• ***Summary:*** "I received your letter of Jan. 16th and also a bottle of 'Shoyu.'" He and his wife "both agree in stating that your Shoyu is very good for the first attempt... (1) It tastes like the Shoyu which is often found in the country [countryside] in Japan. (2) It lacks the ester which gives the fine flavor. (3) The flavor of Moromi is prominent. This and (2) may be due to the young age... I should be very much obliged to you if you would kindly send me your culture of *Aspergillus oryzae* at your convenience."

Miss Church sends him the desired culture and asks several questions concerning his opinions of her shoyu. He answers (Feb. 4) that she has generally interpreted his comments in his first letter correctly. Her Moromi had an immature flavor. "The common rule that the quality of fermented products improves with age, holds true with Shoyu." Address: Dep. of Microbiology, Massachusetts Agricultural College, Amherst, MA.

2016. Parry, Charles A. 1920. Travel sketches, LXXXIII–Bean that made Manchuria famous: A factory at Shimizu–The bean of many qualities. *Japan Advertiser* (*Tokyo*). Jan. 25. p. 7. [Eng]
• ***Summary:*** Contents: Introduction. Sweet and nasty. "Not now." The tea port. History of a bean. Substitutes. Big business. Japanese place names. On 26 Nov. 1919 the author traveled by train from Tokyo to the port city of Shimizu, on Suruga Bay, in Shizuoka prefecture (about 90 miles southwest of Tokyo). "Shimizu is one of the 36 treaty ports, and it was opened along with now fewer than 26 others, in 1899. The name means 'clear water'... My chief object in coming to Shimizu is to visit the Suzuki Company's Bean Oil Factory, for which I have obtained permission by courtesy of the Japan Tourist Bureau. This consists of several large buildings, erected three years ago, including a central office and two mills which being built in a castellated Gothic style, make a picturesque adjunct to the scenery as they rise by the calm waters of Shimizu Bay. The mills deal at present with two only of the many products of the wonderful manchurian [sic] or soy bean, called in Japanese daizu (glycerine [sic, Glycine] hispida) the crushed bean and the oil." The two mills are capable of treating 300 tons of beans per day. The process is secret. "I am informed that factories for the extraction of this oil exist only in Japan and Manchuria; but the Suzuki Co. has a branch office in New York, and the business is rapidly extending."

"The oil is used for frying, for lubricating, for water-proofing clothes, for medicine, as a butter substitute, and in the manufacture of soap, candles, guncotton, and artificial rubber; though it can hardly yet be said to be on the market." For culinary purposes it is not as good as the ordinarily used goma (sesame) oil, being much lighter and requiring the use of a deep saucepan. Yet it costs only about 62% as much as sesame oil; the latter costs ¥1.60 per sho (1.58 quarts).

"At present its chief use is for making soap, for which it is taken at a less refined stage, of a dark brown color while the finished product is light yellow. The oil is at present little used in Japan because little known; its retail sale seems to be limited to the neighborhood of the factories. Of these there are three, the two others being at Yokohama and Kobe, both established only last year.

"One large shed is devoted to storing the crushed beans (*kasu*) after the oil has been extracted, large piles of which lie about... The chief use of this at present is for cattle-food; but it is now to be manufactured into flour, useful for mixing in various proportions with wheat flour."

© Copyright Soyinfo Center 2014

"The daizu [soy] bean has long been known in Japanese cookery in the form of 'kiriako' [sic, kinako] ('yellow powder') to make which the entire bean is slightly roasted and pulverized; then used for mixing with flour to make light cakes, for giving savor to boiled rice, etc. The prices are not yet determined, the cost of manufacture not being known; but it will be cheaper than flour, as well as more nutritious, and will help to relieve the scarcity of rice.

"Substitutes: Other products of the bean are: tofu, the white bean-curd, used universally in Japan and, until recently, almost absurdly cheap; also used in the forms of age-dofu (fried in cottonseed oil), yake-dofu (baked) [yaki-dofu (grilled)], and the curious gori-dofu [kori-dofu], 'frozen tofu,' also called koya-dofu (from koya-san), tofu sprinkled with hot water, frozen, dried, and cut into small cakes; miso, the cheap condiment made of daizu beans fermented with yeast and barley; and soy, Japan's only sauce. A later addition to the list has been to-nyu, or tofu-milk [sic, "bean milk], a very passable substitute for cow's milk at half the price; and still more recently tofu-butter. The whole bean, parched and boiled, is an excellent coffee-substitute, yielding when parched just to the right degree, much of the aroma of that fascinating drink without any of its deleterious effects."

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the word "to-nyu" or the term "tofu-milk" to refer to soymilk; the Japanese word is *tônyû*.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "gori-dofu" or the term "koya-dofu" to refer to dried-frozen tofu.

"The present demand for been cake in Japan is met by the three factories of the Suzuki Co. that at Shimizu supplying central Japan, Yokohama Northern and Kobe Southern.

"There are several varieties of the bean known as white, yellow green and black, the first two being the most used. The plant is as yet little grown in Korea and Japan.

"Big Business: The Shimizu factory, which is the largest of the three, employs about 300 workpeople on day and night shifts. This new bean-industry is, however, only the latest among many activities of the Suzuki Co. which ranks among the great industrial concerns of the world, the third largest in Japan, standing next to the Mitsui and the Mitsubishi, and employing a total of over 3,000 clerks and 100,000 workpeople. It deals also in rice, wheat flour, sugar, sake-brewing, coal, timber, metals, camphor, wool, cloth and manure besides numerous small lines. It has three dockyards, at Harima, Toba and another; a coal-mine in Kyushu; copper mines at Hibi (Okayamaken) Hiroshima (Yamaguchiken) and Dairi (Fukuoka ken) also mines of zinc and iron; while its steel works (*seikojo*) at Kobe are the largest in Japan."

"Shimizu is well situated for growth being midway between the ports of Yokohama and Yokkaichi and serving a prosperous hinterland. Its chief exports are tea and oranges and its imports coal and timber." Address: Japan.

2017. *Times of India* (*The*) (*Bombay*). 1920. Import manifests [at Bombay harbour]. Jan. 26. p. 7.

• ***Summary:*** "S.S. Totomi Maru, from Yokkaichi [in today's Mie Prefecture, central Japan], via Colombo [Ceylon], Agents: N.Y. Kaisha.–2,524 cases safety matches,... 7 cases pencil, 10 casks and 1 case Japanese soy [sauce], 21 cases perfumery,..."

2018. Greenbie, Sydney. 1920. Saké and song. *Dial* (*The*) 68:33-46. Jan. See p. 40.

• ***Summary:*** The writer, who lives in a house overlooking the city of Kobe, Japan, goes with his Japanese friend (Mr. Suzuki) to a restaurant, where geisha girls typically serve and entertain the male customers, who pay them. Mr. Suzuki's wife did not approve of her husband's going, but he prevailed. "The geisha takes the place of the club and no woman will dare deny that to her husband. The geisha is not his companion–she is merely a specialist in the entertainment of men. The wife entertains him at home, the geisha, abroad, and if he wants a concubine or two, there is no law prohibiting it. The present Emperor, himself the son by a side wife, the lady Yanagiwara, is the first to have adopted monogamy, but his father had five wives."

When they arrived at the chosen place, Mr. Suzuki selected several girls he knew and liked from the roughly 800 who were listed. "When the girls my friend favored arrived, we were well into the feast. The normal length of a Japanese meal is about three and a half hours. I sat with my friends watching the meat and the greens sizzling on the brazier, eating little pieces at set intervals. It was tantalizing. I could have devoured the whole of it post-haste, but had to wait each time for someone to take a chopstickful first. It was a delicious torture, for each mouthful was worth the waiting for. Sukiyaki, it is called, which means 'enjoyable fry' [sic].

