capital, near the sea coast, he tells us that he had no access to European medicines. So he was obliged to depend entirely on native medicinals, and by investigating them he was necessarily induced to study the local flora and to make botanical collections. Thus he developed a herbarium of nearly 1,000 species. In 1779 he went to Canton to do botanical research for 3 years, living within a factory. He left for Lisbon in 1782, and died in 1794 or 1796. He was one of the most prominent botanical collectors of the 1700s, giving rich descriptions of

© Copyright Soyinfo Center 2014

economical and medicinal uses.

The book: Volume 1 was first published in 1789; the set was reissued 3-4 years later edited by Willdenow, with added notes. It describes 1,257 plants (Bretschneider 1880, p. 129-46).

Note 1. This is the 2nd earliest document seen (May 2010) concerning soybeans in Vietnam, or the cultivation of soybeans in Vietnam. This document contains the 2nd earliest date seen for soybeans in Vietnam, or the cultivation of soybeans in Vietnam (1790). The source of these soybeans is unknown.

Note 2. This is the earliest Latin-language document seen (April 2013) that uses the word "Teu hu" or the word "Tau hu" to refer to tofu.

Also discusses: *Dolichos tetragonolobus* (p. 437. Winged bean? Habitat: Cochin China and China). The genus *Arachis* (p. 522-24), with two species: *Arachis asiatica* and *Arachis africana.* He notes (p. 524) that Linnaeus calls the latter *Arachis hypogoea* [peanut]. Address: Portugal.

234. Miller, Philip; Chazelles, Laurent Marie. 1790. Dictionnaire des jardiniers,... Supplement: Dolichos soja [The gardener's dictionary,... Supplement]. Paris: Chez Guillot, Libraire de Monsieur. See Vol. 1, p. 415. [Fre]
• ***Summary:*** Entries for the 27 species in the genus *Dolichos* begin on p. 410. On p. 415 we read: "24. *Dolichos soja. Linn. sp. 28. Thumb. flor. Jap. p. 282."* Dolic from Japan (*Dolic de Japon*). The stem of this annual plant is flexuous, erect, much bristled and a foot tall; its leaves are ternate, hairy and pedunculated. Its flowers are purple, laid in axillary clusters: the corolla is barely larger than the calyx: the pods are pendulous, bristling, and hold two white seeds, with the appearance of two large peas, with which the Japanese make a sauce, which they call Soy (*Soja*), to season their culinary preparations.

The French text states: *"Dolic du Japon. La tige de cette plante annuelle est flexueuse, érigée, très-hérissée et longue d'un pied. Ses feuilles sont ternées, elues et pédonculées. Ses fleurs sont propres et en grappes axillaires... les gousses sont pendantes, hérissées, et renferment deux semences blanches, comme de gros pois, dont les Japonois font une sauce pour assaisonner leurs mets, et qu'ils nomment Soja."*

235. Ryôrisho. Fu to tôfu [Cookbook on wheat gluten and tofu]. 1790. Japan. 38 p. Unpublished manuscript. Japanese summary by Kawakami 1978, p. 175. [Jap]
• ***Summary:*** This must be the last volume of a three volume work. This one is about Zen vegetarian cookery (*shojin ryori*). The other two were about fish and poultry. There are a lot of tofu recipes, including Suizenji Tofu, Enmeiji Tofu, Uneri Tofu, and Shiruko Tofu. A description of how to make sweet simmered miso (*neri-miso*) is also given.

236. Burgess (J.). 1792. Classified ad: Genuine rich sauce, for fish, made dishes, hashes, beef-steaks, &c. &c. *Observer* (*London*). Feb. 5. p. 1.
• ***Summary:*** "Bengal Currie Powder, with a receipt for using it. Zoobditty Mutch. Walnut Ketchup. Oyster Ketchup. Mushroom Ketchup. Lemon pickle. Fine Japan soy [sauce]. Quin's Sauce..." Address: No. 107, Corner of Savoy-steps, Strand, London.

237. Hemmij, Gijsbert. 1793. Diary. In: Leonard Blussé, Cynthia Viallé, et al, eds. 2004. The Deshima Diaries Marginalia, 1740-1800. Tokyo: Japan-Netherlands Institute. xl + 898 p. See p. 667 (#30).
• ***Summary:*** 1793 April 3–"On behalf of the first retainer of the Lord of Tsushima, Sukezaemon presented me with some dried fish and a barrel of soy [sauce]. I dutifully reciprocated." Address: Opperhoofd (Chief of the Dutch factory), Deshima, Nagasaki, Japan.

238. Loureiro, Joao de. 1793. Flora Cochinchinensis: sistens Plantas in regno Cochinchina nascentes. Vol. 2. Dolichos soja [The flora of Cochin China. Vol. 2.]. Denuo in Germania edita cum notis Caroli Ludovici Willdenow; Bernolini [Berlin], impensis. See p. 537-38. Edited by Willdenow, with added notes. Also published by the Acad. Sci. of Lisbon. [Lat]
• ***Summary:*** The first edition of this important work was published in 1790. The content of this 1793 edition concerning *Dolichos soja,* published in Berlin and edited by Willdenow, is almost identical to that of the 1790 edition. The text has been re-set to fit on the smaller pages, and some abbreviations have been written out. In the chapter titled "Diadelphia. Decandria" we find: Arachis (p. 430-31; incl. Arachis Asiatica and Arachis Africana, also called Arachis Hypogoea). Phaseolus radiatus (p. 435). Dolichos Soja (p. 537-38).

By unusual coincidence, the earliest known recorded feeding of cow's milk to a human infant (by Underwood) also occurred in 1793. Address: Portugal.

239. *Monthly Review* (*The*). *Series 2.* 1794. Thunberg's travels. 13:121-32. Feb. See p. 127. [Eng]
• ***Summary:*** "'The Dutch and the Chinese are the only nations that are suffered to trade to Japan. The Dutch now send hither annually two ships only, which are fitted out at Batavia in the month of June, and return at the latter end of the year. The principal articles carried from hence are Japan copper, raw camphor, and lacquered woodwork; porcelain, silks, rice, Sakki, and soy [sauce], make a very inconsiderable part of the private trade.'"

240. Moench, Konrad. 1794. Methodus plantas horti botanici et agri Marburgensis, a staminum situ describendi [A method of describing plants in the botanical gardens and fields of Marburg (Germany), according to the position of the

© Copyright Soyinfo Center 2014

stamens]. Marburg, Germany: Marburgi Cattorum. 780 p. See p. 153. [2 ref. Lat]

• ***Summary:*** The plant which Linnaeus had named *Dolichos Soia,* was here rechristened by Mönch (Moench), a German botanist from Marburg, as *Soia hispida.* Moench coined the genus name Soia, a term which had been used previously, but not as a genus name, by Ray (1704), Dale (1705), Tournefort (1730), and Loureiro (1790, 1793). Tournefort had named the soybean *Phaseolus Japonicus.*

After a 6-line description of the genus in Latin, he describes its only species as follows: *"hispida,* leguminibus pendulis hispidis: caule erecto subflexuoso: racemis axiliaribus: corolla vix calyci maiore. *Dolichos Soia. Linn. Kaempfer Amoen. exoticae. p. 837. icon. p. 838.*

"Defectus cali prohibet genera Dolichos Linnaei adsociari, neque cum Phaseolis propter figuram corollae convenit.

"h. H. Annua."

Note 1. This is the earliest document seen (April 2008) concerning soybeans in Germany, or the cultivation of soybeans in Germany. This document contains the earliest date seen for soybeans in Germany, or the cultivation of soybeans in Germany (1794). The source of these soybeans is unknown, as is the date they first arrived in Marburg and were first planted there.

Note 2. The 1966 2-volume reprint of this book, published by Otto Koeltz Antiquariat, Koenigstein-Taunus, contains an English-language introduction and biography by William T. Stearn of London. It notes that the town of Marburg, Hessen, north-western Germany (located in West Germany after World War II, on the Lahn River about 46 miles north of Frankfurt am Main) became the seat of a new university in 1527–Europe's first Protestant university. Named the Academia Marpurgensis (now the Philipps-Universitaet zu Marburg), it was inspired by the Reformation and built with Imperial privilege, but without Papal sanction. "This rapidly became a major center of Protestant learning and controversy. Moreover, being the first university established after the Reformation which had no Papal Bull at its founding, it provided a precedent for the independent creation of other universities by Protestant rulers. Like most young universities, Marburg immediately set out to attract scholars of standing, notably from Erfurt, then the foremost German university. Among them was the poet and physician Erucius Cordus (1486-1535)..." He became the university's first professor of medicine and his teaching covered the study of medicinal herbs. His short book but influential, *Botanilogicon* (Cologne, 1534) concerned botanical nomenclature. "Cordus was particularly dismayed by the danger of wrong drugs being administered through errors in naming, of which he gave examples. In so doing, he indicated the plants which he himself grew" in his private garden at Marburg. The university did not acquire an official botanic garden until 1786.

Conrad Moench (1774-1805), originally a pharmacist, was a professor of botany and chemistry, and director of the botanic garden at Kassel. In 1785, he was transferred to Marburg, where he helped to develop the new botanic garden. In 1794, when Moench published his book *Methodus Plantas Horti...* the garden, according to Wenderoth, contained 1,674 phanerogams (seed plants or flowering plants; spermatophytes). By 1802, when Moench published his *Supplementum,* a further 634 had been added. The aim of these publications was two-fold. First, to provide an enumeration of the cultivated and wild plants of the Marburg district, making their taxonomy accord with the modifications of Linnaean genera proposed by Joseph Gaertner (1732-1791), Friedrich Casimir Medicus (1736-1808), Antoine Laurent de Jussieu (1748-1838), and Moench himself. And second, to elaborate the general system of classification proposed by Johann Gottlieb Gleditsch (1714-1786) in his *Systema Plantarum a Staminum Situ* (1764). "Their spirit was anti-Linnaean. Not only did they reject Linnaeus's system of classification and his generic concepts whenever possible, they likewise rejected his generic names in favor of those used earlier by Tournefort and others... The numerous living plants available at Marburg were mostly European, but included a number from North America and South Africa." Moench's two books from Marburg are "of interest as a record of the plants available at the end of the eighteenth century in a well-stocked German botanic garden and thus provide historical evidence for the introduction and spread of plants in cultivation."

The International Code of Botanical Nomenclature takes Linnaeus's *Species Plantarum* of 1753, together with his *Genera Plantarum* of 1754 as the starting point of modern botanical nomenclature. After 1753 there was great debate among biologists and botanists over the new sexual and binomial system of nomenclature proposed by Linnaeus. Many considered Tournefort's genera better founded. Linnaeus's most bitter and sarcastic critic was the Mannheim botanist Medicus, who supported Tournefort. Conrad Moench also rebelled against the widely used concepts and names of Linnaeus in the same way that Linnaeus had earlier been a rebel against Tournefort's system.

Talk with Ted Hymowitz, and summary of *Oxford English Dictionary.* 1990. Oct. 1. Concerning the terms "Soia" and "Soja," and the letters "I" and "J." The letter "J" is a comparatively late modification of the letter "I." In the ancient Roman alphabet, "I" was used both as a vowel and a consonant. Thus, Iapon, Iapan, or iaponica refer to Japan, Iesus for Jesus, and Gaius Iulus Caesar. From the 11th to the 17th century, the letter "I" represented at once the vowel sound of "I" and a consonant sound far removed from the vowel. Starting in the late 1500s, the letter "J" was carved out of the "I" for use as the consonant (typically before a vowel), leaving "I" for use as the vowel. The differentiation was completed before 1640. Later taxonomists allowed "I,"

© Copyright Soyinfo Center 2014

when used as a consonant, to be considered a "J." They considered that in this case it was being used as a consonant. Thus, for example, Piper and Morse in *The Soybean* (1923, p. 32) write: "Moench (1794) rechristened the Linnaean plant *Soja hispida."* Address: Marburg, Germany.

241. Thunberg, Charles-Pierre. 1794. Voyage en Afrique et en Asie, principalment au Japon, pendant les années 1770-1779. Traduis de Suédois [Voyage to Africa and to Asia, especially to Japan, during the years 1770-1779. Translated from Swedish]. Paris: Chez Fuchs, Librarie. xii + 532 p. 20 cm. [Fre]

• ***Summary:*** Chapter 10, written by Thunberg in Sept. 1775, discusses Japan, Nagasaki (Nangasaki), and the Dutch trade to Batavia [today's Jakarta]. On page 298-99: The goods which they buy in Nagasaki consist mainly of rice, porcelains, umbrellas, silk kimonos, lacquer works, soy [sauce] (*soja ou souï*), copper, and large earthenware pots.

Soy [sauce], which is exported in little kegs, is a liquid or the quintessence of different aromatic ingredients which is good for stimulating the appetite, and is added in small quantities to sauces.

The last sentence in the original French: *"Le soja que l'on exporte en petits barils, est une liqueur ou quintessence de différens ingrédiens aromatiques propre à exciter l'appétit, en en ajoutant une petite quantité aux sauces."*

Note 1. This is the earliest French-language document seen (April 2012) that uses the word *souï* to refer to soy sauce.

Note 2. Carl Peter Thunberg lived 1743-1828. Address: Chevalier de l'Ordre de Wasa, Professeur de botanique à l'Université d'Upsal [Sweden].

242. *British Critic: A New Review.* 1795. Thunberg's Travels. Vol. IV. 6:473-81. Nov. See p. 478. [Eng]

• ***Summary:*** This magazine is publishing long excerpts from Thunberg's *Travels.* Before each is a short introduction (p. 478): "Though soy-sauce is very commonly used in this country, its composition is but little known. It is a considerable article of commerce in Japan, and we here find it thus described.

"'Soy-sauce, which is every where and every day used throughout the whole empire, I might almost say in every dish, and which begins even to be made use of in Europe, is prepared from Soy Beans (*Dolichos Soja*) and salt, mixed with barley or wheat..." p. 121 of Thunberg.

243. Shokumotsu waka honzô [The book of Japanese foods?]. 1795. Japan. [Jap]*

• ***Summary:*** Mentions natto miso soup (*nattô-jiru*).

Note: Recall that this *natto-jiru* may well be made with fermented black soybeans rather than itohiki natto.

244. Thunberg, Charles Peter. 1795. Travels in Europe, Africa, and Asia, made between the years 1770 and 1779. In four volumes. Vol. IV. Containing travels in the empire of Japan, and in the islands of Java and Ceylon, together with the voyage home. 3rd ed. London: Printed for F. and C. Rivington. xix + 310 p. See p. 37, 88, 107, 121-22, 177. Index. 21 cm. [Eng]

• ***Summary:*** In the chapter on Japanese foods, we read (p. 37): "Rice, which is here exceedingly white and well-tasted, supplies, with the Japanese, the place of bread; they eat it boiled with every kind of provisions. *Miso* soup, boiled with fish and onions, is eaten by the common people, frequently three times a day, or at each of their customary meals. *Misos* are not unlike lentils, and are small beans, gathered from the *Dolichos soja."* Note 1. The latter sentence, which is incorrect, led many subsequent early writers to believe that the seeds of the soy bean were called miso, or that miso was a type of small bean. Rather, miso is a paste made from soy beans.

In the chapter on Japanese agriculture, we read (p. 88): "Of Beans, Peas, and Lentils, many sorts are cultivated, both the larger (*Phaseoli*) and the smaller (*Dolichos*). Of *Daidsu* Beans (Dolichos *Soja*) the meal is used for dressing victuals, and the expressed juice for making Soy; as is likewise the whole Bean for the soup called *Miso,* which is a daily dish with the common people. *Atsuki* [Azuki] Beans likewise (*Phaseolus radiatus*) are ground to meal, of which small cakes are made with sugar."

Note 2. This is the 2nd earliest English-language document seen (Jan. 2005) that clearly mentions azuki beans, which it calls *Atsuki Beans.* It is also the earliest English-language document seen (March 2006) that uses the word *Atsuki* to refer to azuki beans.

Note 3. It is not clear what Thunberg means by "meal" when he says "the meal is used for dressing victuals."

In the chapter on Commerce, after discussing the tea trade, Thunberg writes (p. 107): "The *Tea Trade* is confined entirely to the inland consumption, the quantity exported amounting to little or nothing. The traffic in *Soy* [sauce], on the other hand is more considerable; and as the tea produced in this country is reckoned inferior to that of China, so the soy is much better than that which is brewed in China. For this reason, soy is not only exported to Batavia [today's Jakarta], in the wooden barrels in which it is made, but likewise sold from thence to Europe and to every part of the East Indies. In some places in Japan too the soy is reckoned still better than in others; but, in order to preserve the very best sort, and prevent its undergoing a fermentation, in consequence of the heat of the climate, and thus being totally spoiled, the Dutch at the Factory [at Desima / Dezima / Dejima] boil it up in iron kettles, and afterwards draw it off into bottles, which are then well corked and sealed [by applying bitumen / coal tar to the stopper]. This mode of treatment renders it stronger and preserves it better, and makes it serviceable for all kinds of sauce. The *Silk trade* is

© Copyright Soyinfo Center 2014

indeed in a very flourishing state in the empire..."

In the chapter titled "Residence at Dezima [1776], Previous to my Return Home," the author writes (p. 121-22): "Soy-sauce, which is every where and every day used throughout the whole empire, I might almost say in every dish, and which begins even to be made use of in Europe, is prepared from Soy Beans (*Dolichos Soja*) and salt, mixed with barley or wheat. For this purpose, they cultivate this species of bean in several places, although it grows in great plenty wild. Scarcely any kind of legumen [legume] is more copiously used than this. The seeds are served up in soups, once or twice a day all the year round, to people of distinction or otherwise, to the poor and to the rich. *Soy* is prepared in the following manner: The beans are boiled till they become rather soft; afterwards an equal quantity of pounded barley or wheat is added. These ingredients being mixed together, are set in a warm place, and covered up for four and twenty hours, that they may ferment. An equal quantity of salt is then added to the mixture, and twice and a half as much water is poured upon it. After it has been mixed in this manner in an earthen vessel, it must stand well covered two or three whole months together, during which period it is necessary however at first for it to be stirred about several times in the day for several days together. The liquor is then pressed and strained off, and kept in wooden vessels. Some provinces furnish better soy than others; but exclusively of this, it grows better and clearer through age. Its colour is invariably brown, and its chief excellence consists in the agreeable salt taste which it possesses."

While in Colombo, Ceylon, in 1777 the author stated that "the *Dolichos pruriens* grew here tolerably common, with its hairy pods, the hairs of which attaching themselves to the hands, occasion much itching, which is allayed by oil, or decoction of rice, and are celebrated as a Vermifuge."

Note 4. This plant appears in the index as "Dolichos Soja."

Note 5. This is the earliest English-language document seen (March 2009) that contains the term "Miso soup."

Note 6. On the title page, the author's name is given as Carl Peter Thunberg, rather than Karl Peter. Of the four volumes, only vol. IV bears a date, which is 1795. The translator's name is not given, not even in the "Translator's preface" nor in any record on WorldCat / OCLC online bibliographic database. The original text was written in 1776. Yule & Burnell (1886, p. 651, and 1903, p. 859) state: "1776. An elaborate account of the preparation of Soy is given in *Thunberg's Travels,* E.T., [vol.] iv. 121-122;"

Note 7. This is the earliest English-language document seen (Feb. 2008) that contains the word "Soy Beans" (or "Soy-Beans") (p. 121-22).

Note 8. This is the earliest English-language document seen (April 2012) that contains the term "Soy-sauce" (or "soy-sauce"). The *Oxford English Dictionary* says (incorrectly): "1818 Todd (transl. Thunberg), Soy-sauce is prepared from soy-beans (*dolichos soja*) and salt, mixed with barley or wheat."

Note 9. Lewis and Murakami (1923, p. 223) state: "The third English edition of Charles Peter Thunberg's *Travels* (London 1796) contains an English-Japanese vocabulary of approximately 1,500 words; this was probably the first English-Japanese vocabulary ever published. It seems to have been unknown to our author [Ranald MacDonald] and his scholars." Address: Prof. of Botany, Univ. of Upsal [Uppsala], Sweden.

245. Thunberg, Karl Peter. 1796. Voyages de C.P. Thunberg. Tome second [Voyages of C.P. Thunberg. Vol. 2]. Paris: Benoit Dandre. iv + 544 p. See p. 3, 4, 145, 266-68. [Fre]
• ***Summary:*** An early traveler to East Asia who mentioned soyfoods was the Swedish doctor and prof. of botany at the Univ. of Uppsala, Carl P. Thunberg. In Chapter 20 titled "Japanese Foods" he states (p. 267-68): "Three times a day, with each meal, the people eat miso soup prepared with fish and leeks. These miso [he apparently thought miso was the name of a legume; see Thunberg 1796 in English] closely resemble lentils. They are the small dolic beans of Japan (*ce sont de petites fèves de* dolic *du Japon*)*.*"* (Footnote: ** "Dolichos soja.* Lam. Diction. [Lamarck 1790. Dictionary] No. 28)."

"Miso or soy sauce (*Le miso ou la sauce de soya*) constitute the principal food of the Japanese. People of all levels, great or small, rich or poor, eat them several times a day year-round. Here is how they are prepared. The beans are cooked until they are just soft, then they are mixed with an equal quantity of barley or wheat, and the mixture is allowed to ferment for 24 hours in a warm place. Now an equal quantity of salt and 2½ times the amount of water. The mixture is put in an earthen pot, which is well closed and left for 2½ months; it is stirred during the initial days. After the necessary time the liquid is pressed out and stored in wooden kegs. The inhabitants of certain provinces make better 'soya' than those in others. Moreover, the longer it ages, the tastier and clearer it becomes. It is always brown and its principal flavor is a pleasant saltiness. The Japanese also eat fish, boiled or fried in oil" (p. 267-68).

"The tea of Japan is inferior to that of China. However, Japanese 'soya' [soy sauce] is preferable to that of the Chinese. It is shipped in numerous vats to Batavia [today's Jakarta, Indonesia], India, and Europe. The Dutch have found a way of protecting it from the effects of heat and of preserving the fermentation. They boil it in an iron pot, funnel it into bottles, and seal the mouths with pitch. This liquid retains all its 'force' and can be mixed with all other sauces." Note: All this took place long before Appert's invention of canning in 1809 and Pasteur's invention of pasteurization in 1862. In fact pasteurization had been practiced in Japan for 200 to 300 years before this time.

In Chapter 23, "The State of Agriculture in Japan," the

© Copyright Soyinfo Center 2014

author notes (p. 291): The Japanese plant a great deal of rapeseed, and the seed furnishes an excellent oil for lamps. In Japanese, the plant is named *na tanne* and the oil *na tanne abra* or *na tanne no abra* (sic, *natane abura*). "Soy flour (*La farine des fèves de daidsou* (Footnote: *Dolichos soïa*)) is used in various dishes.

Note 1. This is the earliest French-language document seen (Nov. 2012) that mentions roasted soy flour, which it calls *La farine des fèves de daidsou.*

The liquid that is pressed out is used to make soy sauce (*du soya*). The roots are put in a soup named *miso,* which the people use daily for nourishment. Small cakes are also made with the flour of azuki beans (*la farine de haricots d'atsouki* (Footnote: *Phaseolus radiatus*)) mixed with sugar."

Note 2. This is the earliest French-language document seen (Jan. 2005) that mentions azuki beans, which it calls *haricots d'atsouki.*

Pages 314-15 state: "Their soy sauce (*sauce de soya*), which has been introduced by many Europe countries, is made with soybeans (*se fait avec des fèves-soya* (Footnote: *Dolichos soya*)), barley or wheat, and salt. Although these beans come spontaneously and abundantly in many places, the consumption which they make of this flour causes them to take particular care with the plant's cultivation."

Note 3. This is the earliest French-language document seen (April 2012) that uses the term *sauce de soya* to refer to soy sauce. Address: France.

246. *Times* (*London*). 1797. Classified ad: Japan Soy.–For sale. March 13. p. 1, col. 4.
• ***Summary:*** "... at No. 34, Fish street... near the Monument; Genuine Japan Soy [sauce], in casks from 10 to 60 gallons, at 16*s.* per gallon, for ready money only." Address: [England].

247. Hemmij, Gijsbert. 1797. Diary. In: Leonard Blussé, Cynthia Viallé, et al, eds. 2004. The Deshima Diaries Marginalia, 1740-1800. Tokyo: Japan-Netherlands Institute. xl + 898 p. See p. 707 (#27).
• ***Summary:*** 1797 May 12–"I summond the *rapporteurs* and handed them three kinds of Dutch cakes and three kinds of confitures in newly made boxes for the governor. They returned in the afternoon and assured me that the governor had been very pleased and he was sending me a reciprocal present of two flasks of medicinal *sake,* a couple of boxes of flour and *laxa,* and a barrel of *miso* fish" [fish pickled in miso]. Address: Opperhoofd (Chief of the Dutch factory), Deshima, Nagasaki, Japan.

248. Brown (T.). 1797. To families, resident in Chelsea, Pimlico, Battersea, Wandsworth, Kensington, and Knightsbridge (Ad). *Observer* (*London*). Nov. 26. p. 1.
• ***Summary:*** "Genuine wines, now on sale, in fine condition, at Brown's New Tea Warehouse, the Chinese and Tea Plant, Paradise Row, Chelsea,... Fish Sauces of all sorts. Perfumery and Confectionary. New Anchovies, Capers, Japan Soy [sauce], Cayenne Pepper, Oils, Vinegars, &c.;..."

Note: This is the earliest British newspaper seen (Oct. 2009) in which the term "Japan soy" is mentioned. Address: Paradise Row, Chelsea, London.

249. Encyclopaedia Britannica; or, A dictionary of arts, sciences, and miscellaneous literature... 3rd ed... greatly improved. 18 vols. 1797. Edinburgh: Printed for A. Bell and C. Macfarquhar.
• ***Summary:*** In vol. 6, part 1 (D-E), the entry for Dolichos (p. 81) states: 2. The soja is a native of Japan, where it is termed *daidsu;* and, from its excellence, *mame;* that is, "the legumen or pod," by way of eminence. It grows with an erect, slender, and hairy stalk, to the height of about four feet. The leaves are like those of the garden kidney-bean *. The flowers are of a bluish white, and produced from the bottom of the leaves, and succeeded by bristly hanging pods resembling those of the yellow lupine, which commonly contain two, sometimes three, large white feeds. There is a variety of this kind, with a small black fruit, which is used in medicine. Kempfer [Kaempfer] affirms, that the seeds of this when pounded and taken inwardly give relief in the asthma. This legumen is doubly useful in the Japanese kitchens. It serves for the preparation of a substance named *miso,* that is used as butter; and likewise a pickle celebrated among them under the name of *sooju* or *soy* [sauce]. To make the first, they take a measure of mame, or the beans produced by the plant: after boiling them for a considerable time in water, and to a proper degree of softness, they beat or bray them into a softish pulse [pulp?]; incorporating with it, by means of repeated braying, a large, quantity of common salt, four measures in summer, in winter three. The less salt that is added, the substance is more palatable; but what it gains in point of taste, it loses in durability. They then add to this mixture a certain preparation of rice, to which they give the name of *koos* [*koji*]*;* and having formed the whole into a compost, remove it into a wooden vessel which had lately contained their common ale or beverage named *sacki.* In about two months it is fit for use. The koos gives it a grateful taste; and the preparing of it, like the polenta of the Germans, requires the skillful hand of an experienced master. For this reason there are certain people who make it their sole business to prepare the koos, and who sell it ready made for the purpose of making miso: a substance which cannot fail to be greatly valued in those countries where butter from the milk of animals is unknown.

"To make sooju or soy, they take equal quantities of the same beans boiled to a certain degree of softness; of muggi, that is corn, whether barley or wheat, roughly ground; and of common salt. Having properly mixed the beans with the pounded corn, they cover up the mixture, and keep it for a day and a night in a warm place, in order to ferment; then putting the mass into a pot, they cover it with the salt, pouring over the whole two measures and a half of water.

© Copyright Soyinfo Center 2014

This compound substance they carefully stir at least once a-day, if twice or thrice the better, for two or three months: at the end of which time, they filtrate and express the mass, preserving the liquor in wooden vessels. The older it is, the better and the clearer; and if made of wheat instead of barley, greatly blacker. The first liquor being removed, they again pour water upon the remaining mass; which, after stirring for some days, as before, they express a second time, and thus obtain an inferior sort of soy."

For Sakki (*saké*) see vol. 9, part 1 (p. 71, under Japan). Address: Edinburgh, Scotland.

250. Nihon sankai meisan zue [Illustrations of Japanese products from land and sea]. 1797. Japan. [Jap; eng+]

• ***Summary:*** See next page. The first illustration shows koji being made in Japan. In the front center a man is cooling the steamed rice by raking it on a straw mat. To the left another man is carrying the cooled rice by holding the four corners of a straw mat. At the top center another man inside the koji incubation room (*koji muro*) awaits the arrival of the rice, which he will spread on wooden koji trays. As it is inoculated naturally by airborne spores of *Aspergillus oryzae* (the room is full of them), the rice will be transformed into koji–in the first step of the sake-making process.

Another illustration shows an expanded view of the first illustration with subsequent steps in the sake-making process.

Also titled *Nippon Sankai Meisan Zue*, this volume of illustrations is devoted to the making of koji and sake and is historically important as the first book with illustrations of sake making and of the recently developed artisanal technique for making clear sake (*seishu*), requiring clarifying the rice liquor and stabilizing the sake through pasteurization. The work contains seven black and white wood engraved prints: six are 205 x 326 mm, double-page prints with five detailing the step-by-step manufacturing process. Larger scale production of sake (*nihonshu*), the iconic Japanese alcoholic beverage brewed from fermented rice, developed during the Edo period in breweries in Itami and Nada (from description by www.abebooks July 2012).

Illustration sent and source cited by Izumi Motai of Takara Sake USA Inc., Berkeley, California.

251. Beckmann, Professor [Johann?]. 1798. Account of the methods employed in Japan and China to prepare soy, with some observations on the bean from which it is produced. *Philosophical Magazine* (*The*) (*London*) 1:342-45. Sept. [4 ref]

• ***Summary:*** "This article [soy sauce], which is a brown saline liquor, imported to Europe from the East Indies, is employed for seasoning various kinds of dishes, and improving the taste of different sauces. It is brought from Japan in small wooden vessels, and also from China and other parts of India in glass flasks, several of which are packed together in a wooden box. The use of it has been long general in the East Indies; where it is placed on the table at each meal, instead of salt, for the purpose of dipping in it flesh, fish, and other kinds of food.

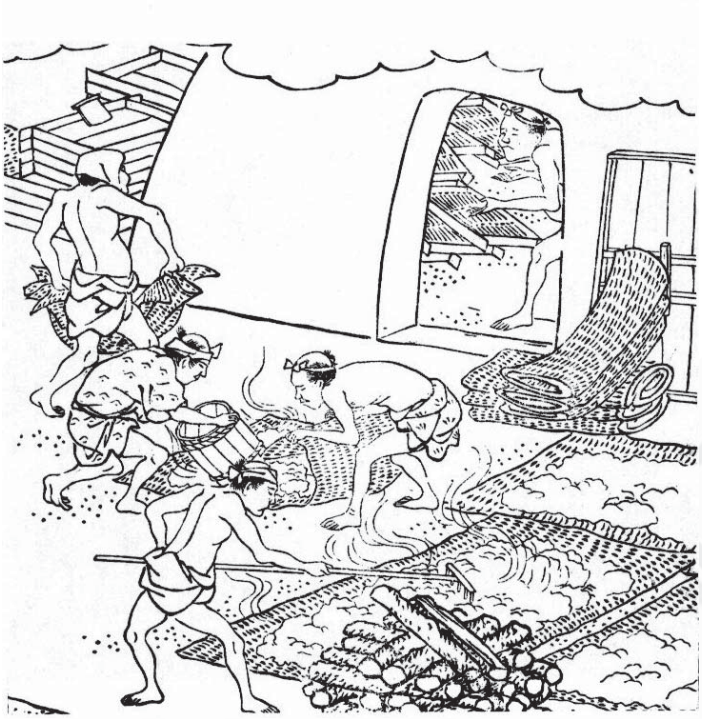
"The Japanese are said to be the inventors of this article; and, at present, their soy is preferred to any other; though it is asserted by connoisseurs that this preference arises more from the price than the goodness. In my opinion, it was first introduced in the European commerce in the present century; for it is not to be found in the old catalogues of goods; in Saavary's or Ludovici's dictionaries, nor in the old books on cookery. The first account of the method of preparing it after the Japanese manner was published by Kempfer [Kaempfer].

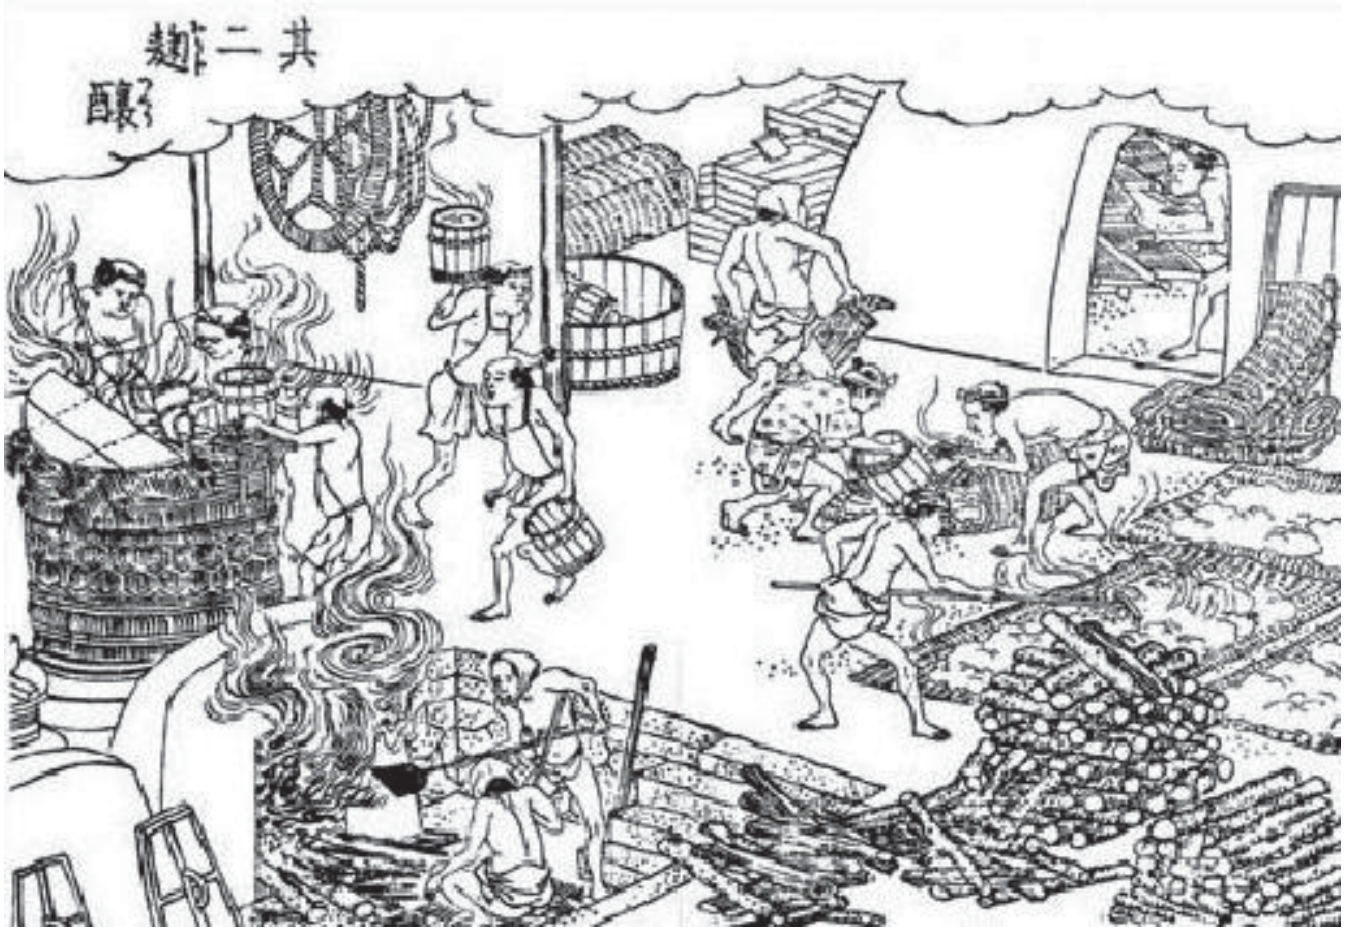
"Before I give a description of this method, it may not be improper to inform the reader that the people in India, instead of our common kidney beans, cultivate and use as food another species of a familiar kind, called in botany *dolichos,* and which comprehends several species. Among these there is one called *dolichos soya.* The plant is all over rough; and its weak stem rises to the height of a man. Its flowers, which are small, scarcely appear above the calyx, and are a blueish or almost violet color. The rough husks contain for the most part only two seeds, which in form, size and taste differ very little from our garden pease, except that they are flatted, shaped somewhat like an egg, and have a black speck at the place where they begin to germinate*. (Footnote: * *Hilum fuscum.* The first description and figure of this plant was given by Kempfer in his *Amoenitat. exot.* p. 837, 838. Both these, however, were improved and rendered more complete by Bergius in *Abhandlungen der Schwedisch. Akad.* xxvi. p. 281. The latest descriptions are those of Thunberg in his *Flora Japonica,* p. 282.; and Jacquin in *Collectanea ad botanicam et hist. nat.* vol. i. p. 46).

"These seeds form the principal component part of soy. In Japan they are first boiled, and then mixed with the same quantity of barley or wheat meal (the latter is for the purpose of giving the soy a darker colour); and the mixture, being covered up, is deposited for twenty-four hours in a warm place, where it ferments. The same quantity of common salt, with the like quantity and half as much water, is thrown over it; and the whole mass, for the space of two or three months, is stirred round daily with a chocolate stick, and closely covered immediately after. At the expiration of that period it is strained or squeezed through a linen cloth, and the liquor, which is preserved in wooden vessels, becomes always clearer and better the longer it is kept. The mass which remains is again subjected to a like process by having water poured over it, and, being stirred round for some days, as before, is then strained.

"Of the preparation in China the following account has been given by Eckberg [sic, Ekeberg or Eckeberg], a Swede:" Beckmann then translates the last half of Ekeberg's 1764 Swedish-language article titled "Om Chinesiska Soyan" (On Chinese Soy Sauce), which see.

© Copyright Soyinfo Center 2014





© Copyright Soyinfo Center 2014

"From what has been above said, it may be readily perceived that the preparation of soy in Europe would be attended with no difficulty if it were possible to cultivate the beans. Bergius, however, gives his countrymen little hope that this can be done; and chiefly for this reason, that the plant blows so late in green-houses, that the summer is gone before the fruit can ripen. But this is often the case with exotics which are reared by our gardeners in hot-houses. As they only begin to blow when their nourishment decreases and occasions a stoppage of their growth, the same thing may happen too late in too fertile a soil, or when they have a superfluity of nourishment. On the other hand, when they are transplanted into soil somewhat poorer, and into an open place where they have less shelter, they do not grow so quick and so long; but they blow earlier. And hence it happens, that many exotics planted in the open air produce ripe seeds, which could never be obtained from them while they were preserved as curiosities and favourites of the gardener in green-houses. I consider it, therefore, as an experiment worth making, to plant these beans in the open fields; and I am inclined to think that in many summers they would produce ripe seeds, especially as Jacquin says expressly that they throve well at Vienna [Austria] in the open air.

"Should my conjecture, however, be not realised, this would not, at any rate, be the case with that of Bergius, who is of opinion that a kind of soy might be obtained from our peas and beans by the same or a similar process; but indeed it would have this great fault, that it would be too cheap, and too soon become common."

Note 1. The author is probably the German Johann Beckmann (lived 1739-1811). He spoke English, taught mathematics, physics, and natural history at the Lutheran St. Peter's Gymnasium in St. Petersburg, and is best known as the author of that fascinating bedside book *The History of Inventions.* A trained botanist and student of Linnaeus, he first visited Linnaeus in 1765 (See W. Blunt. 1971. p. 166, 172, 174, 175). He also wrote a book on botany, and on the history of inventions and discoveries.

Note 2. This is an excellent, accurate description of both soy sauce and the soybean. It is difficult to tell whether it is compiled from other writings (most likely, see footnote), or whether Beckmann visited India and described (in the third paragraph above) the soybeans that he actually saw growing there. If the latter were true, this would be the earliest document seen (Oct. 2010) concerning soybeans in India, or the cultivation of soybeans in India. And this document would contain the earliest date seen for soybeans in India or the cultivation of soybeans in India (1798; one of two documents–the other being Roxburgh 1832).

Note 3. This is the second earliest English-language publication or article seen with the word "soy" (or any variation of soy) in the title. Note that this "soy" refers to soy sauce. Address: England.

252. Stavorinus, Johan Splinter. 1798. Voyages to the East-Indies. Translated from the original Dutch by Samuel Hull Wilcocke. 3 vols. London: Printed for G.G. and J. Robinson. vi + 534 p. See vol. 1, p. 360. [Eng]

• ***Summary:*** In Chapter 29, as part of a discussion of Dutch trade with Japan, the translator adds the following footnotes not found in the original text (see p. v-vi): Two Dutch ships go yearly to Japan. They also export "a trifling amount in soy [sauce], china, lacquered ware, and large silk nightgowns. The private trade of the Dutch officers and ships' crews to Japan, is also very considerable, as well as profitable; they carry out, camphor, china-root, saffron, Venice treacle, Spanish liquorice, ratans, spectacles, looking glasses, watches, manufactured glass, and unicorns' horns (the horn of the menodon monoceros), and receive in return, soy, silks, silk nightgowns, china, lacquered ware, fans, and fine rice" (p. 360).

There are also extensive notes by the translator about the Dutch forts and trading posts / factories in Asia including those on the coast of Coromandel, Negapatnam [Nagapatnam, the head settlement], Sadraspatnam [Zadraspatam, Sadrangapatnam], Pulicat, Sadras, Palicol [Palikol, Katira], Bemelipatnam, Geldria, Surat; In Japan: Decima [Deshima], Nangasakki [Nangasaki, Nangasacqui, Nangasacky, Nangasackij, Nagasaki]. Address: Rear Admiral in the service of the States General.

253. Communications to the Board of Agriculture; on subjects relative to the husbandry and internal improvement of the country. Vol. II. 1800. London: Board of Agriculture. Printed by W. Bulmer. 501 p. See p. 193-96. Illust.

• ***Summary:*** Section IX (p. 193-94) is titled "Copy of a letter from Mr. Campbell, at Fort Marlborough, with an account of seeds sent by him, by the *Queen* Indiaman."

He writes: "Those which go by the Queen are, the cordage palm; the caminium; the copaya, or oil-nut of the Malays; the teak; the soy bean of Japan; and the catupa, a delicate fruit lately discovered." "The adjoined catalogue contains short notices and references to works in which these plants are amply treated of."

He encourages the Board to distribute and test these seeds worldwide, and not only to British colonies. The letter is signed Charles Campbell, Fort Marlborough, 17 May 1798.

On pages 194-96 is an addendum titled "Account of seeds sent in the *Queen* Indiaman." On p. 196 we read:

"*Dolichos Soja,* the Soy Bean.

"This pulse is exotic to the West coast [of Sumatra], and seems to have been imported by the Chinese colonists.

"It is little cultivated here; and never, I believe, with a view to prepare the condiment from it.

"Much of the sauce sold in Europe, under the name of Japan Soy, is manufactured at Batavia [today's Jakarta], by a very simple process. Satisfactory information will, I believe,

© Copyright Soyinfo Center 2014

be found respecting this, in Kempfer's *Amoenitates* [sic, Kaempfer's *Amoenitatum exoticarum...* (1712)], a work I regret the want of.

Note 1. This is the earliest English-language publication seen (Aug. 2008) that contains the word "soy bean" (or "soy beans").

Note 2. Fort Marlborough was in Bengkulu, Sumatra (in today's Indonesia).

• ***Summary:*** The section titled "Copy of a letter from Mr. Campbell, at Fort Marlborough, with an account of seeds sent by him, by the Queen Indiaman" (p. 168) states: "This paper is more calculated for a botanical than an agricultural society; and we do not perceive of what use it can be to farmers, nor how it can advance the internal improvement of our northern isle. In fact, its object is to promote the transfer of the useful trees and plants of Sumatra to our West Indian colonies, and to the continent of America. The seeds sent home by the Queen were those of the cordage palm, the caminium, the copaya, or oil-nut of the Malays, the teak, the soy bean of Japan, and the catupa, a delicate fruit lately discovered."

Note: Fort Marlborough was in Bengkulu, Sumatra (in today's Indonesia).

257. Ryôri shinan taizen [The big book of Shinan cookery]. 1801. Japan. [Jap]*

• ***Summary:*** The twelfth earliest known reference to Kori-dofu (dried-frozen tofu) appeared in this work.

258. Pinkerton, John. 1802. Modern geography: A description of the empires, kingdoms, states, and colonies; with the oceans, seas, and isles; in all parts of the world: Including the most recent discoveries, and political alternations. Digested on a new plan... With numerous maps. Vol. II. London: T. Cadell Jun. and W. Davies; and T.N. Longman and O. Rees. viii + 835 p. See p. 110, 170. Maps. Index. 29 cm.

• ***Summary:*** On page 83 is a detailed map of China. In the chapter titled "China proper" (p. 83), the subsection on "Botany" states (p. 110): "Besides the multitude of vegetables that are cultivated as articles of human food, and which are probably natives of India, Japan, and the neighbouring islands, the following are found in a truly wild state in China, viz. three species of dolichos, *kidney bean;* d. sinensis, *calavanses;* d. soya from the beans of which the true Indian soy is made; and d. cultratus..."

In the section on "Japan" (p. 152-), in Chapter IV, "Natural geography," the subsection on Botany states (p. 170): "The vegetable treasures of Japan are numerous, and have been ably explored by Kæmpfer and Thunberg... There are several points of resemblance between the floras of China and Japan, and this similarity has probably been strengthened by a mutual interchange of useful vegetables; if indeed both countries have not rather derived some of their most valuable plants from Cochin-China, or the Philippine islands: the ginger, the soy bean, black pepper, sugar, cotton, and indigo, though perhaps natives of the more southern regions of Asia, are cultivated here with great success and in vast abundance." Note: Pinkerton lived 1758-1826. Address: [England].

© Copyright Soyinfo Center 2014

(Osaka) and Kichimonjiya Risuke. Japanese summary by Kawakami 1978. [Jap]
• ***Summary:*** This book, whose author is unknown, was issued by two publishers in 1802. Kichimonjiya published an edition titled only *Sokuseki Ryôri* (Instant Recipes). One was a folded book 30 by 40 cm, one was a woodblock print 15 by 8 cm. The front side is fish and poultry, the backside is Zen vegetarian cookery. In the latter section there is a recipe named Yuba Anpei that contains yuba and silken (*kinugoshi*) tofu.

260. Thunberg, Charles Peter. 1802. Travels in Europe, Africa, and Asia, performed between the years 1770 and 1779. In: William Fordyce Mavor, ed. 1802. An Historical Account of the Most Celebrated Voyages, Travels, and Discoveries, from the Time of Columbus, to the Present Period. Philadelphia, Pennsylvania: Published by Samuel F. Bradford. Vol. 12 of 14. 299 p. See p. 217, 236, 267, 275. Series: Early American Imprints: Second series no. 2640.
• ***Summary:*** In writing about Japan, Thunberg states: Page 217: Shimonoseki "is situated at one extremity of Nippon, the largest of all the islands, and contains the two capitals of the kingdom. On the seashore a kind of ulva, called AwaNori, is found, which, when dried and roasted over the coals, and afterwards pulverized, is eaten with boiled rice, and sometimes put into miso-soup."

Page 236: "The Japanese eat thrice a day and their general fare is miso-soup boiled with fish and onions."

Page 267: "Ladies do not eat with the men, but by themselves. Rice supplies the place of bread, and is boiled with every kind of provisions. Miso-soup, boiled with fish and onions, is the customary food of the common people. Misos are small beans, like lentils, the produce of the dolichos soja. Fish and fowls are very plentiful, and are eaten in abundance. Even the flesh of the whale is a common dish among the poorer people.

"Tea and sakki constitute the whole beverage of the Japanese. Wines and distilled liquors they can scarcely be prevailed on to taste. Hitherto they have never suffered themselves to be corrupted by European modes of living, but still retain their original temperance and frugality... Sakki is transported to Batavia as an article of commerce;..."

Page 275: "Rice is their principal corn. Wheat, barley, and rye are little used... They have many kinds of beans and peas, and also of alliaceous plants, turnips, and cabbages. From the seeds of the latter they express an oil for their lamps" [probably rapeseed oil]. Address: M.D., Knight of the Order of Vasa, Prof. of Botany, Univ. of Upsal [Uppsala], etc. Sweden.

• ***Summary:*** Iino (2003, p. 9): The 1803 issue of this publication "gives instructions for making homemade soy sauce. It states that by adding *modoki* the soy sauce loses its qualities for preservation making it susceptible to both mold and worms. By adding stock, acidity is increased, affecting the flavor. Therefore it states that *modoki* must not be added when making homemade soy sauce." Address: Japan.

265. Grubbens, M. de. 1804. Method of preparing Chinese soy. *Philosophical Magazine* (*The*) (*London*) 19(75):260-63. First quarter. [1 ref. Eng]
• ***Summary:*** "Extracted from the Memoirs of the Academy of Sciences at Stockholm for 1803, first quarter, by M. Lindbom, Captain of the Swedish Mines.* (Footnote: *From the *Annales de Chimie,* No. 148).

"The Transactions of the Swedish Academy for the year 1761 contain a description of the method of preparing soy

© Copyright Soyinfo Center 2014

[sauce], by the late captain Ekeberg; but as this description is incomplete as well as incorrect, since the real Chinese soy will not be obtained by following it, I am fully persuaded that M. Ekeberg never saw, nor was acquainted with, the true process for preparing this substance. There is reason to believe that he gave his description from the accounts of the Chinese, who are not always ready to speak the truth, as I observed during the five years I resided in China... but as I have now procured a very correct account of it [manufacturing soy], I think it my duty to communicate it to the Academy.

"Soy is prepared from a kind of beans, which are whiter and smaller than those of Turkey, the farina of wheat, salt, and water. The proportions are 50 pounds of beans, 50 pounds of salt, 60 pounds of farina of wheat, and 250 pounds of water." Note: Farina here refers to finely ground wheat meal, a little coarser than wheat flour.

"After the beans have been well washed, they are boiled with well water in an open pot for some hours, or until they become soft enough to be kneaded with the fingers. During the boiling they must be always covered with water that they may not be burnt. Care must be taken not to boil them too much: if they are diluted, too much of the substance remains in the juice. When the beans are boiled they are put into large flat wooden tubs, or, as the Chinese do, into vessels made of thin broad splinters of bamboo, two inches and a half in depth and five feet in diameter. In the latter they are spread out to the depth of two inches. When they are sufficiently cooled to be touched with the hand, the farina of wheat is added, and well mixed with them; and this is continued till the whole farina is exhausted. When the mass becomes too dry for the farina to adhere to the beans, a little warm juice is added.

"When the whole is well mixed, the mass is spread out in the tubs above mentioned, taking care that the strata are not more than an inch or an inch and a half in thickness. The mass is then covered, by placing over it a lid which exactly closes it. When it is observed that the mass becomes mouldy, and that heat is disengaged from it, which takes place in the course of two or three days, the cover must be raised up, by placing two rods below it, in order that the air may have freer access. In the mean time a rancid odour is exhaled. If the mass assumes a green colour, it is a sign that every thing goes on well; if it begins to grow black, the cover is raised a little more, in order that the mass may be more in contact with the air. When the mass becomes completely black it is entirely spoiled.

"As soon as it is observed that the whole mass is green and mouldy, which is generally the case in eight or ten days, the cover is removed, and the mass is exposed for some days to the air and the sun.

"When the whole mass has become hard like a stone, it is cut into small fragments, which are thrown into an earthen pitcher, and 250 pounds of water, in which 50 pounds of salt are dissolved, are poured over them. The whole is well stirred; and the height which the water occupies in the pitcher is noted. In case one pitcher is not sufficient, the mass is put into several, taking care that each be proportioned to the quantity of the matter.

"When the pitcher is thus filled it is placed in the sun. The matter must be regularly stirred and shaken every morning and evening, but at night care must be taken to put the cover on it to preserve the mass from the cold. This cover is made convex on the outside that the rain may more readily run off from it, and it is employed also in the day time, when it rains. The greater the heat of the sun, the more the preparation of the soy is accelerated. This operation in general is undertaken only in summer, and yet it continues for two or three months.

"In proportion as the mass decreases by evaporation, well water is added, and this is continued till the salt water has entirely dissolved both the farina and the beans. The pitcher is then left some days longer in the sun, in order that the solution may be so much the more perfect, as on this depends the good quality of the soy, and even during this time the matter must be stirred every day.

"When the mass has become very succulent and oily, the whole is poured into bags, which are pressed to squeeze out the soy, which is then pure, and ready to be employed. It is not boiled, as M. Ekeberg asserts. It is then put into bottles, which are well closed. The Chinese, who deal in this article, put it into large pitchers. The soy before it is squeezed out is of a dark brown colour, but it afterwards becomes black.

"The Chinese prepare from the refuse that remains two other kinds of soy. The first time they add 150 pounds of water and 30 pounds of salt: having squeezed this mass, they again pour over it 100 pounds of water and 20 pounds of salt, proceeding always in the same manner as above described.

"The last two kinds are not strong, but very salt [sic, salty]; especially that of the last extraction, the colour of which is also clear. These two kinds are the commonest in China. The difference between them is as 8, 4, 1.

"In the year 1759 I prepared in this manner, in my lodgings at Canton, all the soy which I employed. I even brought some bottles of it to Sweden: it was succulent, oily, moderately salty, and entirely different from that usually sold in Europe: in regard to its taste it was equal to that of Japan, which is generally considered as the best.

"This description is the more certain, as I always executed the preparation myself: I will even venture to assert, that it is that used to obtain soy of the best quality.

"M. Ekeberg asserts that the soy is boiled, and that sugar, ginger, and other spiceries are added: but this is void of foundation and cannot be true, since a Chinese pound of soy does not cost more than two *canderins* Chinese money, which are equal to one and a third skilling Swedish.* This was the usual price during my residence in China, and there is no reason to believe that these ingredients were employed

© Copyright Soyinfo Center 2014

in the preparation of it. Besides, soy has no taste either of sugar or of spiceries; the prevailing taste is that of salt."

266. Nihon ryôrihô taizen [The big book of Japanese cooking methods]. 1804-1817. Japan. [Jap]*
• ***Summary:*** The fourteenth earliest known reference to Koridofu (dried-frozen tofu) appeared in this work.

267. **Product Name:** [Tamari, and Miso].
Foreign Name: Tamari, and Miso.
Manufacturer's Name: Minato-ya. Renamed Sato Shinnosuke Shoten in 1909, then San-Jirushi Brewing Corp. in 1963.
Manufacturer's Address: Ooaza Senba, Kuwana-cho, Kuwana-gun, Ise-no-kuni, Japan.
Date of Introduction: 1804.
Ingredients: Soybeans, water, salt.
Wt/Vol., Packaging, Price: Wooden kegs.
How Stored: Shelf stable.
New Product–Documentation: San Jirushi advertisements in 1980s. Talks with Steve Earle and Michael Fountain. Letter from Steve Earle. 1988. March 7. The best source seen up to this time on the early history of San Jirushi. The product was originally called tamari, not "tamari-shoyu."

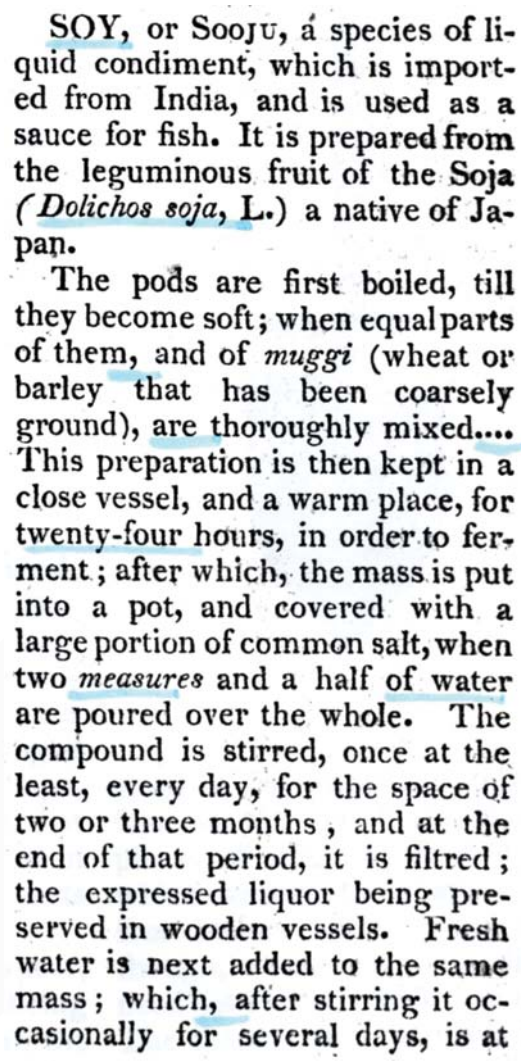
Note: This is the earliest record seen (Feb. 2012) concerning San Jirushi of Kuwana, Japan.

268. Mease, James. 1804. Soy. In: A.F.M. Willich, ed. 1804. The Domestic Encyclopedia. Philadelphia, PA: William Young Birch and Abraham Small. See Vol. V, p. 12-13.
• ***Summary:*** This work is subtitled: "First American edition; with additions applicable to the present situation of the United States: by James Mease." Material added by Mease appears in square brackets ["Crotchets"].

"SOY [sauce], or Sooju, a species of liquid condiment, which is imported from India, and is used as a sauce for fish. It is prepared from the leguminous fruit of the Soja (*Dolichos soja*, L.) a native of Japan.

"The pods are first boiled till they become soft; when equal parts of them, and of *muggi* (wheat or barley that has been coarsely ground), are thoroughly mixed... This preparation is then kept in a close [sic, closed] vessel, and a warm place, for twenty-four hours, in order to ferment; after which, the mass is put into a pot, and covered with a large portion of common salt, when two *measures* and a half of water are poured over the whole. The compound is stirred, once at the least, every day for the space of two or three months, and at the end of that period, it is filtered; the expressed liquor being preserved in wooden vessels. Fresh water is next added to the same mass; which, after stirring it occasionally for several days, is at length strained; and the liquor, though of an inferior kind, thus rendered fit for use.

"*Soy* possesses a strongly saline taste, but has only a slight aromatic flavor: it is chiefly used at the tables of the



SOY, or Sooju, a species of liquid condiment, which is imported from India, and is used as a sauce for fish. It is prepared from the leguminous fruit of the Soja (*Dolichos soja*, L.) a native of Japan.

The pods are first boiled, till they become soft; when equal parts of them, and of *muggi* (wheat or barley that has been coarsely ground), are thoroughly mixed.... This preparation is then kept in a close vessel, and a warm place, for twenty-four hours, in order to ferment; after which, the mass is put into a pot, and covered with a large portion of common salt, when two *measures* and a half of water are poured over the whole. The compound is stirred, once at the least, every day, for the space of two or three months, and at the end of that period, it is filtred; the expressed liquor being preserved in wooden vessels. Fresh water is next added to the same mass; which, after stirring it occasionally for several days, is at

luxurious; and is one of these artificial stimulants of the palate, which deserves no commendation, especially for vitiated or relaxed habits.

"[The Soy-bean bears the climate of Pennsylvania very well. The bean ought therefore to be cultivated.]." Note 1. A portrait of James Mease, M.D., appears in the following book: True, Rodney H. 1939. *Sketch of the History of the Philadelphia Society for Promoting Agriculture:... 150th anniversary... Memoirs Vol. 6.* Philadelphia, Pennsylvania: Philadelphia Society for Promoting Agriculture. ix + 228 p. Portrait is facing p. 29.

Note 2. This is the earliest document seen (July 2011) that clearly refers to the cultivation of soybeans in Pennsylvania. This document also contains the earliest clear date for the cultivation of soybeans in Pennsylvania (1804). However soybeans were probably grown in Philadelphia in 1769 (See Lesley 1884). Mease probably learned that the soy-bean grows well in Philadelphia from John Bartram, who also lived in Philadelphia and was also a member of the American Philosophical Society.

Note 3. This document by Mease was first cited in:

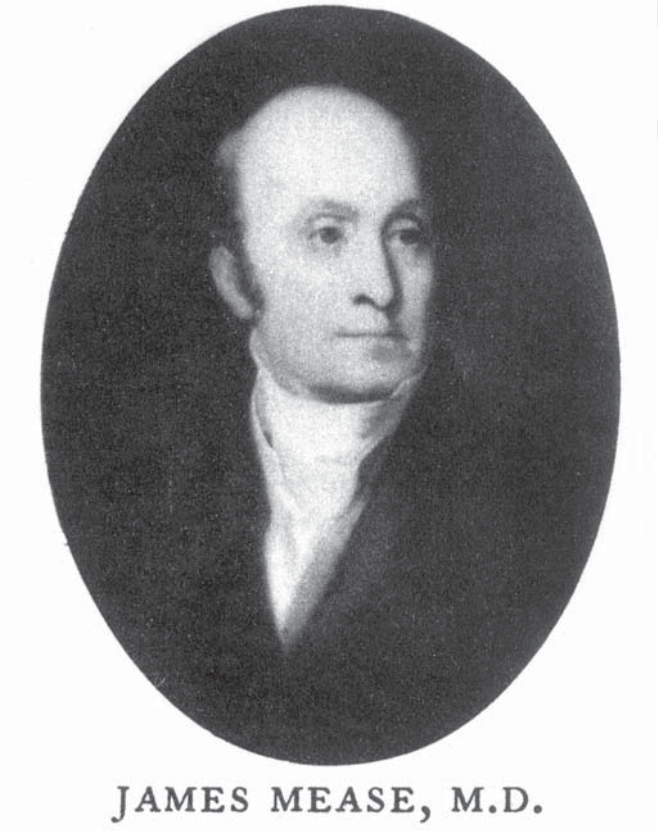
© Copyright Soyinfo Center 2014

Piper, C.V.; Morse, W.J. 1916. "The soy bean, with special reference to its utilization for oil, cake, and other products." *USDA Bulletin* No. 439. Dec. 22. See p. 7.

Note 4. This is the earliest English-language document seen (Feb. 2007) that contains the term "Soy-bean" (or "Soy-beans"), or "the Soja." The term "Soy-bean" is the earliest close ancestor / cognate of the modern American word "soybean." By what thought process did Mease coin this term? Did he think: The Soy-bean is the bean used to make Soy [sauce]?

Note 5. This is the earliest English-language document seen (April 2012) with the word "Soy," used alone to refer to soy sauce, in the title.

Note 6. Hymowitz (1991) reports that the soybeans referred to by Mease were those introduced by Samuel Bowen. Dr. James Mease, a physician, scientist, and author, was born on 11 Aug. 1771 in Philadelphia. He was a leader in the organization of the Pennsylvania Horticultural Society and in 1802 was elected to the American Philosophical Society. Mease obtained his information that "The Soy-bean bears the climate of Pennsylvania very well" from the writings Charles Thomson, one of the secretaries of the American Philosophical Society for the year 1770. The last sentence in this 1804 article is a paraphrase of Thomson's Preface to the *Transactions of the American Philosophical Society* (Vol. 1, p. VII) for the year 1770.



JAMES MEASE, M.D.

In 1805 Mease, age 23, was the secretary of the Philadelphia Society for Promoting Agriculture, in Philadelphia; in 1844 he was chosen president. In 1810 he was secretary of the Agricultural Society of Philadelphia. On 19 Sept. 1991 Dr. Ted Hymowitz of the University of Illinois sent a photocopy of an oval illustration (painting) of a portrait of James Mease, M.D. Address: M.D., Fellow of the American Philosophical Society, Philadelphia, Pennsylvania.

269. Pinkerton, John. 1804. Modern geography: A description of the empires, kingdoms, states, and colonies; with the oceans, seas, and isles; in all parts of the world: Including the most recent discoveries, and political alternations. Digested on a new plan... The article America, corrected and considerably enlarged, by Dr. Barton, of Philadelphia. With numerous maps. Vol. II. Philadelphia: John Conrad & Co.; Baltimore: M. & J. Conrad & Co.;... [ii] + 698 p. See p. 85, 130. Index. 23 cm.

• ***Summary:*** The information about soy in this book is very similar to that in the 1802 edition, although it appears on different pages. In Chapter 4, on the natural geography of China, the section on "Botany" (p. 85) states: "The following are found in a truly wild state in China, viz. three species of dolichos, *kidney bean;* D. sinensis, *calvances;* D. soya, from the beans of which the true Indian soy is made; and D. culcratus: dioscorea alata, *yam;* cucurbita sinensis, China gourd; nicotiana tabacum, tobacco; and convolvolutus battatas, *sweet potato.*

In another Chapter 4, on the natural geography of Japan, the section on "Botany" (p. 130) states: "... the ginger, the soy bean, black pepper, sugar, cotton, and indigo, though perhaps natives of the more southern regions of Asia [Cochin-China] are cultivated here [in Japan] with great success and in vast abundance."

Note 1. Pinkerton lived 1758-1826.

Note 2. This is the earliest document seen (March 2001) that mentions wild soybeans. Address: [England].

270. Shimazu, S. 1804. Seikei-zusetsu [Illustrations. 30 vols.]. Japan. 26 cm. [Jap]*

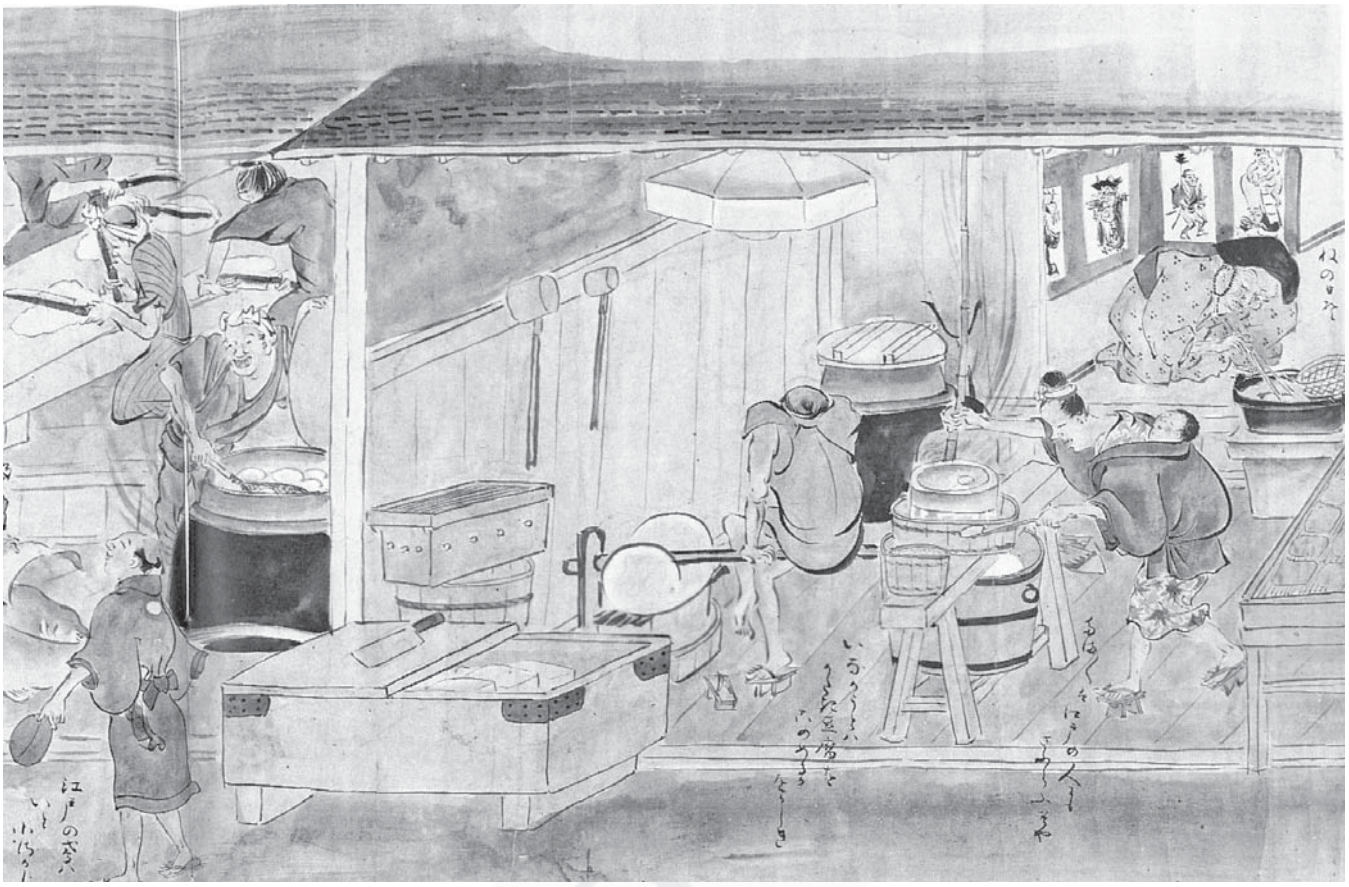
• ***Summary:*** Nagata (1960, p. 75) states that Shimazu has pointed out in *Seikei Zusetsu* (1804-1806) that summer soybeans were sown in April preceding the autumn in the western provinces.

Goto (1984, p. 136) states: "Seikei-zusetsu (1804) outlined the methods of soybean production as recent practices." The book was apparently compiled, authored and/or illustrated by Senshun Sô (1751-1834) and Kunihashira Shirao (1762-1821). Address: Japan.

271. Kinsei shokuhin zukushi ekotoba [Abundant food illustrations and captions of the early modern period]. 1805. Japan. [Jap]

• ***Summary:*** A large, superb illustration shows tofu being

© Copyright Soyinfo Center 2014



made in a commercial tofu shop. The basic steps are unchanged to this day. A lady with a baby on her back, grinds the next batch of soaked soybeans in a hand-turned stone mill. She turns the mill with her right hand while ladling in soaked soybeans using a shallow spoon with her left. She is wearing raised wooden shoes (*geta*) to keep her feet dry and clean. The smooth white puree runs down into a wooden barrel beneath the mill. Puree from the last batch of soybeans she ground has been cooked with water (in front of her) in a large iron caldron covered with a wooden lid. That cooked puree was ladled out into a pressing sack.

A man, probably the tofu maker (with his back to us) is sitting on a lever press (a sturdy board attached to a fulcrum on the wall) pressing a white sack so that the soymilk runs down into a curding barrel and okara remains in the sack.

After a coagulant (nigari or calcium sulfate or both) is added to the hot soymilk in the curding barrel, the milk is transformed into white curds and yellow whey. The whey is ladled off (see two ladles hanging on wall) and the curds are scooped into the cloth-lined perforated wooden forming box that rests atop a wooden tub next to the wall just to the left of the ladles. The curds in the forming box are pressed to make tofu.

A previous batch of tofu is now under cold water in a wooden sink near the left front of the illustration. A knife, used to cut blocks of tofu into smaller cakes, rests on that part of the sink which is covered. A potential customer (far left), with a fan in his left hand, stands on the street.

At the far right of the illustration, thinly sliced pieces of tofu are draining on a mat on a long table, in preparation for deep frying. At the top right, an elderly person from the tofu maker's extended family (probably a parent of the tofu-maker or his wife), kneeling on the tatami mats in the home–one step up from the tofu shop, appears to be deep-frying–probably to make deep-fried tofu pouches (aburagé).

An adjacent room (to the left) is a fish shop where fish are being cut into smaller pieces and deep-fried (perhaps to make cakes or patties of *Satsuma agé*).

On the illustration of the tofu shop are three groups of old, hard-to-read Japanese characters, handwritten in script format. (1) At the top right is written *Ne no hi no.* "Ne no hi" is a word somewhat like "Tuesday," the name of one of the days of the week in old Japan under the lunar calendar system–even though there was no idea of a "week" in Japan at this time. "Ne ho hi" occurred roughly 3 times each lunar month of 28 days, typically at 12-day intervals.

(2) Below the feet of the women with the baby on her back is written: *Tamatama ni Edo no hito* [*?*] *mo saburafu ya,* which may mean "Sometimes people from Edo visit here."

(3) Below the man sitting on the pole that is pressing the sack of okara is written *Inaka* [*?*] *hito wa kataki tofu*

© Copyright Soyinfo Center 2014

o konomeruga okashiki, which may mean "It's funny that country folks prefer firm tofu."

272. Barrow, John. 1806. A voyage to Cochinchina, in the years 1792 and 1793: Containing a general view of the valuable productions and the political importance of this flourishing Kingdom... To which is annexed an account of a Journey, made in the years 1801 and 1802, to the residence of the chief of the Booshuana {Botswana} Nation, being the remotest point in the interior of southern Africa... London: T. Cadell and W. Davies. xvii + 447 p. 28 x 22 cm.

• ***Summary:*** In the section titled "Sketch of the character and condition of the natives of Turon," "Lock-soy" is mentioned.

In a discussion about the food of Cochinchina we read (p. 314-15) [p. 118] that rice "'is with them the grand support of existence. Of this grain they have the art of making a kind of vermicelli, usually called *Lock soy,* which is perfectly transparent, and held on that account in high estimation both in Japan and China; to the latter of which it is exported in considerable quantity. It communicates to soup a gelatinous consistence, but at the same time preserves its form and transparency, qualities which would lead one to doubt if rice be the only ingredient in its composition. The Chinese *Lock-soy* is opaque.'"

Note: This is the earliest document seen (May 2011) stating that Lock-soy is a type of dried vermicelli made from rice (rice noodles). Why is "soy" part of the food's name? Is soy an ingredient? Soy flour? What is the origin and etymology of the name?

Sir John Barrow (of England) lived 1764-1848. Address: Esq., F.R.S.

273. Shecut, John Linnaeus Edward Westridge. 1806. Flora carolinæensis; or, A historical, medical, and economical display of the vegetable kingdom; according to the Linnæan, or sexual system of botany. Being a collection or compilation of the various plants hitherto discovered and made known by the several authors on botany, &c. 2 vols. Charleston, South Carolina: Printed for the author by J. Hoff. 584 p. See vol. 1, p. 514. [1 ref. Eng]

• ***Summary:*** This book, about the flora of Carolina, was written for the purpose of stimulating an interest in the study of botany and simplifying the Linnaean system for beginners.

In Vol. 1, page 514 the genus Dolichos is described. Concerning that genus Shecut says: "There are 24 species, mostly exotic, growing in the Indies." [probably the Dutch East Indies]. The 3rd member of the genus listed is the soybean–today's Glycine max.

"3. Dolichos Soja, *Soy,* or *Sooja,* a native of Japan, though bearing this climate; and is the bean, the leguminous fruit of which affords the liquid condiment called Indian Soy [sauce]. Kempfer [Kaempfer] affirms that the seeds of this species give relief in the Asthma."

Note: Given that the title refers to a flora of the Carolinas, the author seems to be saying that the soybean either grows or will grow in South Carolina. However the sentence at the end of the subtitle appears to say something altogether different; therefore we cannot be sure. Or, Shecut may have read James Mease (1804), who states: "[The Soy-bean bears the climate of Pennsylvania very well. The bean ought therefore to be cultivated.]." In the same article, Mease says of soy sauce: "SOY, or Sooju, a species of liquid condiment, which is imported from India,..." From Mease, Shecut he may have adopted the phrases "bearing this climate" and "liquid condiment called Indian Soy." It is possible that this is the earliest document seen (Aug. 2011) concerning soybeans in South Carolina, or the cultivation of soybeans in South Carolina–but this is not at all clear. And all things considered–we think it is unlikely that Shecut observed the soybean growing in South Carolina.

John Shecut lived 1770-1836. Address: Charleston, South Carolina.

274. Layman, William. 1807. Outline of a plan for the better cultivation, security, & defence of the British West Indies: Being the original suggestion for providing an effectual substitute for the African slave trade, and preventing the dependence of those colonies on America for supplies. London: Printed and sold by Black, Parry, and Kingsbury, Booksellers to the East India Company. viii + 9-93 p. See p. 47.

• ***Summary:*** The Introduction notes that, following the abolition of the slave trade by England, an effectual alternative must replace it. The section titled "Outline of a plan" begins: "The immense importance of our West-India colonies to the manufactures, commerce, revenue, and naval strength, of this country is so well known... next to our home trade they unquestionably form the greatest source of our wealth and power,..."

A footnote states: "In 1805, the number of British ships employed in the West-India trade was 837, amounting to 206,510 tons, and employing 17,680 seamen."

Layman's basic proposal is to introduce Asian cash crops, "the growth of which the soil and climate are sufficiently well adapted" (p. 43), to the British West Indies so that the former slaves can earn a living cultivating them, and so that Britain can purchase the surplus and ship it back to England.

A four-page list of potentially profitable crops is given (p. 44-47), each with its common name, scientific name, and the place or places where it now grows well. Included in this list are: "Soy-bean–Dolichos Soja–Japan" (p. 46). "Soy–China."

Seed oils are: "Cadjan [Cajan, Cajanus]–Japan. Scramium–Sesamum Orientale–Japan and China. Mustard–Sinapsis–China and Bengal. Cole–Brassica oreintalis–Japan. Rape. Linseed. Tsubaki–Camellia Japonica–Japan." Address: Captain of the Royal Navy, Oakley-House.

275. Miller, Philip. 1807. The gardener's and botanist's dictionary: Containing the best and newest methods of cultivating and improving the kitchen, fruit, and flower garden and nursery; of performing the practical parts of agriculture; of managing vineyards, and of propagating all sorts of timber trees... The whole corrected and newly arranged..., by Thomas Martyn Vol. II. London: Printed for F.C. & J. Rivington. 2 vol. in 4. Unpaginated. 38 cm. 20 plates. [9 ref. Eng]

• ***Summary:*** The plants are arranged alphabetically in the book by genus, but not alphabetically within one genus by species. "33. Dolichos Soja: *Lin. spec.* 1023. *syst.* 659. *Reich.* 451. *fl. zeyl. n.* 534. *mat. med.* 171. *Kaempf. amoen.* t. 838. (Phaseolus). *Thunb. jap.* 282. *Lour. cochinch.* 441. *Rumph. amb.* 5. t. 140. (Cadelium). *Stems flexuose, racemes axillary, erect, legumes pendulous, hispid, containing about two seeds."*

Three pages later, under "33." is a description of the plant and its uses. "Stem round at bottom and smooth; above striated, very hirsute, a foot and more in height. Leaves petioled, hirsute: leaflets petioled, ovate, obtuse with a point, entire, the middle one on a longer petiole and larger, an inch in length: petiole striated, hirsute, a finger's length. Flowers in short, erect, hirsute racemes: subsessile, from three to five together. Corollas purple, scarcely larger than the calyx.*

"Native of the East Indies, Ceylon, Japan, &c.

"The seeds, which are usually called *Miso* [sic] in Japan, are put into soups, and are the most common dish there, insomuch that the Japanese frequently eat them three times a day. The *Soja* [soy sauce] of the Japanese, which is preferred to the *Kitjap* of the Chinese, is prepared from these seeds, and is used in almost all their dishes, instead of common salt. The Chinese also have a favourite dish made of these seeds, called *Teu hu* or *Tau hu* [tofu], which looks like curd, and though insipid in itself, yet with proper seasoning as [is] agreeable and wholesome.**"

Footnotes: "*Thunb. and Linn. **Thunb. and Loureiro."

Note 1. This is the earliest English-language document seen (April 2012) that uses the word *"Soja"* or "The *Soja"* (regardless of capitalization or italics) to refer to shoyu or soy sauce.

Note 2. Miller associates the word "Kitjap" with Chinese rather than with Indonesian soy sauce, a point of key historical interest.

Glycine javanica: "*Java Glycine. Lin. spec.* 1024. *Reich.* 453. *Thunb. in Linn. trans.* 2. 340. *Leaves ternate; stalk villose; petioles rough-haired; bractes lanceolate minute.*

"Stem twining, as in *Phaseolus,* with yellow, reflex hairs scattered over it. Leaves of *Phaseolus.* Pedicels yellow, with close hairs. Stipules, to the petioles oval-oblong, to the peduncles lanceolate. Peduncles the length of the leaves, terminated by an ovate-oblong, close spike of nodding violet-coloured flowers, with very minute bractes between them.– Native of the East-Indies*; and near Nagasaki in Japan, where it is called *Fajo Mame,* and flowers in september and october [sic].**" Footnotes: "*Linn spec. **Thunberg."

On the title page, the subtitle reads: "To which are now first added a complete enumeration and description of all plants hitherto known, with their generic and specific characters, places of growth, times of flowering, and uses both medicinal and economical. The whole corrected and newly arranged, with the addition of all the modern improvements in landscape gardening, and in the culture of trees, plants, and fruits, particularly in the various kinds of hot houses and forcing frames: with plates explanatory both of them, and the principles of botany. By Thomas Martyn, B.D., F.R.S. Regius Professor of Botany in the University of Cambridge."

This elegant set of large books consists of 4 volumes, plus 2 volumes of plates. The soybean appears only in volume 2. Miller gives the most detailed botanical description of the soybean in English up to this time.

Note 3. Philip Miller was head of the famous Chelsea Physic [botanic] Garden in England. Among his many students was William Aiton, who introduced the soybean to England.

Note 4. This is the earliest English-language document seen (Oct. 2004) that uses the term "twining" to describe wild perennial ancestors of the soybean.

Note 5. This is the earliest English-language document seen (April 2013) that uses the word "Teu hu" (or "teu-hu"), or the word "Tau hu" (or "tau-hu") to refer to Chinese-style tofu.

Note 6. This is the earliest English-language document seen (April 2013) that uses the word "curd" in connection with tofu.

Note 7. This is the earliest English-language document seen (Jan. 2004) that uses the word "leaflets" (or "leaflet") in describing the soybean plant.

Note 8. This is the earliest English-language document seen (July 2001) that uses the word "petiole" (or "petioles" or "petioled") in connection with the soybean plant. *Webster's Dictionary* defines petiole (derived from New Latin for little foot), a word first used in 1753, as "a slender stem that supports the blade of a foliage leaf," i.e., the stem of a leaf.

Webster's Dictionary defines stipule (derived from New Latin *stipula,* which is derived from the Latin word meaning "stalk"), a word first used in about 1793, as "either of a pair of appendages borne at the base of the leaf in many plants." Address: F.R.S., Gardener to the Worshipful Company of Apothecaries at their Botanic Garden in Chelsea [England] and a Member of the Botanic Academy at Florence.

276. Ryôri no sho [The book of cooking]. 1807. Japan. 50 p. Unpublished. Japanese summary by Kawakami 1978, p. 187. [Jap]

© Copyright Soyinfo Center 2014

• ***Summary:*** This is not the book's true name, but a tentative name applied after it was written. It is not a recipe book but a book on how to make foods, including shoyu and miso. The author was a person who could experiment with shoyu production. A lot of old things are mentioned. The book must be a collection of writings about what the author has heard and also quotations from other books.

277. The new encyclopædia; or, universal dictionary of arts and sciences: Dolichos soja. 1807. London: Printed for Vernor, Hood, and Sharpe. See vol. VII. Dol. (p. 417-418). [2 ref. Eng]
• ***Summary:*** "3. Dolichos Soja is a native of Japan, where it is termed *daidsu;* and, from its excellence, *mame;* that is, the *legumen* or *pod,* by way of eminence. It grows with an erect, slender, and hairy stalk, to the height of about 4 feet. The leaves are like those of the garden kidney-bean. See Phaseolus. The flowers are of a bluish white; are produced from the bosom of the leaves, and succeeded by bristly hanging pods resembling those of the yellow lupine, which commonly contain two, sometimes 3, large white seeds. There is a variety with a small black fruit, which is used in medicine.

"Kempfer [Kaempfer] affirms, that the seeds when pounded and taken inwardly give relief in the asthma. This legumen [legume] is doubly useful in the Japanese kitchens. It serves for the preparation of a substance named miso, that is used as butter; and likewise of a pickle celebrated among them under the name of sooju or soy [sauce]. See these articles."

Note: This is the earliest English-language document seen (Feb. 2008) that has the word "Soja" in the title.

278. Barrow, John. 1808. Reise nach Cochinchina in den Jahren 1792 und 1793: Nebst Nachrichten... [A voyage to Cochinchina, in the years 1792 and 1793: Containing a general view of the valuable productions and the political importance of this flourishing Kingdom... To which is annexed an account of a Journey, made in the years 1801 and 1802, to the residence of the chief of the Booshuana {Botswana} Nation, being the remotest point in the interior of southern Africa...]. By Matthias Christian Sprengel, Theophil Friedrich Ehrmann... [Ger]
• ***Summary:*** Lock-Soy is mentioned on pages 412-13. Sir John Barrow (of England) lived 1764-1848.

279. Nicholson, William. 1808. A dictionary of practical and theoretical chemistry, with its application to the arts and manufactures... London: Printed for Richard Philipps. 826 p. Illust. [20 p. and 13 leaves of plates, some folded]. 22 cm.
• ***Summary:*** The entry for "Soy" on an unnumbered page begins: "We find in the Memoirs of the Swedish Academy [Grubbens 1803] the following account of the mode in which this kind of sauce is prepared.

"The ingredients are 50 lbs. of a small, white bean, the fruit of the dolichos soja, 50 lbs. of salt, 60 lbs. of wheat flour, and 250 lbs. of water.

"After having well washed the beans, they are boiled in well-water in an open vessel for some hours, or until they have become so soft as to be worked between the fingers. During the boiling they must be kept covered with water, to prevent their burning; and care must be taken not to boil them too much, because in that case too much of their substance would remain in the water of decoction.

"The beans, being thus boiled, are taken out, and put into large shallow wooden vessels, which in China are made of thin staves of bamboo, two inches and a half in depth, and five feet in diameter. In these they are spread out to the depth of two inches, and when they are cold enough to be worked with the hand, the wheat flour is gradually thrown in, and mixed with the beans, till the whole of the before-mentioned quantity has been used. When the mass becomes too dry, so that the flour does not mix well with the beans, a little of the hot water of the decoction is added..." Address: [England].

280. Willdenow, Carl Ludwig. 1809. Enumeratio plantarum Horti Regii Botanici Berolinensis:... [Enumeration of the plants in the royal botanical garden of Berlin:...]. Berolini [Berlin]: In Taberna Libraria Scholae Realis. vi + 1099 + x + 70 p. (supplement). See p. 755. [165* ref. Lat]
• ***Summary:*** In the section on "Diadelphia Decandria," under the genus *Dolichos* (No. 816) (p. 754-55) we read: "7. Dolichos Soja. ++ Erecti.

"D. caule erecto flexuoso, racemis axillaribus errectis, leguminibus pendulis subdispermis. *Sp. pl. ed. W. 3.* p. 1051.

"Habitat in India orientali, Japonia" [Habitat is in the East Indies, and Japan]. Symbol for annual plant. Symbol C. for plant that prefers a warm climate, 10-15 degrees on the Réaumur [Reaumur] thermometor.

Note 1. Willdenow (1765-1812) was a German botanist and pharmacist. Born in Berlin, he studied medicine and botany at the University of Halle. He was a director of the Botanical garden of Berlin from 1801 until his death. There he studied many South American plants, brought back by the explorer Alexander von Humboldt. He was interested in the adaptation of plants to climate, showing that the same climate had plants having common characteristics. His herbarium, containing more than 20,000 species, is still preserved in Berlin (Source: Wikipedia).

Note 2. The Réaumur temperature scale, first proposed by René Antoine Ferchault de Réaumur (of France) in 1731, set the freezing and boiling points of water at zero and 80 degrees respectively. Daniel Fahrenheit, a German who lived most of his life in Holland, had already invented the alcohol thermometer (1709) and the mercury thermometer (1714).

© Copyright Soyinfo Center 2014

Later, in 1742, Anders Celsius, of Sweden, was the first to describe a centigrade thermometer–one having 100 degrees between the freezing and boiling points of water. Address: Prof. Publ. Ord. Botan. et Hist. Natural, etc. [Prof. of Botany and Natural History, Berlin].

281. Mease, James. ed. 1810. Archives of useful knowledge, a work devoted to commerce, manufactures, rural and domestic economy, agriculture and the useful arts: Chinese soy. Philadelphia, Pennsylvania: David Hogan. See vol. 1. No. 2, p. 219-23. Oct. [4 ref]
• ***Summary:*** In this introduction to an article by M. de Grubbens titled "Method of Preparing the Chinese Soy," Dr. Mease writes: "The agreeable flavour which the Chinese and Japanese *Soy* [sauce] communicates to fish is well known. But the high price of the article confines its use to few persons. Hence it has always been an object to discover the peculiar mode of preparing it. Several processes, particularly those by Professor Beckmann, M. Ekeberg, and by Sir Tilloch, have been published; which have been copied into various periodical publications, and Encyclopedias.

"It will be seen however, that the following method, carries internal evidence of coming nearer to the truth than any other, and is therefore recommended to our readers. The Editor has the satisfaction to assure them that the Bean, *Deliches Soyae* [sic, *Dolichos*], bears the climate of Pennsylvania well; there is therefore nothing to prevent our enjoying the agreeable condiment, of which it is the basis, except our own indifference. Accounts of the trials of the recipe will be thankfully received."

M. de Grubbens' article is "extracted from the *Memoirs of the Academy of Sciences at Stockholm* for 1803, first Quarter, by M. Lindbom, captain of the Swedish mines." Note 1. For a translation, see de Grubbens 1804. de Grubbens lived for 5 years in China. He prepared soy sauce in 1759 in Canton and brought some bottles of soy that he made to Sweden. Mease lived 1771-1846.

Note 2. This is the earliest English-language document seen (April 2012) that uses the term "Japanese *Soy*" (or "Japanese soy") to refer to Japanese-style soy sauce.

Note 3: This is the earliest English-language document seen (Jan. 2007) that contains string "Soya" or the word "Soyae" in connection with soybeans. The word "Soyae," used as the species name of the soybean may have been a mistake or typographical error, just as the genus name "Deliches" was also an error; neither one was never used again. Mease may have intended to write *Dolichos soja* L., although the correct scientific name of the soybean at this time (1810) was *Soja hispida* Moench. Address: Secretary to the Agricultural Society of Philadelphia, Pennsylvania.

282. Ukiyo burô. 3 vols. 1811. Japan. [Jap]*
• ***Summary:*** According to Ryoichi Iino (2003, p. 10) the term *oshidashi* was used in this book to indicate / refer to soy sauce.

283. Lindner, Friedrich Ludwig. 1811. Neueste Laender- und Voelkerkunde: Ein geographisches Lesebuch fuer alle Staende. Vol. 11 [The newest geography and ethnology: A geographical reader for those in all walks of life. Vol. 11]. Weimar [Germany]: The Geographical Institute. [Ger]
• ***Summary:*** This seems to be a German translation of *A Voyage to Cochinchina, in the Years 1792 and 1793,* by John Barrow Esq. Lock-Soy is mentioned on page 543.

284. Pinkerton, John. 1811. A general collection of the best and most interesting voyages and travels in all parts of the world: Many of which are now first translated into English. Digested on a new plan. Vol. 7. London: Printed for Longman, Hurst, Rees, Orme, and Brown. 820 p. See p. 269.
• ***Summary:*** Each book of this 17-volume work is composed of unnumbered chapters, each describing a different voyage. One of these (p. 231-270) is "The embassy of Peter de Goyer and Jacob de Keyzer from the Dutch East India Company to the Emperor of China in 1655. By John Nieuhoff, Steward to the Ambassadors. Translated from the Dutch."

The Introduction begins: "Although China was discovered over land by Marco Polo the Venetian, towards the end of the thirteenth century, yet it was very little known to Europeans, till the Portugueze [Portuguese] arrived there by sea towards the end of the fifteenth, and the Romish [Catholic] missioners found admittance into the empire. In 1517, they established a trade at Quan-tong [Guangdong], commonly called Kanton [Canton]: afterwards they settled a factory also at Ning Po [Ningbo], called by them Liampo, on the eastern part of China, and drove a considerable trade along the coast, between those two famous ports, till their unsufferable [insufferable] pride and insolence brought on their destruction every where but at Ma-kau, or Makao [Macau], an island in the mouth of the river of Kanton [Pearl River], which they still hold, though under great restrictions."

On p. 269 we read that the daily allowance of food by the two ambassadors (de Goyer and Keyzer) included "six tael of mison" (possibly miso). Note: A tael is a unit of weight equal to 1/10 of a catty, or about 50 gm.

"Their secretaries daily allowance was, one katti [catty, a measure of weight] of fresh meat, five measures of tea, one katti of meal, one measure of taufoe [tofu],... four measures of oil, four tael of mison [miso?], one katti of herbs, and one cup of arrac" [arrack, a strong distilled alcoholic beverage mainly in South- and Southeast Asia].

Note 1. This is the earliest English-language document seen (April 2013) that uses the word "taufoe" to refer to tofu.

Note 2. Kaempfer's History of Japan–first published in English in 1727–also appears in this book. The text is almost identical to the 1727 text. The section about soybeans and soyfoods is in Chapter 6, pages 697-98.

Note 3. Pinkerton lived 1758-1826. Address: Author.

285. Virey, Julien-Joseph. 1811. Traité de pharmacie: Théorique et pratique [Treatise on pharmacy: Theory and practice]. Paris: Rémont and Ferra. 613 p. See Vol. 1, Book 1, p. 107. [Fre]
• ***Summary:*** In Book 1, in section 85 (p. 103) on Legumes, is a subsection titled "Dolic" which states: The *D. Soja,* L. of Japan, has excellent seeds. A sauce is made with the soybean (*le soja*) which is very highly esteemed in Europe.

Note: Julien-Joseph Virey lived 1775-1846. Address: Head Pharmacist, Military Hospital of Paris.

286. Davies, Benjamin. 1813. A new system of modern geography: or, A general description of the most remarkable countries throughout the world;... 3rd ed. Philadelphia, Pennsylvania: Published by Johnson and Warner,... xxiv + 25-447 p. See p. 183.
• ***Summary:*** In the chapter on Japan (p. 178-84), the section titled "Vegetable and animal productions" states (p. 183): "The ginger, the soy-bean, black pepper, sugar, cotton, and indigo, though perhaps natives of the more southern regions of Asia, are cultivated here with great success, and in vast abundance."

Note: One interesting section (p. vii-xii) is titled "The common names of ancient geography, explained by the synonymous modern names, and arranged in alphabetical order." For example: "Albion, now England... Batavia, now Holland... Belgium, now Flanders... Lusitania, now Portugal... Lutetia, now Paris... Memphis, now Cairo, the capital of Egypt... Scandinavia, now Denmark, Norway and Sweden... Thracia, now Romania... Vindebona, now Vienna, capital of Austria." Address: [United States].

287. Stiles & Williams. 1813. Classified ad: Java coffee, Japan soy, spices, &c. *Baltimore Patriot & Evening Advertiser.* Oct. 1. p. 3.
• ***Summary:*** "... 50 mats old Java. Coffee. 2 dozen bottles Japan Soy [sauce], a scarce and delicious Catsup. A few bottles Curry and old Arrack."

Note: What a surprising and interesting definition of "Japan Soy!" Address: Corner of Market and South Streets.

288. Asano, Kozo? 1813. Maniawase ryôri. Sassoku hôchô. Shôjin gyorui [Makeshift, quick cooking. For Zen vegetarian and fish cookery]. Osaka, Japan: Kochiya Kashichi. Japanese summary by Kawakami 1978. [Jap]
• ***Summary:*** The author (who is not known for sure, by may be Asano) lists recipe names and explains briefly how to make them, including recipes using miso.

289. Keizai yôroku 1813. Japan. [Jap]*
• ***Summary:*** Iino (2003, p. 9) notes that this 1813 book "states that the highest quality soy sauces are made using wheat as the flavor harmonizes well with the soybeans." Iino comments that this supports "the idea that wheat, rather than barley, made for a better soy sauce. Therefore, it is thought that the switch from soy sauce made with barley to that made with wheat had been completed by the 18th century." Address: Japan.

290. Kyônan rubetsu-shi [History of Kyonan Rubetsu?]. 1813. Japan. [Jap]*
• ***Summary:*** This work contains the earliest known reference to "yuba" written in the Japanese way. The new term's origin is explained as follows: "On Yuden Mountain, a sacred holly mountain in the feudal province of Dewa, there was an inn, Kinshiya Inn, which was visited by many pilgrims who came to the mountain to pray. The esteemed vegetarian cuisine was prepared by an old woman who was very skilled at making a variety of delicious foods from ground soybeans and soymilk. One of the foods was a thin film, which she fried before seasoning it. Others liked it so much that they began to make it themselves here and there. Sometimes they made it in the shape of bags and squares. In Kyoto, the capital, they used it in vegetarian dishes. Since the new food had been created by the old woman of Yuden Mountain, people named it *yuba,* where *yu* is taken from the *Yu* of Yuden Mountain, meaning 'hot water' and *ba* is the character for 'old woman.'"

Note that while this word was pronounced "yuba," just as it is today, the second character is different from the character used today.

291. Milburn, William. 1813. Oriental commerce; containing a geographical description of the principal places in the East Indies, China, and Japan, with their produce, manufactures, and trade... Vol. II. London: Black, Parry & Co. See p. 519-20.
• ***Summary:*** The subtitle continues "... including the coasting or country trade from port to port; also the rise and progress of the trade of the various European nations with the Eastern world, particularly that of the East India Company, from the discovery of the passage round the Cape of Good Hope to the present period; with an account of the company's establishments, revenues, debts, assets, &c at home and abroad. Deduced from authentic documents, and founded upon practical experience obtained in the course of seven voyages to India and China."

"Soy [sauce]: Is prepared in China and Japan, from a particular species of bean, in the following manner:–the beans are boiled till they become rather soft, to which an equal quantity of wheat or barley is added, and set in a warm place to ferment; the same quantity of salt is then put to the mixture, and three parts as much water added to it. After being properly mixed, it is left to stand, well covered, for two or three months; it is then pressed, and strained off, and kept in wooden vessels. Some places produce better soy

© Copyright Soyinfo Center 2014

[sauce] than others, but exclusively of that, it grows better and clearer through age; its colour is invariably brown. Japan soy is esteemed superior to the Chinese, and is an article of trade from thence to Batavia [Jakarta]. The Dutch, in order to preserve the best sort, and prevent its fermenting, boil it up, and afterwards draw it off into bottles, which are then well corked and sealed.

"Soy should be chosen of a good flavour, not too salt or too sweet, of a good thick consistence, of a dark brown colour and clear; when shaken in a glass, it should leave a coat on the surface, of a bright yellowish brown colour; if it does not, it is an inferior kind, and should be rejected."

Note 1. This is the earliest document seen (May 2012) which states that soy can be shaken in a glass to determine its quality. It is also the first which states that good-quality soy, "when shaken in a glass," "should leave a coat on the surface, of a bright yellowish brown colour..."

"The following are the quantities imported and sold at the East India sales, in the years 1804 to 1808 inclusive, together with sale amount and average price per gallon" [see table below]:

1804: None.

1805: 443 gallons worth £317 (March Sale) and 1125 gallons worth £642 (September Sale), for a total of 1568 gallons worth £959 (average 12 shillings 5 pence per gallon).

1806: 807 gallons worth £477 (September Sale); (average 11 shillings 10 pence per gallon).

1807: None.

1808: 2148 gallons worth £2022 (September Sale); (average 18 shillings 10 pence per gallon).

252 gallons of soy are allowed to a ton. Note 2. Total sold during the 5 years: 4523 gallons worth £3458. Address: Of the Honourable East India Company's Service.

292. Virey, Julien-Joseph. 1814. Des fruits alimentaires [Edible fruits]. *Bulletin de Pharmacie et des Sciences Accessoires* (*Paris*) 6(1):5-25. Jan. See p. 10-11. [Fre]
• ***Summary:*** In the section on "Dry fruits, farinaceous fruits, or those containing amylaceous [sweet] starch" (p. 9), subsection 5 is titled "Crude starch of leguminous seeds and those containing various principles." It states: Before their perfect maturity, *Dolichos lablab, D. chinensis, D. ensiformis, D. lignosis, D. soja, D. catiang, D. tetragonolobus* of Linné [Linnaeus] and Thunberg, which are species of beans (*haricots*) from Asia, contain more or less of the saccharine principle combined in their starch, and above all the soybean (*le soja*) of the Japanese and the catiang of the Chinese.

Gluten is mentioned on page 9, Job's tears on p. 10, and chick peas and lupins on page 11. Address: France.

293. Layman, William. 1814. Hints on slave labour and West India cultivation. *Gentleman's Magazine* (*London*) 84:561-68. June; 84:657-64. Supplement. Part I. New Series. See p. 659.
• ***Summary:*** This is basically a condensation of the following 93-page book published 7 years earlier: Layman, William. 1807. *Outline of a Plan for the Better Cultivation, Security, & Defence of the British West Indies: Being the Original Suggestion for Providing an Effectual Substitute for the African Slave Trade, and Preventing the Dependence of those Colonies on America for Supplies.* London: Printed and Sold by Black, Parry, and Kingsbury, Booksellers to the East India Company. viii + 9-93 p.

A table (p. 659) states: "Soy-bean–Dolichos Soja–Japan." "Soy–China." Address: Captain.

294. Tokaidôchû hizakurige 1814. Japan. [Jap]*
• ***Summary:*** According to Ryoichi Iino (2003, p. 10) the term *oshidashi* was used in this book to indicate / refer to soy sauce.

295. Santo Kyoden. 1815. Kottô-shû [Collected antiques. Historical essay on this transitory world]. 2 volumes. Japanese summary by Kawakami 1978, p. 243. [Jap]
• ***Summary:*** This work contains an early reference to yuba, and offers a different etymology of the term from that given in the *Kyonan Rubetsu-shi* of 1813. *"Doufu-p'i* has traditionally been called *yuba,* however this is a mispronunciation. Its real name is *uba.* Some people say that the reason this film is called *yuba* [written with the characters 'hot water' plus 'old woman'] is due to its yellowish color and the wrinkled surface, which resembled the face of an old woman. However this is not true. According to the *Isei teikin ourai* [Encyclopedia in question and answer format, written in ca. 1730] yuba is called *tofu uwamono* [literally 'tofu upper substance'] and this is the correct name, since yuba is a film which forms on the surface while making tofu. It is also abbreviated as *tofu-no-ha* ('tofu film'). *Uba* is a mispronunciation of *uha,* in which the sound *ha* is mispronounced as *ba. Uba* and *yuba* each contains the sound *uba,* so that it is quite understandable that the dialectical term *yuba* was created."

296. Tuckey, James Hingston. 1815. Maritime geography and statistics: or, A description of the ocean and its coasts, maritime commerce, navigation, &c. &c. &c. Vol. III. London: Printed for Black, Parry, and Co. Booksellers to the Hon. East-India Company. vii + 567 p. Index.
• ***Summary:*** "The exports from Japan by the Dutch Company are copper in bats and camphire, each ship's cargo consisting of 675O pickle [piculs] of the former, and 364 boxes* of camphire, of 125 lbs. each; all of which are purchased on the Company's account only.

"The articles permitted to be purchased by the individuals of the crew are tea, soy [sauce], porcelain, silk and rice." Address: A commander in the Royal Navy.

• ***Summary:*** In the section on "Fruit" (p. 89), subsection 5 (p. 97) is on the vegetables with pods, or papilionaceous vegetables, of which many types are listed, including Dolichos soja. These foods are accused of causing intestinal gas, although they are very nourishing and agreeable, above all the soybean (*le soja*) of Japan and the catiang of China.

Lupins and peanuts are also mentioned. Sesame seeds are mentioned on p. 98.

Note: The subtitle is: By a Society of Physicians and Surgeons (*Par une Société de Médecins et de Chirurgiens*).

299. Encyclopædia Perthensis; or, Universal dictionary of arts, sciences, literature, &c. 2nd ed: Soy, or sooju. 1816. Edinburgh: Printed for John Brown. 23 volumes. See vol. XXI. Soy. (p. 197-98). [1 ref. Eng]
• ***Summary:*** "Soy [sauce], or Sooju, n.s., a celebrated pickle, much used by the Japanese, made from the *mame* or beans of the *Dolichos Soja.* (See Dolichos, No. 3). To make it they take equal quantities of the beans boiled to a certain degree of softness; of *muggi,* or corn, whether barley or wheat, roughly ground; and of common salt. Having properly mixed the beans with the pounded corn, they cover up the mixture, and keep it for a day and a night in a warm place, to ferment; then putting the mass into a pot, they cover it with the salt, pouring over the whole two measures and a half of water. This compound substance they carefully stir at lest once a day, for two or three months; after which, they filtrate and express the mass, preserving the liquor in wooden vessels. The older it is, the better and the clearer; and if made of wheat at instead of barley, greatly blacker. The first liquor being removed, they again pour water upon the remaining mass; which, after stirring for some days, as before, they express a second time, and thus obtain an inferior sort of soy."

300. Encyclopaedia Britannica; or, A dictionary of arts, sciences, and miscellaneous literature. 5th ed. Illustrated with nearly six hundred engravings. Enlarged and greatly improved. 20 vols. 1817. Edinburgh: Printed at the Encyclopaedia Press for Archibald Constable. Illust. 28 cm. *
Address: Edinburgh, Scotland.

301. Kitchiner, William. 1817. Apicius redivivus; or, The cook's oracle: wherein especially the art of composing soups, sauces, and flavouring essences is made so clear and easy, by the quantity of each article being accurately stated by weight and measure, that every one may soon learn to dress a dinner, as well as the most experienced cook; being six hundred receipts [recipes], the result of actual experiments instituted in the kitchen of a physician, for the purpose of composing a culinary code for the rational epicure, and augmenting the alimentary enjoyments of private families; combining economy with elegance; and saving expense to housekeepers, and trouble to servants. London: Printed for Samuel Bagster. Unpaginated. First edition. 15 cm.
• ***Summary:*** Since the pages are unnumbered, it is sometimes difficult to describe exactly where references to soy are found. In the chapter on "Roasting," at the end of No. 62 is a "Recipe to sauce for wild fowls" which contains this ingredient: "Sauce à la Russe*, (the older the better), 1 tablespoonful." A footnote on that page states: "* By à la Russe we suppose cavice, or coratch, or soy [sauce], is meant."

In the chapter on "Broths, gravies, and soups," at the top of the 6th page we read: "culinary scribes indiscriminately cram into almost every dish, anchovies*, garlick, bay leaves, and that hot, fiery spice, Cayenne pepper." A footnote on the same page explains the asterisk (*) after "anchovies": "* Soy, cavice-coratch, anchovies, curry powder, browning, catsup, pickle liquor, beer, and wine, are occasionally very convenient auxiliaries to soups, &c.:"

The recipe for "Plain browning (No. 322) Is a very convenient article in the kitchen, to add to those soups or sauces where it is supposed the deep brown of its complexion denotes the strength and savouriness of the composition, and it is a very good substitute for what is called 'India, or Japan Soy.' Put half a pound of moist sugar and a tablespoonful of water into a clean iron saucepan..."

Recipes in the book that call for "Soy" [sauce] as an ingredient include: Mackarel broiled (No. 169; "send it up with fennel sauce in a boat, or plain butter with mushroom catsup or soy in it"). Mackarel roe sauce (No. 266). Cream sauce for fish (No. 277). Camp vinegar (No. 403). Fish sauce (No. 425).

The "Original receipt for Quin's sauce (No. 424) does not contain soy sauce in this edition, although it does in later editions. However it does state: "Obs. [Observations]– The above is copied from this celebrated epicure's original receipt now lying before me, for which I am indebted to Wm. Blachford. Esq., of Gray's Inn: it authenticity may be fully relied on. This sauce is prepared, as here described, by Messrs. Ball, 81, New Bond St., London." Note 1. In early recipes for prepared sauces, such as Worcestershire, soy

© Copyright Soyinfo Center 2014

was considered a secret ingredient, and was therefore not revealed."

Note 2. Tom Jaine, expert on early culinary history, of Prospect Books (England) thinks (Dec. 2007) that "Obs.–" stands for "Observation(s)."

The section titled "The magazine of taste" (No. 463, near back of book) contains a list of 28 "flavoring materials" which will enable "the thorough-bred *gourmand"* to develop a mahogany "sauce box" containing bottles of favorite ingredients. No. 15 is "Soy (436)." This refers to soy sauce; No. 436 is a recipe for making it at home. The other materials include: Pickles, brandy, curacao, salad sauce, pudding catsup, sauce superlative or double relish, walnut pickle, mushroom catsup, vinegar, oil, mustard, curry powder, etc.

Turning to No. 436 we read: "SOY. (No. 436.). To a small teacupful of water add half a pound of treacle, or moist or lump sugar; set it on the fire in an iron pot till it boils to a dark brown colour, keep stirring it, and take great care, or it will burn: when it is become quite thick, add to it a quarter ounce of salt, and gradually as much water as will reduce it to the consistency of soy; mix well together and boil up for 5 minutes. The addition of a quarter of a pint of good strong beef glaze (Footnote: See No. 187) to three quarters of a pint of the burnt sugar will very much improve it: those who like a goût [taste] of acid may add vinegar.

"Obs.–This will hardly be told from what is commonly called *"genuine India soy,"* and will answer every purpose that is used for. Burnet treacle, or sugar, and Chili vinegar, garlick, and pickled fish appear to be the bases of almost all the sauces that are now sold in the oil-shops. Although indefatigable research and experiment has put us in possession of all these compositions, it would not be quite fair to enrich the cook at the expense of the oilman, &c."
Note 3. The meaning of "Burnet treacle" is unclear. Burnet is a common herb. Treacle mustard is a plant. And treacle is the British word for molasses.

Concerning catsup: "Mushroom catsup" (No. 439) is mentioned 30 times in this book. After the basic recipe we read: "Excellent mushroom catsup may be had at Butler's herb and seed shop, opposite Henrietta Street, Covent Garden [central London]. "Walnut catsup" (No. 438) is mentioned 8 times. Also mentioned are: Oyster catsup (No. 441), Cockle and muscle [sic] catsup (No. 442), Tomata catsup [tomato catsup] (No. 443), White catsup (No. 444), Cucumber catsup (No. 445), and Pudding catsup (No. 446). The word "catchup" does not appear in this book.

The author–who name does not appear on the title page of this first edition–lived 1775?-1827. He was a nonpracticing Scottish physician. Address: England.

302. Raffles, Thomas Stamford. 1817. The history of Java. 2 vols. London: Black, Parbury & Allen. Vol. 1, xlviii + 479 p. Vol. 2, cclx + 291 p. See vol. I, p. 98. Oxford in Asia Historical Reprints, Oxford Univ. Press, 1978.
• ***Summary:*** In the section titled "Cooking" (Vol. I, p. 98) we read: "The Chinese prepare from the *gédelé* [*kédelé* = soybean] a species of soy [sauce], somewhat inferior to that brought from Japan.

A passage on rice cultivation (Vol. I, p. 116-17) states: "Besides the annual crop of rice which is raised on the *sáwah* lands, a variety of plants are raised upon them as a second or light crop within the same year. Among these are several species of *káchang* or bean... Among the most important are... *kédéle* [soybeans]..." "Together with rice are deposited the seeds of other vegetables, which arrive to maturity at different periods, chiefly after the rice harvest. The most common and useful among these is cotton... Next to this are various leguminous and other plants, which do not interfere with rice. No less than six or eight kinds of vegetables are sometimes in this manner seen to shoot up promiscuously in a single field."

The section on Java's "Oil-giving plants" (p. 123) states: "Of the oil-giving plants there are many. The *káchang góring* of the Malay countries, or, as it is indifferently termed by the Javans, *káchang chína, pénden,* or *tána* [peanut] is cultivated almost exclusively for the purpose of obtaining its oil... It is never employed as an article of food by itself; but what remains of it after the oil is expressed, forms an ingredient for the seasoning of rice... The oil is obtained by grinding the seeds between two grooved cylinders, and then separating it either by expression or boiling. The former is chiefly used by the Chinese, and yields as a refuse the oil-cakes, which I formerly observed were employed as manure in some of the gardens near Batavia."

Raffles (lived 1781-1826) was lieutenant-governor of Java from 1811 to 1816. He acquired and founded Singapore on 6 Feb. 1819. A 2nd edition was published in 1830 in London by J. Murray. Address: Lieutenant-Governor of Java.

303. Beeler (Louis). 1818. Classified ad: Just received. *Alexandria Herald* (*Virginia*). Jan. 28. p. 4.
• ***Summary:*** "... Also, fresh Zaan-currants, ground nuts, palm nuts of a new kind,... cloves, cinnamon, nutmegs, mace, Japan soy [sauce] or East India catsup, almond oil, English mustard,..."

Note 1. This is the earliest document seen (Sept. 2011) concerning soybean products (soy sauce) in Virginia. This document contains the earliest date seen for soybean products in Virginia (Jan. 1818); soybeans as such have not yet been reported.

Note 2. The idea that soy [sauce] is a type of catsup [regardless of spelling] from the East Indies continues to persist.

• ***Summary:*** This book starts when the author's ship lands in China in Aug. 1816. It contains the earliest indirect reference seen to fermented tofu in Okinawa or Ryukyu. In 1816 Captain Hall, an Englishman, visited Naha harbor in Okinawa on his way from China. On 23 Sept. 1816 he and his party and Captain Maxwell went to visit the king of Loochoo (today's Ryukyu Islands, including Okinawa). They enjoyed a meal of local food with a Loochoo chief. A detailed description of the meal is given (p. 95-97). "An entertainment was now served, beginning with a light kind of wine, called sackee (*saké*), which was handed round in very diminutive cups, filled... from a small high pot in which the sackee was kept hot. They insisted on our emptying the cup every time, showing us a fair example themselves. During the whole feast the sackee never left the table, being considered apropos to all the strange dishes which we partook of. The first of these consisted of hard boiled eggs, cut into slices, the outside of the white being colored red. A pair of chopsticks was now given to each person... There was something like cheese given us after the cakes, but we cannot form a probable conjecture of what it was made. Most of the dishes were so good that we soon made a hearty dinner..." The author states (p. 217) that "milk is never used" on the island.

Note 1. The red color was probably imparted to the outside of the shelled eggs by red rice koji (*beni koji*) and the food resembling cheese may well have been *tofuyo,* a special type of fermented tofu, which is also made with red koji and for which this area was famous. There is no information on fermented tofu in Korea.

Note 2. If the above conjectures are true, this would be the earliest document seen (Oct. 2011) that mentions *tofuyo* or Okinawan wine-fermented tofu, and the earliest English-language document seen (Jan. 2014) that mentions fermented tofu. It would also be the earliest document seen (Jan. 2014) that mentions red koji (*beni koji*).

Note 3. This is the earliest document seen (Jan. 2014) that mentions Okinawa in connection with soy.

Note 4. "Chopsticks" are also mentioned elsewhere in this book (p. 116, 160): "for instance, when we first tried to eat with their chopsticks: on that occasion there was a sort of giggling embarrassment shewn by some of us,..." Address: England.

308. Shôjin ryôri tsû [The connoisseur of Zen vegetarian cookery]. 1818. Japan. [Jap]*
• ***Summary:*** The fifteenth earliest known reference to Kori-dofu (dried-frozen tofu) appeared in this work.

309. *Port Folio* (*The*) (*Philadelphia and London*). 1819. On China. 7(2):91-111. Feb. See p. 105-06.
• ***Summary:*** The article begins: "The following letter from a gentleman of this city [Philadelphia, Pennsylvania?], now abroad, is the result of careful observation, during a long residence among the people whom it professes to describe."

Page 105: "The Chinese make great use of beans, not only to feed their sheep and cattle, but also as food for themselves, in what they call, *thow foo* [doufu; tofu], and *foo chack,* [dried yuba sticks], a kind of flummery [soft jelly or porridge], exceedingly palatable and nourishing."

Note 1. This is the earliest English-language document seen (Oct. 2012), and the earliest European document seen (Oct. 2012), that mentions yuba.

Note 2. This is the earliest English-language document

© Copyright Soyinfo Center 2014

seen (Oct. 2012), and the earliest European document seen (Oct. 2012), that mentions dried yuba sticks or rolls, which it calls *foo chack* [Chinese; also spelled elsewhere *foo jook, fooh jook* or *fuchu,* "bamboo yuba"]. The yuba is rolled so it looks like a bamboo shoot at each end then folded to form a "V." It is often cooked in a sweet broth, and eaten as a sweet soup; the dried yuba becomes soft, delicate and subtly sweet thin sheets.

"Soy [sauce] is likewise made from beans, with the aid of molasses and salt. The beans are boiled until nearly all the water evaporates and they begin to burn; they are then placed in large jars exposed to the sun, water and molasses are poured upon them and stirred well every day until the liquid is completely impregnated with their flavour; it is then strained off, salted, boiled and skimmed, until perfectly clarified. It will keep any length of time. Many persons have thought that gravy was employed in this condiment, which is not the case, it being entirely a vegetable composition, and certainly very wholesome and agreeable. There are many qualities of it, and it requires much care and attention to make the best. Japanese soy is most esteemed, and is vastly superior to any made in China. Many shopkeepers have large platforms on the roofs of their houses, where a number of jars are placed, for the purpose of making this article of which there is an enormous consumption, since neither rich nor poor can breakfast, dine, or sup without it. It is sauce for every sort of food, gives zest to every dish, and is the *sine qua non* of a Chinese meal."

310. *P.P.F. DeGrand's Boston Weekly Report.* 1819. Shipping news: Abstract of foreign arrivals. June 5. p. 1.
• ***Summary:*** "May 31st. Ship *Levant,* [Captain] Cary, of Boston, from Canton, 128 days.–1530 boxes sugar;... 2 boxes China; 1 tub Candy; 1 box Japan Soy [sauce]."

In the same issue of this newspaper (p. 3) is a section titled "Consignees of Foreign arrivals," which shows that the 1 box of Japan Soy has been consigned to "Adventures."

Note: The meaning of the word "Adventures" is not clear. Most of the goods were assigned, by name, to various merchants or their companies. Of the many types of merchandise that arrived from May 29 to June 2, this is the only lot assigned to "Adventures."

311. Golownin, Capt. Vasilii Mikhailovich [Golovnin, Mikhaiforich]. 1819. Recollections of Japan, comprising a particular account of the religion, language, government, laws and manners of the people, with observations on the geography, climate, population & productions of the country. with observations on the country and the people. To which is added an account of voyages to the coast of Japan, and of negotiations with the Japanese, for the release of the author and his companions, by Captain Rikord. Vol. II. London: Printed for Henry Colburn. 302 p. See p. 157, 213. No index. 22 cm.

• ***Summary:*** Page 157: "... many kinds of beans, which are a favorite dish of the Japanese; they sometimes eat them merely boiled in water, sometimes in treacle or soy [sauce]; small beans are often boiled with thick rice, and pass for a great delicacy. The Japanese soy is also prepared of beans, and turned sour in casks. They say that three years are required for preparing the best soy."

Page 213: Footnote: "The imports by the Dutch ships at Nangasaki, consisted, in 1775, of sugar, elephant's teeth, Japan wood for dying, tin, lead, bar-iron, fine chintzes, Dutch cloths of various colours and fineness, silks, spices, tortoise-shell, saffron, Venice treacle, Spanish liquorice, canes, optical glasses, watches, and the sea-unicorns' horns from Greenland, which bear a high value in Japan. The exports were copper, raw camphor, lackered wood work, porcelain, silks, rice and soy" [sauce]. Address: Russian Navy.

• ***Summary:*** "Soy [sauce], or Sooju, a species of liquid condiment, which is imported from India, and is used as a sauce for fish. It is prepared from the leguminous fruit of the soja (*dolichos soja,* Linnéus) a native of Japan.

"The pods are first boiled, till they become soft; when equal parts of them, and of muggi (wheat or barley that has been coarsely ground) are thoroughly mixed. This preparation is then kept in a close vessel, and a warm place, for twenty-four hours in order to ferment; after which the mass is put into a pot, and covered with a large portion of common salt, when two measures and a half of water are poured over the whole. The compounds is stirred, once at least, every day, for the space of two or three months; and, at the end of that period, it is filtered; the expressed liquor being preserved in wooden barrels. Fresh water is then added to the same mass; which, after stirring it occasionally for several days, is at length strained; and the liquor, though of an inferior kind, thus rendered fit for use.

"Soy possesses a strong saline taste, but has only a slight aromatic flavour: it is chiefly used at the tables of the luxurious; and is one of those artificial stimulants of the palate, which deserves no commendation, especially for vitiated or relaxed habits."

Note: This entry is copied from: Mease, James. 1804. "Soy." In: A.F.M. Willich, ed. 1804. *The Domestic Encyclopedia.* Philadelphia, Pennsylvania: William Young Birch and Abraham Small. See Vol. V, p. 12-13. Address: 1. Esq., F.R.S., Member of the American Philosophical Society, and of the Linnean Society of Philadelphia; 2. LL.D., Of the Royal Military Academy, Woolwich,...; 3. Mr., of Cambridge.

collection of old documents. 670 vols.]. Tokyo Japan. New ed. published 1959-60. [Jap]*

• ***Summary:*** The compiler was born in 1746 in Hokino Village, Saitama prefecture, about 100 km north of Tokyo. He was a great Japanese scholar–and he was blind. At age 34 he decided to begin the compilation of this large work. He set out to gather as many old documents as possible from all over Japan, and examine and select worthy ones for compilation, regardless of their character. Thanks to his efforts, it is now possible for everyone to refer to them whenever they want.

Kawakami and Kimura (1985, p. 36-37) state that *shiokara natto* (also called *tera-natto*) was first mentioned in the *Gunsho Ruijû* (*Katsuji-hon,* p. 344, lower section). They think this compilation is one of the oldest documents in Japanese literature to mention fermented black soybeans. But after that fermented black soybeans in Japan were called *Kaori no Daizu* (or *Ko no Daizu*–Fragrant soybeans). They think the second-earliest mention was in the *Hôchô Kikigaki,* which they think was published in about 1560-1580. However this 2nd book was published in the *Gunsho Ruiju* (*Katsuji-hon,* p. 800, upper section, 6th line).

In 1959-60 a new edition of *Gunsho Ruiju,* compiled and published by the Zoku Gunsho Ruijû Kansei Kai ("Complete Society"). See Section 9; *Bun Pitsu Bu* (Literature Dept.), and *Shôsoku Bu* (News Dept.) Also Section 23. *Buke Bu* (Samurai warrior Dept.). Address: Japan.

314. Rees, Abraham. ed. 1819. The cyclopedia; or, universal dictionary of arts, sciences, and literature: Dolichos soja. London: Longman, Hurst, Rees, Orme & Brown. See vol. XII. Dol. N.P. (Unpaginated). [2 ref. Eng]

• ***Summary:*** "Of the upright kinds [of Dolichos], *D. soja,* Linn. Sp. Pl. 1023. Jacq. Ic. Rar. t. 145, a native of Japan and the East Indies, is famous for its seeds, a great article of food in China and Japan. They are made into a kind of jelly or curd [tofu], esteemed very nutritious, and rendered palatable by adventitious seasoning; or they are prepared with salt, so as to produce the liquid well known at our tables by the name of Soy [sauce]. The flowers of this species are small and unornamental."

First cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished.

Note 1. This is the earliest English-language document seen (Feb. 2004) that mentions tofu in connection with Japan.

Note 2. This is the earliest English-language document seen (April 2013) that uses the word "jelly" in connection with tofu.

Note 3. This is the earliest English-language document seen (Nov. 2002) that uses the term "upright" to describe the soybean plant.

Note 4. This is the earliest English-language document seen (Dec. 2003) with the word "nutritious" (or "nutrition," "nutritional," "nutritive," or "nutrients") in the title that also mentions soy.

Note 5. Sylvester Graham is said to have obtained much of his information about milling, bread baking, and early diets from this encyclopedia (McCance & Widdowson 1956, p. 49).

315. Crawfurd, John. 1820. History of the Indian Archipelago. Containing an account of the manners, arts, languages, religions, institutions, and commerce of its inhabitants. 3 vols. Edinburgh: Printed for Archibald Constable and Co.; London: Hurst, Robinson, and C. See vol. 1, p. 197-98, 370. Vol. 3, p. 319.

• ***Summary:*** Note: "Indian Archipelago" probably refers to today's Indonesia and Malaysia.

In Vol. 1, the chapter on "Useful arts" states (p. 197): "This preparation, called by the Malays *blachang,* and by the Javanese *trasi,* is a mass composed of small fish, chiefly prawns, which has been fermented, and then dried in the sun. This fetid preparation, so nauseous to a stranger, is the universal sauce of the Indian islanders, more general than soy [sauce] with the Japanese. No food is deemed palatable without it."

Continuing on p. 198: Dampier describes it with perfect accuracy, as follows: "Baluchaun is a composition of a strong savour, yet a very delightsom dish to the natives of this country. To make it, they throw the mixture of shrimps and small fish into a sort of weak pickle, made with salt and water, and put it into a tight earthen vessel or jar. The pickle being thus weak, it keeps not the fish firm and hard, neither is it probably so designed, for the fish are never gutted. Therefore, in a short time they turn all to a mash in the vessel; and when they have lain thus a good while, so that the fish is reduced to a pap, they then draw off the liquor into fresh jars, and preserve it for use. The masht fish that remains behind is called balachaun, and the liquor poured off is called nuke-mum [nuoc-mam]. The poor people eat the balachaun with their rice. 'Tis rank scented, yet the taste is not altogether unpleasant, but rather savory, after one is a little used to it. The nuke-mum is of a pale brown colour, inclining to grey, and pretty clear. It is also very savory, and used as a good sauce for fowls, not only by the natives, but also by many Europeans, who esteem it equal with soy."* (Footnote: *"Dampier's Voyages, Vol. II, p. 28").

The chapter titled "Husbandry of the materials of food" notes (p. 370): "The whole class of leguminous plants are called by the generic name *Kachang.*

"The most commonly cultivated as green crops, are two broad leaved plants called *Kachang Kadale,* (*Phaseolus max,*) [soy bean] and *Kachang Ijo,* (*Phaseolus radiatus.*) The *Kachang Ijo,* or green pulse, is a superior grain to the last, but is more delicate, and requires more care in the culture. The Chinese colonists manufacture Soy from it [sic], and it is

© Copyright Soyinfo Center 2014

for their consumption chiefly that it is raised. Of the *Kadale* ten seeds are considered a good return, and of the other about seven may be an average."

In vol. 3, the chapter titled "Intercolonial commerce" states (p. 319): "The specific commodities which Japan is either capable of affording, or actually does afford, for exportation, are gold, silver, copper, tutenague [tutenag; zinc], iron, camphor, ambergris, tea, rice, soy [sauce], wrought silks, lacquered-ware, and earthenware." Address: F.R.S., Late resident at the court of the Sultan of Java.

316. Virey, Julien-Joseph. 1820. Histoire naturelle des médicamens, des alimens et des poisons, tirés des trois règnes de la nature [Natural history of medicines, of foods, and of poisons, drawn from the three kingdoms of nature]. Paris: Rémont and Ferra. xii + 570 p. See p. 281. Index. [Fre]
• ***Summary:*** In the section on "Legumes" is a subsection titled "Dolic" (p. 281) which states: The *D. Soja,* L. of Japan, has excellent seeds. A sauce is made with the soybean (*le soja*) which is very highly esteemed in Europe.

The word *soja* also appears once on p. 46 (*Les légumineuses sont celles des fèves, haricots, pois, lentilles, vesces, lupins, orobes, dolics, soja, arachide, etc.*), twice on page 413 (incl. the soybean of Japan -*le soja au Japan*), Z. Address: Medical doctor at the Faculty of Paris.

317. Kitchiner, William. 1821. The cook's oracle: containing receipts for plain cookery on the most economical plan for private families: Also, the art of composing the most simple, and most highly finished broths, gravies, soups, sauces, store sauces, and flavouring essences: The quantity of each article is accurately stated by weight and measure; the whole being the result of actual experiments instituted in the kitchen of a physician. 3rd ed., which is almost entirely re-written. London: Printed for A. Constable & Co., Edinburgh, and Hurst, Robinson, & Co., Cheapside. xvi + 464 p. 18 cm.
• ***Summary:*** The section titled "The magazine of taste" (No. 463, p. 371) contains a list of 28 "flavoring materials." No. 15 is "Soy" [sauce]. The others are the same as in the 1817 first edition.

After the word "Soy" is printed (No. 436) which should mean, according to the format of the book, that recipe No. 436 is a recipe for making soy sauce at home. However, when we look for No. 436 we are surprised to find that it is missing. Clearly recipe No. 436 for "Soy" has been removed since the 1817 edition (probably because the result tasted almost nothing like real soy sauce) but the cross reference on p. 371 was not.

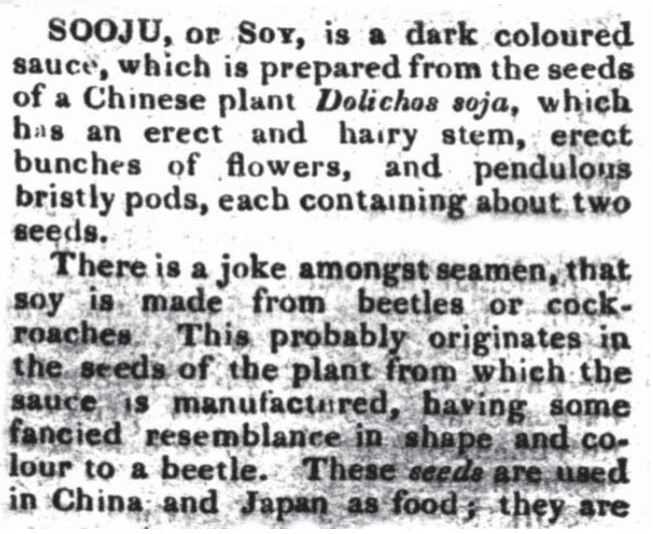
The recipe for Browning (No. 313) "Is a very convenient article to colour those Soups or Sauces... It will commonly be told from what is commonly called *'genuine Japanese Soy*,'* for which it is a very good substitute." (Footnote: *"'By the best accounts I can find, Soy is a preparation from the seeds of a species of the *Dolichos,* prepared by a fermentation of the farina of this seed in a strong lixivium of common salt.'– Cullen's *Mat. Med."* [*Lectures on the Materia Medica.* vol. i, p. 430]). "Browning" is made by simmering half a pound of pounded Burnt Sugar with water, stirring well. "Then add to it an ounce of salt, and dilute it by degrees with water, till it is the thickness of Soy;..."

Several other recipes in the book call for "Soy" [sauce] as an ingredient: Mackarel roe sauce (No. 266). Shrimp sauce (No. 283). Liver sauce for fish (No. 288). Camp vinegar (No. 403). Fish sauce (No. 425). Sauce superlative (No. 429). A note to this latter recipe states that one purpose is to enable "the good Housewives of Great Britain to prepare their own Sauces..."

In the Introduction, the author lists (in approximately chronological order) the title and date of publication of about 250 English recipe books that he has consulted. There are 14 books from 1513 to 1599, and 39 books from 1600-1699, and 90 books from 1700-1799, and 52 from 1800 to 1819.

Note 2. This book was first published in 1817, with the title *Apicius redevivus; or, The cook's oracle...* The author– who name does not appear on the title page of this 3rd edition–lived 1775?-1827. Address: [England].

318. Willich, Anthony Florian Madinger. 1821. The domestic encyclopedia: Or a dictionary of facts and useful knowledge. Chiefly applicable to rural & domestic economy. 2nd American edition, with additions, by Thomas Cooper. Esq, M.D.: Sooju or soy. Philadelphia, Pennsylvania: Abraham Small. See vol. 3, p. 264-65.



SOOJU, or Soy, is a dark coloured sauce, which is prepared from the seeds of a Chinese plant *Dolichos soja*, which has an erect and hairy stem, erect bunches of flowers, and pendulous bristly pods, each containing about two seeds.

There is a joke amongst seamen, that soy is made from beetles or cock-roaches. This probably originates in the seeds of the plant from which the sauce is manufactured, having some fancied resemblance in shape and colour to a beetle. These *seeds* are used in China and Japan as food; they are

• ***Summary:*** "SOOJU, or Soy [sauce], is a dark coloured sauce, which is prepared from the seeds of the Chinese plant *Dolichos soja,* which has an erect and hairy stem, erect bunches of flowers, and pendulous bristly pods, each containing about 2 seeds.

"There is a joke amongst seamen, that soy is made from beetles or cockroaches. This probably originates in the

© Copyright Soyinfo Center 2014

seeds of the plant from which the sauce is manufactured, having some fancied resemblance in shape and colour to a beetle. These *seeds* are used in China and Japan as food; they are made into a kind of jelly or curd [tofu], which is esteemed very nutritious, and which is rendered palatable by seasonings of different kinds [see A. Rees 1819]. The liquid which we know by the name of *soy* is thus prepared. After the seeds have been boiled, until they become soft, they are mixed with an equal weight of wheat or barley meal, coarsely ground. This mixture is fermented; and a certain portion of salt and water being added, the whole is allowed to stand for two or three months, care being taken to stir it every day: and by the end of that time it is ready for use.

"Soy is chiefly prepared in China and Japan; but that imported from Japan is considered preferable to any other. The quantity annually vended at the East India Company's sales is from 800 to 2000 gallons; at an average price of sixteen or eighteen shillings per gallon.

"The Soy-bean bears the climate of Pennsylvania very well. The bean ought therefore to be cultivated."

Note 1. This is the earliest document seen, published in America, that mentions tofu. Willich got his definition of tofu from *The cyclopedia; or, universal dictionary of arts, sciences, and literature* (see Dolichos soja) edited by Abraham Rees (1819).

Note 2. This is the earliest document seen (May 2012) that mentions the words "beetles" or "cockroaches" as an ingredient in the production of soy sauce. This idea is, of course, totally incorrect.

Note 3. This is the earliest document seen (Oct. 2010) that gives statistics for the amount of soy sauce sold per unit of time in England, or the sale price per unit volume.

Note 4. According to the *Oxford English Dictionary,* the "East India Company is a company formed for carrying on an East Indian trade, especially the English company incorporated in 1600 and described in its charter as 'The Company of Merchants of London trading to the East Indies', which from 1773 exercised political power in the East, and had the chief part in the administration of the affairs of Hindustan, till 1858, when the government was assumed by the Crown." Address: USA.

319. Kitchiner, William. 1822. The cook's oracle: Containing receipts for plain cookery on the most economical plan for private families... From the latest London edition, which is almost entirely re-written. Boston, Massachusetts: Published by Munroe and Francis. viii + 9-380 p. Index. 18 cm. [30+* ref]

• ***Summary:*** The title page states that these recipes are the "result of actual experiments instituted in the kitchen of a physician." The chapter titled "Fish sauces" includes several references to other recipes (p. 92): "Soy [sauce], No. 436. Mushroom catsup, No. 439."

The chapter on "Broths and soups" states (p. 99): "We again caution the Cook to avoid *Over-Seasoning,* especially with predominant flavors, which, however agreeable they may be to some, are more extremely disagreeable to others... Zest 255, Soy 436, Cavice, Corach, Anchovy, 433... Catsups 432,..."

In the chapter on "Fish," the section titled "To dress them maigre" lists various sauces for maigre [meatless] dishes (p. 188): "Obs. [Observations]–Mushroom Catsup, No. 439,,... Anchovy and Soy,–or Oyster Catsup, No. 441, variously combined and thickened with flour and butter, are convenient substitutes."

The chapter on "Gravies and sauces" has a recipe (p. 243) for "Mackerel roe sauce" (No. 266). The last line reads: "Mushroom catsup, Walnut pickle, or Soy, may be added."

The same chapter has a recipe (p. 244) for "Anchovy sauce" (No. 270). The first note (2nd paragraph) states: "Obs.–Foreigners make this Sauce with good Brown Sauce No. 329, or White Sauce No. 364, instead of melted Butter,–and add to it Catsup,–Soy,–and some of their flavoured Vinegars, as Elder or Tarragon,..."

The same chapter has a recipe (p. 247) for "Shrimp sauce" (No. 283). The first note ends: "... strain off the liquor to melt the butter with, and add a little Lemon Juice,–Cayenne,–and Essence of Anchovy,–or Soy,–Cavice, &c.–but *the Flavour of the Shrimp is so delicate,* it will be overcome by any of those additions."

The same chapter has a recipe (p. 249) for "Liver sauce for fish" (No. 288) which can be seasoned with "... a little Essence of Anchovy No. 433, or Soy, or Catsup No. 439."

The same chapter has directions (p. 257-58) for "Browning" (No. 322) which begins: "Is a very convenient article to colour those Soups or Sauces, of which it is supposed their deep brown complexion denotes the strength and savouriness of the composition." "Walnut Catsup" is sometimes used." "It will hardly be told from what is commonly called 'genuine Japanese SOY*,' for which it is a very good substitute." Footnote: *"By the best accounts I can find, *Soy* is a preparation from the seeds of a species of the *Dolichos,* prepared by a fermentation of the farina [flour] of this seed in a strong lixivium of common salt."- *Cullen's Materia Medica.*

In the same chapter is a recipe (p. 281) for "Camp vinegar" (No. 403) whose ingredients include: "Soy, two tablespoonsful. Walnut Catsup, four tablespoonsful. Six anchovies, chopped..." Plus cayenne pepper and minced garlick [garlic]. "Steep all for a month in a pint of best Vinegar, frequently shaking the bottle: strain through a tammis [tamis; cloth strainer], and keep it in small bottles, corked as tight as possible."

The same chapter has a recipe (p. 288) for "Fish sauce" (No. 425) which calls for two wineglasses each of Port and Walnut pickle, and four of Mushroom catsup. 6 anchovies, pounded. 6 "Eschallots sliced and pounded; a tablespoon of Soy, and half a drachm [dram, a small unit of

© Copyright Soyinfo Center 2014

weight] of Cayenne pepper." "Obs. This is commonly called *Quin's Sauce,* and was given to me by a very sagacious Saucemaker."

Note: This is the earliest document seen (Feb. 2008) stating that soy sauce is an ingredient in Quin's Sauce, a popular store sauce.

In this same chapter ("Gravies and sauces") is a section titled "The Magazine of Taste" (No. 463, p. 303-04) which begins: "This is a convenient auxiliary to the Cook. It may be arranged as a pyramidical *Epergne* [a stand or tiered center dish] for a *Dormant* in the centre of the table, or Travelling Store Chest." It consists of a Sauce Box containing four 8-ounce bottles, sixteen 4-ounce bottles, and eight 2-ounce bottles. Of these 28 "useful flavoring materials." No. 15 is "Soy" [sauce] (No. 436) in a 4-ounce bottle.

The chapter titled "Made dishes" has a recipe (p. 321-22) for "Savory salt beef baked" (No. 496). For gravy, use strong Consomme, "Soy, or Browning, see No. 322,..."

This book mentions "Catsup" on pages 169-70, and 185. It mentions "Walnut Catsup" on pages 161, 243, 254, 265-66, 281, 287, 291, 292, 319, 329. It mentions "Mushroom Catsup" on pages x, 92, 125, 160, 165, 187-88, 191, 208, 220, 224, 226, 235, 243, 246, 252, 254, 259, 261, 263, 266-67, 274, 287-88, 287-88, 291-92, 304, 323, 331-32, and 357.

Note: Kitchiner's name does not appear on the title page nor in the book. Address: M.D., England.

320. Sôsôshi–Shokoku Dôchû Kinwaraji [Sôsôshi]. 1822. Japan. [1 ref. Jap]*

• ***Summary:*** An article in *Toyo Shinpo* (Soyfoods News). 1991. March. 21. p. 4, shows this illustration (wood block print) by Mimaru KITAO of a lady in the early 1800s in Japan preparing tofu dengaku over a grill (see above right).

The 3 Chinese characters in the book's title are kusa or grass + twin + paper or newspaper. In the subtitle: Shokoku means various countries. Kinwaraji means gold sandal. The meaning of Dôchû is unknown.

321. Encyclopaedia Britannica; or, A dictionary of arts, sciences, and miscellaneous literature. 6th ed... enlarged and improved. 20 vols. 1823. Edinburgh: Printed for A. Constable. Illust. (582 plates). 28 cm. *
Address: Edinburgh, Scotland.

• ***Summary:*** The section titled "Soja" (p. 113-14) begins by describing general characteristics of the genus, then lists three species as follows: *"Soja japonica hirsuta, caule erecto-flexuoso superne subvolubili, racemis axillaribus erectis, leguminibus pendulis.* Nob.

さし絵：草双紙「諸国道中金草鞋」から
（1822年、北尾美丸画）

"Dolichos Soja caule erecto flexuoso, racemis axillaribus erectis, leguminibus pendulis hispidis subdispermis. Lin. Iacq. Collect. 1. p. 46. Ic. rar. 1. tab. 145.

"Daidsu. Phaseolus erectus siliquis lupini, fructu pisi majoris candido. Kaempf. Amoen: exot. p. 837. tab. 839." There follows a detailed a detailed description of the latter plant species.

Note: This document is widely cited since, in it, Savi was the first to give the scientific name *Soja japonica* to the Japanese soybean. This article is apparently part 2 of a 3-part series published from 1822 to 1825.

Gaetano Savi lived 1769-1844. Address: Professore di Botanica nell'I. e R. Università de Pisa.

323. Golownin, Capt. Vasilii Mikhailovich [Golovnin, Mikhaiforich]. 1824. Memoirs of a captivity in Japan, during the years 1811, 1812, and 1813, with observations on the country and the people. 3 vols. 2nd ed. London: Printed for Henry Colburn and Co. Vol. 1, iv + 315 p. No index. 22 cm.

• ***Summary:*** In vol. 1, p. 135-36, a footnote states: "Our food in Chacodade [Hakodate] was at first extremely bad. It usually consisted of boiled rice, a kind of soup made of warm water with grated radish; a handful of finely chopped young onions with boiled beans; or instead of the onions

© Copyright Soyinfo Center 2014

and beans, two pickled cucumbers or radishes. Instead of the radish soup, we sometimes had puddings made of bean meal [tofu?] with rancid stockfish or whale oil. Perhaps twice in the space of fifty days we were supplied with fish, receiving each the half of a kind of plaice (Pleuronectes), with soy [sauce]."

In vol. 1, chapter 4, on p. 206, the author is describing his life and food in the prison where he is being held. Page 198: "Our food in Matsmai [Matsumae, a town on the southwest tip of Hokkaido, Japan; the oldest town on Hokkaido] was incomparably better than it had been in Chakodade... The fish were fried in oil of poppies, and were seasoned with grated radish and soy [sauce]." Note: The grated radish was probably *daikon.* Capt. V. Golownin lived 1776-1831.

324. Titsing, Isaac. 1824. Bereiding van de Soija [Preparation of soy sauce]. *Verhandelingen van het Bataviaasch Genootschap van Kunsten en Wetenschappen* 3:159-60. Published in Batavia. [Dut]

• ***Summary:*** "The preparation of soy sauce (*soija*) is simple, and is performed in the following way:

"One takes a *gantang* (a local Malay unit of measure equivalent to 3.125 kg of rice, or about a gallon) of boiled miso-beans (*gestoofde miso-boonen*). A gantang of boiled wheat or barley groats (*gestoofde tarw of gort*), and as many roasted and ground (*gebrande en gemalen*) wheat or barley groats as one deems to be sufficient to give it the necessary color. One then mixes these three together and encloses the mixture in a cupboard to let it mold, for which 8 days are required. After this mixture has become completely green from the mold, it is taken out of the cupboard and allowed to dry in the sun for one full day.

"Next one takes 2½ gantang of boiled water and one gantang of pure salt, which one dissolves in the water completely; after this it is allowed to stand for 24 hours, until the dirt from the salt has sunk and the water has turned cold. The pure water is then strained off, followed by the addition of the above-mentioned molded substance, which is then stirred with a shovel for 14 days.

"One uses wheat or barley groats for this. The difference is that when the soy sauce (*soija*) is made out of barley groats, it will be much thinner, whereas that made from wheat will be much thicker, have more body, and look like ink.

"The soy sauce (*soija*), which the Chinese call *ketjap* is used like a very delicious and tasty salt with roasted flesh foods, both in Batavia [Jakarta] and in the Netherlands."

Note: The previous sentence is very interesting! In 1824, in the capital of today's Indonesia, the Chinese called soy sauce *ketjap.* Mr. Titsingh [Titsing] lived 1744-1812. He wrote a lot about the Dutch East Indies and Japan. Note that in 1880, Mr. A. Paillieux, in the appendix to his long and excellent article on the soybean in *Bulletin de la Societe d'Acclimatation* (Oct. p. 594-95), gives a French translation of this article but cites the original year of publication as 1781, Vol. III. We believe the date should be 1824 instead.

The resulting soy sauce product is more like Chinese-style soy sauce [*kecap asin*] than Indonesian-style soy sauce, which typically includes sugar plus various herbs and spices. It is very interesting that Titsingh chooses to use the word *soija* (based on the Japanese word *shoyu* = soy sauce) rather than the local Malay word *ketjap* to describe how *ketjap* is made. Address: Netherlands.

325. Wallace, Robert Grenville. 1824. Memoirs of India: Comprising a brief geographical account of the East Indies; A succinct history of Hindostan... Designed for the use of young men going out to India. London: Longman, Hurst, Rees, Orm, Brown and Green. xii + 504 p. See p. 193-94. Index.

• ***Summary:*** "Alligators and noxious reptiles are very numerous near Batavia and the river Caiman takes its name from the number of the former in it."

"The trade of Batavia is considerable. Opium, camphor, benzoin, pewter, iron,... from China [come], porcelain, teas, silks, nankeens, alum, borax, brimstone, cinnabar, mother-of-pearl, paper, sweetmeats, and tobacco; from Japan, copper, sabre blades, camphor, soy, and curious articles of furniture varnished, and flowered with mother-of-pearl. The exports are pepper, sugar, coffee, rice, and arrack, with other indigenous varieties. Batavia arrack is the best in the world."

326. *Bulletin des Sciences Naturelles et de Geologie.* 1825. Continuation du second mémoire sur les genres Phaseolus et Dolichos; par le doct. Gaetan Savi [Continuation of the second memoir of the genera Phaseolus and Dolichos; by Gaetan Savi]. 4:346-48. Deuxième Section du Bulletin Universel des Sciences et de l'Industrie,... [1 ref. Fre]

• ***Summary:*** In the "Botanical" section is a 3-page (p. 346-48) French-language summary of an Italian-language article by Gaetano Savi (Prof. of Botany at Pisa), published in *Nuovo Giornale de' Letterati* (May and June, No. 15, p. 106).

At the top of p. 348 we read: The genus *Soja* has but one species, *Soja japonica,* Savi; it was *Dolichos Soja* of Linnaeus. The Japanese ferment the seeds of this species with rice and wheat to make a sauce used to season various foods.

327. Candolle, Aug. Pyramus de. 1825. Prodromus systematis naturalis regni vegetabilis... Vol. 2 [Introduction to the natural system of the vegetable kingdom... Vol. 2]. Paris: Sumptibus socorium Treuttel et Wuertz. 644 p. See p. 396. A 14-volume work. [6 ref. Lat]

• ***Summary:*** In the chapter on Leguminosae, after the genus Phaseolus and before the genus Dolichos, we find (p. 396): "CLXXIV. SOJA *Moench meth.* 153. *Savi diss.* 1824. p. 16. DC. *leg. mem.* IX. An 8-line description of the genus in Latin

© Copyright Soyinfo Center 2014

is then given, followed by:

"I. Soja hispida (Moench l.c.) (I) [Indigenous] in Japonia, India orient, Moluccis. Dolichos Soja Linn. spec. 1621. Jacq. icon. rar. t. 145. Soja Japonica Savi diss l.c.– Kaempf. amoen. 837 et 838. icon. Corollæ violaceæ vix calyce longiores (v.v.) [vidi vivam = I have seen a living plant specimen.]

"*Beta pallida* [seeds white], floribus flavis, seminibus albis Roxb. [Roxburgh] cat. p. 55."

Also discusses the following plants: *Psophocarpus tetragonolobus* [the winged bean], p. 403; Grows in Mauritius and Madagascar.

Arachis hypogaea [the peanut], p. 474.

Voandzeia subterranea [the bambarra groundnut], p. 474.

Augustin Pyramo de Candolle (lived 1778-1841) was the father of Alphonse de Candolle. His son was a joint author.

Note 1. "Roxb. cat. p. 55" refers to: Roxburgh, William. 1814. *Hortus bengalensis, or a catalogue of the plants growing in the Honourable East India Company's botanic garden at Calcutta.* The soybean (*Dolichos Soja*) is listed on p. 55. A footnote explains that in the garden are growing "Two varieties, one with white seed and yellow flowers, the other with black seed and purple flowers." However the word "pallida" is not mentioned.

Note 2. This is the earliest document seen (Oct. 2004) that uses the word *pallida* in connection with soybeans or the color of soybean seeds. The Latin word *pallidus* means pale or white. One of the two soybean varieties described by Roxburgh in 1814 had white seeds. Address: France.

328. Grubbens, M. de. 1825. Method of preparing Chinese soy. *Economist and General Adviser* (*The*) (*London*) 2:24+. [Eng]

• ***Summary:*** Note: The text of this document is the same as the following: Grubbens, M. de. 1804. "Method of preparing Chinese soy." *Philosophical Magazine* (The) (London) 19(75):260-63. First quarter–except that the first paragraph is not included.

329. *Journal des Connaissances Usuelles et Pratiques.* 1826. Économie domestique: Manière de préparer le Soya chinois [Domestic economy: How to prepare Chinese soy sauce]. 3(14):129-32. [1 ref. Fre]

• ***Summary:*** This excellent, detailed description begins as follows: Soy sauce (*Le Soya*) is made with a species of small bean named *dolichos soya,* smaller and whiter than the broad bean of Turkey (*le fève de Turquie*), plus soft wheat flour (*farine de froment*), salt, and water, which are used in the following proportions: 50 pounds (*livres*) of the beans, 50 pounds of salt, 60 pounds of soft wheat flour, and 250 pounds of water. After the beans have been washed well, they are boiled with well water, in a pot with no lid on, for several hours, or until they are sufficiently softened to be kneaded with one's hands. While they are cooking, they must remain covered with water so they do not burn. One must be careful not to over-boil them lest too much of their substance escape in the broth.

Once the beans have boiled sufficiently, they are spread in large, flat wooden vats or, as the Chinese do it, in jars fashioned with bamboo sections, large and thin; these jars or vats must be two and a half inches deep and five feet in diameter; the beans are spread into them to a depth of two inches. Once they have cooled enough that they can be touched by hand, soft wheat flour is added and all is mixed; the mixing should be continued until the soft wheat flour is absorbed. Should the matter become too dry for the flour to adhere to the beans, then a little broth is added to it.

Once everything is well mixed, the material is poured into the vats we already spoke about, taking care that the layers do not exceed one inch or an inch and a half in depth. A lid is placed on each vat and it is closed tightly. Once one observes that the mixture begins to mold (*moisir*) and that the heat has fully escaped (this will take from two to three days), the lid is lifted slightly, propped up with little round sticks so that air has easier access to the inside. If the matter takes on a green cast, it means that all is going well. Should it begin to blacken, one must then lift the lid more so as to increase the contact with the air. Should it blacken completely, then the lot is considered ruined.

As soon as one has observed the matter turning green and rancid (*rance*) (which will typically take from 8 to 10 days), the lid is removed and the mixture is exposed for several days to the air and to the sun. Once the whole mass [koji] become as hard as a stone, it is broken into small pieces. These are then thrown into a large earthenware jar and 250 pounds of water, in which 50 pounds of salt has been dissolved, is poured unto it; the whole thing is stirred and one makes note of the height reached by the liquid in the container. Should one jar not be sufficient, one can reach for several other jars, taking care that each one remains in proportion to the amount of mixture involved.

Once the jug is filled, it is put out in the sun. The substance is regularly shaken and stirred nights and mornings; at night however, one must take care to put the lid back on in order to ward off the cold. This lid is convex on the outside so that the rain water can drip away more readily. The more intense the heat from the sun rays is, the faster the preparation. In general, this operation is only undertaken during the summer, and it can go on for several months.

As the volume of the mixture decreases through evaporation, well water is added until the water and the salt have completely dissolved the flour and the beans. The earthen jar is left out in the sun for several more days, so that the dissolution can be as perfect as can be; for this will ultimately determine the soya quality. And during that time, one should continue to stir the mixture every day as was

© Copyright Soyinfo Center 2014

done previously.

Once the mixture has become substantial and uniform / smooth (*oncteux*), it is poured in bags, that are strongly pressed so as to extract the soy sauce (*soya*), which is then pure and ready to be used; it is never boiled. It is poured into bottles that are carefully capped. The Chinese, who make a large trade of it, place it in large jugs. Before being expressed, soy sauce is of a brown black color; thereafter it becomes completely black.

With the presscake / lees (*la lie*), the Chinese prepare also two other kinds of soy sauce. They first add 150 pounds of water and 30 pounds of salt; after having stirred this mixture well, they will pour another 100 pounds of water and 20 pounds of salt and proceed for the rest as we described it earlier.

Soy sauce being such a substantial item of trade, it might be useful to introduce into France the bean with which it is made; it is possible that we, ourselves, already have in our possession other beans that could also achieve the goal that we are pursuing.

The Japanese people, who also make great use of soy sauce to season their food, know how to prepare, with this species of bean, a food [miso] that they will use in place of butter, mostly to season prepared foods and meats.

Note 1. This is the earliest French-language document seen (April 2012) that uses the term *Le Soya* to refer to soy sauce.

Note 2. The basic recipe calls for the use of more wheat flour than soybeans (60 pounds vs. 50 pounds). In French, *farine de froment* is softer than *farine de blé.*

Note 3. This Chinese-style soy sauce is not heated before bottling–unlike its Japanese counterpart.

330. Lelius, -. 1827. Journal of a voyage from Calcutta to China. *Quarterly Oriental Magazine, Review and Register* (*Calcutta*) 7(14):222-67. June. See p. 257-58.

• ***Summary:*** Pages 257-58: "A Chinese dinner is a curiosity of the first magnitude, and one which it behoves [behooves] every lover of the ludicrous to witness–One of the Hong merchants *Pon Keequa* by name, or as he is more generally termed "the squire," gave a dinner to a select party of the Factory, at which I had the good fortune to be present."

"We at length arrived at the banquetting-room... There were about twenty courses, and dishes innumerable–I counted sixty on the table at one time; they consisted chiefly of small basins or cups of the most beautiful China-ware, and were arranged in three rows down the centre of the table. We were given to understand, I know not with what truth, that we had the happiness to partake of stewed pigeons' eggs, wild cat, fricassied [fricasseed] frogs, dried worms (particularly recommended as a *bonne bouche* for wine at dessert), sea slugs, sharks, and fins, and a variety of other delicacies,* to which European prejudice might be inclined to apply another term, but which, whatever they may really have been, were rendered extremely palatable by the application of a little Japan soy [sauce],+ or 'essence of cockroach,' the finest I ever tasted."

+ Footnote: +"Soy is really made of a small species of Bean peculiar to Japan; though this may be a bold assertion, considering that the prejudice is so much in favor of Cockroaches."

331. Kitchiner, William. 1827. The cook's oracle: Containing receipts for plain cookery on the most economical plan for private families... A new edition. London: Printed for Cadell and Co., Edinburgh; Simpkin and Marshall, and G.B. Whittaker, London; and John Cumming, Dublin. 491 p. Index. 18 cm. [30+* ref]

• ***Summary:*** This book is "the result of actual experiments instituted in the kitchen of William Kitchiner, M.D. Author of..." The titles of his seven books are given.

Soy [sauce] is mentioned often: Fish sauces (p. 99). To add zest to broths and soups (p. 108). In sauce for maigre fish dishes (p. 209-210). Mackarel roe sauce (p. 275 [Mackerel]). Anchovy sauce (p. 276). Shrimp sauce (p. 279). Liver sauce for fish (p. 282).

In the chapter on "Gravies and sauces" the recipe for "Browning" (p. 291-92) states: "It is a convenient article to colour those *Soups and Sauces,* of which it is supposed their deep brown complexion denotes the strength and savouriness of the composition." Burnt Sugar is a favourite ingredient. "When employed for Culinary Purposes, this is sometimes made with strong Gravy, or Walnut Catsup... It will hardly be told from what is commonly called 'genuine Japanese Soy,' * [footnote refers to "Cullen's *Mat. Med.* vol. i, p. 430] (for which it is a very good substitute)."

To make "Browning": "Put half a pound of pounded Lump Sugar, and a table-spoonful of water, into a clean iron saucepan, set it over a slow fire, and keep stirring it with a wooden spoon till it becomes a bright brown colour, and begins to smoke; then add to it an ounce of salt, and dilute it by degrees with water, till it is the thickness of Soy; let it boil, take off the scum, and strain the liquor into bottles, which must be well stopped:..."

Camp vinegar (p. 320).

In the chapter on "Store sauces," the recipe (p. 328) for "Fish sauce.–(No. 425)" includes "a tablespoonful of Soy" and concludes: "Obs. [Observations]–This is commonly called Quin's Sauce, and was given to me by a very sagacious Saucemaker."

The section titled "The magazine of taste" (No. 463, p. 346) contains a list of 28 "useful flavoring materials." No. 15 is "Soy" [sauce] (No. 436).

Catsup (incl. mushroom catsup, oyster catsup, walnut catsup, cockle and muscle catsup) is mentioned on pages 103, 151, 176, 180, 189, 209, 210, 214, 225, 231, 244, 256, 276, 285, 287, 291, 292, 302, 303, 334, 335, 336, 337, 271, 381, 390, 419, and 426. "Mushroom ketchup" appears on

page 90. Address: M.D., England.

332. Hamilton, Walter. 1828. The East-India gazetteer: containing particular descriptions of the empires, kingdoms, principalities, provinces, cities, towns, districts, fortresses,... 2nd ed. Vol. 1 of 2. London: Printed for Parbury, Allen, and Co. See p. 148. Two (folded) maps. 23 cm. [6 ref]
• ***Summary:*** Under the entry for Batavia: "The Dutch being the only nation that keeps up an intercourse with Japan, a ship is annually despatched from Batavia laden with kerseymeres, fine cloths, clock-work, spices, elephant's teeth, sapan wood, tin and tortoiseshell. The returns from Japan consist principally of ingots of the finest red copper, which is converted into a clumsy sort of coin for paying the native and European troops. Various other articles are smuggled in by the officers such as sabre-blades of an excellent temper, Japan camphor, soy [sauce], china-ware, lacquered ware, and silk goods. The cargo always contains a present for the emperor of Japan, and he in return sends one to the Governor general, consisting usually of...

"A.D. 1619, John Pieterson Coen, the Dutch governor, took the town of Jacatra by assault, and in a great measure destroyed it. He afterwards founded another city, not exactly on the same spot, to which he have the name of Batavia. In 1811 it surrendered at discretion to the British army under Sir Samuel Auchmuty... During the British possession of Batavia, which lasted until 19th August 1816, its condition was greatly improved and even its pestilential atmosphere somewhat ameliorated by the great pains bestowed on the draining of the marshes, the cleaning of the town, and the removing of the Europeans to the elevated tracts of the interior."

Note: A kerseymere is a fine woolen cloth with a fancy twill weave. Address: M.R.A.S.

333. Iwasaki, Tsônemassa. 1828. Phonzo Zoufou [Honzô Zufu: Atlas of Japanese medicinal plants. 96 vols.]. Tokyo: Subaraya. See vol. 50. Fol. 2. Vol. 43, fol. 1-9. 8º (20-25 cm). [Jap]*
• ***Summary:*** In Japanese, *honzô* means "plants" or "trees and herbs." *Zufu* means a "chart, picture, or figure." This illustrated materia medica contains 1,795 illustrations (plates), most of them colored. The plates start with volume 50. The author, T. Iwasaki, lived 1786-1842; his first name is also written as "Kan'en."

Franchet and Savatier (1875, p. 108) state: For the wild soybean–*Glycine soja* (Sieb. et Zucc.) see vol. 50, fol. 2?, under *Kin mame.* For the cultivated soybean–*Glycine hispida* (Moench, Meth) see vol. 43, fol. 1-9.

For the adzuki bean, *Phaseolus radiatus,* see vol. 43, fol. 11, under *Kin Adz'ki,* and vol. 43, fol. 9 verso, under *Adz'ki.*

For kudzu, *Pueraria thunbergiana,* vol. 27, fol. 15, under *Koutsou.* Mène (1882, p. 3793) also states that Kudzu is mentioned in Vol. XXVII, fol. 15 of this work.

Itie (1910, p. 43) notes: "The varieties of soybean in Japan. The number of varieties of *mame* or *daizu* cultivated in Japan is at least as large as the number in China. *Somokou Zoussetz* (*Somoku Zusetzu*) has portrayed and described them in the same way as the *Phonzo Zoufou,* which has given them proper names. The former book illustrates Glycine Soja Sieb. et Zucc. under the name *Tsourou mame,* the second under the name *Kiu mame;* but the identification of these drawings is doubtful."

Note: The UCLA Biomedical Library has another edition of this book; the year of publication is given as 1920. Volume 50 is Curcubits and volume 43 is Brassica. Each volume contains only 20-30 sewn pages. There is an index in the last few volumes. See: Vol. 40 (1-2) and vol. 47 (2). At the back of Vol. 20 are 20 listings for *Glycine soja,* but none for *Glycine hispida.* Address: Japan.

334. Nuttall, Thomas. 1829. Soy bean (Letter to the editor). *New England Farmer* 8(14):105. Oct. 23. Friday.
• ***Summary:*** In this front-page letter dated Oct. 14, Nuttall writes: "As this plant thrives well in this climate, and perfects its seeds, it may not, perhaps, be amiss to say something of its use and history. It is an annual Bean, not much unlike those we commonly cultivate, with an erect stem, showing a slight tendency to twine at the summit only; the flowers are very small for the germs, and reddish in axillary clusters; the legumes are pendulous, hispid with brown bristly hairs, with which the whole plant is more or less clothed–these pods contain 2 or 3 beans when mature, almost of a chocolate brown, and somewhat smaller than any generally cultivated in this country." It belongs to the genus *Dolichos* (*D. Soja*), which also affords us several other edible legumes. It is said to be indigenous to India and Japan, where as well in China and Cochin-China, it is very generally cultivated for food and probably preferred for its great productiveness. A single bean produced, and perfectly ripened with us at the Botanic Garden, 182 pods with 2 to 3 beans in each. Whether in this country, where so many fine legumes are cultivated, it might be esteemed for food, is doubtful; the experiment may easily be made. But its principal recommendation at present in [sic, is] only as a luxury, affording the well known sauce called *Soy,* which at this time is only prepared is [sic, in] China and Japan–that of the latter country being usually preferred. The mode of obtaining this sauce, is said to be as follows: -

"After the seeds are boiled until they become soft, they are mixed with an equal weight of wheat or barley flour coarsely ground. This mixture is fermented, and a certain proportion of salt and water being added, the whole is allowed to stand for two or three months, care being taken to stir it every day; and by the end of that time it is ready for use. Its composition then appears to be perfectly harmless, which cannot be said of many other sauces; and among the Asiatics it is considered beneficial in promoting an appetite.

"Yours, respectfully, Thomas Nuttall."

Note 1. Unfortunately Nuttall did not indicate where he obtained his seeds. In 1831 a person known only as "H." received a few soybeans from Nuttall and grew them in Milton, Massachusetts. Nuttall lived 1786-1859.

Note 2. This is the earliest document seen (May 2011) concerning soybeans in Massachusetts, or the cultivation of soybeans in Massachusetts. This document contains the earliest date seen for soybeans in Massachusetts, or the cultivation of soybeans in Massachusetts (1829). The beans were probably planted in about May-July 1829. The newspaper was published in Boston.

Note 3. This is the earliest English-language publication seen (Sept. 2006) with the word "soy bean" (or "soy beans") in the title.

Note 4. This letter was reprinted in the *American Farmer* (Baltimore, p. 260-61) on 30 Oct. 1829 (Vol. 33, No. 11). Address: Botanic Garden, Cambridge, Massachusetts.

335. King, Lord. 1829. The life of John Locke, with extracts from his correspondence, journals, and common-place books. London: Henry Colburn. xi + 408 p. See p. 133-34. 30 cm.
• ***Summary:*** In the section titled "Extracts from the Journal of Locke," Lord King notes: "The following directions appear to have been set down for some foreigner about to visit England. They are curious, as affording a comparison with the improvement of the present time. 'England.–1679.'"

Among his description of the foods and condiments which ought to be enjoyed in London, Locke noted: "Puddings of several sorts and creams of several fashions, both excellent, but they are seldom to be found, at least in their perfection, at common eating-houses. Mango and saio are two sorts of sauces brought from the East Indies." Saio almost certainly refers to *shoyu* (Japanese-style soy sauce) and was cited as such by both Yule and Burnell in Hobson-Jobson (1886, p. 651, "Soy") and the *Oxford English Dictionary* (1919, "Soya").

An illustration (engraving; see above right) shows a portrait of John Locke (lived 1632-1704), an English philosopher. The preface to this work notes that "After the death of Locke, his papers, correspondence, and manuscripts, came into the possession of Sir Peter King, his near relation and sole executor." Lord Peter King King, the 7th baron, lived 1776-1833.

An 1884 edition of this book, with a slightly different title (which see), was published in London by George Bell & Sons. Though not a facsimile edition, the passage on soy sauce also appears on page 134. Address: Ockham.

Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. Page 73 notes that by 1909 the four major brands manufactured by the Noda shoyu cartel were Kikkoman, Kihaku, Kamigata (Joju), and Kushigata.

340. Crawfurd, John. 1830. Journal of an embassy from the Governor-General of India to the courts of Siam and Cochin China: Exhibiting a view of the actual state of those kingdoms. 2 vols. 2nd ed. London: Henry Colburn and Richard Bentley. See Vol. II, p. 155, 282, 359.

• ***Summary:*** Chapter 2, about Siam, states (p. 155): "The imports from China [to Siam] are very numerous, consisting of what are called in commercial language 'assorted cargoes.' The following is a list of the principal commodities: coarse earthenware and porcelain, spelter, quicksilver, tea, lack-soy (vermicelli), dried fruits, raw silk, crapes, satins and other silk fabrics, nankeens, shoes, fans, umbrellas, writing-paper, sacrificial paper, incense rods, and many other minor articles."

In Chapter 6, about the people of Cochin China (today's Vietnam), we read (p. 282): "They eat vermin, and the flesh of the alligator; hatched eggs with them are a delicacy; and their favourite sauce is a kind of soy [probably nuoc-mam], in part, at least, composed of the juices of putrid fish, and which, both from taste and odour, would be in tolerable to any other people."

Chapter 8, about the Island of Singapore, states (p. 358-59): "The first direct arrival from England to Singapore was in the year 1821; in 1822, four ship cleared out with cargoes for the European market; in 1823, nine; in 1824, twelve; in 1825, fifteen; and in 1826, fourteen ships. The greater number of these were bound for London and Liverpool, but there were some also for Stockholm, Hamburgh [Hamburg], and Bordeaux. The staple imports of this branch are cotton goods, woolens, iron, and spelter [unrefined zinc]. The exports are very various, and may be enumerated as follow: ore of antimony, aniseed, aniseed oil, benjamin [gum benjamin, a balsam or resin from a tree], camphor, cassia, cassia-buds, coffee, cubebs [small spicy berries of the *Piper cubeba* from Java], dragons' blood [a resinous substance, or red juice, extracted from the *Dracoena draco*], elephants' teeth [tusks, ivory], gamboge [a concrete vegetable juice or gum-resin from Cambaja or Cambodja {Cambodia}], horns of cows, deer, and buffalo; hides of ditto, mother of pearl shells, musk, nankins [nankeens, a type of cotton cloth, originally from China], orpiment [sulphuret of arsenic], pepper, Chinese paper, Chinese raw silk, Chinese wrought silk, ratans [small canes, grown in India] and canes; rhubarb, cloves, mace, and nutmegs; pearl sago, Siam sugar, Japan soy [sauce], tin, tortoiseshell, turmeric, gold and silver bullion, and sapan-wood [sappan wood; a red soluble brazilwood obtained from an East Indian tree *Caesalpinia sappan*]. In 1824, and I have seen no later statement, the sworn value of these articles was 1,035,868 Spanish dollars."

Note: This is the earliest document seen (May 2010) concerning soybean products (soy sauce) in Singapore. This document contains the earliest date seen for soybean products in Singapore (1826); soybeans as such have not yet been reported. However, in 1830 soy sauce exported from Singapore was probably made in Singapore from soybeans that were in Singapore at this early date; soybeans may well have been cultivated in Singapore at this time. Address: Esq, FRS, FLS, FGS, &c.

341. Dobell, Peter. 1830. Travels in Kamtchatka and Siberia; with a narrative of a residence in China. 2 vols. London: Henry Colburn and Richard Bentley. See vol. 2, p. 324-25. 20 cm.

• ***Summary:*** Note 1. The first several paragraphs of this are copied from *Portfolio* (1819, p. 105-06).

In Chapter XII of the section titled "A Residence in China," the author is describing Chinese food, especially in the Canton area: "An article of food, of which all classes appear extremely fond, is *thow-foo* [tofu] and *foo-chack,* a sort of flummery [soft jelly or porridge], made from beans, very palatable and nourishing.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term *thow-foo* to refer to tofu.

Note 3. The Cantonese term *foo jook* means dried yuba sticks. Perhaps the author was describing the product after the sticks had been broken into pieces and cooked until soft.

Soy, their famous sauce for all kinds of food, is also made from beans. The beans are boiled until all the water is nearly evaporated, and they begin to burn, when they are taken from the fire, and placed in large, wide-mouthed jars, exposed to the sun and air; water and a certain portion of molasses or very brown sugar are added. These jars are stirred well every day, until the liquor and beans are completely mixed and fermented; the material is then

© Copyright Soyinfo Center 2014

strained, salted, and boiled, and skimmed until clarified; and will, after this last process, become of a very deep brown colour, and keep any length of time. Many persons have thought that gravy was used in preparing this condiment; but this appears not to be the case, the composition being entirely a vegetable one, of an agreeable flavour, and said to be wholesome. There are two or three qualities of it; to make the best requires much care and attention. Japanese *soy* is much esteemed in China, on account of the superior manner in which it is made; perhaps they have a particular sort of bean for that purpose. Shopkeepers at Canton who sell soy, have large platforms on the roofs of their houses, where the jars for preparing soy are all arranged, and exposed to the sun; for the consumption of this article is enormous. Neither rich nor poor can dine, breakfast, or sup without soy; it is the sauce for all sorts of food, gives a zest to every dish, and may be said to be indispensable at a Chinese repast.

"In general, very little meat is eaten."

Note 4. The author spent 7-8 years in China between 1798 and 1820. He died in 1852. Address: Counsellor of the Court of His Imperial Majesty, the Emperor of Russia.

• ***Summary:*** In the section on "Diadelphia Decandria, Class XVII," we read (p. 316): "2151. Soja moen. Soja (Sooja, its name in Japan). Leg. Pap. Vic. 1.

"19457. Soja hispida Moen. Dolichos Soja L." Address: F.L., H., G., & Z.S.

346. Siebold, Philipp Franz von. 1830. Synopsis plantarum oeconomicarum universi regni Japonici [Synopsis of the economic plants from the entire empire of Japan]. *Verhandelingen van het Bataviaasch Genootschap van Kunsten en Wetenschappen* 12:1-74. See p. 54-57. Also first table at end. [Lat; Dut]

• ***Summary:*** The English translation of this periodical title is: "Transactions of the Batavian Society of Arts and Sciences." Batavia roughly corresponds to today's Jakarta on the island of Java, Indonesia. This work lists 447 economic plants, including the soybean. The section on Leguminaceæ [sic, Leguminosæ] (p. 54+), mentions plants of the genera *Dolichos* (incl. *D. hirsutus* or Kudsu / Kudzu), *Sooja, Phaseolus, Pisum, Vicia, Medicago, Arachis, Glycyrrhiza,* and *Mimorsa.* There are two species of soybeans: *Sooja Japonica,* the cultivated soybean, and *Sooja nomame,* the wild soybean. The genus and its species and varieties are described as follows (p. 56):

"CLXXVIII. Sooja, Moench. Sieb. (Sooja du Japon).

© Copyright Soyinfo Center 2014

296 *S. Japonica,* Sieb. *Sooju* vernacular *Daisu,* Japan.

Varieties, grouped by color: a. White seeds. *Daisu,* Japan. b. White fuscis seeds. *Tobimame,* Japan. c. Fuscis seeds. *Sinsjumame,* Japan. d. Black round seeds. *Kuromame,* Japan. a. Black flattened seeds. *Kurotokorosun*, Japan. a. Greenish seeds. *Awomame,* Japan.

Uses: To make *Sooju, Miso, Toofu* (shoyu, miso, and tofu).

297 *S. nomame,* Sieb. *Nomame ac Jawaraketsmai,* Japan (v.v.). [vidi vivam = I have seen a living plant specimen.] *Plantae sponte crescentis folia adhuc tenera pro potu Thea colliguntur.*

At the end of this article are two large fold-out tables, each 30 by 18 inches, and each titled "Synoptic Table of Plant Uses." Each table contains six vertical double columns. References to soy appear only in table I. At the bottom right corner of the first is written in Latin: *"Dabam in Insula Dezima mensi Novembris 1827, Dr. von Siebold."* This translates as: "Given [as a letter for delivery] from the island of Dezima [Deshima], November 1827, Dr. von Siebold." The plants are divided into categories by type of use. For example: I. Simple foods: A. Cereal grains. B. Legumes. C. Fruits, etc. Under each category is a numbered list of the scientific names of the Japanese plants in that category, followed by its name written in both katakana and Chinese characters. Soy-based uses include: IA. Simple foods (*Alimenta simplicia*) (columns 1-4): Legumes (Legumina). 1. *Sooja Japonica,* Sieb. Daizu, "Yellow + Bean." See next page,

Note 1. This is the second earliest document seen (June 1999) written by a European or Westerner in which Chinese characters are used to write the name of the soybean or related products.