"Six geisha came in and sat. Two of them talked, and my stammering Japanese formed part, if not all, of the amusement; but there was no dancing, playing, or singing. What they were being paid for under these circumstances I could not tell. It only indicated the real evil of the geisha habit. They were neither friends nor entertainers, just simply parasites, or, let us give them some place in life, wall flowers." Address: Kobe, Japan.

2019. Satô, Sadakichi. 1920. Daizu tanpakushitsu no kenkyû oyobi sono kôgyôteki ôyô ni tsuite. IV. [Studies on soybean proteins and their industrial applications. IV]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 23(263):1-25. Jan. (Chem. Abst. 14:3299). [Jap]

• ***Summary:*** Continued from Oct. to Dec. 1919. Soybean meal may be used to make a mixed phenol-formaldehyde-protein type of plastic.

The English-language abstract of this article is found in the Sept. 1920 issue of this magazine. Address: Kôgakushi,

2021. *SoyaScan Notes.* 1920. Companies importing Japanese beans to the United States as seen in the pages of *The Bean-Bag* (St. Louis, Missouri) (Overview). Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** By Feb. 1920 many companies were advertising that they imported soy beans or "Oriental beans" to the United States. The main port of entry seems to have been Seattle, Washington. These included: Rogers Brown & Co. (Seattle, Washington; Oct. 1919, p. 45).

Nozaki Bros. (227 Broadway, New York, N.Y. "Importers of Oriental beans and peas;" Feb. 1920, p. 57).

Suzuki & Co.: (400 Colman Building, Seattle, Washington. "General importers and exporters, Rice, peas, beans,...;" Feb. 1920, p. 58). A.U. Pinkham & Co., Inc. (Colman Building, Seattle; "Oriental beans"; Feb. 1920. p. 58).

2022. Satow, Sadakichi. 1920. Sauce and process of making the same [from soya bean]. *U.S. Patent* 1,332,448. March 2. 2 p. Application filed 5 May 1917.
• ***Summary:*** A mixture of soya bean, roasted grain, water, and koji is "fermented," alcoholic or other harmful fermentations being prevented, e.g. by addition of common salt, and the filtered liquid is evaporated to dryness *in vacuo.*
Address: Sendai, Japan.

2023. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1920. Review of Far Eastern commercial press. 23(59):1406-07. March 11.
• ***Summary:*** "Compiled from clippings made by the Far Eastern Div., Bureau of Foreign and Domestic Commerce."

According to the periodical *Trans-Pacific,* the general opinion prevails that the soya bean crop "was better than normal in South Manchuria."

The section titled "Japanese soya bean market" states that the market is becoming more steady–according to the *Japan Advertiser* (31 Jan. 1920). The bean-cake market showed signs of slackness last week. The "bean-oil market showed signs of picking up."

2024. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1920. Far Eastern trade notes. 23(66):1572-73. March 19.
• ***Summary:*** "Vegetable-oil industry at Harbin, China: There are 25 vegetable oil mills in the vicinity of Harbin which consume annually about 250,000 long tons of the estimated 800,000 tons of soya beans produced in the Harbin consular district and make 20,000 long tons of oil. The rest of the bean output is exported through the firms regularly engaged in export trade. There are no refineries in the district, but it is possible that one may be erected in the near future. The production of hemp seed approximates 20,000 long tons annually, very little of which is crushed in the local mills."

Peking University is planning to establish a well-equipped agricultural school and experiment station.

2025. Oriental Show-You Co. 1920. Display ad: Learn to cook Chop suey. *Chicago Daily Tribune.* March 28. p. C13.
• ***Summary:*** This large square ad shows the company name written in front of a full moon and dark sky, with pine branches to the right. At the lower right is an illustration of a large bottle of Oriental Show-You. Across the bottom of the ad: "Note–Oriental Show-You is the genuine imported Japanese sauce. Observe the full name and spelling to avoid imitations."

2026. Adolph, W.H.; Kiang, P.C. 1920. The nutritive value of soy bean products. *National Medical J. of China* (*Shanghai*) 6(1):40-49. March. [15 ref. Eng]
• ***Summary:*** "One of the problems of science has been the search for a perfect food. Though eggs and milk are presently considered to be "perfect foods," the authors believe that the soy bean should also be considered. "The recent world shortage of food, and the demand for foods which are high in nutritive value has turned the attention of dietitians to the possibilities of the soy bean." It is a distinctly well-balanced food.

"During the last few years, the soy bean has found application in the West in the infant dietary, frequently with an admixture of some cereal for additional carbohydrate (Ruhräh 1915), and in summer diarrhea (Sinclair 1916). It is one of the recognized diabetic foods. One of the most satisfactory forms of artificial milk is made from soy beans. The bread used by the French army in the recent war was made essentially from soy bean flour."

"Soy bean products in China: History–The use of the soy bean in China dates back to the beginning of China's agricultural age under the emperor Shen Nung. It is mentioned in the *Ben Tsao Gang Mu* [*Bencao gangmu*] written by Shen Nung in the year 2838 B.C."

Note 1. This is the second earliest English-language seen (Aug. 2002) that treats Shen Nung as a real, historical figure, or that says the first written record of the soybean appears in a book written by him. The *Bencao Gangmu* (The great pharmacopoeia) was actually written by Li Shizhen in +1596.

"Tradition says that the manufacture of soy bean curd

© Copyright Soyinfo Center 2014

[tofu] originated in China in 164 B.C. during the reign of Han Wen Di, by a man named Liu An, the duke of Hwai Nan [Huai Nan]. The colloquial name for soy bean curd is *Do Fu,* and the classical name, *Li Chi,* probably meaning 'the morning prayer.' Its exact derivation, however, could not be traced. It is interesting to note that in China, at the present day the bean curd is made in the early hours of morning, and sold at daybreak."

"Liu An was a great friend of the Buddhist monks, and it is quite probable that he invented this bean curd in order to provide a change or a delicacy to break the monotony of the monastic ration. As a matter of fact, the bean curd is a real delicacy if carefully made and well cooked. Chinese who are connoisseurs on the subject assert that when so prepared it has the taste of pig's brain. The foreigners eating Chinese food often eat carefully prepared bean curd thinking it pork. With sugar it produces a dish like custard. Prepared with salt it resembles scrambled eggs."

"Application–The Chinese people make practically no use of dairy products, and the bulk of the people consume only very meager amounts of meat. Yet in spite of this they have lived for centuries on what appears to be a remarkably well-balanced diet by use of the soy bean."

"A number of interesting examples are found in China of the use of bean products as an agent for growth. One of us has observed in Anking that dealers in birds employ bean curd as the sole food for infant birds. The birds are robbed away from their nests immediately after they are hatched, and are then fed bean curd to tide over the infantile period till able to feed themselves. Possibly more interesting is the case of the true Buddhist monk who from birth is consecrated to the priesthood, and is carried through the period of childhood growth on a rather heavy diet of bean curd. The apparently normal growth of these monks would seem to be paralleled by the experiments of Osborne and Mendel (1917) on the promotion of growth in rats by both the water-soluble and fat-soluble vitamines contained in the soy bean. The country monastic diet is noted for its high content of soy bean products."

"The Chinese coolie... in spite of the scanty intake of meat and the constant exposure to overwhelming sources of infection, still does possess a wonderful resistance. The diet of the average coolie contains a surprisingly large amount of beans and bean products."

"A common saying in some parts of China terms *bean milk the poor man's milk,* and *bean curd the poor man's meat...* It is commonly stated that a meat diet is characteristic of the most aggressive peoples of the world. Has the protein of the soy bean replaced meat in the Orient?

"Bean milk is another bean product which is in composition not far different from cow's milk. In many places in China bean milk is a food drink. It is usually drunk sweetened with sugar. Western countries employ a number of patented methods for removing the 'beany taste' objectionable from the point of view of the Western consumer."

"It would be almost impossible to make a complete list of all the products manufactured from the soy bean in China. The best known and most important are the bean milk, bean curd, bean sauce (soy), and bean oil. In addition to this are the different forms of bean curd preparations, bean sprouts, and a large variety of sauces and condiments into which the soy bean enters as one of the constituents."

Details are then given on bean milk and bean curd. In making bean milk, the "bean residue [okara] which does not pass through the sieve is used as feed for hogs. On coagulation of this solution the soy bean curd (tofu), often called Chinese cheese, separates. As far as is known to the authors there are at present four agents employed in China to effect this coagulation. These are: (1) *lu,* the residue from the crystallization of salt, (2) gypsum; (3) *swan giang,* the soured bean milk whey remaining from the previous coagulation of bean curd; and (4) vinegar."

Table 1 gives the average chemical composition of the yellow soybean [*huangdou*] common throughout Shantung. Table 2 gives the chemical composition of two samples of soy bean curd purchased on the streets of Tsinan and made with *lu* [nigari] as a coagulating agent: The composition of the first sample is: protein 10.22%, fat 3.66%, water 80.90%, ash 1.09%, nitrogen-free extract 4.13%. This composition is compared with that of cottage cheese. Table 3 compares analyses of the ash of soy bean curd with that of soy bean. When it is made by coagulating soybean milk with bittern (from sea salt) the curd is rich in all the inorganic essentials (especially calcium, sodium, and chlorine) missing from the soy bean itself. The authors suggest that some of the racial characteristics of the Japanese people can be traced to their dependence largely on vegetable protein.

Table 4 gives analyses of 2 samples each of [soy] bean milk, cow's milk, bean milk whey, and bean residue [okara]. The chemical composition of the first sample of bean milk is: protein 4.22%, fat 1.87%, ash 0.40%.

Note 2. This is the second earliest document seen (Jan. 2002) that mentions Liu An of Huai Nan in connection with tofu.

Note 3. This is the earliest English-language document seen (April 2013) which states that *Li Chi* was an early or classical name of tofu.

\ Note 4. This is the earliest English-language document seen (April 2013) that uses the term "poor man's meat" to refer to tofu. Address: Lab. of Chemistry, Shantung Christian Univ., Tsinan, China.

Address: Kôgakushi, Japan.

2029. *Los Angeles Times.* 1920. Be on the lookout for "coffee" beans. April 4. p. IX6.
• ***Summary:*** "The Department of Agriculture warns buyers against two so-called coffee beans–the 'South American coffee bean,' the other as 'new coffee bean,' which are being exploited by extravagant statements in advertisements. The former is the jack bean, the latter the soy bean. Both are well-known plants and there is no justification, says the department, either for extravagant advertising under new names nor for exorbitant prices for the seed.

"The use of the seeds of various legumes and cereals as coffee substitutes is not new. Legumes which have been used or exploited as coffee beans include the soy bean, cowpea, chick pea, horse bean and jack bean... The seeds of a few of these legumes, especially the soy bean, possess some merit as coffee substitutes, but the desirability of any is a matter of individual taste. This use has led to extensive advertising of such seed... and even to their large use as adulterants of the true coffee.

"The soy bean, almost since its introduction into America, has been exploited at different times as 'coffee berry,' 'coffee bean,' 'new coffee plant,' 'domestic coffee berry,' and now 'new domestic coffee berry.' For many years the soy bean has been used to a slight extent in Europe, especially Switzerland, as a substitute for coffee.

"In Japan and Southern Russia the soy bean is prepared as a coffee substitute and placed on the market. This product is ground very fine and has much the same appearance as coffee.

"For those who desire a substitute for coffee as a drink, the dry beans of any variety of soy bean, when properly roasted and prepared, may be used. Prepared as coffee, the soy bean gives a liquid which in color and aroma is similar to coffee, but has no stimulating effect. Many people, fond of cereal drinks, think the soy bean coffee fully equal to the cereal coffee substitutes."

Note: This is the earliest document seen (Jan. 2011) that uses the term "new coffee plant" or "new domestic coffee berry" to refer to the soy bean in connection with soy coffee.

2030. Church, Margaret B. 1920. Re: Request for information on and samples of fermented foods in China. Summary of research on these foods in the USA. Letter to Dr. Y.S. Djang, Chichi Industrial Inst., Tientsin, China, April 6. 2 p. Typed, without signature (carbon copy).
• ***Summary:*** Church was given Dr. Djang's name by Carl Fellers, who is presently a member of her Bureau and stationed in San Francisco, California. "We are studying in this office food products produced from soy beans by controlled fermentation processes, and also red rice (ang-kak). As it happens we have studied the Japanese process of making soy sauce most specifically." Church requests samples of Chinese soy sauce not found on the U.S. market, "or sauce flavored with decoctions of such things as Perilla or Ceirela... We are interested in knowing to what extent sweetening such as molasses, caramel or sugar is used in Chinese soy sauce. Is the practice of sweetening soy sauce local, or confined to broad areas as southern China and not Central China?"

Note: This is the earliest document seen (April 2012) that contains the term "Chinese soy sauce."

"At times we have attempted to make fermented bean cheese. It would be of value to us if you could send us one or more of those little to-fu cheeses as they might be secured in the middle of the process, when they are covered with an inch or so of white mold..." Address: Microanalyst [Biological Laboratory, Bureau of Chemistry, USDA, Washington, DC].

2031. Kline, Charles E. 1920. Oil-bearing seeds and nuts in the Shanghai District of China. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 23(98):519-22. April 26.
• ***Summary:*** The chief plants yielding vegetable oils in China are [soy] beans, cotton seed, peanuts, rapeseed, sesamum seed, tea seed, and woodnuts (filberts).

The number of oil mills in China is increasing, and those in northern China treat mainly soya beans, while those in central China produce the other varieties of oil mentioned. The oil mills do not work year round, since there is not sufficient seed available, and also since the high summer temperatures cause the oil to become rancid.

The total capacity of oil mills in Shanghai is 5,400 piculs/day (321 tons/day).

Tables show: (1, p. 520) The quantities of oil, oilseeds, and oil cake exported from the port of Shanghai during the years 1917 and 1918. 1 picul = 133.33 lb. For [soy] bean oil: In 1917–2,351 piculs worth $26,482. In 1918–5,771 piculs worth $71,601. For [soy] bean cake: In 1917–11,213 piculs worth $27,246. In 1918–282 piculs worth $800.

(2, p. 520) The quantities of oil and cake exported from China to the countries of destination; the year (or years) is not given. Both the weight (in piculs; 1 picul = 133.33 lb) and value (in dollars) are given for each destination. In descending order of weight exported:

[Soy] bean oil–United States (incl. Hawaii) 2,136,746 piculs. Japan (incl. Formosa [Taiwan]) 87,673. Korea 23,611, Russia 19,802. Canada 4,001. France 2,132.

[Soy] bean cake: Japan (incl. Formosa) 15,150,706

© Copyright Soyinfo Center 2014

piculs worth $33,383,750. Korea 635,362 piculs worth $1,292,174. Russia 578,960 piculs worth $968,829. Siam 1,412 piculs worth $4,625. United States (incl. Hawaii) 27 piculs worth $54. Canada 9 piculs worth $17.

(3, p. 521) Ocean freight rates from Shanghai to various ports. Figures are given for bean oil and bean cake in 1917, 1918, and 1919 shipped to San Francisco [California], London, and Marseille, Naples & Venice. Present prices (total) are about five times as great as those at the beginning of the war. Address: Vice Consul, Shanghai [China].