II. Composite foods (*Alimenta composita*) (columns 4-5). B. For the sauce "Sooju." Shoyu. Sooja Japonica, Sieb.

C. For the paste (*pulto*) "Miso." Miso. Sooja Japonica, Sieb. plus rice and barley

D. For the cake (*placenta*) "Toofu." Tôfu. Sooja Japonica, Sieb. Note 2. This is the earliest Dutch-language or Latin-language document seen (April 2013) that uses the word "Toofu" or the word "Tôfu" to refer to tofu.

P. For the sprouts (*germinatione artifaali*) "Mogasi." Moyashi. Soja Japonica, Sieb.

Note 3. This is the earliest document seen by Siebold in which the soybean is mentioned. This document also contains the earliest date connected with Siebold and soybeans (Nov. 1827). His name on the title page is written "De. de Siebold."

Note 4. This is the earliest Latin-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *germinatione artifaali,* "Mogasi." Moyashi. Soja Japonica.

Note 5. Siebold was born on 17 Feb. 1796 in Würzburg [Bavaria, Germany]. In 1821, as a young ship's doctor, he arrived in Japan, where he worked as a doctor at Deshima near Nagasaki for the Dutch colony.

Also discusses: Column 1 of table 1 also mentions: 13. *Coix lachryma,* P.S., suudama [Job's tears]. 2. *Phaseolus atsuki,* Japon, Azuki. "Red + Small + Bean." 12. *Arachis hypogaea,* L.E. Rakkasei [peanut]. "Fall + Flower + Bean." Column 2 mentions *Sesamum Orientale, P.S., goma* [*sesame seeds*]. Column 3 mentions the wild soybean (*Sooja nomame*), *Amaranthus oleraceus, A. Japonicus,* and *A. bicolor.* Column 4 also includes sea vegetables (*kaiso*).

Column 5 mentions *ame* [grain syrup], *fu* [wheat gluten cakes], *soba, somen* [wheat noddles], *mochi, konnyaku, kudzu,* and *tokoroten.* III. Medicinal foods (*Medicamina*) (columns 5-6).

"Q. Is there not a joke among seamen, that soy is made from beetles and cock-roaches? A. Yes: it originates from a fancied resemblance in colour and shape of the seeds to the beetle.

"Q. Where is this esteemed sauce prepared? A. Chiefly in China and Japan; that brought from the latter place is most preferred."

349. Utagawa Kinuyoshi. 1830? Eho kaho fuku no iri-mame [Lucky casting of soybeans completed at a fortunate compass point]. Japan. Undated. Woodblock print. [1 ref]

• ***Summary:*** This is a typical woodblock triptych print, *oban tat-e.* The man throwing the roasted soybeans (*mamemaki*), a young nobleman at left, holds a wooden stand in his left hand. His two female attendants will scramble for the lucky beans. The artist, Utagawa Kinuyoshi, lived 1797-1861. Original owned by the British Museum.

350. *Times* (*London*). 1831. Mode of making soy. Sept. 23. p. 2, col. 5.

• ***Summary:*** From *Dobell's Travels:* "Soy, the famous sauce for all kinds of food, is made from beans. The beans are boiled until the water is nearly evaporated, and they begin to burn, when they are taken from the fire, and placed in large wide-mouthed jars, exposed to the sun and air; water and a certain amount of molasses or very brown sugar are added. These jars are stirred well every day, until the liquor and beans are completely mixed and fermented; the material is then strained, salted, boiled, and skimmed, until clarified; and will, after this last process, become of a very deep brown colour, and keep any length of time. Many persons have thought that gravy was used in preparing this condiment; but this appears not to be the case, the composition being entirely a vegetable one, of an agreeable flavour, and said to be wholesome. There are two or three qualities of it; to make the best requires much care and attention. Japanese soy is much esteemed in China, on account of the superior manner in which it is made; perhaps they have a particular sort of bean for that purpose. Shopkeepers at Canton who sell soy, have large platforms on the roofs of their houses, where the jars for preparing soy are all arranged, and exposed to the sun; for the consumption of this article is enormous. Neither rich nor poor can dine, breakfast, or sup without soy; it is the sauce for all sorts of food, gives zest to every dish, and may be said to be indispensable at a Chinese repast."

Note 1. This description of the Chinese process for making soy sauce is unusual in several ways: (1) The writer apparently does not know the name of the bean used. (2) The process of making koji, step one of the two-step fermentation process, is not mentioned. (3) Molasses or brown sugar are added before fermentation. (4) Salt is added after fermentation. (5) The sauce is sunned / fermented on a rooftop rather than in a courtyard at ground level.

Note 2. *Dobell's Travels* refers to: Dobell, Peter. 1830. *Travels in Kamtchatka and Siberia; with a Narrative of a Residence in China.* 2 vols. London: Henry Colburn and Richard Bentley. See vol. 2, p. 324-25.

Note 3. The quotation above differs slightly from that of the original.

351. Remond (John). 1832. Classified ad: Hams, smoked beef, tongues, cheese, &c. *Salem Gazette* (*Massachusetts*). July 3. p. 1.

• ***Summary:*** "... 6 doz Calcutta Curry, just imported. Canton and Japan Soy [sauce]. Cases of Maccaroni [Macaroni]. Jars of Olives. Pickled Walnuts, &c."

Note 1. This is the earliest English-language document seen (April 2012) that contains the term "Canton Soy," which apparently refers to soy sauce made in Canton, China. In the Early American Newspapers (EAN) online database (produced by Readex, a division of NewsBank), there are at least 5 issues / records that contain the term "Canton Soy" from Aug. 1832 to April 1839.

Note 2. This ad last appears in this newspaper on 3 Aug. 1832 (p. 2). Address: No. 8 Derby Square.

352. Don, George. 1832. A general system of gardening and botany: Containing a complete enumeration and description of all plants hitherto known; ...Founded upon Miller's Gardener's Dictionary, and arranged according to the natural system. Vol. 2. London: C.J.G. and F. Rivington. 875 p. See p. 356-57 (Soja), 220-21 (Glycine). Index at front. 27 cm. [3 ref]

• ***Summary:*** This work was published in 4 volumes between 1831 and 1838. It was "caused to be prepared" by the

© Copyright Soyinfo Center 2014

proprietors of *Miller's Gardener's and Botanist's Dictionary.* The alphabetical arrangement of genera used by Miller was discarded. "It only remained, therefore, to choose between the Linnæan artificial method, and the Natural System of Jussieu; but the numerous advantages of the latter, particularly in an extensive work like the present, were too apparent to leave any doubt in the mind of the Editor as to which he ought to adopt... In the Linnæan artificial method, it often happens, that genera, intimately related, are separated far apart into different classes and orders, merely on account of the difference in the number of their stamens and pistils; a circumstance now found in many instances scarcely to be of sufficient importance, even to separate species, still less genera... The plan of the present work is founded on that of M. de Candolle, in his invaluable works entitled *Regni Vegetabilis Systems Naturale* and *Prodromus,* with such alterations as were rendered necessary by the rapid increase of science, and with numerous additions of new genera and species..." Like Miller, Don classifies soybeans in the genus *Soja.*

"CXC. SOJA (*sooja* is the name of a sauce prepared from the seeds by the Japanese). Moench. meth. 153. Savi, diss. 1824. p. 16. D.C. legum. mem. ix. prod. 2. p. 396.

Note 1. This is the earliest English-language document seen (April 2012) that uses the term "sooja" to refer to soy sauce.

"Lin. Syst. *Diadélphia, Decándria.* Calyx bibracteolate at the base, 5-cleft, the 3 lower segments straight and acute, but the 2 upper ones are joined together beyond the middle. Corolla with an ovate vexillum, which stands on a short stipe, and with an oblong straight keel." Note 2. *A Dictionary of Botany,* by Little and Jones (1980) defines vexillum (plural: vexilla) as "See Banner." Banner is defined as "The broad uppermost petal of a papilionaceous corolla as in the irregular flowers of certain members of the pea family, Fabaceae. Synonym: Standard or vexillum."

"Stamens diadelphous, the tenth one approximate, but certainly distinct. Stipe of ovary not surrounded by a sheath at the base. Style short. Legume oblong, 2-5 seeded, membranous; the seeds intercepted by cellular dissepiments. Seeds ovate, compressed.–A hispid erect herb, with pinnately-trifoliate leaves, and with the flowers either aggregate in the axils of the leaves on short pedicels, or disposed in short peduncalate racemes.

"1 S. híspida (Moench. l. c.) Annual. Hardy. Native of Japan, East Indies, and the Moluccas. Dólichos Soja, Li. spec. 1621. Jacq. icon. rar. t. 145. Soja Japónica, Savi, diss. 1. c. Kæmpf. amoen. 837 and 838, with a figure. Corolla violaceous, hardly longer than the calyx.

"The seeds, which are usually called *Miso* [sic, error based on Miller 1807] in Japan, are put into soups, and are the most common dish there, insomuch that the Japanese frequently eat them three times a day. The *Soja* of the Japanese, which is preferred to the *Kitjap* of the Chinese, is prepared from the seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favourite dish made of these seeds, called *ten-hu* [*sic, teu-hu,* i.e. tofu] or *tau-hu,* which looks like curd, and though insipid in itself, yet with proper seasoning is agreeable and wholesome.

"*Var. Beta, pállida* (D.C. prod 2. p. 396.) flowers yellow; seeds white. Roxb. [Roxburgh] hort. beng. p. 55.

"*Hispid* Soja. Fl. [Flowering] July, Aug. Clt. [Cultivated since] 1790. Pl. [Plant] 1½ foot.

"*Cult* [Culture and propagation]. The seeds of this plant only require to be sown in a warm sheltered situation in the month of May."

Under Phaseolus, Don lists a species named *Phaseolus max,* following Linnaeus and Rumphius, but he apparently did not confuse this with the soybean (listed on the same page under Soja hispida), since he noted that the species was not sufficiently known, the seeds were black, about the size of coriander-seeds, and that *Max* is the Spanish name of the plant.

On p. 220 we read: "XCV. Pueraria (in honour of M.N.N. Puerari, a professor at Copenhagen [Denmark]). D.C. ann. sc. nat. 1825. jan. p. 29. Leg. mem.vi. prod.2. p. 240. Lin. syst. Monadélphia, Decándria." Species: *P. tuberosa, P. Wallichii.*

George Don, son of George Don (1764-1814), was a British plant collector and nurseryman, born in Scotland, and lived 1798-1856. He collected plants on various expeditions for the Horticultural Society of London in Brazil, West Indies, and Sierra Leone. One of the most indefatigable and accurate botanists. Philip Miller lived 1691-1771. Note the similarity of the section on food uses of soybean seeds to that of Miller (1807). Address: England.

353. Encyclopædia Americana: A popular dictionary of arts, sciences, literature, history, politics and biography. A new edition. 14 vols.: Soy. 1832. Philadelphia, Pennsylvania: Lea & Blanchard. See vol. 11, p. 502-03.

• ***Summary:*** "Soy; a dark-colored sauce, prepared by the Chinese from the seeds of a sort of bean (*dolichos soja*). The plant has an upright and hairy stem, erect bunches of flowers, and pendulous, bristly pods, each containing about two seeds. The common story that soy is made from cockroaches or beetles, has probably originated from the form and color of these seeds. The process of preparing soy consists in boiling the seeds until they become soft, and mixing with them an equal weight of wheat or barley meal, coarsely ground. This mixture is fermented, and, a certain proportion of salt and water being added, the whole is allowed to stand for two or three months, care being taken to stir it daily: at the end of this time it is ready for use. The seeds are, besides, employed in China and Japan as food: they are made into a kind of jelly or curd, which is esteemed very nutritious, and is rendered palatable by seasoning of different kinds. In Japan, they are put into soups, and are the most common

© Copyright Soyinfo Center 2014

dish of the country, being frequently eaten three times a day. Soy [sauce] is chiefly imported from China and Japan, and that from the latter country is the most highly esteemed. The quantity annually sold in England, at the East India company's sales, is from 800 to 2000 gallons."

Note 1. Much of this information is taken from Willich (1821).

Note 2. The identical information appeared in the 1849 edition of this encyclopedia, in the same volume and pages.

354. Tokashiki, Tsûkan Peichin. 1832. Gyozen honsô [Food herbal]. Japan. In Higaonna Kanjun's 1955 hand-written copy of the original book (located at the Okinawa Prefectural Library), see pages 23 and 27. [Jap]*

• ***Summary:*** E.H. Walker (1976) states: "Originally published in about 1860. Treats animal as well as plant foods, with Japanese names only... A new edition was published in 1961 in Okinawa. The author, T. Tokashiki, lived 1793-1845."

Yasuda (1983, p. 839), in discussing how to eat tofuyo, states" In the *Gyozen Honsô* (*Food Herbal*) (1832, a book about food and medicine) the physician TOKASHIKI Tsûkan Peichin wrote: Tofuyo has a delicious flavor and is good for the stomach. It makes eating a pleasure and is good for various types of sickness" (Ref. #9; Note: This book contains the earliest known direct reference to tofuyo. Peichin refers to a high-ranking officer).

355. Carolinian, A. 1834. The introduction of exotics. *Southern Agriculturist* (*The*) 7:629-31. Dec. [1 ref]

• ***Summary:*** The author begins by reflecting on the widely held feeling that times past were better than the present, but that the present generation often thinks–out of vanity–it is more intelligent than those preceding it. "These reflections have occurred to me in looking over a paper, published above seventy years ago [i.e., before 1764], which furnishes a cataloge [sic] of foreign plants, suitable to this country, and recommending their introduction among us. What the fathers did in these respects, the sons can scarcely hope to equal... The wide world appears to have been searched and made tributary to the resources of South-Carolina...

"The paper referred to, contains the following catalogue:–" Seventy-eight plants are listed with both their common American and scientific names. One of these is: "Daidser: a kind of kid bean, *Dolichos soja.*"

Note 1. The author's name may mean simply a person from the Carolinas. This journal was published in Charleston, South Carolina.

Note 2. This is the earliest document seen (May 2004) that contains the word "Daidser," which should probably be "Daizu" or "Daidzu" [Japanese words for "soybean"]. The term "Dolichos Soja" was first used in 1749 by Linnaeus in his *Materia medica, per regna tria naturae.*

First cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished.

Note 3. The information on soybeans in this publication probably comes from a publication by John Ellis titled "A catalog of such foreign plants as are worthy of being encouraged in our American colonies for the purposes of medicine, agriculture and commerce." Originally published as a pamphlet, it was then reprinted in the *Transactions of the American Philosophical Society* in 1771 or 1772 (1:259). Concerning the soybean it states: "Dolichos soja Linn. Sp. 1023. A kind of kidbean called Daidsu. Used for making Soye* or Indian Ketchup." The four key pairs of similar terms are: (1) "catalogue" and "catalog." (2) "a kind of kid bean" and "a kind of kidbean." (3) "Daidser" and "Daidsu." And (4) "Dolichos soja."

356. Spach, Edouard. 1834. Histoire naturelle des végétaux. Phanérogames. Tome I. [Natural history of plants. Phanerogams. Vol. 1]. Paris: Librairie Encyclopédique de Roret. viii + 490 p. See p. 328. [1 ref. Fre]

• ***Summary:*** The section on "Les Papilionacees–Papilionaceae" (p. 149) contains a subsection for "Les Phaseolees" (p. 156) under which (on the same page) there is an entry for *Soja Moench.*

However in the section on "Les Phaseolees–Phaseoleae" (p. 317) is the actual taxonomic description (p. 328) for "Genre Soja. Soja Moench." After the brief description of the genus, which contains only one species, we read: "Soja hérissé.–*Soja hispida* Moench.–*Dolichos Soja* Linn. Jacq. Ic. Rar. I, tab. 145 [*Icones plantarum rariorum* (Illustrations of rare plants), by Nikolaus Joseph Jacquin (1781)].

Following a brief description of the species: This plant is cultivated in China, in Japan, and in India. The Japanese prepare from its green seeds a type of preserve (*conserve*) with which they season most of their dishes / food. Moreover, these seeds are farinaceous [sic] (*sont farineuses*) and are edible like haricot beans (*les Haricots*).

Note: Phaneorogams are seed-bearing or flowering plants; also called spermatophytes. Edouard Spach lived 1801-1879. Address: Asst. Naturalist, Museum of Natural History [Paris, France; Aide-Naturaliste au Muséum d'Histoire Naturelle].

357. Titsingh, Isaac. trans. 1834. Nipon o daï itsi ran: ou, Annales des empereurs du Japon, tr. par M. Isaac Titsingh [Annals of the Japanese emperors. Translated by Isaac Titsingh, edited by and Julius H. Klaproth]. Paris: Printed for the Oriental translation fund of Great Britain and Ireland. 3 + xxxvi + 460 p. See p. 345. 31 cm. [Fre]

• ***Summary:*** Page 343 states that 1444 was the first year of the Bunnan (*Boun an*) era. In the third month of this year, there fell from the sky-blue vault the beans called *miso** and the red beans (*des fèves rouges*) [azuki]. (Footnote: *In Chinese *Ta teou, Dolichos soya.* [Klaproth] The two Chinese

© Copyright Soyinfo Center 2014

characters for soybean are shown).

Note 1. This is the third earliest document seen (June 1999) written by a European or Westerner in which Chinese characters are used to write the name of the soybean or related products.

Note 2. The meaning of this entry is not clear. Isaac Titsingh [Titsing] lived 1744-1812. Julius Heinrich Klaproth lived 1783-1835. The title pages states that this work was translated by M. Isaac Titsingh with the aid of several interpreters attached to the Dutch factory or settlement at Nagasaki. The work includes a glance at the mythological history of Japan by Mr. J. Klaproth.

358. Balbi, Adriano; Bradford, Thomas Gamaliel. eds. 1835. An abridgement of universal geography, modern and ancient: Chiefly compiled from the *Abrégé de Géographie* of Adrian Balbi. New York, NY: Freeman Hunt, & Co.; Boston, Massachusetts: William D. Ticknor; Philadelphia, Pennsylvania: Desilver, Thomas, & Co. 520 p. Illust. 28 cm.
• ***Summary:*** In the chapter on "Empire of Japan," section 3 titled "Towns" states (p. 418): "Kio, or Meaco [Kyoto, or Miako], was for a long time the Capital, end contains the most remarkable edifices... Meaco is the centre of Japanese commerce and manufactures; silks, tissue, soy [sauce], and lacquered wares are purchased here in their greatest perfection;..."

359. Burnett, Gilbert Thomas. 1835. Outlines of botany: Including a general history of the vegetable kingdom,... Vol. 1. London: John Churchill. viii + 1190 p. See p. 666.
• ***Summary:*** "(2145.) *Sooja* is the name of a Japanese sauce, prepared from the seeds of a species of Dolichos, now made into a distinct genus, and called *Soja hispida.* The *Soja* of Japan is preferred as a sauce to the *Kitjap* of China; both, however, are imported into England in large quantities, and are here known as *Soy* [sauce]. In bond it is worth about 6*s.* a gallon; but, after it has been adulterated, it is sold at 3*s.* and upwards a pint. The Japanese make a soup of the seeds, called *Miso,* which is one of their most favorite and common dishes, the natives eating of it three times a day. The Chinese also have a popular dish made of these seeds, called *Teu-hu* or *Tau-hu* [tofu], which looks like curd; and, though insipid in itself, yet with proper seasoning is rendered agreeable and wholesome."

Note: Burnett, like Miller (1807) and Don (1832) before him, associates the word "Kitjap" with Chinese rather than with Indonesian soy sauce, and reports that both are imported into England in large quantities. The Japanese product was clearly called and sold as "soy" in England. But what was the Chinese product called and sold as? Was it sold as "real" ketchup, catsup, catchup, etc.? Address: F.L.S., Prof. of Botany in King's College, London.

• ***Summary:*** Called Manne [sic, mame / mamé] in Japanese. This species also grows in the East Indies [*Indes orintales*]*;* the pods resemble those of the lupin, the seed is the size of a large pea; from it, in the countries where it is grown, is made a type of pap or mush which is used in place of butter and which is served with roast meats; this pap is called *miso* or soy sauce [*sauce de soja*] and it constitutes one of the main foods of the Japanese. People of all ranks [and social classes] eat it several times each day throughout the year. It [soy sauce] is prepared in the following manner: cook the beans until they are soft; mix them with equal quantities of barley and of wheat; let them ferment for 24 hours in a warm environment; meanwhile add a certain quantity of salt and 2½ times as much water; keep the mixture in an earthenware pot that is well sealed for 2½ months, observing and stirring it during the first days. After that, press out the liquid and store it in wooden kegs. The more this sauce ages, the better it tastes and the clearer it becomes, until it remains with a brown color. Its main taste is salty and agreeable.

A member of the genus Dolichos with slender or small pods also grows in the East Indies; its white seeds offer, after rice, a food of which those people make the greatest use. Address: Member of the Royal Academy of Medicine.

366. Couverchel, Jean-François. 1839. Traité des fruits, tant indigènes qu'exotiques, ou Dictionnaire Carpologique, comprenant... [Treatise on fruits, indigenous as well as exotic, or Dictionary of Fruits]. Paris: Impremerie et Librairie de Bouchard-Huzard. 717 p. See p. 150-51. [Fre]
• ***Summary:*** In the section titled *Dolics, dolichos, L. famille des Légumineuses, J.* we read (R.6): The seeds of *dolichos soja* or *soya,* highly esteemed in Japan, are used to make, together with the juice from meat, the famous extract (*coulis*) or sauce called soy sauce (*soja*) so restorative and so thought after to revive strengths depleted by an excess of pleasure; furthermore, they prepare a boiled paste (*bouillie*) that they use in lieu of cow milk butter and that they call 'miso.'

In order to prepare the *soja* or *soya* (soy sauce) one should choose preferably the species of bean known under the name of *dolichos soya;* a predetermined measure of said beans is gathered and cooked in a sufficient amount of water; it is then mixed (kneaded) with wheat flour, salt and water in the proportions of one part of each; once it is well mixed, it is spread in thin layers in flat and appropriate vessels; these are covered over and left to stand alone; Within a few days, this paste molds, takes on a green cast and a rancid odor; these characteristics indicate that all is going well. It is then exposed to the outside air in order to desiccate it; these flat cakes are then broken into pieces; introduced in varnished or glass vessels, and water is poured into it in the proportions of five to one; it is placed under the sun and shaken quite

© Copyright Soyinfo Center 2014

frequently. When this mixture becomes consistent and creamy, it is poured into bags that are then put under a press. The viscous liquid so obtained is poured into bottles that are carefully corked and saved for subsequent use. Address: France.

367. Graham, John. 1839. A catalogue of the plants growing in Bombay and its vicinity; spontaneous, cultivated or introduced, as far as they have been ascertained. Bombay: Printed at the Government Press. ix + 254 p. See p. 52. 22 cm. [5 ref]

• ***Summary:*** "205. Soja. W. & A. [Wight & Arnott 1834] Diadelphia Decandria. *Sooja*–name of a Chinese sauce prepared from the seeds.

"405. S. [Soja] Hispida W. & A. 762. Dolichos soja. Rox. [Roxburgh] Flora. 3. p. 314. Jacq. [Jacquin] Ic. Rar. t. 145. An annual, hairy plant; flowers small, of a reddish purple; in gardens. In Japan the seeds are called *Miso* [sic, error based on Miller 1807], and are commonly eaten in soups (Don. [1832])

"206. Dolichos. L. Diadelphia Decandria. *Greek,* for long, -tedious: (Odys.) name given in allusion to the habit of the plants, sending forth long shoots. Gaert. *t.* 150. Lam. *t.* 610." The author then gives brief descriptions of Dolichos uniflorus, D. falcatus, and D. sinensis.

The title page reads: "Published under the auspices, and for the use of the Agri-Horticultural Society of Western India. To be continued and completed Printed by special permission, at the Government Press, Bombay." A quote from Linnaeus is on the title page. The author, John Graham, lived 1805-1839. Voigt (1845) notes that Dr. J. Graham was a professor of Botany at Edinburgh, Scotland. Contains a preface giving a short account of the author and a manuscript index of native names. Address: Deputy Post-Master General of Bombay.

"The Entire Cargo of the Barque Juliet from Java consisting of–1,546 Packages superior Black Teas, 7,857 [packages] Superior quality Sugar, 221 baskets fine white ditto [Sugar], 516 Bags Table Rice, 286 Bags Coffee,...125 Casks Arrack [palm wine],... 10 Barrels and 100 cases best Cognac Brandy,... 92 Baskets Salad Oil, 6 Ditto [Baskets] Japan Soy [sauce], 189 Cases French Wines,..."

Note: This is the earliest of 3 documents seen (Oct. 2009) in the Australian Newspapers database that contains the term "Japan Soy." Address: The Mart, George-street [Sydney].

369. Goodrich, Samuel Griswold. eds. 1840. A pictorial geography of the world, comprising a system of universal geography, popular and scientific,... 2nd ed. 2 vols. Boston, Massachusetts: C.D. Strong. 1008 p. Illust. ("One thousand illustrative engravings"). Index. 28 cm.

• ***Summary:*** In Vol. 2, the chapter titled "Empire of Japan" states (p. 969-70): *"Kio* or *Meaco* [Kyoto or Miako], was for a long time the capital, and contains the most remarkable edifices... Meaco is the centre of Japanese commerce and manufactures. Silks, tissue, soy [sauce] and lacquered wares, are purchased here in their greatest perfection,..."

Note 1. This passage mentioning soy also appears in the 1856 ed. (p. 472) in the chapter on "Empire of Japan," section 3 titled "Towns."

Note 2. Issued in ten parts. "Illustrated by more than one thousand engravings. With a copious index, answering the purpose of a gazetteer."

370. Holman, James. 1840. Travels in China, New Zealand, New South Wales, Van Diemen's Land, Cape Horn, etc., etc. 2nd ed. London: George Routledge. viii + 519 p. Illust. Forms vol. 4 of the author's *Voyage Round the World.*

• ***Summary:*** Mr. Holman was in southern China in Sept. and Oct. 1830. He visited Macao and Whampoa, but stayed at Canton, where the following events took place.

On the page titled "Mode of preparing soy" (p. 105): "He also sells soy [sauce], both of the kind made in China, and that which is brought from Japan. The latter is considered the best. There is a large manufactory of this article in the island of Honan, opposite Canton; and another at Whampoa.

"Soy is made from the seeds (or beans) of the Dolichos Sooja, and the process of preparing it is as follows:–The beans are first boiled soft, when nearly an equal quantity of wheat or barley flour is added. After this has gone through a regular process of fermentation, a quantity of salt is put in, sufficient to make a brine strong enough to float an egg, using three times as much water as the original quantity of beans. This compound is then left for two or three months, when it is pressed, and strained for use. It improves by age, and is best preserved in earthen jars, and bottles, well sealed."

The page titled "Dine with Tin-Qua" (p. 139) describes his dinner at a Hong merchant's house: "On dinner being announced, we were conducted to a circular table, and each of us provided with a pair of ivory chopsticks mounted with silver, a silver ladle with the handle much curved, a small cup of soy, a saucer or stand for the bowls out of which we were to eat, and an elegant silver cup richly gilt, with two handles, mounted on a stand of similar material, and resembling in form an inverted saucer."

Page 140: "The dinner commenced with a large bowl of birds'- nest soup, from which each person helped himself. We found it very insipid until flavoured with soy, as the

© Copyright Soyinfo Center 2014

necessary condiments of salt and pepper seem to be wholly neglected in Chinese cookery." Also served "was a vegetable soup made of prepared sea-weed from the coast of Japan." This dried weed is called Tay-choey. Address: R.N., F.R.S. [England].

371. *Manchester Guardian* (*England*)**.** 1841. Domestic, miscellaneous, &c.: Chinese dinners. March 31. p. 4.
• ***Summary:*** From Saturday Magazine: "A festival given at Canton by one of the Hong merchants... to a select party of English, is thus described by one of the party. We sat down in number about fifteen... We were told we had the happiness to partake of stewed pigeon's eggs, wild cat, fricassied [fricasseed] frogs, dried worms (particularly recommended as a *bonne bouche* for wine at dessert), sea slugs, sharks fins, and other delicacies, which, whatever they may really have been, were rendered extremely palatable by the application of a little Japan soy [sauce].

Note: It seems surprising that soy sauce from Japan would have been used at a banquet in Canton, China. How would the writer have known where the soy sauce had been made? How interesting if the Chinese were actually importing soy sauce from Japan at this time because they considered it superior to their own. Or perhaps the writer is using "Japan soy" as a generic term for all soy sauce.

372. *Musée des Familles: Lectures du soir* (*Paris*)**.** 1841. Études de voyages. Les aventures d'un bossu [Studies of voyages. The adventures of a hunchback]. 8:161-71. March. [Fre]
• ***Summary:*** In Chapter 4, "Productions of the country" (*Chapitre quatrieme: Les productions du pays*) (p. 170+) we read on p. 171: Different species of beans or broad beans (*de haricots ou de feves*) are very popular and much appreciated by the Japanese. They eat them either boiled in water, or paired with syrup or soy sauce (*du soya*)*;* beans cooked with rice are considered a delicacy.

373. Siebold, Philipp Franz von; Busk, M.M. 1841. Manners and customs of the Japanese, in the nineteenth century: From recent Dutch residents of Japan, and the German of Dr. Ph. Fr. von Siebold. London: John Murray. xi + 423 p. 20 cm. No index.
• ***Summary:*** This book was compiled from earlier sources, especially those of the first three physicians at Dejima, Japan.

Philipp Franz von Siebold, a learned German, lived 1796-1866. Note Sieb. & Zucc. Siebold's German book titled *Nippon* was published in 1897. Japan is largely an unknown country. Europeans are excluded except for the Dutch factory at Dezima [Dejima]. Siebold, "like his talented and indefatigable predecessors, Kaempfer and Thunberg, held the situation of physician to the factory."

In the chapter on "Banquets" we read (p. 186): "At entertainments of this description, each guest is served with a portion of every dish in a small bowl. Another bowl is placed beside him, and kept constantly replenished with rice, whilst the sauces and other condiments, of which, besides soy [sauce], are salted ginger and salted fish, are handed round by the servants of both sexes, who are in constant attendance."

The chapter on "Husbandry" states (p. 329): "Barley and wheat are likewise grown–the former for feeding the cattle; the latter is little valued, and chiefly used for cakes and soy. This last is made by fermenting together, under ground, wheat, a peculiar kind of bean, and salt. Beans of all sorts, some other vegetables, and various roots, are sedulously cultivated,..."

"Dr. Von Siebold's Japanese museum [at Leyden] is said to be the finest in Europe, and far richer and in every respect superior to the Japanese rooms in the Royal Museum at the Hague." (p. 297). Mrs. M.M. Busk is listed by some as the compiler of this book, but her name does not appear in this 1841 edition.

Note: Soy is not mentioned in this book.

374. Penny cyclopaedia of the Society for the Diffusion of Useful Knowledge: Soja hispida. 1841. London: Charles Knight & Co. See vol. 22, p. 193-94. [2 ref]
• ***Summary:*** "Soja Hispida (Moench), Soja Japonica (Savi), the Dolichos Soja (Linn), a leguminous plant, native of Japan and the Moluccas, and abundant in the peninsula of India, though probably introduced there. The seeds resemble those of the haricot, French or kidney bean, and are used by the Chinese to 'form a favourite dish, called *ten-hu,* or *tau-hu* which looks like curd, and which, though insipid in itself, yet with proper seasoning is agreeable and wholesome' (Don's *Dictionary*)**.** The Japanese call the seeds *Miso* [sic, error based on Miller 1807] and put them into soup, of which they sometimes partake three times a day. They likewise prepare with them the sauce termed *Sooja* which has been corrupted into *Soy.*

"'The beans are boiled until all the water is nearly evaporated, and they begin to burn, when they are taken from the fire, and placed in large wide-mouthed jars, exposed to the sun and air; water and a certain proportion of molasses or very brown sugar are added. These jars are stirred well every day, until the liquor and beans are completely mixed and fermented; the material is then strained, salted, and boiled, and skimmed until clarified, and will after this process become of a very deep brown colour, and keep any length of time. It has been stated that the gravy or juice of meat was used in preparing this condiment, but it appears to be entirely made from vegetable materials. There are two or three qualities of soy. To make the best requires much care and attention. Japanese soy is much esteemed in China on account of the superior manner in which it is made. Shopkeepers at Canton who sell soy have large platforms on the roofs of their houses, where the jars for preparing soy are

© Copyright Soyinfo Center 2014

arranged and exposed to the sun; for the consumption of soy is enormous. Neither rich nor poor can breakfast, dine, or sup without it; it is the sauce for all kinds of food; gives a zest to every dish, and may be said to be indispensable at a Chinese repast.' (Dobell's *Kamschatka.*) Soy is only sparingly used as a sauce in this country. It has the character of being a useful stomachic, but not more so than any of the other condiments when used with moderation."

Note: This is the earliest document seen (May 2004) that uses the word "stomachic" in connection with soy sauce. *Merriam-Webster's Collegiate Dictionary* (1998) defines stomachic (first used as a noun in 1735) as "a stimulant or tonic for the stomach." Address: London, England.

375. Vaucher, J.P. 1841. Histoire physiologique des plantes d'Europe [Physiological history of the plants of Europe]. Paris: Librairie de Marc Aurel Frères, Éditeurs. See Vol. 2, p. 208. [Fre]
• ***Summary:*** In the section titled "Fifth tribe–Phaseoleae" (p. 201), the "Sixth genus" is Soja (p. 208).

A botanical description of the genus is given in French. The habitat of soybean (*Le Soja*) is the Indies (*les Indes*) and Japan, where two varieties can be distinguished: those with violet colored flowers and those with yellow flowers and white seeds. They are both cultivated in botanical gardens. Address: Professor at the Academy of Geneva.

376. Dobel, Pierre. 1842. Sept années en Chine: nouvelles observations sur cet empire: l'archipel Indo-Chinois, les Philippines et les îles Sandwich (Nouv. éd.). traduite du russe par le prince Emmanuel Galitzin [Seven years in China: New observations concerning this empire: the archipelago of Indo-China, the Philippines and the Sandwich islands. New ed. Translated from the Russian by prince Emmanuel Galitzin]. Paris: Amyot. vii + 358 p. Illust. 22 cm. [Fre]
• ***Summary:*** On page iv we read that the author of this work, Mr. Dobel, made three voyages to China and stayed a total of 7 years. Mr. Dobel was born in Ireland, in County Cork. His parents, after being established in North America, placed their son in the University of Pennsylvania. He finished his studies but he lost his parents. He initially chose a military career, but then later decided to be a traveler in Asia.

In the description of a meal (p. 105) he mentions that vinegar and soy sauce (*le soya*) are placed on the table.

Chapter 12, about China (p. 178+), contains a long section about the soybean (Soya) (p. 188-89): After mentioning yuba (*fu-fu* or *fu tchock*) it discusses how soybean jiang and soy sauce are made. There are three grades of soy sauce; the first comes from the first liquid removed by filtering from the soybean jiang, etc. Soy sauce made in Japan and imported to China is the most esteemed. In Canton, huge courtyards are devoted to the production of soy sauce. The consumption of this seasoning is immense; it is served everywhere, by rich and poor alike. Soy sauce is found on every table and at each meal of the day.

For an earlier English edition, see Dobell (1830). Peter Dobell lived 1772-1852. Address: Counselor at the College in the Service of Russia, and former Consul to this power in the Philippines.

377. Tsukue no chiri 1843. Japan. [Jap]*
• ***Summary:*** In Japan today (Jan. 2014) the word "yuba" is written either with two Japanese hiragana characters or with the two Chinese (kanji) characters that mean "hot water" + "leaf." In 1843 these two characters were first used to mean yuba in the *Tsukue no Chiri*–according to the *Nihon Kokugo Daijiten.*

• ***Summary:*** The section titled "Soy" (p. 627) states: "Soy, a peculiar savoury sauce made from the bean of the *Soja,* a species of *Dolichos* growing in the eastern parts of Asia. Genuine soy is well flavoured, thick, brown, and clear; and when shaken in a glass, it should leave a coat on the surface of a bright yellowish brown colour. It is imported from Canton, but the best is brought from Japan by way of Batavia" [today's Jakarta in the Dutch East Indies].

Note 1. Following p. 672 (the end of the basic cyclopædia) is a one-page table titled "Tariff of duties exigible in the United Kingdom." For each imported item there are two rates: (1) From foreign countries, and (2) From British possessions. Tariffs are levied on beans (10 pence/bu), "oil-seed cakes" (1 shilling/ton), and some seeds ("Cole, flax, hemp, rape, sesamum;" 1 pence/qr [pence/quarter; in the UK a "quarter" is usually a quarter of a hundredweight {112 lb} or 28 lbs]).

Note 2. No soybeans or soy cakes were being imported to England at this time. Soy [sauce] is not mentioned. At the end of the book is an alphabetical "Supplement" and three maps of Great Britain.

Note 3. This is the earliest English-language document seen (March 2005) that mentions "rape" seeds (or the rape plant), or that mentions "Cole" a seed very similar or identical to rape seed.

Note 4. This is the earliest English-language document seen (Sept. 2006) that contains the term "oil-seed" (or "oil seed").

Note 5. This is the earliest English-language document seen (Sept. 2005) that contains the term "oil-seed cake" (or "oil-seed cakes" or "oil seed cake"). Address: Accountant,

• ***Summary:*** Section 6, "Description of the articles of export at Canton" (p. 131+), contains a long description of soy sauce (p. 141): "50. Soy. This is a condiment made from the Dolichos bean, which grows in China and Japan; the name is derived from the Japanese *siyau* [sic, *shôyu*]. To make it the beans are boiled soft, and then an equal quantity of wheat or barley is added; after this has thoroughly fermented, a quantity of salt, and three times as much water as the beans were at first, are added. The whole compound is now left for two or three months, and then pressed and strained. Good soy has an agreeable taste, and if shaken in a tumbler, lines the vessel with a lively yellowish-brown froth; the color of soy in the vessel is nearly black. It improves by age. Japan soy is considered superior to the Chinese, but both are of different qualities, and are probably made of various materials, some of which may be base enough. It is for the most part sent to England and America."

Note 1. This is the earliest English-language document seen (April 2012) that uses the word *siyau* to refer to shoyu or soy sauce.

Note 2. This is the earliest English-language document seen (Feb. 2008) that uses the word "tumbler," or the word "froth," or the term "yellowish-brown froth" in connection with soy sauce.

382. Okura, Nagatsune. 1844. Kôeki kokusan-kô [Greatly beneficial domestic production ideas. 8 vols.]. Edo [later Tokyo], Japan: Suharaya. Illust. 23 cm. [Jap]*
• ***Summary:*** This is an early multivolume work about farm management and farm production (including production of foods) in Japan. The author, Nagatsune Ohkura, lived 1768 to about 1847.

Iino (2003, p. 9) presents two illustrations from this 1844 book showing soy sauce production.

(1) A woman, standing, facing forward, and wearing a kimono, is roasting soybeans in a large metal wok over a hot fire in a cauldron dais. A man, kneeling on the floor and facing away, appears to be spreading something (perhaps the freshly roasted soybeans) on a straw mat (probably to cool). Four groups of Japanese script characters describe what is happening in the illustration.

(2) See next page. A man in the foreground is stirring moromi in one of two wooden barrels (each is about 3 feet tall, 3 feet in diameter, with the staves bound together by three braided bamboo hoops). The stirring tool that he is using is illustrated in the lower right corner; at the bottom tip is attached a circular wooden disk about 6 inches in diameter and ½ inch thick. A man in the background, facing forward, is using a long-handled dipper, held in his right hand, to ladle shoyu out of a woven bamboo colander (partially submerged in one of the wooden barrels described above) and into a wooden keg (about 18 inches tall, 20 inches in diameter with the staves bound together by three braided bamboo hoops) on the floor next to the barrel. Three groups of Japanese script characters describe what is happening in the illustration.
Address: Japan.

Serampore, India.

386. Webster, Thomas. 1845. The encyclopædia of domestic economy: Comprising such subjects as are most immediately connected with housekeeping... Assisted by the late Mrs. Parkes, author of "Domestic Duties." From the last London edition with notes and improvements by D. Meredith Reese, A.M., M.D., of New York. Illustrated with nearly one thousand engravings. 2 vols. New York, NY: Harper & Brothers. 1,238 p. See Vol. II, Nos. 4932, 5072. From the last London edition. With notes and improvements by Meredith Reese. Illust. 24 cm.
• ***Summary:*** In Vol. II: No. 4263 (p. 764). "Rice is boiled to a kind of paste, and drawn out into threads forms a transparent substance used to thicken soups, and is known by the name of China lock soy. There is a kind that is opaque, and which is less esteemed."

Recipe No. 4932 (p. 876), "Cod sounds, broiled," calls for "a tea-spoonful of soy [sauce], and a little mustard." Catsup is also called for in recipe No. 4871.

No. 5072 (p. 889). "Soy.–This sauce, much used for fish, comes from Japan and is called there soja [sic, shôyu]. It is made from the seeds of a plant called *Dolichos soja.* Some is also brought from China, but the Japanese is best. It is supposed to be extensively counterfeited in this country. When genuine, it is of an agreeable flavour, neither too salt [sic, salty] nor too sweet, of a thick consistence and clear brown colour. When shaken in a glass, it should leave a coat on the surface of a bright yellowish-brown colour.

"A somewhat similar sauce may be prepared in the following manner: Boil a gallon of the seeds of the *Dolichos soja* till they are soft; and even pease or kidney-beans may be used as a substitute; add an equal quantity of bruised wheat; put this mixture into a warm place for twenty-four hours, and add a gallon of common salt and two gallons of water. Shake the whole together, and put it into a stone jar, where it should remain closed up for two or three months, during which time it should frequently be shaken. After this time, the liquor should be pressed out through a sieve, which will constitute the soy. An inferior kind may be procured by putting salt water upon what remains, and treating it in the same manner."

Note: This is the 2nd earliest document seen (April 2012) that uses the word "soja" to refer to soy sauce.

Note: Thomas Webster lived 1773-1844. Address: F.G.S., Royal Institution of Great Britain for the Application of Science to the Common Purposes of Life.

387. E. 1846. Soy (Letter to the editor). *Farmers' Cabinet and American Herd-Book* 10(12):379-80. July 15.
• ***Summary:*** Letter dated 26 June 1846. "Dr. Emerson of this city [Philadelphia] has received from a friend in China, some seeds of the *Dolichos soja,* a plant from which the Chinese and Japanese prepare their celebrated dark coloured sauce called soy [sauce], an article largely consumed by all ranks of people in those populous countries. The consumption is rather limited in the United States, but in England about 1000 gallons are imported annually, in addition to a large quantity counterfeited at home. It is excellent on fish and with soups. The flavour is peculiar, but when once acquired, the taste like that for olives and many other things, becomes very strong. By the Chinese and Japanese *soy* is not only esteemed for its agreeable but for its wholesome qualities. The notion of its being made for cock-roaches is of course a vulgar error."

After giving a brief description of the process for making "soy," the author notes: "The best *soy* comes from Japan. When genuine, it is of an agreeable flavor, neither too salt nor too sweet, of a thick consistence, and clear brown color. When shaken in a glass, it should leave a coat on the surface of a bright yellowish brown color." An alternative method of making soy [sauce] from the seeds of *Dolichos Soja* is then described. Both this and the previous method mention that soy is made by a fermentation process, but they do not mention koji or any other source of microorganisms.

"The seeds or soy-beans are also employed in China and Japan in various ways as food. They are made into a kind of jelly or curd [tofu], which is esteemed very nutricious [nutritious] and is rendered palatable by seasoning of different kinds. In Japan they are put into soups, and are the most common dish of the country, being frequently eaten three times a day."

An editor's footnote to this letter dated June 26 states: "Dr. E. has left with us a few of the *Soy* beans, which will be distributed among those who may incline to plant them. As the season is late, it is doubtful whether they would mature this summer; a few however might be tried, and others left to plant next spring."

Note 1. Hymowitz (1986, personal communication) thinks this may have been Ralph Waldo Emerson. This journal was published in Philadelphia, Pennsylvania. First cited by Hymowitz. 1987. Introduction of the Soybean to Illinois. Economic Botany 41(1):28-32.

Note 2. This is the earliest journal article seen worldwide that refers to tofu–which it calls "a kind of jelly or curd." Address: Philadelphia, Pennsylvania.

• ***Summary:*** Letter dated 18 Sept. 1847. "It is a native of Japan and of the Molucca Islands. It thrives well in New England, having been successfully raised in the Botanic Garden, at Cambridge, and elsewhere in Massachusetts... The plant is very productive. Eight of the beans, planted in Milton, Mass., in 1831, yielded a wine pint of seed, weighing eleven and a half ounces. One hundred and ten of the beans, taken promiscuously, weighed half an ounce. In this proportion, the production of the eight beans would be 2530, or more than 316 for one. In 1829, a single bean, in the Botanic Garden in Cambridge, produced 182 pods, which, as some of them contained three beans, was more than 364 for one. Should their qualities as articles of food be found agreeable, these beans will become valuable on account of their great productiveness.

"The inhabitants of Japan, of China, and Cochin China, and of some parts of India, cultivate these beans extensively, and eat them cooked or prepared in various ways. They make a very important article in the cookery of the Japanese, who use them chiefly in two forms. The first, called *Miso,* is a rich paste, of the consistence of butter, the place of which it supplies in various dishes, and is composed of a mixture of the beans and rice stewed and highly seasoned with salt. The second, called *Sooju* [shoyu] by the Japanese, is the celebrated sauce, known in commerce by the name of *Soy* [sauce] and imported in large quantities from the East, the best being brought from Japan. The Japanese method of making *Soy* was described by Kaempfer, in the 'Amoenitates Exoticae,' published in Latin, in 1712. It is as follows:" An 18-line description is then given.

"Kaempfer says that the Japanese use this sauce to season every dish of fried or roasted food. For fish, beef, and mutton, it forms a very savoury as well as a harmless condiment, the flavour of which is much admired by those who have become accustomed to it; and by many it is preferred to the best Chinese catsup."

"The making of *Soy,* as here described, seems to be a very simple process, and the experiment is worth trying. Should it prove successful, the cultivation of the plant in this country, may become profitable. The beans are said to be good when cooked, like common kidney beans; but it is doubtful whether they would ever take the place of our best varieties of them."

First cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished.

Note 1. This is the earliest document seen (July 2000) published in the United States that contains the word "Miso."

Note 2. This is the earliest document seen (June 2001) that mentions the term "profitable" (or "profit" or "profits") in connection with soybeans in the United States. Address: Cambridge, Massachusetts.

390. Honzô kômoku keimô [Complete study of materia medica]. 1847. Japan. [Jap]*

• ***Summary:*** According to the *Nihon Kokugo Daijiten* [Japanese Language Dictionary], this is the earliest known Japanese document that contains the word *unohana,* referring to the dietary fiber remaining after making tofu or soymilk.

Thanks to Toshie Marra of the University of California, Librarian for the Japanese Collection, C.V. Starr East Asian Library.

Note. This is the earliest Japanese-language document seen (June 2013) that uses the term *unohana* to refer to okara.

391. **Product Name:** [Inari-zushi (Vinegared Sushi Rice in Sweetened Tofu Pouches/Agé)].
Foreign Name: Inari-zushi.
Manufacturer's Name: Jukkenten Restaurant.
Manufacturer's Address: Tokyo, Japan.
Date of Introduction: 1848.
Ingredients: Deep-fried tofu pouches, water, sugar, shoyu, mirin, sushi rice, sweet vinegared gingerroot (gari).
How Stored: Refrigerated.
New Product–Documentation: Shurtleff & Aoyagi. 1975. *The Book of Tofu.* p. 194. "In Japan, the most popular way of serving agé [deep-fried tofu pouches] is in the form of *Inari-zushi.* Packed into lightweight wooden boxes and topped with thin slices of vinegared gingerroot, Inari-zushi are often found at picnics and outings of all kinds where they play much the same role as do sandwiches in the West. Served at most sushi shops, they are very inexpensive and are prepared in a different way by each chef.

"Inari-zushi is said to have originated in Tokyo about 1848, the creation of one Jiro Kichi, chef at the *Jukkenten* restaurant. Kichi peddled his new culinary treats at night through the streets of Tokyo carrying a four-sided paper lantern called an *andon.* On this he painted a red Shinto *torii* gateway, the hallmark of the Inari shrine where the Goddess of rice is said to abide. Since foxes are said to be very fond of agé, and since the fox is the patron animal of Inari shrines, this pictorial symbolism and its curious logic seemed natural and appropriate; Inari-zushi soon spread throughout Japan."

392. Morrison, John Robert. 1848. A Chinese commercial guide: Consisting of a collection of details and regulations respecting foreign trade with China. 3rd ed., revised throughout. Canton: Printed at the Office of the Chinese Repository. viii + 310 p. Illust. 22 cm.

• ***Summary:*** Section 6, "Description of the articles of export at Canton" (p. 170-83), contains a long description of "Soy" [soy sauce] (p. 180). It is identical to that found in the 2nd ed. of 1844.

Note: Chapter 3 contains detailed information on money (from many countries), Chinese weights & measures, etc. (incl. Chinese measures of capacity, length, and land measures). Interesting terms in Section 6: Aniseed stars,

Chinaware or porcelain (now widely made in Europe), crackers (fire-crackers), pecul / peculs [piculs], caties [catties], lackered ware (the best kind comes from Japan), Nankeens (a kind of cotton cloth, so named from Nanking), paper (that used in books is made from yellow bamboo). Address: LL.D., Hongkong.

393. Williams, Samuel Wells. 1848. The Middle Kingdom: A survey of the geography, government, education, social life, arts, religion, &c., of the Chinese empire and its inhabitants. With a new map of the empire, and illustrations, principally engraved by J.W. Orr. London and New York: Wiley and Putnam. 2 volumes. See vol. I, p. 283, 290; vol. II, 402-03. • ***Summary:*** In volume 1, in Chapter 6 titled "Natural History of China," the section on legumes (p. 283) states: "The widely diffused and extensive tribe of Leguminosæ holds an important place in Chinese botany, affording many esculent vegetables and valuable products. Peas and beans form important objects of culture, and the condiment called *soy* [sauce] (a word derived from the Japanese *soya*) is prepared chiefly from a species of Dolichos. One of the commonest modes of making this condiment is to skin the beans and grind them to flour, which is mixed with water and powdered gypsum, or turmeric. The common Chinese eat few meals, without the addition of one form or other of the bean curd or bean jelly" [tofu].

Note 1. This is the earliest document seen (April 2013) that mentions turmeric in connection with tofu, or the uses the terms "bean jelly" or "bean jam" [probably incorrectly] to refer to tofu. However, Williams seems to be a bit confused here. He starts to describe how the condiment soy sauce is made in China, but he first states (incorrectly), that the dehulled beans are ground to flour which is then mixed with powdered gypsum or turmeric (also incorrect) before the soy sauce fermentation. The powdered gypsum and turmeric are part of the process for making bean curd–in which hot soymilk is curded with gypsum. Typically, to make bean curd in China, soaked (not dry) soybeans are ground to a slurry or paste (not a flour), mixed with water to make soymilk, which is cooked, then mixed with gypsum, which curds the hot soymilk. Firmly pressed tofu can be cooked with turmeric [and often soy sauce] to preserve it and give it a yellow color. Williams' incorrect idea that whole dry soybeans are first ground to a flour before being made into tofu is repeated by many subsequent European writers.

Note 2. This is the earliest English-language document seen (Feb. 2004) that uses the word "flour" in connection with the soy bean.

In a long discussion of the famous *Pun Tsau* [*Pên Ts'ao* or *Ben Cao*] herbal, by Li Shih-chen, the author notes (p. 280) that "The second division of grains contains four families:... 3. That of leguminous plants; and 4. The family of fermentable things, as bean curd, boiled rice, wine, yeast, congee, bread, &c., which, as they are used in medicine and produced from vegetables, seem most naturally to come in this place."

In volume 2, in Chapter 13 titled "Architecture, dress, and diet of the Chinese," the section on "Vegetables eaten by the Chinese" (p. 43) states: "The Chinese have a long list of culinary vegetables, and much of their agriculture consists in rearing them. Leguminous and cruciferous plants occupy the largest part of the kitchen garden; more than twenty sorts of peas and beans are cultivated, and the pods and seeds of two species of Dolichos are eaten, and the beans of another species made into soy by boiling and powdering the kernels, then fermenting them with yeast, and mixing other ingredients according to the taste of the maker or purchaser. Another still more common condiment made from beans, is called bean curd or bean jam, by boiling and grinding them, and mixing the flour with water, gypsum, and the juice of yellow seeds."

Concerning oils and fats (p. 46): "Oils and fats are in universal use for cooking; crude lard or pork fat, castor oil, and that expressed from two species of Camellia and the ground-nut, are all employed for domestic and culinary purposes."

Chapter 20 titled "Commerce of the Chinese," states (p. 402-03): "The silk trade is more likely to increase than any other branch of commerce, after tea, and the Chinese can furnish any amount of raw and manufactured silks according to the demand for them. The best *Soy* is made by boiling beans soft, adding an equal quantity of wheat or barley, and leaving the mass to ferment; a portion of salt, and three times as much water as beans, are afterwards put in, and the whole compound left for two or three months, when the liquid is pressed and strained. The flavor and ingredients of soy vary considerably, even among the people who make it, and much of that exported is supposed to be more or less adulterated." Note: The author apparently does not know what kind of beans are use to make *Soy.* In the 1882 edition of this book, he gives a more accurate description.

Note: This is the earliest document seen (Oct. 2002) concerning soy and adulteration. It speculates that much exported soy [sauce] is adulterated.

Also discusses: *Coix lachryma,* a kind of grass used for weaving floor matting (p. 276). "Hemp is cultivated for its fibres, and the seeds furnish an oil used for household purposes, and medicinal preparations; but the intoxicating substance called *bang,* made from it in India, is unknown in China" (p. 281). Samuel Wells Williams lived 1812-1884. Address: New York, Author of "Easy Lessons in Chinese," "English and Chinese Vocabulary," &c.

Sanier. 280 p. See p. 188-90. [3 footnotes. Fre]
• ***Summary:*** Item No. 64 is "Soy sauce" (*Soya*). Names: English: soy. Portuguese: soja. Chinese court dialect [Mandarin]: chi-you. Chinese (Cantonese): chi-yaou. Nature and origin of the basic material: Soy sauce (*le soya*) is a seasoning made with the seeds of a species of bean (*haricot*), which grows in China and Japan: it is the *si-yao* of the Japanese, the *you-tao* of the Chinese, the *dolichos soja* of the botanists. It is a member of the legume family. Footnote: The *you-tao* is found among the edible plants of Macao and Canton, and entire fields of it are cultivated on the island of Tchou-san, as well as in the provinces of Fujian (*Fo-kièn*) and Zhejiang (*Tché-kiang*).

Method of manufacture: The manufacture of soy sauce (*du soya*), without being difficult, requires attentive care and practice; Chinese families prepare their soy sauce themselves.

Weigh a certain quantity of black [soy] beans (*haricots noirs*), boil them over a low flame; they must be taken out in time to avoid overcooking. Drain them, then add a certain quantity of wheat or barley flour [the amount is not specified]. Cover the vessel, and leave it for a bit in some warm and humid corner. Fermentation begins, an abundant mold forms, and when it is withered and dried out, wash the beans. Next throw them in a jar with an equal weight of sea salt, three times as much boiling water and some aromatic substances. There is nothing more to do than to place the terrine [a glazed, earthenware cooking dish] in the sun; open it during the day and close it at night or when it rains. One month later, the soy sauce is done, which does not prevent many housekeepers from allowing theirs to age thirty or forty days more. Clarify, drain the mass, and put the liquid in bottles.

Description of the finished product: Soy sauce (*Le soya*) is a clear liquid, brownish-black in color; when shaken in a bottle, it should leave a brownish yellow foam on the walls. Its flavor is pleasant and renders it an excellent seasoning.

Soy sauce from Japan is much more esteemed than that of China; its taste, quality, and aroma are so unlike that it is not doubtful that the preparation is different. It appears, besides, that the Japanese use other very common ingredients, they say, in their empire.

Price in Canton (piasters/picul): First grade: 12. Second grade: 10. Third grade: 8. However you can buy a good grade for as little as 5.25 to 7.75 piasters/picul. Churn-ching [Chunking?] sells for 3 piasters a dozen bottles of superior quality soy sauce which is ordinarily sent to British India.

Exportation, destination, and usage: This seasoning has now been adopted throughout almost all of British India, and for the last 20 years [since 1829] it has even been served on the tables of London, Singapore, Pulao Pinang (the first British settlement in Malaya; *Poulo-Pinang*), Manila [Philippines], Batavia [today's Jakarta, Indonesia], and Bourbon [today's island of Réunion / Reunion]–and much is consumed. The usage is expanding in the United States.

A table shows exports of soy sauce (quantity and value) from Canton: In 1844–1,120 piculs worth 9,029 piastres / piasters; 98.9% is sent to England, 0.9% to the USA, and 0.01% to France. In 1845–568 piculs worth 6,380 piasters; 75.7% is sent to England, 13.7% to Denmark, 8.5% to Sweden, 1.6% to the USA, and 0.5% to Germany.

The Chinese consume large quantities of it which they make themselves in their homes; products destined for export come from factories in Henan (a province in central China; W.-G. Honan) and Canton.

Export duties: 4 mèces per picul = 5.05 francs per 100 kg.

Note: This is the earliest document seen (Aug. 2009) concerning soybean products (soy sauce) in Réunion. This document contains the earliest date seen for soybean products in Réunion (1849 or before); soybeans as such had not yet been reported by that date.

Note 2. This is the earliest document seen (April 2007) concerning export duties or tariffs on a soy product–soy sauce exported from China–or soybeans.

Note: This is the earliest French-language document seen (April 2012) that uses the words *chi-you* or *chi-yaou* to refer to soy sauce. Address: Commercial Delegates attached to the French Mission in China.

395. Kôto gosui 1850. Japan. [Jap]*
• ***Summary:*** According to Ryoichi Iino (2003, p. 10) the term *oshidashi* was used in this book to indicate / refer to soy sauce.

396. Dubois de Jancigny, Adolphe Philibert. 1850. Japon, Indo-Chine, Empire Burman (ou Ava), Siam, Annam (ou Cochinchine), Péninsule Malaise, etc., Ceylan [Japan, Indo-China, Burmese Empire (on Ava), Siam, Annam (or Cochinchine), Malay Peninsula, etc., Ceylon]. Paris: Firmin Didot Frères. 2 p. + 666 p. 3 maps (1 folded). No index. 21 cm. [50* ref. Fre]
• ***Summary:*** All references to soy are in the first part of the book, which is about Japan. Page 129 R.3: The dishes are arranged on the table in groups of five. One contains rice, another fish and vegetables seasoned with soy (des légumes confits dans du *soy,...*).

Page 176 R.1: The commercial products most researched are the wax tree (*Rhus succedanea*), bamboo, saké, soy (*du soy; soya*), mustard, silk fabrics,..."

Page 184 L.7: Wheat is one of the principal ingredients of soy, the Japanese sauce, which is so widely used throughout the archipelago and is even shipped to Europe.

Note: The table of contents (at end of book) shows that this book is divided into two major parts: (1) Japon [Japan] and Indo-Chine [Indochina]. The latter part is divided into the following geographical sections: Birmah [Burma], Siam, Péninsule Malaise [Malay Peninsula],

397. Rundall, Thomas; Adams, William. 1850. Memorials of the empire of Japon: In the XVI and XVII centuries. London: Printed for the Hakluyt Society (Series 1, No, 8). xxviii + 186 p. 22 cm. Facsimile edition reprinted in 1968 by B. Franklin (New York). [20+ ref]

• ***Summary:*** Contents: Preface–A description of the empire in the 16th century. From... Harleian manuscript #6249. Six letters of William Adams, 1611 to 1617. Notes. Summary of a narrative by His Excellency Don Rodrigo de Vivero y Velasco... of his residence in the empire: A.D. 1608-1610.

The preface states: The Portuguese first arrived in Japan in about 1542; the Spaniards arrived a little later. The first indication of any misunderstanding between the Japanese government [shogun, "Taico Sama"] and the Europeans residing there appears in 1587. In that year the shogun "despatched [dispatched] two imperial commissioners, in rapid succession, to Father Cuello, the vice-provincial of the Portuguese, to demand: 1. Why he and his associates forced their creed [Jesuit Roman Catholicism] on the subjects of the empire. 2. Why they incited their disciples to destroy the national temples? 3. Why they persecuted the bonzes [native priests]? 4. Why they, and the rest of their nation, used for food animals useful to man, such as oxen and cows? [see note M]. Finally, why they permitted the merchants of their nation to traffic in his subjects, and carry them away as slaves to the Indies?" The replies of the vice-provincial are given, showing disdain for the Japanese and their religions (p. x-xi).

On p. xxiv is a detailed discussion of Dutch trade with Japan and the island of Deshima.

The English attempts at trade with Japan failed. "The English retired from Japan in 1623, and a subsequent attempt was made (in 1673) to renew the intercourse; but it proved unsuccessful" (p. xxv).

"The Americans must be placed in the same category with ourselves [the British]. In the year 1837 the *Morrison,* a vessel belonging to citizens of the United States, sailed from Singapore, on an expedition to Japan." It was driven away by cannon fire from isolationist Japan (p. xxviii). Note: In addition to its commercial aims, the ship (headed by Charles W. King) had been attempting to repatriate seven shipwrecked Japanese citizens who had been picked up in Macau. It also carried Christian missionaries such as Samuel Wells Williams.

Letter No. IV by Sir Thomas Smith to William Adams concerns Capt. John Saris of the *Clove,* who anchored near Firando [Hirado] in June 1613.

Unites of currency (p. 88). 10 Condrins = 1 Mas = 6 pence (British). 10 Mas = 1 Taie = 5 shillings.

In the section of the book titled "Notes," Note O (p. 123-24) is about "Produce of the fields" (from E. Kaempfer). One of the five fruits of the field is: "4. *Daidsu,* or *Daid-beans;* from which *soeju* [shoyu], or *soy* [sauce], is made; and which is highly esteemed as an article of food."

Note A A (p. 164-67), titled "Fate of the English factory at Firando," discusses what items the Spaniards, Portuguese, and Dutch tried to import to Japan, and the weak demand for these products. Note: William Adams lived 1564-1620.

398. *Daily Alta California* (*San Francisco*)*.* 1851. China and Japan. Per Auckland. 2(86):2. Cols. 4-5. March 5. Wednesday morning.

• ***Summary:*** "We learn from Capt. Jennings of the barque Auckland, which arrived in the port yesterday, in seventy days from China, that about 500 miles off the coast of Japan he fell in with a Japanese junk, which was completely water-logged. The crew, consisting of seventeen persons, were taken off by Capt. Jennings, and are now on board his vessel. They had been fifty days on the wreck, and were in great distress, having exhausted their provisions. No communication, of course, has been had with them, beyond what could be accompanied by signs, but they appear exceedingly grateful for the assistance and kind treatment received from the Captain. On approaching land, they exhibited striking evidences of joy and devotion. A box belonging to them, which they have presented to Capt. Jennings, contains what are probably the junk's register, &c., a chart, which we understand to be a very curious affair, and a compass differing entirely from those in use among us, and some gold and silver Japanese coins.

"This would seem to afford a good opportunity for attempting to open an intercourse with Japan. These persons should be well treated, and sent back in one of our ships-of-war, the commander of which should be authorised to make overtures to the Japanese government."

In column 5 on this pages, the Auckland is mentioned 4 times: "Importations... Per Auckland–150 bxs [boxes] and 400 mats sugar, 7352 bxs tea, 700 bbls [barrels] flour, 1 bx mdze [merchandise].

"Consignees... Per Auckland–Macondray & Co, Howard & Green.

"Arrived... Barque Auckland, Jennings, 70 days from Hongkong; sugar &c, to Macondray & Co.

"Memoranda:... Per Auckland–About 25th Jan. fell in with a Japanese junk, which had encountered a severe

© Copyright Soyinfo Center 2014

typhoon, and became very leaky. There were 17 people on board, all of whom have been brought on here."

Note 1. The box given to Capt. Jennings almost certainly contained soybeans, which were taken by Dr. Benjamin Franklin Edwards to Illinois and Ohio. See Hymowitz 1987. Note 2. Commodore Matthew Perry first arrived in Japan on 8 July 1853 demanding that the Japanese government open trade relations with the United States. Thus the Japanese on board the Auckland arrived in San Francisco about 2 years and 4 months before Commodore Perry arrived in Japan.

399. *Daily Alta California* (*San Francisco*)**.** 1851. Intercourse with Japan. 2(87):2. March 6, col. 4. [1 ref]
• ***Summary:*** "In our paper of yesterday was a very interesting item respecting the picking up and bringing here of a crew of ship-wrecked Japanese. We suggest that now is perhaps the best opportunity ever offered for attempting to open communications with Japan. Would it not be wise and probably profitable for some of our merchants to fit out a pioneer expedition from this port to Japan? Send a vessel with a cargo suited to the market, if one could be obtained, and take along these poor Japanese, who are represented as very grateful for the favor shown them. They would carry back a favorable report of us 'outside barbarians,' and might prove the opening wedge for a free commerce between the world and Japan. Who knows but what the fullness of the time has come when her exclusive policy shall give way, and this incident be the fulcrum on which the lever turns?"

Note: Commodore Matthew Perry first arrived in Japan on 8 July 1853 demanding that the Japanese government open trade relations with the United States.

400. *Daily Alta California* (*San Francisco*)**.** 1851. An hour with the Japanese. March 17. p. 2, col. 2.
• ***Summary:*** "Through the politeness of C.C.P. Parker, Esq., custom-house inspector, we had an opportunity, yesterday afternoon, to visit the barque Auckland on board of which vessel are seventeen natives of Japan, picked up by the Auckland nearly five hundred miles from their native land. They are a fine looking set of people, the oldest seventy years old. The information we gathered from Capt. W.F. Jennings, and Mr. H.S. Salters, the mate of the Auckland, was that on the 22d February, in latitude 31 54 N., and 105 14 E., they discovered a dismasted junk, which they endeavored to board. Those on board the junk took to their boat, and were received on board the Auckland. They had been blown off-shore in a gale of wind, had been dismasted, and their vessel thrown upon her beam-ends. She was of about 600 tons burthen, and was filled with a valuable cargo. By signs, we gathered that when they were picked up, they had been at sea nearly fifty days, and were in great distress. Among the articles which were saved from the wreck, were a sheet containing official documents, medicines, etc., a chart of the coast of Japan, and a compass, and also, a quantity of coin, gold, silver and copper. They have been treated with the utmost kindness by Capt. Jennings and the officers and crew of the Auckland. We are told that they rise at daylight every morning and bathe in cold water...

"We understand that they will be placed on board the revenue cutter Polk to-morrow or next day, where they will remain until orders with reference to them are received from Washington [DC]. Mr. King, the Collector, has represented the facts to the President, and it is supposed that an armed vessel will be despatched to convey these people to their homes. The steam frigate Savannah, it is said, is now on the passage from New York to San Francisco, from which latter port she will proceed to Japan. The effect of the taking of these people to their homes cannot be predicted with any certainty. It may be the means of opening a communication with that country. They came on shore yesterday, for the first time, and appeared to be highly delighted with all they saw. We believe these men are the first Japanese who have ever set foot on the American continent. We hope the Government will provide for their conveyance to Japan as speedily as possible, and that Mr. King will see that all things necessary are provided them."

401. *Evening Picayune* (*San Francisco*)**.** 1851. The seventeen shipwrecked Japanese. 2(192):2. Col. 5. March 17.
• ***Summary:*** "These unfortunate individuals who were picked up by Capt. Jennings, of the barque Auckland, some time since, in latitude 31. 54 N. longitude, 105. 14 E.–several hundred miles from the Japanese Islands–came ashore yesterday, in this city, and are the first of their nation, we believe, who have visited any portion of the American continent. They seem to be highly gratified and gazed with some astonishment at the thousand new sights presented to their view. They are perfectly astounded at the movements of the ocean steamers and steamboats, as they move about our harbor. We had several varieties of their coin made of copper and iron, and a drawing of a junk in which they were wrecked, made in a very few minutes by one of them. They resemble the Chinese, but are more intelligent looking.

"We understand that an application has been made to the General Government for a vessel to take them to their native land. Perhaps their return may be means of opening intercourse with Japan."

402. *Daily Alta California* (*San Francisco*)**.** 1851. Something new. March 18. p. 2, col. 2.
• ***Summary:*** "The shipwrecked Japanese, of which so much has been said and of whom so little is known, will be at the *Grand Fancy Dress and Masquerade Ball,* at the California Exchange, on Wednesday evening, March 19th. They will appear in costume, and will perform some of their most favorite dances in the true Japanese style. They are the first of the Japanese race who have ever set foot on the American continent. Their stay here being but very limited, it becomes

© Copyright Soyinfo Center 2014

every one who is desirous of seeing them to avail themselves of the opportunity which is now offered. It will be very amusing, independent of their own dancing, to see them dancing with the ladies of a civilized country."

Note: These Japanese brought soybeans to San Francisco and gave them to Dr. Benjamin Franklin Edwards, who took them to Illinois (see Hymowitz 1987 "Introduction of the Soybean to Illinois").

403. *Evening Picayune* (*San Francisco*). 1851. Something new. 2(193):2. Col. 4. March 18.
• ***Summary:*** This article is identical to one with the same title that appeared earlier in the day in the *Daily Alta California* (San Francisco).

404. *Daily Alta California* (*San Francisco*). 1851. Masquerade ball. March 19. p. 2, col. 3.
• ***Summary:*** "A masquerade ball comes off at Cole's California Exchange, this evening, at which the Japanese, who were brought to our harbor in the barque Auckland, will attend in their native costume. This will be a good, and perhaps the only opportunity that our citizens will have of seeing these singular beings, the first of their tribe who ever set foot upon American soil, and who have voluntarily shut themselves out from the remainder of the world. They will be treated with the greatest degree of respect by Mr. Cole and his associates, and will doubtless be highly pleased with the entertainment, and, when they return to their native land, have a good story to tell of the manner in which they were treated by the Americans."

405. *Evening Picayune* (*San Francisco*). 1851. The Japanese. 2(195):2. Col. 3. March 20.
• ***Summary:*** "These tanned gentlemen visited the masquerade last evening, and presented the chief attraction of the evening. They may be set down as the most decided curiosities that have ever visited our state. They were dressed in similar garb as were our Chinese population before American styles persuaded them from their propriety, but which accoutrements were pronounced to be their every day dress, they having been forced to emigrate on so short notice as to preclude the possibility of donning their finery. Their complexions are of the greyish order, and the expression of their features a counterpart of that of their Asiatic neighbors, the Celestials... Their general intelligence and good nature was universally marked... Their conception of the polite was very evident, and nearly all present were favored by them with a low obeisance and hearty shake of the hand. One facetious *hombre* completed the sale of one of the foreign gentlemen... The visitors all seemed highly pleased with the novel sights presented, and retired from the festivities at an early hour."

Note: These Japanese brought soybeans to San Francisco and gave them to Dr. Benjamin Franklin Edwards, who took them to Illinois (see Hymowitz 1987 "Introduction of the Soybean to Illinois").

406. *Alton Telegraph* (*Illinois*). 1851. Dr. B. F. Edwards. May 2. p. 3, col. 4. Friday.
• ***Summary:*** "The numerous friends of this gentleman, in this and the neighboring counties, will be glad to hear that he arrived at his home in this city on Tuesday last [April 29], in good health. By the politeness of the Doctor, we have been furnished with San Francisco papers to the 15th March."

Note: This is the full text of this short article. Soybeans are not mentioned. In his 1987 article "Introduction of the Soybean to Illinois" (Economic Botany 41(1):28-32), Hymowitz first mentioned this article as follows: "On April 29, 1851 Dr. Benjamin Franklin Edwards returned to Alton, Illinois carrying soybean seeds in his personal possessions." Note: Soybeans must have been in California by this date, as future documents by Dr. Edwards will show. Dr. Edwards obtained the soybeans from shipwrecked Japanese. Address: Alton, Illinois.

407. *Ohio Cultivator*. 1852. Our thanks are due to John Lea,... 8(11):168. June 1.
• ***Summary:*** "... of Cincinnati, for a few seeds of the Japan Pea. And to our old friend H.N. Langworthy, of Rochester, New York, for seeds of the Mammoth Squash. We have planted them, and expect to raise something great for the State Fair."

Note 1: This is the earliest document seen (Oct. 2012) that uses the term "Japan pea" to refer to the soybean.

Note 2: This is the earliest document seen (July 2012) concerning the soybean in New York–that is not about imported soy sauce.

408. Crawfurd, John. 1852. A grammar and dictionary of the Malay language: With a preliminary dissertation. 2 vols. London: Smith, Elder, and Co. 21 cm
• ***Summary:*** Vol. I, "Dissertation and Grammar," contains two parts: A long essay about the language (p. i to ccxci), and a "Grammar of the Malay language" (84 p.). On p. clxxxiv is a list of cultivated plants. *Kachang* means "pulse" in both Malay and Javanese. Malay is always written in the Arabic alphabet, to the 28 letters of which 6 are added using diacritical marks to express sounds unknown to the Arabic language. Of the 34 letters, there are only 3 vowels, all long (p. 1). The Arabic alphabet is very ill adapted to pronunciation of the Malay language, whose native sounds "can be expressed with ease and precision by Roman letters, and with a few trifling modifications, so as to furnish one unvarying character for every sound" (p. 2).

Vol. II is titled "Malay and English, and English and Malay Dictionaries" (208 + 201 p.). Abbreviations: J. = Common to the Malay and Javanese. v. = variants / variant of. Soy-related words and terms include: "Kachang (J.). A

© Copyright Soyinfo Center 2014

common term for pulses or leguminous plants." "Kachang-jâpun. The Japan or soy bean, *Soja hispida."* "Kachang kâdâle (Telinga). Hairy-podded bean, *Phaseolus max."* "Ragi (J.). Yeast, barm. In Javanese, it more frequently means spiceries."

The following soy-related terms do *not* appear: Bungkil, bunkil, kachap, kechap, kechipir, onchom / ontjom, tahu, tahua, takoa, takua, taosi, tausi, tapai, tapé, tauchi, tauge, tempe.

Other terms that do appear: "Agar-agar. The name of the alga or sea-weed which is a considerable article in the Chinese trade, *Plocaria candida"* (p. 2). "Bijen (J. wijen). The sesame plant, *Sesamum indicum."* Note 1. This is the earliest English-language document seen (Jan. 2005) that contains the word "sesame."

"Kachang-china. Chinese pulse, *Phaseolus lunatus;* v. Kachang-mas." "Kachang-goreng. The ground-nut, *Arachis hypogæa;* v. Kachang-tanah and Kachang-miñak." "Kachang-gunung. Mountain pulse, *Hedisarum* [*Hedysarum*] *gangeticum."* "Kachang- ijau. Green pulse [mung bean], *Phaseolus radiatus."* "Kachang-jâriji. The lablab bean, *Lablab vulgaris."* "Kachang-kakara, v. Kachang-jâriji." "Kachang-kakara-gatal. Cowitch, *Dolichos pruriens."* "Kachang-kayu. The pigeon pea, *Cytisus cajan."* "Kachang-kâchil. Rayed bean *Phaseolus radiatus humilis."* "Kachang-manila. The Manilla bean [Manila bean] *Voandzeia subterranea."* "Kachang-mas. Golden bean, or Chinese bean *Phaseolus radiatus;* v. Kachang-china." "Kachang-miñak. Oil bean or ground-nut, *Arachis hypogæa;* v. Kachang koreng and Kachang-tanah." "Kachang-moñat. Monkey bean or snail-flower, *Phaseolus caracalla."* "Kachang-pendek. Lowly bean, *Phaseolus compressus."* "Kachang-putih. White bean, *Dolichos kachang."* "Kachang-tanah. Ground-nut or oil bean, *Arachis hypogæa."* "Lânga (J. oil). The sesame plant, *Sesamum indicum."* "Wijen (J.). The sesame or oil plant, *Sesamum orientale.* In Javanese it has the epithet of, alas, 'wild,' or 'of the forest.'"

John Crawfurd lived 1783-1868.

Note 2. This is the earliest English-language document seen (Aug. 2007) that contains the term "pigeon pea."

Note 3. This is the earliest English-language document seen (May 2008) that contains the term "ragi," which is the Malay / Indonesian word for a "starter culture," such as "ragi tempe," which is tempeh starter made with predominantly *Rhizopus* mold grown on soybeans.

Note 4. "Cowitch, *Dolichos pruriens,"* probably refers to the velvet bean, *Mucuna pruriens* (L.) DC. If it does, this is the earliest document seen (April 2007) and the earliest English-language document seen (April 2007) that mentions this plant. Address: Author of "The History of the Indian Archipelago" [London, England].

409. Dickens, Charles. 1852. The world here and there: or, Notes of travellers. From "Household Words," edited by Charles Dickens. New York, NY: George P. Putnam. 231 p. See p. 76.

• ***Summary:*** "Rice fields, of course, we pass; rice is a staple article of diet to the Japanese, as to so many other millions of the human race. It is the vegetable food that finds its way into more mouths than any other. There is wheat, also, in Japan, used chiefly for making cakes and soy [sauce]; barley for feeding cattle. The cattle being used as beasts of draught and burden, it is thought improper to kill them, or to deprive the young calves of their milk; the Japanese, therefore, refrain from milk and beef. They eat great quantities of fish, poultry, and venison."

410. MacFarlane, Charles. 1852. Japan: An account, geographical and historical, from the earliest period at which the islands composing this empire were known to Europeans, down to the present time, and the expedition fitted out in the United States, etc. New York: Putnam. xii + 365 p. Illust. 19 cm. Reprinted in 1856 by S. Andrus & Son (Hartford, Connecticut). Facsimile edition reprinted in 2002 by Ganesha Publishing (London) and Edition Synapse (Tokyo). Series: Japan in English, Vol. 1. [50* ref]

• ***Summary:*** Charles Mac Farlane, a British romantic author, lived 1799-1858. He explains in the Preface that he never traveled to Japan, and that this is a compilation. It is rather superficial, relying heavily on Englebert Kaempfer (1727).

The section on plants states, rather vaguely (p. 243): "Not only the fields and flat country... but likewise the hills and mountains, are made to produce corn, rice, pease, pulse, and numerous edible plants."

The section on domestic manners describes a Japanese feast. The host "drinks a cup of sackee [sake] with each guest... As whets, servants, of both sexes, from time to time, hand round soy [sauce], other sauces, pickled or salted ginger,... which are all eaten with the Chinese chopstick" (p. 288-89). Address: Esq., Canterbury, England.

411. McCulloch, John Ramsay; Vethake, Henry. 1852. A dictionary, practical, theoretical, and historical, of commerce and commercial navigation. 2 vols. Philadelphia, Pennsylvania: Hart, Carey and Hart. See Vol. 2, p. 201, 536, 18 at end.

• ***Summary:*** Nangasacki [Nagasaki] (p. 200-01): The Japanese islands are believed to contain 50,000,000 people. All foreigners are rigidly excluded, "with the exception of the Dutch and Chinese; and they are allowed to visit Nangasacki, the former with 2 ships and the latter with 10 junks."

"The Chinese trade with Japan is understood to be conducted from the port of Ningpo, in the province of Chekiang, which is so conveniently situated, that 2 voyages may be performed in the year, even by the clumsy junks of China. The commodities with which the Chinese furnish the Japanese, consist of raw sugar, cow and buffalo hides,

© Copyright Soyinfo Center 2014

wrought silks, consisting chiefly of satins and damasks, eagle and sandal wood, ginseng, tutenague or zinc, tin, lead, fine teas, and, for more than 100 years back, some European broad cloths and camlets. The exports consist of copper, limited to 15,000 piculs, or about 900 tons; camphor, sabre [sword] blades, pearls, some descriptions of paper and porcelain, and some Japan ware, which is either curious or handsome, but not so substantial as that of China."

"The following are the quantities and value of goods exported and imported by the Dutch in their trade with Japan in 1825; the ships employed being one of 600, and one of 700 tons burden. The trade is exclusively carried on with the port of Batavia." A table shows exports to and imports from Nangasacki. Imports from Nangasacki to Batavia, then Holland include: "Sakkie [saké] and soy [sauce]. Value: 14,302 florins.

Soy (p. 536): a species of sauce prepared in China and Japan from a small bean, the produce of the *Dolichos soja.* It is eaten with fish and other articles. It should be chosen of a good flavour, not too salt nor too sweet, of a good thick consistence, a brown colour, and clear; when shaken in a glass, it should leave a coat on the surface, of a bright yellowish brown colour; if it do not, it is of an inferior kind, and should be rejected. Japan soy is deemed superior to the Chinese. It is worth, in bond, from 6*s.* to 7*s.* a gallon. It is believed to be extensively counterfeited.–(*Milburn's Orient. Com.*).

At the end is a long table titled "The new tariff of 1846, together with the tariff of 1842, reduced to ad valorem rates, as far as practicable." On page 18 is "Soy." 1846 = 30. 1842 = 30. Address: 1. Esq.; 2. LL.D, Prof., Univ. of Pennsylvania.

412. Watts, Talbot. 1852. Japan and the Japanese: From the most authentic and reliable sources. With illustrations of their manners, costumes, religious ceremonies, &c. New York, NY: J.P. Neagle. 184 p. Illust. No index.
• ***Summary:*** In the section titled "Customs, manners, &c." the author borrows text from Thunberg (1802, p. 267) without using quotation marks (p. 111): "Ladies do not eat with the men, but by themselves. Rice supplies the place of bread, and is boiled with every kind of provisions. Fish and fowls are very plentiful, and are eaten in abundance; but miso-soup * boiled with fish and onions is the customary food of the common people."

Footnote: *"Misos are small beans, like lentils, the produce of the dolichos soja."

In the chapter titled "Empire of Japan (from Goodrich's Pictorial Geography)" under "Towns" (p. 122) we read: "Kio, or Meaco [Kyoto, or Miako], was for a long time the Capital, end contains the most remarkable edifices... Meaco is the centre of Japanese commerce and manufactures. Silks, tissue, soy [sauce] and lacquered wares, are purchased here in their greatest perfection,..."

The chapter titled "The Japanese empire (From Memoirs of a Captivity in Japan, by Captain Golownin, of the Russian Navy)" contains a long excerpt (p. 140) about the mode of making soy [sauce]. "The Japanese soy is also prepared of beans, and turned sour in casks. They say that three years are required for preparing the best soy..." Address: M.D. [USA], Late in the service of the Hon. D. E. I. [Dutch East India] Company.

413. *Ohio Cultivator.* 1853. Japan pea. 9(3):40. Feb. 1.
• ***Summary:*** "Our thanks are due to A.H. Ernst, Esq., of Cincinnati, for a few of these peas, (or beans). We will attend to their trial in the spring."

Note This is the earliest English-language document seen (April 2013) with the term "Japan pea" (or "Japan peas") in the title.

414. *New York Times.* 1853. Latest intelligence: National agricultural convention. First annual meeting of the United States Agricultural Society. Feb. 3. p. 1.
• ***Summary:*** "Washington [DC], Wednesday, Feb. 2. The first annual meeting of the United States Agricultural Society was held at the Smithsonian Institute, this morning."

"Prof. Mapes presented specimens of the Japan Pea– very productive. Also, of the California Soap plant."

Note: "Prof. Mapes" was probably James J. Mapes (1806-1866) of New York. An inventor, chemist, and civil engineer, he was a pioneer in the use of super-phosphates in the U.S. and developed "Improved Super-Phosphate" (also called "Super-Phosphate of Lime") which he made from the bones of animals. He was most active in the mid-1850s, when many articles about him appeared in agricultural journals.

415. *Pittsfield Sun* (*Massachusetts*). 1853. New York Farmer's Club. 53(2733):4. Feb. 3.
• ***Summary:*** The "N.Y. Sun says the business of the day was opened by the Secretary reading an article on the present state of Agriculture in Japan... They have few hogs, no sheep or goats. The Japan pea grows 4½ feet high, with a strong stem, and its size is between the common pea and the bean."

Note: This is the 2nd earliest document seen (Feb. 2008) that uses the term "Japan pea" to refer to the soybean.

416. *Moore's Rural New Yorker.* 1853. The Japan pea. 4(7):54. Feb. 12.
• ***Summary:*** "The attention of horticulturists has been directed to a new pea, which, on account of the source from which it was received, is called the Japan pea. Samples of them have been sent to the Massachusetts Horticultural Society, by Mr. A.H. Ernst, who has grown them in his garden, near Cincinnati, Ohio, the past season.

"The account of their transmission into American hands is, that a Japan vessel in distress was encountered by an American vessel, which took off the crew and some of the

© Copyright Soyinfo Center 2014

stores, landing them at San Francisco, California. Among other things were some of these peas, which falling into the hands of Dr. [Benjamin Franklin] Edwards, of Alton, Illinois, he handed them over to J.H. Sadd, a distinguished horticulturist, by whom they were placed at the disposal of the Horticultural Society of Cincinnati. Mr. Ernst, who has successfully cultivated them, speaks of their being a peculiar plant, of an upright, stiff form, branching much,–the leaves large, light green and downy beneath. The flower is small, lilac-colored, the seed pods numerous, small, and wooly, grow in clusters, and are very productive. Its bearing propensities are large, the plant attaining good size, which it is believed will adapt it for field culture. They mature fully on the Ohio River, and it is believed that they may be introduced into general cultivation.

"Mr. J.E. Teschemacher, the botanist at the Mass. Hort. Society furnishes the following information which will be found interesting:

"The plant alluded to by Mr. Ernst is Cajanus bicolor, a native of the East Indies, Amboyna, Japan, &c.; flowers small, interior yellow, vexillum purple, erect shrub, pubescent [hairy], nearest in alliance to the Lupinus. The seeds are good to eat and, when young, very delicate. On soaking the round seeds for an hour in moderately hot water, they take exactly the form and appearance of the common white bean, become quite tender, and have a pure and delicious nutty and oily flavor. *The whole plant, with the seed, is excellent for fattening hogs and cattle.*

"There is one other species, Cajanus flavus, common in South America and the West Indies, where it is sometimes used for a fence to sugar plantations. In Jamaica, this species is much used for feeding pigeons, and is there called the Pigeon-pea. In Martinique the seed is much esteemed for the table.

"Being a tropical plant, it would hardly stand our winters. Yet, from the observations of Mr. Ernst, it is not improbable that our climate might admit of an annual harvest of the seed, which seems to be so abundantly produced as to make an experiment highly interesting."

In summary, Dr. Benjamin Franklin Edwards, in San Francisco, probably examined quarantined Japanese on the barque Auckland and received soybeans, called Japan peas, as a gift. This is the key document describing how soybeans got to California, and then to the Midwest.

First cited by Hymowitz. 1987. Introduction of the Soybean to Illinois. Economic Botany 41(1):28-32.

Note 1. This is the earliest document seen (July 2011) concerning soybeans in Ohio, or the cultivation of soybeans in Ohio (one of two documents).

Note 2. This is the earliest document seen (March 2011) concerning soybeans in California (one of two documents).

Note 3. This is the earliest document seen (June 2007) concerning soybeans in Illinois (one of two documents).

Note 4. This is the 2nd earliest English-language document seen (April 2013) with the term "Japan pea" in the title. It clearly explains the origin of the term. At least seven other documents published in 1853, after this one, also mention the Japan pea.

Note 5. Mr. Teschemacher's identification of this plant seems to be mistaken. Prof. Ted Hymowitz notes (personal communication, 18 Oct. 1991): "The descriptions by Teschemacher and others of the Japan Pea clearly point to the soybean. *Cajanus bicolor* DC is a synonym for *Cajanus cajan* (L.) Millsp., the common pigeon pea cultivated throughout the *tropics*. Obviously Mr. Teschemacher has confused the pigeon pea with the soybean. The pigeon pea could not possibly produce seed in Ohio, Massachusetts, etc. In addition, the plant that Teschemacher saw is described as reaching a height of 2 to 4 feet–typical heights for the soybean. Pigeon peas (except for recently developed dwarf types) reach a height of from 6 to 10 feet or more. In sum, no one pays much attention to Mr. Teschemacher's identification. Thus it is not mentioned in the modern literature."

Note 6. This is the earliest English-language document seen (May 2000) that uses the word "pubescent" in connection with the soybean.

Note 7. This is the earliest English-language document seen (Feb. 2003) that contains the term "Pigeon-pea" (or "Pigeon-peas" or "Pigeon pea")–even though the identification is mistaken.

Note 8. This is the earliest English-language document seen (June 2013), published in the USA, which states that whole soybeans are good to eat.

Note 9. This is the earliest English-language document seen (Feb. 2003) that mentions soybeans as a feed for "hogs." A hog is a domestic pig or swine which weighs more than 120 pounds. Address: Rochester, New York.

417. *Hartford Daily Courant* (*Connecticut*). 1853. The Japan pea. Feb. 14. p. 2.

• ***Summary:*** "At the late annual meeting of the U.S. Agricultural Society at Washington [DC], as we learn from the *National Intelligencer,* Prof. Mapes of New Jersey handed to the President a portion of the vine or stalk of the Japan pea, which was raised last season in Suffolk County, New York. The seed was originally obtained from some of the company of a Japanese vessel wrecked on the coast of California, and formed a portion of their food. He described it as a plant whose botanical character had not yet been precisely settled, but which was probably well deserving the attention of agriculturists. The specimen offered was cut off about two feet from the ground, and was thickly studded with seed pods, thus producing very many times the crop of the ordinary pea of our gardens. In planting, these peas are set about five feet apart, and in the course of their growth cover the whole surface of the intervening ground. They require no sticking or other support, the stem being quite stiff

© Copyright Soyinfo Center 2014

and unyielding. This pea appears to be specially useful for feeding to horses; but may no doubt be made to contribute largely to human sustenance."

Note 1. Prof. James J. Mapes (1806-1866), a professor of analytical chemistry in New York, moved to Newark, New Jersey, in 1847; there he pursued his agricultural interests for the rest of his life.

Note 2. Letter (e-mail) from Prof. Ted Hymowitz. 2006. Sept. 29. Ted is not surprised by this story. "In 1852 Mr. Ernst sent soybean seed to the New York State Agricultural Society. The society must have distributed seed" to those who requested it. It seems likely from the above that Prof. Mapes had soybeans in New Jersey by Feb. 1853–but we cannot be sure. If he did, this would be the earliest document seen (March 2011) concerning soybeans in New Jersey. It seems less likely that he cultivated them, since he does not mention this, and instead states that they were cultivated in Suffolk County, New York.

Note 3. This is the earliest document seen (July 2011) concerning soybeans in New York, or the cultivation of soybeans in New York. This document contains the earliest date seen for soybeans in New York, or the cultivation of soybeans in New York (spring 1852). The source of these soybeans was probably the New York State Agricultural Society, but possibly A.H. Ernst of Spring Garden, Cincinnati, Ohio.

Note 4. This is the earliest document seen (March 2011) concerning soybeans in Washington (one of two documents).

418. Ernst, A.H. 1853. [Letter to B.P. Johnson (Corresponding Secretary) dated January 4]. *J. of the New-York State Agricultural Society* 3(10):81-88. Feb. See p. 84.
• ***Summary:*** "Mr. A.H. Ernst, Spring Garden, Cincinnati, writes us, under date of January 4, 1853,

"'Dear Sir–I send you this day, by Livingston, Fargo & Co.'s Express, a small package of seed, which appears to be a new article in our country, at all events it is so here. I know not where it should be classed. In growth and leaf it neither resembles the bean nor pea; yet the grain or seed, very strongly resembles the former, when in a green or forming state, assuming the round form of the latter at maturity.

"'The growth of the stock is upright, stiff and woody, seed-pod rough and wooly. It evidently requires room in the cultivation, to enable the laterals to expand; the plant attains three feet or more in height, and seems well adapted to take care of itself, from its stiffness and form, a desideratum to the agricultural economist. A few seeds, which were kindly given me last spring, proved very productive, which you will see by the number of pods on the stock. Should its cooking qualities prove good, which I have not tested, but is said to be so, it may prove a valuable acquisition to our agricultural products.

"'Its history is briefly this: an American ship took from a Japan vessel, in distress, the crew, with some of the stores, and carried them to San Francisco, and from which a few of the seeds were brought to Alton, Illinois, where Mr. John H. Lea grew them last year, (summer of 1851,) and sent a part of the product to our Horticultural Society, from which, those I sent you, I grew the past summer.'"

This reference was first cited by Hymowitz in his 1987 article "Introduction of the Soybean to Illinois." *Economic Botany* 41(1):28-32. He noted that Dr. Benjamin Franklin Edwards gave the soybean seeds he brought with him from San Francisco to Mr. John H. Lea of Alton, Illinois. Lea planted them in his garden during the summer of 1851.

Note 1. This is the earliest document seen (April 2011) concerning soybeans in Illinois (one of two documents), or the cultivation of soybeans in Illinois. This document contains the earliest date seen for the cultivation of soybeans in Illinois (summer of 1851) (one of two documents). It is of interest to the compiler of this bibliography, William Shurtleff, that the oldest college in Illinois, Shurtleff College, was located in Alton, Illinois. It ceased operation in 1959 but its campus is still used by the Dental School of Southern Illinois University–Edwardsville.

Note 2. This is the earliest document seen (July 2011) concerning soybeans in Ohio, or the cultivation of soybeans in Ohio (one of two documents). This document contains the earliest date seen for soybeans in Ohio, or the cultivation of soybeans in Ohio (summer 1852). The source of these soybeans was John H. Lea of Alton, Illinois. He in turn received them from Dr. Benjamin Franklin Edwards of Alton, Illinois, who got them from shipwrecked Japanese fishermen in San Francisco.

Note 3. This is also the earliest document seen (March 2011) concerning soybeans in California (one of two documents).

Note 4. This is the earliest document seen (July 2011) concerning soybeans in New York (one of two documents). The source of these soybeans was Mr. A.H. Ernst of Cincinnati, Ohio.

Note 5. This is the earliest document seen (Sept. 2000) concerning Andrew H. Ernst and soybeans. A.H. Ernst (1796-1860), a native of Germany, was a devoted horticulturist, nurseryman, and pioneer pomologist. He owned and operated "Spring Garden" nursery, one of the earliest and best nurseries in Ohio, located 1½ miles from Cincinnati. He was also one of the founders of Cincinnati's famed and beautiful Spring Grove Cemetery. Address: Spring Garden, Cincinnati, Ohio.

419. *Pittsfield Sun* (*Massachusetts*). 1853. Agricultural. Saturday, February 26, 1853. 53(2737):4. March 3.
• ***Summary:*** At a meeting of the New York Farmer's Club, held in the rooms of the American Institute, Broadway, New York, the subject of the day was new plants. Judge Meigs, Secretary, "in regard to the cultivation of the Japan Pea, said that the land must be rich, deeply tilled, then divided

© Copyright Soyinfo Center 2014

into squares of four feet each. One person with a blunt stick to mark holes an inch deep in the centre; another person to put a pea in each hole and cover up with earth. Two men or boys could plant an acre before dinner. No other plant, much less a weed, should be allowed in the field, which should be perfectly clean and tilled. The Japanese never allow any plant, but of one sort, in a field, all pure wheat, pure rye, peas, &c."

420. *New England Farmer.* 1853. State Board of Agriculture: Met January 25, 1853. 5(3):116. March.
• ***Summary:*** "Mr. Wilder presented a dried specimen of a plant covered with seed, which he had received from A.H. Ernst, late President of the Cincinnati [Ohio] Horticultural Society. The plant is the *Cajanus flavus,* near allied to the Lupines. The seed was introduced into the country two years since by one of our ships, which found a Japan vessel in distress, from which the crew, with part of the stores, were taken and carried into San Francisco. This seed was among their provision stores, and a small quantity was brought to Alton, Illinois, by Dr. [Benjamin Franklin] Edwards, and grown by Mr. John H. Lea, a careful horticulturist of that place. The plant presented grew in Cincinnati last summer. Mr. Wilder read a statement from Mr. Teschemaker [Teschemacher, of Boston], which describes this new plant as follows: 'Shrub erect, pubescent, native of the East Indies, Amboyna, Japan, &c. The seeds are good to eat, and when young, very delicate.'"

Note: Since the New England Farmer is published in Boston, Massachusetts, the State Board of Agriculture is probably the board for Massachusetts.

421. *New England Farmer.* 1853. United States Agricultural Society. 5(3):135. March.
• ***Summary:*** "The First Annual Meeting of the United States Agricultural Society was holden at Washington [DC], on the 2d of February 1853, at 10 o'clock, in the Lecture Room of the Smithsonian Institution."

"Prof. Mapes, of New Jersey presented specimens of the Japan pea, an account of which we have recently given, as it was presented at the State Board of Agriculture, on the 25th January."

422. *Magazine of Horticulture, Botany, and All Useful Discoveries and Improvements in Rural Affairs* (*Boston*). 1853. Art. II. Massachusetts Horticultural Society. 19:186-89. April.
• ***Summary:*** Page 188: Jan. 22. "Dr. Wight read a letter from Mr. A.H. Ernst, accompanied with seeds of the Japan peas; and also a note from Mr. Teschemacher, upon the same. The Letters are as follows:–"My Dear Sir:–I herewith send for your distribution amongst the members of the M.H. Society, a small parcel of peas.

"The growth of the plant is peculiar, being of an upright and stiff form, somewhat branching; the leaves are large, light green, and downy beneath; the blossom is small and of a lilac color; seed pods numerous, small and wooly,–growing in clusters over the entire plant, proving very productive.

"Its habit of growth is such as to fit it to withstand severe storms; and, should it prove valuable as food for cattle, it must commend itself to the agricultural community in field culture.

"In its cultivation it evidently requires room, to give the plant a full development for branching. Its bearing properties are immense. Accompanying the seeds I send a plant, to show its habits of growth and bearing properties. Its origin is said to have been Japan. It was introduced into this country, some two years since, by the agency of one of those calamities which sometimes result in benefit to mankind.

"An American ship encountered a Japan vessel in distress, and the crew were carried to San Francisco, California. Amongst the stores which were transferred was the 'Japan pea,' a few of which found their way into the hands of Dr. Edwards, of Alton, Illinois. He handed them over to Mr. J.H. Ladd, a distinguished horticulturist, who presented the produce to our society. Those now sent you were grown in my grounds,–having fully matured in our climate. Your climate may prove too severe.

"I have sent small packages of seed to kindred associations, with the request that they may be placed in careful hands. It is possible that it may not be anything new with you. I would be thankful for any information you may possess in reference to it.–Very respectfully, A.H. Ernst, Spring Garden, Cincinnati, Ohio, Jan. 11th, 1853."

"'The plant alluded to by Mr. Ernst is *Cajànus bicolor* [sic], a native of East Indies, Amboyna, Japan, &c. Flower small, interior yellow, vexillum purple; erect shrub; pubescent; nearest in alliance to Lupinus. The seeds are good to eat, and, when young, very delicate. On soaking the round seeds for an hour, in moderately hot water, they take exactly the form and appearance of the common white bean, become quite tender, and have a pure and delicious nutty and oily flavor. *The whole plant, with the seed, is excellent for fattening hogs and cattle.*

"'There is one other species, *Cajàanus flàvus,* common in South America and the West Indies, where it is sometimes used for a fence to sugar plantations. In Jamaica this species is much used for feeding pigeons, and is there called the Pigeon-pea. In Martinique the seed is much esteemed for the table.

"'Being a tropical plant, it would hardly stand our winters. Yet, from the observations of Mr. Ernst, it is not improbable that our climate might admit of an annual harvest of the seed, which seems to be so abundantly produced as to make an experiment highly interesting.–Most truly yours, J.E. Teschemacher, Boston, 19th Jan., 1853.'"

Note: Mr. Teschemacher has confused the pigeon pea with the soybean.

423. *Western Horticultural Review* (*Cincinnati, Ohio*). 1853. Transactions. The Cincinnati Horticultural Society. 3(7):328-30. April.

• ***Summary:*** "Has kept up its regular meetings, which have been of considerable interest, especially the discussions upon different subjects connected with Horticulture. The Japan Pea, which has been liberally distributed by Mr. Ernst and has excited much interest among other societies, was again brought upon the tables, and its excellent properties were pressed upon the members. It should have room to grow, say four feet each way, when it will be very productive. When cooked, it was found to be savory, like the "Horticultural Bean," and in boiling, the skin separated so as to be readily removed from the surface of the water. This plant is recommended especially as a food for stock. The members considered that Mr. Teschemacher's decision respecting it, as reported in the proceedings of the Massachusetts Horticultural Society, were not correct, and that it was not a Cajanus, but a Phaseolus, as described in the pages of this work, last year, by Mr. James Ward."

424. Lea, John. 1853. Japan pea (Letter to the editor). *Western Horticultural Review* (*Cincinnati, Ohio*) 3(8):389. May.

• ***Summary:*** "Dr. Warder:–When I introduced the "Japan Pea" to the Horticultural Society of this city, in November, 1851, I advised its being planted about a foot apart in the row, and the rows about two feet apart. Your last number of the *Horticultural Review* (for April) recommends planting "four feet each way." This makes a great waste of ground, and the error should be corrected. Perhaps eighteen inches apart in rows two or three feet apart, is the proper distance. I did not recommend this pea "as a food for stock," but for *domestic* winter use [as food]. As a pea for *summer* use, it is not suitable. It requires the full length of our season to ripen, and flourishes under great heat and drought. This "pea," so called–in fact a bean–is self-supported by a remarkably hard, *wood-like* stem, about three feet high. It is very productive."

John Lea, April 20, 1853.

425. *Ohio Cultivator.* 1853. Japan pea. 9(23):360. Dec. 1.

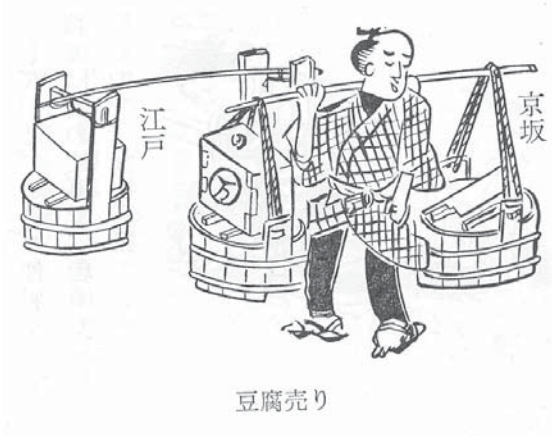
• ***Summary:*** "Among the new products which promise to be profitable for western farmers, the Japan Pea deserves special notice. It grows upon a strong, branching stem, some three feet high, with numerous clusters of pods, containing about three peas each, of the size of the common field pea. An ordinary stem which we raised this season produced 276 pods; and we have reports of others producing much more than this. Many farmers desire to raise field peas for stock purposes, but are unable to grow them upon our rich lands, to such the Japan Pea may prove valuable; it is also said to be good for table use, but of this we cannot speak from experience. In taste it resembles a bean, rather than a pea. Any one wishing to try the experiment of cultivating this pea will be furnished with a dozen grains, while our stock lasts, on sending us a *fip* or two stamps, to cover expense of postage and paper. We shall publish an article on the mode of culture, in due time."

Note: The word "fip" refers to a "fippenny bit," which was a silver coin that circulated in the eastern U.S. before 1857 and was valued at about six cents.

426. Kitagawa, Morisada. 1853. Morisada mankô [Mr. Morisada's book of comical illustrations without particular thoughts]. Japan. [Jap]*

• ***Summary:*** This book contains an early reference to Kori-dofu (dried-frozen tofu), and an illustration of a man selling natto (*nattô*). He is squatting with a bowl in one hand between two baskets of natto which are apparently connected by a shoulder pole. In his right hand is a cup with a handle on it, which he uses to scoop out the natto.

In *Tôfu no Hon* [The Book of Tofu], by Abe and Tsuji (1974, p. 8) is an illustration of a tofu street vendor taken



© Copyright Soyinfo Center 2014

from this book. It shows two types of shoulder poles and attached carrying containers. The upper left one is from the Edo / Tokyo area. The one actually on the man's right shoulder is from the Kyoto & Osaka area.

According to Saito (1985, p. 16) the book may also mention and have an illustration of a walking street vendor selling tofu. The author was born in 1810. The book may have a second title, *Ruijû kinsei fûzoku-shi.*

427. *Report of the Commissioner of Patents, Agriculture.* 1853. Acknowledgment of seeds received from the gentlemen named below: p. 448. For the year 1852.
• ***Summary:*** "A.H. Ernst, esq., of Cincinnati, Japan peas." Ernst is listed simply among seven men from various states who sent seeds to the Patent Office. No more is said about Ernst or his seeds.

Note 1. This is the earliest document seen (April 2007) concerning soybeans in Ohio (one of two documents).

Note 2. This is the earliest document seen (March 2011) concerning soybeans in Washington, DC, where the office of the Commissioner of Patents was located (one of two documents). This document contains the earliest date seen for soybeans in Washington, DC (1852).

Note 2. This is the earliest document seen (June 2007) concerning the work of the U.S. Patent Office (forerunner of the U.S. Department of Agriculture) with soybeans. Address: Cincinnati, Ohio.

428. T.E.W. [Wetmore, T.E.]. 1854. The Japan pea. *Moore's Rural New-Yorker* 5(3):22. Jan. 21.
• ***Summary:*** "I received last spring a few seeds for trial–planted them as early as the nature of the ground would admit. They came up well and made a stout growth. Being of an upright, bushy growth, in my ignorance of them, I planted and permitted them to grow too thickly.–They have large, bean-like leaves, small, axillary, inconspicuous flowers–which appeared so late that but a very small portion matured seed sufficiently to plant again. The plants were crowded with short, downy pods–one plant, standing somewhat apart, having over 200 well formed pods, whilst the least in the thickest part of the drill had 65. I see in the journal of the New York State Agric. Society, those who have reported their success to the secretary, speak of its great prolificness. From this fact, if it can be sufficiently acclimated, it would seem to bid fair to be an important addition to our leguminous crops. But there is another drawback which would debar its general cultivation as a field crop. Its stems are quite large and hard as wood, so that to harvest a field of Japan Peas would be about as easy as to harvest a field of brush."

Note 1. This is the earliest document seen (March 2002) concerning the harvesting of soy beans; they are difficult to harvest. It is also the earliest document seen (April 2002) that uses the word "harvest" as a verb in connection with soybeans.

Note 2. This is the earliest document seen (March 2003) concerning quantitative research conducted on soybeans.

Note: This is the earliest English-language document seen (March 2003) that uses the word "trial" (or "trials") in connection with soybean research. Address: [Michigan].

429. *New York Times.* 1854. Latest intelligence: From Washington. Feb. 24. p. 1.
• ***Summary:*** "Washington [DC], Thursday, Feb. 23... The United States Agricultural Society met this morning... Prof. Mapes exhibited some wheat and cress growing on the same head."

"In the evening, Prof. Mapes showed a model of an improved sub-soil plow, invented by himself; and Dr. Warden, of Ohio, distributed some Japan peas, and described them."

Letter (e-mail) from the Ohio Historical Society (Columbus, Ohio). 2007. Jan. 12. "We are unable to find any record of a Dr. Warden related to this topic in Ohio. We tried various Cincinnati histories, as well as trying the Census, but without a first name or some other context, we cannot go much further."

432. *American Agriculturist.* 1854. Japan pea or bean. 13(11):120. Nov. 1. Note from George Haywood of New-Rochelle, New York.
• ***Summary:*** "We have just received from Mr. George Haywood of New-Rochelle, a stalk of this new pea, or, as we should term it, bean, since it more resembles the latter. This can be examined in our office, by those interested.

© Copyright Soyinfo Center 2014

"This stalk is about an inch in diameter at the bottom, is about 2½ feet high, with branches upon two sides only–east and west, in the growing position. We counted on this one stalk 308 pods, containing two and three beans in each, in all somewhat over 700. Some others have raised twice this number from one stalk. Mr. H. informs us that he planted it in ordinary soil, well manured, in the latter part of June. They should usually be planted much earlier." Address: New-Rochelle, New York.

433. *Horticultural Review and Botanical Magazine* (*Cincinnati, Ohio*). 1854. U.S. Agricultural Society. 4(11-12):571-72. Nov/Dec. New series.
• ***Summary:*** "The third annual session of this society was held, on February 28th, 1845, in the Smithsonian Institution. Twenty-six States were represented by accredited delegates from the State and county societies, and a large number of individual members of the Society was also present."

"Dr. Warder distributed specimens of the Japan Pea which was recommended as a valuable food for stock of various kinds and especially adapted, as a fodder and grain plant for the Southern States,..."

Note: Dr. Jno A. Warder of Cincinnati is one of the editors of this periodical.

434. Ernst, A.H. 1854. The Japan pea. *Report of the Commissioner of Patents, Agriculture.* p. 224-25. For the year 1853.
• ***Summary:*** "The Japan Pea, in which so much interest has been manifested in this country for a year or two past, from its hardihood to resist drought and frost, together with its enormous yield, appears to be highly worthy of the attention of agriculturists.

"This plant is stated to be of Japan origin, having been brought to San Francisco about three years since, and thence into Illinois and Ohio. Its habit of growth is bushy, upright, woody, and stiff, branching near the ground, and attaining a height of three or four feet. The leaflets are large, resembling those of an ordinary bean, occurring in sets of three, with long quadrangular stems. The flowers, which are small and white, but rather inconspicuous, sometimes having purple centres, grow in thick clusters, nearly covering the principal branches of the plant, are succeeded by downy pods, from an inch to an inch and a half in length, each containing from one to three compressed oval beans, when green, but unmarked, and of a buff color, resembling peas when dry. The stalks appear to be too woody for fodder in a dried state, though they may be used as such, together with the large thick leaves, when green. The excellency of the seed, at maturity, when properly cooked, for winter food, both for man and animals, has been fully tested, notwithstanding contradictory statements have been made.

"This product will grow well on moderately fertile, as well as on rich soils, and may be planted in the latitude of Washington [probably D.C.], one seed in a place, at the distance of three feet apart, from the last of April to the first of July. It seems to be well adapted to plant, as an after-crop, on land which has been cultivated with early potatoes or peas, or to supply the vacancies in a corn-field caused by birds or worms."

Note 1. This is the earliest English-language document seen (April 2003) that uses the term "habit of growth" (or "growth habit") in connection with soybeans. Note that the habit of growth was described as "bushy, upright, woody, and stiff,..." rather than viny.

Note 2. This is the earliest document seen (Nov. 2002) that uses the term "bushy" to describe the soybean plant.

Note 3. This is the earliest English-language document seen (Aug. 2007) indicating that soybeans are a drought-resistant plant. Address: Cincinnati, Hamilton County, Ohio.

435. Hakura, Yokyu? 1854. Yôshû roku [A record of small provision]. Japan. Publisher unknown. 46 p. Written in Kanbun (Chinese). Japanese summary by Kawakami 1978, p. 156. [Jap]
• ***Summary:*** Mentions red miso (*aka-miso*), how to make a type of miso soup called *shi-yu* or *kuki-yu,* and tofu. Hatcho miso from Mikawa was recommended as red miso.

436. *Report of the Commissioner of Patents, Agriculture.* 1854. Preliminary remarks. p. v-vi. For the year 1853.
• ***Summary:*** "Among the foreign products which have been more recently introduced and distributed, and which appear to be adapted for profitable cultivation, we would instance... peas from Japan... Among the products proposed to be introduced from abroad, are rice and the soja bean of Japan, the latter of which is used for making the celebrated 'Soy sauce.'"

Note 1. The author apparently does not realize that the "peas from Japan" and the "soja bean of Japan" are one and the same plant.

Note 2. This is the 2nd earliest English-language document seen (Feb. 2008) that uses the term "soja bean" (or "soja beans") to refer to the soybean.

Note 3. This is the 2nd earliest English-language document seen (April 2012) that contains the term "soy sauce" (without a hyphen).

a practical treatise & handbook of reference for the colonist, manufacturer, merchant, and consumer... London: T.F.A. Day. xix + 668 p. See p. 313. Index. 23 cm.

• ***Summary:*** In the section on "Pulse" we read (p. 313). "The well known sauce, Soy, is made in some parts of the East, from a species of the Dolichos bean (*Soja hispida*), which grows in China and Japan. In Java it is procured from the *Phaseolus radiatus.* The beans are boiled soft, with wheat or barley of equal quantities, and left for three months to ferment; salt and water are then added, when the liquor is pressed and strained. Good soy is agreeable when a few years old; the Japan soy is superior to the Chinese. Large quantities are shipped for England and America. The Dolichos bean is much cultivated in Japan, where various culinary articles are prepared from it; but the principal are a sort of butter, termed *mico,* and a pickle called *sooja.*

"1,108 piculs of soy were shipped from Canton in 1844, for London, British India, and Singapore. 100 jars, or about 50 gallons of soy, were received at Liverpool in 1850. The price is about 6*s.* per gallon in the London market."

One page earlier, the section on "Pulse" states (p. 312): Of leguminous grains there are various species cultivated and used by the Asiatics, as the *Phaseolus Mungo* [mung bean], *P. Max* [soya bean], and *P. radiatus* [probably azuki bean], which contains much alimentary matter; the earth-nut (*Arachis hypogaea*), which buries its pods under ground after flowering."

"Captain H. Biggs [sic, Bigge], in a communication to the Agri.-Hort Soc. [Agricultural & Horticultural Society] of India, in 1845 [sic, Aug. 1844], states that of the esculents a large white pea forms the staple of the trade of Shanghae [Shanghai], or nearly so, to the astonishing amount of two and a-half millions sterling. This he gives on the authority of the Rev. Mr. Medhurst, of Shanghae, and Mr. Thoms [sic, Thom], British Consul at Ningpo. These peas are ground in a mill and then pressed, in a somewhat complicated, though, as usual in China, a most efficient press, by means of wedges driven under the outer parts of the framework with mallets. The oil is used both for eating and burning, more for the latter purpose, however, and the cake, like large Gloucester cheese, or small grindstones in circular shape, is distributed about China in every direction, both as food for pigs and buffaloes, as also for manure."

Note 1. The "large white pea" is clearly the soybean.

Note 2. This is the earliest document seen (Aug. 2001) that uses the spelling "Shanghae."

In the chapter titled "Oleaginous plants" we read (p. 512): "In Japan a kind of butter, called *mijo,* [sic, *miso*] is obtained from a species of the Dolichos bean (*Dolichos soja*).

Also discusses: Almonds and almond oil (p. 510, 533). Wheat gluten (221, 234, 264). Hemp and hemp oil (p. 510). Sesame or teel, sesame oil, black til, and gingelie oil (p. 511, 533-34). "The export of linseed and rapeseed cakes from Stettin" (p. 564).

Note 3. Peter L. Simmonds lived 1814-1897.

Note 4. This is the earliest English-language document seen (July 2003) that uses the words "gingelie" or "teel" to refer to "sesame."

Note 5. This is the earliest English-language document seen (Sept. 2006) that uses the word "Oleaginous" or the term "Oleaginous plants" in connection with the soybean. Oil derived from the soybean is also mentioned. Address: England.

439. Montgaudry, Baron de. 1855. Compte rendu des expériences faites pour l'acclimatation des semences importées en France par M. de Montigny [Report of experiments made on the acclimatization of seeds imported into France by Mr. de Montigny]. *Bulletin de la Societe d'Acclimatation* 2(1):16-22. Jan. See p. 17, 20-22. [Fre]

• ***Summary:*** For years Mr. de Montigny has been sending seeds and plants from China to the Society for Acclimatization. When he last returned from China, in April 1854, Mr. de Montigny brought five varieties of seeds; a portion of this collection was entrusted to the Society for Acclimatization for experimentation.

Mr. Montgaudry was given responsibility by the Society for Acclimatization for distributing these five varieties of seeds to its members. These seeds were three varieties of rice, a variety of green bean (*Haricot*) unknown in France, alpist or canary-grass (*Alpiste*), giant maize / corn (*Maïs géant*), and two varieties of soybeans (*Pois oléagineux,* literally "oil peas") (p. 17).

The two varieties of soybeans are completely dissimilar. One has small green seeds; the other has rather large yellow seeds. These seeds are very precious and of the highest usefulness for France. Every year, France is obliged to buy from abroad more than 30 million francs worth of edible oil, but during the years when the two types of rapeseed (*les Colzas et les Navettes*) freeze or cannot produce because of drought, some 60 to 80 million francs must leave the country [to buy oil].

The two types of rapeseed only grow successfully on choice land, which must be both light and rich in humus. Generally, this quality of land comprises only a small proportion of the total is almost all localities [in France]. The soybean (*Le Pois*), however, is much less choosy about the soils where it grows well: it prospers on all terrains. In the valleys it grows wonderfully and on the mountains it gives good crops (p. 20).

The soybeans brought back by M. de Montigny are cultivated on a large scale in the fields of northern China. It is principally in the provinces of Honan, Shantung, and Shansi that one finds vast expanses covered with these soybeans. The climate of these provinces is quite similar to that of our own so-called 'cold provinces.' In China there is a large trade based on products obtained from these soybeans.

© Copyright Soyinfo Center 2014

The oil is used in many ways and is preferred to rapeseed oil and colza oil (refined rapeseed oil). Although it has an aftertaste of peas or beans, this is not as disagreeable as the bitterness from rapeseed or colza oils. With the addition of a little lard, it becomes similar in flavor to second-grade olive oil.

Note 1. He was referring to unrefined, probably filtered soy oil.

The residue left after expressing the oil is in the form of cakes, which the Chinese use to fatten their livestock and enrich their soil. These cakes are a powerful soil amendment in the countryside.

Note 2. *Webster's Dictionary* defines a soil amendment as "a substance that aids plant growth indirectly by improving the condition of the soil."

In China, soybeans are transformed into both a food for the poor and a seasoning highly regarded by the rich. For the poor, the flour of these soybeans (*la farine de ces Pois*) [i.e. ground soybeans] is used to prepare a paté resembling that of *fromage blanc* (a fresh dairy cheese resembling cream cheese; quark), known in France as *fromage à la pie;* it [i.e., tofu] is sold in public places for a few cents (*centimes*) a portion and cut into cakes by means of a brass wire according to the customer's wishes. Ordinarily the Chinese fry their paté or cheese (*fromage*) [tofu] in the oil which also comes from soybeans; this fried food is highly esteemed.

For the rich, a seasoning (*assaisonnement*) is prepared which requires more care and culinary talent. The soybean paté (*La pâte de Pois*) [fermented tofu] is fermented after having been seasoned with pepper, salt, powdered bay/laurel leaves, powdered thyme, and other aromatics. During the fermentation, the producer bastes the paté with soybean oil (*l'huile de Pois*). After several days of fermentation, the preparation is ready. This paté or cheese [fermented tofu] becomes a very powerful digestive (aid to digestion) and an aperitif, which no one can resist because it is extremely tasty.

"At Kaifeng in Honan, at Tsinan in Shantung, and at T'aiyuan in Shanshi, the oil and cheese of soybeans are made in huge amounts, and are consumed locally. But the city of Ning-po, capital of Chekiang, is the center of production and of shipping of various products made from soybeans. The port of Ning-po is hard to reach in large vessels, but they can stop at the island of Choushan, where there is a very good port. Thousands of Chinese junks leave Ning-po and travel along the coast of China with no cargo but the products of soybeans, which they carry to all parts of the Celestial Empire, to Japan, and to all countries where they are known.

Soybeans have produced seeds in France since 1854. Their acclimatization is assured. Unfortunately we still have only a small quantity of seed, but M. de Montigny, who must return to China, will send the Society a large enough amount so that this precious seed will soon be distributed to all parts of France. This will be an eminent service rendered to the nation.

Mr. de Montigny had brought back a large quantity of soybeans, but it was not going to be up to him (as early as 1854) for this seed to be cultivated on a large scale on French soil. Most of the supply was lost in Paris, for reasons independent of all the zeal, all the planning by Mr. de Montigny, who was not in control of the steps undertaken by persons who appeared to offer to him all the warranties and from whom he could not anticipate the odd way (*façon singulière*) of using such precious seeds (p. 22).

Note 3. Monsignor Louis C.N.M. de Montigny, bearer of the seeds, was born at Hamburg of French parents in 1895. In 1843 he went to China and in 1847 he was appointed Consular Agent at the port of Shanghai, where he stayed, with promotions, until 1895. There he rendered great services to natural science and horticulture by introducing into France useful Chinese plants and animals, via the Society for Acclimatization (Bretschneider 1898, p. 536).

Note 4. The Baron of Montgaudry, author of this article, was the nephew of Comte Georges-Louis Leclerc de Buffon (1707-1788), a French naturalist who held the prestigious position of superintendent of the Royal Garden (*Jardin du Roi/Roy, Jardin des Plantes*) in Paris and was on the cabinet of the Natural History Museum. According to Paillieux (1880, p. 561) starting in 1739, French missionaries in China sent Buffon specimens and seeds of the most important plants in that country. Soybeans were probably received and planted by 1739 or 1740, and definitely by 1779. Buffon was a contemporary and ardent opponent of Linnaeus. He must have been disappointed when, in 1744, Louis XV issued the order that the Linnaean system was to be adopted in the future. Buffon was the author of the superbly illustrated *Histoire Naturelle* (1749-1804) in 44 volumes, some of them published posthumously.

Note 5. This is the earliest document seen (Feb. 2001) concerning soybeans in France, or the cultivation of soybeans in France.

Note 6. This is also the earliest document seen (June 2001) describing the work of the Society for Acclimatization in France with soybeans.

Note 7. This is the 3rd earliest French-language document seen (April 2013) that mentions tofu. It is also the earliest French-language document seen (April 2013) that compares to the particular French cheese named *fromage à la pie* (quark in German).

Note 8. This is the earliest French-language document seen (April 2012) uses the term *pois oléagineux* to refer to the soybean.

Note 9. This is the earliest Western-language, or French-language, document seen (Sept. 2006) that mentions soy oil, which it calls *l'huile de Pois* [*oléagineux*]. This is also the earliest document seen (April 2002) concerning the etymology of soy oil.

Note 10. This is the earliest Western-language document seen (Nov. 2012) that mentions fermented tofu, which it calls

© Copyright Soyinfo Center 2014

La pâte de Pois.

Note 11. This is also the earliest document seen in the Western World that mentions an industrial (non-food) use of soybeans (as a fertilizer for the soil).

Note 12. This is the earliest document seen (May 2005) that mentions flavor problems with soy–in this case, soybean oil.

Note 13. This is the earliest document seen (June 2007) that mentions the use of junks (or barges or boats) or water to transport soybeans or soy products within a country (China).

Note 14. This is the earliest French-language document seen (Nov. 2013) that mentions soy flour, which it calls *la farine de ces Pois.* Address: French Consul at Shanghai and Ning-po, China.

440. Bartlett, Levi. 1855. The Japan and Oregon peas–rape. *Granite Farmer* (*Manchester, New Hampshire*)**.** Vol. 6. No. 7. Feb. 17.

• ***Summary:*** "The last *Patent Office Report* contains a notice of the Japan pea, by A.H. Ernst of Cincinnati, O [Ohio]. As also, a very flattering account of the Oregon Pea, by A.B. Rozell of Tennessee. The glowing account given of this pea, by Mr. R. will be read by thousands of farmers, here at the north, and doubtless many of them will be anxious to obtain seed, even at very high prices. In Tennessee and Ohio, these peas may be fully entitled to all the praise they have received in the P.O. Report. But in New Hampshire they are of no more agricultural value, than the cotton plant or the sugar-cane.

"Last spring we received from the Patent Office a package of each kind, accompanied by a printed circular, stating their good properties, manner of cultivation, &c.

"The two kinds were planted on the 12th of May [1854], in a warm, deep, loamy soil, and well sheltered from rains. They were frequently hoed; and about the 20th of September, they had grown some three feet in height. The Japan pea produced many clusters of short, hairy pods, from an inch to an inch and a half in length, each containing from one to three compressed oval beans... We think that but a few if any of the seeds of the Japan pea matured sufficiently to vegetate. Very similar results attended the cultivation of both kinds in western New York, and Michigan, as we learned by the *Rural New Yorker...*

"Accompanying the pea, we received a paper of *Rape seed,* (a plant of the cabbage tribe) with a printed circular, giving the method of cultivation, use, &c. of the plant and seed." There follows a long description of his successful trial and high evaluation of the rape. "The seed is distributed in small packages from the Patent Office..." "When rape seed is exhausted of its oil, it comes from the press in the form of hard (rape) cakes, which crushed to powder, forms a valuable manure,..."

"[We distributed scored of packages of the peas referred to, and requested our friends to experiment with them in various ways. The result in no case was favorable, and we readily came to the same conclusion expressed by Mr. Bartlett.–Ed.]"

Note 1. This is the earliest document seen (July 2011) concerning soybeans in New Hampshire, or the cultivation of soybeans in New Hampshire. This document contains the earliest date seen for soybeans in New Hampshire, or the cultivation of soybeans in New Hampshire (12 May 1854).

Note 2. This may be the earliest document seen (Aug. 2011) concerning soybeans in Tennessee, or the cultivation of soybeans in Tennessee, but this is not completely clear.

Note 3. Piper (1914, p. 551) states that an early name for the mung bean in the USA was the "Oregon pea under the erroneous idea that it came from that region." Address: Warner, New Hampshire.

441. Browne, D.J. 1855. Report on the seeds and cuttings recently introduced into the United States. Preliminary remarks. *Report of the Commissioner of Patents, Agriculture.* p. x-xxxv. For the year 1854. See p. xv.

• ***Summary:*** *"Japan pea,* also described in last year's report, and has been since cultivated with remarkable success.

"Soja bean, (Soja hispida) procured by the Japan Expedition [of Commodore Perry]; two varieties, the 'White' and the 'Red-seeded,' both of which are employed by the Japanese for making *soy,* a kind of black sauce, prepared with the seeds of this plant, wheaten flour, salt, and water. This 'soy,' or 'soja,' which is preferred to the *Kitjap* of the Chinese, is used in almost all their dishes instead of common salt. The soy may be made as follows:

"Take a gallon of beans of this plant and boil them until soft; add bruised wheat, one gallon; keep in a warm place for twenty-four hours; then add common salt, one gill [½ cup], and water, two gallons; and put the whole into a stone jar, and keep it tightly closed for two or three months, frequently shaking it; and then press out the liquor for use.

"The seeds of this plant only require to be sown in a warm, sheltered situation at the time of planting Indian corn, and cultivated as any garden bean."

Note 1. The author of this report apparently did not realize that the Japan Pea and the Soja Bean are one and the same plant. Note 2. This is the earliest American document seen (Jan. 2003) that uses the term "Soja hispida" to refer to the soybean.

Note 3. The "Japan Expedition" refers to that led by the American Commodore Matthew Calbraith Perry (lived 1794-1858).

Note 4. Piper and Morse (1923, p. 40) state concerning the Perry Expedition to Japan in 1854: "The Mammoth may well be the 'white-seeded' soja bean obtained by the Perry expedition. The 'red-seeded soja bean' was, probably, the adsuki bean (*Phaseolus angularis*), as no red-seeded soybean is known." If this were an adzuki bean, this would be the earliest document seen (March. 2003) concerning azuki in

© Copyright Soyinfo Center 2014

the United States.

Note 5. This is the earliest English-language document seen (April 2012) that uses the term "Kitjap" to refer to Chinese soy sauce." Observe the similarity between the words "Kitjap" and "Ketchup"–suggesting that the word "ketchup" may have a Chinese origin.

Note 6. Also discusses: White quinoa (*Chenopodium quinoa,* p. xiii-xiv). White Lupine (*Lupinus albus,* from southern Spain and Germany, xv-xvi). Yellow Lupine (*Lupinus luteus,* from Germany, p. xvi). Chinese yam (*Dioscorea batatas,* from China but more recently from France, p. xvii).

Note 6. This is the earliest document seen (Jan. 2005) that mentions quinoa in the USA. Address: United States Patent Office, Washington, DC.

442. *Country Gentleman* (*Albany, New York*)**.** 1855. Japan and Oregon peas (Abstract). 5(10):151. March 8. Whole No. 114.

• ***Summary:*** A short summary of an article by Levi Bartlett in the Granite Farmer. "Levi Bartlett gives it as his opinion, in the *Granite Farmer,* founded on experiments, that while in Tennessee and Ohio, these peas may be entitled to all the praise they have received, in New-Hampshire they are of no more value than the cotton plant or sugar cane."

Note: This periodical is published in Albany, New York. Address: New Hampshire.

443. J.W. 1855. Japan peas. *Country Gentleman* 5(12):184. March 22.

• ***Summary:*** "Will you please inform me in regard to the use of the Japan pea and its cultivation."

Will some of our correspondents please answer? Address: [New York? Journal published in Albany, New York].

444. T.V.P. [T.V. Peticolas]. 1855. Japan pea. *Country Gentleman* 5(15):232. April 12. Whole No. 119. Also published in The Cultivator 3(5):159. May. Series 3.

• ***Summary:*** "... on the subject of the Japan Pea, or rather Bean. I have cultivated it for the last three years, and have disseminated it from Canada to Texas. It produces abundantly in common corn ground, planted six inches apart in the row, and the rows from 18 inches to two feet apart–wide enough to hoe or use a small cultivator. When eaten a few times they are pleasant enough, but have very little flavor–better when mixed with other beans. Before cooking, they must be soaked at least twenty-four hours. They are inconvenient to use green, being so difficult to hull. Chickens are very fond of them, and hogs devour them with great gusto. I think they would do for a field crop sown broadcast in good soil."

Note 1. This is the earliest document seen (Oct. 2012) concerning soybeans in Canada or in Texas. This document contains the earliest date seen for soybeans in Canada or Texas (April 1855). These soybeans may well have been grown in Canada and/or in Texas, but we cannot be certain of that.

Note 2. This is the 2nd earliest English-language document seen (June 2009) that mentions green vegetable soybeans; it notes "They are inconvenient to use green, being so difficult to hull."

Note 3. This is the earliest document seen (Oct. 2003) that uses the word "cultivator" in connection with soybean production.

Note 4. This is the earliest document seen (July 2002) concerning the feeding of soybeans or soy products to chickens in the United States.

Note 5. Letter from Ted Hymowitz. 1994. May 18. He says this man's full name is T.V. Peticolas. He probably received his soybean seeds from A.H. Ernst. His evaluation of soybeans as a potential new crop was amazingly astute (Hymowitz 1987, p. 31). Address: Mount Carmel, [Clermont Co.], Ohio.

445. Worthington, T. 1855. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 7. p. 211-12. May 22.

• ***Summary:*** "I heard the other day in Cinti [Cincinnati?] that your department had sent there for Japan peas. Enclosed is a specimen of some raised of me last summer producing 50 bushels to the acre when corn [illegible word] them? brought? but 10 bushels. I never knew any thing stand the drowth [drought] so well and they are valuable for stock but I have not been able to cook them so as to acceptable for human food. They may be planted successfully till the 20th of June...

"... I derived? & can forward at once four or five gallons of Japan peas and will take in return such useful seeds for this? latitude and season? as you may have yet on hand.

"... I should like to have samples of... the Soja [Foja?, Foya?] bean of Japan."

Note: The author apparently does not realize that the Japan pea which he has is the same as the Soy bean of Japan, which he is requesting. Question marks and blanks indicate illegible handwritten text.

First cited by Graff 1949. Address: Logan, Hocking Co. Ohio.

446. T.V.P. 1855. Japan pea. *Cultivator* (*The*) 3(5):159. May. Third Series.

• ***Summary:*** Reprinted from *The Country Gentleman.* 1855. April 12. p. 32. "... on the subject of the Japan Pea, or rather Bean. I have cultivated it for the last three years, and have disseminated it from Canada to Texas. It produces abundantly in common corn ground, planted six inches apart in the row, and the rows from 18 inches to two feet apart–wide enough to hoe or use a small cultivator. When eaten

© Copyright Soyinfo Center 2014

a few times they are pleasant enough, but have very little flavor–better when mixed with other beans. Before cooking, they must be soaked at least twenty-four hours. They are inconvenient to use green, being so difficult to hull. Chickens are very fond of them, and hogs devour them with great gusto. I think they would do for a field crop sown broadcast in good soil." Address: Mount Carmel, Ohio.

447. *Pittsfield Sun* (*Massachusetts*). 1855. The farm of General Worthington near Chillicothe... 56(2866):1. Aug. 23.
• ***Summary:*** "... contains seven or eight hundred acres of the best land in the garden of Ohio, well supplied with the purest water, and adorned with magnificent groves of forest trees... Figs from the land of Smyrna, frijoles from the plains of Mexico, and peas from Japan [Japan peas], flourish in his garden."

448. Munch, Frederick. 1855. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 7. p. 1228-29. Nov. 25.
• ***Summary:*** "The Japan pea is one of the finest looking vegetables in the garden, grows prolific [sic], bears well, is not injured by insects, & requires but moderate attention; our season is just long enough to have it fully matured."

Note 1. This is the earliest document seen (June 2011) concerning soybeans in Missouri, or the cultivation of soybeans in Missouri. This document contains the earliest date seen for soybeans in Missouri, or the cultivation of soybeans in Missouri (Nov. 1855). First cited by Graff 1949.

Note 2. This is the earliest document seen (Aug. 2001) that mentions insects in connection with soybeans. Address: Marthasville, Warren County, Missouri.

449. Browne, D.J. 1855. Agricultural operations of the United States Patent Office. *American Institute of the City of New York, Transactions* p. 587-632. For the year 1854.
• ***Summary:*** In the section on "Legumes" (p. 596) we read (p. 598): "Japan pea, also described in last year's report, and has been since cultivated with remarkable success.

"Soja bean (*soja hispida*), procured by the Japan expedition; two varieties, the 'white' and the 'red-seeded,' both of which are employed by the Japanese for making soy [sauce], a kind of black sauce, prepared with the seeds of this plant, wheat flour, salt and water. This 'soy,' or 'soja,' which is preferred to the kitjap [ketjap, kecap] of the Chinese, is used in almost all their dishes instead of common salt. The soy may be made as follows: take a gallon of the beans of this plant and boil them until soft, add bruised wheat one gallon; keep them in a warm place for twenty-four hours, then add common salt one gill, and water two gallons, and put the whole into a stone jar and keep it tightly closed for two or three months, frequently shaking it, and then press out the liquor for use. The seeds of this plant, to be cultivated, only require to be sown in a warm sheltered situation, at the time of planting Indian corn, and cultivated as any garden bean." Address: Philadelphia, Pennsylvania.

450. Danforth, John. 1855. The Japan pea. *Report of the Commissioner of Patents, Agriculture.* p. 194. For the year 1854.
• ***Summary:*** "Last May, I planted four Japan peas, from which I raised, in number, thirteen hundred and seventy-six [1376], measuring about a pint. As this plant appears to be well adapted to our climate, I have reserved my peas for planting next year."

Note: This is the earliest document seen (March 2011) concerning soybeans in Connecticut, or the cultivation of soybeans in Connecticut. This document contains the earliest date seen for soybeans in Connecticut, or the cultivation of soybeans in Connecticut (May 1854). Address: New London, New London County, Connecticut.

451. Hildreth, Richard. 1855. Japan as it was and is. Boston, Massachusetts: Phillips, Sampson and Co.; New York: J.C. Derby. xii + 576 p. Folded map. Index. 21 cm. Facsimile edition reprinted in 1973 by Scholarly Resources (Wilmington, Delaware).
• ***Summary:*** Richard Hildreth (lived 1807-1865) never traveled to Japan, but he read widely from the writings of those who did. He summarizes them and quotes them in this book, which is basically a history (in chronological order, by the date of Hildreth's source).

In Chapter 32 (1690-1692), in the section on tea, the following quotation (probably from Engelbert Kaempfer) appears (p. 312): "'The common sauce for these and other dishes is a little *soy* [sauce], as they call it, mixed with *saki* [*sake*], or the beer of the country.'"

In Chapter 39 (1775-76), in the section on imports and exports, the following summary appears (from C.P. Thunberg) (p. 390-91): "The chief articles of export were copper, camphor and lackered [sic, lacquered] goods; porcelain, rice, saki, soy,* were also exported" (Footnote: *"This sauce, used in great quantities in Japan and exported to Batavia by the Dutch, whence it has become known throughout the East Indies and also in Europe, is made from the soy bean (*Dolichos Soia*) [sic], extensively used by the Japanese in the making of soup [sic]. The soy is prepared as follows: the beans are boiled until they become rather soft, when an equal quantity of pounded barley or wheat is added. These ingredients being mixed, the compound is set away for twenty-four hours in a warm place to ferment. An equal quality of salt is than added, and twice and a half as much water. It is stirred several times a day for several days, and then stands well covered for two or three months, when the liquid portion is decanted, strained, and put in wooden casks. It is of a brown color, improves with age, but varies in quality, according to the province where it is made. The Dutch of Deshima cork up the better qualities in glass [sic,

© Copyright Soyinfo Center 2014

porcelain] bottles, boiling the liquor first in an iron kettle, to prevent fermentation, by which it is liable to be spoiled)." Address: Author, Boston, Massachusetts.

452. Miquel, Friedrich Anton Wilhelm. 1855. Flora van Nederlandsch Indie (Flora Indiae Batavae) [Flora of the Netherlands Indies. Vol. I, part 1]. Amsterdam and Utrecht: C.G. van der Post. 1116 p. See p. 196-97 (Phaseolus species) and p. 221-24 (Glycine and Soya species). [9 ref. Dut]
• ***Summary:*** Miquel's Soya species include: 1. Soya hispida Moench, 2. Soya Wightii Grah. (named Glycine javanica by Linnaeus and Soya javanica by Grah.), 3. Soya angustifolia Miq. 4. Soya hamata Miq.

Glycine species include: 1. Glycine labialis Linn., 2. Glycine mollis Wight et Arn.

Note: This is the earliest document seen that mentions *Soya angustifolia.*

According to Merrill (1917), Miquel (p. 197) named a narrow-leafed form from Java *Phaseolus radiatus.* He erroneously thought it was the soybean. Note: It may have been the azuki bean.

Miquel was born on 24 Oct. 1811 at Neuenhaus, Germany, and died on 23 Jan. 1871 at Utrecht, Netherlands. A botanist, he was the son of a country physician. His University studies and subsequent academic career took place in the Netherlands. "Trained as a physician at the University of Groningen, Miguel specialized in botany and was director of the Rotterdam botanic garden (1835-1846), professor of botany at Amsterdam (1846-1859) and at Utrecht (1859-1871), and director of the Rijksherbarium at Leiden (1862-1871). His numerous (296 items in his bibliography) botanical publications deal mainly with the floras of the former Netherlands East Indies, Surinam, and Japan... Miguel was also the founder of the University of Utrecht herbarium."

An illustration (see above) facing the title pages shows a portrait of Georgius Everhardus Rumphius, blind and white-haired in his old age, holding a branch on a table.

Also discusses: *Psophocarpus tetragonolobus* [winged bean] (p. 181). Address: Hoogleeraar in de Plantenkunde te Amsterdam.

453. Pratt, S.D. 1855. The Japan pea. *Report of the Commissioner of Patents, Agriculture.* p. 194. For the year 1854.
• ***Summary:*** "The Japan peas sent to me last spring, eight in number, were planted on the 3rd day of June. The ground was made mellow with a hoe, and the peas were planted about one foot apart, like garden beans. Six of them came up within a week and presented a thrifty, vigorous appearance. The season was the dryest [sic] within the recollection of our oldest inhabitants; and when the garden plants were drooping and wilting from excessive drought, they retained a fresh, healthy appearance.

"These peas were planted so late that they did not mature before the last of October, after several frosts, and two or three of the plants were broken down by accident; but with all these things against me, I harvested about half a pint, which will be distributed among farmers in this vicinity who may be desirous to cultivate them. The plant in its growth was not troubled with insects, and the downy covering of the pods will prevent the fly or bug from inserting its ovipositor into the green pea, and leaving there a rudimentary bug to revel on the farmer's toil and blast his hopes. The pea should be planted at least two feet apart, about the time of corn-planting. That they can be successfully cultivated in Central New York there is no doubt." Address: Pompey, Onondaga County, New York.

454. Victor, T. 1855. The Japan pea. *Report of the Commissioner of Patents, Agriculture.* p. 194. For the year 1854.
• ***Summary:*** "In the latter part of April last, I planted six Japan peas, from which, notwithstanding the unfavorableness of the season, I raised seven hundred and twenty-six [726] in number, or about one hundred and twenty [120] to one." Address: City and County of New York.

455. Champley, G. 1856. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 10. p. 45-46. Jan. 7.
• ***Summary:*** "I should be highly gratified if you will forward me a few seeds of The 'Japan pea,' The Chinese Sugar-Cane [sorghum] & any other suitable for the extremely rich soil of the Prairie."

Note 1. This is the earliest document seen (Oct. 2012)

concerning soybeans in connection with (but not yet in) Indiana. Presumably, the Patent Office sent him the soybeans he requested. First cited by Graff 1949.

Note 2. As of 1 Nov. 2000 directory assistance has no phone listings for anyone with the surname "Champley" in Oxford, Indiana, or in Benton County, Indiana, or in the surrounding area. Address: Oxford, Benton Co., Indiana.

456. Donohue, John. 1856. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 10. p. 751. Feb. 14.
• ***Summary:*** "M. Brown Esq: Sir I received? from you last spring 28 Jappan [sic, Japan] pea 26 of them came up, and from our pea I counted 2000 and I think that they [illegible word] 1500–I had some of them cooked and found them to be the [illegible word] pea I've eat."

Note: This is the earliest document seen (May 2011) concerning soybeans in Maryland, or the cultivation of soybeans in Maryland. This document contains the earliest date seen for soybeans in Maryland, or the cultivation of soybeans in Maryland (spring 1855). First cited by Graff 1949. The name of the author's town is difficult to read. It also looks like Hardigran. Address: Havre de Grace, Harford Co., Maryland.

457. Herndon, Jno. B. 1856. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 10. p. 779-80. Feb. 14.
• ***Summary:*** The writer encloses a newspaper clipping titled "The Japan Pea," which he wrote on 1 Nov. 1855 to the editors of the *Louisville Bulletin* (which see), accompanied by these words: "Please accept the enclosed Statement: any use you may make of it in your Agricultural Report will be agreeable to me."

First cited by Graff 1949. Address: Mayslick, Kentucky.

458. F.D. 1856. Japan pea. *Country Gentleman* 7(9):144. Feb. 28. Reprinted in Cultivator, Series 3, 3:125-26. April.
• ***Summary:*** "Perhaps you or some of your many correspondents, can inform me whether any reliable experiments have been made with the Japan pea, to determine its value as a food for stock? Hogs seem to be very fond of it, and I observe cattle eat the hulls with a good relish, but how far it possesses any value as a nutritious and economical food for any kind of stock, is the question I shall be glad to have answered. It is easy of cultivation, very prolific, and from the density of its shade, keeps the ground clean of weeds, advantages which would render it a desirable plant to the farmer provided it contains the elements of a good food for stock."

Note: This is the earliest document seen (August 2001) that mentions soybeans in connection with weed control. Address: New Richmond, Ohio.

459. Thorburn (J.M.) & Co. 1856. Classified ad: Agricultural–New Chinese or Japan potato (*Dioscorea Batatas*). *New York Times.* March 8. p. 3.
• ***Summary:*** "Just received, a few thousand in prime condition, of this new esculent. Price $3 per dozen or $20 per 100. Printed description, with directions for its culture, furnished to purchasers and other applicants.

"Also, new Annual Chinese Sugar Cane, Japan Peas, new Orange Water mellon, Oregon Peas [mung beans], &c., &c.,..."

Note 1. This ad also appeared in the March 10 and 11 (p. 3) issues of this newspaper.

Note 2. *Dioscorea batatas,* which is now more widely known by the scientific name *Dioscorea opposita,* is called either *nagaimo* or *yamaimo* in Japanese, depending on the root shape. In Chinese it is known as *huai shan, shan yao,* or *hua shan yao.* In English it is known as Chinese yam, Japanese mountain yam, or glutinous yam. Grated *nagaimo* is known as *tororo,* which is a key ingredient in the Japanese cold noodle dish *tororo udon. Jinenjo* (wild glutinous yam) is another variety of Japanese yam that is used as a topping in soba noodles. Address: No. 15 John-st. [New York City, New York].

460. Danforth, John. 1856. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 11. p. 7-72. March 18.
• ***Summary:*** "Hon. Charles Mason, Patent Office, Washington [DC]: I learn from a Gentelman [sic] in Kentucky that you have not got any of the Japan Peas in your office at Washington. If this is true I will send you a small lot. Say one pint or a quart. I have had over forty applications for those peas this season and have furnished the all with [sic] a few, by mail without price pay or reward, requesting them to make their? Report & Return to the office at Washington."

Note: First cited by Graff 1949. Address: New London, Connecticut.

461. F.D. 1856. Inquiries and answers: Japan pea. *Cultivator* (*The*) 4(4):125-26. April. Third Series.
• ***Summary:*** First printed in *Country Gentleman,* 28 Feb. 1856, p. 144–which see. Address: New Richmond, Ohio.

462. Wyche, John J. 1856. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 11. p. 641-42. May 31.
• ***Summary:*** This handwritten, faded letter is hard to read. "Accompanying (?) this you will (?) receive a lot of Japan Peas, which it is not too late to distribute in the South to which indeed it is better adapted than to the North. In return for the multiplied favors received from your Department I hope this fall (?) to be able to send (?) a number of new (?) seeds I have now under cultivation..."

Note: This is the earliest document seen (April 2012) concerning soybeans in North Carolina, and (probably) the cultivation of soybeans in North Carolina. This document contains the earliest date seen for soybeans in North Carolina (May 1856). Henderson is a city in the north central part of the state. The population in 1980 was about 13,500. First cited by Graff 1949. Address: Henderson [Vance County], North Carolina.

463. *Richmond Daily Whig* (*Virginia*). 1856. The Japan pea. Dec. 27. p. 3, col. 1.
• ***Summary:*** "The Japan pea is much recommended by Mr. Thomas Maslin, of Moorefield, Hardy county, Virginia. He says that from six Japanese peas sent to him in 1854, which were not cultivated in a way to give much hope of success, the product first season was 7,350, or an average of 1,225 to each stalk. The next year he planted two ounces of the beans, many of which were destroyed in their growth by the cut-worm, but the product was about five bushels, after the family had used what had been wanted in the green state. He further remarks:

"They grow up in a stiff stalk about the size of a man's finger, and throw out branches from the ground up, and every branch is completely covered with pods, which contain three or four peas, and form a bush nearly as large as a flour barrel. When green, they are about the size and shape of a corn bean. I counted some stalks this fall that had 2,500 to 3,000 peas, and have seen as much as one hundred pods upon branches not a foot long. I have no doubt that they will yield five times as much per acre as any other grain or vegetable I have ever seen. They are fine for table use, either green or dry, but particularly so when dry, and have no doubt but they will be valuable for stock, as my fowls and the rats eat them in preference to corn."

Note 1. This is the earliest document seen (Sept. 2011) that clearly refers to soybeans in Virginia, or the cultivation of soybeans in Virginia. This document contains the earliest date seen for soybeans in Virginia (1854), or the cultivation of soybeans in Virginia (1855 or before). The source of these soybeans is unknown.

Note 2. This is the earliest document seen (Feb. 2000) that uses the term Japanese peas (or Japanese pea) to refer to soybeans.

464. L. 1856. Japan peas. *Cultivator* (*The*) 4:376. Dec. Third Series.
• ***Summary:*** The writer asks how to cultivate the Japan peas that he received from the Patent Office. "The Japan pea is a bushy, upright plant, growing 3 or more feet in height, and branching near the ground. To secure large and showy plants, the seed should be planted one in a hill at a distance of about 3 feet. It will not probably ripen its seed as far north as Ulster, but if it does, you may cook it for your own use, if fond of peas, or feed it to your pigs." Address: Ulster County, New York.

465. Adams, James O. ed. 1856. Experiments with foreign seeds. *Transactions of the New Hampshire State Agricultural Society* p. 351-57. For the year 1855. See p. 353.
• ***Summary:*** "The Japan Pea is very prolific, yielding by the hundred fold. The pea, however, is very small, and not superior to our common varieties. They will be serviceable for sheep."

Levi Bartlett, Esq., of Warner [New Hampshire] is mentioned on p. 357 as one of two gentlemen who have furnished reports of their success in experiments with these seeds. Address: Secretary of the State Society, New Hampshire.

466. *Annalen der Landwirtschaft in den königlich-preussischen Staaten.* 1856. Bericht des General-Garten-Directors Lenné ueber die Resultateder Anbau-Versuche mit den von dem Koeniglichen Landes-Oekonomie-Collegium vertheilten oder anderweitig begozenen Saemerien [Report of the General Garden Director of Lenné on the results of cultivation trials using seeds sent by the Royal Landes-Oekonomie- Collegium or obtained in other ways]. 14(27):107-167. See p. 107-08, 135. [Ger]
• ***Summary:*** The 1st section titled "Oilseeds" (*Hülsenfrüchte,* p. 107-08) mentions: "Japan Pea. *Soja hispida"* and White beans from China." Both were obtained from the Patent Office in Washington, DC, via Mr. von Gerold on 28 Dec. 1854.

The section on "Beans" (*Bohnen*) mentions "5. Peas, Erbse." Apparently Soja Hispida. These seeds probably came from Japan.

Note: In the title, a collegium is a group in which each member has about equal weight.

467. Crawfurd, John. 1856. A descriptive dictionary of the Indian islands & adjacent countries. London: Bradbury & Evans. 459 p. Reprinted in 1971 by Oxford University Press, with an introduction by M.C. Ricklefs.
• ***Summary:*** This book is about the region now (May 2011) known as Southeast Asia, and especially about the Malay Archipelago (today's Indonesia and Malaysia). Its main focus is geography, history, language, culture, and colonial affairs, but there is some information about food and agriculture.

The section titled "Pulses" (p. 361) states: "The generic name in Malay and Javanese for all leguminous plants, is kachang, by adding an epithet to which we have the name of the species. Several species are regular objects of cultivation, as Phaseolus max, lunatus and radiatus; Dolichos kachang; Lablab vulgaris; Soja hispida; Cytisus cajan, and Arachis hypogæa. In Java, the greater number of these are cultivated in the dry season from irrigated land, which during the wet had yielded a crop of rice; that is, they form one of two crops

© Copyright Soyinfo Center 2014

from the same land within the year. The last-named plant, the ground nut, is raised in inferior dry lands, and is the chief source of the lamp-oil consumed by the natives. Most of the cultivated leguminous plants may be judged by the epithets annexed to them to be exotics; thus, Phaseolus lunatus, is called Kachang China, or Chinese pulse; and Soja hispida, the soy-bean, Kachang-Jâpun, or Japanese pulse; Phaseolus max has a Talugu or Telinga name annexed to it, kâdâlé."

Note: Crawfurd seems to be confused about Phaseolus max, an early and outdated name for the soybean, which is now (Feb. 2004) called "Kachang kedele" (rarely "kadele," never "kadale") in Indonesia.

The section on "Oil" notes "in Malay miñah, and in Javanese lânga, both of them words of extensive currency throughout the Malay and Philippine Archipelagos. The plants from which fatty oils are chiefly extracted are the coco-palm [coconut], the ground pea [peanut], the sesame, and the palma-christi; the first for edible use and the three last for the lamp... Animal oils are hardly used in any shape; essential oils are obtained from the clove, the nutmeg, the kayu-puti (Melaleuca cajeput) and in great abundance and cheapness from the Malay camphor-tree (Dryobalanops camphora)."

The section titled "Arachis" (p. 13, about the peanut) states: "The Arachis hypogæa, or ground pea, is known in the Malayan countries under the several names of kachang-tanah, kachang-China, and kachang-Jâpun, meaning ground, Chinese, and Japan pulse. The two last of these names would seem to imply, what is probable, that the plant is an exotic, and was introduced either from China or Japan, with both of which the inhabitants of the Archipelago had maintained a commercial intercourse before the arrival of Europeans in India. With the exception of the coco-palm, it is, of all the oil-yielding plants, the most extensively cultivated in the Archipelago."

Note: This is the earliest English-language document seen (Sept. 2006) that contains the terms "oil-yielding" or "oil-yielding plants" in connection with seeds.

Other food-related entries include: Agar-agar, Kaempfer (Engelbert), nutmeg, onion (Allium), opium, orange, potato, Rumpf / Rumphius, safflower, and sago. John Crawfurd lived 1783-1868. Address: F.R.S. [London, England].

468. Encyclopædia Britannica, or dictionary of arts, sciences, and general literature: Japan. 1856. Boston, Massachusetts: Little, Brown, & Co.; Chicago, London, Toronto...: Encyclopaedia Britannica, Inc. 820 p. 8th ed. See vol. 12.
• ***Summary:*** In volume 12, under Japan, the section on agriculture (p. 693) states: "Beans and peas of different kinds are cultivated in great abundance, particularly the bean *Dolichos soja,* from which *soy,* a kind of sauce, is prepared by boiling and fermentation, is made."

Note: This encyclopedia has no index. This is the only entry seen for the soybean; it is not mentioned under beans, China, or Indonesia, and there are no entries for Japan pea, soy*, or soya.

469. Faulkner, Alexander. 1856. Faulkner's dictionary of commercial terms: With their synonyms in various languages. Bombay, India: Printed at L.M. D'Souza's Press. iii + 158 + vii p. 18 cm. [1 ref]
• ***Summary:*** "Soy. A peculiar savoury sauce, made from the bean of the *Soja,* a species of *Dolichos,* growing in the Eastern parts of Asia. Genuine soy is well flavoured, thick, brown, and clear; and when shaken in a glass it should have a coat on the surface of a bright yellowish-brown colour. It is obtained from Canton [China]; but the best is exported from Japan, by way of Batavia [Dutch East Indies]. Waterston."

Also discusses: "Ground nuts.–Guz. (Guzerattee) [Gujarati], Hind [Hindi], *Bhoysing.* Groundnuts are now extensively cultivated in the Concans on account of the oil which they afford. They are occasionally exported to England and France.

"Ground nut oil.–Hind. *Bhoysing ka teil.* It is the oil obtained from ground-nuts by expression. It is largely exported from Bombay to France and England."

Note: The Concans or Co'ncan was an extensive maritime district of southwestern India in the province of Bejapore extending 220 miles along the shore from Damaun to Malabar, bounded on the west by the Indian Ocean and on the south by Canara and Sattara [Satara]. Between 16º and 20º north latitude. On today's map, it would be along the coast south of Bombay. A long range of mountains, named the Western Ghats, runs right along the shore of western India from the Gulf of Khambhat to near the southern tip of the continent (Cape of Comorin).

470. Green, Daniel S. 1856. Narrative of the expedition of an American squadron to the China Seas and Japan, performed in the years 1852, 1853, and 1854, under the command of Commodore M.C. Perry, United States Navy. Report upon the agriculture of Japan. *Senate Executive Document* No. 79. 33d Congress, 2nd Session. Vol. 1. p. 52; Vol. 2. p. 85. Also published as House of Representatives Executive Document No. 97. Same Congress, Session, and pages.
• ***Summary:*** Upon his return and at Commodore Perry's request, Dr. Daniel S. Green, surgeon of the expedition, wrote a short "Report upon the agriculture of Japan" from notes and from memory, hoping that it might afford some interest to American farmers. This document marked the introduction of Japanese products to American agriculture.

"Their chief grain is rice, of which they are said to produce the best in all Asia. They also make barley and wheat. The first is used for feeding the cattle; the other [wheat] is not much valued, and is chiefly used for cakes and soy [sauce]. This last is made by fermenting, under ground, wheat with a peculiar kind of bean and salt" (1:52).

"Of beans the Japanese have several sorts, as white

© Copyright Soyinfo Center 2014

and black, runners or climbers, and bush or snap beans; the black-eye or cow pea, and a peculiar hairy-podded bean, growing upon a branching stem, called commonly Japan pea; and also a diminutive one, not much larger than a lentil [probably azuki]. From one of these [Japan pea] the famous *soya* is made, a fermented condiment used for various dishes" (II:85).

Vol. I, p. 369 gives a list of articles received from the Japanese government, from Udono, 4th commissioner, including "1 box, 10 jars of soy."

Note 1. This is the earliest journal article (from an irregular serial) seen (Oct. 2001) that mentions soy.

Note 2. This is the earliest English-language document seen (Oct. 2006) that uses the term "black-eye" to refer to the cow pea.

Note 3. This document was published as a book in 1856 in London by Trubner & Co. (624 p.). Compiled by Francis Lister Hawks, the lead author is given as Matthew Calbraith Perry. Address: USA.

471. Hawks, Francis L. comp. 1856. Narrative of the expedition of an American squadron to the China Seas and Japan, performed in the years 1852, 1853, and 1854, under the command of Commodore M.C. Perry, United States Navy,... New York: D. Appleton and Co.; London: Trubner & Co. viii + 296 p. See p. 66, 430, 443, 511.

• ***Summary:*** Introduction (p. 66): "Their [the Japanese] chief grain is rice, of which they are said to produce the best in all Asia. They also make barley and wheat. The first is used for feeding the cattle; the other is not much valued, and is chiefly used for cakes and soy [sauce]. This last is made by fermenting, under ground, wheat with a peculiar kind of bean [soy bean] and salt."

Page 430: A list shows articles received from the Japanese government: "5th. From Udono, 4th commissioner–... 1 box, 10 jars of soy."

Page 443: "All formal business being now concluded to the mutual satisfaction of both parties, the Japanese commissioners invited the commodore and his officers to partake of an entertainment prepared for the auspicious occasion... When all were seated, the servitors brought in a rapid succession of courses, consisting chiefly of thick soups, or rather stews, in most of which fresh fish was a component part. These were served in small earthen bowls or cups, and were brought in upon lacquered stands, and placed, one before each guest, on the tables. Together with each dish was a supply of soy or some other condiment, while throughout there was an abundant quantity of saki–the Japanese national liquor–a sort of whisky distilled from rice. Various sweetened confections, and a multiplicity of cakes, were liberally interspersed among the other articles on the tables."

In describing the shops in Hakodadi [Hakodate] (p. 511): "The provision shops contain rice, wheat, barley, pulse, dried fish, seaweed, salt, sugar, saki, soy, charcoal, sweet potatoes, flour,... There is no public market in the town, as neither beef, pork, nor mutton are eaten, and very little poultry." Address: D.D., LL.D.

472. MacFarlane, Charles. 1856. Japan: An account, geographical and historical, from the earliest period at which the islands composing this empire were known to Europeans, down to the present time, and the expedition fitted out in the United States, etc. Hartford, Connecticut: Silas Andrus & Son. xii + [9]-365 p. Illust. No index. Folding map. 21 cm. [15 ref]

• ***Summary:*** In the section on "Domestic manners" is a description of a Japanese feast (p. 288-89) which states: "A Japanese feast usually consists of seven or eight courses. During the several removes, the master of the house walks round, and drinks a cup of sackee with each guest. This is their way of hobnobbing, or "taking wine." The viands consist of game, venison, poultry, fish, and all kinds of vegetables, seaweeds not excepted. Fish is, however, the *pièce de résistance,* the standing dish, the roast beef of the Japanese... As whets, servants, of both sexes, from time to time, hand round soy, other sauces, pickled or salted ginger, and small nicely-cut morsels of salted fish, which are all eaten with the Chinese chopstick. It is expected that the guests compliment the giver of the feast on the beauty of his lacquered ware, on the splendor of his bowls, and on the richness and beauty of his domestic utensils, and furnishing in general."

Since the author has never been to Japan, he uses the last part of the Appendix (p. 331-65' see especially p. 363-65) to give a bibliography of his sources.

Charles MacFarlane, a British romantic author, lived 1799-1858. Address: Author [England].

473. Siebold & Comp. 1856. Catalogue raisonné et prix-courant des plantes et graines du Japon cultivées dans l'établissement de von Siebold & Comp. à Leide [Annotated catalogue and current price list of plants and seeds from Japan cultivated at the firm of von Siebold & Co., Leiden, Netherlands]. Leyden [Netherlands] and Bonn: Henry & Cohen. 24 p. 23 cm. [1 ref. Fre]

• ***Summary:*** In the section titled "Seeds of garden and agricultural plants harvested in the fall of 1855 in Japan" is a one-line entry (p. 18) which reads: "28. Soja japonica Savi * à graines blanch. vert et noir. Usage: Pl. à Soy. Un petit paquet: Fr. 1." (Footnote: *"C'est la plante légumineuse, des graines de laquelle les Japonais préparent le Soy (*Sojû*). sauce bien connue aux gourmands.")

Translated into English: "28. Soja japonica Savi *; white, green, or black seeds. Usage: Plant can be used to make soy sauce. (Footnote 4: *"This is a leguminous plant, whose seeds the Japanese use to make Soy (*Shôyu*) sauce, which is well known to connoisseurs of fine food (*gourmands*)."*)*

Note 1. This is the earliest seed catalog seen (Dec. 2003), worldwide, in which soybean seeds are offered for sale–although no prices are given. The original catalog is located at the Department of East Asian Studies, Ruhr-Universitaet Bochum, Universitaetsstrasse 150, 4630 Bochum 1, Germany.

Note 2. Siebold & Co., plant and seed company, was started in 1842 by Philipp Franz von Siebold with Blume and Rodbard; Siebold and Joseph G. Zuccarini first gave the soybean its present genus name, Glycine. They gave the wild soybean its present scientific name *Glycine soja.* M.M. Busk in 1841 wrote: "Dr. Von Siebold's Japanese museum [at Leyden] is said to be the finest in Europe..." For details on Siebold's life and work as a botanist see: Bretschneider (1882–*Botanicon Sinicum,* Part I, p. 126-27).

Note 3. This is the earliest French-language document seen (April 2012) that uses the term *Le Soy* (*Sojû*) to refer to soy sauce.

Note 4. First cited by Prof. Ted Hymowitz, Univ. of Illinois. Personal communication 1 Jan. 1997. Address: Leyden, Netherlands.

474. Smith, J. Jay. 1856. Editor's table: New and valuable trees and fruits. *Horticulturist, and Journal of Rural Art and Rural Taste* (*Albany, New York*) 11:330-31. [1 ref]

• ***Summary:*** "One of the most remarkable catalogs ever published has just appeared in Leyden [Netherlands]; it contains a priced list of the Japanese plants actually cultivated in the nursery of Siebold & Co., of that place" [Leyden].

"He also offers seeds of the Soja japonica, the real plant from which the sauce called Soy is prepared."

Note 1. Siebold & Co. was started by Philipp Franz von Siebold; he and Joseph G. Zuccarini first gave the soybean its present genus name, Glycine. They also gave the wild soybean its present scientific name *Glycine soja.* M.M. Busk in 1841 wrote: "Dr. Von Siebold's Japanese museum [at Leyden] is said to be the finest in Europe..." For details on Siebold's life and work as a botanist see: Bretschneider (1882–*Botanicon Sinicum,* Part I, p. 126-27).

Note 2. This is the earliest document seen (March 2002) stating that the soybean was being sold in a seed catalog.

Note 3. First cited by Prof. Ted Hymowitz, Univ. of Illinois. Personal communication 1 Jan. 1997.

To continue: "As is well known, the Dutch monopolize the intercourse of Europeans with Japan, the country most in climate like the British Isles, but resplendent with a vegetation infinitely richer and more varied. Camellia, Cephalotaxus, Cryptomeria, Aucuba, Chimonanthus, Clematis, and Pyrus Japonica, sufficiently indicate how beautiful and hardy is the flora of Japan, to say nothing of Weigela, Forsythia, and the whole race of Moutans. Availing themselves of their commercial privileges, the Dutch have sedulously occupied themselves with the acquisition of everything most worthy of introduction to Europe, and the result is already a total number of 3 or 400 species and varieties offered for sale by the firm mentioned above. Of so curious an assemblage, we are sure that a brief account will be interesting to all lovers of gardens. We shall, however, confine our remarks to what are represented to be hardy races."

These include conifers (4 species) and sycamores (2). "Fruit trees comprehend a very early apricot called *Armeniaca Mume* [later *Prunus mume*], whose early rose-colored flowers are extremely ornamental, while the fruit, owing to the firmness of the flesh, is particularly well adapted for preserving [as *umeboshi* in Japan]... Mention, moreover, is made of a Japanese variety of Peach." Also described are many small flowering trees and shrubs, and some climbing shrubs. "Finally there is a considerable number of herbaceous plants, among which are included several new kinds of *Funkia* and *Lilium,* a Burdock called *Lappa edulis,* the roots of which are eaten like Scorzonera; a couple of Irises; *Polygonatum japonicum* whose roots are a substitute for asparagus; a *Polygonum* called *Sieboldi,* recommended as a green crop for cattle food, as an excellent bee plant, &c. &c.; and the Chinese Yam, which M. Siebold calls *Dioscorea opposita,* and to the hardiness of which he fully testifies." Soja japonica is then mentioned.

"Some of these novelties have already been introduced into England, and are offered for sale by E.G. Henderson. Who will be the first to advertise these interesting articles in America?"

Note 4. This is the earliest English-language document seen (Dec. 2006) that refers to umeboshi salt plums, but it does not mention them specifically.

475. *American Agriculturist.* 1857. The Japan pea. 16(1):10. Jan. 7.

• ***Summary:*** "This we have not yet tried as our first impressions were not greatly in its favor. We first saw them cooked, upon the table of a friend, and were not especially pleased with the flavor. As we have seen them growing, the large spreading branches, the hard woody character of the stalks, which unfit them for feeding, and the small number of peas in the pods, seem to be against their adaptedness to general cultivation. Others are better pleased with them. Mr. Thos. R. Joynes of Accomac, Virginia, writes as follows: 'On the 9th of April I planted a row of about 20 yards in length, the seed about 3 inches apart in the row... They were gathered about Oct. 1st, and yielded about 6 quarts of beautiful plump, rich, yellow or cream-colored peas. I think they would have yielded more had they not been sown so thickly...

"'As to their eating qualities, I can only say that I have just risen from the table at which I made my first trial of them, and I want nothing better. They make a rich and most excellent dish–inferior to no bean or pea I have ever seen.'

© Copyright Soyinfo Center 2014

"We think, on further trial, Mr. Joynes will be less pleased with their eating qualities–at least such has been the experience of most of those who have attempted to use them for culinary purposes... We first saw them cooked, upon the table of a friend, and were not specially pleased with the flavor."

Note 1. This is the earliest English-language document seen (Sept. 2004) that uses the word "cream" or the term "cream-colored" to describe the color of soybean seeds.

Note 2. It is not clear whether the soybeans were consumed as green vegetable soybeans or whole dry soybeans.

Note 3. This periodical was published (in Jan. 1857) by Orange Judd, 191 Water-st., New York. Terms: One dollar a year in advance.

• ***Summary:*** "Hon. Charles Mason. Dear Sir. Of the Japan Peas I received, I planted eight, from which, I gathered about one quart of peas fit for planting. They received no extra care. Our mode of cooking is, to soak them, in warm water over night, & boil next day. By this method, we have an agreeable substitute for green peas thrwo? [sic, throughout?] the fall, winter, and spring.

"Cooked in this way, they are, in taste, very much like the Lima Bean. By most who have tried them here they are thot [sic, thought] to be a valuable addition to the list of garden products. They will stand quite a frost without injury.

"Should you have at your disposal a few seeds of the Chinese Sugar Cane (Sorghum Sacc?) & of the Improved King Phillip Corn, it would give us pleasure to try them, distribute, and report concerning their adaptability? to our soil, which, as you are aware?, is upon the sandstone that underlies the coal [illegible word]."

First cited by Graff 1949. Address: Welchfield, Geauga Co., Ohio.

477. Coy, Edward L. 1857. Trial of seeds from the Patent Office. *Cultivator* (*The*) 5(1):29. Jan. Third Series.

• ***Summary:*** "Japan pea–...Last spring I received from the Patent Office a package of the seed. I had heard and read so much in its favor, that I was desirous of raising all I possibly could from what little seed I possessed." He planted the seeds on May 1. The plants grew well but "the peas were not 'forthcoming.' At the time of our first heavy frost (Oct. 15) they were about half grown. The frost did not kill them at once; but they did not grow any after it. The experience of others in this section agrees with mine, as to their adaptation to the climate of Northern New York. A few of the plants were exhibited at our County Fair that were as green as mine. In fact, I doubt if they can be ripened (unless under glass) as far north as this." Address: West Hebron, New York.

478. Read, John. 1857. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 15. p. 795-98. Feb. 12.

• ***Summary:*** "Chas. Mason... The Japan Pea I have cultivated for three years very successfully and? this? distributed very generally and are? proved suited our climate.

"They are an excellent article of diet in winter use. From personal experience they are the most productive article I ever cultivated.

"I send you by this day's mail a few samples of the above [illegible word]."

"Japan and Oregon Peas and Pea? [illegible word] Hoo Sung Seed? I can send you some more Japan Peas & some Mexican Turtle South Beans if you wish."

Note 1. First cited by Graff 1949, p. 111. The binding of this volume obscures some of the text of this letter.

Note 2. Piper (1914, p. 551) states that an early name for the mung bean in the USA was the "Oregon pea under the erroneous idea that it came from that region." Address: Huntington, Pennsylvania.

479. Lindsley, W.D. 1857. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 15. p. 1045-46. Feb. 28.

• ***Summary:*** "On the first day of May last, I planted one acre with the Jappan [sic] Pea, the product of a parcel of peas I received from the Patent Office in 1856... The pea, though planted on the same day, and in the same field [as the corn], came up in good order, but grew slowly owing to the backwardness of the season and drouth. In fact they did not all ripen? before the fall of frost, but the yield was abundant. I harvested 2 square rods & procured sixty lbs. The yield per acre 4,800 lbs. I planted the peas with my corn drill in rows 2? ft apart & gave them the same attention I do my corn. After the pea had become dry, I allowed my hogs to harvest them at their leisure. I was surprised at the avidity they ate them. I then turned in my sheep, & finally my cattle & horses, & all ate them with a relish, that satisfied me, that it is one of the most valuable plants the farmer can raise. The main stalk grows from 3 to 4 ft high & remains? erect? for months after the pea is ripe & not a pea? is lost when sheep & hogs do the harvesting. The pod does not open like other peas when ripe, or frosted. I believe them to be superior to corn for fattening sheep, & equally as good for hogs. I shall raise acres? the coming season? for my stock to feed upon the coming winter. Respectfully..."

Note 1. This is the earliest document seen (July 2002) concerning the feeding of soybeans or soy products to sheep.

Note 2. This is the earliest document seen (July 2002) concerning the feeding of soybeans to cattle, but it is not clear whether these were dairy cows or beef cattle.

Note 3. First cited by Graff 1949. Address: Sandusky, Ohio.

480. Jefferson, -. 1857. Chinese sugar cane (Letter to the editor). *American Cotton Planter and Soil of the South* (*Montgomery, Alabama*) 1(9):264. Sept.
• ***Summary:*** A letter to the agricultural editor and proprietor, N.B. Cloud. M.D. "Dr. Cloud–Dear Sir: I here send you my experience in regard to the cultivation, and the value, as a field crop, of the following forage plants, recently introduced among us, to-wit: Chinese Sugar Cane, Chinese Japan Pea, and Peabody's Prolific Corn. All of these I have planted this year, and it is gratifying to me to say that they were all what they were recommended to be. The Chinese cane though, I think is far superior to the others as a field crop..."

"As regards to the Japan Pea, I can say that they are superior to any that I have yet seen.–They are very prolific and will make more food off one acre than any other Pea will take off two."

Note 1. This is the earliest document seen (June 2011) concerning soybeans in Mississippi, or the cultivation of soybeans in Mississippi. Since Mr. Jefferson refers to soybeans as "Japan Peas" he may have obtained them from the Agricultural Division of the Patent Office.

Note 2. This is the earliest document seen (Jan. 2003) stating that the soybean is a good forage crop.

Note 3. This journal was formed by the merger of two others. Volume 1 of this journal equals Vol. 5 of *Cotton Planter* and Vol. 7 of *Soil of the South.* Address: Hamburg, Mississippi.

481. Garber, J.B. 1857. Remarks on some of the new Chinese plants. *Horticulturist, and Journal of Rural Art and Rural Taste* (*Albany, New York*) 12:77-79.
• ***Summary:*** Page 77: "Japan Pea.–We are also indebted to the Celestial Empire for this plant, now pretty extensively disseminated, and I have often been asked the question: What it is good for? If you will soak them over night in warm water, and, next day, give them a good cooking, serve them up as Lima beans, and do not say they are superior to beans, then I can only say, 'tastes differ.' The Pea is raised with less trouble, and produces more abundantly in all soils and all seasons than Lima beans. Last spring, we received two new varieties of the Japan Pea via California, nothing different, however, except in color, one being green, and the other red."

Note: The Japan Pea is the soybean. Benjamin Franklin Edwards brought the ones from California. Address: Columbia, Pennsylvania.

482. Smith, J. Jay. 1857. Editor's table. *Horticulturist, and Journal of Rural Art and Rural Taste* (*Albany, New York*) 12:287.
• ***Summary:*** Page 287: "The Japan Pea has various common names. It is, as you suppose, the *Soja hispida* of botanists. Many species of *Cajanus* are used for the same purpose as this, and occasionally get the same common name. Our correspondent recommends it very highly as a productive, easily cultivated, and excellent family vegetable." Address: Philadelphia, Pennsylvania.

483. Osmond, A.P. 1858. [Japan peas]. *Letters and Reports of the Agricultural Division of the Patent Office, 1839-60.* Vol. 20. p. 26. Feb. 13.
• ***Summary:*** "D. Sir: A friend gave me last spring 3 Japan Peas which I planted in my back yard in the city of Wilmington, Del. They vegetated nicely, but one plant was by accident broken off. The others grew and matured and without any cultivation the two peas produced 800 well formed peas. As this is a better result than I had seen I thought I would inform you of the result.

Note: This is the earliest document seen (March 2011) concerning soybeans in Delaware, or the cultivation of soybeans in Delaware. This document contains the earliest date seen for soybeans in Delaware, or the cultivation of soybeans in Delaware (spring 1857). First cited by Graff 1949. This letter has text on both sides of the page, but bears the single page number 26. Address: Canterbury, Kent Co., Delaware.

while throughout there was an abundant quantity of saki–the Japanese national liquor–a sort of whisky distilled from rice."

Page 248: In Hakodadi [Hakodate] "The provision shops contain rice, wheat, barley, pulse, dried fish, seaweed, salt, sugar, saki, soy, charcoal, sweet potatoes, flour, and other less necessary articles, and all apparently in abundant quantities."

486. Simmonds, Peter Lund. 1858. A dictionary of trade products, commercial, manufacturing, and technical terms: with a definition of the moneys, weights, and measures of all countries, reduced to the British standard. London: G. Routledge & Co. viii + 422 p. 18 cm.

• ***Summary:*** Two entries are related to the soybean: "Mico, mijo [miso], a vegetable butter or solid oil, made from *Soja hispida,* in Japan."

"Soy, a sauce or flavoring originally made in the East; and said to be produced from a species of *Dolichos* bean." Note: the author is apparently unaware that the sauce is made from soybeans.

The Preface begins: "The present is especially a practical, commercial and industrial age: newspapers, lecturers, popular authors, all lend their efforts towards the diffusion of sound and useful knowledge among the masses; and the commercial and industrial element has become the leading feature of instruction."

Also discusses: Almond oil, almonds, amande, arachis oil ("generally known in commerce as nut oil"), catsup (non-soy; "Catsup, Ketchup, a seasoning or sauce for meat, made of mushrooms, tomatoes, walnuts, or other vegetable substances), earth-nut (see ground-nut; in America called pea-nut), flax, flax-seed, gingelie (Indian name for *Sesamum orientale* or teel seed), gluten, glutinous, ground-nuts (from which oil is expressed), hemp (a fibre), hemp-seed (from which oil is expressed), ketchup (see catsup), lima-bean ("the *Phaseolus limensis,* an esteemed kind of pulse cultivated in the tropics; the perennial kidney-bean, *P. perennis"*), linseed, linseed-meal, linseed-oil, oil (fixed or fat oils vs. volatile or essential oils; solid fats vs. fluid fixed oils), oil-cake ("the marc or refuse after oil is pressed from flax-seed, rape-seed, coconut pulp, &c..."), pea-nut (an American name for the ground-nut), sesame (a plant from which oil is expressed; in India called Gingely, Gingelie, teel or til), siritch (Arab name for sesame oil), soya (see sherbet).

Note 1. This is the earliest English-language document seen (Jan. 2009) that gives "Phaseolus limensis" as the scientific name of the lima bean.

Note 2. Peter L. Simmonds lived 1814-1897. This book is dedicated to Dr. Lyon Playfair, C.B., F.R.S., President of the Chemical Society, etc. Address: F.R.G.S., F.S.S., author, 8 Winchester St., Pimlico [southwest London, England].

• ***Summary:*** "London, Friday, Aug. 19, 1859–5 p.m. Our Colonial and Foreign Produce markets continue very quiet, and prices generally are without material alteration."

"Drugs–262 cases Calcutta 30 casks Bombay Castor Oil chiefly sold,... 100 kegs Japan Soy [sauce] bought in at 2/."

489. Cornwallis, Kinahan. 1859. Two journeys to Japan, 1856-7. 2 vols. London: Thomas C. Newby. Vol. 1, vii + 340 p.; Vol. 2, 340 p. Illust. No index. 19 cm. Facsimile edition reprinted in 2002 by Ganesha Publishing (London) and Edition Synapse (Tokyo). Series: Japan in English, Vols. 4-5.

• ***Summary:*** This book appeared five years after the Perry Expedition to Japan captured the interest of the western world. Cornwallis, a young British writer, took advantage of this interest by writing this book–which was later exposed as a forgery (See: Yamigawa, Joseph K. 1941. "Cornwallis Account of Japan a Forgery and its exposure. *Monumenta Nipponica* 4(1):124-32. Jan.). He drew his material partly from the numerous authentic books about Japan already widely available, and partly from his imagination.

Cornwallis said that he first arrived in Japan in July 1856 on an American sloop of war which landed in the harbor of Shimoda. He immediately becomes enchanted by everything about Japan, and depicts it as an almost ideal place.

During a visit to Simoda [Shimoda], he had lunch at the temple of the Russians: "After we had discussed to our satisfaction the birds and the fishes, the rice and the soya, the latter the finest fish sauce in the world, we wound up by eating fruit and drinking saki [sake],..." (p. 34).

© Copyright Soyinfo Center 2014

The next morning, on board ship after the usual Japanese breakfast, a Russian came on board. "He laughed at our complaints [about the food, and said] that we had better, for our own peace, make up our minds to rest content with a good supply of rice, soya, saki, and a stray chicken or fish now and then, so long as we remained at our present anchorage" (p. 35).

His 2nd journey to Japan supposedly took place in Aug. 1857. This time he was on board an American steam-frigate that went from Shanghae [Shanghai, China], to the "Japanese island of Lew-kew" [in the Ryukyu Islands, also spelled Luchu or Loochoo; a chain of islands extending 600 miles from Taiwan to Kyushu, Japan].

Part / Volume II contains a long history of European exploration of and visits to Japan. With his host, Mr. Noskotoska, he visits Nagasaki and the old Dutch trading post there he calls "Desima" [Dejima, Deshima]. During a visit in Nagasaki to the Noskotsuka home, where he is fascinated by the women (who do not feel embarrassed to be seen naked after bathing) and treated like a king, he was invited to "the mid-day repast" at home. "Here were four small lacquered tables, on each of which lay the accustomed ivory chopstick, the small porcelain cup for tea, and the larger one of lacquer-work for saki [sake, saké], the small glass cruet of soy [sauce], the porcelain spoon, and the silver fork" (p. 105). Address: [England].

490. Oliphant, Laurence. 1859. Narrative of the Earl of Elgin's mission to China and Japan in the years 1857, '58, '59. 2 vols. Edinburgh and London: William Blackwood and Sons. xiv + 492 p. Illust. (coloured lithographs). Map.
• ***Summary:*** Page 60: In Nagasaki, they visit a tea-garden high on a hill above the city. "We have long since taken off our shoes, and now squat in a circle on the floor, and gaze with curiosity, not unmixed with alarm, at the display before us. There is raw fish thinly sliced, and salted ginger; there are prawns piled up with a substance which in taste and appearance very much resembles toffy; there are pickled eggs and rock-leeches, and pieces of gristle belonging to animals unknown, to be eaten with soy [sauce];... but still the experiment is hazardous, and we are relieved at the sight of a bowl of rice as a safe *piece de resistance."*

Pages 67-68: In Macao, at a Chinese restaurant, the author "managed, by the aid of chopsticks, to make a very satisfactory repast off eggs a year old preserved in clay, sharks' fins and radishes pared and boiled into a thick soup, *bêche de mer* or sea-slugs, shrimps made into a paste with sea-chestnuts, bamboo roots, and garlic, rendered piquant by the addition of soy [sauce] and sundry other pickles and condiments, and washed down with warm samshu in minute cups. Dishes and plates were all on the smallest possible scale, and pieces of square brown paper served the purpose of napkins."

Pages 398-99. The author found it very difficult to obtain any statistics about Tientsin or its trade. He finally found a respectable, local Chinese merchant. "The theme upon which he dwelt most feelingly was the excessive poverty of the city of his abode. It exported absolutely nothing, he averred... Among its imports from the south are dried fruits, sugar, glass ware, camlets, woollens [woolens], opium, &c., in small quantities. Numerous cargoes of [soya] beans and bean-cakes are brought over from Neu-chwang [Newchwang] and the Manchurian coast."

In Appendix II a table (p. 491) shows "Trade returns between Shanghai and Japan." Imports from Japan from 1st Jan. to 30th June 1859. Isinglass (Kanting) 1,551 peculs [piculs]. Seaweed, all kinds, 61,561 peculs. Soy [sauce] 562 peculs. Address: Private secretary to Lord Elgin.

• ***Summary:*** Contains many recipes for tofu and miso, plus amazake and shirozake (lit. "white sake"), hishio, natto, and Kinzanji miso.

492. Steinmetz, Andrew. 1859. Japan and her people. London and New York: Routledge, Warnes, and Routledge. xv + 447 p. Illust. No index. 22 cm. 2nd ed. 1860. Facsimile edition reprinted in 1973 by Scholarly Resources, Inc. (Wilmington, Delaware). Reprinted again in 2002 by Ganesha Publishing (London) and Edition Synapse (Tokyo). Series: Japan in English, Vol. 1. [30 ref]
• ***Summary:*** The author of this book has apparently not been to Japan; he compiled it from more than 30 major works on Japan (see p. xi-xii). The book is divided into two parts and 7 chapters. The 35 old illustrations add to the color of the book.

In Chapter 3, "Palaces, temples, castles, towns, houses, gardens, vehicles, etc." we read (p. 175): ";... all sorts of vegetables which the season affords, and innumerable other dishes peculiar to Japan, made of seeds and powdered roots, and dressed in many different ways. The common sauce for these and other dishes is soy mixed with saki."

In Chapter 6, "Social and domestic life," is a long quotation from Kaempfer (1727) describing the great yearly festival held on the third day of the third month [*hina matsuri,* dolls' festival]. "... cakes made of mugwort and rice, which they call *futsumotzi* [*sic, kusa mochi*], that is, mugwort cakes, are prepared after the following manner:–The mugwort leaves [are finally] "reduced to powder, and mixed with boiled rice and *adsuki,* or red beans, coarsely powdered, and so baked into cakes" (p. 273).

"A Japanese feast usually consists of seven or eight courses... As whets, servants of both sexes, from time to time, hand round soy [sauce], other sauces, pickled or salted ginger, and small, nicely-cut morsels of salted fish, which are all eaten with Chinese chopsticks" (p. 274-75). Andrew

• ***Summary:*** The chapter on "Sauces and Gravies" states (p. 80-81): "Nine-tenths of the ketchup sold by grocer-oilmen is a vile compound of liver and the roe of fish, seasoned with pepper and other condiments. If you wish the article genuine [apparently mushroom ketchup], procure the mushrooms, and make it yourself. "India Soy is difficult to purchase genuine: it should be made from an Indian plant called Dolichos soja, or soya; but treacle and salt are the basis of the soy ordinarily sold.

"'Many persons,' observes Mr. Dobell, in his *Travels in China,* 'have thought that gravy was used in preparing soy; but this appears not to be the case, the composition being entirely a vegetable one, and made from beans. Japanese soy is much esteemed in China; probably it is made with a particular bean.* In China the consumption of soy is enormous: neither rich nor poor can dine, breakfast, or sup without soy; it is the sauce for all sorts of food, and may be described as indispensable at a Chinese repast.'" (Footnote: *"Now that Japan is open to our trade, we hope to receive Japan soy with greater certainty").

The chapter on "Salads" notes (p. 93): "The following are excellent salad ingredients: essence of anchovies, soy [sauce], sugar, truffles, flavoured vinegars;..."

Note: The name of the author, J. Timbs, does not appear on the title page.

• ***Summary:*** Page 212: "Lady or calavan pea–J.J.F.–The pea you send is the Japan pea, or *Soja hispida,* a popular bean with the Japanese, of which the celebrated Soy soup [sic, Soy sauce] is made."

Note: This is the earliest document seen (June 2008) that refers to the soybean as either the "Lady pea" or the "calavan pea."

495. Schroeder, Georg. 1860. Handbuch für Zollbeamte und Steuerpflichtige: ein alphabetisch geordnetes Waarenverzeichniss,... [Handbook for customs officers and tax collectors: an alphabetical list of goods...]. Cassel. 528 p. See p. 101. 8vo. [Ger; Eng]

• ***Summary:*** The entry for *Japanische Soja* (Japanese soy) states (p. 101): a very strong kind of Arrak or Branntwein from Japan [sic].

Note: This is the earliest German-language document seen (April 2012) that uses the term "Japanische Soja" to refer to soy sauce or to Japanese soy sauce.

The entry for *Soja, Soya, Soy* states (p. 218): An Indian liquid for the seasoning of foods. Address: Zoll-Inspektor.

496. Unger, F. 1860. On the principal plants used as food by man. *Report of the Commissioner of Patents, Agriculture.* p. 299-362. For the year 1859. See p. 318. Translated from the German.

• ***Summary:*** Page 318 states: *"Soja hispida,* Monch. (*Soja japonica,* Sav.), or Soy, from Japan, is cultivated in Southern Asia and Europe.

Note 1. The author is using the word "Soy" to refer to the soybean plant rather than to soy sauce.

"What the previously mentioned legumens [legumes] are to the colder portions of the earth the Ground nut (*Arachis hypogaea,* L.) is to the warmer zone. This plant was known neither to the ancient Egyptians and Arabians nor to the Greeks. The latter certainly did not understand this plant under the name of *arachos* [written in Greek letters], which was probably a species of *Vicia.* It has been cultivated for a long time on the west and east coast of Africa, and only quite recently introduced into the Mediterranean regions. A Hindostan [Hindustan] name alone exists for it in Asia. In modern times only, it has been cultivated generally in China and Cochin China, which countries it has reached in some unknown way. On the other hand, six species of *Arachis* certainly belong to the *Flora* of Brazil, and the older authors also mention the cultivation of *Arachis hypogaea* under the names of *Mandubi, Anchic,* and *Mani,* on which account there is little reason to doubt its American origin. The thick tuberous seeds are frequently eaten raw, but are very palatable when roasted. The oil from it is excellent, and is much esteemed in India."

Also discusses "the bean (*Vicia faba,* Linn., *Faba vulgaris,* Mönch.)," lupines (*Lupinus hirsutus, L. albus,* and *L. termis*), lentil (*Ervum lens*), pea (*Pisum sativum*), Chick-pea, Flat-pea (*Lathyrus sativa*), and kidney bean (*Phaseolus vulgaris*) (p. 316-17).

Note 2. This is the earliest English-language document seen (June 2008) that uses the term "Chick-pea" (or "chick-pea" or "chick pea"). We read: "The Chick-pea (*Cicer arietinum,* L. {Greek name}, Theophrastus), is an important kind of pea to the East. The Jews, Greeks, and Egyptians cultivated it in ancient times, and it was also used as an object of devotion, at an early period, even in India, as is shown by the Sanscrit [Sanskrit] names. The common class of Greeks even now make use of it, both raw and roasted, during the winter months, and employ it as a substitute for coffee. It is also cultivated frequently, at the present day, in Egypt, as far as Abyssinia, and, according to Th. Kotschy, is one of the most generally distributed of cultivated plants on the heights of Lebanon as well as in Spain. This plant is represented as almost growing wild in the Caucasian countries, in Greece, &c, and is also found run wild here and there in the fields of Middle Europe." It was "introduced into the model farm of Charlemagne" (p. 317). Address: Dr.,

497. Viridet, Marc. 1861. Circulaire de la Section d'Industrie et d'Agriculture de l'Institut Genevois [Circular of the Section of Industry and of Agriculture of the Geneva Institute]. *Bulletin de l'Institut National Genevois* 10(21):80-83. March. [Fre]

• ***Summary:*** This circular, published in this periodical, begins: "The Section of Industry and of Agriculture of the Geneva Institute continues to invite its members, as well as agriculturists and amateurs in our Canton, to try cultivating the following plants, whose introduction and popularization would be advantageous. Nineteen plants are described briefly.

No. 7 is: The soybean of Japan (*Soja japonica* {*Soja du Japon*}), a type of bean whose seeds and pods [as green vegetable soybeans] are good to eat. It succeeded very well in the Canton, where Mr. James Fazy has cultivated it successfully for three years in a row at his field in Russin.

Note 1. Russin is a municipality in the canton of Geneva, Switzerland, at the far southwestern tip of the Canton (46º11' north latitude), reaching deep into France. This latitude is about the same as that of central Maine or northern Minnesota–thus, quite far north for soybeans to bear seeds. Some plants bore 90-132 pods (p. 82).

Note 2. This is the earliest document seen (Jan. 2010) concerning soybeans in Switzerland, or the cultivation of soybeans in Switzerland. This document contains the earliest date seen for soybeans in Switzerland, or the cultivation of soybeans in Switzerland (before March 1861). The source of these soybeans is unknown.

Note 3. This is the earliest (and only) French-language document seen (Jan. 2010) that uses the term *"Soja du Japon"* (regardless of capitalization or hyphenation) to refer to the soybean. Address: President of the Section, Geneva, Switzerland.

498. Hodgson, Christopher Pemberton; Hooker, William Jackson. 1861. A residence at Nagasaki and Hakodate in 1859-1860. With an account of Japan generally. With a series of letters on Japan by his wife. London: Richard Bentley. xxxii + 350 p. Illust. No. index. 19 cm. Facsimile edition reprinted in 2002 by Ganesha Publishing (London) and Edition Synapse (Tokyo). Series: Japan in English, Vol. 9. [20* ref]

• ***Summary:*** Soy is not mentioned in the body of this book. However near the end is a special section (p. 327+) titled "Catalogue of Japan plants, systematically arranged, communicated by Sir William Hooker." It is compiled from many sources, including Dr. Von Siebold and Prof. Zuccarini, Dr. Asa Gray, etc. Under Leguminosæ (p. 322) are listed: *"Soja hispida,* Moench. *Glycine Soja,* S. & Z." Address: Late British consul to these ports.

499. Iinuma, Chôjun [Yokusai]. 1861. Sômoku zusetzu [Sômoku zusetsu, or an iconography of plants indigenous to, cultivated in, or introduced into Nippon (Japan). 20 vols.]. Japan. See vol. XIII, p. 18-21, 37, 126 (No. 17), 129 (No. 32). 27 cm. [Jap]

• ***Summary:*** This botanical contains 1,215 illustrations (plates), in black and white. The author's name is also romanized as Ynouma Tsiodjoun, and the title as Sô mokou Zoussetz. Each sheet of paper in this book is a leaf–folded only once (called *fukurotoji* in Japanese). Both sides of each folded sheet have the same leaf number.

In vol. XIII, the section on soybeans is on leaves 17-20. There are illustrations on leaves 18-20. In the section titled "beans" (*mame,* in katakana), is a section on soybeans (*O mame*). In Japanese, the scientific name of the plant is *Dolichos soja* (pronounced "Dorikosu soya" in Japanese); it is also called *Japansche Slingerboon* (probably a Dutch term, pronounced "Yappanse Suringeru-boon" in Japanese). The description starts on the back (verso) of leaf 17 (=17b). The soybean has 15 varieties, each based on the seed shape and color. For each variety: At the top of the page, two simple color illustrations (line drawings) show the shape, color, and hilum size and location. Below that is the name, usually written in katakana (phonetic), but with occasional Chinese characters. Remember that *mame* means "bean" in Japanese: Gogatsu-mame (5th month bean), Wase-mame, Nakate-mame, Okute-mame, Maru-mame, Shiroteppo-mame, Kuro-mame (black soybean), Kuroteppo-mame, Goishi-mame (Go = Chinese chess. Ishi refers to the "stones" moved in that board game), Aomame (green soybean), Kage-mame, Aka-mame (red soybean, with 4 additional forms and colors), Chamame (brown soybean, with 2 additional forms and colors), Kurokurakake-mame, Akakurakake-mame, Fuiri-mame (uzura-mame–speckled).

Note 1. This is the earliest document seen (Oct. 2004) that gives the names of various Japanese soybean types or varieties such as *Nakata-mame, Okute mame,* etc.

Note 2. This is the earliest document seen (Oct. 2013) that describes the color of numerous different soybeans.

Note 3. This is the earliest document seen (Oct. 2004) that mentions red soybeans, or that uses the term *Aka-mame* to refer to red soybeans.

Also in vol. XIII, on the back of leaf 36 is a description of the wild soybean (*tsuru-mame*) followed on leaf 37 by an illustration of the *tsuru-mame* plant, with flowers and seeds. Vol. XIII stops at folio 55.

Franchet and Savatier (1875, p. 108) state: For the wild soybean–*Glycine soja* (Sieb. et Zucc) see vol. 13, fol. 37?, under *Tsourou Mame.* For the cultivated soybean–*Glycine hispida* (Moench, Meth.) see vol. 13, fol. 18 and 21.

For the adzuki bean, *Phaseolus radiatus,* see vol. 13, fol. 30. Under: *Tsourou adzou ki* and *Boundô, Ya enari.*

For kudzu, *Pueraria thunbergiana,* vol. 13, fol. 26, under *Koutsou.*

© Copyright Soyinfo Center 2014

This book was cited by Maximowicz in 1873 (p. 398; says "Soo bokf. XIII 18-21, 37").

Mène (1885) says of this book: The soybean is shown in vol. XIII, p. 126, No. 17, under the name *O mame;* in No. 18 on the same page its name is given as *Soja hispida,* var. *lanceolata* and *Midzu-kugusi.* As for the wild soybean, *Glycine Soja* of Siebold and Zuccarini, it is classed under the names *Tsuru-mame* and *Nô-mame* in vol. XIII, p. 129, No. 32.

Iinuma lived 1782-1865. Note that all editions of this work were published posthumously.

Talk with E. Ito of the Japanese section of the Library of Congress (LOC). 2004. Sept. 21. LOC has two copies of this book. One is in the rare book cage of the Asian Division; it is fragile and cannot be photocopied. This first edition was published as follows: Vols. 1-5 in 1856. Vols. 6-15 in 1861. Vols. 16-20 in 1862. Address: Japan.

500. Smith, George. 1861. Ten weeks in Japan. London: Longman, Green, Longman and Roberts. xv + 459 p. Illust. Index. 23 cm. Facsimile edition reprinted in 2002 by Ganesha Publishing (London) and Edition Synapse (Tokyo). Series: Japan in English, Vol. 11. [20* ref]

• ***Summary:*** This is a very interesting book by a careful observer of Japanese culture. In 1860 he stayed mostly in Nagasaki, Yokuhama (Yokohama), and Yeddo (Edo, later Tokyo). Though he has long experience living as a Christian missionary and bishop in China and Hong Kong, he generally admires the Japanese, yet repeatedly calls them "pagans."

While walking among the shops in Nagasaki, he notes (p. 27): "Soon again we pass the spacious warehouses of the dealers in sauces, condiments and soys, where large jars lie filled with decoctions of pulse and rice, and are left to ferment and become mellow with exposure and age."

In the countryside around Yeddo he observed (p. 235): "The large quantities of rye grown in these parts were explained to us as being used in the manufacture of the celebrated Japanese soy; while rice is the ordinary material employed in making the universal spirituous beverage so often alluded to under the name of sakee" (saké, sake). Note: The word "sakee" appears in at least 19 places in this book.

"The secluded Chinese community who reside in Nagasaki compose a trading guild and factory, subjected for ages to all the past vexatious restrictions experienced by the Dutch." They generally number about 200 persons (p. 32).

The chapter on "Nagasaki" begins (p. 78-79): "The Chinese form no unimportant part of the community in Nagasaki and are regarded with much dislike by the Japanese. In ancient times there was a free intercourse and unrestricted commerce between the two countries. But the change produced by former European difficulties and civil wars in the policy of the Japanese government towards the Spaniards, Portuguese and Dutch, was extended also to the Chinese mercantile strangers. After the severe edicts against the Christian religion and the prohibition of Christian books, the Chinese were detected importing Roman Catholic publications, and incurred the heavy displeasure of the government. In the year A.D. 1688 they were forcibly confined to a small settlement on the edge of the harbour, and subjected to the same restraints as those endured by the Dutch in the neighbouring scene of their imprisonment in Desima (Deshima). In the year A.D. 1780 the Chinese trading guild was removed a couple of hundred yards further back from the harbour to a Budhist [Buddhist] monastery... Rigidly guarded and watched, the Chinese factory shared with the Dutch the humiliation and inconvenience of a common captivity." The Chinese guild is now confined to their factory in the southern suburb, where they are isolated by Japanese guards. "Formerly the Chinese were not allowed to walk into the city... At present they amount to about four or five hundred persons, their number being diminished or increased by the departure or return of their junks trading to Japan." At present, three Chinese junks are annually permitted to make a trading voyage to Japan.

Mr. von Siebold first came to Japan in 1823 and remained in the Dutch factory at Desima until 1830, "devoting himself to literary pursuits and scientific researches into the botany and natural history of the country." While studying the "history and geography of Japan, he purchased and published a native map of the empire. In the days of the old regime this audacious act was easily made to bear the appearance of constructive treason; and the colonel was... imprisoned for thirteen months in a solitary room at Desima, and finally banished from the Japanese empire. After an absence of nearly thirty years he returned eight months ago, and has resumed at the age of sixty-four his studies and investigations respecting the country in the hope of being able after three or four years to perfect his observations and on his return to Europe to publish the results of his lengthened researches for the benefit of the scientific world." He now has a lithographed map of Nagasaki, and believes the population is a little over 60,000 (p. 208-09).

A table shows that 35 ships with cargo and 20 in ballast (empty) arrived in Nagasaki during the last 6 months of 1859. During the same period there departed 43 ships with cargo and 9 in ballast. Much of the trade is with China; items include sea weed for jelly, sea slugs for soup, peas and beans (p. 227-28).

Along the Tokaido, near Kanagawa: "The usual crops of wheat, barley, bean, peas and small quantities of still ungathered rape-seed, prevailed..." (p. 271). Address: D.D., Bishop of Victoria, Hong Kong.

501. Tilley, Henry Arthur. 1861. Japan, the Amoor, and the Pacific: With notices of other places comprised in a voyage of circumnavigation in the Russian corvette "Rynda," in

1858-60. London: Smith, Elder and Co. xii + 405 p. Illust. No index. 22 cm. Facsimile edition reprinted in 2002 by Ganesha Publishing (London) and Edition Synapse (Tokyo). Series: Japan in English, Vol. 12.
• ***Summary:*** The section titled "Natural productions" (p. 93-95) states: "... the sauce called Soya, made from bean meal [sic] and salt, flavoured with herbs; different fermentations of rice known as saki [saké]; flax and a kind of nettle (*Urtica Japonica*) from which ropes are made;..."

"The chief food of the people is fish and rice, with eggs, vegetables, vermicelli, sea-weed, and pickled roots, cakes, and sweetmeats, to diversify the diet. Saki, tea, and sugar-water are the only drinks."

Japan is described (p. 56) as a "mysterious land so long a marvel to the rest of the civilized world."

The merchants and trading classes of Japan "are considered contemptible" [the lowest of the six classes] by higher authorities, government employees, and feudal retainers" (p. 61). The pariahs [outcasts] are all those whose business is with dead animals, in skinning them, &c. (p. 82).

Trade with foreign nations begins each year on July 1. Wax, camphor, and seaweed are exported in large quantities from Japan (p. 65).

"The Japanese belong to the Mongolian race, of which they may be considered the first class, as they are certainly superior to the Chinese, both morally and physically" (p. 83).

"Education is widely spread among the people, who are all able to read and write; the bonzes [Buddhist priests] being the chief instructors" (p. 89). Address: [Englishman].

502. Rural. 1862. The farm and garden: Illinois coffee. *Chicago Daily Tribune.* Feb. 25. p. 0_3.
• ***Summary:*** "Champaign, Feb. 17, 1862." Mr. Huffman, of Effingham, has sent specimens of the berries of this coffee... It is neither the *Okra* or *Japan Pea,* but a legitimate member of the pea family, and will doubtless prove as valuable for coffee as any of its congeners." Mr. Huffman sells 50 seed for a dollar, postpaid; this is $23 a pound or $138 per bushel.

"The plant grows about two feet high, and has a habit closely resembling the Japan pea,..."

"The Japan pea had a large run, and those who had seed for sale were, for a time, lavish in its praise, but it has thus far proved of no value."

Note 1. "Japan pea" was an early name for the soy bean in the United States.

Note 2. This is the earliest article on soy seen (Feb. 2005) in the *Chicago Tribune.*

503. Simon, Eugène. 1862. Sur un envoi d'animaux et de végétaux du Japan [On a shipment of animals and vegetables from Japan (Letter to the editor)]. *Bulletin de la Societe d'Acclimatation* 9:689-93. Aug. See p. 691-93. [Fre]
• ***Summary:*** This is a long letter addressed to the Secretary General of the Society for Acclimatization. A section titled *Sur la fabrication du soja* [On the production of soy sauce] (p. 691-93) states: Soja, or soy sauce, is a condiment which, in Japan, is consumed in considerable quantities. Some years ago it enjoyed marked success in America, England, Holland, and in India, where it had first been introduced. Today, the popularity remains only in America. The exportation is weak from the Indies, where it is replaced by another product, and the trade is nearly null in Europe because of the difficulty of making it cross the hot latitudes of the tropics via the tip of South of Africa.

It is nevertheless an excellent product, which could offer the culinary art a resource to be used in many ways, if one could obtain a quality as good as that in the country from which it comes. Actually, nothing could be easier. All one needs to do is to make it locally [in France]. This is a very important industry in Japan. There are more than 6 factories in the city of Nagasaki, and each occupies an average area of 700 to 800 square meters. In total, they produce 1.2 million kg of soy sauce for consumption.

Two types of grain are necessary to make soy sauce. One is a special type of bean called haricot Soja, or soybeans, of which 15 kg are included under #5 in the shipment I have just made to France. The other is ordinary barley (*orge,* not *ble,* wheat). One makes equal parts of beans and wheat. The beans are cooked in an equal volume of water and the wheat is roasted. Then one combines them in a big tub, into which one pours them little by little, while mixing them as much as possible with the aid of a large wooden spatula (pusher). When it all has the consistency of a rather thick paste, one places it in a wooden mold (koji tray) about 1.5 inches deep, 18 inches long, and 8 inches wide. In arranging this cake or this brick in the mold, one must make the upper surface slightly concave. These cakes are then transported into hermetically sealed chambers (the koji room), where it must ferment on shelves around the walls and in the center of the room. All the walls and the openings, with the exception of two window placed at the height of a man, from which one can watch the fermentation from the outside, must be carefully insulated or padded with straw, fixed in the middle of a lattice of bamboo or other wood.

The fermentation starts at the end of very few hours [no inoculation?] but if the temperature of the chamber is very low, one can stimulate the fermentation by placing a small brazier here. However, one must use the brazier only as a last resort; the effect is to brown the cakes. The fermentation lasts for 7 days, during which time one can enter once or twice into the chamber, in order to assure oneself that all is in good condition. When they are well made, the cakes must have a uniform yellowish gold tint. They are then removed and thrown into a large vat, 6 feet deep and 4.5 feet in diameter. Here one adds a saturated salt solution [*sel a chaux* = calcium oxide] in the proportion of 2 kg of solution to 1 kg of cake. One agitates it and mixes it gradually until the vat is full.

© Copyright Soyinfo Center 2014

One must then leave the vat alone for at least one year, but when one wants an extra fine soy sauce (*soja*), it must be left for 3 years. Regardless of the time, one removes the mash (*pâte*) from the vat, puts it in a hemp sack, or better yet, one of palm filaments, and carries it to the press. The soja which collects during the first turns of the press is the best quality. But because of the high price it would be able to demand, one would not find its sale assured. One therefore renounces this quality, except in the two capitals of Edo (Tokyo) and Miyako (Kyoto), where there live a large number of princes and rich people, who can conveniently pay for it.

In general, only two grades of soy sauce are made. The first is made from all the liquid which one is able to extract by the press, and which is then of a good medium quality. The second is obtained by mixing the presscake with salt water and letting it stand for 6 months; this is only sold to the poor. A jar of soja weighing 214.5 kg sells in Japan for 16-17 French francs. The ordinary soja of the first quality is a liquid of thick consistency and dark brown color. It is almost the only sauce for all Japanese dishes, rich or poor. It always accompanies fish. The Europeans in China or Japan, who have used it a lot or a little, add it to beef or to beef bouillon, to which it imparts a most agreeable color and flavor. The number 10 case of various products, which will be a part of my shipment contains 3 bottles of soja of different qualities under the numbers 18, 19, and 20. No. 18 comes from Miyako (Kyoto), but it is possible that the trip may alter it a little.

Note: This is the 2nd earliest French-language document seen (April 2012) that uses the word *soja* to refer to soy sauce. The French used the word *soja* to refer to soy sauce before they used it to refer to the soybean. Address: French consul in China.

504. Cloquet, Jules. 1862. Rapport sur les travaux de la Société Impériale d'Acclimatation [Report on the work of the Imperial Society for Acclimatization]. *Bulletin de la Societe d'Acclimatation* 9:1061-64. Nov. See p. 1064. [Fre]
• ***Summary:*** This speech was presented at the International Exposition of London. Extracted from reports by members of the French section of the international jury of the Universal Exposition of London of 1862, vol. 6, p. 123. The Imperial Society for Acclimatization was founded in Paris in 1854. It was recognized as a public agency by imperial decree on 25 Feb. 1855.

The author discusses important introductions made by the Society. "5th. Plants. A large number of plants have been the object of attempts at acclimatization; several have given good results. Thus, one can cite among the main food or industrial plants acclimatized: 1. The Chinese yam (*l'Igname de Chine; Dioscorea batatas*), an excellent food tuber introduced by Mr. de Montigny; 2. Chervil (*le Cerfeuil bulbeux; Chærophyllum bulbosum*), and the Cerfeuil bulbeux of Siberia (*C. Prescottii*), excellent vegetables; 3. The soybean of China and Japan (*le Pois oléagineux de la Chine et du Japon; Soja hispida*); 4. Chinese sweet sorghum (*le Sorgho sucré de la Chine*), which is very versatile; 5. The *Lo-za* [*Loza*] *de la Chine,* mentioned by Mr. Rondot, a bush completely acclimatized to France, whose leaves produce a beautiful dye known as 'Green of China' (*vert de Chine*); 6. Chinese bamboos (*les Bambous de la Chine; Bambusa nigra* and *B. mitis,* or edible). These two species have been acclimatized in the garden at Alger by Mr. Hardy, and introduced in several departments of southern and central France." Address: France.

505. Ripley, George; Dana, Charles A. eds. 1862. The new American cyclopaedia: A popular dictionary of general knowledge. 16 vols. New York, NY: D. Appleton and Company. 850 p. See Vol. 14, p. 800. 26 cm.
• ***Summary:*** The entry on p. 800 for "Soy" states: (Japanese, *sooja*), a sauce prepared in Japan and China from the small beans of the plant called by McCulloch *dolichos soja,* and by others *soja hispida* or *soja Japonica.* The beans are boiled nearly to dryness, then put in wide-mouthed jars with water and molasses or brown sugar, and exposed to the sun and air. Every day they are well stirred; and when the fermentation is completed the mixture is strained, salted, and boiled, and skimmed until clarified. Japanese soy is considered the best; but there are many deceptions in the article. It is recognized by a peculiar flavor, neither too salt nor sweet; a thick consistence and clear brown color; and particularly by its leaving, when shaken in a glass, a coat of bright yellowish brown upon the sides. It is imported into Europe and the United States to be used with fish.

506. Chû kano sho [Rough writing/draft for the kitchen]. 1863. Publisher unknown. 62 p. Handwritten. Japanese summary by Kawakami 1978, p. 101. [Jap]
• ***Summary:*** The Japanese title of this work, by an unknown author, may be pronounced Kuriya no Shitagaki. It contains a listing of many fish names, and mentions *Kokusho* (*or Kokushiho*), a unique and rich miso soup from the Edo period.

The dictionary of trade products, commercial, manufacturing, and technical terms: with a definition of the moneys, weights, and measures of all countries, reduced to the British standard. New edition, revised and enlarged. London: Routledge, Warne & Routledge. 463 p. 17 cm.

• ***Summary:*** Two entries are related to the soybean: "Mico, mijo [miso], a vegetable butter or solid oil, made from *Soja hispida,* in Japan."

"Soy, a sauce or flavoring originally made in the East; and said to be produced from a species of *Dolichos* bean, *Soja hispida."*

Peter L. Simmonds lived 1814-1897. Address: F.R.G.S., F.S.S., author.

509. Williams, Samuel Wells. 1863. The Chinese commercial guide: Containing treaties, tariffs, regulations, tables, etc... With an appendix of sailing directions. 5th ed. Hongkong: A. Shortrede & Co. xvi + 387 + 266 p. Index. 21 cm. Facsimile edition reprinted in 1966 by Ch'eng-Wen Publishing Co., Taipei, Taiwan.

• ***Summary:*** In the section titled "Description of articles of export" [from China, alphabetical], Chinese characters (see next page) accompany every entry. On p. 111 is an entry for "Beans and peas" (*tau*) incl. bean cake (*tau ping* or *tau shih* = "bean stones"). "The Chinese cultivate legumes to a greater extent, perhaps, than any other nation."

The manufacture of bean jam [jiang] and bean curd cakes [tofu] for food from the flour employs many people. The cakes used for manure are made by crushing the ripe peas [sic, beans] and boiling the grits soft; the mass is then pressed into cakes in iron hoops, and made solid by means of wedges driven down by heavy mallets. Peas and bean cakes are exported from Yingtsz' [Ying-k'ou, Yingkou?] and Tientzin to Amoy and Swatau [Swatow, Shantou, in Guangdong province]; they comprise one-fourth of all the produce shipped from Tientsin in 1861; and there is little else sent from Yingtsz'. In 1859, about a million piculs [1 picul = 133.33 lb] of the cake were reshipped to the south of China from Shanghai alone, chiefly for the consumption of sugar growers."

In the same section is an entry (p. 139) for: "Soy, *shi yú* [*shiyu* = fermented black soybean sauce], and *tsiáng yú* [*jiangyou* = soy sauce], is a condiment made from the Dolichos bean, which grows in China and Japan; our name is derived from the Japanese *siyau* [*shoyu*]. To make it, the beans are slowly boiled soft, then an equal quantity of wheat or barley flour is added; after this has thoroughly fermented and become mouldy, the beans are washed, and put into jars with their weight in salt, adding some aromatics, and three times as much boiling water as the beans were at first. The whole compound is now left for a month or more, exposed to the sun, and then pressed and strained. Good soy has an agreeable taste, and if shaken in a tumbler, lines the vessel with a lively yellowish-brown froth; its color in the dish is nearly black. There are many qualities of it, and when well made all improve by age. Japan soy is considered superior to Chinese, but both are of different qualities, and are probably made of various materials, some of which may be base enough. It is most commonly sent to England, India, and Europe, to form the basis of other sauces and condiments. It is worth from $4 to $8 per picul and goes chiefly from Canton."

On p. 129 is a section on "Oil" (*yú*), incl. [soy] bean oil (*tau yú*), wood oil (tung), cotton-seed oil, sesamum oil, olive oil, ground-nut oil, cabbage or rape oil, fish oil, etc.

In the same section (p. 149) is an entry for "Vermicelli (Chinese characters) *fun sz,* i.e. flour threads. This article, sometimes called *loksoy* [*lock soy*], manufactured from both rice and wheaten flour, is extensively used among the natives in soups. It is everyway inferior to the European."

Note 1. This is the earliest English-language document seen (Sept. 2006) that uses the term "bean oil" to refer to soybean oil, or that mentions *tau-yú* as the Chinese (Cantonese) name for soybean oil.

Note 2. This is the earliest English-language document seen (Sept. 2006) that uses the term "Dolichos bean" to refer to the soybean. It is also the earliest English-language document seen (Sept. 2006) that repeatedly uses the word "bean" (not preceded by the word "soy" or "soya") to refer to the soybean.

Note 3. This is the earliest English-language document seen (Sept. 2003) that contains the term "cotton-seed" or term "cotton-seed oil" (each spelled with a hyphen).

Note 4. This is the earliest English-language document seen (Oct. 2006) that that uses the term "crushing" (or "crush," "crushes," "crushed" or "crushings") in connection with soybeans to refer to the process of pressing the beans to yield oil and cake.

This section also discusses (alphabetically): Almonds (but not almond oil), ground-nuts (*hwa sang* characters, ground-nut cake characters hwa sang ping; the "oil is the chief article of export"), gypsum (*shih kau,* used especially in making bean-cakes and curd [tofu], sometimes called bean-macaroni), manure cakes or poudrette (*kang sha,* made from night soil mixed with earth for exportation. "The refuse of ground-nuts, sesamum, rape-seed, and other oleaceous seeds, is prepared for manure and for feeding swine and sheep, and sent from one part of the country to another"), salt, seaweed, sesamum seed, and silk.

A table titled "Rates of freight in steamers to Canton" states (p. 228): "Soy, per tub of 1 picul–$0.75."

In the section on "Foreign commerce with Japan" we read (p. 254): "Camphor, sulphur, porcelain, copper, nut-galls, vegetable wax, cassia, soy, and verdigris, have been furnished at rates and quantities sufficient to export to Europe."

Other sections discuss Chinese, Japanese, and British

© Copyright Soyinfo Center 2014

BEANS and *peas* 荳 *tau*; bean-cake 荳餅 *tau ping* or 荳石 *tau shih*. The Chinese cultivate legumes to a greater extent, perhaps, than any other nation.

OIL, 油 *yú*; bean oil 荳油 *tau yú*, tea or camellia nut oil 茶油 *cha yú*; wood oil 桐油 *tung yú*; cotton-seed oil 棉油 *mien yú*; and sesamum oil 芝蔴油 *chí má yú*; also olive oil, 生菜油 *sang tsái yú*; ground-nut oil, 花生油 *hwá sang yú*; cabbage or rape

SOY, 豉油 *shi yú*, and 醬油 *tsiáng yú*, is a condiment made from the Dolichos bean, which grows in China and Japan; our name is derived from the Japanese *siyau*. To make it, the beans are slowly boiled soft, and then an equal quantity of wheat or barley flour is added; after

510. Brennwald, C. 1865. Rapport général sur la partie commerciale de la Mission suisse au Japon [General report on the commercial section of the Swiss mission to Japan]. Berne, Switzerland: Printed by J.A. Weingart. 155 p. See p. 100-01, 103. [Fre]

• ***Summary:*** The section on Japanese exports mentions miso and soy sauce. Address: Counselor and Secretary of the Legation [to Japan].

511. Burr, Fearing, Jr. 1865. The field and garden vegetables of America: Containing full descriptions of nearly eleven hundred species and varieties; with directions for propagation, culture, and use. Boston, Massachusetts: J.E. Tilton. xv + 667 p. See p. 499-500. Illust. Index. 20 cm. [25* ref]

• ***Summary:*** Pages 499-500 state: "Japan. *Hov. Mag.* [*The Magazine of Horticulture, Botany, and Rural Affairs.* By C.M. Hovey. Boston [Massachusetts]. Monthly. 1834 to the present time].

"Cajanus bicolor. The Japan Pea is a native of the East Indies, and also of Japan, as implied by the name. The plant makes a strong, erect growth, with numerous spreading branches; the leaves are large, light green and downy beneath; the flowers are small, yellow at the centre,–the upper petal purple; the seed-pods are small and downy, and are produced in profuse abundance,–growing in clusters over the entire plant; the seeds are small, roundish, or pea-form, and of a cream-yellow color when ripe." Note: This is the earliest English-language document seen (Sept. 2004) that uses the term "cream-yellow" to describe the color of soybean seeds.

"Propagation and Culture.–It is raised from seed, which, as the plant requires the entire season for development, should be sown as soon as the ground is warm and settled. Make the drills about 20 inches apart, and drop the seeds ten or twelve inches apart in the drills, covering half or three fourths of an inch deep. The plants will blossom the last of July or beginning of August, and the seeds will be suitable for use in their green state, from the 20th of August until destroyed by frost, the crop being seldom fully perfected in the Northern States.

Use.–The seeds are the only parts of the plants eaten, and these, while young, are tender and delicate. The ripe seeds if soaked for an hour in moderately hot water, take the form and appearance of the Common White Bean, become quite soft and tender, and have a pleasant, nutty, and oily flavor. The whole plant with the seeds, is also used for feeding stock.

"A variety occurs with green seeds, which is not only considered superior to the Common Yellow-seeded just described, but is two weeks earlier."

Note 1. The plant referred to here is actually the soybean, which Mr. Teschemacher incorrectly identified as the pigeon pea *Cajanus bicolor* in Feb. 1853. Note 2. No reference to the Japan Pea appears in the 1863 edition of this book.

Also discusses: Chufa or earth almond (*Cyperus esculentus,* edible cyperus, nut rush, p. 32. When dried and pulverized, the tubers "are said to impart to water the color and richness of milk"). Note 3. This is the earliest English-language document seen (Sept. 2002) concerning a non-soy, non-dairy milk–made from chufa or earth almonds. Amaranthus (Chinese amaranthus, Chinese spinach, p. 279-80). Quinoa (*Chenopodium quinoa,* p. 292-93. Varieties: white-, black-, or red- seeded, from Mexico or Peru. Goosefoot). Pea-nut (Ground bean, earth nut, pindar nut, ground-nut, *Arachys hypogea,* p. 544-46. Varieties: African, Wilmington {North Carolina}, and Tennessee). Winged pea (*Lotus tetragonolobus,* Red birdsfoot trefoil, p. 547. Pods 3½ inches long, with four longitudinal leafy membranes, or wings; seeds globular, slightly compressed, yellowish-white. *Use.*–"The ripened seeds are sometimes used as a substitute for coffee; and the pods, while young and tender, form an agreeable dish, not unlike string beans"). Bene-plant (Oily grain, *Sesamum* sp., p. 548-49. This medicinal plant {which is "cooling and healing"} may be used for food or oil. Varieties: biformed-leaved, oval-leaved, trifid-leafed {having three parts}). Address: Hingham [Massachusetts].

512. Champion, Paul. 1866. Sur la fabrication du fromage de pois en Chine et au Japon [On the production of tofu in China and Japan]. *Bulletin de la Societe d'Acclimatation* 13:562-65. Oct. Meeting of June 1. [Fre]

• ***Summary:*** "The Chinese and the Japanese eat considerable quantities of a white material rather analogous in its appearance to the French product named *fromage à la pie* (quark), and which they make with a particular type of soybean (*Pois oléagineux*) which is also used for food and from which one can extract a rather expensive and very good quality oil. The production of this cheese [tofu] is simple, but it requires care and rather extensive practice to produce a white product."

The author then gives a detailed 3-page description of how tofu (*fromage de pois,* literally "pea cheese") is made–though he never mentions its name in either Chinese or Japanese.

Note. This is the earliest French-language document seen (April 2013) that uses the term *fromage de pois* to refer to tofu.

It is coagulated with magnesium chloride, and will keep for 1 day in summer and 1 week in winter. It is also often salted and it is mixed with various sauces which allow it to keep for several years. In the process of making tofu, the hot soymilk is poured into a second tub and allowed to cool

© Copyright Soyinfo Center 2014

before the coagulant is added. The foam is removed using a copper scoop. After several minutes, a skin / film (*une peau*) [yuba] forms on the surface of this liquid. It can be lifted off by passing a stick (*baguette*) underneath it and hung up to dry by inserting one end of the stick into one of many holes that have been deliberately created in the wall. This film, by the way, has a rather agreeable taste, and is eaten either fresh or dried; a second film is often formed and is lifted off in the same manner.

Note 1. This is the earliest French-language document seen (Oct. 2012) that mentions yuba, which it calls *une peau.*

After the tofu has been pressed, so that the volume has been reduced by half, it is removed from the forming box, or the tofu (cheese) is sometimes shipped out to a great distance. To transport them, it is sufficient to close the box with planks, nailed with the aid of bamboo pegs. Arriving at the destination, it is cut into small pieces by means of a large metal knife.

Tofu (pea cheese) is generally a grayish white and looks like a jelly. It does not keep for more than a day during the hot months, and to preserve it from rapid deterioration, it is generally mixed with salt or sauces of various types. It can then be kept for several years. A piece of tofu the size of a fist sells for 2 Cash (i.e., 1 centime).

He then (p. 564) describes shops in China selling hot soymilk for breakfast. "Generally, the shops where this cheese (*ce fromage* = tofu) is made are filled with Chinese, who bring cups to get some of the hot liquid (*le liquide chaud*), which is used to make the cheese and which has not yet been coagulated; they drink this beverage (*ce breuvage*), which has an insipid but not disagreeable taste, just like we enjoy coffee with tea. For many of the poor, the morning meal consists of a cup of this liquid, in which they dip various types of deep-fried crullers" (*des espèces de gâteaux frits à l'huile*).

"I will send with this note some samples of soybeans which, according to the analysis that I am in the process of making, contain more than 10% oil, and all the materials employed in this industry as well as some small preserved dried cheeses (*des petits fromages secs conservés*), of which I have spoken above. I have seen this production established on a large scale in many ports of China from the south to Peking, and also in various ports of Japan which I have visited. This cheese, when well prepared, has a very agreeable flavor. Deep-fried it makes a delicious dish. It is widely consumed among the Chinese and would be able to be employed, I believe, to advantage in Europe."

Note 2. This is the earliest document seen (Oct. 2011) worldwide–in any language or in any country–that discusses the use of soymilk as a beverage. We find this quite surprising! Why are there no earlier references to its use as a beverage in Chinese documents? This is also the earliest French-language document seen (Aug. 2013) that mentions soymilk, which it calls *le liquide chaud* and *ce breuvage.*

Note 3. This is the earliest document seen (April 2013) that describes how to make tofu on a commercial scale. Address: France.

513. Miquel, Frederich Anton Wilhelm. 1866-1867. Prolusio florae Iaponicae [Essay on the flora of Japan]. Amstelodami (Amsterdam): Printed by C.G. van der Post. viii + 392 p. See p. 240. 2 plates 45 cm. [Lat]*
• ***Summary:*** Discusses *Glycine hispida* (*Soja hispida*).

514. Lindley, John; Moore, Thomas. eds. 1866. The treasury of botany: A popular dictionary of the vegetable kingdom; with which is incorporated a glossary of botanical terms. 2 vols. (Parts I and II). London: Longmans, Green, and Co. xx + 1254 p. See Part I. p. 131, 536-37, 747. Part II. p. 1068, 1075. Illust. 17 cm.
• ***Summary:*** Bean (Part I, p. 131) "Sahuea bean, *Soja hispida.*

Glycine (Part I, p. 536-37) "A small genus of *Leguminosae,* all, excepting one, being slender decumbent [reclining along the ground, but with ascending apex or extremity] or twining herbs, with alternate stalked leaves made up of three to seven leaflets varying much in form, and bearing axillary racemes or fascicles of small yellow or violet pea-flowers. The genus belongs to the tribe *Phaseoleae,* and is most nearly allied to *Teramnus,* from which it is distinguished by its pods being destitute of the hardened hooked style seen in the latter, and by the ten stamens, which are united into a tube, being all, instead of the alternate ones only, anther-bearing. The species are pretty equally distributed through tropical Asia, Africa, and Australia, where a few inhabit extratropical regions.

"The Sooja of the Japanese, *G. Soja,* the only erect species of the genus, a dwarf annual hairy plant, a good deal like the common dwarf kidney or French bean (*Phaseolus vulgaris*), has small violet or yellow flowers, borne in short axillary racemes, and succeeded by oblong two to five-seeded hairy pods.

"The seeds, like kidney beans in form but smaller, are called Miso [sic, error based on Miller 1807] by the Japanese and are made into a sauce which they call Sooja or Soy. The manner of making it is said to be by boiling the beans with equal quantities of barley or wheat, and leaving it for three months to ferment, after which salt and water is added, and the liquid strained. The sauce is used by them in many of their dishes, and they use the beans in soups. The Chinese cook the beans also in various ways, and the plant is cultivated for the sake of them in various parts of India and its Archipelago.

"Mr. Bentham groups the species in three sections, which some regard as genera: *Soja,* with flowers fascicled on the racemes, and falcate pods with depressions but not transverse lines between the seeds; *Johnia,* with flowers similarly arranged, and straight pods with transverse lines

© Copyright Soyinfo Center 2014

between the seeds; and *Leptocyanus,* with solitary flowers on the racemes, and straight pods. The Glycine or *Wistaria* of gardens is now referred to *Millettia.*

Miso (Part II, p. 747). "A fatty substance obtained from *Soja hispida.*

Soja (or Soya) hispida (Part II, p. 1068) is the only representative of a genus of *Leguminosae* of the tribe *Papilionaceae,* and much cultivated in tropical Asia on account of its beans, which are used for preparing a well-known brown and slightly salt sauce (Soy), used both in Asia and Europe for flavouring certain dishes, especially beef, and supposed to favour digestion. Of late it has been cultivated as an oil-plant. S. hispida is an erect hairy herb, with trifoliate leaves, and axillary racemose flowers, which have a five-cleft calyx, a papilionaceous corolla, ten diadelphous stamens, and an oblong pod which contains from two to five ovate compressed seeds. Modern botanists generally refer the plant to Glycine: which see."

Soy (Part II, p. 1075) "A sauce originally prepared in the East, and said to be produced from the beans of *Soja hispida.*

Note 1. This is the earliest document seen (April 2003) in which the soybean is classified under *Papilionaceae.*

Note 2. This is the earliest English-language document seen (April 2003) that uses the term "oil-plant" to describe the soybean.

Also discusses (in alphabetical order): Agar-agar. Alfalfa. Algæ. Almond. Amande de terre (French, *Cyperus esculentus*). Amaranthus. Arachis [peanuts]. Aspergillus. Bean, under-ground kidney = *Arachis hypogaea.* Cannabis. Chenopodium [Common Goosefoot]. Coix [lachryma, Job's tears]. Cyperus. Earth-nut (*Arachis hypogæa*). Flax. Gingelly oil. Hemp.

Part II: Job's tears. Legume. Leguminosæ. Linseed. Linum. Lupinus (incl. *Lupinus albus, L. luteus*). Nut, bambarra ground (The seed of *Voandzeia subterranea,* p. 795). Nut, earth (*Arachis hypogæa*). Oil (incl. sesamum). Oilcake ("The residuum after expressing the oil of various seeds, especially linseed and rape, which is used for cattle feeding, and as a manure"). Oil-plant (*Sesamum orientale*). Pindals, pindars. Psophocarpus. Pueraria. Quinoa (*Chenopodium Quinoa*). Sea-girdles (*Laminaria digitata*). Sea-hangers. Sea-wand (*Laminaria digitata*). Seaware. Seaweeds. Seawrack. Seawracks. Sesame. Sesamum. Tetragonolobus.

"Voandzeia. So called from Voandzou, the name given by the natives of Madagascar to the only known representative of this genus of *Leguminosæ,* the *V. subterranea* of botanists, a creeping annual, with long-stalked leaves composed of three leaflets... It is a native of Africa, and is extensively cultivated in many parts of that continent, from Bambarra and the coast of Guinea to Natal [in today's South Africa], its esculent pods and seeds forming common articles of food among the inhabitants of those regions. Although the plant is not indigenous to the Western Hemisphere, it is commonly found in many parts of South America, such as Brazil and Surinam, whither it has been carried by the negro slaves and has now become naturalised. The pods are sometimes called Bambarra Ground-nuts; in Natal the natives call them Igiuhiuba; while in Brazil they are known by the name of Mandubi d'Angola (showing their African origin), and in Surinam by that of Gobbe.

"Voandzou. The Malagassy name of a genus of *Leguminosae,* called after it *Voandzeia"* (p. 1224).

Note 3. This is the earliest English-language document seen (Nov. 2005) that contains the word "oilcake" (or "oilcakes"). Address: 1. Ph.D., F.R.S., F.L.S., Botanic Garden, Chelsea. Late emeritus Prof. of Botany in University College, London; 2. F.L.S., Curator of the Chelsea Botanic Garden.

515. Soubeiran, J.L. 1867. Séance de 5 July 1867 [Meeting of 5 July 1867]. *Bulletin de la Societe d'Acclimatation* 14:448-64. Aug. See p. 453. [Fre]

• ***Summary:*** Page 453: Dr. Mourier sent from Yokohama (Japan) several boxes containing: (1) Upland rice, *Okano-komé,* which is cultivated like wheat... (3) Red-azuki (*Aka-adzeuki*). (4) Black azuki (*Kouro-Adzeuki*). (5) White beans (*Shiro mamé*) [probably white soybeans]. (6) Black soybeans (*Kouro-mamé*); these four seeds [Nos. 3-6] are used to make miso and tofu,

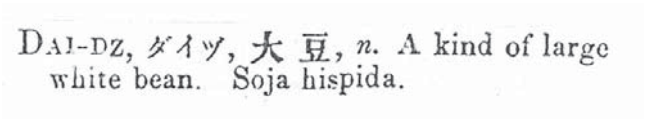
Note: Azuki beans are never used to make miso or tofu, but white and black soybeans are–especially white soybeans. Address: Secretary of the meeting.

516. Hepburn, James C. 1867. A Japanese and English dictionary; with an English and Japanese index. Shanghai, China: American Presbyterian Mission Press. xii + 558 + 132 p. 2nd ed. 1872; Abridged ed. 1873, 1881; 3rd ed. 1886; 4th ed. 1888; 5th 1894; 7th ed. 1903. First edition was reprinted in 1966 and 1983. Index. 24 cm.

• ***Summary:*** This is Hepburn's earliest Japanese-English dictionary. The words are arranged alphabetically by their romanized spelling. Each word is written in three ways. After the romanized word (main entry), written in uppercase letters with diacritical marks (which we have largely omitted below), the same word is written in katakana, then again in Chinese characters. Finally, one or more definitions are given.

Soy-related words and terms in the 1867 edition:
Amazake: Sweet sake, a kind of fermented rice.

Daidz [Daizu]: A kind of large white bean. Soja hispida.



DAI-DZ, ダイヅ, 大豆, *n.* A kind of large white bean. Soja hispida.

Go: Beans mashed into paste. *Mame no go.*

Gokoku: The five cereals, wheat, rice, millet, beans, *kibi.*

Hiriodz [Hiriodzu, Hiryozu]: A kind of food [made of

© Copyright Soyinfo Center 2014

tofu fried in oil].

Note 1. This is the earliest English-language document seen (April 2013) that contains the term *Hiriodz* (the modern spelling is Hiryozu) which refers to Kyoto-style deep-fried tofu treasure balls.

Ireru–*Kono mame wa yoku iremash'ta:* these beans are well parched.

Iriru–Mame wo iriru: to parch peas [beans].

Kinako ["yellow flour"]: A kind of food made of beans.

KINA-KO, キナコ, 黄紛, *n.* A kind of food made of beans.

Kiradz [Kiradzu, Kirazu]: The refuse left in making *tôfu* .

Koji: Malt made by fermenting rice or barley, in the process of making sake, and soy [sauce].

Koji-buta: A shallow box for holding malt.

Mame: Bean, pea. *Mame no ko:* bean flour [probably kinako, roasted whole soy flour].

Miso: A kind of sauce made of [soy] beans.

MISO, ミソ, 味曾, *n.* A kind of sauce made of beans.

Natto: A kind of food made of [soy] beans.

NATTŌ, ナットウ, 納豆, *n.* A kind of food made of beans.

Nigari: The brine formed by the deliquescence of salt.

Sashi (verb): Shoyu wo sashi–To season with soy [sauce].

Sashimi: Raw fish cut in thin slices and eaten with soy.

Sh'taji [Sorted after "Shis," Shitaji]: Soy (used only by women). Syn. Note 2. This is the earliest English-language document seen (April 2012) that uses the word "sh'taji" or shitaji" to refer to soy sauce.

Shoyu: Soy, a kind of sauce made of fermented wheat and beans.

SHŌYU, シャウユ, 醤油, *n.* Soy, a kind of sauce made of fermented wheat and beans.

Note: This is the earliest English-language document seen (April 2012) that uses the word "shoyu" (spelled correctly like this) to refer to soy sauce.

Tofu: A kind of food made of beans.

TŌFU, トウフ, 豆腐, *n.* A kind of food made of beans.

Umeboshi (*hakubai*). Dried plums. Ume-dzke [Ume-zuke]: Pickled plums. *Ume ga mada umimasen:* The plums are not yet ripe.

Yuba [hot water + leaf]: A kind of food made of beans.

YUBA, ユバ, 湯葉, *n.* A kind of food made of beans.

Note 3. This is the earliest English-language document seen (Oct. 2012) that contains the word "yuba." The Chinese characters (meaning "hot water" + "leaf") are the same used today."

Yu-dofu: Boiled tofu.

YU-DŌFU, ユドウフ, 湯豆腐, *n.* Boiled *tōfu.*

The English-Japanese part of this dictionary starts after p. 558 and is titled "An index; or, Japanese equivalents for the most common English words." Separately numbered to p. 132, it includes: "Bean, Mame. Barm, Kôji, tane. Pea, saya yendo [saya-endo]. Soy [sauce], Shôyu."

Terms NOT mentioned include Aburaage, Aburage, Atsu-age, Daitokuji natto, Edamame (or Eda mame or Yedamame), Ganmodoki, Hamanatto, Hiya-yakko, Kori-dofu, Koya-dofu, Nama-age, Okara, Tamari, Tonyu, Unohana, Yaki-dofu.

Note 4. The author apparently did not realize that the various soyfoods he defined (with the possible exception of soy sauce) were made from soybeans.

Note 5. This is the second earliest English-language document seen (June 1999) in which Chinese characters are used to write the name of the soybean or related products.

Note 6. This is the earliest English-language document seen that contains the word "tofu" (April 2013) or the word "natto" (Jan. 2012), or the word "koji" or the term "koji-buta" (July 2012).

Note 7. This is the earliest English-language document seen (Feb. 2004) that refers to amazake, which it calls "Amazake."

Note 8. This is the earliest English-language document seen (Oct. 2012) that uses the term "Shoyu" (or "shoyu") to refer to soy sauce.

Note 9. This is the earliest English-language document seen (Nov. 2012) that uses the word "Kinako" to refer to roasted soy flour.

Note 10. This is the earliest English-language document seen (June 2013) that uses the word "Kiradz" [Kiradzu, Kirazu] to refer to what is now called "okara," or "soy pulp." Address: Shanghai, China.

517. Knight, Charles. ed. 1867. The English cyclopædia–Natural History. Vol. IV: Soja. London: Bradbury, Evans, & Co. 1291 p. See p. 843.

• ***Summary:*** "Soja, a genus of Plants belonging to the natural order *Leguminosæ*.*Soja hispida* (Moench), *S. Japonica* (Savi), the *Dolichos Soja* (Linn.), is a native of Japan and the Moluccas, and abundant in the peninsula of India, though probably introduced there. The seeds resemble those of the

© Copyright Soyinfo Center 2014

haricot, French or kidney bean, and are used by the Chinese to 'form a favourite dish, called "ten-hu," or "tau-hu" [tofu], which looks like curd, and which, though insipid in itself, yet with proper seasoning is agreeable and wholesome' [Don 1832]. The Japanese call the seeds 'Miso' [sic] and put them into soup, of which they sometimes partake three times a day. They likewise prepare with them the sauce termed 'Sooja,' which has been corrupted into 'Soy.' Soy is only sparingly used as a sauce in this country. It has the character of being a useful stomachic, but not more so than any of the other condiments when used in moderation."

Note: The entry for "Soy" says to see "Soja."

Note: Much of the information in this entry for Soja comes from the *Penny Cyclopaedia of the Society for the Diffusion of Useful Knowledge* (London, 1841. See Soja hispida).

Also in this volume: Sesamum (p. 758). Voandzeia (p. 1224).

Under Deutzia Thunb. (p. 99) he lists 3 species: crenata, scabra, and gracilis.

Note 1. How Miquel compiled this book (according to Bretschneider 1882): In 1830 the Japanese government forced Siebold to leave Japan, saying that he had a map of the island, which was illegal. "Siebold had forwarded one portion of his vast botanical collections accumulated in Japan to Prof. C.L. Blume in Java, who described some of these plants in the *Museum botanicum Lugduno-Batavorum,* 1849-51... The greater part of his dried plants, however, had been transmitted by Siebold to the Museum of Leyden, and from these materials Prof. Miquel compiled his *Prolusio Florae japonicae* [*Prolusio florae Iaponicae*], 1865-67."

Note 2. This is the earliest document see (May 2002) concerning Heinrich Bürger.

Note 3. Richard Oldham (1837-1864) collected plants for the Kew gardens (England) in Eastern Asia in 1861. The Oldham numbers, 360 and 368, refer to the numbers of the specimens in his collection–which is now at the British Museum of Natural History, Kew. Address: Prof. of Botany, Director of the Rijksherbarium in Leiden, Netherlands.

519. Simmonds, Peter Lund. 1867. The commercial dictionary of trade products, manufacturing and technical terms:... A new edition, revised and enlarged. London and New York: George Routledge and Sons. viii + 463 p. See p. 353. 17 cm.

• ***Summary:*** The entry for "Soy" is two words longer (and more accurate) than that in the 1858 edition. "Soy, a sauce or flavoring originally made in the East; and said to be produced from a species of *Dolichos* bean, *Soja hispida.*

Otherwise, the contents and page layout of this book

© Copyright Soyinfo Center 2014

seem to be identical to those of the 1858 edition except that a long supplement has been added to the rear, p. 423-63.

Soy-related entries in the supplement: "Midsu [sic, miso], an oily pulp made from beans in Japan, with which food is dressed instead of butter." "Miso, a substance used in Japan as butter by boiling the soy bean (*Soja hispida*), and mixing it with rice, salt, etc.

Other interesting entries in the supplement: Agar-agar, chufas, hasheesh (Arabic word for hemp, hay; also an intoxicating drug made of hemp, which is sold in the form of sweetmeats, paste, and tobacco), mindoubi (a name in Brazil for the ground nut, *Arachis hypogæa*). Peter L. Simmonds lived 1814-1897. Address: F.R.G.S., F.S.S., author, 8 Winchester St., Pimlico [southwest London, England].

520. *Brisbane Courier* (*Queensland, Australia*). 1868. Sauces. Jan. 11. p. 7.
• ***Summary:*** "India Soy [sauce] is difficult to purchase genuine; it should be made from an Indian plant called Dolichos soja, or soya, but treacle and salt are the basis of the Soy ordinarily sold. 'Many persons,' observes Mr. Dobell, in his *Travels in China,* 'have thought that gravy was used in preparing soy, but this appears not to be the case, but the composition being entirely a vegetable one, and made from beans. Japanese soy is much esteemed in China, probably it is made with a particular bean? In China the consumption of soy is enormous; neither rich nor poor can dine, breakfast, or sup without soy; it is the sauce for all sorts of food, and may be described as indispensable at a Chinese repast.'"

Note: This is the earliest of 2 documents seen (Oct. 2009) in the Australian Newspapers database that contains the term "Japanese soy."

521. **Product Name:** [Matsuyama-Age Dried Deep-Fried Tofu].
Foreign Name: Matsuyama-agé, or Kansô Aburagé.
Manufacturer's Name: Hodoya Shoten.
Manufacturer's Address: Doita-cho 499-1, Matsuyama-shi, Shikoku island, Japan.
Date of Introduction: 1868.
Ingredients: Water, soybeans, coagulant, oil for deep-frying.
New Product–Documentation: Shurtleff & Aoyagi. 1975. *The Book of Tofu.* p. 190. "Japan's most unique variety of agé is Crisp Agé (*Kanso Aburagé*), which comes in light crisp sheets that are mild in flavor, golden brown in color, and about 6 by 8 by ¼ inch in size. Rich in protein (24%) and natural oils (64%), it has a very low water content (4.5%), which allows it to be stored for more than 3 months at room temperature without spoilage... It has been prepared for several hundred years in the city of Matsuyama on the large island of Shikoku, as well as on Okinawa. Talk with a Japanese from Shikoku. 1981. This product has been made since the start of the Meiji period on Shikoku. Each piece is about 8 inches square. The first manufacturer was Hodoya-Shoten. The current president of Hodoya is Mr. Takaaki."

522. Chambers's encyclopædia: A dictionary of universal knowledge for the people: Soy. 1868. London: W. and R. Chambers. See vol. IX, p. 10.
• ***Summary:*** "Soy is a thick and piquant sauce, made from the seeds of the Soy Bean (*Soja hispida*), a plant of the natural order *Leguminosæ,* suborder *Papilionaceæ,* so nearly allied to the genus Dolichos (q.v.) as to be often included in it. It is a native of China, Japan, and the Moluccas, and is much cultivated in China and Japan. It is also common in India, although, probably, not a native of that country. The seeds resemble those of the Kidney Bean, and are used in the same way. The Japanese prepare from them a substance called *Miso,* which they use as butter.

"Soy is made by mixing the beans softened by boiling with an equal quantity of wheat or barley roughly ground. The mixture is covered up, and kept for 24 hours in a warm place, to ferment. The mass is then put into a pot, and covered with salt, the salt used being in quantity about equal to each of the other ingredients. Water is poured over it; and it is stirred, at least once a day, for two months, after which the liquor is poured off and squeezed from the mass, filtered, and preserved in wooden vessels. By long keeping, it becomes brighter and clearer. A Chinese sauce, called *Kitjap* (Ketchup), is often sold in Britain as soy, but is very inferior to the true soy."

524. Saito, Akio. 1868. [Chronology of soybeans in Japan,

© Copyright Soyinfo Center 2014

1700 to 1868, the last half of the Tokugawa / Edo period] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Jan. p. 16. Feb. p. 10-11. [Jap]
• ***Summary:*** 1707 May–The Tokugawa shogunate government (*bakufu*) passes a law to lower the prices of goods. Shops selling high-priced tofu are punished. But tofu makers argue that although the price of soybeans has dropped, the prices of other ingredients such as nigari and oil have risen.

1709–Kaibara Ekken (1630-1714) writes *Yamato Honso,* in which he discusses the shapes and use of the 1,362 products from Japan, China, and other countries. He notes that among the five crops (*go-koku*), soybeans are the second most widely produced after rice.

1712–Kaempfer, the German physician and naturalist who stayed in Japan during 1691-1692, writes *Nihon-shi* in the Netherlands. In the book he discusses soybeans and includes a very accurate illustration of the soybean. This draws the attention of other European scholars.

1722–Kinzanji miso becomes popular in Edo (today's Tokyo).

1724 Feb.–The Tokugawa shogunate government commands that various goods, such as sake and shoyu [soy sauce], should be lower in price because the price of rice has decreased.

1726–The amount of shoyu imported to Edo from the Osaka-Kyoto area (*kudari shoyu*) is about 132,000 kegs (*taru*). Note: The average keg held 9 shô = 16.2 liters = 4.28 gallons (U.S.). Thus, 132,000 kegs = 564,960 gallons or 2,138,400 liters.

1730–The amount of shoyu imported to Edo from the Osaka-Kyoto area increases to 162,000 kegs.

1739–A French missionary living in China sends some soybean seeds to France for the first time. Attempts are made to grow them at the botanical garden, but the weather is not good and they fail. Later unsuccessful attempts were made to grow soybeans in Germany in 1786 and in England in 1790. There is another theory which says that the soybean went to Europe through Russia.

1748–The cookbook titled *Ryôri Kasen no Soshi* is published. It is the first cookbook which introduces the present form of tempura batter.

1753–The Swedish naturalist Linne (Linnaeus; 1707-1778) gives the soybean its first scientific name.

1770–Sugita Genpaku (lived 1733-1817) discusses the nutritional value of foods and uses the word *eiyo* (meaning "nutrition") for the first time in Japan.

1782–The book *Tofu Hyakuchin* (One hundred rare and favorite tofu recipes) is written by Ka Hitsujun (his pen name) of Osaka. He introduces about 100 tofu recipes. The next year he publishes a supplementary volume, *Zoku Tofu Hyakuchin.* He divides tofu recipes into five different categories according to their special characteristics, like common, regular, good, very good, and fantastic (*jinjohin, tsuhin, kahin, myohin, and zeppin*). In his jinjohin category, he includes 36 recipes such as *Kinome Dengaku, Kijiyaki, Dengaku,* etc.–showing that these were common recipes of the period. Over the next several years, many books with the word "Hitsujin" at the end of the title appear.

1783-1787–The terrible famine of the Tenmei period (*Tenmei no Dai Kikin*) occurs. It is worst in Oou province, where several hundred thousand people die of starvation. Many farm villages are abandoned.

1788–At about this time the word *nukamiso* first appears.

1802–Takizawa Bakin (lived 1767-1848) writes *Kiryo Manroku,* a travel book, and in it he states: "Gion tofu is not as good as the Dengaku of Shinzaki, and Nanzenji tofu is not better than Awayuki in Edo. He criticizes tofu as a famous product from Kyoto (*Kyoto meibutsu tofu*) in his writing.

1804–Takahashi Fumiuemon (or Bunuemon) on the island of Shodoshima starts making shoyu; he starts selling it in 1805.

1810–Choshi Shoyu receives an order from the Tokugawa Bakufu (*Gozen Goyo-rei*).

1818–There are now 10 miso manufacturers in Edo (today's Tokyo). Yomo Hyobei's miso shop in Shin Izumi-cho (presently Ningyo-cho 3-chome, Nihonbashi, Chuo-ku, Tokyo) has a prosperous business. In some funny poems (*Senryu*) this shop is mentioned: "With sake and miso their name is ringing in the four directions" (*"Sake, miso de sono na mo shiho ni hibiku nari"*). And: "This shop is surrounded by nested boxes for food, and these boxes are used for red miso" (*"Jûbako ni torimakaretaru shiho-ga-mise"*). His red miso and his fine sake made with water from a waterfall (*takisui*) are very popular.

1822–Pounded natto (*tataki natto*), an instant food made of chopped natto, sells for about one-fifth the price of tofu on a weight basis. The restaurant Sasa no Yuki in the Negishi area of Edo, becomes well known for its tofu cuisine.

1832–Shoyu production in Noda reaches 23,000 koku (1 koku = 180 liters or 47.6 gallons), compared with only 17,000 koku in Choshi. Thus Noda passes Choshi in shoyu production.

1839–Shibata Kyuo (1783-1839), a follower of Shingaku, writes *Zokuzoku Kyuo Dowa* in which he pens words that later become famous: "In a place where the cuckoo can sing freely, you have to walk 3 *ri* (1 *ri* = 2.445 miles or 3.924 km) to buy your sake and 2 *ri* to buy your tofu" (*Hototogisu jiyu jizai ni naku sato wa, sakaya e san ri, tofu-ya e ni ri*). Shingaku, founded by Ishida Bangai, is a popular teaching of the time combining Shinto, Buddhism, and Confucianism (*Jugaku*). It emphasizes that "to understand heart/mind is the most important thing."

1845–Inari-zushi becomes very popular in Edo. It originated around Hiranaga-cho (presently Sadacho 1-chome, Chiyoda-ku, Tokyo). It is made with deep-fried tofu pouches (*abura-agé*) stuffed with rice or okara and sells

© Copyright Soyinfo Center 2014

for 7 *mon* each.

1851–There are now 140 miso manufacturers in Edo. Half of them are in the Hongo area of Tokyo.

1853–Kitagawa Morisada (born 1810) writes *Morisada Manko,* the story of his life during the Edo period. In it he says of tofu: "In the Kyoto-Osaka area it is soft, white, and delicious, but in Edo [today's Tokyo] it is hard, not white, and not tasty." Of miso he says: "In the Kyoto-Osaka area many people make their own miso each winter, but in Edo people buy red miso and Inaka miso (from the countryside), and nobody makes their own miso." Concerning the sale of natto (*natto-uri*) he says: "Cook soybeans, ferment them overnight, then sell them. In the old days, natto was sold only in the winter, but recently it has also come to be sold in the summer."

1857–Soybean varieties brought back from Japan by the Perry Expedition are distributed to the U.S. Commissioner of Patents.

1858–Eitaro, a Japanese confectionery shop in Nihonbashi, Edo, starts selling Amanatto [sugar-sweetened red beans] made from Kintoki Sasage for the first time. Sasage is a type of cowpea [*Vigna sinensis*].

1864–For the first time shoyu made in the area around Edo (*Kanto shoyu*) is permitted to use the term "highest quality shoyu" *saijo shoyu* to describe the product.

1865–Inflation in Edo. The prices of rice, sake, miso, oil, vegetables, fish, etc. skyrocket. The Tokugawa Shogunate (*Bakufu*) orders people to lower their prices and forbids holding back or buying up goods. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

525. White, William Nathaniel; Van Buren, J.; Camak, J. 1868. Gardening for the south: or, How to grow vegetables and fruits. New York, NY: Orange Judd and Co. 444 p. See p. 238.

• ***Summary:*** "Japan pea.–(*Soja hispida*). This is an erect-growing, rough-hairy, annual Leguminous plant, with a woody stem, growing some three feet high, branching near the ground, with ternate leaves, resembling those of the Kidney bean. There are three varieties; those with white, red, and yellow seeds.

"They are planted at the same time with Kidney beans in rows 3 feet apart and 2 feet in the row, leaving but one plant in the hill; cultivate as corn. The peas, when ripe, after soaking over night, are prepared for the table like Kidney beans, and are largely used for preparing the soy sauce of Japan and China." Address: 1. Athens, Georgia.

527. Champion, Paul; Lhôte, M. trans. 1869. Fabrication du fromage de pois en Chine et au Japon Fabrication du fromage de pois en Chine et au Japon [Production of tofu in China and Japan]. In: P. Champion and S. Julien, eds. 1869. Industries Anciennes et Modernes de l'Empire Chinois... Paris: Eugene Lacroix. xiii + 254 p. See p. 185-89. [Fre]

• ***Summary:*** This chapter gives a detailed description of the production of tofu, but also mentions soymilk and yuba. "Tofu (*Le fromage de pois,* literally "pea cheese") which is regarded in China and Japan as a very important food, looks similar to *fromage à la pie* (a smooth cottage cheese or soft cream cheese; quark). It is made from a particular variety of soybeans (*pois oléagineux,* literally "oil peas"), which are also consumed directly and which can be used, in addition, to make an oil of very good quality and rather high price.

"The production of tofu is simple, but it demands much care. The soybeans are first soaked for about 24 hours, then they are drained in a wicker basket. Next they are ground in a mill, while mixing them with the soak water, which had been set aside. The mill used for this purpose is made of horizontal discs of hard stone. The upper stone is pierced with a conical hole. The apparatus is rotated by means of a connecting rod, connected by joints, that a worker rotates with one hand while the other hand is used to throw the soybeans into the hole of the upper stone with a spoon / scoop (*cuiller*). With each addition of the soybeans, a certain amount of water for grinding is added. The soybeans, ground by the action of the mill, are transformed into a liquid slurry (*bouillie liquide*), which collects between the millstones, falls into a circular channel, and accumulates in a tub. This slurry is poured onto a filter formed of a linen cloth attached to an overhead frame; when the filtration is very slow, the material is mixed. To facilitate this operation, the frame / chassis is suspended from the ceiling at the height of a man.

"The liquid filtrate (*Le liquide filtré*), mixed by hand, is collected in a wooden vat and poured into a cooking pot, where it is cooked slowly. This cooking pot is formed of a deep, wide pan of cast iron, surrounded by a type of wooden tub (frame?); the metallic surface presenting a limited area, permits the person cooking the liquid, without fear, to raise the temperature briskly; this can alter the material. This apparatus is almost always used by the Chinese for cooking organic materials. A second cooking pot is located next to the first one on the same stove, in the form of a parallelepiped (a

© Copyright Soyinfo Center 2014

six-sided polyhedron all of whose faces are parallelograms lying in pairs of parallel planes) and receives the direct action of the fire-box. The liquid which has flowed from the mill starts to be covered with foam at about 100ºC. It is kept boiling for about 10 minutes, then is decanted into the second cooking pot, where it is subjected to a lower cooking temperature, because of the disposition of the stove. The first cooking pot, once empty, is refilled immediately with a new quantity of liquid filtrate; the drained pulp (*la pulpe égouttée*) [okara] on the filter cloth is washed with water, and the liquid which runs out is used to wet the beans which undergo grinding. This wash water carries with it a significant quantity of usable material.

Note 1. This is the earliest French-language document seen (June 2013) that mentions okara, which it calls *la pulpe égouttée.*

"When the liquid (*la liquer*) has been heated for a few moments in the second pot, it is poured into a large tub and allowed to cool. One is careful to agitate it with the aid of one's hand, causing it to rotate. The foam which forms gathers in the middle of the surface and is removed with the aid of a copper scoop. After standing for several minutes, the liquid becomes covered with a thick film

pellicle (*pellicule épaisse*) [yuba], which is removed with a stick (*baguette*) without tearing it. The film is hung up to dry by affixing the stick in the wall. Sometimes a second film is formed; it is treated in the same manner. The material thus solidified at the surface of the liquid is employed in foods. It is eaten either fresh or dried and its flavor is not disagreeable.

Note 2. This is the earliest French-language document seen (Oct. 2012) that uses the term "pellicule épaisse" to refer to yuba.

"The liquid which remains in the vat is destined to produce the tofu (*fromage de pois*). One first adds to it a small quantity of water mixed with plaster (*plâtre*) [calcium sulfate], which has probably been baked in the cooking stove. Finally one adds a few drops of a concentrated solution from a salt marsh. (According to our analysis, this is nothing but magnesium chloride.) The liquids are mixed slowly to form a homogeneous mass, which soon coagulates and becomes a solid. The plaster is certainly added to coagulate the casein of the soybeans (*pois*). As for the magnesium chloride, it is rather difficult to define the role that it plays; it is used in only a few cities in China.

"Once formed, the tofu curds are poured, while still hot, into a square forming box, 40 cm on a side and 5 cm deep. These boxes, stacked up double, are placed side by side on a long stone table, having gutter drains along the two sides. The boxes on the table are closed at their lower part by a fine-weave linen, through which the water trapped in the cheese (*fromage*) can flow out. When the tofu (*fromage de pois*) is sufficiently drained, it is compressed in the box where it is trapped, by putting on the top a plank laden with weights. When the volume is reduced by half, the box is removed and the cheese it contains is sometimes shipped out to a great distance. To transport them, it is sufficient to close the box with planks, nailed with the aid of bamboo pegs. After arriving at the destination, it is cut into small pieces by means of a metal knife.

"Tofu is generally a grayish white and looks like a jelly. It does not keep more than a day during the hot months, and to preserve it from rapid deterioration, it is generally mixed with salt or sauces of various types [especially soy sauce]. It can then be kept for several years.

"A piece of tofu the size of a fist sells for 2 Cash, i.e., one centime. Sellers of tofu also offer for consumption the hot uncoagulated liquid (*le liquide chaud non coagulé*) [soymilk], of which we have spoken previously. Poor Chinese nourish themselves on this substance, which has a dull flavor but is not disagreeable. The shops where this cheese is sold present a curious aspect at certain times of the day. Chinese workers come in great numbers to buy a portion of liquid cheese (*de fromage liquide*), which they carry away in small cups; others consume the coagulated cheese on the spot.

"For many people of the poorer class, the morning meal consists solely of a cup of soymilk (*une tasse de fromage de pois liquide*) in which they soak some cakes [crullers] that have been deep-fried in oil."

Note 3. This is the earliest French-language document seen (Aug. 2013) that uses the term *fromage de pois liquide* to refer to soymilk.

"The production of tofu ("pea cheese") is executed on a grand scale in most of the ports of China through which we have traveled, from the south to Peking, and in the few towns in Japan that we have been able to visit.

"Tofu is rather agreeable in flavor. It could render a great service to the feeding and nourishment of Europeans if they are able to cultivate the seeds... Tofu, deep-fried like french-fried potatoes, makes a very delicious dish.

"The seeds used to make tofu usually contain 17% of a clear oil, whose flavor is not disagreeable."

"We will add to the above information some analytical results that our colleague, Mr. Lhôte, and we, have obtained on the soybeans (*pois oléagineux*, literally "oil peas") and tofu (*le fromage*)." A table (p. 189) gives: (1) The percentage composition of soybeans (now called *Pois de Chine,* or Chinese Peas) on an as-is basis and on a moisture-free basis: Water 15.07/ -, ash 4.63/5.45, lipids (*matières grasses*) 12.98/15.28, and nitrogen 5.79/6.81.

(2) The percentage composition of tofu (called *Fromage de pois,* or pea cheese) on an as-is basis and on a moisture-free basis: Water 90.37/ -, ash 0.76/7.89, lipids 2.36/24.50, and nitrogen 0.78/8.09.

(3) The percentage composition of yuba (called *Matière coagulée pendant la préparation du fromage,* or "The material coagulated during the preparation of tofu") on an

One full page (frontispiece, facing the title page; see previousw page) contains a specimen of the Chinese text translated by Mr. Stanislas Julien. The characters are written with handsome calligraphy. Address: China & France.

528. Jephson, Richard Mounteney; Elmhirst, Edward Pennell. 1869. Our life in Japan. London: Chapman and Hall. xviii + 428 p. Illust. No index. 23 cm. Facsimile edition reprinted in 2002 by Ganesha Publishing (London) and Edition Synapse (Tokyo). Series: Japan in English, Vol. 14.
• ***Summary:*** This is largely a silly book, that tries to be amusing, but ends up being foolish. It's about Englishmen riding horseback and hunting in Japan, while taking many opportunities to belittle Japanese culture and religion– although there are some parts of Japanese culture that they appreciate. The authors arrived in Japan on 9 May 1866 after having been in Hong-Kong for a year. At breakfast in Japan, one of them, "suddenly changing his tone to one of reckless indifference,... tell the cook to make some more of that grill, with no end of Cayenne pepper and Worcestershire sauce in it!" (p. 62).

"Extreme cleanliness characterises not only their dwellings, but their food, manner of cooking, serving it, &c. As an instance to show how well assured we became of this, we may mention that on more than one occasion, when returning home late at night, we have partaken of the delicate seaweed soup that is hawked about in the streets of every town, and that without any fear of either the materials of the soup itself, or the cups we drank out of, being less clean than at our own table. When you come to consider that the price of the soup rendered it accessible to the meanest coolie,..." (p. 381). Note: This may well have been miso soup with wakame.

"They consume little or no meat, except in the form of soups;..." (p. 381).

"The first Japanese dinner we ever went to, caused us more wonderment at the time, and appeared to possess more novelty, than anything we had ever seen before. This was an entertainment given at Nagasaki by some of the chief officers of Prince Satsuma to the British Admiral and his friends" [on 28 July 1866] (p. 382). Every aspect of the 40-course dinner is described in great detail. "The drink was a spirit called *saki,* which is extracted from rice." (p. 383). It is consumed hot.

The Bill of fare, describing briefly each of the 40 courses, is given; it includes "1. Bitter Green Tea (whipped)," hot Saki, seaweed, salted plums, "14. Soup of fish and seaweed," and "27. Soup of Vermicelli, with 'Soy' [probably sauce] and Red Berries." (p. 385-86). Address: Englishmen.

529. Martens, Georg Matithias von. 1869. Die Gartenbohnen. Ihre Verbreitung, Cultur und Benuetzung. Zweite vermehrte Ausgabe [Garden beans. Their distribution, culture, and utilization. 2nd expanded edition]. Ravensburg, Germany: Druck und Verlag von Eugen Ulmer. 106 p. See p. 103-05. With 12 color plates. 28 cm. [94* ref. Ger]
• ***Summary:*** The author discusses the soybean under the name *Soja hispida* Moench, gives a botanical description of the species, then and gives a classification of 13 varieties that he had secured from various sources, of which he apparently grew but one. He grew that one by his window in Stuttgart, having obtained it from the village of Daguiga, near the city of Aigun [or Ai-hun, in northeast Heilungkiang province] on the Amur River. He planted the seeds on May 23 and they were ripe by Sept. 24. He describes their area of distribution in East Asia, from the 50th north latitude in Siberia down to the Moluccas near the equator, but notes that their center of cultivation is Japan, where they are made into a type of butter named Miso, and a famous sauce named Soja that stimulates the appetite (*eine Art Butter, Miso genannt, und eine berühmte, den Appetit reizende Sauce, die Soja,...*). He considers these two delicacies fit for gourmets and epicures. The sauce was introduced to Europe by the English. In China, the beans are cooked to a white, thick paste (*Brei*), tofu (*Teu hu*), one of the most popular foods there.

In Europe, with suitable care, soybeans can be made to ripen / mature as far north as 53º north latitude, near Berlin. Thus, during the last continental blockade [first, of the British, by Napoleon, based on his 1806 Berlin Decree and 1807 Milan Decree; then in 1807 the British retaliated with their own sort of blockade], which is still an infamous memory, in the lands that at that time were part of the French empire, the soybean was prized and cultivated for a while as a coffee substitute (*als Kaffeesurrogat*). Later the milk vetch (*Kaffeewicke; Astragalus baeticus* L.), the chufa or earth almond (*Erdmandel; Cyperus esculentus* L.), and other coffee substitutes were used, but they have all been long since forgotten–except for chicory [*Cichorium intybus;* the thick roots of this perennial herb are dried, ground, and roasted, then used to flavor or adulterate coffee].

Martens divides the species into 3 subspecies based on the form of the seed, under which the varieties are named according the color and size of the seed. In this, he creates an entirely new system for classifying and naming soybeans.

I. *Soja elliptica* Martens. Seeds oval. 1. *S. elliptica nigra.* Seeds black and elongated; obtained through his son from Shanghai and Paris. 2. *S. elliptica castanea.* Seeds brown and elongated; obtained from Chefoo (China), Venice (Italy), and Berlin. 3. *S. elliptica virescens.* Seeds greenish yellow and elongated; obtained from Shanghai and Paris. 4. *S. elliptica lutescens.* Seeds yellow; brought by Mr. Schottmueller from Chefoo as "true Chinese oilbeans."

II. *Soja sphaerica.* Seeds globose/spherical. 5. *S. sphaerica nigra.* Seeds black, large; obtained from

© Copyright Soyinfo Center 2014

Yokohama and Nagasaki, Japan. 6. *S. sphaerica minor.* Seeds black, small; obtained from Japan and Sumatra. 7. *S. sphaerica virescens.* Seeds greenish; obtained through his son from Yokohama as "Ao mame" and from Shanghai. 8. *S. sphaerica lutescens.* (The *Soja pallida* of Roxburgh). Seeds pea-colored to pea-yellow, large; obtained from Dr. Schuebler in Oslo (Christiana), Norway, as "New Japan peas," under which name they have been recommended and popularized in the United States. 9. *S. sphaerica minima.* Seeds yellow, small; obtained through his son as "Shiro mame" from Yokohama.

III. *Soja compressa.* Seeds compressed. 10. *S. compressa nigra.* Seeds black and flat, the largest of all soybeans; obtained as "Kuro Mame" from Yokohama. 11. *S. compressa parvula.* Seeds black, small; obtained via Schotmueller from Chefoo. 12. *S. compressa virescens.* Seeds greenish; obtained from Chefoo and from Berlin as *Soja ochroleuca* Bouché. 13. *S. compressa zebrina.* Seeds brown banded with black like a zebra; obtained from the Berlin Botanic Garden.

Note 1. This is the earliest document seen (Nov. 2012) which states clearly that soybeans have been (or can be) used as a coffee substitute (*als Kaffeesurrogat*). It is also the earliest German-language document seen (Nov. 2012) that mentions soy coffee.

Note 2. This is the earliest document seen concerning soybeans in Norway. It is not clear whether or not the soybeans were being grown in Norway at this time.

Note 3. This is the earliest German-language document seen (April 2013) that mentions tofu, which it calls *Teu hu.*

Note 4. This is the earliest German-language document seen (April 2012) that uses the term *die Soja* to refer to soy sauce.

Note 4. This is the earliest document seen that (Aug. 1999) that divides the species into 3 subspecies based on the form of the seed, under which the varieties are named according the color and size of the seed. Martens is the first to use a number of such terms in connection with the soybean, such as "nigra" "castanea," "virescens," "lutescens," "elliptica," "Soja elliptica," "Soja pallida," etc.

Note 5. This is the earliest document seen (Feb. 2007) that uses the word "nigra" to refer to black soybeans.

Note 6. This is the earliest document seen (July 2001) in any language that contains the word "Chefoo," a port city in Shandong province, presently named Yantai (Wade-Giles: Yen-t'ai), and long associated with soybeans and soybean cake.

Note 7. Also discusses *Psophocarpus tetragonolobus* Dec. (p. 101). Address: Doctor der Naturwissenschaften, Germany.

• ***Summary:*** Soya is a brown, salty liquid, imported from China and Japan, and used as a seasoning on roasts (*Braten*), sauces, fish, and other foods, but which, in order to be pleasant, must be used sparingly. This article is prepared from a small bean of the legume family named *Dolichos Soya.* The beans are cooked, mixed with roasted wheat in salt water, and allowed to stand for 2 to 3 months. A type of fermentation takes place, and the process apparently resembles that of pickling cabbage or cucumbers. Finally, the liquid is pressed out of the ripened or fermented mass and filtered. The product comes into the trade sometimes in corked glass bottles, and sometimes (from Japan) in small kegs (*Fässchen*). The Japanese product is the better of the two; it is used daily by the people in Japan. The product is, in general, of rather inconsistent quality; the best products are recognized by their aroma and taste. It is presumed that great adulteration takes place with this product. In England, an investigation was undertaken by shaking some of the product in a glass. If a shiny, yellowish-brown film did not form on the surface, the product was considered to be of poor quality. In 1867, England imported 11,493 gallons of this sauce and, of that, exported 2,166 gallons.

Also discusses: *Cyperus esculentus* (*Erdmandeln,* p.

DOLICHOS SOJA.—黃大豆 (*Hwang-ta-tau*), 毛豆 (*Mau-tau*).—The hairy, short pods of this Leguminous plant are eaten, when freed from the valves. They are mixed with vinegar and sesamum-oil, and drank as a cooling draught in summer. The ripe, ovoid, yellow beans are used to make bean-curd 豆腐 (*Tau-fu*), a substance largely consumed by the Chinese when vegetables are not very plentiful. It is the cheese of the Chinaman. The beans are ground and pressed to produce the bean-oil, or pea-oil, as it is sometimes miscalled by foreigners. The beans are said to be laxative, peptic and nutrient. Bean-sprouts 豆芽 (*Tau-ya*), are the germinating beans of this plant, artificially raised in large quantities for food in winter.

125), peanuts (p. 135), and sesame oil (p. 484).

The full subtitle reads as follows: *Beschreibung der im Handel vorkommenden Natur- und Kunsterzeugnisse, namentlich der Kolonial-, Material-, Droguerie- und Farbwaaren, Mineralien- und Bodenprodukte, chemisch-technischer und anderer Fabrikate. Unter Mitwirkung bewährter Fachmänner bearbeitet von...* [Description of natural and artificial products in commerce, especially of the colonial materials, drugs, and dyestuffs, minerals, and other products of the earth / agricultural products (*Bodenprodukte*), chemical-technical and other manufactured goods. With the assistance of well-known experts].

Note 1. *Bodenprodukte* ("products of the earth") probably includes cultivated agricultural products and noncultivated commercial products such as berries, mushrooms, hay, and perhaps even firewood. Note 2. The 4th edition of this book was published in 1890. Address: [Germany].

533. Smith, Frederick Porter. 1871. Contributions towards the materia medica & natural history of China. For the use of medical missionaries & native medical students. Shanghai, China: American Presbyterian Mission Press, and London: Truebner & Co. vii + 237 p. See p. 88, 202-03. 24 cm.

• ***Summary:*** This book, based in part on the famous *Pen-ts'ao kang-mu* by Li Shih-chen (1578-1597), contains a listing of medicinal plants arranged alphabetically by either their popular English name or scientific name. Chinese characters for the plant name, the romanized Chinese name, and key related terms are also given immediately after the main entry. There is no index. The soy bean is listed under "Dolichos soja (*Hwang-ta-tau;* characters = Yellow + large + bean), (*Mau-tau;* characters = hairy + bean).–The hairy, short pods of this Leguminous plant are eaten, when freed from the valves. They are mixed with vinegar and sesamum-oil, and drank as a cooling draught in summer. The ripe, ovoid, yellow beans are used to make bean-curd (*Tau-fu*), a substance largely consumed by the Chinese when vegetables are not very plentiful. It is the cheese of the Chinaman. The beans are ground and pressed to produce the bean-oil, or pea-oil, as it is sometimes miscalled by foreigners. The beans are said to be laxative, peptic [promoting digestion] and nutrient. Bean sprouts (*Tau-ya*), are the germinating beans of this plant, artificially raised in large quantities for food in winter (p. 88).

Note 1. This is the second earliest English-language document seen (Jan. 2013) that refers to soy sprouts, which it calls "Bean sprouts (*Tau-ya*)... And this is the earliest English-language document seen (Jan. 2013) that uses the term "Bean sprout" or *Tau-ya* to refer to soy sprouts, then goes on to explain what these terms mean.

Note 2. This is the earliest document seen (Feb. 2000) that uses the word "laxative" in connection with soy beans.

Note 3. This is the earliest English-language document seen (April 2013) that uses the term "cheese of the Chinaman" to refer to tofu.

Note 4. This is the earliest English-language document seen (Sept. 2006) that uses the term "pea-oil" ("as it is sometimes miscalled by foreigners") to refer to soybean oil

Also on p. 88, under *Dolichos trilobus* (*Koh*) is a description of kuzu. "The Pachyrizus trilobus is sometimes included under this name... A fibre resembling linen, called (Chinese characters) *Koh-pu* or *Kung koh,* of a yellow color, very fine and durable, and much prized in Hankow, is obtained from the climbing branches. The best of this cloth comes from Wu-chang hien (Hupeh), and from Kwang-sin fu in Kiangsi. The root is eaten, although to some extent deleterious, if not thoroughly cooked. A kind of arrow root (Chinese characters), called *Koh-fen,* is made from the root in Ngan-king fu (Nganhwui), Kwang-sin fu (Kiangsi) and at Teh-ngan fu (Hupeh). Emetic, diaphoretic and antiphlogistic properties reside in the root, which is given in fevers, exanthemata and rashes of all kinds, and in bloody fluxes [excessive abnormal discharge from the bowels]. Every part of the plant is officinal" [medicinal].

Soy sauce (p. 202) is listed under "Soy (*Tsiang-yú*)–The condiment known by this name, derived from a Chinese synonyme used by the Japanese, is a black, thin liquid, having an agreeable, saltish flavour, and frothing up of a yellow colour when very slightly shaken. It is the universal

© Copyright Soyinfo Center 2014

sauce of the Chinese and Japanese, and is largely exported to India and Europe as a convenient menstruum for other flavouring substances used as condiments. The yellow beans of the Dolichos soja are boiled very soft, and mixed with any cereal flour in varying proportions, and allowed to ferment and become mouldy. Salt and tea, or boiling water, are then added, and the mixture is then exposed to the sun and dew of the open air for three weeks or a month, care being taken to avoid rain. The liquid becomes much thicker, darker and more uniform in consistence, and after constant stirring is then strained and kept for use. Bran is sometimes used in making it. Large quantities are both sold from the shops and made at home by the Chinese. It is considered to provoke the appetite, and to correct any injurious quality of food. It is laxative, cooling, and an antidotal, according to Chinese estimation. It is sometimes daubed upon burns, scalds, eczematous and leprous sores."

Note: This is the earliest English-language document seen (April 2012) that uses the term "Tsiang-yú" to refer to the Chinese word for soy sauce.

Under "Maccaroni [Macaroni] (Mien-kin)," following the description of the basic kind made from wheat flour (which is "a part of the diet of priests and those fasting from animal food"), we read: "A kind of macaroni, very much like foreign macaroni, is made from bean-curd and called *Tau-kin* (bean + muscle, sinew, or tendon)."

Under "wheat," the author discusses the grain itself, "wheaten flour," and "wheaten starch," but he does not mention wheat gluten. Nor are azuki beans (*hsiao-tou*) listed. Bretschneider harshly criticizes this book: "Of little value, unreliable." But Rev. G.A. Stuart, M.D., in his Chinese Materia Medica (1911) states on the title page "Extensively revised from Dr. F. Porter Smith's Work." Smith lived 1833-1888. He wrote the preface in Nov. 1870 from Hankow, China. Address: Medical missionary (from England) in central China [Hankow].

534. House, E.H. 1872. A Japanese statesman at home. *Harper's New Monthly Magazine* 44(262):589-600. March. See p. 598.

• ***Summary:*** The statesman is Kenzo Hirosawa, who is at home in Yeddo [Edo, today's Tokyo], Japan.

"Raw fish!" The writer forces himself to try it. "But is it utterly revolting and untenable? Hardly so. Do I like it, then? Truly, not too well. But I willingly admit it might be worse, especially as it is deftly mitigated by pungent soy. I do not know its name, but it is like salmon in aspect, and in taste like nothing in my particular prior experience"

535. *Phoenix* (*The*)*: a Monthly Magazine for India, Burma, Siam, China, Japan & Eastern Asia.* 1872. Japanese proverbs. 2(23):191. May. [Eng]

• ***Summary:*** "(52) *Tôfu ni kasugai:* Like using a clamp-shaped nail to fasten Tôfu (a soft kind of food) together."

Note 1. This is a remarkable periodical, with many interesting articles about East Asia in each issue.

Note 2. This article started on page 127 (No. 20, Feb), where it states: "We are indebted to Mr. W. G. Aston, Interpreter to H.M. [British] Legation in Yedo, for the text and translations which we give below, and also to two Japanese gentlemen for a careful revision of both."

536. Buckle, Thomas Henry; Taylor, Helen. 1872. The miscellaneous and posthumous works of Henry Thomas Buckle. 3 vols. London: Longmans, Green, and Co. See vol. 3, p. 24. 23 cm.

• ***Summary:*** In *Common Place Book* (p. 24) under "1485. The soy [sauce] of the Japanese first used in Europe in the eighteenth century," are excerpts from four early sources that discuss soy:

"The Japanese soy is also prepared of beans, and turned sour in casks. They say that three years are required for preparing the best soy" (*Golownin's Captivity in Japan,* 8vo, 1824, vol. iii. p. 157).

"Thunberg (*Travels in Japan,* London. 1795, vol. iv. p. 121) says, 'Soy sauce, which is everywhere and every day used throughout the whole empire, I might almost say in every dish, and which begins even to be made use of in Europe, is prepared from soy beans (*Dolichos Soja*) and salt, mixed with barley or wheat.'"

"In 1679, Locke, in his Journal, mentions at London, "Mango and saio, two sorts of sauces brought from the East Indies" (*King's Life of Locke,* 8vo, 1830, vol. i. p. 249).

"At iv. 107, Thunberg says, 'The soy is much better than that which is brewed in China.' The Chinese highly value the Japanese soy, of which they consume immense quantities (see *Dobell's Travels through Kamtchatka, &c.,* 8vo, 1830, vol. ii. p. 325).

"On Soy, see Crawfurd's *History of the Indian Archipelago,* Edinburgh, 8vo, 1820, vol. i. p. 370."

Henry Thomas Buckle (1821-1862) was an English historian, the author of *History of Civilization in India.*

537. Hepburn, James C. 1872. Japanese-English and English-Japanese dictionary. 2nd ed. Shanghai: American Presbyterian Mission Press. xxxi + 632 + 201 p. 28 cm.

• ***Summary:*** This is Hepburn's 2nd Japanese-English dictionary. The words are arranged alphabetically by their Romanized spelling. Each word is written in three ways. After the romanized word (main entry), written in uppercase letters with diacritical marks (which we have largely omitted below), the same word is written in katakana, then again in Chinese characters. Then comes an abbreviation of the part of speech (n. = noun; v. = verb, etc.). Finally, one or more definitions are given.

This 2nd edition is 162 pages longer than the original 1867 edition; the Introduction is 19 pages longer, the Japanese-English section 74 pages longer, and the English-

© Copyright Soyinfo Center 2014

Japanese section 69 pages longer.

We will not repeat definitions that are identical to those in the 1867 edition. For new spellings, the 1867 spelling will be shown in parentheses. No new soy-related words were found in this 1872 edition. Soy-related words and terms in the 1872 edition: Adzuki (replaces Adzki) [azuki]. Amazake. Daidzu (replaces Daidz) [Daizu]. Hiriodzu (replaces Hiriodz) [Hiryozu]: A kind of food made of *tofu* fried in oil.

Note 1. This is the earliest English-language document seen (April 2013) that contains the term *Hiriodzu* (the modern spelling is Hiryozu) which refers to Kyoto-style deep-fried tofu treasure balls.

Kinako.

Kiradzu [okara]. Koji: Barm or yeast made by the fermentation of rice or barley, in the process of making sake and soy [sauce]. Koji-buta: A shallow box for holding barm. Miso. Miso wo suru: To rub *miso* in a mortar. Natto.

Nigari. Sashi (verb). Sashimi. Shitaji (replaces Sh'taji). Note 2. This is the earliest English-language document seen (April 2012) that uses the word "shitaji" [spelled like this] to refer to shoyu or soy sauce.

Shoyu. Tofu: A kind of food made of beans, bean curd. Umeboshi (*hakubai*).

Yuba [hot water + leaf]. Yu-dofu.

The English-Japanese part of this dictionary starts after p. 558 and is titled "An index; or, Japanese equivalents for the most common English words." Separately numbered to p. 132, it includes: "Barm, Kôji; tane." "Soy, Shôyu."

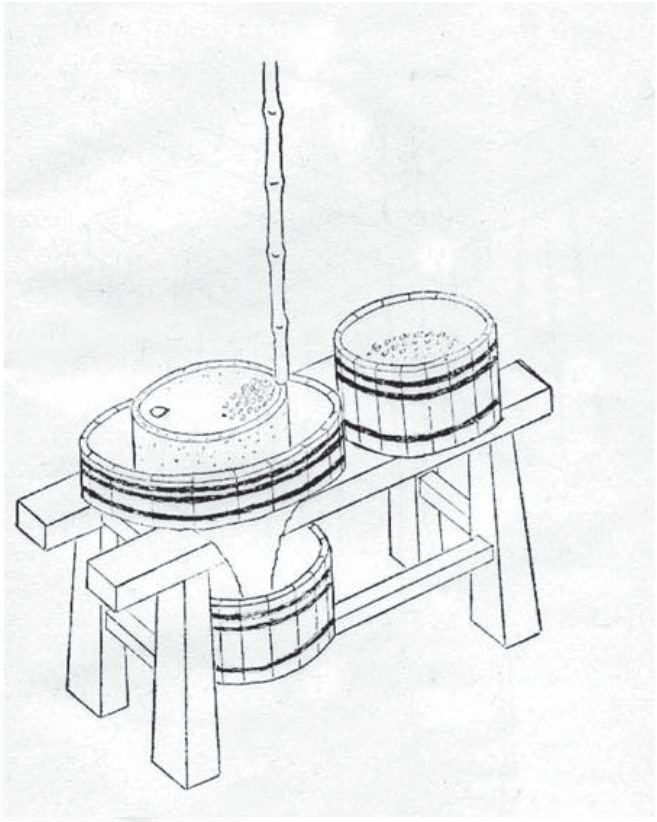
Terms NOT mentioned include Abura-age, Aburaage, Aburage, Atsu-age, Daitokuji natto, Edamame (or Eda mame or Yedamame), Ganmodoki, Hamanatto, Hiya-yakko, Kori-dofu, Koya-dofu, Nama-age, Okara, Tamari, Tonyu, Unohana, Yaki-dofu.

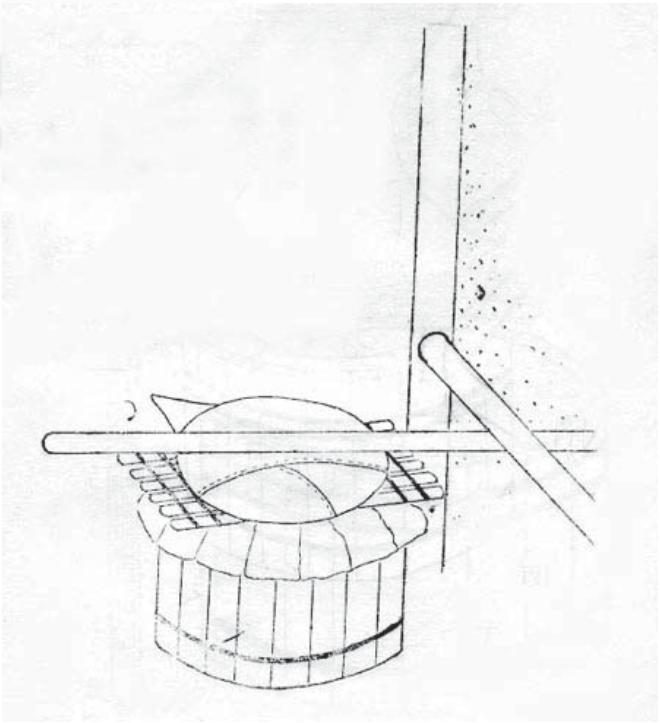
Note 2. The author apparently still did not realize that the various soyfoods he defined (with the possible exception of hiriodzu and soy sauce) were made from soybeans. Address: M.D., LL.D.

538. Katagiri, Torakichi; Sakakibara, Yoshino. 1872. Tôfu shûsetsu [Tofu: Collected theories]. Tokyo: Ministry of Education. 40 p. Illust. 19 cm. [Jap]

• ***Summary:*** The cooking teacher and author was Sakakibara Yoshino. The tofu production teacher was Katagiri Torakichi. Both of the first two men told it by word of mouth. It was written by the Japanese Ministry of Education (*Mombusho/ Monbusho*).

This charming booklet contains many illustrations (line drawings) of different types of tofu (*tsuto-dofu, tsumiire tofu, Matsukawa-dofu, yaki-dofu, agé-dofu, chikuwa-dofu, shôro-dofu* [pine-dew tofu]) and tofu making equipment (hand-turned stone mill on a stand, wooden tubs and vats, ladles, bamboo whisk, pressing sack design, a round wooden lever being used to press soymilk from the pressing sack into a wooden vat, bamboo colander, paddle for stirring in nigari,





forming box cloths, forming box design, large knife for cutting tofu into cakes).

For an English-language translation of a document quite similar to this one, with different but related illustrations, see Richard B. Hubbard (1886).

Note 1. This is the earliest document seen (April 2001) that discusses or illustrates equipment for making tofu.

Note 2. This is the earliest booklet seen (Oct. 2001) that mentions soy.

539. Mogi, Fusagoro. 1872. [Scroll from Mogi Fusagoro with preface by Mogi Keizaburo to Shoda Bunuemon on the founding of a Noda Shoyu brewery]. 2 p. Unpublished manuscript. Translated by W.M. Fruin, 1983. p. 307-08. Original in Shoda Shoyu Company Archives, not far from Noda. [Jap; Eng]

• ***Summary:*** Gives a detailed recipe for making shoyu, including the amount of each ingredient and the month in which each step is performed. To make the *best* quality shoyu: "Mix together: First year, January, 2 koku (95.2 gallons) of the *best* grains. First year, April, 2 koku. First year, October, 2 koku. Second year, March, 2 koku. Ferment the above mixture for an average of 16½ months from January of the first year and press before November of the second year. Note the importance of starting the shoyu at the coldest time of the year and of not adding all ingredients at the beginning.

Three alternative recipes are given using lower quality grains. The fermentation times are 15 or 19 months from July of the first year. Income and expenses are calculated. Costs of raw materials for 1,200 kegs of the best quality shoyu are 50 koku soybeans for 250 ryo (unit of currency), 50 koku wheat for 167 ryo, and 200 hyo akaho salt for 67 ryo. Note: A hyo is apparently a small sack of salt. Shoda later became famous as a cereal milling company. Nisshin separated off from Shoda. Address: Noda, Japan.

541. Stoeckhardt, Adolph; Senff, Emanuel. 1872. Untersuchung von chinesischen Oelbohnen [Investigation on Chinese oilbeans (soybeans)]. *Chemische Ackersmann* (*Der*) 18:122-25. [Ger]

• ***Summary:*** "On a trip to England, Mr. Berndt, a manufacturer of velvet in Deuben [in Saxony], made the acquaintance of an English seaman, who told him many things about Manchuria, in China, where he had often been. He explained, among other things, that in northern China several varieties of beans are cultivated, and from them is obtained an oil (*ein fettes Oel*) which, like our cottonseed oil, is used as a food oil (*Speiseöl*), and also a type of cheese (*eine Art Käse*) [tofu], which is widely used as food. Finally, from this bean, one can make a type of soy sauce (*eine Art Soya*), which can also be used with foods. Later Mr. Berndt shared with me two small samples of these beans, which were sent to him by post from Hongkong through the arrangement of Mr. C. Eckardt; one was yellowish white and one black. The former, egg-shaped, had somewhat the size and color of small, pale peas; the latter was significantly smaller, shiny black, and of somewhat flattened, egg-shaped form. Both belong to the genus (*Gattung*) Phaseolus."

Note 1. This is the earliest German-language document (April 2013) seen that uses *Käse,* the German word for "cheese," to refer to tofu.

A table (p. 122) gives a laboratory analysis, conducted by Assistant Senff, of the two beans. It showed the following percentage composition (Yellowish white / black): Crude oil (ether extract, *Aetherauszug*) 20.53 / 16.88. Nitrogen-containing substances (*stickstoffhaltige Substanzen*) 38.54 / 38.04. Nitrogen-free extract (*stickstofffreie Extractstoffe*) 24.61 / 27.79. Cellulose (*Rohfaser* = crude fiber) 5.13 / 5.53. Minerals (ash) 4.50 / 4.62. Water 6.69 / 7.14. Note 2. This is the earliest document seen (April 2002) that mentions the term "nitrogen-free extract," which includes starch, sugar, gums, and the like. The nitrogen-free extract and fiber soon came to be classed together under the name of carbohydrates. This is also the earliest document seen (Dec. 2001) that clearly mentions fiber in soybeans, or the fiber content of soybeans.

"The composition of these beans is actually of surprisingly high grade, in part because of the high content of oil which takes the place of starch, and also because of the high nitrogen content. The chemical composition of lupine seeds (*Lupinensamen*) has already provoked lively astonishment, since in these, unlike the seeds of other known legumes, we find no starch, but rather a large amount of oil and protein (*eine reichlichere Menge von fettem Oel und Proteinstoffen*). So we are confronted with the Chinese oilbeans (*chinesischen Oelbohnen* = soybeans) in which the unique characteristic of the lupine seeds seem to be expressed in a higher potency, as shown in the following comparison." A table shows that most beans and peas contain 30-35% starch, 1.5-3% oil, and 24-26% protein. Lupine seeds contain no starch, 5-8% oil, and 30-35% protein. But the seeds of the Chinese oilbeans [soybeans] contain no starch, 16-20% oil, and 38-39% protein. The oilbeans are thus shown to be the most protein-rich livestock fodder; they also have a high respiration value (*Respirationswerth*). They seem even more important because these two main components are also suited for the human diet. The use of the oil as food oil (*die Verwendung des Oels als Speiseöl*) is confirmed, and the use of the proteins is not unlikely, since they consist largely of plant casein, through the application of salt and aromatic plants and subsequent fermentation,

© Copyright Soyinfo Center 2014

may well produce a tasty cheese, like that made from milk casein. Note 3. This is earliest document seen (May 2008) that clearly mentions starch in soybeans, and states that they contain none.

Note 4. This is the earliest German-language document seen (May 2008) which refers to soybeans as *chinesischen Oelbohnen* = "Chinese oilbeans."

"The high nitrogen content of the beans may also be confirmed through an analysis of their cake (presscake?). Upon inquiry to professor Völcker [Voelcker] in London I received the answer that he could not state for sure that the beans could be used to make a type of cheese, however he has investigated the oilcake ('Chinese Oilbean Cake') and found the following percentage composition compared to rapeseed cake: oil 5.32 / 8-9. Nitrogen-containing substances 45.93 / 27-28. Nitrogen-free extract 24.52 / 32-25. Cellulose 5.71 / 15-16. Minerals (ash) 5.70 / 6-7. Water 12.82 / 12-15.

"Concerning the preparation of soy sauce (*Soya*), this indispensable table seasoning among the people of India and seafarers, a trusted friend who is very familiar with Oriental trade conditions, informs me that 'according to tradition, certain fungi, fruits, and parts of fish (especially also parts of the crablike sea-spider) are added to it, in a very complicated and long process that lasts several months.' From another source I learned the following: 'Soy sauce (Soya) is prepared from an oil-rich bean that grows in China. During the process it is mixed with other ingredients. Thereby a significant percentage of good-tasting oil is obtained and the residue is used as an excellent fodder for cows. Can any of my valued readers provide more specific information on the above?"

Note 5. This is the earliest document seen (May 2008) containing mention of soybean cake in the western world. It also the earliest document seen (May 2008) containing an analysis of the cake.

Note 6. This is the earliest document seen (July 2000) concerning soybeans in Hong Kong. This document contains the earliest date seen for soybeans in Hong Kong (1872). Soybeans were probably also being grown at that time in Hong Kong, but we cannot be certain of this.

Note 7. Mr. Carl Berndt of Saxony, is mentioned several times by Prof. Friedrich Haberlandt in his classic *Die Sojabohne* (1878). In part 1, page 4, Haberlandt states that Carl Berndt, a velvet manufacturer at Hainsberg-Deuben in Saxony, was one of the first people in Germany who attempted to cultivate soybeans. He had no success. "He wrote me about his efforts as follows: 'I had received 8 piculs of those beans [Note 8. A picul is a Chinese unit of weight = 133.33 pounds] (some green and some yellow), which I obtained through an official order of Governor (*des Minister-Präsidenten*) Dr. Weinlich of Shanghai via our local consul. I sent samples of those all over with the request that the recipient inform me of the results of his agronomic trials. Unfortunately I have waited in vain and I assume that the outcome was as unfavorable as it had been in my case and in my neighborhood. Although some gardeners and I managed to raise a few plants and harvest a few seeds, they rotted after being replanted and therefore could not germinate.'" Pages 10-11 of Haberlandt note that the first analysis of the composition of soybean seeds that became known in Germany was carried out by (Mr.) Senff using seeds obtained directly from Japan by Mr. Berndt. The results of this analysis were first published in 1872 in the journal *Chemischer Ackersmann* ("Chemical Farmer," p. 123). The tests showed soybeans to contain on average 38.29% protein and 18.71% oil. Page 14 of Haberlandt describes a letter that Carl Berndt wrote to Prof. Haberlandt. And in part 4, page 79 of Haberlandt states that Carl Berndt conducted soybean trials in 1877 in Deuben with 300 seeds; these trials succeeded beyond all expectations.

Note 9. This is the earliest document seen (Sept. 2002) that mentions the use of ether or any other solvent for extracting soybean oil. The extraction was on a laboratory scale. Ether is a light, volatile, flammable liquid (hydrocarbon), also used as an anesthetic.

Note 10. This is the earliest German-language document seen (Sept. 2006) that mentions soybean oil, which it calls *ein fettes Oel.*

Note 11. This is the earliest German-language document seen (Aug. 2003) that uses the term *Stickstoffhaltige Bestandtheile* to refer to nitrogen-containing constituents / protein in connection with soybeans. Address: Acad. Laborat Tharand.

542. Syrski, S. 1872. Landwirthschaft in Japan [Agriculture in Japan]. In: Karl von Scherzer, ed. 1872. Fachmaennische Berichte ueber die oesterreichisch-ungarische Expedition nach Siam, China und Japan. (1868-1871) [Expert Reports on the Austro-Hungarian Expedition to Siam, China, and Japan]. Stuttgart: Verlag von Julius Maier. Appendix (Anhang), p. 175-227. See p. 175, 186, 190, 207. Index. 25 cm. [Ger]

• ***Summary:*** Page 186 gives the prices of 1 *shô* (*schio* = 1.825 liters) of various staples. A Tempo is apparently a Japanese unit of currency and a kr. is an Austro-Hungarian unit of currency: Fava beans (*Rossbohnen, Sora-mame*) 4 Tempo (18 kr.), azuki (*Adsuki*) 10 Tempo (45 kr.), soybeans (Daidsu; Dolichos soja) 6 Tempo (27 kr.), Kintoki, with red seeds 5 Tempo (22 kr.) [Note: Kintoki is an abbreviation of "kintoki azuki," which is a large variety of red azuki beans], barley 3 Tempo (13 kr.), wheat 6 Tempo (27 kr.), sesame 10 Tempo (45 kr.). Note: This is the earliest German-language document seen (Jan. 2005) that mentions azuki beans, which it calls *Adsuki.*

Page 190 notes: The pickled beans (*Bohnensulze*), called "Misso" in Japan, is prepared from Daizu, a variety of Dolichos, together with wheat- and barley meal/flour, plus some added salt. The seasoning soy sauce (*Soia*) is likewise made from soybeans (*Daidzu-Dolichos*) and wheat meal

© Copyright Soyinfo Center 2014

with the addition of salt, and sprinkled on many foods... Essentially the diet of Japanese peasants consists of rice and the above-mentioned miso, therefore of an easily digestible carbohydrate (*aus einem leicht verdaulichen Kohlenhydrate*) and a strong nitrogenous substance (*stickstoffhaltigen Substanz,* protein), which is made easily digestible through processing. Concerning the nutritional value of their most important foods, Japanese peasants believe that fish, eggs, and poultry give the most strength (*Kraft*)**.** These are followed by miso and vermicelli made from wheat flour, then rice and potatoes. They believe that buckwheat gives but little strength.

The section titled "Legumes" notes: A green Dolichos variety (*Dolichos unguiculatus* according to Thunberg, called Jaenari in Japanese) is planted in the fields of central Japan in June and harvested at the beginning of October. A Dolichos variety (*Dolichos soia;* called *Daidsu* in Japanese) is planted in southern Japan in April and harvested in July. In central Japan this crop is planted between rows of wheat as they near maturity in May, and harvested in September. The ground is not manured (*nicht gedüngt*)*;* the plants make use of the fertilizer (*Düngungsmaterial*) already applied for the wheat. As a rule, 6 shô of seed-beans yield a crop of 120 shô on a field of 300 tsubo.

Note: Rein (1889, p. 57) states: "According to Scherzer, six Shô of seed-beans of the early-ripening Shiro-mame are credited with a crop of 120 Shô on 300 Tsubo of land. This means a harvest of only 20-fold, or, taking account of the seed lost in sprouting, about 12 pods of two beans each to every plant."

"This type of Dolichos, as is well known, is the main ingredient in the seasoning soy sauce (*Soia*) and the aspic or pickle (*Sulze*) miso (*"Misso"*)**.**

"A black variety of Dolichos, called Kuro-mame in Japanese (i.e. black soybeans) is planted in the area around Nagasaki in April on land fertilized with ashes (*auf einem mit Asche gedüngten Boden*)*,* and in central Japan in May two seeds are laid in a hole between the rows of wheat. It is harvested in August or September in southern Japan, and in October in central Japan, and used rather widely as a food."

Note 1. Scherzer lived 1821-1903.

Note 2. This is the earliest document seen (Feb. 2005) concerning soy in connection with (but not yet in) Hungary.

Note 3. This is the earliest document seen (Oct. 1999) that mentions the use of fertilizers for growing soybeans.

Note 4. This is the earliest document seen (Aug. 2001) that mentions carbohydrates in connection with soybeans.

Note 5. This is the earliest German-language document seen (April 2012) that uses the word *Soia* to refer to soy sauce. Address: PhD.

Note: This and other articles were reprinted in the Academy's *Mélanges Biologiques Tirés du Bulletin de l'Académie Impérial des Sciences de St.-Pétersbourg* (*Akademiia Nauk S.S.S.R., Leningrad*)*.* They were later published by the Academy as a book titled *Diagnoses plantarum novarum asiaticarum.*

545. *Chicago Daily Tribune.* 1873. The Japanese at table. Oct. 12. p. 5.

• ***Summary:*** "From the Far East: If bread is the staff of life with Europeans, so is rice with Asiatics. It is the staple food of the people, and with a little soy [sauce] or pickle, or some other simple condiment, is often the only food of the lower classes in Japan... It is strikingly curious to see them eat for the first time...

"A small table about 9 to 12 inches square and 6 to 9 inches high is placed sometimes in the middle of the feeders, sometimes one to each person. On this table are two or three small dishes,–perhaps one has some slices of cold fish,

© Copyright Soyinfo Center 2014

another some pickles, lily root, green ginger, and horseradish [wasabi], another a little soy, and so on... ever and anon there is a pause to take a slice of fish, which is rendered more palatable by being dipped in the soy."

546. *Far East* (*The*) (*Yokohama, Japan*). 1873. A curious phase of superstition has been exhibited since the formation of lotteries. 4(4):92. Oct.
• ***Summary:*** "The temple of Oiwa Inari is one very much venerated by the citizens of Tokei; and is one to which, actors, geishas, and the like go to pray for success in their profession. Since the lotteries have been in vogue, it has been given out that this is the temple at which to pray for good fortune in the drawings; the fox Oiwa having such things under his special care. The consequence is, it is always crowded with poor people who have invested (many of them their all) in these lotteries: who bring Sekihan (made of rice and red beans) and Aburage (beans fried in oil) of which the fox is said to be very fond; and who pray incessantly for the favour of Oiwa. The crowd is everyday very great from morning until night; but particularly on the days of drawing."

Note 1. This is the earliest English-language document seen (April 2013) that uses the word "Aburage" to refer to deep-fried tofu pouches.

Note 2. This article appears in the section titled "Monthly Notes from Local Papers," which starts on p. 88.

547. *Manchester Guardian* (*England*). 1873. Commercial markets: London Produce Market, Tuesday. Nov. 5. p. 6.
• ***Summary:*** "Japan Soy [sauce].–410 cases chiefly sold at 12*s.*"

548. Hepburn, James C. 1873. Japanese-English and English-Japanese dictionary. Abridged by the author. New York: A.D.F. Randolph & Co.; London: Trübner & Co. vi + 330 + 206 p.
• ***Summary:*** "Preface: In order to render the Dictionary more portable and convenient in size, the Author has thought it best to abridge the larger work and bring it out in its present form. In so doing, he has omitted the Chinese and Japanese characters, the synonyms, and the examples showing the use of the words, excepting such as contained a peculiar idiom, and which could not be included in a definition. All the native Japanese words, with the exception of those which were rarely used or obsolete [such as Yu-dofu], have been retained; as, also, all the words derived from the Chinese which are in current use."

"The Second, or English and Japanese, Part, has not been abridged or altered from the original, except in the correction of such typographical errors as were met with."

Note 1. New words in this edition that are not in the 1867 edition are preceded by "**."

Soy-related terms: Adzuki: A small red bean. Amazake: Sweet sake, a kind of fermented rice. Daidzu: A large white bean. Soja hispida. Hiriodzu: A kind of food made of tofu fried in oil.

Kinako: A kind of food made of beans. Kiradzu: The refuse of beans left in making tofu. Koji: Barm or yeast. Koji-buta: A shallow box for holding barm. Miso: A kind of sauce made of beans.

** Moromi: The grounds left in making soy [sauce], used as an article of food.

Note: This is the earliest English-language document seen (April 2012) that contains the word "Moromi." However the definition is poor. The word *moromi,* which is often translated as "mash," is the stage in making soy sauce (it has a consistency resembling apple sauce) before the liquid shoyu (soy sauce) is pressed out, leaving behind the shoyu presscake or residue (which could be called "grounds").

Natto: A kind of food made of beans. Nigari: The brine formed by the deliquescence of salt. Sashimi: Raw fish cut in thin slices and eaten with soy. Shoyu: Soy, a kind of sauce made of fermented wheat and beans. Tofu: A kind of food made of beans. Yuba: A kind of food made of beans.

Terms NOT mentioned include Aburage, Abura-age, Aburaage, Daitokuji natto, Edamame (or Eda mame or Yedamame), Hamanatto, Hiya-yakko, Koya-dofu, Kori-dofu, Okara, Tamari, Tonyu, Unohana, Yaki-dofu.

Note 2. The author apparently did not realize that the various soyfoods he defined (with the possible exception of soy sauce) were made from soybeans. Address: M.D., LL.D.

549. Heuzé, Gustave. 1873. Les plantes alimentaires [Edible plants. 2 vols.]. Paris: Libraire Agricole de la Maison Rustique. Undated. See Vol. II, p. 381-82. 27 cm. [soy ref. Fre]
• ***Summary:*** Vol. II, Part II concerns "Leguminous plants with pods." In Book 2, titled "Dolic or dolique" (p. 371+), Chapter II (p. 373-83) concerns "Species and varieties." The soybean is in the second major group, "Dwarf dolics" (p. 380), as follows: Variety "15.–Japanese soybean (*Dolic du Japon. Dolichos soja,* Linn.; p. 381-82) states: Synonyms: *Dolic soja. Soja japonica,* Sav. *Dolic à café* [the coffee bean]. *Soja hispida,* Moench."

Note 1. This is the earliest French-language document seen (Nov. 2012) that uses the term *Dolic à café* to refer to the soybean.

Note 2. This is the earliest French-language document seen (Nov. 2012) that refers to the soybean in connection with coffee.

A botanical description in French follows: "The stems, which are from 65 to 100 cm tall, are hispid / hairy, straight, straight, and rust-colored. The leaves have three cordiform folioles, equipped with stipules; flowers violet, sessile [attached directly by the base], in short clusters, straight and axillary [growing from an axil]. The pods are lightly curved, slightly pendulous, very short, bumpy, and covered with rust-

© Copyright Soyinfo Center 2014

colored hairs. The seeds are oval, shiny, compressed, clear nankeen (*nankin clair;* brownish yellow) in color, and almost dull.

This variety is cultivated in China, Japan, and Asia. Its flowers are white, purple, or violet, according to the variety.

The types that are most widely cultivated, after the core / main type [nankeen colored], are two: 1. The black soybean (*Le soja noir, Soja hispida*). 2. The yellow soybean (*Le soja jaune, Soja ochroleuca*).

The Japanese transform the seeds of this dolic into a paste (*miso*), with which they make a sauce (*soja*), which they use to prepare various foods.

This species is an annual; in France it has been called *pois oléagineux* ("oil peas"). It was introduce here from China by Mr. de Montigny. It is cultivated in some points in the departments of Ariège and of Haute-Garonne. It grows rapidly and is quite resistant to drought.

Also discusses: *Dolichos tetragonolobus* L. Synonyms: *Pois carré* (in Europe). *Psophocarpus tetragonolobus* DC. In India it is known as *mourou-kouavré* (p. 377). Gustave Heuzé lived 1816-1907. The book is undated, but the date usually given in catalogs is 1873 (less commonly as 1872). Address: Member of the Central Society of Agriculture of France. Adjunct inspector general of agriculture.

550. Maximowicz, C.J. (or Maksimovich, Karl I.). 1873. [Lat]

• ***Summary:*** Maximowicz points out that Glycine Soja S. & Z. is not the cultivated soybean but rather the wild species that was subsequently described by Regel and Maack as *Glycine ussuriensis.* The exact text relating to two Glycine species reads:

"Glycine Soja S. Z. l. c. I. 119.–non Benth.–*Gl. usuriensis* Rgl. Fl. Usur. n. 146. tab. VII. fig. 5-8.–*Tsuru mame.* Soo bokf. XIII. 37.

"In *Kiusu* [Kyushu] et *Nippon,* ad Yokohamam; in *Mandshuria* [Manchuria]: a finibus Koreae secus Usuri [Ussuri] et Sungari fl. ad Amur meridionalem.

"Gl. hispida m. vocanda est *Soja hispida* Mch.–*Dolichos hispidus* Thbg. et Soo bokf. XIII. 18-21., quae in *Japonia, China,* et *Japonia* ubique colitur, et a praecedente tantum hispiditate majore, caule erecto et legumine majore differet, an igitur forsan varietas culta censenda?"

551. *American Agriculturist.* 1874. The Japan pea. 33(2):63-64. Feb. With one engraving.

• ***Summary:*** "The Southern seedsmen have advertised and southern journals have had articles in relation to the Japan Pea... we last spring obtained from Mark W. Johnson, dealer in seeds and agricultural implements,

Atlanta, Ga. [Georgia], a sample of these peas... This fall we have received a sample of the same pea from L.L. Osment, Cleveland, Tenn. [Tennessee], who says they are 'unsurpassed for table use.'

"The plant grows to a height of three or four feet, and is hairy in all its parts... Mr. Johnson, who sent us the seed, wrote 'not desirable for table use.' Remembering to have seen the same thing some years ago in the garden of a friend near Boston we wrote him for his experience. He writes: 'They may be delicious to the celestial palate, but my wife found them hard to cook and I found them hard to eat–never getting soft no matter how long they were boiled.' Thus far we think the weight of evidence is against their utility as a table vegetable. As an agricultural crop, they are highly promising, at least in localities where the seasons are sufficiently long to mature them. Mr. Johnson speaks highly of the wonderfully prolific character of the pea, and its excellence as a food for stock. It is so much esteemed in some quarters that it has received the rather extravagant name of 'Southern Relief Pea.' Mr. Osment claims it to have produced 200 bushels to the acre. From the manner in which the pods set upon ours we should judge the yield would be very large. This pea is deserving the attention of cultivators as a fodder crop and for plowing in as a fertilizer. As to what the pea is botanically we are not quite sure; it does

© Copyright Soyinfo Center 2014

not belong to the proper Pea (*Pisum*), but is very near the Chinese Soy Pea, and is probably a form of that or a closely related species. The Soy Pea (formerly *Soja hispida,* but now *Glycine Soja*) is cultivated in China, Japan, and other parts of the east, and is used to make the sauce called Soy, which was formerly more used than at present."

A handsome illustration (engraving; p. 64) shows "The Japan Pea" by J.W. Fasel. Note 1. This document contains the earliest illustration seen (Aug. 1996) of the soybean in the USA.

Note 2. This is the earliest document seen (Aug. 2011) that clearly refers to soybeans in Tennessee, or the cultivation of soybeans in Tennessee. This document contains the earliest date seen for soybeans in Tennessee, or the cultivation of soybeans in Tennessee (summer 1873).

Note 3. This is the earliest English-language document seen (Feb. 2002) that uses the terms "Soy Pea" or "Chinese Soy Pea" or "Southern Relief Pea" to refer to the soybean.

Note 4. This is the earliest English-language document seen (March 2008) which states that the scientific name of the Japan pea is probably *Glycine Soja,* previously *Soja hispida*–that is, the soybean.

Note 5. This is the earliest document seen (Jan. 2000) stating that a seed dealer in the USA (Mark W. Johnson in Atlanta, Georgia) is selling soybeans for seed use. Line 1 implies that earlier advertisements exist.

Note 6. This is the earliest English-language document seen (July 2002) that describes "plowing in" soybean plants in the USA for use as a fertilizer [green manure] to improve the soil.

Note 7. Starting with this article, and continuing until after World War II, some writers incorrectly referred to the scientific name of the cultivated soybean as *Glycine soja,* whereas that is actually the scientific name of the wild soybean.

Note 8. This is the earliest document seen (Nov. 1998) that uses the word "promising" in connection with the soybean as an agricultural crop–in any country worldwide.

552. *American Agriculturist.* 1874. The Japan pea. 33(6):205. June.

• ***Summary:*** "'Jap' writes: 'When properly cooked, they are very palatable to persons who are fond of beans or peas, for the taste resembles a mixture of navy beans and lady peas cooked together. To cook them: Put in soak over-night in warm water; then boil them, taking care not to add cold water, grease, or salt. When done, mash, season to suit taste, and bake."

553. Ritter, H. 1874. Tofu, Yuba, Ame [Tofu, yuba, ame]. *Mittheilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* (*Yokohama*) 1(5):3-5. July. [Ger]

• ***Summary:*** The discussion begins with tofu: Tofu (*Das Tofu*), one of the foods that is rather widely enjoyed by Japanese, is made from beans. It can be described most simply as 'bean cheese (*Bohnenkäse*);' the literal translation of the two characters, 'beans rotten,' seems to give us the first glance of its earlier meaning as a cheese–which is a product of fermentation. However, this only appears to be so, since tofu is definitely fresh and unfermented. Perhaps the earlier name signifies that the tofu essentially consists of legumin (*Legumin;* a legume protein), not considered as a portion but as a fermentation product of the beans.

The preparation is very simple. White soybeans (older beans are preferred to newer) are soaked for about 12 hours in cold water or 8 hours in hot water, then ground with water between the stones of a handmill to form a slurry (*Brei*). The slurry is filtered through a silk or very fine-meshed sieve. The larger particles remaining in the sieve are reground in the mill. The amount of water used during grinding is such that from one measure [volume] of beans about 10 measures of slurry are obtained. This slurry is then poured into a kettle, which contains an amount of boiling water equal to about one-third the volume of the slurry; it is simmered over a low / weak fire. It is best, when the kettle is only half full, because the foam will suddenly starts to rise; this rise can be moderated by the addition of some oil. As soon as the contents of the kettle comes to a boil, it is removed from the fire and the slurry is filtered through a cotton sack [over a vat], then pressed with a lever. The pressed residue in the sack (*Der Pressrueckstand* [okara]) is often cooked again with half the amount of water. Note 1. This is the earliest German-language document seen (June 2013) that mentions okara, which it calls *Der Pressrueckstand.*

"The filtered liquid (*Die filtrirte Fluessigkeit* [soymilk]), which now consists of a solution of legumin, is carefully freed of its foam, and then the precipitation of legumin is brought about using nigari (*shio no nigari, Salzbitter*) as the coagulant. Nigari is the mother-liquor which drips out of [a sack of] sea salt in humid / wet weather, consists mainly of calcium- and magnesium salts. The nigari is added in three steps. First, about ½% of the liquid id added and only on the surface, while stirring slightly, since too much stirring would be disadvantageous. Then a somewhat larger amount is added, and without disturbing the first precipitation, stirred lightly. Finally, after most of it [the curd] has settled, a little more nigari is added, as much for the formation of the final curds and to obtain the right consistency. If you add too little nigari, you won't get any cakes (*Kuchen*) [of tofu], but too much nigari will give you a hard cake; soft tofu is preferred.

The author concludes by noting: "One cannot deny that most of the dishes made from tofu are rather nice, even for the European palate."

Note 2. This is the earliest German-language document seen (April 2013) which contains a description of tofu by a

© Copyright Soyinfo Center 2014

German living in Japan or East Asia.

Note 3. This is the earliest German-language document seen (April 2013) that uses the word *Bohnenkäse* ("bean cheese") to refer to tofu.

Note 4. This is the earliest document seen written by a Westerner (Nov. 2003) that uses the word *Nigari.*

Note 5. This is the earliest German-language document seen (Aug. 2013), that mentions soymilk, which it calls *Die filterte Fluessigkeit.*

Yuba (*das uba*) and *ame* (*das Ame*) are then described briefly. "Yuba is a peculiar preparation made from the legumin of the soybean [Note: *Webster's Third New International Dictionary* (1963) defines legumin (a term derived from the French *légumine*) as "a globulin [a type of protein] found as a characteristic constituent of the seeds of leguminous plants."] This thin yellow or brownish leathery tough film or skin is formed and consists of legumin which has become insoluble through cooking in contact with the air. It is prepared in the manner described above from the legumin solution in the soybean with addition of wood ashes [which raise the pH], cooked in an open kettle. As is the case with all alkaline protein solutions, there forms on the surface an insoluble film, which is then lifted off with a skewer and dried. Yuba is prepared as a food in various ways, but is used mostly as an addition to other foods."

Note 6. This is the earliest German-language document seen (Oct. 2012) that mentions yuba, which it calls *uba.*

Ame (grain syrup or *Midzuame*) is a widely used delicacy and sweet, loved by Japanese children. It consists of glucose (starch sugar) and dextrin that results from the malting of millet (*Hirse*) or rice. The *ame* made from millet is the sweetest, while that made from rice, especially from glutinous rice (*mochi kome*), has the advantage of being whiter." The process of making *ame* is then described in detail.

Dr. Rein adds to these proceedings that tofu is used in place of protein in lacquered or japanned work, in order to produce a more plastic product.

Note 7. This is the earliest document seen that mentions rice syrup (*ame* or *midzuame*) in Japan.

Note 7. The name of this journal varies. This issue was titled *Mittheilungen der Deutschen Gesellschaft für Natur und Voelkerkunde Ostasien's* and also known as the *Transactions of the German Asiatic Society of Japan.* The place of publication is Yokohama. This article actually has no title. Address: PhD, Japan.

554. Hoffmann, J.J. 1874. Ueber die Bereitung von Schoju, Sake und Myrin [On the preparation of shoyu, saké and mirin]. *Mittheilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* (*Yokohama*) 1(6):8-11. Dec. [Ger]

• ***Summary:*** The author was the first Westerner to make a scientific study of the shoyu process, of which he gives an accurate and detailed 2-page description: Soybean sauce (*Bohnensauce- Schoju*)–shoyu–is for the Japanese almost as indispensable as rice and is used as widely as tea or tobacco. The rich man and the beggar use it in the same way, but with differences in quality, as the main seasoning at their meals, and in no household, in fact at no meal may it be absent.

It is made in large factories, and in countless stores in all cities and towns throughout the entire island empire, it is stocked and sold in small wooden kegs.

It is made with soybeans, indeed very high protein, starch-free small soybeans (Dolichos Soja jap. Nagatemame), plus wheat, salt, and water in the same proportions by volume. Small kegs are used to measure the ingredients. The beans and grains are used in the same condition of dryness.

Before the basic raw materials are mixed, the soybeans are cooked in large iron kettles for half a day. The wheat is roasted in large containers (*Steingefaessen*) and then cracked into grits / pieces using a small hand-mills. Then the moist beans are mixed with the wheat grits on a firmly packed clay floor, then to them is added a fermentation starter culture consisting of wheat kernels covered with mold spores. The mixture is filled into rectangular wooden trays each about 2-3 inches deep, and these are placed and stacked in a closed room that resembles a large bakery oven.

Here the wooden trays stay for 3 days, during which time an effort is made to keep the room evenly warm throughout. During the cold seasons of the year the room is heated with a small charcoal burner. In this way the plant seeds gradually become covered with mold spores and develop their capacity to produce diastase enzymes. In cold weather, the room may be kept closed on the 2nd and 3rd days, but on warm days it may be vented using the door and windows during the 2nd and 3rd days to prevent overheating. To determine the suitable temperature, no thermometer is used; the feel of the maker is used instead.

On the 3rd day the contents of the wooden trays are thickly covered with a mycelium of mold. The contents of the trays is now transferred into large wooden vats (each of 20-30,000 liters capacity) and mixed with water and table salt. The contents of each vat is mixed with a wooden plunger as the fermentation proceeds. The process typically begins at the start of winter. The fermentation typically last for 3 to 5 years. The 3-year material is a dirty brown whereas the 5-year material is pure dark-brown in color.

The 3- and 5-year products are then mixed in equal proportions. The 5-year material adds its pleasant aroma, but it has a somewhat unpleasant bitter taste. This is masked with the 3-year material which has a nice flavor but less aroma.

This mixture is now filled into sturdy cotton bags, each 2 feet long and ½ foot wide. These are then pressed with a very primitive angle press consisting of a long lever arm weighted at the end by large stones. The shoyu (*Schoju*) from the first pressing is the best and most expensive type, but it is usually not sold as such. Rather it is dispensed preferentially

© Copyright Soyinfo Center 2014

to those with advanced orders. It has the strongest aroma and a beautiful dark-brown color. When put in a glass and shaken it makes a fat-glistening ring.

The shoyu presscake (*Rueckstand*) is mixed with salt water and some days later, after frequent stirring, repressed. This shoyu is very clear with little aroma, so it is mixed with a good dark-brown shoyu and with some sweet sake (*suessem Sake*).

The wooden kegs in which shoyu is sold are everywhere the same having a capacity of 18 liters or 4.76 gallons (1 *to*). In new kegs, the shoyu keeps for only a few months; it keeps longer in older kegs. There are four grades of shoyu. The prices are 6 German marks for grade 1, 4 marks for grade 2, 3 marks for grade 3, and 2 marks for grade 4.

As an article for export, shoyu has not gained much significance, despite great efforts. During shipping there is a buildup of mold which impairs the good flavor and aroma. The best varieties of shoyu are, however, very pleasing to the taste of most Europeans, and at the same time very effective in stimulating the appetite and digestion. For these reasons and because it is completely harmless / safe, shoyu is preferred to many European products [such as meat extracts] that serve the same purpose.

Hoffman then describes how sake is made; yet nowhere in either of these two parts of the long article does he mention the word *koji,* even though he describes it. He learned all of this at the famous shoyu-mirin factory of Mr. Sagamia Monjiro in Nagareyama, 5 German miles north of Yedo / Edo [today's Tokyo].

Note 1. The date on the title page is Nov. 1876, but Hoffmann's paper was not presented until 1878. This is the earliest document seen (Oct. 2001) that is a study of several fermented foods, including one made from soybeans–*shoyu.*

Note 2. This is the earliest document seen (April 2012) that describes how to make soy sauce (actually shoyu) on a commercial scale.

Note 3. This is the earliest German-language document seen (April 2012) that uses the term *Schoju* or the term *Bohnensauce* to refer to shoyu or soy sauce. Address: Prof., School of Medicine, Tokyo Univ., Japan.

555. Iinuma, Chôjun [Yokusai]. 1874. Shintei sômoku zusetzu [An illustrated flora of Japan. New ed. Edited, with corrections, etc., by Tanaka Yoshio and Ono Motoyoshi]. Japan. See vol. XIII, p. 17-22, 36-37. Illust. Dec. 27 cm. [Jap]

• ***Summary:*** This entire work consists of 20 volumes, divided by yellow divider pages and bound in 5 physical volumes. It is printed on very light-weight (low-density), rather translucent, double-folded Japanese paper, and extensively illustrated. On title page of vol. 1 is written Mino Ogaki, Hirabayashi-so, which may refer to the publisher (a person) and his publishing company. The date on the title page is Meiji 7, 12th month (Dec. 1874). Near the front of volume 1 is a preface in French titled "Préface de la deuxième edition du Sô-mokou-Zoussets. Revue et augmentée" by Tanaka Yoshiwo, dated 24 July 1874. It notes that it has been a long time since the first edition was published; the author and scholar Yokoussai died unexpectedly before he was able to finish his work, and a little later his son followed him to the grave. Otherwise, the only roman letters in the book appear at the top of illustrations, giving the name of the plant in Japanese, its scientific name, and its family. On the spine of each volume is printed "Sintei Somoku Dzusetsu, by Yokusai Iinuma." Today the title would be written "Shintei Sômoku Zustesu." The author's name is often catalogued as Chôjun Iinuma; he lived 1782-1865. A full-page illustration of the author appears near the front of volume 1, and below it is written in roman letters "Iinouma Yokoussai."

The section on soybeans is very similar to that in the 1861 edition. Soybeans are discussed only in Vol. XIII, Diadelphia. Called ômame, mame, or daizu in Japanese, the scientific name of the plant is *Dolichos soja* (pronounced "Dorikosu soya" in Japanese); it is also called *Japansche Slingerboon* (probably a Dutch term, pronounced "Yappanse Suringeru-boon" in Japanese).

After a 1-page description of the plant (see next 2 pages) written in old-style "kanbun" rather than contemporary Japanese, making it very hard to read), there follow 5 pages of detailed descriptions of 23 different soybean varieties, each with its Japanese name or names. Note that *mame* (pronounced MAH-may) means "bean" in Japanese. 1. *Go-gatsu mame.* 2. *Wasé mame.* 3. *Nakaté mame.* 3a. *Okuté mame.* 4. *Maru mame.* 5. *Shiro teppô mame.* 6. *Kuro mame.* 7. *Kuro teppô mame.* 8. *Koishi mame.* 9. *Ao mame.* 10. *Kage mame.* 11-15. *Aka mame.* 16-18. *Cha mame.* 19. *Kuro kura kaké mame.* 20. *Aka kura kaké mame.* 21-23. *Fuishi mame.* Above each name is a hand-painted color illustration of the seed showing the color of its seed coat and hylum, shape, and actual size.

On page 21 (plate 17) is a full-page black and white illustration (line drawing) of ô-mame, Glycine hispida moench (Leguminosae), with a color flower.

On page 22 (plate 18) is a full-page black and white line drawing of *midzu-kugiri, Glycine hispida* Moench F. lanceolata (Leguminosae), with two color illustrations of the seeds, and preceded by a brief description of the plant. On pages 36-37 (plate 17) is a full-page black and white illustration (line drawing) of the wild soybean, *tsuru-mame, no-mame, Glycine soja* S. et Z. (Leguminosae) (Leguminosae), with a color illustration of its flower, and preceded by a brief explanation.

Note: This is the earliest document seen (June 2009) that gives the color of the seed coat of many different soybean varieties. Address: Japan.

Yuen Yin, with the pronunciation of the characters as heard in Peking, Canton, Amoy, and Shanghai. Shanghai, China: American Presbyterian Mission Press. lxxxiv + 1252 p. 28 x 22 cm. [8 ref. Eng; chi]

• ***Summary:*** In this dictionary, the Chinese characters are arranged alphabetically. Each main character, written large, has the pronunciation written below it, and the meaning written in English to the right. Below these are numerous compound words in which the character appears, followed by a definition of each. No pronunciation is given for compounds or combinations of several characters, such as teu-fu [doufu], which makes the dictionary hard to use. The main radical relating to soya is no. 151, Teu, 7 strokes, referring to pulses and sacrificial vessels (p. 874).

Page 145, under fu (rotten, corrupt, spoiled), lists the characters (teu-fu) for "bean curd; low policeman and underlings are named teu-fu-kwan because they live on and are no better than this curd; and also the teachers in low government schools."

Page 764, under shi, lists the characters for "salted beans" [fermented black soybeans], "salted beans and flour," "soy [soy sauce; shi yu in Chinese or shoyu in Japanese], an English word probably derived from this name."

Note: This is the earliest English-language document seen (Nov. 2011) that uses the word "shi" to refer to fermented black soybeans.

Pages 874-75, under teu, list the characters for "legumes of every kind, pea, beans," "bean-curd jelly" [tofu].

Note. This is the earliest English-language document seen (April 2013) that uses the term "bean-curd jelly" to refer to tofu.

Page 968, under tsiang [ch'iang], lists the characters for "a relish made of salt mixed with bean or other kinds of flour, and water, and allowed to remain until cured; it is used as a condiment; relishes, sauces, condiments; salted preparations," "a dry relish," "a shop for sale of oilman's stores, and condiments," "bean sauce, this is the basis of most of the Chinese relishes," "vegetables seasoned in soy."

On page 839, under ta (big), there is no listing for ta-teu, the soybean. On page 252, under hwang (yellow), there is no listing for hwang-teu, the yellow soybean. On page 580, under mao (hair), there is no listing for mao-teu (fresh green soybeans). Thus it seems that the compiler of this dictionary was unaware of the soybean.

Page 1111, under yiu, lists the character for oil in various combinations. When preceded by the character for "fragrant" it refers to "sesamum, gingilie, or benne oil," made from the seeds of *Sesamum orientale.* Soybean oil is not specifically mentioned.

Note: This is the earliest English-language document seen (Feb. 2005) that uses the word "benne" to refer to sesame seeds. Address: United States Legation, Peking.

557. Southern Seed & Plant Co. 1875. Strange but true! (Ad). *Atlanta Constitution* (*Georgia*). March 10. p. 4.

• ***Summary:*** "Japan Peas–200 bushels per acre on common land; unequaled for stock or table use; grows on upright stalks. 15 cts [cents] per paper, 50 cts per pint, 80 cts per quart.

"Chufas–Furnish grazing all summer and food for yourself all winter; fine for poultry and fattens more hogs than ten times the area in corn; 150 bushels per acre on poorest land. 10 cts per paper, 40 cts per pint, 70 cts quart, $10 per bushel."

"Send for our free catalogue, giving full list, descriptions and *testimonials from those who have grown the above seeds."*

Note: The official record yield for soybeans in the national yield contest first topped 100 bushels/acre in 1969. Yet this seed company's display ad is claiming 200 bushels per acre in 1875! Unbelievable.

Also offers: Toong Qua cucumber that grows to weigh 70 pounds each. Snake Cucumber grows from 2 to 8 feet long and coils like a snake. Japan Radish [daikon], pods 2 feet long and delicious. Address: Gallatin, Tennessee.

558. Renard, Édouard. 1875. La pêche et la pisciculture dans l'Extrême Orient [Fishing and fish culture in the Far East]. *Bulletin de la Societe d'Acclimatation* 22:281-99. June. [Fre]

• ***Summary:*** Contents: Malaysia and the Indian Archipelago (*Archipel Indien;* probably Dutch East Indies). Cochin China. China. Japan.

Mr. Dabry de Thiersant (p. 292) has written a magnificent work about fish farming (*la pisciculture*) in China, where all fish are classified into two large categories: (1) The cyprinids (family Cyprinidae, *Kia-Yu*) such as carp, etc., which are herbivores and which they raise in artificial ponds and in regular ponds (*les pièces d'eau, dans les étangs*). (2) Marine fish, and even some that live in fresh water, such as pike and perch, are called *Ye-Yu* or wild fish (*poissons sauvage*). These latter are often the bane of Chinese aquaculturists, who use every possible means to get rid of them when they are accidentally introduced into their fish ponds (*viviers*).

Note: This is the earliest European-language document seen (Nov. 2002) concerning fish farming or aquaculture; however soybeans are not mentioned.

In Japan, people of the upper classes (the officers, feudal lords {*daimyo*}, etc.) eat carp entirely raw. Removed from the water, it is served on the table on bamboo leaves–still alive. What are our colleagues at the Society for the Protection of Animals going to say about such a barbaric process? When all the meat has been cut from the bones so that only a skeleton is left, these thin slices of fresh carp meat, dipped in shoyu (*trempées dans la soya*), constitute one of the most savory dishes of Japanese epicures (*Lucullus,* p. 295).

Note: Lucullus, a Roman general who lived 117-58

© Copyright Soyinfo Center 2014

B.C., was known for the splendor of his banquets.

Also discusses: Sea vegetables in Japan–kombu, fucus, and agar (Isinglass) (p. 296-97). Address: France.

559. Vidal, Dr. 1875. Animaux et plantes utiles du Japon [Useful animals and plants of Japan]. *Bulletin de la Societe d'Acclimatation* 22:506-31. Sept. [Fre]

• ***Summary:*** These are answers to questions posed by the Society about the useful plants of Japan. The plants are grouped alphabetically by family. Includes discussion of the following: 19–Edible plants: Gingerroot, *Kadzoura* (a type of mountain grape from northern Japan; p. 506-07), sweet potato (*Sato imo*), mikan orange, yuzu citron (p. 507). Legumes (p. 512): Cowpea or string bean (*sasaghé = sasage, la feve de marais*) [*Vigna sinensis*], the ordinary white haricot (*Inghi mame*), several species of large pea (*Pois grossiers, Mame* = perhaps soy beans). Concerning the latter: "The Japanese make various cakes and some pâtés with these different seeds. But there is one species of large bean (*Pois grossier*) which is cultivated only in the fields for use as a fertilizer; as soon as it has reached full growth, it is turned under and left to rot [as green manure].

"Two or three species of *Dolichos* are cultivated; the root of one of these, *Dolichos bulbosus* (*Koudzou* [*probably kuzu*]), furnishes a very good starch, which is widely used by the Japanese.

Sarassin (*Soba*) and Patience, *Rumex Patentia* (*Gobo*), apricots (*Andzhou*), and prunes (*Oumé = ume*) (p. 513). Sesame seeds (*goma*, p. 514) are widely used for oil. Eggplant (p. 515).

20-22–Medicinal, industrial, and accessory plants: Ginseng (p. 515), ornamental legumes including two lovely species of Glycines–*Wistaria chinensis* and *W. brachybotrys* (p. 520). *Ginkgo bilboa* (p. 524). Warabi (edible fern). Mushrooms (incl. Shiitake, Matsutake, Samatsu shimeji, etc. p. 525).

560. Franchet, Adrien; Savatier, Lud. 1875. Enumeratio Plantarum in Japonia sponte crescentium... [Listing of plants native to Japan. Vol. I.]. Paris: F. Savy. xiv + 487 p. See p. 108, 390. [4 ref. Lat; fre]

• ***Summary:*** The authors reported two types of soybeans from Japan: "451. Glycine soja Sieb. et Zucc. fam. nat., n. 14.–Miq. Prol. [Miquel. 1867. Prolusio florae Iaponicae], p. 240." Habitat: In mountainous regions. Kyushu, in the mountainous valleys of the Kawara mountains (*Iama, Buerger*); Nangasaki [Nagasaki] (Oldham). Japanese name: Unknown. Icon. Jap. [Japanese illustrations]–So mokou Zoussetz, vol. 13, fol. 37? sub: Tsourou [Tsuru] Mame. Phonzu Zoufou, vol. 50. fol. 2? sub: Kin mame. Observations (in French): "It is with doubt that we cite the illustrations of this plant, which remains unknown to us.

"452. Glycine hispida Moench. Meth., p. 153 (sub: Soja hispida)–Miq. Prol. p. 240. Habitat: Kyushu. Japanese names: Kuro mame [black soybean], no mame [wild soybean], kuzu, yama daizou [mountain soybean] (ex Miquel). Japanese illustrations:–So mokou Zoussetz, vol. 13, fol. 18 to 21. Phonzu Zoufou, vol. 43. fol. 1-9. Observations (in French): Bentham and Hooker do not admit the genus *Soja*, and with good reason, it seems, we have changed the name of *Soja hispida* Moench. The two species of *Glycine* that we cite here seem very closely related, and Mr. Bentham believed that he had to unite them. But, on the other hand, Miquel affirms that they are distinct. According to him, the seeds of *G. soja* are not separated within the pod, that is to say the pod does not have any of the constrictions and dividing cellulose membranes which exist in the pod of *G. hispida*, a characteristic which is more or less pronounced in all of the species of the genus *Glycine* according to Bentham and Hooker. See: Bentham and Hooker Gen. Plant. 1, p. 530, and Miquel. Prol. p. 240-41.

According to Piper and Morse (1923, p. 33) the authors considered that the cultivated soybean was probably derived from *Glycine ussuriensis* Regel & Maack.

The authors also discuss the genus *Amaranthus* (see vol. 1, p. 390-91): *A. caudatus, A. mangostanus,* and *A. melancholicus.* Address: Medical doctor, Yokosuka, Japan and Paris.

561. Ripley, George; Dana, Charles A. eds. 1875. The American cyclopædia: A popular dictionary of general knowledge. Vol. 13. New York, NY: D. Appleton and Company. See p. 203.

• ***Summary:*** Under the entry for "Pea" we read (p. 203): "The Japan pea, at present widely advertised as a most valuable plant for its seeds and fodder for the southern states, is a species of *soya,* very near the soy pea, *S. hispida,* if not a form of it."

562. Haberlandt, Friedrich. 1876. Der Anbau der rauhhaarigen Soja oder Sojabohne (Soja hispida Moench) [The cultivation of the hirsute soybean]. *Wiener Landwirthschaftliche Zeitung* 26(9):87-89. Feb. 26. [Ger]

• ***Summary:*** Contains a detailed account of Haberlandt's first trials and analyses of the oil and protein content of the soybean's seeds.

"Among the seeds that the teaching staff of agronomy at the Royal College of Agriculture (*Lehrkanzel des Pflanzenbaues an der Wiener Hochschule für Bodencultur*) in Vienna, acquired at the Viennese World Exposition of 1873, were a number of varieties of soya (Soja), gathered from the Chinese, Japanese, Mongolian, Transcaucasian, and East Indian expositions." An illustration shows a soybean plant with pods.

Note 1. This is the earliest document seen (July 2008) by Prof. Haberlandt about soybeans or that mentions Prof. Haberlandt in connection with soybeans. Also subsequently published in *Biedermann's Centralblatt* (June 1876, p. 441-

© Copyright Soyinfo Center 2014

45).

Note 2. This is the earliest document seen (July 2002) concerning soybeans in Austria, or the cultivation of soybeans in Austria. This document contains the earliest date seen for soybeans in Austria (1873), or the cultivation of soybeans in Austria (1875). The source of these soybeans is the various expositions at the World Exposition in Vienna of 1873.

Note 3. This is the earliest document seen (April 2008) concerning soybeans in Transcaucasia, or the cultivation of soybeans in Transcaucasia–which is a region roughly equal to that occupied in 2008 by the countries of Armenia, Azerbaijan, and Georgia. This document contains the earliest date seen for soybeans in Transcaucasia, or the cultivation of soybeans in Transcaucasia (1873). The source of these soybeans is unknown. We cannot be certain that soybeans were being cultivated in Transcaucasia by 1873, although Haberlandt says in 1878 that these soybeans were "from Transcaucasia" so they were almost certainly being cultivated there–especially since they were seen as being important enough to take to this Viennese World Exposition. Moreover, Wuchino (1901) states that soybeans were first grown in Transcaucasia in the 1870s. We learn later (1878) that Haberlandt got black soybeans from the Transcaucasian exposition.

Note 4. This is the earliest document seen (May 2008) concerning soybeans in Central Asia (Transcaucasia), or the cultivation of soybeans in Central Asia. This document contains the 2nd earliest date seen for soybeans in Central Asia, or the cultivation of soybeans in Central Asia (1873). The source of these soybeans is unknown.

Note 5. This is the earliest document seen concerning soybeans in Mongolia, or (probably) the cultivation of soybeans in Mongolia (one of two documents). It is possible, but unlikely, that these soybeans came from the nation that since 1911 has been called Mongolia (formally Mongolian People's Republic, also called Outer Mongolia). It is more likely that they came from what is today called Inner Mongolia, which is part of China, an autonomous region in northern China bounded on the north by the Mongolian People's Republic. Address: Prof., Wiener Hochschule fuer Bodencultur, Vienna.

563. Rauch, A. 1876. Die Soya [The soybean]. *Fundgrube* (*Die*) (*Monatschrift fuer die gesammten praktischen Beduerfnisse und Interessen des taeglichen Lebens, von Dr. A. Rauch, Bamberg*) 3:177-78. Oct. [Ger]

• ***Summary:*** The soybean (*Soya hispida* or *Dolichos Soya;* many German writers use the name "Soja") is a creeping and climbing bean (*rankendes Bohnengewaechs*) that is native in Japan, and in all of southern Asia, especially in China, is likewise widely cultivated, like the common bean in Germany. The seeds, which are distinguished by an especially good taste, are used as very popular food in the countries where soybeans are grown, which is found at almost every meal. They are also part of a significant commercial product, since they are used to make a strong sauce, which is much sought after in fine kitchens / cuisine. In England, for example, each year more than 1,200,000 lb (*12,000 Zentner*) of the beans and significant quantities of the Soya sauce*, which is made in China, are imported. Footnote: *"Some sauces sold as 'Soya sauce' in England do not contain any of the actual sauce."

In Europe, various attempts have already been made to acclimatize the soybean. But these have so far been unsuccessful, in that the plants, at best, flower, but never bear seeds. "Previously I received several seeds of various soybean varieties from Japan, from my longtime friend, honorable [Philipp] v. Siebold, who died at an early age. However my attempts to cultivate them was unsuccessful.

© Copyright Soyinfo Center 2014

The plants came up, and some of them bloomed, but so late (in September) that none ripened seeds.

"I was therefore quite astonished to read an article in the *Wiener Landwirthschaftliche Zeitung,* by Dr. Haberlandt, professor at the Royal College of Agriculture in Vienna (*Wiener Hochschule für Bodencultur*)*;* he reported that soybean cultivation at he Agricultural Experiment Garden (*landw. Versuchsgarten*) in Vienna, during the summer of 1875, had completely succeeded." Describes the pioneering work of Friedrich Haberlandt with soybeans in Austria.

Note: Bamberg is a city in Bavaria, in south central Germany on the Regnitz River 30 miles west of Bayreuth. Address: Germany.

564. Griffis, William Elliot. 1876. The Mikado's empire. New York, NY: Harper & Brothers, Publishers. 625 p. Illust. Index. Map. 23 cm. [25+* ref]

• ***Summary:*** Book 1. History of Japan from 660 B.C. to 1872 A.D. Book 2. Personal experiences, observations, and studies in Japan, 1870-1874.

This is a remarkable book, beautifully written by an American teacher and traveler in Japan who loves the culture and the people, who lived and traveled widely among them in both the countryside and cities during his four years in Japan (29 Dec. 1870 to 25 July 1874), and who speaks Japanese. He has a deep knowledge of many aspects of Japanese history, including the history of Japanese religions (incl. Buddhism). He was invited to Japan to organize a scientific school on the American principle in Fukui, Ichizen, and to give instruction in the physical sciences. This is the 1st of 18 books he wrote about Japan. He returned to Japan in 1926 the receive the Order of the Rising Sun.

Among the Aino [Ainu] in Hokkaido [Yezo] (p. 31): They sit, like the Japanese, on their heels. Their food is mainly fish and sea-weed, with rice, [soy] beans, sweet-potatoes, millet, and barley, which, in Southern Yezo, they cultivate in small plots."

Describing the Japanese origin myth, with the Sun Goddess (Amaterasu), Izanami, Izanagi, etc. (p. 48-49): "The God of Clay and the Goddess of Fresh Water married. Their offspring was Naka musubi. From his head grew the mulberry and silk-worm, and from his navel sprang the five cereals, rice, wheat, [soy] beans, millet, and sorghum." "Reporting the matter in heaven, Amaterasu was angry at Sosanoö, and degraded her (the Moon-goddess) from joint rule, and condemned her to appear only at night, while she, the Sun-goddess, slept. Amaterasu then sent a messenger the second time to see whether the Food-goddess was really dead. This was found to be the case. Out of the dead body were growing, millet on the forehead; silk-worms and a mulberry-tree on the eyebrows; grass on the eyes; on the belly, rice, barley, and large and small beans." Note 1. Large beans are soybeans; small beans are azuki.

Page 208: The native sauce, *shô-yu,* made of fermented wheat and beans, with salt and vinegar, which the cunning purveyors of Europe use as the basis of their high-priced piquant sauces [such as Worcestershire sauce], was made and used as early as the twelfth century. The name of this saline oil (*shô,* salt; *yu,* oil) appears as 'soy' in our dictionaries, it being one of the three words (soy [sauce], bonze, moxa) which we have borrowed from the Japanese." Note 2. The author's derivation is incorrect; *shô* does not mean "salt," but rather *hishio* or *jiang,* which is the mash, having the consistency of applesauce, before the liquid is pressed out.

Page 357: In the cooper shops is a "dazzling array of wood-work, so neat, fresh, clean, and fragrant... There are two coopers pounding lustily away at a great rain-tank, or saké-vat, or soy- tub" [vat]. An illustration shows two coopers at work hooping a vat.

At the pagan temple (p. 381): "Several old women have stands, at which they sell holy [soy] beans, pious pease, and sanctified rice. These are kept ready in tiny earthen saucers. The orthodox buy these, and fling them to the cloud of pigeons that are waiting on the temple eaves, and fly, whirring down, to feed. Ten thousand sunbeams flash from their opaline necks..."

Page 420: "The village houses were built of a frame of wood, with wattles of bamboo smeared with mud, and having a thatched roof. Within, the floor was raised a foot or so above the ground, and covered with mats. When the rooms had partitions, they were made of a frame of wood covered with paper, and made to slide in grooves. In the middle of the floor was the fire-place. From the ceiling hung pot-hooks, pots, and kettles–one for tea, one for rice, another for radishes, beans, or bean-cheese [tofu]. In these villages good-nature and poverty seemed to be the chief characteristics of the people."

Page 426-27: "The seller of fish, vegetables, oil, and bean-cheese, each uttering his own trade trade-cry, ambled on."

Page 455: "Men or women itinerants carry a small charcoal brazier under a copper griddle, with batter, spoons, cups, and shoyu sauce, to hire out for the price of a cash each to the little urchins, who spend an afternoon of bliss making their own griddle-cakes and eating them."

Note 3. This is the earliest English-language document seen (April 2012) that uses the term "shoyu sauce" (regardless of capitalization or hyphenation) to refer to soy sauce.

Page 496: "... a shop to which the *élite* of the epicures of Yedo [today's Tokyo] resorted daily for the delicacy of eels fried in soy [sauce]. The appetizing odor was wafted" into the neighborhood.

Page 516: "May 1st [1871]–During the past month I have made many excursions on horseback through the country round. staying overnight at the village inns. Sasaki and Iwabuchi have been my companions. I have seen the paper manufactories, oil-presses, the sake breweries, soy-

vats,..."

Page 542: Jan. 22d, 1872. For dinner: "Rice, bean-cheese, daikon, mushroom, fish, are served."

Azuki beans (red beans, small beans) are also mentioned on pages 454 and 469. The population in 1872 was 33.3 million. On pages 587-88 is a sort of bibliography.

William Elliot Griffis lived 1843-1928.

Note 4. This is the earliest English-language document seen (April 2013) that uses the term " bean-cheese" (hyphenated, by itself, with a space before the word "bean," and where it is not preceded by the words "soy," "soya," "soja," etc.) to refer to tofu. Address: A.M., Late of the Imperial Univ. of Tokyo; presently in New York.

565. Imperial Japanese Commission to the International Exhibition at Philadelphia (1876). 1876. Official catalogue of the Japanese section: And descriptive notes on the industry and agriculture of Japan. Philadelphia, Pennsylvania: Published by the Japanese Commission. 130 p. 24 cm.

• ***Summary:*** The Preface (p. 3) begins: "Never until the year 1873, had Japan participated to any great extent in the various European International Exhibitions. Up to that time she had been merely represented by some of the provincial governments, acting independently of the central Government. However, the Government determined to be worthily represented at the Vienna International Exhibition of 1873,..." But Japan was well prepared for the Philadelphia Centennial Exhibition.

Under classes of "Agricultural products" (p. 32, 34): Class 621–Peas, beans, etc. (incl. Soya, adzuki). Class 650–Sea weeds (incl. Vegetable isinglass [agar, kanten]). Class 657–Flour and starch (incl. Kudzu {*Pueraria thunbergiana*}). Class 659–Wines and other kinds of drinks (incl. Sake, Soy {a kind of sauce}).

Page 71 discusses relief painting in lacquer: "The lacquer can even be carved, and, finally, the artisan can incrustate mother-of-pearl shell, ivory, thin metal, or anything he likes into the lacquer. By mixing a sort of paste made of [soy] bean powder, or the white of eggs, with the lacquer, he can thicken it to such an extent as to give it a kind of plasticity, admitting the possibility of making impressions which remain visible after hardening."

In the long chapter titled "Descriptive notes on the industry and agriculture of Japan (p. 37-117) is section on "Agricultural products. Classes 620-21–Cereals, vegetables, etc." (p. 104-06). Beans, generally referring to soy beans, are mentioned many times. "Manures of a mineral nature consist of marls, shells and ashes; those of vegetable origin of inferior kinds of beans and peas or their residues, of [soy bean] oil-cakes, the residues of sake-brewing,..."

"The excellent kinds of beans and peas, which are made into a kind of cheese [tofu] and a peculiar mixed dish called 'misso' [miso] afford the necessary nitrogenous substances, and to a certain extent form the substitute for meat; the Soyu [shoyu; soy sauce] also belongs to this kind of food, and is frequently mixed with other dishes. With regard to animal food, it is limited almost exclusively to fish, poultry and eggs. But a change has already been effected to a certain extent in the larger towns, where butcheries have been established. An experiment of sheep farming was commenced one or two years ago" (p. 106).

Note: This is the earliest English-language document seen (April 2012) that uses the word "Soyu" (regardless of capitalization) to refer to shoyu or soy sauce.

Under "Class 657, 658–Flour, starch, etc. we read (p. 110-11): "It has been mentioned above that the various kinds of beans constitute a very important element of the national diet. Some of the preparations made of beans and peas are worthy of a short notice. In preparing the 'Tofu,' white beans are soaked in water, ground between two stones, strained through a sieve and afterwards boiled. The contents of the kettle are then filtered through cotton cloth and the residue pressed out. The liquid [soymilk], which may be considered as an alkaline solution of legumine, is precipitated by successive additions of the bitter lye [nigari] which runs off from sea-salt by deliquation, and which is mostly composed of magnesium salts. The precipitate is legumine with a small percentage of legumine-composits [-composites] and a large proportion of water. The 'yuba' is also made by boiling the above-mentioned legumine solution in an open kettle, with a slight addition of ash-lye. The insoluble skins which form upon the surface of the boiling liquid, are taken off and dried. Another kind of preserved food is the 'misso' [miso]. White beans are first boiled, pounded in a mortar to form a paste, then mixed with fermenting rice and salt, whereupon the whole mixture is placed in tubs and left in some cool place; at the end of a month it is ready for use. In mentioning the various preparations made of beans, the 'Soy' or, as the Japanese call it, 'Soyu' [shoyu] should not be omitted; but as it belongs rather to the produce of fermentation, the process will be described under the head of Class 660 [Alcohol and malt liquors].

One page 112 we read: "The soy, or 'soyu,' is made of a small bean, the 'Dolichos soja,' or 'Soya hispida,' to which are mixed wheat, salt and water. The beans are first boiled, and the wheat bruised and steamed; both are then mixed with a small addition of fermenting wheat, placed in flat wooden boxes and kept for several days at a fixed temperature in a special room. At the end of three days, the mass [koji] is all covered with fungi and partly with roots of germination. After having been mixed with a salt-lye, which has been prepared hot and allowed afterwards to cool down, and to depose certain impurities, the mashings are now removed to enormous coops [vats] in which they are kept for several years. Experience has shown that the best soy is produced by mixing equal quantities of mashings of three years and five years' standing. This mixture is transferred into bags of thick cotton-cloth, placed in large boxes, and then submitted

© Copyright Soyinfo Center 2014

to pressure–at first only to a slight pressure, which yields the best soy, and afterwards, however, to a gradually increasing pressure, the separation of the last portions being assisted by an addition of salt water.

"The soy forms a very important condiment for all kinds of dishes, and is consumed in large quantities. In 1874 the production amounted to 1,506,402 hectolitres."

An interesting term in the Index (p. 129) is "Bean-cheese," which refers to tofu (p. 110).

Also: Use of hemp (*asa*) for manufacture of cloth (p. 77, 113). The tea ceremony (p. 108). Sea weeds, incl. cultivated nori and Asakusa nori in Tokio bay, kanten or vegetable isinglass, and fu (that resembles carragheen [carrageenan] moss and is used in the sizing of the warp of silk goods) (p. 109). Kudzu (p. 110). Sake (p. 111). Address: Japan.

566. Philadelphia International Exhibition, 1876. Official catalog of the British section. 1876. London: Printed by George E. Eyre and William Spottiswoode. Part I. 424 p. Published by authority of the Lord President of the Council. 23 cm.