2032. Fairchild, David. 1920. Foreign Plant Introduction Medal: Memorial to the late Frank N. Meyer presented to Mr. Barbour Lathrop "for distinguished service in the field of Foreign Plant Introduction." *J. of Heredity* 11(4):168-73. April.
• ***Summary:*** "Frank N. Meyer, Agricultural Explorer of the Office of Foreign Seed and Plant Introduction, who lost his life in the waters of the Yangtze River, left a bequest of a thousand dollars... This was Mr. Meyer's touching tribute to the organization with which he was connected for thirteen years as its agricultural explorer in China, Turkestan and other parts of Asia." The members of the office decided to put the bequest into a permanent tribute to his memory in the shape of a medal which should be awarded for distinctive service in the field of foreign plant introduction. The medal was designed by the well-known sculptor Theodore Spicer-Simson. On one side is a facsimile of the bas-relief which Queen Hatshepsut of the 18th Dynasty [of Egypt] (1570 B.C.) had executed upon the wall of her palace at Thebes to commemorate the first introduction of a foreign plant–the incense tree from the land of Punt. On the reverse side of the medal is the name of Frank N. Meyer, with the inscription from a poem by Chi K'ang, a poet of the Tang Dynasty, 618 A.D., which freely translated carries the thought that "In the glorious luxuriance of the hundred plants he takes delight."

Page 172 states that Mr. Barbour Lathrop's last expedition ended in the summer of 1903. Although he has conducted no long expeditions since then, "his interest in the work of plant introduction has continued. During his travels he has sent us many valuable things, including a most complete account, with photographs, of the soy-bean products of Japan,..."

The first medal was awarded to Mr. Barbour Lathrop of San Francisco, California, on 3 May 1920 in the Homer Building, Washington, DC. Address: President of the American Genetic Assoc.

2033. Kawatsuka, K. 1920. Daizu no saikin- byô [Bacterial disease of soybean]. *Byochu-gai Zasshi* (*J. of Plant Protection, Tokyo*) 7:220-21. April. [Jap]

2034. Muramatsu, Shunsuke. 1920. Daizu tanpakushitsu no kagakuteki oyobi seirigakuteki kenkyû [Chemical and physiological studies on the proteins of the soy bean]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 41(4):311-54. April. (Chem. Abst. 14:3265). [25 ref. Jap]
• ***Summary:*** The author extracted successively from dry ground soybeans from Japan the following percentages of protein using the solvents named: Water 65.2 to 90%. Salt solution 3.97 to 6.40%. Alkali 1.64 to 3.49%. The residual nitrogen calculated a protein was 3.51 to 24.91%. The total globulin consisted of 78.5% of glycinin and 21.5% of phaseolin, the total albumin of 78.5% of legumelin and 21.21% of soylegumelin. He proposes the factor of 5.82 for calculating the protein from the nitrogen. Note: Nakajima (1932) cited this work extensively. Address: Nôgaku-shi, Japan.

2035. Satô, Sadakichi. 1920. Daizu tanpakushitsu no kenkyû oyobi sono kôgyôteki ôyô ni tsuite. VII. [Studies on soybean proteins and their industrial applications. VII]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 23(266):321-42. April. [Jap]
Address: Kôgakushi, Japan.

2036. Yamasaki, Eiichi. 1920. Studies on the chemical kinetics of catalase. II. Catalase from a germinated bean: Glycine hispida Maxim. *Science Reports of the Tohoku Imperial University. First Series* (*Mathematics, Physics, Chemistry*) 9(2):59-73. (Chem. Abst. 14:3679).
• ***Summary:*** Contents: Introduction. I. Experimental details: 1. The ferment. 2. Comparison of the enzyme activity at four different temperatures. 3. Calculation of experimental results.

II. Theoretical part: 1. Explanation of experimental results. 2. Temperature coefficient of constants. 3. The general mean value of constants k and k'. Conclusion.

It seems probable that: (1) Catalase is a common name of a group of enzymes which have the power of catalysing H_2O_2. (2) They have different stabilities to be indentified respectively. (3) They probably have different physical properties. Address: Tohoku Univ., Sendai, Japan..

2037. *San Francisco Chronicle.* 1920. Japanese exports show huge gains. May 12. p. H3.
• ***Summary:*** "The industrial development of Japan has caused an increase in importations of oils, except illuminating oils, says the Guaranty Trust.

"Japan's trade since the armistice shows increases in exportations of buttons, fancy matting, raw silk, habutae, hosiery, cotton, tissues, brushes and camphor; decreases in rice, wheat flour, beans, colza oil, soy bean oil, mineral oils, hides and leather, copper, sulphur, starch, zinc and antimony."

• ***Summary:*** "Some years ago the R.N.-Y. [Rural New-

© Copyright Soyinfo Center 2014

Yorker] began talking about the Soy bean crop. We were led to it by reading about what this bean did for Manchuria. At the time of the war between China and Japan [1894-95] this province was poverty-stricken in soil and in people. Apparently it had no distinct and popular crop which could bring in money. The Japanese introduced the culture of Soy beans, and the industry grew. The crop brought nitrogen and humus to the soil, and the oil and feed in the bean made the province rich. There are few more striking instances in history where the introduction of a new crop has brought a country from poverty to affluence. We believed that something of the same thing would work out in parts of our own country through the use of Soy beans, and that is evidently happening... Before many years the process of producing Soy bean oil, with the crushed beans for stock food, will become a great industry, and where it is started you will find a rich community."

2039. Calvino, Mario. 1920. Estudio sobre el cultivo de la soya en Cuba [Studies on soybean culture in Cuba]. *Revista de Agricultura, Comercio y Trabajo* (*Cuba*) 3(4):124-31. May. [Spa]
• ***Summary:*** Calvino conducted extensive tests with varieties from the United States relative to their adaptation, culture, yields and nutritive value. "We have continued our experimentation with Soya, having obtained from the office for the introduction of new plants of the Department of Agriculture in Washington, DC, a magnificent collection of varieties: S.P.I. 40125, Wilson Five, Barket [Barchet], Early Brown, Pekin, Arlington, Biloxi, Black Eyebrow, Virginia.

"The varieties that we already had are the following: Soya amarilla [yellow] Nakasawa (obtained via Mr. Nakasawa of Japan), Soya Gigante [Giant Soy] imported from the USA. Soya Negra [black]: This seed arrived mixed in with some others, and having observed some plants in our fields, we propagated its seeds. Hahto, an excellent variety obtained from the USDA in Washington." Most seeds were first planted on 14 March or 11 Aug. 1919. They germinated about 6 days later, and were harvested on 9 June or 28 Oct. 1920. The yields (in bushels/acre, in descending order by yield) are follows: Peking, 21.3; Early Brown, 17.1; Black Eyebrow, 16.4; Biloxi, 14.5; Hahto, 14.4; Virginia, 13.7; Wilson-Five, 13.6; Amarilla Nakasawa, 13.3; Arlington, 12.1; Mammoth 8.1; Barchet, 7.6. The percentages of oil ranged from 15.6 (Arlington) to 19.2 (Biloxi) while the percentages of protein ranged from 28.1 (Virginia) to 39.1 (Hahto).

Photos show: (1) Comparison of inoculated and uninoculated soy bean plants with roots exposed. (2) A man standing in an experimental field of soy beans in 1919. (3) A man in a field of tall Biloxi variety of soy beans. (4) A ruler showing the size of soy-bean pods and beans. (5) Eleven different varieties of soy beans lined up next to rulers to show the relative size of each. (6) Biloxi variety of soy bean plant with roots. (7) Giant variety of soy bean plant with roots. (8) Soy bean plants with pods, grown at the Agronomic Station. (9) Close-up of inoculated soy bean plant roots, with small nodules. Also contains many tables.

Note: From 1910 to 1914 Prof. Calvino was at the National School of Agriculture in Mexico giving a course on the multiplication of plants. He may have learned of soybeans in Mexico at that time. Address: Doctor en Ciencias Agricolas de la Universidad de Pisa, Cuba.