• ***Summary:*** The book contains an interesting chapter titled "Exhibitions–Their origin and progress." Prior to 1851 there had been many local exhibitions worldwide, dating back to Biblical times. The first international exhibition was held in London in 1851. To date there have been five international exhibitions: London (1851, 1862), Paris (1855, 1867), and Vienna (1873). These have been attended by a total of 32,959,097 visitors. The Annual International Exhibitions at South Kensington in 1871, 1872, 1873, and 1874 did not realize the expectations of their promoters; public interest rapidly died out and the scheme was abandoned. The first exhibition of the Japanese Empire was held at Kiôto (Kyoto) and contained the objects destined for the Vienna exhibition of 1873. This Kyoto exhibition opened on 17 April 1872 and was so successful that the original limit of 50 days was extended, and the Exhibition did not close until the end of July. The next year the Mikado (emperor) decreed an exposition on a much wider basis, presenting a comparison between the past and present, and even affording a glimpse into the future of Japan. Note 1. This is the earliest document seen (Aug. 2011) that contains the Japanese word "Mikado," meaning Emperor of Japan.

In terms of classification of products, Agriculture is Department VI, in the agricultural building. Agricultural products are classes 620-629; cereals, grasses, and forage plants are class 620, and leguminous plants and esculent vegetables are class 621. Animal and vegetable products are classes 650-662; preserved meats, vegetables, and fruits, dried or in cans or jars. Meat and vegetable extracts is class 656. Vegetable oils is class 662. Horticulture is Department VII, in the horticultural building.

Note 2. This is the earliest English-language document seen (May 2006) that contains the term "vegetable extracts" (or "vegetable extract"). The context shows that they resemble meat extracts. It would be very interesting to know of what and how they are made, and how they are used. By 1896 a type of soy sauce named "Dr. Lahmann's Japan Soja" was described as a "vegetable extract."

An alphabetical list [directory] of exhibitors includes Crosse & Blackwell (Soho Square, London; classes 656, 660, 662), and Lea & Perrins.

On page 246 is the following: "Cl. [Class] 656, 203. Lea & Perrins, Sauce Manufacturers, Worcester, Worcestershire Sauce. (917) Exhibitors, New York, 1853 (Medal)."

On page 77 begins a "List of articles of produce and manufactures chargeable with duty on being imported into the United States." A table titled "Of articles of produce and manufactures chargeable with duty on being imported into the United States" shows (p. 289) that the duty on "Soy" [sauce] is 35 per cent. This is the only reference to soy seen in this book.

Note 3. This is the earliest document seen (April 2001) that contains a directory including listings related to soy. Address: England.

567. Satow, Ernest Mason; Masakata, Ishibashi. comps. 1876. An English-Japanese dictionary of the spoken language. London: Trübner & Co.; Yokohama, Japan: Lane, Crawford, & Co. xv + 366 p.

• ***Summary:*** Page 295: Soup, n. [noun] (flavored with soy [sauce]) *tsuyu; sui-mono;* (made with miso) *otsuke; miso-shiru; o mi otsuke* (the last used only by women).

Soy, n. shôyu (c).

Note 1. The symbol "(c)" denotes that the word which precedes it is of Chinese origin. However, the word *shôyu* is not of Chinese origin, but rather of Japanese origin.

Note 2. This is the 2nd earliest English-language document seen (April 2012) that uses the term "shôyu" to refer to soy sauce. Address: 1. Japanese Secretary to H.M. Legation at Yedo; 2. Imperial Japanese Foreign Office.

568. Blavet, A. 1877. Le *Soja Hispida* et le *Cicer Arietinum* [The soybean and the chickpea]. *Moniteur Horticole* (*Belgium*) No. 1. p. 7. Jan. [Fre]*

• ***Summary:*** Even though not shining among the first rank of the food species, these two legumes are of real interest for our vegetable plots. For some time now, based on favorable trials conducted in France, they have been recommended very seriously to all those who are interested in the important question of food. We believe, therefore, that it would be useful to our readers to give a brief description of these two vegetables which are still almost unknown in our country.

The *Soja Hispida* or *Dolichos Soja* belongs to a genus that is very closely related to the genus *Glycine,* and certain botanists even lump them together. It is an annual hairy (*hispide*) plant, about 1 meter in height when erect. Its leaves are trifoliate, consisting of three leaflets or folioles.

© Copyright Soyinfo Center 2014

Its flowers are violet, arranged in clusters (*en grappes ascillaires*), followed by oblong pods, slightly arched, each containing from 2 to 5 oval seeds, a little compressed. It originated in Asia.

In Japan, in China, and in tropical Asia (I might add in Mexico), these seeds are eaten as a vegetable [green vegetable soybeans]. In these regions, it can be said that the culinary art owes them a lot, because they enter into the preparation of all the sauces. Among other things, they are made into the celebrated Soy [sauce], so sought after by Asiatic gastronomes, and which is also known and used in Europe to enhance the taste of certain dishes, and especially beef, whose digestion it uniquely facilitates. The soybean (*le Soja*) is also said to be an important oil-bearing plant.

In October 1878 we had two soybean plants growing in our plot of vegetables at the Universal Exposition [in Vienna]. One member of our society asked Mr. Vilmorin what he knew about this plant. He replied: About eight years ago [i.e., in 1870] I saw it appear, then it was not spoke about again. Anyway, the visitors [at the Exposition] paid such high honors to our two plants, that all we were left with was the stems [because the visitors had stripped off the pods and seeds].

You know better than anyone how much perseverance and stubbornness it takes to propagate a novelty, regardless of its excellence. You have to convince, particularly at the beginning, you have to overcome the bad will, the habits, the distrust, the jealousy, the incompetence, the conviction that it is impossible to do better... and whatever! This the first year I gave the soybean (*le Soja*) to market gardeners / vegetable growers (*maraîchers*); a certain number of them did not wait for the plant to reach maturity before putting it on the compost pile. They called it an obscenity which took up room unnecessarily. They came to a hasty conclusion / judgment, as you can tell.

Others who thought about it more gave the plant the opportunity to bear fruit, but the failed to write a report about its cultivation.

Finally, only two people understood that this very accommodating legume was not out of place. Yet one must add that this was thanks to the presence of a ship-owner (*armateur*), who had eaten it in Mexico. He was very fond of this product, and it is to this fact that the plant was given the honor of being cultivated on a large scale in one of the châteaus where one of our two gardeners happened to be.

Note: This is the earliest document seen (Feb. 2009) concerning soybeans in Mexico, Central America, or Latin America. It is not clear whether or not these soybeans were cultivated in Mexico (they may well have been) or where they came from (they may well have come from China on a Manila galleon as part of the China trade).

It's the same kind of thinking. Without the laudable perseverance of one of our horticulturists, our excellent Etampes soybean (very early), would never have come to our attention. What if it had been grown by a market gardener who just brought some of it to our market without thinking for years to give it the least extension to its cultivation.

The first year it was sold for 12 francs per liter.

569. Haberlandt, Friedrich. 1877. Der Anbau der rauhhaarigen Sojabohne [The culture of the hirsute soybean]. *Landwirthschaftlichen Versuchs-Stationen* 20:247-72. [5 ref. Ger]

• ***Summary:*** Haberlandt submitted this article in Jan. 1877 from Vienna. The original soybean seeds were obtained at the Vienna World Exposition of 1873 then grown out in the garden of the Royal College of Agriculture (*Hochschule für Bodencultur*) in Vienna. The seeds grown in Vienna and harvested in 1875 and 1876 were larger and heavier than those obtained at the Exposition.

"Among nutritional plants, the hirsute soybean (*der rauhhaarigen Soja*) is of the first rank. For no other legume nourishes so many people, and has such great nutritional value, and multiple food uses" (p. 247). On p. 248 Haberlandt shows that he is familiar with the soybean work of the Society for Acclimatization in France. "In France the soybean is known as the oil pea, and it is cultivated at various points in the departments of Ariège and Haut-Garonne... Many years ago attempts were made to grow *Soja hispida* in Hohenheim [Germany], but the plants were barely brought to a blooming state. People also had the same experience in other places. Dr. A. Rauch of Bamberg [Germany] (see *Die Fundgrube von Dr. A. Rauch. III. Jahrgang. Bamberg* 1876), on several occasions, received seeds of various soybean varieties from Japan. They were sent by his long-time friend, Colonel [Philipp Franz] von Siebold, who died at an early age. But every trial by Dr. Rauch was unsuccessful.

In 1875 Prof. Haberlandt conducted soybean trials at the Royal College of Agriculture in Vienna. In early 1876 he published detailed results of these trials in the *Wiener Landwirthschaftliche Zeitung.* Nutritional analyses of these seeds were published.

In early 1876 Prof. Haberlandt then sent samples of seeds to seven cooperators in central Europe, who planted and tested the seeds in the spring of 1876, with good or fairly good results in each case. These men reported the details of their agronomic trials (*Anbauversuche*) to Haberlandt, who quotes from their reports (p. 253-59). Haberlandt sent soybeans to: Master-gardener W. Köhler (p. 253-54) in Ungarisch-Altenburg [Hungarian Altenburg, formerly Magyarovar, today's Mosonmagyarovar in Hungary about 22 miles northwest of Györ]. He planted 100 seeds in mid-May, 1876, in a sunny place in the botanical garden, in a bed 5 meters long by 2 meters wide. All the seeds germinated (*Alle Samen keimten*) and the plants developed luxuriantly. But one night, when they were 5-6 cm tall, all the young plants were eaten by rabbits. However they grew back and yielded

© Copyright Soyinfo Center 2014

1.6 kg of seeds.

Landowner (*Gutsbesitzer*) A. Stojics (p. 253-54) in Gross-Becskerek in Hungary. He planted 100 brownish-red (*braunrothen*) and 100 yellow soybeans in mid-April. In mid-September he harvested 0.33 kg seeds of the former and 0.32 kg of the latter.

Note 1. This is the earliest document seen (Feb. 2005) concerning soybeans in today's Hungary (though Hungary was not officially created until 1918), or the cultivation of soybeans in Hungary. This document contains the earliest date seen for soybeans in Hungary, or the cultivation of soybeans in Hungary (mid-April 1876) (one of two documents). The source of these soybeans was Friedrich Haberlandt in Vienna.

Landowner Graf. H. Attems (p. 253-55), owner of a seed testing station (*Samenculturstation*) in St. Peter bei Graz in Steiermark [today's Styria, capital of Graz in Austria]. On 19 May he planted 50 brownish-red (*braunrothen*) seeds from China and 50 yellow seeds from Mongolia. He harvested the seeds between Oct. 11 and 24, obtaining 0.870 kg of the brownish-red and 0.642 kg of the yellow.

Mr. A. Tomaszek [Tomasek] (p. 253, 255-56, 260, 263), farmer and civil servant (*Oekonomie-Beamter / Verwalter*) in Napagedl in Mähren [Moravia, a region in today's central Czech Republic]. He planted 25 yellow and 25 reddish-brown soybeans on April 29. The yellow yielded 1,400 seeds and the reddish-brown 1,350 seeds.

Note 2. This is the earliest document seen (Feb. 2005) concerning soybeans in what is today the Czech Republic (though it was not officially created until Jan. 1993), or the cultivation of soybeans in the Czech Republic. This document contains the earliest date seen for soybeans in the Czech Republic, or the cultivation of soybeans in the Czech Republic (29 April 1876) (one of two documents). The source of these soybeans was Friedrich Haberlandt in Vienna.

Note 3. Concerning Mähren (Moravia): from 1849 to 1918 it was a separate crownland of Austria, with capital at Brno. In 1918 it was organized as a province of Czechoslovakia.

Princely Privy Councillor (*Hofrath*) W. Janig (p. 253, 256-57) in Prague in Böhmen [Bohemia]. He was sent 200 seeds which he sent to 5 locations (including in Sichrow, Swijan [on the Iser or Jisera River], and Darenic) in Bohemia [now in the Czech republic] for planting. All but 5% sprouted. In Sichrow, 25 seeds planted in early May yielded 2,500 seeds in October. Continued. Address: Mittheilungen aus dem landwirthschaftlichen Laboratorium und Versuchsgarten der k.k. Hochschule fuer Bodencultur in Wien [Vienna].

570. Haberlandt, Friedrich. 1877. Der Anbau der rauhhaarigen Sojabohne [The culture of the hirsute soybean (Continued–Document part II)]. *Landwirthschaftlichen Versuchs-Stationen* 20:247-72. [5 ref. Ger]

• ***Summary:*** Continued from p. 253. Prof. Dr. Kulisz (p. 253, 257) in Tetschen-Liebwerd in Böhmen [Bohemia, now in the Czech Republic] planted 150 seeds of 3 varieties. Despite snow, rain, and frost in May, 98 plants survived, yielding 660 seeds. The tallest plant was not over 50 cm high.

Dr. Nicolaus Dimitriewicz (p. 253, 257-58), a former student at the Royal College of Agriculture in Vienna, and now a farmer (*Oekonom*) in Bukovina [Bukowina or Bucovina, a former Austrian crownland, now (2005) divided between the Ukraine and Romania]. He received 100 seeds which he sent to 6 farmers he knew in four nearby locations in the district of Kotzman (*des Kotzmaner Bezirks*).

Note 1. As of 1994, Kotzman is the town and district of Kitsman in the southwestern Ukraine, just north of the border with Romania. Also spelled Kotzmann, Cotman, Cozmeni, Kosman, Kozmeny, or Kucmeh, it is located 19 miles northwest of Chernivtsi (also spelled Chernovtsy, Chernowitz, or Czernowitz).

The seeds were planted late, on April 20 or later, and some were killed by frost. Others, protected from the frost, grew fairly well. For example, the second farmer harvested 669 seeds from 19 plants. The 64 plants which survived yielded less than 2.821 kg of seed. Note 2. This is the earliest document seen (Feb. 2001) concerning soybeans in the Ukraine, or the cultivation of soybeans in the Ukraine (one of two documents). This document contains the earliest date seen for soybeans in the Ukraine, or the cultivation of soybeans in the Ukraine (20 April 1876). The source of these soybeans is unknown.

And A. Schnorrenpfeil (p. 253, 258), Administrator of *Gutswirthschaft* at the Agricultural Academy in Proskau (*Landwirtschaftlichen Akademie Proskau*) [now named Proszkow, in today's southwest Poland] in Preussisch-Schlesien [Prussian Silesia, a Prussian province later divided into upper- and lower Silesia]. He planted 50 seeds of two varieties in late April.

Note 3. Proszkow is a market town located 7 miles southwest of Oppeln (now Opole), in southwest Poland at north latitude 50º40'.

Note 4. This is the earliest document seen (Feb. 2005) concerning soybeans in Poland, or the cultivation of soybeans in Poland (one of two documents). This document contains the earliest date seen for soybeans in Poland, or the cultivation of soybeans in Poland (20 April 1876). The source of these soybeans was Prof. Haberlandt in Vienna.

Joh. Stua (p. 263-64), of the Technolog. Laborat. der k.k. [kaiserlich-königliche] Hochschule für Bodencultur [Imperial-Royal College of Agriculture] in Vienna, conducted a detailed nutritional analysis of the yellow Mongolian, yellow Chinese, and brownish-red (*braunrothe*) varieties. The first 3 columns of a full-page table (p. 264) show percentages in air-dried soybeans of (1) the original soybean seed sample, (2) soybeans grown the first year,

© Copyright Soyinfo Center 2014

and (3) soybeans grown the second year. Columns 4-6 show the same information adjusted as if the soybeans had a 10% water content. For each variety, data are given for water, protein, fat, nitrogen-free extract (Stickstofffreie Extractivstoffe), crude fiber, and ash (*Aschenbestandtheile*). Note 5. This is the earliest German-language document seen (Oct. 2004) that mentions red soybeans (actually brownish-red) or that uses the word *braunrothe* to refer to the color of soybeans. In many other documents by or about Prof. Haberlandt, the term "reddish-brown" (*braunrothen*) is used to describe the color of a type of soybean he obtained from China.

Tomaszek (p. 263) wrote Haberlandt that he was astonished by the high oil and protein content of the soybeans he grew and harvested and had analyzed by a chemist at the sugar factory. So he had the analyses repeated by Prof. K. Zulkowski of the technical university at Brünn, and got similar results. Zulkowski found (table, p. 263) that the air-dried seeds of yellow soybeans from China contained 16.99% fat, 40.19% protein, and 6.43% nitrogen. The brownish-red soybeans from China contained 16.68% fat, 44.93% protein, and 7.19% nitrogen. Note 6. This is the earliest document seen (April 2003) that mentions Zulkowski.

These analyses are in close accord with those published by Senff in 1872 (table, p. 265). Soybeans are compared with lupins and other legumes.

On pages 270-71 Haberlandt discusses food uses of soybeans. "The soy sauces, which were imported from India and spread from England over Continental Europe, could in no way awaken a favorable opinion of the flavor of the soybean, for these sauces have a strong flavor of browned (*gebräuntem*) sugar, perhaps also mixed with other ingredients, so that the soybean's own flavor is completely masked (*verdekt wird*). Because of their complete lack of starch, soybeans do not become soft through cooking, so it is necessary to crush and rub the half-soft cooked seeds before their further preparation... Best would be a use [of soybeans] which imitates that of corn kernels (*Maiskörner*), from whose flour the people of southern Europe prepare their beloved dish, Polenta. Soybeans roasted at 160ºF taste delicious and surpass all other plants that have heretofore been used as coffee substitutes."

Note 7. This is the earliest document seen (Nov. 2012) in which Dr. Haberlandt mentions that roasted soybeans made a good coffee substitute.

Note 8. Tables from this article are described in a separate record. Address: Mittheilungen aus dem landwirthschaftlichen Laboratorium und Versuchsgarten der k.k. Hochschule fuer Bodencultur in Wien [Vienna].

571. Haberlandt, Friedrich. 1877. Der Anbau der rauhhaarigen Sojabohne [The culture of the hirsute soybean: Tables (Document part)]. *Landwirthschaftlichen Versuchs-Stationen* 20:247-72. [5 ref. Ger]

• ***Summary:*** Tables show: (1–p. 260) The weight in grams of 1,000 original seeds compared with the first progeny in 1875 and the second progeny in 1876. Yellow soybean from Mongolia: 81.5, 126.0, and 163.6. Note the significant increase in seed weight. Yellow soybean from China: 92.5, 148.0, 143.0. Reddish brown soybean from China: 105.0, 154.5, 141.8. Black soybean from China: 101.6, 110.6,–(no value given).

(2–a full-page table, p. 261) Prof. Haberlandt's results in testing 7 different types of soybeans in 1876: Yellow from Mongolia (progeny), yellow from China (progeny), reddish-brown from China (progeny), black from China (one original, one progeny), black from Mongolia (original), and black from Japan (original). For each variety is given: Size of the trial plot in square meters (range 4.0 to 11.0), Planting date (April 25 to May 5), successful emergence of sprouts (May 19 to June 2), first flowering (June 20 to July 3), start of ripening (Aug. 25 to Oct. 24), date of harvesting (Sept. 26 to Nov. 6), number of plants harvested (52 to 339), weight of the harvested seeds in grams (570 for black from Mongolia to 3,710 for yellow from China), weight of the air-dry straw in grams (1,920 for black #1 from China to 7,270 for yellow from China), calculation of weight of seeds per hectare (in kg) (1,111.1 for black from Japan to 3864.6 for yellow from China), calculation of weight of straw per hectare (in kg) (4,062.5 for black #1 from China to 6,025 for black from Mongolia), number of seeds per plant (40.5 to 124.4 for black #1 from China), weight of 100 air-dry seeds in grams (101.6 from black #1 from China to 163.6 for yellow from Mongolia).

(3–p. 268) The total heat units (*Wärmesummen*) required for 7 different types of soybeans in 1876 to the start of ripening and to harvest: Yellow from Mongolia (progeny) 1824ºC, 2230ºC. Yellow from China (progeny) 1887ºC, 2253ºC. Reddish brown from China (progeny) 1699ºC, 2293ºC. Black from China (original) 2844ºC, 3175ºC. Black from China (progeny) 2661ºC, 3175ºC. Black from Mongolia (original) 2905ºC, 3175ºC. Black from Japan (original) 2954ºC, 3175ºC. Note that the yellow varieties (the first two) required the fewest heat units, while the black varieties required the most.

Note 1. This is the earliest document seen (Oct. 2013), worldwide, that contains information on the weight of soybean seeds. Haberlandt measured the weight in grams of 1,000 soybean seeds.

Note 2. This is the earliest document seen (Oct. 2004) that clearly mentions soybean straw, which the stems, leaves, and empty pods left after the plants have been thrashed for seed. Soybean hay is the whole dry plants with the beans left in the pods, cut at any time from the setting of seed until the leaves begin to turn yellow. Address: Mittheilungen aus dem landwirthschaftlichen Laboratorium und Versuchsgarten der k.k. Hochschule fuer Bodencultur in Wien [Vienna].

572. *Landwirth* (*Der*)*: Allgemeine Landwirthschaftliche Zeitung* (*Breslau*)**.** 1877. Die rauhhaarigen Sojabohnen [The hirsute soybeans]. 13(48):261. June 15. [Ger]

• ***Summary:*** At the Vienna World Exposition of 1873, many varieties of soybeans from Mongolia, China, and Japan were represented. They are widely cultivated in those countries. Subsequently, at the Royal School of Agriculture in Vienna, trials were made to study the growth and yield of the plant. The results from the year 1876, according to Prof. Haberlandt–as reported in the *Wiener Landwirthschaftliche Zeitung*–lead to the conclusion that the soybean can only mature seeds where the medium level of summer warmth is a little over 140 R. and where neither grape tendrils nor maize (*Mais;* corn) are able to ripen more. In Austria-Hungary, early-ripening soybeans can be cultivated. The small number of trials seem to indicate that large-scale cultivation would produce good yields. The experimenters noted the remarkable fruitfulness of the soybean. In Bukowina [Bukovina or Bucovina, a former Austrian crownland, now divided among the Ukraine and Romania], each seed yielded 188 seeds. Moreover, analyses show that the seeds are of great nutritional worth, and the progeny of the original seeds have more protein and fat than their forbears. The straw also has high value as a feed, and feeding trials show that cows like not only the green plants but also the straw. Since soybeans are widely used for food among the people of East Asia, Prof. Haberlandt hopes that this plant, because of its great fruitfulness, will become widely cultivated in Europe within a few years, and will been seen as competing in importance with the various cereal grains, potatoes, and corn.

Note: Breslau (see Journal name; the German name for Wroclaw [pronounced vrot-SLAF]) came under the control of Prussia in 1741, and remained part of Germany until 1945, when it was assigned to Poland by the Potsdam Conference.

573. Warren, C.F. 1877. Places I have visited in Japan. *Church Missionary Intelligencer and Record, a Monthly Journal* 2:475-80. Aug. New series.

• ***Summary:*** (Continued from p. 414). Part "VII. Temple of Inari at Fushimi, near Kiyoto [Kyoto] (p. 479)."

Page 480: "Idolatry is practised here, but the fearful superstition connected with the worship of Inari is carried on beyond the principal shrine in a somewhat more retired spot backed by a hill in the distance. Some 350 wooden *torii,* placed close together, and forming two pathways side by side, show that we are approaching a spot where many press to worship–for these *torii* are offerings made by devotees. The shrine to which they lead is small, the entire building being only a few feet square. Its doors are closed, and there is only a small aperture, a few inches square, left open to admit the numerous offerings. On the shrine small toy-like *torii,* about a foot in height, may be counted by the dozen. What exalted deity is here worshipped? It is the fox! On one occasion I happened to be at the spot, just as an old man came to take away the offerings made the preceding day. When he opened the door I examined the interior of the shrine. The only furniture it contained was a box, placed under the small aperture in the door, to receive offerings, and a tray, placed against the back of the shrine, on which some of the offerings of the previous day had been arranged. The old man was provided with a basket, into which he put the offerings on the tray. He then took fresh offerings from the box by the door, and laid them in order in the place. They consisted of fried bean curd, *mochi*–a kind of unleavened cake made from rice flour–peas, beans, dried fish, &c, and cash. These had all been offered to the fox-gods; and on one side of the shrine I observed a small hole, through which these deified animals are supposed to enter, to feast on the supply provided for them."

Note: This is the earliest English-language document seen (April 2013) that contains the term "fried bean curd."

"Worshippers come to this shrine, ring the bell, clap their hands, present an offering, bow, and mutter a prayer; then they pass into the spacious grounds at the back to visit the holes of foxes. As they go over the well-beaten path, they stop at place after place to pour a few drops of wine, or to make some other small offering at the foxes' holes. Several years ago this form of superstition was discouraged by the Government, but it still survives, and no doubt will survive, until the people are taught to worship the great Creator, and to serve Him alone. The superstition is widespread. Education may do much to show its absurdity; however, nothing will effectually eradicate it but the Gospel of Christ." Address: Rev.

574. Richthofen, Ferdinand Freiherr von. 1877-1912. China: Ergebnisse einiger reisen und darauf gegrundeter studien [China: The results of some travels and studies based on them. 5 vols.]. Berlin: Verlag von Dietrich Reimer. Illust. Index. 29 cm. [Ger]

• ***Summary:*** Contents: Vol. 1. Introduction, 1877. Vol. 2. Northern China, 1882. Vol. 3. Southern China, edited by E. Tiessen, 1912 (since Richthofen died on 6 Oct. 1905). Vol. 4. Paleontological part. Vol. 5. Conclusions.

This German-language travelogue describes the author's seven trips throughout China from 1867 to 1871. Various color maps in Vol. 1 show the course of each journey. Soy is mentioned in volumes 1, 2 and 3.

In vol. 1, p. 420, in discussing the *Zhouli* (Rites of the Zhou dynasty, ca 300 B.C.) we read: (4) Beans, and to be sure probably the soya-bean (*shu*) which is also mentioned in other early texts. Note: Thus, Richthofen believes that *shu* refers to soybeans.

But only in Vol. 2, p. 145-46 is the soybean discussed in detail. Elsewhere soybeans (called simply *Bohnen* or "beans") are listed among the different crops grown in various provinces. In chapter 4, titled "Southern Manchuria

© Copyright Soyinfo Center 2014

or the province of Shönking" (also spelled Shengking or Shing-King, a geographical area in southern Liaoning province, apparently known only to Germans since it is not one of China's 18 provinces) we read (p. 145-46) that legumes are the No. 1 export. Almost all the export of *Ying-tze* consists of [soy] beans, the [soy] bean oil (*Bohnenöl*) pressed from them and the bean cake (*Bohnenkuchen*) that remains. Most of the beans are shipped to the coast of northern China, where they are used as food. The bean cake is used in part as a fodder for cows (*als Futter für das Vieh*) and, in part, as fertilizer on the sugar fields of southern China. Recently Japan started to import this cake from Manchuria. The [soy] bean oil is used for the preparation of foods in the central and southern provinces of China. MacPherson reports that in the one province of Shöng-king, soybeans account for 20% of all exports. All the rest come from *Piën-wai.* The trade is in the hands of Chinese merchants, who buy the beans at the various inland locations, then consolidate them at other locations where they are pressed [to give soybean oil and meal]. The presses are often located in the same villages where the beans are grown. A description of the press and its operation are given. In 1867 a large English firm from Shanghai erected a steam-driven press at Ying-tsze, in the hope that the use of greater pressure, speed, and volume of work, they could make a less expensive product, and thereby gain a significant part of the oil processing business. However the cost of erecting this plant was very high, since many changes had to be made. There were also numerous other problems. However at the time of Richthofen's visit, after the expenditure of much effort, time, and money, they were finally able to obtain favorable results. Many Europeans are now entering China with modern technology and great energy, bringing better and faster methods to silk spinning, sugar refining, and in Siam to rice hulling.

Soybeans are also grown (along with maize, millet, kaoliang, and some opium poppies) in the Liao valley of east of Mukden (p. 143), throughout southern Manchuria (p. 144, along with wheat, barley, millet, sorghum, cotton, peas, rice, indigo, sesame, tobacco, opium poppies, and potatoes), in the mountains of Shandong (p. 248-49, with wheat, peanuts, sesame, and rapeseed). At a harbor in Shandong, major imports include [soy] beans, sugar, paper, lumber, some English cotton goods and lead (p. 261). Soy beans are also grown in the northern part of the provinces of Chili and Shansi (p. 360, along with kaoliang, oats, buckwheat, peas, and black [soy] beans), in the province of Shanxi (p. 480, along with wheat, cotton, tobacco, maize, sorghum, and oilseeds), and in the province of Henan (p. 535, along with wheat, barley, peas, rapeseed, sweet potatoes, and poppies for opium production; from June until the end of July 80% of the fields are planted to cotton, and soybeans are planted between the stands of cotton).

Vol. 3 states that soybeans (*Bohnen*) are grown along the Yangtze River (p. 81, along with rice, various types of sorghum, maize, and some sugarcane), in the mountains of Szechuan south of the Yangtze (p. 223, along with sweet potatoes, buckwheat, and millet; and p. 238, along with hemp, peanuts, silk, and opium poppies; and p. 260-61, winter crops include "field beans" {*Feldbohnen*}, of wheat, barley, peas, and rapeseed. Summer crops include soybeans {*Bohnen*}, soybeans {*Soya*}, peanuts, maize, sesame, millet, kaoliang, hemp, buckwheat, and tobacco), in southeast China (p. 412-13, along with hemp and potatoes, plus peanuts, sesame, and rape as oilseeds), in the province of Kwangtung (around Canton in southern China, p. 482, along with rice, sugar cane, wheat, buckwheat, tobacco, and rapeseed), in Hupei province of central China (p. 531-32, along with oil-cake and rapeseed), in the mountains eastern Chekiang and Anhwei (p. 671, along with rice, what, tobacco, maize, and sweet potatoes, and p. 677, along with maize, sweet potatoes, and kaoliang sorghum), in Kiangsu on the island of Tai-hu (p. 701, along with vegetables).

Also discusses: Peanut oil (Vol. 3, p. 498). Sesame oil (Vol. 3, p. 413).

Note 1. This is the earliest German-language document seen (Sept. 2006) that uses the term *Bohnenöl* to refer to soybean oil.

Note 2. Ferdinand Richthofen lived 1833-1905. Note 3. This is the earliest European-language document seen (March 2002) that mentions kaoliang (literally "tall millet"). However Bray (1984, p. 449) says that this word first appears in the *Wang Chen Nung Shu* (also called *Nung Shu;* Wang Chen's Agricultural Treatise) of +1313. Address: Bonn, Germany.

575. Houghton, Ross C. 1877. Women of the Orient: An account of the religious, intellectual, and social condition of women in Japan, China, India, Egypt, Syria, and Turkey. Cincinnati, Ohio: Hitchcock and Walden; New York, NY: Nelson and Phillips. 496 p. Illust. Index. [10* ref]

• ***Summary:*** In Chapter 4, "Education" is a long passage quoted from an article in the *Leisure Hour* [date, author, and title not cited] (p. 88-90) which contains "a translation of one of the very few Chinese works designed for the instruction of women." Page 90: "The third important thing is, do not waste rice or flour; be careful of the soy [sauce], vinegar, oil, and salt; in the day of plenty think of a day of want, that when that time comes you may not have to beg."

In Chapter 12, "Woman's position and life in the household," notes (p. 241): "The domestic position of an average Japanese woman is superior to that conceded to her sisters in other Eastern countries. Although she does not enjoy all the rights and privileges secured to a married woman in a Christian land, still she is treated as the companion rather than the slave of her husband, and her likes and dislikes are, to a considerable degree at least, respected. She is, however, without legal rights, and her evidence is not

© Copyright Soyinfo Center 2014

admissible in a court of justice."

Concerning Japanese food (p. 242-43): "A favorite relish is 'soy,' a strong sauce composed of pepper [sic] and fermented black beans."

Illustrations show: (1) A Japanese family at dinner (p. 242). (2) A Japanese lady (p. 243). Address: Rev., A.M., St. Louis, Missouri.

576. Leunis, Johannes. 1877. Synopsis der Pflanzenkunde: Ein Handbuch fuer hoehere Lehranstalten... Zweite gaenzlich umgearbeitete Auflage... 3 vols. [Synopsis of botany: A handbook for institutions of higher learning... 2nd ed. 3 vols.]. Hannover: Hahn'sche Buchhandlung. See vol. 2, p. 412. [Ger]

• ***Summary:*** Volume 2 (*Zweiter Theil*) is devoted to botany, bound with vol. 1, and arranged by plant families. Under legume family (*Leguminosae, Huelsenpflanzen*) are the papilionaceae (*Schmetterlingsblüter,* p. 374+) within which we find the genus Dolichos (p. 412), which includes *D. pruriens, D. Lablab,* and *D. Soja* (the soybean). Symbols indicate that the genus contains plants with therapeutic or medicinal value (*Apotheker–oder Arzneipflanzen*) and that the soybean alone is a commercial plant (*Handelspflanze*).

Concerning the soybean we read: *Dolichos soja** L. (Footnote 5: *The term Soja or Sooja is used by the Japanese to refer to a sauce {*Tunke*} in which soybeans {*die Soja-Bohnen*} are used) or *Soja japonica*** Savi (Footnote 6: **Japanese)

Note 1. This is the earliest German-language document seen (April 2012) that uses the word *Tunke* to refer to soy sauce.

The Japanese Soybean (*Japanische Sojabohne*). Cultivated in its native Japan and now also throughout all of southern Asia, because the beans taste good and also serve for the preparation of a piquant, brown, thick, sauce, which is very popular on foods, and in India is added to almost all foods and is also imported to Europe and used to improve sauces or extracts (*Brühen*) and also as a sauce for roasts (*Braten-Sauce*)*;* however the Soya that is now in commerce in Europe is not made from soybeans but rather made by us from other materials, namely from molds (*Pilzen*).

Also discusses: Alfalfa (p. 382-83). Lupines (p. 410). Voandzeia (p. 411). Almonds (p. 414).

Note 2. Leunis lived 1802-1873. His portrait (an illustration) faces the title page of Vol. 1. This book was published after the author's death by A.B. Frank, lecturer in Botany at Leipzig University. Volumes 1-2, 1230 pages, have no index. Vol. 3, mostly about algae, has an index. Address: PhD, late Prof. of Natural History at the Josephinium in Hildesheim [near Hannover, Germany] (weiland Professor der Naturgeschichte am Josephinum in Hildesheim).

577. Shôyu shûsetsu [Collected theories on shoyu]. 1877. Japan. [Jap]*

• ***Summary:*** Book on shoyu production showing the wide variation in formulas used. For a translation of several parts, see Fruin 1983 (p. 26-27).

578. *Boston Daily Globe.* 1878. Japanese ways: An entertaining lecture at Horticultural Hall, yesterday, before the Free Religion Association, by Professor E.S. Morse. Feb. 15. p. 5.

• ***Summary:*** Prof. Morse, gave "in an off-hand way his impressions of that country, with whose ways he seems to have fallen in love." "There are many beautiful fish caught on the coasts; and the Professor said that they were excellent eaten raw, and advised his hearers to try some raw fish, sliced, with soy sauce, and see if they did not like it. 'The Japanese use neither butter, milk, bread, nor cheese.'"

"Kindness to animals is a great characteristic; no bird is ever shot at, no animal ever beaten, and on all the highways you will find stones, erected centuries ago, directing men to water their horses here."

579. Ahlburg, H.; Matsubara, Shinnosuke. 1878. Kôji no setsu [Theory of koji]. *Tokyo Iji Shinshi* (*Tokyo Medical Journal*) 24:12-16. March 10. [Jap]

• ***Summary:*** According to Nakazawa (1950, and to the SoyaScan database), this is the earliest publication seen on koji. Note that although the document is in Japanese, a European is listed as the first author. Actually, Ahlburg, a German, was a co-experimenter but not an author. The original scientific name of the koji mold dates from this document. Romanized terms (all uppercased) appearing in the article are: Mycoderma vini, Mycoderma ceriviae [Cerevisiae?], Bacterium aceti, Mucor, Euntium, Eurotium, E. Oryzae Ahlbg.

Murakami (1971) says of this article: "Ahlburg, in 1876, isolated for the first time a yellow-white mold from koji for *Saké* making." It as originally named *Eurotium oryzae* Ahlburg although it was renamed *Aspergillus oryzae* (Ahlburg) Cohn by Cohn in 1884.

580. *Mittheilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* (*Yokohama*). 1878. Sitzung in Tenkoin, Yedo, am 22ten Juli 1878 [Meeting in Tenkoin, Tokyo, on 22 July 1878]. 2(16):271. July. [Ger]

• ***Summary:*** "Concerning Dr. Langgaard's communication on tofu, Mr. Kempermann remarks that in his opinion tofu is mainly a food of the wealthy; for the poor seem to place great significance on sugars [carbohydrates], and in times of great shortages of rice, sugar consumption will be considerable.

"Dr. Langgaard remarks that shoyu plays a very insignificant role as a source of nutrients. Shoyu contains a great deal of salt and serves mainly as a seasoning. It is important to mention, concerning shoyu, that, especially when it is used in fresh condition, at one and the same meal,

© Copyright Soyinfo Center 2014

only small quantities can be enjoyed.

"After this, Mr. Netto pointed out that tofu consumption depends on the price of fish. In Kosaka* the poorest people eat tofu when they must forego the enjoyment of fish."

* Note: The meaning of the term "Kosaka" is unclear. The only known place by that name is a relatively unknown small town in Akita prefecture, in northeastern Japan. Address: Japan.

581. *Tokyo Iji Shinshi* (*Tokyo Medical Journal*). 1878. Miso, tôfu, yuba shikensetsu [On the nutritional value of miso, tofu, yuba]. No 25. p. 3-7. July. [Jap]*

582. Wein, Ernst. 1878. Ueber den Anbau der rauhhaarigen Sojabohne in Bayern. I. Ernteresultate der auf der Versuchstation angestellten Culturversuche [On the cultivation of the hairy soja bean in Bavaria. I. Harvest results from culture trials in agricultural experiment stations]. *Zeitschrift des Landwirthschaftlichen Vereins in Bayern* 68:469-74. Dec. [Ger]

• ***Summary:*** Professor Haberlandt, who died earlier this year in Vienna, had successes with acclimatization trials using the hairy/hirsute soybean in the various crownlands of the Austrian-Hungarian monarchy. These became the stimulus for the cultural trials with this plant conducted by Prof. Dr. J. Lehmann in all the administrative districts of the Kingdom of Bavaria. Some 69 farmers took part in these trials and most of them reported their results.

Here the writer would like to report the results of the cultural trials conducted at the experiment station. Most of the seeds for these trials came from the Austrian trials, but a small portion were original seeds from Japan. Planting took place on April 30, with 10 seeds planted 3 cm deep per square meter. These were transplanted into 21 square meters of humus-rich soil in the garden. Two varieties of seeds were planted, one light-yellow (white) and one brown. These were of various sizes, so each variety was divided into small and large seeds. On parcel I were planted 720 small yellow (white) seeds weighing 94.7 gm. On parcel II were planted 560 large yellow seeds weighing 93 gm. On parcel III were planted 420 small brown seeds weighing 47.9 gm. On parcel IV were planted 412 large brown seeds weighing 75.5 gm. On parcel V were planted 500 yellow original seeds weighing 69.2 gm. The plants broke ground (emerged) on May 6. Flowering on the first 4 parcels lasted from July 24 to Aug. 4, which the 5th parcel first bloomed in October. The plants developed slowly at first due to the cold, moist weather, but later they developed and grew well.

The average temperature from May 1 to Oct. 1 was 16ºC. The plants showed early on that they had been planted too densely. Results of the harvest are given for each parcel. For example: Parcel I. Small yellow variety. Date of harvest: Oct. 17. Number of plants harvested: 629 (629 seeds weighed 82.7 gm). Number of seeds harvested: 23,498. Average number of seeds per plant: 37. Weight of the seeds: 2,758 gm. Weight of the pods: 1,212 gm. Weight of the straw 9,142 gm. Total weight harvested: 13,112 gm. One thousand seeds weighed 117 gm.

A table (p. 473) shows the main figures for parcels I-IV. Parcel IV gave the best results, yielding 49,429 seeds which weighed 6,846 gm, etc.

Note: In 1878 the Kingdom of Bavaria was ruled by Ludwig II (lived 1845-1886; reigned 1864-1886), who built the beautiful fairy-tale castle Neuschwanstein, was close friends with Richard Wagner, and was declared mad and deposed in 1886. Address: Dr., Central Agricultural Experiment Station, Bavaria, Germany.

583. Ahlburg, H. 1878. Das Koji und die Hefe [Koji and the yeasts: About Eurotium oryzae]. *Mittheilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* (*Yokohama*) 2(16):252-55. In: Korschelt 1878. Ueber sake... [2 ref. Ger]

• ***Summary:*** Contents: Observed facts. Discussion of the genera *Mucor, Aspergillus* (*flavus*), *Botrytis, Eurotium* (*Oryzae*), *Monilia flava.* Address: Japan.

584. Commission Imperiale à l'Exposition Universelle de Paris, 1878. 1878. Le Japon à l'Exposition Universelle de 1878 [Japan at the Universal Exposition of 1878]. Paris: Publiè sous la Direction de la Commission Impériale de Japon. 2 volumes in one. 26 cm. Preface by M. Matsugata. Facsimile edition (preservation photocopy) reprinted in 1998 by BookLab, Inc. [Fre]

• ***Summary:*** Part I (159 p.) is about the geography and history of Japan. Part II (192 p.) is about art, education and teaching, industry, production, agriculture, and horticulture in Japan. The Preface is by M. Matsugata, Head of the Imperial Department of Agriculture and President of the Japanese Commission to the Universal Exposition of 1878.

In Part II, the section on "Fermented beverages–Condiments" contains a long section on "Shoyu" (p. 124-25). It gives a brief description and discusses the ingredients (equal parts dehulled wheat, soybeans, and salt; the best salt comes from Ako in the province of Harima), purifying the salt by dissolving then heating it in water, and stirring the mash (2 or 3 times a day from June to September), aging for 15, 20, or sometimes 30 months to obtain shoyu. The mash in then pressed in cotton sacks, and the resulting liquid is boiled, cooled, allowed to settle, then stored in small wooden tubs. The residue from the first pressing can be used to make a second-grade shoyu, which can be mixed in varying proportions into different grades of shoyu.

Note 1. This is the earliest French-language document seen (April 2012) that uses the term *shoyu* to refer to soy sauce.

In the section on "Agriculture," the subsection on "Cereal grains" (p. 133) discusses both soybeans and azuki

© Copyright Soyinfo Center 2014

beans (*Phaseolus radiatus*). "The soybean (*Le Mame*) or *Soja Hispida* is comprised of several varieties: The green soybean (*l'Awo mame*), the white soybean (*le Shiro mame*), the black soybean (*le Kuro-mame*), the yellow soybean (*le Ki mame*), *Konrinza mame, Ichia mame,* and the saddled soybean (*Kurakake mame*). Some of these different varieties are early maturing and some are late.

The soybean finds numerous uses, for it can be eaten cooked, ground into flour [kinako / roasted soy flour], or used for the manufacture of shoyu, miso, or tofu. The bean, its seed coat, pod, leaves, and stem serve as feed for horses. Lately it has been used on a trial basis to feed sheep, and the results proved that it was the best feed that one could give to them.

Tofu is made with two kinds of boiled soybeans: White and yellow. After being pressed and hardened, it will last for a long time. Yuba is a somewhat similar product, made with the same ingredients. Note 2. This is the earliest French-language document seen (March 2004) that contains the word *Tofu.*

The black soybean speckled with white (*Gan Kui mame* [*Gankui*]) is one of the best varieties to eat.

The azuki (*L'Azuki ou Phaseolus radiatus*) includes the early and late types, and comes in several varieties such as the *Hine no Azuki,* the Dainagon Azuki (*le Dai Nagon Azuki*), the White Azuki (*Shiro Azuki*), etc. Sweet azuki bean paste (*L'An*), is widely used in confectionery, is made by mixing the Azuki and sugar. One cake made from it is called *Yokan.* Azuki flour (*farine de l'Azuki*) is used to remove greasy stains from fabric / cloth. The *Yaye Nari,* a green bean (*haricot*), is used in the same ways as the azuki bean (p. 135). Note 3. This is the earliest French-language document seen (Jan. 2005) that uses the word "Azuki."

Also discusses: Sea vegetables (many individual types with both Japanese and scientific names, p. 127-29). Kudzu (*Pueraria thumbergiana* [sic, thunbergiana], starch from the roots and fodder from the leaves, p. 139; fibers used to make cloth, p. 153). Hemp seeds (p. 139). Sesame seeds and sesame oil (*Goma,* p. 145). Peanuts and peanut oil (*Tojin mame,* p. 145). Hemp as a fiber plant (p. 151). Address: Paris, France.

585. Geerts, A.J.C. 1878. Les produits de la nature japonaise et chinoise:... partie inorganique et minéralogique [The natural resources of Japan and China: Inorganic and mineralogic part]. Yokohama, Japan: C. Lévy, imprimateur-Éditeur. xi + 294 p. See p. 150-51. [1 ref. Fre]
• ***Summary:*** This book intends to be a modern-day *Bencao Gangmu* (in Japanese *Honso Komoku*)–a famous Chinese text. Pages 150-51 discuss *nigari* (*yen-tan-sui, shiwo-no-nigari*). It is widely used in China for the manufacture of tofu (*fromage végétal, to-fu*), by precipitating the legumine or leguminous casein (*légumine ou caseine légumineuse*).

Note 1. This is the earliest French-language document seen (April 2013) that uses the term *fromage végétal* to refer to tofu.

Note 2. Geerts' initials stand for Antonius Johannes Cornelius. He lived 1843-1883.

586. Haberlandt, Friedrich. 1878. Die Sojabohne: Ergebnisse der Studien und Versuche ueber die Anbauwuerdigkeit dieser neu einzufuehrenden Culturpflanze [The soybean: Results of studies and trials on the potential for growing this newly introduced crop plant]. Vienna, Austria-Hungary: Carl Gerold's Sohn. ii + 119 p. 28 cm. [30 ref. Ger]
• ***Summary:*** This is the first book about soybeans written in the western world. An extremely important, classic work, it discusses the introduction of soybeans to Europe, by many cooperators.

Contents: Foreword. Part 1 (p. 1-15). Introduction: The possibility of increasing the number of our cultivated plants from the legume family. Prospects opened to us by the cultivation of soybeans. Previous soybean agronomic trials in Hohenheim, Bamberg (by Dr. A. Rauch using seeds from Japan supplied by Siebold), Hainsberg-Deuben in Saxony (*Sachsen*) (by Carl Berndt, a velvet manufacturer), and Coswig bei Messen (in 1872) in Germany. Acclimatization of the soybean in France. Sporadic, heretofore unnoticed occurrences of soybeans in South Tirol (also spelled Tyrol), Istria (or Istrian Peninsula; now in Slovenia), Dalmatia [now mostly in Croatia; see Note below], and Italy. The collection of soybeans, obtained at the Vienna World Exposition (*Wiener Weltausstellung*) of 1873 from China, Japan, Mongolia, Transcaucasia, and Tunis [North Africa], and their use in wider agronomic trials. Enumeration of authors who have cited (*anführen*) the soybean under different names and planned for its dissemination. Characteristics of the soybean plant. Description of the seeds and their anatomical structure. Their high nutritional value in comparison with ordinary legumes. Their use in Japan, according to Kaempfer. Obtaining oil and cake from the soybean.

Part 2. Agronomic trials in the years 1875 and 1876 (p. 16-35; see Document part for details). Source of the supply of the various soybean varieties used in the original trials. Trials at the Royal College of Agriculture (*Hochschule für Bodencultur*) in Vienna in 1875. Results from 1876 from Hungarian Altenburg and Gross-Becskerek in Hungary, in St. Peter bei Graz in Steiermark [Styria], in Napagedl in Mähren [Moravia; in the Czech Republic as of Jan. 1993], in Sichrow, Swijan, Darenic, Tetschen-Liebwerd in Böhmen [Bohemia], in Bukowina [Bukovina or Bucovina, a former Austrian crownland, as of 1994 divided among the Ukraine and Romania], in Proskau [now Proszkow in today's Poland] in Preussisch-Schlesien [Prussian Silesia], and in the experimental garden at the Royal School of Agriculture. Comparison of the resulting seeds with the original seeds. Chemical analysis of the seeds and straw. Evidence of the "heat units" (Wärmesummen; "warm temperature

© Copyright Soyinfo Center 2014

summation" or "warm sum," similar to U.S. maturity groups) which the soybean was able to use for their development in Vienna, St. Peter, Tetschen-Liebwerd, and Proskau.

Part 3. Agronomic trials in the year 1877 (p. 36-86). Results of the soybean agronomic trials in Austria-Hungary, Germany, etc. in 1877. Extracts from 14 reports of various trial locations in lower Austria, and 11 trial locations in Mähren [Moravia]. Extracts from 19 reports from Bohemia, 10 from Austrian Silesia (Oesterr.-Schlesien), Galizien [Galicia; a former Austrian crownland; after World War II the western half was made part of Poland and the eastern half was made part of the Ukranian S.S.R. in the Soviet Union], Bukowina, and Russian-Poland, 6 reports from upper Austria, Salzburg, and Tirol, 11 reports from Steiermark, Krain [Carniola; now mostly in Slovenia], and Kärnthen [Kaernten or Carinthia, an Austrian crownland; now a state of southern Austria, bordering on Italy and Yugoslavia], 12 from Istria, Dalmatia, and the Grafschaft [county and earldom] of Görz, 40 from Hungary and Croatia [formerly part of Yugoslavia], 23 from Germany, 1 from Switzerland, and 1 from Holland.

Part 4 (p. 87-113). Comparison of the value of the three different colors of soybeans (yellow, reddish-brown, and black) used in the trials. Time of planting. Ability of hydrated seeds to withstand freezing. Width of planting. Condition and care of the soil. Requirements for light and warmth. Need for moisture. Time that the harvests took place and general remarks on the weather in 1877. The quantity of planted and harvested soybeans in 1877 and the yields. Animals [incl. insects, especially the so-called Drahtwurm, the larva of *Agriotes segetis*] and parasites that damage soybeans. Chemical composition of the soybeans [by Dr. Mach and asst. Portele in S. Michele {South Tirol}, and by Caplan in Vienna]. Feeding trials with the straw and preparation of the seeds as a food for humans. Retrospective and conclusion.

Note 1. Austria-Hungary is a former "dual monarchy" in central Europe formed in 1867. It included what is now Austria and Hungary, Bohemia, Moravia, Bukovina, Transylvania [now in northwestern and central Romania], Carniola, Kustenland, Dalmatia, Croatia, Fiume [later named Rijeka in Croatia], and Galicia. After the treaty of Berlin in 1878, it administered the Turkish provinces of Bosnia and Herzegovina, which it annexed in 1908. It was a member of the triple alliance with Germany and Italy from 1882 to 1914. It collapsed as a result of defeat in World War I. In 1918 it was divided into many independent republics, including Austria, Hungary, and Czechoslovakia.

Note 2. Dalmatia, a former Austrian crownland, is a region on the Adriatic Sea, largely in today's Croatia. It extends from Zadar on the north to near the border of Montenegro, and contains a small southern portion of Bosnia and Herzegovina (Jan. 1993). It is mountainous and contains many island and good harbors.

Note 3. Carniola (German: Krain) is a region that lies in

today's Slovenia. The chief town is Ljubljana. It is bounded on the west by the Julian Alps and on the northwest by east end of the Carnic Alps. It was a duchy of Austria until 1849, then an Austrian crownland from 1849 to 1918. It was divided after World War I with 80% of the area going to Yugoslavia and 20% going to Italy. A 1947 treaty placed it entirely within Yugoslavia.

Note 4. This document contains the earliest date seen for soybeans in Hungary, or the cultivation of soybeans in Hungary (April 1876) (one of two documents). The source of these soybeans was Prof. Friedrich Haberlandt in Vienna.

Note 5. Details on parts I and IV are given in separate 1878 "Document Part" records in this database.

Note 6. This is the earliest document seen that contains the word *Wärmesummen* ("heat units").

Note 7. This book, surprisingly and unfortunately, contains no illustrations.

Note 8. A portrait of Dr. Haberlandt (oil painting) is owned by the University of Mosomagyarovar in Hungary. Soyfoods Center owns a black-and-white photo of the painting.

Note 9. The Vienna World Exposition opened on 1 May 1873 and closed on 1 November 1873. So it lasted for 6 months. Address: Hochschule fuer Bodencultur, Vienna, Austria.

587. Haberlandt, Friedrich. 1878. Erste Abtheilung [Part 1, pages 4-6 (Document part)]. In: F. Haberlandt. 1878. Die Sojabohne [The Soybean]. Vienna: Carl Gerold's Sohn. ii +

119 p. [4 ref. Ger]

• ***Summary:*** Page 4 begins: "Even though the soybean has already found its way to Europe several times, attempts to cultivate it have failed completely because the seeds were from Japan, southern parts of China, and from India. Consequently they were late-ripening seeds. Many years ago attempts were made to grow *Soja hispida* in Hohenheim [Germany], but the plants were barely brought to a blooming state. People also had the same experience in other places. Dr. A. Rauch of Bamberg [Germany] (see *Die Fundgrube von Dr. A. Rauch. III. Jahrgang. Bamberg* 1876), on several occasions, received seeds of various soybean varieties from Japan from his long-time friend, Colonel (*Oberst*) [Philipp Franz] von Siebold, who died at an early age. But every trial by Dr. Rauch was unsuccessful. The plants came up and some even blossomed, but the blooming happened so late in the year (starting in September) that it was unthinkable that the seeds would ripen fully.

"Mr. Carl Berndt, who owned a silk factory at Hainsberg-Deuben in Saxony was also one of the first to conduct agronomic trials (*Anbauversuche*) with soybeans in Germany. He had no success. He wrote to me about it as follows: 'I had received 8 piculs of those beans [Note: a picul is a Chinese unit of weight = 133.33 pounds] (some green and some yellow), which I obtained through an official order of Governor (*des Minister-Präsidenten*) Dr. Weinlich of Shanghai via our local consul. I sent samples of those all over with the request that the recipient inform me of the results of his agronomic trials. Unfortunately I have waited in vain and I assume that the outcome was as unfavorable as it had been in my case and in my neighborhood. Although some gardeners and I managed to raise a few plants and harvest a few seeds, they rotted after being replanted and therefore could not germinate.'

"One type of soybean that requires warmer weather must have been the one which was introduced to France by M. de Montigny from China. In France it is called oil pea (*pois oléagineux*) and is cultivated at several locations in the districts of Ariège and Haut-Garonne. It is said to have the capacity for rapid growth and resistance to drought*. (Footnote: *Gustav Heuzé: "Les plantes alimentaires." Paris, p. 382, vol. 2).

"During the last German-French war [Franco-Prussian War, 1870-72, France lost], Otto Wehrman, captain in the artillery, found one of those acclimated soybeans in the botanical garden of Montigny near Metz. He liked the plant and took four or five seeds back home. On his estate in Coswig near Meissen he conducted an agronomic trial in 1872 and harvested 80-100 seeds in the fall. He wrote me that in the year 1873 he did the planting sooner, around mid-April, and obtained a fairly decent harvest. In the year 1874 he discontinued the cultivation because he had no use for the harvested beans. Meanwhile, his neighbors became interested in the soybean, so he decided to start growing the plant again in 1875. He harvested 3 liters of seed, which he replanted in April 1876. As a result of the long drought that year, the plants became stunted and the majority of pods had not yet full ripened when early frosts set in and destroyed the crop completely. The quantity of seeds harvested was smaller than that sowed. Its quality was far worse, which caused Wehrman to give up further trials with this variety of soybean.

"Even though the soybean has already spread here and there in the south of Austria, it still hasn't become known in broader circles. Thus, last summer, Dr. E. Mach, director of the agricultural academy (*Lehranstalt*) in South Tyrol [Tirol], sent me a sample of a plant which was supposed to be already long known in that area, and it was none other than a soybean plant. In that area it is called 'coffee bean' (*Kaffeebohne*) and its seeds are used for the preparation a coffee substitute (*Kaffesurrogat*). Likewise, Mr. Josef Kristan, teacher in a primary school in the Istrian Peninsula (*Capodistria in Istrien*), reported to me that he had discovered that the soybean could already be found in Istria and its seeds are used as a coffee substitute. A friend of his assured him that there wasn't any difference between these and real coffee. He also received several seeds from Albona [named Labin as of 1988; a commune in western Croatia, on the Istrian Peninsula, 21 miles northeast of Pula], where people grow it from time to time in their gardens without knowing its value. Acquaintances of his stated as well that they had seen the same plant in Dalmatia and in southern Italy. All of the above information only came to my attention after I had been conducting soybean agronomic trials for two years. I had been in correspondence with the authorities mentioned above in order to send them small samples so that agronomic trials could be continued at other locations as well.

"The soybeans which I had used in my first tests in 1875 had been acquired at the Vienna World Exposition in 1873, and were in part from Japan and China, and in part from Mongolia, Transcaucasia, and Tunis [p. 6; later renamed Tunisia]. There were, in total, no less than 20 varieties (*Sorten*) as follows (table): Five yellow-seeded, three black-seeded, three green-seeded, and two brownish-red-seeded varieties from China. One yellow-seeded and three black-seeded varieties from Japan. One black-seeded variety from Trans-Caucasia. And one green-seeded variety from Tunis.

"During the first year of trial (1875) it had already become apparent that among those were several types that could be recommend for further agronomic trials because they ripened early. Among these were yellow-seeded varieties from both Mongolia and China, and a reddish-brown variety from China. One black variety each from China, Japan, and Transcaucasia ripened poorly. The remaining varieties either didn't bloom at all or only started to bloom in the late fall. Still others developed only a small number of unripe or poorly ripened pods with stunted grains

© Copyright Soyinfo Center 2014

that couldn't germinate."

Note: This is the earliest document seen (Aug. 2009) concerning soybeans in Tunis (Tunisia). This document contains the earliest date seen for soybeans in Tunisia (1873). The source of these soybeans in unknown. Address: Hochschule fuer Bodencultur, Vienna, Austria.

588. Haberlandt, Friedrich. 1878. Erste Abtheilung [Part 1, pages 6-7 (Document part)]. In: F. Haberlandt. 1878. Die Sojabohne [The Soybean]. Vienna: Carl Gerold's Sohn. ii + 119 p. [4 ref. Ger]

• ***Summary:*** "Different authors have given the soybean many different names. It gets its most extensive and earliest recognition in the famous work of Kaempfer, *Amoenitatum exoticarum politico-physico-medicarum,* which comprises 5 volumes and was published in 1712 in Lemgo [Germany, in today's North Rhine-Westphalia]. The work includes a detailed description of Kaempfer's travels in Persia and Central Asia. He calls the soybean by that vernacular name "Daidzu" or "Mame," a name still common today in Japan, which means legumes, so called because of its superiority. He describes it as an upright type of bean with pods that resemble those of the lupine and a white seed like larger peas: 'Four feet long but more luxuriant or lush (*üppiger*) than *Phaseolus,* it winds straight up with its many-branched, unevenly round and rough stem. The leaves look like those of the green bean except that the underside is more bristly. The small flowers, somewhat gathered on short stems, bloom in August. They are bluish-white, small, and similar to the lentil, with a straight flag and barely spread wings (*mit gerader Fahne and kaum ausgebreiteten Fluegeln*). The stems that bear the abundant pods are long and bristly, similar to the pods of the lupine. They contain 2 or sometimes 3 seeds and resemble in shape, size, and taste the garden pea. But they are somewhat compressed with a protruding hilum (*Nabel*).

Linné [Linnaeus] chose for this legume the name *Glycine Soja.* In his *Icones plantarum rariorum,* N.J. Jaquin [Jacquin] gives its name as *Dolichos Soja* and gives an illustration, which however is inferior to the one by Kaempfer. Dr. Ph. von Siebold and Dr. J. Zuccarini cite it in their *Florae Japonicae familiae naturalis* (vol. 4, part 2, 1846) as *Glycine Soja.* Other than that, it can be found as *Soja japonica, Savi.* and *Soja hispida, Mönch.*

"De Candolle, in his *Prodromus syst. nat.,* notes that the soybean is distributed across Japan, South India (*Süden Indiens*) [sic, East Indies, *India orient*], and on the Moluccas. Franchet and Savatier state in their *Enumeratio plantarum in Japonia sponte crescentium,* p. 108, that it grows in the mountainous regions of Kyushu [Japan's southernmost main island], the valleys of Kawara, the Janca? mountains, near Nagasaki. Maximovicz [Maximowicz, Maksimovich] mentions in his *Primitiae florae Amurensis,* page 47, that it is cultivated along the upper Amur River, near Aicho, where it covers entire fields. Ditmar found it on 19 July 1856 in Ana [Aua] on the Ussuri River, and in Chinese gardens in bloom on 10 Aug. 1855. Roxburgh pays respect to the soybean in his *Flora indica* and mentions its occurrence in the Moluccas." Address: Hochschule fuer Bodencultur, Vienna, Austria.

589. Haberlandt, Friedrich. 1878. Erste Abtheilung [Part 1, pages 10-15 (Document part)]. In: F. Haberlandt. 1878. Die Sojabohne [The Soybean]. Vienna: Carl Gerold's Sohn. ii + 119 p. [4 ref. Ger]

• ***Summary:*** "The value of soybeans results from their high content of the most important nutrients. The first analysis that made the composition of these seeds known in Germany was carried out by [Mr.] Senff using seeds obtained directly from Japan by Mr. [Carl] Berndt. The results of this analysis* (Footnote: *See the journal *Chemischer Ackersmann* ("Chemical Farmer") 1872, p. 123) showed that 100 parts of air-dried soybeans have the following composition:" A table (p. 11) based on two samples and their average shows: Water 6.91%, protein 38.29%, oil (*Fett*) 18.71%, nitrogen-free extract 26.20%, crude fiber 5.33%, and ash (minerals) 4.56%.

A second table (p. 11) which compares the nutritional composition of soybeans, common beans (*Fisole*), peas, lentils, fava beans (*Pferdebohne = Vicia faba* = "horse beans") and yellow lupins, shows that soybeans have a much higher content of protein (38.29%, followed yellow lupins at 35.32%), oil (18.71% followed by yellow lupins at 4.97%), and ash (minerals, 4.56%, followed by yellow lupins at 3.78%).

"There are few statements in the pertinent literature concerning soybean utilization. But there is no doubt that, in their native countries, they have heretofore been used exclusively as foods. In *Synopsis der Pflanzenkunde* ("Synopsis of Experience with Plant Culture;" 1877, Hannover, Vol 2, p. 413), Dr. Johannes Leunis says that soybeans taste good and are also used to make a thick brown sauce, which is added to almost all foods in India, China, and Japan, and is also an article of commerce in Europe, used to improve sauces and gravies. However the sauce now available in Germany is said to be made of other ingredients rather than soybeans, namely mushrooms. From England, where this soy sauce is imported from India by the firm Grosse [sic, Crosse] & Blackwell in London, its use is spreading to the continent and is available in Vienna. Kaempfer, who describes the soybean plant so excellently in the classic work on his travels, also gives detailed information about its use as foods in Japan, which has since appeared in numerous other writings, such as Oken's *Allgemeine Naturgeschichte aller Stande* ("General Natural History of All Places") [1841] vol. III, part 3, page 1661."

Haberlandt then quotes in their entirety Kaempfer's descriptions of miso and soy sauce (about 200 words each).

© Copyright Soyinfo Center 2014

He also indicates a vague knowledge of tofu.

"It is reported that in China a type of food is made from the oilcakes or perhaps from soybeans directly, that superficially resembles a soft cheese or Quark (a European white unfermented cheese; *nach dem weichen Käse oder dem Quark ähnliche Speise machen*) presumably the original mush is subjected to a fermentation process and then mixed with pepper and other spices. A large part of China's population is said to use this staple food."

Note 1. This is also the earliest German-language document seen (April 2013) that uses the word "Quark" in connection with tofu.

He goes on to describe the chemical composition and uses of the oil presscake in China.

Page 14: "Since the oil content (*Oelgehalt*) of the soybean is lower than that of other oilseeds, it must be assumed in advance that its application for the production of oil (*Oelgewinnung*) must be disregarded. This also became evident through a test which Mr. Carl Berndt conducted on the rest of the soybeans that hadn't been used for agronomic trials. He was kind enough to give me the following report: 'Although I should have expected that one could not determine the full quantity of oil from a relatively small quantity of seeds, I was still astonished that there was not more than 6%. The analysis had resulted in 16 to 18%, and therefore the mechanical quantity was estimated at 10-12%.

"'Actually it was quite difficult to locate an oil miller who would clean his mill sufficiently that one received pure oil. Moreover, these people didn't proceed with the interest and care that are necessary, since I found lots of oil in the presscakes, indicating that they had not been pressed sufficiently. In terms of quality, I am more satisfied than I had expected to be. I had someone prepared baked goods where oil was used in the recipe and I could not detect the slightest after-taste. As a cross-check, I had another part of the baked goods prepared with Provenzer oil, but I could not tell the difference between the two.

"'To what extent the [soybean] oil could be used for industrial [non-food] purposes, especially as a mordant (*Beize*) for the dyeing of Turkish-red, which uses very old, spent oil (that is soluble in carbonic potassium) can only be established when a sufficient quantity of oil becomes available.'"

Note 2. This is the earliest document seen (Oct. 2001) concerning special industrial uses of soybean oil as a non-drying oil, as a mordant for dyeing. Address: Hochschule fuer Bodencultur, Vienna, Austria.

590. Haberlandt, Friedrich. 1878. Zweite Abtheilung. Anbauversuche im Jahre 1875 und 1876 [Part 2: Culture trials in the years 1875 and 1876 (Document part)]. In: F. Haberlandt. 1878. Die Sojabohne [The Soybean]. Vienna: Carl Gerold's Sohn. ii + 119 p. See p. 16-35. [30 ref. Ger]
• ***Summary:*** Contents of Part II: Source of the supply of the various soybean varieties used in the original trials. Trials at the Royal College of Agriculture (*Hochschule für Bodencultur*) in Vienna in 1875. Results from 1876 from Hungarian Altenburg and Gross-Becskerek in Hungary, in St. Peter bei Graz in Steiermark [Styria], in Napagedl in Mähren [Moravia; in the Czech Republic as of Jan. 1993], in Sichrow, Swijan, and Darenic [Czechoslovakia], Tetschen-Liebwerd in Böhmen [Bohemia; in the Czech Republic as of Jan. 1993], in Bukovina [Bukowina or Bucovina, a former Austrian crownland, as of 2005 divided among the Ukraine and Romania; by Dr. Nik. Dimittrievicz], in Proskau [now Proszkow, in southwest Poland] in Preussisch-Schlesien [Prussian Silesia], and in the experimental garden at the Royal School of Agriculture. Comparison of the resulting seeds with the original seeds. Chemical analysis of the seeds and straw. Evidence of the "degree days" or "heat units" (Wärmesummen; "warm temperature summation" or "warm sum," similar to U.S. maturity groups) which the soybeans needed for their development in Vienna, St. Peter, Tetschen-Liebwerd, and Proskau.

In 1875 Prof. Haberlandt conducted the first agronomic trials with the 19 soybeans he obtained at the Vienna World Exposition (*Wiener Weltausstellung*) of 1873. On 2 May 1875 he planted three varieties of seeds at the Royal School of Agriculture in Vienna. The brownish-red variety (plot #1) from China blossomed on June 28, the light-yellow variety (plot #2) from China blossomed on July 1, and the light-yellow variety (plot #3) from Mongolia blossomed on June 29. The seeds of all three varieties ripened on Sept. 11. On plot #1 grew 27 plants, that yielded 249.2 gm of seeds (equivalent to 2,769 kg/hectare). On plot #2 grew 25 plants, that yielded 336.5 gm of seeds (equivalent to 3,739 kg/hectare). On plot #3 grew 15 plants, that yielded 196.9 gm of seeds (equivalent to 2,177 kg/hectare).

Prof. Haberlandt then sent samples of seeds to seven cooperators in central Europe, who planted and tested the seeds in the spring of 1876, with good or fairly good results in each case. These men reported the details of their agronomic trials to Haberlandt, who quoted from their reports. For details see: F. Haberlandt. 1877. "Der Anbau der rauhhaarigen Sojabohne." *Landwirthschaftlichen Versuchs-Stationen* 20:247-72.

In addition, on April 25 and May 5 Prof. Haberlandt planted 7 varieties (some original seeds, some reproductions; 4 black, 2 yellow, and 1 brownish-red [*braunrothe*]) in the experimental garden at the Royal School of Agriculture. A table (p. 26) gives his detailed results. Comparison of the resulting seeds with the original seeds showed that individual seeds in each new generation generally weighed more than those in the previous generation. Page 29 shows a chemical analysis of the seeds and straw. Haberlandt then calculated (p. 33) the "degree days" or "heat units" (*Wärmesummen;* "warm temperature summation" or "warm sum," similar to U.S. maturity groups) which his different soybean varieties

© Copyright Soyinfo Center 2014

needed for their development. For the seeds to begin to ripen they seem to need a total of 1824 to 5924 heat units (ºC), and to be ready for harvest 2230 to 3174 heat units. The minimum need at Proskau was 2246.9. The soybean can be grown as a green fodder plant at locations with less heat units. A table on p. 34 shows the mean temperature for each month, the northern latitude, and the elevation (meters above sea level) at Vienna, Graz, Tetschen-Liebwerd, and Proskau. Graz had the lowest latitude (47º4') and Tetschen-Liebwerd the highest (50º44'). Vienna and Graz had the warmest temperatures in May, June, and July. Address: Hochschule fuer Bodencultur, Vienna, Austria.

591. Haberlandt, Friedrich. 1878. Dritte Abtheilung. Anbauversuche im Jahre 1877 [Part 3: Culture trials in the year 1877. Part I (Document part)]. In: F. Haberlandt. 1878. Die Sojabohne [The Soybean]. Vienna: Carl Gerold's Sohn. ii + 119 p. See p. 36-60. [Ger]

• ***Summary:*** Contents: Excerpts from 14 reports of various trial locations in lower Austria (*Nieder-Oesterreich*), and 11 trial locations in Moravia (*Mähren*). Excerpts from 19 reports submitted from Bohemia, 10 from Austrian Silesia (*Oesterr.-Schlesien*), Galicia (*Galizien*) [a former Austrian crownland; after World War II the western half was made part of Poland and the eastern half was made part of the Ukraine], Bukowina, and Russian-Poland, 6 reports from Upper Austria, Salzburg, and Tirol [Tyrol], 11 reports from Steiermark, Krain [Carniola; now mostly in Slovenia], and Kärnthen [Kaernten or Carinthia, an Austrian crownland; now a state of southern Austria, bordering on Italy and Yugoslavia], 12 from Trieste (*Triest*) [an Austrian crownland from 1867 to 1919, when it was ceded to Italy by the Treaty of St. Germain], Istria, Dalmatia, and the Grafschaft [county and earldom] of Görz (Goerz), 40 from Hungary and Croatia [formerly part of Yugoslavia], 23 from Germany, 1 from Switzerland, and 1 from Holland.

In lower Austria soybeans were tested by: Mr. Zurakowski (Title: Administrator of a archducal farm estate, *erzh.* [*erzherzoglich*] *Gutsverwalter.* Note: The archduke was a prince of The House of Austria) in Gmünd (Gmuend), Mr. Ruzicka in Essling, Baron (*Freiherr*) von Tschudi in Jacobshof, Ferd. Ritter v. Erb in Grinzing near Vienna, Graf Christ. Kinsky in Matzen, Mr. H. Weyringer in Simmering near Vienna, Mr. Kaudelka in Therasburg, Mr. von Maygraber of k.k. Major in Altlengbach, Mr. Carl Rauch in Osterburg, Mr. Pfarrer Engelbert Richl in Münchendorf (Muenchendorf), Mr. G. Simon in Hirschstetten near Vienna, Prof. Jul. Thausing of the agricultural teaching institute in Mödling (Moedling), Dr. F. Leithner in Krems [lower Austria, on the Danube River, 38 miles west-northwest of Vienna], and Dr. Ditz (Title: Agricultural Administration of princely Liechtenstein, *fürstl. Liechtenstein'schen Oekonomieverwaltung*) in Wilfersdorf. Note: As of 1994, Wilfersdorf is in the northeast corner of Austria, about 25 miles north-northeast of Vienna and about 335 miles northeast of Liechtenstein.

Agronomic trials in Mähren [Moravia] by: J. Hoch of the Agricultural School in Gross-Meseritsch, Mr. Turecek in Mistek, Prof. Schmerz of the educational establishment in Brünn (Bruenn; Brno in the Czech Republic as of 1994), A. Tomasek in Napagedl, Mr. Vrba [Wrba] of the agricultural institute in Eubenschitz [Eibenschitz, as of 1994 in the Czech Republic], Mr. Emanuel Ritter of Prosskowetz [Proskowetz] in Kwassitz, Mr. J.B. Uhlirz director of the agricultural middle-school in Prerau, Prof. Dr. A. Zöbl (Zoebl) of the agricultural middle-school in Neutitschein, farmers of the princely Economic Administration of Liechtenstein in Eisgrub bei Lundenburg and in Rabensburg using seeds sent by Dr. Ditz, Norbert von Baratta in Budischau.

Agronomic trials in Bohemia (Böhmen) by: Mr. A. Fritsch in Stenonitz, Mr. Friedrich (Title: Agricultural administrator of a farm estate, *Gutsverwalter*) in Krizanau (45 km northwest of Brünn / Brno), the Marquis de Bellegarde in Schloss Niemes, Jos. Dolzer in Hohenfurt, Ludwig von Beer in Vojnic, Mr. Rothe (castle-gardener) in Schönpriesen (Schoenpriesen), Dr. Hanamann Director of the research station in Lobositz, Mr. Klimetschek of the princely Schwarzenberg trial-school in Zittolieb, Mr. J. Susta of the princely Schwarzenberg domain of Wittingau, Mr. Ferd. Marouschek [Marousek] in Kloster-Münchengrätz (Muenchengraetz), Mr. Pachmayer in Luzan, Dr. Nickerl of the Physiokrateum [Faculty of Natural Sciences] in Prag [Prague], Mr. M. Schlöcht (Schloecht) in Dobrai, Prof. Dr. Kulisz of the agricultural middle-school in Tetschen-Liebwerd, Prof. A. Nowoczek of the agricultural teaching institute in Kaaden, Mr. F. Honilec of the agricultural school in Klattau, Planic, and Kout, Ad. Eckert Director of the agricultural school in Chrudim, Mr. A. Svoboda [Swoboda] (Title: Owner of an estate, *Hofbesitzer*) of Schnackhof bei Zamrsk, and the princely Schwarzenberg Wirthschafts-Direction in Frauenberg.

A large table (p. 26) shows Prof. Haberlandt's results in testing 7 different types of soybeans in 1876: Yellow from Mongolia, yellow from China, brownish red (*braunrothe Sorte*) from China, black from China (2), black from Mongolia, and black from Japan.

Agronomic trials Austrian Silesia (*Oesterr.-Schlesien*), Galizien [Galicia], Bukowina [Bukovina], and Russian-Poland by: Baron von Tschudi of the Swiss Confederation in Vienna wrote of trials on his land in Schönbach (Schoenbach) in Austrian Silesia, Mr. Bischof of the Baron Brunicki Domain in Zaleszczyki in East Galicia, Mr. Seling [Seeling] Ritter von Saulenfels in Szdebnik bei Lekawice, Johann Ritter von Breuer in Suchawola, Mr. A. Praunn (a forester in Stadt Lemberg) in Zubrza bei Lemberg, Mr. S. Jakubovszki in Tarnow, Mr. Ritter von Stavinsky in Kleczy, Mr. Klemens Botkouski (Title: Owner of an aristocratic estate, *Gutsbesitzer*) in Lukaczestie (or Luka-czestie,

© Copyright Soyinfo Center 2014

Bukovina [in today's {2005} Romania, 16.5 km east of Gura Humorului]), M. C.W. Ambrosius in Radautz (Bukovina), Mr. Stanislaus von Trebicki in Kurowice bei Sterdyn (Russian Poland).

Agronomic trials in Upper Austria (*Oberösterreich*), Salzburg, and Tirol by: Baron von Thysebärt at Schloss Grünau (Gruenau) bei Ried-Mauthausen in Upper Austria, Mr. E. Klusak (castle-gardener) in St. Wolfgang bei Ischl in Upper Austria, Mr. C. Braunbart director of the agricultural school at the Ritzlhof in Upper Austria, Mr. von Kempf (k.k. Major) in Salzburg, Mr. Alfr. Erttel in Planta bei Meran in southern Tirol, Dr. Eduard Mach director of the agricultural teaching institute of San-Michele in South Tirol.

Agronomic trials in Steiermark, Krain [Carniola], and Kaernthen [Kärnten, Kaernten or Carinthia] by: Mr. Hans Graf Haller in St. Johann bei Pettau in Steiermark, Mr. J. Rothschädl (Rothschaedl) in Reitenau in Steiermark, Mr. Fr. Auchmann (a maker of champagne and coffee-substitutes) in Marburg in Steiermark, the seed cultivation station in St. Peter bei Graz (owned by Graf H. Attems), Ad. Baumgartner director of the agricultural school in Grottenhof bei Graz (he cooked the seeds for use in a salad and as a vegetable), Mr. Goethe director of the Obst- und Weinbauschle in Marburg, Burgermeister J. Fiala in Friesach in Carinthia, Mr. Cos. Schütz (Schuetz) secretary of the agricultural society in Klagenfurt, Baron von Ankershofen in Klagenfurt, Mr. J. Mach in Slateneg in Krain [Carniola], Mr. Franz Schollmayer in Laibach [as of 1994 Ljubljana, the capital of Slovenia; summary of his 1977 article].

Note: This is the earliest German-language document seen (June 2009) that mentions green vegetable soybeans, which it describes as shown above. Continued. Address: Hochschule fuer Bodencultur, Vienna, Austria.

592. Haberlandt, Friedrich. 1878. Vierte Abtheilung. 9. Chemische Zusammensetzung der Sojabohne, Fuetterungsversuche mit dem Stroh und Zubereitung der Samen als Nahrungsmittel fuer den Menschen [Part 4, Section 9. Chemical composition of the soybean, feeding trials with the straw, and preparation of the seeds as human food (Document part)]. In: F. Haberlandt. 1878. Die Sojabohne [The Soybean]. Vienna: Carl Gerold's Sohn. ii + 119 p. See p. 87-110. [4 ref. Ger]

• ***Summary:*** A table (p. 95, continued from p. 84, and reproduced in part in Piper & Morse. 1923. *The Soybean.* p. 156) shows that Haberlandt planted seeds of one variety at Vienna at intervals of one week for 11 even weeks throughout the season (from March 31 to June 9) and attempted to correlate the number of days to maturity (life periods) with the number of heat units (*Wärmesumme / Wärmesummen,* in ºC) required for three different stages of growth–germination, blossoming, and maturity. The life period ranged from 182 days for the seeds planted first to 138 days to the seeds planted next to last. The seeds planted first (March 31) required the most heat units to come to maturity (2,972ºC) whereas those planted last (June 9) required the fewest heat units (2,322).

Note 1. This is the earliest document seen (March 2003) concerning the scientific study of soybean germination, or the relationship between heat units and germination.

In 1877 several new analyses of the soybean were conducted, to add to those from past years. One was communicated by Mr. A. Tomasek in Napagedl [in Mähren / Moravia, a region in today's central Czech Republic], the other by Dr. Eduard Mach in St. Michele [South Tirol]. The first was conducted by the sugar factory chemist, Mr. Schroeder, in Napagedl (p. 103). For air-dried reddish-brown (*rothbraun*) and yellow soybeans he found the following: Protein: 36.12% / 35.87%. Nitrogen: 5.78% / 5.74%. Fat: 17.50% / 18.25%.

Dr. Mach had his analysis conducted in the agricultural education center by his assistant C. Portele. He examined 3 varieties (yellow, reddish-brown, and black) obtained from Haberlandt and grown out in San Michele, and a fourth reddish-brown variety, which is grown in southern Tirol (Tyrol) as the Coffee Bean, has been acclimatized there for a long time, and until now has remained entirely unknown and unrecognized. The composition of the four is as follows: Water: 8.1 / 9.4 / 9.9 / 10.1%. Ash: 5.4 / 5.1 / 4.8 / 5.2%. Protein: 36.8 / 31.6 / 31.2 / 38.1%. Fat: 17.6 / 17.4 / 18.1 / 17.8%. Crude fiber: 4.8 / 4.3 / 4.2 / ?%. (p. 103-04).

Also Mr. C. Caplan (p. 104), assistant at the agricultural chemistry research station in Vienna, conducted analyses of the seeds, their pods, and the leaves and stalk. His results were published in 1878 in the *Oesterreichisches landw. Wochenblatt* (No. 3, p. 26): Water: 14.0 / 14.0 / 14.0%. Protein: 32.32 / 4.64 / 6.08%. Fat: 16.76 / 1.29 / 2.03%. Nitrogen-free extract: 26.56 / 41.87 / 37.12%. Crude fiber: 5.57 / 30.45 / 22.79%. Ash: 4.76 / 7.79 / 9.31%.

It is unnecessary to emphasize the importance of the soybean as a food for man and his animals. Not only is there high nutritional value in the beans and straw, they also have a flavor such that eating them takes no special effort.

A considerable number of taste experiments have been made and it can be stated that nobody's sense of taste has revolted against food uses of soybeans.

Dr. F. Leithner complains that they are not easily cooked softly enough. 'I tasted them with oil and vinegar, sort of baked bean style, and as a soup. In oil and vinegar they seemed to have a slightly sweet aftertaste, like sweet peas. Also as soup they reminded me of regular bean soup with a slightly sweet flavor. One of my guests liked them very much.'

Mr. Alfred Erttel, captain of the royal-imperial army in Planta near Meran wrote: 'Cooking experiments were highly satisfactory; the soybean is finer and has a better flavor than regular beans.'

Director A. Baumgartner in Grotenhof had them

© Copyright Soyinfo Center 2014

prepared as a salad and as a vegetable. He found them to be very much like regular beans.

Director D.E. Mach commented about the taste experiment he conducted: 'In order to come to a valid opinion about the savoriness of the soybean and its value as a food, we tried to have them prepared in various ways. We must admit that they were very tasty cooked whole or as a puree, as well as with oil and vinegar, yes, even finer than peas or lentils. It must be mentioned however that soybeans take a long time to cook soft.'

By adding that no negative opinion about the soybean has come to my attention, I would also like to state: I believe that the seeds of the soybean by themselves are too concentrated a food and they would be best mixed with other foods, which are less concentrated and contain mostly carbohydrates. The Chinese and Japanese have instinctively been led toward that. They add their 'miso' or their soy mush to most of their other dishes in a certain ratio without eating soy by itself. Kaempfer describes a way that the Chinese and Japanese prepare miso which is very complicated; the cooking takes a lot of time and money. So it would seem simplest to use soybeans in the kitchen in a finely ground form. I had soy grits (*Sojaschrot*) of that kind added to various potato dishes, for example mashed potatoes and rice. I mixed soy grits with wheat grits, cooked with milk or water, and I had soy grits added to mashed potatoes to make a dish resembling Polenta. This might be called Sojenta. My family also experimented with adding soy meal to wheat flour to make bread, with and without the addition of milk, and in all cases we were highly pleased with the results. This opinion about the taste of soy was shared by others, who shared in the tasting (p. 107).

Note 2. At this point (p. 107-08) Haberlandt adds a lengthy footnote from his friend and colleague Professor W. Hecke who followed with great interest the progress of soy culture in Austria and who had conducted taste tests with soy grits (*Sojabohnenschrot*)**.** Hecke encouraged the use of soy with potatoes to make a nutritionally balanced, inexpensive, tasty, and easily accepted basic dish. One part of soy flour or grits (*Sojamehl oder Schrot*) and two parts fresh potatoes were cooked separately, then mixed into a fairly stiff mush / porridge. Salt and fried onions were added as seasonings. The milk and fat, ordinarily added to mashed potato dishes could be omitted. Note 3. This is the earliest German-language document seen (Nov. 2013) that mentions what is probably whole soy flour or grits, which it calls *Sojamehl* or *Sojabohnenschrot.*

Note 4. This is the earliest document seen (Nov. 2013) that describes a cereal-soy blend, or the use of soy flour to make bread.

Haberlandt then continues: If used in this way, the soybean will someday play a major role in the diets of the poor. It will be more than salt for potatoes. With its fat (*Fett,* i.e., oil) it will replace lard [Note 5. Soybean oil was later used to make lard compounds, lard substitutes, and shortening] and with its protein it will supply strength. Appropriate mixtures will be easily developed according to the other ingredients used.

As grits or fine meal (flour) it will also move into the palaces of the rich, in whose kitchens from India and China is already a common item. It will only be a question of finding suitable ways of preparing them. The flavor of half-cooked soy grits resembles that of poppy seeds or almonds, and should be suitable as an addition to the finest foods otherwise made from meals (flour).

The soybean could be of major importance in the provisioning of forts and ships and in supplies for armies. It could justly be used as a better substitute for peas in 'Pea Sausage' [*Erbstwurst,* a cooked food containing pea meal fixed with fat pork and salt.] It will compete effectively as a coffee substitute with other plant products now used for this purpose. Soy coffee is already produced in South Tirol [Austria] and Istria [now a peninsula in Croatia and Slovenia]. Mr. Franz Mark of Budapest [Hungary] pointed out the possibility of using soybeans as a chocolate substitute, for which it would undoubtedly serve better than the peanut, which, in Marseilles [port in southern France], is mixed with sugar to make an inexpensive chocolate substitute.

Note 6. This is the earliest document seen (Aug. 2002) concerning the use of soy as a meat extender (in Pea Sausage).

Note 8. This is the earliest document seen (Nov. 2012) that mentions the possibility of using soybeans as a chocolate substitute. Address: Hochschule fuer Bodencultur, Vienna, Austria.

593. Isono, Tokusaburo. 1878. [On shoyu]. Inaugural dissertation at Tokyo Imperial University, Japan. [4] + 25 p. [Eng]*

• ***Summary:*** Discusses the preparation and analysis of shoyu with a description of salt manufacture in Japan. Republished in 1879 in Tokyo by the Dept. of Science in Tokyo Imperial University (*Tokyo Daigaku*)**.** Address: Tokyo.

594. Isono, Tokusaburo. 1878. On shoyu [Its preparation and analysis, with a description of salt manufacture in Japan]. Inaugural dissertation at Tokyo Imperial University, Japan. 25 p. [Eng]*

• ***Summary:*** Page 4: "Common salt is indispensable as an article of food in Japan as well as... This nigari is used in precipitating to-fu as I stated before on page 3..." Address: Tokyo.

595. Langgaard, A. 1878. Bemerkungen ueber den Naehrwerth des Tofu nach Analysen von J. Schimoyama [Observations on the nutritional value of tofu from analyses by J. Schimoyama]. *Mittheilungen der Deutschen*

© Copyright Soyinfo Center 2014

Gesellschaft fuer Natur- und Voelkerkunde Ostasiens (*Yokohama*) 2(16):268-69. See also p. 271. [Ger]
• ***Summary:*** This article begins: "A large number of foreigners living in Japan are of the opinion that the physical condition of the Japanese people has completely deteriorated (*körperlich vollkomen heruntergekommenes ist*)**.** This opinion is heard not only from lay people but, also (quite often) from physicians, with the additional opinion that with such a nitrogen-poor [low-protein] diet as the Japanese eat, you can hardly expect anything different."

Dr. Langgaard praises tofu as a food which is enjoyed almost daily by all classes of Japanese society, even the poor. In German it is called by the suitable term "bean cheese" (*Bohnenkäse*)**.** One table (based on research by J. Schimoyama [Shimoyama]) gives the nutritional composition of tofu: Dry matter 11.79%. Water 88.21%. Fat: 26.11% of dry matter or 3.08% of fresh tofu. Protein: 69.54% of dry matter or 8.19% of fresh tofu. Salts [ash]: 4.35% of dry matter or 0.52% of fresh tofu.

Note 1. This is the 2nd earliest German-language document (April 2013) seen that uses the term *Bohnenkäse* to refer to tofu.

A second table, combining the research of Liebig with data from the previous table, compares the following foods on an equal nitrogen basis: Mother's milk, tofu, beef, wheat flour, potatoes, and rice. It shows that tofu is very rich in protein, and the lowest of all foods compared in non-nitrogenous [non-protein] substances. A third table shows that the Japanese diet based on rice and tofu is an economical way to obtain the nutrients one needs, and is comparable to the European diet of potatoes and meat. Address: M.D., Japan.

596. Wernich, Albrecht Ludwig Agathon. 1878. Geografisch-medicinische Studien nach den Erlebnissen einer Reise um die Erde [Geographical-medicinal studies based on the experiences of a trip around the world]. Berlin: Verlag von August Hirschwald. x + 423 p. See p. 85. No index. 23 cm. [3 soy ref. Ger]
• ***Summary:*** Chapter 5, titled "Japan–Food value and foods" contains a long discussion of the soybean (*Dolichos Soja*) and soyfoods (p. 84-87) including tofu (*Bohnenkäse oder Bohnengefaultes*) and shoyu (*Soja oder Schoju*)**,** with two long quotations. Soybeans are rich in protein and almost free of starch. They can be roasted to taste like nuts and used in baked goods.

Note. This is the earliest German-language document seen (April 2013) that uses the term *Bohnengefaultes* to refer to tofu.

Endnote No. 35 (p. 411) states that miso soup (*Misoschiru*) or shoyu soup (*Schio-ü-schiru*) are part of the typical Japanese breakfast. Miso is made from beans, barley, and salt; shoyu is made from beans, wheat, and salt. The soup typically contains small amounts of vegetables (such as varieties of potatoes), beans, cabbage and mushrooms, turnips or carrots, onions, etc. weighing a total of about 170 gm. The main dish at breakfast is rice (weighing about 470 gm). Also included are fish or an egg, salt-pickled vegetables, and 100 gm of tea.

Also discusses *Pueraria Thunbergiana* (kuzu, p. 87). Total references: 162. Albrecht Wernich lived 1843-1896. Address: Docent for Special Pathology and Therapy at Berlin University.

597. *Kogyo Tokei-hyo* (*Census of Manufacturers*)**.** 1878--. Serial/periodical. Tokyo: Japanese Ministry of International Trade and Industry (MITI), Research and Statistics Dept. (Tsusho Sangyo Daijin Kanbo Chôsa Tokei-bu). Annual. [Jap]
• ***Summary:*** Contains statistics concerning Japan's industries and commodities. For example, in the report for the year 1987 (published in June 1989) under miso we find "124111 Miso (Including powdered or spray-dried miso). Total production in Japan: 641,337 tonnes. Value in million yen: 138,960..." Similar figures are given for each of Japan's 47 prefectures, listed from north to south, starting with Hokkaido and ending with Okinawa. The four largest producing prefectures are Nagano 186,316 tonnes (29% of the total), Aichi 63,294 tonnes, and Shin (?) 34,282, and Aomori 32,145 tonnes.

Note: The powerful and influential publisher, MITI, is called Tsûsan-sho in Japanese. Address: Tokyo, Japan.

598. Podoba, Ivan Grigor'evich. 1879. Iz zametok po opytam kul'tury novovvodimykh v Novorossiiskom krae rastenii [Notes on experiments of newly cultivated plants in the Novorossiiskya region of southern Russia. III]. *Zemledel'cheskaya Gazeta.* No. 6. p. 82-85. Feb. 10. [Rus]
• ***Summary:*** The section on leguminous plants (*Bobovyya rasteniya*) (p. 83-85) begins with a long table which shows the following for 22 plants that Podoba tested: Collection No., Name of plant, weight planted, weight harvested, net weight, important notes. The plants included two lentils, two flax varieties, two horse beans (*Pferde-Bohne, Vicia Faba,* one each from Scotland and Algeria), various lupins and *Lathyrus* species, and Japanese peas (*Japanische Erbse* [possibly soybeans]).

At the end of this table is a section titled *Soja hispida* (*soya;* the soybean) which states: "From the family Papilionaceae, with little flowers. In the spring of 1877, along with 25 seeds of *Lallemantia Iberica,* I received 50 seeds of *Soja* from Professor Haberlandt of Vienna. Concerning the productivity of this plant, it is possible to draw the clear conclusion that 45 seeds yielded 20 ounces (40 *lot;* 1 lot = ½ ounce). The second year's harvest was also wonderful, however due to rabbits, which ravaged the planted area, I was able to obtain only two pounds of seeds. The yield of pods per plant stalk (up to 2 feet in height)

© Copyright Soyinfo Center 2014

of this Chinese plant surpasses the yield of all our other leguminous plants. The seeds [of soya] resemble those of small haricot beans and according to foreign chemical analyses, soybean seeds contain 34-35% crude protein (peas have 23%) and 18.2 to 18.4% fat (peas have 1.8%). Thus, according to the composition data, soya is a more nutritious [and better for feeding] than peas (see No. 6 of *Zemledel'cheskaya Gazeta,* 1877).

"I am cultivating two varieties of soybeans: No. 151. With yellow seeds–more productive and ripens at the end of July. 152. With dark-red seeds–ripens later and not as fruitful."

In the previous section B, titled "Oil-bearing and other industrial plants," is a numbered list of seeds, which the author received from various places. The scientific name (in Roman letters), source, and (usually) a description of the cultivation and harvest is given. The plants include: 121. Linseed. 122. *Lallemantia Iberica.* "In the spring of 1877, at my request, Prof. Haberlandt sent me 25 seeds, of which I planted 22." 123. Sesame (*Sesam orientalis*), sent by a Russian consulate in Persia. 124. *Madia sativa.* 126. Opium poppy (*Papaver somniferum*).

Under 122. *Lallemantia Iberica* the author notes: Due to the absence of this plant from both commercial seed catalogs and reports of cultural trials, it is assumed that it was first cultivated in Europe. In 1873, Haberlandt introduced several varieties of seeds from Persia to the Vienna World Exposition for acclimatization. In the spring of 1877, at my request, Haberlandt sent me 25 seeds, of which I planted 22. After two harvests, I have 22 pounds of the plant–not including the amount I gave away.

Note 1. This is a continuation of an article in issues No. 2 and No. 4 (p. 57) of this periodical.

Note 2. This is the earliest Russian-language document seen (March 2003) concerning the soybean, and the earliest document seen (March 2003) concerning the soybean by I.G. Podoba.

Note 3. Novorossiisk / Novorossiysk is a seaport city in western Krasnodar Kray, in southern Russia in Europe, on the northeast shore of the Black Sea, about 65 miles west-southwest of the city of Krasnodar. Address: Tavricheskaia [Ukraine as of 2002].

600. *Brisbane Courier* (*Queensland, Australia*). 1879. Queensland trade with Japan. April 30. p. 3.
• ***Summary:*** "The following letter was addressed to Mr. Wildash previous to his departure from Japan: 'Interior Department, Tokio, Japan, January 25, 1879. Sir, I have the honor to request you to hand to the Government of Queensland two maps of Japan, also a small assortment of agricultural seeds to the National Agricultural and Industrial Association of that colony, as exchanges for those conveyed through you to the Government of Japan from Queensland. I have also great pleasure in forwarding you various samples of our national productions for the purpose of distribution in your colony, and with a view of fostering a commercial intercourse between the two countries.–I have the honor to be your obedient servant, Ito Hirobumi, Minister of the Interior Department.'

"The following is the list of agricultural seeds received from Japanese Minister of Interior, and referred to in Mr. Wildash's letter:–Barley, wheat, rye, millet (Oplysmenus frumentacus), millet (Panicum miliaceum), bean (black Soja), bean (Soja Glycine), pea (Pisum sativum), pea (white), Indian corn."

Note 1. This is the earliest document seen (March 2010) concerning soybeans (not including wild perennial relatives of the soybean) in Australia or Oceania. This document contains the earliest clear date seen (April 1879) for soybeans in Australia or Oceania.

601. *Brisbane Courier* (*Queensland, Australia*). 1879. Monday, May 19, 1879. May 19. p. 2.
• ***Summary:*** "The agricultural seeds forwarded to the National Association by the Japanese Minister of the Interior, per Mr. Wildash, are now available for distribution to farmers and others desirous of proving their characteristics and value. The seeds comprise barley, wheat, rye, maize, millet (two kinds), soja bean (two kinds), pea (two kinds), all of which have been raised in different districts of Japan. The secretary will be happy to forward small trial quantities on application."

Note: These may be the first soya beans available for cultivation in Australia. They came from Japan. They were almost certainly cultivated in mid-1879 in Queensland, but we cannot be 100% sure.

602. *Bulletin Trimestriel de la Societe des Sciences, Agriculture et Arts de la Basse-Alsace* (*Strasbourg*). 1879. M. Fuehrer lit un compte-rendu d'un mémoire qui a été publié dans la *Wiener Landwirthschafliche Zeitung* par M. le professeur Hecke sur la fève soja [Mr. L. Führer reads a report of an article on the soybean published in the *Wiener Landwirthschafliche Zeitung* by Prof. Hecke]. 13(3):355-62. Meeting of 3 Sept. 1879. M. Rod. Turckheim, residing. [1 ref. Fre]
• ***Summary:*** Gentlemen, I should inform you of the report published in the journal *Wiener Landwirthschafliche Zeitung* by Prof. Hecke on the agronomic trials done in Austria, Bavaria, and Silesia of the bean, introduced following the Universal Exposition of Vienna and known to former botanists by the name Dolichos bean of Japan (*Dolic du Japon*) [the soybean]. The beans of this plant are used in

© Copyright Soyinfo Center 2014

Japan to make a type of sauce that is served as a condiment called *Soja.* The plant was first placed in the botanical system in the genus Dolichos, from which it takes its name, and which is found in Theophrastus, from a variety of beans having very elongated pods. This genus, differing from true beans (*haricots*) only because their carina (*carène*) is not twisted in a spiral, contains 60 species, all exotic, including *Dolichos lablab,* the famous Egyptian lentil for which the patriarch Esau had to give up his right of primogeniture [to his younger brother Jacob]. Our plant had taken the name of *Dolichos soya* within the genus, and later, the genus Dolichos having acquired too many species, it served as a model for a particular genus known as *Soja hispida* [the soybean]. Note 1. In botany, the word "carina" refers to the two conjoined lower petals of a bean, pea, or other legume flower that enclose the stamen and style. It is derived from the Latin word *carina,* meaning the hull or keel of a boat.

Soy sauce (*la sauce du soja*) was well known in Europe; it was even stylish (*à la mode*) at the turn of the century [ca. 1800] in London and Paris, but no one there had the plant. It was only after the Universal Exposition of Vienna where Dolichos beans of all [sic, several] countries figured, that the attention of some farmers and notably that of Professor Haberlandt had been called to these beans. Some agronomic trials were done; it was soon recognized that the species or varieties coming from Japan and north China were those that could adapt themselves most easily to the climate of central Europe, and the yellow variety was recognized as being preferable to any other.

Let us also recall that at last April's meeting, our colleague Mr. Wagner made a rather large distribution of seeds coming from his own crop. It will be then possible to obtain exact information on the merit of the new legume.

The journal *Isis,* which also contains an article on soy (*soja*), publishes a table comparing the composition of different edible beans. It compares the water, albumin, non-protein extracted material, and ash content of the soybean, haricot bean, pea, lentil, broad bean / faba bean (*fève*), and lupine.

It is certain that a great number of plants have been extolled for agriculture and we should have expected marvelous results. Yet very few justified the reputation that had been made of them, and in the majority of cases the plants in use for centuries prevailed over their new competitors. But it is not less true that to agronomic trials of exotic plants we owe wine, potatoes, tobacco, and many others. These trials would merit encouragement then, even if of 50 new plants only one succeeds, and could improve our agriculture. It is for this reason that I wish to call the Society's attention to another plant which I mentioned earlier–the *Dolichos lablab* or Egyptian lentil (*le lentille d'Égypte*).

Note 2. Mr. L. Führer is a member of this Society and responsible for publishing the Bulletin and for the "Initiative / Information Commission" (*commission d'initiative*). Address: Basse-Alsace, France.

603. Warington, Robert. 1879. Agricultural chemistry in Japan. *Chemical News and Journal of Industrial Science* 40(1039):195-96. Oct. 24.

• ***Summary:*** "In the International Exhibition, now being held at Sydney [Australia], a collection of soils, manures, and agricultural products is shown by the Imperial College of Agriculture in Tokio, Japan. Accompanying the collection is a descriptive catalogue, compiled by Mr. Kinch, the Professor of Chemistry at the College, in which a short account is given of the various products exhibited, with chemical analyses of the majority of them. The catalogue contains in all about 80 analyses of Japanese products. The whole of this important work has been accomplished in the laboratory of the College, under the superintendence of Mr. Kinch, and is certainly highly creditable to the Institution."

The section titled "Soy Bean (*Glycine* [*Soja*] *hispida*)" (p. 195) mentions miso, tofu, and shoyu.

Starch and sugar: Starch is prepared in Japan from the root of a leguminous plant, *Pueraria Thunbergiana* (p. 196).

"Alcoholic liquors.–Rice-beer (*Sake*) is the most important beverage of the country. It is manufactured only during the winter months. The ferment is first prepared by spreading steamed rice mixed with wood-ashes in shallow trays, which are then seeded with the yellow spores of the fungus developed in a previous operation, and kept for some days in a warm chamber. When the fungus has developed, the mass is used to inoculate a fresh quantity of steamed rice. The mash is prepared by adding to steamed rice and water a certain proportion of the above ferment, and the whole is repeatedly agitated for two days. In this stage of the operation the starch of the rice is converted into sugar. The mash is then transferred to a large vessel, and the temperature raised to that of the human body. In this stage an active alcoholic fermentation takes place. The liquor thus formed is not, however, the final product. To it are added fresh quantities of steamed rice, water, and ferment, and after three days mashing this addition is again, and yet again repeated. When the last rice has been added the whole is allowed to ferment for thirteen days. The sake is now strained, and the residue pressed. After standing fifteen days to clear, the pure sake is heated to 120º F. to destroy any remaining yeast, and is then fit for use.

"Finished sake contains, according to six analyses given by Mr. Kinch, 11.33 to 15.0 per cent of alcohol by weight, and 2.33 to 3.05 per cent of solid matter; the total free acid, reckoned as acetic, was 0-20 to 0-27 per cent. Various sweet, imperfectly fermented, liquors are also manufactured. The solid residue left after pressing out the sake is distilled, and yields spirit of various strengths. The strongest spirit exhibited was 10.7 over Proof." Address: M.R.C.S. Eng.

604. *Revue Horticole: Journal d'Horticulture Pratique* (*Paris*). 1879. Société Centrale d'Horticulture de France: Seance du 13 Novembre 1879 [Central Horticultural Society of France: Meeting of 13 Nov. 1879]. 51:454-55. Dec. 1. [Fre]

• ***Summary:*** The section on the soybean (p. 455) states: Mr. Duchartre reads a note on the comparative richness in nitrogen and fat contained in several species of plants considered to be the richest in these sorts of substances, such as the pea, haricot beans, broad beans, lentils and soya. The note draws the conclusion that, of all these, soya is by far the richest in these factors. Thus, while up to this time, broad beans had been regarded of having a superior output [content]: 30.80% proteins and 70% fats, soybean seeds contain 35% proteins and 73% fat. Such an output, if it is indeed justified, would explain the use that is made of soy beans as a food source and would justify the label of "Oleaginous pea" (*Pois oléagineux*) that has been given to *Soja hispida.*

After reading this note, Professor Baillon tells the audience that this plant, known since ancient times, is nothing but the *Glycine hispida,* and mentions the numerous culinary uses the Japanese have for it and the very diverse preparations and products in which they use it, most frequently adding rice to it. These pieces of information are extracted from the *Amoenitates exotice* [sic], by Kaempfer, one of the first naturalist travelers who visited Japan.

605. Bryan (C.C.). 1879. Holiday goods (Ad). *Washington Post.* Dec. 16. p. 4, col. 2.

• ***Summary:*** "Finest Dehesa raisins [from Malaga, Spain], finest Layer figs,... Catawba grapes, Malaga grapes,... Mexican beans, Japanese soy sauce, Scotch jams and marmalades."

This ad also appeared in the Dec. 18 and 25 issues of this newspaper. Address: Northwest corner 15th and I sts. northwest [Washington, DC].

606. Atkinson, R.W. 1879. The chemical industries of Japan. No. 2.–Ame. *Transactions of the Asiatic Society of Japan* 7:313-22.

• ***Summary:*** Although *amé* "is best known to foreigners in the form of a sweetmeat much esteemed by children," it is also largely used "in the manufacture of *mirin* and *shoyu.* In a viscous liquid form, sold out of jars in shops, it is called *midzu-ame,* with the best variety of the latter called *awa-ame.*

The basic starch-containing raw material is either millet (Jap. *awa*), or *mochigome* (glutinous rice), or the common kind of rice called *uruchi.* The *ame* made from rice is much sweeter than that made from millet. The late Dr. Ritter wrote in detail of ame in a paper published by the German Asiatic Society in 1874 [See: *Mittheilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* (Yokohama) 1(5):3-5. July]. A detailed description of the process for making ame is then given. Address: B.Sc., London.

607. Cook, G.H. 1879. The soja bean; a new forage plant. *Rutgers Scientific School, Annual Report* 15:54-58. [1 ref]

• ***Summary:*** "When in Munich last year, I saw the soja bean in cultivation, as a new crop, and probably a desirable addition to our forage products. It was seen in the grounds of the Bavarian Agricultural Experiment Station, and was in very vigorous growth. The gentleman in charge gave me a few seeds; and seeds of several other varieties of the same plant were procured at Vienna by my friend Mr. James Neilson. We have planted them, and gathered crops of the different kinds this year. The following is a translation of the paper sent out from the Bavarian Experiment Station to those who were growing and testing the capabilities of the plant." Note 1. See: Lehmann, Julius. 1878. *"Ueber den Anbau der rauhhaarigen Sojabohne. Zeitschrift des Landwirthschaftlichen Vereins in Bayern* 68:61-64. Feb.

"On the Cultivation of the Hairy Soja Bean."–"The exertions made in the last decade to naturalize foreign useful plants in Germany, and by their cultivation to increase the income from farm lands, have so far been without result. This has been the case with sorghum, ramie, Siberian fodder, water rice, &c., for each of which great hopes have been excited; but nothing now remains but the remembrance and the proof of the difficulties in the way of our agriculture.

"Fortunately the success of this pursuit depends less on such attempts, than on increasing the quantity of our well-known crops, by good cultivation and heavy manuring–by careful selection of seed and proper care of the plant. All farmers taking these precautions, and using discoveries in these directions, will surely gain satisfactory profits even without new plants.

"Yet the progressive farmer will be interested and make personal experiments, of these attempts at acclimating, if the plant promises to fill some want. We now seem to have such a one for our increasing cattle raising. We need a fodder for young cattle, for milk cows and for bullocks, whose seeds contain, in proper amount, albumen and fat, with a pleasant taste. In cereals and their brans, and also in leguminous seeds, we have fodder containing albumen but not fat enough. The addition of oil-cake is not entirely satisfactory, because the proportion of fat in it varies, and its cost is too great.

"Two years ago Prof. Haberlandt, of Vienna, an untiring botanical experimenter, introduced to us a plant whose pleasant-tasting seeds are rich in albumen and fat, in very digestible forms. This plant is the hairy soja bean (*Soja hispida, Mönch.*) Prof. Haberlandt found samples of the seed at the Vienna Exposition among the agricultural products of China, Japan, Mongolia, Transcaucasia and India. He says this plant has been cultivated from early ages. It grows wild

© Copyright Soyinfo Center 2014

in the Malay Archipelago, Java and the East Indies, and is cultivated extensively in China and Japan. Its seeds, boiled or roasted, have a pleasant taste, and form an almost daily part of the food in India, China and Japan. The soja is an annual leguminous plant."

"In 1876, twenty experiments were made in various parts of Bohemia, Moravia [both in the Czech Republic as of Jan. 1993], Southern Austria, Styria [a state in Austria, called Steiermark in German], Hungary, and Upper Silesia [a region mostly in southwest Poland]. From the well-ripened seeds of these crops, one hundred and thirty-five trials were made the next year under various climatic influences. Prof. Haberlandt has written us that only twelve of the experiments failed, and most of the results were unusually good.

"According to Professor Haberlandt there are several varieties of the soja, which vary much in their time of ripening. For the climate of Middle Europe the early kind is best. Sown early in May the seeds mature at the end of September or October. Its time of growth is like that of the horse bean. (This is the *Vicia faba,* the horse bean or Windsor bean of Europe, which is cultivated there for feeding domestic animals, and, like it, ripens after harvest.) It differs from this bean in its productiveness and its non-liability to harm from insects. It has harvested from thirty-three to fifty-five bushels of seed, and two and one-third tons of very nutritious straw to the acre."

"Prof. Schwackerhofer of Vienna, has analyzed the original and harvested seed [two crops], and the soja straw, with the following results." A table shows that the original seed contained 30.56% albuminoids and 15.81% fat. The first and second crops contained and average of 34.56% albuminoids and 18.32% fat–both much higher. The soja straw contained 4.43% albuminoids and 2.51% fat.

A second table (p. 58) compares the composition and comparative value per 100 pounds of 12 feed and fodder crops. Soja beans were found to contain 4.8% ash, 34.7% albuminoids (second highest value after cotton-seed cake (decorticated)), 18.3% fat (the highest), 28.3% carbohydrates, and a comparative value of 2.55 (the highest, with clover hay taken as 1.0).

"In this table the soja bean is shown to have the highest value of any of the substances named, and by mixing it with oat straw or cured corn-fodder, it will make a rich and healthful fodder for cattle, and one which can be afforded in greater quantity and at less expense than first quality timothy or clover hay. It would form, too, a proper crop to be in the rotation between corn and wheat, instead of oats or potatoes, as now practiced. It is not subject to the same difficulties in curing as our common field bean, as the beans do not easily shell out, and coarser stalks enable it to be cured [to make hay] like Indian corn. And being a sowed crop, it is cultivated with the minimum of labor."

Note 2. Prof. George Hammell Cook was instrumental in establishing the New Jersey State Board of Agriculture at Rutgers on 7 April 1872; he was appointed its first secretary. Rutgers thus become one of the early state institutions that conducted agricultural research. On 10 March 1880 the New Jersey Agricultural Experiment Station was established at Rutgers College (New Brunswick)–with state funding only (no federal aid). On 2 March 1887 the Hatch Act created state agricultural experiment stations with federal grants. This is the earliest document seen (Jan. 2005) concerning soybean research by a state research institution or agricultural experiment station.

Note 3. This is the earliest document seen (July 2011) concerning soybeans in New Jersey, or the cultivation of soybeans in New Jersey. This document contains the earliest date seen for soybeans in New Jersey, or the cultivation of soybeans in New Jersey (1879). The source of these soybeans was Bavaria, Germany, and Vienna, Austria.

Note 4. This is the earliest document seen (March 2001) describing cultivation of soybeans by a U.S. land grant institution.

Note 5. This is the earliest document seen (Feb. 2008) that uses the word "albumen" (or "albumens") or the word "albuminoids" (or "albuminoid") in connection with soy. The word "albumen" usually refers to the white / protein of an egg, but here it refers to protein of the soja bean "whose seeds are rich in albumen" (protein). The word "albumin" (first used in 1869) refers to any of numerous simple heat-coagulable, water-soluble proteins that occur in muscle, egg whites, milk, and other animal substances, and in many plant tissues and fluids.

Note 6. This is the earliest English-language document seen (Feb. 2011) that refers to soynuts. Discussing the soybean, it says: "Its seeds, boiled or roasted, have a pleasant taste, and form an almost daily part of the food in India, China and Japan." It is also the earliest document seen (March 2001) concerning the etymology of soynuts.

Note 7. This is the earliest document seen (April 2001) that uses the term "hairy soja bean" to refer to the soybean.

Note 8. This is the earliest English-language document seen (Oct. 2012) with the word "soja bean" (or "soja beans") in the title.

Note 9. This is the earliest English-language document seen (Jan. 2002) related to soybeans that uses the word "forage" in the title.

Note 10. This is the earliest document seen (March 1999) that mentions Mr. James Neilson who, in 1878, obtained several soybean varieties in Vienna, Austria, brought them back to the United States, and planted them at Rutgers University in New Brunswick, New Jersey, in 1879.

Note 11. This is the earliest document seen (May 2000) that uses the word "rotation" or discusses crop rotation in connection with soybeans.

Note 12. This is the earliest English-language document seen (Sept. 2001) that mentions the word "carbohydrates" in connection with soybeans.

© Copyright Soyinfo Center 2014

Note 13. This is the earliest annual report seen (Oct. 2001) that mentions soy.

Note 14. This is the earliest document seen (July 2002) that mentions feeding soybean fodder to milk cows, however none has yet been fed.

Note 15. This is the earliest document seen (Nov. 2005) that mentions cotton-seed cake (any spelling). It is also the earliest English-language document seen (Nov. 2005) that contains the term "cotton-seed cake" or "decorticated" in connection with such cake or meal.

Note 16. This is the earliest English-language document seen (Oct. 2004) that uses the word "cured" in connection with making soybean hay. Address: New Brunswick, New Jersey.

608. Kinch, Edward. 1879. Japan: A classified and descriptive catalogue of a collection of agricultural products exhibited in the Sydney international exhibition by the Imperial College of Agriculture, Tokio, Japan. Tokyo: Agricultural Bureau (Naimushô), Home Dept. 65 p. 20 cm. [Eng]

• ***Summary:*** Each item that was displayed is numbered. All chemical / nutritional analyses give percentage composition unless otherwise stated. The chapter on "Manures "begins (p. 4): "The principal manures used in this country are human excrements both solid and liquid, which are collected with the greatest care and applies to the land whilst in a more or less advanced state of decomposition. The excreta are often made into a compost with dried grass.

The section titled "vegetable manures" (p. 7-13) gives analyses of rape cake (*abura kasu*), malt dust (*ame kasu*), sesamum cake (*goma kasu*), rice beer residues (*sake kasu*), soy [sauce] residues (*shoyu kasu;* water 16.37%, ash 4.96%, organic matter 78.67%), rice cleanings (*nuka*), and barley bran (*fusuma*).

Note 1. This is the earliest English-language document seen (May 2012) that contains the term *shoyu kasu* (in italics, without diacritics) which it defines as "Soy residues," and the earliest that gives its composition.

The chapter on "Foods" begins (p. 16): "By far the most important national food is rice, *Kome;* more than one half of the cultivated land of the Empire is devoted to paddy fields, *Ta,* and besides the rice grown on this irrigated land a considerable quantity is grown on the dry fields, *Katake."* *Mochi-gome* or glutinous rice, is specially used for making the new years' cakes, *Mochi.*

The many kinds of leguminous plants include: Peas, field and haricot beans, vetches, lupins; soy beans *Glycine* (*soja*) *hispida, O-mame or Daidzu;* fol. lanceolata (*Midzu-kugiri*)*; Phaseolus radiatus, Adzuki* or *Shodzu; P. radiatus v. pendula, Tsura-adzuki; P. radiatus subtriloba, Bundo;* Horse gram, *Dolichos uniflorus, Sasagi;* Gram, *Dolichos umbellatus, Hata-sasagi;* Overlook pea, *Canavalia incurva, Nata-mame;* Ground nut, *Arachis hypogæa, Rakkasho* or *Tojin-mame.*

"Also should be mentioned the sesamum, *Goma,* the oil of which is extensively used in cooking; *Perilla ocymoides, Ye-goma;* and rape, *Brassica sinensis, Abura-na,* which is cultivated for its seed, the oil being used for burning." Also list (with scientific and Japanese names, p. 17-18) the principal root crops, fruits, sea weed and lichens, fungi, and starch.

Next: Chemical analyses of rice, wheat, rye, "red bean–*Adzuki–Phaseolus radiatus* (large variety and small variety)."

Note 2. This is the earliest English-language document seen (March 2006) that uses the word *Shodzu* (or *shôdzu* or *shôzu* or *shodzu* or *shozu*) or the word "red" or the term "red bean" to refer to the azuki bean, or that gives its scientific name as *Phaseolus radiatus,* or that reports the existence of large and small varieties, or that uses the word *Bundo* to refer to a variety of azuki bean.

Then (p. 22-26): "44. Beans. *O-mame, Daidzu. Glycine* (*soja*) *hispida.* White round soy bean. Miso mame. Percentage composition (table): Water 11.32, albuminoids 37.75, fat 20.89, fibre 1.50, ash 3.86, starch and soluble cellulose 24.58. Total 100.00.

"This bean is met with in several varieties of different colour and size, but they differ little in composition. It is vegetable which approaches nearest in chemical composition to animal food (meat), containing as it does one fifth of its weight of fat and often two-fifths of nitrogenous matter. It is an extremely valuable adjunct to the food of a people who subsist so largely on a purely vegetable diet, of which the bulk is rice so rich in heat producers–starch, and poor in flesh formers–albuminoids.

"Shoyu, Miso, and *Tofu,* are made from these beans, and enter largely into the food of the nation.

"45. Miso. *Shiro-miso* or white miso. From Osaka. Percentage composition: Water 50.73, fibre 12.93, ash 6.58 (containing 5.4 per cent of common salt), sugar 17.54, albuminoids 5.64, soluble carbohydrates 6.58. Total 100.00. Soluble in water 35.88 per cent.

"46. Miso. *Aka-miso* or red miso. From Osaka. Percentage composition: Water 50.40, fibre 8.25, ash 12.50 (containing 12 per cent of common salt), sugar 0.61, albuminoids 10.08, soluble carbohydrates 18.16. Total 100.00. Soluble in water 34.71 per cent."

Note 3. This is the earliest English-language document seen (March 2009) that uses the term "Shiro-miso" refer to white miso (and vice versa) or "aka-miso" to refer to red miso (and vice versa).

"In the preparation of *Miso* the beans are boiled, pounded in a mortar into a paste and mixed with fermenting rice, *Koji* (see *sake*) in various proportions, and with more or less salt, and the mixture is placed in tubs and left in a cool place for about a month. It will be seen that one variety, white miso, contains much sugar, derived from the *koji,* and

© Copyright Soyinfo Center 2014

little salt; whilst the other variety contains very little sugar and much more salt.

"47. Tofu. Percentage composition: Water 89.29, ash 0.48, fibre 1.01, nitrogenous substances 4.87, non-nitrogenous substances 4.35 (containing 3.32% fat). Total 100.00.

"This food is made by boiling the white soy beans, *Shiro-mame,* in water after they have been soaked, ground and strained through a sieve. The solution is filtered through cotton cloth and the residue pressed; the liquid, containing legumin in solution, is precipitated by the addition of the brine which runs off from sea salt during its deliquescence in the air. The precipitate constitutes *Tofu."*

Note 4. This is the earliest English-language document seen (Oct. 2008) that uses the word "legumin" to refer to the water soluble protein in soybeans than can be precipitated by a coagulant to make tofu.

"48. Kori tofu. Percentage composition: Water 18.75, ash 1.60, nitrogenous substances 48.80, non-nitrogenous substances, chiefly fat 30.85. Total 100.00.

"Prepared from the above [tofu] by exposing it to the air during frost, until it freezes, and afterwards thawing in the sun, by which the greater quantity of the water is removed.

Note 5. This is the earliest English-language document seen (April 2013) that mentions dried frozen tofu, which it calls Kori tofu.

"49. Soy [sauce]. Shoyu. Specific gravity 1.1996. Grams per litre: Total solid residue 359.888, ash 195.168 (principally common salt), sugar 31.034, albuminoids 41.000, free acid expressed as acetic acid 6.200.

Note 6. This is the earliest document seen (Jan. 2008) that uses the term "specific gravity" in connection with soyfoods–in this case soy sauce.

"Manufacture of *Shoyu. Shoyu* is made from the soy bean, *Glycine* (*soja*) *hispida q.v.* together with wheat, salt and water. Equal parts of beans and wheat are used. A small part of the wheat is mixed with *Koji* (see *sake*) and allowed to ferment. The remainder is roasted and the beans are also roasted. The roasted beans and wheat are then mixed together with the fermenting wheat, placed in shallow wooden boxes, and kept for some days, at a fixed temperature, in a warm chamber with thick walls, until the whole mass is covered with fungus. It is very important that the temperature of this chamber should be kept at the proper point. By these processes, part of the starch of the wheat is converted into dextrin and sugar, and lactic acid and acetic acid are formed. It is then mixed with salt lye, the proportion used being about 4 *go* of salt to 12 *koku* of water to extract 1 *koku* of the fermented product. The mashings are removed to large vats and there kept for at least 20 months and generally for 3 or 5 years. The better qualities of *shoyu* are kept the longer times. It is found that the best soy is produced by mixing that kept for 5 years with that kept for 3 years. After it has been kept a sufficiently long time, it is strained through thick cotton bags and the residue pressed in the same manner as in *sake* pressing. Before filtering, honey is sometimes added in the proportion of 10 *kin* to 1 *koku* of *Moromi* or mixed soy, in order to give it a sweet taste. Occasionally a sweet sake, obtained by taking 1 *koku* of *koji* to 7 *to* of water and 1 *to* of steamed rice, mixing them together and steaming for two hours, is added instead of honey. The residue obtained on pressing *moromi* is again mixed with salt and water, in the proportion of 8 *to* of salt to 1 *koku* of water and again pressed, this yields and inferior *shoyu.* Sometimes water is added to this second residue and it is again pressed. The residue first obtained is sometimes used as food, and the last residue as manure. One *koku* of the mixture, *moromi,* produces 4 *kuwamme* of residue at the first filtration and about 3.5 *kuwamme* of residue at the second and third. The *shoyu,* after pressing, is allowed to settle for two days in large tanks, and then drawn off and again filtered. *Shoyu* is a very important condiment, it is mixed with a great many kinds of food and is produced and consumed in very large quantities.

"1000 *Go* = 100 *Sho* = 10 *To* = 1 *Koku* = 4.929 Bushels. 1 *Kin* = 1.325 lbs. 1 *Kuwamme* = 8.28 lbs.

Note 7. This description of how shoyu is made contains several major errors.

Finally, there are chapters on alcoholic liquors (with emphasis on sake or "rice beer, sometimes called rice wine"), sweet liqueurs (*mirin, homeishiu, shiro-zake*), food adjuncts (incl. salt, vinegar, spices, herbs, and perhaps shoyu), edible sea weeds (20 varieties, with both Japanese and scientific names, and an analysis of each), tea, tobacco, fodder, animal foods, dye stuffs, oils and waxes, and starch (incl. *kudzu, Pueraria thunbergiana*).

Note 8. This is the earliest document seen (July 2008) concerning soybean products (tofu, dried-frozen tofu, and shoyu) in connection with (but not yet in) Australia.

Note 9. This is the earliest document seen (July 2008) by Edward Kinch (1848-1920) that mentions soy. Kinch was born on 18 Aug. 1848 at Henley-on-Thames, Oxfordshire, England, the 3rd child of Charles Kinch and Emma Plumbe Kinch. He was baptised there on 12 Dec. 1845 in St. Mary's church. Kinch was a chemist, specializing in agricultural chemistry. In 1869 he became assistant professor at the Royal Agricultural College (RAC) in Cirencester (in southwestern England). From 1876 to 1881 he was a professor of agricultural chemistry at the Imperial College of Agriculture in Tokyo, Japan. Then from 1881 to 1915 he was professor of chemistry at the RAC in Cirencester. He married Edith Shirley Huntington in 1889 in Pembroke district, Pembroke, Wales. They had two children, William (born ca. 1886) and Dora Ann (born ca. 1893). He died on 6 Aug. 1920 in Haselmere, Surrey, England.

Note 10. This catalog was displayed at the Sydney International Exhibition, held in Australia in 1879. The Sydney International Exhibition was Australia's first

© Copyright Soyinfo Center 2014

international exhibition, a showcase of invention and industry from around the world. An imposing Garden Palace was constructed in the Botanic Gardens as a home for the exhibition. Address: F.I.C., F.C.S., &c., Prof. of Chemistry. Imperial College of Agriculture, Komaba, Tokio, Japan.

609. Pickering, Charles. 1879. Chronological history of plants: Man's record of his own existence illustrated through their names, uses, and companionship. Boston, Massachusetts: Little, Brown, and Co. 1222 p. See p. 763. [10 ref]

• ***Summary:*** In the section titled "Chronological arrangement of accompanying animals and plants," at the year 1296 A.D. we read: "*Soja hispida* of Japan. Enumerated by the Chinese official 141 as unknown in Cambodia:–'miso' beans are mentioned in 1444 in the annals of the Japanese emperors (transl. Tits. [Titsingh / Titsing] and Klaproth); were observed by Kaempfer v. 837, and Thunberg, under frequent cultivation near Nagasaki and elsewhere; are known to be made into the condiment called 'soia' (Pers.) in English *soy;* also into a white porridge [tofu] in general use among the Chinese and called by them 'teu hu' or 'tauhu' (Loureiro). Westward, S. hispida was observed by Mason in Burmah; by Roxburgh, and Graham, in the gardens of Hindustan. Transported to Europe, it is described by Jacquin rar pl. 145" [*Icones plantarum rariorum*].

Note 1. This may be the earliest document seen (May 2010) concerning soybeans in Burma (later renamed Myanmar), or the cultivation of soybeans in Burma. This document may contain the earliest date seen for soybeans in Burma, or the cultivation of soybeans in Burma (1879). The source of these soybeans is unknown. However, as of Feb. 2012 we have been unable to find verification for Pickering's statement about Mason in the writings of Francis Mason. Finding the earlier citation by Mason may allow us to push back this date.

Note 2. This is the earliest English-language document seen (April 2013) that uses the word "tauhu" to refer to Chinese-style tofu. Address: M.D., Boston, Massachusetts.

610. *New-York Tribune.* 1880. A new vegetable from China. Feb. 8. p. 4.

• ***Summary:*** From The Globe: "Some experiments carried on by two or three Austrian and German horticulturists [including Friedrich Haberlandt of Vienna] have brought into notice an almost forgotten plant which was introduced into Europe from China nearly thirty years ago, but whose existence, and whose products have been undeservedly lost sight of. This is the *Soja hispida,* a species of leguminous plant, somewhat resembling in habit and appearance the well-known pea. Unlike the latter, however, it has two distinct uses–industrial as well as alimentary. It is highly prized in China and Japan, and is said, indeed, to take its scientific title [Soja] from the Japanese name of the sauce–sooja–which is made from its seeds."

Chinese are referred to as "the Celestials."

611. G.P. 1880. I opet povoljan izvjestaj o "soji" [Once again, a favorable report on "soybeans"]. *Gospodarski List* (*Farmer's Newspaper, Zagreb, Croatia*) 28(6):46. March 20. [Cro]

• ***Summary:*** "Reading the German agricultural journals and our *Farmer's Newspaper* (*Gospodarsky List*) last year, I thought the legume soya (*soja*) would very soon take roots and start growing everywhere, thus giving humans as well as our domestic animals good food and feeds. But our *Farmer's Newspaper* published in this year's issue No. 2 that soya in our country has been alas quickly disapproved, has no future, and so future testing and dissemination should be disregarded–even though in all other Austro-Hungarian crown lands it is planted and spreading, even in German Bavaria and Saxony. Since, over the last two years, I have carefully followed articles at home and abroad about soya, and made trials myself, I should not like to miss the chance to report to you about this excellent legume.

In 1878 I got from the Agricultural Society at Zagreb 1 kg of a Japanese soybean variety, imported from Japan by Mr. Auchman. Interested growers and some advanced farmers received two-thirds of the lot, and one-third was sown from May 9 to 13 on the experimental field of the school. Although in this cold month some common beans were damaged by frost, the soybean has not been affected. Flowering started on Aug. 14, at a height of between 2 and 3 feet, and they were harvested on Oct. 31. After 10 days of drying shelled, they gave 6 kg of pure seeds. Other trials yielded less and with some growers did not ripen at all, since they were planted too late (at the end of May). These growers disapproved of soya, declaring that it was not suitable for our climate and soils. This Japanese soybean variety from Mr. Auchman is the main reason that soybeans have so quickly gotten so much disapproval from so many growers in our country. In the report of trials from Count Attems in Graz, and in the agricultural journal from Vienna, all agree that Auchman's soybean variety is too late and cannot compete with the Chinese varieties, which ripen in our country at the same time as some varieties of common beans. I was pleased to understand the problem. So last year in March, I got 500 gm each of yellow, brown, and black Chinese varieties from Count Attems in Graz to use for my own trials.

On 15 May 1879 I planted one plot with Chinese varieties, and another with the Japanese variety. The Chinese varieties started to flower on July 15, after only 2 months, but the Japanese variety didn't flower until August 15, a month later and 3 months after sowing. In the second half of September, the Chinese varieties were ready to be harvested, but the Japanese variety was still green, and on Oct. 16 it was covered with snow. About 10 days later it was harvested; after being dried for 15 days in the barn and being

© Copyright Soyinfo Center 2014

shelled, it gave only 6 kg of seeds. Only a few pods were ripe, about half of them developed soft seeds, and the rest remained green. The test weight was much lower than with the Chinese varieties, but there was no difference in the taste. According to this trial, the Japanese variety should be grown where early sowing (at the beginning of April) is possible, and where moisture and frosts in October are absent. It has a much better growth habit and dry-matter weight of the total plants than the Chinese varieties, so it could give a higher yield of fodder for our animals.

The rest of the Chinese soybean varieties were divided among 3 farmers, and half of that sample was sown in time. They did not expect such results, especially after this summer's extreme drought, which killed all common beans–but the soybean remained green and yielded well. They were surprised that some plants, damaged in one place by sheep, and in another trial by an ox, still gave some seeds. Some plants had between 180 and 200 pods containing 300 to 400 seeds.

"I harvested 10 kg of yellow, 4 kg of brownish-red, and 4 kg of black Chinese varieties with the aim of distributing all seeds among farmers, amateurs, and schools in this [Ogulin] district so as to spread this excellent legume as quickly as possible.

"Even though this newspaper has published a lot about planting the soybean, I would like to add my opinion that it should be sown more densely, about 20 cm apart, if only every third seed emerged [and survived]. It could be sown also in rows of thin corn since ripening together, and cultivation is almost the same, only soybeans should not be hilled, since many pods are very close to the soil surface and they may start spoiling due to the high moisture of the hills. And in regard to nutritional value, no other of our legumes could compete with the soybean, since as soon as one tastes the soybean he decides to plant it in his own garden. It can be consumed without any spices, and what is most important, it is easily digested, its coat being so thin that it is not a bother in the mouth, compared with the coats of our beans which remain undigested even in a stronger stomach. Soybean soup is also excellent, so it can surpass expensive fasting soup on many bourgeois tables.

"I send you this report with that wish that soya should take root in our country as soon as possible. I will try to repeat it also in the coming season and will not forget to report again after harvest about the new results. (Editor: We are looking forward to that as soon as possible).

Translated by Dr. Joze Spanring of Ljubljana, Slovenia. Address: Teacher, Ogulin, Croatia.

612. *Bulletin de la Societe d'Acclimatation.* 1880. Extraits des procés-verbaux des séances de la société. Séance générale du 16 Avril 1880 [Excerpts of verbal proceedings from meetings of the society. General meeting of 16 April 1880]. 27:185-96. April. See p. 191-92. [Fre]

• ***Summary:*** Mr. Vavin shows the assembly seeds of *Soja hispida* and indicates the remarkable size to which they expand when soaked in water. Mr. Paillieux states that the true name of this plant is *Glycine hispida.* Mr. Vavin replies that, according to Mr. Baillon, 23 varieties (*variétés*) of this plant exist in China, but only 3 of these varieties are known in Europe.

"Our colleagues then express regret that Mr. Blavet, president of the Society of Horticulture of Étampes, who has conducted agronomic trials with soya using seeds provided by the Society for Acclimatization, has not yet sent us a sample of his crop, even though he was able to give 9 liters of seed to Mr. Vilmorin."

Mr. Grisard observes that, according to the observations of Mr. Corroy, director of the botanical garden of the farm at Mares, in Cochinchine (French Indochina), the seeds of soya–at least those which are black–are generally not much relished by livestock.

Mr. Paillieux notes that the seeds of *Glycine* come in different colors–green, yellow, white, black, and red. There are also early and late varieties (*variétés*)*;* only the early varieties will bear mature seed in France. As for the number of varieties, there would seem to be more than 30 in Japan.

613. Sempolowski, A. 1880. Zur Kultur und Verwerthung der Sojabohne [On the culture and use of soybeans]. *Fuehlings Landwirtschaftliche Zeitung* 29(5):278-81. May. [Ger]

• ***Summary:*** It is well known that Prof. Dr. Fr. Haberlandt, who obtained soybeans in 1873 at the Vienna Exposition (and unfortunately died at too young an age), conducted many soybean trials in order to find varieties that yielded well in Austria and bordering countries. The best varieties proved to be the yellow-seeded ones that originated in Mongolia. Later, in other areas many more trials were conducted.

"I conducted my first trials with soybeans two years ago [i.e., in 1878] at 53-53º north latitude. The yield was satisfactory, however I had to let the harvested plants finish ripening indoors." Further trials were conducted in former years in several places in Posen [Poznan; a very old city and province in west central Poland, part of Prussia 1793-1918]. A table (p. 279) shows where soybeans were grown (at Oswiezem, Twno, Zabikowo, Prusinowo, and Zabikowo), the number of seeds planted, the dates of planting (April 24-May 15) and harvest (Oct. 4-16), the seed spacing, yield (in kilograms and number of seeds), seeds harvested per seed planted (maximum 146 to 1, minimum 22 to 1), and quality of the harvested seed. This table shows the extraordinary fruitfulness of the soybean.

"In China and Japan, soybean seeds are used as food. Almost daily they are enjoyed as vegetables, like our beans (*beinahe tagtäglich als Gemüse, gleich unseren Bohnen, genossen wird*), or they can be used to prepare various sauces, which are known as tasty and digestion-promoting

© Copyright Soyinfo Center 2014

additions to the other dishes and which have been shipped to Europe." The process for making soy sauce is described. Soybeans are used as a source of oil, especially in the provinces of Newchwang and Cheefo, where there are many oil mills. The method for pressing out the oil is still very primitive (see a report on the agricultural part of the Paris Exhibition of 1878; Berlin 1879, page 57). Soybean cake is used as fertilizer on sugar plantations. Cooked soybeans are also tasty, as in a salad with oil and vinegar, or in soup. It must be noted that it takes a long time to cook soybeans until they are soft–at least 24 to 48 hours. A table shows the nutritional composition of soybeans (9.23% water and 33.35% protein). Because the leaves and hulls are also quite nourishing, the soybean has a great future as a fodder plant. Address: Dr.

614. *Southern Farmers' Monthly* (*The*). 1880. A Chinese vegetable. 3(6):170. June.

• ***Summary:*** "Some experiments recently carried on by two or three Austrian and German horticulturists, have brought into notice an almost forgotten plant which was introduced into Europe from China, nearly thirty years ago, but whose existence and whose products have been undeservedly lost sight of. This is the *Soja hispida,* a species of luguminous [leguminous] plant, somewhat resembling in habit and appearance the well-known pea. Unlike the latter, however, it has two distinct uses–industrial as well as alimentary. It is highly prized in China and Japan, and is said, indeed, to take its scientific title from the Japanese name of a sauce sooja–which is made from its seeds... The peas are boiled for about 20 minutes, and furnish a dish which is highly relished, not only by the Celestials, but by Europeans who have tasted it. It is said to resemble in flavor the green pea, but lacks its sweet taste... The sauce has a high reputation among the Chinese and Japanese, not merely as a condiment, but as a medicinal agent. Chemical analysis of the seeds show [sic, shows] them to be very rich in proteine.

"The oil is available for many uses–for burning in lamps or even as a substitute for olive oil. Being somewhat of a siccative [drying] nature, it is not adapted for a lubricant, but is for that reason useful as a substitute for linseed oil in the manufacture of paints and in other similar industrial arts. Finally, to complete the list of virtues of this Celestial pea, the haulm [stem or stalk] gives an excellent fodder for cattle and horses."

Note 1. This is the earliest document seen (June 2001) that mentions the use of soybean oil in paints (or varnishes or enamels). First cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished. The editor of this periodical in 1880 was L.C. Bryan.

Note 2. This is the earliest document seen (Sept. 2001) concerning the use of soybean oil as a lubricant–for which use it is not suitable.

Note 3. This is the earliest English-language document seen (Aug. 2003) that contains the term "proteine" (or "proteines") in connection with soy.

Talk with Ted Hymowitz. 1991. Sept. 16. After 2½ weeks of searching he has just found that this "Dr. Emerson" was Dr. Gouvenneur Emerson (lived 4 Aug. 1795–8 July 1874), a surgeon on the ship "Superior" that went to China. He received his M.D. degree from the University of Pennsylvania, and was a member of the American Philosophical Society, and of the convention which resulted in the formation of the American Medical Association. He never married. The source of this information is: *Who Was Who in America: Historical Volume, 1607-1896. Rev. ed.* 1967. Published by Marquis Who's Who Inc., Chicago, Illinois. 689 p. See p. 239. Address: Editor, Savannah, Georgia.

615. Greev, Edward. 1880. What the Japanese eat. *Frank Leslie's Popular Monthly* (*The American Magazine*) 10(2):164-74. Aug.

• ***Summary:*** A very interesting article with many large illustrations. On page 171 we read: "We quitted the dealer in vermicelli, etc., and entered a shop devoted to the manufacture of *tofu* (bean-curd, or cheese), a national dish. It is semi-gelatinous, white, delicious and wholesome. Yuba is another sort of paste food, made from white beans. Misso [miso] is a white bean paste, mixed with fermented rice and salt. It requires a Japanese-trained stomach to digest this.

Note: This is the earliest English-language document seen (March 2009) that uses the term "bean paste" (not preceded by the word "soy" or "soya") to refer to miso.

"Soyu [shoyu] (soy), a sauce made with boiled beans and wheat, was also sold at this establishment. The mess is fermented until it is a mass of fungi, then cooled and salted with hot lye. It is next transferred to enormous vats, in which it is kept for several years, then pressed in bags made of thick cotton cloth. The brown juice that runs from the horrible mass is soyu, and is not only palatable, but wholesome. The Japanese flavor dishes with it, and use it as we do vinegar, for pickling. It tastes like mushroom catsup.

"I had seen the process of soy-making, therefore declined to visit one of those establishments; whereupon my guide took me to a candy factory. As a nation, the Japanese are not large consumers of sugar."

Mentions many other Japanese foods and beverages including saké (rice-wine or rice-beer); he describes how it is made. Illustrations: (1) Seven Japanese men and women seated on tatami mats around a low table having a meal; in the background is a large painted wall. (2) A Japanese butcher's shop, as seen from outside. (3) A salt vender and house servant, carry goods at both ends of a shoulder pole. (4) The *Pelor japonicum*–a curious Japanese fish. (5) A dealer in dried fish with a man carrying goods on a shoulder pole. (6) Japanese entertaining European guests, seated in

© Copyright Soyinfo Center 2014

chairs at a raised table. (7) A rice warehouse near Tokyo. (8) A saké shop at New Year's with a large crowd of men. (9) A Japanese tea house.

616. *Gardeners' Chronicle* (*London*). 1880. The cultivation and uses of the soy bean (Soja hispida). 14:369-70. Sept. 18. [1 ref]

• ***Summary:*** "The cultivation of the Soy Bean (Soja hispida) is being strongly recommended in France as a green vegetable." Planting instructions are given.

"The greatest use to which the plant is put in China and Japan is in the preparation of soy [sauce] and of food from the ripe seeds. The manufacture of shoyu, or soy, is thus described in a descriptive catalog of agricultural products of Japan exhibited at the late Sydney International Exhibition [Australia; held in Oct. 1879]. Equal parts of Beans and Wheat are used..." The koji is made in shallow wooden boxes. "The mashings are removed to large vats, and kept there for at least twenty months, but more often for three or five years, the better qualities being those that are kept for the longer periods. The best soy is produced by mixing that kept for five years with that kept for three years. After it has been kept a sufficiently long time, it is strained through thick cotton bags, and the residue submitted to pressure. Before filtering honey is sometimes added. The residue is again mixed with salt and water and again pressed, the yield being soy of an inferior kind. Sometimes water is added to this second residue, and is again pressed. The residue first obtained is occasionally used as food, and the last residue as manure."

Note 1. It seems from the above text (and seems likely in itself) that both shoyu and the catalog describing the shoyu were exhibited at the Sydney International Exhibition of 1879. Address: England.

617. Paillieux, Auguste. 1880. Le soya, sa composition chimique, ses variétés, sa culture et ses usages [The soybean, its chemical composition, varieties, culture, and uses]. *Bulletin de la Societe d'Acclimatation* 27:414-71. Sept.; 27:538-96. Oct. 28 cm. [73 ref. Fre]

• ***Summary:*** One of the most important and original of the early publications on soya in Europe. Its in-text bibliography on soya was the largest of any published up to that time.

Contents: Part I: Introduction and extracts on soybeans and soyfoods from 30 articles published previously in the *Bulletin of the Society for Acclimatization* from 1855 to 1880 (pages 414-430. Note 1. Each of these articles has a separate record in this database).

1. Soybean botany (p. 430-31). 2. The soybean in Japan (p. 431-42): Engelbert Kaempfer and his writings on miso and shoyu, information on soya from a document titled *Japan at the World Exposition of 1878* (*Le Japon á l'Exposition universelle de 1878,* written in French by a Japanese, p. 29-33), recipe for making shoyu in France, tofu. 3. Soya in Cochinchine (French Indochina, p. 442-46): Black soybeans. 4. Soya in China (p. 446-51): Soy oil (*Huile de Soya*), fermented tofu (*le fromage de soya, teou-fou*), soy sauce (*tsiang-yeou;* In London, England, it is sold under the name of "India Soy" at Cross & Blackwell, Soho-Square {p. 451}).

Note 2. This is the earliest French-language document seen (April 2013) that uses the term *fromage de soya* (p. 449) to refer to tofu. 5. Soya in Austria-Hungary (p. 452-71): Starting with soybeans at the World Exposition of Vienna in 1873, includes a long, in-depth discussion (with many excerpts) of Prof. F. Haberlandt's book *Le Soja,* published in Vienna in 1878.

Tables in Part I show: (1) The chemical composition (in both their normal and dry states) of Chinese soybeans (*pois de Chine*), tofu (*fromage de pois*), and tofu curds (p. 427). (2) The yield of tofu. 120 gm of soybeans yields 184 gm of tofu (p. 427). (3) The weight and nitrogen content of the different components when tofu is made from soybeans (p. 428). (4) The Japanese names of 23 soybean (*mame*) varieties and a very brief description of their characteristics (p. 435-36; e.g., 1. *Go-guwatsu no mame* {5th month bean}. 2. *Use mame* [*sic, Wase mame*] {early}. 3. *Nakate mame* {half season}. 3a. *Okute mame* {late}. 4. *Maru mame* {round}. 5. *Shiro teppo mame* {white, like a pistol bullet} 6. *Kuro mame* {black}. 7. *Kuro teppo mame* {black, like a pistol bullet} 8. *Koishi mame* {small stone}. 9. *Awo mame* {*Ao,* green}. 10. *Kage mame* {shade, shadow}. 11-15. *Aka mame* {red; 1 of same species, two of different species}. 16-18. *Tsya mame* {*Cha,* tea colored}. 19. *Kuro Kura Kake mame* {black saddled}. 20. *Aka Kura Kake mame* {red saddled}. 21-23. *Fu iri mame* {striped, variegated, mottled; see Uzura mame = speckled like quail eggs}). This nomenclature was taken from a Japanese work titled: "Explanation, with figures, of trees and plants recently determined / identified."

(5) The romanized Chinese names of six types of soybeans and a French translation of each (e.g., *Houang-teou = Soya jaune*) (p. 447). (6) Two analyses of soybean seeds, reprinted from *Chemischer Ackersmann,* 1872 (p. 458). (7) The chemical composition of three soybean varieties, including Yellow of Mongolia, Yellow of China, and Reddish-Brown of China; the composition of the original seeds and the first generation seed is given for each type (p. 460-61). (8) The chemical composition of reddish-brown, yellow, and black varieties of soybeans (p. 469-70; data from M. Schroeder, Mach, and Caplan, published by F. Haberlandt). (9) Weight of 1,000 seeds for four generations grown out in Vienna. Original seeds: 81.5 to 105 gm. First generation: 110.5 to 154.5 gm. Second generation: 141.8 to 163.6 gm. Third generation: 116.0 to 151.0 gm.

Contents (continued), Part II. 6. The Soybean, by Count Heinrich Attems (p. 538-60): Soybean cultivation, time of planting, spacing of seeds, quantity of seeds, harvest, uses, and food preparations made from whole soybeans. Practical

© Copyright Soyinfo Center 2014

soybean culture trials on a grand scale, in the domain of the archduke Albert, an extract from a booklet by Edmond de Blaskovics titled "The Soybean, Its Culture, Use, and Value as Forage" (Vienna, 1880). Excerpts of six articles on soya from the *Wiener Landwirthschaftliche Zeitung* (*Viennese Agricultural Journal*) (Jan. 1879 to June 1880) (p. 548-54). Excerpts of ten articles on soya from the *Oesterreichisches Landwirtschaftliches Wochenblatt* (*Austrian Agricultural Weekly*) (March 1879 to Feb. 1880) (p. 554-59).

7. The soybean in France (p. 561-76): History (starting with Buffon, who became director of the *Jardin des Plantes* [Royal Garden, also called Jardin du Roi] in 1739), varieties grown, cultivation, utilization (mainly as forage plant for livestock and as an oilseed for oil and meal), accessory uses (miso, Japanese-style soy sauce {*shoyu*}, Chinese-style soy sauce {*tsiang-yeou*}, Japanese-style tofu {*tô-fu*}, Chinese-style tofu {*téou-fou*}, fermented black soybeans {*téou-che*}, and soy coffee {*café de Soja*}, white fermented tofu {*fromage blanc*}, red fermented tofu {*fromage rouge*}, green vegetable soybeans {*des graines fraîches, écossées encores vertes, comme le Haricot flageolet*}, whole dry soybeans {*les graines sèches comme le Haricot blanc ordinare*}).

8. Conclusion and tables showing French analyses of soybeans (p. 576-78). Appendixes (p. 579-96): Summaries of letters to the Society describing 27 cultural experiments with soybeans conducted during late 1880 at various locations in France, Switzerland and Algeria. (Note 3. Though the publication date of this appendix is given as Oct. 1880, some of the letters are dated as late as 21 Nov. 1880). Reprint of a 2-page letter from Eugene Simon, former French consul in China, on soybean farming in China (p. 591-93). Reprint of a description by Eugene Simon, based on the description of a Chinese, of how tofu is made in China (p. 593-94). A French translation of a 1781 article by Isaac Titsingh on preparation of soy sauce in Indonesia (p. 594-95). And some information about soybeans from the ancient Chinese herbal *Pên Ts'ao Kang Mu* (p. 595). Reprints of 2 letters from Eugene Simon in China, on soya and tofu in China. French translation of a 1781 article by Isaac Titsingh on preparation of soy sauce.

Note 4. We find it surprising that this superb work contains no illustrations of a soybean plant, or of any part of the plant, or of any foods made from soybeans; the only illustration (p. 569) is a cross section of an empty pit into which one could put a mixed silage that contained 20% soybean plants. The distance a-b is 3 meters; f-g is 2 meters; e-f is 0.5 meters; a-e is 1 meter; i-h is 0.4 meters.

Note 5. This is the earliest French-language document seen (Dec. 1999) that uses the term *Huile de Soya* to refer to soybean oil.

Note 6. This is the earliest document seen (March 2001) that has a bibliography of more than 50 references concerning soybeans.

Note 7. This is the earliest European-language document seen (Sept. 2004) that mentions the Japanese soybean types *Nakata-mame* or *Okute mame*.

Note 8. This is the earliest French-language document seen (April 2012) that uses the term *tsiang-yeou* to refer to Chinese-style soy sauce. Address: France.

618. Paillieux, Auguste. 1880. Le soya, sa composition chimique, ses variétés, sa culture et ses usages [The soybean, its chemical composition, varieties, culture, and uses (Continued–Document part I)]. *Bulletin de la Societe d'Acclimatation* 27:414-49. Sept. 28 cm. [73 ref. Fre]
• ***Summary:*** Introduction (p. 414): At the moment, when according to all appearances, a precious plant is going to take the place in our culture to which it has the right, we consider it our duty to bring back to light the previous efforts of the Society for Acclimatization, to introduce and propagate this plant in France. We will publish, therefore, word for word excerpts of everything soya in the records, reports with articles, letters and notes published in the bulletins of our society during the past 25 years. Our study, it seems to us, cannot be proceeded by an introduction more interesting than this.

From 1855 until the present (1880), the Society has not ceased to receive and distribute soybean seeds, and to make known its cultivation and utilization. It has rewarded successful trials by recognition and publication, and described the production processes of the industries that use soybeans.

We might have tried to refer the reader to past bulletins of the Society, but not everyone has access to these old documents, and besides looking up these articles on soy takes time and care. These motives led to our decision.

The question of soy has been dormant for a long time. But it awakens today with cultural experiments, which have been carried out for seven years in Etampes, using seeds given by the Society, with tests of tofu making which have been conducted in Marseilles; it was finally highlighted with the introduction of the plant in Austria-Hungary, in Bavaria, in Italy, etc. The question is ripe for a solution.

We do not know, whatever our own hopes may be, what the future holds for soy, but if its cultivation may render one day great service to the country, all the honor would belong to the Society, which, during a quarter century, has not ceased to facilitate and to encourage it.

Written on the 25th anniversary of Society's work with soy. We will divide this work into 6 chapters, starting with excerpts from past bulletins of the Society.

Chapter 1. Linnaeus gave our plant (*Le Soya*) the name *Dolichos Soja* (*Species plantarum,* 1621). Jacquin mentioned it later in his *Icones plantarum rariorum,* p. 143. Moench gave it the name Soja hispida. Moench gave it the name Soja hispidia (*Method plant. hort. bot. et agri Marburgensis,* 1794, p. 153).

Messrs. Bentham and Hooker have not admitted this genre; for them the plant is nothing but a veritable Glycine.

© Copyright Soyinfo Center 2014

This is also the opinion of almost all modern botanists. Miquel affirms that there are two species of *Soja* in Japan, *Prolusio florae Japonicae.* These are: (1) *Glycine hispida* (*Soja hispida,* Moench). (2) Glycine Soja, Sieb. et Zucc.

Note 1. In 1880 Paillieux called it Soja Hispidia.

Chapter 2. The soybean (*Le Soya*) in Japan. Begins with the full story of Englebert Kaempfer [see our chapter on Kaempfer], including translations into French of his writings on miso and shoyu.

There follows a list of Japanese soybean varieties of which they possess the names, 19 names, 22 species (see previous record, table, p. 435), with nomenclature taken from a Japanese work entitled Explications, with figures, of trees and plants newly determined, with the last 3 names taken from a work entitled Japan at the World's Fair of 1878, written in French by a Japanese. (Note that only in 1880 did Paillieux change the name of soybean to Le Soya). Then come descriptions of the characteristics of some of the various beans. "In short we can say that the various types of Mame can be used to make miso, shoyu, or to-fu." The Japanese do not make soybean oil (*huile de Soja*). They use sesame oil for cooking and rapeseed oil to burn in lamps... Soybean straw is given to animals. In Satsuma, in the far south of Japan, horses are given soybeans (*graines de Daizu*) at the end of their rations and it is claimed that this is good nourishment and not as expensive as naked barley. (Confusion about Mame and Daizu). Here is what is said about soybeans in the work entitled *Japan at the World's Fair of 1978:* The Mame serves numerous usages; it can be cooked, ground [after being dry roasted] to a meal or flour, and used to make shoyu, miso, and tofu. The soybean, its pods, its leaves, and its stalks serve to nourish horses and sheep; tests show that this is the best nourishment available... Shoyu, after being filtered, is boiled, then cooled. The lees / dregs are then removed and it is stored in small kegs. The reside of first grade shoyu is used as follows. One takes 5 *to* of this residue and one ads one *to* of water. It is mixed, pressed, and boiled, Then one ads 2 *to* of salt, lets it rest and decants it. This second product is then added in larger or smaller quantities to various qualities of shoyu (p. 440). There follows a detailed practical recipe for making shoyu in France by an unnamed correspondent. He recommends substituting peas for soybeans in France. He uses the word *Daizu* for soybean (1½ page description). Here is the recipe for the sauce I have learned in Japan. He made it in France, using 2 parts by volume of naked barley and 3 parts of soybeans (*Daizu*).

Page 441: In Japan, there is no village, no matter how small, that does not have a shoyu maker. It is also made in private homes. The correspondent says: During my stay in Japan, the price of shoyu varied, according to the quality, from 8 to 12 sen, 40 to 60 centimes per *masu,* that is to say per 1.8 liters. To-fu (*Fromage de Daizu*). Note that they now call soybean Daizu. This is a detailed description of how tofu is made in Japan.

Page 442: Key points. Cold extraction of the slurry. The residue is used as fodder for livestock–from beef to rabbits. Soymilk (which he calls "the albuminous liquid" {*Le liquide albumineux*}) is put on the fire. Coagulate it with nigari (*eau de mere*) which contains magnesium chloride. Put the tofu in a basin of running water. To-fu is usually eaten fresh (he says *To-fu* for Japanese tofu and *Teou-fou* for Chinese). It is very frequently cooked with shoyu and dried fish, sometimes fried, more often grilled. Sometimes during the winter it is frozen, then dried to give it a spongelike consistency. In this state it lasts a long time and is cooked / prepared in various ways. In its fresh state, this vegetal cheese (*fromage végétal*) has a very delicate consistency, but it has a certain taste of raw beans that is not pleasant / agreeable.

Note 2. This is the earliest French-language document seen (April 2013) that mentions dried frozen tofu.

Chapter 3. Le Soya in Cochin China (p. 442). France has long been involved in Indochina as a Colonial power. There follows a report from the Committee on Agriculture and Industry in Cochin China. Siebold et Zuccarini. There is a long excerpt (Corroy 1878) from an article about "The feeding of horses and mules imported into Cochin China" from *Bulletin du Comite Agricole et Industriel de la Cochinchine* 1:449-58. For the year 1877. Series 2. See p. 456-58. It is about using black soybeans (*Glycine Soja*) as feed.

Glycine soja is cultivated in India up to the Himalayas and down to Ceylon, in Philippines, Java, etc. The seeds, boiled or lightly roasted are agreeable to the taste and to the stomach. Soy sauce is used to stimulate the appetite. The people also make a white pâté resembling coagulated milk, called Teu hu or Tau hu by the Chinese, which is for them a food more widely used than any other and which, though bland by itself, when served with seasonings and condiments, is a pleasant and healthy dish.

Chapter 4. Le Soya in China (p. 446). The generic name of the soybean is Yeou-Teou. Yellow soybeans are huang-tou. He-tou is black soybeans. Certain varieties are selected for each of the various food uses; not just any varieties are used. Soybeans are used to make fermented spirits and artificial wines called Teou-che.

Soy oil (p. 448). This oil is very widely used. It is of the first grade among the 15 or 20 oils possessed by the Chinese. Europeans find that it has a disagreeable aftertaste of raw beans. Except for this, it is of excellent quality. It was written in the introduction that M. Fremy analyzed the seeds / grains of Soya and that they contained 18% oil. Three samples analyzed by the German chemist Senff contained an average of 18.71% lipids. The analysis of Mr. Pellet of 3 samples of yellow Soya from China, Hungary, and Etampes, that we furnished him, gave about the same result.

Tofu (*Le fromage de Soya,* p. 449): Only the Tartars, scattered throughout the Empire, have continued to use milk.

© Copyright Soyinfo Center 2014

The Chinese do not use it. For them the soya takes its place. From the soybean they extract and filter a milk, a true milk (*lait*) usable like the milk of the cow, goat, or ewe (female sheep).

We are reporting in the chapter entitled Soya in France what type of tests we have done personally and those which have been done by the Society of Horticulture of Marseille. We have but to mention here the immense consumption of soymilk (*lait de Soya*) in China, as such or in form of cheese [tofu]. The Introduction contains reports on tofu by Baron Montgaudry and M. Champion, so there is no need for us to say any more about tofu here. Continued. Address: France.

619. Kinch, Edward. 1880. Contributions to the agricultural chemistry of Japan. *Transactions of the Asiatic Society of Japan* 8(Part 3):369-415. Oct. See p. 392-93, 398-401, 413-15. Reprinted in March 1907 as a monograph. [29 ref]
• ***Summary:*** "Of vegetable manure the principal are sea-weed, the residues from different manufactures, e.g. rape cake, sesamum cake, cotton cake and other oil residues, as from camellia seeds, the residues from the manufacture of *shôyu, ame* [*rice syrup*], *sake, shôchu,* indigo etc." (p. 392). [Note that soybean cake is not mentioned].

"The oil cakes, *ame kasu* (malt dust, the residue from the manufacture of ame from rice, millet and malt of wheat or barley) and *shôyu kasu* [The residue from the manufacture of shoyu] are the most valuable. These manures should not be applied in quantity at the seed time in an unmixed state, owing to their fermenting and also attracting and harbouring insects, which attack the seeds and young plants." Rape cake (*Abura kasu*) and Sesamum cake (*Goma kasu*) are also mentioned.

There are original analyses (p. 393) of 6 samples of "Soy [sauce] residues, *Shôyu kasu* Residue from the manufacture of *Shôyu* from beans and wheat." These vary over an extremely wide range. Nitrogen content ranges from 1.27% to 5.20%, and ash is 0.57% to 11.53%.

"Soy bean, sometimes called Japan pea, *Glycine hispida* (Moench) also known as *Soja hispida:* of this many varieties of different colour and size, etc. are met with, but as far as is known, they differ but little in composition. They are known collectively as *Daidzu* or *O-mame;* a common white round variety is known as *Miso-mame* and *Shiro-mame;* other names of varieties are *Awo-mame, Kuro-mame, Ki-mame, Ichiya-mame, Kurakake-mame* and *Korinza* (p. 398).

Note 1. This is the earliest English-language document seen (March 2008) which states clearly that the present scientific name of the Japan pea is *Glycine hispida* (Moench)–that is, the soybean. Actually, however, the correct scientific name since 1873 had been *Glycine hispida* (Maxim.)

"This bean approaches more nearly in its proximate chemical composition to animal food than any other vegetable known. It contains about one-fifth of its weight of fat and nearly two-fifths of nitrogenous matter. It is extensively cultivated in the north of China and also grows in the Himalayas. In China it is compressed for the sake of its oil, and the residual cake is used for food and also extensively as a manure. In Japan it is used in the preparation of *Shôyu, Tôfu, Miso* and also of *Yuba,* and in these various forms enters to a considerable extent into the food of the nation, to which it is a most valuable contribution, supplying as it does the alimentary principles–albuminoids and fat–in which the staple food, rice, is deficient: it also contains a much larger percentage of the necessary mineral matters than does rice. Of late years this bean has been grown experimentally in different parts of Germany, with success. The haulm and leaves which furnish a valuable fodder, and a variety is cultivated specially for that purpose and known as *Kari-mame.*

"The composition of a sample of the white round variety known as *Miso-mame* was found to be: Water 11.32%, ash 3.86%, fat 20.89%, albuminoids 37.75%, fibre 2.00%, starch etc. 24.08%. Total: 100%" (p. 398). Note 2. This and each of the following nutritional analyses appear to be original, not cited from earlier sources.

A table then contains an analysis of each of the following 4 products: Shiro-miso from Osaka, aka-miso from Osaka, to-fu [tofu], and kori to-fu [tofu]. The composition of aka-miso was found to be: Water 50.40%, ash 12.50% (incl. 11.00% common salt), sugar 0.61%, nitrogenous matter 10.08%, fibre 8.25%, soluble carbohydrates 18.16%. Total: 100%.

The composition of to-fu was found to be: Water 89.29%, ash 0.48%, fat 3.32%, nitrogenous matter 4.87%, fibre -, soluble carbohydrates 2.04%. Total: 100%.

The composition of kori to-fu was found to be: Water 18.75%, ash 1.60%, fat 28.80%, nitrogenous matter 48.80%, fibre -, soluble carbohydrates 2.05%. Total: 100%.

There follows a discussion (p. 398-400) of foods that can be made the soy bean (*miso, kôji, tôfu, kôri-dôfu,* and *shôyu* or soy), and a description of how each is made. *"Miso* is made by mixing the boiled beans with *Kôji* (rice ferment used in *sake* brewing) in various proportions, and with more or less salt, and keeping the mixture in tubs in a cool place for about a month. It will be noticed [from the table above] that one variety contains much sugar, derived from the *Kôji,* and little salt, and the other much salt and little sugar.

"*Tôfu* is made by pounding the soy beans after soaking in water, then straining through a sieve and boiling in water. The solution is filtered through cotton cloth and the residue pressed; the strained liquor, containing vegetable casein or legumin, is precipitated by brine. *Nigari,* formed by the deliquescence of common salt. The precipitate pressed and cut into cakes is *tôfu."*

Note 3. This is one of the earliest English-language documents seen (Jan. 2004) that uses the word "tofu." This is *the* earliest document seen (Jan. 2004) that uses the word

© Copyright Soyinfo Center 2014

"cakes" in connection with tofu.

Note 4. This is the earliest English-language document seen (Oct. 2008) that mentions "vegetable casein" in connection with soybeans or tofu, or that equates "vegetable casein" with "legumin" (the word Kinch used in 1979), the water soluble protein in soybeans that can be precipitated to make tofu.

"Kôri-dôfu is prepared from the above by freezing it and afterwards exposing to the sun, when, in the process of thawing, the greater quantity of the water is removed, leaving a horny spongy residue.

Note 5. This is the 2nd earliest English-language document seen (April 2013) that mentions dried-frozen tofu, which it calls "kori to-fu" or *kôri-dôfu.* This is also the earliest document seen (April 2013) that uses the word "spongy" to describe the texture of dried-frozen tofu.

"An example of *shôyu* or soy was found to have a specific gravity of 1.199 and to contain per litre: Total solid residue 359.88 grms., ash 195.16 grms., sugar 31.03 grms., nitrogenous matters 41.00 grms., free acid, expressed as acetic acid 6.20 grms. The ash is chiefly common salt, but contains a quantity of phosphates derived from the mineral matter of the beans and kept in solution by the acetic acid formed."

"The [shoyu] mashings are removed to large vats and there kept for many months, usually twenty, and frequently for 3 or 5 years. The better qualities of *shoyu* are kept the longer times. It is found that the best soy is produced by mixing that kept for five years with that kept for three years. After it has been kept a sufficiently long time, it is strained through thick cotton bags and the residue pressed. Before filtering, honey is sometimes added in the proportion of 10 *kin* to 1 *koku* of *moromi* or crude soy, in order to give it a sweet taste. Occasionally a sweet sake, *ama-sake,* prepared by taking, 1 *koku* of *koji* to 7 *to* of water and 1 *to* of steamed rice, mixing them together and steaming for two hours is added instead of honey. The residue obtained on pressing *moromi* is usually again mixed with salt and water, and pressed; this yields an inferior *shoyu.* Sometimes water is added to this second residue and it is again pressed. The residue first obtained is sometimes used as food and the last residue as manure.

"The *Shoyu* after straining is allow[ed] to settle for two days in large tanks, then drawn off and filtered; before sale it is heated to incipient ebullition, otherwise it quickly goes bad.

"The quantity of nitrogenous matter in solution in *shoyu* appears to increase with the length of time elapsing before filtering the *moromi."*

Note 6. *Webster's Dictionary* defines ebullition as "the act, process, or state of boiling or bubbling up."

Also contains detailed information on and chemical composition of adzuki beans or *shôdzu* (*Phaseolus radiatus*), daikon, sea-weeds (incl. three types of Asakusa nori (*Porphyra vulgaris*), kobu (*Laminaria saccharina*) [konbu, which Thunberg and Kaempfer also discussed], wakame, arame or kokusai, awo-nori or ohashi-nori, hijiki, Irish moss or carrageen, tokoroten-gusa or agar agar, kanten or tokoroten, and funori), and sake.

At the end of the article is the summary of a discussion. Professor Atkinson made some remarks about shôyu. He said that Mr. Isono, a graduate of the University of Tôkiyô, had made analyses of *shôyu moromi* at various periods (after 3, 10, and 20 months), which are printed in full, together with an analysis of Kikkoman shoyu. "It was interesting to observe the disappearance of the glucose, and the gradual increase of the soluble nitrogen from the first sample to the last. The greatest change took place between the third and the tenth months. but, after the removal of the greater part of the glucose and dextrin, converted into alcohol and lost by evaporation, very little alteration occurred, except in the color of the liquid, which became darker."

Note 7. This is one of the earliest English-language documents seen (May 1999) that contains an accurate description of miso; it also contains very early information on the composition of different types of miso.

Note 8. This is the earliest English-language document seen (Dec. 2000) that uses the term "chemical composition" in connection with the soy bean.

Note 9. This is the earliest English-language document seen (Nov. 2003) that uses the term "sesamum cake" to refer to sesame cake.

Note 10. This is the 2nd earliest English-language document seen (April 2012) that uses the term "shôyu" to refer to soy sauce.

Note 11. This is the earliest English-language document seen (July 2001) that contains the word "fibre" in connection with soy beans. The fibre content of one variety of soy bean and one miso variety are given.

Note 12. This is the earliest English-language document seen (July 2003) that uses the Japanese word "Goma" to refer to "sesame."

Note 13. This is the earliest English-language document seen (Nov. 2005) that contains the term "cotton cake."

Note 14. This is the earliest English-language document seen (April 2012) that contains the word "Kikkoman."

Note 15. This is the earliest English-language document seen (May 2012) that contains the term *shôyu kasu* (in italics, with diacritics) which it defines as "Residue from the manufacture of *Shôyu* from beans and wheat." Address: Prof. of Chemistry, Imperial College of Agriculture, Komaba, Tôkiyô.

© Copyright Soyinfo Center 2014

• ***Summary:*** Page 561: "Historical–Buffon [Comte Georges-Louis Leclerc de Buffon, lived 1707-1778] became director of the *Jardin des Plantes* [Royal Garden, also called *Jardin du Roi*] in 1739. Shortly thereafter French [Catholic] missionaries in China sent him specimens and seeds of most of the important plants of that country. Soybeans or their seeds were almost certainly among their shipments, and without being able to prove it, we have no doubt on this subject. Be that as it may, we have recovered from the Museum [of Natural History] a sachet which, in 1779, contained soybean seeds. It bears the following dates of harvest: 1834, 1836 to 1841, 1843, 1844, 1846, 1847, 1849, and 1850 to 1855 inclusive. Then 1857 to 1859, 1862, 1865 to 1867, 1870, 1871, 1873, 1874, 1877.

"In fact, soybeans have been cultivated at the Museum very probably since 1740, certainly in 1779, and more recently from 1834 to 1880 without interruption. The plant has always germinated and borne fruit as desired, cultivated like haricot beans (French green beans), without any particular problems. It has proved its hardiness and the small influence which changes in atmospheric conditions have on it.

"Since 1855, the abundant distribution of soybean seeds ceaselessly by the Society for Acclimatization, has allowed soybean agronomic trials to be conducted throughout France. But it is difficult, if not impossible, to obtain information about trials made before 1855.

Mr. Blavet, president of the Horticultural Society of Etampes, has uncovered an interesting document in a brochure titled *Seance publique de la Societe d'Agriculture de l'arrondissement d'Etampes* (Public session of the Agricultural Society of Etampes), for the year 1832, page 84. One chapter bears the title "Report by Mr. C. Brun of Beaumes, member of the Agricultural Society of Etampes, chevalier of Saint-Louis, doctor on the faculty of sciences of France, of some agronomic trials conducted by him in 1821, on various species of cereal grains, on his property of Champ-Rond, near Etampes [Seine-et-Oise], France." A final note says: The heat of the summer of 1821 was so favorable to exotic plants that I saw the following plants bear fruit abundantly in my outdoor garden at Champ-Rond, near Etampes: the Dolichos of China (*le Dolichos de la Chine;* perhaps wistaria), the soybean (*Dolichos Soja*), and Dolichos Lablab (also called hyacinth bean). The Niouelle (?) of Senegal showed here for the first time its long pods (*épis*), etc." Note: This is the earliest document seen (April 2000) that describes the 1821 soybean experiment by Mr. C. Brun of Beaumes.

"The duty of the Museum, as a public-interest organization is to distribute seeds, either as a pure gift or as part of an exchange, to persons who request them. Undoubtedly, therefore, trials have been made at various early dates, but we have no record of them.

"Starting in 1855 a large number of participants received seeds from the *Société d'Acclimatation* and experimented with them. Most of these people did not report the results of their trials, as they were obliged to. Others, however, did, including Messrs. Vilmorin, Delisse, Lachaume, etc. But their cultivation did not lead to any progress, so the soybean was not established a permanent crop in France.

"In 1868 Mr. Chauvin, vice-president of the Society of Horticulture at Côte-d'Or [a department in eastern France], cultivated several soybean varieties there, and the culture has continued there to this day.

"In 1874 the Society of horticulture of Etampes received soybean seeds from the Society for Acclimatization, and began experiments that continued until 1880. One can find them mentioned in the Introduction to the Etampes livestock reports. Their cultivation is direct with great seal by Mr. Blavet, president of the horticultural society of that area.

During the same period, one Dr. H... brought the best soybean varieties from Japan and cultivated them. He failed in this trial because his soybeans were late-maturing types. He then restricted himself to cultivating yellow soybeans from China. He encountered no more difficulties and he made *Sho* [perhaps shoyu, or Japanese-style soy sauce] by himself for use in his home.

"In 1878 we received seeds of two soybean varieties. One, from Japan, had white flowers and very pale yellow seeds with a greenish hue. The other, from China, was yellow and belonged to the *Houang-téou* ["yellow soybean"] series; they were among the seeds received from Mr. Montigny and other donors, and have been cultivated at the Museum, at Etampes, at Marseilles, and a little bit all over. (Footnote: These varieties look a little different on the outside, but their chemical composition, usage, and cultivation are the same).

"The seeds from Japan give us nice green foliage, but the plants do not mature their seeds. The Chinese variety succeeds in France as it does anywhere else."

In 1879 a yellow variety received directly from China matured well and was harvested at Marseilles. In 1880 Vilmorin-Andrieux & Company introduced into France one of the varieties tested by Haberlandt in Austria, which variety has proven well adapted to French conditions.

On pages 564-65 the author attempts a sober appraisal as to why a plant with such obvious merits, that has been known in France for over 140 years, is still virtually unknown. Established institutions such as the Museum of Natural History and the government had taken exasperatingly little interest in aiding the private efforts of the Society to introduce new plants. Chemical analyses, demonstrating the nutritional superiority of the soybean, had been lacking until about 1855, when Mr. Frémy [Fremy] confirmed that the soybean contained oil. Messrs. Champion and Lhôte have given an incomplete analysis [published in 1869]. But the classical books on agricultural chemistry, the works of our professors, which make known the chemical composition of the seeds of our typical legumes, omit information on the

© Copyright Soyinfo Center 2014

soybean. There was a general resistance, especially on the part of the establishment, to growing new crops and using new foods. And finally the basic approach of the Society in introducing soya first and foremost as a human food was questioned.

"Our point of departure has not been successful. Soya has been presented simply as a new legume. But it is more difficult to cook than other legumes, The flavor is good, but not superior. Fresh, it takes lots of time to shell. Dry, it requires pre-soaking for 24 hours in water that is not hard. If one is ignorant of its nutritive properties, there would be little incentive to grow it, and one would keep growing the traditional legumes instead.

"The people of Austria-Hungary have been wiser. Having already acquired incontestable proof of the value of soya for livestock fodder, they have no other objectives. They seem at the very least to have considered as secondary the utilization of soya for human nutrition. Therefore as soon as they had enough seed, they cultivated large areas, while we were still cultivating the furrows between the rows in the kitchen garden for use as food.

"The seeds will soon be found in all the good markets of southern Germany. The small farmer will then find them (soybeans) all around him at low prices. In eating them, he will find himself strengthened. Then he, in turn, will plant them himself."

Varieties (p. 565-66): In 1878, Japan, China, and the Dutch East Indies have presented all their varieties of soybeans at our Universal Exposition in Vienna. We think that there are more than 30 varieties of soybeans. Let the Society for Acclimatization and Messrs. Vilmorin, Andrieux, etc. get us seeds and we will plant them all. Then we will find among them, perhaps, some early varieties, to add to those we know.

Cultivation (p. 566-56).

Utilization (p. 567-71): We believe it has already been demonstrated that the cultivation of soybeans is easy, that its fecundity is great, and that its chemical composition is superior. Then why have they not been cultivated for the past 10 years?

We tried to introduce soya as a food plant for the garden rather than as a fodder and oilseed. We started where we should have finished. If we persist in this direction we shall fail. Soya will fall back into oblivion, while in southern Germany, the Danube provinces, central Russia, and Italy, it will soon be widely grown and serve as a source of riches.

Accessory uses (p. 571): The soybean is used to make miso (*le miso*), shoyu (*le shoyu*), Chinese-style soy sauce (*le tsiang-yeou* [*jiangyou*]), the tofu (*le tô-fu*) of the Japanese, the tofu (*le teou-fou*) of the Chinese, fermented black soybeans (*le teou-che* [*douchi*]), and soy coffee (*le café de Soja*). We have always said that the shoyu of the Japanese is excellent, whereas the soy sauce of the Chinese is inferior (p. 571).

In the middle of page 571 and near the bottom of page 572 the term *fromage de soja* is used to refer to tofu.

Note 2. This is the earliest French-language document seen (April 2013) that uses the term *fromage de soja* to refer to tofu.

Note 3. This document contains the earliest date seen for soybeans in France, or the cultivation of soybeans in France (very probably in 1740, certainly in 1779). The source of these soybeans was French missionaries in China. Continued. Address: France.