• ***Summary:*** Contents: Introduction. Manchurian production of soya beans–exports of soya beans and products. All materials produced by cultivation–local consumption. Marketing raw materials–inspection–shipments. Methods of purchasing raw materials–brokerage. Storage–transportation methods and costs. Prices paid producers–economic conditions of farmers. Crushing of raw materials–prices paid at crushers. Production capacity of oil mills–types of mills and methods of operation. Quality of oil produced–production of bean oil and cake at Dairen. Fuel used in mills–activity of mills. Number of employees–wages. Marketing of products–Dairen exports of bean cake and oil. Prices of bean oil and cake. Ocean freight rates–export charges, insurance, etc. Increased United States demand–market for oil machinery.

"The oil-bearing materials produced in Manchuria are soya beans, perilla seed, peanuts, hempseed, castor beans, sesame seed, flaxseed, sunflower seed, and rapeseed." Estimates indicate that "about 1,500,000 tons of soya beans are produced in South Manchuria and about 800,000 tons in North Manchuria, or a total of 2,300,000 tons for the whole Province."

Tables show: (1) Exports of soya beans, bean cake, and bean oil each year from 1914 to 1919 (p. 180). (2) Exports of bean-cake each month from Oct. 1918 to Sept. 1919 from Dairen (Manchuria) to Japan (by far the largest), United States, Straits Settlements, China, Korea, and total (p. 184). (3) Exports of bean-oil each month during the same time to Japan (by far the largest), Europe, United States, China, Korea, and total. (4) The prices (in silver yen per picul or piece of cake) of beans, cake, and oil during the same period. Mentions the increasing demand for the oil in the United States. Address: Consul, Dairen [Manchuria].

2048. Morse, W.J. 1920. The soy bean in Manchuria. *Rural New-Yorker* 79:1208. July 17.
• ***Summary:*** "Relative to the editorial article, page 974 [May 15], on the Soy bean in Manchuria, the facts are somewhat different from those stated.

"It is stated that at the time of the war between China and Japan, Manchuria was poverty-stricken in soil and in people, and that the Japanese introduced the culture of Soy beans, and the industry grew. Although the exact date of the introduction of the Soy bean into Manchuria is unknown, the probability is that it came north from the Central Provinces of China many centuries ago. The bean trade was of ancient standing when the first Westerner visited 'Manchoo Tartary.' At the time the first British consul took up his residence at Newchwang, Manchuria, trade in beans, bean oil, and bean cake was an ancient and flourishing institution. Newchwang since 1832 had been a growing port of shipment for the great coastal trade in beans, bean oil and bean cake, on which Manchuria's prosperity has always depended. It is thus seen that long before the Chinese and Japanese war the Soy bean occupied an important part in the agricultural industry of Manchuria. During the Russian-Japanese war [1904-05] vast armies which occupied the whole of southern and central Manchuria depended for their cereals largely upon local supplies, and a great impulse was given to Manchurian agriculture at that time, but after the withdrawal of the troops the cessation of local demand called for the discovery of a new market, and especially so for the money crops of wheat and beans. Japan offered the first market, but with the post-bellum wave of depression sweeping over Japan it became necessary to find other markets.

© Copyright Soyinfo Center 2014

"Japanese merchants were the first to try to introduce the Soy bean into Europe. In 1908 shipments of Soy beans were made to England by Japanese firms... During 1909 over 400,000 tons of beans were exported to Europe from Manchuria. At first nearly all of the exportations went to England, but within a short time Germany took the lead in importing Soy beans, Soy bean oil and Soy bean cake. The article referred to states that on the Pacific Coast, in parts of the Central West, and also in some sections of the South, the crop is working in. The Soy bean is grown only to a very limited extent on the Pacific Coast. However, large importations of Soy beans are coming into the Pacific Coast States, most of which seed is handled by oil mills in Seattle [Washington], Portland [Oregon] and a few other coast cities." Address: Asst. Agrostologist [USDA, Washington, DC].

• ***Summary:*** A two-page summary of information on soybeans from 16 sources, most of them in French. Soybeans are widely used in Manchuria and Japan. Soybean seeds from Cambodia and lower Laos are superior to those from Manchuria. A table gives the composition of three soybeans from Laos, Tonkin, and Manchuria. Soybeans in Indo-China and their use during World War I in England and France. Vegetable milk made by Li Yu-ying in France. A table gives the composition of three soybeans from Yun-Nan, Tonkin (Lang-Son), and Tonkin (Delta). Mr. Fr. de Roux recommends that soybean be more widely used in France and its colonies. Summarizes soybean research in Connecticut and New Jersey, and soybean production and yields in Ohio. More than 500 soybean varieties have been tested in the USA; the yellow varieties generally work best for human foods, oil and flour, while the brown and black are used for animal feeds. In 1917 cotton seed mills also used soybeans grown locally or in Manchuria. Milk made from soybeans is similar to animal milk and can be used to make cheeses. Soybean oil is used in the USA and England for making paints, but of greatest interest is its use in margarine and other food uses. In Japan, a society was founded with capitalization of 100,000 yen to extract soy protein for use as a substitute for celluloid. Conclusion: "In view of these many uses, it seems interesting to us to pursue in our colonies some cultural trials with this interesting legume. Could it perhaps be developed in certain temperate regions? É.D.W."

2052. *Japan Advertiser.* 1920. Tokyo a city of many kinds of specialty restaurants: All sorts of food can be found at all sorts of prices if one knows where to go. No. 9,307. Aug. 22. p. 5, cols. 1-3. Sunday. [Eng]
• ***Summary:*** This introduction to the many types of restaurants in Tokyo mentions various soyfoods. Better class houses serve beef. The centerpiece is the "nabe"–"the iron skillet in which the food is cooked. The cooking is done by the customer, no skill being required as the secret of good 'nabe' is in the tenderness of the meat and in the sauce which is prepared by the house. Onions, either Bermuda or the long leek variety, tofu, konnyaku (a stringy preparation made out of a root), and sometimes cabbage leaf are the usual ingredients which are put in the nabe along with the thin slices of meat. Sake can be had if ordered. A reasonable meal at a beef house now costs about ¥1.50, although the nabe alone is probably listed at only 60 or 70 sen.

"Another name by which this dish is usually known outside of Tokyo, is sukiyaki. This is derived from *suki,* which means a spade, and *yaki,* to cook. The reason for this unusual derivation is that when meat we first introduced into Japan as food for humans, there was a very great prejudice against it. Those who wished to indulge in this 'unclean' food were forced to go into the mountains, far from any habitation and conveniences, and they made use of the farmer's broad spade on which to cook the meat. Another reason, aside from the fact that Buddhism preached abstinence from the flesh of animals, that the Japanese did not look with favor upon meat as a food was the flesh has always been eaten by the Eta, or the outcast class of the country."

"In contradistinction to meat, eels have always been looked upon as a delicacy. Eel restaurants are numerous in Tokyo, but they are not cheap... The customer is served in private rooms at these eel houses... Eels are considered very nutritious and are eaten by all classes. It is a favorite dish with coolies when they have the price... The first 'ox' day of the summer doyo, or period of greatest heat, is set aside as a special day to eat eels.

"There is not much choice in the way in which eels are prepared. Kaba-yaki is the name of one style. The bones are all removed, the eel is laid out flat and broiled over a charcoal fire with a special shoyu sauce and served on a big flat plate. Rice is also served..." One serving typically costs 1-3 yen.

"A very cheap kind of food, yet one whose 'social standing' is as good as any, is soba or udon... Cold soba is

© Copyright Soyinfo Center 2014

known as mori, and is eaten by being dipped into shoyu sauce and is flavored with sea-weed." "Tempura soba is served in a bowl with a piece of tempura placed on top. This is a very nutritious dish. Soba is served is served in the same way with onions or a piece of abura-age or fried tofu and is known as okame soba."