621. Mene, Édouard. 1880. Des productions végétales du Japon [The vegetable products of Japan]. *Bulletin de la Societe d'Acclimatation* 27:644-66. Nov. [3 soy ref. Fre]
• ***Summary:*** This is part of a longer article, published in several issues, which is an excellent review of earlier publications and work. This part begins with a section on legumes. Among the legumes discussed are *Vicia Faba* (*sora mame, otafuku mame, okakura mame*), *Dolichos unguiculatus* (*sasaghe* [*sasage,* present name: *Vigna unguiculata* (*L.*) *Walp. subsp. unguiculata*], incl. *Jin-roku Sasaghe, Yuhuté Sasaghe, Heritori-yu- roku-Sasaghe*), *Canavalia* (*nata-mame = C. incurva* [*sword bean*], *shiro-nata mame = C. lineata*), *Haricot* (*Phaseolus vulgaris,* incl. *Ingen mame* and azuki {*Phaseolus radiatus* var. *subtrilobata*}), sesame, etc. The author saw samples on display at the Japanese Ministry of Agriculture and at the Exposition at Champ-de-Mars in France.

"Soy sauce (*Le Shoyu*) (p. 648-49): This condiment, so appreciated by the Japanese, had samples displayed is the class of fermented beverages. It is often made with wheat flour and beans (*haricots*), but more often with boiled soybeans (*pois*).

"Chinese *Soye* or *Soya* (*Le Soye ou Soya chinois*) is the same condiment, but more especially made with red beans (*haricots rouges*). Note: Clearly the author did not realize that soy sauce is made from soybeans (not from haricot beans or peas, nor from azuki beans).

Note: This is the earliest French-language document seen (April 2012) that uses the words *Le Soye* or *Soya Chinois* to refer to soy sauce.

"In Canton, it is made in the following way: the red beans are cooked in water for one hour; thrown in a sieve and drained; next the beans are sprinkled with wheat flour and carefully spread out on a wood plank that is put in a warm and humid place that favors the development of considerable mold; after four or five days the mold is taken off and the beans, after having been dried in the sun for 24 or 48 hours, are washed in cold water; salt and water are added, and the mixture is exposed to the sun for two weeks. It is then boiled for half an hour, adding for flavor a bit of star anise, regular anise, and orange peel; the mixture is then filtered through a basket and finally bottled as *Soya."*

There follows a short section titled "Peas" (*Pois, Pisum*

© Copyright Soyinfo Center 2014

sativum), including *Endo mame.* Next comes a detailed but somewhat confused discussion of soybeans (*Pois oléagineux, Soja hispida*) and a listing (often repetitive) of many different types and colors, as follows (p. 649-50): "There was also a variety of soybeans (*Pois oléagineux, Soja hispida*), an early soybean (*mamé*), one with large hanging pods covered with red hairs, and one with large, yellowish-white seeds.

"The principal varieties of *Soja* and *Soja hispida* indicated in the watercolors of the Tokyo Bureau of agriculture were: 1. *Soja* with white flowers, a yellowish-white bean of medium size with white pods. 2. Early green *Soja,* a large yellowish-white bean with large pods covered with red hairs. 3. *Soja blanc,* with large yellowish-white seeds. 4. *Grand Soja blanc,* a large, yellowish-white bean with rather long greenish pods. 5. Green *Soja,* a yellowish-white bean of medium size with little green pods and the stem scattered with brown hairs. 6. *Kinoshita-mame,* a small yellow bean with little hairy pods. 7. Red *Soja,* a red bean of medium size with green, velvety leaves and red flowers. 8. Black *Soja,* a black medium-sized bean. 9. *Kouro-hiro mame,* a large black oval bean [*kouro = kuro* = black]. There are also varieties called: 10. *Awo-mame,* a large, greenish-white bean [*awo = ao* = green]. 11. *Shiro-mame, Kuro-mame, Kuro-kake mame, Kinname* (*Glycine soja*), *Kouringa, and Ichia-mame.*

"In the collection of beans at the Exposition of Champ de Mars the following soybeans were found: 12. *Daizu* (*Soja hispida*), a round yellowish bean of medium size. 13. *Shiro-daizu,* a large yellowish bean [*shiro* = white]. 14. *Oshiro-daizu,* a very large yellowish bean, twice the size of *Shiro-daizu.* 15. *Akayendo,* a medium-sized yellowish bean. 16. *Awo-mame,* a large, greenish-white bean (variety of *Glycine*). 17. *Aokuro-daizu,* a large greenish bean speckled with black. 18. *Thya-iro-mame,* a large, reddish-brown bean (variety of *Glycine*) [*Thya-iro = cha-iro* = brown]. 19. *Shiro-mame,* a white bean speckled with grey (variety of *Glycine*). 20. *Aka-daizu,* a large red bean [*aka* = red]... 21. *Kouro-daizu,* a large black bean."

Near the end of this subsection we read (p. 651): "In China, an oil is extracted (*on extrait*) from soybeans (*pois oléagineux,* literally 'oil peas'); it is used for both cooking and illumination. The green or black peas are often used to color rice wine. Mixed with beans (*haricots*) and wheat, they form the base for the manufacture of soy sauce and of tofu (this latter condiment is composed of two species of boiled beans). With soybean seeds (*Avec les graines de Soja*) the Japanese also prepare a sort of pap (*bouillie*) which for them takes the place of butter and which they call *Miso.* The leaves and branches of the soybean serve to nourish goats and sheep." Address: France.

622. Bishop, Isabella Lucy (Bird). 1880. Unbeaten tracks in Japan: An account of travels on horseback in the interior, including visits to the aborigines of Yezo [Hokkaido] and the shrines of Nikkô and Isé, by Isabella L. Bird. 2 vols. New York, NY: G.P. Putnam's Sons. See vol. I, p. 232, 237-38.
• ***Summary:*** The section titled "Notes on food and cookery" (p. 232-40) states: "Some fish are fried in the oil of the *Sesamum Orientale,* which produces an odour which makes one fly from its proximity. Eels and other dainties are served with soy (*shô-yu*), the great Japanese sauce, of a dark brown colour, made from fermented wheat and beans with salt and vinegar [sic], and with a dash of *saké* added to give it a higher flavour" (p. 232).

Buddhist teachings on the sacredness of life have, in some parts of Japan, been effaced by contact with foreigners. There some people eat wild birds and fowl. "Seaweed is a common article of diet and is dried and carried everywhere into the interior. I have scarcely seen a coolie make a meal of which it was not a part, either boiled, fried, pickled, raw, or in soup" (p. 234). *Brinjal* or egg-plant are among the many vegetables pickled. Confections consist of sugar-coated [azuki] beans, and *yokan*–made from seaweed. Mochi is a small round cake of unbaked rice dough.

"The common people are also fond of 'a pot-boil of birds' in which a little soy and *mirinshu* are added to the water" (p. 237).

"The chief kinds of soup used by the middle classes are bean soup [miso soup], egg soup, and clear soup. The latter is of two kinds, one water and salt, the other water and soy" [sauce]. Among the lower classes there are many kinds, most of which taste like dirty water with a pinch of salt, and contain cubes of bean curd, strips of dried fish, cuttlefish, etc... Carp is used with bean soup only..." (p. 237-38).

Note: This is the earliest English-language document seen (July 2011) that uses the term "bean soup" to refer to miso soup.

In formal entertainments, the highest of the three classes is *san no zen* in which three small tables of eatables are provided to each guest. The first table includes rice, and "bean soup with carp." Each table contains from 8 to 12 bowls or dishes (p. 238).

Note 2. The author, Mr. J.F. Bishop, lived 1831-1904. Note 3. Yezo (also spelled Yezzo, Yeso) refers to Hokkaido, Japan's northernmost main island. Address: Author [England].

623. Walker, Francis A. ed. 1880. International Exhibition, 1876 [at Philadelphia]. 10 vols. Washington, DC: Government Printing Office. 24 cm. No index.
• ***Summary:*** This, the sixth international exhibition and the first held outside of Europe, also celebrated the 100th anniversary of America independence. Unfortunately the many volumes covering this exhibition are extremely poorly organized and difficult to use. They contain no indexes, either for the entire set or for each volume. The table of contents of each volume does not match the actual contents of that volume. Since there seems to be no logical sequence,

© Copyright Soyinfo Center 2014

one must look page by page.

In Vol. I (p. 600), the section on "Animal and vegetable products (used as food or as materials)" includes: Class 650–Sponges, sea weed. Class 655–As musk, civet, ambergris. Class 656–Preserved meats, vegetables, and fruits. Dried, or in cans or jars. Meat and vegetable extracts. Class 662–Vegetable oils.

The next section, "Textile substances of vegetable or animal origin" (p. 600) includes hemp, flax, jute, ramie, and silk. Note: This is the earliest English-language document seen (June 2002) that uses the term "animal origin."

In Vol. IV, Groups III-VII (1880), is a section titled "Group IV. Animal and vegetable products, and the machinery for their preparation" (p. 2) by Ryland T. Brown. In Group IV, under "Reports on Awards" (p. 94-95) we read: "487. Lea & Perrins, Worcestershire, England. Worcestershire sauce. Report.–Commended for the following reasons: 1. Excellent taste. 2. Very carefully prepared." "496. Naga-oka Zenpachim Tokio, Japan. Sauces. Report.–The Shoyu sauce, to be used with meat and fish for the purpose of flavoring gravies and soups, is excellent; the preparation is most careful, and it recommends itself strongly for its purity and flavor."

The 11th volume (bound in 2 volumes) in the series of reports on the International Exhibition of 1876 is titled "Report of the Board on behalf of United States Executive Departments at the International Exhibition, held at Philadelphia, Pennsylvania, 1876." For more details, see the Official Catalog of the British Section in the exhibition. Address: Chief of the Bureau of Awards.

624. Nanrido Eiraku. 1880? Nenjuban saisen: Shirôto ryôri. Sassoku hôchô [Year-round recipes: Speedy cooking for amateurs]. Publisher unknown. Undated. Japanese summary by Kawakami 1978. [Jap]

• ***Summary:*** Written in the Kyoto-Osaka area of western Japan some time during the 1800s, this book quoted the *Tofu Hyakuchin.* It lists daily home recipes, including tofu recipes and some using shoyu. Kirazu, the early term for okara, is mentioned. The recipes are listed according to the season in which they are best prepared.

625. Smith & Dewar. 1881. Sales of household furniture: Saturday, 5th March at one, within 79 George St., entirely without reserve. *Scotsman* (*Edinburgh*). Feb. 26. p. 12.

• ***Summary:*** "Important cellar of high-class bottled wines, champagnes, brandies, whiskies, and liqueurs (the Property of an Edinburgh Gentleman,...) and consisting of over seven hundred dozens."

"Miscellaneous.–Sauterne by Schroder & Schyler, Old Marsala [wine, from around the city of Marsala, Sicily], Old Wedderburn Rum, Old Dry Muscatel in Antique German Flasks, Five Cases Finest Chinese Ginger, Six Jars Chow Chow [a relish made of different vegetables that are pickled in a jar and served cold], Genuine Japan Soy [sauce] from Jeddo [Edo, today's Tokyo]: Quarter Cask Brandy... Cigars.–Two Cases Manila Cheroots and Cigars, 1877."

Note: In legal contracts, the term "without reserve" is frequently used in conditions of sale at public auction, that the property to be offered for sale, will be sold without reserve (i.e., no matter how low the best price offered). Address: Auctioneers & Valuators, 79 George St., Edinburgh [Scotland].

626. Ladureau, A. 1881. Culture et composition du Soya hispida [Cultivation and composition of soybean]. *Association Francaise pour l'Avancement des Sciences* 10:944. April. Excerpt from minutes of proceedings. 10th Session, 17 April 1881, Alger/Algiers. [Fre]

• ***Summary:*** "The soya hispida is an oil pea (*pois oléagineux*), native to Japan, remarkable for its richness in oil and protein. It contains 20% oil and 7% nitrogen. This is a richness of which no other examples are found among all the other known plants.

"It can be used for human food, but its taste requires some getting used to. The beans can give very good results in the feeding of livestock, being fed either when green or after being soaked.

"The characteristic point in the culture of this plant is that it requires a large spacing between plants, 30 cm in fertile soil and 25 cm in poor soil, where the plant doesn't develop as well; but this minimum limitation of 25 cm should never be exceeded."

"Discussion: Mr. Corweneinder says that the ensilage (*l'ensilage*) of soya hispida is very easy; after the seeds begin to form, one must simply put the plants in a silo. In this way, one obtains excellent results." Address: Directeur de la Station Agronomique du Nord, France.

627. Renouard, Alfred. 1881. Sur l'introduction du soja hispida en Europe [On the introduction of the soybean to Europe]. *Association Francaise pour l'Avancement des Sciences, Comptes Rendu* 10:945-51. April. Session of 17 April 1881, Algiers. [3 ref. Fre]

• ***Summary:*** Contents: Introduction. History. Cultivation and harvest. Soya as a forage plant. The edible soybean [food uses]. "The *soya,* or rather the *soja hispida* is a plant that is cultivated at many locations in Europe, but whose name is not well known here, and which has only been cultivated for several years. Japan has long known the specialties of its cultivation. There it is well known under the name of *o'mamé* and from it is extracted, from the roasted seeds, the sauce called "japonaise," which is found in the commerce of Europe, where it enjoys a good reputation.

History: At the Exposition of Vienna, in 1873, the Japanese government exhibited, for the first time, the soya as a forage and food plant. Some Austrian scholars, including Prof. Haberlandt of the Institute of Agronomy at Vienna,

© Copyright Soyinfo Center 2014

then studied the composition of this oilseed and perceived that it would make an excellent forage. In 1877 trials started in Austria. In 1871 the Society for Acclimatization in Paris sent several samples of soya seeds to M. Blavet, president of the Horticultural Society of Étampes. He grew the crop and sent samples to other departments and abroad. Later the seed house of Vilmorin coined the name "Soya of Etampes" (*soya d'Étampes*). But it does not seem that these laudable efforts have been crowned with success. Mr. Paillieux of the National Society for Agriculture, Mr. Saint-André, director of the Agronomic Station at Montpellier, Mr. Vavin of the Society for Acclimatization, have all worked with soya and are still working for the propagation of this useful plant.

"In the region of Nord, it is to a Frenchman, who actually lives in Moravia, that we owe the actual propagation of soybean culture: Mr. Julius Robert, who cultivates nearly 3,000 hectares at Seelowitz. Last year he made a gift of several hundred liters of soybeans to the Society of Farmers of Nord. At the instigation of Mr. Corenwinder, several farmers tried them. The results obtained by the first experimenters were, in general, satisfying, but we should not yet make a final judgment as to the plant's definite acclimatization. Nearly 30 farmers from around the town of Lille are proposing to plant soybeans again. Free samples, provided to our society by Mr. Olivier Lecq (of Templeuve), an agent for Mr. Robert and those who conducted the first trials, have been rapidly distributed. Today we can consider the soybean as definitely well tested in our department.

"Cultivation and harvest of soybeans: Mr. Yossida [Yoshida], a Japanese man from Tokyo, was sent to the town of Lille by his government to work seriously on cultivation and preparation of flax / linseed. He told us that there were at least 100 varieties of soybean in Japan. A Japanese book titled *Explanation, with Illustrations, of Trees and Plants Newly Determined,* mentioned 25 very distinct varieties of soybeans. The Chinese herbal only cited five varieties, which seems to prove that the soybean is native to Japan.

"In France, we barely know 2 or 3 varieties: the yellow and the brown soybean for temperate climate, and the black for the warm climate. It is the yellow variety that was tried in the department of Nord, and also, by the way, the one that has been cultivated at the Museum since 1790; there we can observe that it comes up well but it does not produce seeds every year" (p. 946).

"In the department of Nord the soybean, can be harvested toward the end of September or during October. However, in warmer countries or regions, the harvest can begin in August or September."

"The harvest ought to be done like that of the like the dwarf bean (*haricot nain*), in the department of Nord, in ripping out the stalks entirely, then suspending them from poles in an open field, the bundles of soybeans tied just above the top of the roots [hung upside down]. The plant thus dries rapidly, if the weather does not pose an obstacle to it. When the soybeans are well dried out, they can easily be stored: they are not attacked by weevils (*bruches*) that cause, as everyone knows, so much damage to beans, peas, lentils, etc."

In 1879 in Austria trials were conducted by Mr. de Blackowicz [Edmund v. Blaskovics] under orders from the Hungarian Ministry of Agriculture. In 1879 he obtained an average yield of 1,699 liters/hectare (range: 237 to 3,262).

Mature and well dried, the soybean constitutes an excellent feed for animals in France. On this subject, comparative experiments on the nutritional value of air-dried soybean pods and dead leaves were conducted in 1879 by Messrs. Weiske, Delmel, and Schulze at the Proskau agronomic station.

In total, 1,000 gm of pods were fed to each of two sheep, from Jan. 8-15 then from Jan. 16-23. One table shows percentage of each nutrient in the pods digested by each sheep (p. 948). A second table shows the percentage of each nutrient in the dead leaves digested by each sheep (p. 949).

"Finally, the soybean has been fed to animals after having been ensiled in a mixture with various forages. The fermentation which these forage crops undergo changes the composition of each. For example, in mixing soya with maize (which contains only 4-5% protein), the protein content of the mixed silage is increased. The following analysis, made in 1879 at Lobozitz (Bohemia) in the agricultural laboratory of the prince of Schwartzenberg, is of a forage composed 80% maize on the stalk and 20% soya on the branches. A table (p. 949) shows: Moisture 8.62%, fatty materials 2.33%, cellulose 43.94%, nitrogen-free extracts 27.56%, proteins 8.75%, and ash 8.80%.

On the farm of Mr. Julius Robert, the cattle being fattened were fed as follows (per head per day). A table (p. 949) shows–in February: Hay 3 kg. Soya and maize ensilage 5 kg. Corn flour 1 kg. Beet peels 40 kg. Chopped straw 6 kg. Salt 80 gm. The amount of soy and maize silage fed in March and April were increased to 8 kg. The next table (p. 950) shows that the cattle gained (on average) 633 kg in Feb., 654 kg in March, and 690 kg in April. The increases in weight gain in March and April must be due entirely to the marked increase in the amounts of soy and maize silage fed during those two months.

The article concludes: "To make from the soybean what the Japanese and Chinese make from it is the least important part of the question; because we think that Europe will leave them with their soy butter (*mizou* [miso]), their sauce (*soyo* [shoyu]) and their cheese [tofu]. It is not surprising that people tried to make cheese; the legumine [a kind of protein] which the soybean contains in large proportion, is, as we know, analogous to casein and undergoes the same chemical reactions. By the way, all these products, except the sauce, are detestable to the European palate.

"Next year I shall give an account of the results obtained during three years of trials in the department of Nord" [in far

northern France on the border with Belgium].

Contains eight tables from earlier publications by other authors.

Note: This is the earliest French-language document seen (April 2012) that uses the word *soyo* to refer to soy sauce. Address: The Younger (*fils*), Civil engineer, manufacturer at Lille, secretary general of the Industrial Society of Nord [a department in northern France] (Ingénieur civil, Manufacturier à Lille, Secretaire général de la Société industrielle du Nord).

628. Atkinson, R.W. 1881. On the diastase of *kôji.* *Proceedings of the Royal Society of London* 32:299-332. May 12. [6 ref]

• ***Summary:*** Read March 10, 1881, by Prof. A.W. Williamson. At the bottom of page 299 Atkinson states: "* I feel that some apology is needed for using the Japanese word *kôji,* but as there is no foreign product in any way resembling it, I have thought that there would be less danger of confusion arising by retaining the Japanese word than by using the word 'malt.' As will be seen from the following description, the nature of this substance is quite different from that of malt, so that the use of that word might lead to erroneous impressions."

"Summary: Section I.–Preparation of the kôji: Mechanical preparation of the rice. Addition of spores of *Eurotium oryzae* (Ahlb.). Growth of mycelium in warm chamber. Rise of temperature during growth sufficient to preserve the temperature of the chamber constant, and, in winter, much above the temperature of the outer air. Temperature of koji itself from 10º to 23º F. above that of the chamber.

"Activity of growth shown by the rapid replacement of oxygen in a confined portion of air by carbonic acid.

"Loss of weight of the rice during the growth of the fungus.

"Section II.–Action of water on kôji: Amount of solid matter dissolved depended upon time and temperature of digestion, and upon the proportion of water used.

"Amount of albuminoids dissolved depended mainly upon the duration of digestion.

"Temperature of greatest change in cold water extract of kôji.

"Section III.–Action of kôji extract upon some carbohydrates: Extract of koji causes inversion of cane-sugar. It also effects the hydration to dextrose of maltose and dextrin. Curve A.

"Extract of koji breaks up the starch molecule into maltose and dextrin; the maltose is quickly hydrated, and the products after some time are dextrin and dextrose.

"Experiments showing the action of koji extract upon starch-paste at various temperatures from 4-10ºC. to 70ºC. Curves B to H.

"Effect of common salt in neutralising the hydrating power of koji extract.

"Section IV.–Change which the rice grain undergoes by the growth of the fungus: It is shown by a comparison of the analyses of rice and koji that the principal change which is to be observed is the conversion of the insoluble albuminoids of rice into the soluble state, and, probably as a result of this, the large increase in the total soluble solid matter.

"It may be desirable before entering upon the preparation and properties of the substance which the Japanese call *kôji,* to mention briefly the uses to which it is put in this country. It is universally employed as a fermenting agent, but it is something differing from such a body as 'barm or yeast,' by which Dr. Hepburn translates koji in his invaluable dictionary. Its principal use is in the production of sake, the alcoholic liquid which is everywhere consumed in Japan. This liquid is prepared from steamed rice by digestion with koji, the diastase of which effects the conversion of the starch into matter capable of being fermented.

Another use to which koji is applied is in bread-making. It is also employed in the manufacture of the famous sauce 'Soy' [sauce], which is likewise a product of fermentation, though its preparation is much more complicated, and has not yet received an explanation.

"In *Nature* (September 10th [sic, 12th], 1878), I gave a very brief account of the mode of producing sake, and about the same time Mr. O. Korschelt read a paper before the German Asiatic Society of Japan giving a detailed description of the process, together with some experiments upon the action of water upon koji. The result of his investigation was that koji acted as a kind of diastase, converting starch into sugar, but he gave no experiments which could serve to identify the product.

In a paper read before the Chemical Society in March, 1880, of which an abstract appears in the *Chemical News,* April 9th, 1880, I gave a series of analyses of the mash, as the result of which the conclusion was drawn that the diastase of koji, unlike that of malt, yields dextrose and dextrin when it acts upon gelatinised starch. The conclusion was correct as referring to the ultimate products, but further experience has shown that the first product is not dextrose, but maltose, which, however, is quickly hydrated to dextrose. Evidence of this will be found in a later part of this paper" (p. 300).

"The Japanese prepare a kind of sweetmeat by the action of malt-extract upon steamed rice or millet, and this product, called *âmé* (*amé*), from the examination of a large number of specimens, was found to contain 68 to 94 per cent. of maltose."

Page 327 notes that Mr. Watanabe is preparing to conduct an investigation into the chemistry of the 'Soy' manufacture. He is aware that "the diastase of *kôji* resembles that of malt in one respect, that its activity is lessened by the presence of certain bodies, such as common salt."

The koji "manufactory" with which Prof. Atkinson is

© Copyright Soyinfo Center 2014

most familiar is the one at Yushima, in Tokio [Tokyo]; Mr. Jihei Kameyama is the proprietor. "It consists of a long arched passage, cut in the thick bed of clay which underlies Tokio at a depth below the surface of 15 to 20 feet." In this manufactory, "there are in all four of these underground passages, only one of which is used during the summer, as very little koji is made during that season. The height is rather less than 4 feet, the breadth about 7 or 8 feet, and from the entrance, reached by descending a vertical shaft, it extends about 25 or 30 feet in one direction, then bends off nearly at right angles for about the same distance."

"That the growth of the [koji] fungus takes place with great vigor is shown not only by the rise in temperature, but by the rapidity with which it removes oxygen from the air." The oxygen is replaced by carbonic acid... The rice contained 14.2 per cent. of water and the *kôji* 29.5 per cent; thence 85.8 parts of dried rice yielded 76.35 parts of dry *kôji,* that is, 89 per cent., and thus a loss of weight occurs amounting to 11 per cent. of the dry rice used. This loss consists mainly of starch, which is oxidised to carbonic acid and water..."

The large amounts of carbonic acid formed in the underground koji passages must be removed by ventilation. "The only means adopted of effecting a change of air consists of a square shaft about 8 inches in one direction and 6 inches in the other, leading from the anterior end of the passage into the open air above. It will be evident, therefore, that as the ventilation depends upon the difference of temperature between the inner and the outer air, it will be much better in winter than in summer. In fact it is in the spring and early summer that the [work] stoppages occur." Lacking air, "the growth of the fungus must be much less active, and perhaps this is one reason why the production of *kôji* in the summer is almost abandoned."

"The *kôji* prepared in the manner just described consists of grains of rice bound together in lumps by the interlacing threads of mycelium."

Note 1. This is the earliest English-language document seen (March 2002) with the word *koji* in the title.

Note 2. This is the earliest document seen (March 2002) that mentions diastase in connection with koji. However neither the word "enzyme" nor the word "enzymes" appear in this paper. Address: B.Sc. (Lond.), Prof. of Analytical and Applied Chemistry, Univ. of Tokio, Japan.

629. Raveret-Wattel, C. 1881. Extraits des procés-verbaux des séances de la société. Séance générale du 20 Mai 1881 [Excerpts of verbal proceedings from meetings of the society. General meeting of 20 May 1881]. *Bulletin de la Societe d'Acclimatation* 28:380-93. May. See p. 385-86. [Fre]
• ***Summary:*** A letter to the Society from Eugene Simon states: "In the Feb. 1881 issue of this *Bulletin* there was an article titled *'Le Haé-Téou ou Hei-Teou'* which was excerpted from the *Cultivateur de Saône-et-Loire* [No. 37. 1 Feb. 1881]. Pretending to render under Caesar that which belongs to Caesar, the author attributes to a French missionary, Mr. P. Leboucq, the first French-language reference to this black-seeded variety of *Soja hispida* [the soybean].

"However, I believe that, as early as 1857 or 1858, Monsieur de Montigny shipped us considerable quantities of black soybeans at the same time as he shipped us yellow soybeans. And in any case, I made additional shipments at several intervals in 1861, 1862, and 1863. (Footnote: The first shipment by Mr. de Montigny was as early as 1855. For more details, see the excellent summary by Mr. Paillieux titled "The Soybean at the Society for Acclimatization," published in this Bulletin in 1880, p. 415+).

"I shipped soybeans from Shanghai, from Peking, from Japan, and from Szechuan. My reports to the ministry and probably also to the *Bulletin of the Society for Acclimatization,* who received some from the ministry, would bear witness to this." Address: Secretary of the meetings, France.

632. Van Buren, Thomas Broadhead. 1881. The food of the Japanese people. Yokohama, Japan: Printed at the Japan Gazette. 19 p. No index. 24 cm.
• ***Summary:*** Contents: Introduction (meat eating countries vs. Japan). Cerealia (cereals). Leguminous plants. Tubers and roots. Herbaceous food-plants. Ame. Leading food plants (with Japanese name, scientific name, and parts eaten; incl. kudzu, udo, konnyaku, and daikon). Sauce.

Most civilized people are and always have been meat-eaters. "So universal has meat-eating been among the dominating races that it has become a generally received opinion that animal flesh is a necessity to a well-developed physique. The praises of beef are sung wherever Occidental civilization has penetrated. It is not only a popular belief, it is as accepted scientific opinion, that a considerable percentage of animal flesh must enter into the nourishment of any well-

© Copyright Soyinfo Center 2014

fed people."

"The food of Japan, with a population of 36,000,000, or about that of Great Britain and Ireland, engaged in every branch of human industry, presents a complete contrast to all this. Here they are essentially vegetarians, animal flesh being largely prohibited by religion, and its general use made impossible by reason of its comparative scarcity and consequent high price." Until a few years ago, their "isolation prevented the introduction of new food-plants adapted to their climate..."

In Japan there are little more than 1,000,000 head of cattle. Of these, only the cows (not more than 600,000) are eaten; male cattle are used only as beasts of burden. Thus in Japan there are less than 2 head to every 100 people, compared with 73 head in the United States. Of the 36,000 cattle slaughtered last year in Japan, "more than one-half were consumed by foreign residents and the foreign naval and merchant marine. The Japanese army and navy also consume considerable beef. It is therefore safe to say, as I have already intimated, that beef does not enter into the food of the mass of the people to any appreciable extent. Mutton and pork, outside of the treaty ports, are almost unknown. Of barnyard fowls, geese, and ducks there is a large variety. The wildfowl, consisting of pheasants, quail, woodcocks, grouse, ducks and geese are also abundant, but these, as well as eggs, on account of their high prices, can scarcely be said to enter into the diet of the common people at all, except upon rare occasions. Fish is more largely eaten. The variety of fish is very large... A very considerable percentage of the catch is dried." "At present it may be said that one-half the people eat fish every day, one-quarter two or three times a week, and the balance perhaps once or twice a month.

"Even with these exceptions the food of the masses is fully or even more than 90 per cent. vegetable." The Japanese exhibit "endurance of body and power of intellect to a very considerable degree, while deprived of the usual nutriment held to be essential to such developments."

The main cereals of Japan, in descending order of the quantities produced, are rice, barley, millet, rye, and Indian corn. The three main varieties of millet are extensively cultivated and used: First class is *Setaria Italica* (Italian millet). Second class is *Panicum miliaceum* (Indian millet). Third class is *Panicum frumentacum* (Called "hiye" [hie] in Japan).

"Leguminous plants. Perhaps in no country in the world are beans and pease comparatively so extensively cultivated as in Japan. There are more than 40 varieties. That known as the soy-bean is especially important, as it is rich in those nutritive properties which are wanting in rice, and is invaluable in a country where meat is almost entirely lacking in the diet. The composition of this variety, known as Miso-mame, is as follows (table): Water 11.32%. Ash 3.86%. Fat 20.89%. Nitrogenous matter 37.75%. Gluten 2%. Starch and sugar 24.08%. Its "proximate chemical composition approaches more nearly to animal food than any other known vegetable." Tables showing the composition of lean and fat beef are then given for comparison.

"I know it is held by scientists that, while these plants show a great chemical likeness to beef, the action upon the human body is not the same, being much less valuable. I can only repeat that here is a race of people of good physique, of stalwart and well proportioned, although not tall, frames, and of cheerful dispositions, who daily perform tasks requiring great strength and endurance, who eat almost exclusively this vegetable food, and who, without any of the comforts of our western homes, and undergoing extreme exposure unknown to our people, live about the average lives of the laborers of Europe and America, with a table expenditure of about one-sixth or one-seventh that required by the latter."

All classes of Japanese also consume many algæ and other sea plants, including many species of chondrus and Fucus-laminaria. Instead of sugar they use *ame,* "made from malted barley and rice or millet, the malt converting the starch of the rice or millet into dextrine and maltose, and producing the product varying from a thick sugar or honey up to a hard candy. The food value of this article is very great, and, as it is sold at a low price, its consumption is large. A table shows the composition of two grades of *amé,* first and second (cheaper).

Sauce enters very largely into the preparation of Japanese food for the table. The most widely-used kind is made as follows: "'Shoyu,' known to us as 'soy' [sauce], the one almost exclusively employed is made from wheat and the shoyu bean [soy bean] (ground) in equal proportions of one *sho* each (a sho is about 1 quart, 1 pint, and ½ gill). The materials are mixed and boiled, after which the mass is steamed in a basket or box prepared for the purpose, with a perforated bottom. When the steaming process is finished it is put in a cask and left until a green yeast is produced. The compost is then taken with salt water. After standing a good length of time the liquid is strained, and the sauce is ready for use. It has a rather pleasant flavor, and is said to be the basis of most of the renowned sauces [such as Worcestershire] prepared in England. The refuse is fed to cattle."

Note: This is the earliest English-language document seen (April 2012) that uses the term "shoyu bean" (regardless of capitalization) to refer to the soybean.

The last 6 pages (p. 14-18) contain a "List of plants used for food, or from which food is obtained in Japan." They are arranged by families. For each species is given: Botanical name, Japanese name(s), and remarks. Under Leguminocea [sic, Leguminosae], Papilionacea [Papilionaceae], we read: *Glycine soja* (S. & Z.), Tsuru mame; No mame, seeds. *Glycine hispida* (Moench) or *Soja hispida* (Miq.), Omame; daidzu, Soy bean; seeds; many varieties. *Dolichos soja* (L.), Japan pea. *Glycine hispida* f. lanceolata, Midzukugiri.

The section on legumes (p. 15) also discusses: (1)

© Copyright Soyinfo Center 2014

Arachis hypogea (L.), Rakkasho, Tojinmame, Ground-nut; earth-nut; fruit. (2) *Vicia faba* (L.), Sora mame, Broad beans; seeds = *Faba vulgaris.* (3) *Pisum sativum* (L.), Yendo [Endo], Pea; seeds; two main varieties; midori yendo [endo] and saya yendo [endo], the latter eaten for the pod. (4) *Pueraria thunbergiana* (Benth.), Kudzu, root, starch = *Dolichos hirsutus* (Th.). (5) *Canavalia incurva* (D.C.), Nata mame, seeds = *Dolichos incurvus* (Th.). (6) *Phaseolus radiatus* (L.), Adzuki-Shôdzu, seeds. *Phaseolus radiatus* var. pendulus (Savatier), Tsuru-adzuki, seeds. *Phaseolus radiatus* var. subtrilobatus (Sav.), Bundo-Yayenari, seeds. (7) *Dolichos umbellatus* (Th.), Sasage, Adzuki-sasage, seeds. (8) *Atylosia subthombea* (Miq.), No-adzuki; Hime-kudzu, seeds.

Note 1. This is the earliest English-language document seen (Jan. 2005) that uses the term "broad beans" (or "broad bean") to refer to *Vicia faba.*

Note 2. This is the earliest English-language document seen (March 2006) that uses the word "Yayenari" (or "Yaye-nari" or "Yaenari" or "Yae-nari") to refer to a variety of azuki beans. Address: United States Consul General of Japan, Kanagawa.

633. *New York Times.* 1881. Editorials [Vegetable food in Japan]. Sept. 10. p. 4, col. 6.

• ***Summary:*** "So universal has meat-eating become among the dominating races, remarks our Consul-General at Yokohama, that the praises of beef are sung wherever Occidental civilization has gone, and it is not only a popular belief, but an accepted scientific opinion, that any well-fed people must use animal food considerably; to have meat to eat frequently is reckoned the best proof that the common laborer in a country is well favored. Japan, with a population of 36,000,000, equal to that of the United Kingdom, engaged in very diversified industry, presents a complete exception to the rule as to food. The scarcity of animal food in consequence of the nonintercourse policy, and its almost unnecessary prohibition by the religious faith, have made a nation of vegetarians, except as to fish, which is not forbidden as 'flesh.'

"There are now in the country hardly more than 1,000,000 cattle; of these, as emasculation is not practiced, the males being used for breeders, only 600,000 cows can be looked to as food, and there are less than 2 head to each 100 people, against 73 head in this country. Of the 36,000 head slaughtered in 1880, the foreign residents and the foreign marine consumed more than half. Outside of the treaty ports mutton and pork are almost unknown; there is an abundance of fowls, both wild and barn-yard, but the common people cannot pay for them. The supply and variety of fish, however, are very large, over 200 kinds being used as food, and the Government is actively working to increase both. Already probably one-half the people eat fish once a day, one-quarter several times a week, and the rest several times a month. Still the food of the masses is more than nine-tenths vegetable, and the list of this has been made long by their necessity-sharpened wits. Of cereals, rice is the most important, occupying more than half the tilled area in the Summer; barley, millet, wheat, rye, and corn rank next in the quantity produced."

"Beans and peas are more extensively cultivated in Japan than anywhere else, and there are over 40 varieties. One–the soy bean or Nirva-mume–contains 20 per cent fat and 60 of nitrogenous matter, starch, and sugar, and closely approaches meat both in composition and in its action on the body. The sweet potato, being very prolific and cheap, ranks next to rice in importance, 16,000,000 bushels being the last reported production... A surprisingly large list of wild plants and sea-weeds is utilized as food. The place of sugar is considerably supplied by a preparation made from millet or rice and malted barley, the starch of the rice or millet being converted by the malt, and the product varying from a thick sugar or honey up to hard candy, being cheap and in large consumption.

"Sauce, so-called, enters very largely into use with food plants; its name is shoyu, known to us as soy [sauce]. The kind almost exclusively used is made from wheat and the shoyu bean ground in equal parts. It is boiled and steamed, then left to ferment; after being then dried in the sun it is allowed to stand awhile in a cask of salt water, is then strained and is ready for use, the refuse being fed to cattle. Its flavor is pleasant, and it is said to be the basis of most of the celebrated sauces put up in England. The proof of the pudding being in the eating, it is interesting to note the testimony that the Japanese–a race of good proportion, physique, and strength, whose comforts are much less and whose exposure is much greater than in case of Western nations–live an average life, in length and health fully up to that of the European or American, with a table expenditure of not more than one-sixth or one seventh that of the latter."

Note 1. Much of this editorial is borrowed from a recently published booklet titled *The Food of the Japanese people,* by Thomas B. Van Buren (1881). However both the meaning and source of the meaningless term *Nirva-mume,* which is said refer to the soy bean, remain a complete mystery.

Note 2. This is the earliest article on soy seen (Aug. 2002) in the *New York Times.* It is also the earliest document seen (Aug. 2002) that is an example of major media coverage of soyfoods in North America.

634. *Gardener's Monthly and Horticulturist.* 1881. The soy bean. 23(275):337. Nov.

• ***Summary:*** "This–the Soja hispida–has been under culture in American gardens ever since Commodore Perry's memorable expedition to Japan. But no one seems to have known the use of it, and so it soon disappears, as, in the usual way of cooking it, any ordinary bean is better. Among Mr. Dreer's Japan collection at the State Fair [probably

© Copyright Soyinfo Center 2014

Pennsylvania] we noted that it again appeared, and we are moved to give the following from the Gardener's Chronicle, as showing how to use it:

"'The greatest use to which the plant is put in China and Japan is in the preparation of soy [sauce] and of various kinds of food from the ripe seeds. The manufacture of shoyu, or soy, is thus described in a descriptive catalogue of agricultural products of Japan, exhibited at the late Sydney International Exhibition [Australia; held Oct. 1879]. Equal parts of beans and wheat are used; a small part of the wheat is mixed with koji, which is an alcoholic [sic] preparation from rice, and allowed to ferment; the remainder is roasted, and the beans are also roasted. The roasted beans and wheat are then mixed together with the fermenting wheat, placed in shallow wooden boxes, and kept for some days at a fixed temperature in a warm chamber with thick walls, until the whole mass is covered with fungus. It is very important that the temperature of this chamber should be kept at the proper point. By these processes part of the starch of the wheat is converted into dextrine and sugar, and lactic acid and acetic acid are formed. It is then mixed with salt lye. The mashings are removed to large vats, and kept there for at least twenty months, but more often for three or five years, the better qualities being those that are kept for the longer periods. The best soy is produced by mixing that kept for five years with that kept for three years. After it has been kept a sufficiently long time, it is strained through thick cotton bags, and the residue submitted to pressure. Before filtering, honey is sometimes added. The residue, after pressing, is again mixed with salt and water, and again pressed, the yield being soy of an inferior kind. Sometimes water is added to this second residue, and it is again pressed. The residue first obtained is occasionally used as food, and the last residue as manure. (See *Gardeners' Chronicle,* vol. xiii., new series, pp. 178, 209, 242.)

"'Shoyu, or soy, is a very important condiment; it is mixed with a great many kinds of food, and is produced and consumed in very large quantities. Regarding the use of the soy bean as a vegetable in Japan, the writer of the foregoing remarks on soy says: 'It is the vegetable which approaches nearest in chemical composition to animal food (meat), containing, as it does, one-fifth of its weight of fat, and often two-fifths of nitrogenous matter. It is an extremely valuable adjunct to the food of a people who subsist so largely on a purely vegetable diet, of which the bulk is rice, so rich in heat producers–starch, and poor in flesh formers–albuminoids.'"

635. Penhallow, D.P. 1881. Meiso [Miso]. *Kansas City Review of Science and Industry* 5(7):437-41. Nov.

• ***Summary:*** "It is well known that the Japanese are a rice-eating people, with whom this article, meiso, is perhaps, the most important of all their foods, but it is not so generally known that the flesh of animals could hardly be considered a regular article of food until within the past few years, and even now, with the great mass of the people, meat is seldom used. Thus for centuries, these people have lived almost wholly without that which western people consider so important a source of nitrogen. It seems, however, that the demands of nature were recognized and met by obtaining from the vegetable kingdom what they failed to secure from the animal, and thus it is we find them consuming enormous quantities of beans prepared in a great variety of ways. Some of the important preparations from beans are cheese, or tofu–a white, curdy mass strongly resembling cottage cheese, unflavored with salt, and held in high estimation. It is prepared in a variety of ways, but almost invariably forms a part of every meal as a constituent of soup. Cake–a stiff, jelly-like confection made by straining boiled [azuki] beans and incorporating with a large proportion of sugar. Pickles–beans in the pod and frequently on the stem [edamame], pickled in a strong brine; they are eaten without further preparation. Sugared beans–roasted beans enveloped in a heavy coating of sugar, and sold as a confection. Shoyu, or Soy–a liquid of dark color and salty flavor, made by fermenting a mixture of salt, beans, and roasted wheat or barley. It is largely eaten with fish and rice. There are other modes of preparation which we will pass over with the exception of meiso, which forms the subject of this article.

"The pasty mass manufactured and sold under this name constitutes one of the most important of the preparations from beans, and enters largely into the diet of all classes as a basis for soup, or, in various forms, as a sauce for fish and meat. In composition it consists of:

"Salt–4.5 *to* = 2.30 bushels.

"White [soy] beans–1 *koku* = 5.13 bushels.

"Rice–4 *to* = 2.05 bushels.

"Salt.–The salt employed is of a very crude sort. It is obtained from sea water by evaporation under the influence of solar heat, and as no attempts are made to secure any special degree of purity, it is consequently contaminated with other salt's and its specific value thereby lessened. Sticks, straw–especially from the coarse bags in which it is transported–and dirt are also always to be found, and as no efforts to cleanse or purify, beyond removal of the larger fragments of straw, etc., are made at the factory, the product into which such salt enters has a rather uninviting appearance. It is always used dry.

"Beans.–The ordinary white [soy] beans appear to be used in preference to any others. They are prepared by boiling for about six hours, when the fire is drawn and they are allowed to cool in the boiler. The next morning they are removed from the boiler and placed in mash boxes which measure 10 x 3 x 1 feet, where they are thoroughly reduced and mixed with the rice and salt by means of a round pole used as a pestle.

"Rice.–White rice, or that which has been well cleaned, is soaked in cold water for two days. It is then well drained

© Copyright Soyinfo Center 2014

and transferred to a boiler containing fresh water, when it is steamed for three hours. While yet hot, it is taken to a warm room and allowed to remain under the influence of a warm, moist air for four days, when the whole is found to be covered with an abundant growth of fungus.

"The room in which this operation is performed usually measures about 10 x 20 feet, is constructed of mud walls–eight or ten inches in thickness, and is made as close as possible with the exception of one small window to admit light for the workmen, and a door through which to enter. The only moisture in the room is that which comes from the moist rice, but a constant temperature of 80ºF. is maintained by means of a large charcoal fire at each end of the room. It is regarded that a warm, moist air, undisturbed by draughts, is quite essential to the success of the operation, though darkness is not deemed requisite, the absence of windows being more a matter of economy than anything else. The production of the fungus is usually regarded as the critical part of the whole manufacture, and failure sometimes occurs. No reason could be obtained from the Japanese why the subsequent fermentation is dependent upon the presence of the fungus; that its production is an essential part of the process was all the information that could be obtained.

"At the end of four days, the rice is taken out into a large airy room and spread upon straw mats, 3 x 6 feet, and allowed to cool for one and a half hours. It is then transferred to small trays which measure 18 x 8 x 8½ inches, for convenience in handling, when it is allowed to cool as rapidly as it can. Whether the rice now dries or remains moist appears to be a matter of indifference. As soon as thoroughly cooled, it is incorporated with the salt and beans. It is generally customary, however, to prepare the rice in large quantities once in four days, and thus have a stock always on hand. In that case, as soon as cooled, it is mixed with the salt and placed in large storage vats, where it is tamped solid by the feet, and will then keep without trouble for two months.

"When all the ingredients have been thus prepared, they are placed, cold, in the mixing boxes already described, and thoroughly incorporated into a stiff, pasty mass by means of a long mixing rod. This mixture is then placed in large vats having a capacity of about seventeen koku or eighty-seven bushels. Here it is packed solid by the feet and allowed to undergo a very slow fermentation. Every effort is made to keep the temperature of the mass down as low as possible, and if, during the summer, the heal of fermentation gets too great, the whole mass spoils. It is then mixed with roasted wheat and by further fermentation converted into shoyu or soy. Sometimes the mixture fails to ferment properly, when it is taken out and mixed with a fresh portion of beans. The fermentation is allowed to continue six months in summer und eight months in winter, at the end of which time the meiso is ready for the market.

The result of these various operations is a stiff, pasty mixture of repulsive appearance and disagreeably sour odor, and though it would hardly find favor with Americans or Europeans, possibly excepting epicures, it seems to be in great demand with the Japanese.

"The factory where these facts were obtained employs six men, and the annual produce amounts to from 900 to 1,000 *koku,* equal to 4,617 to 5,130 bushels. The cost of the various ingredients and the finished product is as follows: *"

"Beans, 1 *koku*–5.13 bu–6 yen.

"Rice, 1 *koku*–10 yen.

"Salt, 1 *koku*–5.40 yen.

"Total cost of meiso per koku–7.13 yen.

"Market price per koku–13.20 yen.

Footnote (*): "Prices for 1880; probably somewhat higher at present. Yen, gold, is equal to the U.S. dollar." Continued. Address: Prof., late of the Imperial Agricultural College of Japan [Tokyo].

636. Penhallow, D.P. 1881. Meiso [Miso] (Continued–Document part II). *Kansas City Review of Science and Industry* 5(7):437-41. Nov.

• ***Summary:*** Continued: "The mouldy rice, prepared as described, constitutes the yeast of the Japanese, and is used for all the purposes, including bread-baking, for which we would employ ordinary yeast. Its production is, therefore, of considerable importance, as upon it depends the manufacture of meiso, saki (fermented liquor), vinegar, and shoyu. It, therefore, becomes evident that, the principal interest of this entire manufacture centers in the fungus which develops upon the rice, because of the variety of forms which may be developed from its spores under different conditions of warmth and moisture, and also exposure to the air.

"In order to obtain some satisfactory evidence on this interesting subject, the various products–mouldy rice, meiso, yeast, and vinegar–were submitted to microscopical examination. A sample of meiso was taken from a vat where fermentation had been in progress for some time. It was noticed that the temperature was so low that the whole mass felt cold to the hand, and thus whatever fermentation was in progress, must have been going on at a very slow rate. On examination, there appeared numerous spore-like bodies, similar in form and size to the spores from the mouldy rice, which they doubtless were. In addition, there were many short and irregularly branched filaments in all stages of growth from the spore. Nothing was seen which could be called yeast-plant proper, or *S. cerivisiae* [*Saccharomyces cerevisiae*].

"A sample of freshly made vinegar showed the liquid to contain a very large number of spermatia-like bodies, while masses of the true vinegar-plant were also numerous. The cells of these measured one seven-thousandth of an inch in diameter. No true yeast-plant was to be found, though this may possibly have been due to the degree of saccharine exhaustion as well as the low temperature of the fermentation

© Copyright Soyinfo Center 2014

A sample of vinegar, containing a good surface growth of the vinegar-plant, was kept for three weeks, in the hope that fruit might appear and thus furnish one more link in the chain of evidence; but none appeared, although the net-work of cells constantly and rapidly increased, and further observations were interrupted by departure for home.

"Yeast made in the ordinary way, but using the mouldy rice to start the ferment, showed the familiar forms of the true yeast-plant. The fungus on the mouldy rice proved to be our old friend *Penicilleum* [*Penicillium*].

"These observations furnish us with a practical illustration of the fact that these vegetable structures of low degree of organization, are not necessarily constant in form and structure, but are liable to vary greatly under different conditions of temperature, moisture, and exposure, and that they are associated with fermentation of varying rapidity as well as with products which are more or "less dissimilar. They furnish one instance of the effect which environment has upon the individual.–*The Kansas City Review* [of Science and Industry. 1881. Vol. 5, No. 7, p. 437-41. Nov.]. Address: Prof., late of the Imperial Agricultural College of Japan [Tokyo].

637. *Tropical Agriculturist* (*Ceylon*). 1881. The soy bean, a new feeding stuff. 1:567. Dec. 1.

• ***Summary:*** This is reprinted from *British Mail* [*Masl*]. "Mr. Wamford [Warnford] Lock has drawn attention to the soy bean of China and Japan, Glycine soya (Soja hispida), sufficiently familiar as the source of the eastern sauce of that name, and affording a valuable oil (bean oil), which is the subject of an article in the new 'Industrial Encyclopaedia.' It is attracting considerable attention among Continental agriculturists, and has recently been experimented on with regard to its value as a food for milch cows and fat cattle. As a forcing food for milch cows, the soy bean is superior to grains; for fat cattle, it is less adapted, and ranks second to grains.

"The plant can be cultivated in Central and Eastern Europe, and similar localities, especially in unfavourable years, when other crops are backward. For growth as a field crop it is recommended to be sown in rows 18 in. apart in the middle of May.

"The qualities of the beans grown in diluvial [deposited by a flood] and alluvial [deposited by running water] soils are shown by the following analyses [alluvial given in parentheses]:–Water 15.20 (19.50), fat 16.21 (17.94), protein 28.63 (25.94), non-nitrogenous extractive matter 30.84 (33.16), fibre 4.38 (4.45), mineral matter 4.74 (8.82).

"The straw or haulm of the plant is practically worthless for neat cattle, but the husks and leaves, mixed with mashed food, or even alone, are readily eaten. It has also been found that the chopped beans, soaked for 12 hours in water containing a little salt, are greedily taken by cattle, and that few pass through undigested.

"According to M. Roman, a French savant, the cultivation of the soja or soya, has of late years been largely developed in Austria-Hungary, Italy, and parts of France. This plant is extensively cultivated by the Chinese, who make a cheese and various dishes from its fruit. When roasted the seeds form an excellent substitute for coffee, and altogether M. Roman thinks that the plant will pay better than the potato. At present the retail price of the soja beans is sixpence per pound, but as the plant becomes more extensively cultivated, they will no doubt be reduced in price."

Note 1. This journal is published by the Dept. of Agriculture, Peradeniya, Ceylon.

Note 2. This is the earliest English-language document seen (Nov. 2012) that uses the term "substitute for coffee" in connection with soy coffee.

Note 3. This is the earliest English-language document seen (Aug. 2003) that uses the word "protein" in connection with soybeans.

638. *Oesterreichische Monatsschrift fuer den Orient* (*Vienna*). 1881. Die japanische Sojabohne als Nahrungsmittel [The Japanese soybean as a source of food]. 7(12):204-05. Dec. 15. [1 ref. Ger]

• ***Summary:*** In the July issue of this periodical was information on the preparation of miso from soybeans. Additional information was sent by Dr. G. Wagener, our correspondent in Tokyo.

Contains a detailed description of how to make miso (miszo). Soybeans are soaked for 12 hours until soft. The water is poured off and the beans are then cooked for 5 hours in fresh water. The thick, viscous, sweet-tasting cooking liquid is filtered off (using a basket) and the beans are mashed underfoot. To each 1.8 liters of beans are added 5.4 liters of koji (made by the fermentation of rice), 5.4 liters of salt, and 1.8 liters of the cooking liquid. The combination is mixed and filled into vats, which are then covered with oiled-paper (*Oelpapier*). This koji miso or white miso is ready after 10 days.

A very delicious red (aka) miso is made without koji. In the countryside, miso is prepared in other ways and can be kept for 7-8 years.

• ***Summary:*** For a long time, a number of learned societies, among which I must place at the forefront the Society for Acclimatization of Paris, have tried to introduce into France the cultivation of a sort of oil pea (*pois oléagineux*), resembling both the lentil and the haricot, and imported from Japan to Austria under the botanical name of *Soya hispida.*

© Copyright Soyinfo Center 2014

According to one of the associate members of our society, Mr. Julius Robert, who resides at Seelowitz, Moravia, this pea gives excellent results in the feed of livestock, and it is also sought after for domestic [human] consumption. Mr. Albert Lapureau wanted to determine its chemical composition; he has noticed in various analyses he has conducted a considerable quantity of nitrogenous materials. Based on their faith in the valuable information about this Dolichos bean (*dolique*) provided by Misters Julius Robert, Corenwinder, and Olivier Lecq, who first occupied themselves with it, as by Mr. Ladureau, a certain number of members of the Society decided to plant soybeans.

The most detailed results were furnished to us on this subject by Mr. Victor De Swarte, treasurer-general of Jura. With a care that denotes all of the benevolent ardor with which our colleague devotes himself to what can be useful to the agriculture of his country, Mr. De Swarte brought back the results obtained from two farmers from Lons le Saulnier, Messrs. Nel and Grant, and he sent us a very interesting communication on these trials. We cannot thank Mr. De Swarte enough, and we encourage him to keep us informed of his further observations on this subject.

Let us again remember here that, according to the opinion of Mr. Robert, confirmed scientifically by our wise colleague Mr. Corenwinder, the soybean grown in our countries, must be cut while still green to be used as forage. [At this stage] the useful principles (*principes* [nutrients]) of the plant have not yet migrated to the seed, and as they remain entirely in the plant, they profit all the more the farmer, who uses it [the soybean plant] to feed his livestock. Address: The Younger (*fils*), Secretary-Archivist [of the Society, France].

640. Bankoku gokuhiden [For all nations, top secret]. 1881. Japan. 126 p., handwritten. Publisher unknown. Japanese summary by Kawakami 1978, p. 129. [Jap]
• ***Summary:*** Contains 90 interesting recipes, including goma-dofu (sesame tofu), tofu umeboshi, aniri tofu, and tofu kamaboko.

641. Henderson, Peter. 1881. Henderson's handbook of plants. New York, NY: Peter Henderson & Co. 412 p. See p. 95, Glycine. Index. 27 cm. [1 ref]
• ***Summary:*** "Glycine: from *glykys* sweet; referring to the taste of the roots of some of the species. *Linn. Diadelphia-Decandria.* Nat. Ord. *Fabaceæ.*

"A small genus, nearly all of which are tender climbing plants, producing axillary flowers, singly or in racemes, white, yellow, or rose; they are only adapted for green-house culture. There is one species, *G. soja,* that is a hardy annual, a native of Japan, that produces seeds like small kidney beans, which the Japanese use in large quantities, either in soup, or in making a sauce called sooja or soy, this sauce being used in many of their dishes. The *Wistaria* was formerly incorrectly called Glycine."

Note 1. This is the earliest document seen (Dec. 2004) by Peter Henderson or his company that mentions the soybean. However, there is no indication that he is selling any of the plants or seeds described in this book.

Note 2. This book is divided into two parts: (1) A description of different plants, listed alphabetically, and (2) a useful "Glossary of botanical and general horticultural terms and practices, with synopses of the natural orders, etc." Includes terms such as: Corolla, dicotyledons, papilionaceous, soil, and sowing. Peter Henderson lived 1822-1890. Written on the title page: "Author of *Gardening for Profit, Practical Floriculture, Gardening for Pleasure,* etc. etc." A description of each book is given on p. 412.

Also discusses: Sesamum. Bene Plant. *S. Orientale,* a native of the East Indies, "is the Bene Plant of our gardens, and of domestic medicine, being used with excellent results in severe cases of dysentery. It is now grown for that purpose in the vicinity of New York and other large cities... In the Southern States and in Africa this species was, and is yet to some extent, considerably grown for the oil the seed yields, which oil will keep many years without acquiring any rancid taste or smell. When first made it is quite heating, and is used as a stimulant; but after two or three years it becomes quite mild, and is used as a salad oil. The seeds are used by the negroes for food, which they prepare in various ways. In Japan, the oil is used as we use butter in cooking." Address: 35 Cortland St., New York.

culinary and forage qualities, and which grows in Japan, the Indies and in the Moluccas. They were planted from April 15 to May 15 and their culture was the same as for haricot beans. The dry plants (*Les fanes*) and the pods of the soybean (*du soja*) make good feed for sheep. In food value, the dry plant closely approaches that of clover. We strongly encourage our agriculturists to cultivate this legume, for they will have a double profit: the seeds which give an excellent dish and, at the same time, a good forage for the sheep. Address: Haute-Loire, France.

644. Phares, David Lewis. 1881. Farmer's book of grasses and other forage plants, for the southern United States. Starkville, Mississippi: Published by the author. J.C. Hill, printer. 148 p. See p. 19. 22 cm.

• ***Summary:*** "Glycine hispida Japan pea: This bean (it is not a pea) came under my observation some twenty-five years ago [i.e. in about 1856], as the Japan Pea. It was then cultivated to a limited extent for a few years; but ceased to attract attention till the close of our civil war; when it was again widely sold as the Southern Relief Pea. The catalogues name it Soja hispida. Though not a climber, it may be the Dolichos Soja, or Soy bean of China and Japan.

"In this country, this bean is probably not esteemed so highly as it should be either for the table or for forage. Few people bring it to the table more than once; for when prepared as other beans it is inedible and disgusting. But when the ripe seeds are soaked from twelve to twenty-four hours they may be cooked so as to afford a most delicious and nutritious dish. The soaking changes the shape of the bean from globose to oblong."

"This is probably the Sooja or Miso of Japan so much used in soups in that country. The soy or sauce made from these seeds is used three times a day, as salt with us, in nearly all dishes. The favorite Chinese curd-like dish, *Teu hu,* also is made of these beans."

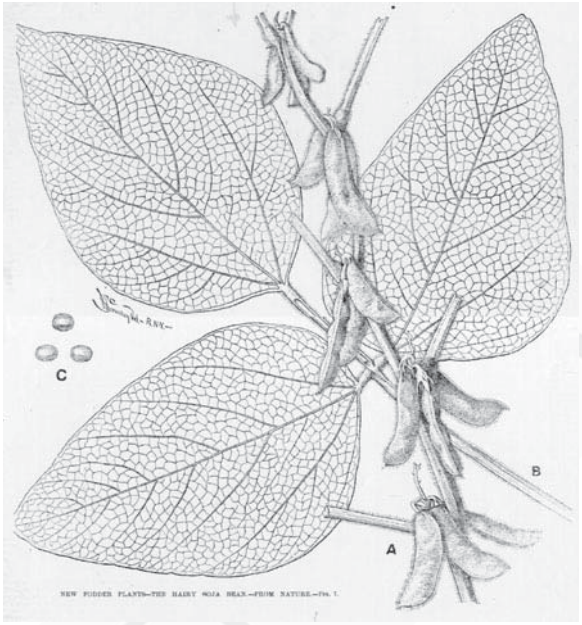
Phares lived 1817-1892. He resided in Mississippi in 1881, and says that he observed soybeans being cultivated in about 1856, but it is not clear that they were being cultivated in Mississippi, either in about 1856 or at the time this letter was written. Later documents (Riley 1909) prove that soybeans were grown in Mississippi as early as 1857.

Note 1. This is the earliest American document seen that uses the term "Glycine hispida" to refer to the soybean.

Note 2. This is the earliest document seen (April 2008) that mentions the soybean in connection with the U.S. Civil War. Address: A.M., M.D., Prof. of Biology, A&M College of Mississippi, Sanitary Commissioner for the State at large of Mississippi.

645. *Rural New-Yorker.* 1882. Notes from the experimental grounds of the Rural New-Yorker [The Hairy Soja Bean]. 41:9-10. Jan. 7.

• ***Summary:*** A large, excellent illustration (line



drawing, by W. Scranton of the *Rural New Yorker*) shows three leaves, several clumps of pods, 3 seeds, and the upper stems of soja bean plant.

"The Hairy Soja Bean ["Hairy" is based on the German term "rauhaarigen"], of which an original sketch is now presented,... was first brought to our notice by Professor Geo. H. Cook of the Rutgers Scientific School of New Brunswick, New Jersey... he says that when in Munich in 1878, he saw the Soja Bean in cultivation as a new crop, and probably a desirable addition to our forage products. It was seen in the grounds of the Bavarian Agricultural Experiment Station, and was in very vigorous growth. The gentleman in charge gave him a few seeds; and seeds of several other varieties of the same plant were procured at Vienna by Mr. James Neilson. Both planted them and gathered crops of the different kinds in 1879. The following is a translation of a part of a paper sent out from the Bavarian Experiment Station to those who were growing and testing the capabilities of the new plant: "Two years ago Professor Haberland [Haberlandt], of Vienna, an untiring botanical experimenter, introduced to us a plant whose pleasant-tasting seeds are rich in albumen and fat in very digestible forms. This plant is the Hairy Soja Bean (Soja hispida, Moench). Professor Haberland found samples of the seed at the Vienna Exposition among the agricultural products of China, Japan, Mongolia, Transcaucasia and India... Its seeds, boiled or roasted, have a pleasant taste, and form an almost daily part of the food in India, China and Japan."

Experiments were made in various parts of Bohemia, Moravia [both in the Czech Republic as of Jan. 1993], Southern Austria, Styria [the capital of Graf in today's Austria], Hungary and Upper Silesia in 1876. The next year 135 trials were made under various climatic influences from the well-ripened seeds from these crops. Professor

Schwackerhofer, of Vienna, has analyzed the original and the harvested seed, and the Soja straw.

The article then summarizes two articles on soybeans, one from *La Nature* in France (July 1881) and another from *Gardener's Chronicle* in London (18 Sept. 1880).

"Seeds of the Soja Bean were sent to us by Mr. James H. Gregory [seedsman] of Marblehead, Massachusetts, at our request, last winter." The Rural New-Yorker grew them, and concluded: "While the leaves and stems were quite green our cattle eat them with evident relish but the relish was less apparent as they ripened–and they were refused entirely after being cut and dried. From the above test we should never raise the Soja Bean as a fodder plant. Many kinds of the cow-pea, as may be seen from our reports in these columns during 1880, will yield five times the amount of vine and leaves."

646. Grisard, Jules. 1882. Extraits des procés-verbaux des séances de la société. Cinquième section. Séance du 31 Janvier 1882 [Excerpts of verbal proceedings from meetings of the society. Fifth section. Meeting of 31 Jan. 1882]. *Bulletin de la Societe d'Acclimatation* 29:311-14. Jan. [Fre]
• ***Summary:*** Mr. Paillieux, recently elected vice-president of the section, distributes to the members seeds of several vegetables, then gives information about each. There are four varieties of soybeans: "Soya. I spoke about this plant at great length last year. Today I will be brief. I know of only three varieties of soya that can be cultivated in the climate of Paris. I will say a few words about each of these.

"*Le Soya d'Étampes.* The Horticultural Society of Etampes received this variety some years ago from the Society for Acclimatization. Its culture as been succeeded perfectly. It is one of the numerous yellow-seeded varieties that exist in China and Japan. It does not mature early and, most of the time, its pods do not become sufficiently dry in the fields; they require drying in a barn. It is very productive and develops extraordinarily well. Therefore, when it is planted, it must be given more space than other varieties. It is of excellent quality and has been tasted more often than any other variety.

"The green soybean of Japan (*Le Soya vert du Japon*). This variety was introduced 4 years ago by Mr. Dedouvres, who cultivated it with success in Paris. Its chief merit is to produce seeds of a color that are preferred in cuisine.

"The yellow soybean of Hungary (*Soya jaune de Hongrie*). This is a Chinese variety cultivated on a large scale in Austria-Hungary and imported by MM. Vilmorin-Andrieux & Co. This variety (*Ce Soya*) matures earlier than Étampes, and ripens its seeds in the fields in 15 to 21 days less than Étampes. It is not as strong as the Étampes, less well developed, but it occupies less space. Since the yield of the Hungarian soybean is about 25% less than the yield of Étampes, you must plant it on 25% more land to get equal production."

"Today I will distribute to you seeds of the *Soya d'Étampes* and the green soybean of Japan. On March 7, I will distribute seeds of the early soybean of Hungary."

Mr. Paillieux also distributes seeds of *hadaka mugi* (naked barley), *pois de Géorgie* (Georgia peas) and *La courge de Siam* (the gourd of Siam–which is cultivated all over Spain).

Page 314 notes that Mr. Chappellier has grown his crops on a very dry terrain; the soybeans (*les Soya*) have not grown tall here. Mr. Paillieux remarks that if the soil does not possess a certain humidity conducive to prompt germination, the seeds do not give good results. Mr. Millet observes that the grains could be soaked in water. Mr. Paillieux responds that, for the soybean, this method has been employed in Germany, but it offers no advantages. Address: Secretary, France.

647. Penhallow, D.P. 1882. Meiso [Miso]. *Scientific American Supplement* 13(319):5091. Feb. 11.
• ***Summary:*** Originally published in *Kansas City Review of Science and Industry.* 1881 5(7):437-41. Nov. Address: Prof., late of the Imperial Agricultural College of Japan [Tokyo].

648. *Sun* (*The*) (*Baltimore, Maryland*). 1882. Letter from the Pacific Coast (Correspondence of the *Baltimore Sun*) (Letter to the editor). Feb. 13. p. 6.
• ***Summary:*** "San Francisco, Feb. 3, 1882. New plants from China and Japan are being added to the agriculture of California." When the seeds of two valuable trees were sent to California recently by the United States consul-general at Shanghai, these seeds were "distributed freely by the publishers of the *San Francisco Evening Bulletin."*

"Last year the *Bulletin* distributed the Soja beans of Japan, which grow luxuriantly, and which will supersede all other varieties of food for men and animals. For centuries these heavy podded beans have fed the millions of Eastern Asia, and they are now favorite food in Southern Europe. The plant grows shrubby here and three feet high. The pod never drops its beans on the field. No other leguminous plant bears beans of such tasteful, healthy and nutritious qualities, in which the straw participates largely as fattening food for cattle.

"Analysis finds in Soja beans 34½ per cent. of albuminous element and 18¼ per cent. of fat, while horse beans show only 25½ and 1½ per cent., respectively, and maize contains 10½ and 4½ per cent. only. As an alternative crop the Soja bean will prove a blessing and a restorative to the soil here and in all your Southern States, where we predict its speedy introduction."

Note 1. This is the earliest document seen (Oct. 2009) concerning the cultivation of soybeans in California. This document contains the earliest date seen for the cultivation of soybeans in California (1881 or before).

Note 2. Unfortunately, this letter is not signed. The

writer appears to be closely associated with the *San Francisco Evening Bulletin,* however he could be a special correspondent for the *Baltimore Sun.*

649. Kraevskii, -. ed. 1882. Peterburskago sobranii sel'skikh khoziaev: 16-go fevralia 1882 goda [St. Petersburg meeting of agriculturists: 16 Feb. 1882]. *Golos* (*"Voice"*) (*St. Petersburg, Russia; Newspaper*) No. 72. March 18. p. 5. [Rus]

• ***Summary:*** This full-page article begins: Head of the meeting: "Our colleague, K.A. Skachkov, who is well acquainted with China and its agriculture, will present his report about the soybean and its use in Chinese agriculture."

K.A. Skachkov: He notes the previous mention of soybeans by A.V. Sovetov. Soybeans are considered "new" only in Europe; they have existed for centuries in China and Japan, where they are well documented in monographs on soybeans. He discusses soybeans in northern China (methods of cultivation, climate, yield) and uses of soybeans in China and Japan such as soy sauce (*tsiap yu*), jiang (after processing soybeans to make jiang, which is fermented, the jiang is used to pickle the roots of vegetables which, being well salted, are eaten between meals and called *jiang-tsai*), soybean prices in Russia, and various types of tofu (*age-dofu, yaki-dofu,* etc.). He notes that in China soybeans are not sold in raw form (?), but can be obtained from factories.

After the talk, the head of the meeting asks if there are any questions or comments; various Russian participants (not only Skachkov) answer the questions. First, K.A. Skachkov comments on the preparation of tofu; the "60-day" soybean is best planted during the latter half of June in Russia.

E.I. Ragozin, asks: "What are the practical uses of the soybean for us [in Russia]? How can it be used in our agriculture? Can it be used only as feed for livestock or can it play a more important role? It is very interesting to discuss the theoretical possibilities of soybeans, but in my opinion it would be better to put them to use." A.V. Sovetov replies that, as he has discussed in a previous report, the soybean can be used as both livestock feed and human food. "It is of high nutritional value and contains twice as much nitrogen as meat, but only 18% fat. The answer to the question of how soybeans can be assimilated into Russian agriculture (and how successfully it can be bred here) lies in numerous experiments and trials of actually growing this plant here. Podoba has already proven that it can be grown in the far southern region of Russia (Tavricheskaia), as has Chernoglazov in the Poltavskaia region and Levanda in the Kiev region. However, I do not known how far north soybeans can be grown, although I have heard of trials in the Voronezhkaia region."

A.S. Ermolov: "My cultivation of soybeans in the Voronezhkaia region was not successful. I know that they are not acclimatized to withstand frost." Again A.V. Sovetov replies that soybeans can handle a light spring frost, but an early fall frost kills soybean plants just as it does pea plants. As Podoba reports, it can survive temperatures 2-3ºC below zero. Discusses successful times and temperatures for soybean cultivation.

A.S. Ermolov: "Nevertheless, the soybean plant is fairly easily acclimatized. I talked about this matter with Friedrich Haberlandt, who agrees with me. It is just a matter of obtaining the right varieties."

Head of the meeting: "I would like to add that with time and patience, plants can be gradually acclimatized to almost any environment." A.V. Sovetov, in agreement, adds: Cucumbers and pumpkins, which are warm-weather plants, have been acclimatized to the colder climates of northern Russia. Likewise with beans. E.I. Ragozin adds that he cultivates beans here in the St. Petersburg region.

A.S. Ermolov concludes that soybeans can be cultivated perfectly well in at least *southern* Russia. However, he still questions how soybeans can be used in Russia. None of the other agriculturists at this meeting have told the society how they use the soybeans they grow, so Ermolov suggests listening to the ideas Sovetov has and will present.

A.V. Sovetov: Soybeans can be used to make: Soybean broth, a substitute for beans or peas, soybean potato cakes, a mixture with rice or corn. Soybeans have a very high nutritional value. They can also be used as a feed for livestock, or as food for the army or navy.

Head of the meeting: Difficulties in cultivating this plant should not prevent us from trying.

E.I. Ragozin: Would it be possible for me to obtain and attempt to cultivate the 60-day bean plant? A.V. Sovetov: Of course, but this 60-day bean plant is not a soybean plant, so the previous statements may not apply to it. Head of meeting: Closing remarks.

650. *Bulletin de la Societe d'Acclimatation.* 1882. Extraits des procés-verbaux des séances de la société. Cinquième section. Séance du 7 Mars 1882 [Excerpts of verbal proceedings from meetings of the society. Fifth section. Meeting of 7 March 1882]. 29:376-82. March. [Fre]

• ***Summary:*** Mr. Paillieux distributes to the members who are present seeds of several vegetables, then gives information about each. "2. The Early Soybean of Hungary (*Soya hâtif de Hongrie*). Mr. Vavin observed, apropos of soya, that it is mistaken to name the Soya d'Étampes with this name since it is the Society for Acclimatization which originally supplied the seeds to the Society of Etampes.

"Mr. Paillieux recalled that a note on the usage of the soybean can be found in one of the Bulletins from last year [Feb. 1881, p. 158-60].

"The dishes which can be made from it are very widely consumed in China and Japan. Roasted, it can replace chicory in making coffee."

Mr. Paillieux also distributes seeds of Japanese broad beans (*Sora mame Musaraki* [*Murasaki? = purple*]*;* also

© Copyright Soyinfo Center 2014

called horse beans), and Japanese white melon (*Shiro uri*). Address: France.

651. D'Utra, Gustavo. 1882. Soja [Soya]. *Jornal do Agricultor* (*Brazil*) 4(7):185-88. Sept. 16. [Por]
• ***Summary:*** The name of this plant comes from the Japanese. The soybean was cultivated at the Bahia School of Agriculture in 1882. He notes that Soja and Daidsu are Japanese names, that the Japanese use soybeans to make a paste called miso, which can be used as a substitute for butter, and a sauce called sooia or soja, which can be used to season meat.

The Chinese also use the soybean (*a soja, Dolichos sinensis*), also known as the bean of the Indies (*feijao das Indias*) a food known as *kitjap* [soy sauce].

Sr. Dias da Silva Junior (the editor of this journal) has distributed soybean seeds free of charge.

Note 1. This is the earliest document seen (May 2009) concerning soybeans in Brazil or South America, or the cultivation of soybeans in Brazil or South America or Latin America. This document contains the earliest date seen for soybeans in Brazil or South America or Latin America, or the cultivation of soybeans in Brazil or South America or Latin America (1882). The source of these soybeans is unknown.

Note 2. This is the earliest Portuguese-language document seen (April 2012) that uses the word *sooia* or the word *soja* or the word *Kitjap* to refer to soy sauce. Address: Engenheiro-Agronomo, Rio de Janeiro, Brazil.

652. Mene, Édouard. 1882. Des productions végétales du Japon [The vegetable products of Japan]. *Bulletin de la Societe d'Acclimatation* 29:466-90. Sept. See p. 477-90. [40 soy ref. Fre]
• ***Summary:*** This excellent review of earlier publications and work, which is largely about the soybean, contains 40 references to earlier publications, many of them from the *Journal of the Society for Acclimatization* and from early European botanists. Much of the information is taken from earlier issues of this periodical and from the book *Le Japon a l'Exposition universelle de 1878.*

Contents: The soybean (*Soja hispida, O mame: Daizu,* p. 477). The wild soybean (Glycine hispida, Soja hispida, p. 477; it is found in the wild in the coastal regions of the island of Kyûshû. Called *Tsuru-mame* and *Nô-mame* by Franchet and Savatier. Soybeans in the catalog of the Japanese Universal Exposition of 1878: No. 24–The black soybean (*Kuro-mame*), No. 25–The white soybean (*Shiro-mame*), No. 26–The green soybean (*Ao-mame*), No. 37–The black soybean speckled with white (*Gankui-mame*). Where the soybean is cultivated: Not only on the island of Japan, but also in India, on the island of Ceylon, on the Malacca peninsula (i.e., Malay Peninsula), on the Philippine islands, in Borneo, Java, in the Kingdom of Siam, in Cochin China, at Tong-King [Tonkin, formerly in North Vietnam] and throughput China, but mainly in Mongolia and in the provinces of Honan, Shengking [Liaoning], Shantung, and Shansi.

Note 1. This is the earliest document seen (May 2010) concerning soybeans in Malaysia, or the cultivation of soybeans in Malaysia. This document contains the earliest date seen for soybeans in Malaysia, or the cultivation of soybeans in Malaysia (1882). The source of these soybeans is unknown.

Note 2. This is the earliest document seen (May 2010) concerning soybeans in the Philippines, or the cultivation of soybeans in the Philippines. This document contains the earliest date seen for soybeans in the Philippines, or the cultivation of soybeans in the Philippines (1882). The source of these soybeans is unknown.

Note 3. This is the earliest document seen (May 2010) concerning soybeans in Siam (renamed Thailand in 1938), or the cultivation of soybeans in Siam. This document contains the earliest date seen for soybeans in Siam, or the cultivation of soybeans in Siam (1882). The source of these soybeans is unknown.

Note 4. This is the 2nd earliest document seen (May 2010) concerning soybeans in Siam Vietnam, or the cultivation of soybeans in Vietnam. This document contains the 2nd earliest date seen for soybeans in Vietnam, or the cultivation of soybeans in Vietnam (1882). The source of these soybeans is unknown.

The Chinese exposition (class 73) contains samples of all the varieties of soya cultivated in the provinces of the empire: No. 2991 and 3000–Green, white, black, yellow, striped / streaked / variegated (*panachés*), and red soybeans. Source: Chinese customs at Newchwang. No. 3014-3016–Yellow, black, and green soybeans. Source: Customs at Tientsin [Tianjin]. No. 3058 to 3061–Yellow, green and black soybeans., from the customs at Chefoo [Yantai]. No. 3091. Yellow soybeans, from the customs at Chinkiang [Zhenjiang]. No. 3103 to 3109–White, red, black, and yellow soybeans from the customs at Shanghai. No. 2135 to 3128–White, black, red, and green soybeans from the customs at Wenchow [Wenzhou]. No. 3152 to 3156–White, green, and black soybeans from the customs at Takow [Kao-Hsiung].

At the Japanese exposition (class 74, condiments and stimulants) are samples of miso and shoyu from Tokyo and the province of Hizen, especially the town of Nagasaki.

The Chinese exposition also contains in class 74 (condiments and stimulants) samples of soy sauce [*soye, soya*] called *Tsiang-yeou* from the Chinese customs at Chefoo, Ning-po, Wenchow, and Canton. The Chinese often add aroma in the form of star anise, green anise, and orange rind. Chinese soy sauce is made with yellow soybeans called *Houang-téou.*

Descriptions of how to make shoyu, miso, tofu, and soybean oil based on earlier European publications (p. 479-83).

© Copyright Soyinfo Center 2014

In France, Mr. Vilmorin and Dr. Adrien Sicard (of Marseilles), both of whom are involved with soybean cultivation, have prepared soy cheese (*fromage de Soja*) numerous times. Dr. Sicard has made both the white cheese and the red cheese; the latter is rolled in a powder made by grinding red sandalwood (*santal; Pterocarpus santalinus*), mace, and cinnamon (p. 482).

In China, quite a few soy oil factories are found at Calfond in Henan, at Tsinan in Shantung, and at Tayeurn in Shanxi. But the center of soy oil production in China is Ning-po in Zhejiang / Chekiang. From the port of Ning-po and from a port on the island of *Tcheou-chan* [*Zhoushan?*] a large number of junks, carrying only soy oil, depart. Two other manufacturing centers are Newchwang and Chefoo (p. 483).

There follows a long section on the introduction and acclimatization of the soybean in Europe (p. 484-89) based on earlier European documents.

The next section, about kudzu (*Pueraria Thunbergiana,* p. 489-90) cites 9 early references, including *Le Japon a l'Exposition universelle de 1878,* vol. II, p. 153). Address: France.

653. *Southland Times* (*Otago, New Zealand*)**.** 1882. Diet of the Japanese. Oct. 6. p. 4.
• ***Summary:*** From: *Phrenological Journal:* This is a summary of an 1879 article by Prof. Edward Kinch, of the Tokio University. "Few natives, except officers in the capital, sailors and soldiers eat beef. Mutton and pork beyond the treaty ports are hardly yet known. About two hundred varieties if fish are eaten, one-half of the people eating fish every day. The food of the masses is 'ninety per cent. vegetable.'"

"The Soybean, which in chemical composition closely approaches animal fibre [sic, flesh], is extensively cultivated. Probably no country excels Japan in the variety of leguminous plants raised for food."

654. Giliaranskii, V.P. 1882. Monografiya Kitaiskago maslichnago gorokha "Soja hispida" [Monograph on Chinese oil-bearing pea plant *Soja hispida*]**.** *Trudy Imperatorskago Vol'nago Ekonomicheskago Obshchestva, St. Petersburg* (*Transactions of the Imperial Free Economic Society*) 3(3):269-71. Nov.; 3(4):435-50. Dec. [10 ref. Rus]
• ***Summary:*** Part I (Nov.): Soybeans were introduced to Russia to increase the country's food production. Discusses the nutritional value of soybeans. Haberlandt introduced the cultivation of soybeans to Europe, and his trials proved that soybeans could be successfully grown in various European countries. However Podoba was the first who practically / experimentally proved the success of soybean in Europe. Podoba also installed a laboratory partner named Fein in southern Russia. The first popularizer was A.V. Sovetov, who initiated further projects and data collection.

Giliaranskii began his work in 1881 when he received 5 soybean seeds from his director, Nikolai Pavlovich Ill'inu, who also allowed Giliaranskii to use his equipment and laboratory. In 1880 the Asian Department of Foreign Ministry (of Russia) obtained soybean samples by demand. In the same year, crop information about soybeans was received from the Consulate.

In the text, Giliaranskii then cites five documents that were helpful to him in compiling this article: (1) Organov, N. 1881. *Soia ili maslichnyi gorokh* (*Soja hispida* *) [Soybean or oil-bearing plant (Soja hispida *)]. *Trudy Imperatorskago Vol'nago Ekonomicheskago Obshchestva, St. Petersburg* (Scholarly Works of the Imperial Free Economical Society 1(2):184-198. Feb.; 1(3):304-325. March). (2) The publications of Dr. Bretschneider, who was on a mission to Peking. (3) La Planta Soja hispida, by Geerts, a report from a mission to Japan. Chapters 3 and 4 from Part 1; Chapters 4 and 5 from Part 2 (translation from French), including much information about soy sauce and miso. (4) The famous book: Haberlandt, Friedrich. 1878. *Die Sojabohne: Ergebnisse der Studien und Versuche ueber die Anbauwuerdigkeit dieser neu einzufuehrenden Culturpflanze* [The soybean: Results of studies and trials on the potential for growing this newly introduced crop plant]. Vienna, Austria-Hungary: Carl Gerold's Sohn. ii + 119 p. (5) *Oesterreichische Monatsschrift für den Orient* (Vienna). 1881. *Die japanische Sojabohne als Nahrungsmittel* [The Japanese soybean as a source of food]. 7(12):204-05. Dec. 15.

Part II (Dec.): Chapter 1. Oil of soybean seeds (*Maslo semian soi*)**.** Bretschneider discusses the taste and use of soybeans in Russia. Karl Brendt is mentioned again. Giliaranskii states: "My yield included 40 *zolotnik* (1 *zolotnik* = 4.26 gm) of oil, produced from the variety of seeds received from Mr. Podoba. The oil was extracted using sulfuric ether. I had about 4 lb of soybeans, which I ground in a coffee mill. Then I immersed the flour in ether in a test tube for 4-5 days. Almost all of the oil was extracted. I also extracted the oil using carbon bisulphide, but the yield was 1.5% less than with sulfuric ether.

"I also tried to extract the oil using petroleum ether, but again the yield was unsatisfactory. In addition, the petroleum ether dissociates from the soybean oil, thus changing the latter's smell and taste. The product known as *rigolen,* which has a boiling point of 35ºC, would be the best solvent of all, it is impossible to obtain in St. Petersburg.

"The oil I extracted using sulfuric ether had a clear, heavy yellow color, similar to olive oil in color and viscosity... however as time passes, under certain conditions, it becomes black in color." Through his experiments, Giliaranskii proved that soybean oil contains nitrogen. Sato and his experiments are mentioned (p. 436-37).

A table (p. 437-38) gives the percentage composition of soybean cake (water, protein, fat, nitrogen-free extract, cellulose, ash), with two columns based on the research

© Copyright Soyinfo Center 2014

of Völcker (1872) and J. Küehn (see Pott 1889, p. 490). Soybean oil cakes, known in English as "bean-cakes," are an important export from the port of Newchwang to southern China, especially to Syamou (?). Discusses the price of soybeans.

Chapter 2. Uses of soy sauce (in China, as well as Europe). Methods of preparing soy sauce are described in numerous Chinese and Japanese publications, but also in European publications such as: (1) *Etude pratique du commerce d'exportation de la Chine,* by N. Rondot (1848, Renard, p. 188). (2) *Chinese Commercial Guide,* by W. Williams (1863, Hong Kong, p. 139). (3) Newspaper article by K.A. Skachkov in *Golos* [Voice] (No. 72, 1882). The main ingredients used in making soy sauce are yellow soybeans (*Soja hispida,* Shiro-daizu or Teppo-mamé or Shoyu-mamé), wheat koji, salt, and water. A detailed description of the process is given. Amazake is sometimes added to soy sauce to give variation in the flavor. Kinch's analysis of Geerts' data (p. 443) gives the relative density of soy sauce as 1.199. The density of soy sauce solids is 359.88 gm/liter. A table (p. 443) gives the density (in gm/liter) of soy sauce constituents as follows: Ash 195.16. Sugars 31.03. Albumen 41.00. Acids 6.20.

Chapter 3. Sauce *miso* or *dai-dzu-ko.* Describes seven different types of Japanese miso and how each is made: 1. Original miso or *shiro miso*–white with little salt. 2. *Chu-miso*–very salty. 3. *Aka-miso*–red, prepared with koji. 4. *Nagoya-miso.* 5. *Kinzanji-miso*–made with soybeans, eggplant and gingerroot. 6. *Mugi-miso*–made with barley and soybeans. 7. *Kogane-miso*–a type of *aka-miso.* A table (p. 445) compares the nutritional composition of *shiro-miso* and *aka-miso.*

Chapter 4. Tofu. Chinese name: doufu. English name: bean-curd. Japanese name: tofu. Yellow soybean varieties (*Gogwatsu-mamé, Wase-mamé,* and *Natsu-mamé*) are widely used in Japan to make tofu. A table (p. 447-48) gives the percentage composition of tofu, with two columns based on the research of Kinch (1880) and Geerts (1876). Tofu is seen as an excellent alternative for dairy cheeses.

Chapter 5. Preparation and composition of dried-frozen tofu (kori-tofu) and other types of tofu (dried cheeses). A table gives the nutritional composition of kori-tofu (based on Kinch 1880). Also discusses *agé-tofu, abura-tofu,* and yuba. Describes the method for preparing yuba, which is eaten in soups in Japan. Several tables were summarized by Nikitin in Russian (1900) and German (1901).

Note: This is the earliest Russian-language document seen (Oct. 2012) that mentions yuba. Address: USSR.

655. Kinch, Edward. 1882. Die Sojabohne [The soybean]. *Biedermann's Central-Blatt fuer Agrikulturchemie* 11:753-55. Nov. [Ger]

• ***Summary:*** According to Watt (1890, p. 511): "In 1882, Professor Kinch urged the advisability of renewed efforts [to grow soya] in the Himalayan tracts, and, as a consequence, the government of India directed the attention of local officials to the subject. Seed obtained from the Government Gardens, Saharanpur, were distributed to Madras, the Panjab, Bengal, Bombay, Hyderabad, and Burma, for experimental cultivation. It appears to have been grown from seed obtained from China with a fair amount of success at the Saidapet Experimental Farm in 1882."

"The chemical composition of the bean, according to Professor Kinch, places it above all other pulses as an albuminous food, while that of the straw also surpasses in nitrogen value that of wheat, lentils, and even hay."

Table 1 gives original analyses of the nutritional composition of various soybeans, including: from Japan, pale/colorless from China, yellow from Germany, from India, brown, round black, and oblong black soybeans.

"The average composition of the straw, the pods, and of a type of soybean straw from Japan, which are used as very tasty feeds for horses, cows, and sheep" are given in table 2.

Table 3 gives the nutritional analyses of various soybean products: White miso, red miso, Tofu or *Bohnenkäse,* frozen tofu (*gefrorener Bohnenkäse*), and soybean cake (*Sojabohnenkuchen*) which remains after pressing out the oil (*Abpressen des Oels*).

Table 4 shows the percentage composition of nine different mineral salts in the ash of soybean seeds and straw.

Note 1. This may be the 2nd earliest document seen (May. 2010) concerning soybeans in Burma. It seems likely that soybeans were cultivated in Burma at that time, but that is not certain. This document may contain the 2nd earliest date seen for soybeans in Burma (1882).

Note 2. This may be the second earliest document seen (Oct. 2010) concerning soybeans in Pakistan, however that is not certain. The nation of Pakistan was created out of British India in 1947. In 1882 Panjab (Punjab) was a province in British India. It was divided in Aug. 1947 into East Punjab, India (with about 1/3 the area and ½ the population of the original province), and West Punjab, Pakistan. West Punjab was renamed simply Punjab and is now one of Pakistan's four provinces; its capital is Lahore.

Note 3. This is the earliest German-language document seen (April 2013) that mentions dried-frozen tofu, which it calls "gefrorener Bohnenkäse." Address: Professor, Cirencester, England.

656. Paillieux, Auguste. 1882. Yaye nari.–*Phaseolus radiatus* L. [Azuki bean, or Yaye nari]. *Bulletin de la Societe d'Acclimatation* 29:641. Nov. [Fre]

• ***Summary:*** Mr. Paillieux, vice-president of the Society, is presiding at the meeting on 6 June 1882. He offers the members present the seeds of various edible plants, about which he gives the following information: "The Yaye nari belongs to a race of beans which are very esteemed in Japan and which bear the name Azuki, *Phaseolus radiatus* of

© Copyright Soyinfo Center 2014

Linnaeus. The varieties of Azuki are numerous. I cultivate the summer (*Natsu*) azuki, which is early and red. I have given up on the autumn (*Aki*) azuki, which is late. This spring, for the first time, I planted the white (*Shiro*) azuki.

To these names one must add those cited by the Japanese author of *Japan at the Universal Exposition of 1878,* that is to say the Hine [Hime] no azuki, Dai nagon [Dainagon] azuki, and the Yaye nari. *An,* a sweetened bean paste widely employed in confectionery, is made with the azuki and sugar, The cake or confection named *yokan,* according to several authors, is also made with the azuki. Azuki flour is also used to remove fat or grease from fabrics.

"I have eaten a puree of summer azuki and I found it very delicious. It does not have a flavor like our Haricot beans, but more like a mixture of Haricots and lentils.

"I received from my helpful correspondent a sweetened dish named *yokan,* and I had some prepared for me by Mr. Mamoz. It is rather tasty, and it could be a popular confectionery product if it could be sold at a low price, however sugar is very expensive in France.

"I have not yet tasted the Yaye nari, of which I present some seeds to you today. Last year I planted only a few bunches, but the importance of its culture in Japan and China is without doubt. Seeds have been sent to M. Vilmorin Andrieux and Co., and to Mr. Faivre, of Beaune. It seems to mature earlier than the summer azuki. I believe therefore that it is now time to plant the seeds I am offering to you. I would be very grateful if you would let me know next year what results you obtained.

"I would like to take this occasion to say several words about an operation that is very widely used in Japan and in China. I believe it is applied to both the soybean and to the azuki.

"Be that as it may, in Japan, the azuki is soaked in water and then allowed to sprout (*fait germer*), in a warm dark place, in earthenware vessels. Then they are washed with a large quantity of water to remove the seed coats, and [the sprouts] are consumed under the name of Moyashi ("eye and legs"). It goes without saying that one cooks them first in salted water and then in shoyu. They are rather tasty, and this is an easy way to provide a fresh vegetable in winter.

"I am indebted for this information to Dr. Hénon, Abbot David and Abbot Perny, and of course Mr. Eugène Simon; they have told me that the etiolation of germinating seeds is widely practiced in China and yields a good food." Address: France.

657. Mason, Francis. 1882-1883. Burma, its people and productions: or, Notes on the fauna, flora, and minerals of Tenasserim, Pegu, and Burma. 2 vols. Rewritten and enlarged by W. Theobald. Hertford, England: Published by order of the Chief Commissioner of British Burma, by S. Austin & Sons. 19 cm.

• ***Summary:*** The previous edition of this work was published in 1860. This edition is greatly enlarged and expanded. In Volume II (published in 1883), on page 513, in the section on Leguminosae, under *Glycine* we read that *Glycine soja* is cultivated in Ava. "Erect. Flowers in small axillary clusters. Pods 1-1½ in. long, almost falcate. Seeds 3 lines long, slightly compressed, pale-coloured.

"The word 'soja' is a variation of the Japanese 'soya,' whence our word 'Soy,' for a sauce prepared in China and Japan from the seeds of one or more species of *Dolichos* or allied genera."

Note 1. Pickering (1879, p. 763) states: "Westward, S. hispida was observed by Mason in Burmah."

Note 2. This is the earliest document seen (May 2010) that clearly refers to soybeans in Burma or the cultivation of soybeans in Burma. This document contains the earliest clear date seen for soybeans in Burma or for the cultivation of soybeans in Burma (1883). The source of these soybeans is unknown.

Note 3. Ava is a ruined city on the Irrawaddy River, in Sagaing division, 6 miles southwest of Mandalay. Founded in the 14th century, it was the capital of Burma for 400 years. In 1783 it was replaced by Amarapura, but was again the capital from 1823 to 1837.

Ground nuts (*Arachis hypogæa*) [peanuts] are mentioned under "Order Leguminosae" (p. 491). The Burmese name is given as Mye-leh. "Indigenous to South America, but cultivated all over the East for its edible kernels and the oil extracted from them, which is excellent" (p. 500). In the index of vernacular names of Burmese plants, the name of the peanut is given as "Myeh-peh" (p. 713). Address: Rev. D.D., M.R.A.S.

658. Bretschneider, Emil V. 1882. Botanicon sinicum. Notes on Chinese botany from native and Western sources. I. *J. of the Royal Asiatic Society, North China Branch. Series 2.* 16:18-230. For the year 1881. [1882* ref. Eng]

• ***Summary:*** The single most important early work on Chinese botany written by a Westerner. Bretschneider, an M.D., lived 1833-1901. Contents: Preliminary Notices (p. 18-22). 1. Contribution towards a history of the development of botanical knowledge among eastern Asiatic nations: Chinese literature on materia medica and botany (p. 22-75, incl. the Materia Medica of Shen Nung, p. 26-32), Chinese works on agriculture (p. 75-86). Chinese geographical works containing botanical information (p. 86-92). Early acquaintance of the Chinese with Indian and Western Asiatic plants (p. 92-95). History of materia medica and botany in Japan (p. 96-101). On the botanical knowledge of Coreans [Koreans], Manchoos [Manchus], Mongols, and Tibetans (p. 101-05).

2. On the scientific determination of the plants mentioned in Chinese books (p. 105+, incl. Cleyer, Siebold, and Kaempfer, p. 124-27). 3. Alphabetical list of Chinese works (p. 131-216). Index of Chinese authors (p. 217-22).

© Copyright Soyinfo Center 2014

Celebrated mountains of China (p. 223-28).

Concerning Shen nung, "Chinese works on agriculture" (p. 75) states: "The primeval Emperor *Shen nung,* whom the Chinese believe to have composed the first treatise on Materia medica, is also credited with having laid the foundation of Chinese Husbandry. His name implies this tradition, for Shen nung means: the Divine Husbandman. It is related in the early records that the people of his age were rude and wholly unacquainted with the advantages of agriculture. They subsisted on fruit, vegetables, and the flesh of birds and beasts. Shen nung examined first the quality of the soil, fashioned timber into ploughs and taught the people how to till the ground and raise grain. On a previous page I referred to the mountain in Shan si, where tradition makes him first teach his people the fundamental processes of agriculture. Sz' ma Ts'ien [Ssu-ma Ch'ien] (B.C. 163-85) records in the *Shi ki* [*Shih chi; Historical records*] (book 1) that Shen nung sowed the five kinds [of cereals]."

In the section on the work of early Europeans who studied the flora of East Asia, the following researchers are discussed in detail: Cleyer (p. 124), Kaempfer (p. 125-26), Thunberg (p. 126), Siebold (p. 126-27), Miquel and Zuccarini (p. 127), Hoffman and Schultes (p. 127-28), Dan. Hanbury (p. 128), O. Debeaux (p. 128), Dr. Fr. Porter Smith (p. 128-29), and P. Perny (p. 130; very critical). Address: China.

659. Bretschneider, Emil V. 1882. Botanicon sinicum. Notes on Chinese botany from native and Western sources. I. Andreas Cleyer and Engelberth [Englebert] Kaempfer (Document part). *J. of the Royal Asiatic Society, North China Branch. Series 2.* 16:18-230. For the year 1881. See p. 125-26. [1 ref. Eng]

• ***Summary:*** "The first attempt of a European to study the Flora of Japan was made by Andreas Cleyer, a German, who visited Yeddo in 1683 as envoy of the Dutch East-India Company, and who resided in Nagasaki as chief supercargo [in charge of the commercial concerns] of the Dutch factory till 1686. His letters on Japanese plants addressed to Dr. Mentzel have been published in the *Academiæ naturæ curiosorum Ephemerides,* 1686-1700. Cleyer's descriptions as well as the drawings appended have little value."

In the Royal Library at Berlin Bretschneider saw Cleyer's drawings as well as "another volume entitled *Cleyer's Flora Japonica,* containing only 101 coloured drawings of Japanese plants, apparently painted from nature in Japan by Cleyer's order. These have more claim to botanical correctness. Cleyer has himself added some memoranda. The names are given in Japanese letters only. This volume was referred to Dr. Siebold, who in 1856 drew up an Index of the drawings and added the scientific botanical names.

Note: Cleyer's diary was published in German in 1985 under the title *Tagebuch des Kontors zu Nagasaki auf der Insel Deshima, 20 Oktober 1682–5 November 1683,* edited by Eva. S. Kraft.

"A few years after Cleyer had left Japan, another German, an able explorer and botanist, arrived in that country and spent about two years there. Engelberth [Englebert] Kaempfer was born in 1651 at Lemgo (Lippe-Detmold). In 1683 he accompanied a Swedish Embassy to Persia as secretary, but on its return he separated from it and proceeded to the Persian Gulf, where a Dutch fleet was stationed at that time. In 1685 he entered the service of the Dutch East-India Company as a surgeon, and arrived at Batavia [later renamed Jakarta, Indonesia] in 1689. In the following year a Dutch squadron was sent out to Siam and Japan, and Kaempfer was of the party. On the 22nd September 1690 he reached Nagasaki. He had two opportunities of visiting Yeddo, performing the journey thither partly by the overland road, partly by sea. His first stay in Yeddo lasted from March 13 to April 5, 1691; the second from March 31 to April 29, 1692. He left Japan in the same year, returned to Europe in 1694, and died in 1716 in his native country. For further biographical details regarding Kaempfer see Rosny's "Variétés orientales," 1872, p. 98, where an interesting account of his life and scientific works is found. Kaempfer was not only a skillful botanist, but an acute observer in general. He has connected his name imperishably with the history of botanical discoveries in Japan, and the accounts he noted down with respect to the Japanese Empire and other countries he visited will always stand as a model of accurate and judicious information and keen observation. In 1712 he brought out his *Amoenitates Exocticae.* The second fasciculus [fascicle] (p. 466) contains an account of the plants from which paper is manufactured in Japan; in the third fasciculus (p. 605) a treatise on the Tea-shrub is found. Besides this the whole of the fifth fasciculus (p. 707-912) is devoted to the description of more than 500 species of Japanese plants, 31 of which are represented by excellent drawings. The Japanese names of the plants are always given, and Chinese names in Chinese characters are generally added. Although these characters are often wrongly or indistinctly printed, there is no difficulty in deciphering them. Kaempfer's botanical descriptions are generally faithful, in some instances much detailed.

"The Amoenitates Exoticae represents only a small portion of Kaempfer's labours. After his death all his unpublished manuscripts as well as his herbarium, namely the plants collected in Japan and his drawings of Japanese plants, were purchased by Hans Sloane, the well-known collector and promoter of science, whose immense collection subsequently gave origin to the British Museum. In 1727 Kaempfer's valuable *History of Japan,* etc. was published in English, translated from his original (Dutch) manuscript. In 1791 Sir J. Banks edited a volume with the title: *Icones selector plantarum quas in Japonia collegit et delineavit E. Kaempfer, ex archtyp, in Museo Britannico asservatis.* It

© Copyright Soyinfo Center 2014

contains 50 plates." Address: China.

660. Bretschneider, Emil V. 1882. Botanicon sinicum. Notes on Chinese botany from native and Western sources. I. C.P. Thunberg (Document part). *J. of the Royal Asiatic Society, North China Branch. Series 2.* 16:18-230. For the year 1881. See p. 126. [1 ref. Eng]
• ***Summary:*** After describing the pioneering botanical work of Englebert Kaempfer in Japan, Bretschneider continues: "After Kaempfer the first botanist to visit Japan was C.P. Thunberg, a Swede, born in 1743, died in 1822. He landed at Nagasaki in 1775, and on the 4th of March of 1776 proceeded by the overland route to Yeddo, where he arrived on the 30th of June. As the fruit of the botanical collections made during his stay in Japan he published in 1784 his *Flora japonica,* 50 plates. I have seen in St. Petersburg [Russia] another unpublished volume of drawings representing Japanese plants, executed from nature by order of Thunberg. As a scientific botanical nomenclature did not exist at the time when Kaempfer wrote, Thunberg tried to name those Japanese plants described in the Amoenitates exoticae, which had not been previously determined and named by Linæus, and to identify the native names mentioned by Kaempfer." Address: China.

661. Bretschneider, Emil V. 1882. Botanicon sinicum. Notes on Chinese botany from native and Western sources. I. Philipp Franz von Siebold (Document part). *J. of the Royal Asiatic Society, North China Branch. Series 2.* 16:18-230. For the year 1881. See p. 126-27. [1 ref. Eng]
• ***Summary:*** After describing the pioneering botanical work of Englebert Kaempfer and C.P. Thunberg in Japan, Bretschneider continues: "Much more was done in this respect by Dr. Siebold, the well-known and ardent explorer of Japan.–Ph. Fr. v. Siebold, a German, was born in 1796 in Wuerzburg. After having studied medicine and natural sciences he went to Holland, and entering the service of the Dutch East-India Company, set out for Batavia, where he arrived in 1822. The next year he was sent as a physician and naturalist to Japan. He lived several years in the Dutch Factory at Decima [Deshima] (Nagasaki). In 1826 he had an opportunity of visiting Yeddo [Edo, today's Tokyo]. As the Japanese government suspected him of being in possession of a map of Japan, he was obliged to leave the country in 1830, and returned to Europe, where he employed himself for several years in publishing the results of his researches in Japan. In 1859 he went again to that country, where he lived till 1862. He died at Munich in 1866.

"Siebold had forwarded one portion of his vast botanical collections accumulated in Japan to Prof. C.L. Blume in Java, who described some of these plants in the *Museum botanicum Lugduno-Batavorum,* 1849-51. H. Zollinger published a few years later an Index of Siebold's plants in the Java Herbarium (Buitenzorg). The greater part of his dried plants, however, had been transmitted by Siebold to the Museum of Leyden, and from these materials Prof. Miquel compiled his *Prolusio Florae japonicae* [*Prolusio florae Iaponicae*], 1865-67.

"Siebold himself, with the assistance of Prof. J.G. Zuccarini of Munich, had commenced much earlier to describe his Japanese botanical collections, but their publications were left in a fragmentary state. The most interesting of them is the *Flora japonica,* sive plantæ quas in Imperio Japonico collegit, descripsit, ex parte in ipsis locis pingendas curavit Dr. Ph. Fr. de Siebold, digessit Dr. Zuccarini, 1835-1844, 127 plates. Miquel attempted to continue this iconographical work and published, from 1868-1870, 23 additional plates.* The original drawings to which Siebold alludes on the title pages (about 600) have been purchased, together with a set of Siebold's dried Japanese plants, from his widow, by the Academy of St. Petersburg [Russia]. The drawings form eight large volumes and are beautifully executed.

"Siebold always tried to ascertain the Japanese names of the plants he gathered, and also noted down the Chinese characters applied in Japan to these plants. He was assisted in this task by native botanists, and we can, I think, assume that his identifications are quite reliable."

Footnote: *"I know only the 127 plates published by Siebold and Zuccarini. Franchet and Savatier, *Enum. plant. Japon.* [*Enumeratio Plantarum in Japonia sponte crescentium...*], Pref. XIII, state that in all 175 of these plates have been published, but in the second vol. p. 665 that authors assign to Flora japonica 150 plates only." Address: China.

662. Bretschneider, Emil V. 1882. Botanicon sinicum. Notes on Chinese botany from native and Western sources [Part I]. London: Trübner & Co. 228 p. No index. 28 cm. [1882* ref. Eng]
• ***Summary:*** The contents of this book was first published in 1882 as an article in the *Journal of the Royal Asiatic Society, North China Branch.* (Vol. XVI, 1881; Article III). Series 2. The contents and pagination of this book is the same as the original article (which see). Address: M.D., Physician of the Russian Legation at Peking, China.

663. Greey, Edward. 1882. Young Americans in Japan: or, The adventures of the Jewett family and their friend Oto Nambo. Boston, Massachusetts: Lee and Shepard Publishers. xiii + 372 p. See p. 49. Illust.
• ***Summary:*** Chapter 3, titled "Nagasaki by night" states (p. 49): "After a brief delay, a number of servants entered, bearing *zen* (low tables) filled with dishes of food, which they set before each of the party. When the covers were removed the attendants retired, and, the Professor having asked a blessing, Oto said, -

"'You will find this bean-soup [miso soup] nice; the

© Copyright Soyinfo Center 2014

lumps in it are pieces of fish. That clear white food is raw carp; it is very good. The boiled fish is also excellent. The vegetables are potatoes, turnips, and mushrooms.'"

In Chapter 20, "Japanese New Year's festivities" we read (p. 358-59): "'My gracious! What is this about?' cried Sallie, pointing to a kakemono representing a man throwing something at two hideous demons, while in the background Dai-koku and Yebisu [Ebisu] were enjoying a bowl of hot *saké.*

"'Ah!' exclaimed the old gentleman. 'That is a picture of a ceremony we call *Oniwa soto* (expelling the demons). You must know that to-day is termed *Toshi koshi* (passing away of the year). I performed a similar ceremony this evening, just before you arrived.'

"'Please, tell us all about it,' said Sallie.

"Mr. Nambo smiled and continued, -

"'I roasted some [soy] beans, mixed them with some broken charcoal, brick and potsherd, and put the mixture in a rice *masu* (two-quart measure [square wooden measuring box]), then I dressed myself in my old ceremonial robes, took a *sambo* in my left hand, placed the *masu* on it and bade my youngest male servant follow me with a broom. We first entered my sleeping-room and closed the door to within an inch or so, then I threw a handful of the broken stuff to the ceiling and cried, *'Fukuwa uchi oniwa soto.'* (Good fortune come in, bad go out)."

"'What jolly fun!' exclaimed Fitz. 'Well?'

"'The ceremony is not a joke,' gently observed Mrs. Nambo."

"'After I had made the adjuration, my servant shouted: *'Gomotomu osaye mashu'* (You are quite right). Saying which, he slapped his broom on the floor as though driving out the demons. When I had cried and he answered me thrice, we retired to the next room, carefully closing the door of my chamber behind us. We visited each apartment and repeated the ceremony, then I threw what remained in the *masu* at the demons who were skulking about the veranda.'"

Note: The author was a member of the first American expedition to Japan; he later landed and traveled in Japan. "This book describes the adventures of an American family and a young Japanese who has been educated in the States. They land at Nagasaki,..." and travel to Tokio. "The story, though essentially a work of fiction, is founded on facts that have come under my personal observation,..." The book contains 171 illustrations. Address: Author, Manchester-by-the-Sea, Massachusetts.

Beibaku daizu tabako natane sanrin kyôshinkai hôkoku [A report of the united association of promoting rice, barley, soybean, tobacco, rapeseed, and forest products]. Tokyo: Nômu-kyoku. 151 p. 21 cm. [Jap]
Address: Japan.

665. Spon, Edward N.; Spon, Francis N. 1882. Spons' encyclopaedia of the industrial arts, manufactures, and commercial products. Vol. 4: Bean-oil. London and New York: E. & F.N. Spon. p. 1153-1536. See p. 1378. Edited by Charles G. Warnford Lock.

• ***Summary:*** The section titled "Oils and fatty substances" begins (p. 1360) by noting that in everyday language the word "oil" is often "made to embrace three distinct classes of bodies:–(a) 'fixed' or 'fatty' oils, (b) 'volatile' and 'essential' oils, and (c) 'petroleum' and other 'mineral' oils... The term 'fat' is applied to these oils when they are in a solid state; thus the same product may be an 'oil' in one climate, and a 'fat' in another."

In the section on "Vegetable oils and fats [A. Fatty or fixed]" we read (p. 1377-78): "Bean oil.–The seeds of the Chinese oil-bean, the *sooja* or *miso* of the Japanese (*Glycine Soja* [*Soja hispida*]) afford 17-18 per cent. of a fatty oil. The plant is shrubby, attaining a height of 3-4 ft., and resembling the common dwarf kidney or French bean. The seeds are somewhat smaller than French beans, and vary in colour, from white to yellow and green. The plant is chiefly cultivated in the north of China, especially in the province of Shantung. The Chinese usually obtain 17 per cent. of oil from the seeds by simple pressure. The oil bears a general analogy to the ordinary edible oils of commerce, possessing an agreeable flavour and odour. It is useful for burning; exposed to a low temperature it becomes pasty, and oxidizes rapidly on exposure to the air. As a drying oil, it might replace linseed for some purposes. As an illuminator, it is being rapidly replaced by American petroleum, but is still extensively used for food. The oil, the cake left after expression of the oil, and the beans themselves, are important articles of Chinese commerce.

"The exports from Chefoo in 1878 were 2468½ *piculs* (of 133.3 lb each) of bean-oil, 994,188 of bean-cake, and 160,549 1/3 of beans; in 1870, the exports of the oil from this port were 44,530 *piculs;* in 1877 only 327 *piculs;* and in 1879, 1491 *piculs.* The exports of bean-oil from Newchwang were 4947 *piculs* in 1877, 3287¼ in 1878, and 11,630 in 1879; of beans, in the same years, 1,439,062, 2,156,064, and 1,835,444 *piculs* respectively; and of bean-cake, 792,166, 1,924,968, and 1,800,523 *piculs.* Chinkiang exported 69,090 *piculs* of beans in 1877, and 43,784 in 1879. Hankow imported 21,077 3/4 *piculs* of native bean-oil, value 15,624*l.* [British pounds sterling], in 1879. Kiukiang, in 1879, imported 17,675 *piculs.* Shanghai, in 1879, imported 282¼ *piculs* from native ports, and exported 33,940 *piculs* (besides 372 re-exports) to native ports. Wuhu imports quantities of the oil from Hohan, via Hankow, also from Hochow, Luchowfu, and some other places north of the [Yangtze] river; the figures were, 659½ *piculs* in 1877, 13,574¼ in 1878, and 5284 in 1879. The cake is used for human and cattle food, and as manure. (See also Spices–Soy.) The

© Copyright Soyinfo Center 2014

plant is cultivated for its beans in many parts of India and the Archipelago; and has been successfully introduced into Austro-Hungary and N. Germany."

Note 1. This is the earliest English-language document seen (Nov. 1999) with any term referring to the oil of the soybean in the title.

Note 2. This is the earliest document seen (Oct. 2001) containing industry or market statistics on soybean crushing, including production and trade of soybean oil, meal or cake.

Note 3. This is the earliest document seen (Oct. 2001) containing industry or market statistics on production or trade of soybeans.

Vol. 4 also discusses: Under narcotics–Hemp (bhang, charas, ganja, hashish; p. 1305-07). Under "Oils and fatty substances: Vegetable oils and fats"–Almond oil (p. 1377). Hempseed oil (p. 1391). Linseed oil (p. 1393-94). Miscellaneous and unenumerated oils–*Cyperus esculentus* (p. 1413-14). Under animal oils and fats–Butterine, bosch, oleomargarine, or artificial butter (p. 1362-63, 1464-66). Bibliography of oils (p. 1483-84).

Note: This is the earliest English-language document seen (Aug. 2013) that contains the term "Hempseed oil" (regardless of capitalization) written just like this. Address: England.

666. Spon, Edward N.; Spon, Francis N. 1882. Spons' encyclopaedia of the industrial arts, manufactures, and commercial products. Vol. 5: Soy. London and New York: E. & F.N. Spon. p. 1537-2142. See p. 1814. Edited by Charles G. Warnford Lock.

• ***Summary:*** In the section titled "Spices and condiments" we read: "Soy.–This useful condiment [soy sauce], said to form the basis of almost all the popular sauces [such as Worcestershire sauce] made in Europe, is prepared by the Chinese and Japanese from the fruit of *Glycine Soja* [*Soja hispida*], which holds an important place among the oil-yielding plants, and has been described under the article on Vegetable Fatty Oils (p. 1378). The condiment is prepared by boiling the beans with an equal quantity of roughly-ground barley or wheat, and leaving it covered for 24 hours to ferment; salt is then added in quantity equal to the other ingredients, water is poured over, and the whole is stirred at least once daily for two months, when the liquid is poured and squeezed off, filtered, and preserved in wooden vessels, becoming brighter and clearer by long keeping. Its approximate value in the London market is 2s. 3d. to 3s. a gallon for Chinese, and 2s. 4d. to 2s. 5d. for Japanese. [Note: The Chinese sauce is more expensive]. It is not specified in the trade returns, but doubtless forms the chief item in the unenumerated spices imported from China."

Note 1. This is the earliest English-language document seen (Sept. 2003) that contains the term "fatty oils"–which refers to edible oils that are liquid at room temperature (see also p. 1360).

Note 2. This is the earliest English-language document seen (Sept. 2006) that contains the terms "oil-yielding" or "oil-yielding plants" in connection with the soybean.

Also discusses: Varnish–Hempseed oil (p. 2024). Address: England.

667. *Agricultural and Horticultural Society of India, Proceedings and Report* (*Calcutta*). 1883. Japan pea. Jan. 5. p. xxvii, xxxi-xxxii. New Series.

• ***Summary:*** This paper appears in the "Proceedings of the Society," for "Thursday, the 5th January, 1883 [For December 1882]. W.H. Cogswell, Esq., President, in the Chair." A.H. Blechynden is secretary. "Read a note from the Superintendent of the Botanic Garden, Saharunpore, forwarding a small paper of the Japan Pea (*Soja hispida*,) and promising a larger quantity on receipt of a supply shortly expected from Japan.

"The Secretary stated that this pea had been brought to the notice of the Society some 38 years ago, as the following extract from its proceedings for August 1844 [p. 170] will show. A correspondent from China (Captain Bigge,) presenting an assortment of seeds from China, makes the following remarks in regard to one kind, which is doubtless the *Soja hispida:* -

There follows the complete text of the following document: *Agricultural and Horticultural Society of India, Proceedings and Report* (Calcutta). 1844 "Presentations to the gardens and museums." 3(Part 2):170. Meeting of Aug. 14.

Note: Saharunpore, now spelled Saharunpur, is in today's northwest Uttar Pradesh, India.

668. Geerts, A.J.C. 1883. Observations on Kinch's list of plants used for food. *Transactions of the Asiatic Society of Japan* 11(Part 1):31-35. April. [3 ref. Eng]

• ***Summary:*** Note 1. Geerts is referring to the article by Kinch titled "List of plants used for food or from which foods are obtained in Japan," on pages 1-30 of this issue of this periodical.

"Prof. Kinch seems not to have been acquainted with the list of 447 economical plants, published in 1826 by Ph. Fr. von Siebold in the *Transactions of the Batavian Society of Arts and Sciences* [*Verhandelingen van het Bataviaasch Genootschap van Kunsten en Wetenschappen*], Vol. XII, under the title of *'Synopsis plantarum oeconomicarum universi regni Japonici,'* for Mr. Kinch mentions only the more imperfect list given by Thunberg in his *Flora Japonica.* Further, several articles written on the subject of economic Japanese plants, published by von Siebold in the Journal of the Royal Dutch Society for the Advancement of Horticulture, during the years 1844-45-46, etc., might be perused with advantage by those who wish to study the practical side of Japanese economic plants.

"In Karl von Scherzer's work, *Fachmaenuische Berichte*

© Copyright Soyinfo Center 2014

ueber die oesterreichisch-ungarische Expedition nach Siam, China und Japan, Stuttgart, 1872, there is an extensive article by Dr. S. Syrski, on Japanese horticulture and economic cultivated plants, pp. 175-220. Several interesting observations on the mode of culture, time of sowing, planting, and harvesting, will be found there."

"As a preliminary catalogue Mr. Kinch's list may be useful for those persons who do not possess the botanical literature on the Japanese flora, but as a practical indication for horticulturists the list is deficient. Note 2. Chinese characters (or katakana) are given for each for the following Japanese terms.

"For instance the plant *Dai-dzu* or *O-mame,* the Soja hispida, Moench, has in Japan five distinct cultivated varieties and eleven or perhaps more sub-varieties, viz:

"I. White or slightly yellow beans, Haku-dai-dzu. 1. Very early variety with very small bean. Harvest in July. *Goguwatsu-mame* 2. Early variety with small white bean, *Wase-mame* or *Natsu-mame.* These [first] two varieties are also called *Bai-to* or *Tofu-mame* and serve especially for preparing *To-fu* [tofu]. 3. Middle early variety with somewhat larger round beans, *Nakate-mame.* Much used for preparing miso. 4. Late variety with round and hard beans, *Okute-mame.* 5. Late variety, with smaller, perfectly round and hard beans, *Maru-mame.* Can be kept a very long time and is much used as food for horses. 6. Late variety, with large, perfectly round, and very hard beans, *Teppo-mame* or *Aki-mame.* Is much valued for the preparation of *Shoyu* [soy sauce].

II. "Black beans, *Koku-dai-dzu* or *Kuro-mame.* 1. Middle late variety, with round, small, hard, black beans, *Kuro-mame.* 2. Middle late variety, with round, large black beans, *Kuro-teppo-mame.* 3. Late variety, with flat, elliptic, black beans, *Go-ishi-mame* or *Kuro-torokusun* or *Hachi-bu-name* or *Tamba-kuro-mame.* These kinds [in category II.] are eaten in a boiled mixed with sugar as *entremets.*

"III. Brown beans, *Katsu-dai-dzu.* 1. Round reddish brown beans, *Aka-mame.* According to the size the Japanese distinguish even six subvarieties of this brownish Soya-bean. The reddish kinds are far less cultivated than the white and black varieties. 2. Light brownish-red and round beans, *Cha-mame.* According to the more or less intense colour the Japanese distinguish three sub-varieties of *Cha-mame.* They are rarely cultivated. [Both these types] are eaten with sugar in a boiled state" (p. 34).

Note 3. This is the earliest English-language document seen (Oct. 2004) that mentions red or reddish soybeans (actually brownish-red).

Note 4. This is the earliest English-language document seen (Feb. 2007) that contains the word "Soya-bean" or ("Soya-beans").

"IV. Greenish or blue-greenish beans, *Sei-dai-dzu* or *Aö-mame.* 1. Round, middle-sized greenish beans, *Aö-mame.* The Japanese distinguish two sub-varieties, viz., α. *Sei-hi-to* with the epidermis only of a green colour, but white inside [and] Beta. *Nikuri-Sei,* which are outside and inside of a greenish colour. 2. Light green round beans, *Kagemame.* [All] are only cultivated in the provinces of Ise, Iyo, Harima, Idzumo [Izumo], Omi. Eaten with sugar in a boiled state. Note 5. This is the earliest English-language document seen (Oct. 2004) that uses the term "light green" to describe the color of a soybean.

"V. Spotted beans, *Han-dai-dzu* or *Fu-iri-mame.* 1. Greenish, flat, oblong beans with a black spot at the navel. *Kuro-kurakake-mame.* Relatively rare and only cultivated in Nagato [an old province on the southwest tip of Honshu, Japan; as of 2003 part of Yamaguchi prefecture], Idzumo [Izumo] and the environs of Kiyoto [Kyoto]. 2. Yellowish-green, flat, and slightly oblong beans, with a dark brown spot at the navel. *Aka-kura-kake-mame.* Rare. 3. Yellowish-green beans with many dark spots. *Furi-mame* or *Udzura-mame.* Rare. Cultivated in Harima province."

Note 6. This is the earliest English-language document seen (Oct. 2004) that uses the term "Yellowish-green" to describe the color of a soybean.

Note 7. This is the earliest English-language document seen (Sept. 2004) that uses the word "spots" (or "spotted" or "spotting") or the term "reddish brown" to describe the color of soybean seeds.

Note 8. This is the earliest English-language document seen (Oct. 2013) that discusses the color of many soybean varieties.

Note 9. Geerts' initials stand for Antonius Johannes Cornelius.

Note 10. This is an excellent, original article, which gives the names of many Japanese soybean varieties for the first time in English or any other European language. That information is largely derived from Iinuma (1861 and/or 1874).

669. *Good Health* (*Battle Creek, Michigan*). 1883. Food of the Japanese. 18(4):103. April.

• ***Summary:*** "In noticing a recent report sent to his Government by Thomas V. Van Buren, U.S. Consul-General to Japan, the *Scientific American* remarks as follows:

"'Among the many reports returned to the State Department at Washington [DC] by our consular agents abroad, this report on the food of the Japanese people is of exceptional interest."

"More than forty varieties of peas and beans are cultivated. The richly nutritive soy bean properly supplements the rice, which plays so large a part in the national diet."

Note: This is the earliest document seen (Dec. 2013) in which Dr. John Harvey Kellogg [or any other Seventh-day Adventist] mentions the soy bean.

670. Kinch, Edward. 1883. List of plants used for food or

© Copyright Soyinfo Center 2014

from which foods are obtained in Japan. *Transactions of the Asiatic Society of Japan* 11(Part 1):1-30. April. Read April 12th, 1882. Reprinted in March 1907 as a monograph.
• ***Summary:*** "In the following list of food plants the genera have been arranged according to the system pursued by G. Bentham and J.D. Hooker in their 'Genera Plantarum'... I am not aware that any list of the plants used for food in Japan has been published since that by Thunberg in his 'Flora Japonica,' 1784 [which mentions 'Dolichos polystachyos et Soja' in the Preface]."

"In the last hundred years this list has been considerably extended. The principal works consulted have been Thunberg's 'Flora,' Franchet and Savatier's 'Enumeratio,' Miquel's 'Prolusio' and Tanaka and Ono's 'So moku Zusetsu' and part of Suringar's 'Algae 'Japonicae."

Under the heading Leguminoseæ (Suborder Papilionaceæ), Kinch reports: (1) Glycine soja, S. & Z., called tsuru-mame or no mame in Japanese, has no English name. Its seeds are used. (2) Glycine hispida Moench (synonyms: Soja hispida Miq. and Dolichos soja L.), called O-mame or Daidzu in Japanese, is called Soy bean or Japan pea in English. Its seeds are used and there are many varieties of seeds. (3) Glycine hispida f. lanceolata, called midzu kugiri in Japanese, has no English name. Its seeds are used.

Also discusses in this suborder: (4) *Arachis hypogæa,* L., Rakkuwasho [rakkasei] or Tojin-mame, ground nut, earth nut. (5) *Vicia faba,* L., Sora-mame, broad beans. (6) *Pisum sativum,* L., Yendo, pea. (7) *Pueraria thunbergiana,* Benth. = *Dolichos hirsutus,* Th., Kudzu, for root starch. (8) *Phaseolus vulgaris,* L., Ingen mame, French bean. (9) *Phaseolus radiatus,* L., Adzuki or Shôdzu, for beans. (10) *Phaseolus radiatus* var. *pendulus,* Savatier, Tsuru-adzuki, for seeds. (11) *Phaseolus radiatus* var. *subtrilobatus,* Savr., Bundo or Yayenari [Yaenari], for seeds.

Also mentions *Prunus mume* or plum. "Unripe fruit preserved in vinegar and salt as a pickle" [umeboshi].

Note: This is the earliest English-language document seen (Dec. 2006) that uses the term *Prunus mume* to refer to the scientific name of the plum tree whose fruits are used to make umeboshi salt plums. This is also the 2nd earliest English-language document seen (Dec. 2006) that refers to umeboshi salt plums, but it does not mention them specifically.

Note 3. Some of this information is very similar to that in Van Buren (1881, p. 15). Address: Royal Agricultural College, Cirencester, England. Formerly Prof. of Chemistry, Imperial College of Agriculture, Tokyo.

671. Carrière, E.-A.; André, Ed. eds. 1883. Chronique horticole: Essais d'acclimatation [Horticultural chronicle: Acclimatization trials]. *Revue Horticole: Journal d'Horticulture Pratique* (*Paris*) 55:313-16. July 16. See p. 315-16. [Fre]

• ***Summary:*** The Society for Acclimatization distributes to its members the seeds of exotic, edible or industrial plants, in order to test their cultivation and multiplication in France.

Recently, Mr. de Muratel, who resides in the Tarn region, gave an account of the trials that he made using the seeds he had been entrusted with. The results are very interesting.

Discusses the soybean of Etampes (*Le Soja d'Étampes*), and the green soybean of Japan (*Le Soja vert du Japon*).

Also discusses the chufa of Spain and the Yaye-Nari (*Phaseolus radiatus;* azuki bean). Address: France.

672. *New York Times.* 1883. Scientific gossip. Dec. 2. p. 12.
• ***Summary:*** "Both E. Meissl and F. Böcker assert that the soja bean, which has been but recently imported into Europe from Japan, is a very valuable fodder, being exceedingly rich in fatty constituents."

673. Leunis, Johannes. 1883-1885. Synopsis der Pflanzenkunde; Ein Handbuch fuer hoehere Lehranstalten [Synopsis of botany: A handbook for institutions of higher learning. 3d ed. 2 vols.]. Hannover, Germany: Hahn'sche Buchhandlung. Vol. 1, xv + 994 p. Vol 2, xxii + 1002 p. See vol. I, p. 836. Vol. II, p. 130-32. [Ger]
• ***Summary:*** In the section on Phaseolus: "51. Soja* Moench. *Soja or Sooja is the Japanese name of the sauce (*Tunke*) for which soybeans [Soja-Bohnen] are used.

Soja hispida [hispida means rough] Moench. (S. japonica [japonica means Japanese]). Savi (Dolichos Soja. L.). The Japanese soybean. An annual, upright plant, indigenous to Japan and now cultivated throughout eastern Asia, because the beans are equal in protein to lupins, taste good, and are also used for the preparation of a piquant or pungent, brown, thickish sauce, which is used in India with almost all meals, and is also sold in Europe to improve broths and as a grilling, roasting, or baking sauce. However the soy sauce (*Soja*) presently sold commercially in Europe is not made from soybeans, but rather from other materials, namely from fungi / mushrooms (*Pilzen*), and it is made by us. The plant also grows in our climate although it often does not bring its seeds to ripeness / maturity. Therefore recommendations to grow it are uncertain.

"52. Dolichos L." Address: Germany.

674. Okoshi, Narinori. 1883. A sketch of the fisheries of Japan (Fisheries exhibition literature). London: William Clowes and Sons, Ltd. 43 p. See p. 22, 24. Index. 22 cm.
• ***Summary:*** Section VI, titled "Fish cookery" (p. 22) begins: Cookery of fish is almost an art in Japan." In the first mode of preparing raw fish, "the flesh of the fish is cut in thin slices and arranged on a plate very neatly in the form of waves,... and it is served with sauce (shoyu), mashed raw turnips [grated daikon], horse-radish [wasabi], and generally some fresh vegetables cut in small pieces and sea-weed."

© Copyright Soyinfo Center 2014

"The most essential element of our cookery of either fish or vegetables is the sauce known here under the name of Japanese shoya, properly called *shoyu,* which is extracted from beans and koji; hard dried fish [katsuobushi] is also greatly used" (p. 24).

Note 1: This paper was presented on 23 Oct. 1883 at the International Fisheries Exhibition, London. Also gives statistics on sea vegetables (p. 8-9, 11-12, 14).

Note 2. This is the earliest English-language document seen (April 2012) that uses the word "shoya" or the term "Japanese shoya" to refer to shoyu or soy sauce. Address: Member of the Japanese Consulate in London [England].

675. Pogson, Frederick. 1883. Manual of agriculture for India. Calcutta, British India: Thacker, Spink and Co. 296 p. See p. 280-81. Index. [1 ref]

• ***Summary:*** Chapter 14, "Field pea crops, including the Japan pea" states (p. 184): "The Japan pea assumes the form of a bush from two to three feet in height. In the plains it should be sown after the rains cease. Drills should be made three feet apart, and a single seed should be sown at every three feet; the spot where the seed is sown being manured as for beans. The botanical name of the Japan pea is *Soya Hispida.* It is half pea and half bean in appearance, with singular leaves, and pods somewhat like the pods of the *Cajanus sativa* or *Urhur Dall* [*Dahl*] of the next chapter."

In the Appendix (p. 267+) is a section titled "Japan pea" which states (p. 280-81): "A small supply of this pea-bean was received by the writer in the spring of 1882. It was freely distributed in Dehra, but failed entirely as a hot-weather crop. A few seeds sown at Mussoorie grew to the height of two feet, and bore pods very much resembling those of the *Urhur Dall* (*Cajanus sativa*). At the writer's request a supply of the seed was sent to Simla, and the result is given beneath.

"'The Government of India has decided on the cultivation of the Japan pea being extended in this country, and with this view it has suggested that further experiments should be made in suitable places. This bean or pea has its natural habitat in China and Japan, it also grows in Mongolia, and in India in the Himalayas, and within the last few years it has been cultivated experimentally in several European countries, under the name of the Soy bean. It is a vegetable, which approaches most nearly in its proximate chemical composition to animal food. The Soy bean first attracted attention in Europe in the year 1873, when specimens from Japan, from China, and from India were shown at the Vienna International Exhibition. Dr. Forbes Watson, reporter on the products of India, called attention to it in the catalogue of the exhibits of the India Museum. Since then numerous experiments have been made on the European continent on its growth, and also feeding experiments with the bean and its straw on different kinds of animals have been prosecuted. Such experiments have been carried on by Woolling and Wein at Munich; by Haberlandt, Lehman, Harz, Stahel, Zimmerman, Siewert, Wieske, and others at various stations in Germany, Austria, and Hungary; and experiments have also been made in France and in Italy.

"'In Japan it is known by names signifying THE bean, and from it are made not only soy [sauce] but a paste, known as *miso,* which is in constant request at nearly every meal, *tofu* or bean cheese, and other foods used to a less extent. This bean cheese is also well known in China, and is obtained by extracting the legumin from the beans with water and precipitating it with brine. These foods are most valuable additions to the dietary of the Oriental nations, and especially the Japanese, who use so little animal food. They tend to supply the deficiencies of the staple food, rice, in nitrogenous matter [protein], fat, and also in mineral constituents. The Buddhist priests, who are strictly forbidden the use of animal food, consume considerable quantities of these beans, principally in the form of *miso.'–Vide 'Simla Argus,' 18th November, 1882.*"

Note: Simla was a hill station in British India. The *Argus* was a periodical published at Simla, a hill station in British India in the 1880s. The Simla Argus Press published a few books at the same place and time. Address: Lieutenant, Her Majesty's Bengal Army, Dehra Doon; Honorary Member Agri-Horticultural Society of India.

676. Schaedler, Carl. 1883. Die Technologie der Fette und Oele: Des Pflanzen- und Thierreichs [The technology of oils and fats: From the plant- and animal kingdoms]. Leipzig, Germany: Baumgartner. Berlin: Polytechnische Buchhandlung. 1108 p. Illust. Index. 22 cm. [Ger]

• ***Summary:*** In Chapter 12, "Descriptions, properties, and confusions of the oils and fats" is a section titled "Papilionaceae (Leguminosae), papilionaceous plants (*Schmetterlingsblüthler*)." The first plant discussed (p. 370) is the soybean: "1. Dolichos Soja Linn = Soja japonica = Chinese oilbean (*Chinesische Oelbohne*), *Sao; Sojabohne.* It is native to Japan and China and cultivated in southern Asia. The seeds, which have a piquant (*pikante*) taste and are used as food. The oil, called soybean oil (*Sojabohnenöl*), and incorrectly called "oil of peas" "(*Huile de pois*)" serves as an edible oil.

Also discusses: Margarine (p. 85). Peanuts (p. 360-65. The oil is called *Erdeichelöl, Oleum Arachidis, Huile d'Arachide, Huile de Pistache de terre, Ground-nut oil, Earth-nut oil, Pea-nut oil, Moong-phullie* (Hindostan), *Katjang-tannah* (Java), *Cochang-gorung* (Sumatra), *Mandobi* (Brazil), *Amendoim* (Brazil)). Almonds and almond oil (p. 370-79). Sesame oil (p. 444-50). Chufa (*Cyperus esculentus, Erdmandel, Grasmandel, indianische Süsswurzel,* p. 480-810). Chufa oil (*Cyperi esculenti, Cyperus oil, Huile de souchet comestible*). Linseed oil (p. 494-509). Hemp and hempseed oil (p. 150-52, 535-39). Contains many superb text illustrations, including multi-part illustrations of the plant, seeds, and flowers of the peanut, almond, sesame seeds, and

© Copyright Soyinfo Center 2014

hemp. The soybean is not illustrated.

Note 1. Carl Schaedler was born in 1843.

Note 2. This is the earliest German-language document seen (April 2012) that uses the term "Chinesische Oelbohne" to refer to the soybean.

Note 3. This is the earliest German-language document seen (Sept. 2006) that uses the term *Sojabohnenöl* to refer to soybean oil. Address: PhD, Vereideter Chemiker und Sachverstaendiger der Koenigl. Gerichte zu Berlin.

677. Scheube, Botho. 1883. Die Nahrung der Japaner [The food of the Japanese]. *Archiv fuer Hygiene* p. 352-83. [3 soy ref. Ger]

• ***Summary:*** In the Japanese diet, rice plays the most important role. From a special type of glutinous rice, the Japanese prepare their beloved rice cakes, called mochi, which are found in every house during the New Years festival. The Japanese bake no bread, yet *Fu* (made from wheat gluten) could be considered a kind of bread. The process for making it is described.

Legumes, beans and peas, also are important in the Japanese diet. Countless types are cultivated, but the most important is the remarkable soybean (*Sojabohne–Glycine hispida*), on account of its richness in nitrogen [protein] and fat, and its relatively low starch content. The most important foods made from soybeans are tofu, miso, and shoyu; a detailed description is given of the process by which each is made. Two analyses of shoyu, by Ogata and by Kinch, give its composition. Beans and peas are also eaten as vegetables by the Japanese, and bean meal [probably kinako] is used in the preparation of many kinds of cakes.

On pages 361-67 are many tables containing descriptions of the diets consumed by various individual Japanese persons, usually for three days or three meals. For each is given: The age and approximate weight of the person, the foods consumed, and the weight (in grams) of each food consumed each day. Tofu (*Bohnenkäse*), miso soup (*Miso-Suppe*), and wheat gluten cakes (*fu*) appear with rice (and/or sushi or mochi) and tea in most diets. The word *Bohnensauce* (p. 362) appears to refer to shoyu (soy sauce).

Botho Scheube lived 1853-1923. Address: Docent, Univ. of Leipzig, Germany.

678. *University of California, College of Agriculture. Report of the Professor in Charge to the President.* 1883. List of donations of seeds and living plants, received since December, 1880. p. 118-21. For the year 1882. See p. 119.

• ***Summary:*** "From San Francisco Bulletin Company: March, 1881... *Soja* Bean, from Japan;..." (p. 119).

679. *Times* (*London*). 1884. Japan at the health exhibition. Aug. 28. p. 2, cols. 4-5.

• ***Summary:*** "The last foreign court completed at the International Health Exhibition [in London] is that of Japan." In a few days, a Japanese restaurant will be opened. "Two Japanese cooks have accompanied the Commissioners, and here the visitor will be able to make the acquaintance of some of the dishes which find a place on the *menus* of the Parisians of the East. Sweet-tasting bamboo sprouts, sweetmeats and confectionary of fanciful appearance; *saké,* 'the wine of the country,' a fermented drink made of rice and containing 11 to 12 per cent. of alcohol, the nutritious *miso* made from soy beans and fermenting rice [koji], frozen töfu [sic, dried frozen tofu] or bean curds, tangle [kombu], salted mushrooms, dried shrimps, cured bonito, laver [nori], various edible sea-weeds, orange vinegar, and several soys [soy sauces], are among the good things which those who are adventurous in dietary may enjoy."

Note: This is the earliest English-language document seen (April 2013) that uses the word "frozen" in connection with tofu; there is no such word as *töfu.*

680. *Times* (*London*). 1884. The Health Exhibition Japanese restaurant. Sept. 17. p. 4, col. 6.

• ***Summary:*** The Nippon Rioriya, modeled after the eating houses in Tôkio, is hard to find at the exhibition. "Taking advantage of the concession to European prejudices the Commissioners have made in providing spoons, instead of obliging him to drink his soup like tea from the bowl, the adventurous diner-out will find that he has before him a savoury compound called on the card *misoshiru* [miso soup]. This is made, as the root word denotes, from *miso,* a fermented mixture of soy beans, wheat, and salt." He may also enjoy "a piece of plump sole stewd in soy" [sauce], the "brown soy-coloured beans and strips of *kikurage,* or ear-shaped mushrooms," the *wanmori* which includes "pieces of a soaked *fu,* a kind of biscuit made from the glutinous part of wheat flour. The gravy in which these *pièces de résistance* are floating is thickened with a transparent starchy substance, obtained from the root of a climbing plant (*Pueraria Thunbergiana*), called by the Japanese *kuzu."*

"One other relish must be noticed, the sliced root of the burdock, salted and preserved in *miso."*

section related to food is "Japan. A descriptive catalogue of the exhibits sent by the sanitary bureau of the Japanese Home Department," prepared under the direction of K. Nagai, Commissioner, and J. Murai, Assistant Commissioner. There follows a 2-page Introduction by Kiuichiro Nagai, dated Sept. 1884. Then a table of contents of five groups; Group I is food. Then a table of Japanese weights and measures. Pages 545-71 begin: the "Descriptive catalogue." Group I–Food. Detailed information and / or chemical analyses are given of the following: are given: (7) Soy bean (*Glycine hispida*) *O-mame.* (7A) Phaseolus radiatus. Adzuki. (192) Dried fruit of *Lagenaria vulgaris–Kan-pio* [*kanpyo*], cook with soy sauce. Mushroom (*Agaricus campestris*). *Shii-take* [*Shiitake*], cook with soy sauce. Kanten, vegetable isinglass, cook with soy sauce. Frozen konniaku [konnyaku]. Minoboshi daikon, cook with soy sauce. Fu, nama-fu, yaki-fu (roasted) (Wheat gluten). Kuzu starch. Buckwheat soba, cook with soy sauce. (203) Hijiki sea weed (*Cystoseira* species), cook with soy sauce. (204) Ogo sea weed (*Gigartina* sp.), cook with soy sauce. (205) Wakame sea weed (*Alaria pinnatifida*), cook with soy sauce. (206) Agar-agar (*Gelidium corneum.* Tengusa). Use to make tokoroten or kanten. (207) Tangle (*Laminaria japonica*). Kombu [konbu]. (208) Laver, dried (*Porphyra tenera*). *Asakusa-nori.* (209) Awonori [Aonori], dried (*Enteromorpha compressa*).

(210) Frozen bean-curd. *Kôri-tôfu.* "Preparation.–It is made by steeping soy beans in water and then grinding them, after which the refuse is removed by boiling and dissolving it in a little oil. This refuse is called 'Kiradzu' [kirazu] or 'Unohana.' The liquid [soymilk] remaining after taking away such refuse is put into a kettle and again boiled. Upon the surface of the water [sic, soymilk] there forms a thin substance [film] like wet paper; this is skimmed off and dried. It is called 'Yuba' (lit., bean-curd skin), the taste of which is very agreeable. When it [the soymilk] begins to bubble up brine is sprinkled over it in order to stop the bubbles, and it is put into a special wooden box, then thrown into a cotton cloth bag and coagulated into long square shapes, which is bean-curd."

Three tables follow: (1) "Analysis of bean curd" [tofu]. (2) "Analysis of dried bean-curd" [dried frozen tofu]. (3) "Analysis of refuse of bean-curd" [okara].

Note 1. In the description of making tofu (above), yuba is removed during the tofu-making process.

Note 2. This is the earliest English-language document seen (June 2013) that uses the word "Unohana" or the term "refuse of bean-curd" to refer to okara.

(211) Yuba (Skin of bean curd; "Yuba is made during the process of making bean curd, and is a thin, yellow, transparent substance)."

Note 3. This is the earliest English-language document seen (Oct. 2012) that uses the term "bean-curd skin or the term "Skin of bean curd" to refer to yuba.

(213) Somen (Vermicelli), cook with *shioyu* (soy sauce).

Note 4. This is the earliest English-language document seen (April 2012) that uses the term *shioyu* to refer to shoyu / soy sauce.

(228) Umeboshi (Salted and dried plums). (229) Miso (a fermented substance made from soy beans and yeast [koji]). *Miso-ai, Sansho-miso, shoga-miso, wasabi-miso, togarishi-miso, goma-miso* [*sesame miso*], *keshi-miso, katsuwo-miso* [*katsuo-miso*]. (229a) Konomono [*Kô-no-mono*] (Vegetables pickled in fermenting mixture of bran and salt (incl. Nukamiso-dzuke ([Nukamiso-zuke] pickled in salt and bran), Takuwan-dzuke (Takuan-zuke; daikon radishes pickled in salt and bran), Shiwodzuke ([Shiozuke] salt-pickled), Shio-oshi (salted and pressed), Kasudzuke ([Kasuzuke] pickled in sake residue), Misodzuke (Misozuke; pickled in miso), &c.)). Takuwandzuke [Takuanzuke; Takuan pickles]. (229b) Kasu-zuke (mentions miso soup). (230-35) Shoyu (Soy) and how it is made [p. 21 of section]. Chemical analysis of Kikkoman shoyu. Eight chief brands of shoyu. (236) Mirin (a kind of sweet liquor), with koji. Sembei [senbei], with miso. (242) Yokan, three varieties. (246) Midzu-ame [mizuame]. Frozen mochi.

Class III–Prepared animal substances. Dried cod fish, cooked with soy [sauce]. Beef tsukudani, cooked with soy [sauce].

Note 5. This is the earliest English-language document seen (June 2013) that contains the word "tsukudani."

Class IV. Beverages. Sake (wine), made with koji (yeast). "Koji (yeast) is used for brewing Sake in Japan, almost like malt used for brewing beer in western countries,..."

Class VI. Cookery practically demonstrated. Nippon Ryoriya (Japanese restaurant), incl. misoshiru (miso soup), and konomono. Address: England.

682. International Health Exhibition, London. 1884.
(210) Frozen bean-curd. Kôri-tôfu (Document part). In: International Health Exhibition, London. 1884. *The Health Exhibition Literature.* Vol. XVII. London: William Clowes and Sons, Ltd. 749 p. See p. 560-61.

• ***Summary:*** "It is made by freezing common bean-curd. Bean-curd is made of *Daidzu Glycine* (*soja*) *hispida* and contains a largo quantity of vegetable albumen. This is one of the most frequent kinds of food of the middle and lower classes of the people of Japan; it contains an abundance of nourishment, and Hygeists [Hygienists] recommend its use. However, bean-curd is indigestible as in passing through the process of freezing, it undergoes a change. Ordinary bean-curd is not a safe eatable to remove to a distance, as it spoils very readily: therefore, frozen bean-curd only is exhibited here with explanation of the ingredients of the common curd.

"Preparation.–It is made by steeping soy beans in water and then grinding them, after which the refuse is removed by boiling and dissolving it in a little oil. This refuse is called 'Kiradzu' or 'Unohana.'

© Copyright Soyinfo Center 2014

Note: This is the earliest English-language document seen (June 2013) that uses the word "Kiradzu" or the word "Unohana" to refer to okara.

The liquid remaining after taking away such refuse is put into a kettle and again boiled. Upon the surface of the water there forms a thin substance [yuba] like wet paper; this is skimmed off and dried. It is called 'Yuba' (lit., bean-curd skin), the taste of which is very agreeable. When it begins to bubble up brine is sprinkled over it in order to stop the bubbles, and is put into a special wooden box, then thrown into a cotton cloth bag and coagulated into long square shapes, which is the bean-curd.

"Analysis of bean curd: Nitrogen 0.76%. Fat 2.36%. Water 90.37%. Ashes [ash] 0.76%.

"Analysis of dried bean-curd [moisture free]: Nitrogen 8.09%. Fat 24.59%. Ashes [ash] 7.79%.

"Analysis of refuse of bean curd [kirazu or unohana]: Albumen 3.664%. Fat 0.837%. Glucose 0.266%. Starch 2.630%. Cellulose 2.896%. Other non-nitrogenous substances 6.156%. Water 85.660%."

Note 1. This is the earliest English-language document seen (July 2012) that seems to use the word "nitrogen" and the word "albumen" interchangeably.

"Use.–Bean curd is prepared for eating by boiling it or holding it over a fire; it is usually eaten with soy [sauce] and various condiments. It easily digests and is suitable food for adults, for infants, or for invalids, but it cannot be preserved for more than a day or two, owing to its perishable nature, whereas frozen bean curd does not easily spoil and can be preserved for a length of time, but it is indigestible and furnishes less nourishment than the unfrozen."

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "Frozen bean-curd" or the term *Kôri-tôfu* or the term "dried bean-curd" or the term "frozen bean curd" to refer to dried-frozen tofu. Address: England.

683. International Health Exhibition, London. 1884. (211) Yuba (Skin of bean curd) (Document part). In: International Health Exhibition, London. 1884. *The Health Exhibition Literature.* Vol. XVII. London: William Clowes and Sons, Ltd. 749 p. See p. 561-62.

• ***Summary:*** Preparation.–Yuba is made during the process of making bean curd [tofu], and is a thin, yellow, transparent substance.

"Use.–It is used as a food adjunct with boiled rice, by most persons, by boiling or warming over a fire and salting it.

"Analysis: Albumen 51.597%. Yellow oil 15.620%. Cellulose 0.401%. Nitrogenous substances 6.651%. Ashes [ash] 2.821%. Water 22.850%. Total 100.000%

"Analysis of dry substance [moisture free]: Carbon 2.821%. Nitrogen 22.850%. Hydrogen 42.024%. Oxygen 8.257%. Ashes 5.868%. Water 18.180%. Total 100.000%" Address: England.

684. International Health Exhibition, London. 1884. (229) Miso (a fermented substance made from Soy Beans) (Document part). In: International Health Exhibition, London. 1884. *The Health Exhibition Literature.* Vol. XVII. London: William Clowes and Sons, Ltd. 749 p. See p. 563-65.

• ***Summary:*** "Preparation.–There are many ways of making miso, they do not differ much from each other, and the kind containing the largest quantity of yeast [koji] is considered the best. The usual mode is, after soaking soy beans in water for about two hours, to put them into a suitable vessel and steam them; then, after mixing them with salt and yeast (the proportions are one *to* of beans to three *sho* of best salt and one *to* of yeast) [10 *sho* = 1 *to* = 18 liters = 4.76 gallons], they are removed to wooden plates; the next step is to evenly mix the ingredients. The liquid is then put into casks, and is then left untouched for upwards of a year.

"Another method.–Three *to* of yellow soy beans are soaked in water for a night; then they are boiled in a large kettle, and as soon us the water in the kettle has evaporated and the beans show a reddish yellow colour, they are removed to a mortar and pounded; they are then placed on mats. When they are thoroughly cooled, they are shaped into balls, as large as hand balls, cut with a knife into flat pieces about an eighth of an inch thick, and placed on mats shaped like scales of fish. As soon as mould appears upon them, they are taken, crushed into small pieces, and exposed to the rays of the sun for a day or two. When nearly dry, one and a fifth *to* of salt and a suitable quantity of water are added to them, and the whole is pounded in a mortar. After preserving in a cask for twenty or thirty days, it is again pounded thoroughly, and then left in a cask for a month or two, and sometimes longer, when the preceding process will be repeated. Finally, if it is sealed up in casks, it will never deteriorate. It is in prime condition when three years old.

"Use.–In Japan miso is one of the most necessary articles of food, and has been used from time immemorial, both by nobles and men of inferior rank. It is made into a soup, and is one of the courses served up as a principal article of every day diet. The mode of making it into soup is, in the first place, to rub it around an earthenware bowl [suribachi], into which a suitable quantity of water has been poured; it is then filtered through a sieve called *misokoshi,* and vegetables according to taste are added to it; the whole is then boiled and served up. The quantity of water to be used depends on the taste of those who have to eat it. Miso is used to give an agreeable flavour by mixing it with other food, and is then called Miso-ai [Miso-ae]. There are many other preparations of miso mixed with various condiments, namely, Sansho-miso (miso and Japanese pepper), Shogamiso (miso with ginger), Wasabimiso, Tagarashi-miso, Gomamiso (miso with horseradish, chillies, and sesame),

© Copyright Soyinfo Center 2014

Keshi-miso (miso with poppy seeds), Katsuwo-miso (miso with Katsuwo [Katsuo is oceanic bonito]), &c.

The uses of miso are innumerable, and it is most nutritious food.

Analysis, by Komaba Agricultural College:–Red Miso, from Osaka–Water 50.40%, fibre 8.25%, ashes [ash] (containing nearly 12 per cent. of common salt) 12.50%, sugar 0.61%, albumen 10.08%, soluble carbohydrates 18.16%. Total 100.00%.

Note: This is the earliest English-language document seen (Dec. 2008) that contains the word *misokoshi.* Address: England.

685. International Health Exhibition, London. 1884. (230-235) Shoyu (soy) (Document part). In: International Health Exhibition, London. 1884. *The Health Exhibition Literature.* Vol. XVII. London: William Clowes and Sons, Ltd. 749 p. See p. 565.

• ***Summary:*** "Shoyu is a mixture of soy beans, wheat, salt and water; the quantity of soy beans and of wheat being the same. The mode of preparing it, is to thoroughly boil, after washing in a cask with water, 50 *koku* of [soy] beans and to parch about 50 *koku* of wheat, in a pan for a little while, and thoroughly boil it after grinding on stone mill. When these two substances are mixed together and kept in *Oka-muro* (a warm room) for about four days the substances are converted into a yellow flower-like matter; this is yeast [sic, koji]. This yeast is then thrown into a mixture of 120 *koku* of water and of 6 *kuwanme* of salt. It is afterwards thoroughly cooled, boiled in a large kettle, and stirred with a bamboo instrument twice a day in summer and once a day in winter. After the lapse of three years the sediment is poured into a bag, then put into a small tub, and is submitted to strong pressure by means of a bar, at the end of which hangs a heavy stone. The fluid expressed is poured into a kettle and submitted to a heat of not more than 80ºC; it is again removed to a large tub and set away for a night, when it becomes of a deep black colour and acquires a very delicious taste.

"Use.–Shoyu is one of the most valuable foods, and is in daily use. Mixed with several kinds of food it imparts to them a delicious flavour. It is universally liked and is really indispensable in the Japanese kitchen. The quantity of shoyu annually consumed in Japan is extremely large, and of late years the article has been exported.

Analysis of Kikkoman Shoyu from Noda (province Shimosa) by Isono Tokusaburo B.Sc.–1,000 c.c. of Shoyu contains following constituents:–Specific gravity 1.199. Total residue 421.706. Ashes 175.864. Chlorine 94.001. Glucose 53.226. Dextrin 54.710. Alcohol 1.650. Volatile Acid 1.920. Fixed Acid (as SO_3 [sulfite]) 13.031. Nitrogen 17.208

"The following eight are the chief kinds of Sho-yu:–1. Sho-ji. 2. Sashimi. 3. Yamasa. 4. Yamajin. 5. Yamada. 6. Yigamisa [Jigamisa]. 7. Yamadai. 8. Yamataka." Address: England.

686. Paillieux, Auguste; Bois, D. 1884. Le potager d'un curieux. Histoire, culture et usages de 100 plantes comestibles exotiques, peu connues ou inconnues: Soya [The inquisitive person's kitchen garden. History, culture, and uses of 100 exotic, edible, little-known or unknown plants: Soya]. *Bulletin de la Societe d'Acclimatation* 31:896-916. Nov. See p. 907-11. [2 ref. Fre]

• ***Summary:*** In this excellent series of articles, the various plants are listed alphabetically by their French name. The section titled "Soya" begins with a summary of what Kaempfer said about the soybean. But whereas Kaempfer knew of only one variety, the authors know of at least 30, which have seeds of various colors and either a white or brown hilum. Only a view varieties will grow in the area around Paris; they have experimented with four (the rest do better in southern France): (1) a Chinese soybean, grown in Hungary, imported by M.M. Vilmorin-Andrieux & Co., which is a good source of seeds. This is the latest variety they know; (2) The Étampes soybean, which was distributed in 1874 by the Society for Acclimatization; (3) A green soybean from Japan; and (4) A pale green soybean from Japan and China. Instructions are given for growing soybeans; they should be planted from April 25 to May 10. The harvest starts in late October for most varieties but in September for the China/Hungary variety. When the seeds have attained their full development but before they begin to dry, they can be eaten as an excellent fresh vegetable. Dry soybeans are also a good food; cook them with a little soda (*soude;* salt wort or kali). The soybean makes unquestionably the best coffee substitute. In fact soybeans are cultivated in Tirol (Tyrol, part of Austria since 1814) and in Istria under the name "Coffee Bean (*Fève de café*), and this may well also be the case in Dalmatia and in the south of Italy.

"Heuzé, in his book *Plantes alimentaires* (*Edible Plants*) gives the soybean the name *Dolic à café* (the coffee bean) and that it is cultivated in some points in the departments of Ariège of Haute-Garonne; but we have not been able to verify this. Quite recently we have been notified by Mr. Faivre, of Beaune, that about 12 years ago the soybean was introduced at Allerey, a commune of Saône-et-Loire, by the abbot Mr. Crétin, and that its seeds have been used to make coffee by many families in the countryside. Mr. Faivre, and ardent and generous propagator of soya, has sent us seeds of the plant cultivated at Allerey. They are brown and identical to those recently imported by MM. Vilmorin.

"Worldwide the soybean occupies a place of equal importance with wheat, corn, and potatoes. It yields an excellent forage. It contains 18% oil. After extraction of the oil (*Après extraction de l'huile*), the cakes (*les tourteaux*) furnish a powerful fertilizer. In its many forms, the seeds of the soybean enter into the daily diet of hundreds of millions of people. They also nourish livestock, especially millions of horses and mules. They constitute, as numerous analyses

© Copyright Soyinfo Center 2014

demonstrate, the most rich and complete food that one can desire." Address: 1. Member of the Société nationale d'Acclimatation; 2. Preparateur de botanique au Muséum. Both: France.

687. *Gardeners' Chronicle* (*London*)**.** 1884. Japanese food vegetable products. 22:781-82. Dec. 20. New Series.
• ***Summary:*** "The Japanese Commission at the late International Health Exhibition have produced an excellent catalog of their exhibits, which contains a great deal of valuable information on the production and uses of the specimens in question. In the first group, devoted to food products, a series of analyses is given of the principal grains and pulses, fungi, cucurbitaceous fruits, &c."

"*Kori-tôfu: Frozen Bean Curds.*–It is made by freezing common Bean curd, which is made of Daidzu (Glycine [Soja] hispida), and contains a large quantity of vegetable albumen. This is one of the most frequent kinds of fruit of the middle and lower classes of the people of Japan; it contains an abundance of nourishment, and hygeists [hygienists?] recommend its use. Bean curd is indigestible, but in passing through the process of freezing it undergoes a change. Owing to the Bean curd spoiling very readily, it is not suitable for carrying long distances. It is made by steeping Soy Beans in water and then grinding them, after which the refuse is removed by boiling and dissolving it in a little oil. The liquid remaining after taking away such refuse, is put into a kettle and again boiled. Upon the surface of the water a thin substance, like wet paper, forms, this is skimmed off and dried and known as 'Yuba,' the taste of which is very agreeable. When it begins to bubble up brine is sprinkled over it in order to stop the bubbles and it is put into a special wooden box and afterwards thrown into a cotton-cloth bag and coagulated into long square shapes, which is the Bean curd.

"Bean curd is prepared for eating by boiling it, or holding it over a fire. It is usually eaten with soy [sauce] and various condiments; it is easily digestible and is suitable food for adults, infants, or invalids, but it cannot be preserved for more than a day or two owing to its perishable nature, whereas frozen Bean curd can be preserved for a length of time, but it is indigestible and furnishes less nourishment than the kind first named. The "yuba" or skin of the Bean curd is used as a food adjunct, with boiled Rice, by most persons, by boiling or warming over a fire and salting it."

Other Japanese foods described in detail in this early article are Ginkgo biloba (Ginnan, the fruit of the maidenhair tree), Lagenaria vulgaris (Kau-pio, a dried fruit), Agaricus campestris (Shii-take [Shiitake] mushrooms), Gelidium corneum (Agar-agar or Kanten), Frozen Kouniaku [Konnyaku], Katakuri Starch, Kuzu Starch (from the root of Pueraria Thunbergiana), Warabi Starch, Hijiki (Cyrtoseira sp.), Ogo (Gigartina sp.), Wakame (Alaria pinnatifida), Tangre [Tangle] or Kombu (Laminaria japonica. "It is used as a food by boiling with soy, sugar, mirin, &c., or served in soup"), Laver, dried–Asakusa-nori (Porphyra vulgaris) [Note that items from Hijiki to Laver are sea vegetables], Umeboshi: Salted and dried plums.

Continued in the issue of 10 Jan. 1885.

Note 1. This is the earliest English-language document seen (April 2013) that uses the terms "frozen," or "Kori-tôfu," or "Bean Curds," or "Frozen Bean Curds" to refer to frozen tofu.

Note 2. This is the earliest document seen (Jan. 2010) concerning the use of soya in infant foods or infant feeding.

Note 3. This is the earliest English-language document seen (Dec. 2006) that uses the word "Umeboshi" or the term "Salted and dried plums" to refer to umeboshi salt plums.

Note 4. As of 1975, the scientific name of the shiitake mushroom was *Lentinus edodes.* It had been cultivated and used as human food for centuries in China and Japan. It is not used much in most developing countries, nor in the West where the common champignon *Agaricus bisporus* (*A. brunnescens*) is the mushroom of commerce. One important advantage of shiitake is that it can be cultivated on wood.

Note 5. This is the earliest English-language document seen (Oct. 2008) that uses the term "vegetable albumen" to refer to soy protein.

688. Candolle, Alphonse de. 1884. Origin of cultivated plants. London: Kegan Paul, Trench & Co. viii + 468 p. See p. 330-32, 442-43, 451. Index. 20 cm. (International Scientific Series, v. 49 [i.e. 48]). Translation of Origin des Plantes Cultivees, 1883 ed. 2nd ed. 1886. [15 ref. Eng]
• ***Summary:*** This is the first English-language edition of this landmark work by de Candolle (lived 1806-1893), the renowned Swiss botanist, whose father (Augustin Pyramo de Candolle, lived 1778-1841) was also a famous botanist. The world's first authority on the origin of cultivated plants, Alphonse de Candolle postulates (p. 17) that agriculture arose independently in three regions: "China, the southwest of Asia (with Egypt), and intertropical America."

The section on soy is compiled from 15 earlier publications, which are footnoted. There is no separate bibliography at the back of the book.

"Soy–*Dolichos soja,* Linnaeus; *Glycine soja,* Bentham. This leguminous annual has been cultivated in China and Japan from remote antiquity. This might be gathered from the many uses of the soy bean and from the immense number of varieties. But it is also supposed to be one of the farinaceous substances called *shu* in Chinese writings of Confucius' time, though the modern name of the plant is *ta-tou.* The bean is nourishing, and contains a large proportion of oil, and preparations similar to butter, oil, and cheese are extracted from it and used in Chinese and Japanese cooking. Soy is also grown in the Malay Archipelago, but at the end of the eighteenth century it was still rare in Amboyna, and Forster did not see it in the Pacific Isles at the time of Cook's

© Copyright Soyinfo Center 2014

voyages. It is of modern introduction in India, for Roxburgh had only seen the plant in the botanical gardens at Calcutta, where it was brought from the Moluccas. There are no common Indian names. Besides, if its cultivation had been ancient in India, it would have spread westward into Syria and Egypt, which is not the case.

"Kaempfer formerly published an excellent illustration of the soy bean, and it had existed for a century in European botanical gardens, when more extensive information about China and Japan excited about ten years ago a lively desire to introduce it into our countries. In Austria, Hungary, and France especially, attempts have been made on a large scale, of which the results have been summed up in works worthy of consultation. It is to be hoped these efforts may be successful; but we must not digress from the aim of our researches, the probable origin of the species.

"Linnaeus says, in his *Species,* 'habitat in India,' and refers to Kaempfer, who speaks of the plant in Japan, and to his own flora of Ceylon, where he gives the plant as *cultivated.* Thwaites's modern flora of Ceylon makes no mention of it. We must evidently go further east to find the origin both of the species and of its cultivation. Loureiro says that it grows in Cochin-China and that it is often cultivated in China. I find no proof that it is wild in the latter country, but it may perhaps be discovered, as its culture is so ancient. Russian botanists have only found it cultivated in the north of China and in the basin of the river Amur. It is certainly wild in Japan. Junghuhn found it in Java on Mount Gunung-Gamping, and a plant sent also from Java by Zollinger is supposed to belong to this species, but it is not certain that the specimen was wild. A Malay name, *kadelee,* quite different to the Japanese and Chinese common names, is in favour of its indigenous character in Java.

"Known facts and historical and philological probabilities tend to show that the species was wild from Cochin-China to the south of Japan and to Java when the ancient inhabitants of this region began to cultivate it at a very remote period, to use it for food in various ways, and to obtain from it varieties of which the number is remarkable, especially in Japan."

Soy is also mentioned as follows: "The Chinese, who grew wheat 2700 B.C., considered it a gift direct from heaven. In the annual ceremony of sowing five kinds of seed, instituted by the Emperor Shen-nung or Chin-nong, wheat is one species, the others being rice, sorghum, *Setaria italica,* and soy. (p. 355).

A "General table of species" (p. 436+) shows the origin of cultivated plants. Under those "Cultivated for the seeds–Nutritive" (p. 442-43) is listed: "Soy–*Dolichos soja* Date: A. Origin: Cochin-China, Japan, Java."

The date code "A." signifies (see p. 436-37) that this Old-World species has been cultivated for more than four thousand years, according to ancient historians, Chinese works, and botanical and philological indications.

Also listed in this general table: Lupin, Egyptian Lupin, Bambarra Ground Nut, three types of buckwheat, and Kiery (*Amaranthus frumentaceus,* from India).

Plants native to North America: Jerusalem artichoke, mushroom (*Agaricus campestris*), pumpkin and squash, Virginia strawberry. Some other interesting plants: Tea from Assam, China, Mantschuria [Manchuria] (p. 117). Tobacco (p. 139). Cacao (*Theobroma cacao*) from tropical Brazil (p. 313). Arabian coffee from tropical Africa, Mozambique, Abyssinia, Guinea (p. 415).

In the final chapter, "General observations and conclusions" we read (p. 451): "Men have not discovered and cultivated within the last two thousand years a single species which can rival maize, rice, the sweet potato, the potato, the bread-fruit, the date cereals, millets, sorghums, the banana, soy. These date from three, four, or five thousand years, perhaps even in some cases six thousand years" (p. 451).

Soy is listed in the Index in three places as follows: Dolichos Soja, Glycine soya, and Soy.

Note 1. This is the earliest document seen (June 2006) that clearly refers to the cultivation of soybeans in Ceylon (renamed Sri Lanka in 1972).

Note 2. This is the earliest English-language document seen (Sept. 1996) that uses the word "soy" to refer to the soybean. Since 1688, "Soy" has always referred to soy sauce.

Note 3. When de Candolle refers to the scientific name of the soybean as *Glycine soja,* it is not clear whether he is using this term incorrectly as a synonym for the cultivated soybean, or correctly as the scientific name for the wild soybean.

Note 4. On the title page, under the author's name, we read: "Foreign associate of the Academy of Sciences of the Institute of France; Foreign member of the Royal Society of London, Edinburgh [Scotland], and Dublin [Ireland]; of the academies of St. Petersburgh, Stockholm, Berlin, Munich, Brussels, Copenhagen, Amsterdam, Rome, Turin, Madrid, Boston, etc.

Note 5. The term "centers of origin" or "centers of origin" does not appear in this book.

Note 6. Also discussed: Bambarra ground nut (*Glycine subterranea, Voandzeia subterranea;* p. 347-48). Quinoa (p. 351-52). Lupin (p. 325-27). Address: Geneva [Switzerland, 1882].

689. Cohn, Ferdinand. 1884. Ueber Schimmelpilze als Gaehrungserreger [On molds as instigators of fermentation]. *Jahres-Bericht der Schlesischen Gesellschaft fuer Vaterlaendische Cultur* (*Breslau/Wroclaw*) 61:226-30. For the year 1883. [Ger]

• ***Summary:*** In this lecture, presented on 31 May 1883, Prof. Cohn named the species *Aspergillus oryzae.* It had previously been named *Eurotium oryzae* Ahlburg (now a synonym).

© Copyright Soyinfo Center 2014

Note: Thom and Raper (1945, p. 261) note that "The name *E. oryzae* with an incomplete description for the saké organism was published by Korschelt, in *Dingler's Polytechnisches Journal* 230:330. 1878, as taken from a letter from 'Herr Ahlburg.'"

On page 227 Cohn notes: "In the winter of 1883 I obtained some grains of tane kosi [sic, *tané koji, tane koji*] (the so-called mother-yeast of the Japanese rice wine, saké) from Shinkizi [Shinkiji] Nagai, a native of Tokyo who was staying in Breslau as a student of agriculture. I prevailed upon this intelligent and industrious young man, under my supervision, to make sake using the tané koji and methods he had learned in Japan. After a number of unsuccessful trials, we met with excellent success. The Japanese methods are, although used for hundreds of years, so rational, that they can hardly be improved based on a scientific understanding of the process. Tane Kosi are grains of rice which are overgrown with the mycelium and spore bodies (*Fruchttraegern*) of *Aspergillus oryzae,* the splendid rice mold with its greenish-yellow conidia."

"Another fermentation product made by *Aspergillus oryzae* is the well-known soy sauce (*Sojasauce*). This was also prepared at our institute by Mr. Shinkizi Nagai using the Japanese method. This soy sauce was prepared from soybeans (*Sojabohne, Dolichos Soja*) that have recently been cultivated here. Soybeans are different from our typical beans in that they have a very low content of starch and are very rich in fat and 'Cheese-stuff' (literally *Kaesestoff,* Legumin, vegetable casein) [i.e., protein]. Because of this fact, the soybean is used to make cheese [tofu] in Japan."

A detailed description of the process for making soy sauce is then given.

Note 1. This is the earliest German-language document seen (April 2012) that uses the term *Sojasauce* to refer to soy sauce.

Note 2. Breslau is the German name for Wroclaw, a city in southwest Poland. Address: Prof., Dr.

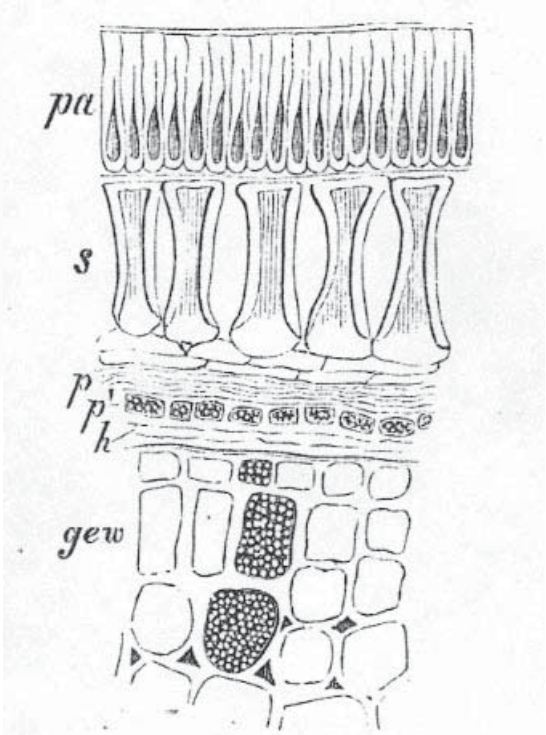
Kassel: Verlag von Theodor Fischer. xiv + 485 p. See p. 99. Incl. 100 illust. and tables. 19 cm. Vol. 5 in the series *Allgemeine Waarenkunde und Rohstofflehre.* [8 soy ref. Ger]

• ***Summary:*** This book describes how to analyze commercial products (chemically, microscopically, etc.) to determine their composition and to detect adulteration. Chapter III (p. 75-105) is titled "The legumes and their starches" (*"Die Huelsenfruechte und ihre Stärke"*). Section 8 (p. 99-103) within that chapter is titled "The soybean" ("Die Sojabohne"). The author discusses soy sauce and how to tell when it is adulterated, miso and how it is made in Japan, and the use of the soybean as a coffee substitute. He gives the weight of seeds according to data from Haberlandt, lists different varieties according to a classification by Harz (1880, 1885), describes the shape and structure of the seeds, gives a microscopic analysis of the shape of the cells in a cross-section of the seed coat. An illustration (line drawing of a microscopic image, p. 101) shows a "Cross section through the soybean," with the following cell types labeled: pa = palisade cells (*Pallisadenzellen* {*Palisadenzellen*}), s = hour-glass cells (*Säulenzellen*), p and p' = outer and inner parenchyma layer (*Aeussere und innere Parenchymschicht*), h = hyalin stria (*hyaline Streifen*), gew = seed tissue (*Samengewebe*). Starch-bodies are missing.



pa Pallisaden-, s Säulenzellen, p äussere, p' innere Parenchymschicht, h hyaline Streifen, gew Samengewebe. Stärkekörner fehlen.

Note 1. This is the earliest document seen (Feb. 2002) that describes use of a microscope to examine soybean cells or that contains an illustration of those microscopic cells.

The author presents a chemical analysis and description of the seeds. He notes that no trace of starch can be found

© Copyright Soyinfo Center 2014

in soybeans, a characteristic shared by lupins, one of the infallible criteria for detecting both, and an indication of the high nutritional value of the soybean. Peanut seeds are also discussed on p. 103.

On pages 417-31 Hanausek gives a detailed analysis of coffee substitutes. On page 424, in the subsection on "Coffee substitutes made from the seeds of legumes," he notes that this type is rarely found any more, but that the soybean may be used.

Note 2. Under the term "Genussmittel" (food adjuncts {stimulants / enjoyables}), Hanausek includes: Tobacco, tea, cocoa, coffee, kola nuts, cacao, Guarana* (paste from the seeds of the shrub or bush *Paullinia sorbilis Mart.* (*P. Cupana Kth.*) used in north Brazil), Tschan (Chan)* (made from the fruits of a type of sage plant in Guatemala), betel nuts, opium, and hashish. (* = not in a German dictionary).

Hanausek lived 1852-1918. Address: Krems an der Donau (Krems on the Danube), Austria.

692. Lincoln, Mary Johnson. 1884. Mrs. Lincoln's Boston cook book: What to do and what not to do in cooking. Boston, Massachusetts: Roberts Brothers. xiv + 536 p. Illust. Index. 20 cm.

• ***Summary:*** Worcestershire sauce is used as an ingredient (often optional) in 8 recipes in this book: Mock turtle soup (p. 137-38). Fish chowder (p. 155-56). Remnants of cooked fish (p. 169-70). Scalloped oysters (p. 177). Devilled lobster (p. 183). Tartar sauce (Hot for broiled fish, p. 194). Veal cutlets (p. 240-41). Salamis of game (p. 270).

In the section titled "Explanation of terms used in cookery" is the earliest definition of soy [sauce] found in a U.S. cookbook (p. 506): "Soy. A Japanese sauce prepared from the seeds of *Dolichos Soja.* It has an agreeable flavor and a clear brown color. Used to color soups and sauces."

In the section on "Bread and bread making" we read (p. 42): *"Health-Food Flour.*–A still better method of converting wheat into flour, and one which is indorsed by leading scientists and physicians, has been recently introduced by the Health Food Company of New York. Only the choicest kinds of wheat are used. The outer husk is first removed by moistening the grain, and subjecting it to a gentle rubbing by what is termed the 'attrition process.' This softens the woody fibre of the outer bran, which is easily removed by sifting, but does not affect the hard gluten coats. The grains are dried, then pulverized into various grades by a compressed cold-air blast, which dashes the grains into atoms with tremendous force. This is called *whole-wheat flour,* the name indicating that the whole of the gluten, or nutritive part of the flour, is retained. It is not sifted like other flours, but pulverized into all the varieties of *crushed wheat, coarse granulated and fine granulated wheat;* each variety, even the finest flour, containing all that is valuable as food. Bread made with this flour has been found, after repeated trial, to be sweet and agreeable to the taste, light and spongy in texture, with none of the objectionable features of Graham bread, and answering fully all the demands of perfect nutrition.

"Cheap inferior Graham flour, made of poor flour mixed with bran, is worse than no food at all." "The Arlington, the Franklin, and some other brands of whole-wheat flour, are highly indorsed by those familiar with them."

Note: Perhaps the most influential cookbook published in America before 1900, and "one of the most innovative, original cookbooks of all time, and precursor and predecessor of the most-enduring American cookbook, Fannie Farmer's *Boston Cooking School Cook Book* (1896)." "One reviewer at the time wrote: 'It is the trimmest, best arranged, best illustrated, most intelligible, manual of cookery as a high art, and as an economic art, that has appeared.'" "Lincoln's methods, often referred to as 'scientific cookery,' required cooks to understand systematic measurements, nutrition, digestion, and the chemistry of cooking, as well as the basics of keeping an orderly kitchen and serving as a gracious hostess."

Mary Johnson Lincoln lived 1844-1921. In the late 1870s, when her husband suffered from failing health, she "worked as a domestic to maintain an income... It was at this time that the Woman's Education Association (WEA) of Boston decided to establish a cooking school–the Boston Cooking School–which would become the most famous of the first American cooking schools." Lincoln wrote that the determining influence in its organization "'was the return of Mrs. Sarah T. Hooper... who had seen the work at the South Kensington School on her way through London, and came home filled with enthusiasm to have similar work in Boston, especially for the benefit of the poor and those who would work out as cooks.' Hooper, an active member of the WEA, became the first president, and hired Joanna Sweeney and Maria Parloa to teach classes." Lincoln soon became a teacher as well (MSU biography). Address: Boston Cooking School, Boston, Massachusetts.

693. Matsumura, Jinzô. 1884. Nippon shokubutsumeii; or, nomenclature of Japanese plants in Latin, Japanese, and Chinese. Tokio, Japan: Z.P. Maruya & Co. 209 p. + xciii. See p. 87. Supervised by R. Yatabe, Prof. of Botany in the Univ. of Tokio. Added title page in Japanese. 22 cm. 2nd ed. 1895. Third ed. 1916. [Lat; Jap; Chi]

• ***Summary:*** Matsumura lists two species of Glycine: "1,029. *G. hispida,* Moench.–Leguminosae. ô-mame, mame, daizu" (in Chinese characters).

"1,030. *Glycine Soja,* Sieb. et Zucc. tsuru-mame, no-mame" (Has no Chinese characters). Address: Asst. Prof. of Botany in the Univ. of Tokio, Japan.

p. See p. 420. 25 cm. 2nd ed. was 1888 (543 p., New York).
• ***Summary:*** The only apparent reference seen to soy (p. 420) states "Dwarf and long beans, peas and dolichos-beans are a good deal cultivated, though like various other vegetables they are much less important than two plants, which the Japanese can hardly do without. These are long white radishes or daikon... and the nasu or egg-plant (Solanum melongena)..."

Beans are also mentioned on pages 384, 405 (the *go-koku* or "five chief fruits of the field–rice, barley [and/or wheat], millet, hemp and beans"), and 446 (*go-koku*). Soy is not listed in the index. Johann Justus Rein lived 1835-1918. Address: Prof. of Geography in Marburg.

695. Yûeki shôyu seizô-hô hiketsu [Secrets of making fine, profitable shoyu]. 1884. Japan. [Jap]*

696. *Gardeners' Chronicle* (*London*). 1885. Japanese food vegetable products. 23:51. Jan. 10. New Series.
• ***Summary:*** This is the conclusion of an article begun in the 20 Dec. 1884 issue. "Soy. Two preparations from the Soy Bean (Glycine soja), besides that already referred to, deserve mentioning–namely, miso, a fermented substance; and shoyu, or soy itself. The first is a curious preparation, described as follows:–There are many ways of making miso, differing very little from each other; the kind containing the largest quantity of yeast is considered the best. The usual mode is after soaking Soy Beans in water for about two hours to put them into a suitable vessel and steam them; then, after mixing them with salt and yeast, they are removed to wooden plates; then the ingredients are very evenly mixed, the liquid is put into casks, and is then left untouched for upwards of a year. Another method is to soak a quantity of yellow Soy Beans in water for a night, then boil them in a large kettle, and as soon as the water in the kettle has evaporated, and the beans show a reddish-yellow colour, they are removed to a mortar and pounded, after which they are placed on mats. When they are thoroughly cooled they are shaped into balls as large as hand-balls, cut with a knife into flat pieces about an eighth of an inch thick, and placed on mats shaped like scales of fish. As soon as mould appears upon them they are taken, crushed into small pieces, and exposed to the rays of the sun for a day or two. When nearly dry, salt and water are added to them, and the whole is pounded in a mortar and then left in a cask for a month or two, and sometimes longer, when the preceding process will be repeated. Finally, if it is sealed up in casks it will never deteriorate. It is in prime condition when three years old. It forms one of the most necessary articles of food in Japan, and has been used from time immemorial, both by nobles and men of inferior rank. It is made into a soup, and is one of the courses served up as a principal article of everyday diet. The mode of preparing the soup is to rub the miso around an earthen bowl, into which a suitable quantity of water has been poured. It is then filtered through a sieve, and vegetables added according to taste; the whole is then boiled and served up. Miso is also used to give an agreeable flavour by mixing it with other food, and it is likewise mixed with condiments, as Japanese Pepper, Ginger, Horse-Radish, Chillies, Sesame, Poppy seeds, &c.

"Soy [sauce] or *Shoyu*, is perhaps the chief product of the Soy Bean. It consists of a mixture of these Beans, Wheat, salt, and water. The mode of preparing it is to thoroughly boil, after washing in a cask with water, fifty parts of Beans, and to parch about fifty parts of Wheat in a pan for a little while and thoroughly boil it, after grinding on a stone mill: when these two substances are mixed together and kept in a warm room for about four days, the substances are converted into a yellow flour-like matter: this is yeast. This yeast is then thrown into a mixture of salt and water, and afterwards thoroughly cooled, then boiled in a large kettle, and stirred with a Bamboo instrument twice a day in summer, and once a day in winter. After the lapse of three years, the sediment is poured into a bag then put into a small tub and submitted to strong pressure by means of a bar at the end of which hangs a heavy weight. The fluid expressed is poured into a kettle and submitted to a heat of not more than 80º; it is again removed to a large tub and set away for a night, when it becomes a deep black colour, and acquires a very delicious taste.

"Soy is one of the most valuable foods, and is in daily use; mixed with several kinds of food it imparts to them a delicious flavour. It is universally liked, and is really indispensable in the Japanese kitchen. The quantity annually consumed in Japan is extremely large, and of late years the article has been exported."

• ***Summary:*** Mr. Paillieux gives a lecture on two subjects: Shoyu (*Le Shoyu*) and *Le Haricot radié* (which appears to be a confused mixture of the green mung bean and the red azuki bean). "In 1880 I published in this bulletin an extended article about the chemical composition, varieties, culture, and uses of the soybean (*du Soya*)... Today I would like to call your attention again to *Shoyu*, a precious sauce which the Japanese could not live without, and to provide the means to taste it by distributing to each of you some small flasks that

© Copyright Soyinfo Center 2014

contain a sufficient quantity of it.

"You do not have to thank me for my generosity; these flasks were given to me by MM. J. de Vigan and Company, a large house importing Japanese and Chinese products..."

"I beg you not to confuse *Shoyu* with *India-Soy,* which is sold in London and even in Paris; the latter is only a poor imitation.

Note: Where and how is India-Soy made? What are the major differences in sensory qualities between the two sauces?

"*Shoyu* is not a condiment in the sense that we normally attach to this word. It does not have a pungent, heating taste like pepper, mustard, chili peppers, etc. To the contrary, it is refreshing. MM. de Vigan can speak of it with reason and precision, for they consume a bottle a week of it, as much for their children as for themselves.

"The Japanese put *Shoyu* on all that they eat, and according to all appearances, we would be tempted in France to make an immoderate usage of it when we begin to use it.

"I shall not speak to you of Japanese cuisine, which to me is strongly suspect, but I shall tell you that for me *Shoyu* can, in many cases, replace meat stock, quite a unique thing, but that explains itself perhaps by the notable proportion of fat that soybeans contain.

"A teaspoon of Shoyu in an ordinary broth makes it much better. It does wonders in *court-bouillon* for the cooking of fish. It combines advantageously with beefsteak stock. In a salad with cold meat, it has a very good effect. Finally, it is incomparable in scrambled eggs (*oeufs brouillès*).

"The house Potel and Chabot, whose chef is our colleague Mr. Lhermitte, served the table of the Japanese mission in 1878. He assures me that Shoyu is excellent in bean salads and unsurpassed with eggs, whatever the mode of preparation.

"You see that it is not necessary to be Japanese to multiply the uses of Shoyu. When a first-rate chef (*cordon-bleu*) has it, his/her cooking is transformed and becomes so much better that one does not perceive the use made of the famous sauce, at a moderate dose.

"Here, gentlemen, is a recipe for preparing Shoyu, made in France by my excellent correspondent Dr. Hénon who had learned it in Japan:

"'Take two parts naked barley or wheat and three parts soybean (*Daïdzu* (*Soya*)). Next soak for a day and a night in soft (non-calcareous) water. Then steam until completely cooked. The grains need not pop open but must be tender. Mix the two grains then spread them out in beds 2-3 cm high in wooden trays that are kept in a place that is fairly warm, neither too dry nor too humid. The grains will mold in 12-15 days, according to the season. The best time is spring or autumn. The mold must be greenish blue, thick and resembling velvet.

"'The big red or black molds are worthless; discard them as soon as they appear. When the grains are completely covered with mold and form a solid mass, expose them to the sun. When they are dry, rub them between the hands and sift them to get rid of the powder (mold spores?) produced by the moldy debris (*la poussière produite par les débris des moississures*). At this time, take two parts salt for three parts molded grains; place in barrels or earthenware vases with a sufficient quantity of water to cover all with 3-4 inches of liquid.'"

"'Stir the mixture up from time to time and wait three to six months, then filter the sauce through a sieve. It can be stored in casks or bottles for several years, and for my taste, replaces broth or meat stock quite well in cooking.

"'I do not know,' adds my correspondent, 'how much Shoyu is exported from Japan or how much is consumed in that country, but it is the basis of Japanese cuisine. It replaces butter, oil, fat, and meat stock. All beans, fish, and pasta ordinarily are accompanied by Shoyu. There is not a village, no matter how small it may be, that does not Shoyu makers in it. In addition, it is made often in particular houses.

"'During my sojourn in Japan, the price of Shoyu varied, according to its quality, from 8-12 *sen* (40-60 centimes) per *sho,* that is, 1.80 liters.'

"I published two other procedures, practiced in industry, that present notable differences with the household recipe that I just gave you.

"In one it is said that the grains ought to ferment in hermetically-sealed chambers, with the exception of two windows placed at the height of a man which allow surveillance of the operation.

"In the other, they prescribe a particular preparation of the salt destined for production of Shoyu.

"I do not give you the text of these documents. They are rather drawn out and are found in the report I published on soybeans. I do not want to abuse your kind attention."

At the end of the meeting, Mr. Paillieux distributed Shoyu to the attendees. Address: Secretary, France.

700. Watanabe, Eijiro. 1885. Tôfu no setsu [Theories on tofu]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 7:62-76. [Jap]

• ***Summary:*** Begins with a brief biography of the author by a friend named Sugiura. The author was an organic chemist employed at the Japanese patent office, and this article is an analysis of the chemical composition of tofu, published in part for reasons of public health and hygiene. Address: Japan.

701. Balfour, Edward. 1885. The Cyclopædia of India and of eastern and southern Asia, commercial, industrial, and scientific; products of mineral, vegetable, and animal kingdoms, useful arts and manufactures. 3rd ed.: Glycine hispida, Bentham. London: Bernard Quaritch. See vol. 1, p. 1213. 26 cm.

• ***Summary:*** Soja hispida, Moench, from Glykys, sweet, the roots and leaves of most of the species being so. An annual herb of India, China, and Japan; the main ingredient of the Soja condiment. G. Soja, Sieb, is said to be distinct from G. hispida.

There follows a detailed description of *Glycine Sinensis* [Wisteria or Wistaria], considered one of the most beautiful plants in Chinese gardens. Address: 2 Oxford Square, Hyde Park, London [England]. Founder of the Madras Muhammadan Library; of the Government Central Museum, Madras; of the Mysore Museum, Bangalore [India].

702. Balfour, Edward. 1885. The Cyclopædia of India and of eastern and southern Asia, commercial, industrial, and scientific; products of mineral, vegetable, and animal kingdoms, useful arts and manufactures. 3rd ed.: Leguminosae. London: Bernard Quaritch. See vol. 2, p. 697-98. 26 cm.

• ***Summary:*** "Leguminosae is a name of the Fabaceae or bean tribe, *q.v.* Leguminous and cruciferous plants occupy the largest part of the Chinese kitchen garden; many sorts of peas and beans are cultivated, and the pods and seeds of two species of dolichos are eaten, and the beans of another species made into soy by boiling and powdering the kernels and then fermenting them with yeast, and mixing other ingredients, according to the taste of the maker or purchaser. Peas and beans form important objects of culture, and the condiment called soy (a word derived from the Japanese Soya) is prepared chiefly from a species of dolichos. One of the commonest modes of making this condiment is to skin the beans and grind them to flour, which is mixed with water and powdered gypsum or turmeric. The common Chinese eat few meals without the addition of one form or other of the bean-curd or bean-jelly. The soy was at one time largely used as a condiment in the several countries of Europe, but has been displaced for others. See Fabaceae. ['The bean tribe, leguminous plants.' Soy is not mentioned.]" Address: 2 Oxford Square, Hyde Park, London [England]. Founder of the Madras Muhammadan Library; of the Government Central Museum, Madras; of the Mysore Museum, Bangalore [India].

703. Balfour, Edward. 1885. The Cyclopædia of India and of eastern and southern Asia, commercial, industrial, and scientific; products of mineral, vegetable, and animal kingdoms, useful arts and manufactures. 3rd ed.: Soy [sauce]. Bentham. London: Bernard Quaritch. See vol. 3, p. 715. 26 cm.

• ***Summary:*** This entry is shorter than and different, in parts, from its counterpart in the 1873 edition. New text: "Chinese use Soja hispida pulse when ripe for the manufacture of an oil, and give the remnant of the grain, together with stalks and leaves of the plant, as a food for cattle. Its cultivation has become general in Syria [sic, Styria], Dalmatia [in Croatia], and Hungary. In the two former countries, the grain, after being allowed to ripen, is threshed out and roasted, and then employed for making coffee. In China, the grains are soaked till they swell and become soft, and then cooked like the small sort of beans. In other places, the seeds are set in a very damp, watery soil, and kept in darkness until they sprout up into a long white stalk, 4 or 5 inches high, which is then cut and served up after the manner of a salad. A sort of cheese, consumed in quantities by the poorer people both in China and Japan, is made from Soja hispida.

Note: This appears to be the earliest document seen (June 2007) concerning soybeans in Syria, or the cultivation of soybeans in Syria. However, Balfour got his information about Syria, Dalmatia, and Hungary from Friedrich Haberlandt's classic book *The Soybean* (*Die Sojabohne*), the only early work in which Dalmatia and Hungary are both discussed. The third place, however, is Styria (Steiermark in German), not Syria! The next earliest reliable document concerning cultivation of soybeans in Syria was published in 1975, and describes soybean trials in Syria in April 1974. Address: 2 Oxford Square, Hyde Park, London [England]. Founder of the Madras Muhammadan Library; of the Government Central Museum, Madras; of the Mysore Museum, Bangalore [India].

704. Candolle, Alphonse de. 1885. Origin of cultivated plants. New York, NY: D. Appleton and Co. viii + 468 p. See p. 330-32, 443. The International Scientific Series Vol. 48. Translation of Origin des Plantes Cultivees, 1883 ed. 2nd ed. 1886. Reprinted in facsimile in 1959 by Hafner Publ. Co, New York. 19 cm.

• ***Summary:*** This is the first U.S. edition of this landmark work by de Candolle (lived 1806-1893), the renowned Swiss botanist, whose father was also a famous botanist. The section on soy in this edition is identical to (in fact, a facsimile of) that in the first British edition published in London in 1884.

De Candolle, a Swiss botanist, was the first to recognize that information from botany, philology, geography, and archaeology must be integrated if scholars were to understand the origins of agriculture. He tried to determine the regions where most of the world's important crops were first domesticated. Address: Foreign Assoc. of the Academy of Sciences of the Inst. of France.

la Société Nationale d'Acclimatation. 592 p. Index. 24 cm. [34 soy ref. Fre]

• ***Summary:*** The title page states in small letters: *Extrait du Bulletin de la Société Nationale d'Acclimatation,* indicating that much of the material in this book is based on articles previously published in this French-language Bulletin. However many other early books on Japanese agriculture have also been consulted and are carefully cited.

In the Introduction, the author explains that he was appointed by the Society for Acclimatization to prepare this report on the vegetable products of Japan which had been exhibited at the Universal Exposition of Paris in 1878–in two parts. Those displayed by the Japanese firm Trocadero, and those displayed in the galleries of the palace at Champ-de-Mars. The author and many others were deeply impressed by this exhibition.

Grains (class 69, p. 31): Wheat or rice are mixed with beans or peas and fermented to make shoyu and miso. Shoyu is one of the most widely used condiments in Japanese cuisine. The method of production is described briefly. Among the condiments displayed in class 74 were a number of flasks of shoyu from Tokyo.

Legumes (p. 40-47): Discusses soybeans, tofu, azuki beans (*Phaseolus radiatus* var. *subtrilobata,* p. 42-44; incl. yayenari, red, white, black, and yellowish azuki, Dainagon azuki, azuki flour, an, yokan), shoyu, soybeans (*Pois oléagineux, Soja hispida,* p. 45-46; incl. Kuro-mame {Black soybeans}, various colors and shapes of dry soybeans {green, yellowish, large yellowish, greenish black, brownish red, white, large red}).

There is also a special, long section on soybeans (*Soja hispida. O mame: Daizu;* p. 270-83) and soyfoods. In the Japanese exposition, the display of useful products (*tableau des productions utiles*) designates: No. 24. *Kuro-mame.* Black-seeded soybeans, the size of an average sized haricot bean. No. 25. *Shiro-mame.* White-seeded soybeans, spotted / flecked / speckled / mottled (*tachetées*) with gray. No. 26. *Ao-mame.* Greenish-seeded soybeans. No. 34. *Gankui-mame.* Black-seeded soybeans, flecked with white.

The soybean (*Le Soja*) is cultivated in Japan, India, Ceylon, the Malacca peninsula [today's Malaysia], the Philippine islands, Borneo, Java, the kingdom of Siam, Cochin China, Tongkin (*Tong-King*), and throughout China, primarily in Mongolia and in the provinces of Henan / Honan, Liaoning (*Shenking*), Shandong / Shantung, and Shanxi / Shansi (*Chan-si*).

The Chinese exposition (class 73) contained samples of all the varieties of soya cultivated in all the provinces of the empire. Nos. 2991 to 3000. Green, white, black, yellow, striped or variegated, and reddish soybeans, provided by the Chinese customs office at Newchwang. Nos. 3014-16. Yellow, black, and green soybeans from the customs office at Tientsin. Nos. 3058-61. Yellow, green, and black soybeans from customs at Yantai / Chefoo. No. 3091. Yellow soybean from customs at Chinkiang. Nos. 3013-19. White, red, black, and yellow soybeans from customs at Shanghai. Nos. 3125-28. White, black, red, and green soybeans from customs at Wenzhou / Wenchow. Nos. 3152-56. White, green, and black soybeans from customs at Kao-hsiung (*Takow*).

The soybean is one of the plants most widely used in Japan and China for both food and industrial purposes. As indicated previously, shoyu, miso, and tofu are indispensable to the Japanese diet. Samples of these products were displayed in the Japanese exhibit in class 74 (condiments and stimulants); they came from Tokyo and from the province of Hizen, mainly from the town of Nagasaki. In the Chinese exhibit, also in class 74, were samples of (*soye*) or (*soya*) which are similar to Japanese shoyu but are called *Chiang-yu* (*Tsiang-yeou*) in China. They were provided by the customs offices at Yantai / Chefoo, Ning-po, Wenzhou / Wenchow, and Canton. For aroma, the Chinese often add star anise, green anise, and orange peel. Chinese soy sauce is made from yellow soybeans (*Houang-téou*).

Note: This is the earliest French-language document seen (April 2012) that uses the term *Chiang-yu* to refer to soy sauce.

Note: This is the earliest document seen (Jan. 2006) describing a soy sauce made with star anise, green anise, orange peel or other spices or herbs outside of Indonesia.

A detailed description of the method for making Japanese shoyu is given, excerpted from the book *Le Japon à l'Exposition universelle de 1878* [Japan at the Universal Exposition of 1878] (1878, vol. II, p. 124). Additional excerpts concerning shoyu, miso, and tofu are taken from: Simon 1862, Kaempfer 1712, *Bulletin of the Society for Acclimatization* 1880 (p. 248), and Champion 1866.

In France, Mr. Vilmorin and Dr. Adrien Sicard (of Marseilles), who are both involved with soybean cultivation, have prepared soy cheese (*fromage de Soja*) numerous times. Dr. Sicard has made both the white cheese [probably tofu] and the red cheese; the latter is rolled in a powder made by grinding red sandalwood (*santal; Pterocarpus santalinus*), mace, and cinnamon (p. 276).

One of the most important soy products is the oil, which is obtained from the seeds–especially the large yellow soybeans that the Chinese call *Houang-téou.* The Japanese do not make soy oil (*huile de Soja*) but in China manufacture of this product gives rise to considerable commerce. Fremy (1855) found that soybean seeds contain 18% oil. The oil is a drying oil, yellow in color and with a special odor and a taste of dried legumes, similar to that of peas. It is used in cooking and illumination. In China, quite a few soy oil factories are found at Calfond in Henan, at Tsinan in Shantung, and at Tayeurn in Shanxi. But the center of soy oil production in China is Ning-po in Zhejiang / Chekiang. From the port of Ning-po and from a port on the island of *Tcheou-chan* [*Zhoushan?*] a large number of junks, carrying only soy oil, depart. Two other manufacturing centers are Newchwang

© Copyright Soyinfo Center 2014

and Chefoo. There follows a detailed description (p. 276-77) of how soy oil is obtained from soybeans.

Another common use is as fermented black soybeans (*Chi*) which (according to Stanislas Julien) contain soybeans mixed with ginger and salt. Kiu-tsee is a fermented soy product made in Canton; it contains red rice, soybeans, and the leaves of *Glycosmis citrifolia.* The Chinese also make a pasta and a sort of vermicelli from soybean seeds named *Hou-mi-téou.*

The stems and leaves make excellent forage. Black soybean seeds are often mixed with chopped soybean hay and fed to horses and mules in northern China and Manchuria.

In Japanese and Chinese medicine, black soybean seeds, ground and made into a decoction, are used to combat asthma attacks.

There follows a long history (p. 277-83) of the introduction of the soybean to Europe (starting at the Jardin des Plantes in Paris, in 1740 or 1779) and its acclimatization, based largely on articles from the *Bulletin of the Society for Acclimatization.* It includes a summary of the work of Prof. Haberlandt in central Europe.

Also discusses: Japanese plum trees (*Prunus mume*) and umeboshi salt plums (p. 52-54, 466-67). Sesame seeds and sesame oil (p. 54-55). Amaranths (p. 63-64). Job's tears (*Coix lacryma;* p. 214-15). Kudzu, kuzu powder, and kuzu cloth (*Pueraria Thunbergiana;* p. 283-85). Peanuts and peanut oil (*Arachis hypogæa, Tojin-mame;* p. 286-87). Sesame seeds and sesame oil (*Sesamum indicum, Goma;* p. 518-20). Hemp and hemp oil (*Cannabis sativa, Asa;* p. 558-59). Address: Médecin de la Maison de Santé de Saint-John de Dieu [Paris, France].

707. Official report of the Calcutta International Exhibition, 1883-84. 2 vols. 1885. Calcutta: Bengal Secretariat Press. See Vol. I, Part I, p. 270. 23 cm.

• ***Summary:*** On the title page: "Compiled under orders of the Executive Committee."

In Vol. I, Part I (which is 489 pages), page 270 states: "(6) Glycine Soja, (S. & Z.)–The Soy Bean.

"This is known in the vernacular as *Gari-kulay,* Beng. [Bengali]; *Bhat, bhatwan,* Hindi; *Tsu dza,* Naga. This plant is densely clothed with fine ferruginous hairs, is sub-erect; met with in the tropical regions and the outer Himalaya, from Kumaon to Sikkim, the Khasia and the Naga Hills to Upper Burma. Dr. Stewart mentions a field of bhat having been observed in Bissahir in the Panjab [Punjab; probably in today's Pakistan], altitude 6,000 feet. The plant is chiefly met with in a state of cultivation. Dr. Roxburgh first saw it from seed received from the Moluccas in 1798."

Note 1. The reference to "Dr. Stewart" almost surely refers to John Lindsay Stewart who wrote important books in 1867, 1869, and 1874 (plus at least 6 scientific articles) on the plants of the Punjab and north-west India. Two of these books have now been scanned in "full view" but we can find no statement resembling the one above attributed to Dr. Stewart. In 1864 Dr. Stewart was appointed the first Conservator of Forests in the Panjab. He died on 5 July 1873 in Dalhousie at age 41.

"De Candolle views it, and apparently correctly, as a native of Cochin China, Japan, and Java. But he remarks that "it is of modern introduction into India." "There are no common Indian names" for it. This seems to be a mistake; the plant is well known in India under the names given above. In Manipur and the Naga Hills it is one of the most abundant of pulses. Its Naga name is *Tsu dza,* a name not unlike *Soja,* but at the same time it may be viewed as related to the old Chinese name *Shu.* The Soya most likely reached India from China, passing by way of Assam. But while it cannot be said to be wild on the Naga hills, from the existence of so large a percentage of Japan and Java plants on those hills, the Soya might quite probably have had its most western home on the mountain tracts bordering on Assam. The importance of these hill tracts in settling questions of the nativity of cultivated Indian and Chinese plants has not been fully appreciated, and we might fairly anticipate that many statements at present accepted as facts will be considerably modified with an extended knowledge of the wild and cultivated plants of the Assam and Chinese frontier. The thorough exploration of this region is very desirable.

Note 2. This document contains the 2nd earliest date seen for the cultivation of soybeans in north east India (1885).

Note 3. This is the earliest document seen (Sept. 2010) concerning the cultivation of soybeans in Manipur, or in Nagaland, both North East Indian states which shares a long border with Assam.

"This pulse is an important article of food in Tibet. It is made in India into a sauce called "Soy." The advisability of extending its cultivation on the Himalayan tracts was pressed on the Government of India in 1882 by Professor Kinch, and the attention of local Governments also was called to it."

Note 4. This is the earliest document seen (Sept. 2010) concerning soybeans in Tibet, or the cultivation of soybeans in Tibet. This document contains the earliest date seen for soybeans in Tibet, or the cultivation of soybeans in Tibet (1909). The source of these soybeans is unknown–as, unfortunately, is the author's source of this information about soybeans in Tibet. Note that the lowest elevations in Tibet are about 12,000 to 15,000 feet, and the summer temperatures are quite cold. It seems unlikely that soybeans would grow under these conditions.

Note 5. Is it possible that soya is really "an important article of food in Tibet?" If so, what is the author's source of information? We have seen no such source? Is it cultivated there? In what form is it consumed? Roasted soy flour might be used like *tsampa* (roasted barley flour).

In the section on "The oils, oil-seeds, soap..." we read (p. 305): "Very extensive collections of oilseeds were shown, especially those collected by the Chamber of Commerce, Bombay... The following may be enumerated as the most interesting and useful oils:..." Among the 71 oils listed, No. (36), page 308 is: *"Glycine Soja,* (*Sieb.*).–The Soy Bean. Large quantities of this seed are annually consumed in the manufacture of an edible oil."

Other oils include: "(9) *Arachis hypogæa,* (*Linn.*).–The Ground-nut or Earth-nut. This may be described as a modern industry; the oil, as a substitute for olive oil, having within the past 30 or 40 years developed in an almost unprecedented manner." France is a major importer of the nuts.

On the last two pages of Vol. I, Part I is a "Vernacular notice," whose "Translation" is given. It begins: "It is hereby brought to the notice of the general public that an Exhibition of all things worthy to be shown from all countries of the world will be held in Calcutta on the Maidan from the 4th of December 1883 till the 1st of March 1884." The frontispiece shows an aerial view of the Exhibition.

Note 6. Maidan, which means literally "open field," is the largest urban park in Calcutta. As of Oct. 2010 it still exists, is widely used, and is the home to numerous play grounds, including the famous cricketing venue Eden Gardens, several football stadia, and the Kolkata Race Course.

"(26) *Cocos nucifera,* (*Linn.*).–The Cocoa-nut." "(68) *Sesamum indicum,* (*Linn.*).–Gingelly or Sesame Oil." Address: Calcutta, Bengal [British India].

708. Paillieux, Auguste; Bois, D. 1885. Le potager d'un curieux. Histoire, culture et usages de 100 plantes comestibles, peu connues ou inconnues: Soya [The inquisitive person's kitchen garden. History, culture, and uses of 100 edible, little-known or unknown plants]. Paris: Librairie Agricole de la Maison Rustique. 294 p. See p. 261-65. 2nd ed. 1892. 3rd ed. 1899, p. 575-625. [1 soy ref. Fre]
• ***Summary:*** The five-page section on Soya (p. 261-65) discusses its use primarily as a vegetable. For more about its broader uses, see Paillieux's 1881 book titled *Le soya, sa composition chimique, sa culture et ses usages.* This section discusses: Englebert Kaempfer's writings: "In Japan, this plant is named *Daidsu* and surnamed *Mame,* that is to say a food grain *par excellence."* Cultivation trials with four varieties conducted by the Society for Acclimatization: (1) Soybean from China, cultivated in Hungary, imported by MM. Vilmorin-Andrieux and Co. The seed color is pale yellow and the hilum is brown. This is the earliest maturing variety we have seen. (2) Soybean of Etampes. These seeds were distributed in 1874 by the Society for Acclimatization. The seeds are light yellow and the hilum is white. The plant is beautiful, very strong and very productive, but a little late in maturing. (3) The green soybean, originating from Japan, has rather roundish green seeds and a brown hilum. Its is not as early as the soybean from China, mentioned above. (4) The light green soybean, with a white hilum, has somewhat flattened seeds. It has come to us from both Japan and China. Its pods mature rather late. Vilmorin is importing more varieties, including a brown one. The variety in their 1880 catalog seemed a bit late.

There follow instructions for planting, cultivating, and harvesting soybeans (*Soya*). When the soybeans are fully developed, but before the pods begin to dry, they should be picked. At this stage they are as good as fresh flageolets–though the pods are a bit difficult to remove.

In the dried state, soybean seeds make a good food. Their taste is sweet and very agreeable. We have prepared them like ordinary white haricot beans. They should be soaked for 24 hours before cooking in water that is not hard, or in distilled water. For best results, add 3 grams per liter of soda crystals [sodium bicarbonate].

Soya is without doubt the best of all the coffee substitutes. Many housewives serve a mixture of coffee and chicory each morning for breakfast. But [ground] roasted soybeans need not be mixed with anything. It gives a good coffee *au lait* whose aroma resembles that of Mocha–though it is not as strong. The soybean is cultivated in Tyrol [Tirol] and the Istrian Peninsula under the name of "coffee bean," and we suppose this is also the case in Dalmatia and the south of Italy.

Mr. Heuzé in his book *Edible Plants* (*Plantes alimentaires*) gives the soybean the name *Dolic à café* (the coffee bean) and says that it is cultivated in some points in the departments of Ariège and of Haute-Garonne; we have not been able to verify this. Recently we learned from Mr. Faivre, of Beaune, that the soybean had been introduced, about 12 years ago, at Allery, a commune in Saône-et-Loire [in east central France] by Father Cretin (*M. l'abbé Crétin*), and that its seeds were used like coffee beans by many families in the country.

Mr. Faivre, an ardent and generous propagator / spreader of soya, sent us some seeds of the plant cultivated at Allery. They are brown and identical to those recently imported by Vilmorin. Finally, the engineer and head of one of our departments wrote us that he enjoys Soya each morning for breakfast, and that he prefers it to Mocha. He recommends roasting the seeds lightly.

If gardeners will set aside a little space for Soya each year in their gardens, they will obtain, at no extra expense, the coffee needed each morning by their families.

There is much more we know and could say about Soya. Worldwide, it occupies a place equal to wheat, corn, and potatoes. Indeed, it makes an excellent forage. It contains 18% oil. The cake, which remains after the oil is extracted, makes a powerful fertilizer. Under various forms, these seeds become part of the daily food of hundreds of millions of people. They are also used to feed animals, especially millions of horses and mules.

As numerous analyses have demonstrated, they constitute the richest and most complete food that one can desire. We recommend to the reader the recent work, done with great care by Pettet and Schou, in *Revue des Industries Chimiques et Agricoles* (1882).

Contents: Introduction. Discussion of individual plants arranged alphabetically by their French names. For each plant is given, below the French name: Scientific name, early sources, and plant family. Some of the plants discussed include: Amaranth (*Amarantus oleraceus*). *Glycine apios* (legume family). The peanut (*Arachis Hypogaea; Arachide, Pistache de terre*) (p. 20-23). Daikon or Japanese radish (*Raphanus Sativus,* L. var; *Daikon ou radis du Japon*). Azuki bean (*Phaseolus Radiatus; Haricot radié*) (p. 102-07; The section titled "A Java" mentions seasoning a dish with *Ketjap,* which it calls *la sauce noire,* or "black sauce"). Glutinous yam (*Dioscorea Batatas; Igname*). Konnyaku (*Amorphophallus Rivieri; Koniaku*). Kudzu (*Pueraria Thunbergiana; Kudzu*) (p. 154-64). White melon of Japan (*Cucumis Melo; Shiro uri; Melon blanc de Japon*). Myoga (*Zingiber mioga; Mioga*). Udo (*Aralia cordata; Oudo*). White quinoa (*Anserine Quinoa; Chenopodium quinoa; Quinoa blanc*) (p. 242-45). Chufa (*Cyperus esculentus; Souchet comestible, Souchet sultan, Amande de terre*) (p. 256-61). Soya (*Dolichos Soja; Soja hispida Moench; Glycine Soja; Soya*) (p. 261-65). Bambarra groundnuts (*Voandzeia subterranea; Voandzou*) (p. 272-74). Table of contents (by both French name and scientific name). Address: 1. Member of la Société nationale d'Acclimatation; 2. Préparateur au Muséum. Member of the Société Botanique de France.

709. Welch, Adonijah Strong. 1885. Report on the organization and management of seven agricultural schools in Germany, Belgium, and England. Washington, DC: Government Printing Office. 107 p. See p. 73-77. Made to Hon. George B. Loring, U.S. Commissioner of Agriculture. • ***Summary:*** The last section is titled "The Royal Agricultural College at Cirencester, England," where the author visited on 8 Feb. 1884. The subsection titled "Work of the laboratory" (p. 73) describes seven types of current original research. including: "7. On the soy bean (Soja hispida), its chemical composition and value as a food.

"The following is a detailed account of Prof. Edward Kinch's description and analyses of the soy bean of China. I append his entire report of the results of this interesting investigation, because it not only shows the character of the work done in his laboratory, but indicates that this bean may be profitably grown in some parts of the Western States. Indeed, the same bean was grown on the experimental grounds of the Iowa Agricultural College last year, and showed a very large yield."

Prof. Kinch's report, titled "The Soy bean," states: "This bean, sometimes known as the Japan pea and China bean, is the seed of the *Soja hispida,* Miquel (*Glycine hispida,* Moench; *Dolichos Soja,* Linné; *Glycine Soja,* Jaquin), a plant of the natural order Leguminosae,..." suborder Papilionaceae, and tribe Phaseolæ. Its natural habitat appears to be China and Japan; it also grows in Mongolia and in India, in the Himalayas, and within the last few years it has been cultivated experimentally in several European countries. This bean is worth more than a passing notice, as it is the vegetable which approaches most nearly in its proximate chemical composition to animal food. This will be seen later on. There are a great number of varieties of the soy bean known, which differ to some extent in the shape, size, and especially in the color of the seed, and in a few minor particulars, but which seem to vary comparatively little in chemical composition. Dr. C.O. Harz has classified the principal varieties as follows:

"Group I.–*S. hispida platycarpa. 1. olivaeea. 2. punctata. 3. melanosperma* (*a. vulgans. b. nigra. c. renisperma. d. rubro-cincta*). *4. platysperma. 5. parvula.*

"Group II.–*S. hispida tumida. 6. pallida* (*Roxburgh*). *7. castanea. 8. atrosperma.*

"These names sufficiently indicate the nature of the variety as far as the seed is concerned. The soy bean is extensively cultivated in the north of China, whence it is exported, to the southern provinces; it is here pressed for the sake of its oil and the residual cake largely used as a food for man and beast, and also as a manure.

"In Japan it is known by names signifying the bean, and from it are made not only soy [sauce] but a paste known as *miso,* which is in constant request at nearly every meal, *tofu,* or bean cheese, and other foods used to a less extent. This bean cheese is also well known in China, and is obtained by extracting the legumin from the beans with water and precipitating it with brine. An analysis of it is given below.

"These foods are most valuable additions to the dietary of the Oriental nations, and especially of the Japanese, who use so little animal food; they tend to supply the deficiencies of the staple food, rice, in nitrogenous matter, fat, and also in mineral constituents.

"The Buddhist priests, who are strictly forbidden to use animal food, consume considerable quantities of these beans, principally in the form of *miso.* The soy bean first attracted attention in Europe in 1873, when specimens from Japan, from China, and from India were shown at the Vienna International Exhibition. Dr. Forbes Watson, reporter on the products of India, called attention to it in the Catalogue of the Exhibits of the Indian Museum. Since then numerous experiments have been made on the European Continent on its growth, and also feeding experiments with the bean and its straw on different kinds of domestic animals have been prosecuted. Such experiments have been carried on by Wolling and Wein, at Munich; by Haberlandt, Lehman, Harz, Stahel, Zimmerman, Siewert, Wieski, and others, at various stations in Germany, Austria, and Hungary, and experiments have also been made in France and in Italy.

© Copyright Soyinfo Center 2014

"The proximate chemical composition of some of the different varieties, grown in different places, is now given and compared with some other foods of vegetable and animal origin."

Table 1, titled "Percentage composition of the soy bean," gives the percentage of six constituents (water, nitrogenous matter [protein], fat, carbohydrates, fiber, and ash) in seven different types of soy beans: Pale yellow (from Japan, China, Germany &c., India), brown, round black, and long black.

"It has been shown by Levallois (*Comptes-Rendus*) that the soybean contains a special variety of sugar, many of its properties resembling mellitose; this constitutes about 10 per cent, of the soluble carbohydrates. Of the nitrogenous matters nearly all is in the form of albumenoids; a small quantity, about 1 per cent., appears as a peptone-like body, and about one-tenth to two-tenths per cent. is non-albuminoid."

Table 2, titled "Percentage composition," compares the percentage content of the six constituents listed above for six foodstuffs: Peas, [common] beans, lupins, lentils. lean beef, and fat mutton.

"These analyses show the greater richness of the soy beans in nitrogenous matter and in fat than the common bean and pea, and that, when the water is equalized, it more nearly approaches meat in proximate composition. The only leguminous seed of common occurrence, which contains more oil than this bean, is the earth-nut or ground-nut, *Arachis hypogæa,* which is now so largely cultivated abroad for its oil and its cake. In order to compare the soy bean straw with hay and with other straws of like nature, the following average analyses are given:

Table 3 (untitled) compares the percentage content of the six constituents listed above for six feeds: Meadow hay, bean straw, pea straw, lentil straw, soy bean straw, soy bean hulls.

"A special variety of *Soja hispida* is cultivated in some parts of Japan as a fodder crop and cut just as the pods are fully formed. The hay made from this is much relished by horses, cattle, and sheep. A sample of a crop grown on the Imperial College of Agriculture Farm, Komaba, Tokiyo, gave on analysis: Water 15.0%, nitrogenous matter 19.8%, fiber 35.9%, ash 6.8%, carbohydrates and fat 22.5%. Total 100.0%.

"It will be seen that this hay exceeds even lentil straw in the amount of nitrogenous matter it contains." Continued. Address: LL.D., Ames, Iowa.

710. Welch, Adonijah Strong. 1885. Report on the organization and management of seven agricultural schools in Germany, Belgium, and England (Continued–Document part II). Washington, DC: Government Printing Office. 107 p. See p. 73-77. Made to Hon. George B. Loring, U.S. Commissioner of Agriculture.

• ***Summary:*** Continued from page 76: "The following are means of various analyses made in Japan of food products obtained from the soy bean, and which are largely consumed there:"

Table 4, titled "Percentage composition," shows the percentage content of the six constituents listed above in four Japanese food products: White miso, red miso, bean cheese [tofu], and frozen bean cheese [dried frozen tofu].

Note 1. This is the earliest English-language document seen (April 2013) that uses the term "frozen bean cheese" to refer to dried-frozen tofu.

"The ash of miso consists mainly of common salt, which is added in the process of manufacture.

"The ash of the soy bean was found, as a mean of several samples, to have the following percentage composition. The composition of that of the straw is also given: Table 5 (untitled) lists the percentage composition of each of the following constituents in soy bean ash and soy bean straw ash: Potash, soda, lime, magnesia, ferric oxide, chlorine, phosphoric pentoxide, sulphur trioxide, and silica.

"The crop takes from the soil a large amount of valuable mineral constituents, phosphoric acid and potash, as well as a large amount of nitrogen.

"The results of the German and Austrian experiments show that where temperature is not too low, the result of the harvest as compared with that of ordinary beans or peas is exceedingly satisfactory.

"The kinds most suited for cultivation there are the yellow, brown, round black, and long black varieties, i. e., *pallida, castanea, atrosperma,* and *melanosperma,* especially the first three named. They require a vegetation time of about one hundred and fifty days, during which the average temperature must be about 58º F. (14.3 C.), and number of heat units (the average temperature multiplied by the number of days) [*Wärmesummen*] about 2,100 C. They may be sown the beginning of May and harvested the end of September or even the beginning of October.

"The seeds should not be sown deeply, not more than 1 to 1½ inches deep, and about eighteen plants to the square yard may be left after weeding and thinning out. The plants grow to a small bush about 2½ feet high, and produce pods with two to five seeds. The most suitable soil is a peaty soil, or one containing a good deal of organic matter, and the next most favorable is a calcareous soil. Nitrate of soda has been found to be a good manure for the crop in Germany and also potash salts, especially potassium sulphate. Ammonium sulphate did not give as good a return as the same amount of nitrogen in the form of nitrate; on soils poor in organic matter it would probably be better to supply the nitrogen in some organic combination, such as rape-cake, shoddy, and the like. Phosphoric acid, especially as a dicalcic phosphate was a help on some soils.

"Field experiments made by myself on this crop in Japan showed that wood ashes had a good effect, and that anything like an excess of nitrogen was very harmful to the yield of grain. In that country the plants are often sown on

© Copyright Soyinfo Center 2014

the dividing ridges between the plots of paddy and without any manure. The yield of seed and straw in the German experiments compares very favorably with that of peas and beans grown under the same conditions; from 2,000 to 3,000 pounds of seed and from 5,000 to 10,000 pounds of straw per acre have been obtained.

"Feeding experiments with the produce have been made with pigs, sheep, oxen, and milch cows, and with very good results. The bean is a most excellent addition to other foods, especially such as are deficient in nitrogenous matter and fat. The digestion co-effients of the nitrogenous matters of the fat and of the non-nitrogenous matter of the soy bean, and also in the cake left after its pressure for oil, closely approximate to 90 in each case. As a mean of two direct experiments with soy bean straw, the digestion coefficients were found to be as follows: Nitrogenous matter 60.8, fat 6.2, fiber 33.6, and non-nitrogenous extractive matters 69.0. The hulls are rather less digestible.

"The albuminoid ratio in the bean is about 1 to 2.3, in the straw 1 to 8.1, in the hulls about 1 to 20, and in the cake 1 to 1.3. An analysis of the cake shows: Water 13.4%, nitrogenous matter 40.3%, fiber 5.5%, carbohydrates 28.1%, fat 7.5%, ash 5.2%. Total: 100.0%.

"In good condition it would be a valuable addition to our feeding cakes, but it is too highly valued in the East to enable it to be imported to any extent at a profit.

"The soy bean plant has considerable power of resisting unfavorable climatic influences, as cold, drought, and wet; and appears to be particularly free from insect attacks, and, indeed, from all parasites; this last, if it continues, is by no means a slight advantage. The soy beans are eagerly bought by the natives of Southern Italy, an almost vegetarian race; that they are easily digested I can speak from experience, having frequently used them on my table, cooked after the manner of haricots. Taking into account the great richness of these beans in valuable food constituents, their easy digestibility, the value of the straw, and the great probability of some variety being able to be acclimatized without great trouble, this *Soja hispida* is worth consideration. The bean would form an exceedingly useful addition to the food of the poorer classes, as a substitute for a portion of the animal food which in the kitchens of the laboring classes is so wastefully cooked. One use it has already found, not altogether to be commended, viz., after roasting, as an adulterant of and substitute for coffee.

"We have procured seeds of several varieties direct from Japan, and of one variety from Germany, and these are now being cultivated in the botanic garden. They were sown rather late, and the month of June has not been favorable to their growth, but some of the varieties promise fairly." Address: LL.D., Ames, Iowa.

711. Enslie, J.J. 1886. Japan. Report for the year 1885 on the trade of Nagasaki. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 39. p. 1-11.
• ***Summary:*** A table (p. 8) shows the quantity (in lbs) and value (in pounds sterling; 1 pound = $4.88 in 1885 and $5.00 in 1884) of principal articles imported to Nagasaki during the year 1885. Oilcake [soya]: 1885–2,706,054 lbs worth £4,316. No figures are given for 1884. Note: By far the most valuable export from Nagasaki in 1885 was coal (for use as a fuel in ships, and for heating).

Note: This is the earliest English-language document seen (Nov. 2005) that uses the word "oilcake" to refer to cakes made of soybeans from which the oil has been removed by pressing. Address: Japan.

712. Hubbard, Richard B. 1886. Japanese bean curd. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 19(68):646-51. Sept. [1 ref. Eng]
• ***Summary:*** "I transmit herewith a translation of an article on the manufacture of tôfu, or Japanese bean curd, published by the Educational Museum of Tokio. The use of this bean (the *Soja hispida* or *Glycine hispida*) in the manufacture of so nutritious an article of diet, the nearest approach as it is stated, in its chemical constituents to animal food among known vegetable foods, seems to me to be one to which our attention should be called, with a view to introduce it to our tables. Richard B. Hubbard, United States Legation, Tokio, June 24, 1886."

Contents: Early history. Method of preparation (with 5 excellent illustrations {line drawings}, described below). Preparing tofu for the table. Uses of tôfu. The soy bean (excerpts from Prof. Kinch's article upon the Agricultural Chemistry of Japan, *Transactions of the Asiatic Society of Japan.* 1880. Vol. 8, p. 398).

The translation was made by Dr. W.N. Whitney, interpreter of the legation. "Early history: Tôfu or bean curd was first used in China, according to the statement of Chinese authorities, in the reign of Wai-rau-wo of the Han dynasty (B.C. 206 to A.D. 25). In Japan, the record of its uses only dates back to the third decade of the fourteenth century, mention being made of it in the works called Tei-kiu-wo-rai and Isei-tei-kui-wo-rai, edited by Kitabatake Geni, and previous to which time we do not find any reference whatever to tôfu of the bean from which it is made, the *Soja hispida."*

"Method of preparation: The yellowish-white beans are soaked in water for twenty-four hours, or a night and a day, when they are poured into a stone mill (Illustration, Fig. 1) and ground. As the quality of the product of manufacture is largely dependent upon the purity of the water used, it is necessary that the purest water obtainable should be employed. The beans, having been first pounded, are mixed with an equal quantity of water in the oblong tub, Fig. 1 (a), and gradually poured into the orifice in the upper stone of the mill with a copper dipper. This mill resting within a

© Copyright Soyinfo Center 2014

bottomless tub (b) some eight or ten inches in height, upon the narrow wooden stand, is rotated by means of a bamboo rod or handle (d), which has one end inserted into a socket in the upper millstone. The thin pulp [slurry] of ground beans and water as it flows between the stones of the mill is directed into a tub beneath (e), and kept from running along the horizontal bars of the table by the perpendicular sides of the bottomless tub which surrounds the mill.

"The pulp which is collected in the under tub (e) is put into an iron pot and heated over a wood fire until it begins to boil, which stage is indicated by the appearance of bubbles or foam upon the surface. One or two gills of cold water [a gill is ½ cup or ¼ pint] are then poured around the edge of the pot inside, and as soon as the foam has subsided the pot is covered and a second boiling takes place; cold water is then again poured in and the contents allowed to stand. In stirring and mixing the pulp in the pot, a kind of wisp [whisk], made of split bamboo and coated with thickened oil dregs, is employed. The pulp is then dipped out of the pot with a ladle of bamboo, into a grass-cloth bag (Fig. 2, a), to prevent it running over the sides of which, a kind of flat trough (b) is used. Several dipperfuls of water are then poured into the bag, the mouth of which is tied up and the whole laid upon a mat of sticks (c), and over a linen cloth stretched over the top of a shallow tube [sic, tub], as shown in Fig. 2.

"Pressure is then brought to bear upon the bag by means of the round wooden stick used as a simple lever, as shown in Fig. 3. The liquor [soymilk] which oozes out, filters through the cloth laid over the top of the shallow tub, into the vessel beneath. Should the quantity of pulp ground up be large, several bags will be necessary, or one bag may be refilled several times.

"The contents of the tub, being the liquor expressed from the grass-cloth bag containing pulp, is then stirred up with about a gill of brine* poured in with a little bamboo ladle, and the cloth cover replaced." (Footnote: *"The brine used is obtained by deliquescence, and precipitates the vegetable caseine [casein] or legumen contained in the liquor [soymilk] expressed from the pulp.–Translator"). The cloth is again removed after the lapse of a few minutes allowed for the brine to thoroughly mix, and two gills more of brine are poured in, and, a few minutes later, still another portion of two or three gills, a little at a time.

"Whenever coagulation takes place in the filtered liquor in the tub, a shallow bamboo basket (Fig. 4), containing a stone to keep it down, is twice let down into the liquor, and the water [whey] which runs into the basket is removed. When coagulation is complete, the bamboo basket is inverted and the tub tilted to one side, to allow the water to drain off through the meshes of the basket.

"The next step is to transfer the coagulum from the tub to a rectangular-formed box (Fig. 5), which is accomplished in the following manner: A wooden frame, which just covers the edges of the forming box, is placed in position upon the open top of this box, which, it should be stated is 1.8 feet long, 0.62 feet wide, and 1 foot deep inside..." After the tôfu is pressed, the "box with its contents are then placed in a large trough of cold water." After cooling, the tofu, which has assumed "the consistency of a cooked omelet, is cut up with a broad-bladed brass knife into quite thick slabs of about 4 by 6 by 1½ inches in size. The quantity of water and brine used in the preparation of tôfu should be in the proportion of 15 sho (1 sho = 107.92 cubic inches) of water and ½ sho of brine to 4.5 sho of the bean.

"Preparing tôfu for the table: Tôfu may be prepared in many ways for the table, such as by frying or toasting, or making into soup. It may also be scrambled or made into croquettes. When fried, toasted, or scrambled, it has very much the taste of sweet-bread, and when saturated with Japanese soy is not unlike that dish in appearance and consistency. When used in soup it is cut up in little squares. There are several books in Japanese treating of this subject, such as the 'Tôfu-zoku hyaku-chin,' or the 'Hundred curiosities in Tôfu.'

"Uses of Tôfu: Tôfu, and the residue [okara] in its manufacture, are used for various other purposes, such as in the imitation of *tsuye-shu,* a kind of vermilion. For this purpose tôfu from which the water has been expressed is mixed with a kind of red lacquer, with a spatula, and thoroughly kneaded. This resulting paste is laid upon the articles to be manufactured, and after drying it may be carved or engraved upon.

"The warm water in which the beans are first boiled is used to extract grease from clothing, and to cleanse the mats used upon the floors of Japanese houses, and also for washing the ceilings, for which purposes it has no equal. The pulp [okara] remaining in the grass-cloth after the vegetable caseine has been expressed, is used by the Japanese women as a substitute for soap in washing the hair. It is also used when mixed with finely-chopped straw as a food for horses and cattle, and sometimes as manure."

Note 1. This is the earliest English-language document seen (June 2013) that uses the word "residue" or the word "pulp" to refer to okara.

Note 2: This is the earliest English-language document seen (Sept. 2004) that uses the term "yellowish-white" to describe the color of soybean seeds.

Note 3. This is the earliest document seen (June 2001) that uses the word "soap" in connection with soybeans; okara is used in Japan as a soap. Address: Minister, United States Legation at Tokio, Japan.

713. Tamari, Kizo. 1886. Vegetables in Japan. *Transactions of the American Horticultural Society* 4:77-80. For the year 1886.

• ***Summary:*** "Peas and beans are so numerous in varieties that they can not be easily described. Besides common cultivated peas and beans, we have asparagus beans with

© Copyright Soyinfo Center 2014

long and tender pods, ensiform beans [shaped like a sword blade], many kinds of kidney beans and soy beans (*soya hispida*), etc. Some [such as soy beans] are used green, in pod, and the seeds are mostly used for making different kinds of cakes [confections] or as parched beans" [soynuts / irimame].

Note 1. This is the earliest English-language document seen (Dec. 2012) that uses the term "parched beans" to refer to soynuts.

The most important crop among our pulse is the soy bean. The annual product is about the same as that of wheat, viz.: eleven and one-half [11.5] million bushels. This large amount is consumed in three different forms in our culinary uses, viz.: miso, shioyu [shoyu] and tofu. The first and second are made of the beans, wheat or barley, common salt and water; the first in the form of paste, and the second a liquid, commonly called Japanese sauce. The third is a white mass, made by coagulating extract juice of the bean with a solution of epsom [sic, Epsom] salts. This is called Chinese cheese by the English."

Note 2. This is the 2nd earliest English-language document seen (April 2013) that uses the term "Chinese cheese" to refer to regular (nonfermented) tofu.

"Tofu is very extensively and commonly used, especially among those living apart from the seacoast, and where they can not get fresh fish, this is cooked and used as a substitute for fish. This bean is exceedingly rich in nitrogenous substances. It contains about thirty-seven per cent. of albuminoids, or over three times as much as wheat, barley, or oats, and one and a half times as much as peas or beans. So far, our people are the most extensive consumers of pulse of any people in the world. It seems to me that it is caused by the demand for nitrogenous food, which was almost excluded from animal food besides fishes on our table."

Note 3. The latter refers to the fact that Buddhism in Japan prohibits the consumption of four-legged creatures.

Note 4. This volume is a report of the seventh annual meeting, held at Cleveland, Ohio, September 7th to 10th, 1886. Address: Japan.

714. *J. of the Society of Arts* (*London*). 1886. Manufacture of tofu in Japan. 35(1778):102-03. Dec. 24.
• ***Summary:*** "The United States Minister at Tokio says that considerable attention is paid in Japan to the manufacture of *tôfu,* or bean curd, which approaches more nearly in its chemical composition to animal food than any other vegetable known." An excellent, detailed description is given of the method of preparing tofu in Japan.

Note 1. For the full report, see: Hubbard, Richard B. 1886. "Japanese bean curd." *U.S. Bureau of Manufactures, Department of Commerce and Labor, Monthly Consular and Trade Reports* 19(63):646-51.

Note 2. This is the earliest English-language document seen (April 2013) with the word "tofu" in the title. However in the body of the article, the word is always italicized and spelled *töfu.*

715. Candolle, Alphonse de. 1886. Origin of cultivated plants. 2nd ed. London: Kegan Paul, Trench & Co.; New York, NY: D. Appleton and Co. viii + 468 p. See p. 330-32, 355, 443, 451. Index. 27 cm. 35 plates, with Fig. 26 being of the soybean. South Kensington Museum science handbooks. With 23-page supplement, 1901. Reprinted in New Delhi, India in 1983 by Ajay Book Service. [17 ref]
• ***Summary:*** "The soy-bean. *Glycine Soja,* Sieb. and Zucc. *Synonyms*–Soja hispida (Moench.); Dolichos Soja (Linn.); Soja angustifolia (Miq.). *Hind.* [Hindi]–Bhat, Bhatwan. *Punjab* [Panjabi]–Bhút. *Beng.* [Bengali]–Gari-kulay. *Naga*–Tsu-dza.

"This important bean is the seed of Glycine Soja, a small, sub-erect, trifoliate, hairy annual, with pods generally 3 to 4-seeded. It belongs to the natural order Leguminosae, sub-order Papilionaceae, tribe Phaseoleae, and sub-tribe Glycineae; 5 genera are included in this sub-tribe. Glycine contains about 12 species, chiefly Australian, but 3 are Indian, namely *G. javanica, G. pentaphylla,* and our present species.

"The soy-bean forms a considerable article of food in China and Japan. Since 1873 it has been successfully grown, as an experiment, in some of the warmer parts of Europe. It is widely spread in the outer Himalaya, and tropical regions from Kumaun to Sikkim, and the Khasir [Khasia / Khasi Hills], and the Naga Hills to Upper Burma. It is often cultivated, rather largely in Busti and Gorakhpur [in today's Uttar Pradesh], Patna, and Purniah [Purnea] Districts [both in today's northeast India].

"This crop is generally grown by itself; the seeds are sown from June to September; the harvesting takes place between November and January. It is consequently a kharif crop. The seeds should be placed at a depth not exceeding 1 to 1½ inch; 18 plants may be left, after weeding and thinning, to the square yard. A peaty soil, or one rich in organic matter, suits the plants best; a calcareous soil is also favourable to its growth. Sulphate of potash is a good

© Copyright Soyinfo Center 2014

manure, nitrogen may be supplied either as nitrate of soda or, in the case of soils poor in organic matter, in the form of rape or mustard cake, but it is rarely needed, while large applications of nitrogenous manure exert a distinctly injurious effect upon the yield of beans. So far as we know, this very important, vigorous, and productive pulse is not attacked by any insect or parasitic fungus."

A full-page illustration (p. 141) shows the upper part of a soy-bean plant, with flowers and a lengthwise cross section of one of the pods.

"Very few vegetable products are so rich as this bean at once in albuminoids and in fat and oil, the former constituent amounting to 35 per cent., and the latter to 19. The cultivation of the pale large-seeded varieties should be extended."

A table titled "Composition of soy-beans" (p. 143) shows that the seeds contain 35.3% protein, 18.9% fat, 4.6% ash, 11.0% moisture. "The nutrient-ratio is here about 1:2, while the nutrient-value is 105. Potash forms nearly one-half, and phosphorus-pentoxide one-third of the ash of the soy-bean. Ripe soy-beans require long soaking, preferably in warm water, in order to render them soft.

"In China and Japan three preparations are extensively made from the soy-bean. Soy sauce is the best known of these, but more important are the soy or bean cheeses, and a kind of paste. The beans are sometimes pressed for the sake of the oil they yield; the residual cake forms an extremely rich cattle food, containing as it does 40 per cent. of flesh-formers and 7 per cent. of oil. The soy-bean may also be grown as a fodder plant. If cut just when the pods are fully formed it makes an excellent hay, superior to that of the lentil."

Note 1. This is the earliest English-language document seen (April 2013) that uses the term "bean cheeses" or (by implication) "soy cheeses" to refer to tofu.

Webster's New Geographical Dictionary (1988) defines Bengal (earlier Bengal Presidency) as a former province in northeast British India, and now a region encompassing West Bengal, India, and Bangladesh. The capital was Calcutta, located on the Hooghly River about 90 miles from its mouth. Calcutta is now the capital of West Bengal, India. Dhaka (Dacca) is the capital of Bangladesh. Bangladesh was formerly East Bengal (part of India, 1700s-1947), then East Pakistan, 1947-1971. It became Bangladesh in 1971.

This one of the earliest document seen (March 2001) that clearly refers to soybeans growing in Burma, but it is not clear whether these are cultivated or wild soybeans.

Page 127 discusses "The Pea-Nut. *Arachis hypogaea,* L." Six local vernacular names are given. "This plant is probably of American origin, although it has long been cultivated in India, on the West Coast of Africa, and in many other tropical countries. There is a similar plant, *Voandzeia subterranea* [Bambara groundnut], allied to Vigna, which grows under the same conditions." The composition of pea-nuts (in 100 parts and in 1 pound) is given. "Half the weight of pea-nuts is oil... Pea-nuts, after the greater part of the oil has been extracted by pressure, yield a cake well adapted for feeding cattle." An excellent full-page illustration (line drawing, p. 126) shows the pea-nut plant with seeds growing under ground and details of flowers and seeds.

Note 2. This is the earliest document seen (March 2001) that mentions *Voandzeia subterranea. Webster's Third New International Dictionary* has an entry for "voandzeia: [NL, from Malagasy *voandzou*]. A genus of tropical creeping herbs (family Leguminosae) with trifoliate leaves and small axillary flowers." We later learn that one species, *Voandzeia*

© Copyright Soyinfo Center 2014

subterranea (L.) Thouras, is called the Bambara groundnut. The Bambara are a Negroid people of Upper Niger.

Note 3. This is the earliest English-language document seen (Oct. 1999) that contains the term "nitrate of soda" (as a fertilizer) in connection with soy-beans. It was later renamed "sodium nitrate."

Note 4. This is the earliest document seen (Oct. 2002) that uses the word "kharif" to refer to the rainy season in South Asia.

Note 5. A long, positive review of this book appeared in the *Times of India* (25 Dec. 1886, p. 4), which mentioned that even though Church had never been to India, he derived his knowledge from reliable sources. The word "soy-beans" appeared twice in the review. Address: Prof. of Chemistry, Royal Academy of Arts, London.

717. Hepburn, James Curtis. 1886. A Japanese-English and English-Japanese dictionary. 3rd ed. Tokyo: Z.P. Maruya & Co., Limited. Yokohama, Shanghai, Hongkong & Singapore: Kelly & Walsh, Limited. London: Trübner & Co. 962 p. 22 cm.

• ***Summary:*** "During the fourteen years which have elapsed since the publication of the last edition of this Dictionary [in 1867], the Author has kept it constantly before him, correcting errors, improving and enlarging the definitions, and adding new words and illustrations, according as his time and other important engagements allowed him. But owing to the amazing changes and rapid advancement of the Japanese in every department, he has found it difficult to keep pace with the corresponding advance of the language in the increase of its vocabulary. He has endeavored, however, to collect these words, examine, classify and define them. Many, no doubt, have escaped his notice. Still there is an addition of more than ten thousand words to the Japanese and English part."

New soy-related definitions in this edition, not found in or changed from the 1867 edition: Aburage: Anything fried in oil or grease, especially fried *tofu.* [fried tofu].

Amazake: Sweet *sake,* a kind of drink made of fermented rice.

Azuki: A small red bean, Phaseolus radiatus. Daizu: A kind of large white bean, Soja hispida.

Hiriôzu: A kind of food make of *tôfu* fried in oil.

Note 1. This is the earliest document seen (April 2013) that contains the word *Hiriôzu.* It refers to Kyoto-style deep-fried tofu treasure balls. It is also the earliest document seen (Dec. 2013) that contains a traditional Asian meat alternative made from deep-fried tofu.

Kinako: A flour made of beans.

Kirazu: The refuse of beans left in making *tôfu* [okara].

Note 2. This is the earliest English-language document seen (June 2013) that uses the word "Kirazu" [not Kiradzu] to refer to what is now called "okara" or "soy pulp."

Koji: Barm or yeast made by the fermentation of rice or barley in the process of making *sake* or *soy* [sauce].

Miso: A kind of sauce made of beans, wheat and salt. Miso wo suru: To rub miso in a mortar.

Sake: A fermented liquor brewed from rice. Sake wo kamosu: To brew sake. Sake ni yô: To be drunk. Sake no uye ga warui hito: One who behaves disorderly because of drink. Sake ni oboreru: To be addicted to drink [alcohol].

Shoyu: Soy, a kind of sauce made of fermented wheat and beans. Syn. [Synonym]: Shitaji.

Tamari: Soy, shôyu. Note 3. This is the earliest English-language document seen (April 2012) that uses the word "Tamari" to refer to a type of Japanese soy sauce,

Tofu: A kind of food made of beans, bean curd.

Unohana: The Deutzia scabra; also refuse of beans [okara] from making tofu. Yuba: A kind of food made of beans, the skin of bean curd.

Terms listed unchanged from the 1867 edition include Natto, and Yu-dofu.

No listing is given for: Daitokuji natto, Edamame [Yedamame], Hamanatto, or Okara.

The "English and Japanese dictionary," which starts on page 771-73, contains the most important English words with numerous examples. Included are: Bean: Mame. Spec. Azuki, sora-mame, daizu, endo, ingen, sasage. Bean pod: Mame no saya. Bean curd: Tôfu.

Soy: Shôyu. Address: M.D., LL.D., Yokohama, Japan.

718. Kellner, O[skar Johann]. 1886. Fuetterungsversuche mit Schafen ueber die Verdaulichkeit verschiedener Futterstoffe: Sojabohnenheu, Sojabohnen [Feeding trials with sheep on the digestibility of various fodders]. *Landwirtschaftlichen Versuchs-Stationen* 32:72-89. See p. 82-84, 87-89. [5 ref. Ger]

• ***Summary:*** In this early feeding trial, sheep (incl. Merino sheep) were fed soybean hay and seeds (*Sojabohnenheu* and *Sojabohnen*). Section 4 is titled "Composition and digestibility of soybean hay" (p. 82-84). Tables show the following values with the pods still attached (*Schoten eben angesetzt*) on a moisture-free basis. Year of investigation: 1882. Proteids 16.91%. Crude fat 2.56%. Nitrogen-free extract 31.28%. Crude fiber 42.29%. Ash 6.96%.

Section 6, titled "Composition and digestibility of the soybean" (p. 87-89), contains four tables.

Note 1. This is the earliest soy-related publication seen by Dr. Kellner (lived 1851-1911). He was a prolific writer. In the *Catalog of Scientific Papers* compiled by the Royal Society of London, from 1800-1883 he had 6 references, from 1874-1883 he had 13 references, and from 1884-1900 he had 29 references as the sole author and 22 additional references where he was the senior author with other authors, mostly on livestock and their feeds. In the *Dictionary Catalog of the National Agricultural Library: 1862-1965,* he has 98 references.

Note 2. This periodical is also titled: *Mittheilungen aus dem agriculturchemischen Laboratorium zu Tokio.* Address: Agricultural-chemical Lab., Tokyo [Japan] (Aus dem agriculturchemischen Laboratorium zu Tokio).

719. Kihara, Hakushô. 1886. Sake shôyu tsukurioke yôsekihyô [Chart showing the volumes of various sizes of containers (kegs) for sake, shoyu]. Tokyo: Takasaki Shûsuke. 176 p. 20 cm. [Jap]*

• ***Summary:*** Note: At this time, both sake and shoyu were sold in wooden kegs called *oke* in Japanese.

720. Rein, Johann Justus. 1886. Japan: Nach Reisen und Studien, im Auftrage der Koeniglich Preussischen Regierung dargestellt [Japan: Travels and researches undertaken at the cost of the Prussian government. Vol. II.]. Leipzig, Germany: Verlag von Wilhelm Engelmann. 679 p. See p. 5, 65-70, 123-27, 185, 649. Illust. Indexes (1 German and Latin, 1 Japanese). 2nd ed. 1905. [9 ref. Ger]

• ***Summary:*** A superb book, showing the high German art of studying other cultures. The many illustrations are either beautiful wood engravings (*Holzschnitte*), real photographs, or actual samples of paper or textiles (glued in). In the chapter on "Food plants" (*Nährpflanzen*), the following is a partial contents of the section on "Pulse or leguminous plants" (*Hülsenfrüchte oder Leguminosen,* p. 65-71): Introduction to crops cultivated in Japan. 1. The ground-nut and ground-nut oil. 2. The soybean: "Among the pulse of Japan (and not the less of China), the soy-bean ranks first in extent, variety of use, and value; and chemical analyses prove the empirical judgment is well founded. In point of nutriment, the soy-bean is of all vegetables the nearest to meat. It contains nearly two-fifths of its weight in legumin rich in nitrogen, and nearly one-sixth in fat. The soy-bean is to the inhabitants of Japan what their *garbanzos* (chick-peas) are to the Spanish, and their *feijao preto* (black beans) to the Brazilians. The author then describes the characteristics of the soy-bean, the work of Haberlandt with soy-beans in Austria, and the yields that he and his co-workers obtained.

"In Japan the varieties of soy-bean are distinguished– according to colour, as white (more properly yellowish), black, brownish red, green, and spotted; according to duration of growth [maturity] as early-ripening, middle-ripening, and late-ripening; according to form, as spherical, ellipsoidal, kidney-shaped, and compressed laterally; and according to use, as to those which serve primarily in making Shôyu (soy), Tôfu (bean-cheese), and Miso (a sort of sauce), and those eaten in any plain shape."

Soy-bean varieties in Japan include: 1. "White (pea-yellow) soy-beans, Japanese Shiro-mame or Haku-daidzu. To this division belongs an early-ripening sort with very small seeds, called Goguwatsu-mame [Go-gatsu], or 'five-months-kind,' because it ripens in the fifth month of the old Japanese calendar, our July; also another small-seeded, early-ripening variety, the Wase-mame or Natsu-mame, that is, early and summer-bean. These two are also called Tôfu-mame, because they are used chiefly in making Tôfu. Another sort serves to produce Miso. It is called Nakate-mame, 'middle-late bean,' its time of maturity occurring half-way between that of the early and late kinds. Its seeds are round and somewhat larger. The late ripening varieties, Okute-mame (late-bean), Maru-mame (bullet-bean), and Teppô-mame (gun-bean), or Aki-mame (autumn-bean) have, as their names indicate, mostly bullet-shaped seeds, which become harder and larger than the early ones. The variety last named is used in making Shôyu, while Maru-mame is valuable as horse-feed.

2. Black soy-beans, Japanese Kuro-mame or Koku-daidzu. These are eaten boiled with sugar, as an entrée, or as a relish to rice. There is a middle-late sub-species, with round, elliptical seeds, Kuro-mame, in short, and another like it with big, bullet-shaped beans is called Kuro-teppô-mame. And again there is a late-ripening sort with flat, elliptical seeds under several names.

3. Brown soy-beans, Japanese Katsu-daizu (thirsty soy-bean) are much less grown than the white and black sub-species, and are used like the latter. They are distinguished as Aka-mame, red soy-beans, round, reddish-brown in colour, in different varieties, and Cha-mame, tea beans, three light-brown sorts of small extent and significance.

4. Greenish or bluish green soy-beans, Japanese Ao-mame or Sei-daizu, are eaten mostly boiled and with

© Copyright Soyinfo Center 2014

sugar, like the black and brown-red varieties. And, with the brownish sorts, they are much less widely grown than the black and yellowish. The Japanese distinguish the following sub-species of Aö-mame [sic, Ao-mame]:–(a) Sei-hito,– epidermis green, inside a whitish yellow. (b) Nikuri-sei,– greenish throughout. Both sub-varieties run from roundish-ellipsoidal to a bullet roundness, are of medium size, and remind one of green peas. (c) Kage-mame, with pale green, round beans. 5. Speckled soy-beans, Japanese Fuiri-mame or Han-daidzu. This group is not important. Its cultivation is confined to a small area, in a few provinces. Its sub-varieties are known as:–(a) Kuro-kura-kake-mame, with a black spot on the saddle (eye), otherwise greenish; flat and with the outline of an egg. (b) Aka-kura-kake-mame, with a brown spot on the saddle (eye), otherwise yellowish-green, flat and drawn out long. (c) Fuiri-mame or Udzura-mame, speckled or spotted soy-bean, yellowish-green with many dark flecks. A rare variety, grown only in a few places, especially in Harima.

"Early-ripening soy-beans are sown as early as April in Southern Japan, in Central Japan during May. Those that ripen in autumn need much more warmth, and are sown, as a rule, one month later... Late-ripening Daidzu is also a favourite for planting along the edge of fields and on the new-built dykes of rice-fields."

Returning to the work of Haberlandt: "At the end of his above-mentioned treatise, Haberlandt summed up in five noteworthy propositions, the results of his experiments with the soy-bean and of its chemical analysis. His conclusions are as follows:

"(a) The acclimatization of the early-ripening sorts, particularly those with yellow and reddish brown seeds, appeared to have fully succeeded in Central Europe.

"(b) The seeds obtained were larger, heavier, and handsomer than those from Eastern Asia, the chemical composition, however, remaining unchanged.

"(c) The soy-plant resists light spring frosts better than our young beans, and endures greater dryness in summer than most leguminous plants, though otherwise much like other kinds of beans.

"(d) It is distinguished by heavy crops, besides furnishing, in its stems and leaves, either green or dried, a nourishing feed, of which cattle are very fond.

"(e) In their high percentage of protein and fat, they far excel all other pulse in nutritive quality; and when properly prepared are second to none in flavour.

"After such favourable judgments, it might have been expected that the soy-bean, at least in the warmer regions of the Austro-Hungarian monarchy, would soon become popular and generally cultivated. The result, however, was quite otherwise. The hopes which he had aroused in behalf of this plant seem to have disappeared with Haberlandt, who died in 1878.

3. Azuki beans (many varieties are named and described).

Two tables (p. 73-74) show the following: (1) Analysis of 10 different numbered samples of soybeans, empty pods, and straw and leaves. Eight are from Haberlandt's book *Die Sojabohne* [The Soybean] (1878), two are from Caplan, and one each from Mach, Senff, Levallois, and Kinch. (2) Comparative composition of 9 different legumes, including soybeans, azuki beans, common peas, broad beans / faba beans, lentils, yellow lupins, and peanuts. The soybean has by far the most crude protein, is second in fat (after peanuts), and is average in (minerals).

Foods made from soybeans (p. 123-27): Shoyu (*Shôyû, die japanische Bohnensauce, auch Soja*). Miso (made with rice koji [*Kôji oder fermentierender Reis*]). Tofu (*Tôfu, Bohnenkäse,* made with *Shio-no-nigari* (*Salzbitter*)) incl. dried-frozen tofu (*Kori-tôfu, gefrorener oder Eis-Tôfu*).

"Kori-tôfu, frozen or ice-Tôfu, is the spongy, horn-like substance that remains when common Tôfu is allowed to freeze and then thawed and dried in the sun, thus getting rid of most of its water. By Yuba [Yuba] is meant a third preparation, consisting of brownish, tough skins (*Häuten*), made by boiling the dissolved legumine of the Tôfu-process, with the addition of some wood-ashes, and then taking away in succession the skins that rise" (p. 126-27; see Rein 1889).

Note 1. This is the earliest German-language document seen (Oct. 2012) that contains the word Yuba.

The section on "Oil plants and their products" (p. 176-89) gives details on 13 plants and the oil obtained from them, including: 1. Rapeseed oil. 2. Mustard oil. 3. Camellia oil. 4. Cottonseed oil. 5. Peanut oil. 6. Sesame oil. 7. Perilla oil (*Perilla ocymoides*). 11. Hempseed oil. Soybean oil is not one of these. However a table (p. 185) gives the average composition of various Japanese oilseeds (Source: E. Wolff et al.; Ollech 1884): Rapeseed, peanuts, cottonseed, sesame (brown and white), hemp seeds, shelled beech-nuts, and soybeans.

Note 2. Volume 1 was published in 1881. The title of volume 2 is Land-und Forstwirtschaft, Industrie und Handel. Johann Justus Rein lived 1835-1918.

Note 3. This is the earliest German-language document seen (April 2013) that uses the term "kori-tôfu," or "gefrorener Tôfu," or "Eis Tôfu" to refer to dried-frozen tofu.

Note 4. Also discusses: Ame, midzu-ame, and barley malt syrup (p. 121-22). Fu, or baked wheat gluten cakes. Hemp, hempseed, and hempseed oil (p. 88, 177, 184-85). Kudzu (p. 75, 199, 217). Peanuts and peanut oil (p. 176-81, 185). Sea-weeds–especially marine algae (p. 93-96). Sesame seeds and oil (p. 88, 176-78, 181-82, 185). Address: Prof. of Geography, Univ. of Bonn, Germany.

geographical, and discursive. London: John Murray, Albemarle Street. xlviii + 870 p. See p. 651 ("soy"). 23 cm. [1166* ref. Eng]
• ***Summary:*** "Soy, s. A kind of condiment once popular. The word is Japanese *si-yau* [sic] (A young Japanese fellow-passenger gave the pronunciation clearly as shô-yu–A.B.), Chinese [Cantonese] *shi-yu.* It is made from the beans of a plant common in the Himalaya and E. Asia, and much cultivated, viz. *Glycine Soja,* Sieb. and Zucc. (*Soya hispida,* Moench.) boiled down and fermented."

The authors then quote passages relating to soy from Lord King's *Life of John Locke* (1679), Dampier (1688), Ovington (1690), Kaempfer (1712), and Thunberg's Travels (1776).

Yule lived 1820-1889. A small illustration shows Arthur Burnell (lived 1840-1882).

Contents: Dedication to Sir George Yule, C.B., K.C.S.I. Address: 1. Living in Palermo; 2. Madras Civil Service, one of the most eminent modern Indian scholars.

722. *Otago Witness* (*New Zealand*). 1887. Miscellaneous. Feb. 11. p. 8.
• ***Summary:*** From The Standard: "The cultivation of the Soy bean (Soja hispida), extensively used in Japan, is being recommended in the United States, where it has been tried on a small scale. It is a round, yellowish-white bean, which is constituents is said to come nearer to animal food than any other vegetable. According to an article published at the Educational Museum of Tokio, this bean was first raised in China about 200 years B.C. [sic, 11th century BC] and its use in Japan dates back to the fourteenth century [sic, at least the 8th century]. In the latter country it is chiefly used as 'tofu' or bean curd, which is cooked in various ways. Analysis shows that the bean contains 37 per cent. of albuminoids, and nearly 21 per cent of fat. In Germany the Japanese bean has been cultivated with success."

• ***Summary:*** The earliest study on the flavor of shoyu, and a very early study on the composition of shoyu.

724. Williams, W. Mattieu. 1887. Tofu and vegetable cheese. *Gentleman's Magazine* (*London*) 257(1878):616. June.
• ***Summary:*** The article begins: "Vegetarians should look to this. Tofu is a curd manufactured from beans in Japan. According to the 'Journal of the Society of Arts.' December 24, 1886, it 'approaches more nearly in its chemical composition to animal food than any other vegetable known.'"

The author describes briefly how tofu is made in Japan. "The fibrous residue left in the bag [okara], after the filtering out of the vegetable casein [protein], may be mixed with chaff as a food for cattle."

Note. This is the earliest English-language document seen (June 2013) that uses the term "fibrous residue" or "fibrous residue left in the bag" to refer to okara.

He adds that he has made tofu from common split peas in a similar manner and precipitated the vegetable casein with acetic acid. "All kinds of peas and beans will yield soluble casein when thus treated, and most valuable food may thus be obtained free from the woody fibre, which is difficult to digest.

"My experiments were avowedly but preliminary and suggestive; they, however, point to the possibility of a very important industry in the manufacture of a new and most desirable food, viz. vegetable cheese. If I am not altogether mistaken, it may be produced on a large scale at about threepence per pound, and be equal, if not superior, to the best cheese made in the dairy. As I have shown in the work above quoted, a sheep weighing 60 pounds contains less nutritive matter than 20 pounds of ordinary cheese. This also applies to the vegetable cheese."

725. Kellner, O.J.; Mori, Y[ôtarô]. 1887. Beitraege zur Kenntnis der Ernaehrung der Japaner [Contributions to an understanding of the nutrition of Japanese]. *Mittheilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens in Tokio* (*Yokohama*) 4(37):305-21. Aug. [37 ref. Ger]
• ***Summary:*** *Vegetarian Messenger* (May 1888, p. 127-28) states that the staple diet of the Japanese "is almost wholly Vegetarian... As to beef, however (there is no mutton in Japan), there can be no question that its consumption is very small. In 1882, only 36,288 beasts were slaughtered, or about one kilogramme of meat per head of population, and it must be borne in mind that a large consumption takes place at the open ports amongst Europeans, and in the proximity of vessels... It would appear that the flesh of mammals is almost entirely excluded from that diet." Address: Tokyo.

726. Osawa, Kenji; Ueda, Keiji. 1887. Shokumotsu shôka no ryôhi (zokkô) [The quality of digestion of foods (continuation)]. *Chugai Iji Shinpo* (*Medical News, Foreign and Domestic, Tokyo*) No. 177. p. 16-21. Aug. [Jap]*
• ***Summary:*** A digestion experiment with tofu continued for two days, October 28-29, 1885. The subject, K.U., weighed 51.45 kg at the beginning and 49.36 kg at the end of the experiment. The diet consisted of tofu with some shoyu and starch. The following percentages of the basic nutrients were digested: Protein 96.1%. Fat 97.4%. Carbohydrates (incl. fiber) 88.4%. Ash 72.4%. Address: Physiological Institute, University of Tokyo.

728. *Vegetarian Messenger* (*Manchester, England*)**.** 1887. Correspondence: Notes and queries. Oct. p. 341-43.
• ***Summary:*** "Soy beans.–Where can these be procured, and how are they to be cooked?–X.Z."

"Vegetable boots and shoes.- Are these now made and sold? If so, where?–T.B." No reply is given to either question.

"Vegetable cheese.- *Querist* asks when we are to have the vegetable cheese [tofu] promised in a former number of the *Vegetarian Messenger* [May 1887, p. 154-55]. (We fear that the death of an active friend, Mr. Nunn, who was making experiments in this direction, and who made the promise alluded to, will postpone the appearance of vegetable cheese indefinitely. Experiments should, however, be made by those who have any practical acquaintance with the chemistry of foodstuffs. Mr. Mattieu Williams, writing in the *Gentleman's Magazine* for June, on the subject of the manufacture of Japanese bean cheese," discusses his experiments with peas and beans. These investigations "'point to the possibility of a very important industry in the manufacture of a new and most desirable food, viz., vegetable cheese. If I am not altogether mistaken, it may be produced on a large scale at about 3 pence per pound, and be equal, if not superior, to the best cheese made in the dairy.'").

Note. This is the earliest English-language document seen (April 2013) that uses the term "Japanese bean cheese" to refer to tofu.

729. *Chemist and Druggist* (*London*)**.** 1887. The manufacture of Japan soy. 31:613. Nov. 12.
• ***Summary:*** "At a recent meeting of German chemists a Mr. Erich communicated a paper on the preparation of Japan soy, a product of which the details of manufacture are as yet imperfectly known. Soy has been manufactured in Japan for over a thousand years, and forms a very considerable article of consumption in that country and throughout the East. There are many factories of the condiment in the country, one of the largest being at Tokio, where considerably over one million gallons are specially prepared for export every year. The principal ingredients known to be used in the manufacture of soy are a very hard long-awned variety of barley, common salt, soya beans (*Dolichos soya*), a specially prepared ferment, and water. The soy beans are roasted like coffee, the barley is partly roasted and partly malted. The roasted parts of the barley and the beans are soaked in cold water, cooled, and preserved by the addition of a liberal dose of common salt. To this are added first a diastase solution, and afterwards a specially prepared ferment, which causes an extremely slow fermentation, but without any considerable formation of carbonic dioxide or alcohol. The degree of strength of the soy depends upon the time used in the process of manufacture, which varies from one to three years. If kept cool and out of the light soy can be kept good for a very long time, but the action of light and the free access of air cause fermentation."

• ***Summary:*** Soy-related definitions include: Dengaku: A kind of food made of baked *tôfu.*

Go: [Soy] Beans mashed into paste for making *tôfu;* also used by dyers to limit colors. Mame no go: [Soy] bean paste.

Go-koku [Gokoku]: The five cereals–wheat, rice, millet, beans, and sorghum.

Hitashi-mono [Hitashimono]: Beans or vegetables boiled or steeped in *shôyu* [shoyu].

© Copyright Soyinfo Center 2014

Irimame: Parched peas [sic, parched soybeans = soynuts].

Kirazu: The refuse of beans left in making *tôfu.*

Mamemaki: The ceremony of scattering parched beans [parched soybeans] about to drive out evil spirits on the last evening of the old [lunar] year.

Toshi-koshi [Toshikoshi]: The crossing from the old to the new year; the ceremonies observed on the last day of the year,... when parched beans [parched soybeans] are scattered after sundown to drive off noxious influences and evil spirits. The parched beans used this evening, if kept and eaten when the first thunder of the new year is heard, are supposed to protect against lightning.

Note 1. This is the 2nd earliest English-language document seen (Dec. 2012) that uses the term "parched soy beans" to refer to soynuts / irimame.

Tsui-na (*oni yarai*)*:* The ceremony of driving evil spirits out of the house by scattering parched [soy] beans about on the last evening of the old year.

Note 2. This is the earliest English-language document seen (Dec. 2012) that uses the term *Tsui-na* in connection with Setsubun and the ceremony scattering of roasted soybeans in Japan.

Yô-kan [yokan]: A kind of confectionery made of sugar and [azuki] beans.

Yuba: A kind of food made of beans.

James Curtis Hepburn lived 1815-1911. Address: M.D., LL.D., Tokyo, Japan.

• ***Summary:*** Continued from page 444: Finally, this bean is the base of a sort of sauce that has now jumped the boundaries of Asia and whose consumption is widespread among the well-to-do classes (*les classes aisées*) of North America, England, and Holland. This is the *Tsiang-yeou* [*pinyin: jiangyou*] of the Chinese, the *Shoyu* of the Japanese, the *Ketjap* of Batavia and Java, the India-Soy of the Americans and the English, and the *Zoya* of the Dutch. This product is a liquid of a darker or lighter brown, depending on the quality, obtained by the fermentation of cakes (*gâteaux* [of koji]) made of grilled barley and boiled soybeans. These cakes, after fermentation, are dissolved in water with salt, and left alone for 2 and even 3 years [for a 2nd fermentation], then pressed in sacks. The liquid that flows out is *Shoyu;* it has a taste and a smell that are reminiscent of meat extracts. In Japan it replaces butter, oil, fat and meat sauces. Everything–vegetables, fish, noodles–is ordinarily seasoned with *shoyu.* It is the object of an important industry: in Nagasaki, there are more than 10 factories that produce 1,200,000 kg/year for consumption. The most sought-after quality is that of Tokio (Yédo). It is from this city that originates the sketch that I have the honor to present you.

Composition: According to analyses communicated by Mr. Pellet to the Academy of Sciences in May 1880, here are the composition of two soybeans, the first from China and the second harvested in France. Table 1 (p. 445) gives the percentage of macro- and micronutrients in each. The Chinese soybeans contain 16.4% lipids (*matières grasses*), 35.5% protein (*matières proteiques*), and 4.8% ash (*cendres*) vs. 14.12%, 31.75%, and 5.15% for the French. Table 2 (p. 446) gives the composition of the ash for the two soybeans as follows: phosphoric acid, potash, lime / limestone, and magnesia. It shows that the phosphoric acid and potash represent about 75% of the weight of the ash. Table 3 (p. 446) compares the composition of 100 soybeans harvested at Nice and analysed by Levallois, with the composition of 100 grains of wheat analysed by Isidore Pierre. The soybeans contain about 2.8 times as much nitrogen (protein).

To the analyses done by Mr. Pellet, we must add some slight corrections: according to the analyses made by Mr. Müntz, at the Agronomic Institute (*l'Institut agronomique*), the starchy and sugary materials [carbohydrates] have been increased to 6.40%, the nitrogenous materials [protein] to 36.67% and the fatty materials to 17.00%.

The sugary material, contained in the soybean (*Soya*),

© Copyright Soyinfo Center 2014

constitutes a particular sugar that, like cane sugar, only reduces to Fehling's solution / liquid after having been inverted by sulfuric acid, as Levallois discovered as well.

Its rotary power is much higher than that of cane sugar. Exact degree measurements are given.

Let us now compare the compositions of wheat, beans, potatoes, according to Boussingault, with that of soybeans. Table 4 (p. 446-47) gives percentages of starch and sugared principles, nitrogenous materials, fatty materials, water, potash, and phosphoric acid.

This comparison shows the superiority of soybeans over these vegetable products, even over wheat, for if the ash of it appears richer in phosphoric acid, we must take into account that wheat furnishes 2.41% ash while soybeans give more twice the weight of ash, 5.15%.

The liquid prepared with soybeans in Japan, *shoyu,* was analyzed at the official laboratory in Tokio (no. 1 [on table 5]). I duplicated the analysis (no. 2) to reassure myself that shipment [to France] had not altered its composition. Table 5 (p. 447) shows, nearly identical values for the two sauces, in terms of density, dry extract, ash, nitrogenous materials, salt (NaCl), phosphoric acid, and potash.

As these analyses show, *shoyu* contains about a third of its weight in solid matter, half of which is formed of minerals. Of the latter (minerals), table salt (NaCl) is found in the proportion of 9/11 [i.e., 82% of the minerals is NaCl], phosphoric acid 2%, and potash 3%. Nitrogenous materials represent about a tenth of the total solid matter.

Conclusions: The analyses that I just cited make the considerable value of soybeans from a nutritional point of view stand out. Its richness in protein (*matières protéiques*), in fact [make it] a vegetable meat (*une chair végétale*), and this meat would be superior, as a concentrated food, to [real] meat. In fact, here is a comparison of percentage compositions (*compositions centésimales*) of soybeans and beef that has had its fats and oils removed [probably in the laboratory]. Table 6 (p. 447) compares water, protein, fat, potash, and phosphoric acid.

These figures need no commentary; they are quite eloquent by themselves and make comprehensible how in Japan a handful of this bean suffices to nourish a vigorous man.

One could, advantageously use soybean flour (*la farine de Soya*) as a powerful food, in a small volume, with debilitated individuals. It is, like milk, a type of complete food, joining the plastic element, represented by protein, the respiratory element, fat, and salts, in which phosphoric acid and potash dominate.

Note 1. This is the earliest French-language document seen which gives a specific name to soy flour, or which uses the term *farine de Soya* to refer to soy flour.

The almost total absence of starchy materials, and the insignificant quantity of sugar that this grain contains, indicates it quite naturally as the best base for bread or rusks for the use of diabetics.

I have the honor to present to the Society some samples of bread and rusks made with soybeans.

Finally, *Shoyu*, that combines a significant proportion of nitrogenous materials [protein] with a rather strong quantity of sodium chloride, could be usefully administered to consumptives [people having tuberculosis], who would find there, beside highly nutritious materials, to compensate for / offset the weakening caused by the loss of salt (*déchloruration*) to which they are subject.

Note 2. This is the earliest document seen (March 2010) which is of practical importance concerning the use of soy in diabetic diets.

Discussion: Mr. Roussel–Could Mr. Lecerf please give us some information about the cultivation of soya and tell us if this plant can be acclimatized in France.

Mr. Lecerf–The Soya grows rather well in the same geographical area as corn / maize. The essential requirement for it to bear seeds, is that neither light nor heat be obstructed. Fertilizer is not necessary for it. Even fresh manure is harmful to it, it grows well in all types of terrain, and all atmospheric variations support its growth.

It is planted from the middle to the end of April. It yields about 600 to one [600 seeds from every seed planted]. It is harvested about the end of October. One indispensable precaution is to space the plants from 0.25 to 0.5 meters apart, according to the richness of the soil, by putting several seeds in the same hole, but not to let them develop as a single clump.

Mr. Duchaussoy–I am very happy with the communication by our colleague. I have cultivated Soya for several years. The first year, the harvest had been average, but the second year I harvested almost nothing. I attribute this to the cold, humid weather. Has Mr. Lecerc not observed that the odor of the Japanese *liqueur* [soy sauce] recalls that of the extract of belladona? [deadly nightshade, which is dark purple; he is being sarcastic].

Mr. Lecerf–The odor of this *liqueur* made from Soya, which the Japanese call Shoyu, is somewhat reminiscent of buckwheat bread, or better still of meat extracts.

Mr. Bardet–I would like to ask Mr. Lecerf if it is not possible to modify the color of the bread [which is too dark], and if there is no butter in the bread [i.e., did he add some butter to his soy bread to make it taste better, or is he "buttering up" the whole subject].

Mr. Lecerf–This bread, being made with only soy flour, could not have its color modified by the addition of other types of flour, which would detract from its value as a bread that contains little or no starch.

Mr. Léon Petit–The bread that was presented to us had an excellent flavor. Mr. Lecerf has accomplished a true *tour de force* in masking the bitter taste, so difficult to avoid when one uses Soya flour–a taste due to the oil contained in the seeds.

736. Petit, Léon. 1888. L'huile de soya. Son emploi en médecine comme purgatif à petite dose [Soy oil. Its use in medicine in small doses as a purgative]. *Bulletin de la Societe de Medecine Pratique de Paris.* p. 449-52. Meeting of April 26. Presided over by M. Laburthe. [Fre]

• ***Summary:*** Kaempfer first introduced soybean seeds into Europe from Japan, where they are used to make *miso* and *shoyu* (a black and limpid liquid). These two are indispensable condiments in the Japanese diet. They also make a vegetable cheese, tofu, which is usually eaten fresh, and of which the people are very fond.

In Cochin China, soya occupies a major place in the culinary art. The Chinese do not consume milk; instead, they crush the soybean and obtain from it a liquid, rich in casein and oils, which they use like we use the milk from cows' goats, or sheep. From it, they also make white cheeses, red cheeses [fermented tofu], and a sauce, *Tsiang-Yéou* (*jiangyou* or soy sauce), which are greatly appreciated. For my part, I have had the occasion to taste this condiment several times and I admit that I do not share, in this regard, the enthusiasm of the Chinese. Much more, *soya* enters in the preparation of a ferment used for making spirits and wines.

Nothing could be easier than obtaining soybeans; in France, they germinate as easily as haricots. They contain 30-35% protein and make excellent forage.

The soybean has been tested as a forage plant, either alone or mixed with hay, oats, barley, sugar beets, etc. Mr. Paillieux, a distinguished agriculturalist, even conducted various trials in using the soybean for human food.

He cooked the seeds, like one cooks haricot beans, after they had been soaked in distilled water. He also roasted soybean seeds to make a sort of coffee. He successfully reproduced the various Japanese and Chinese food preparations. He even tried to make a flour by grinding the beans, but this flour degenerated [rancidified] because of the large quantity of oil and fat that it contains.

It is possible that if this oil were extracted, the soybean oilcake (*le tourteau de Soya*) could be ground / reduced into flour which would contain more than 40% nitrogenous materials [protein] and would have no bad [after]taste. But unfortunately, this flour would have a rather high net cost, because of the manipulations that its production would necessitate, unless a use for soybean oil, which is the object of an enormous traffic in China, is found. This very limpid oil, which has a beautiful yellow color like olive oil, leaves a little acrid taste in the mouth which is not disagreeable. It possesses very obvious drastic qualities. I had a liter at my disposition, and I observed that with a minimum dose of 10 gm, you obtain a very energetic purging [like diarrhea], without any type of abdominal pain / colic (*colique*). I hope, before long, to receive a certain quantity of soybean oil that I shall place at the disposition of those of our colleagues who would like to test it as a purgative.

Note: The writer is the only person ever to ascribe a "purging" or "purgative" property to soy oil.

There follows a question and answer session. Mr. Terrier asks: Can Mr. Lecerf provide us with some information about the use of this oil in China and Japan? Mr. Petit responds: I believe that the Chinese and Japanese use this oil only for therapeutic purposes. Soy sauce (*La liqueur de Soya*) is widely employed in England as a condiment. Mr. Lecerf adds: I know nothing about how the Chinese and Japanese use soy oil as a medical substance; but, as I said, this oil is of the highest rank among the oils consumed throughout China. I would say to Mr. Petit that the *India Soy,* which the English consume, is a product which contains only a small proportion of soybeans; it is made with considerable quantities of barley and rice [sic], and it comes from China. However *Shoyu,* which I present to you, is originally from Edo [Tokyo, Japan]. Like that from Batavia [Jakarta] (Ket-Jap [ketjap, kecap]), it is made with from equal parts wheat and soybeans (*Soya*).

Mr. Gillet de Grandmont asks: Very precise and extensive information on the cultivation of soybeans can be found in the *Annals* [*Bulletin*] *of the Society for Acclimatization.* This bean, which I have tried to use for food, does not soften easily upon cooking; it always retains a very disagreeable, acrid taste. I could hardly stand it, except consumed in the form of a salad after cooking.

Mr. Lecerf replies: In the fresh state [as green vegetable soybeans], soybeans are not hard and their taste is even agreeable. In the dry state, it is easy to render them less tough, by adding a small quantity of sodium bicarbonate [baking soda] to their cooking water, and by taking care to soak them in water 24 hours in advance. Address: M.D., 2 Rue Casmir-Delavigne, Paris.

737. Suchi, Tokutaro. 1888. Shibô no eiyôtaki kôyô [Digestion experiments with rice and tofu]. *Tokyo Igakkai Zasshi* (*J. of the Tokyo Medical Society*) 2(9):457-62. May; 2(10):511-20. June? [Jap]

• ***Summary:*** K. Oshima (1905, p. 153) reports that T. Suchi, age 21 and in good health, conducted these experiments upon himself. "The amount of fresh rice and fresh tofu eaten per day was exactly the same in both experiments. In cooking the tofu 40 cubic centimeters of shoyu and 10 gm of sugar were used each day. In experiment No. 17 the tofu used was fried in rapeseed oil by the investigator himself, the amount of oil thus used being carefully weighed." Urine and feces were collected and analyzed.

Digestion experiment No. 16 continued for 7 days, Nov. 18-24, 1887. Suchi weighed 41.30 kg at the beginning and 41.51 kg at the end. The diet consisted of rice and tofu. Suchi digested 95.2% of the protein (*tanpakushitsu*) in the diet, 96.5% of the fat, 98.3% of the carbohydrates, and 77.2% of the ash.

Digestion experiment No. 17 continued for 6 days, Nov.

© Copyright Soyinfo Center 2014

29 to Dec. 4, 1887. Suchi weighed 41.42 kg at the beginning and 41.47 kg at the end. The diet consisted of rice, tofu, and vegetable oil. Suchi digested 94.2% of the protein in the diet, 93.9% of the fat, 99.5% of the carbohydrates, and 78.9% of the ash.

Note: This is the earliest Japanese-language document seen (Aug. 2003) that uses the term *tanpakushitsu* to refer to protein in connection with soybeans. Address: Physiological Institute, Tokyo University.

738. *Journal de Medecine de Paris.* 1888. Revue des sociétés savantes: Pains, biscottes et liqueurs de Soya hispida [Review of learned societies: Soy bread, biscuits, and soy sauce]. 14(23):912-14. June 3. Meeting of April 26. [Fre]
• ***Summary:*** Mr. Lecerf presented samples of bread, biscuits, and sauce obtained by him from the soybean. He briefly describes soybean cultivation and yields. He then answers questions by Mr. Duchausoy about shoyu, by Mr. Bardet about soy bread (which contains only soy flour and no butter; the only oil or fat in the bread is that contained naturally in the flour).

The British consume large amounts of soy sauce which they call *India soy.* The shoyu presented here originated in Edo, Japan; like that of Batavia [Jakarta, in today's Indonesia] (called *Ket-Jap*), it is made with a mixture of equal parts wheat and soybeans.

Mr. Gillet de Grandmont says that the soybean is hard to soften by boiling and has a very disagreeable flavor. Mr. Lecerf replies that fresh soybeans are not hard and their flavor is not disagreeable. Dry soybeans should be soaked for 24 hours, then cooked in water that contains baking soda. Address: Paris, France.

739. *Chicago Tribune.* 1888. An eel dinner in a Tokio cafe. An appetising meal that is manipulated with chop sticks. June 9. p. 16.
• ***Summary:*** From Rumah in St. Louis Globe Democrat: "A specialty of Tokio houses of refreshment is eel houses." "We celebrated a recent anniversary day by an eel dinner at a famous eel house."

"The feast began with a soup or stew of eels, the bottom of the bowl being filled with a delicate white curd [tofu], and the flavor of the dish being as mild and evasive as flaxseed tea... The plain broiled eels are called white eels, and after them came black eels, or eels dipped in soy [sauce] before and during the broiling. They acquire a rich brown tint and a most piquant flavor by this treatment, and the soy, or bean sauce, with which the Japanese always improve their fish and birds, might be used in the same way in other countries. Japanese soy is the foundation of Worcestershire sauce, and is much better before it is charged with all the spices and cayenne that convert it into the English condiment."

740. Kellner, O.J. 1888. Researches on the composition and digestibility of Japanese feeding stuffs. *Bulletin of the College of Agriculture, Tokyo Imperial University* 1(2):1-45. July. See p. 25-29, 39-45. [3 ref. Eng]
• ***Summary:*** Section "V. Hay of soy beans (karimame)" (p. 25-29) describes experiments feeding soy bean hay to sheep (rams). "This hay is considered the best coarse fodder in this country. It is usually cured, when the pods have developed their normal size but the leaves are still green. A specimen of such hay was examined in 1883 by Mr. *M. Ota."*

In part "II. Soy bean (daizu)" (p. 39-45), Kellner notes: "Although the soy beans are somewhat expensive owing to their principal utilization as human food (tofu, miso and shoyu), it may happen that small proportions of them are resorted to in the feeding of the live-stock, for the purpose of supplementing the protein of a ration otherwise too poor in that nutrient." Soy beans, apparently raw, were fed to sheep. Feces ejected, water drunk, and live weights were measured. The article concluded: "The specimen of soy beans examined by us contains the following proportions of digestible nutrients, percent of the dry matter: Crude protein 34.30, fat 18.25, fiber 9.09; nitrogen-free extract 19.65; the last 2 total 28.74.

"Of all raw vegetable products, earth nuts perhaps excepted, the soy beans are the richest in the most valuable nutrients, protein and fat, and contain them in a highly digestible form."

Note 1. This is the earliest English-language document seen (April 2008) that uses the term "human food" in connection with soy beans.

Note 2. This is the earliest English-language document seen (Aug. 2003) that contains the term "crude protein" (or "crude-protein" or "crude proteins") (one of two documents). Address: Dr., Prof. of Agricultural Chemistry, Imperial College of Agriculture and Dendrology, Komaba, Tokyo, Japan.

741. Carrière, E.-A.; André, Ed. 1888. Chronique horticole [Horticultural chronicle]. *Revue Horticole: Journal d'Horticulture Pratique* (*Paris*) 60:409-13. Sept. 16. See p. 411. [Fre]
• ***Summary:*** The section titled "The soybean in Japan" (*Le Soja hispida au Japon*) states (p. 411): This legume, which is expanding rather slowly among our crops, is cultivated in Japan on a large scale, annual production having risen to about 470 million liters.

Since the average price in Japan is about 12 French francs per 1,000 liter, the total harvest is worth about 5.64 million francs–a very respectable figure. The yield can be as high as 40,000 liters per hectare. Address: France.

742. Tsuboi, Jirô. 1888. Miso no gan chitsubutsu [Nitrogenous matter of miso]. *Tokyo Igakkai Zasshi* (*J. of the Tokyo Medical Society*) 2(18):952-54. Sept. [Jap]*
• ***Summary:*** The author took 2,508 gm of miso powder

© Copyright Soyinfo Center 2014

(*miso-ko*), added 50 cc of 80% alcohol, and boiled it for 3-2 minutes. He put on a wooden lid or stopper and kept it in a warm water bath at 60ºC for several hours. Then he filtered it, added 25 cc of water to the remaining solids, extracted the liquid, and made that extract more concentrated by putting it in a warm water bath. He added oxalic acid (*shû-san*) and evaporated it dry. He then removed the dark brown substances remaining, measured the nitrogen. He calculated the nitrogen extract (*ekisu-sei chisso*) and found that it was 0.204%, while the total nitrogen was 1.158%. Therefore the nitrogen in miso is found mostly in the protein and the amount of nitrogen in the extract (*ekisu-bun*) is very small. The *ekisu-sei chisso* is 17.616% of the total nitrogen. (Tô I Kai 2, 952-954 [Sugi]).

743. *Bayerische Gewerbe-Zeitung* (*Nuremberg*). 1888. Japanische Soja [Japanese soy sauce]. No. 23. p. 538-40 [Dec.]. [Ger]

• ***Summary:*** Under the trade name of "Japanische Soja," a peculiar product has also recently become known in Germany. Used as a seasoning with different dishes, it is said to enhance their good taste and nutritive value, and also to stimulate ones appetite. It is a slightly thick, dark reddish-brown liquid with a piquant, pleasant, salty and aromatic taste.

The main constituent of this product is the meal of the soybean (*das Mehl der Sojabohne*), an East Asian plant that sometimes grows wild and is sometimes cultivated. Its kidney-shaped seeds are used daily in Japan in the food of the poorer classes (The soybean has also found practical uses in Germany) or they can be prepared as soya extract or gravy (*Sojabrühe*) which is added to many foods instead of butter or meat.

The production of shoyu (*Soja*) is successful even in large factories, as well as in small shops, and the process is apparently thousands of years old. A measure of the extraordinary amounts of shoyu used in Japanese households is that fact that one company, which is widely known in Europe, at its head factory in Japan employs about 2,000 workers who produce about 1 million gallons = 4,543,500 liters of shoyu. This company, named Tokyo Shoyu Kaisha, in addition to its head factory in Tokyo, has some 48 distilleries (*Brennerien*) throughout the country and a steamship to carry their products to the capital. After many years of effort, it has found a way to preserve the product so it is suited for export to foreign countries, despite many previous unsuccessful attempts.

The way of manufacturing shoyu, about which there have previously been only sketchy reports, is essentially as follows: Dehulled soybeans are dried, then roasted like coffee beans, so they do not lose their aroma during transport. A very hard type of wheat is used in unpolished form; part of it is roasted with the soybeans. A specific quantity of fresh wheat is malted (*gemalzt*), and from this an infusion (*Aufguss*) is prepared, similar to that in our distilleries. In a separate vat, the roasted beans and wheat are combined with cold water and soaked for a long time, during which an artificially very low temperature and the abundant addition of cooking salt [NaCl], the fermentation is allowed to proceed. After a certain time, the diastase solution, which is prepared from the malt, is added to the whole; it is stirred now and then, and left alone. As soon as a certain stage of development is reached, which usually can be recognized from experience by the color of the condiment, a special kind of yeast (*Hefe*) (unknown outside Japan) is added. Under the prevailing conditions, namely of low temperature and high salt content, this yeast causes a very slow fermentation– supposedly without the development of carbonic acid and without alcohol as an end product.

According to the difference in the content of the extract and in the quality of the raw materials, three kinds [of moromi] are manufactured: The lowest quality is allowed to ferment for one year, the middle quality for two years, and the highest quality for three years. During this time the vats [of moromi] remain untouched [and are not stirred].

After being separated from the dregs / sediment (*Bodensatz*), the soy sauce (*Soja*) is ready for use. It is stored in cool rooms in tightly-closed porcelain bottles (*Flaschen*); it stays good for several years. With the entrance of air or light, a slow fermentation continues but without recognizable changes during many weeks. Through the slow fermentation in a strong salt solution, according to several chemical analyses, the rather considerable protein of the [soy] beans and barley is made soluble. The dark color is caused by the strong roasting of these materials. In recent years, public attention has been drawn from various sides to the agricultural value of soy sauce, and its introduction or importation for general use has been recommended. With potatoes, as in Japan with rice, it can form a true food of the people. To that end, it should be made available in small quantities to purchase for only a few pennies. In addition, it seems that, because of its ability to stimulate and promote digestion, it can improve the taste of soups and sauces, all kinds of meat and fish, vegetables, etc. It is better suited than the often-used strong spices, whose sharpness / harshness is not good for everybody.

Either during cooking or at the table, add soy sauce to the dishes according to taste.

In order to avoid the formation of a thin film of salt [sic, yeasts] on the surface of bottled soy sauce (even though it is not detrimental), you should store bottles of soy sauce lying on their sides [rather than upright].

• ***Summary:*** Each plant is given a number, starting with 1 for "Aantigan." The short passage on the soybean reads: "3127. *Kadeleh of kadaleh S. M. & J.* [*S. = Sundaneesch. M. = Maleisch. J. = Javaansch*] = *Soya hispida Mönch, Nat. fam. der Papilionaceæ. Gr.* [*Groeiplaats*] *Op Java en elders in tuinen, uit Japan overgebracht; zaadplant. Gebr.* [*Gebruik*] *De zaden dienen tot bereiding der Soya of Kétjap."*

This can be translated as follows: "No. 3127. Named kadeleh or kadaleh in Sundanese, Malayan, and Javanese. Scientific name: Soja hispida Moench. Member of the natural family Papilionaceæ. Places of growth: On Java and elsewhere in gardens, imported from Japan; a seed plant. Uses: The seeds are used for the preparation of soy sauce or ketjap."

Note: Filet lived 1825-1891. The only other species of the genus Soja mentioned in this book is Soja Wightii (*Tjijhe-badak*), No. 8846 (p. 297). Address: Oud-Officier van Gezondheid van het N.-I. Leger.

748. Holbrook, Martin L. 1888. Eating for strength: or, Food and diet in their relation to health and work, together with several hundred recipes for wholesome foods and drinks. New York: M.L. Holbrook & Co. 236 p. No index. 20 cm.
• ***Summary:*** The author, a health reformer, advocates a vegetarian diet. Chapter 9, titled "Alimentary products of the vegetable kingdom," has a section on "Peas, beans and lentils" which states (p. 117): "The special characteristic of the bean, as compared with cereals, is a less amount of starch and a larger amount of nitrogenous matter. This renders it an excellent substitute for flesh meat. All experience goes to show that it is a more satisfying vegetable product for hard-working men than almost any other. In Catholic countries, especially France, where flesh food is less used, and where during Lent and on Fridays it is proscribed, leguminous products are more extensively used than elsewhere. They are much used by the vegetarians of India and China..."

"In Japan the bean is made into a curd [tofu], a most nutritious article of diet, and the nearest approach in its chemical constituents to animal food of any of the vegetable foods. A very full account of the mode of preparing and using it was published by the United States Government in the consular reports for 1886. This curd is used in soup, croquetts [croquettes] and a hundred other ways, and is said to be well liked. It might to our advantage be introduced into our country, and so might the soy bean generally used in Japan and China, which is richer in fat than our own beans are." A table (p. 118, based on Kinch 1880) gives the composition of the soy bean.

Note 1. This is the earliest English-language document seen (Nov. 2003) that contains the term "substitute for flesh" or "substitute for flesh meat" to refer to a meat alternative.

Note 2. This is also earliest document seen (March 2001) concerning the etymology of meat alternatives.

The chapter on "Food in various diseases" recommends remedies for constipation (brown bread, fruit, and fresh vegetables), chronic rheumatism (a vegetarian diet), diabetes (gluten bread, "made now by many health food companies"), food for orphan asylums, prisons, etc. ("a rightly constituted vegetable diet," 'non-flesh' diet, or 'Vegetarian' dietary).

Note 3. This is the earliest English-language document seen (Sept. 2006) that contains the term "health food" (or "health-food" or "health foods"). Address: M.D., Prof. of Hygiene in the New York Medical College and Hospital for Women, Editor of the *Herald of Health,* etc.

751. *Pharmaceutische Centralhalle fuer Deutschland.* 1889. Japanische Soja [Japanese soy sauce]. 30(3):44-45. Jan. 17. New series: Vol. 10. Extracted from Bayerisches Industrie- und Gewerbeblatt. [1 ref. Ger]

• ***Summary:*** Japanese soy sauce (*Japanische Soja*) is a thick, dark-brown liquid, with a piquant, pleasant, salty taste and an aromatic fragrance. Coming from Japan, it has recently been recommended as an addition to meals, not only to make foods taste better but also to enhance their nutritional value.

In Japan, soy sauce is made in large factories, the largest of which employ 2,000 workers. A description of the process is given. For the best quality soy sauce, the fermentation process should take three years.

752. Osawa, Kenji. 1889. Shôka shiken tsuika [Additional investigations on digestion]. *Chugai Iji Shinpo* (*Medical News, Foreign and Domestic, Tokyo*) No. 211. p. 6-8. Jan. [Jap; eng+]

• ***Summary:*** Experiment no. 18 was a digestion experiment with rice and tofu, plus small amounts of starch (kuzu powder), shoyu, and sugar. It was conducted for 3 days, June 20-22, 1887. A table shows the amount and nutritional composition of each food used. The following percentages of the basic nutrients were digested: Protein 95.2%. Fat 94.8%. Carbohydrates 98.8%. Ash 83.4%. The author concluded that mixed foods (except for fat) are more easily digested than single foods. Address: Physiological Institute, Tokyo University.

753. Carrière, E.-A.; André, Ed. 1889. Chronique horticole: La production de Soja hispida au Japon [Horticultural chronicle: Production of soybeans in Japan]. *Revue Horticole: Journal d'Horticulture Pratique* (*Paris*) 61:121-25. March 16. See p. 125. [Fre]

• ***Summary:*** Soya hispida is now raised in a few market gardening operations in Europe, but it is only found in small amounts, not because its seeds are rare but because this type of bean is not regarded as a highly lucrative vegetable.

In Japan, the opposite is true and this crop has expanded to the point that the average value of the annual crop surpasses 100 millions francs. Address: France.

754. Kellner, O.J. 1889. Tofu cakes. *Bulletin of the College of Agriculture, Tokyo Imperial University* 1(4):24-25. March. [Eng]

• ***Summary:*** This article is about okara and its uses. "Tofu, e.g. bean curd essentially consists of legumin, and is prepared from soy beans, which are steeped in water, finely ground on stone mills and extracted with much water. The solution of legumin thus obtained is heated to boiling, filtered after cooling, and precipitated with the brine that drains off from the crystals of common salt during the preparation of the latter from sea water. The precipitate, after being pressed in wooden frames represents the tofu, a common human food in China and Japan. The portion left undissolved of the beans, called *tofu kasu* [okara] is chiefly used as food for domestic animals, but sometimes also consumed by the poorer classes or used as manure.

An analysis of such cakes, by Mr. J. Sawano, gave the following results (fresh substance): Water 85.74%, crude protein 3.82%, fat 1.44%, crude fibre 3.15%, nitrogen free extract 5.38%, ash 0.47%, total nitrogen 0.611%, albuminoid nitrogen 0.024%. The following are "per mille" [i.e., mg/100 gm]: Potash 1.71, soda 0.07, lime 0.97, magnesia 0.40, ferric oxide 0.10, phosphoric acid 1.20, sulphuric acid 0.12, silica and sand 0.12, chlorine 0.01.

"As the dry matter of the cakes is still rich in protein (26.7%) and fat (10.3%), they deserve, of course, to be more recommended as a food for cattle and hogs, than as a manure for direct application."

Note: This is the earliest English-language document seen (June 2013) that uses the term *kasu* or *tofu kasu* to refer to okara. It is also the earliest document seen (June 2013) stating that okara is fed to "hogs" or "domestic animals." Address: Tokyo, Japan.

755. Tahara, J.; Kitao, M. 1889. Notes sur la composition du shoya. Sur les matières azotées dans la sauce japonaise dite "Shoya" [Notes on the composition of shoyu. On the nitrogenous materials in the Japanese sauce called "Shoya"]. *Revue Internationale des Falsifications* 2:159-61. April 15. German-language summary in Chemisches Central-Blatt 1889(1):732. [1 ref. Fre]

• ***Summary:*** The sauce well known as "Shoya" [sic, shoyu] is indispensable in the culinary art of Japan. Mr. T. Isono, in his 1878 thesis on shoyu, reported that it is a clear, dark brown liquid, having a sweet and salty taste and a particular savory aroma. The relative density ranges from 1.15 to 1.23. All foods in Japan, whether of animal or vegetable origin, are prepared with the aid shoyu, without the addition of sea salt; however the latter is a major ingredient in shoyu. The annual production of shoyu in Japan is about 3-4 million *koku* (1 koku = 180.4 liters, thus 540-720 million liters) and each Japanese consumes, on average, 60-100 cc/day.

A table shows that 13 samples of shoyu, examined at

© Copyright Soyinfo Center 2014

a laboratory in Tokyo, were found to have the following average composition by weight: Solids (dry residue) 36.71%, nitrogen 1.33%, glucose 3.80%, dextrin 1.30%, acids (calculated as acetic acid) 0.72%, ash 19.45%, sea salt 15.86%, phosphoric acid 0.48%. Maximum and minimum values are also given for each nutrient.

"As far as we know, research on shoyu (*Shoya*) conducted to date is limited to qualitative analyses. Furthermore, Mr. Isono has measured the alcohol and nonvolatile acids. We propose to determine whether the shoyu contains nitrogen in the form of proteinaceous materials which come from the beans used in its manufacture, or whether these substances have already undergone a partial alteration during the fermentation period.

"To this end, we obtained the best quality shoyu, made by the House of Yamoguchi [Yamaguchi] in Shimosa prefecture" [just northeast of Tokyo]. The product had a specific gravity of 1.26 at 21ºC. The reaction was distinctly acid.

A second table shows the results of the qualitative analysis, 100 gm calculated by weight: Solids (dry residue) 32.58%, total nitrogen 1.18%, glucose 2.76%, dextrin 1.30%, alcohol 0.43%, volatile acids (calculated as acetic acid) 0.16%, non-volatile acids (calculated as acetic acid) 0.83%, inorganic salts 17.47%.

A third table gives an analysis of the ash by weight: sodium chloride (table salt) 87.26%, sulfuric acid 2.84%, phosphoric acid 2.65%, magnesium 3.90%, calcium traces, potassium traces. ash 19.45%, sea salt 15.86%, phosphoric acid 0.48%.

In addition, ammonia and amines were found in shoyu, plus a new aromatic substance that crystallizes and contains nitrogen. It melts at 213ºC. 100 cc of shoyu contains total nitrogen 1.18%, proteins 0.55% and of the new aromatic substance 0.46%; it will be discussed in a future article.

Most Japanese believe that shoyu is very nutritious article of food, rich in protein. The above tests show that view to be erroneous, since it contains only 3.4% protein. However shoyu is indispensable to Japanese cuisine.

Note: This is the earliest document seen (July 2001) that uses the word "Shoya" to refer to soy sauce. Since the word was spelled this way twice in the title and at least 13 times in the body of this French-language article, it appears not to have been a typographical error. "Shoya" was subsequently used by only one other author (Loges 1910), but in that case to refer to soybeans. Address: Tokyo.

756. Wileman, A.E. 1889. Salt manufacture in Japan. *Transactions of the Asiatic Society of Japan* 17(1):1-66. April. See p. 27. Read 14 Nov. 1888. [Eng]
• ***Summary:*** In Japan, salt is made from sea water "in the numerous salt gardens, or salterns, scattered along the coast." After the water has been evaporated from salt, it still contains "bitterns" or "mothers," which possess a very bitter or acrid taste due to the magnesium salts (mainly magnesium sulphate) present in solution.

The pans used for making salt by evaporation last only 35-40 days because of a build-up of "pan scale" on the inside surface.

Page 27: "Several expedients are resorted to for diminishing the pan scale as much as possible and frequently with success.

"One consists in adding to the brine contained in the boiling pan the lees [sic, whey] obtained from the manufacture of Tôfu [Tofu] or Bean Curd. This bean curd is made by treating a large white bean called the 'Daizu,' or scientifically, Soja Hispida, with water and then boiling it. The liquor exuding from these beans when squeezed in a cloth, is what is used for putting into the brine. For a boiling of two *koku* (= 40 gallons) of brine, two *shô* (= 3 quarts) is the regulation quantity."

757. Kellner, O.J.; Mori, Y.; Nagaoka, M. 1889. Researches on the manufacture, composition, and properties of "koji." *Bulletin of the College of Agriculture, Tokyo Imperial University* 1(5):9-33. July. [10 ref. Eng]
• ***Summary:*** A detailed analysis. *"Koji* i.e. steamed rice or barley upon which is developed the mycelium of special fungus plays an essential part in various manufacturing processes peculiar to Japan and China. It is used as a saccharifying substance in the preparation of rice wine (*sake*) and alcohol (*shochiu*) and seems likewise to be the chief active ingredient which brings about the slow fermentation as well in the manufacture of *miso,* a food adjunct very common in Japan, as in the preparation of *shoyu,* a peculiar sauce also largely consumed in the country.

"... we prepared koji from rice and barley in the following way, which is generally adopted in the koji works, and which has already been described by O. Korschelt (1878), and R.W. Atkinson (1881)." Address: Dr., Prof. of Agricultural Chemistry, Imperial College of Agriculture and Dendrology, Komaba, Tokyo, Japan.

758. Lecerf, Ch. 1889. Le soya, sa valeur alimentaire et son emploi thérapeutique [The soybean. Its food value and therapeutic applications]. In: Compte Rendus, Congrès International de Thérapeutique et de Matière Médicale. 1889. Paris. 347 p. See p. 296-302. Meeting of Aug. 3. Therapeutic section. [4 ref. Fre]
• ***Summary:*** The soybean (*Le Soya or Soja*) is a legume of the group *Phaséolées,* widely cultivated in China, Japan, and the Far East, where it serves as a foundation of the food of the indigenous people.

The Dutch traveler Kaempfer, in 1712, first reported on this plant, which he designated under the Japanese name Daïdsu. After that it was named: *Dolichos soja* by Linnaeus, *Soja hispida* by Moench, and *Glycine hispida* by Siebold. A detailed botanical description is given. It is an

© Copyright Soyinfo Center 2014

annual herbaceous plant, having slender stems about 80-90 cm in height. Its leaves are trifoliate with a special pattern of veins (*imparipennées- trifoliolées*), its leaflets / folioles are hairy and oval but pointed on the ends. Its flowers are small, papilionaceous corolla, varying in color from white to purple; they are disposed in axillary groups, etc.

The type that I have just described is the one that acclimatizes itself most easily to the European regions where the cultivation of corn / maize is possible. In Japan and China, there are numerous varieties of soya, having brown, black, or greenish seeds. In these countries, each of these varieties has a special use: One kind is used to make tofu (*le Téou-fou*), a kind of cheese of which the Chinese people are very fond. Another is used in the preparation of Shoyu, a kind of sauce which is (so to speak) indispensable to the Japanese. Yet another kind is employed by the Chinese to make Cantonese wine starter (*Kiu-tsée;* [from China]) a solid ferment, which is used in making wines and artificial brandies.

All that is known about the various uses of Soya, about the trials that have been made concerning the acclimatization of this plant in Europe, as well as the chemical composition of the plant and its seeds, can be found in an excellent monograph by Mr. A. Paillieux [1881].

In April 1888, in a communication to the Society for Practical Medicine (*Société de médecine pratique*), I called to the attention of the medical corps the services that this legume could render to diabetics and to invalids, and presented samples of bread made with soya flour.

I am happy to note that my idea did not remain without a response / an echo. Our learned president, Prof. Dujardin-Beaumetz, was kind enough to present to the Academy of Medicine (on 29 May 1888) the soya bread (*pains de Soya*), which I made with no flour other than non-soy flour; he was kind enough to conduct trials with this bread in his department at the Cochin hospital [a famous hospital in Paris].

Later, Mr. Blondel published (*Journal de pharmacie et de chimie,* 5th series, vol. 18, p. 537) a very interesting study on the structure of soybean seeds., and demonstrated the almost complete absence of starch in their tissues. Then Mr. Egasse, in an excellent article in *Bulletin général thérapeutique* (30 Nov. 1888) summarized the various works concerning Soya and its economic and therapeutic applications.

Not much attention was given to Soya [in Europe] until after the Exposition of Vienna in 1873, to which the Japanese brought numerous samples. Professor Haberlandt and Count Cettems were the principal popularizers, and even though they recommended its cultivation mainly from the viewpoint of feeding and fattening livestock, they opened the door to the idea that the seed could be of service if it were introduced as a human food.

In France, the Society for Acclimatization encouraged cultivation trials with Soya, which it sought to popularize; but in spite of the numerous trials that were made and of which the majority gave excellent results, its cultivation continued only in and around Étampes (Seine-et-Oise).

The analyses [of the chemical composition] of soybean seeds that have been made in Austria, Germany, and France are numerous. The writer then gives the composition (in two large tables on p. 299) of three samples of soybeans (from China, Hungary, and Etampes) and their ash as conducted by Mr. Pellet and published in the *Comptes Rendus des Seances de l'Academie des Sciences* (Paris) (1880, vol. 40, p. 1177).

The analyses of Mr. A. Muntz was based on French samples, whose content of starch and sugar was rather high. They contained 6.4% (p. 299).

The sweet material (*matière sucrée*) of the soybean was studied by Mr. Levallois, who also made comparative analyses of the proportion of phosphoric acid and nitrogen contained in wheat and in soybeans. His latter results are given in the form of a short table.

If we compare the chemical composition of Soya, according to the analyses of Mr. A. Muntz, and that of beef that has been defatted (as in a laboratory) according to the analyses of M. Lehmann, we see that the Soya contains more of the useful nutrients / principles than the meat. A table (p. 300) compares the amylaceous and sweet materials, proteins, fats, phosphoric acid, and water for the two foodstuffs.

Soya is therefore a precious plant, which, in a small volume, offers a large nutritive value. Its low starch content makes it very useful in diabetic diets.

The oil contained in the soybean seed, even though it is said that the Chinese use it as an edible oil, is a laxative and has a taste that is not very agreeable; this taste would make it hard to use, even as a substitute for castor oil. It is the oil, above all, which makes it difficult to make bread from Soya flour, and which gives this flour a disagreeable taste, which even cooking does not diminish noticeably. This oil is not, strictly speaking, a drying oil as is often said; it is a mixture of resin, fixed oil, and essential oil (*de résin, d'huile fixe et de huile essentielle*).

With the flour, from which most of the oil has been removed, I have succeeded in making a bread that is not disagreeable. It stays fresh for 4 to 5 days, and has the great advantage for sick people over gluten bread of having a good crumb (the soft, white part of a loaf, other than the crust), not to mention the insignificant amount of starch that it contains.

This bread, cut into slices and dried in a drying stove, furnishes biscuits; finally the flour, mixed with egg yolks, enables us to makes wafers / thin waffles than can be sweetened with saccharine.

Soya bread, in appearance, has a great similarity to rye bread; its color darkens gradually as it ages. And it is easily digested, provided, as Mr. Dujardin-Beaumetz advises, one does not consume more than 250 gm per day.

In using this bread, a certain accommodation must be

© Copyright Soyinfo Center 2014

made; during the first few days it has a mild laxative effect, but this diminishes as one gets used to it.

Many sick people, having previously used gluten bread, have switched to Soya bread basted on its good taste. Then they discovered the additional advantages of a bread that absorbs and retains moisture well, and that stays fresh and soft for rather a long time. Note: At mealtimes, many French people used to dunk their bread (which is served next to the meal) into a hot, tasty liquid (soup, milk, coffee, gravy, etc.) and use it like a utensil to move or push other foods around, and clean the plate at the end of the meal.

The trials conducted to date do not yet allow us to say for sure, in diabetes mellitus, what the action of Soya is on the production of sugar. But we can affirm, already, that the quantities of glucose (*glycose*) do not increase when Soya bread is substituted for gluten bread. A fact that appears to remain constant with diabetics who use Soya, is a decrease in the volume of urine excreted in 24 hours.

If, by virtue of their low starch content, Soya preparations are useful to diabetics, the relatively large proportions of proteins and of phosphates which they contain make them a substantial food which can render a service to debilitated persons.

Discussion: Mr. Constantin Paul says–Concerning Soya biscuits, sweetened with saccharine, recently recognized as good for the feeding of diabetics, I would like to call the attention of the Congress to the services which can be rendered, in the diets of the sick, by the use of saccharine in general, so convenient to use to console the diabetics that that they do not have completely suppress all sweets...

Mr. Stokvis adds that saccharine has been recently used in Holland and he would like to make the same observation as Mr. Paul. As long as saccharine is used in a sufficiently alkaline milieu, no stomach problems are observed. Address: Pharmacist, Paris.

759. *Pharmaceutische Centralhalle fuer Deutschland.* 1889. Offene Correspondenz [Open correspondence]. 30(47):698. Nov. 21. New series: Vol. 10. [Ger]
• ***Summary:*** Mr. W. in The Hague (Netherlands) is looking for a supplier of soybeans. An extract of soybeans is on the market under the name of "Soya Japan" [probably Japanese shoyu / soy sauce] or "Kefo" and is used as an ingredient in or seasoning for soups. One supplier of this Soya extract is Gehe & Co. in Dresden.

760. Stearns, Frederick. 1889. A Japanese dinner: An elaborate and somewhat curious affair of many courses. Dainty dishes served in rare and most exquisite porcelains: A cup of tea made from priceless leaves–The menu in detail. *Detroit Free Press.* Dec. 8. p. 16.
• ***Summary:*** The writer was invited to dine with a Japanese gentleman in Tokio at a "beautiful new tea house, called *Kan-toku-tei* (lofty virtue), in the midst of one of the finest and oldest landscape gardens of Tokio. This garden is over 250 years old." The first-class Japanese dinner was laid for four persons. Since the writer was unable to sit on his heels or to use chopsticks, the dinner was served on a Western style and he used "that vulgar utensil called a fork."

Each dish and the vessel in which it was served are described. Three little piles of zests were served with one course: Yellow chrysanthemum petals, bruised and moistened with salted water; horse radish; and small cucumbers very thinly sliced and pickled in brine. Several of the foods were dipped "into a little cup of soy [sauce], adding at the same time one or more of the zests."

Another course "consisted of young bamboo shoots (resembling somewhat our asparagus) cooked in soy sauce and mirin. With these were... salmon soaked first in soy sauce and then broiled, but eaten cold. This is called teriyaki."

Note: This is the earliest English-language document seen (April 2012) that contains the word "teriyaki." It does not contain the term "teriyaki sauce."

The next course, a soup, included "a greenish sea weed called nori,..."

"The only criticism I would make upon Japanese food is that it is too much salted to suit foreign palates. But for daintiness of appearance, pretty decorations and exquisite porcelains it would be difficult to find a parallel." Address: Yokohama, Japan.

761. Kellner, O. [Oskar Johann]; Nagaoka, M.; Kurashima, Y. 1889. Researches on the manufacture and composition of "miso." *Bulletin of the College of Agriculture, Tokyo Imperial University* 1(6):1-24. Dec. [12 ref. Eng]
• ***Summary:*** Contents: Introduction. Raw material and preparation of miso: Soy beans, koji from rice or barley, common salt. The chemical processes during the ripening of miso (incl. chemical composition of fresh substance and dry matter, which include nitrogenous substances or albuminoids, ether extract [crude fat], carbohydrates, crude fibre, ash, solubility, water). Varieties, composition, and nutritive properties of miso: (1) "Shiro miso, white miso, is characterized not only by its white colour but also by its low content of salt and by the short time it will keep good"–no longer than 10 days; 4 days fermentation time. (2) "Yedo miso, so called from the former name of the metropolis" [Yedo/Edo, now Tokyo]; 20 days. (3) "Inaka miso, country miso, is the richest in salt and is prepared with the help of barley koji"; 11-12 months. (4) "Sendai miso derives its name from the city of Sendai in Miyagi prefecture where it is widely prepared, but is frequently also termed *Aka miso* (red miso)"; 8-15 months. (5) Other sorts of miso which are only of local importance. Four are consumed mostly in miso soup: Sano miso, Nagaseyama miso, Mikawa or Sanshiu miso [Sanshu miso]. Four others can be consumed uncooked and used as condiments: Kinzanji miso ("named after a

© Copyright Soyinfo Center 2014

Buddhist temple and prepared by fermenting a mixture of soy beans, barley koji, salt, starch-sugar {*amé*}, slices of egg plant {*Solanum melongena*}, and ginger roots"), Sakura miso ("quite similar to the preceding, but sweeter on account of an admixture of large quantities of starch-sugar or raw cane sugar"), Tetsuka miso [Tekka miso] ("is common miso with the addition of sesamum oil, roasted soy beans, and slices of the roots of burdock {*Arctium Lappa"*}), Kogo miso ("is prepared like common miso but with an addition of rice bran").

Note 1. This is the earliest English-language document seen (Dec. 2012) that contains the term "roasted soy beans."

The introduction begins: "Miso, e.g. a food prepared from a mixture of soy beans, rice or barley, common salt, and water, by slow fermentation, seems to have been known in Japan since remote times. Its manufacture, like so many other useful processes, appears to have been taught to the Japanese by Chinese or Koreans. At least the *Sandai jitsu roku,* tells us, that a Chinese priest named *Jingo* transmitted more than 1000 years ago a small quantity of miso to the then Emperor of Japan, and the name *'Korei shiwo'* sometimes, though not frequently used instead of the word 'miso,' points to its introduction from Korea, where indeed, as well as in China, miso is still a favorite food.

"In Japan miso is very widely consumed, especially by the lower classes, who enjoy it as a sort of food adjunct to the vegetables of which their daily diet consists. Although it is eaten throughout the whole country, it seems to be especially favoured in the north-eastern provinces. Statistics on its consumption do not exist at present and may also be difficult to compile, as in the countryside it is made by families themselves [at home], and only in large communities are special miso works [factories] established. Assuming, however, 10 monme (37.5 grms.) to be the lowest quantity daily consumed per head, and 20 millions out of the 39 [million] of the whole population to eat miso every day, a yearly amount of nearly 30 million kilograms of miso is arrived at, for the preparation of which more than half the yearly produce of soy beans (2.3 million koku [335,000 tonnes] in 1883) is needed. Although these figures are certainly too low, they surely indicate the importance of this food in the nutrition of the Japanese people."

Tables show: (1) The composition of three different types of soy beans that make good shoyu and good miso, and the weight of 1000 grains/seeds of each (p. 3). (2) The composition of four different types of sea salt: Ajino from Bizen, Ako from Harima, Mitajiri from Suwo, and Giotoku from Shimosa [Shimôsa] (p. 4). (3) The composition of soy beans and of barley, and amount of each used in making miso (p. 6). (4) The composition of the fermenting miso after 50, 85, 120, and 150 days, on a fresh (as-is) basis (p. 7) and a dry-matter basis (p. 8). (5) Changes in nutrients in the soy beans and in the barley during fermentation (p. 11). (6) Changes in the miso during fermentation (p. 13). (7) Temperature of the original mixture and length of fermentation for four types of miso: Shiro miso, Yedo miso, Inaka miso, and Sendai miso (p. 15). (8) Composition of five types of miso (p. 19). (9) Proportion of raw materials, age, temperature of the beans when mixing them with the other ingredients, and price per *kin* (=0.601 kg) of the same four types of miso.

Note 2. Dr. Kellner published three subsequent articles in this journal but none concerned soybeans: (1) "Manuring experiments with paddy rice" (Bulletin No. 8, June 1890); (2) "Manuring experiments with paddy rice. (Third year)" (Bulletin No. 11, July 1892); (3) "Comparative experiments on the effects of various phosphatic fertilizers on upland soil, and analysis of rice grain" (Bulletin No. 12, March 1893).

Note 3. This is the earliest English-language document seen (Sept. 2002) that contains statistics on the production or consumption of soyfoods (in this case miso), in Japan.

Note 4. This is the earliest document seen (Sept. 2002) that contains statistics on miso by geographical area.

Note 5. This is the earliest English-language document seen (Aug. 2001) that mentions the word "nutrition" in connection with soy.

Note 6. This is the earliest document seen (March 2009) that mentions "Inaka miso" [made at home in the countryside], or "Tetsuka miso" [Tekka miso], or "Yedo miso" [Edo miso], or "Sendai miso" [a dark rice miso made in and around the city of Sendai], or "Kinzanji miso," or "Sanshiu miso" [Sanshu miso, a soybean miso made in central Japan].

Note 7. The parallel Japanese title of this English-language periodical is *Tôkyô Nôrin Gakkô. Gakujutsu hôkoku.* Address: Dr., Prof. of Agricultural Chemistry, Imperial College of Agriculture and Dendrology, Komaba, Tokyo, Japan.

762. Department of Agriculture, C.P. 1889. *Report on the Nagpur Experimental Farm in the Central Provinces* (*India*) 17 p. For the year 1889-90. Ending 31 March 1889. See p. 3, 17.

• ***Summary:*** In the section titled "Field experiments: Kharif crops," a table (p. 3) shows 0.55 acres of the Japan pea (*Glycine hispida*) were cultivated for grain (seed). The average out-turn [yield] of this crop was 69 lb/acre in 1887 and 67 lb/acre in 1888. Also mentions the following crops: Mung (*Phaseolus mungo*), popat white (*Lablab vulgaris*), til (*Sesamum indicum*), castor, chillies (*Capsicum annuum*), linseed, hemp, and cotton.

A table titled "Total area under experiment on Nagpur Experimental Farm during the year 1888-89" (p. 17) gives similar information for Japan pea and other crops mentioned above. Total kharif acres were 27.46; total rabi acres were 39.61.

"When the bean in 1885 was grown experimentally at Nagpur from Japanese seed, it yielded at the rate of 180 lbs.

© Copyright Soyinfo Center 2014

per acre (see Report Experimental Farms for that year, p. 5), but later (*vide* Nagpur Experimental Farm Report for 1889-90, p. 5) it yielded but an average of 88 lbs. per acre over five years." Address: Superintendent of the Experimental Farm, Nagpur.

763. Dôjin, Enankyô. 1889. Tôfu hyakuchin: tegarû ryôri [One hundred and rare and favorite tofu recipes: Easy cookery]. Osaka, Japan: Shinkada Seishichi. 18 p. 19 cm. [Jap]
• ***Summary:*** This book appears to be a simplified and condensed version of the 1782 classic *Tôfu Hyakuchin,* by Ka Hitsujin.

764. Hayward, Albert I. 1889. Report of the Agriculturist. *Maryland Agricultural Experiment Station, Annual Report* 1:70-75. For the year 1888. See p. 71-73.
• ***Summary:*** The section titled "The soja bean (*Soja hispida*)" (p. 71-73) states: "The object of this crop was to test the qualities of this Japanese forage plant." The crop was planted on 9 June 1888 on 27 plots, each one-eighth of an acre in size. All growth stopped in mid-July when a blight seemed to seize the plants. "Aphides were found on the leaves and the ends of the roots were dead." "About the 10th of August new leaves began to appear and the growth was very vigorous from that time till harvest," which began Sept. 21. The average plant height was 2 feet, but some plants reached 3 feet. "The pods had begun to form but the seed was not developed. The stems were hard and woody near the ground. The crop was run through a fodder-cutter and ensiloed with corn and sorghum, alternating the loads as they were drawn, thus mixing three forage plants. This proves to be a food eaten very readily by cattle and showing a marked improvement in the flesh of the animals and in quantity of milk produced. The woody stems of the beans are kept moist in the silo and the stock eat them up clean." The largest yield was at the rate of 11,088 lb/acre. "This would undoubtedly have been very much increased by a reasonable quantity of manure or fertilizer." A table (p. 73) shows the chemical composition of the soja bean plant (at two stages of growth, Sept. 22 & 26), red clover, and timothy.

When "the Soja Bean and common Red Clover are compared ton for ton of green product, at time of harvesting, the former gives more total dry substance, or food, than the latter, and this in the form of more valuable nutrients. It has also been abundantly proven that land which will not produce enough clover to pay for cutting, will yield an average crop of the Soja Bean."

Note: This is the earliest English-language document seen (May 2000) that uses the word "silo" (or "silos") in connection with soybeans (one of two documents). Address: B.S., Agriculturist.

765. Hirayama, Akira. 1889. Shinsen tôfu ryôri [Fresh tofu cookery]. Japan: Published by the author. 70 p. 18 cm. [Jap]*

766. Imbrie, William. 1889. Handbook of English-Japanese etymology. 2nd ed. Tokyo: Z.P. Maruya & Co. viii + 287 + iv p. See p. 265-66. Index. 20 cm.
• ***Summary:*** This is a page for page translation of *In Puris Naturalibus.* Page 265: The left half of the page is written in Romanized Japanese, and the right hand side is the English translation. The word *kirazu* appears (in Romanized Japanese) four times on page 265 and 4 more times on page 266. For example (p. 265): *kirazu: kono tôfu no kirazu wo... sono kirazu wo kau koto...*" "The father is poor, and the children are numerous; and they can hardly live from day to day. Such humble people get along by mixing in these tôfu husks to eke out their rice. And there are ever so many people of that kind. And yet such persons are extremely ashamed of being seen buying the husks." One boy's mother asked him to go fetch a basket of tofu husks [okara]. As he walked home he met some boys: "And so the boy with the basket said, 'Pshaw! none of you can tell. Why! it is tofu husks.' Thereupon a lot of the boys called out together, 'Oh I say! really is it husks? Then, take down the basket and let us see inside.' 'No!' said he,' I can't let you see inside.' 'Why won't you let us see inside?' said they. 'Because my mother told me to bring them home without showing them to people.' Oh the heart of a child–how innocent, how pure it is!"

Note 1. The terms *kirazu* and *tôfu no kirazu* (meaning okara) are used only in Japanese and are translated as "tôfu husks."

Note 2. This is the earliest English-language document seen (June 2013) that uses the term "husks" or "tôfu husks" to refer to okara.

Tofu is mentioned on pages 264, 265, 266, and 271. Miso is mentioned on p. 266.

William Imbrie lived 1845-1928. Address: Philadelphia.

767. Kellner, O.J.; Mori, Y[ôtarô]. 1889. Untersuchungen ueber die Ernaehrung der Japaner [Investigations on the nutrition of the Japanese]. *Zeitschrift fuer Biologie* 25:102-22. [16 ref. Ger]
• ***Summary:*** The Japanese practice a near-vegetarian diet and consume very little meat. In 1882 only 36,288 cattle were slaughtered and the 37 million inhabitants consumed less than 1 kg per capita each year. The authors found that rice constitutes about 50% of the total vegetable food of the Japanese, followed by barley and wheat (27%), other small grains such as millet and buckwheat (13.9%), with green vegetables, roots, tubers, etc. making up the remainder. Soybeans, which are rich in protein and fat, are not widely consumed as such directly, but are made into other unique foods such as tofu and miso, and a tasty sauce, shoyu. Miso is made in almost every household in Japan. The process for making miso, tofu (*Bohnenkäse*), and shoyu is described (p.

© Copyright Soyinfo Center 2014

103-04).

A table (p. 121) gives the chemical composition of various Japanese foods (on a moisture-free basis), including soybeans cooked with shoyu, and tofu (*Bohnenkäse*). Address: Tokyo, Japan.

768. Koenig, Franz Joseph. ed. 1889. Chemische Zusammensetzung der menschlichen Nahrungs- und Genussmittel. Vol 1. Chemische Zusammensetzung... Ed. 3 [Chemical composition of human foods and food adjuncts (stimulants / enjoyables). Vol. 1. Chemical composition... 3d ed.]. Berlin: Verlag von Julius Springer. 1161 p. See p. 241-42, 595-600, 625, 631-32, 1041. See also Vol. 2, 1893. [21 ref. Ger]

• ***Summary:*** Summaries of early studies on chemical composition of soybean seed and of miso. The long and interesting section titled "Commercial sauces and food seasonings" (p. 241) is discussed in a separate record.

A table (p. 389) gives numerical data on the oil from various oilseeds, including the soybean: Melting point, saponification number, neutral fat (*neutralfett*), free fatty acids, total fatty acids, molecular weight of the fatty acids, lecithin, stearic acid from lecithin, phosphorus, unsaponifiable components.

Pages 486-90 give a good review of the literature on soybeans, discussing the various types, composition, shoyu or soy sauce, koji, Japanese miso, and tofu. A table (p. 489) gives the composition of 5 soy products analyzed by Edward Kinch: White miso, red miso, fresh tofu, frozen tofu, and soybean cake. König notes that some of these foods are not suited for the German palate, however E. Wein makes several good-tasting dishes from soybeans, used in a soup like beans or peas, in a salad like green beans, or cooked with potatoes or rice and pureed to resemble the Italian 'Polenta'–called 'Sojenta' by Haberlandt. The taste of these soybean preparations reminds one somewhat of almonds or chestnuts. See also soy flour under "Meal" (*Mehl*) (p. 625).

Pages 595-600 give detailed nutritional analyses of soybeans based on studies by various authors: Black oblong soybeans (based on E. Wein 1881, and Edw. Kinch 1882). Yellow soybeans (Anderson, Senff, Fr. Schwackhoefer and Joh. Stua, Zulkowski, E. Mach and K. Portele [of Versuchs-Station St. Michele, original communication; harvested in Tirol, Austria, in 1877], R. Ulbricht and von Koritsánsky [Koritsansky, of Acad. Laborat. of Hungarian Altenburg, original communication; harvested in Hungarian Altenburg in 1878], E. Wildt [of Vers.-Stat. Posen, original communication; harvested in Posen], Schroeder-Napagedl, Blaskovics, Wein, Weiske, Kinch). Brown soybeans (Schwackhoefer, Zulkowski, E. Mach and K. Portele, Ulbricht, E. Wein, Schroeder, Weiske, Kinch). Black round soybeans (Senff, Mach, Wein, Kinch). Other soybeans (Caplan, Mach, Wagner, H. Pellet, Carriere, Kinch, Meissl, Kellner, Jenkins). Soybeans grown with fertilizer / manure (*Gedüngte Sojabohnen*, E. Wein).

Page 625 contains one analysis of whole soybean flour (Sojabohnenmehl) conducted in 1882 by C.H. Knorr in Heilbronn; the analyst was *v. d. Becke und Cosack*. This flour contained 10.23% water, 25.69% nitrogenous substances, and 18.83% fat, etc.

Note: This is the earliest document seen (Nov. 2013) that uses the word *Sojabohnenmehl* to refer to whole soybean flour.

Pages 631-32 give detailed nutritional analyses of soybean products based on studies by various authors: Leguminose-Maggi (18 brands made by Jul. Maggi & Co. in Kempthal, Switzerland; sampled from 1885-1888; studies by E. Schumacher-Kopp, M. Wesener [personal communication]). Soybean preparation named "miso" (Made by Jul. Maggi & Co. in Kempthal; sampled in 1888; Study by W. Kisch [personal communication]). Miso (red or white, 1882; by Edw. Kirch [sic, Kinch]). Tofu (fresh or frozen; E. Kirch [sic, Kinch]). Address: Prof. and Head, Agricultural-Chemical Experiment Station, Muenster in Westphalia, Germany (Professor und Vorsteher der Agric.-Chem. Versuchsstation Muenster i. W., Germany).

769. Matthews, Charles George; Lott, Francis Edward. 1889. The microscope in the brewery and malt-house. London: Bemrose & Sons. 198 p. See p. 85, 184-85. Illust. Index.

• ***Summary:*** This book is dedicated to Mon. Louis Pasteur. In Chapter 6, "The moulds or microscopic fungi," states (p. 85): "The only distinct industrial purposes to which mould-growths are applied, are in connection with this power of forming Alcoholic ferments. It appears besides, that moulds may give rise to a species of Diastase, as for instance, in the preparation of the Japanese 'Koji,' made from steamed rice on which a yellow dust–the spores of a fungus–is placed, and subsequently allowed to vegetate. 'Koji' is capable of liquefying gelatinized starch, and setting up a fermentation in it, giving rise to a kind of Beer–the Japanese 'Saké' Koji is also used in breadmaking and as a source of 'Soy' [sauce]. The mould giving rise to these spores is called Eurotium Oryzæ" [Aspergillus oryzae].

In the Glossary we read: "Eurotium Oryzæ, a mould, the spores of which are found in Kôji, the Japanese ferment" (p. 184).

"Kôji, macerated rice containing fungus spores, used by the Japanese as a ferment in making Saké, and bread; also in the manufacture of 'Soy'" [sauce]. Address: 1. F.C.S. [Fellow of the Chemical Society], F.I.C. [Fellow of the Inst. of Chemistry], etc.; 2. F.I.C., A.R.S.M., etc. [England].

• ***Summary:*** This book is a translation of volume II of his superb book *Japan nach Reisen und Studien,* published in 1886. The result of many years of study, including a stay in Japan, it is based on travels and researches undertaken at the cost of the Prussian government. Rein spent the first five months of 1874 in Japan, residing in the German Legation in Tokio and studying lacquer. After submitting a detailed report on the subject, he traveled throughout Japan.

On page 6, the author discusses the *Gokoku* (five chief cereals) and the introduction of agriculture to Japan. "As Tokugawa Ieyasu, the founder of the last Shôgun [shogun] dynasty, emphasizes in the twelfth of his 'Eighteen Laws,' the introduction of agriculture into Japan is ascribed to the sun-goddess *Tenshô Daijin* (Amaterasu). She was, to the old Japanese, Janus and Ceres in one. Her temple, at Yamada, in Ise, was the great national sanctuary, which had to be cared for according to law, and built anew every twenty-one years out of consecrated Hinoki-wood (*Chamæcyparis obtusa* S. and Z.) 'in order that the land might have peace and thrive.' By Gokoku (five chief cereals) were meant rice, barley and wheat, Italian millet, other kinds of millet, and beans–in fact, the principal *Kokurui,* that is, cereals and pulse. The term Go-koku, however, did not meant the same thing in all ages. Thus we find in Kaempfer, *Amoenitatum exoticarum* (1712, p. 834), Kome (*Oryza*), O-mugi (*Hordeum*), Ko-mugi (*Triticum*), Daidsu (*Dolichos soja,* L.), and Adzuki (*Phaseolus radiatus,* L.) mentioned as Gokoku. Later the idea was extended farther, and included all important food-plants belonging to the group of cereals and pulse."

"The Emperor Shinnung [Shen Nung] had introduced and spread the practice of agriculture in China, about the year 2700 B.C. For this he was deified after death, and a temple was dedicated to him in Peking. In the park-like surroundings of this temple, the emperor of China since then, at the time of the spring equinox, annually ploughs a piece of land and sows it with go-koku." Note 1. This is the second earliest document seen (Dec. 2000) that gives an early date (2700 B.C.) for Shen Nung. It is the earliest document seen (Dec. 2000) that weakly links Shen Nung with soybeans, which were probably one of the Gokoku.

Soy-bean is described in the chapter on "Food Plants," under "Pulse or Leguminous Plants." "Among the pulse of Japan (and not the less of China), the soy-bean ranks first in extent, variety of use, and value; and chemical analyses prove the empirical judgment is well founded. In point of nutriment, the soy-bean is of all vegetables the nearest to meat. It contains nearly two-fifths of its weight in legumin rich in nitrogen, and nearly one-sixth in fat. The soy-bean is to the inhabitants of Japan what their *garbanzos* (chick-peas) are to the Spanish, and their *feijao preto* (black beans) to the Brazilians. The author then describes the characteristics of the soy-bean, the work of Haberlandt with soy-beans in Austria, and the yields that he and his co-workers obtained. Note 2. This is the earliest English-language document seen (June 2008) that uses the word "garbanzos" (or "garbanzo") to refer chick peas.

"In Japan the varieties of soy-bean are distinguished–according to colour, as white (more properly yellowish), black, brownish red, green, and spotted; according to duration of growth [maturity] as early-ripening, middle-ripening, and late-ripening; according to form, as spherical, ellipsoidal, kidney-shaped, and compressed laterally; and according to use, as to those which serve primarily in making Shôyu (soy), Tôfu (bean-cheese), and Miso (a sort of sauce), and those eaten in any plain shape." Soy-bean varieties in Japan include: 1. "White (pea-yellow) soy-beans, Japanese Shiro-mame or Haku-daidzu. To this division belongs an early-ripening sort with very small seeds, called Goguwatsu-mame [Go-gatsu], or 'five-months-kind,' because it ripens in the fifth month of the old Japanese calendar, our July; also another small-seeded, early-ripening variety, the Wase-mame or Natsu-mame, that is, early and summer-bean. These two are also called Tôfu-mame, because they are used chiefly in making Tôfu. Another sort serves to produce Miso. It is called Nakate-mame, 'middle-late bean,' its time of maturity occurring half-way between that of the early and late kinds. Its seeds are round and somewhat larger. The late ripening varieties, Okute-mame (late-bean), Maru-mame (bullet-bean), and Teppô-mame (gun-bean), or Aki-mame (autumn-bean) have, as their names indicate, mostly bullet-shaped seeds, which become harder and larger than the early ones. The variety last named is used in making Shôyu, while Maru-mame is valuable as horse-feed.

2. Black soy-beans, Japanese Kuro-mame or Koku-daidzu. These are eaten boiled with sugar, as an entrée, or as a relish to rice. A species like it with big, bullet-shaped beans is called Kuro-teppô-mame. 3. Brown soy-beans, Japanese Katsu-daizu (thirsty soy-bean) are much less grown than the white and black sub-species, and are used like the latter. They are distinguished as Aka-mame, red soy-beans, round, of red-brown colour, in different varieties, and Cha-mame, tea beans, three light-brown sorts of small extent and significance. 4. Greenish or bluish green soy-beans, Japanese Ao-mame or Sei-daizu, are eaten mostly boiled and with sugar, like the black and brown-red varieties. And, with the brownish sorts, they are much less widely grown than the black and yellowish. The Japanese distinguish the following sub-species of Aö-mame:–(a) Sei-hito,–epidermis green, inside a whitish yellow. (b) Nikuri-sei,–greenish throughout. Both sub-varieties run from roundish-ellipsoidal to a bullet roundness, are of medium size, and remind one of green peas. (c) Kage-mame, with pale green, round beans. 5. Speckled soy-beans, Japanese Fuiri-mame or Han-daidzu. This group is not important. Its cultivation is confined to a small area, in a few provinces. Its sub-varieties are known as:–(a) Kuro-kura-kake-mame, with a black spot on the saddle (eye), otherwise greenish; flat and with the outline of an egg. (b) Aka-kura-kake-mame, with a brown spot on the

© Copyright Soyinfo Center 2014

saddle (eye), otherwise yellowish-green, flat and drawn out long. (c) Fuiri-mame or Udzura-mame, speckled or spotted soy-bean, yellowish-green with many dark flecks. A rare variety, grown only in a few places, especially in Harima. Note 3. This is the earliest English-language document seen (Sept. 2004) that uses the word "speckled" (or "speckling" or "specks"), or the word "flecks," or the term "light-brown" to describe the color of soybean seeds.

"Early-ripening soy-beans are sown as early as April in Southern Japan, in Central Japan during May. Those that ripen in autumn need much more warmth, and are sown, as a rule, one month later... Late-ripening Daidzu is also a favourite for planting along the edge of fields and on the new-built dykes of rice-fields."

Note 4. This is the earliest English-language document seen (June 2009) which states that there are early-, medium-, and late-ripening varieties of soybeans.

"At the end of his above-mentioned treatise, Haberlandt summed up in five noteworthy propositions, the results of his experiments with the soy-bean and of its chemical analysis. His conclusions are as follows:

"(a) The acclimatization of the early-ripening sorts, particularly those with yellow and reddish brown seeds, appeared to have fully succeeded in Central Europe.

"(b) The seeds obtained were larger, heavier, and handsomer than those from Eastern Asia, the chemical composition, however, remaining unchanged.

"(c) The soy-plant resists light spring frosts better than our young beans, and endures greater dryness in summer than most leguminous plants, though otherwise much like other kinds of beans.

"(d) It is distinguished by heavy crops, besides furnishing, in its stems and leaves, either green or dried, a nourishing feed, of which cattle are very fond.

"(e) In their high percentage of protein and fat, they far excel all other pulse in nutritive quality; and when properly prepared are second to none in flavour.

"After such favourable judgments, it might have been expected that the soy-bean, at least in the warmer regions of Austro-Hungary, would soon become popular and generally cultivated. The result, however, was quite otherwise. The hopes which he had aroused in behalf of this plant seem to have disappeared with Haberlandt, who died in 1878.

"As I know from a reliable source, people soon became convinced that it was possible to cultivate with certainty the early-ripening yellow sorts. The crops from these, however, are unsatisfactory. It is so difficult to boil them soft that they have no sale and cannot be turned to due account."

The seeds of certain wild kinds of beans also serve for food, incl. Tsuru-mame or No-mame (*Glycine soja,* S. and Z.) and No-adzuki (*Atylosia subrhombea,* Miq.). (p. 62).

Tables (both based on other sources) show: (1) Analyses of soy-beans (*Glycine hispida,* Moench) (p. 62). Gives the nutritional composition of 8 varieties, plus the empty pods, and the straw and leaves. (2) Comparative "analyses of various pulse" (p. 63), including *Glycine hispida* (*Daidzu*–soy-beans), *Phaseolus radiatus* (*adzuki*), *Pisum sativum* (*Yendo*–peas), *Vicia faba* (*Sora-mame*), lentil, yellow lupine, and ground-nut.

Pages 105-08 contain accurate, detailed discussions of shoyu, miso (which "does not spoil, and is said to be at its best when three years old"), and tofu.

A table titled "Average composition of various Japanese oil-seeds according to E. Wolff and others" (p. 157) includes the composition of ground-nut [peanut], sesame (brown, or white), hemp-seed, and soy-beans.

Also discusses: Adzuki (*Phaseolus radiatus,* p. 60, 108). Algae, marine, used as food [sea vegetables] (p. 77, 80-82). Ame, midzu-ame, and barley malt (p. 103-04). Arachis hypogæa (p. 56, 153-54). Fu (wheat gluten, p. 108). Hemp (*Cannabis sativa,* p. 75, 157, 165-66). Kudzu (p. 65, 160, 184). Sesame seeds (Benni-seed, gingeli, p. 154-55). Address: Prof. of Geography, Univ. of Bonn [Germany].

• ***Summary:*** "6. Shôyû, the Japanese bean-sauce, also called Soja, English Soy, both being corruptions of the Japanese name, is a dark-brown fluid with a pleasant aromatic odour and a peculiar salty taste. It foams up yellow when shaken, and leaves behind on the side of the glass a clear shining line of a fatty appearance, so that the Japanese designation "soy-oil" (Shô = soy, yû = oil) is quite appropriate. Its specific gravity, which Kinch gives as 1.199, may vary not inconsiderably according to the method of its production...

For the manufacture of Shôyu as I became acquainted with it in Kiôto (Kyoto), they use wheat (Ko-mugi), light-yellow Soja-beans (Shiro-mame), common salt (Shio or Shô), and water (Midzu); the first two in equal parts, three parts of water, and five or six parts of salt. In other places they take equal volumes of all four components. A small portion of the wheat is brought to fermentation with Kôji (rice-ferment); the rest is roasted to a delicate light-brown in iron pans over a fire of coals and then ground in little hand-mills. The Soja-beans are boiled soft for about half a day with a little water, in iron kettles, and after that pounded to mush. Flour, bean-mush, and the fermenting wheat are now thoroughly mixed, poured into little wooden boxes, and exposed to fermentation for three days in a suitable room, at as uniform a temperature as possible (25ºC.), whereby the mass becomes covered with mould-fungus" (See also Hoffmann 1874).

"All through winter, for several minutes every day, the paste or porridge in these vats is vigorously and thoroughly stirred. In the warm season, when the fermentation takes

© Copyright Soyinfo Center 2014

place more rapidly and the solid parts collect on the surface, it is only necessary to stir it from twice to four times daily. This is done with a sort of wooden shovel with a long handle, to use which the workman stands on the edge of the butt.

"A common proverb says, the more rats have found their death in the butts, the better the Shôyû. This, though not to be taken literally, expresses the long time required for making Shôyû. This period varies, in fact, from twenty months to five years, beginning in autumn as a rule, after the Soya-bean harvest. In this slow and peculiar fermentation process a considerable proportion of starch is converted into dextrine and sugar, besides which lactic acid and acetic acid are formed. The paste, at first thick, becomes thinner and more fluid, while its grey hue gradually changes to a muddy brown, and at last to a pure dark-brown. This last and the agreeable aroma accompanying it, together with a bitter taste, are developed generally between the third and fifth year. The Shôyû which is most prized for its odour and taste is obtained only by mingling equal quantities of three-year and five-year product. The mixture is put into strong, coarse, close-woven bags of wool or hemp-linen, which have been rendered closer still by being dipped in Shibu (which see). These bags, 60 to 70 cm. long and 18 cm. wide, are filled loosely, and then laid lengthwise and crosswise on top of each other in a large square box. Then a heavy wooden cover is put on, and a simple lever-press applied, one in which the long arm of 4 or 5 m. is weighted with stones. The expressed Shôyû flows through a hole in the bottom of the box into a bamboo cane, and through this to a cask sunk in the ground, and is then ready for use. As in oil refining, the first stuff produced is the most valuable. By continued pressure with increased weight a second quality is obtained, and at last a third, clear-flowing and less aromatic, as the dregs are mixed with salt-water and then squeezed again. Shôyû reaches the market in wooden barrels containing one To (20 liters). According to Hoffmann, the price was 1.5 yen (six shillings) for a To of the best sort, from three to four shillings for the second, and two shillings for the last.

"The delightful aroma and pleasing taste of Shôyû are quickly lost in a long sea-voyage, through the formation of mould. In good condition, however, Shôyû proves an excellent means of sharpening the appetite and assisting digestion. It is, on this account, as Chief Staff-surgeon Hoffmann justly remarks, much preferable to European preparations that are supposed to effect the same result, being perfectly harmless to the human system." Note 3. This is the earliest English-language document seen (April 2012) that uses the term "bean-sauce" to refer to soy sauce. Address: Prof. of Geography, Univ. of Bonn.

772. Rein, J.J. 1889. Tofu, kori-tôfu, and yuba (Document part). In: J.J. Rein. 1889. The Industries of Japan. Together with an Account of its Agriculture, Forestry, Arts, and Commerce. London: Hodder and Stoughton. xii + 570 p. See p. 107-08. [3 ref. Eng]

• ***Summary:*** "8. Tôfu, called in English bean curd, in German and French, less appropriately, *Bohnenkaese* and *fromage de pois,* is a valuable article of food made in Japan and China from yellow Soja-beans. It consists of fresh coagulated legumine [legumin], so that the English term suits it better than the German. Its preparation is simple.

"The yellow Soja-beans are put to soak, in cold water for from twelve to twenty-four hours, or a shorter time in warm, and then ground between the stones of a hand-mill, water being added to assist maceration. It becomes thus a thin mass, in which the quantity of water exceeds that of the beans about ten times. This is next filtered or pressed through a fine sieve, and the remnant put through the mill a second time. Ten volumes of this filtered stuff are now diluted with three volumes of hot water, and heated to boiling-point. This is done in a kettle, which is only about half filled. When cool again, the mass is filtered through a woollen sack, and the process ends with pressing it under the lever.

"As in our soups from leguminous plants, the legumine is now found dissolved in the filtrate. To coagulate and separate it, there is added Shio-no-nigari (salt-bitter), i.e. brine from sea-salt, consisting principally of chloride of magnesium. Care is taken to have the precipitation take place slowly and quietly. (In China, according to St. Julien, burnt gypsum is also added.) When the liquor has cleared it is dipped out carefully, while the stuff precipitated is placed in four-cornered wooden forms with punctured, movable walls, which are lined with cloth. This is folded together over the Tôfu, a board is laid on top, and the Tôfu pressed out with a moderate weight of stones. Finally, the soft greyish mass is cut into tablets with broad latten [resembling brass] knives, and put away under water. In summer this suffices only for a short time. To be kept longer, it is put up in Shôyu, or pickled, etc.

"Kori-tôfu, frozen or ice-Tôfu, is the spongy, horn-like substance that remains when common Tôfu is allowed to freeze and then thawed and dried in the sun, thus getting rid of most of its water. By Yuba is meant a third preparation, consisting of brownish, tough skins, made by boiling the dissolved legumine of the Tôfu-process, with the addition of some wood-ashes, and then taking away in succession the scums that rise."

Note 1: This is the earliest English-language document seen (April 2013) that uses the term "frozen Tôfu" or "ice-Tôfu" to refer to dried-frozen tofu.

Note 2. This is the earliest English-language document seen (Oct. 2012) that uses the word "scums" to refer to yuba. Address: Prof. of Geography, Univ. of Bonn.

• ***Summary:*** This dictionary contains three entries related to the soy-bean in Volume 1. At the entry for "bean" we read: "Sahuca or soy beans, the seeds of *Glycine Soja,* largely cultivated in India and China, from which the sauce known as *soy* is made.

"bean-cake, n. A large cheese-shaped compressed cake of beans after the oil has been expressed, used largely in northern China as food for cattle, and in the sugar-plantations of southern China as manure."

"bean-curd, n. A thick white jelly resembling blanc-mange [blancmange], made of beans, much eaten by the natives of northern China, Corea [Korea], and Japan."

Note 1. This is the earliest document seen concerning soybean products (bean-curd) in Korea; soybeans as such have not yet been reported.

Note 2. This edition of *The Century Dictionary,* published from 1889-1891, is the earliest edition listed in the *National Union Catalog.* Address: Prof. of Comparative Philology & Sanskrit in Yale Univ.

774. G. [Greshoff, M.?]. 1890. De Soja-boon en hare beteekenis als voedingsmiddel voor Nederlandsch-Indie [The soybean and its significance as a food for the Netherlands Indies]. *Tijdschrift voor Land- en Tuinbouw en Boschkultuur in Nederlandsch Oost-Indie* 5(10):347-56. Jan. 1. [5 ref. Dut]

• ***Summary:*** In the Netherlands Indies, the soybean (*De soja*), which is called *katjang kadeleh* and *katjang djepoen,* plays a very important role in the production of the sauce known as *ketjap.* However real soy sauce (*soja*) is of much greater importance to the Japanese and Chinese. The Chinese have carried their tradition of soy sauce usage and consumption abroad. The natives of Java use unripe beans, whereas the Chinese use well-ripened beans.

Chemical analyses over recent years have proven the superior nutritional value of the soya bean. No other legume has given such a favorable analysis. This shows how the experience makes the right choice ages before theory had its say about such things. It is as if every reputable chemical food analyst has to issue their own personal analysis of the soya bean in order not to embarrass themselves. According to the Japanese Yossyda [Yoshida?], there are 100 varieties of soya in cultivation in his homeland. Geerts describes 16 different kinds in his monograph. Analyses are given of several soybean varieties. The first, by Geerts and Dewars (Dutch) analyzed 7 varieties: yellow soybeans from Japan (*Wase-mamé*) and China, black soybeans from Japan (*Kuro-mamé*) and China, green soybeans from Japan (*Ao-mame*), Nakaté from Japan, a yellow soybean cultivated in south Russia. One analysis is given by Meissl and Böcker (German), and one by Church (British). Then seven analyses by Church are given of other common legumes from India. Then follows Church's analyses of rice, Indian wheat, corn / maize (*Djagoeng* [*jagung*]), and common sorghum (*Sorghum vulgare; Djagoeng tjeutriek*)–followed by a short explanation.

Experience has shown that in colder climates, the starch content of soybeans rises, while the content of other nutrients drops. This is why major areas of soybean cultivation (as promoted for 15 years by Haberlandt) have been limited to central Europe.

The soybean is said to contain an enzymatic substance which rapidly converts starch to sugar, and to which the high value of soy sauce is attributed. But tests have yet to prove this. Then follows an essay on the caloric value of soy compared to other foods, and how to calculate this correctly. Church's methods of determining the nutrient value of foods are described as too limited.

Among vegetable foods, the soybean is very digestible. According to the latest research by Ladd, comparing the digestibility of various proteins (*eiwitstoffen*), soybean is 75% versus 64% for flour and 54% for grains. Because soya is very low in starch, it is a perfect food for diabetics. At a recent congress for doctors in Paris, soy bread was promoted and given much attention. Prof. Stokvis told the congress how a baker named Koehler bakes soy bread and soy cookies of high quality.

The soybean is also appropriate, because of its nutritional composition, as a food for children and the sick. It is up to an enterprising person to bring it onto the market. Also, soy sauce would be a good commercial product if manufactured in Europe. But the most important point is that soya is an excellent food and, as such, is not given the recognition it deserves in the Netherlands Indies. It is an inexpensive vegetable meat. It deserves to be cultivated, because it can serve as a good, low-cost source of protein for a large number of people. It is appropriate for use in institutions, orphanages, and the army and navy, and deserves experimentation on a large scale. The indigenous people of the Netherlands Indies are used to eating the bean unripe, and not very well cooked–and they are persistent in serving it like this, which has led to the rejection of soy in many important circles.

Glycine soja is a very good secondary crop, next to rice. There is no need to emphasize this, since the Inspector of the Civil Medical Service has brought to the attention of the Netherlands Indies government and its officials, in a very professionally written piece, the advantages of soya cultivation.

"I can't give you any indications about the basis on which the soybean ("katjang kadeleh") will best thrive. There are so many questions concerning the growth and function of the so-called root nodules (*wortelknolletjes*) of the *Papilionaceae* and the microorganisms that live therein. It has been determined that these plants, which include the soybean (*de soja*) are capable of creating free nitrogen and assimilating it."

Note 1. This is the earliest document seen (June 2012) concerning soybean root nodules and nitrogen fixation in

© Copyright Soyinfo Center 2014

Europe.

The author closes with the wish that the import of soya will prove to be a blessing for Java. [Note 2. This could mean either importation of soybeans from China, or more widespread introduction of soybean culture to Java, or import from Java to the Netherlands.] For about a year he has been trying to bring soy to the attention of the Netherlands, an attempt he wants to repeat again under the favorable auspices of a small official publication circulated to those who are interested.

Note 3. Paerels 1913 (p. 288) and Kempski 1923 (p. 79) both cite F.A. von Stuerler as the author of this article, but at the end of the article, the author's name is written simply as "G." On the same line is written: "B. Nov. 1889."

Note 4. This is the earliest Dutch-language document seen (Feb. 2001) that has the word "Soja" (or "Soja-boon" or "Sojaboon") in the title.

Note 5. This is the earliest Dutch-language document seen (Aug. 2003) that uses the word *eiwitstoffen* (or *eiwitstoff*) to refer to proteins in connection with soybeans.

775. Brooks, William P. 1890. Division of Agriculture: General results of a trial of a few Japanese crops. *Massachusetts* (*Hatch*) *Agricultural Experiment Station, Bulletin* No. 7. p. 14-17. Jan.

• ***Summary:*** The article begins: "At the time of leaving Japan in October of last year I was unaware that I should be placed in charge of a department of the Hatch Experiment Station, and did not, therefore, make arrangements for the forwarding of any considerable amount of seed of any kind. I had been located in a section of that country, however, with a climate having essentially the same range of temperature as that of Massachusetts; and had become convinced by observation that some of the crops there cultivated were of peculiar value. I, therefore, on my own account had the seeds of a few varieties collected, and left them to be forwarded with shrubs and trees which were to be taken up after the fall of their leaves.

"I have thought it best to make these statements in explanation of the fact that the quantities of some of the seeds were so small... All these crops were planted on June 3d on a light loam..."

In section IV titled "Varieties of beans" (p. 16-17) are two subsections on soja beans and one each on red beans and white beans (*Phaseolus radiatus* [azuki beans]). "Soja Bean. Medium Early–*Glycine hispida,* Jap. *Daidzu.* This variety showed its first flowers July 28th, and the crop was fully mature Sept. 25th, when it was pulled. The area was 880 sq. ft. and the yield 30 lb of cleaned beans, which is at the rate of 25 bu. per acre. Should this class of beans prove desirable here this variety will be superior to most of the kinds offered under the same name so much earlier. It is well known that the beans of this class are of remarkable richness, containing a very unusual proportion of nitrogen, and it certainly seems desirable to give them a fair trial.

"Soja Bean No. 2, Very Early Variety–*Glycine hispida.* Jap. *Kurakake Mame.* The Japanese name means "*Saddled* Bean," and is given because of the peculiar disposition of black around the eye and on the sides of the bean, for all the world to their fancy like a saddle on the back of a horse. The first blossoms were noticed July 10th and the crop was pulled fully ripe on Aug. 31st. "In Japan I have cultivated this variety side by side with some of our earliest sorts and found it to excel them in earliness, but no comparative test was made here this year.

"Red beans.–*Phaseolus radiatus* [red azuki]. The peculiarity both of this and the following variety in germination may be of interest. They 'come up' like peas, the bean remaining wholly underground. The pods of both are unusually long, containing eight to ten small beans, which are characterized by a very thin and tender skin. This variety blossomed about the end of July, and was well ripened Sept. 25th, when it was pulled. The area was 440 sq. ft., and the yield was 23 lbs. of dry beans, or at the rate of about 38 by. per acre. These beans present an unusually handsome appearance and bid fair to prove an acquisition.

"White beans.–*Phaseolus radiatus* [white azuki]. This variety was in full blossom July 27th, and was ripe Sept. 25th, when it was pulled. The area under cultivation, 440 sq. ft., gave 21 lbs. dry beans (weight taken, as in case of all crops spoken of, Dec. 21st) which is at the rate of about 35 bu. per acre. This variety except in color closely resembles the preceding; but it is not as handsome. The amount of seed now on hand is insufficient for a trial of their food qualities, but another season, if successful in securing crops, we shall make such a trial."

Note: The "Red beans" and the "White beans" were almost certainly red azuki beans and white azuki beans, respectively; their scientific name at this time was *Phaseolus radiatus.* This is the earliest English-language document seen (Jan. 2005) that uses the term "red beans" to refer to red azuki beans, or the term "white beans" to refer to white azuki beans.

Other Japanese crops planted on June 3 were: (1) Millet (*Panicum crus-coroi* [sic, *crus-galli*]. Jap. *Hiye*), (2) Millet (*Setaria Italica* or *Panicum Italicum,* Red Headed Variety. Jap. *Mochi awa,* or glutinous millet), and (3) Millet (*Setaria Italica* or *Panicum Italicum.* Jap. *Awa*).

Note 1. The terms "Medium Early" and "Very Early" used to describe the soja beans are probably just descriptive terms rather than early varietal names. Address: Agriculturist, Amherst, Massachusetts.

780. McCarthy, Gerald. 1890. The best agricultural grasses. *North Carolina Agricultural Experiment Station, Bulletin* No. 73. 97 p. Oct. 15. See p. 45, 64-68, 70.
• ***Summary:*** "Soja Bean–*Glycine hispida.* The soja bean, or as it is sometimes called, Japan pea, is indigenous to South-eastern Asia, and is a near relative of the cow pea. Though this bean has been known in the Southern States for a long time, its cultivation has never become very extended. The beans are regarded as a staple food in Japan, but in this country they are scarcely edible, probably because they are not properly cooked. The soja bean is a tender annual, and its habit of growth, use and value, is much like the cow pea.

"This bean is usually sown in drills two feet apart, and on good soil has yielded as high as forty bushels per acre. This yield of vine fodder is less than that of the cow pea, and the fodder is more difficult to cure. Cattle are not so fond of it as of cow-pea hay. It makes good ensilage. This plant requires as good soil and treatment as are usually given to field beans."

Table I titled "Flowering period, use, &c., of grasses" (p. 64) states that the soja bean flowers in July, prefers medium soil, gives an average yield of 4-6 tons/acre on good soil, and is used for meadow (not pasture).

Table II titled "Seeds" (p. 65) states that there are, on average, 2,800 seeds/ounce, and 90% of these are vital [viable]. An average of 60-100 lb of commercial seed is required to plant 1 acre. There are 60 lb per bushel.

Table III titled "Proximate composition and feeding value of hays containing 14 to 14.3 per cent. water" (p. 66) analyzes 28 types of hay. According to analyses by the South Carolina Agricultural Experiment Station, the proximate composition and feeding value of soja bean hay is: albuminoids 14.05% total, 9.28% digestible. Crude fiber: 24.03% total, 14.09% digestible. Nitrogen free extract: 38.00% total, 23.18% digestible. Fat 2.09% total, 0.40% digestible. Nutritive ratio 1:4.1. Relative feeding value per ton: 15.09. The author then defines several key terms: "The nutritive ratio is the sum of the per cent. of digestible fiber and digestible nitrogen free extract added to the per cent. of digestible fat, multiplied by 2½, and the total divided by the per cent. of digestible albuminoids. A well balanced ration has a ratio of 1:5.

Footnote (p. 67): In Table 3, since "few of the plants included have been analyzed by American chemists, and for the sake of uniformity [Emil] Wolff's analyses have been very largely used." "The relative feeding value has been obtained by multiplying the number of pounds of digestible fat and digestible albuminoids in one ton of hay by 4½ cents, and the number of pounds of digestible fiber and nitrogen free extract by 0.9 cent. These values owe also to German experimenters."