"A typical Japanese restaurant where a table d'hote is served is known as a kaiseki restaurant." One popular dish is "onuko, or fish mixed with miso and flavored with vinegar."

In Tokyo, pork "is eaten more than any other kind of meat, but as it is the cheapest it is found only in the poorest restaurants." Surprisingly large quantities of horse-meat are consumed at cheap restaurants. Tempura, which is very popular, "means a certain way of cooking–namely, dipping in this wheat-flour batter and frying in deep oil, usually goma-abura, or sesame oil, although almost any vegetable oil can be used." Also discusses sushi. Rice comes at the end of the meal. Sake is not supposed to be drunk after rice is consumed, as it produces indigestion. Address: Tokyo.

• ***Summary:*** Japanese imports and exports of vegetable oils and oil-bearing material in 1919 were valued at about £5,328,801 and £2,273,372, respectively. The amounts imported and exported are given in pounds. Soya-bean oil was the leading import in 1919, at 3,692,646 lb (worth 724,707 yen); soy oil imports were 2,633,769 lb in 1918 and 1,024,182 lb in 1917. In 1919 some 3,862,297 lb of it were exported, compared with 6,518,554 lb in 1918 and 7,307,582 lb in 1917. Coconut oil was the leading export in 1919 at 23,395,329 lb; 476,773 lb of it were imported.

For oil-bearing materials (seeds) in 1919, the leading import was soya beans (377,639,051 lb imported, 1,456,212 lb exported.) The leading export was linseed (19,126,759 lb; 19,253,750 lb imported). A table summarizes the commodities and countries from which imported or to which exported, quantities, and values for the years 1917-19.

• ***Summary:*** A half-page table compares the acreage of respective commodities between 1919 and 1920, which is

© Copyright Soyinfo Center 2014

approximately as follows (1 chobu = about 2.5 acres):

Soya bean 1919–57,761 chobu. 1920–80,094 chobu. Up 39%.

Kuro [black] soya bean 1919–4,386 chobu. 1920–5,308 chobu. Up 21%.

Azuki bean 1919–35,190 chobu. 1920–47,440 chobu. Up 35%.

Dainagon [large azuki] bean 1919–10,166 chobu. 1920–14,642 chobu. Up 44%.

Kintoki red [azuki] bean 1919–13,882 chobu. 1920–11,775chobu. Down 16%.

Also gives statistics for: Daifuku bean. Chufuku bean. Tenashi bean. Nagauzura bean. Maruuzura bean. Address: P.O. Box 251, Kobe, Japan.

2061. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1920. Kyoshin Yoko, Ltd., Kobe, Japan. 3(6):38. Nov.

• ***Summary:*** "Owing to remarkable decrease in export demand and to a certain drop in its prices compared with what prevailed during the war-time which farmers experienced last two years, the output on such items for export as beans, peas, potatoes etc., etc., have been shown a great deal of decrease this year, leaving the acreage used for same to planting such commodities for use of domestic consumption as soya beans, azuki beans, rice, wheat, barley, rye, oats, linseeds, etc.

"Due to a very little demand offered abroad and low price prevailed on oversea market last season the quantities moved for export up to the present moment was hardly to reach to half of the output last year. Under the circumstances, many of the farmers have changed their field to plant soya beans and other kinds of cereals this year Instead of kotenashi beans, and therefore the output this year for this commodity is expected to be about one-third of last year. Anticipated output will be about 3,000 tons against 8,000 tons last year."

2062. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1920. Soya bean oil trade big. 3(6):50. Nov.

• ***Summary:*** "Tacoma, Washington–Importation of soya bean oil from the far east through Puget sound ports has reached such proportions that both in Seattle and Tacoma port commissions and private companies have erected special huge tanks to handle the trade. A few years ago soya bean products were a novelty in commercial circles here.

"Soya bean oil is used in the manufacture of soap, paint, varnish and toilet preparations and a residue is sold as food for cattle. Most of the oil comes from Kobe, Japan. It is brought here in old kerosene cans or in wooden receptacles and is shipped east in tank cars."

• ***Summary:*** In No. 1 (Aug. 1920), soybeans and soyfoods are discussed in the following sections (p. 218-19): (7) Yellow soybeans. (8) Fermented black soybeans or shi (explanation, about the name). (9) Jiang or shô (explanation, about the name). (14) Fermented tofu. Since the text is written in Chinese characters, it is hard to tell the meaning of sections 10-13.

No. 2 was published in Nov. 1921. No. 3 in May 1922. No. 7 in March 1924. No. 8 in Sept. 1924. No. 9 in Oct. 1925. Address: Kyôju Nôgakushi, Tôadôbunsho-in Shina Kenkyû-bu.

2065. Dep. of Finance (Okurashô). 1920. Financial and Economic Annual of Japan (20th). Tokyo, Japan: Government Printing Office. 199 p.

• ***Summary:*** The section on "Food problem, adjustment of prices, etc." (p. 6) begins: "Amidst this general activity of economic market, the balance of trade for the first time since 1915 was returned against Japan, and it seemed as if a dark, ominous cloud appeared in the horizon. In practice, however, the economic circles, spoiled by continued prosperity, did not take heed of this warning, but persisted in viewing the situation through rose-coloured spectacles. Speculative mania, luxury in living and abnormal rise of new enterprises were [the] order of the day, together with further advance in prices of commodities" [inflation]. The price of rice rose so high there were rice riots last year. "In November an Imperial ordinance was issued to exempt till November 1920 soy beans, raw beef, eggs and cotton fabrics and yarns from import duties, and also to restrict the export of cotton yarns."

Table 1 (p. 8) gives statistics on the tax on soy [sauce]. In 1920-21 it is estimated to be 5.83 million yen, compared with an estimated 5.25 million yen in 1919-20. This is an increase of 79,685 yen.

Table 3 (p. 14-15) gives the Japanese government revenue from the tax on soy sauce each year from 1907-08 (5.47 million yen) to 1920-21 (estimated 5.83 million yen).

In the section "Tax on liquors" we read (p. 20): "VI. Soy [sauce] tax: The tax is levied at the following rates upon persons manufacturing soy (Japanese sauce): -

"Soy yen 1.75 per koku of Moromi.

"Tamari yen 1.65 per koku manufactured.

"In 1900, the tax on soy for household use was created, the rates of which range from sen 50 to yen 4 according to the amount of manufacture. No person whatever is permitted to manufacture for household use more than five koku of soy

© Copyright Soyinfo Center 2014

per annum."

Page 24: "In view of the advance of prices and the consequent unrest as to living, such daily necessaries as soy beans, raw beef, eggs, cotton yarn and cotton fabrics were further placed on free import list, effective till November 30th, 1920."

Table 19 (p. 46) gives annual area (in *chô*) and production (in *koku*) of soy beans (and of "small red beans" [azuki]) from 1909 to 1918. (Note: 1 *koku* = 44.8 gallons = 180 liters. 1 *chô* = 2.45 acres = 0.992 hectares. 1 *kwan* [*kan*] = 8.72 lb). Sample figures were as follows:

1909–479,771 *chô* and 3,766,962 *koku*.

1913–475,284 *chô* and 2,993,095 *koku*.

1918–482,207 *chô* and 3,451,820 *koku*.

Table 33 (p. 62) gives the index number (relative amount) of wages by profession. A "soy-maker" earns 155.6, which is about average among food and drink workers.

A table (p. 67) gives the amount of various manufactured goods made in Japan from 1909 to 1918. The amount of Soy [sauce] increased from 2,197,708 *koku* in 1909 to 2,630,498 *koku* in 1918.

Table 53 (p. 94) gives the value (in yen) of "Chief commodities exported" from 1906 to 1919. For Soy [sauce] the export value increased from 952,840 yen in 1906 to 968,819 yen in 1919.

Table 54 (p. 96-97) gives the "Value of chief commodities imported" (in yen) from 1906 to 1919. For Soja-beans the import value increased from 9,018,173 yen in 1906 to 22,042,824 yen in 1919.

Table 56 (p. 102) gives the "Value of chief commodities imported from various countries" (in yen) from 1913 to 1919. For Soja beans in 1913 the value of imports were: From China: 3,828,508 yen. From Kwantung [Guangdong] province (in southern China): 2,988,212 yen. From Asiatic Russia: 326,874 yen. From other countries: 80 yen. By 1919 Kwantung province was by far Japan's biggest source (14.7 million yen), followed by China. Asiatic Russia, and Other countries.

Table 73 (p. 140) gives the prices of principal commodities from 1912 to 1919. During this period, the price of

Soja beans increased from 10.49 yen per *koku* to 20.81 yen per *koku.*

Red beans [azuki] increased from 14.49 yen per *koku* to 36.60 yen per *koku.*

Soy [sauce] decreased from 88.18 yen per *koku* to 40.61 yen per *koku.*

Miso increased from 0.44 yen per *kwan* to 1.02 yen per *kwan.*

Seed-oil [mainly rapeseed] increased from 46.34 yen per *koku* to 105.24 yen per *koku.*

Oil-cake [mainly rapeseed] increased from 2.72 yen per 10 *kwan* to 5.70 yen per 10 *kwan.*

Table 74 (p. 141) gives the index number of prices of commodities from 1912 to 1919; the index number for each commodity in 1912 is 100. During this period, the price of

Soja beans increased in price by 98%.

Red beans [azuki] increased by 158%.

Soy [sauce] decreased by 68%.

Table 75 (p. 141) gives the prices of principal commodities in Tokyo from 1909 to 1918, including Soja beans, red beans, and soy [sauce].

Table 76 (p. 143) gives the index numbers of prices of commodities in Tokyo from 1909 to 1918.

Miso increased by 182%.

The section on Chôsen [Korea], under "Agricultural products" states (p. 174): "Chosen is a wholly agricultural country, and farming is its most important industry. The fields of Chosen are almost always cultivated on a small scale and are owned by the Yan-pan and richer classes. Rice is the staple agricultural product, followed by barley, Italian millet, soy beans, wheat, and red beans. There are also such special products as cotton, tobacco, hemp, and ginseng. The cultivation of fruit-trees has of late produced very good results; and the area of their cultivation is gradually extending. Silk culture which had hitherto been in a very poor condition, is now, in consequence of official encouragement, being carried on everywhere. Both these are engaged as subsidiary industries by the agricultural class. Live stock is also raised as a by-product of agriculture, and cattle, horses, goats, and pigs are found everywhere in the country; but stock farming is not pursued as an independent enterprise. The cattle are well known for their great size and good quality; and a large number of them are annually exported to Japan Proper and Asiatic Russia."

According to Piper & Morse (1923, p. 13) a table in this document (which we cannot find) gives five-year averages of acreage, production and yield of soybeans in Japan for the following years: 1897-1901, 1902-1906, 1907-1911, 1912-1916, and 1917-1919. The average annual production of soybeans is about 18 million bushels, grown on 1.1 million acres, with a yield of 15-16 bushels per acre. Address: Japan.

• ***Summary:*** Lists and describes briefly nine soybean varieties received from the office of new plant introduction of the U.S. Department of Agriculture ("A magnificent collection of varieties.") and four varieties already owned by the Station in Cuba. They were first planted in March 1919 (a second lot of four of these varieties were planted at this time–Wilson Five, Peking, Black Eyebrow, and Amarilla Nakasawa) and again in August 1919. The varieties and their yields (in kg/ha) in descending order of yield for the first planting are as follows: Pekin [Peking] (1435.9 + 790 / -). Early Brown (1153.9 / -). Biloxi (1153.9 / -). Virginia (923 / -). Unknown (976.6 / -). Black Eyebrow (1153.9 + 1140 / -). Wilson 5 [Wilson-Five] (920.5 + 1230 / 277.7). Arlington (820.5 / -). Soya S.P.I. 40125 (615.3 / -). Barket [Barchet] (513.0 / -).

The four varieties already owned by the station and their yields during these first two plantings were: (1) Amarilla Nakasawa / Nacasawa (from Mr. Nakasawa of Japan; 897.4 + 1100 / 1375). (2) Gigante (imported from the USA; 551 / -). (3) Negra. "This is not a variety name. Rather this seed came mixed with other seeds. We noted some of these plants in our fields and we propagated them." Note: This is said to have been the first Cuban soybean selection. (4) Hahto, from the USDA. "This is the most interesting soybean variety for Cuba for use as either green seeds (*grano verde;* green vegetable soybeans) or whole dry seeds (1000.0 / -).

For each variety the following information is given. Color of seed, date of start of germination in petri dishes (14 March 1919) and laboratory temperature, percentage germination, number of days to germination in lab, date of germination, date of harvest in fields (9 June 1919), yield, observations. There is a special section on the Hahto variety; sown on 10 June 1919, it yielded 1,000 g/ha. A table (p. 190) shows the nutritional composition of 12 the 13 varieties (all but Negra). Hahto had the highest protein content (39.12% protein, 11.90% water, and 17.36% fat), whereas S.P.I. 40125 had the highest oil content (28.91% protein, 10.60% water, 19.60% oil). A second such table (p. 191) shows assimilable nutrients of all 13 varieties.

The article concludes: "According to Dr. E. Babe, Chief of the Dept. of Chemistry at Santiago de las Vegas, in China and Japan the soybean is used to prepare very nutritious foods including a special bread for diabetics and a milk that is widely appreciated." Note: Dr. Babe, who never went to Asia, is said to have acquired this information from the literature on soybeans.

Photos show: (1) A field of variety trials in 1919. (2) 11 soybean varieties, with 10 samples of seeds from each variety. (3) A field of mature Biloxi soybeans. (4) An uprooted Biloxi soybean plant. (5) The Hahto soybean: Pods, green seeds, and dry seeds. (6) An uprooted Hahto soybean plant with many pods.

Note: This is the earliest Spanish-language document seen (June 2009) that uses the term *grano verde* to refer to green vegetable soybeans. Address: Delegate of the Secretary of Agriculture, Commerce, and Labor, and Acting Director, Cuba.

2069. Hoshino, Tokuji. comp. 1920. Economic history of Manchuria. Seoul, Chosen: Bank of Choshin. x + 303 p. Illust. Portraits. Folded color map. 20 cm.

• ***Summary:*** A digital version of this book is available on HathiTrust. The word "soya" appears on 19 pages: p. 146 (7 times), 137 (5 times), 138 (4 times), p. x, p. 142, 145 (3 times), p. 72, 138, 140, 148, 216, 303 (2 times), p. vi, 18,, 52, 124, 134, 144, 217 (1 times each).

In the chapter on Agriculture (p. 124-60), the long section on "Soya beans" appears on pages 137-148. In this section the terms "bean cake" and "bean oil" appear many times. A large table (p. 147-48) shows the export of soya beans, [soya] bean cake, and [soya] bean oil from Dairen, Newchwang, and Vladivostok from 1908 to 1917.

The term "bean cake" or "bean cakes" appears on 26 pages: p. 144 (4 times), p. 18, 19, 142, 183, 184 (3 times), 20, 28, 140, 143, 186, 187, 215, 216, 218 (2 times), p. vii, 137, 138, 147, 148, 177, 186, 219, 224, 294, 299 (1 time each).