Table IV titled "Digestion co-efficients" [coefficients] (p. 67) gives values 8 types of hay. For soja bean vines: Albuminoids 64, fiber 58, non-nitrogenous extract 61, fat 24.

Table V (p. 68) shows the dry substances contained in 2,000 pounds of air-dry hay composition and feeding value of 27 types of hay containing 14 to 14.3 per cent. water. One analysis by the South Carolina station is given. The cash value of the fertilizing matter contained in one ton of soja bean hay is $9.36, about average.

Table VI titled "The theoretical value of hay" (p. 70) gives values for 28 plants. For hay made from soja bean vines: Feeding value per ton: $15.09 (4th highest among all 28 plants tested, after lucerne $16.74, Japan clover $16.17, and cow pea vine $15.89). Net manurial per ton: $7.48 (3rd

© Copyright Soyinfo Center 2014

highest after cow pea vine $8.82, and lucerne $8.28). Total relative cash value per ton: $22.57 (4th highest after lucerne $25.02, cow pea vine $24.71, and Japan clover $23.88).

Note: This is the earliest English-language document seen (Oct. 2006) that contains the term "cow pea vine" (or "cow pea vines"). Address: Botanist, Raleigh, North Carolina.

781. *Chemisches Central-Blatt.* 1890. Japanische Sojabohne [Japanese soybeans (Abstract)]. 1890(25):1013. Dec. 17. [1 ref. Ger]

• ***Summary:*** A German-language summary of the following German-language article: *Bayerische Gewerbe-Zeitung* (Nuremberg). 1888. "Japanische Soja" (Japanese soy sauce). No. 23. p. 538-40. It also cites four other articles on the same subject, for comparison.

782. Georgeson, C.C.; Cottrell, H.M.; Shelton, W. 1890. Experiments with forage plants. *Kansas Agricultural Experiment Station, Bulletin* No. 18. p. 173-91. Dec. See p. 186-88.

• ***Summary:*** In the section titled "Miscellaneous forage plants" we read (p. 186-88): "Soy Beans, *Glycine hispida.*– We tested several varieties of these beans the past season, the object being to learn something of their value for this country and climate. As noted below, one variety was obtained from Peter Henderson & Co. and one was from home-grown seed, having been raised on the farm in 1889; the others were imported direct from Japan. These beans did remarkably well, considering the drouth they went through, and the early-ripening varieties give promise of becoming valuable to this country. The good qualities in the Soy beans have long been known, but the great difficulty with most varieties that have heretofore been tried in the North and West has been that our season is rarely long enough for them to mature properly, and hence the yield has usually been cut short. The varieties which we imported are all early, and will mature here in any season. This fact, taken in connection with their highly nutritive qualities both for man and beast, their heavy yields and easy culture, will in a measure forecast their usefulness. The average composition of Soy beans is as follows:

"Water 10.0%, ash 5.0%, crude protein 33.4%, crude fiber 4.8%, nitrogen free extract 29.2%, crude fat 17.6%."

The following four soy bean varieties are described: (1) "Kuiske Daidzu.–Seed imported from Japan." (Note that this name is spelled "Kiuski" in 1891 in the next issue {no. 19} of this Kansas Bulletin, then spelled "Kiyusuke" 5 times thereafter, from 1892 to 1910, starting in issue no. 32 of this Kansas Bulletin. In 1891 we learn that "Kiyusuké" is the name of a person). (2) "Edamame [green vegetable soy beans].–Seed imported from Japan." (3) "Yellow Soy Bean.–From Peter Henderson & Co." [seedsmen, New York]. (4) "Large Yellow Soy Bean.–Seed grown on the farm in 1889."

"We also obtained from Japan two varieties of *Dolichos radiatus.* The Japanese name for this class of beans is *Adzuki.* The two varieties grown here are known only by their native names, viz. *Shiro Saya Shozo"* [red seeds, white pods] and *"Kuro Saya Shozo"* [red seeds, black pods].

In search of new fodder plants, the Station also tested *"Coix lachryma* (Job's Tears), a grass which grows 6 to 8 feet tall, and produces a large grain, rich in protein." The test failed, "owing mainly to drouth."

Note 1. This is the earliest document seen (June 2004) stating that Peter Henderson & Co. is selling soybeans. We learn later (in an 1898 publication) that Henderson & Co. is located in New York.

Note 2. Opposite the title page are listed the Kansas Agric. Experiment Station staff. One of the assistants is "W.T. Swingle, B.Sc., Botany." By 1907 Walter T. Swingle was a physiologist with the Bureau of Plant Industry. By 1909 he was translating Japanese articles related to soy into English.

Note 3. This is the earliest document seen by Prof. C.C. Georgeson about soybeans, or about adzuki beans.

Note 4. This is the earliest English-language document seen (July 2013) that mentions Edamame (spelled as one word), a soybean variety imported from Japan, or that contains the word "Edamame" (regardless of capitalization).

Note 5. This is the earliest document seen (July 2013) that mentions the soybean varieties Yellow Soy Bean or Kiyusuke Mame.

Note 6. This is the earliest document seen (July 2013) that capitalizes the first letter of each word in a soy bean name to indicate that the name refers to a soybean variety (e.g. "Yellow Soy Bean," "Large Yellow Soy Bean").

Note 7. This is the earliest document seen (Sept. 2004) that gives the color (Yellow) of various soybean varieties.

Note 8. This is the earliest U.S. document seen (Sept. 2004) that contains the word "Adzuki" (or "Azuki" or "Adsuki") beans. Address: 1. M.Sc., Prof. of Agriculture and Superintendent of Farm; 2. M.Sc., Agriculture; 3. Foreman of the Farm.

783. Shimada, Kôichi. 1890. Shôyu no hyôjun [Standards for shoyu]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 11(10):149-50. Dec. [Jap]

• ***Summary:*** This study was conducted on 10 brands of regular shoyu. When sugar or barley malt syrup are added to the shoyu, the contents of these are listed separately. Maximum, minimum, and average figures are given for each nutrient. Only the average figures are translated here. Specific gravity 1.205. Solids 38.01%. Grape sugar/glucose 4.29%. Free acid (lactic) 1.04. Nitrogen 1.28 (Range 0.51 to 1.56). Inorganic salts 20.27 (range 17.47 to 23.61). Sodium chloride 17.81 (range 15.25 to 21.76), phosphate 0.47. Salt as a percentage of solids 46.84.

785. Chamberlain, Basil Hall. 1890. Things Japanese: Being notes on various subjects connected with Japan. London, K. Paul, Trench, Trübner & Co.; Tokyo, the Hakubunsha, Ginza; etc. ii + 408 p. Index. 21 cm. 2nd ed. 1891. Slightly revised edition published 1905. Reprinted in 1970 by Charles E. Tuttle Co., Inc. (Rutland, Vermont, and Tokyo). [50+* ref]
• ***Summary:*** The author, who arrived in Japan in 1873 and was first introduced to the mysteries of the Japanese language by a dear old samurai, has lived through the transition stage of modern Japan.

This book is arranged alphabetically by subject. An extensively revised 2nd edition was published in 1891. Food (p. 122-25): "The following is a specimen of the bill of fare at a Japanese banquet. The reader must understand that everything is served in small portions, as each guest has a little table to himself, in front of which he squats on the floor:–Preliminary course, served with sake:–*suimono,* that is, a kind of bean-curd [tofu] soup;... *sashimi,* minced raw fish; *hachi-zakana,* a fine, large fish, either boiled with salt or boiled with soy [sauce]; *uma-ni,* bits of fish or sometimes fowl, boiled with lotus-roots or potatoes in soy and in a sort of liqueur called *mirin;*...

"First course (*Zembu*):–*Shiru,* soup which may be made of bean-curd [tofu], of fish, of sea-weed or of some other material;... *aemono,* a sort of salad made with bean sauce [miso] or pounded sesamum seeds;..."

"It is the custom, too, to set food before a guest, at whatever time of day he calls. On such occasions soba is in request–a sort of buckwheat vermicelli, served with soy [sauce] and the sweet liqueur called *mirin;* or else *shiruko,* that is, rice-cakes [mochi] with a sauce made of red beans [azuki] and sugar."

On Buddhism and vegetarianism in Japan (at Food, p. 122-23): Beans are a constant part of the daily diet. Buddhism has left its impress here, as on everything in Japan. To Buddhism was due the abandonment of a meat diet, now over a thousand years ago. The permission to eat fish, though that too entailed the taking of life, which is contrary to strict Buddhist tenets, seems to have been a concession to human frailty. Pious frauds, moreover, came to the rescue. One may even now see the term 'mountain whale' (*yama-kujira*) written up over certain eating-houses, which means that venison is there for sale. The logical process is this:–A whale is a fish. Fish may be eaten. Therefore, if you call venison 'mountain whale,' you may eat venison. Of course no actual prohibition against eating flesh, such as existed under the old *régime,* exists now. But the custom of abstaining from it remains pretty general; and though beef and pork were introduced at the time of the late revolution,... recent statistics show that meat-eating is again on the wane."

There are also interesting sections on Kaempfer, Engelbert (p. 187-88), Perry (Commodore) (267-69), and Siebold, Philipp Franz, Freiherr (p. 320-22).

For an excellent, later book with the same title, written by a Japanese in English, see Mock Joya (1960). Address: Prof. of Japanese and Philology in the Imperial Univ. of Tokyo, Tokyo [Japan].

786. Fesca, Max. 1890. Beitraege zur Kenntniss der japanischen Landwirtschaft. I. Allgemeiner theil [Contributions to an understanding of Japanese agriculture. I. General part]. Tokyo: Printed by Seishi-Bunsha for the Kaiserlichen Geologischen Reichsanstalt. x + 277 p. No index. 25 cm. Also published as vol. 1 of 2 volumes bound in one (Paul Parey, 1893). [1 ref. Ger]
• ***Summary:*** Fesca, a sophisticated German agricultural chemist, looks at Japanese agricultural practices, and finds many of them inefficient. Contents: Foreword. Weights and measures in the Japanese and decimal systems. Natural factors: The climate, the soil. The soil as an economic factor of production: Land prices, crop rotations, etc. Techniques for using the soil: Soil improvement, fertilizers.

Various legumes, and especially the soybean, grow in the temperate (*gemaessigte*) Zone northeast of Tokyo (p. 43-44). Two large tables (p. 134-35) show the amount of rice land per capita and the amount of dry land per capita in each province. The five provinces with the most rice land per capita are: Kaga (5.01), Noto, Bizen, Ugo, Awa (on Shikoku).

In the section on crop rotations, soybeans are mentioned on pages 171-72, 175-77.

A table (p. 190) compares various crops (including soybeans) with rice in terms of their profitability to the farmer. Soybeans are less profitable. Tobacco is the most profitable, followed by indigo, cotton, and potatoes–all of which are more profitable than rice.

Soy is discussed most in the chapter on fertilizers (p. 222-25, 266). A large table (p. 222) gives the chemical composition of four traditional fertilizers, including sake lees (*sakekasu*), shoyu dregs (*shoyukasu*) and okara (*tofukasu*). Shoyu dregs, okara, and cooked soybeans are all discussed in detail on p. 224, based (in part) on analyses conducted previously by Kellner, also a German. "Cooked soybeans are widely used as a fertilizer; they are a concentrated source." Soybeans (p. 232). Also discusses: Sesame and peanut cake (p. 226). Kudzu (p. 231).

Bound at the back are two large color fold-out maps: (1) Showing the provinces and the six vegetation zones of the Japanese islands. (2) Showing the value of land in each

province (in yen/cho). Address: Tokio [Tokyo].

787. Fuller, J.B. 1890. Annexure B, and Annexure C. *Report on the Nagpur Experimental Farm in the Central Provinces* (*India*). For the year 1889-90. Ending 31 March 1890.
• ***Summary:*** Annexure B, titled "Results of cultivation of the non-experimental area of the Nagpur Farm during the year 1889" states (p. 8) that 0.55 acres of Japan peas yielded 87 lbs. of grain and no straw. Cost of cultivation: 17 rupees, 14 annas, and 6 paise. Value of produce: Not sold.

Annexure C, titled "Total area under cultivation on the Nagpur Experimental Farm during the year 1889-90" states (p. 9) that 0.55 acres of Japan peas were cultivated in the non-experimental area. Also mentions three kinds of cotton (Upland Georgian, Hinghanghat Bani, and Sea Island), sorgho, til [sesame], wheat, linseed, sugar cane, juar, tur, mung, urd, and popat (white). Address: Commissioner of Settlements and Agriculture, Central Provinces [India].

788. Gorkom, K.W. van. 1890. Supplement op De Oost-Indische Cultures, in betrekking tot handel en nijverheid [Supplement to East-Indian crops: In relation to commerce and industry]. Amsterdam, Netherlands: J.H. de Bussy. vii + 303 p. See p. 283-87. Supplement to the 1884 publication of the same title. 25 cm. [2 ref. Dut]
• ***Summary:*** The section titled "Kadelé" (Soybeans) discusses the cultivation of soybeans (also called *katjang djepoen* [Japan beans], Soya, *Glycine hispida,* or *kadelé boontjes*) on Java and the experimental culture in Europe. Interest is shown in the cultivation of soybeans as a food for diabetics.

Soya is cultivated in Java both for its seed and for its green leaves which are used as animal feed. The small soy beans are roasted by the indigenous people or, in the form of cakes / patties (*tetempé* [tempeh]), eaten like bean-cheese (*boonen-kaas* [tofu]). (*"De kadele boontjes worden door de inlanders geroosterd of, in den vorm van koeken* (*tetempé*)*, als boonen-kaas gegeten"*).

Note. This is the earliest Dutch-language document seen (April 2013) that uses the term *boonen-kaas* to refer to tofu.

The author considers that Indonesian soy sauce (*kétjap*) is inferior to Japanese soy sauce. Nutritionally, soya is rich in proteins (*proteïnestoffen*) (± 38%) and fat (± 21%), and low in starch and sugar.

In Germany and Austria, many years have been spent in developing and cultivating varieties of soybeans adapted to the European climate. Dr. Haberlandt, professor at the University of Vienna, distinguished himself for this work, even to the extent that a variety was named after him. In the experimental gardens at the National Agricultural in Wageningen [Netherlands], a field of soya is cultivated, but the results are not yet satisfactory. Yields are low, especially during the dry and warm summers, when the plant flowers abundantly, but the seeds don't have time to develop properly. The author hopes that through continued experiments, a suitable variety will be developed.

The soya bean has received attention from the medical profession because of its composition. Dr. Le Cerf of Paris was one of the first to try using soya with diabetic patients. He introduced soya bread instead of an almond bread and was successful with it. Dr. Stokvis, a professor in Amsterdam, recommended soy bread (see *Nederlandsch Tijdschrift voor Geneeskunde* No. 10), and the chemical analyses published by Mr. L.C.W. Cox in the same journal (issue No. 19) supported the recommendation. Patients were content with the bread, although they did not find it very appetizing. The author states that if rye or wheat flour could be used together with soy flour (*soja-meel*), they would yield a very digestible and nutritious food. For this reason also he recommended experiments aimed at acclimatizing soya to Europe.

Dr. Sollewijn Gelpke has published a work titled "The Yield and Cultivation of Dryland Crops," in which he writes that the cultivation of soya is quite easy and in Java takes place on sawahs (wet rice fields) and clay, in contrast to peanuts (*katjang-tanah*), which is grown on tegals and sand. [Note: A tegal is a dry (not irrigated) field, near the rice fields, but used for vegetables and other secondary crops.] Soya beans are sun-dried, soaked in water for 24 hours, then sown on land that has first been flooded with water. Otherwise they are sown by poking holes in the ground and dropping in the seeds. Gelpke says that soya is so appealing to the indigenous people that, if the soil is hard, he just opens the surface with a crowbar and sows his seeds. This way of cultivation is seen especially on the heavy clay soils of Java.

In the Netherlands it is not well known that soya is cultivated in Java, because it could be imported for less money than is currently the case. The author has samples of the beans and has noticed that the seeds from European experiments are smaller in size than those grown in Java.

Various laboratory analyses are given. It is noted that soya flour coming from Hungary is used for the production of soy bread, baked by Mr. Koehler of Amsterdam. Mr. Cox studied this bread. The author believes that the sugar content of this bread is high enough to make it unsuitable for diabetic patients, and notes the presence of starch and dextrin. Morawski and Harz have confirmed that ripe soya beans don't contain starch, whereas unripe beans do.

Note 1. Kempski (1923) says: "see van Gorkom's Oost-Indische Cultures, neu herausgeg. von Prinsen-Geerligs, Verlag de Bussy, Amsterdam, 1913, Vol. III, p. 283/86."

Note 2. This is the earliest Dutch-language document seen (Aug. 2003) that uses the word *proteïnestoffen* (or *proteïnestoff*) to refer to proteins in connection with soybeans.

Note 3. This is the earliest Dutch-language document seen (Nov. 2013) that mentions soy flour, which is calls *soja-meel*. Address: Dr., Former Head Inspector of Crops,

Dutch East Indies (Oud-Hoofd-Inspecteur der Cultures in Nederlandsch Oost-Indië).

789. Henderson (Peter) & Co. 1890. Henderson's American farmers manual. New York, NY. 26 p. 28 cm.
• ***Summary:*** In the section titled "Miscellaneous Plants for Forage, Soiling, &c.," the soybean appears on page 24, along with 24 other such plants. The entry reads: "Soja or Japan Bean. (*Glycine hispida.*)–A variety altogether distinct from any other Bean. The haulm is strong and vigorous, and covered with soft fur. The pods contain four to five small Beans of a yellowish brown color. This Bean is very suitable for growing in the *South,* and is used largely for plowing under. In Japan the beans are used principally for making 'Tofu' or bean curd. Per lb., 20 cts. [$0.20]; per bushel of 60 lbs., $6.00."

Note 1. This is the earliest listing seen for the soybean in any seed catalog published by Peter Henderson & Co. where a description of the plant is given. Sherry J. Vance, research aide at the L.H. Bailey Hortorium (462 Mann Library, Cornell University, Ithaca, New York 14853-4301) wrote to William Shurtleff of Soyfoods Center on 22 April 1997: "Per your request, I have checked our catalogs for Peter Henderson from 1881 to 1890 looking for entries on soybeans. Despite a thorough search, I was unable to locate soybeans offered in any of the Henderson catalogs from 1881-1889."

Note 2. Peter Henderson lived 1822-1890. On the cover of this catalog are four illustrations of farming scenes. Across the top is written: "If you have no use for this Catalogue, kindly give it to some of your farmer friends." Address: 35 & 37 Cortland St., New York.

790. Henderson (Peter) & Co. 1890. Manual of everything for the garden–1890. New York, NY. 146 p. 28 cm.
• ***Summary:*** The soybean appears on page 50, in a half-page section titled "Miscellaneous and Sundry Seeds for the Farm," along with about 39 other such seeds. The entire entry reads: "Bean, Soja or Japan, 20 cts. lb.; $6.00 bu."

Location: Bailey Hortorium, Mann Library, Cornell University, Ithaca, New York.

Note 1. The soybean appeared in at least 3 Henderson catalogs published in 1890.

Note 2. Peter Henderson lived 1822-1890. On the cover of this catalog is a painting of a little girl sitting with in the front yard of a house with a fountain, where many flowers are growing.

Note 3. Other "sundry" seeds listed in this section on p. 50 include: Pearl millet, early orange sugar cane, kaffir corn, rural branching doura (milo maize), Egyptian rice corn, halapense (Johnson grass), yarrow or milfoil, chicory (for coffee), opium poppy, ramie (bohmeria or urtica), tenacissima (Java Ramie), osage orange, honey locust, teosinte (*Reana luxurians*), serradella, lupins of sorts, wild rice (*Zizania Aquatica*).

Location: Special Collections, USDA National Agricultural Library, Beltsville, Maryland. Address: 35 & 37 Cortland St., New York.

791. Henderson (Peter) & Co. 1890. [Catalog]. New York, NY. 114 p. 28 cm.
• ***Summary:*** On the cover of this catalog is a "Partial view of our Exhibit at the semi-centennial N.Y. State Fair held at Syracuse, Sept. 11th to 18th 1890." The exhibit is huge.

The soy bean appears on page 50, in a half-page section titled "Miscellaneous and Sundry Seeds for the Farm," along with about 41 other such seeds. The entry reads: "Bean, Soja or Japan, 20 cts. lb.; $6.00 bu."

This catalog is owned by Special Collections, USDA National Agricultural Library, Beltsville, Maryland. Address: 35 & 37 Cortlandt St., New York.

792. Kellner, O[skar Johann]; Mori, Y[ôtarô]; Nagaoka, M[uneshige]. 1890. Beitraege zur Kenntniss der invertirenden Fermente [Contributions to the knowledge of inverting enzymes]. *Hoppe-Seyler's Zeitschrift fuer Physiologische Chemie* 14(3):297-317. [13 ref. Ger]
• ***Summary:*** This article contains a long analysis of the role of koji and its enzymes (*Koji-Ferment*) in the fermentation process that creates rice wine (saké). The process of making koji from spores is described, as well as the quantitative changes which take place with the development of the mycelium on two substrate (rice or barley) at various temperatures. The work of Prof. Atkinson is discussed at length.

On pages 306-08 Kellner gives the results of his experiments on the effects of koji extracts on various carbohydrates: cane-sugar, milk sugar (lactose), maltose, inulin (a tasteless white polysaccharide), and starch. (Note: In chemistry, inversion, is the conversion of dextrorotary sucrose into a levorotary mixture of glucose and fructose). Before the inversion, there is 4.04% reducing sugar, expressed as dextrose (optical rotation 20.9º); after the inversion there is 7.46% (optical rotation 8.4º). Kellner summarizes these results on p. 310 as follows: "From our investigations, one can conclude that koji contains a powerful inverting ferment [enzyme], which transforms cane sugar into dextrose and levulose, maltose into dextrose, and starch into dextrin, maltose, and dextrose. However milk sugar and probably also inulin are not transformed. Therefore the koji enzyme (*Koji-Ferment*) is entirely different from the diastase of malt; it is also probably different from the invertin (*Invertin* = invertase) of beer yeasts, which easily inverts cane sugar to dextrin and maltose–according to Mr. J. Kjeldahl. Kellner then repeats the experiments on carbohydrates using yeast extracts (p. 311-13) and confirms that the latter give different results than koji extracts. He then coins the term "Invertase" (p. 313) to refer to the inverting

© Copyright Soyinfo Center 2014

enzyme in *Eurotium Oryzae* Ahlb. (later renamed *Aspergillus oryzae,* the koji mold).

On p. 316 Kellner explains: In addition, koji is frequently used in a mixture with considerable amounts of table salt (*Kochsalz* = NaCl), steamed soybeans, and other materials (*Stoffen*) for the preparation of miso (a food {*Nahrungsmittel*} very widely found throughout Japan) and shoyu (a sauce which is also known in Europe); it seems to be used here mainly as the carrier of a slow, often years long fermentation. "Since miso contains only 6-12% salt and shoyu contains about 150-160 grams of salt per liter, and since this salt limits the action of soluble ferments, we have investigated how the transformation of soluble starch takes place through invertase the presence of various amounts of salt." A table (p. 317) shows two experiments. The percentage of table salt in the mixture is increased from zero to 20% in five or six steps. As the percentage of salt increases, the reducing sugar (expressed as dextrose) decreases moderately, while the relative activity of the invertase decreases dramatically. Fehling's solution is used in the experiment. Address: Japan.

793. Merck, Klemens. 1890. Klemens Merck's Warenlexikon fuer Handel, Industrie und Gewerbe. Beschreibung der im Handel vorkommenden Natur- und Kunsterzeugnisse, unter besonderer Beruecksichtigung der chemisch-technischen und anderer Fabrikate, der Drogen- und Farbwaren, der Kolonialwaren, der Landesprodukte, der Material- und Mineralwaren. Vierte, wesentlich vermehrte auflage [Merck's dictionary of products and commodities for trade, industry and commerce. 4th ed.]. Leipzig, Germany: Verlag von G.A. Gloeckner. viii + 722 p. + 48 p. See p. 576. 25 cm. [Ger]
• ***Summary:*** The entry for "Soya" (p. 576) is almost identical to that in the 1882 edition. Soya is also mentioned under Beans (*Bohnen,* p. 78-79). The title page states that this book was compiled in cooperation with Messrs. Lorenz Brauer, Paul Degener, and others. Edited/published (*Herausgegeben*) von Dr. G. Heppe.

Also discusses: Peanuts (p. 150). Sesame seeds and sesame oil (p. 562). Address: [Germany].

794. Purdy, Charles W. 1890. Diabetes: its causes, symptoms, and treatment. Philadelphia and London: F.A. Davis. viii + 184 p. See p. 87. Index. Physicians' and students' ready reference series, No. 8. [2 soy ref]
• ***Summary:*** In Section VI, "Treatment of diabetes mellitus," the soya bean is mentioned (p. 87): *Soja,* or Japanese bean, owing to its high nutritive properties and its low percentage of starch, is likely to enter largely into the diabetic diet of the future. It has recently been much cultivated in some parts of Europe, especially in Hungary. Its composition is as follows: Nitrogen, 36.6 per cent.; fatty matter, 17 per cent.; starchy matter, 6.4 per cent.

"A sauce is made from *soja* which bears the name of *miso* and *soju* [shoyu]. A kind of cheese [tofu] is made from it, and very much prized in Japan as a table-luxury. (Footnote: See Egasse 1888, p. 433-38).

"In Europe the soja has already been utilized for food of men and animals, and recently the attempt has been made to make bread of it. This is very difficult because of the large proportion of oil which it contains. This oil is very purgative [sic], and hence it becomes necessary to rid the meal of it in order to render it fit for domestic usages. Lecerf in Paris and Bourdin in Rheims have succeeded in rendering the bread made from this meal very well supported by the stomach.

"This bean, which, as the analysis shows, is more nutritive than meat, serves for nourishment to a great country like Japan, under the forms of sauce, of cheese, of farina, and even of *real* artificial milk" (Footnote: Therapeutic Gazette, March 15, 1890, p. 150).

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "artificial milk" or "real artificial milk" to refer to soymilk.

Gluten is also mentioned several times (p. 84-85): "First in importance ranks the question of bread in the construction of any diabetic diet-list. The withdrawal of this article from the list is usually the most serious deprivation the patient has to encounter. In consequence of this fact, an almost endless number of breads have been placed upon the market, which are *claimed* to be free, or nearly free, from starch, and are hence named diabetic breads. Now, I do not hesitate to say that most breads which have been put upon the market with such claims are 'a snare and a delusion,' and have unquestionably shortened the lives of hundreds of diabetic patients. Most samples of so-called 'diabetic flour,' from which the starch is claimed to have been eliminated, 'or nearly so,' contain from 30 to 70 per cent. of that article... But Dr. Chas. Harrington, of Boston, has rendered us under perpetual obligations to him for fearlessly exposing the most of these deceptions, by publishing a careful analysis of most of them in detail. It may first be noted that his analysis of home-made bread gives the proportion of contained starch as 44.99 per cent. The Graham wafer, made of Graham flour, contains 58.45 per cent. of starch. The gluten flour, of Farwell & Rhines, of Watertown, N.Y., contains 67.17 per cent. of starch... The gluten flour of the New York Health Food Company contains 66.18 per cent. of starch. Bread made of this flour would contain 35 per cent. of starch... The Boston Health Food Company's diabetic flour, No. 1, sold as absolutely non-starchy, contains 62.94 per cent. of starch. Bread made of this flour would contain 30 per cent. of starch." Address: M.D., Queen's Univ. [Kingston, Ontario, Canada].

• ***Summary:*** Contents related to the soy bean: *Glycine* (p. 509-10). *Glycine hispida,* Maxim. (p. 510-11): Synonyms, vernacular, references, habitat, oil, medicine, food and fodder, chemistry, the bean, oil.

Under Glycine: "Reference having been made to the authorities of the Calcutta Herbarium on the subject of G. soja, Sieb. et Zucc., being, as shown in the Flora of British India, a native of this country, Dr. Prain kindly went into the subject very carefully. He writes: 'We have not, from any part of India, any specimens of G. soja proper. The Khasi Hills plant is more erect, more hispid, and has larger legumes than the Himalayan, and indeed resembles G. hispida, Maxim., quite as much as it does the Indian cultivated "G. soja," which, indeed, it connects with G. hispida. It is, in fact, the plant most like the wild G. soja, S. et Z., which no one ever professes to have found wild in India, while it is also the one most like G. hispida, Maxim. (which has never been found wild anywhere). It is the plant collected by Dr. Watt and myself in the Naga Hills.'

"The writer noted on his Naga Hill specimens that they were found in a semiwild state, and that the plant was known to the Angami Nagas as *Tsu Dza,* a name not unlike soja. Throughout India, the soy bean is cultivated, black and white seeded forms being met with, which vary to some extent, but all preserve the specific characters of G. hispida. Plants raised at Saharanpur from Japanese seed have larger and broader leaves than the usual Indian forms. The fact that this cultivated plant possesses, even among the aboriginal tribes, names which are original, i.e., in no way modern derivatives, points to an ancient cultivation, if, indeed, it may not be accepted as an indication of its indigenous nature. (Editor.)"

"Vern[acular]–Bhat, bhatwan, ram kurthi (Hind. [=Hindi or Hindoostanee]); Bhut (Punj. [= Panjabi]); Gari-kulay (Beng. [=Bengali]); Hendedisom horec (black-seeded), Pond disom, horec (white-seeded variety) (Santal); Tzu-dza (Naga); Bhatnas, bhatwas (Nepal); Seta, kala botmas (Parbat.); Musa, gya (Newar); Khajuwa (Eastern Terai); Bhut (Kumaun).

References: The author cites 17 early references concerning soya and, using information from these.

This brief bibliography on soya is one of the best and worst seen. Its is good in that it cites a host of previously uncited publications. It is bad in that the references are so abbreviated as to often be incomprehensible; and some of them are incomplete or incorrect.

Habitat: "Extensively cultivated throughout India and in Eastern Bengal, Khasia hills, Manipur, the Naga hills, and Burma, often found as a weed on fields or near cultivation."

Medicine: "A decoction of the root is said to possess astringent properties." Food and fodder: "The Soy-bean forms an important article of food in China and Japan. Since 1873, it has been successfully grown in the warmer parts of Europe. It is also widely spread, in a cultivated state, over a great part of the Himálaya [Himalaya] and the plains and lower hills of India. On the plains the crop is generally grown by itself, as a *kharif* crop; the seeds are sown from June to September, and the harvesting takes place from November to January.

"The bean is eaten in India in the localities where cultivated. The Rev. A. Campbell states that in Chutia Nagpur it is generally used roasted and ground as *satu,* or simply roasted in the form of *atá.* In other parts of the country it is also eaten in the form of *dal.* In China and Japan three preparations are made from the soy-bean, namely soy-sauce, soy-cheese, and a kind of paste. The last two of which are manufactured by crushing and pressing the seeds."

Note 1. An extensive "List of works consulted" (bibliography) appears in Vol. I (1889, p. xiii-xxii), followed by a list of contributors (p. xxiii-xxvi) and list of abbreviations (p. xxvii-xxxiii).

Note 2. This is one of earliest documents seen (March 2005) that clearly refers to the cultivation of soybeans in Burma.

Note 3. This is the earliest English-language document seen (Nov. 2012) that uses the word *satu* to refer to roasted whole soy flour, or that mentions roasted whole soy flour is made and used in India.

Sir George Watt lived 1851-1930. This 7-volume work, published from 1889 to 1896, is arranged alphabetically by product. An extensive bibliography is in vol. 1, and the index comprises vol. 7. Address: M.B., C.M., C.I.E., Reporter on Economic Products with the Government of India.

796. Whitney, William Dwight. ed. 1890. The century dictionary: An encyclopedic lexicon of the English language. New York, NY: The Century Co. See the entry for "Soy" in Vol. 5, p. 5790.

• ***Summary:*** This dictionary contains three entries related to the soy-bean in Volume 5: (1) "Soy (soi), noun. [Also *sooja;* = F. *soy, soui* = G. Sw. Dan. *soja* (NL. *soja, soya*); Jap. *si-yan,* Chinese *shi-yu,* soy.] 1. A kind of sauce prepared in the East from the soy-bean (see def. 2). It is eaten with fish, cold meat, etc. There are two or three qualities of soy [sauce], but the Japanese soy is reckoned the best.

'I have been told that *soy* is made with a fishy composition, and it seems most likely by the Taste; tho' a Gentleman of my Acquaintance who was very intimate with one that sailed often from Tonquin [Tonkin, in today's Vietnam] to Japan, from whence true *Soy* comes, told me that it is made only with Wheat, and a sort of Beans mixt with Water and Salt.' Dampier, Voyages, II, 28.

'From travellers accustom'd from a boy / To eat their salmon, at the least, with *soy.'* Byron, Beppo, vii.

2. The soy-bean or -pea, *Glycine Soja* (*Soja hispida,* etc.). It is an annual leguminous plant with stout nearly erect or somewhat climbing stems covered with rusty hairs, bearing trifoliate leaves and from their axils two or three

© Copyright Soyinfo Center 2014

pods 1½ or 2 inches long. The seeds are made into the above sauce and variously used in cookery; an oil is also expressed from them, and the residue is extensively used in China for feeding cattle and as a fertilizer. The plant is native from northern India to Japan. The cultivated plant differs somewhat from the wild, and by some authors is distinguished as *Glycine hispida.* Also *Sahuca bean.*

(2) soy-bean (soi'bên), noun. See *soy,* 2.

(3) soy-pea (soi'pê), noun. See *soy,* 2.

Note 1. James Platt (1899) says: The word "Soy" has been badly treated by all our dictionaries. The best is the 'Century,' where it is traced to 'Japanese *siyan,* Chinese *shiyu,'* but even that involves two errors. One is a misprint (*'siyan'* should be *siyau*)*;* the other is that it accounts for only half the English word.

Note 2. "Miso" is not mentioned in this dictionary. Address: Prof. of Comparative Philology & Sanskrit in Yale Univ.

797. Brooks, William P. 1891. The Agricultural [sic, Agriculturist]. *Massachusetts* (*Hatch*) *Agricultural Experiment Station, Annual Report* 3:4-5. Jan.

• ***Summary:*** "Report has been made on several varieties of Japanese crops, viz., four varieties of beans and three of millet. Of the latter, two, the Setaria Italica (*Jap. Mochi Awa*) and the Setaria Italica (*Jap. Awa*), seem especially promising for seed production and fodder...

Note: In the 4th Annual Report (p. 8-9), published one year after this one, we learn that the Soja bean was one of the four varieties of beans tested. Red beans [azuki] were almost certainly another one of the four (see Brooks 1890, Bulletin No. 7, p. 14-17). Address: Agriculturist, Amherst, Massachusetts.

798. Wigmore, J.H. 1891. Notes on the eiraku-sen. *Transactions of the Asiatic Society of Japan* 19:501-04. See p. 502. Read 17 March 1891. [1 ref]

• ***Summary:*** The *eiraku-sen* was an important Japanese coin. "In the 10th year of Oyei (1403), says the story, the greatest typhoon ever known in Japan drove a Chinese ship [off course] to Misaki village in Izu, now Sôshû." The people on the ship requested harbor. Mitsukane "confiscated the ship's cargo, and after provisioning the crew with miso, salt, fuel, and rice, sent them back to China."

The author of *Denyen Jikata Kigen* gives three reasons for believing that this story is not true.

799. Georgeson, C.C. 1891. Experiments under way on the farm. *Industrialist* (*The*) (*Manhattan, Kansas*) 16(37):145-46. June 6.

• ***Summary:*** Fifty-five distinct field experiments are under way, with an aggregate of 2,068 plats subject to separate study, observation, and thought. Crops being studied are wheat, corn, oats, forage and miscellaneous crops. In the section titled "Forage and Miscellaneous Crops" we read: "8th. trial of Soy Beans.–The results obtained last year with certain early varieties imported from Japan were full of promise." Address: Prof., State Agricultural College.

800. Goodale, George Lincoln. 1891. Some of the possibilities of economic botany. *Nature* (*London*) 44(1144):530-36. Oct. 1. See p. 532-33. [1 ref]

• ***Summary:*** This is an "Abstract of the Presidential address delivered before the American Association for the Advancement of Science, at Washington [DC], August, 1891..."

For details see full address published in *American J. of Science* (Oct. 1891, p. 271-302). Address: M.D., LL.D., Fisher Prof. of Natural History, Harvard Univ., Cambridge, Massachusetts.

801. Rita. 1891. The ladies' column. *Bush Advocate* (*Hawke's Bay, New Zealand*). Oct. 3. p. 7.

• ***Summary:*** One section reads: "Indian soy [sauce].–Indian and Japanese soy prepared from the dolicas saja [sic, Dolichos soja], termed by them 'soga' [sic, shoyu, soya?]. A good imitation is made as follows: Take one gallon or haricot or kidney beans; boil till soft; add bruised wheat one gallon. Keep in a warm place 24 hours, then add one gallon common salt, 2 gallons water; put the whole in a strong jar, bung it up for two or three months, stirring frequently, then press out the liquor."

Note: This same recipe appeared in the *Evening Post* (New Zealand) on 27 Feb. 1892.

802. Goodale, George Lincoln. 1891. Some of the possibilities of economic botany. *American J. of Science* 42(250):271-316. Oct. Third Series. See p. 280-85, 302. [1 ref]

• ***Summary:*** This is the Presidential address delivered before the American Association for the Advancement of Science, at Washington [DC], August, 1891..."

The section titled "Vegetables" (p. 280-85) states that Vilmorin is an authority on the many unique vegetables now available in Europe. "In 1854 the late Prof. Gray called attention to the remarkable relations which exist between the plants of Japan and those of our eastern coast. You will remember that he not only proved that the plants of the two regions had a common origin, but also emphasized that many species of the two countries are almost identical."

"One of the most convenient places for a preliminary examination of the vegetables of Japan is at the railroad stations on the longer lines... For native consumption there are prepared luncheon boxes of two or three stories, provided with simple and yet embarrassing chopsticks. It is worth the shock that it causes ones nerves to invest in these boxes and try the vegetable contents... "Prof. Georgeson, formerly of Japan, has kindly identified some of these for me,...

© Copyright Soyinfo Center 2014

"Prof. Georgeson, whose advantages for acquiring a knowledge of the useful plants of Japan have been unusually good, has placed me under great obligations by communicating certain facts regarding some of the more promising plants of Japan which are not now used here. It should be said that several of these plants have already attracted the notice of the Agricultural Department in this country.

"The soy bean (*Glycine hispida*). This species is known here to some extent, but we do not have the early and best varieties. These beans replace meat in the diet of the common people" [in Japan].

Footnote 22 (p. 302) includes: "Beans (*Glycine hispida*), many kinds and prepared in many ways." Also mentions pickled green plums (Ume-boshi). "Several kinds of seaweeds are also very commonly served with rice." Address: M.D., LL.D., Fisher Prof. of Natural History, Harvard Univ., Cambridge, Massachusetts.

803. De Negri, G.; Fabris, G. 1891-1892. [Vegetable oils. Oil of Soja hispida (soja bean)]. *Annali del Laboratorio Chimico Centrale delle Gabelle* (*Rome*). p. 220-256. [Ita]*

• ***Summary:*** The Soja hispida is a herbaceous plant of the *Leguminoseae,* indigenous to China and Japan, where the seeds are highly valued as a comestible. The seeds contain a large quantity of a fermentable sugar, and also a ferment (enzyme) similar in its properties to diastase. The oil, present in the proportion of 14-18%, can be extracted by pressure or by means of ether; it possesses laxative properties, a yellowish-brown color and a slight aromatic odor. It readily solidifies, and is intermediate between the siccative (drying) and non-siccative oils. Note: This is the earliest document seen that uses the word "laxative" in connection with soy bean oil. Petit (1888) said soy oil was a "gentle purgative" and Smith (1871) noted that soy beans were said to be laxative.

The following physical and chemical constants are given for soy oil; they confirm those obtained by Stingl and Morawski (1886): Specific gravity at 15ºC 0.9242. Solidifying point 8-15ºC. Melting point of the fatty acids 27-29ºC. Solidifying point of the fatty acids 23-25ºC. Maumené test (temperature rise) 59ºC. Iodine number 121.3. Iodine number of the fatty acids 122. Saponification value 192.5.

The oil gives, with Hauchecorne's reagent, a dirty white coloration in the cold, but deep orange when heated; with Brulle's reagent a deep orange; but no coloration with Bechi's reagent.

804. Chamberlain, Basil Hall. 1891. Things Japanese: Being notes on various subjects connected with Japan... 2nd ed. revised and enlarged. London: Sampson Low, Marston and Company, Ltd.; Hongkong, Shanghai, Yokohama, and Singapore, Ltd.: Kelly & Walsh, Ltd. [8] + 503 p. Index. 1st ed 1890 (408 p.). Slightly revised edition published 1905. Reprinted in 1970 by Charles E. Tuttle Co., Inc. (Rutland, Vermont, and Tokyo). [14 ref]

• ***Summary:*** This book is arranged alphabetically by subject. Festivals (p. 154): *"Setsubun* is the name of a movable feast occurring sometimes late in January, sometimes early in February, on the eve of the first day of spring, old calendar. Beans [roasted soybeans] are scattered about the house on the evening of this day in order to scare away demons, and of these beans each person present eats one more than the number of the years of his age."

Food (p. 168): Same as in the 1890 ed.

Sun, moon and stars (p. 394): There are three great nights of the lunar year for moon viewing. "The 15th night of the 8th moon, which is no other than our harvest moon at the full, is celebrated by an offering of beans and dumplings and of bouquets of eulalia-grass [*susuki*] and lespedeza blossom. This moon is termed the 'bean moon.'"

Note: In *Chado: The Way of Tea,* a translation of the Japanese classic *Sado-sai-jiki,* and various other Japanese books we learn that the full moon on the 15th night of the 8th lunar month is the brightest and most widely viewed one of the year and is called *meigetsu* (literally "bright moon"). Aesthetic appreciation of the full autumn moon originated in China as early as the Han dynasty (202 BC to AD 220). Moon-viewing became popular in China during the Tang dynasty (618-907) and this tradition was transmitted to the Japanese court in Kyoto in about the 8th century; the aristocracy called this festival *Otsukimi* ("moon viewing") and celebrated it, outdoors, by composing poems, listening to music, etc. Today that date falls in mid-September. In both Japan and the West, this is the "harvest moon" and its celebration a pre-harvest festival.

However it is the *next* full moon, about a month later, on the 13th day of the 9th lunar moon that is called the "bean moon" (*mame-meigetsu*). It is indeed, as Chamberlain says, celebrated by an offering of beans (*edamamé,* or green vegetable soybeans) and dumplings (glutinous rice steamed with chestnuts). In some parts of Japan the edamamé are mashed, sweetened with sugar, then used to coat rice-flour dumplings. This *mame-meigetsu* is still celebrated at the Kitano Tenmangu Shrine in northwest Kyoto.

Tea (p. 403): Other tea-like infusions: *"Mugi-yu,* an infusion of parched barley; *Mame-cha,* a similar preparation of beans. *Fuku-ja,* or 'luck tea,' is made of salted plums, sea-weed, and xanthoxylon seeds, and is partaken of in every Japanese household on the last night of the year."

Concerning red beans [aduki]: Birthdays (p. 56): "Birthdays are not much observed in Japan, except that rice mixed with red beans [azuki] is eaten on the auspicious day."

Festivals (p. 154-55): Dec. 13.–This day is called *Koto-hajime,* that is, "the beginning of things," because such preparations for New Year as house-cleaning, decorating, and the pounding of rice for cakes (*mochi*), are then taken in hand. People eat *o-koto- jiru* on this day,–a kind of stew

© Copyright Soyinfo Center 2014

whose ingredients are generally red beans [azuki], potatoes, mushrooms, sliced fish, and a root called konnyaku."

Jan. 15-16.–The end of the New Year holidays. The 16th is the *Hokônin no Yado-iri,* or Prentices Holiday Home. Rice-gruel mixed with red beans [azuki] is eaten."

N.B. *Azuki-meshi,* that is, rice mixed with red beans, is eaten on the 1st, 15th, and 28th of each month, these being the so-called *san-jitsu,* or "three days." On the 30th, people eat buckwheat vermicelli (*misoka-soba*).

Overview of Japanese commerce: "The chief progress made during the past thirty years has been in industrial developments" (p. 433). A large table show imports to Japan in 1890 (p. 434): The top five imports (with the value in million yen) are: Textiles and textile fabrics 20.49. Rice 12.30. Sugar 8.48. Raw cotton and wool 5.74. Kerosene oil 4.95. "Oil cake" [mostly soybean cake] is another major import, but grouped with oils, oil wax, and paints in oil 0.41.

Exports from Japan (p. 434-35): The top five are: Raw silk, waste silk, and cocoons 16.75. Tea 6.28. Copper 5.36. Silk piece goods and silk manufactured goods 3.64. Coal 3.10. Also seaweed 0.68.

The top five ports for exports and imports are (p. 435): Yokohama 73.0. Kobe 49.0. Nagasaki 7.7. Osaka 3.80. Shimonoseki 1.77.

Japan's leading trading partners (imports + exports) are: Great Britain 32.5. USA 26.7. Hongkong 14.8. China 14.0. France 12.2. Address: Emeritus Prof. of Japanese and Philology in the Imperial Univ. of Tokyo, Tokyo.

805. Dujardin-Beaumetz, Georges Octave. 1891. Ueber die Behandlung des Diabetes mellitus [On the treatment of diabetes mellitus]. In: Verhandlungen des X. Internationalen Medizinischen Congresses. See vol. 2, part 5, p. 78-101. Held 4-9 Aug. 1890 at Berlin, Germany. [Fre]

• ***Summary:*** This section of the International Medical Congress consists of three papers on the treatment of diabetes. The first, by Mr. Pavy of London, is in English. The second, by Mr. Dujardin-Beaumetz of Paris (p. 84-91), is in French. Since Mr. Dujardin-Beaumetz was unable to attend, his paper was read by Mr. Ewald of Berlin. The third paper, by Mr. Seegen of Vienna, Austria-Hungary, is in German. Thereafter is a long discussion with many participants.

Only the paper by Mr. Dujardin-Beaumetz includes a discussion of soybeans. Gluten bread, introduced by Bouchardat, was a step forward, but it contained too much starch. Almond bread, as suggested by Seegen, was tried in France with fairly good results. But the best results came from soy bread (*le pain de soja*).

The soybean (*Glycine hispida*), which provides a much-appreciated food in Japan and a cheese (*un fromage*) [tofu] now widely researched, is presently cultivated on a large scale in Europe. It contains almost no starch, and the histological samples taken by Blondel proved that soybean seeds contain almost no starch. However, it contains a purgative oil, soya oil (*l'huile de soja*), which creates difficulties when making soy bread.

Nevertheless, a soy bread is now made commercially in France, either with or without gluten. It is accepted by numerous diabetics and it is far superior to the best gluten bread. Unfortunately the unusual and rather strong soy taste will always limit the use of this bread.

The first participant in the discussion is Mr. Miura (Tokyo, Japan), who comments (in German, p. 100-01) on the treatment of diabetes in East Asia and notes that soybeans are widely used. Address: Paris, France.

806. Popenoe, E.A.; Mason, S.C.; Marlatt, F.A. 1891. Germination of weeviled peas–Garden notes on potatoes, beans, and cabbage. *Kansas Agricultural Experiment Station, Bulletin* No. 19. p. 193-201. Dec. 1890. See p. 199-201.

• ***Summary:*** The section titled "Some Japanese beans" (p. 199-201) lists and describes ten such beans, all but two of which were procured from Japan by Prof. Georgeson. Of the ten, four are soy beans, and the first 3 of these were collected by Georgeson. "The three imported Soy beans seem to be specially commendable as resisting drought and heat to a degree surpassing all others on trail, and in ripening so uniformly that they may be pulled or cut, harvesting the crop at once without material loss from shelling." For each plant, there is a description of the plant, its flowers and seeds, time of ripening, and yield.

"No. 7. Glycine hispida–'Soy'–'Eda-mame' (Jap.)... [The seeds are] oval, or nearly round, smooth, greenish yellow. This was the earliest of the Soy beans, being fully ripe by August 29th. The plants continued vigorous through the severest drought of the summer, seeming to suffer little from it. The average yield per acre was estimated at 1,669 pounds.

"No. 8. Soy–'Kiuski Daidzu' (Jap.)... Ripened a week to ten days later [than No. 7]. Average yield per acre estimated at 1,026 pounds.

"No. 9. Soy–'Yamagata Cha-daidzu' (Jap.)... "Seeds, three-eighths of an inch long, oval, dull brown in color. Began bearing the latter part of August and continued till frost. The average yield per acre estimated at 1,693 lb.

"No. 208. 'Soja'–Glycine hispida (Wood). The seed of this was received from T.W. Wood & Sons, of Richmond, Virginia, and the results obtained are shown for comparison with the Japanese varieties. Planted at the same time, they were only in first bloom August 27th, when No. 7 of the Japanese list was nearly ripened. The vines grew rank and succulent, three to four feet high. No pods were ripened till late in September, and further production was cut short by frost. The estimated yield per acre was 498 pounds."

Two varieties of adzuki beans (*Phaseolus radiatus*) are also described. The black podded one yielded 934 lb/acre and the other yielded 628 lb/acre.

Note 1. This is the earliest document seen (July 2013)

© Copyright Soyinfo Center 2014

that mentions a named soybean variety in the United States, or that mentions the soybean varieties Yamagata Cha-daidzu or Eda-Mame (or "Eda Mame," spelled as two words).

Note 2. This is the earliest soy-related English-language document seen (March 2003) that contains the word "Entomology."

Note 3. This is the earliest English-language document seen (Sept. 2004) that uses the term "dull brown" to describe the color of soybean seeds. Address: Dep. of Horticulture and Entomology [Manhattan, Kansas].

807. Rathgen, Karl. 1891. Japans Volkswirtschaft und Staatshaushalt [Japan's economy and national budget]. Leipzig: Duncker & Humblot. xx + 785 p. See p. 328, 331, 397, 445, 611-12. In: Staats- und Socialwissenschaftliche Forschungen. Vol. 10. No. 4. [2 ref. Ger]

• ***Summary:*** Wheat flour is an important component in the production of shoyu (p. 328).

"Production of soybeans by year was as follows. (Note 1. 1 cho = 2.45 acres and 1 koku = 180 liters or 47.6 gallons): 1878 was 414,961 cho and 1,642,183 koku. 1881 was 427,557 cho and 2,175,337 koku. 1884 was 440,647 cho and 2,323,435 koku. 1887 was 466,315 cho and 3,253,790 koku (p. 330). The large increase in numbers is due mainly to a 76% increase in yields during this 9 year period. This must be difficult since most soybeans are grown around the edges of fields, on paddy bunds and in very small plots.

"Soybeans are grown throughout Japan, but they are concentrated in Tokyo plain and the prefectures bordering on its north. In 1887 the following 12 prefectures accounted for 56% of Japan's total production: Kanagawa, Saitama, Chiba, Ibaraki, Tochigi, Gunma, Nagano, Niigata, Yamagata, Fukushima, Miyagi, and Iwate.

Note 2. This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for Japan.

"This exceptionally nutritious bean appears in all possible forms in Japanese cooking, as a vegetable, boiled in sugar, as tofu ("als Tofu (Bohnenkäse)" = bean cheese), and as the main component of fermented miso soup (*Miso-Suppe*) and of soy sauce (*Soja-Sauce*).

"During the period 1870-74, the price of soybeans averaged 3.015 yen/koku. In 1875 it was 4.46 yen and in 1886 3.98 yen, with a high of 7.11 yen/koku in 1882."

"Since 1885, with the introduction of use taxes, new production statistics have begun to be kept on the shoyu industry. In 1887/881 some 1,180,188 koku of shoyu was taxed from 11,687 businesses, averaging 101 koku per factory. By comparison, the amount of shoyu taxed in 1888-89 was 1,304,551 koku from 10,634 businesses, averaging koku per factory. As with sake breweries, the number of plants has diminished from 13,682 in fiscal year 1885/86 to 10,634 in the fiscal year 1888/89. Although shoyu factories are found throughout Japan, there are certain regions of concentration. Chief among these is Chiba prefecture, which in 1887/88 had 689 factories and a production of 121,816 koku, averaging 177 koku/factory. The capital of the industry is the city of Choshi. Other major shoyu producing prefectures are Ehime (555 plants, 73,525 koku), Hyogo (544 plants, 73,168 koku), Okayama (580 plants, 64,389 koku), Fukuoka (381 plants, 58,022 koku), Ibaraki, Aichi, Kanagawa, and Saitama.

On p. 611-12 is a detailed discussion of Japan's shoyu tax. Shoyu production was already being taxed in 1875. Then law 10, enacted on 8 May 1885, which went into effect of 1 July 1885, reinstated the tax. This tax is similar to the sake tax. A yearly license costing 5 yen is required and a tax of 1 yen/koku of shoyu produced is levied. Government tax revenues from shoyu grew from 640,379 yen during the partial year 1885/86 to 1,215,254 in 1889/90.

Rathgen lived 1856-1921. Address: Leipzig, Germany.

808. Riley, C.V. ed. 1891. Reports of the United States commissioners to the Universal Exposition of 1889 at Paris. Vol. 5, Agriculture. Washington, DC: Published under direction of the Secretary of State by authority of Congress. 935 p. See p. 127. Index.

• ***Summary:*** In the section on "African and Asiatic countries" is a subsection titled "Japan" (p. 127) which (according to the table of contents) is about "The Soja (*Glycine hispida*) and the azouki [azuki] (*Phaseolus radiatus*), two important Japanese vegetables."

The actual entry states: "The exhibit in class 71 was particularly interesting; beside the Government exhibit there were fifteen private ones and eleven of these exhibits contained soja or *daizon* [*sic, daizu*]. The soja (*Glycine hispida*) is a leguminous plant closely resembling the pea, and is one of the principal vegetables in use among the Japanese, who employ it in various ways; *kôritôfou,* or cheese of the soja [dried frozen tofu], is a sort of alimentary paste, prepared by coagulation and freezing. The soja is also grown to a small extent in France, and was exhibited in a collective exhibit from the département de l'Aube. Its grain contains very little amylaceous matter (starch) and sugar, and is therefore particularly adapted for food for diabetic patients, while it also contains much nitrogenous matter and phosphoric acid, which renders it very nutritive.

Note. This is the earliest English-language document seen (April 2013) that uses the term *kôritôfu* to refer to dried-frozen tofu.

"Another vegetable much used in Japan is the *azouki* (*Phaseolus radiatus*), a sort of bean [azuki]. Dried prunes, *anzous* (*Prunus armeniaca*) [apricots], were also shown and were of good quality. There was a fine exhibit of dried ginger. Raisins, nuts, peanuts, preserved bamboo sprouts, etc., were also shown, and the whole display was a good one."

Note: This is the earliest document seen (Aug. 2011) about the United States Department of Agriculture

811. Speth, G. 1892. Irish potatoes, sweet potatoes, tomatoes, forage plants. *Georgia Agricultural Experiment Station, Bulletin* No. 17. p. 163-98. March. See p. 190-91, 196-98.
• ***Summary:*** The section on "Forage plants" (p. 190+) begins with a long subsection on cow peas, which is considered the "most valuable" forage plant in the Southern States. The subjection titled "Soja bean" (p. 196-98) begins: "Although known in the Southern States for a long time, it has never been fully appreciated, but promises in time to become a great rival to the cow pea; it produces a great amount of forage, which seems to cure easier than the cow peavines and proves more productive of peas.

"It is of as easy culture as our cow peas, yielding a forage which is greatly relished by farm stock, and which compares favorably with cow pea vines. The beans which possess most highly nutritive qualities, being rich in protein and fat, which are the most expensive elements in all feeding stuffs, resembling in composition, good beef. In its home, Japan, where it is extensively cultivated, it takes that place which meat takes here."

Professor Atwater has stated in an article in the *Century:* "In the most economical feeding of animals it takes a number of pounds of hay, corn and other feeding stuff to make a pound of beef or pork." The Bulletin continues: "If a pound of vegetable protein costs 2½ cents as we find it to cost in the Soja beans, a pound of animal protein must cost considerable [sic] more if produced by the aid of protein obtained from corn at a cost of double that amount."

A long discussion, comparing the effect of soja beans and corn on soil fertility, notes that "leguminous plants are not dependent on nitrogenous fertilizers; they gather their supply from the atmosphere..."

There follow five related tables: (18) Yield of forage and seed of cow peas, soja beans, varieties of corn and peanut vines." For each crop it gives the amount of forage per acre (green, and dry), and seed per acre. Soja beans yield 9,730 lb per acre of green forage or 2,940 lb per acre of dry forage or 1,307 lb per acre of seed.

(19) Composition of cow peas, soja beans and corn. (20) Composition of cow pea vines, soja bean vines, corn forage, and peanut vines (cured). (21) Yield of crude nutrients of one acre of (vines and forage). (22) Yield of crude nutrients of one acre of (seeds and grains).

The article ends: "The results evidence the exceptionally high value of the Soja beans as a feeding stuff, far greater than that of corn or cow peas, the superiority of the vines for forage, which in composition are equal to the cow peas and greatly surpass the corn forage."

Note 2. This is the earliest English-language document seen (Aug. 2003) that contains the term "animal protein" (or "animal-protein" or "animal proteins"). Address: Horticulturist, Experiment, Georgia.

812. Brooks, William P. 1892. Division of Agriculture. *Massachusetts* (*Hatch*) *Agricultural Experiment Station, Bulletin* No. 18. p. 41-104. April.
• ***Summary:*** The section titled "Report on trial of miscellaneous crops" (p. 97-104) includes many varieties imported from Japan: Oats (3 varieties). Millet, *Panicum crus-galli.* Millet, *Panicum miliaceum.* Hemp. Flax. Wheats. Japanese varieties of beans.

All the beans "belong to two distinct classes, known to the Japanese respectively as *'Adzuki'* or *'Shodzu,'* the latter name meaning 'small bean' and *'Omame'* or *'Daidzu,'* both the latter names meaning 'large bean.' The beans of the first class are a distinct species, *Phaseolus radiatus* and are used by the Japanese almost entirely in confections. They are characterized by a remarkably thin skin, and are generally boiled, put through a sieve, and variously sweetened and colored although also prepared in other ways. An enormous quantity of these confections is eaten by persons of all ages and classes.

"The beans belonging to this class have been sometimes incorrectly designated Soja beans by American writers." It grows fairly well but is "much poorer in albuminoids [proteins] and fat than the soja bean."

A table compares the nutritional composition of a red adzuki bean raised in Massachusetts in 1890 with a kidney bean (*Phaseolus vulgaris*).

"Whether the beans of this class [adzuki] will prove valuable here may be doubtful. They are certainly unusually attractive in appearance; but it is not likely that the Japanese bean confections, which nearly all foreigners in Japan regard as decidedly flat and insipid, will ever come into favor here."

"The beans of the second class (*'Daidzu'*), belong to a distinct genus and by some authorities are named *Soja hispida,* whence the common designation soja (sometimes soya) bean; by other authorities, the species is named

© Copyright Soyinfo Center 2014

Glycine hispida which name, probably, has the claim of priority. The name 'soja' or 'soya' has undoubtedly been taken from the name 'soy' given to a sauce (used extensively as a condiment), in the manufacture of which this bean is largely used. The name given to the Japanese variety of this sauce is *'shoyu.'* This bean is also extensively used in many ways in Japan as human food, and is also largely employed as food for horses and cattle.

"It has been said that this bean is the richest known vegetable substance. 'In point of nutriment the soy bean is of all vegetables nearest to meat,' says Rein [1886]. A sample of beans grown here in 1890 has been submitted to analysis, with results shown below:"

A table titled "Soya Bean. *Glycine hispida.* shows: Dry matter: 11.53%. Crude protein: 34.49%. Crude fat 16.45%. Nitrogen free extract 26.29%. Crude fibre: 4.40%. Ash: 6.55%.

Several of the varieties which I have had under cultivation, having been taken from northern Japan (Sapporo), ripen seed here with as great certainty as the kinds of corn under cultivation. It is believed that some of these varieties will prove valuable grain crops. The yield, it is true, cannot be expected to equal that of corn; but the grain is far richer, and because of the high percentage of protein it contains it is fitted to take the place of bran, cotton-seed meal and linseed meal for which our dairymen yearly pay out so much money.

"It should further be remembered that if the results of modern investigations on this point are not misleading, this plant must be able to take most of its nitrogen from the air which must vitally affect the question of its economy as a farm crop. Most of our crops are nitrogen consumers. This, being a nitrogen gatherer, should enable the farmer to dispense in large measure with purchased nitrogenous fertilizers."

Details of cultivation of red and white adzuki beans are given. The red yielded at the rate of 27.3 bushels per acre and the white yielded at the rate of 21.7 bushels per acre. "We have invariably found the red varieties superior to the white in productive capacity, and in beauty of appearance. The seed of these varieties was kindly sent us by Prof. Georgeson of the Kansas Experiment Station, as our original stock had been destroyed by fire. The seed was planted May 14th, the crop pulled Oct. 3rd. and threshed Oct. 23d."

Six varieties of soya beans were also tested (p. 103-04): Eda [sic, Eda Mame] (8.37 bu/acre), Kuiske [Kiyusuke] (14.26), Medium Early White (23.25). Medium Black (22.8), Medium White (19.5), Medium Green (30.2). The first two were sent by Prof. Georgeson, the last four imported from Sapporo, Hokkaido [Japan], by Brooks. The yields in bushels per acre are given after each variety name in parentheses. Medium Early White had previously yielded as high as 35 bushels per acre. "I believe that crops of about 30 bushels per acre of this variety [Medium Early White] may be safely anticipated."

Note 1. This is the earliest English-language document seen (Aug. 2013) that mentions the soybean varieties Medium Black, Medium Early White, or Medium White.

Concerning the variety Eda [sic, Eda Mame] (p. 103): "Seed received from Prof. Georgeson, planted May 14th, crop pulled Oct. 3d., and threshed Oct. 23d. The area occupied by this variety was 20.3 square rods; the yield was 1.06 bushels, or at the rate of 8.37 bushels per acre. This is one of the poorest varieties we have under cultivation."

Note 2. An analysis of "Georgeson" plus "Eda" shows clearly that Georgeson et al. named this variety "Eda Mame." Address: Agriculturist.

813. Medium Early White: New U.S. domestic soybean variety. 1892. Seed color: White or pale yellow.
• ***Summary:*** Sources: Brooks, William P. 1892. "Division of Agriculture." *Massachusetts* (*Hatch*) *Agricultural Experiment Station, Bulletin* No. 18. p. 41-104. April. See p. 104. "Variety, Medium Early White; seed originally from Sapporo [Japan]. The past season is the third that this variety has been cultivated upon our grounds. The area the past season was 37.17 square rods, the yield 5.4 bushels, or at the rate of 23.25 bushels per acre. In previous years we have had crops at the rate of 22.5, 25, 27, and 35 bushels per acre. As we had but a very small quantity of seed, the seeding of the past season was thinner than desirable for a full crop from the land. I believe that crops of about 30 bushels per acre of this variety may be safely anticipated. The dates of planting, etc., of this variety were the same as in the case of the varieties described above" [i.e., planted May 14th, crop pulled Oct. 3d, and threshed Oct. 23d]. Note: This description seems to contain a contradiction: If the past season was the third that this variety was cultivated on these grounds, then there could have been no more than two previous harvests and yields. Yet four previous yields are given, implying that this past season was the 5th season this variety was grown. Since in soybeans in Massachusetts are typically harvested in about October, the first crop was probably harvested in about Oct. 1887.

Flagg, Chas. O. 1894. "Rotation of crops: Experiments with leguminous plants." *Rhode Island Agric. Exp. Station, Annual Report* 6:176, 190-92. For the year 1893. See p. 191. A table shows the range of yield of green fodder (in pounds per acre) for Medium Green (4613–6597 pounds). This was one of 32 legumes planted on 29 May 1893.

Brooks, William P. 1895. "The Agricultural Division." *Massachusetts* (*Hatch*) *Agric. Exp. Station, Annual Report* 7:7-16. Jan. See p. 13-14. The seed was originally brought from Japan by Brooks in late 1889. Medium Green appears to be most valuable for ensilage. Note: The term "medium green" (written in all lowercase letters) was first used to describe soybean strains by Brooks in Jan. 1894.

Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No 98. 28 p. May 27. See p. 20-21. States that Medium Green is a synonym for Guelph. Piper and Nielsen (1909) and Piper and Morse (1910) state the same thing. Piper and Morse (1923) say "Guelph or Medium Green." Then in 1927, Morse gives separate entries for both Guelph and Medium Green.

Morse, W.J. 1927. "Soy beans: Culture and varieties." *USDA Farmers' Bulletin* No. 1520. 34 p. April. See p. 7, 9. "Early Green.–The same as Medium Green." "Green.–The same as Medium Green." "Guelph.–The same as Medium Green." "Medium Early Green.–The same as Medium Green."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 14-15. Medium Green is in the USDA Germplasm Collection. Maturity group: I. Year named or released: by 1903. Developer or sponsor: Prof. W.P. Brooks, Massachusetts AES (Agric. Exp. Station). Literature: 01, 03. Source and other information: From Japan in 1889 by Prof. W.P. Brooks, Massachusetts AES (Agric. Exp. Station). 'Guelph' was synonym. Prior designation: None.

Talk with Dr. Richard Bernard, former curator of the USDA Germplasm Collection. 1998. Oct. 15. "Many varieties got named long after they were released, especially in the old days. It took them a while to settle on name. They decided that names like Medium Green, while descriptive, were not valid variety names, so they came up with Guelph." Dr. Bernard further complicated the problem because he had two different strains that were called Medium Green or Guelph, so he let the two names exist together, because the strains are different. These two are still in the soybean germplasm collection. Address: USA.

815. Medium White: New U.S. domestic soybean variety. 1892. Seed color: White or pale yellow.
• ***Summary:*** Sources: Brooks, William P. 1892. "Division of Agriculture." *Massachusetts* (*Hatch*) *Agricultural Experiment Station, Bulletin* No. 18. p. 41-104. April. See p. 104. "Variety, Medium White; seed imported from Sapporo [Japan]; planted, etc., as above [planted May 13th; pulled Oct. 13th and threshed Oct. 25th]. Area occupied, 0.76 square rods; yield, 5.5 pounds, or at the rate of 19.5 bushels per acre. In explanation of the comparatively small yield of this variety, as well as of the preceding [Medium Black], it should be stated that as we had but a mere handful of the seed, it was planted very thinly. This variety, I believe, is essentially, perhaps identically like or original stock."

Hills, J.L. 1894. "Dairying." *Vermont Agric. Exp. Station, Annual Report.* 7:70-118. For the year 1893. See p. 118. There are three entries (X, XI, and XIII) for "Soja (or soy) bean (*Soja hispida*)." Entry XI is for "seed obtained from the Hatch Experiment Station of the Massachusetts Agricultural College... This is a Japanese plant which has been grown in this country for several years. It has been very generally successful as a forage crop. The dried and ground beans make a passable imitation coffee (Plumb 1894). A few varieties, 'Early White,' 'Medium White,' 'Medium Green,' 'Medium Black,' and perhaps others mature seed in Massachusetts, and have yielded from 22 to 28 bushels per acre. It is a good plant for fodder or ensilage. The seed planted here in 1893 was obtained from two sources. That obtained from the Massachusetts Station grew best and yielded five tons of green fodder, a ton and a quarter of dry matter and a quarter of a ton of protein to the acre." Address: USA.

816. Coupin, Henri. 1892. La soya [The soybean]. *Nature* (*La*) (*Paris*) 20:203-04. Aug. 27. [Fre]
• ***Summary:*** An overview of the soybean (*La Soya*). It is not possible to encourage too much the acclimatization of exotic plants in France. One cannot doubt the worthiness such an interest when a plant, such as the soybean, has found, in its country of origin, such numerous applications.

This plant is used in China and Japan for human food and for animal feed, for making bread, cheese [tofu], for extracting an oil [soy oil], etc. Why would we not do the research necessary to raise such a precious plant in France? Many trials have already been conducted and have succeeded rather well; we will return to that later, but first we must see how the soybean behaves in Japan and China.

The soybean (*Glycine Soya*) belongs to the legume family. A botanical description is given.

In Japan, the soybean is one of the most widely used plants. It is known under the name of either *mame* or *daizu*, and it is widely used to make a sort of paste, named *miso* (*le Miso*). The process for making miso is described. [Note: However koji is not mentioned so it will not work]. It ferments for 1-2 months, and then is ready for food use. It is

© Copyright Soyinfo Center 2014

part of the breakfast of many Japanese.

The second product made from soybeans is a condiment, a liquid named *Shoyu.* It is a sort of dark brown syrup which serves as a sauce to season dishes, especially fish. The manufacture of shoyu is a very important industry in Japan. In the city of Nagasaki alone there are as many as ten factories, and each makes more than 1.2 million kilograms per year of shoyu. A description of how shoyu is made is given using equal quantities of boiled soybeans and roasted wheat, plus salt. 1.8 liters sells for 40-50 centimes.

The third product made from soybeans is a cheese called tofu (*le To-fu* or *fromage de Daizu*). The process for making tofu is described. It can be eaten fresh, but unfortunately it retains the taste of raw beans, which is not very agreeable.

In China the soybean is known as *Yeou-teou,* but here it is not ordinarily cultivated on a large scale, as it is in Japan. According to Eugene Simon: Each person makes his or her own cheese [tofu]. Very also, often, each one makes his oil, if not at home, then at least at one of his parents' homes or in the neighborhood; it is distributed by the head of the family.

There is a variety of black soybean which constitutes the principle food of animals; horses and mules eat the seed in nature. People use mainly the white soybean (*la Soya blanche*)*:* from it they extract an oil [soy oil], which is the object of an enormous trade and which occupies the top rank among the oils used in China. As in Japan, the Chinese also make tofu. According to Paillieux and Bois, in the entire Chinese empire, only the Tartars use daily milk; the [Han] Chinese do not consume it at all. They use soymilk instead. The soybean is solid milk. Not all legumes contain legumine, as the soybean does. Describes how to make soymilk from soybeans.

Trials for the acclimatization of soybeans in Europe are rather numerous. In 1875, the first ones were conducted by F. Haberlandt and Blaskovics in Austria-Hungary. In France, Buffon received soybean seeds and cultivated them at the Museum [of Natural History]. One of the problems with the soybean is that its seed mature very late. However some varieties mature their seeds earlier than others.

An illustration [non-original] shows a soybean plant. At the bottom of the column on page 1, we read: See No. 425, of 25 July 1881, p. 115 [an article by E. Roman]. Address: Ingenieur en chef à Périgueux.

817. *Vegetarian Messenger* (*Manchester, England*). 1892. Japanese agriculture. Aug. p. 226. [1 ref]
• ***Summary:*** An article in the *Times* (London) summarizes a recent USDA report on this subject. "All kinds of leguminous plants are raised in abundance in almost every part of the empire, beans being largely used in the manufacture of soy, a kind of sauce."

818. *Homestead* (*The*) (*Des Moines, Iowa*). 1892. The soy bean. 38(39):889. Sept. 23. Whole No. 1897. [1 ref]
• ***Summary:*** "In our recent visit to Manhattan, Kansas, we were very much interested in the soy bean, of which several acres of four different varieties are growing on the college farm... Prof. C.C. Georgeson, in charge of the station, was for three years employed by the Japanese government as professor of agriculture. While there he made a special study of the economic plants of Japan, particularly of *soy,* or as it is commonly called, the *soja* bean. Out of the many varieties in use in Japan, he has selected four with which he is making his experiments. In a recent number of the *Industrialist* [27 Aug. 1892, p. 1] he gives the following report:

"We are just now, August 24, harvesting a portion of the soy bean crop." The seeds of four varieties were sown in rows 32 inches apart. The crop was planted May 23-24. "Cattle and hogs eat all parts of the plant greedily... At no time since we began to grow this plant in 1890 has it suffered from dry weather."

Professor Georgeson is experimenting with the soy bean mainly to try to find a crop which will do well in that large portion of Kansas where clover is not reliable and alfalfa does not fit well with any rotation. One of the virtues of the soy bean "lies in this, that it can be planted after corn planting is finished, cut in time to sow the ground to wheat and furnishes an exceedingly large amount of food highly nitrogenous, and hence the best possible combination with the carbonaceous foods such as corn, corn fodder, straw, etc., which are so abundant and cheap in the West. We shall watch the development of the soy bean with a great deal of interest. The Agricultural College at Ames has been experimenting with the bean, but with varieties that are not a success in the climate of Iowa."

First cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished. \

819. *Homestead* (*The*) (*Des Moines, Iowa*). 1892. The soy or soja bean. 38(48):1099. Nov. 25. Whole No. 1906.
• ***Summary:*** "Early in the fall we called attention to our readers as to the possibilities of the soy bean as a substitute for clover in Kansas and Nebraska, and especially in that part of these states where clover has not been a pronounced success. This bean has been known for some years, and been the subject of experimentation at the various stations in the East and South, but has not been very highly esteemed, especially in the eastern states. The *Rural New Yorker* has recently been taking the consensus of agricultural opinion on the matter... It does not meet with much favor in Vermont, New York or Connecticut, these states claiming that they have a better thing in the common red clover. The Massachusetts Station gives a better report probably because it has a better variety and knows better how to handle it. North Carolina reports that it is a very valuable crop, a trifle better in its nutritive value than clover grown on the same ground. Kansas, however, gives it the highest commendation,

© Copyright Soyinfo Center 2014

and we give the report of her experimentation in full. Prof. Georgeson, of the above station, who by the way studied the plant in Japan, has four varieties that mature in the latitude of Manhattan, Kansas, says:

"1. I unhesitatingly recommend our farmers to experiment with it. 2. It will produce more feed to the acre here than clover, and do it in half the time required for the latter. We cannot start clover with any other crop; when the so-called 'nurse crop' is harvested the young clover is killed by the scorching sun. This is so generally the case that but few experienced farmers in central Kansas and westward ever attempt sowing clover with wheat or oats, or any other crop. The first year, even when seeded by itself, it seldom affords much hay, and it is unwise to pasture it for fear of killing it. The soja beans we have, yield a full crop of feed during three months of the summer. They are harvested, and the ground can be put in fall wheat, by the time the clover crop is fairly established. Moreover, the soja bean can be grown where clover cannot get a foothold on account of the heat and drouth. 3. So far as tried, I have found it best to grow it in rows about thirty inches or a little more apart, and let the plants average one to every two inches in the row. I cultivate them until shortly before the blossoms appear. I have so far had no difficulty in curing them as I would a heavy crop of clover. Whether it is better to cure it as hay or to put it in the silo is yet to be determined by experiment. 4. I see many reasons why it can be made a profitable crop throughout this state, and throughout the West, but especially in the region where the corn crop and tame grasses are uncertain.

"These reports are what we should have expected. It is very hard to find any better in the way of a forage producer and fertilizer combined than the red or mammoth clovers. It is where these fail that the soy bean finds its appropriate place."

This bean "has the advantage, that it will endure drouth that is fatal to the clovers... We expect much from the soy or soja bean, but most where it can be used as a substitute for the clovers. "We notice that a man down in Missouri [perhaps Mr. Cole] is selling it as 'The Domestic Coffee Berry.' It is all right for the grower to grind the beans and mix them to adulterate his own coffee if he wishes, but even then he should buy a peck or so at the price he is asked by this man for a pound, and then give his pigs and calves a share before grinding for his coffee."

Note 1. This is the second earliest U.S. document seen (Aug. 2002) that uses the term "coffee" in the name of a soybean variety. It is the earliest document seen that calls it "The Domestic Coffee Berry" or uses the term "Coffee Berry." In the earliest U.S. coffee-related document seen, published in 1858, it was called the "Coffee plant." First cited by Hymowitz. 1986. Bibliography of early, previously uncited publications on soybeans in the United States. 2 p. Unpublished.

Note 2. This is the earliest document seen (Sept. 2011) concerning soybeans in connection with (but not yet in) Nebraska, and Vermont.

Note 3. We have been unable to identify the source of this long, interesting quotation. However during the week of Nov. 19, 1892, Prof. Georgeson and George T. Fairchild (President of the Kansas State Agricultural College [and father of David Fairchild, of plant introduction fame]) attended the annual convention of Agricultural Colleges and Experiment Stations at New Orleans, Louisiana (See The *Industrialist* 19 Nov. 1892, p. 55). The quotation probably came from a talk that Prof. Georgeson gave at that convention.

820. Georgeson, C.C.; Burtis, F.C.; Shelton, W. 1892. Test of some Japanese beans. *Kansas Agricultural Experiment Station, Bulletin* No. 32. p. 232-38. Dec. 1891.

• ***Summary:*** "Two species of Japanese bean have been grown here at the Station for two years past. These are the soy bean (*Glycine hispida*), and the adzuki–the mungo, of India (*Phaseolus radiatus*). Both of them have given promise of much usefulness in this country. They have been subjected to severe tests concerning their endurance of this climate, and have come out triumphantly. Having seen these beans grown in Japan, and noted the very important part they take in the diet of the Japanese, the writer became anxious to try them here, which has been done with gratifying success."

The Soy Bean. "The United States Department of Agriculture made an effort to introduce it [the soy bean]

© Copyright Soyinfo Center 2014

years ago, and several enterprising seedsmen have from time to time made attempts in the same direction; but with the result that it has been generally successful only in the South because the varieties introduced were too late to mature in the latitude of the Northern States. Knowing this, pains were taken to procure some of the earliest varieties grown in Japan. A few dozen beans of each of several kinds arrived in the spring of 1890. They were planted in the latter part of May and matured seed before frost, in a little over three months' time. The amount planted being so small, no attempt was made to estimate the yield, but they appeared to be very productive. One thing in their favor was proved that first season–their ability to withstand drouth...

"The seed thus raised was planted in the latter part of May, in 1891, and harvested early in September, with yields ranging for the several varieties from 12½ to nearly 19 bushels of beans per acre. These yields would under more favorable conditions have been considerably larger...

"The bean takes its common name, 'Soy,' from a sauce manufactured from it, which in commerce goes by the name of 'Soy,' though the Japanese name for this sauce is 'Shoyu.' The beans are boiled and mixed with certain proportions of rice and salt, and the compound is then allowed to undergo a process of fermentation, which results in the delicious brown sauce so common in Japan, and which forms the basis of the best sauces in this country. The term 'soja,' often applied to this bean, is misleading, inasmuch as the species named by Siebold and Zuccarini *Glycine soja* is not cultivated there, or at least rarely cultivated, though it is wild in the south; and later this species was confounded with the cultivated species, *G. hispida* Moench, whence the origin of the term 'soja,' as applied to the cultivated bean. The soy bean is a native of Japan, and it has been cultivated there from a very remote period, as is testified by the numerous and strongly-differentiated varieties which have been developed. The Japanese cultivate it extensively, and it is to them an important article of food. It takes to a very large degree the place of meat in their diet, and it is altogether too costly and precious an article to be fed to live stock, except when it on rare occasions is grown as a hay crop. They use the beans ripe, and, properly cooked, they make a palatable and highly-nutritious dish. Sometimes they are eaten green when nearly full grown; they are then boiled in the pods and shelled at the meal.

"In this country they will likely be of most value as a fodder plant, though they compare favorably with navy beans for table use; they are, however, more glutinous and less starchy than navy beans, and on this account may not suit the taste of all persons."

"The following four kinds are early enough to be depended upon to mature seed in this latitude every year." *Eda-mame:* yield, 12.6 bushels beans (at 60 pounds per bushel) per acre. *Yellow Soy Bean:* yield, 14.57 bushels per acre. *Yamagata Cha-daidzu* (tea-colored bean, from Yamagata): yield, 18.8 bushels per acre. *Kiyusuké Daidzu* (Kiyusuke is the name of a person): yield, 18.23 bushels per acre.

"As has been stated, all of these yields would have been larger if the weather had permitted the saving of the crop in better shape."

Pages 237-38 give detailed information on "The adzuki (*Phaseolus radiatus*)," including white-podded and black-podded varieties. Mrs. Nellie S. Kedzie, Professor of Household Economy, tested the adzuki beans in recipes and found them to be "a very good bean for cooking purposes." Baked in the old-fashioned way, the adzuki is "sweeter that the ordinary white bean; so less sugar or molasses is needed in baking. I found this bean especially nice for making bean soup."

Photos (p. 232) show yellow soy bean, Yamagata-Cha-daidzu, and white podded adzuki plants.

Note 1. This is the earliest document seen (Sept. 2005) that contains a photo of the soy bean or of the adzuki.

Note 2. This is the earliest document seen (Oct. 2004) that mentions the soybean variety *Kiyusuké Daidzu* (spelled that way). Address: 1. M.Sc., Prof. of Agriculture, and Superintendent of Farm; 2. B.Sc., Asst. in Agriculture; 3. Foreman of the farm. All: Kansas State Agricultural College, Manhattan, Kansas.

821. Georgeson, C.C. 1892. The economic plants of Japan–XVI. Leguminous plants. *American Garden* (*New York*) 13(12):727-29. Dec.

• ***Summary:*** This article begins: The soy bean (*Glycine hispida,* Moench); Jap. *O-mame, Diadzu* [*sic, Daidzu*]**.** A bush-bean extensively cultivated in all parts of Japan. The plant varies from 1½ to 3 feet in height, according to the variety and soil, and the varieties, which are numerous, differ much in size, color, time of ripening and the general appearance of their beans... The beans are more or less lenticulate, some almost globular.

"This vegetable is always grown in rows about two feet apart, and usually as a second crop, the early beans being planted between the rows of wheat and barley, and the late ones immediately after these crops are harvested. After the beans are well up, they are cultivated with the hoe once or twice, and if the soil is poor, enriched with liquid manure, but otherwise they receive no special care. The beans are, for the most part, not used until ripe, when they are prepared for food in a multitude of ways. Occasionally the green pods, containing nearly full-grown beans, are boiled, and the beans shelled and eaten from the pod. The early varieties mature in from 80 to 100 days, and the late ones from 100 to 120 days.

"Varieties of this bean are numerous. Probably more than a hundred can be found in the country. Beans of all varieties of this species are in shape intermediate between peas and our common beans. Many of them are nearly round, many are somewhat flattened on two sides, or lentil-shaped,

© Copyright Soyinfo Center 2014

and some are oblong, but never to the same degree that our common beans are elongated. As to size, they vary from that of duck-shot to a little above very large peas. The size of the hilum and its markings are in many cases characteristic."

Note: This is the earliest English-language document seen (April 2007) that uses the word "hilum" in connection with soy bean seeds. The hilum is the place on the seed where it is attached to the pod. The hilum of most soybean varieties is dark in color.

"The beans are easily classed, according to color, as white, yellow, black, brown, green and spotted varieties. About 38 sorts that came under special observation I noted down as being worthy of more general culture. Some of these were sent from the Japan Imperial College of Agriculture to the French Exposition in 1889. Four of the varieties have been grown successfully at the Kansas Agricultural College for several years, and may be trusted to mature seed in this latitude. Two other kinds tested here proved failures because they ripened too late. The successful kinds yielded under field culture last year from 16 to 18 bushels of beans an acre. They promise to become quite valuable in this country, not only for the table but for stock-feed. Soy beans are more nutritious than any other known species of bean. They yield as much nourishment as good beef–pound for pound. Most of the housekeepers who have tried those grown here pronounce them fully equal to the navy bean for table use, and some think them superior. They contain more albumen and less starch than the navy beans, and so do not cook quite so mealy as the latter, but they are fully equal to them in flavor. Their rough and rather tough pods render them unsuited for use in the green state, hence they will not come in competition with wax beans; but they can compete with the navy beans, and they have doubtless a great future as stock feed. Not only is the bean itself nutritious, but the entire plant is rich in nitrogen. The Japanese as yet consume but little meat; with them the soy bean takes the place of meat, especially with the middle classes. One of their favorite uses of this bean is in the form of bean-cheese, or tofu.

"For making bean-cheese the *Shiro-mame,* or white soy bean, is commonly used. The beans are soaked in cold water for 24 hours, then while still wet they are ground between two small millstones turned by hand, the product being not flour but a thin paste, which is collected in a tub below. To this more water is added, and it is then boiled in a large kettle for an hour. On being removed from the fire it is strained through a bag to remove the hulls, the filtrate running into a tub or vessel of suitable size. Water is stirred into it, and a small quantity of 'bitter brine' (refuse from the salt-works, consisting chiefly of chloride of magnesium) is added, about a quart of 'bitter brine' to every two gallons of dry beans. This causes the legumin to be precipitated; when it has settled to the bottom of the tub, a little pressure is applied by means of a lid, which fits inside the vessel and is weighted somewhat. When cool, the water is decanted off, and the *tofu* or curd is cut in slices, and is now ready for the market. In this condition it is a spongy yellowish white substance, resembling cheese-curd. It is peddled from house to house, and is universally esteemed; but it is always roasted, fried, baked or cooked in some way before it is served. It has been my privilege to eat it on many occasions, and I can testify that it is both palatable and satisfying. The only scruple one need have about eating it is concerning the purity of the water used in its preparation. According to Professor Kinch, *tofu* has this composition: water, 89.29; ash, 0.48; fiber, 1.01; nitrogenous substances, 4.87; non-nitrogenous substances, 4.35. Americans eat many things less nourishing than this bean-cheese." Address: Prof., Kansas Agricultural College.

822. Georgeson, C.C. 1892. The economic plants of Japan–XVI. Leguminous plants. Adzuki (Document part). *American Garden* (*New York*) 13(12):727-29. Dec. See p. 728-29.
• ***Summary:*** This section of the article states: "*Phaseolus radiatus,* L.; Jap. Adzuki. This is another bean largely grown. It is not a native, but was in all probability introduced from India. It is a bush-bean, about two feet tall; leaflets oval, often sinuate or lobed; flowers yellow; pod long and narrow; beans very small and mostly red or yellowish green, square at the ends and very short–in fact, they resemble a hand-satchel in shape. They are used mostly for grinding into flour, from which a sort of bean-cake is made. They are also boiled with rice, producing a dish called *aka-meshi,* which is served on festive occasions. They have the reputation of being the best-flavored beans in existence, but much depends on their preparation. Doctors of the Chinese school attribute medicinal properties to this bean, and order it as an exclusive diet for *kake* [sic, *kakke* = beriberi] patients, a disease sometimes attacking people who live largely or exclusively on rice. These beans are cultivated like soy beans, as a second crop, in rows two feet apart. Most varieties ripen in three months from the time of planting. Japan produces annually from a million and a half to two million bushels of this bean. I imported a little seed of two varieties two years ago, along with the soy beans already mentioned, and they have yielded very satisfactorily, producing last year twelve bushels to the acre. They ripen earlier than soy beans, and are not such robust growers." Address: Prof., Kansas Agricultural College.

823. Chisholm, George Goudie. 1892. Handbook of commercial geography. 3rd ed., revised. London: Longmans, Green, and Co. 515 p. See p. 72-73, 344. Illust. Maps. Index.
• ***Summary:*** In the Chapter I, "Commodities directly or indirectly on climate," in Section A, "Products of the temperate zone," is a subsection titled Pulses which states (p. 72-73): "167. The chief pulses of commerce are common peas and beans, chick-peas, and soya beans."

"In warm countries, where butcher-meat is little

© Copyright Soyinfo Center 2014

consumed, this [chick-peas] and other pulses are in fact an almost essential part of the regular diet, since they supply elements of food not contained in sufficient quantity in grain and fruits. It is for this reason that soya beans are largely consumed in two other warm countries, China and Japan, as well as in India. According to Decandolle this bean is indigenous in Cochin-China, Java, and Japan. It is now very extensively cultivated throughout Eastern Asia, and is made (along with other pulses) into a great variety of preparations for use as human food. Soya [sauce], an extract from soya-beans, is also exported to Europe, and especially to England, to be used as an ingredient in soups and sauces, but much of the so-called soya is manufactured in Europe itself from various mushrooms [sic]. Oil can also be expressed from the beans, and in some parts of Central Europe the cultivation of this bean as food for cattle has been tried."

In the section on "Countries," under Asia–Japan we read (p. 344): "787. Besides rice, the principal food-crops are wheat, barley, and soya beans."

"788. Japanese agriculture leaves little room for live stock. Sheep have only recently been introduced in small numbers experimentally. The number of horses is about a million and a half, that of cattle one million, as against nearly two millions of the former and upwards of ten millions of the latter in the British Isles, which have a rather smaller population. Japan is thus altogether without, or very poorly supplied with, some important products. It has no native wool, no milk, butter, or cheese, and a comparatively small supply of leather, which has to be replaced for different purposes by various other materials." Address: London.

824. Giles, Herbert Allen. 1892. A Chinese-English dictionary. London: Bernard Quaritch; Shanghai, Hongkong, Yokohama & Singapore: Kelly and Walsh, Ltd. xlvi + 1416 p. 31 cm. [4 ref. Eng; chi]

• ***Summary:*** This massive volume, weighing almost 12 lb, contains more than 1,450 pages and 13,848 Chinese characters. Contents: Dedication (to the Honourable C.P. Chater). By the same author (17 books). Preface: Number of characters, the characters numbering, duplicate characters, phonetic arrangement, orthography, the tones, the dialects (Beneath the number attached to each character will be found its rhyme (R) as given in the *P'ei-wên-yün-fu.* The romanization of each character is given in Cantonese, Hakka, Foochow, Wênchow, Ningpo, Peking, Mid-China, Yangchow, and Ssuch'uan {Szechwan} dialects, as well as in Korean, Japanese, and Annamese, each being distinguished by its initial letter), the definitions, the entries, etymology, grammar, difficulty of Chinese, personal. Philological essay (incl. tones, ranging from 4 to 9, in ten dialects). Table of sounds.

Examples of soy-related characters:

Chiang (p. 122, No. 1220). "A soy made by mixing salt with bean-flour. Sauce. Pickled food." Fourteen compounds using this character are given, including: Bean sauce, soy. Pickled bean curd [fermented tofu]. Bean sauce. Soy [sauce] is of two kinds, the clear and the thick. Dry relishes. Soy colour–a dark reddish drab. He won't use money for vinegar to buy soy.

Ch'ih (p. 205, No. 1996). "Salted fruits, etc., dried and used as relishes." Four compounds incl.: Salted beans. Soy, sauce.

Ch'ou (p. 259, No. 2521). "Sweet-smelling; strong-smelling. Stinking. *Ch'ou fu.* "stinking bean-curd; noxious."

Note 1. This is the earliest English-language document seen (Oct. 2011) that mentions *Ch'ou fu* which it translates as "stinking bean-curd." This is also the earliest document seen (Oct. 2011) that uses the term "stinking bean-curd."

Fu (p. 458, No. 3686). "Rotten; putrid; worthless." Eleven (p. 458, No. 3686). "Rotten; putrid; worthless." Eleven compounds and sayings include: Bean curd, see No. 11,417. Bean curd officials–a term of contempt applied to certain of the poorer classes of official servants who are compelled to feed largely on this cheap food. Also explained as flabby or unenergetic officials. A Mongol name for cheese. A kind of milk made from beans (*rufu* = milk + fu) [Note: Probably fermented tofu, *not* soymilk].

Huang (p. 522, No. 5124). Yellow. Compounds: Yellow beans [soja].

Mao (p. 778, No. 7,679). "Hair, down, feathers." But the word "Hairy beans" = edamame does not appear here.

Shih (p. 988, No. 9999). See No. 1996.

Ta (p. 1,036-37, No. 10,470). "Great." But the word "Great bean" = soybean does not appear here.

Tou (p. 1,127, No. 11,417). "Beans; pulse." See also No. 11,412. Thirty compounds, incl.: Bean-sprouts. Bean-curd. A cheap restaurant (a bean-curd restaurant). Bean-cake. Bean oil. Big bean, black bean, or yellow bean = the soja bean (*Glycine hispida,* Max.), used for making bean-curd, soy, oil, etc. Ground-nuts.

Yu (p. 1,316-17, No. 13,409). "Oil, fat, grease." 45 compounds incl. Sesamum-seed oil. Linseed. Wood oil. An oil factory. Oil dregs. But "bean-oil" = soybean oil does not appear here.

Note 2. This is the earliest English-language document seen (Aug. 2007) that contains the term "sesamum-seed oil."
Note 3. Herbert Giles lived 1845-1935.

Note 4. Unfortunately, the pronunciation of the compounds is not given (as in Mandarin).

Note 5. This is the earliest English-language document seen (Oct. 2011) that uses the term "pickled bean curd" to refer to fermented tofu.

Note 6. This is the earliest English-language document seen (Oct. 2002) that uses the term "Wood oil" to refer to what would later be called "China wood oil" or "tung oil," a pale yellow drying oil obtained from the seeds of tung trees (any of several trees of the genus *Aleurites*), and used mainly in quick-drying varnishes and paints, and for waterproofing.

The author's full name is Nicolas-Auguste Paillieux (lived 1812-1898; he died on 8 Feb. 1898 at age 85). An illustration (non-original line drawing; p. 503) shows a mature soybean plant bearing many pods, plus a close-up of three pods to the lower right of the plant (from an original in J.R.F. 1882). Note: Desire Bois lived 1856-1946.

Also discusses (listed alphabetically): arachide (peanuts, p. 26-28), haricot mungo (azuki, p. 201-09), kudzu or ko (p. 271-84), quinoa (p. 460-66), souchet comestible (chufa, p. 498-502, with illustration). Address: 1. Member of the Societe Nationale d'Acclimatation 2. Asst. de la Chaire de Culture, Museum d'Histoire naturelle de Paris.

829. Schaedler, Carl. 1892. Die Technologie der Fette und Oele des Pflanzen- und Thierreichs. 2 vermehrte und verbesserte Auflage [The technology of oils and fats from the plant- and animal kingdoms. 2nd ed.]. Leipzig, Germany: Baumgaertner's Buchhandlung. xiv + 1373 p. Illust. 22 cm. [Ger]
• ***Summary:*** In Chapter 16, "Descriptions, properties, and confusions of the oils and fats" is a section titled "Papilionaceae (Leguminosae), papilionaceous plants (*Schmetterlingsblüthler*)." The first plant discussed (p. 525) is the soybean: "1. Dolichos Soja Linn = Soja japonica, Soja hispida = Chinese oilbean (*Chinesische Oelbohne*), *Sao; Sojabohne.* It is native to Japan and China and cultivated in southern Asia. The seeds, which have a piquant (*pikante*) taste and are used as food. The oil, called soybean oil (*Sojabohnenoel*), and incorrectly called "oil of peas" (*"Huile de pois"*) serves as an edible oil.

The composition of the soybean is given, according to Meissl and Böcker. The starch content depends on the degree of ripeness of the beans, according to O. Harz; completely mature seeds contain very little starch, while unripe seeds contain more of it.

The ether-soluble portion of the bean consists of about 90% neutral triglycerides (*Neutralfett*) and 5-10% cholesterol (*Cholesterin*), lecithin, wax, and gum (*Harz*).

Also discusses: Margarine (p. 157, 1325-29). Peanuts (p. 511-20. The oil is called *Erdeichelöl, Madrasöl, Oleum Arachidis, Huile d'Arachide, Huile de Pistache de terre, Ground-nut oil, Earth-nut oil, Pea-nut oil, Moong-phullie* (Hindostan), *Nelay-cadalay* (Tamil), *Katjang-tannah* (Java), *Veru-sanaga Feling, Cochang-gorung* (Sumatra), *Mandobi* (Brazil), *Amendoim* (Brazil)). Almonds and almond oil (p. 526-36). Sesame oil (p. 611-17). Chufa (*Cyperus esculentus, Erdmandel, Grasmandel, indianische Süsswurzel*, p. 655-56. The oil is called *Oleum Cyperi esculenti, Cyperus oil, Huile de souchet comestible*). Linseed oil (p. 672-90). Hempseed oil (p. 721-24). Contains 463 superb text illustrations, including multi-part illustrations of the peanut plant, seeds, and flowers, Underwood's peanut picker (wooden machine), Crooker's wooden separator for peanuts, and a metal peanut

© Copyright Soyinfo Center 2014

sheller. Also a multi-part illustration of the almond seed and flowers. The soybean is not illustrated.

Note: Carl Schaedler was born in 1843. The author of the first edition of this book, Paul Lohmann, who had exactly the same position at the same place in Berlin as Schaedler, died shortly before this second edition was published. Thus, Dr. Schaedler finished preparing it for publication. Address: Vereideter Chemiker und Sachverstaendiger der Koenigl. Gerichte zu Berlin.

• ***Summary:*** The governor hurriedly lets the residents know that he has just received from Mr. de Mahy a box of soya bean seeds (*une boîte de graines du haricot* soya), with which is made a cheese [tofu] that keeps for a very long time. It improves with age and that is a precious resource for settlers who live far from the urban centers.

This notice appears to have surprised a few of our colleagues. It did not contain, however, the revelation of an unknown food.

Cheese made from soya is called tofu (*to-fu*). Here is the recipe for tofu, which seems to us of interest to reproduce given the efforts being made to acclimatize this legume in Europe. You begin by softening the seeds of this bean in water, then you crush them in a mortar so as to make a milky paste. When this paste is pressed in a piece of linen it separates into two parts: one [okara] stays inside the linen and is used for animal feed. The other, a liquid which passes through the linen, is rich in emulsified fatty matter and in albuminoidal matter (albuminoids). This liquid is heated; coagulation is facilitated by adding nigari (eau mere / mother water, which flows out of sea salt piles). This curd separates and gives the cheese. It is eaten either raw, or cooked with fish, or most often pulverized. During the winter [after being frozen], it is dried. In this state, it keeps for a very long time.

Soya cheese (*Le fromage de soya*) is a very important food in China. Only the Tartars / Mongols have continued to use [cow's] milk. The Chinese do not consume any such milk. In its place they use soya. Its seed is a sort of solid milk. No other legume contains as much legumin (a substance chemically analogous to casein) as the soybean. None other is as rich in fatty acids. All you need to do is to crush the soya seed, dilute it with water, and filter through a sieve to obtain a product with milklike properties that can be used just as you would milk. Soya cheese looks just like quark cheese (*fromage à la pie*).

The soybean (*La soya*) which is cultivated in Japan, in China, in the Indies [Dutch East Indies, today's Indonesia], in Cochin-China [today's South Vietnam], in Tonkin [today's North Vietnam], etc. is used for more than just making tofu. It is used in these countries in a great variety of ways to make human foods and seasonings. Transformed by cooking in water into a gruel / pap (*bouillie*) which is mixed with salt and polished rice, one obtains miso, which is served at lunch [as the seasoning in miso soup] by many Japanese.

Mixed with barley and submitted to fermentation, after adding additional water and being pressed, one obtains a syrupy liquid, called shoyu, a unique sauce used to season almost all Japanese foods (*mets*), and which is employed in such large quantities that the factories of the city of Nagasaki make more than 1,200,000 kilograms of it each year. Finally, an oil is extracted from the soybean which is the object of an important trade and which serves for both human consumption and in industry.

837. *Natuur* (*De*). 1893. Soja [Soya]. 42(20):233-34. May 13. [1 ref. Dut]

• ***Summary:*** This Dutch-language periodical appears inside a German-language periodical titled *Die Natur* (Halle). The author of this article (whose initials "CKN" appear at the end) discusses: The soybean plant, named *Glycine Soya* or *Dolichos Soja* or (in Dutch) *de Sojaboon,* which is widely used for food in Japan (where it is called *Mame* or *Daizu*) and China. Food products made from the soybean in Japan: Miso, shoyu (soy sauce), To-fu [tofu] or *Kaas van Daizu;* a brief description is given of how each is made. Soybeans in China, where it is called "Yeou-teou," and where they make a cheese (*Soja kaas*), oil (*eigen olie*), and milk (*melk*) which resembles cow's milk.

Note. This is the earliest Dutch-language document seen (April 2013) that uses the term *To-fu* or the term *Kaas van Daizu* or the term *Soja kaas* to refer to tofu.

Black soybeans (*zwarte Soja*) are widely used. Proteins in the soybean, including legumine. In Europe, by 1881, the soybean was known in Italy, Austria, Hungary, and France (especially at Etampes and Montpelier); from the seeds, people learned to obtain oil, milk, cheese, an excellent cattle feed, and a vegetable for humans–similar to the French bean but much better (*en een groente voor den mensch, gelijkende op onze spersiebonen, maar veel beter*). Soybeans are used by doctors to treat people suffering from diabetes.

In France, the seeds are roasted like coffee beans; the result is a good-tasting coffee substitute (*dure koffie,... een even goed smakend surrogaat verkrijen*).

A large illustration (engraving; see above) shows a soybean plant bearing many pods. In the lower left corner is one large pod. In the lower right is written "Al Clement," which appears to be the artist's name.

Note 1. This is the earliest Dutch-language document seen (Nov. 2012) that mentions soy coffee.

Note 2. This is the earliest Dutch-language document seen (June 2009) that mentions green vegetable soybeans, which it calls *"een groente voor den mensch,..."*

Note 3. This is the earliest Dutch-language document seen (Aug. 2013) that mentions soymilk, which it calls *melk.*

Note 4. This is the earliest Dutch-language document seen (Oct. 2003) that mentions oil from the soybean, which it calls *olie.*

838. *St. Louis Post-Dispatch* (*Missouri*). 1893. Use of the soya bean. Nov. 12. p. 20.

• ***Summary:*** "The use of the Soya bean in the dietary of diabetics has recently attracted much attention. Heretofore the bean has been used only for culinary purposes, the Japanese using a liquid called sooju [shoyu] or soja [soy sauce], a condiment which they prepare by fermenting the seeds of the Soya bean. The Japanese name of the plant is Daidsu [Daizu]. Linnaeus, the great botanist, called it *Dolichos Soja."*

The Japanese call the beans Mame, and make 'miso' or sooju from them. The preparations are used principally in cooking meat. In China an emulsion [soymilk] is made from the oil of the beans [sic, from the whole beans]. It forms a white liquid and is drunk in the districts in which milk is too dear for the poor to buy it. The Chinese also make a kind of cheese [tofu] from the beans. Soy sauce is exported to and used in many European countries. The Dutch call it 'Zoya.' In the East Indies it is known as 'Ket Jay' [sic, 'Ket Jap'] (probably the source of 'catchup' or 'ketchup'). This liquid is obtained by fermentation of cakes of roasted barley and boiled soya bean. After [the first] fermentation salt is added. The whole is kept for two or three years and then the sauce is squeezed out of the mass.

"Bread and biscuit, made from the flour of the beans, have been highly recommended for diabetics on account of the low proportion of starch and the high proportion of fat and proteid. They are said to be pleasant to the taste. Dr. W. Hale White, writing from Guy's Hospital, London, where he has used the bread and biscuit for some time, says: 'They are to patients suffering from diabetes not only a good substitute for gluten bread, but they form a pleasant change from it, and many patients much prefer the taste of them to gluten bread.'"

Agriculture, N-W. Provinces and Oudh (India). Printed at the Thomason Civil Engineering College Press. x + 65 + xix p. + unnumbered plates. See p. 3, 45 and plate LXXXV. [6 soy ref]

• ***Summary:*** "Glycine hispida, Maxim. See plate LXXXV. Soy bean or Japan pea; bhat (N.-W. Himalaya); kajuwa (Tarai); bhatnas, bhatwas (Nepal and N. Tirhoot).

"Natural order *Leguminosæ.* An annual clothed with ferruginous [rust-colored] hairs. Stems stout, suberect, or climbing. Leaves trifoliolate, on long petioles. Flowers small, reddish. Pods 2-3 seeded, axillary, linear oblong, recurved, and densely pubescent.

"The *Glycine Soja,* under which name the soy bean is described in the Flora of British India, is another species, and has been identified with *G. ussuriensis* of Regel, which grows quite wild in Mandchuria [Manchuria], whereas this plant has nowhere been found as unmistakably wild...

"In these provinces its cultivation is confined to the lower slopes of the Himalaya and to a few of the neighboring plains districts. It is grown in poor soils during the rainy season, and represents a very inferior variety of the Japan pea, which under proper cultivation is a much more robust plant, with broader leaves and larger pods and seeds...

"The plant affords excellent fodder for all kinds of stock, if harvested before it is fully matured. From the seed a preparation called *miso* is largely used in China and Japan; and the green pods yield the well known sauce" [sic].

Plate LXXXV, drawn by H. Hormusii, is an excellent illustration of the cultivated soy bean plant (Glycine hispida, Maxim.) showing young and old leaves, flowers, and slightly hairy stems. An inset shows five different views and parts of the flower.

The author acknowledges his indebtedness to Dr. Watt's most useful "Dictionary of the Economic Products of India" and Prof. Church's "Food Grains of India." Address: Director, Botanical Dep., Northern India.

840. Fesca, Max. 1893. Beitraege zur Kenntniss der japanischen Landwirtschaft. II. Specieller theil [Contributions to an understanding of Japanese agriculture. II. Special part]. Berlin: Paul Parey. ix + 929 p. See 187-203, 872-73. Also published as vol. 2 of 2 volumes bound in one (Paul Parey, 1893). [7 ref. Ger]

• ***Summary:*** The chapter on the legumes (*Die Huelsenfruechte,* p. 187-203) is partly a review of the literature, with emphasis on soybeans (*Daizu, Omame, Sojabohne*). He begins by noting that for a nation like Japanese, where the people live predominantly on plant foods (*Pflanzenkost* = vegan diet), legumes are of major importance for the nutrition of the people, in that they offer a substitute for meat. They also supply important nitrogen to the soil. A table (p. 188) shows soybean production and yield in Japan from 1879 to 1887. The area increased from 441,699 *cho* to 466,315. Note: 1 *cho* = 2.45 acres. Production increased from 2,280,135 *koku* to 3,253,790. Note: 1 *koku* = 180 liters or 47.6 gallons. Yield increased from 5.1 *cho/koku* to 7.69. Soybeans like the climate of northeastern *Yezzo* [Hokkaido]. A table (p. 190) gives the date of planting, date of harvest, and days to maturity at Hakodate, Sapporo, and Nemuro (all on Hokkaido). Also discusses: Soy sauce (*Shoyusauce;* p. 190), dates for other locations, and fertilizer (*Düngung*) needs (p. 191-92, incl. phosphoric acid, potash, wood ashes, straw, and superphosphate). A table (p. 193) shows soybean area (in *cho*), production. and yield in 1887 in 6 parts of Japan (Yezzo, northern Japan, central Japan [which had by far the greatest planted area and production], western Japan, Shikoku, Kyushu).

Also discusses: The extraordinarily high nutritional value of the soybean (p. 196), yellow lupins (p. 196), defatted soybean cake (*Daizukasu,* p. 196), shoyu or soy sauce, *Shoyubohne,* and koji (p. 197-99), tofu, *Bohnenkäse,* and *Tofumame* (p. 199), Kori-Tofu and E. Kinch (p. 199).

His analysis of shoyu presscake (*Shoyukasu*) and okara (*Tofukasu*) showed that they contained respectively: Water 53.6 and 85.7%. Ash: 6.7 and 0.5%. Crude protein: 12.6 and 3.8%. Crude fat: 13.7 and 1.4%. Nitrogen-free extract: 6.7% and 5.4%. Crude fiber (*Rohfaser*)*:* 6.7 and 3.2%. *Tofukasu* is a rather good livestock feed, and it is also eaten by poor people. The shoyu presscake, although richer in nutrients than okara, is used, at most, only in small amounts in feeds and then it must be cooked. Living yeast cells in the koji can easily cause stomach diseases and problems, and the presscake also has a high salt content. Note: This is the earliest German-language document seen (June 2013) that uses the term *Tofukasu* to refer to okara.

Miso (4 types; p. 200-02): (1) White miso (*Shiro-Miso:* Low salt content and short shelf life; keeps for 10 days); made with rice koji. Fermented for 3-4 days. (2) Edo Miso (*Yedo-Miso*)*:* Higher salt content, shelf 5-4 months up to 1 year. Made with rice koji. Fermented for 10 days in summer, 30 days in winter. (3) Farmhouse miso (*Inaka-Miso*)*:* Very high salt content. Shelf life: About a year; made with barley koji. Fermented for about 11-12 months. (4) Sendai miso, also known as Red miso (*Sendai-miso: auch Aka-Miso genannt*)*:* Red color and high salt content. Shelf life: several years. Made mostly with barley koji. Fermented for 1½ to 2 years.

Azuki (*Phaseolus radiatus,* with planted area, production and yield for 1883 and 1884, p. 203).

A table (p. 873) shows a valuation of Japan's agricultural production for about 17 major crops (Source: *Japan's Volkswirtschaft und Staatshaushalt*). For each crop, the annual production (in koku), the worth per unit, and the value of the total crop in yen are given. The most valuable crops are: Rice: 40 million koku, 200 million yen. Dehulled barley (*beschalte Gerste*)*:* 7 million koku, 14 million yen. Naked barley (*nakte Gerste*)*:* 5 million koku, 12.5 million yen. Soybeans (*Sojabohnen*)*:* 3 million koku, 12 million yen.

© Copyright Soyinfo Center 2014

Wheat (*Weizen*)*:* 3 million koku, 12 million yen. Address: Prof., Dr., Germany.

841. Flagg, Chas. O.; Towar, J.D. 1893. Agricultural Division. *Rhode Island Agricultural Experiment Station, Annual Report* 5:129-62. For the year 1892. See p. 149-52, 156-57. [4 ref]

• ***Summary:*** The section titled "Forage Plants" (p. 149-62) states: "From Dr. O.C. Wiggin of Keysville, Va. [Virginia], was received a small package of Soja beans and two varieties of cowpeas... six varieties of Japanese beans [including two soja bean varieties, Yamagata Cha daidzu, and Kiyusuke daidzu, see p. 157] were received from the Kansas Experiment Station."

"Soja or Soya Bean. (Soja hispida, natural order Leguminosæ)." According to *Henderson's Hand-book of Plants* (p. 417) "'This is a climbing annual plant allied to (*Dolichos*) ("cow-pea"). It is much cultivated in tropical Asia on account of its beans, which are used for preparing a well-known brown and slightly salt [sic] sauce (Soy) used both in Asia and Europe for flavoring certain dishes, especially beef, and supposed to favor digestion.'

"We believe this plant worthy of trial by those who desire a variety of crops for soiling and especially as, in common with all the *Leguminous* plants, it is rich in nitrogenous elements. It could easily be cut and stored as ensilage...

"During the early winter a variety of this bean was extensively advertised by a party in Missouri as 'Cole's Domestic Coffee Berry,' and offered for sale at the extravagant price of $3.50 per pound. Its wonderful merit as a substitute for coffee was set forth in a 'dodger' with 'testimonials' attached. The seed can be purchased of J.M. Thorburn & Co., No. 15 John St., New York, or other large seed dealers, in small quantities, at 15 cents (15 cts.) per pound."

A table (p. 151) gives the composition of soja beans, red clover, and cowpea plants. Values for the soja bean plant are based on three analyses, two grown at the Massachusetts Experiment Station in 1889 and cut August 20th and August 30th, the third grown at the South Carolina Experiment Station and cut in full bloom August 5th 1889."

Another small table (p. 152) gives the fertilizer constituents of the above soja bean plant cut in full bloom: Moisture 7.05%. Nitrogen 2.37%. Potash 1.315%. Phosphoric acid 0.58%. The crop from one acre of soja beans cut and weighed green (27,769.5 lb) has the following fertilizing values, based on the value of each constituent: Vines $34.54. Roots $4.99. Total: $39.53.

"For many years the idea has been prevalent among the farmers of southern New England that it does not pay to sow clover... This condition of things is unfortunate for our agriculture in the light of the discovery within recent years that the *leguminous* plants are able to use the nitrogen of the atmosphere for their growth through the medium of *bacteria* infesting a *nodular* growth upon the their roots. All the clovers, peas, beans, lupines, vetches, spurry, serradella, and sainfoin belong to this class and are generally cultivated for their seeds, for fodder or for green manuring. None other of our ordinary field and garden plants, grasses, cereals, root crops, vines, etc., have yet been shown to posses any such ability to assimilate atmospheric nitrogen, hence are dependent for their growth upon the supply of nitrogen within the soil and rain water, or supplied by the farmer in manure or fertilizers. When purchased, nitrogen is the most expensive element, costing more than three times as much per pound as potash and more than twice as much as phosphoric acid, hence true economy should direct the prudent farmer to invest his money in *phosphoric acid, potash* and the *seeds* of *leguminous plants* in so far as he can use such crops for market, for feeding or for green manuring" (p. 155).

A table titled "Summary of analyses of leguminous crops" (p. 157) compares the composition of soja beans, cowpeas, and three types of "Japanese beans" (Yamagata Cha daidzu, Kiyusuke daidzu, and Black Podded Adzuki). The two "daidzu" beans are actually types of soja beans.

Note 1. This is the earliest document seen (Aug. 2011) concerning soybeans in Rhode Island, or the cultivation of soybeans in Rhode Island. This document contains the earliest date seen for soybeans in Rhode Island, or the cultivation of soybeans in Rhode Island (1892). The source of these soybeans was Dr. O.C. Wiggin (of Keysville, Virginia), and the Kansas Agricultural Experiment Station.

Note 2. This is the earliest document seen (Jan. 2000) that mentions J.M. Thorburn & Co. in New York, or Mr. Cole in Missouri, as seedsmen for soja beans.

Note 3. This is the earliest English-language document seen (June 2007) that uses the word "nodular" or the word "bacteria" (or "bacterium") in connection with root nodules.

Note 4. The authors apparently do not realize that Yamagata Cha-daidzu and Kiyusuke daidzu are the names of soja bean varieties (see table p. 157).

Note 5: This is the 2nd earliest document seen (Nov. 2012) that contains the term "Cole's Domestic Coffee Berry," used as a clever name for the soybean. Address: 1. B.Sc., Director of the Station, Agriculturist, and President of the Board; 2. B.Sc., Asst. Agriculturist. Both: Providence, Rhode Island.

842. Goodale, George Lincoln. 1893. Some of the possibilities of economic botany. *Smithsonian Institution Board of Regents, Annual Report* p. 617-46. See p. 631. [1 ref]

"The soy bean (*Glycine hispida*)**.** This species is known here to some extent, but we do not have the early and best varieties. These beans replace meat in the diet of the common people" [in Japan]. Address: M.D., LL.D., Fisher Prof. of Natural History, Harvard Univ., Cambridge, Massachusetts.

843. Henry, Augustine. 1893. Notes on economic botany of China. Shanghai, China: Printed at the Presbyterian Mission Press; Kilkenny, Ireland: Boethius. 68 p. See p. 13-14. 18 cm. Facsimile edition printed in 1986 by Boethius Press, Kilkenny, Ireland. [Eng]

• ***Summary:*** The book begins: "Missionaries and others living in the interior, are often in a position to make enquiries concerning the natural production of China, the results of which would be of great service to science. I intend to publish a few notes, pointing out the direction in which such work might be done as regards articles derived from the vegetable kingdom."

The author focuses on the vegetable products of Shêng-king [Liaoning, a province in northeast China whose capital is Mukden]. The soja bean is a staple of Newchwang trade.

"7. The Soja bean, *Glycine hispida,* Max. is noted for its numerous varieties and manifold uses. *Ta-tou* is the book-name of the *species;* but in the colloquial the varieties have each a distinct name, and these have not been very well made out for China. In Japan there are five great varieties, the white or yellowish, green, black, brown, and spotted, divided into sixteen sub-varieties, according to difference in form (which varies from spherical to flattened elliptical) size and colour. These sub-varieties differ in their use, time of arriving at maturity, etc. In China the chief kinds are *Huang-tou* [Yellow soybean] and *Hei-tou* [black soybean]: and perhaps the following sorts mentioned in the Paris Ex. C. [Exhibition Catalogue?] as occurring at Newchwang, are simply varieties of the Soja bean, viz., *Pai-tou* [*white soybean*]*, Ch'ing-tou* [green soybean] and *Ma-tou* ["sesame bean"]. Information is wanted about these varieties. The Soja bean is the most important of the legumes cultivated in China; from its seeds *bean-oil* is produced; the refuse in the manufacture of which, *bean-cake,* is largely used in the South for manuring the sugar plantations. From certain varieties *bean-curd, soy* and *bean-sprouts* are prepared...

"For Sheng-king we wish descriptions and uses of the different varieties of the Soja bean, distinguished according to the local names."

Also discusses other species of beans and peas cultivated in China (p. 12-13; each is accompanied by two Chinese characters): 1. *Pien-tou,* the *lablab* bean, of which there are two varieties, one with purple, the other with white flowers. Botanists call this species *Dolichos lablab,* L.

2. *Kang-tou, Vigna sinensis Hassk,* the "chow-lee" of India [cowpea].

3. *Tao-tou* ([jack bean], literally "sword bean"), *Canavalia ensiformis,* D.C., the "over-look" pea of the West Indian negroes.

4. *Tsan-tou* ("silkworm bean"), *Vicia Faba,* L, the common bean, the broad bean.

5. *Wan-tou, Pisum sativum,* L., the common garden pea.

6. *Phaseolus mungo,* L. This haricot includes in China two if not more very distinct varieties. (a). *Lu-tou* ("green bean"), the Chinese vermicelli pea [mung bean]; the small seeds of this are ground into flour and are used for making the kind of vermicelli known as *Fên-t'iao.* (b). *Ch'ih-hsiao-tou* ("red small bean"), small red haricots [azuki].

8. Besides the foregoing there are several other species of beans cultivated to a small extent, among which may be mentioned the *Man-tou* of Hupeh, *Phaseolus chrysanthus,* Sav. and lentils, *Ervum Lens,* L. which is called at Ichang *Chin-mai-wan.*

Note 1. This is the earliest English-language document seen (April 2003) that uses the term "lablab bean."

Also: kudzu (*ko,* p. 57-59), which is said to grow all over China, especially in the vicinity of Kiukiang.

Note 2. The edition published in Ireland in 1893, having the same title, has E. Charles Nelson as the 2nd author. It has vx [15] pages of front matter plus 6 unnumbered pages. And it is 21 cm tall, rather than 18. According to OCLC / Worldcat (Oct. 2010) the edition published in Ireland is owned by 44 libraries worldwide, compared with only 2 for the Shanghai edition. Address: I.M. Customs, Shanghai, China.

844. Japan, Dep. of Agriculture and Commerce, Agricultural Bureau. 1893. A descriptive catalogue of the agricultural products exhibited in the World's Columbian Exposition. Tokyo: Printed at the Seishibunsha. 115 p.

• ***Summary:*** The World's Columbian Exposition was a World's Fair held in Chicago, Illinois, to celebrate the 400th anniversary of Christopher Columbus's arrival in the New World in 1492.

Discusses 38 commercial products, with most divided into basic information and products made from the crop. Includes: Rice ("The manures applied to rice fields" include "green manures, farm yard manures, composts, ordures, fish manures, Sake kasu, Shoyu kasu, rape seed cake, and soy bean [cake] {p. 11}), barley ("It is much used as the material for making miso. Miso is prepared by pounding together boiled soy bean, salt, and the Koji {yeast}* prepared from common barley or naked barley; and is one of the most common articles of food in Japan." (Footnote: *"Eurotium oryzae). It [barley] is also used for making *ame* {p. 23}).

Wheat ("Wheat is used principally for preparing soy

© Copyright Soyinfo Center 2014

[sauce], vermicelli, onmen [sic, somen?], undon [sic, udon], and several kinds of confectionary" {p. 27}. It is also used for making *fu* or wheat gluten; "Roast 'fu' is used as food by boiling it with soup, soy, mirin, etc." {p. 29}), naked barley (*Hordeum nudum; hadakamugi*), Job's tears (*Coix lacryma; hatomugi*), soy bean (*Soja hispida; daidzu*), adzuki (*Phaseolus Radiatus,* [*azuki*]), sasage (*Dolichos Umbellatus*), haricot bean (*Phaseolus vulgaris*), peas, buckwheat ("Sobakiri" and "Kôri-soba" are both seasoned with soy sauce {p. 46}), rape seed (*Brassica chinensis, natane*) and rape seed oil (*natane abura*), sesame seeds (yellow {*kigoma*}, white {*shirogoma*}, and black {*kurogoma*} are displayed) and sesame oil (made from only yellow and white sesame), yegoma (*Perilla occimoides*), hemp, shiitake, chilli (*Capsicum Longum; tôgarashi;* "The fresh unripe fruit and leaves of certain varieties are eaten by cooking them with soy, sugar, "Katsuwobushi" [katsuobushi],* etc." {p. 103}). Also discusses: Dried daikon (p. 109-11), konjak flour (*Conophallus konjak; konniak-ko, konnyaku;* "For cooking, it is cut into small pieces and boiled with soy, soup, mirin, sugar etc." {p. 112}), kampio (*Lagenaria vulgaris; kampio* [*kampyo, kanpyo*]*;* "It is used as an article of food by boiling with water, soy, sugar, mirin etc." {p. 113}), wine.

Concerning the soy bean: In 1887, the total area of arable land devoted to soy bean cultivation is 4,633,152 *tan* (1 *tan* = 0.245 acre; thus 1,142,472.2 acres or 462.352.16 hectares). The total production of soy bean in the Empire was estimated to be 3,253,790 *koku* [419,459 metric tons] (1 *koku* = 180 liters, and 1 bushel = 35.2390 liters; thus 585,682,200 liters = 16,620,284 bushels).

Note 1. From the above figures, a yield of 14.53 bushels per acre can be calculated.

From 1887 to 1891 the price of soybeans per *koku* ranged from 4.180 yen in 1888 to 5.319 yen in 1890. Four specimens of soybeans were exhibited: Green soy bean (*awo-daidzu*). Black soy bean (*kuro-daidzu*). Common soy bean.

"Daidzu or soy bean is extensively used in Japan to prepare various kinds of foods indispensable for the daily meal, such as 'soy' or 'shôyu,' 'tamari' (a kind of soy), tofu, and miso. It is also largely used as a food for horses and manure [bean cake].

Note 2. This is the 2nd earliest English-language document seen (April 2012) that mentions tamari, which it calls "tamari" (not "tamari shoyu").

A analysis of the percentage composition of 3 kinds of soy beans analyzed by the Sanitary Experiment Station at Tokio is given; Green soy beans have the highest crude protein content (42.85% with 12,28% water). White soy beans (*shiro-daidzu*) have the highest ash content (5.00% with 13.46% water). Black soy beans have the highest fat content (18.26%, and the 2nd highest crude protein content 40.25%, with 11.09% water). Soy bean (*Itachi-daidzu*) from Saitama prefecture.

Although daizu is abundantly produced in Japan, since its daily consumption by all classes of people is great, it is now imported from China and Korea in large quantity. However imported soy bean is never used to make first class shoyu or soy, since the imported beans are inferior to those produced in Japan.

A table shows the quantity (in *kin*) and value (in *yen*) of soy bean exported from Japan from 1887 to 1891; 2.1 million *kin* were exported in 1889.

Four specimens of soy sauce are on display. Two brands (the trade marks are shown) are made by Mr. Mogi Shichirouemon, and two are made by Mr. Mogi Saheiji. All are made at Noda-machi, Chiba prefecture, Japan. Brands (a) and (c) are of the first quality; brands (b) and (d) are of the second quality.

A table shows the amount of shoyu made in Japan each year from 1887 to 1891; the amount ranges from 1,304,551 *koku* in 1888 to 1,157,982 *koku* in 1890. Since 1 *koku* = 180 liters, the amount made in 1888 is 234,819,180 liters. The total number of shoyu manufacturers in 1889 was 10,682. A table shows the price (in yen) of various brands and quantities of shoyu from 1887 to 1892. A brief description of the process for making shoyu is given. The word "barm" is used instead of koji. Either barley or wheat can be used with daizu to make the barm. The "mixture is kept for about 25 months, stirring it occasionally with a paddle, say twice a day during winter and three times in summer, and when it is fermented to the required degree, soy is extracted by means of a soy press. The clear liquid thus obtained is pasteurized by heating to about 130º F. and when entirely cooled, it is transferred into casks."

As shoyu is manufactured from daizu, wheat, etc., "it naturally contains a large quantity of albuminous matter. Shoyu is used in Japan as table salt is in Europe and America; consequently it is indispensable for daily use for cooking fish, meat, vegetables. etc. It has a remarkable merit when applying it in the place of sauces (like 'worcestershire') for beefsteak, fry, stew, etc. It answers better than salt when used with cold meat.

"Japanese soy or 'Shoyu' has long been exported to various parts of Europe where those who once taste it never fail in extolling its flavour. It is said that in Holland, Japanese soy has been used by many people from long years ago and highly esteemed by them." A table shows the chemical composition of shoyu.

"Since the fine flavour of Japanese soy has recently become known to people abroad, several trial consignments were made both to Europe and America, and the result, though it has obtained a high reputation among them, still it has not yet become a leading article of export." A table shows the annual amount and value of shoyu exported from Japan from 1887 to 1891. It ranges from 1,302.71 *koku* worth 11,091 in 1887 to 3,749.01 *koku* worth 41,028 yen in 1891. Thus the exports are growing rapidly.

© Copyright Soyinfo Center 2014

Three specimens of tamari are one display, one dilute and one concentrated. The first two are made and sold by Mr. Ishima Mosaku. The 3rd (regular tamari) is made and sold by Mr. Morimoto Chôhachi. All are made at Yokkaichi in Miye [Mie] prefecture. Tamari is made chiefly in the prefectures of Miye, Aichi and Gifu [in central Japan]. Tamari is very similar to shoyu except that no wheat is used in manufacturing tamari.

Tofu (bean curd): "Tofu is one of the most favourite foods of Japanese and sold in all places both in towns and villages. The specimen here exhibited is called Yakidofu and is prepared by roasting partially dried 'Tofu' over a charcoal fire." "As 'Tofu,' sometimes called bean curd, being a coagulated vegetable albumen of soy beans, it contains a large proportion of nutritious matter, most important to human life, especially, to those who subsist mainly upon vegetables." The price of this Yakidofu is 18 yen per 10 dozen.

Note 3. This is the earliest English-language document seen (April 2013) that mentions grilled tofu, which it calls *Yakidofu.*

A specimen of Kôri-tôfu or frozen bean curd is displayed; it is made in Minami Adzumi-gun, Nagano prefecture. "As it can be preserved for many years it is a suitable for provision for vessels undertaking long voyages."

Concerning adzuki: There are both red adzuki and white adzuki. Early varieties are sown in the spring; late varieties {called aki-adzuki in the autumn}. "It is mostly used for preparing "An"–a pulpy mixture of boiled Adzuki flour and sugar, and in that state is largely used for making various kinds of confectionary." It is also used to make "Sarashi-an or refined flour of 'adzuki," and "shiruko–a juice prepared by boiling the flour with a suitable quantity of water and adding sugar..." Note 4. Shiruko could be described as adzuki bean soup with mochi (rice cake).

Concerning rape seed: "Rape was formerly cultivated to a great extent but since the introduction of Kerosene Oil, the acreage of its cultivation has been much diminished, yet it is grown in nearly all parts of Japan and forms one of the important farm crops."

845. Japan. Dep. of Agriculture and Commerce, Bureau of Commerce (Nôshômushô Shôkôkyoku). 1893. General view of commerce & industry in the empire of Japan. Tokyo: Printed by M. Onuki. ii + 491 p. See p. 22, 37, 67, 247, 324, 345, 349-51, 429-30, 440-41, 469-70, 474. Index.

• ***Summary:*** Name of organization with diacritics is: Nôshômushô Shôkôkyoku. Pages 21-22: A list of all the 71 commodities exported from the port of Kobe in 1891 whose value exceeded ¥10,000. The largest by far was rice (5.5 million yen), followed by tea, matches, and camphor. Also: Kanten or colle vegetable [agar] 408,615. Rape seed oil 114,572. Sea weeds 22,372. Cut sea-weeds 17,765. Soy [sauce] 11,483 yen.

Page 37: After the "Restoration of Meiji," a new port was opened at Kobe, near Osaka. Its principal articles of merchandise were "rice, salt, sugar, tea, soy,..."

On pages 61-67 are tables of Japanese weights and measures and comparative tables with those of the empire of Great Britain, including both troy and avoirdupois. These show Japanese units for length (9 units; the standard is the shaku), area of land (6), capacity (5), and weight (6; the standard is the kwan). In 1885 the Government of Japan joined the Universal Metric Convention, and in 1891 established the present system of weights and measures.

Page 67: Industrial pursuits can be classified into original ones (that existed from ancient times, having first been introduced from China and Corea [Korea]) and those introduced from the West. Original industries include "salt making, sugar making, Sake brewing, soy brewing, oil producing,..."

Page 247: Exports (Class 22) include "Soy. The total value of the latest export is 41,029 yen, and chiefly exported to Hawaii."

Page 324: A table shows imports (both weight and value) of "Oil-cake" from 1887 to 1891, from China, Korea, and Other.

Page 345: Class II–Duty free goods includes "Oil cake."

Page 349: Class II–Duty free goods, includes "All kinds of Mush-rooms, excepting Shiitake, Confectionaries, all kinds of Liquors, Vinegars, Soy [sauce], Oils, and Prepared Tobacco... Sea-weeds excepting Kobu [Kombu, seaweed],..."

Pages 429-30: "Table of the total quantity [weight in picul or catty] and value [in yen] of the commodities exported from Japan to the United States." Soy [sauce] rose from 7,862 catties [1 catty weighs 1.33 lb] worth 261 yen in 1887 to 9,744 catties worth 1,146 yen in 1891.

Page 440-41: Chapter 7, "Commercial and industrial unions in Japan," lists the 2,013 "trade unions" of businesses in the same general field. One of these, "Liquor and soy," has 106 members.

Pages 469-70, 474: Table III lists "Industrial corporations." One class, "Soy and miso," has 4 members and capital of 75,500 yen. Address: Tokyo, Japan.

846. Kaeufliche Saucen [Commercial sauces (Document part)]. 1893. In: F.J. Koenig, ed. 1893. Chemie der Menschlichen Nahrungs- und Genussmittel. Zweiter Theil. Ihre Herstellung, Zusammensetzung und Beschafftenheit, ihre Verfaelschungen und deren Nachweis. Dritte Auflage [The Chemistry of Human Foods and Stimulants. Vol. 2. Their Production, Composition and Properties, their Falsification and Proof of that. 3rd ed.]. Berlin: J. Springer. xvi + 1385 p. See p. 194-95. [3 ref. Ger]

• ***Summary:*** The most widely available sauce is Japanese shoyu (die "Japanisch Soya," or *Shoya,* or Soy), which, in Japan, is made by a fermentation process from barley or wheat (for the malting {koji} phase), table salt, yeasts, water,

© Copyright Soyinfo Center 2014

and mainly out of a soybean variety (*Dolichos Soya* or *Soya japonica*) cultivated especially for this purpose. The soybean has an excellent aroma for this purpose. The composition of the soybeans used for this purpose (according to Kellner 1887) are given.

For details on the art of making Japanese shoyu, see Vol. 1, p. 241.

Shoyu is a very important foodstuff / seasoning (*Nahrungsmittel*) in Japan; it is enjoyed with almost all dishes and must partially take the place of meat. Each year in Japan about 540 to 720 million liters are manufactured; the Japanese enjoy, on average, 60-100 cc of shoyu (*Shoya*) per day.

The next section is basically a summary of Tahara and Kitao (1889) Nagai and Murai found the composition of Japanese shoyu to be as follows (in gm per 100 cc): dry matter 35.17, total nitrogen 8.93, sugars 4.44, dextrin 4.56, alcohol 0.14, volatile acids = acetic acid 0.16 gm, non-volatile acids = lactic acid 1.08 gm, ash 14.67 gm, specific weight (relative density) at 21ºC 1.199.

A large table at the bottom of p. 195 gives a detailed nutritional analysis of nine commercial sauces by C. Söllscher and F.J. König. These nine include: Essence of Anchovies, Harvey-Sauce, Japanese Soya (shoyu), Indian Soya, Beefsteak Sauce, and Maggi's Suppen- und Speisegewürze (Seasoning for Soups and Foods). The contents of a typical bottle and the relative price are also given: Japanese Soya is the most expensive (2.75) and Beefsteak Sauce is the least expensive (1.50).

Note: This is the earliest document seen (April 2012) that mentions an HVP sauce product (Maggi's).

847. Koenig, Franz Joseph. ed. 1893. Chemie der menschlichen Nahrungs- und Genussmittel. Zweiter Theil. Ihre Herstellung, Zusammensetzung und Beschafftenheit, ihre Verfaelschungen und deren Nachweis. Dritte Auflage [The chemistry of human foods and food adjuncts (stimulants / enjoyables). Vol. 2. Their production, composition and properties, their falsification and proof of that. 3rd ed.]. Berlin: Verlag von Julius Springer. xvi + 1385 p. See p. 194-95, 389, 486-90, 529-30, 1044-53, 1071. Illust. Index. 24 cm. [12 ref. Ger]

• ***Summary:*** Summaries of early studies on the chemical composition of soybeans and various soyfoods, including some original studies. Discusses (p. 194-95) commercial sauces, including Japanese shoyu (*"Japanisch Soya oder Shoya oder Soy"*). See separate entry.

Discusses (p. 1044-51) adulteration of coffee and coffee substitutes. Under "Coffee made from legumes" (p. 1051) we read: "The soybean (compare p. 486) is also used for the preparation of a coffee substitute." A table (p. 1053, based on Kornauth) compares the composition of 12 roasted seeds and fruits used to make coffee substitutes, including chicory, barley, figs, soybeans, white lupins, and chufa.

An illustration (p. 1071) shows different cellular layers of the soy bean sprout leaves (*Keimblätte*)–after an illustration by J. Moeller.

Also discusses: Peanuts (*Erdnusse, Arachis,* p. 322, 373, 385, 389, 494, 621, 686, 1051). Sesame seeds (p. 322, 385, 372, 389, 408, 494). Almonds (p. 322). Hemp (p. 322, 385, 493). Lupins (p. 372, 385, 389, 490-91, 1050, 1053, 1068-69). Chufa (*Erdmandel, Cyperus esculentus,* p. 1051, 1053). Address: PhD, Prof. (who teaches but does not have a faculty seat or voting rights) at the Royal Academy and Head of the Agricultural-Chemical Experiment Station at Muenster, in Westphalia, Germany (ordentlicher Honorarprofessor der Koeniglichen Akademie und Vorsteher der agric.-chemischen Versuchsstation Muenster i. W.).

848. Neale, A.T. 1893. III. Field tests of forage crops. I. Varietal tests of southern pea vines, &c. *Delaware Agricultural Experiment Station, Annual Report* 5:31-35. For the year 1892.

• ***Summary:*** Contents: Relative yields of green crop per acre. Relative yields of seed per acre. Cost of seed. Peculiarities of growth. Effects of commercial fertilizers upon crop yields. Summary.

The "Soja bean, a Japanese plant, is urged by a few farmers and experimenters as superior to all other fodders." At Dover, the soja bean gave a maximum yield of 8.6 tons/acre of green vine fodder when fertilized with Nitrate of Soda and Muriate of Potash. By comparison, the best cow pea varieties gave 12.5 and 12.6 tons/acre under similar conditions. Soja bean seed costs $2.25 per bushel, and 1 bushel sowed 4.0 acres.

The section titled "Peculiarities of growth" states (p. 33): "The Soja bean is upright in its growth, makes a great deal of foliage and does not run or tangle; it, too, could be easily handled with mowing machinery, &c., if thickly planted."

Note: This is the earliest document seen (Jan. 2003) that uses the word "machinery" ("mowing machinery") in connection with soybean harvesting or production. Address: Director of the Station, Newark, Delaware.

849. Sagot, Paul Antoine; Raoul, Edouard François Armand. 1893. Manuel pratique des cultures tropicales et des plantations des pays chauds [Practical manual for tropical crops]. Paris: Augustin Challamel. xxxii + 734 p. See p. 151-55. [Fre]

• ***Summary:*** In the chapter titled *Légumes et Culture Potagère,* there is a section on soybeans and soyfoods written by Edouard Raoul titled "Soja hispida Moench, Pois Soja, Pois oléagineux de Chine. Daïzou des Japonais." It discusses the widespread culture of soybeans in southern Asia, China, and Japan. "The seed is very rich in oil and in casein soluble in water. Its consistency, especially before maturation, is very tender and fine. Unfortunately it does not have much

© Copyright Soyinfo Center 2014

taste of its own. The pod is very small and contains only 2-3 seeds. It is not easily opened. I prefer soybean seeds having a color that is clear fawn-colored or tawny (*fauve*) or greenish, to those which are black."

"The plant must be sown from very fresh seeds. The germination (in Europe) is often very unequal, and many of the seeds don't develop... Some seeds sent by me to French Guiana (*la Guyane*) have been cultivated by Mr. Bar au Maroni, and have borne fruit, but I don't have precise details on their vegetation or ease of utilization."

Brief descriptions are then given of miso, shoyu, tofou (tofu), *kouri-tofou* [dried-frozen tofu], "which is nothing but tofu dried using heat" [sic], and *uba* (yuba, "a product very rich in nitrogenous materials {proteins} and fats"), followed by a list of the names of the best-known Japanese soybean varieties, and a discussion of the difference between *Glycine hispida* Moench (*Kuro mame* [black soybeans], *no mame, kuzu, yama-daizou* [wild soybeans]), and *Glycine soja* Siebold et Zuccar. (*kiu mame* and *tsourou-mame*). Typical analyses of the stems and leaves, seeds, and entire plants are given based on research conducted by M. Joulie. A comparison of the nutritional value of soya and wheat is given based on the research of Wechler in Austria and Messrs. Fremy, Muentz, and Pellet in France. Dr. Menudier uses soy flour in diabetic diets.

Also discusses: Winged beans (p. 149-50; *Psophocarpus tetragonolobus* Dec., *Dolichos tetragonolobus* L., *Pois carré*). Peanuts (p. 150-51; *Arachide, Arachis hypogœa*). Bambarra groundnuts (p. 151; *Voandzou, Voandzeia subterranea* Dup. Th.).

Note 1. This is the earliest document seen (May 2009) concerning soybeans in French Guiana, or the cultivation of soybeans in French Guiana. This document contains the earliest date seen for soybeans in French Guiana, or the cultivation of soybeans in French Guiana (1893). The source of these soybeans was Prof. E. Raoul, who was apparently in France.

Note 2. This is the earliest French-language document seen (April 2013) that uses the term *kouri-tofou* to refer to dried-frozen tofu.

Note 3. Sagot lived 1821-1888.

Note 4: This is the earliest document seen (Nov. 2003) concerning general information on soybean production in the tropics.

Note 5. Notice that "kuzu" is given as a name for the wild soybean in Japan. Address: 1. Docteur en Médecine, Ancien Chirurgien de la Marine, Ancien Professeur d'Histoire Naturelle a l'École Normale Speciale de Cluny; 2. Pharmacien en Chef du Corps de Santé des Colonies. Professeur du Cours de Productions et Cultures Tropicales a l'École Coloniale.

850. Zavitz, C.A. 1894. Report of the experimentalist. *Ontario Agricultural College and Experimental Farm* (*Guelph*), *Annual Report* 19:53-130. For the year 1893. See p. 79.

• ***Summary:*** The section titled "Beans, comparative test of 17 varieties" (p. 79), states: "In 1893, 17 varieties of beans were grown on plots side by side... Each plot was one one-hundred and-sixtieth of an acre. The beans were planted in rows 25 inches apart on May 22nd..."

A table shows the names of the 17 varieties and the yield of each. "Yellow Soy" yielded 20.4 bushels/acre and Edamaine [Edamame] yielded 7.7 bushels/acre. The seed of the Yellow Soy was obtained from the United States, and that of the Edamaine [sic], a fodder plant, was obtained from the Kansas Experiment Station [from Prof. Charles C. Georgeson]. "Other varieties [sent by Georgeson] which did not mature their seed were Yamagata, Cha Daidzie [sic, Yamagata Cha-Daidzu], Kiyusuke Daidzie [sic, Kiyusuke Daidzu; both soy bean varieties] and Black Podded Adyuski [sic, Adzuki]. These varieties will be tested again in another year.

Note 1. This is the 2nd earliest document seen (Jan. 2010) that clearly refers to soybeans in Canada, or in Ontario province, Canada, or to the cultivation of soybeans in Canada, or in Ontario province, Canada (May 1893). The source of these soybeans was the United States, probably from Kansas.

Note 2. This is the earliest document seen (Jan. 2010) by or about C.A. Zavitz in connection with soybeans. Zavitz apparently does not realize that Yamagata Cha-daidzu and Kiyusuke daidzu are the names of soja bean varieties (see p. 79).

Note 3. This is the earliest document seen (Jan. 2010) in which C.A. Zavitz states that he obtained soybeans from Kansas. Between 1890 and 1893 the Kansas Agricultural Experiment Station and Prof. Charles C. Georgeson who worked there published more than twenty articles on soybeans; Prof. Zavitz probably read at least one of these before he contacted Kansas to request soybean seeds.

Note 4. Bound at the back of this volume is the 15th "Annual Report of the Ontario Agricultural and Experimental Union." Address: B.S.A., Experimentalist, Ontario Agricultural College [Guelph, Ontario, Canada].

851. McCarthy, Gerald; Emery, F.E. 1894. Some leguminous crops and their economic value. *North Carolina Agricultural Experiment Station, Bulletin* No. 98. p. 133-54. March 1.

• ***Summary:*** This bulletin contains three parts, the first two of which discuss soy beans. Part I, titled "Legumines as improvers of the soil," by G. McCarthy, states: "Among the natural orders or families of plants, none hold a higher place in relation to human welfare than the *Leguminoseæ* or Pulse family. This family includes every variety of bean, pea, clover, medic, vetch, and many useful and poisonous drugs, besides a number of the finest ornamental and timber trees. The legumines were among the first vegetables cultivated by

© Copyright Soyinfo Center 2014

mankind, and have ever been among those most esteemed. Nearly all of this family of plants have a peculiarly-shaped butterfly-like flower, and the seeds are enclosed in pods, which are often arranged in one-seeded joints. Both the stems and the seeds of all the legumines are very rich in albuminoids–the food which goes to form the muscular or lean-meat portion of flesh, and are therefore especially valuable for a young and growing stock and for working animals.

"In North Carolina, the most valuable and generally used forage and fertilizing plants of this family are the true clovers, medics [such as black medic (*Medicago lupulina*) and burr clover (*Medicago denticulata*)], Japan clover, vetches, cow-peas, and Japan peas... It is well know that most or all of this family of plants have a property possessed by no other family of plants–that of harboring in their roots a species or class of yet unnamed microbes which fix the free-nitrogen of the air which is then absorbed and utilized by the plant in its growth and fruition. We can therefore, by stimulating a luxuriant growth of legumines obtain at slight expense the nitrogen required by other nitrogen-consuming crops."

On p. 242 we read: "Japanese peas–*Glycine hispida.*– The Japanese or Mongolian pea is more commonly called 'soja' and 'soy' bean, but it is not a bean. Recently there have been introduced several new varieties of this pea. All the following varieties were sown May 20 [1893] and received the same treatment:

"The common Soja Bean or Soy Pea.–Seed round, yellow. Vigorous growing, hairy, bushy plant attaining a height of 20 to 25 inches. Stems become woody soon after flowering. A very prolific bearer of round yellow seeds, which are sometimes used as a substitute for coffee. The peas, when properly cooked, are edible and palatable. The edible qualities of the soy bean are so highly esteemed in Japan that it is there rarely fed to stock.

"The following directions [recipe] for cooking the 'soy' pea are given by Dr. J.H. Mills, of the Baptist Orphanage at Thomasville, N.C. [North Carolina]: Soak the peas till the skins come off. Then stir the peas in the water until the skins rise to the surface and skim them off. Boil the peas with bacon until soft. Add pepper and butter to suit and serve hot. If the peas are green the preliminary soaking may be omitted. This makes a most palatable dish, well liked by children.

"Japan Pea No. 9.–A vigorous, bushy plant resembling the 'soy,' but smoother and has larger dark-colored seeds. This is the best of the new varieties.

"Japanese Pea No. 7.–A small, slender, bushy plant bearing a fair crop of small cream-colored peas–inferior to the soy and No. 9.

"Japanese Beans–Phaseolus radiatus [Adzuki beans]–*Japanese Bean No. 5.*–A low and slender-growing plant bearing numerous pods well filled with a small red bean which makes excellent soup.

"Japanese Bean No. 6.–A plant scarcely distinguished from No. 5 and of about the same value. Both these beans are for table use only and not for forage."

An illustration (p. 142) by "VAC" or "VC" shows the "Japanese or Soy Pea" plus several enlarged pods in the lower right corner.

In Part III, titled "The fungous and insect enemies of legumines," by Gerald McCarthy, Section C, "Insect enemies," discusses the following insects that damage leguminous forage plants in North Carolina: (1) The pea weevil, *Bruchus pisi,* is the larger of the two common weevils. But *"Bruchus fabæ* [the bean weevil] is our most destructive weevil and is the species which infests cow-peas and table beans [including soy beans] in store [storage]." This weevil is the smaller of the two, "is light yellow in color and quite hairy." As soon as this bean weevil matures in stored beans or cow-peas, it immediately "lays eggs on the hard seeds and these soon hatch into devouring grubs, which, after eating their fill, again produce the winged form to lay more eggs, and so on while the food supply lasts. A few weevils in the stock of beans put into the bin in the fall may increase to millions by the spring and ruin a thousand bushels of beans or cow-peas.

Remedies: If the presence of weevils is suspected, the seeds of beans or peas "should be plunged into water nearly scalding hot–140ºF for five minutes before sowing. As soon as the seed is threshed out and before bagging for storage, it should be placed in a tight bin, or hogshead, or piled in a conical heap on the floor of a tight room and subjected to the fumes of carbon bisulphide."

(2) The clover-seed midge, a two-winged fly, is "a sister species of the notorious Hessian fly, *Cecidomyia destructor.* Also mentions the clover root borer and the clover hay worm.

Note 1. This is the earliest English-language document seen (May 2012) that uses the term "Japanese Pea" or "Mongolian pea" or "Japanese Pea No. 7" to refer to the soy bean. Since "Japanese Pea" is mentioned in only one other document (Soule 1907, p. 280-81, from Virginia) we conclude that this is not the name of a new soy bean variety.

Note 2. This is an early reference to the soybean in connection with Mongolia.

Note 3. This article contains one of the earliest American recipes for cooking whole soybeans.

Note 4. In the late 1800s, the adzuki bean was sometimes given the scientific name *Phaseolus radiatus.* In the U.S., Georgeson of Kansas gave it this name in 1890 and 1892. Later the name was used for the mung bean.

Note 5. This is the earliest English-language document seen (Aug. 2000) that contains the word "entomologist."

Note 6. This is the earliest English-language document seen (March 2007) that uses the word "medic" to refer to a leguminous plant, probably alfalfa (*Medicago sativa*). It is also the earliest English-language document seen (March

© Copyright Soyinfo Center 2014

2007) that uses the word "medics" to refer to members of this plant family.

Note 7. This is the earliest English-language document seen (Feb. 2007) that uses the word "legumines" to refer to legumes.

Part II of this article (p. 147-50), titled "The cultivation of leguminous plants for forage," by F.E. Emery, notes that the soy bean was one of the most common "legumines" used for hay, soiling, and silage. "The cow-pea and the soy bean will give better satisfaction for soiling or silage than for hay, unless sown broadcast..." For soiling: "Soy beans grow upright and may be planted alternately with corn in the same row and cut at the same time with it." Address: 1. Botanist and entomologist; 2. Agriculturist. Both: Raleigh, North Carolina.

852. McCarthy, Gerald; Emery, F.E. 1894. The forage plant garden, including full notes taken during growth. *North Carolina Agricultural Experiment Station, Bulletin* No. 98. p. 157-70. March 1.

• ***Summary:*** Pages 169-70 contain sections with the following titles: "Japan or Mongolian Pea.–*Glycine hispida* and Red Bean, *Phaseolus radiatus* [azuki bean]. Japan Pea No. 9.–*Glycine hispida,* variety. Japan Pea No. 5.–*Phaseolus radiatus.* Japan Pea No. 7.–*Glycine hispida,* variety. Japan Pea No. 6.–*Phaseolus radiatus.* Japan Pea.–*Glycine hispida,* common Soy Pea or 'Soja Bean.' The Japanese Peas and Beans."

Some of the information in these sections is very similar to that given in a previous section of this same bulletin, on pages 142-43 but pages 169-70 contain more details–and illustrate the confusion that existed about these plants and their names. The last section titled "The Japanese Peas and Beans" (p. 170) states: "As forage plants the common so-called Soja Bean, more properly named Soy Pea, is by far the best of all these plants. It is later than Nos. 7, 8 and 9, but grows much more luxuriant and will give 50 to 100 per cent. more forage per acre." Address: 1. Botanist; 2. Agriculturist. Both: Raleigh, North Carolina.

853. Schlegel, Gustave; Cordier, Henri. 1894. The Chinese bean-curd and soy and the soya-bread of Mr. Lecerf. I. Tofu. *T'oung Pao* (*General Newspaper*) 5:135-46. March. [11 ref. Eng]

• ***Summary:*** "Of late these Chinese preparations have again attracted the notice of Europeans. The *Temps* in France published last November [sic, April 8, 1893] a note upon the subject after an article in the *Avenir de Diego-Suarez* of 2 March 1893, and Dr. Vorderman, of the civil medical service in Java and Madura... We will add to these notices what is written about the subject by the Chinese themselves.

"I. Tao-fu or Bean Curd. According to 'Collected Omissions of *Sieh-choh'* nothing had been ever heard of the confection of bean-curd before or after the period of the three dynasties of antiquity (B.C. 2205-250), and it was only mentioned for the first time in the work of *Liu-ngan* [*Liu An*] king of Hoai-nan [Huai Nan] of the Han (second century before our era) Cf. Mayers, Chinese Readers Manual, No. 412, Cap. 24."

"The *Tao-fu* or Bean-curd was also called 'Leguminous milk', and was prepared by boiling curds or milk from beans.

"It is further related that when *Shi-tsih* [pinyin: Shi Ji] was governor of *Ts'ing-yang* [pinyin: Qing Yang] (Latitude 30º45', Longitude 115º26') he, in order to purify himself and to rouse the population, did not permit himself the use of meat, but bought every day in the market several pieces of bean curd, so that the townpeople called these curds 'The little slaughtered sheep.'

"The bean of which this curd is prepared is known in science by the name of *Soja hispida,* and has been imported in the form of a meat-sauce from Japan to Europe under its japanese name of *Sho-yu,* the corrupted japanese pronunciation of the chinese *tsiang yu* or 'relish-oil' which this sauce bears in some parts of China, and which has been further corrupted by the Dutch into *Soja,* by which name (also written *soya* and *soy*) it became known all over Europe. We will return to this by and by.

"According to Dr. Vorderman (loc. cit. p. 354) the soy-beans are distinguished in light-colored (cream-color, straw-yellow, light ochre-yellow and amber-yellow), brown and black. The first two sorts are roundish, the last either roundish or oblong, as they come from the one or the other variety of the plant. Accordingly, the plant with roundish seeds is called *Soja hispida, tumida* and that with oblong seeds *Soja hispida, platycarpa,* amounting, with the differences in color, to four varieties: 1. Soja hispida, tumida Beta pallida; 2. Soja hispida, tumida Beta atrospuma [atrosperma]; 3. Soja hispida, tumida Beta castanea; 4. Soja hispida, platycarpa Beta melanosperma.

"No. 2 and 4 are black and serve especially for the fabrication of Soy or Ketchup, whilst No. 1 (pale-yellow) and No. 3 (brown) are used for other culinary purposes.

"Since the Vienna [Austria] exhibition of 1873, when several samples of Chinese, Japanese and Indian soybeans were exhibited, their great nutritive proprieties and richness of azote [nitrogen] and fat have been shown by chemical analysis, and the culture of this plant has been largely introduced into Europe, especially in Hungary."

Note 1. This is the earliest English-language document seen (July 2003) that contains the word "soybeans"–spelled as one word.

König in his work *Die menschlichen Nahrungs und Genussmittel,* 2nd Ed., Vol. II, p. 372, gives an analysis of the composition of 4 types of soybeans. "Dr. Vorderman says that he has not been able to detect amylum [starch] in the Soybeans of Java, China and Annam in applying the reaction of jodium [iodine] upon the section of the bean. The texture of the cotyledons consists principally of oblong, radiating

© Copyright Soyinfo Center 2014

parenchyme-cells, about five times longer than broad.

Note 2. This is the earliest English-language document seen (Oct. 2004) that uses the word "cotyledons" in connection with soybeans.

"II. *Tao-kan* or Preserved Bean Curd. The Chinese make of the Soy-beans two preparations, one called in Java *Tao-hu* and the other *Tao-toa.* They both consist of leguminous cheese, obtained from the light-brown beans, principally those obtained from Annam. But at present many Chinese in Batavia prefer the so much cheaper *kadele putih* grown in the *Preanger* and the *Ommelanden* (circumjacent territory of Batavia).

"These lightcolored beans are macerated during five hours in rainwater, when they swell up to about twice or thrice their original size. After having been cleansed from accidental dirt or admixtures, they are ground in a stone handmill, very much resembling that in which Europeans ground colors. One Chinese turns the mill, whilst the other throws the macerated beans, still in their husk, with a little water into the mill, so that the stuff runs as a white, thin mass, by a small gutter, into a tub prepared for its reception. This mass is then heated upon the fire in a large iron open cauldron, until it reaches the boiling-point. The froth is skimmed, and the fluid strained, after boiling, through a cotton cloth, in which a white, doughy residu [sic, residue = okara] remains, having a peculiar oily smell, and which serves as food for ducks and fowl.

"The filtrated fluid, which has a milkwhite color, is mixed, whilst it is being cooled, with a certain proportion of common Madura-salt or with a little calcined gypsum.

Note 3. This is the earliest English-language document seen (Aug. 2013) that refers to soymilk, which it calls the "milk from beans" and "The filtrated fluid, which has a milkwhite color..."

"This gypsum is imported from China in the form of large lumps of radiated gypsum. As it is specially used for preparing the leguminous cheese of the soybeans, it is called by traders in Batavia by the Malay-Chinese hybrid word *Batu-tao* i.e. 'bean-stone.'\ "The salt (or, as in China, the chloride of magnesium) and gypsum change the juice, by precipitation of the legumine [legumin], into a white, gelatineous [gelatinous] mass, which, when sufficiently cooled, obtains a certain consistency, allowing it to be cut into flat square pieces. This can, however, not be done for after two hours after the precipitation. These squares are then laid upon plantain-leaves protected by a white cotton cloth against dust, and hawked about in the streets.

"They have an unpleasant raw bean-flavor, but when mixed with other victuals, this taste is lost. It is used as well in the preparation of Chinese victuals, as in that of the so-called Indian rice-dish.

"In order to preserve the *tao-fu* for continuous use, it is made to *tao-koa* (or dried beans) by the following method.

"The *tao-fu,* cut into flat squares, is plunged into a decoctum of *Curcuma longa,* which colours it intense yellow. These yellow cakes are then wrapped up in white square pieces of cotton, laid between boards and exposed to a certain pressure. Generally they are at the same time stamped with Chinese characters.

"By this pressure a good deal of water is lost, but the cakes can be preserved much longer.

"Dr. Vorderman says that both *tao-fu* and *tao-koa* can be successfully used in the nourishment of feeble children, who refuse to take eggs. *Tao-koa* is also imported from China, but these cakes are much larger than those prepared in Java, and are always stamped with Chinese characters."

Note 4. This is the earliest document seen (Aug. 2002) that mentions Liu An of Huai Nan in connection with tofu.

Note 5. This is the earliest English-language document seen (April 2013) that uses the word "Tao-fu" (or "Tao fu"), or the word "Tao-hu" (or "Tao hu"), or the word "Tao-kan" (or Tao kan") to refer to Chinese-style tofu.

Note 6. This is the earliest English-language document seen (Sept. 2004) that uses the term "pale-yellow" or the term "straw-yellow" to describe the color of soybean seeds.

Note 7. An article in this same issue, titled "The Chinese in Boston" [Massachusetts], notes that presently "1,000 Chinese live in Boston, of which 700 work in the 180 laundries, and about 300 are merchants and traffickers, all dwelling on Harrison Ave. Here one also finds 63 gambling dens (or houses of ill repute) and several others where opium is smoked–visited in part by the most vile class of Americans."

Note 8. We wonder if there wasn't at least one tofu shop in Boston at this time. Address: 1. Professeur de Chinois à l'Universite de Leide [Leiden]; 2. Professeur à l'Ecole spéciale des Langues orientales vivantes et à l'Ecole libre des Sciences politiques à Paris.

854. Schlegel, Gustave; Cordier, Henri. 1894. The Chinese bean-curd and soy and the soya-bread of Mr. Lecerf. III. Tao-yu or soy oil. *T'oung Pao* (*General Newspaper*) 5:135-46. March. See p. 140-43. [10 ref. Eng]

• ***Summary:*** This section is not about soybean oil, but about various types of Chinese soy sauce. "But the Soy-bean does not only serve for the preparation of beancurd, but also for the renowned condiment and sauce known as *Soya,* not only in the far east, but also over all Europe and America. It is known by the name of *Shi* which is explained in the *Yih-ya* as being a homonyme of the word *Shi* or 'taste' and was known by the people of *Thsi* because it is a combination of the five tastes.

Note: This is the earliest English-language document seen (Nov. 2011) that uses the word *Shi* to refer to fermented black soybeans.

"In the dictionary *Shwo-wen* [*Shuowen*] (about A.D. 100) the condiment is described as 'Salt-mixed dark pulse.' Bretschneider (Botanicon Sinicum, II, 165, Shanghai 1892)

© Copyright Soyinfo Center 2014

says he cannot understand what the character (dark) is intended to mean.

"If he had looked up the word in our Dutch-Chinese dictionary published in 1884, i.v. *Soya,* he would have found its explication given according to the *Tan-yuen-luh,* written by *Yang-shin,* one of the most prominent scholars of the Ming-dynasty (Wylie, Notes, p. 130), who says: *'Shi* is properly a bean; it is mixed with salt and *darkly* shut up into jars and pots, wherein it is fermented; this is why it is called dark pulse.' In fact, this is the way the Soya is made. The beans are first boiled soft, mixed with an equal quantity of wheat or barley, and left to ferment; a portion of salt, and three times as much water as beans, are afterwards put in, and the whole compound left for two or three months, when the liquid is pressed and strained.

"As we have said above, the mass is fermented in large stone covered jars, and any-one who has visited Canton will have, if not seen, at least smelled the disagreeable stench emanating from the large jars with fermenting Soy in the Soymakers-lane.

"The Chinese say that the character *Shi* does not occur in the nine classics, but that in the commentary of the 'Great bitter, the salt and the sour of the Nine discussions of Sung-yuh,' the 'Great bitter' is explained as being the *Shi* or Soy; and that in the Chapter on Aliments in the Annals is spoken of a thousand measures of salted soybeans (*shi*)*:* whilst, according to the History of Aliments of the former Han-dynasty, soy was sold in (the capital) Chang-ngan by a certain *Fan Shau-ung,* who was on that account called the Soy-Fan."

"In the Elegies of Thsoo (Wylie, Notes, 181) 4th Century B.C., is equally spoken of the Great bitter, the salt, the sour, the pungent and the sweet, where, according to the commentary, the great bitter is the Soy, the pungent are Pepper and Ginger and the sweet Sugar and Honey; and that it means that the juice of the Soybean was mixed with Pepper and Ginger, and that the salt and sour was mixed with Sugar and Honey, so that the pungent and sweet flavor was produced.

"In the book 'Antiquities of Wu-lin' (Wylie, Notes, p. 45), written during the southern Sung-dynasty (13th century), we find mentioned among the victuals in the market: birdsnests (?), gingered soy (*shi*) and honied and gingered soybeans.

"This is the native soy; but the *Poh-wuh chi* (Wylie, Notes, p. 153), published in the latter part of the 3d century, says that Soy is also prepared in foreign countries. The beans are steeped in bitter wine and afterwards dried very hard; they are then boiled in and again dried, which process is thrice repeated. Afterwards the mass is mixed with a proportional quantity of powdered pepper. This species of Soy is called in China *Khang-pih* (Man-strengthening) because it pushes down the humours and composes them.

Bretschneider thinks that though the character *Shi* does not occur in the Classics, Soy was very probably known in olden times under the name of *Tsiang* [chiang or jiang] which occurs in the *Li-ki,* the *Chow-li* a.o. The common name for Soy in Peking, he says, is *Tsiang-yu* or *Tsiang* oil. This name, imported into Japan, but pronounced there *Sho-yu,* from which our word Soya has been corrupted, was first imported by the Dutch from Japan to Europe.

"But this supposition is not supported by Chinese authorities, who describe the *Tsiang* as a salted condiment or sauce made from all sorts of meat, fishes, fruits, etc., but never from beans.

"According to the *Fan-tsze-ki-jen* the *Tsiang* was introduced from *Toung-hai,* the modern *Hoai-ngan fu.* The first quality cost 200 pieces a pound; the middling sort one hundred, and the inferior quality thirty. This condiment was so expensive that we read in the Annals that a thousand jars of briny *tsiang* were put upon a par with a state of a thousand carriages.

"In the *Ping-tsih* are mentioned Briny Tsiang of stewed chicken, Briny Tsiang of stewed fishroe (Footnote: With reference to this condiment, we may mention the *Ké-tsiap,* brine of pickled fish or shell-fish, prepared in Fuhkian [Fujian, W.-G. Fukien] {Douglas [1873], Dict. of the Amoy dialect}, and which is most surely the origin of the word *Ketchup,* another name for soy [sauce]. It has nothing to do with the Malay, though the malay word *Ketjap* 'to taste' has a family-air.), of stewed turtles, of hashed fish mixed with mustard, and of the fat of the elk.

"In old *Nan-yueh* people ate *Tsiang* made of the *Kow-fruit,* a kind of mulberry according to some, but the betelpepper according to others.

"A condiment was also made of the peony roots of the elmseeds which was called *Mut,* of bitter squash and of the bottle-goard [gourd].

"In like wise a sauce was made of the *Yu-tsih* fish, and even of salted bees, crabs, shrimps, or rather lobsters, and ant-eggs. But not a single writer speaks of *tsiang* made of beans, and more particularly of the soyabean" (p. 143).

Note: This is the earliest English-language document seen (Feb. 2007) that contains the word "soyabean" (or "soyabeans"), written as one word. Address: 1. Professeur de Chinois à l'Universite de Leide [Leiden]; 2. Professeur à l'Ecole spéciale des Langues orientales vivantes et à l'Ecole libre des Sciences politiques à Paris.

855. *Charlotte Observer* (*North Carolina*)**.** 1894. The experiment station of Raleigh NC desires to assist the farmers of North Carolina. April 8. p. 1 [unnumbered].
• ***Summary:*** This is apparently an insert on unnumbered pages from the North Carolina Experiment Station. This one, dated 29 March 29 1894, has a section titled "Some late bulletins from the North Carolina Experiment Station" (Nos. 90-98). No. 97 (48 p.) is titled "Digestion experiments," "The digestion work covers feeding with soy (soja) bean hay,

© Copyright Soyinfo Center 2014

cat-tail millet, Johnson grass hay,...” No. 98 (24 p.) is titled “Some leguminous crops and their economic value.” “Gives the result of the year 1893, with a great many varieties of clovers, cow peas, soy (soja) beans and other legumines. The bulletin includes discussions of legumines as improvers of the soil, their cultivation for forage, and their fungous and insect enemies.”

The section titled “Field peas” discusses the contents of Bulletin 98 and states: “In the soja bean class, the old yellow variety is the most productive, both in fruit [seed] and foliage, but is much later than some of the newer variety [sic, varieties].

“Concerning the popular names of these plants it may be said that the so-called cow pea is not a pea but a bean and is more properly called Chinese beans. The so-called soja bean is a true pea, and should be called soy pea, or Japan pea. But by whatever names we call them, these plants are among the most valuable crop the southern farmer can grow.

“Gerald McCarthy, Botanist, N.C. Experiment Station.”

856. *Times* (*London*). 1894. The cereal crops of Japan. April 9. p. 12, cols. 2-3.
• ***Summary:*** “A report has been made to his Government by M. Sienkiewicz, the French Minister at Tokyo, upon the cereal crops of Japan, which comprise rice, barley, wheat and rye.” Although only one-eighth of the total area of Japan is cultivated, it produces (in ordinary years) enough food to feed the population of more than 40 million people. “Wheat and barley are largely employed in the manufacture of *shoyu,* or Japanese sauce, and also for making pastry.” Most of the article discusses rice, including huge exports (at high prices) and imports (at low prices).

857. Shimada, Koichi. 1894. Kansai shôyu oyobi tamari shiken seiseki [Results of tests on shoyu and tamari from Kansai, or Western Japan]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 146. p. 297-327. April. [Jap]
• ***Summary:*** Early information on the chemical composition of soy sauce in Japan. The term “tamari” (with furigana attached) is written with the characters “kuki” plus “sho or chiang.” Very revealing.

858. *Weekly Argus* (*Crawfordsville, Indiana*). 1894. Too sacred to touch. Stricken down, he lay where he fell until death came to his relief. May 19. p. 7.
• ***Summary:*** “The ex-lord abbot, of the Otani sect, who died lately at his residence in Kyoto, was the head of all the Buddhist priests in Japan.” He had been in poor health since the previous year. While making his way along a hallway, attended by a male servant, he fell. The alarm was sounded, and instantly about twenty women charged will all sorts of duties and ceremonial offices in the house of the prelate ran to the spot. But so inflexible is the etiquette of the abbot’s household “that in the absence of his wife not one of the attendants might touch the body of the incarnate Buddha, even in the moment of his death agony.” He died about an hour later. Describes the many ceremonies conducted.

The funeral ceremony was on a grand scale. However: “The viands served were of the plainest kind–a little miso soup, with square cut pieces of bean curd, and some rice.”

859. *Chicago Daily Tribune.* 1894. Japanese substitute for coffee. The soy bean declared to be equal to the genuine article (Abstract). July 7. p. 14.
• ***Summary:*** From New York *Sun:* “The agricultural experiment station of the Purdue University of Indiana has issued a circular setting forth the qualities of the soy, or soja bean and advocating its use as a substitute for coffee. The soy bean (soja hispida) is a Japanese plant which can be grown in this country.

Note: This is a summary of: Plumb, Charles S. 1894. “A substitute for coffee.” *Purdue University* (*Indiana*) *Agric. Exp. Station, Newspaper Bulletin* No. 6. 4 p. May 9.

To that is added new information about chicory. “Inquiry among coffee merchants in this city discovered that the soy bean as a substitute for coffee was not commercially or otherwise known here. According to an expert who has been a coffee taster for nearly a quarter of a century, chicory is the only thing which can be considered a substitute for coffee. By substitute he means adulterant, using the word in a good sense... Chicory,... mixed with a good grade of coffee is a better and more wholesome drink than some of the low-grade coffees. The expert said that while he and his partners sold pure coffee to their customers unless they ordered otherwise, they used coffee mixed with chicory themselves.

“Chicory, although considered the best adulterant, is not the only one. Several of the cereals play a part in the preparation of cheap coffee, if they do not pretend to be substitutes. It is said that the entire Canadian pea crop, and a large part of the Michigan crop are devoted to the adulteration of coffee. Rye and barley are also used as adulterants.”

860. *Mataura Ensign* (*Otago, New Zealand*). 1894. Corea [Korea] and Coreans: Roasted dog and other delicacies. In search of a female. Sept. 29. p. 7.
• ***Summary:*** From NZ Press, by Fare Fac: “The Kingdom of Corea has for centuries been a bone of contention between China and Japan... But, with one exception, the Chinese have always come out victorious. This was in 1592,” when Japanese forces invaded the country and defeated the Chinese. Five years later, however, the Chinese again became possessed of the country, and have held it as a suzerain ever since. It was the Japanese who gave the name to the outside world. The Chinese name is Tsiotsien, the native name Kaoli, and the Japanese name Korai, *Anglice* Korea or Corea.”

© Copyright Soyinfo Center 2014

The eastern slope is not very fertile, so most of the population lives on the western slope. Here they raise a little barley, rice and [soya] beans in the alluvial pockets of the foothills.

"The [soya] bean cake is the pressed marc of the pulse grown on the western shores. The oil is used internally and externally–it smells worst when it in used outside–also for lighting and lubrication. The marc is used for fuel and stock food. The bean cakes look exactly like 24 inch grindstones and are quite as soft."

861. Carpenter, Frank G. 1894. Li's banquet: A dinner with the premier in one of his palaces. How a Chinese state dinner is served. *Los Angeles Times.* Oct. 21. p. 13.
• ***Summary:*** This banquet took place in Tien-Tsin, China. The dinner was given in honor of General John W. Foster, our ex-Secretary of State, who was then on a trip around the world. As is the custom, no women were present at the banquet.

"All of the Chinese dishes were served in such shape that they could easily be taken up with chopsticks. In place of salt, each man has a little bowl of Japanese soy into which he dipped his food before eating it."

862. *Chemisches Central-Blatt.* 1894. Pflanzenkaese [German review of "On the vegetable cheese, natto" (Abstract)]. 1894(26):1049-50. Dec. 26. [1 ref. Ger]
• ***Summary:*** A German-language summary of the following English-language article: Yabe, Kikuji. 1894. "On the vegetable cheese, natto." *Bulletin of the College of Agric., Tokyo Imperial Univ.* 2(2):68-72.

Note: This is the earliest German-language document seen (Jan. 2012) that mentions natto, which it calls *Pflanzenkäse, der Natto,* or *Nattokäse.* Address: Imperial Univ., College of Agriculture, Tokyo, Japan.

863. *Age* (*The*) (*Melbourne, Australia*). 1894. [Vegetarianism in Japan]. Dec. 29. p. 4. [1 ref]
• ***Summary:*** This untitled article begins: "Japan is moving. The *Sei-i-kwai,* a medical journal published in Tokio, has a number of original articles in the English language, and while the tone and treatment are clearly imitative, there is nevertheless evidence of a certain originality of thought. The following of an extract from an article by Dr. Ishizuka on the Natural Food of Man affords a good example of the peculiar style and treatment." Observes that the teeth of men or closer in structure and movement to those of herbivorous, than of carnivorous animals. "Now, among the foods which are fitted to the normal teeth of men, there is nothing better than the cereals." "It is the general opinion at present that meat and vegetables are necessary articles for animal nutrition, but it is contrary to the principal purpose of creation... Consequently Shaka, the founder of Buddhism, separated days for abstaining from meat and fish in order to regulate the use of them, and Confucius also gave an instruction against the excessive use of meat. It will be clear then that meat is not an article of daily use."

"It is a well known fact that Buddhist monks never eat meat and fish, but they eat beans more than most people in various forms, *miso, natto,* etc."

867. Yabe, Kikuji. 1894. Nattô no kenkyû [Studies on natto]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 15:196-205. Also in Nogakukai Kaiho 24:3-10 (1894). [Jap]
• ***Summary:*** For an English-language version, see Yabe's 1894 article titled "On the vegetable cheese, natto" in the *Bulletin of the College of Agriculture, Tokyo Imperial Univ.* 2(2):68-72. Address: Nôgaku-shi, Japan.

868. Cavendish, Alfred Edward John; Goold-Adams, Henry Edward. 1894. Korea and the sacred white mountain: Being a brief account of a journey in Korea in 1891. London: George Philip & Son. 224 p. Illust. (40 original, many color). Maps. Index.
• ***Summary:*** This book is an amplification of the author's diary kept during a stay of a few weeks in Korea. Soy is mentioned as follows: Page 12: "Chefoo is the watering-place for Korea, Pekin, Tientsin, and Shanghai, but the foreign portion of it is very small, with three indifferent boarding-houses, but good pears and good bathing, if you do not mind a naked fisherman or two about. The chief exports appear to be straw plait for hats and bean-cake for manure."

Page 33-34: Korean ponies, which carry foreign travelers and their belongings, are very small. The forage ration consists of about 2 lbs. of beans and millet boiled in water, and the whole poured hot into a trough; the average

© Copyright Soyinfo Center 2014

feed is two gallons of this mixture, given three times a day, and supplemented by 2 lbs. of chopped straw (rice or millet)." "Other means of transport are found in donkeys, cattle, and coolies."

Page 48: Beans are becoming largely grown in Korea, for the demand for them in Japan is increasing, as they are used in the manufacture of Bean-curd, Miso, and Soy [sauce], while the Japanese are growing instead mulberries for sericulture. Wheat, barley, and rice, the latter of two kinds, one of which grows in dry soil, are also increasing, the export of these in 1890 being–barley, 5,260,533 lbs., value $50,341; beans, 87,950,800 lbs., value $1,004,762; wheat, 5,869,466 lbs., value $60,381; rice, 116,622,000 lbs., value $2,057,868."

Page 54. "Besides flax, maize, and cotton, there were fields of the small millet (*Setaria italica*), substitute for porridge, and of the tall millet, Susu or Kaoliang (*Holcus Sorghum*), with stems 8 to 12 feet high and as thick as a man's thumb, turning to golden yellow or bright mahogany colour; from the latter kind the Koreans make the coarse cloth of which their rough garments are composed, when they do not use Manchester shirtings; also fields of beans, food for cattle and men, and the foundation of Japanese soy [sauce] and our Worcestershire sauce."

Pages 146-47: "He produced some samshu, a muddy fluid which smelt and tasted like Kaffir beer, with strong spirit in it; this peculiar taste is due to the bean-water [water in which soy beans have been boiled] which they mix with the spirit distilled from rice or millet. We were given a bottle of this liquor by the head-man, and the cook bought another of Chinese make, which was quite clear and less diluted with bean-water."

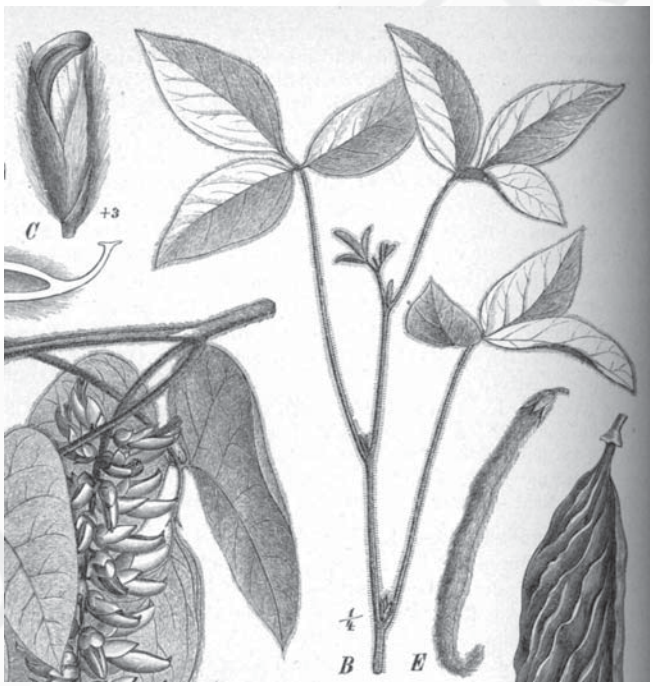
Pages 195-96: "Whilst waiting in the inn to-day, I had plenty of opportunities of observing the nauseous smell of the food greedily devoured by the Koreans. Five or six little dishes, containing various preparations of meat or fish, chillies, [soy] beans, cabbage, rice, &c., were ranged on a little table a foot high, and gave forth a most evil odour. A Korean likes his viands very highly seasoned, and in eating takes a little of every dish into his mouth, that he may enjoy the pleasant mingling of the different flavours." Note: At least one of these dishes probably contained Korean-style soy sauce or miso–but we cannot be sure.

Bean or beans (usually noted in passing as a crop with other crops) are mentioned on pages 66, 67, 68, 134, 138, 150, 191, 194, 199. Address: 1. Captain, F.R.G.S., 1st Argyll and Southern Highlanders, now in Edinburgh; 2. Captain, R.A.

869. Engler, Adolf; Prantl, L.K. 1894. Die Natuerlichen Pflanzenfamilien nebst ihren Gattungen [The natural plant families, together with their genera]. Leipzig: Verlag von Wilhelm Engelman. 396 p. See vol. 3. Part 3, p. 360-61, 392 (Fig. 131 B-D). [Ger]

• ***Summary:*** "390. Glycine L. (*Soja* Savi, *Johnia* W. et Arn., *Notonia* W. et Arn., *Leptocyamus* Benth., *Bujacia* E. Mey.)... There are about 15 varieties in tropical Africa, Asia, and Australia...

"Uses: *G. hispida* Maxim., the Japanese soybean is grown throughout East Asia for the pleasant tasting seeds; they serve also for the preparation of a pungent brown sauce, which in South Asia accompanies almost all meals and is also imported to Europe. The plants also thrive in Germany and are recommended for cultivation, however they do not always ripen in our climate, so their cultivation is unsure.



Illustrations (p. 362, Fig. 131) show (B) the leaves and flowers of a soybean plant (¼ size), and (C) an enlarged soybean flower (3 times normal size).

Also discusses the peanut (p. 324-25) with an excellent five-part illustration. Address: 1. Prof. der Botanik und Direktor des botan. Gartens in Berlin; 2. Prof. der Botanik und Direktor des botan. Gartens in Breslau.

870. Flagg, Chas. O. 1894. Rotation of crops. *Rhode Island Agricultural Experiment Station, Annual Report* 6:176-95. For the year 1893. See p. 190-93.

• ***Summary:*** The section titled "Experiments with leguminous plants" (p. 190-93) states: "The trial of legumes was made upon three of our most uniform and thoroughly exhausted plots of the experiment land on the plain. The object, aside from studying the habits ad growth of the most common leguminous plants, was to determine the effects of different applications of nitrogen. The three plots (permanently numbered 17, 19, and 21) each received an application of 1,200 pounds dissolved South Carolina Rock (16.63 per cent. total phosphoric acid), and 180 pounds

© Copyright Soyinfo Center 2014

muriate of potash (50 per cent. potassium oxide), while in addition No. 19 received 150 pounds of nitrate of soda (15.50 per cent. nitrogen), and No. 21 received 450 pounds of nitrate of soda of the same strength, while no nitrogen whatever was applied to No. 17."

Seeds of 32 legumes were sown on 29 May 1893 in duplicate rows 3 feet apart across on each of the three plots. Seven varieties of soja beans were planted. A "Table giving weights of short rows and computed yields per acre" (p. 191) shows the amount of nitrogen or soda applied to each plot and the computed yield of green fodder (in pounds per acre) for the 3 plots. The Soja Bean varieties and their yield range for the three plots are: Medium Green Soja Bean (4613–6597), Medium Black Soja Bean (4386–7108), Early White Soja Bean (1890–2646), Yamagata-cha Daidzu [brown] (2646–4915), Kiyusuke Daidzu (5369–7562), Edamame (3403–3781), Yellow Soy (2193–3856). The two varieties giving the highest yields were Kiyusuke Daidzu (7562 lb/acre) and Medium Black Soja Bean (7108 lb/acre). Yields are also given for Black Podded Azuki (3100–5218) and White Podded Azuki (4537–5596), White Lupine, Blue Lupine, Yellow Lupine, Serradella, and Spurry (*Ornithopus sativus*).

"In our last report (Fifth Annual Report, page 150) we called attention to the merits of the varieties of the soja or soya bean and cow pea as fodder crops especially valuable to the dairy man for summer feeding, soiling and for ensilage. They are tender plants and can only be sown when all danger of frost is past and must be harvested before frost in the fall, therefore their season of usefulness is somewhat limited. The farmer with a large herd of milch cows and limited pasture desires an abundant crop for soiling early in spring and late in autumn. We can find such among the leguminous plants."

Note 1. This is the earliest document seen (one of two documents, July 2013) that mentions the following soybean varieties: Early White, Medium Black, Medium Green.

Note 2. This is the earliest document seen (May 2000) that uses the word "rotation" or "rotations" in the title in connection with soybeans.

Note 3. This is the earliest English-language document seen (March 2006) that uses the word "Azuki" to refer to azuki beans. Address: Director of the Station, Agriculturist, and President of the Board of Managers, Providence.

871. Japanese Bureau of Agriculture (Norinsho). 1894. The fisheries of Japan. *Bulletin of the United States Fish Commission* 13:419-435. For the year 1893.
• ***Summary:*** The short section titled "Utilization of algæ" (p. 434-35) was compiled and arranged from the 1893 "Descriptive Catalogue of Exhibits Relating to the Fisheries of Japan at the World's Columbia Exhibition" by Hugh McCormick Smith.

It notes of amanori (*Porphyra vulgaris*)*:* "The weed is but seldom eaten fresh and nearly always is made into thin sheets like paper, and dried for preservation. This is heated over the fire and eaten with broth, or by itself with a little [soy] sauce. It is also used for various other culinary purposes."

Company name with diacritics is: Nôrinshô.

• ***Summary:*** Dr. O. Loew of Munich has been invited to be the successor to Prof. Dr. O. Kellner at the Agricultural-Chemical Laboratory in Tokyo.

873. Nagai, Sôji. 1894. Sake shôyu kokusû sanshutsu shinpô [A new method of calculating the number of koku (a Japanese unit of volume) of sake and shoyu]. Iiyamachi, Nagano-ken, Japan: Published by the author. 75 p. 20 cm. [Jap]*
• ***Summary:*** A *koku* is a Japanese unit of volume. One *koku* is approximately 278.3 liters. One koku was originally defined as enough rice to feed one person for one year. A koku of rice weighs about 150 kilograms or 330 pounds.

Note: A masu is a square wooden measuring box; the sides are joined at each corner using a finger joint or comb joint. They come in different sizes.

1 *go* = 180 cc = 0.763 cups (U.S.).

1 *sho* = 10 *go* = 1800 cc = 1.8 liters = 1.903 quarts = 0.476 gallons (U.S.).

1 *to* = 10 *sho* = 18 liters = 19.03 quarts = 4.76 gallons (U.S.).

1 *koku* = 10 *to* = 180 liters = 190.3 quarts = 47.6 gallons (U.S.). Address: Iiyamachi, Nagano-ken, Japan.

874. Saunders, William. 1894. Report of the Superintendent of Gardens and Grounds. *Report of the Secretary of Agriculture.* p. 365-394. For the year 1893. See p. 378, 387.
• ***Summary:*** In the section titled "Notes in miscellaneous plants (p. 365+), there is a subsection on "Soy bean" (p. 378) which states: *"Glycine soja* is a low-growing annual plant resembling the well-known kidney or bush bean of the gardens. The seeds of this species are used by the Japanese and Chinese in the manufacture of the sauce which they call soy, or soja. This is said to be made by boiling the seeds or beans in water together with millet, wheat, or other grains, the mixture being allowed to ferment, and afterwards refined and stored for use. Soy is a thick, black liquid resembling molasses, but not so tenacious. This sauce is a favorite accompaniment to other food dishes in China and Japan. The leaves [sic, seeds] furnish a valuable oil, and the resulting cake is used for feeding animals and for manure to the fields of sugar cane in Southern China. These beans have frequently been recommended as a substitute for the coffee bean, but they are a poor substitute for it–about equal to scorched wheat or rye."

In the section titled "Interrogatories and Replies" (p.

© Copyright Soyinfo Center 2014

385+) is a letter (p. 387) from "E.P.D. (Massachusetts)" who asked: "Can you inform me if the soja or Japan bean is cultivated in this country? It is said to be valuable as an article of food, being more nutritious than meat.

"Reply–The soja bean has been grown more or less, chiefly as a novelty, in this country for many years–for half a century at least–but having gained recognition as being of special importance. It has been recommended for the oil contained in it as a substitute for coffee, etc. It is said to be used in Japan mainly as an ingredient in a sauce called soy. Seeds can be obtained from most of the large seed stores in this country." Address: Superintendent of Gardens and Grounds [USDA, Washington, DC].

875. True, A.C. 1894. Report of the Director of the Office of Experiment Stations. *Report of the Secretary of Agriculture.* p. 417-64. For the year 1893. See p. 439-40.
• ***Summary:*** In the section on "Practical experiments at the Agricultural Experiment Stations" (p. 365+), there is a long subsection titled "Soja beans" (p. 439-40) which states: "These beans are also known as soya and soy beans. Two distinct species have been called by these names. The small bean (*Phaseolus radiatus*) is largely used in Japanese confections, but is of no special value as a forage plant.

"The large bean (*Soja hispida* or *Glycine hispida*) is the true soja bean, and has been found by the stations in a number of States to be a valuable forage plant. In Japan this bean is largely used as food for man and animals.

"The soja bean is an animal leguminous plant resembling the bunch or upright varieties of cowpeas. The growth is erect and from 3 to 4.5 feet high. The short pods are borne thickly on the stocky, bushy plant. Stems, leaves, and pods are densely covered with short hairs.

"The soja bean can not be said to be a new plant in the United States but was introduced from Japan before the organization of the experiment stations in 1888. However, the varieties first introduced were too late in maturing for localities in which early autumn frosts occur. The Massachusetts State Station and the Kansas Station introduced from Japan early varieties of soja beans, Repeated experiments at these stations indicated that these matured in Massachusetts with the same certainty as the common varieties of corn, and that they ripened in Kansas in any season. The varieties which experiments have shown to be early enough for Kansas are Eda mané [sic, Eda-mame; see Popenoe, Mason, and Marlatt 1891], Yellow Soy, Yamagata Cha-daidzu [brown], and Kiyusuké Daidzu. In Kansas soja beans have shown considerable ability to resist drought.

"The seed should be planted only after the ground is warm in the spring. In Kansas the latter part of May is the preferred season. The beans, at the rate of 5 to 10 per foot, are planted in drills from 2.5 to 3 feet apart. The cultivation is similar to that given the bunch varieties of the cowpea and should not occur while the leaves are wet with dew or rain. The vines are cut when the beans begin to ripen, cured in small, high piles, and threshed when dry.

"At the South Carolina Station the yield of beans was from 10 to 15 bushels per acre. At the Georgia Station soja beans yielded 1,307 pounds of beans per acre, while the yield of cowpeas on an adjacent plat was only 840 pounds. The weight of dry forage from the former was also greater than that of the hay from cowpeas. At the Massachusetts Hatch Station the variety Medium Early White soja bean yielded at the rate of 35 bushels per acre. The variety Black Medium made a ranker growth of vine than most of the other sorts. At the Massachusetts State Station soja beans yielded 5,949 pounds of dry matter per acre. The red varieties [probably azuki beans] have been found superior to the white in productiveness and in beauty of appearance. At the Georgia Station soja-bean forage was relished by stock and was more easily cured than cowpea vines. The yield of soja bean forage, exclusive of beans, was at the rate of 2,940 pounds of dry matter per acre, containing 88.2 pounds of crude fat, 438.06 pounds of crude protein, 730.29 pounds of fiber, 1,143.36 pounds of nitrogen-free extract and 186.39 pounds of ash. Analysis showed the beans to be much richer than cowpeas in protein and fat but poorer in starchy matters. One hundred pounds of air-dry beans contained 25.86 pounds of nitrogen-free extract. The nutritive ratio is very narrow. This very high percentage of fat and protein makes soja beans a suitable substitute for cotton-seed meal and linseed meal and other concentrated and costly feeding stuffs which dairymen often find it necessary to purchase. Soja bean meal without any admixture was relished by milk cows at the Massachusetts Hatch Station.

"The soja-bean plant has been advantageously used for hay, for soiling, and for silage, and is believed to have, in common with most cultivated leguminous plants, the power of obtaining some of its nitrogen from the air, and hence acting as a soil renovator."

Note: This is the earliest English-language document seen (Oct. 2006) that contains the term "cowpea vines" (or "cowpea vine"). Address: Director of the Office of Experiment Stations [USDA, Washington, DC].

876. Wilson, James. 1894. Soiling crops, 1894. *Iowa Agricultural Experiment Station, Bulletin* No. 27. p. 85-104.
• ***Summary:*** Various soiling crops were fed to milch cows. "During the summer of 1894 we grew Soja beans, or Japan beans, under experimental conditions for feeding to dairy cows, so as to get indications of their value as an addition to our field crops and their effect on the quantity and quality of milk, and on the flavor of butter. This bean comes to blossoming–which is the best feeding stage for milk-making–in August, when few plants now known to our cropping system are in succulent condition. It seems to be entirely at home in a dry climate. It is rich in protein, palatable when cows become used to it, gives a fine flavor to

© Copyright Soyinfo Center 2014

butter, increases the flow of milk when substituted for green sweet corn, and increases the fat per cent over corn, as our tables will show.

"The seed was sent to the college by Prof. Georgeson, of Manhattan, Kansas, who brought several varieties of it from Japan."

Leguminous plants that furnish the protein element can be grown on the farm. When fed with green corn, corn meal, or by themselves, they give good results and can save a farmer money.

Page 96 is titled "Soja Bean" and states: "The Soja bean, or soy bean, or Japan bean has been grown at different times on the college farm for twenty years [i.e. since 1874]... The seed used came from Prof. Georgeson, of Manhattan, Kansas, who, during his residence in Japan, selected varieties suitable to our climate. We grew two varieties of it, the yellow soja, the earlier, and the Keyuska [Kiyusuke] succeeding, in order of ripening... We grew it in hills, planted and cultivated as corn is... It is widely advertised as a coffee plant, and sold at high figures for that purpose. The cows did not eat it readily at first, but after getting it sprinkled with bran and salt for a few days they ate it readily... at the end of the test period, August 19th, they had reached a larger flow [of milk] than at any time during the feeding of sweet corn." Note: This is the earliest document seen (March 2012) that uses the term "Japan beans" or "Japan bean" as other names for the soy bean.

Page 97 gives an analysis of the soja bean plant, cut in August (as is, and dry matter). Address: Director of the Station, Ames, Iowa.

877. Yabe, Kikuji. 1894. On the vegetable cheese, natto. *Bulletin of the College of Agriculture, Tokyo Imperial University* 2(2):68-72. German summary in Chemisches Central-Blatt 1894(2):1049-50. [Eng]

• ***Summary:*** "Since remote times there has been prepared in Japan from soya beans, a sort of vegetable cheese called *natto.* The beans are first boiled in water for five hours to render them exceedingly soft. The still hot mass is in small portions wrapped in straw and the bundles thus formed, well tied at both ends, are then placed in a cellar, the middle of which a fire is kindled, whereupon the cellar is well closed. The heat is left to act for twenty-four hours, after which the product is ready for consumption. Although the moderate heat of the cellar acts only for twenty-four hours, there is still a considerable bacterial change going on. The microbes may be derived either from the air or from the straw. Of course it can not be expected that bacteria on the surface of the soya beans would still be very active. They are probably killed by the five hour's boiling*. (Footnote: *Exceptional cases where bacteria can stand boiling heat still longer are known, for instance with *Bacillus subtitlis.*) This product has a peculiar but not putrid smell. The soft mass of the beans is kept together by a very thick viscid substance. In this substance I have found four kinds of microbes present, and the chemical decomposition of proteids must be due to one or more of these microbes."

The author then describes but does not give scientific names for the four microbes. Three of these were micrococci (a yellow, an orange yellow, and a white micrococcus), and the fourth was a small, not motile, bacillus which liquified gelatine and produced a greenish fluorescence. "With regard to the specific smell of *natto,* repeated experiments have convinced me that the above mentioned yellow micrococcus is the chief cause, while with regard to the slimy substance which shows such an enormous degree of viscidity further experiments have to be carried out; because the yellow micrococcus is not the cause of this viscidity."

A table (p. 72) compares the nitrogenous substances in soya beans and natto made from those same soya beans. The moisture rises 3.9-fold from 15.16% to 59.12%. The total nitrogen increases by only 2%, from 7.355 to 7.542. Footnote: This may be chiefly due to the loss of carbon dioxide during the fermentation. The nitrogen of proteids (excluding peptones) decreases by 42%, from 6.899 to 4.033. The nitrogen of amides increases 14.7-fold from 0.128 to 1.892. The nitrogen of peptone increases almost five-fold from 0.328 to 1.617.

"There can hardly be any doubt that the *natto*-preparation is more easily digestible than the original soya bean, as it is very soft (Footnote: While the water of the air-dry soya bean amounted to 15.16%, that of *natto* amounted to 59.12%) and contains peptone" (p. 72).

Note 1. This is the earliest English-language document seen (Jan. 2012), written by a Japanese, that contains the word "natto."

Note 2. This is the earliest English-language document seen (Jan. 2012) that gives a detailed description of how natto is made, its chemical composition, a little about its microbiology. and its final appearance, smell, etc. However, we told nothing about how or when it is eaten in Japan. Although Yabe mentioned *Bacillus subtilis* in a footnote (p. 68) as a heat-resistant bacterium, he did not realize that it was the actually the bacterium / bacillus that caused the natto fermentation.

Note 3. This is also the earliest English-language document seen (Jan. 2012) that uses the term "vegetable cheese" or the word "cheese" or the word "slimy" to refer to natto. Address: Nôgaku-shi; Tokyo Univ., Japan.

878. Kellner, O.J. 1895. Ueber die Bereitung von Sake, Shoyu, und Miso [On the preparation of sake, shoyu, and miso]. *Chemiker-Zeitung* 19(6):97-98; 19(7):120-21. Jan. 19. [6 ref. Ger]

• ***Summary:*** The first installment of this article gives details on the production of sake in Japan. The process can be divided into 4 steps: The production of a diastatic ferment (koji), the culturing of the yeast (*Hefezüchtung*), the main

© Copyright Soyinfo Center 2014

fermentation, and separation of the fermented liquid (sake). A detailed description is given of the preparation of both koji starter (the ash of camellia wood is used) and koji. The koji, make in koji cellars, contains a very powerful, inverting ferment (*ein sehr kräftiges, invertirendes Ferment*), whose effect goes further than the diastase of malt. The finished sake, which contains 11-14% alcohol, is consumed hot. Sake makers in Japan, like beer makers in earlier times in Germany, are very conservative and will hardly allow the introduction of a thermometer into their operations.

Shoyu or "Bohnen-Sauce" is called Soja or Shoja in Germany. About one-fourth of the wheat is finely pulverized. It is fermented in vats for various times ranging from 8 months to 5 years. Then the liquid is pressed out in cotton sacks. Finally the press-cake is mixed with salt water, and re-pressed to yield a lower quality product. The finished product consists of a mixture of soy sauces of different ages to improve the flavor and aroma. The best soy sauce is made from equal parts of 3-year and 5-year soy sauce. The press-cake is used for fertilizer.

A nutritional analysis of shoyu is given. Its relative density ranges from 1.182 to 1.193. In 1888-89 in Japan 10,634 shoyu plants produced 1.3 million koku [1 koku = 180 liters or 47.6 gallons, so 1.3 million koku = 234 million liters or 61.88 million gallons]. Per capita consumption was about 5.5 liters per year.

Concerning miso, the author discusses rice miso first, then barley miso, implying that the former is more widely used. He notes that miso can be made in only 4 days by incubating it hot. He then gives nutritional analyses of 5 types of miso that he made in 1889. "According to my estimation, at least 30 million kg, over half of the yearly soybean harvest, is used in miso production... Those soybeans that are not used for shoyu and miso production, serve largely for the production of tofu (*Bohnenkäse*)." The tofu is coagulated with a solution obtained from sea salt that is rich in magnesium chloride [i.e. nigari]. Address: Privy Councillor (Hofrath), Japan.

879. Brooks, William P. 1895. The Agricultural Division. *Massachusetts* (*Hatch*) *Agricultural Experiment Station, Annual Report* 7:7-16. Jan. See p. 13-14.

• ***Summary:*** A table (p. 13) compares the composition of "American average of corn silage" with "Millet and soya bean silage." The author concludes: "It will be noted that the millet and soya bean silage is considerably richer than the corn silage in protein, which is the most valuable portion of a fodder,–the nitrogenous portion." The two fodders contained 11.25% vs. 8.0% crude protein on a dry matter basis.

The section titled "Soya beans" (p. 13) states: "We have continued to experiment with a number of varieties of this crop. We find three of value, and these we call 'Early White,' 'Medium Green' and Medium Black.' The seed of all was originally brought from Japan [by Brooks in late 1889; See Brooks 1890, p. 14, 16]. The first is the most reliable for seed production in this vicinity, though neither of the others has failed to ripen every season during the last 6 years. The 'Medium Green' appears to be the most valuable for ensilage. This has given a yield of rather over eight tons per acre when ready for the silo...

"Pot experiments in the culture of three varieties of the soya bean, employing for each soil from our own grounds and soil from a locality where this crop had never been grown, were carried out in 1893. The pots were variously fertilized in two parallel series for each kind of soil. To the soil of every pot in one series for each kind of soil a little dust from the floor where soya beans had been thrashed was added. The object aimed at was to determine whether the addition of this dust, which, it was known, must contain in abundance the germs of the tubercle bacillus peculiar to soya bean roots,–the bacillus which gives the plant the power to fix atmospheric nitrogen,–would affect the development of root tubercles and the growth and yield of the plants. The results were striking. From a very early stage, the plants in the pots to which a pinch of dust from the threshing floor had been added were of a markedly greener color and more vigorous. The weight of both vine and seed from such pots was larger. Upon examination after harvest the roots were found to have a far greater number of tubercles. The important point here is, that the tubercle development is coincident with greater vigor.

"Out-of-door experiments of a similar nature upon a large scale have been tried in the field this year. Upon ½ of a number of areas similarly fertilized throughout, a small quantity of earth from a field where soya beans had been cultivated for several years was scattered; the result in every instance was a marked increase in crop.

"Soya beans, as well as other leguminous crops, sometimes fail to assimilate atmospheric nitrogen to any great extent when first cultivated in a neighborhood. This is frequently, no doubt, because the appropriate tubercle bacilli are not present in sufficient numbers. They will usually increase from year to year, and when they become abundant, success will be more certain. It may sometimes pay to import a small quantity of earth from a locality where the crop does well, for the purpose of securing a supply of the needed bacilli."

Note: It is not absolutely clear how the tubercle bacilli that Brooks used in his pioneering experiments arrived in America. They apparently arrived on the seeds that Brooks imported from Japan in 1889. These may have been the first soybean bacilli in America. In 1897 David Fairchild "wrote to Japan and imported several pounds of soil from a soybean field" (Fairchild 1948, p. 14).

"A considerable number of miscellaneous crops have been under trial on a small scale. The more important of these are the following: mummy pea, Canada field pea, blue-stem wheat, naked black barley, Japanese naked barley,

© Copyright Soyinfo Center 2014

Japanese barley, Japanese clover, dwarf Essex rape, spurry, flat pea (*Lathyrus sylvestris*), and alfalfa." Details are given on four of these.

"Soya bean meal [probably ground whole soybeans] compared with gluten meal" (p. 16). The two were tested as "part of a ration for milch cows. The results do not indicate any considerable difference. Cream separated by the Cooley submerged system is more perfect in the milk from cows receiving the bean meal. The line of demarcation is far more distinct, and the cream is thicker and richer in fat."

880. Martin, Ernest. 1895. Le Tao-fu (soya), son origine, ses propriétés, son acclimatation [Tofu (soya): Its origin, properties, and acclimatization]. *Revue Scientifique* (*Revue Rose*) 3(5):144-46. Feb. 2. Series 4. [Fre]

• ***Summary:*** A French-language review of the literature on tofu, including a brief discussion of soy sauce and soybeans. The Soya hispida (Family: Papilionacées; Glycine Phaseolus) is an oilseed (*graine oléagineuse*) that originated in China. According to the research of Prof. Schlegel at the University of Leiden, it was first mentioned in the work of Liu-An, king of Huai-nan, of the Han dynasty, in the 2nd century before the Christian era. From this period, the seed was boiled and a milk-like liquid [soymilk] was extracted which had the reputation of possessing beneficial properties.

When the soybean (*le soya*) was imported to Europe, it was in the form of a sauce made in Japan and sold by the Dutch who were the first [sic] European navigators to arrive in Japan. Note: Portuguese navigators arrived in and traded with Japan before the Dutch.

Its name was *sho-yu,* which is nothing but the corruption of the Chinese characters *tsiang-yu,* which signifies savory oil [sic]. From sho-yu, the Dutch made the word "soya" or "soy" the name by which the bean is known in Europe.

Discusses: The shape and color of soybeans. The Exposition of Vienna [Austria] in 1873. König's discovery that soybeans contain 31-33% protein. The research of Vorderman and Pellet. Tao-Kan, Tao-Hu (tofu in Java), and Tao-Koa. Tofu exported from Annam. How Chinese in Batavia make soymilk and tofu (curded with gypsum); use of the pasty residue (*résidu pâteux*) [okara] for feeding to penned poultry, such as chickens and ducks. Further processing of tofu to extend its shelf life.

Note: This is the earliest French-language document seen (June 2013) that uses the term *résidu pâteux* to refer to okara. Preparation of soy sauce. Many uses of tofu in Chinese therapy. Shi-tsih as the founder of the vegetarian diet. Writings of Montigny, the French consul general. Soy bread in diabetic diets. Mr. Desvilles. Soybean trials and acclimatization in France. Composition of soybeans grown in France.

"From the viewpoint of practical utility, we conclude that the acclimatization of species of the vegetable and animal kingdoms, which was formerly the goal of multiple costly tests, has now lost much of its importance. The ease of communications and the rapidity with which exotic shipments can be made often provide the same results.

"However we must continue to be attentive to failures of acclimatization, for they have much to teach us. One of the most interesting problems of science is that of mutations. The work of the mutationists (*tératologistes*), and especially of Dareste, on the production of artificial anomalies, has led to new proof that the variability of animal organization is much greater than one would be tempted to believe–and this variability extends also to plants... Such research can help elucidate the problem of the origin of races, which has heretofore remained in the deepest obscurity despite the work of savants such as Is. Geoffroy Saint-Hillaire, Darwin, and Quatrefages.

"Thus there is nothing surprising in the transformations manifested in living things which, transplanted from afar, find themselves placed in telluric [terrestrial] and climatological conditions completely different from those of their original habitat. Examples of this transformation multiple with each new day;" they include the opium poppy, rhubarb, some legumes, numerous varieties of bamboo. "What is the reason for these laws of transformation and degeneration that extend over each of the large kingdoms of nature? The problem is posed but has not been seriously addressed.

"As for the soybean (*graine de soya*), we have shown that it undergoes this transformation in a very sensitive manner: in it, the protein molecule progressively gives way to the starch (*amylacée*) molecule. At the heart of the plant organism, a special synthesis is accomplished: its chemical composition is modified in proportions such that it becomes inappropriate for the goal targeted by its cultivation in Europe."

881. Hanausek, T.F. 1895. Correspondenz: Mittheilungen aus Japan [Correspondence: Communications from Japan. Enquiry on miso to Dr. Kellner]. *Chemiker-Zeitung* 19(11):222. Feb. 6. [Ger]

• ***Summary:*** Letter dated 26 Jan. 1895. Address: Vienna, Austria.

882. Kellner, O.J. 1895. Die Bereitung von Miso in Japan [The preparation of miso in Japan]. *Chemiker-Zeitung* 19(13):265. Feb. 13. [3 ref. Ger]

• ***Summary:*** This is an answer to questions from Dr. Hanausek to *Chemiker-Zeitung.* Kellner wrote his first major article on miso in 1893. There are 4 basic types of miso in Japan: 1. Shiro miso (white miso) is made from large-seeded soybeans (*grosskörnigen Sojabohnen*), rice koji, and salt. The ingredients are mixed at 70-90ºC, and the product is ready after 3-4 days of fermentation. It will not keep longer than 10 days. Note 1. This is the earliest document seen (Oct. 2001) worldwide that mentions "large-seeded soybeans."

© Copyright Soyinfo Center 2014

The next document to use that term appeared in 1936 in the USA.

2. Yedo miso (named after the early name for Tokyo) is made from the same ingredients as Shiro miso. The ingredients are mixed at 35-45ºC, and a part of the salt is added in a cooled solution after the mixing. The fermentation takes about 10 days in summer, 30 days in winter. The miso will keep for 4 to 15 months at room temperature.

3. Inaka miso (countryside or peasant's miso). Less expensive barley koji is used in place of rice koji. The soybeans are steamed for a very long time until they attain the desired reddish color. The fermentation takes 11-12 months, and the finished miso will keep for about 1 year. This type contains the most salt. To accelerate the fermentation, mix the ingredients while the soybeans are still hot.

4. Sendai miso (named after the city of Sendai) is substantially different in preparation from the other types. The cooked beans are rubbed to a paste, formed into prismatic pieces [*prismatische Stuecke*], and hung up with straw cords to dry for 1 to 1½ months. Then they are washed with lukewarm water, pulverized, sifted through a fine sieve, mixed with barley koji, salt, and cold water, and mashed in a mortar. The mass is put in the fermentation vat and roughly every 2 months reworked in the mortar. The fermentation, for which a cool room is used, is first ended after 1 to 1½ years, and the finished miso has a fine aroma, sweet taste, and reddish color. Because of the latter it is widely referred to as "red miso."

In the production of special types of miso, the following ingredients may be added to the basic ingredients before the fermentation: Glucose or cane sugar, gingerroot, slices of eggplant, Japanese burdock, roasted soybeans (*geröstete Sojabohnen*), rice bran, sesame oil. Moreover, many families, for use in their homes, prepare a miso using the press-cake that is left over after making shoyu and that has not been washed with salt water. It is used in place of steamed soybeans, and it is permeated with a fermentation-instigating power. In place of koji, dehulled barley may be used. In commercial miso production, only rice- or barley koji is used.

Note 2. This is the earliest German-language document seen (Dec. 2012) that mentions soynuts, which it calls *geröstete Sojabohnen.* Address: Prof., Dr., Moeckern [near Leipzig], Germany.

884. Yabe, Kikuji. 1895. ["On the vegetable cheese, natto"]. *Zentralblatt fuer Bakteriologie. Series 2.* 1(11):413-14. May 15. [1 ref. Ger]

• ***Summary:*** This is a German summary of the English-language article by Yabe which was published in 1894 in Japan in the *Bulletin of the College of Agric., Tokyo Imperial Univ.* 2(2):68-72. No German or other foreign title is given.

"In Japan a vegetable cheese named 'natto' is prepared from soybeans..." ("In Japan bereitet man aus Sojabohnen einen 'Natto' genannten vegetabilischen Käse, indem..."). Address: Nôgaku-shi, Imperial Univ., College of Agriculture, Tokyo, Japan.

885. Inoue, M. 1895. Note on nukamiso. *Bulletin of the College of Agriculture, Tokyo Imperial University* 2(4):216-18. Aug.

• ***Summary:*** Nukamiso (which is unrelated to miso) is rice-bran in a state of lactic fermentation that is used for pickling and softening certain vegetables such as daikon (Japanese white radish) and egg-plant. Nukamiso is prepared in barrels by almost every family in Japan.

The article concludes: "It may be that *nukamiso* will gradually find its way into other countries, as our soya-sauce or *shoyu* has done."

Note 1. This is the earliest English-language document seen (April 2012) that uses the term "soya-sauce" to refer to soy sauce.

Note 2. The parallel Japanese title of this English-language periodical is *Tôkyô Teikoku Daigaku. Nôka Daigaku. Gakujutsu hôkoku.* Address: Nôgakushi [Tokyo, Japan].

886. Inouye, M. 1895. The preparation and chemical composition of tofu. *Bulletin of the College of Agriculture, Tokyo Imperial University* 2(4):209-15. Aug. [6 ref. Eng]

• ***Summary:*** One of the best early articles on tofu in Japan. Inouye tried to make a product resembling Swiss cheese with tofu, with moderate success.

"The efforts to prepare an easily digestible food from soya beans led to the preparation of *miso* and *natto,* two kinds of vegetable cheese, which were investigated some time ago in the laboratory of this college. (Footnote: On the preparation of *miso,* by O. Kellner, this Bulletin, Vol. 1, No. 6. On *natto,* by Yabe; Bulletin Vol. 2, No. 2).

"But the most interesting preparation is *tofu,* which consists principally of the protein-matter of the soya bean and which, according to the investigation of Prof. Osawa in Tôkyô, is as easily digestible as beef. This preparation is freshly made every day and sold in the form of tablets [cakes] about 10 c.m. broad, 2 c.m. thick, and 25 c.m. long [4 by 10 by 0.8 inches thick], is of snow-white appearance and of the consistency and taste of freshly precipitated casein of milk, but as there is no trace of bacterial action connected

© Copyright Soyinfo Center 2014

with its preparation, the name vegetable cheese is certainly not justified." A table (p. 211) shows the composition of tofu a determined by *Kellner.*

"*Tofu* is also sold in another form called *kori-dofu* [dried-frozen tofu]. It is prepared by exposing the fresh *tofu* tablets to the action of frost, under which they shrink considerably, lose water, and become more compact. While fresh *tofu* contains, on an average, 89.02% of water, *kori-dofu* contains only 15.32% in the air dry condition. The analysis of *kori-dofu* gave me the following results: Water 15.32%. Albuminoids 41.42%. Fat and lecithin 23.65%. Non-nitrogenous extract 15.05%. Cellulose 1.48%. Ash 3.08%."

Note 1. This is the earliest English-language document seen (April 2013) that uses the term *kori-dofu* to refer to dried-frozen tofu.

The author then describes the tofu manufacturing process, noting that it "is manufactured only on a small scale, by people who sell it in their own shops." "The beans are first soaked for about twelve hours in water and then crushed between two mill-stones until a uniform pulpy mass is obtained. This is then boiled with about three times its quantity of water for about one hour, whereupon it is filtered through cloth. This liquid is white and opaque, exactly like cow's milk; while the smell and taste remind one of fresh malt." "I also analyzed the fresh milky liquid with the following results" for "Soya bean milk" and cow's milk, respectively (p. 212): Water 92.53% / 86.06%. Albuminoids 3.02% / 4.00%. Fat 2.13% / 3.05% Fibre 0.03% /–. Ash 0.41% / 0.70%. Non-nitrogenous extract, including carbohydrates 1.88% /–. Milk sugar–/ 5.00%.

"The fat contained in this liquid as well as in the *tofu*-tablets was found to consist partly of lecithin. *Tofu* dried at 100º yielded 26.65% fat and 4.83 gr. of this fat yielded, after igniting with carbonate of soda and nitrate of potash in the usual way, 0.280 grm. of magnesium pyrophosphate, which, when multiplied by the lecithin-factor, 7.2703, corresponds to 2.035 grm. lecithin, amounting to 11.2% of dried *tofu,* leaving for the genuine fat 15.4% (Footnote: A portion of this lecithin was probably present in the soya bean as lecithalbumin; comp. Leo Liebermann, J.B. f. Thierchemie, 1893, p. 32, and E. Schulze, *Chemiker Zeitung,* 1894, No. 43); more of the latter, therefore, is left in the refuse than of the former."

Note 2. This is the earliest English-language document seen (March 2001) that contains the word "lecithin" or "lecithalbumin" in connection with soy–in this case tofu.

"In the manufacture of *tofu*-tablets from the freshly prepared milky liquid, about 2% of concentrated brine [natural nigari] as it is obtained as mother liquor from the preparation of sea salt, is added with constant stirring, whereupon a flocculent precipitate is soon formed which is separated by means of a cloth filter, slowly pressed, and then cut into tabular shape. I have tried to arrive at a satisfactory explanation of the nature of *tofu,* and have found that the salt-brine does not act by its chloride of sodium, but by the calcium and magnesium salts which are in it; for we can at once obtain precipitate from the milky liquid if we add a little calcium nitrate or magnesium sulphate, while we can not obtain any separation or precipitation by adding even considerable quantities of sodium chloride or sodium sulphate."

"I have analysed a sample of the salt brine used for *tofu* making and found it to contain, besides chloride of sodium, 27.9% of chloride of magnesium and 7.0% of chloride of calcium."

Footnote 4 (p. 213): "In order to see whether a product similar to Swiss Cheese could be obtained from the crude soya casein or *tofu,* I infected 50 grm. of fresh *tofu* with a small dose of pulverised Swiss cheese, and added ten per cent of common salt to the mixture, pressed it in cloth, and allowed it to stand in a moist beaker glass for several months. The product resembled, only to a limited extent, the cheese from milk, but further experiments with the addition of small quantities of milk sugar are intended."

Note 3. This is the earliest English-language document seen (Aug. 2013) that contains the term "soya bean milk."

Note 4. This is the earliest English-language document seen (Aug. 2013) that contains the word "milky" in connection with soymilk, or that uses the term "milky liquid" to refer to soymilk. It is the second earliest English-language document seen (Aug. 2013) that mentions soymilk, and the earliest that mentions it in connection with Japan. However there is no suggestion that Japanese consume soymilk as a beverage.

Note 5. This is the earliest English-language document seen (March 2009) that uses the term "vegetable cheese" to refer to miso. Address: Nôgaku-shi [Prof. of Agriculture], Japan.

887. Miyoshi, Manabu. 1895. Anwendung japanischer Soja und deren Gemisch fuer Pilz Kultur [Use of Japanese soya and mixtures of it for culturing molds]. *Botanical Magazine* (*Tokyo*) 9(104):361-65, 403-04. Oct. 20. [2 ref. Jap; ger]
• ***Summary:*** The first part of this article (p. 361-65) is in Japanese. The second part is a 1½-page German-language summary of the article, apparently by the author. Address: Prof., Botanical Institute, Tokyo Imperial University, Japan.

888. Georgeson, C.C. 1895. Soy beans for stock. *Prairie Farmer* 67(45):1. Nov. 9.
• ***Summary:*** "Jas. E. Booge, of Sioux City, Ia [Iowa], writes: 'I wish to know in what climate soy beans grow, and what time it is best to plant them. It is something I know nothing of, and I would like to try them. How many bushels will they produce to the acre, and what kind of stock will eat them, and how should they be prepared for food?'

The author replies: "We have grown soy beans here,

© Copyright Soyinfo Center 2014

at the Kansas Experiment Station, for the last six years, and always with gratifying success. They withstand the dry weather and hot winds better than any other legume that we have tried so far. Their power to resist drought and their highly-nutritious qualities are their chief recommendations. The early varieties can be grown successfully as far north as South Dakota and in Wisconsin. The later varieties cannot be depended on to mature seed even here in Kansas. They should not be planted until the ground is warm. We usually plant the main crop here at the Kansas Station during the last ten days of May, but they can also be planted later. Last year I planted a field on the wheat stubble just after the wheat was removed in the beginning of July, and although the season was excessively dry they still produced a crop of beans which matured seed before frost. Like all other crops, they do best on rich soil, but they will grow on poor soil also. They yield better than navy or other field beans. They can be planted with a bean planter, a corn planter or even a grain drill. We usually plant them with a shoe press drill, stopping up three hoes [sic, holes] so as to leave the rows thirty-two inches apart, and a plant to each two inches of row is thick enough. A bushel of seed put in in this manner will plant an acre."

"As to the use of the soy bean as stock food, we have fed it to stock as ensilage in the form of hay, and the ripe beans ground to a meal, in all cases with gratifying results. The ensilage produced a marked increase in the quantity, and an improvement in the quality of the milk, and the bean meal is better than oil meal in nutritive qualities. To be exact, linseed oil meal contains twenty-seven pounds digestible protein, and 32.2 pounds carbohydrates, and 7.1 pounds fat, in 100 pounds of meal, whereas soy bean meal contains 30.1 pounds digestible protein, 30.7 pounds carbohydrates, and 15.8 pounds fat in 100 pounds. If made into hay the crop should be cut when the beans in the pod are about half grown, just before the leaves begin to fall. After it is cured it should be handled as little as possible to avoid crumbling the leaves. This hay has a nutritive quality equal to that of bran. We have, in a favorable season, raised three tons of this hay per acre.

"The seed from which the stock we have here, is grown was originally imported by the writer direct from Japan."

Note 2. This is the earliest document seen (Aug. 2011) concerning soybeans in South Dakota, or the cultivation of soybeans in South Dakota. This document contains the earliest date seen for soybeans in South Dakota, or the cultivation of soybeans in South Dakota (Nov. 1895). The source of these soybeans is unknown.

Note 3. This is also the earliest document seen (Sept. 2011) concerning soybeans in Wisconsin, or the cultivation of soybeans in Wisconsin. This document contains the earliest date seen for soybeans in Wisconsin, or the cultivation of soybeans in Wisconsin (Nov. 1895). The source of these soybeans is unknown.

Note 4. This is the earliest document seen (Oct. 2003) that uses the word "planter" ("bean planter"), or the word "drill" (referring to an implement), or the term "grain drill" in connection with soybean production. This is also the earliest document seen (Oct. 2003) that mentions the use of a machine (a planter or drill) for soybean production. Address: Prof., Kansas Agric. Exp. Station [Manhattan, Kansas].

889. Prinsen Geerligs, H.C. 1895. Eenige Chineesche voedingsmiddelen uit Sojaboonen bereid [Some Chinese foods made from soybeans]. *Pharmaceutisch Weekblad voor Nederland* 32(33):1-2. Dec. 14. Summarized in Teysmannia (1897) 7:413-15. [5 ref. Dut; eng]

• ***Summary:*** Contents: Introduction. Tofu or bean cheese (*Tao-hoe of boonenkaas*). Chinese soja or Fao-ijoe (boonenolie; soybean oil). Japanese soya (soy sauce; In Japanese: Shoijoe; in Chinese: Sex-sze-ijve). Taucho or bean paste (*Fao toio of boonenbrei*).

In the section on tofu, soymilk is mentioned twice.

Note 1. This is the earliest Dutch-language document seen (April 2013) that uses the term *boonenkaas* (unhyphenated) to refer to tofu.

Note 2. This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *melkachtige, vettige vloeistof* ("milky, fatty liquid") or *gefiltreerde melkachtige vleistof* ("filtered milky liquid") to refer to soymilk.

Note 3. This is the earliest document seen (March 2009) that mentions Indonesian-style miso, which it calls "Fao toio." This would later be spelled tao-tjo, taotjo, tauco, or taucho.

At the end of the section on tofu, the author continues: Another widely used bean preparation is soy sauce (de Soja), of which two kinds exist: the Japanese and the Chinese Soja. The first-mentioned has already been repeatedly described, for example by König (1889, p. 241), further by J.J. Hoffman in his "Contributions to the Knowledge of the Language, Geography, and Ethnology of the Netherlands Indies" (*Bijdragen tot de Taal-, Land- en Volkenkunde van Nederl. Indië;* Vol. V, p. 192), and recently by G. Schlegel in T'oeng pao [T'oung Pao 1894] (Part 5, No. 2) and O. Kellner in *Chemiker Zeitung* (1895, p. 120). While I could not find anything in the literature about the preparation of Chinese soy sauce (*Soja*), I have copied the following from the manufacturers themselves.

Chinese Soja or Fao-ijoe (bean oil). For this, only black varieties of the *Soja hipida* [*sic, hispida*] *humida Beta atrosperma* or *Soja hipida platycarpa Beta melanosperma* have been used. Their seeds are cooked and the water poured off, after which the beans are left in the sun for half a day to dry. Now they are cooled on big trays of woven bamboo out of the sun, then covered with leaves of a *Hibiscus* variety. On the beans there will always appear a type of mold, the *Aspergillus Oryzae* to be precise, which, at least on Java, appears every time again on moist soybeans exposed to

© Copyright Soyinfo Center 2014

the open air, but strangely enough does not appear on other foods. The beans are allowed to stand until the mold sporulates, which can be seen by the green color of the mold threads (hyphae), then they are dried again for some days and then put in a strong salt solution that has been cooled. This mixture is put in the sun for 8 days and afterwards it is boiled. The salt solution is then poured off from the beans and saved. The beans are boiled again and the water is added to the first salt solution. This process is repeated as many times as it takes to extract the residue completely.

The decoction is strained through a fine sieve, boiled again, and the sugar from the areng palm, star anise (not the leaves), and some other herbs (which are available from Chinese druggists as "soya herbs") are added. Finally, this dark brown, pleasantly aromatic liquid is boiled down until salt crystals start to appear on the surface, indicating that the liquid is completely saturated with salt. After cooling, the soy sauce (*soja*) is ready to use. It yields a spice which is used together with all different kinds of foods as a pleasant condiment, and in the Chinese, Javanese, and even the European kitchen on Java it is an irreplaceable ingredient.

Soy sauce is sold in several quality grades, of which the best is a thick sauce with a special aroma. The lesser kinds are thinner and are made by diluting the thick soy sauce with salt water, while in the very low-grade kinds, instead of the pleasantly sweet-tasting palm sugar, the bitter, sour-smelling unassimilated molasses from sugar factories is used.

Note 4. This is the earliest document seen (May 2010) that describes the preparation of a sweet Indonesian-style soy sauce quite similar to *ketjap manis* (which seems to have been first created about 1960), yet the writer does not mention its name.

The Chinese soy sauce appears as a black colored, thick, clear liquid in which sometimes a viscous sediment can be found. When diluted with water it turns turbid or cloudy, but after adding salt this cloudiness disappears. Here is an analysis of one of the most common varieties: Specific gravity 1.254, saccharose and glucose 15.60%, nitrogen containing substances (*stikstofhoudende stof*) soluble in alcohol 4.87%, nitrogen containing substances not soluble in alcohol 2.62%, nitrogen-free substances soluble in alcohol 0.25%, nitrogen-free substances (*stikstofrije stof*) not soluble in alcohol 0.75%, salt 17.11%, other ash components 1.65%, water 57.12%. Total 100%.

The substances insoluble in nitrogen consist (except for peptone) mainly of legumin, which is soluble in strong salt solutions (compare Beilstein, *Handbuch Organische Chemie,* III, p. 1275) and will precipitate when diluted. This protein product (*eiwitstof*) has, by repeated precipitation with alcohol and renewed dilution in water and salt, been cleaned and could be recognized as a legumin. The elementary analyses gave these figures: Carbon 51.6, hydrogen 7.1, nitrogen 15.9.

Furthermore, the dilution in water was precipitated by ammonium sulfate, magnesium sulfate and sodium sulfate and not by a large quantity of sodium chloride.

The nitrogen containing substances soluble in alcohol were leucine, tyrosine and aspartic acid, all breakdown products of legumin, plus a little ammonia. Nitrogen-free extraction substances are almost not present and consist of a little pectin and the black coloring agent from the skin of the soybeans, which gives the black color to the soya.

Just like Kellner (*Chemiker Zeitung* 1895, p. 121) remarks, the composition of the soya is very similar to the one of meat extract, by which the big importance of this condiment in countries, where mainly vegetable type food is consumed, can be readily explained. Very peculiar moreover is the way in which during the preparation of the soya the heavily digestible protein substances, which are locked into the thick skinned cells of the soya, have been converted into an easily digestible, very delicious food.

One lets the boiled beans mold by means of the *Aspergillus oryzae,* which above all has the quality of changing amylodextrine and starchy substances into sugars followed by carbonic acid and water breakdown. We can say that a microscopic investigation of a molded soybean shows that the mold threads (hyphae) penetrate the cell walls of the complete soybean and partly dissolve them so the contents will be more readily available. When the mold has used up all that food, as shown by its fructification, the beans are put into a strong solution of salt water so that the legumin will dissolve, producing a thick fluid liquid. At the same time, the broken down substances of the legumin will dissolve pepton [peptone], leucine, tyrosine and ammonia, next to the aromatic substance that will start to form in this stage. The continued manipulations, addition of sugar, herbs, etc., are of course of minor importance, but principally the clever way in which the mold is being used to dissolve the cell walls is highly interesting. This, like so many Chinese preparations, is completely empiric and no Chinese would have the slightest notion of what all this molding is about.

This article describes the first attempt to identify the tempeh mold. In the section on Indonesian miso (taucho), the author notes: In a similar way, in Java, other molds are used to make leguminous seeds into more digestible foods. Thus the presscake, which remains after making peanut oil and would be indigestible without further preparation, is subjected to the action of molds. In central and eastern Java *Chlamydomucor Oryzae* [now known as *Amylomyces rouxii*] is used, whereas in western Java an orange mold of the family Oospore (Neurospora) is used. In the former case, the food is called 'bongkrek,' and in the latter 'ontjom.' If soybeans are molded with *Chlamydomucor* the spice is called 'tempets' [sic, tempeh]. In the preparation, the seeds are boiled, spread, mixed with a little molded cake from a former batch, and left alone for a while until the mass is bound into a solid white cake.

All the aforementioned molds have the ability to break starch and pectin substances down into sugars, by which

© Copyright Soyinfo Center 2014

means the cell walls are opened and the seeds made more easy to digest.

In the case of the starch-containing peanut presscakes, the breakdown of starch into sugars, followed by the use of the resulting sugars, proceeds so rapidly that the cakes become warm and within 1 day about 5% of their weight will disappear.

Kagok Tegal 28.9.95.

Note 5. This is the earliest document seen written only in Dutch that mentions Indonesian miso, which it calls *Fao toio* or *boonenbrei,* and *tao tsioe.*

Note 6. This is the earliest document seen stating that Hibiscus leaves are used in Indonesia to make soyfoods–in this case soy sauce.

Note 7. This is the earliest document seen (April 2012) that mentions "bongkrek"–but the explanation is incorrect.

Note 7. This is the earliest document seen (Sept. 2011) that mentions "ontjom." Address: Java, Indonesia.

890. Yabe, Kikuji. 1895. Un fromage végétal, le "natto" [A vegetable cheese, natto]. *Annales Agronomiques* 21:494. [Fre]

• ***Summary:*** This is a French-language summary the following English-language article published in Japan. Yabe, Kikuji. 1894 "On the vegetable cheese, natto." *Bulletin of the College of Agric., Tokyo Imperial Univ.* 2(2):68-72.

891. Agricultural Society of Japan (*Dai Nihon Nokai*). 1895. Useful plants of Japan: Described and illustrated. Vol. 1. Tokyo: Agricultural Society of Japan. 233 p. See p. 5-6. 22 cm. [Eng]

• ***Summary:*** Discusses five varieties of *Glycine hispida* (p. 5-6) including: 21. Black soy-bean, Jap. *Kuro-mame.* "The beans have black skin. They are eaten either boiled or parched and also used to make *miso* (a kind of sauce with solid consistency), cakes, and *natto* (a cooked beans eaten as relish to rice)."

Note 1. The writer fails to mention that both miso and natto are fermented foods.

Note 2. This is the earliest English-language document seen (Jan. 2012) stating that natto is eaten with rice, or as a relish to rice.

22. White soy bean, Jap. *Shiro-mame.* Similar to No. 21 but the beans have yellowish-white skins. "Numerous varieties as to size, form, or duration of growth occur, and all are eaten either boiled or parched. Many important services are due to this bean. They are used to make malt [koji], *miso* (a kind of sauce), *shôyû* (bean sauce), and *yuba* (a kind of food). The *mamenoko* (bean flour) [probably roasted soy flour or *kinako*] is made of the beans and is eaten with *dango,* etc. It yields a dye called *Mame-no-go.* Oil is also pressed out from these beans. They are used in many other different ways."

Note 3. This is the earliest English-language document seen (Nov. 2012) that uses the word *mamenoko* to refer to roasted soy flour.

23. Green bean, Jap. *Ao-mame.* Similar to No. 21 but with larger seeds of greenish color. "One variety with green colour both of the skin and albumen called *Konrinzai* occurs, and is used to make *Aomame-no-ko* (green bean flour).

24. Jap. *Goishi-mame.* The seed of this variety is flat and black. Eaten boiled.

25. *Gankui-mame.* "Closely allied to the preceding. The beans are larger and thinner in the middle, and eaten principally boiled."

Also discusses: Job's tears (*Coix lachryma,* Jap. *Tômugi, Hatomugi,* p. 5. The grain is pounded in a mortar, cleaned, and "consumed as meal and *mochi.* An infusion of the parched and ground grains is used instead of tea, and is called *Kosen*)." Five varieties of adsuki beans (*Phaseolus radiatus,* p. 7-8).

Pea-nut (*Arachis hypogœa,* Jap. *Tôjin-mame, Nankin-mame,* p. 9. "They are eaten parched or used in confectionery, or to extract oil. A variety with larger nuts about 3 times bigger was introduced from America in 1873").

Kudzu (*Pueraria thunbergiana,* Jap. *Kudsu, Makudsu,* p. 69-70, 92. "The largest roots are about 3-4 ft. [long] and about the thickness of a man's arm. In winter they are taken, and an excellent starch is prepared from them. It is used for food or paste. The vine is used to make baskets, and its fibre is taken for cloth. The leaves are used to feed cattle").

Sesame (*Sesamum indicum,* Jap. *Goma,* p. 84. "There are three varieties, black, white, and brown colored. The latter variety is the best to take oil. The oil is principally used for dressing food. The grilled seeds are used to add to cakes, salads, etc."). Address: Tameike 1, Akasaka, Japan.

892. Atwater, W.O. 1895. Methods and results of investigations on the chemistry and economy of food. *USDA Office of Experiment Stations, Bulletin* No. 21. 222 p. See p. 193-94.

• ***Summary:*** In the section on "Food Consumption" a subsection titled "Japanese Dietaries" (p. 193-94) states: "The legumes are little eaten in their natural state but form the basis of a number of prepared foods and relishes, such as miso, tofu, and shoyu, all of which are made from the soja bean. The miso is prepared from cooked beans, which are rubbed to a thick paste and fermented with the ferment used in the preparation of the rice wine. Tofu, or bean cheese, is essentially the legumin of the soja bean, which is first extracted with water and then precipitated by the addition of the mother liquor (magnesium chlorid), obtained from the evaporation of sea water in the manufacture of salt. The cheese is eaten fresh. The shoyu sauce is prepared from a mixture of cooked and pulverized soja beans, roasted and pulverized wheat, wheat flour, salt, and water. The mixture is fermented with the above-mentioned rice ferment for 1½ to 5

© Copyright Soyinfo Center 2014

years in casks. This sauce is used very largely by all classes." Address: Prof. of Chemistry in Weslyan Univ. Director of the Storrs (Connecticut) Agric. Exp. Station, and Special Agent of the U.S. Dep. of Agriculture.

893. Flagg, Chas. O.; Towar, J.D.; Tucker, Geo. M. 1895. Field experiments. *Rhode Island Agricultural Experiment Station, Annual Report* 7:111-28. For the year 1894. See p. 114-19.

• ***Summary:*** The section titled "Experiment with leguminous plants" (p. 114-20) states: "The experiment with leguminous plants which began last year (see Annual Report for the year 1893, p. 190) upon plots 17, 19, and 21, was continued through this year with slightly varying results. The three plots received like quantities of potash and phosphoric acid, but plot 17 received no nitrogen, plot 19 received one-third ration, and plot 21 full ration. In nearly every case in 1893 the plot (19) that received one-third ration (150 lbs.) of nitrate of soda gave a larger yield than either plot 17 or 21. While in 1894 a majority of the plants on the full-ration plot (21) gave the largest yields, although the gain was not great except in two or three cases; in no case was the gain in weight of plot 21 over plot 19 sufficient to cover the expense of applying the extra 300 lbs. of nitrate of soda."

A table (p. 116) gives the names of the crops planted (all were planted on 13 June 1894), the weight of three fertilizers added (in lb/acre; phosphate rock, muriate of potash, and nitrate of soda) the height of the plants, usual method of sowing (broadcast vs. drilled; all the crops mentioned below were drilled in 24-inch rows), date of harvest, excess yield due to additional nitrogen. The crops include: Soja bean (common), Soja bean (Medium Green; plants or beans), Soja bean (Medium Black; plants or beans), Soja bean (Early White; plants or beans), Black podded adzuki (plants or beans), White podded adzuki (plants or beans), Kiyusuke daidzu (plants or beans), Yamagata daidzu (plants or beans), Eda-mame (plants or beans), Yellow soy (plants or beans).

"With most of the soja beans the increase of yield is not sufficient the cover the cost of applying any nitrogen at all the second year, while the first year there was a slight profit made by applying the one-third ration."

A table (p. 118) shows the composition of dry matter of some leguminous green fodders (including 5 types of soja bean) as compared with corn, oats, and millet.

Page 119 states: "All varieties of *Soja Beans* are used profitably either as silage, as green fodder, or as a green manure. They grow readily; the *Common* variety and the *Early White* are among the earliest to mature. One bushel of seed is required per acre.

"Black Podded Adzuki, White Podded Adzuki, Kiyusuke Daidzu, Yamagata Daidzu, Eda-mame and *Yellow Soy,* are Asiatic varieties of beans similar to the soja beans. The seed of these varieties, as well as the soja beans, makes an excellent, rich meal for stock feeding, while the Black Podded Adzuki beans are said to be desirable and nutritious for table use."

Note 1. The above text indicates that the investigators do not realize that soja beans, daidzu, eda-mame, and yellow soy are all different types of soybeans. Some of these are Japanese names.

Note 2. This is the earliest English-language document seen (June 1998) that uses the term "green manure" in connection with soybeans.

This is the earliest English-language document seen (June 2000) that mentions the use of "phosphate rock" or "rock phosphate" as a fertilizer, or in connection with soybeans. Address: Kingston.

894. Heco, Joseph. 1895. The narrative of a Japanese: What he has seen and the people he has met in the course of the last forty years. Edited by James Murdoch, M.A. 2 vols. Tokyo: Maruzen. Illust. 23 cm.

• ***Summary:*** Vol. 1 is from the time of his being a castaway in 1850 down to the battle of Shimonoseki. The ship *Auckland* is mentioned in Vol. 1 on pages 83, 91, 92, and 100 of this book, however soy is not mentioned.

Hymowitz (2007/06) wrote: "Amazingly, one of the Japanese fisherman rescued by the crew of the *Auckland* remained in the United States. As a 14-year-old he took the name Joseph Heco (ne Hizozaemon), learned to read and write English, and became a U.S. citizen. He published a book in 1895 that confirmed the *Auckland* incident from the Japanese point of view."

Note: Summary of book from WorldCat record: "Joseph Heco (1837-1897), a native of the province of Sanyodo, went to sea in 1850. When his ship was dismasted, he and other members of the crew were rescued by an American ship which took Heco to California; the young Japanese did not return to his native land until 1859. The narrative of a Japanese, vol. 1 (1895) contains Heco's reminiscences, based on diaries that he began to keep as soon as he had mastered English..."

This book was first published in 1800 by American-Japanese Pub. Association; they reprinted it in 1970. Edited by James Murdock. Library of American Civilization.

895. Hills, J.L. 1895. Dairying. *Vermont Agricultural Experiment Station, Annual Report* 8:142-92. For the year 1894. See p. 167-68.

• ***Summary:*** Section VI, titled "Miscellaneous fodder crops" (p. 167-68) begins: "A series of experimental plots containing a tenth of an acre each was laid out in the spring of 1894... The following crops survived the attacks of insects, drought, etc., and were harvested. The first table gives the plot number, name of nine crops–incl. Soja Bean (Green) and Soja Bean (Black), original substance (percentage water and dry matter), and the composition of the dry matter (percentage crude ash, crude protein,

© Copyright Soyinfo Center 2014

crude fibre, nitrogen-free extract, ether extract, nitrogen, phosphoric acid, and potash). The second table contains the same columns plus "Total yield" and the same crops. The Soja Bean (Green) was by far the best yielder, followed by the Soja Bean (Black). The composition is given in total pounds rather than as a percentage.

On p. 168 we read: "Soja (or Soy) Beans, green and black medium varieties, (*Soja hispida*). Seed was obtained from the Hatch Experiment Station of the Massachusetts Agricultural College; 27 inch rows. These beans were grown in 1893 as well as in 1894, and proved satisfactory each year. As explained in the last report, they are of Japanese origin, make good dry fodder or ensilage, and are relished by cattle. No other leguminous hoed crop which we have grown have given us better returns in tonnage of green fodder, dry matter or protein. The green variety this year yielded at the rate of six and a half tons green fodder, two tons dry fodder and nearly a quarter of a ton of protein to the acre." Address: Director of the Station and Chemist, Burlington, VT.

896. Kingsford, Anna Bonus. 1895. The perfect way in diet: A treatise advocating a return to the natural and ancient food of our race. 6th ed. London: Kegan Paul, Trench, Truebner & Co. Ltd. xiii + 121 p. 16 cm. [92* footnotes]
• ***Summary:*** *The Encyclopedia Britannica* (1929, at Vegetarianism) considers this book one of the two classics on the subject. It is a revised and enlarged translation of the author's July 1880 thesis, from the University of Paris, under the title *De l'Alimentation Végétale chez l'Homme.* The original thesis was published in Paris in French, then translated into German. The first English edition was published in 1881. The author, a physician (M.D.) deals much more with the physical and social aspects of a vegetarian diet, than with its moral and philosophical aspects. This is not because she regards the latter of lesser importance, "but because their abstruse and recondite nature renders them unsuitable to a work intended for general reading."

This long essay, which is not divided into chapters, discusses both vegetarianism and animal welfare. It begins with a Proem (prose poem, from *The Light of Asia,* about the life of the Buddha by Edwin Arnold), then discusses anatomy and physiology, cookery, physical force, national habits, chemistry, stimulating effects of flesh food, alcoholism, slaughter houses, social considerations, sufferings of cattle, dangers of flesh-eating, treatment of disease, economical considerations, over-breeding, the leather question, cruelty in the fur trade, the manure question, sport, recapitulation, conclusion.

On page 26 the author praises the Japanese diet: "The Japanese not only abstain from animal food, but even from milk and its productions. One of the laws which they most religiously observe is, not to kill, nor to eat anything that is killed... The Japanese are represented as robust, well made, and active, remarkably healthy, long-lived and intelligent...

"'Fish and rice are the staple articles of Japanese diet... Beans are an important article, and from these is manufactured *tofee* [sic, tofu]–literally bean-cheese, an article largely used by the poorer classes'" (*New York World* 1887).

"China.–'The perfection of the art of cooking is nowhere more observable than in the monasteries of the Buddhists. They have but the simplest elements of food to deal with. No meat, no fish, no poultry are allowed at their tables. No eggs, no lard, no butter, no milk must be introduced into their confectionery. Vegetables alone are permitted, and yet by means of these a dinner of surprising variety is served, and if the guest judged only be appearances he would suppose that the worthy abbot had forgotten the rigid rules of his monastic establishment, and was about to break his vow by partaking of most heretical viands'" (*Pictures of the Chinese,* by Rev. R.H. Cobbold, M.A.).

On pages 93-94 the author shows that a meatless diet will support a much larger population from a given area of land than a meat-centered diet for which the land is used for pasture and grazing. Address: Doctor of Medicine of the Faculty of Paris, 11 Chapel Street, Park Lane [London?].

897. Matsumura, Jinzô. 1895. Shokubutsu mei-i. Enumeration of selected scientific names of both native and foreign plants, with Romanized Japanese names, and in many cases Chinese characters. Tokyo: Z.P. Maruya (Maruzen K.K.). 8 + 26 + 17 + 321 + 62 p. See p. 134. With a 26-page European-language bibliography and a 16-page Japanese bibliography on botany. [606* ref. Eng]
• ***Summary:*** The author admits two species: Glycine soja (tsuru-mame or no-mame, indigenous) and G. hispida (of foreign origin).

Note: The National Union Catalog states that two similar editions of this work were published in Tokyo in 1895. The first, published by Maruya, is 321 p. The second, published by "Z.P. Maruya & Co. (Maruzen K.K.)," is 455 p. Address: Rigakuhakushi. Prof. of Botany, Tokyo Imperial Univ.

898. Miyoshi, Manabu. 1895. Die Durchbohrung von Membranen durch Pilzfaeden [Penetration of membranes by mold filaments]. *Jahrbuecher fuer wissenschaftliche Botanik* (*Berlin*) 28(2):269-89. [39 ref. Ger]
• ***Summary:*** Japanese shoyu was first used by Prof. Miyoshi of this Institute as a liquid cultural medium for various molds. He recommended a mixture of 50 parts water, 20 parts Japanese shoyu, 5 parts raw sugar, and 25 parts concentrated cooked onion juice.

Note: This is the earliest document seen (Sept. 2001) that describes the industrial uses of soybeans or soy products (shoyu) as a culture medium (for growing microorganisms). Address: Prof., Botanical Institute, Tokyo Imperial University, Japan.

899. The Sino-Japanese War (1894-1895), and the Treaty of Shimonoseki (17 April 1895) (Important event). 1895.
• ***Summary:*** "Japan's opening of Korea in 1876 led to increasing embroilment with China over the peninsula. Peking adamantly insisted on its suzerainty over Korea, which Japan refused to recognize...

"During the next decade the Chinese intensified their efforts at modernizing their military forces, particularly the navy, while the Japanese became increasingly involved in Korea, thus setting the stage for an even more serious confrontation. Then the Tonghak ('Eastern Learning'), a popular religious organization with a strongly antiforeign bias, broke out in revolt in southern Korea in 1894, China sent a small body of troops at the Korean king's request, and Japan then sent in a larger force, demanded reforms of the Korean government, and finally seized control of it and had it declare war on China. War followed between Japan and China on August 1.

"The ensuing hostilities were the first real test of the efforts at military modernization both China and Japan had been making for a whole generation. Most Westerners assumed that the Chinese giant would win through sheer size, but Japan quickly proved that its modernization had been more successful. Its armies seized the whole of Korea and then invaded Manchuria. But victory was largely determined by sea power, which in the absence of railways controlled even China's access to Korea. While the Chinese fleet was larger, the Japanese was qualitatively much better. On September 17 off the mouth of the Yalu River, the Japanese, using modern British naval tactics, severely crippled the Chinese fleet, which came out like cavalry, lined abreast. The Japanese then captured the naval base of Port Arthur in South Manchuria and besieged Weihaiwei on the northern coast of Shantung, where the remainder of the Chinese fleet was bottled up. Weihaiwei fell, the fleet surrendered, and China had to sue for peace.

"The terms of the Treaty of Shimonoseki, signed between Itô and Li on April 17, 1895, were relatively severe, though perhaps less so than they might have been had not a Japanese fanatic shot and wounded Li. China was obliged to cede Taiwan, the nearby Pescadores Islands, and the Kwantung Peninsula in South Manchuria; recognize Korea's independence; pay 200 million taels indemnity; open more ports; and negotiate a commercial treaty. The latter, signed in 1896, gave Japan all the privileges that the Western powers had in China and added the further privilege of carrying on 'industries and manufactures,' using the cheap labor in the treaty ports." Note: The Treaty of Shimonoseki gave all foreigners a clear right to establish factories in treaty ports. After 1895, foreign-run factories using Western technology rapidly increased in number as, revealingly, did privately owned Chinese factories using Western technology.

"Japan's triumph, however, was soon tarnished by a blatant power play by the Western nations. Russia, which itself had ambitions in both Manchuria and Korea, was alarmed by Japan's success. It persuaded Germany and France to join in a diplomatic intervention on April 23, 1895, 'advising' Japan to give up the Kwantung Peninsula. Bowing to *force majeur,* Japan complied, receiving in compensation 30 million taels of additional indemnity. There was naturally a strong reaction of indignation among the Japanese public, which became further embittered when the same three powers appropriated pieces of China for themselves in 1898, the Russians taking, under a twenty-five year lease, the Kwantung Peninsula that Japan had been forced to disgorge only three years earlier.

"The achievement of equality: Still, Japan's victory over China greatly impressed the West, and the British in particular, disillusioned with the incompetence of the Chinese government, began to show a decidedly more pro-Japanese attitude."

"On July 30, 1902. the Anglo-Japanese Alliance was signed–the first military pact on equal terms between a Western and a non-Western nation... The British, seeing their long dominance of the eastern seas threatened by the rise of new naval powers, bolstered their position in East Asia by allying themselves with the only strong naval power in the area. They also forestalled by this pact any Russo-Japanese pact to partition Northeast Asia and instead secured Japanese support for the maintenance of the treaty system in China. The Japanese, faced with growing rivalry with Russia over Korea and Manchuria, needed the alliance to ensure that, if war broke out, Russia would not be joined by other European powers, as it had been in its intervention over the Kwantung Peninsula in 1895. The wording of the alliance made it clear that in such a case Britain would come to Japan's aid."

But an even more important victory came a few years later in 1904, when Japan defeated the powerful Russian Empire.

901. *Times* (*London*)**.** 1896. Agriculture: Crops and live stock. Jan. 13. p. 8, col. 3. [1 ref]
• ***Summary:*** "A vegetable preparation possessing many of the dietetic properties of meat is produced in Japan under the name of 'tofu.' It consists principally of the protein matter of the soya bean, and is said to be as easily digestible as beef. It is freshly made every day, and is sold in thin tablets of snow-white colour, and of the consistency and taste of freshly-precipitated casein of milk. The name 'vegetable cheese,' proposed to be applied to it, is not justifiable, as there is no trace of bacterial action associated with its preparation. Another form, known as 'kori-dofu,' is prepared by exposing the fresh tofu tablets to the action of frost, with the result that they shrink considerably, lose water, and become more compact. Fresh tofu contains, on the average, 89 per cent of water, whilst kori-dofu contains only 15.3 per cent, in air-dry condition. Tofu is manufactured by the people who sell it in their shops. The beans are first soaked for 12 hours in water, and then crushed between two millstones to a uniform pulpy mass. This is boiled for an hour with three times its quantity of water, and is then filtered through cloth. The liquid passes through white and opaque, exactly like cow's milk, whilst the smell and taste is suggestive of fresh malt. Upon standing, very fine particles separate on the surface, and these under the microscope are easily recognizable as small globules of fat. After two or three days there is a strong development of lactic acid, under the influence of which the casein separates exactly as in the souring of milk. Mr. Inouye, of the College of Agriculture at the Imperial University, Tokio, states that in preparing tofu tablets from the fresh milky liquid about 2 per cent of concentrated brine is added with constant stirring; a flocculent precipitate soon forms and is separated by means of a cloth filter, slowly pressed, and cut into tabular shape. In this way about one-fourth of the total quantity of the proteid in soya beans is obtained in the tofu. The brine employed is made from sea water, and it is to the potassium and magnesium salts contained in this that the precipitation of the tofu appears to be due. Wherever rice forms the principal food of man, as in China and Japan, the addition of some other food rich in nitrogenous matters, or proteids, is necessary to make up for the deficiency of proteids in rice. The people of the sea coast supply this want by the use of marine animals, whilst inland the seeds of various leguminous plants, and notably the soya bean, are employed, as beef and other meats have only recently come into use. Tofu, therefore, may be regarded as a kind of vegetable beef prepared artificially from a plant product, and, when consumed in conjunction with rice, filling the *róle* of a nitrogenous or proteid food in the presence of a larger quantity of a carbonaceous one."

Note: This is the earliest article seen (Dec. 2005) in the *Times* (London) that contains the term "soya bean."

902. Prinsen Geerligs, H.C. 1896. Einige chinesische Sojabohnenpraeparate [Some Chinese soybean preparations]. *Chemiker-Zeitung* 20(9):67-69. Jan. 29. (Exp. Station Record 8:72). [3 ref. Ger]
• ***Summary:*** This is a German translation of the author's 1895 Dutch article, but with two mistakes concerning tempeh corrected. He changed the name of the mold from *Chlamydomucor Oryzae* to *Rhizopus Oryzae* and he changed the name of the product from "tempets" to "tempeh." He added in conclusion that "it was finely sliced and enjoyed, mold and all." But he continued, apparently mistakenly, to refer to tempeh as a Chinese soyfood.

He also improved his description of Chinese-style soybean paste, which he now calls *Tao-tjiung* (*Bohnenbrei*) [*doujiang*], and says has much similarity with the miso of the Japanese (p. 68 R.7).

Note 1. These two articles by Prinsen Geerligs ushered in the era of scientific research on tempeh by European microbiologists and food scientists.

Note 2. This is the earliest document seen (Sept. 2011) that contains the word "tempeh"–spelled with an "h" on the end.

Note 3. It is also the earliest German-language document seen (Sept. 2011) that mentions tempeh, which it calls "tempeh."

Note 4. This is the earliest German-language document seen (Aug. 2013) that uses the term *milchweisse Flüssigkeit* ("milk-white liquid") to refer to soymilk. Address: Java, Indonesia.

903. *Vegetarian Messenger* (*Manchester, England*)**.** 1896. Tofu, a Japanese vegetable cheese. Feb. p. 33-35.
• ***Summary:*** A summary of a long paragraph on tofu from an article titled "Agriculture: Crops and live stock," in the *Times* (London) (13 Jan. 1896, p. 8).

904. Corson, Juliet. 1896. A Lenten dinner: Good things that can be made in the lean season even. *New York Times.* March 8. p. 27.
• ***Summary:*** "Soya, or soy, is a favorite table sauce, which was first brought to England by officers returning from India. Small pieces of fish, poultry, and vegetables are preserved in this sauce, with the double effect of keeping them entirely sweet and making them tender... being remembered that the Chinese soya is sweet and spicy, but less peppery than the cassareep of the West Indies. The Japanese is salter [sic, saltier] and less spicy and sweet than the Chinese."

Note: "Cassareep is a thick black liquid made from cassava root, often with additional spices, which is used as a base for many sauces and especially in Guyanese pepperpot. Besides use as a flavoring agent, it also acts as a preservative" (Source: Wikipedia, Sept. 2010).

905. Hickman, J. Fremont. 1896. Forage crops. *Ohio*

© Copyright Soyinfo Center 2014

Agricultural Experiment Station, Bulletin No. 70. p. 79-107. April. See p. 85-87, 94-95, 105.

• ***Summary:*** In the section titled "Leguminous Forage Plants" is a subsection on "The Soja Bean. (*Glycine hispida.*) This is known in its native country (Japan) as the Japanese or Mongolian pea, in the United States as the 'Soja' or 'Soy' bean... In Japan the soja bean is regarded, when properly cooked, as an edible and palatable dish, being so highly esteemed that it is rarely fed to stock. The berries, when broken and boiled in water, make a fair substitute for coffee.

"In May, 1893, two varieties were planted in rows three feet apart and in hills twelve inches apart in the row; these were cultivated, much as we would cultivate potatoes, during the season. They made a very fine growth."

On 17 May 1895 a small patch (one-tenth acre) of soja beans was planted in rows, and another one-tenth acre was planted with a grain drill at the rate of one bushel per acre. A photo (Plate I, facing p. 94) shows this patch when the plants were about six weeks old. "To the right of the soja beans is a patch of rape, which is shown more distinctly in Plate II" (next page).

The soja bean plant, "like alfalfa and cowpeas, may be used in at least three ways: as a forage crop, for hay, and as a green manure, for plowing under."

"This plant has not been tested at this Station as a green manure, but, belonging as it does to the Leguminous family, and making such a large, strong growth within a single season, it would seem to have the advantage over the clovers, which take a full year to develop enough to turn under.

"From my present knowledge of this plant I regard it as one of the most promising new plants, either as a forage crop or for plowing down."

Page 105 summarizes: "*The soja bean* is one of the most promising new forage crops grown at this Station. It makes a very good yield per acre, is a hardy, rapid grower, makes a relatively good soiling crop, and promises well as a green manure." Address: M.A.S., Agriculturist, Wooster, Ohio.

906. Kellogg, John Harvey. 1896. Bean cheese: Editorial. *Modern Medicine and Bacteriological Review* (*Battle Creek, Michigan*) 5(5):112. May.

• ***Summary:*** "A variety of cheese known as *tofu* is much used by the Japanese. It is made from the soja bean, which, after soaking for twelve hours in water, is ground to a uniform pulpy mass, then boiled for an hour in three times its quantity of water, and afterward filtered through a cloth. The milky liquid thus obtained is allowed to stand two or three days, when lactic acid develops, by which the vegetable casein is separated as in sour milk. Ten per cent. of concentrated brine is added by constant stirring, which causes a flocculent precipitate. This is separated by a cloth filter, and is formed into tablets by a slow pressure.

"*Tofu* is eaten in the form of soup and in many other ways. The solid nutriment which it contains amounts to only about ten per cent. Sometimes the greater part of the water is separated by freezing, and the block of frozen *tofu* afterward allowed to thaw in the sun. When prepared in this way, the proportion of solid nutriment, chiefly fat and vegetable casein, is nearly eighty per cent."

Note 1. This is the earliest document seen (Dec. 2013) in which Dr. John Harvey Kellogg clearly mentions a soyfood product–tofu.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "frozen tofu" to refer to dried-frozen tofu. Address: M.D., Battle Creek Sanitarium, Michigan.

907. Smith, Jared G. 1896. Fodder and forage plants, exclusive of grasses. *USDA Division of Agrostology, Bulletin* No. 2. 58 p. [2 ref]

• ***Summary:*** Includes detailed discussions of the following plants (listed here alphabetically; many are illustrated): Amaranthus (p. 8)–Bigweed, pigweed, tumbleweed (fig. 2). Several species are used on the western ranges, incl. *A. blitoides.*

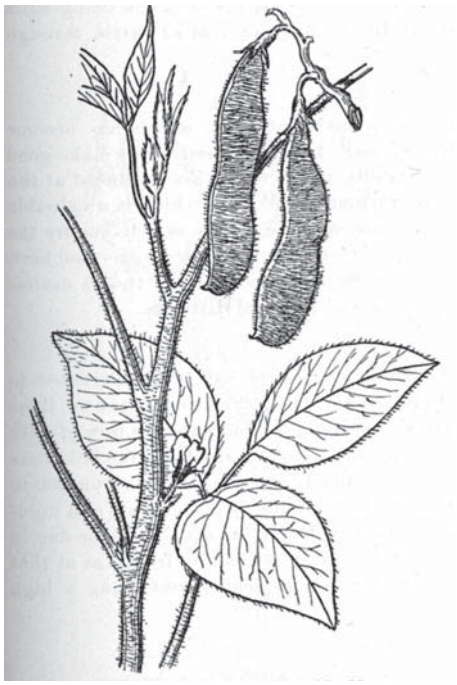
Amphicarpæa monoica (p. 8)–Hog peanut. "A wild bean, native of the woodlands and forests throughout the region east of the Missouri River, with two kinds of flowers...

Arachis hypogæa (p. 9)–Spanish peanut, peanut, ground nut, goober, earth nut (fig. 4). "An annual herb, a native of Peru and Brazil, introduced very widely in cultivation throughout the Southern States. The peanut is hardy as far north as Maryland. This is one of the most valuable fodder plants for the Southern States. There are two varieties–the one which furnishes the peanut of commerce, which requires a long season; and the Spanish peanut, which matures in about three months. The pods of the latter are smaller, and the seeds fewer and smaller, than those of the edible variety. Peanut-vine hay is more nutritious than that of red clover. The yield of nuts ranges from 50 to 75 bushels to the acre. The Spanish peanut is the one usually grown for forage... The nuts or beans are rich in oil and albuminoids. Peanut meal makes a richer stock food than cotton-seed meal. A valuable oil can be expressed from the seeds."

Cyperus esculentus (p. 15)–Chufas, hognut, ground almond (fig. 12). "A Perennial sedge, spreading extensively by underground stolons, which produce enormous numbers of edible tubers... The oil extracted from the nuts is said to surpass in excellence all other oils used for culinary purposes."

Glycine hispida (p. 21)–Soja bean, soy bean, coffee bean (fig. 17). "An erect annual legume, with hairy stems and leaves, which has been cultivated in China and Japan from remote antiquity. It was long grown in botanic gardens, but when the facts concerning its use as a human food by oriental nations came to light about twenty years ago, it was largely introduced into this country and Europe, where through trials of its forage and food value have been made...

© Copyright Soyinfo Center 2014



When fed to milch cows, a ration of soja beans increases the yield of milk, improves the quantity of the butter, and causes the animal to gain rapidly in weight. It is an excellent addition to a ration for fattening cattle. In China and Japan, where the soja bean is an article of diet, substances similar to butter, oil, and cheese, as well as a variety of dishes, are prepared from it. The yield of green forage amounts to from 6 to 8 tons per acre, and of the beans from 40 to 100 bushels. The feeding value of the bean has been found to be greater than that of any other known forage plant except the peanut."

Lotus tetragonolobus–square pod pea (p. 27). A much-branched ascending annual, closely related to the birdsfoot clover. It is a native of southern Europe [sic], and is grown there for salads and as an ornamental plant. It has been recommended by the California Experiment Station as the best winter crop for plowing under in spring as green manure. It yields from 20 to 25 tons of green fodder, equivalent to 4 to 5 tons of air-dried hay, and the roots are described as being fairly incrusted with tubercles, whose office it is to extract nitrogen from the air; and though the plant does not contain as high a percentage of crude protein as alfalfa or the clovers, it is worth as a green manure two or three times as much as either, because of the enormous amount of herbage produced. Sown in January, it will be ready to be plowed under in May. The seed should be sown broadcast thinly on freshly plowed earth and harrowed in.

Lupinus albus–White lupine. Lupinus hirsutus–Blue lupine. Lupinus luteus–Yellow lupin (p. 27-28).

Note 1. This is the earliest document seen (Aug. 2008) by or about USDA's Division of Agrostology and soybeans. On 1 July 1895, within the USDA, the new Division of Agrostology was established. Directed by Frank Lamson-Scribner, it conducted research on grasses and forage plants, especially in the Western U.S.

Note 2. This is the earliest English-language document seen (Aug. 2008) that contains the word "Agrostology" or "Agrostologist" in connection with soybeans. Address: Asst. Agrostologist, Div. of Agrostology, USDA.

908. Trimble, Henry. 1896. Recent literature on the soja bean. *American J. of Pharmacy* 68:309-13. June. [12 ref]
• ***Summary:*** One of the best early reviews of the literature, especially the Japanese and European literature, published in the United States. This paper introduced several new soyfoods (such as *natto* and *kori-dofu*) to the United States Contents: Introduction. Nutritional composition of the soja bean based on analyses of 5 samples from China, Hungary, France, and Japan. Diastatic enzyme / ferment "present in the soja beans to a greater extent than in many other leguminous seeds (see Güssmann 1890). Composition of etiolated soja shoots [sprouts]. The oil [of the soja bean]. Starch content. Sugar content. Use of soybeans as food in Japan. Miso. Natto. Tofu. Kori-dofu. Introduction of the soja bean to the United States in about 1888. Ability to obtain nitrogen from the air.

Note. This is the earliest English-language document seen (Jan. 2013) that uses the term "etiolated soja shoots" to refer to soy sprouts.

"The immediate excuse for the appearance of this paper is the fact that a number of contributions have recently appeared on the soja bean, notably from the College of Agriculture, Imperial University of Japan."

"The oil may be extracted by pressure or by means of solvents [in the laboratory]; it is said to possess some laxative properties, is of a yellowish brown color, and has a slightly aromatic odor; it is intermediate between the drying and non-drying oils." The following constants, based on Stingl and Morawski (*Chemiker Zeitung,* 1886, p. 140) are given: "Specific gravity at 15ºC: 0.924. Point of solidification: 8-15ºC. Fusing point of the fatty acids: 27-29ºC. Point of solidification of fatty acids: 23-25ºC. Temperature rise: 59ºC. Iodine number: 121.3. Iodine number of the fatty acids: 122. Saponification number: 192.5. Note: Trimble actually got these constants from *J. of the Society of Chemical Industry,* 31 May 1893, p. 453-54, which summarised an Italian-language article by De Negris and Fabris (1891), whose values confirmed those obtained by Stingl and Morawski.

Trimble (p. 311-12) gives a good, detailed description of natto based entirely on Yabe (1894). Parts of his summary perceptive: "Yabe found in this substance four kinds of microbes present, and he believes the chemical decomposition of the proteids to be due to one or more of these microbes... A chemical investigation by the author just mentioned [Yabe] revealed tyrosine, peptone, guanine, leucin and xanthine. The total proteids amounted to considerably

© Copyright Soyinfo Center 2014

more in the *natto,* when allowance is made for moisture, than existed in the original bean, and the artificial product is also considered to be much more digestible."

Concerning tofu and soymilk: "A still more interesting preparation of the soja bean than either of the preceding [miso and natto] is *tofu.* This has been described and investigated by M. Inouye (*Bulletin Imp. College of Agriculture,* Vol. 2, No. 4 [1895]). The beans are first soaked for about twelve hours in water, and then crushed between two millstones until a uniform pulpy mass is obtained. This is then boiled with about three times its weight of water, and filtered through cloth. The liquid filtrate is white and opaque, very closely resembling cow's milk, while the odor and taste remind one of fresh malt. On standing, the liquid becomes sour from the formation of lactic acid, and a coagulation of the casein takes place. The freshly boiled and filtered liquid is coagulated either by the addition of a portion of the sour liquid which has been set aside from a previous lot, or it is treated with about 2 per cent of a concentrated brine, such as is obtained as mother liquor from the preparation of sea salt."

"Somewhere about the year 1888 the soja bean was introduced into the United States. It has been tried in a number of State Experiment Stations, and is gradually working into favor in the Southern States. In Kansas the plant has been found to withstand considerable drought... The plant is valuable for forage or soiling. The beans have been produced in South Carolina to the amount of 10 to 15 bushels per acre. On account of their richness in oil they have been used as a substitute for cotton-seed meal in feeding cattle, with very satisfactory results.

"The plant is believed to have, in common with most leguminosæ, the power of obtaining some of its nitrogen from the air, and hence, of acting as a soil renovator."

Note 1. This is the earliest document seen (Aug. 2013), published in the USA, that contains the word *tofu,* or *kori-dofu* [dried-frozen tofu], or that discusses soymilk.

Note 2. This is the earliest English-language document seen (March 2003), published in the USA, that uses the word "crushed" or one of its cognates (crushing, crushers, etc.) in connection with soybeans.

Note 3. This is the earliest U.S. document seen (Sept. 2002) that mentions the use of a solvent for extracting the oil from soybeans.

Note 4. This is the earliest English-language document seen (March 2008) that contains the term "iodine number" (regardless of hyphenation or capitalization).

Note 5. This is the earliest English-language document seen (March 2008) that contains the word "drying" in connection with soy oil and its iodine number, or that states that soy oil is intermediate between the drying and non-drying oils. Address: USA.

909. Yabe, Kikuji. 1896. Kaese aus sojabohnen ["Cheese from soybeans"]. *Zentralblatt fuer Bakteriologie. Series 2.* 2(23/24):769. Dec. 24. [2 ref. Ger]

• ***Summary:*** This is a German-language review of an article from the *Nederlandsch Landbouw Weekblad.* 1896. No. 82– from *Molkerei-Zeitung.* 1896. No 43. The Japanese prepare from the Legumin-rich soybean two types of cheese, which are named miso and natto. Address: Nôgaku-shi, Imperial Univ., College of Agriculture, Tokyo, Japan.

910. Chicago City Directories, Shinzaburo Mogi, Kikkoman, Shinzo Ohki, Oriental Show-You Co. 1896-1923. Chicago, Illinois.

• ***Summary:*** The Chicago city directory shows no listings in 1896, 1902, or 1904 for Mogi or Yamato. In 1914 Shinzaburo Mogi is president of Yamato Importing Co., 824, 36 S. State in Chicago. S. Nakinura also works there. They import silks. In 1916 Shinzaburo Mogi is still president but the address is now 3rd floor, 319 West Adams. S. Kurihara is secretary. Mr. Mogi's residence is at 6050 Blackstone Ave. Mr. Tanba and Oriental Show-You are not listed.

In 1923 Shinzaburo Mogi is treasurer of Oriental Show You Co. and resides at 6210 Dorchester Ave. The listing for Oriental Show-You Co. shows Shinzo Ohki, president, Earlie Diffendarfer, vice president (residence: Columbia City, Indiana), Mitsuji Kiyohara, secretary, and Shinzaburo Mogi, treasurer. Soy mfgrs, 208 N. Wab Av. The listing for Yamato Importing Co. shows S. Mogi, president, S. Kitazawa, vice president, N. Kimura, secretary, T. Kinchi, treasurer. Whol[esale] dry goods. 305 W. Adams. Address: Chicago, Illinois.

911. **Product Name:** [Dr. Lahmann's Japan Soja].
Manufacturer's Name: Dr. Heinrich Lahmann.
Manufacturer's Address: Germany.
Date of Introduction: 1896.
How Stored: Shelf stable.
New Product–Documentation: Ad in Ellen Goodell Smith. 1896. *The Fat of the Land and How to Live on It.* A description of "Japan Soja" is given on p. 164-65. A full-page ad (p. 258) is titled "Pure. Vegetable. Nutritive." by The Hygienic Supply Co. (F. Witte), 203-205 Park Ave., Baltimore, Maryland. They are "Importers of German health goods and books" including Dr. Lahmann's Japan Soja, which "Is a pure vegetable extract, which is far superior to Meat Extract. It can be used for making soups, or may be added to other foods in order to make them more appetizing. Price per jar, $1.00." Other German imports include Dr. Lahmann's Vegetable Milk (for infants), Dr. Lahmann's Vegetable Extract, and Dr. Lahmann's Nutritive Cocoa.

Note 1. According to *Vegetarisches Kochbuch mit Gesundheit Regeln,* by Carlotto Schultz (1886), Dr. H. Lahmann of Stuttgart is an authority on the feeding of infants and problems related to indigestion. Note 2. Strittmatter (1915, p. 56) says that H. Lahmann M.D. lives in Munich, Germany.

© Copyright Soyinfo Center 2014

Note 3. Janet Barkas in *The Vegetable Passion* (1975, p. 100) states that Dr. Heinrich Lahmann was an early, influential vegetarian in Germany. "Lahmann traced many illnesses to an over-reliance on meat and unnatural medications." He was one of the first German physicians to use natural healing methods. He was the author of at least 3 major books, his sanitorium generated much enthusiasm, and, at the turn of the century, he founded a vegetarian society in Dresden.

Note 4. This is the earliest known commercial soy product made in Germany.

912. Aston, W.G. trans. 1896. Nihongi (Nihon Shoki). Chronicles of Japan from the earliest times to A.D. 697. 2 vols. London: Published for the Japan Society by K. Paul, Trench, Truebner. 443 p. [Eng]

• ***Summary:*** This incident appears in the first book, in the chapter titled "The Age of the Gods." The Deity Uke-mochi no Kami, the Goddess of food, brought forth from her mouth all kinds of foods, which were prepared and set out on 100 tables for the entertainment of the Deity Tsuki-yomi no Mikoto. Seeing this, the latter "became flushed with anger and said:–'Filthy! Nasty! That thou shouldst dare to feed me with things disgorged from thy mouth.' So he drew his sword and slew her."

Then the Sun Goddess, Ama-terasu no Oho-kami [also called Amaterasu-omikami, the Shinto Sun Goddess], sent another messenger, Ame-kuma-bito, to see the Goddess, who "was truly dead already. But on the crown of her head there had been produced the ox and the horse; and on top of her forehead there had been produced millet; over her eyebrows there had been produced the silkworm; within her eyes there had been produced panic [*Panicum* millet]; in her belly there had been produced rice; in her genitals there had been produced wheat, large beans and small beans."

Two footnotes explain that, according to Hepburn, "large beans" refer to soybeans (*Soja hispida*), and "small beans" to azuki beans (*Phaseolus radiatus*).

"Ame-kuma-bito carried all these things and delivered them to Ama-terasu no Oho-kami, who was rejoiced, and said:- 'These are the things which the race of visible* men (*as opposed to the unseen gods) will eat and live.' So she made the millet, the panic, the wheat, and the beans the seed for the dry fields, and the rice she made the seed for the water-fields" (p. 27).

Note 1. Aston is a very famous early Japan scholar, born in 1841. Reischauer and Fairbank (1960, p. 464) cite this as *Nihon shoki* (*History of Japan,* also known as the *Nihongi*), compiled in A.D. 720.

Note 2. The 1896 edition of this book is very rare. In 1924 the original edition published by the Japan Society was reissued as two volumes in one. The story cited above appears on p. 32-33. In addition, the "five kinds of grain" (including hemp, millet, rice, corn and pulse) are mentioned on p. 21 and p. 278. Address: C.M.G., England.

913. Gregory, James J.H., & Sons. 1896. Catalog of home grown seeds. Marblehead, Massachusetts. 72 p.

• ***Summary:*** In the section titled "Grains, Grasses and Forage Plants," page 36 states: "Soja or Soya Bean. The 'American Coffee Berry.' Under the name of American Coffee Berry this Japanese bean is being sold in the West at fabulous prices. It does not even belong to the coffee family of plants, still it is a fact, as we find by actual test, that when roasted and *coarsely* ground it tastes so nearly like Brazilian coffee the difference is scarcely perceptible. It certainly is the best of all substitutes for coffee yet found, and as there is nothing injurious about it, it being the most nutritious of all vegetable products, and as it can be raised almost anywhere where corn will mature, and yield from twenty to thirty bushels per acre, we believe that the time is not far distant when it will be quite generally raised as a substitute for cheaper varieties of coffee. The extraordinary richness of the seed makes them an excellent home substitute for cotton and linseed meal for feeding purposes. Cows are very fond of the ground beans, and the meal mixed with corn meal makes valuable food for poultry. Price per quart, postpaid, 45 cents; per package, 10 cents.

"Varieties–We have grown many varieties imported chiefly from Japan and have selected three to catalogue.

"Extra Early Dwarf.–This will mature wherever bush beans will. It grows two feet high and bears a chocolate-colored bean. Price, per quart, postpaid, 45 cts.; per package, 10 cts.

"Medium Early.–This will mature as far north as central New England, grows three feet in height, is an abundant cropper, bearing round, straw-colored beans. Price, per peck, per express, $1.25; per quart, postpaid, 45 cts.; per package, 10 cts.

"Late or Ensilage.–These varieties cannot be relied on to ripen north of southern New England, but for ensilage purposes they can be successfully raised in middle New England. Plants four feet high; beans varying in color. Price, per bushel, per express or fright, $3.00; per peck, $1.00; per quart, postpaid, 40 cents; per package, 10 cents.

"Both Medium Early and Late are excellent sorts to use for ensilage, layer and layer with corn, for they greatly enrich the ensilage, contributing the rich nitrogenous element in which the corn stalks are markedly deficient. For this purpose the stalks should be cut when the beans are about full sized. They not only help the yield of milk but keep the cows in better flesh, and add decidedly to the richness of the manure pile, making it worth as much again for plant food as that made from corn stalks." An illustration shows a soja bean plant containing many pods.

Other plants listed in this catalog include: Alfalfa or lucerne, Japan clover (*Lespedeza striata*), golden wonder Millet, kaffir corn, manshury barley, Japanese buckwheat,

© Copyright Soyinfo Center 2014

yellow doura, prickley comfrey [prickly comfrey], milo maize, Japanese millets, and sacaline (*Polygonum Sachalinense*).

This catalog is owned by the Smithsonian Horticulture Branch Library in Washington, DC.

Note: This is the earliest document seen (Aug. 2013) that mentions the soybean variety Extra Early Dwarf. Address: Marblehead, Massachusetts.

914. Nishimura, Eijuro. 1896. Miso shôyu jôzôhen [Miso and shoyu fermentation]. Tokyo: Hakubunkan. 316 p. See p. 18. 20 cm. Series: Tsuzoku nichiyo kagaku zensho, no. 11. [Jap]*

• ***Summary:*** More than 90% of the protein in soy beans is in the form of albuminoids.

Note: This is the earliest book in WorldCat / OCLC that has miso as a subject or title word.

915. Skeat, Walter William. 1896. A concise etymological dictionary of the English language. 4th ed., further revised with enlarged supplement. New York, NY: Harper & Brothers, Publishers. xii + 633 p. See p. 453-54, 611.

• ***Summary:*** The etymology of the word "Soy" states (p. 453-54): "Soy, a sauce. (Japanese.) Also *sooja,* 'which has been corrupted into 'soy;' Eng. Cycl. Japanese *shóyu,* soy, sauce; though the name is now given to the bean (*Dolichos soja*) whence *soy* is made."

In Appendix 6, "Distribution of words according to the languages from which they are derived," is a section (p. 611) "19. Words of Asiatic origin, but neither Aryan nor Semitic." Under "Japanese" are listed only two words: "japan, soy." Address: Rev., Litt.D, LL.D., Elrington and Bosworth Prof. of Anglo-Saxon in the Univ. of Cambridge [England].

916. *Bruce Herald* (*Otago, New Zealand*). 1897. Miscellaneous. Jan. 12. p. 6.

• ***Summary:*** "Vegetable meat of Japan, called "torfu" [sic, tofu], is said to consist chiefly of protein of the soya bean, and to be as nutritious and digestible as meat. It is sold in tablets, is white as snow, and tastes like fresh malt."

917. Hanai, T. 1897. Physiological observations on lecithin. *Bulletin of the College of Agriculture, Tokyo Imperial University* 2(7):503-06. Feb. [9 ref. Eng]

• ***Summary:*** "Seeds rich in starch generally contain much less lecithin than such as are rich in proteid, thus barley grains contain less than half the amount of lecithin that soja-beans do (see Schulze & Steiger 1889, *Hoppe-Seyler's Zeitschrift für Physiologische Chemie,* Vol. 13). Probably there is also a larger proportion of lecith-albumin in the seed of soja and lupin than in those of squash and barley.

Note 1. This is the earliest English-language document seen (Aug. 2003) that contains the term "albumin" (or "albumins") in connection with soy.

Note 2. In this article, Hanai did not investigate soybeans; he studied only the leaves of the tea plant (*Thea chinensis*) and the bark of *Prunus Cerasus.* Address: Nôgaku-shi, Japan.

918. Tokio Nurseries Co. 1897. General catalogue of plants, bulbs, seeds, &c. &c. Tokio, Japan. v + 53 p. 25 cm. [Eng]

• ***Summary:*** In the section titled "Vegetable seeds" (p. 45-50) is a subsection on "Pulse" (p. 47-48). The first entry is: "Soya Hispida, glycine hispida, soy bean, wide cultivation of this bean in the East, is used in the preparation of Japanese Soy [sauce], of Vegetable Bean Cheese [tofu], as well as Green fodder and manure. Thus the bean forms one of the staple products of Japan.

"'Early Variety,' sow April, crop in June. $1.20 per 10 lbs. $12.00 per 100 lbs.

"'Late Variety,' sow May, crop in August, eaten only when fully boiled down. $2.00 per 10 lbs. $18.00 per 100 lbs."

Other species of pulse listed are: *Phaseolus Mungo var. subtrilobata* ([azuki], 4 varieties; "'Common,' a very hardy productive one, sending out bushy crowns. The beans are crushed and made into sweets. $1.00 per 10 lbs." Also: White, Black-Eyes, New Prolific), *Phaseolus Mungo var. radiatus* ([mung beans]; "green podded, which when smashed is made into sweets, June-Sept., $1.50 per 10 lbs."), broad beans, peas ("Ordinary pisum sativum, also used in the preparation of viscous soy" [sauce]), red pea, *Dolichos Lablab, Mucuna Capitata,* French beans, Speckled Partridge ("correct botanical name is not yet identified"), *Canavalia ensiformis.*

"Cable address: Nurseries Co., Tokio. Headquarters for lily bulbs, Cycas revoluta, Japanese plants and seeds." On the cover are two photos: (1) A horse pulling a two-wheeled cart loaded with boxes. (2) People packing things into trays and baskets outdoors.

Note 1. This is the earliest Japanese seed catalog seen (Dec. 2004) that mentions soybeans.

Note 2. This is the earliest Japanese seed catalog seen (Dec. 2004) that contains one or more photographs.

Note 3. This is the earliest English-language document seen (April 2012) that mentions a non-soy sauce made from peas that resembles soy sauce. Address: Komagome, Denchu, Tokio, Japan.

919. Williams, Thomas A. 1897. The soy bean as a forage crop. *Farmers' Bulletin* (*USDA*) No. 58. p. 1-19. March. Revised (very slightly) in 1899. [7 ref]

• ***Summary:*** Contents: General characteristics and origin. Varieties. Conditions of growth. Methods of culture. Harvesting. Yield. Chemical composition. Digestibility. Value and uses: As a soiling crop, as a silage crop, as a hay crop, as a pasture plant, as a soil renewer, value of the bean for feed. Summary. Appendix–Soy beans as food for man.

© Copyright Soyinfo Center 2014

In the letter of transmittal printed at the front of this bulletin, F. Lamson-Scribner (USDA Agrostologist) says: "For reasons set forth in the body of this bulletin [see p. 4], the name 'soy' has been adopted to 'soja,' by which it has been generally known.

"In 1875 Professor Haberlandt began an extensive series of experiments with this plant in Austro-Hungary, and in a work published in 1878 he gave the results of his studies and strongly urged the cultivation of the soy bean as a food plant for both man and beast. Although he succeeded in exciting a great deal of interest in its cultivation while making his experiments, and distributed a considerable amount of seed, very little seems to have come of it; for at his death, which occurred in 1878, the interest flagged, and the soy bean has failed to obtain the place as a staple crop which he prophesied for it."

"It is only within the last 15 years that it [the soy bean] has received much attention as a forage crop." Robert C. Morris of Illinois grew soy beans in 1896.

"The term 'soy' applied to this bean is derived from a Japanese word 'shoyu,' denoting a certain preparation from the seeds which is a favorite article of diet in that country. The term 'soja' is often used in connection with this plant, but Professor Georgeson, who spent some time in Japan, and who, since his return to this country, has experimented extensively with this plant, says [1892, "Test of some Japanese beans"]: 'The term *soja,* often applied to this bean, is misleading, inasmuch as the species named by Siebold and Zuccarini *Glycine soja* is not cultivated there (Japan), or at least rarely cultivated, though wild in the south...'" (p. 3-4). Note 1. Prof. Georgeson played an important role in changing the name of this plant to soy bean from soja bean.

"Varieties (p. 5-7): The different varieties of soy bean are distinguished largely according to the color, size, and shape of the seed, and the time required for the plants to reach maturity. They also differ more or less in the habit of growth and in the character and degree of the hairiness of the various parts of the plant. The names applied to the varieties here in the United States usually refer to the time of reaching maturity and the color of the seed; as, for example, 'Early White,' 'Medium Late Green,' 'Medium Black,' etc. The early varieties generally fruit heavier in proportion to the size of the plant than the later ones, and hence are better to grow for seed, while the medium or late varieties are better for forage on account of the larger yield of fodder that may be obtained.

"The 'Early White' soy bean is an excellent variety to grow when a crop of seed is desired, particularly in the North, where the growing season is likely to be short... 'Medium Early Green' is one of the best varieties to plant for hay, as it yields heavily and retains its leaves well. For soiling or for ensilage 'Medium Early Green,' 'Medium Early Black,' or the 'Late' green or black varieties may be used, according to the length of the season and the time at which the crop is to be used. In the New England States the 'Medium Early Green' variety is generally preferred, while in the Central States 'Medium Early Black' seems to be the favorite... For green manuring the large medium or late varieties are best; 'Medium Late Black' being excellent for this purpose."

Harvesting: The "best forage will be obtained by cutting just as the pods are forming... In harvesting a crop for the seed, the plants may be pulled by hand or cut with a scythe or mower and gathered into small piles, which should be relatively high and of a small diameter, so that the plants may dry out readily. Thrashing can be done with a flail or with the thrashing machine. Very good results can be had with common grain thrashers by taking out a portion or all of the concaves and substituting blanks."

The subsection titled "As a pasture plant" (p. 16) states: "In some parts of the country, particularly in the South, the soy bean crop is often pastured. Although hogs are perhaps most frequently used, all kinds of stock can be pastured on it. The crop can often be fed in this manner to great advantage. The labor and expense of harvesting is saved and the droppings from the animals are of great value to the land. Young stock, particularly sheep and hogs, can be very profitably pastured on this crop. Many farmers maintain that by this method of feeding the land is benefited as much as if the crop had been plowed under, and they obtain the pasturage in addition."

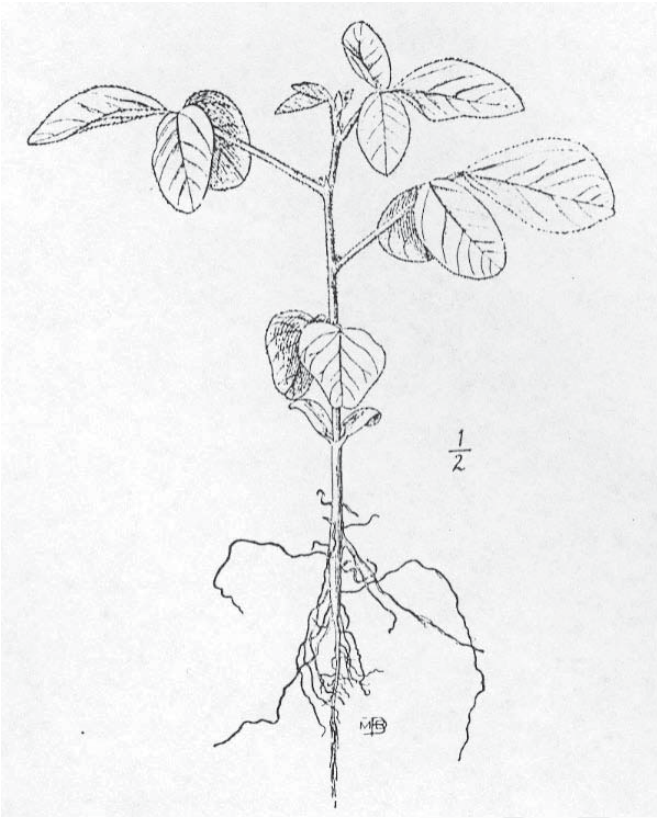
The subsection titled "As a soil renewer" (p. 16-17) states: "Leguminous plants, through the aid of the root tubercle organisms, are able to add to the available nitrogen of the soil... When the soy bean was first introduced into the United States it did not form root tubercles, owing to the absence of the tubercle organism from the soil, and it has been grown for several years in some localities without the appearance of any tubercles. In other cases the tubercles have developed in great abundance after a short time. At the Massachusetts (Hatch) Station the medium green soy bean produces great numbers of the tubercles. (See fig. 5.) At the same station it was found that a liberal application of nitrates interfered with the development of the tubercles."

"Value of the bean for feed: There is no crop so easily grown that is so rich and can be used to such good advantage in compounding feeding rations as the soy beans. Excepting the peanut, there is no other raw vegetable product known which contains such high percentages of protein and fat in such a highly digestible form.

"For feeding to animals the beans should be ground and the meal used with some less concentrated feeding stuffs. Comparatively few experiments have as yet been made in the United States to test the feeding value of soy-bean meal. Professor Brooks, in Massachusetts, found that it compared very favorably with cotton-seed meal. Cows fed on soy-bean meal gave richer milk and produced a better quality of butter than when fed on cotton-seed meal, but on the latter the

© Copyright Soyinfo Center 2014

cream was richer. Professor Georgeson obtained excellent results in feeding hogs on a ration of which soy-bean meal was a prominent constituent" (See Bulletin No. 61 of the Kansas Station).



Excellent illustrations (line drawings, some made from photos, p. 4-7, 17; see also next page) show: (1) A young seedling soy bean (½ size). (2) (a) flowering branch of a soy bean plant (reduced 2/3). (b) one of the flowers (enlarged), (c) pods of a soy bean plant (reduced 2/3). (3) Extra early soy bean, leaves and roots at age 7 days (¼ size). (4) Medium black soy bean, leaves and roots at age 7 days (¼ size). (5) Roots of a soy bean plant, showing tubercles.

Tables show: (1) Composition of soy bean at four different stages of growth. (2) Chemical composition of the various kinds of forage made from the soy bean (incl. hay and ensilage). (3) Total amounts in pounds of food constituents produced on an acre of land by soy bean and fodder corn (proteins are flesh formers; fat, fiber, and extract matter are fat and heat producers). (4) Digestibility of soy-bean forage.

An appendix to this article is titled "Soy Beans as Food for Man," by C.F. Langworthy (which see).

Note 2. This is the earliest document seen (Jan. 2003) that uses the word "mower" or the word "concaves" in connection with soybean production.

Note 3. This is the earliest English-language document seen (Jan. 2003) that uses the word "machine" (thrashing machine) in connection with a specific machine for soybean production.

Note 4. This is the earliest document seen (Aug. 2013) that mentions the soybean varieties Medium Early Black, Medium Early Green, or Medium Late Black.

Note 5. This is the earliest document seen (Oct. 2004) which gives details on use of soy bean as a good "pasture plant" or a pasture plant well suited for use in fattening hogs.

Note 6. This is the earliest English-language document seen (Oct. 2004) that uses the words "pasturage," "pasture," or "pastured," or the term "pasture plant," in connection with soybeans. Address: Asst. Agrostologist, Div. of Agrostology, USDA.

• ***Summary:*** The section titled "Japan: Past and present" states: "Twenty years ago she [Japan] was an isolated nation, untalked of among the nations of the west; but she is now a great military, manufacturing, and commercial power, combining the maritime instincts of Britain with the go-aheadism of America, and so becoming the combined John Bull and Yankee of the Pacific. So afraid have the United States become of the competition of the lively Japs that one of the planks in the last election was exclusion of the Jap and his products." These protectionist measures are bound to fail for two reasons, which are given.

Japan is facing labour troubles and a rise in the cost of living, as a table shows. If 100 "is taken as the unit of cost of living in 1872," then "the figures below show the amount of advance since [to about 1897]:–Rice 100 to 161. Miso 100 to 189. Shoyu 100 to 158. Firewood 100 to 141. Charcoal 100 to 150. Cotton 100 to 150. Rent 100 to 228–or an average increase of 64 per cent., while wages have gone up only 33 per cent., or little more than half as much."

923. Nishimura, Y. 1897. The chemistry of soja sauce manufacture. *Bulletin of the College of Agriculture, Tokyo Imperial University* 3(3):191-206. June. German summary in Chemisches Central-Blatt 1897(2):817. [5 ref. Eng]
• ***Summary:*** Contents: Introduction. Preparation of wheat and soja bean. Preparation of soja koji. Chemical processes during the ripening of soja sauce wort (*moromi*). Microscopical examination. The production of the flavour. Suggestion for the improvement of manufacture.

"The manufacture of soja sauce forms one of the important industries of Japan and the export of the article [is] increasing from year to year. (Footnote: Every Japanese uses daily in place of common salt from 50 cc. to 80 cc. of this sauce as a food condiment.) The production in 1893 was 2,307,844 hectoliters (=1,279,238 koku). The number of brewers was now nearly 10,000. One of the factories in Tokio alone employs 250 workmen and manufactures annually 45,000 hectoliters."

This is a detailed description of the process for making koji, moromi, and soja sauce, and an attempt to improve the process and product, and to reduce the fermentation time. Making soja sauce consists of four principal stages: Preparation of the wheat and soja bean, preparation of the soja koji, the ripening process, and pressing and boiling. "Soja sauce is prepared from wheat (sometimes also from barley), the soja bean,* and a salt solution by a slow process, which requires from one to two years and sometimes more. (Footnote: *"The so-called yellow soja bean (*itachi*) which principally serves for the manufacture of soja sauce is rather small and has a certain lustre... All materials for my investigation were obtained from the great soja sauce factory, *Asamasa,* at Nakano near Tokio)."

"It was clear to me that the whole ripening process consisted principally in the action of the powerful enzymes of *Aspergillus oryzae* upon the carbohydrates and proteids in the soja bean and wheat, and further in the development of an agreeable flavour" (p. 19).

"As the present method of manufacture of soja sauce requires much time and therefore a considerable amount of unremunerative capital, it seemed to me of great importance to find some way by which the process could be shortened. Two points seemed to me worthy of consideration. 1. To hasten the action of enzymes. 2. To produce the agreeable taste and flavour in the same measure as the enzyme action is hastened" (p. 200).

First the author crushed freshly prepared moromi so as to increase the surface area acted upon by the enzymes. Then he diluted the moromi with an equal amount of water and heated the mixture to a temperature of 30-35ºC for 1 week. But the normal flavour of good soja sauce had not developed. "The colour of the mixture was dark brown and its taste decidedly sour. To the mixture just mentioned was added 2% cane sugar and 2 c.c. of thick sake yeast for 300 grams of the mixture, and this was again digested at 30-50ºC for 12 days. In this case the flavour was more agreeable and the taste not sour." The author also recommended the direct addition of alcohol in the form of sake or *nigori* (crude sake) to improve the flavour. In this way he was able to make soja sauce with a good odour and taste in 5 weeks. He then tried making soja sauce with germinated soja beans [sprouts], but no real advantage was gained.

Note. This is the earliest English-language document seen (Jan. 2013) that uses the term "germinated soja beans" to refer to soy sprouts.

Microscopical examination demonstrated that "the membranes of the cells of the wheat-endosperm and of the seeds of the soja bean, had been attacked and partially dissolved; only the husk of the wheat had resisted completely. This action must be due to the powerful enzyme derived from the *Aspergillus oryzae* developed during the preparation of the koji." "The mycelium observed was mostly due to *Aspergillus* and *Penicillium.* The small elliptic yeast cells observed resembled *Saccharomyces exigus* while the large kind of yeast resembled the sake yeast" (p. 203). Bacteria were observed during the summer on the surface of the moromi, but could never be found alive in its interior.

The gradual production of alcohol seems to affect the development of flavour.

The article concludes: "I hope that the manufacture of soja sauce will be improved, however, not only by adopting the measure I propose, but also by introducing steam power and other modern appliances."

Note 1. This is the second earliest English-language document seen that contains statistics on the production or consumption of soyfoods (in this case soy sauce) in Japan.

Note 2. The parallel Japanese title of this English-language periodical is *Tôkyô Teikoku Daigaku. Nôka Daigaku. Gakujutsu hôkoku.* Address: Nôgakushi.

924. Langworthy, C.F. 1897. Soy beans as food for man. *Farmers' Bulletin* (*USDA*) No. 58. p. 20-23. July 7. Revised (very slightly) in 1899. [1 ref]
• ***Summary:*** Describes and gives the nutritional composition of various Japanese soyfoods, including natto, miso (white, red, or Swiss), tofu, frozen tofu, yuba, shoyu. Many of his descriptions of soyfoods are based on Trimble (1896).

"Tofu, or bean cheese, is prepared as follows: The beans are soaked in water for about twelve hours, and crushed between millstones until of a uniform consistency. The ground material is then boiled with about three times its bulk of water for about an hour, and filtered through cloth. The filtrate is white and opaque, having somewhat the appearance of milk. It has, however, the taste and smell of malt. This milky liquid, to some extent, resembles cow's milk in composition, as is shown by the following table:" The table, titled "Comparison of the composition of soy-bean milk and

© Copyright Soyinfo Center 2014

cows' milk," shows that the two liquids (soy / cow) have the following composition: Water 92.53% / 86.08%, albuminoids 3.02% / 4.00%, fat 2.13% / 3.05%, etc.

"The protein in soy-bean milk is precipitated by adding the mother liquor obtained in the manufacture of salt from sea water, which contains considerable magnesium chloride. The precipitate is filtered off and formed into cakes with the hands. It is eaten in the fresh state or frozen. In the latter case it loses part of its water."

"Though these soy-bean products are prepared chiefly in Japan and other eastern countries, their manufacture has been attempted to some extent in Switzerland and elsewhere..."

"Bean sausages in considerable variety are prepared in Germany, and formed part of the ration of the German soldier in the Franco-Prussian war. So far as can be learned, these are always made from ordinary varieties of beans and not from soy beans...

"Under the name of coffee beans, soy beans are eaten to some extent in Switzerland as a vegetable, and dried and roasted are also used as a coffee substitute. Their use for this latter purpose is not unknown in America. The attempt has recently been made by certain dealers to place the soy bean on the market as a new substitute for coffee and to sell it under other names at an exorbitant price.

"Bulletin No. 98 of the North Carolina Experiment Station recommends soy beans as a palatable vegetable when prepared as follows: Soak the beans until the skins come off and stir in water until the skins rise to the surface and then remove them. Boil the beans with bacon until soft, season with pepper, salt, and butter, and serve hot. If the beans are green the preliminary soaking may be omitted. No other references to the use of soy beans for human food in the United States have been found."

Note 1. This is the earliest English-language document seen (Aug. 2013) that contains the term "soy-bean milk." It is also the earliest U.S. government document or USDA document seen (Aug. 2013) that uses the term "soy-bean milk" (or any other term containing the word "milk") to refer to soymilk.

Note 2. This is the earliest document seen (Jan. 2005) concerning the work of the USDA with nutrition (or home economics) and soybeans. Address: Office of Experiment Stations, USDA, Washington, DC.

925. *Consular Reports* [*USA*]**.** 1897. New tariff in Japan. 55(204):91-101. Sept. See p. 97. [Eng]
• ***Summary:*** This tariff was annexed to the "protocol of the Anglo-Japanese Treaty, signed at London, July 16, 1894." Edwin Dun, U.S. Minister, in Tokyo, sends a translation of the tariff law and states that the budget for the year 1897 was passed without amendment by both branches of the Japanese Diet, so this statutory tariff bill regulates the customs dues to be levied in all cases wherein Japan is not bound by treaty stipulations.

Under "Section X.–Oil and wax," we read: "Bean or pea oil"–10% ad valorum tax.

Note: Japan's first modern legislature, the Imperial Diet, was established in 1890 under the Meiji Constitution.

926. Ward, A.B. 1897. An agricultural experiment station. *New England Magazine* 15(1):65-81. Sept. See p. 78.
• ***Summary:*** Discusses the origins of the experiment station at Connecticut and the pioneering work in the new field agricultural microbiology.

Over the past fifty years, since the farm and laboratory have joined hands, "advance has been steady and secure. But little more than forty years ago, Sir John Bennet Lawes and Dr. J.H. Gilbert were establishing their station at Rothamsted, Boussingault [1802-1887] was experimenting in his laboratory in Alsatia [Alsace, France], and, best of all, the farmers in Möckern, in Saxony [later part of Germany], were petitioning the government to assist them in founding a station to study the questions arising their work.

"It was in emulation of Möckern that American scientists sought to provide Connecticut with similar advantages;...

"Japanese beans, with broad low leaves flapping in the wind and curious pods which seem to have slid from a Satsuma jar or a Banko teapot. There are two classes of these beans–the Japanese Soja or Soya bean, 'the delicious soy,' of which there are seven varieties under cultivation, and a smaller, thin-skinned bean which, boiled, sifted, sweetened and colored, forms a favorite Japanese confection."

927. *New-York Tribune***.** 1897. Dinner at the Japanese legation: There are some peculiarities in the menu, though not many. Oct. 17. p. C14.
• ***Summary:*** "Chickens, too, are served in a peculiar way. They are cut up into small squares, fried and then dressed with a sauce called 'shoyu,' which the Japanese say is the origin of the so-called Worcestershire sauce."

928. *New Zealand Tablet* (*National*)**.** 1897. Science notes: The flavours of butter and cheese. Oct. 22. p. 27.
• ***Summary:*** "We learn some curious facts about butter and cheese from that section of Professor Marshall's learned Presidential Address on Botany, at the meeting of the British Association, which was devoted to the bacteriology of the dairy. To different forms of bacteria, he tells us, are due the distinctive flavours of varieties of butter and cheese..."

"The lecturer suggested that interesting results might be obtained from the investigation of the vegetable cheese [tofu] made in China and Japan from the curd of the soy bean, which is allowed to become mouldy in the process" [fermented tofu].

929. *Star* (*Canterbury, New Zealand*)**.** 1897. In a Japanese inn. Oct. 23. p. 8.

© Copyright Soyinfo Center 2014

• ***Summary:*** From *St. James's Budget:* The writer, who stayed in a traditional Japanese inn (*hatoga*), described eating a meal there. "The European traveller will be confronted with a variety of surprises." Of the soups, he liked the *wan mori* (clear soup) best. *"Chawan mushi,* or soup with eggs in it, thick and custard-like, containing minced meats, fish, vegetables, &c.; and miso shiru, or bean soup [miso soup], are also palatable.

"It is only within the last few years that the Japanese have begun to eat meat. Now, however, in most of the inns on the main roads *ushi nabe* will appear on the menu. This dish is composed of beef cut up small, stewed and served *aux fines herbes,* together with a liberal admixture of soy [sauce]. *Tori nabe,* or stewed fowl, is a similar dish and most appetizing. Soy gives a strong flavouring also to another esteemed dish, *unagi meshi,* or eels and rice."

930. *Times* (*London*). 1897. The condition of Japanese agriculture. Nov. 2. p. 3, col. 6. [1 ref]
• ***Summary:*** The Department of Agriculture and Commerce in Tokyo has recently issued a report on Japanese agriculture. It shows the agricultural wealth of the country and the relative importance of various crops and other productions. Rice is the most important crop and during the past 10 years the area devoted to its cultivation has steadily increased. "Japan consumes all her own rice and produces enough for her own consumption in an average year... The total yield of the three grains, barley, rye, and wheat is increasing, and is now about half the yield of rice... The growth of the soya bean and Italian millet has declined steadily" in recent years.

931. Davenport, E. 1897. The cow pea and the soja bean. *Illinois Agricultural Experiment Station, Circular* No. 5. 4 p. Dec. 1.
• ***Summary:*** "The cow pea, which is essentially a bean, and the soja bean, which is a pea, are so similar in nature and use as to be closely associated in the public mind and to make it expedient to treat of them in close connection. Both are natives of Southeastern Asia, where the seed is used principally as human food and the vines as stock food. In this country they are used almost exclusively for stock."

"The cow pea is more spreading, makes more hay and of better quality, because the soja bean, though very upright, has a woody stem, and drops its leaves badly... The cow pea succeeds best in the South... The soja bean has been but recently introduced from Japan, succeeds best in the North and fails utterly in the far South. Both may be sown either broadcast or in drills, but both yield more seed from drills. Both enjoy good land, but will grow upon land 'too poor to raise anything else.'... The cow pea has more than 60 varieties ranging from two to five months for maturity, and from upright to trailing in habit; the soja bean has few varieties and they are all upright."

Table 1 shows the composition and digestibility of the cow pea and the soja bean (green, hay, and seeds) in comparison with that of Indian corn. The hay from soja beans is inferior for reasons given above.

"The two common varieties of soja beans are the Black Medium and the Early White, or Improved White. Of these the first seems to give the ranker growth of vines and the latter the heavier yield of seed." Address: Director of the Station, Urbana, Illinois.

932. Angell, Stephen H. 1897. Soya as food and fodder. *Consular Reports* [*USA*] 55(207):551-52. Dec. [2 ref. Eng]
• ***Summary:*** A remarkable article about all aspects of soybeans and soyfoods. It begins: "The following is a translation from an article by M. Henri Fortune, the well-known French agriculturist. 'There exists a plant extensively cultivated throughout China, Japan, Cochin China, and Tonquin, of which the culture on clay and flinty clay lands would be an excellent experiment for agriculturists and persons interested in the progress of agriculture. This plant acclimatizes perfectly in Belgium.

"'It is employed in the above countries as a food and for divers other purposes. Transformed by cooking into a pulp, which is mixed with salt and rice, we obtain the 'miso,' which constitutes the regulation breakfast of the Japanese. I have eaten this preparation in Yedo [Edo, Tokyo] in 1892, and I found it excellent in taste and very nourishing.

"'Mixed with barley, fermented with water and pressed, this product yields a sirup known as the "soya," which is, so to speak, the unique sauce for all and every Japanese dish, and is employed in such large quantities that the works in the town of Nagasaki have a yearly production of 2,000 tons. The soya also yields a very superior quality of oil, which advantageously replaces olive oil.'"

"'The bread made from the flour of the soya is as good as cake without sugar, and is very appetizing, and is not to be compared with gluten bread, which constipates.'" Fortune believes that 'soya bread is twice as nourishing as wheaten bread, five times as poor in starch, and ten times as rich in fatty materials, and, once its qualities are fully known, the soya may be pronounced the bread of the future.' He recommends the use of soya in bread and biscuits for diabetic diets.

"'In China, the soya replaces milk, which the Chinese do not drink at all. To make this milk, the grain must be crushed, put in a sieve, water slowly poured over it, and a product obtained having all the qualities of milk.

"'The cheese made from soya is delicious. The grain is softened in water and pounded in a mortar. The pulp compressed in a cloth gives two parts; that which is hard is used to feed poultry, etc., and the other, which passes through the cloth, is albumen, and is put on the fire, the curds separated with the aid of rennet, and, when coagulated, a little salt is added.'"

Of green vegetable soybeans he writes: "'We have a

© Copyright Soyinfo Center 2014

project in hand to call together the principal Paris restaurant keepers this winter, to allow them to partake of this new vegetable, which will advertise it throughout the world under the patronage of such substantial connoisseurs.

"'In a few years hence, one will buy soya at the grocers, as to-day one buys beans. It is an excellent substitute for hay, and keeps horses in good condition, and cows, when fed on it, will yield at least 20 per cent more milk daily than when fed on ordinary hay.

"'The soya produces per hectare (2.471 acres) from 2,500 to 3,000 kilograms (5,512 to 6,614 pounds) of seed, especially if phosphate fertilizers are sufficiently employed.'"

Note: This is the earliest document seen (Feb. 2001) concerning soybeans in Belgium, or the cultivation of soybeans in Belgium. This document contains the earliest date seen for soybeans in Belgium, or the cultivation of soybeans in Belgium (Dec. 1897). The source of these soybeans is unknown. Address: Commercial Agent, Roubaix, France July 13, 1897.

933. Japan. Dep. of Agriculture and Commerce, Bureau of Commerce (Noshomusho Shokokyoku). 1897. General view of commerce & industry in the empire of Japan. Tokyo: Printed by Y. Yamaguchi. 315 p. See p. 22-23, 234. Also published in 1900 in Paris by M. de Brunoff)
• ***Summary:*** Name of organization with diacritics is: Nôshômushô Shôkôkyoku. Page 5: "The treaty ports or towns open to foreign trade are: Yokohama and Tokyo, on the Bay of Tokyo. Kobe and Osaka on the Bay of Osaka. Niigata, on the western coast of Honshiu [Honshu]. Hakodate, on the Tsugaru Strait. Nagasaki, on the south-western coast of Kiushu [Kyushu]. Kelung, Tamsui, Takow, and Taiwan on the western coast of Taiwan. Ten partially opened ports in Japan and three in Corea [Korea] are also listed.

On pages 18-22 are tables of Japanese weights and measures and comparative tables with those of the empire of Great Britain, including both troy and avoirdupois.

Agriculture and mining (p. 22-23): Agriculture has been the leading pursuit of the people since earliest times and in the greater part of the cultivated area rice is grown; other principal food crops are wheat, barley, and soya beans. Industries not imported from the west include "salt making, sugar making, sake brewing, soy brewing, oil producing,... (p. 23).

Imports–Class II.–Duty free goods (p. 228) includes: "Grain, including rice, paddy, wheat, barley, oats, rye, peas, beans [incl. soya beans], millet, Indian corn. Flour and meal prepared from the above. Oil cake [when imported from Manchuria, this was typically soya bean cake].

Exports–Class II.–Duty free goods (p. 232-34) includes: "All kinds of mushrooms, excepting Shiitake, Confectionaries, all kinds of liquors, Vinegars, Soy [sauce], Oils, and Prepared Tobacco... Sea-weeds excepting Kobu [Kombu, seaweed],..." Address: Tokyo, Japan.

934. Lafar, Franz. 1897. Technische Mykologie. Ein Handbuch der Gaerungsphysiologie... Erster Band: Schizomyceten-Gaerungen [Technical mycology. A handbook of fermentation physiology... Vol. 1: Schizomycetic fermentations]. Jena: Verlag von Gustav Fischer. xiii + 362 p. See p. 290, 305-15. Illust. No index. 25 cm. Foreword by Prof. Dr. Emil Chr. Hansen (Carlsberg-Laboratorium, Kopenhagen [Copenhagen]). [7 ref. Ger]
• ***Summary:*** The introduction gives a detailed early history of the discovery of fermentation, microorganisms and *Mikrozymen / Mikrozyma* (microzymes) (including the work of Needham, Spallanzani, Franz Schulze, Theodor Swann, Schröder and Dusch, Louis Pasteur, and Béchamp), its relation to spoilage, the development of fermentation theory, and the nature of the fermentation organisms.

In Chapter 31, "Cheese fermentations and related decompositions," section #179 is titled "Natto and miso." These fermented foods are both made from the soybean (*Soja-Bohne*). For natto: The fermentation results in a partial transformation of the proteins into amides, peptones, guanin, xanthin, and tyrosin. The resulting mass is called natto in Japan, and is sold commercially. Note: Even though the word "enzymes" is not used, the author describes their action. This is the earliest document seen (July 2003) describing the action of enzymes produced during a soybean fermentation. At the end of the same section, koji, shoyu, tofu, nukamiso, taohu, and tao-yu (Chinese-style tofu and soy sauce) are mentioned–with 7 partial references.

Chapter 33, titled "The binding of free nitrogen by bacteria" (p. 303-17) discusses this relatively new idea in depth, including the discovery of root nodules on legumes, the origin and function of the nodules, and the nodule bacteria; Soybeans are mentioned on p. 303. Chapter 36, titled "Nitrogen-fixing bacteria" (p. 335-43) gives more details.

Note 1. Although there are many in-text citations, the bibliography for this volume appeared in Vol II, published in 1901-1907. An English-language translation of this volume was published in 1910.

Note: This is the earliest document seen (Sept. 2002) concerning the early history of microbiology and the discovery of enzymes. Address: Unestablished university lecturer (*Privatdozent*) for Fermentation-Physiology, Technical High School. Assistant at the Physiological Laboratory of the Royal Experiment Station for the Fermentation Industry at Hohenheim near Stuttgart [Germany].

• ***Summary:*** "Soy (soi) n[oun]. (Chinese shôyû) 1. A Chinese or Japanese liquid sauce for fish, etc., made by subjecting boiled beans (esp. soja beans), or beans and meal, to long fermentation and then to long digestion in salt and water. 2. (Bot[anical]). The soja, a kind of bean. See Soja."

"Soja (sôja or sôya). n[oun]. (Bot.) An Asiatic leguminous herb (Glycine Soja) the seeds of which are used in preparing the sauce called *soy."*

"Catchup, or catsup (Probably of East Indian origin because it was originally a kind of East Indian pickles). A table sauce made from mushrooms, tomatoes, walnuts, etc. (Written also *Ketchup*)*."*

Note: At the entries for Ketchup and for Catsup, it says, "See Catchup." Address: Springfield, Massachusetts.

936. Scott, Charles Payson Gurley. 1897. The Malayan words in English. New Haven, Connecticut: The American Oriental Society. 93-144, 49-124 p. See p. 64-67. Index. 25 cm. [73* ref]

• ***Summary:*** The word "ketchup" is discussed in detail (p. 64-67). It is a well-known name for various kinds of sauces. The word *catchup,* which first appears in English in 1690, is defined as a "high East Indian Sauce." This word is found in Malay as *kechap* or *kichap,* and in Dutch transliteration as *ketjap.* It is also found in Lampong as *kichap* and in Sundanese as *kechap.* In Malay dictionaries from 1884 to 1895 it is defined as soy [sauce], Japanese soy [sauce], or indigenous / native soy [sauce]. The earliest Sundanese entry found (Rigg 1862) states: *"Kéchap,* Catchup, a dark coloured sauce prepared by the Chinese."

But what is soy? The word comes from the Japanese *shô-yu* (Hepburn 1867). The Chinese form, in Mandarin, is *sh'-yiu* (Williams 1874) or *shi-yu* (Doolittle 1872), Canton *shi-yau* (Chalmers 1870; Williams 1856), Ningpo *tsiang-yiu* (Morrison 1876). The Chinese forms are probably original.

Other words that have come into English from Malay or other languages of the Malay archipelago (Javanese, Lampong, Sundanese, etc.) include: agar-agar (a sea-weed), amuck (frenzied, homicidal rage), bantam (a dwarf fowl), batik (spotted cloth), catchup (see ketchup), cockatoo (a parrot), compound (from campong, a village), gecko (a lizard), gingham (cotton cloth), gong (instrument of sound), gutta-percha (a gum or resin produced by a tree), junk (a boat), kachang (a legume), ketchup (a condiment), lorikeet (a parrot), lory (a parrot), orang-utan (primate animal), padi (rice), picul (a weight), rattan (part of palm stem used for walking sticks and wickerwork), sago (pith of a palm), sambal (a curry).

Note: Reprinted from the *Journal of the American Oriental Society* vol. 17 (1896) and vol. 18 (1897).

937. *Tropical Agriculturist* (*Ceylon*). 1898. The soy beans. 17(7):460. Jan. 1. [1 ref]

• ***Summary:*** "The Madras Government sends us a paper showing how Surgeon-Lieutenant -Colonel W.G. King, Sanitary Commissioner for Madras, addressing the District Medical and Sanitary Officer, Vizagapatam, the Deputy Collector of Bellary and the Tahsildar of [nearby] Saidapet [Tamil Nadu], on 8th September 1897, says:

"I have the honour to forward herewith __ oz of soy beans, with the request that you will kindly cause them to be sown in any suitable place where they can be carefully watched as to progress of growth, and that you will oblige me by stating the nature and amount of crop obtained and whether you think the beans can be grown successfully in your district from the experience so obtained. I need not remind you that the 'Soy bean' is probably the most nutritious form of readily assimilable pulse at present known, and that, should it prove possible to introduce it widely in this Presidency, it would prove of great advantage in jail administration and also to the poorer classes generally... In asking you to kindly undertake the experiment, I may state that it was only after long and persistent search in India and Burma that I have ultimately obtained specimen."

"Very few vegetable products are so rich as this bean at once in albuminoids and in fat or oil, the former constituent amounting on the average to 35%, and the latter to 19... In China and Japan three preparations are extensively made from the soy bean. Soy sauce is the best known of these, but more important are the soy or bean cheeses, and a kind of paste. The beans are sometimes pressed for the sake of the oil they yield; the residual cake forms an extremely rich cattle food, containing as it does 40 per cent. of flesh-formers and 7 per cent. of oil. The Soy bean may also be grown as a fodder plant. If cut just when the pods are fully formed, it makes an excellent hay, superior to that of the lentil."

938. Yokohama Nursery Co., Ltd. 1898. Descriptive catalogue... for 1898. Yokohama, Japan. 72 p. Illust. Index. 27 cm. [Eng]

• ***Summary:*** On the cover of this English-language catalog is an illustration of a wistaria (*Wistaria Chinensis*) blooming in a decorated pot. In the section "Price list of seeds" (p. 67-70) is a subsection (p. 70) titled "Some vegetable seeds," which gives the price of 6 types of seeds in American gold dollars per pound. These include: Soy bean 0.06, Tennoji turnip (flat, very large) 0.30, egg plant (round and long) 0.75, Sakurajima mammoth radish [daikon] 0.85, gourd 2.00, and cucumber (climbing kind) $10.00 per 10 lbs.

Some sections (such as "Porcelain flower pots") contain beautiful illustrations. "Branch office: At 15 Broadway, New York, U.S.A... Cable address: Uyekikaisha Yokohama, Suzuki New York. The company is most famous for its lily bulbs, Cycas revoluta, rhapis palms, chrysanthemums, bamboos, and peonies. Unnumbered pages at the front describe: Testimonials. Terms of business. Time of shipping from Japan. Freight rates from Yokohama worldwide. Packing and proximate measurement. Steamers (companies,

© Copyright Soyinfo Center 2014

frequency of departure, and destinations).

Concerning the binding of these catalogs: The Yokohama Nursery catalogs from 1898 to 1901 seem to have a spine with internal stitching. Most of the thicker catalogs are bound with colored thread, although this may be partly or mostly for decorative reasons. Some of the earlier thinner catalogs (e.g., Tokio Nurseries, 1894) are bound with colored thread. Address: Nos. 21-35 Nakamura, Yokohama, Japan.

939. *Chicago Daily Tribune.* 1898. Great is kaffir corn... Value of the soy bean. March 21. p. 4.
• ***Summary:*** "There is still another food coming into cultivation in Kansas and Nebraska that will have an important effect probably on agriculture in those states. The food is the soy bean, a Japanese product that was brought to this country in 1890. This bean has the peculiar property of being able to supply certain qualities that are lacking in all varieties of corn as a fattening product. It is a little black bean that has been grown for centuries in Japan, and takes its name from a sauce into which the beans are made in that country. None of the ordinary fodder plants of this country compare with the soy bean in nutritive qualities. As a food it is equally attractive to human beings as to live stock. It compares favorably with the ordinary bean for table use."

Then summarizes the following experiment in which 12 pigs were fed rations based on varying proportions of Kaffir corn and soy beans: Georgeson, C.C.; Burtis, F.C.; Otis, D.H. 1896. "Feeding experiments." *Kansas Agric. Exp. Station, Bulletin* No. 61. p. 147-60. Nov.

940. *Southland Times* (*Otago, New Zealand*). 1898. Soja bean. March 26. p. 6.
• ***Summary:*** "Glycine hispida (Soja bean; soy bean; coffee bean). It is an erect annual legume with hairy stems and leaves, which has been cultivated in China and Japan from remote antiquity. It was long grown in botanic gardens, but when the facts concerning its use as a human food by oriental nations came to light about twenty years ago it was largely introduced into this country [USA] and Europe, where thorough trials of its forage and food value have been made. There are a large number of named varieties which vary in the color of their seeds and the length of time which the plants require to come to maturity.

"The seed is planted at the rate of half a bushel to the acre, in drills 2½ to 3 feet apart, and cultivated about the same as Indian corn. In Virginia soja beans are planted between the hills of corn, so that two crops are produced on the same field at the same time. The yields of seed are often enormous. Soja beans are fed to stock green, as silage, or as hay. The haulms are rather woody, and do not make the best quality of hay, but as either ensilage or green forage they are unsurpassed. The hay contains from 14 to 15 per cent crude protein and 3 to 6 per cent of fat. The beans contain from 32 to 42 per cent protein, and from 12 to 21 per cent of fat in fresh material. When fed to milch cows a ration of soja beans increases the yield of milk, improves the quality of the butter, and causes the animal to gain rapidly in weight. It is an excellent addition to a ration for fattening cattle.

"In China and Japan, where the soja bean is an article of diet, substances similar to butter, oil, and cheese [tofu], as well as a variety of dishes, are prepared from it. The yield of green forage amounts to from 6 to 8 tons per acre, and of the beans from 40 to 100 bushels. The feeding value of the bean has been found to be greater than that of any other known forage plant except the peanut."

941. Matsumura, Shônen. 1898. Daizu no gaichû ni tsuite [An insect injurious to soybeans]. *Dobutsugaku Zasshi* 10(114):126-30. April 15. [Jap; eng]
• ***Summary:*** The English-language summary is titled "Grapholita glycinivorella, sp. nov." It gives a detailed description and illustration (p. 129) of this insect (moth and larva), whose wing expanse is 13-15 mm, and whose body length is 7 mm. It is a form of *G. nebritana,* Treitschke. Its habitat is Sapporo, Japan.

This insect is now called *Leguminivora glycinivorella, Sargus cuprarius.* Note: This is the second earliest publication about an insect that attacks soybeans.

942. Dujardin-Beaumetz, Prof. 1898. The soya bean: A vegetarian treasure. *Vegetarian* (*The*) (*London*). July 23. p. 468.
• ***Summary:*** From *Health News:* The Soja, or Soya bean, is the Japanese bean (*Glycine soja*), cultivated in certain countries of Europe, and more particularly in Hungary, since 1875. This bean, which contains extremely little starch, and has been employed in the dietetic treatment of diabetes by Lecerf, contains a very large amount of albuminoid matter (flesh formers); and, on referring to the different analyses published by Steuff [Steuf], Capan, Pellet, and Muntz, we find the following percentage of alimentary principles contained in the bean:–Albuminoid matter, 36.67 per cent.; fatty matter, 17.60 per cent. If this analysis is compared with that of meat, the Japanese bean has a decided advantage over beef.

"From an alimentary point of view, the soya bean serves several uses. A sauce is made from it, which bears the name of *stiso* [*miso?*] and *soju* [shoyu], but the most curious and interesting point in the application of soja to dietetics, is a kind of cheese made from it–it is the *pea or bean cheese* [tofu], very much prized in Japan.

"In Europe, the soya bean has been utilized as the food of men and animals, and in the last few years the attempt has been made to make bread of it, which is a matter of considerable difficulty, by reason of the large proportion of oil which this bean contains. This oil, as Leon Petit has shown, is very purgative, and might replace castor oil in medical practice. Hence it becomes a necessary to rid the

© Copyright Soyinfo Center 2014

meal of this oil, in order to render it fit for domestic use. Lecerf, in Paris, and Bourdin, in Rheims, have succeeded in rendering the bread made from this meal very well borne by the stomach.

"Here, then we have a bean which is more nutritive than meat, and which serves for nourishment to a great country like Japan, under the different forms of sauce, of cheese, of farina, and even of an artificial milk. The advantage which the Vegetarian dietary may derive from such a food is evident." Address: Physician to the Cochin Hospital, Paris.

943. Fesca, M. 1898. Die Sojabohne [The soybean]. *Tropenpflanzer* (*Der*) (*Berlin*) 2(8):233-46. Aug. [7 ref. Ger]
• ***Summary:*** The author writes about the importance of soybeans for the German colonies. This is primarily a review of earlier writers, such as O. Kellner and E. Kinch. "The soybean is one of the most important cultivated plants in East Asia. In Japan and most parts of China, it is by far the most important legume. It is also cultivated in India..." In Japan, 385,000,000 kg of soybeans are produced on 430,000 to 450,000 ha of land. This is 8½ to 9% of Japan's total agricultural land and 19% of the land not planted to rice. Large amounts of soybeans are also planted around the edges of fields and on the tops of dams. The yield of soybeans in Japan for 1892-94 was 880–900 kg/ha. The soybean is one of the main crops in Shantung province, China, according to travelers Williamson and von Richthofen; it is used extensively for oil. An excellent 5-part illustration (p. 235) shows the cultivated- and the wild soybean plant, with close-ups of the pods, seeds, and flowers.

The author then discusses *Shoyu.* Through a long, slow fermentation process some of the starch is transformed into dextrin and sugar, then lactic and acetic acids are formed. Aromatic compounds are also formed but little is known about their amount or composition. The fermentation breaks down proteins. He then gives Kellner's analysis of the composition of shoyu. According to E. Kinch, one liter of shoyu contains 31.03 gm of sugar and 41 gm of nitrogenous substances.

The author praises tofu as a fine protein source and cites E. Kinch's 1879 analysis of the composition of tofu and dried-frozen tofu [*Kori-Tofu*].

He gives analyses of the composition of shoyu presscake (*Shoyuruechstande*) and okara (*Tofurueckstande*). Of the shoyu presscake he says: "Unfortunately the high content of salt (NaCl; 3-5%) makes it unusable for man or beast. It can, however, be used as a fertilizer." Address: Prof., Dr.

944. Takamuku, T. 1898. Shôyu kôji no enchiimu narabini moromi no jukusei ni tsukite [On the enzymes of shoyu koji and the ripening of moromi (mash)]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 19(8):787-803. Nov. [Jap]
• ***Summary:*** The title on the English-language table of contents reads: "On the Enzyme of Soja Kôji and the Process of Soja Sauce Ripening."

945. Tôa Dôbunkai. 1898-1909? Manshû daizu chôsa hôkokusho. Dai 5-ki [Report of a survey on soybeans in Manchuria. 5th period]. Tokyo: Tôa Dôbunkai. 1 vol. (microfilm reel). Undated. [Jap]
Address: Aomori, Japan.

946. Bishop, Isabella L. Bird (Mrs.). 1898. Korea and her neighbors: A narrative of travel, with an account of the recent vicissitudes and present position of the country. 2 vols. London: John Murray; New York, NY: Fleming H. Revell Co. Vol. 1: x + 261 p. Illust.
• ***Summary:*** In Vol. 1: Preface, p. vi: "It must be evident to all who know anything of Korea, that a condition of tutelage, in some form or another, is now absolutely necessary to her existence as a nation. The nominal independence won for her by the force of Japanese arms is a privilege she is not fitted to enjoy, while she continues to labour under the burden of an administration that is hopelessly and superlatively corrupt."

Page xi: The author made four visits to Korea between Jan. 1894 and March 1897 as part of her larger plan to study the characteristics of the Mongolian races. Her first journey produced the impression that Korea was the most uninteresting country she ever travelled in.

Soy [sauce] is mentioned–Pages 141-42: If, while traveling, no "clean room" existed in an inn, "I had a room in the women's quarters at the back, remarkable only for its heat and vermin, and the amount of ang-paks, bundles of dirty clothes, beans rotting [fermenting] for soy [sauce and paste], and other plenishings which it contained,..."

Page 177: "A quart of rice, which when cooked is of great bulk, is a labourer's meal, but besides there are other dishes, which render its insipidity palatable. Among them are pounded capsicum, soy [sauce], various native sauces of abominable odours, kimchi, a species of sour kraut [*kimchi*], seaweed, salt fish, and salted seaweed fried in batter. The very poor only take two meals a day, but those who can afford it take three and four."

Page 179: Koreans are omnivorous, and they waste nothing. "Cooking is not always essential. On the Han I saw men taking fish off the hook, and after plunging them into a pot of red pepper sauce, eating them at once with their bones. Wheat, barley, maize, millet, the Irish and sweet potato, oats, peas, beans, rice, radishes, turnips, herbs, and wild leaves and roots innumerable, seaweed, shrimps, pastry made of flour, sugar, and oil, *kimchi*, on the making of which the whole female population of the middle and lower classes is engaged in November, a home-made vermicelli of buckwheat flour and white of egg, largely made up into a broth, soups, dried persimmons, spongecakes, cakes of the edible pine nut and honey, of flour, sugar, and sesamum seeds, onions, garlic, lily bulbs, chestnuts, and very much else are eaten. Oil of sesamum is largely used in cooking,

© Copyright Soyinfo Center 2014

as well as vinegar, soy [sauce], and other sauces of pungent and objectionable odours, the basis of most of them being capsicums and fermented rotten [soy] beans!"

Page 182: The inn, if inn it was, gave me a room 8 feet by 6, and 5 feet 2 inches high. *Ang-paks,* for it was the family granary, iron shoes of ploughs and spades, bundles of foul rags, seaweed, ears of millet hanging in bunches from the roof, pack-saddles, and worse than all else, rotten beans fermenting for soy [sauce and paste], and malodorous half-salted fish, just left room for my camp-bed."

Note: The author does not mention Korea's very popular soybean pastes–such as doenjang or kochujang. She may well have used the word "soy" to refer to both soy sauce and soy pastes.

Bean or beans are mentioned: Page 18: "Hides, [soy] beans, dried fish, *bêche de mer,* rice, and whale's flesh are among the principal exports. It was not till 1883 that Fusan was officially opened to general foreign trade, and its rise has been most remarkable."

Page 39: In the market booths are to be seen "rice, millet, maize, peas, beans,..."

Page 85: In 1894 they paid taxes on barley, beans, rice, and cotton.

Page 100: "... they conveniently export their surplus produce, chiefly beans, tobacco, and rice, and receive in return their supplies of salt and foreign goods."

Page 112: In the Han River valley: "Every valley has its streamlet, and is barred across by dykes of mud from its head down to the Han–rice, with tobacco, beans, hemp, and cotton, being the great articles of export."

Page 119: "Ma-Kyo is the river port of Che-chön... "It exports rice, beans, and grain from the very rich agricultural country on both sides of the river,..."

Page 123: "When full grown a bull can carry from 350 to 500 lbs. They are fed on boiled beans, cut millet stalks, and cut pea haulm, and the water in which the beans are boiled."

Page 138: Korean ponies "are fed three times a day on brown slush as hot as they can drink it, composed of [soy] beans, chopped millet stalks, rice husks, and bran, with the water in which they have been boiled."

Page 147: "There is much wet rice along the route, as well as dry rice, with a double line of beans between every two rows,..."

Page 149: "It is a most fertile tract, and could support a large population, but not being suited for rice, is very little cultivated, and grows chiefly oats, millet, and beans, which are not affected by the strong winds."

Page 150: "There the villagers could not or would not take us in. They said they had neither rice nor beans, which may have been true so late in the spring."

Page 185: "A smaller valley contains about 3,000 acres of rice land only, and on the slopes surrounding all these are rich lands, bearing heavy crops of wheat, millet, barley, cotton, tobacco, castor oil, sesamum, oats, turnips, peas, beans, and potatoes."

Page 186: "In wheat, barley, or rye fields the sowing is in October, and the harvest in May or June, after which beans, peas, and other vegetables are sown."

Page 187: "Grain, peas, and beans are threshed out with flails as often as not in the roadway of a village,..."

Page 189: The village "has several schools, and exchanges rice and beans for foreign cottons at Won-san,..."

Page 217: Newchwang "is a city of 60,000 souls, the growth of its population having kept pace with its rapid advance in commercial importance since it was opened to foreign trade in 1860. Several British steamers with big Chinese characters on their sides were at anchor in the tideway, and the river-sides were closely fringed with up-river boats and sea-going junks, of various picturesque builds and colours, from Southern China, steamers and junks alike waiting not only for cargoes of the small beans for which Manchuria is famous, but for the pressed bean-cake which is exported in enormous quantities to fertilise the sugar plantations and hungry fields of South China."

Page 218–Concerning Newchwang: "'Peas,' really beans (Footnote: *Glycene hispides* [sic, *Glycine hispida*] {Dr. Morrison}), are its chief *raison d'être,* and their ups and downs in price its mild sensations. 'Pea-boats,' long and narrow, with matting roofs and one huge sail, bring down the beans from the interior, and mills working night and day express their oil, which is as good for cooking as for burning."

Page 235–Muk-den [Mukden] is a busy place, and does a large and lucrative trade, specially in grain, beans, and furs."

Seaweed is mentioned on pages 38, 140, 142, 177, 179, 182, 198-99. Kimchi: p. 98, 147, 177. Address: F.R.G.S., Geographer, Great Britain.

947. Bretschneider, Emil V. 1898. History of European botanical discoveries in China. 2 vols. London: Sampson Low, Marston and Co., Ltd. xv + 1167 p. Indexes (names of persons, names of plants). 28 cm. 2nd ed. 1935. [200+* ref] • ***Summary:*** A magnificent work. Vol. I ends on page 624. Vol. II is on pages 625-1167. National Union Catalog says Bretschneider's formal Russian name is Emilii Vasil'evich Bretshneider (1833-1901).

In Vol. 1: On pages 401-03 the author discusses the life and work of George Bentham, the author of *Flora Hongkongensis.*

On pages 403-51 the author discusses the life and work of Robert Fortune. "The travels and explorations of R. Fortune in China, beginning with the year 1843, inaugurate a new era in the history of botanical discoveries in that country. Previous to that time the Chinese plants known to our botanists in Europe and introduced into our gardens, came from Canton or Macao...

© Copyright Soyinfo Center 2014

"R. Fortune was born in Berwickshire, Scotland, on the 16th of Sept., 1812, and was educated in the parish school of Edrom... Fortune visited China four times, 1843-45, 1848-51, 1853-56, 1861, and accordingly published four interesting accounts of his travels in that country." Fortune traveled in Japan during 1860, visiting the ports of Nagasaki, Kanagawa, and Yukuhama [Yokohama] near Yedo. He visited Yedo for 15 days. In the spring of 1861 he returned to Japan. His four books are "Three years wandering in the northern provinces of China" (1847), "A journey to the tea countries of China" (1852; in which he discusses the soy bean), "A residence among the Chinese" (1857), and "Yedo and Peking: A narrative of a journey to the capitals of Japan and China" (1863).

Pages 536-37 discuss Louis C.N.M. Montigny, who was born on 2 Aug. 1805 at Hamburg [Germany] of French parents. He first went to China in 1843, as *chancellier* accompanying the French Embassy. In 1847 he was appointed Consular Agent at Shanghai, where he stayed until about 1858. He died on 14 Sept. 1868 and his obituary appeared in the *Revue Horticole* (1869, p. 52). During his residence in Shanghai he rendered great services to natural science and horticulture by introducing into France interesting beasts and birds, and useful Chinese economic plants–including *Soja hispida* and its oil. These plants were cultivated a distributed by the *Société d'Acclimatation* of Paris.

Page 545 notes that Voisin, a French missionary who went to China in 1824, obtained from China several economic plants among which was the textile plant, *Ko.* Seeds were presented to the Museum of Natural History in Paris through Stanislas Julien and the plants raised from these seeds were examined by Prof. Jussieu, who found that it was a legume resembling *Dolichos bulbosus.* It was later identified as Pueraria.

Pages 554-55 discuss Stanislas Julien the great French sinologist, who was born in 1797. In 1832 he succeeded A. Rémusat as Professor of the Chinese language at the Collège de France. He translated several interesting Chinese treatises on economic plants, their cultivation and use, generally with a view to incite his countrymen to introduce these plants into France. In 1855 he wrote about *Soja hispida* in the *Bulletin of the Society for Acclimatization* (France) (p. 225). He died in 1873.

Contents: Preface (book includes, in addition to China proper, Manchuria, Mongolia, Eastern Turkestan, Tibet, Corea [Korea], and the Liu kiu [Loochoo] and Bonin [Ogasawara] Islands. Note: The latter are about 30 subtropical islands located about 1,000 miles directly south of Tokyo, Japan).

Also discusses: azuki beans (*Phaseolus radiatus,* p. 76, 129), cowpeas (*Vigna sinensis,* p. 77), hemp (*Cannabis sativa,* p. 166), kuzu (*Pueraria Thunbergiana,* p. 175, 738, 755, 1051), peanuts (p. 231, 233, 451), sesame (*Sesamum orientale,* p. 11, 158, 165, 227, 487).

Concerning *Prunus mume* we read: "Near the entrance to the pass on the Canton side, Abel [Dr. C. Abel, 1816-1817] saw a species of *Prunus* in full flower, in Chinese *mei hwa shoo;* hence the name of the mountain. (The *mei hwa* is *Prunus Mume,* S. & Z. [Siebold & Zuccarini]) (184)" (p. 233). See also p. 893.

Note: This is the earliest English-language document seen (Dec. 2006) that uses the term *Prunus mume* to refer to the name of the tree whose fruit is used to make umeboshi salt plums. Address: Late physician to the Russian Legation at Peking.

948. Brinkley, Frank; Nanjô, F.; Iwasaki, Y.; Mitsukuri, K.; Matsumura, J. comp. 1898. An unabridged Japanese-English dictionary: With copious illustrations. Tokyo: Sanseido. xxvi + 1687 p. Illust. 19 cm. [Jap; Eng]

• ***Summary:*** "... with coöperation of Prof. K. Mitsukuri in zoological terms, Prof. J. Matsumura in botanical terms."

For each entry, the romanized word comes first, followed by the word written in hiragana and then in kanji (Chinese characters). Note: The authors often use the word "bean" when they should use the word "soybean." Soy related:

"Aburage: Bean-curd fried in oil.

"Amazake: Sweet *sake;* a kind of drink made of fermented rice. Syn. [Synonym]: Hitoyozake, Kozake.

"Ame: A honey-like jelly made of flour of various grains; starch-sugar.

"Ammochi: Mochi stuffed or covered with boiled and crushed pea-beans [sic, azuki beans] mixed with sugar.

"Azuki [bot.] Mungo.

"Azuki meshi: Rice and red pea beans mixed and boiled for food.

Azuki mochi: Same as Am-mochi.

"Dengaku: (2) (Coll.) *Tôfu* baked and covered with sweetened miso. *Dengaku wo yaku:* to bake or prepare *dengaku.*

"Dengaku-dôfu: See above.

"Daizu (Bot.) Soja bean.

"Edamame: (1) (lit.) Branch bean. (2) (coll.) [Soy] Beans boiled in pods on the stalks.

"Gobuzuke: Dried radish chopped into pieces of about 5 *bu* (of half an inch) in length and cooked with soy [sauce] and sugar.

"Gusokuni: Lobster chopped into transverse pieces and cooked with sugar and soy.

"Hachihaidôfu: *Tôfu* chopped into small pieces and boiled in a soup composed of four cups full of water, two of soy, and two of sake.

"Hitasu–Shôyu ni hitasu: To steep in soy.

"Hiyayakko: *tôfu* served cold.

"Ikanago-shôyu: Soy prepared in Sanuki [on Shikoku island], from a kind of fish called *Ikanago.*

© Copyright Soyinfo Center 2014

Irimame: Parched peas or [soy] beans. *Irimame ni hana ga saku* (coll. Prov.) (lit.) blossoms on parched peas; something regarded as impossible.

"Iritori: Fowls boiled with a mixture of sugar, soy and *mirin* until the sauce is fully absorbed.

"Iritsuke: Any fish roasted or boiled in a pan until the sauce or soy is fully absorbed.

"Kabayaki: (1) A way of roasting fish. (2) Eels cut open on the dorsal line, covered with soy mixed with sugar, and roasted. (3) Unagi no kabayaki: Roasted eels.

"Kenchin: (Modern Chin.) (1) Black beans malted and fried, and eaten with soy or table salt. (2) A soup containing various vegetables and *tôfu* mixed together and fried.

"Kigaracha-meshi: Rice boiled with water and a small quantity of *sake* or soy (so called from its yellowish color).

"Kijiyaki: The flesh of bonito or tunny-fish covered with soy and sugar, and baked.

"Kinako: [Soy] Bean flour (of yellowish or greenish color).

"Kinome-dengaku: *Tôfu* or the fruit of the egg plant covered with a pasty mixture of *miso,* sugar, and the buds or leaves of the *sanshô,* and baked.

"Kiuri-momi: Cucumber chopped fine and seasoned with salt, vinegar and soy.

"Kôji: Yeast, barm [sic]. *Kôji wo nekasu:* To make yeast [sic, kôji].

"Kokushô: A soup prepared with *miso* and the flesh of *koi* [carp] (*cyprinus haematoperus*).

"Kombumaki: Roasted or cooked fish wrapped in a piece of *kombu,* tied and boiled with sugar and soy.

"Kuromame: (Bot.) Black soy bean.

"Kyarabuki: The stems of the *fuki* boiled with soy.

"Mamemaki: A ceremony of scattering parched peas [sic, soybeans] about in an occupied house to drive out evils spirits, celbrated on the last night of December, or the early part of January (o.s.) [old style] crying aloud the while *fuku wa uchi* (fortune inside), *oni wa soto* (devils outside). Syn. Oniyarai, Setsubun.

"Mame-no-ko: [Soy] Bean flour used for covering or sprinkling over *mochi, dango.* Syn. Kinako.

"Miso: A kind of sauce made of wheat, [soy] bean, and salt. *Miso wo tsukeru:* (a) (lit.) to spoil (as one's coat) with miso. (b) (fig. coll.) to disgrace one's self; *Tonda miso wo tsuketa:* (coll.) have met with a shocking failure.

"Misokoshi: A miso strainer.

"Misomame: (Bot.) Soja bean, Glycine.

"Misoshiru: A kind of soup made with miso.

"Moromi: The grounds or lees left in making soy or *sake* and used as food.

"Moromi-sake: A kind of sake with rice grounds not separated from the liquid. Syn. Doburoku, Nigorizake.

"Murasaki: Another name for the sardine, or for soy.

Namaage or Nama-age: Not listed.

"Nattô: A kind of food made of boiled [soy] beans (usually sold in small packages made of rice straw).

"Nigari: The brine left by the deliquescence of salt.

"Nigashio: Same as Nigari.

"Oborodôfu: (1) A *tôfu* boiled down until it is almost dry and relished with soy and sugar. (2) A kind of *tôfu* [sic, unpressed tofu curds].

"Omame: (Bot.) Soy bean.

"Satsuma-iri: Food prepared by cooking a mixture of parched rice and finely chopped sweet potato, and relishing it with soy and sugar.

"Shitaji: Soy. See *Shôyu.*

"Shôyu: A kind of sauce made by pressing a fermented mixture of calcined barley meal, boiled [soy] beans, yeast, water, and salt; soy. Syn. Shitaji, tamari.

"Shôyu no moromi: Soy before it is pressed.

"Suiri: Cooked with vinegar. *Iwashi no suiri:* A sardine cooked with a mixture of vinegar and soy. Syn. Suni.

"Sukimi: Flesh of fish sliced thin, and eaten relished with soy and *wasabi* or horse-radish.

"Sukiyaki: Roasting sliced meat or flesh with soy, in a shallow pan. Note: This is the earliest document seen (April 2012) that contains the word "sukiyaki."

"Sumiso: A kind of sauce made by rubbing together *miso* and vinegar in a mortar [suribachi].

"Suribachi: An earthenware vessel used in rubbing *miso;* a mortar.

"Sushi: (1) Fish seasoned with vinegar. (2) A general name for food made of boiled rice and fish, eggs, vegetable, etc. seasoned with vinegar and soy. As an affix the form is changed to *zushi. Inari-zushi:* food made of fried *tôfu* stuffed with a kind of *chirashi-zushi.*

"Tamari: Soy before it is pressed [sic].

"Tekkamiso: A kind of food made by roasting *miso* mixed with parched beans, chopped burdock, and a little oil.

Temae: (1) One's own side. *O temae miso wa shio ga karai:* (coll.) Self approbation is disgusting.

"Teriyaki: Flesh of fish baked with a kind of sauce composed of soy, *mirin,* and sugar.

"Tôfu: A kind of food made from bean curd hardened by mixing with a small quantity of the brine left after the deliquescence of salt [nigari]. In composition the form changes into dôfu. *Tôfu ni kasugae:* (Prov.) (lit.) an iron clamp to connect pieces of tofu; no effect. Yaki-dôfu: Baked [grilled] *tôfu.*

"Tsukuru: To pickle in sake, brine vinegar, etc. *Shôyu wo tsukete yaku:* To bake [grill] seasoned with soy. Syn. Hitasu, uruosu.

"Uchimame: The soy bean flattened with hammer and boiled in soup.

"Udondôfu: Tôfu cut into udon like pieces, and eaten boiled in a soup made of cups of soy, two of *sake* in four cups of water.

"Yuba: The skin of bean curd used as food. Syn. Uba.

"Yudôfu: Boiled *tôfu."* Address: 1. Captain, R.A., Editor

of the *Japan Mail;* 2. M.A., Bungakuhakushi; 3. Nôgakushi.

949. Chamberlain, Basil Hall. 1898. A handbook of colloquial Japanese. 3rd ed. London: Sampson Low, Marston, & Co.; Tokyo: The Shuyeisha, Ichigaya; Yokohama, Shanghai, Hongkong, Singapore: Kelly & Walsh, Ld. ix + 567 p. 19 cm.
• ***Summary:*** Page 241: Court words, used by the Imperial Family, include: For miso they say *"o mushi* (lit. honourably steamed). English: bean sauce." For tôfu they say *"o kabe.* English: Bean-curd." O-kabe belongs also to the language of women.

Note. This is the earliest English-language document seen (Oct. 2012) stating that *o-mushi* is the Japanese court word or women's word for "miso."

Page 451: A poem of 31 syllables (5, 7, 5, 7, 7) says: Hototogisu / Jiyû jizai ni / Kiku sato wa,–/ Saka-ya ni san ri, / Tôfu-ya ni ni-ri!" Translation: "The village where one may listen undisturbedly to the cockoo's song is–three leagues from the grog shop, and two from the bean-curd shop!"

Anglo-Japanese vocabulary: soy [sauce], *shôyu, shitaji.*

Japanese-English vocabulary: "kabe, (with honorific prefix *o*), the Court word for tôfu, bean-curd."

Page 517: "miso, a kind of bean sauce."

Page 520: "mushi, (with honorific prefix *o*), the Court [women's] word for miso, bean sauce."

Page 538: "shôyu, soy (our word comes from the Japanese)."

Page 546: "tôfu, bean-curd: tôfu-ya, a shop for or seller of bean-curd." Address: Emeritus Prof. of Japanese and Philology in the Imperial Univ. of Tokyo, Tokyo.

950. Dodson, W.R.; Stubbs, Wm. C. 1898. Grasses, clovers, forage and economic crops. *Louisiana Agricultural Experiment Station, Bulletin* No. 53. 55 p. See p. 28-29. Series 2.
• ***Summary:*** In the section titled "Leguminous forage crops" (p. 13+), the subsection on "Soy bean or soja bean (*Glycine hispida* or *Soy hispida*)*"* (p. 28-29) states: "It seems to be very well adapted to Louisiana as far as the production of hay is concerned, but it is not sure to mature seed. In 1895 and 1896 the crop of seeds at Baton Rouge was very small, while in 1897 there was a heavy crop that matured well, both of early and late planting... It is the purpose of the station to secure all the varieties possible directly from Japan, and test their relative merits. The term Soy bean is therefore indefinite, and reports as to its merits will mean nothing till someone characterizes the varieties that may be met with."

A photo (p. 27), titled "Pea nuts, pindars, goobers (*Arachis hypogœa*)*,"* shows a portion of the stem with flowers and fruit–about one-sixth natural size. The correct technical [scientific] name of "cow-peas" is also discussed; most authorities agree that *Vigna catjang* and *V. sinensis* are synonymous. Address: 1. A.B., S.B., Botanist; 2. Ph.D., Director of the Station. Both: Baton Rouge, Louisiana.

951. *Foreign Seeds and Plants Imported by the Section of Seed and Plant Introduction, USDA, Inventory.* 1898. Serial/ periodical. U.S. Department of Agriculture, Division of Botany. Inventory No. 1, S.P.I. Numbers 1-1000, is 81 p.
• ***Summary:*** This serial publication, begun by O.F. Cook, is the single best source of information on early soybean introductions to the USA. A sequential number was assigned to each new seed or plant introduced. The earliest Seed and Plant Inventory numbers for "Glycine hispida–Soja bean" are #480 (received March 1898 through Prof. N.E. Hansen, from South Ussurie, Siberia) and #647-56 (received March 4, 1898, through Hon. A.E. Buck, from Tokyo, Japan).

The Introductory Statement in Inventory No. 1, written by O.F. Cook (Special Agent in Charge of Seed and Plant Introduction) states: "When the work of this section [of Seed and Plant Introduction] was formally organized the Department was already in the possession of a considerable quantity of seeds [not including soja beans] secured by Prof. Niels Ebbesen Hansen of the Agricultural College of South Dakota during a visit to Russia, central Asia, and Siberia." The first seeds from Prof. Hansen, cabbage seeds, were received in Feb. 1898. "More recently there has arrived from France a large series of seeds [not including soja beans] and cuttings personally selected by Mr. Walter T. Swingle, agricultural explorer of this section."

"The organization, methods, and purposes of this section have been recently explained in a bulletin and a circular, which are available on application. It should be repeated here that our efforts are on a line quite distinct from that of the Congressional seed distribution, whose object is the general and popular distribution of vegetable, field, and flower seeds."

No starting date is given in Issue No. 1. The transmittal date of No. 2 is 5 July 1899. The final year for this serial is not clear. In 1902 this publication ceased and the inventory was continued in the USDA Bureau of Plant Industry, Bulletins No. 5 (issued 18 Jan. 1902), No. 66 (8 Feb. 1905), No. 97 (15 March 1907), No. 106 (20 Dec. 1907), etc. co

Ted Hymowitz notes that most of these early soybean varieties have been lost (Pers. comm. 27 May 1989). We can find no explanation in the early issues of what the abbreviation "S.P.I." means.

952. Osborne, Thomas B.; Campbell, George F. 1898. Proteids of the soy bean. (*Glycine hispida*)*. Connecticut Agricultural Experiment Station, Annual Report* 21:374-82. For the year 1897.
• ***Summary:*** Contents: Introduction. Yellow soy bean. Soy bean (*Kiyusuki diadzu*) [sic, *Kiyusuki daizu*]*.* Conclusion.

The article begins: "The proteids of the soy bean, so far as we are informed, have never been the subject of special investigation. The seeds used by us were grown in Kansas

© Copyright Soyinfo Center 2014

and kindly supplied by Prof. C.C. Georgeson. Two varieties have been examined, one known as the yellow soy bean and the other, called in Japan, kiyusuki diadzu [sic, *kiyusuke daidzu*]." The authors give a detailed discussion (6 pages) of the methodology used for extracting, filtering (or, where filtration was impossible, passing through a centrifugal separator), isolating, and measuring the proteids in the soy bean. A globulin, which the authors named "Glycinin," was prepared by saturating a 10 per cent sodium chloride extract of the meal with ammonium sulphate, redissolving the resulting precipitate, and dialyzing the solution. A table (p. 377) gives an analysis of glycinin in terms of its content of carbon, hydrogen, nitrogen, sulphur, and oxygen–based on 9 samples. The authors then state: "It is probable, therefore, that we have here a definite proteid, distinct from legumin, containing 0.50 per cent. less nitrogen and 0.30 per cent. sulphur than that substance. We propose for this globulin the name *Glycinin.* They then describe its numerous reactions, as with sodium chloride, by dialysis or cooling ("it separates in the form of spheroids"), etc.

Other tables: (2) The composition of dried glycinin (p. 379). (3) Composition of the glycinin from Kiyusuki diadzu (p. 380). "These results agree well with those obtained from the yellow soy bean." (4) Comparison of the composition of glycinin from the two soybean varieties (p. 381). The true composition of glycinin (p. 381). It consists of 52.12% carbon, 6.93% hydrogen, 17.53% nitrogen, 0.79% sulphur, and 22.63% oxygen.

"Conclusion: The soy bean contains as its chief proteid constituent *glycinin,* a globulin similar in properties to legumin, but of somewhat different composition, containing nearly twice as much sulphur, four-tenths per cent. more carbon and one-half per cent. less nitrogen... The soy bean contains a more soluble globulin which resembles phaseolin in its composition, and, so far as we could ascertain, also in its reactions... Besides these globulins about 1.5 per cent. of the albumin-like proteid *legumelin* was obtained. We have found legumelin in a number of other leguminous seeds, the pea, vetch, horse bean, lentil, adzuki bean, and cow pea."

Tables (p. 382) show the chemical composition of (1) legumin as found in the soy bean, and (2) the small amount of proteose obtained from the soy bean. "Owing to the small amount of proteose no evidence was obtained as to the purity or individuality of this preparation."

Note 1. This is the earliest U.S. agricultural experiment station publication seen (Aug. 1998) which is entirely about soy beans.

Note 2. This is the earliest English-language document seen (Oct. 2008) that uses the word "albumin" (or "albumins"), or the word "globulin" (or "globulins"), or the word "glycinin," or the word "legumelin," or the word "proteose" in connection with soy. It is also the first U.S. study of soy proteins. Note 3. This is the earliest document seen (Oct. 2004) that mentions the soybean variety Kiyusuki daizu. Address: 1. Ph.D.; 2. Ph.B. [Bachelor of Philosophy]. Both: Chemists, Connecticut Agricultural Experiment Station.

953. Richthofen, Ferdinand Freiherr von. 1898. Schantung und seine Eingangspforte Kiautschou [Shandong and its port of entry, Kiaochow (Jiaoxian)]. Berlin: Dietrich Reimer. xviii + 324 p. Illust. Index. 25 cm. [Ger]

• ***Summary:*** The section on the "Agriculture" of Shandong province states (p. 109) that the soybean (*die Sojabohne*) is one of the most important crops, along with wheat, barley, millet, kaoliang (sorghum), corn, rapeseed, peanuts, cotton, hemp, and tobacco. Poppies are also widely grown for the production of opium.

In the section on "Economic goals" we read (p. 273-74) that [soy] bean cake (*Bohnenkuchen*) is the province's second largest export (after strawboard), being worth 1,340,000 taels, ahead of silk, and of peanut oil (160,000 taels). Bean cake is the substance left over after pressing the oil out of certain types of beans. These cakes go mainly to Swatow for use in fertilizing the sugarcane fields, and more recently to Japan as a substitute for fish manure. The regions where these beans are cultivated lie to a much greater extent in the present district of Kiaochow than in that of Chefoo (*Tschifu*) [presently named Yantai].

Note 1. The town of Kiaochow [Jiaozhou], in Shandong province, was under German control from 1898-1914. Note 2. Ferdinand Richthofen lived 1833-1905.

Note 2. This is the earliest document seen (Oct. 2003) that uses the word "taels" (or "tael") in connection with soybeans. A tael is a unit of Chinese currency. Address: Berlin [Germany].

954. Tokio Nurseries Co. 1898. General catalogue of plants, bulbs, seeds, &c. &c. Tokio, Japan. v + 37 p. 25 cm. [Eng]

• ***Summary:*** In the section titled "Vegetable seeds" (p. 32-35) is a subsection on "Pulse" (p. 33-34). The entries concerning soybeans and other beans are very similar to those in the 1897 edition. However the prices in this English-language catalogue are all given in Japanese yen. A note at the bottom of each page states: "Yen is equivalent to about 50 cents U.S. currency, 2 shillings or 2½ francs." Address: Komagome, Denchu, Tokio, Japan.