The word "soy," referring to soy sauce (Japanese shoyu) appears only on p. 142, where we read: "(6) Uses of Beans, Bean Cake, and Bean Oil in the Far East: (a) Beans: Perhaps the Japanese are the greatest consumers of beans in the world as an article of diet. Every morning they take soup made of miso which is prepared from beans. For the seasoning of their food they seldom use salt, using instead bean sauce, the chief ingredients of which are beans and salt. Thus the Japanese eat beans in one form or another at least three times a day. An extensive use is also made of beans by the Chinese, who make them into the Chinese paste *chiang* which they habitually eat with fish, meat, and vegetables. But the more expensive Chinese soy, which corresponds to the Japanese shoyu, is only used by wealthy families and restaurant keepers, and is not consumed by the very poor. Another product of beans which is widely used in both Japan and China is tou-fu [tofu, doufu] or bean-curd."

"(b) Bean oil is used extensively in cooking Although it is inferior to rape and sesamum oils for this purpose, these oils cannot compete with it in point of price; the recent advance in price, due to the foreign demand, may however–if sustained, as seems certain–go far to change the positions of the oils relatively to each other. In spite of its unpleasant characteristic odour and unpalatability, the poorer classes in China consume it in its crude state, but among the rich it is boiled and allowed to stand until it has become clarified.

"As a lubricant bean oil is used for greasing axles and parts of the native machinery in use in the arts and crafts. Other uses in South China are for the making of waterproof cloth, and paper umbrellas and lanterns, and the oil is also mixed with lacquer for the manufacture of varnish and

© Copyright Soyinfo Center 2014

printing ink.

"(c) Bean Cake: Bean cake, which is but the residue after the oil has been expressed from the beans, was of comparatively little value to the Manchurian farmers, who used to feed their stock with it, before the discovery of its great value as a fertilizer. First in the sugar plantains in the provinces of Fukien and Kwangtung, and then in the plantations in Java and the South Sea Islands, it was used as a fertilizer, and for centuries it has been an important article of trade with those places. But the great importance it has since attained in Manchuria's foreign trade dates from the conclusion of the Sino-Japanese War, when it began to be exported to, Japan for use in the paddy fields there. Soon it was found that it possessed fertilizing qualities superior to those of the fish manure of past ages which, containing too high a proportion of oil for the purpose for which it was used, was liable to breed insects hurtful to the crops, and so great grew the demand for it in Japan that the relative position of the oil and the cake was changed at one time, the cake becoming the principal product and the oil a by-product, though the tendency now is for the oil to regain its former position, owing to the growing demand for it in the Western markets. The results of the analyses made of bean cake in three different places show the following chemical composition." Analyses were conducted by: (1) Government laboratory, Japan. (2) Agricultural Institute, Scotland. (3) South Manchuria Railway Co. Composition: Water 11.0 to 15.3%. Albuminoids [proteins] 42.1 to 45.2%. Fat 5.2 to 9.6%.

"The Chinese farmer does not yet use bean-cake in his rice field, and in Manchuria it is only used for vegetable-growing. Thus Japan owes much to Manchurian bean-cake for the productiveness of its naturally sterile soil.

"As cattle feed bean cake is used in Manchuria for horses and mules–only, however, when very hard work is being done, and is mixed with bran and *kaoliang* stalk. Its use as cattle feed in Japan still belongs to the experimental stage. Two novel uses of soya beans have been discovered by Mr. Suzuki of the Central Laboratory of the South Manchuria Railway Company. The one is the making from it of a new sort of paint, named Solight, and the other, a chemical composition called Tantalse, which imparts its waterproof characteristic to the cement, mortar, or concrete with which it is mixed, or to paint upon which it is applied. The merits of Solight are enumerated thus: it may be applied as it is; it dries quickly, that is in about half an hour; it has no bad odour like paint; its easy combination with any color; its cheapness.

"Beans are also used in soap-making, and there are already several soap factories in Dairen which use beans as the chief material. The uses of beans are studied by many Japanese institutions and individuals, and many new discoveries have been made; indeed there seems to be no end to their uses."

This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa.

Page 545. In the chapter on "Agriculture." A table shows production of soy beans, potatoes, and sweet potatoes, 1914-1918 (in 1,000 koku). Production of soy beans increased from:

3.664 million *koku* in 1914
3.807 million *koku* in 1915
3.750 million *koku* in 1916
3.695 million *koku* in 1917
3.451 million *koku* in 1918. Address: Prof. at the Waseda Univ. and Late of the *Japan Times*.

2076. U.S. Tariff Commission. 1920. Summary of tariff information, 1920; prepared for the use of the Committee on Ways and Means, House of Representatives. Washington, DC: Government Printing Office. 1004 p. See p. 320-22, 779-80, 990. [7 ref]

• ***Summary:*** Contains a description of the soybean, its uses, production, and quantities imported, and the tariff regulations applicable to the various soy products.

Paragraph 200, page 321: "The provision in this paragraph for 'bean stick [dried yuba sticks] or bean cake, miso, and similar products,' covers a Japanese food product made from ground soja (soya) beans and water, known as frozen tofu or koya-dofu, and fried tofu or hoshi aburage, the frozen tofu or koya-dofu being in the shape of small, porous, yellow cakes about one-half inch thick, from 1½ to 2 inches square, and the fried tofu or hoshi aburage being in thin cakes one-quarter inch thick and 2½ to 5 inches in diameter, which have been fried in some kind of oil or grease. Even if not bean cake it is dutiable as a product similar to bean cake, bean stick, and miso. (G.A. 8045, T.D. 37079, of 1917, following Abstract 29577, T.D. 32780, of 1912.) *'Amasake,'* made from rice yeast (30 per cent) and boiled rice (70 per cent), used as a drink among the Japanese, was likewise classified as a 'similar product,' apparently as similar to miso. (Abstract 31147, of 1913).

Oil cake produced from the soya bean is free of duty as oil cake provided for in paragraph 560. (Abstract 23794, T.D. 30828, of 1910)."

Paragraph 201, p. 321-22: In the Act of 1909, sauces of all kinds were subject to a 40% ad valorem duty; this decreased to 25% in the Act of 1913. Thick sauces include dressings and condiments such as chutney. "Thin *Chinese*

© Copyright Soyinfo Center 2014

soy made by mixing cooked soy beans with wheat flour, salt, and water and exposing to the sun for about three months, used to flavor and color soups, fish, and meats, about 80 per cent being used in the kitchen and about 20 per cent on the table, is dutiable as a sauce hereunder and not as a nonenumerated manufactured article under paragraph 385. (9 Ct. Cust. Appls., -; T.D. 37976, of 1919.) *Japanese shoyu* is also classified as a sauce under this paragraph. (T.D. 37574, of 1916; Abstract 43496, of 1919.)"

Paragraph 606, p. 779-80. A duty is first levied on soya beans in the Act of 1913.

"Description and uses.–*Soya beans* used in oil mills, the important consumers, are chiefly imported. Soya-bean cake, or meal, a by-product of oil manufacture, is a valuable cattle feed and enters extensively into international trade. (See pars. 560 and 561.) In China and Japan the beans, cake, and oil are elaborated into a large number of food products, such as milk, cheese, flour, bean cake, and soya sauce... Except by resident Asiatics there is only a limited use of soya beans for food purposes.

"Production.–Soya-bean culture has recently developed rapidly... Imports of *soya beans,* too small to be listed separately prior to 1914, rose from about 2,000,000 pounds in 1914 to about 32,000,000 pounds in 1918; during the same period imports of soya bean *oil* rose from 16,000,000 to nearly 337,000,000 pounds.

"Soya beans cooked and salted, but not enough to so change them as to prevent their identification as soya beans, and packed in tins, jars, bottles, or similar packages, do not thereby lose their status as soya beans and are free of duty under this paragraph rather than dutiable under paragraph 199. (6 Ct. Cust. Appls., 415, of 1915.) *Soya beans* in stone jars and hermetically sealed tins, invoiced as *bean sauce,* were likewise classified, and not dutiable as prepared beans under paragraph 199, nor as sauce under paragraph 201. (G.A. 8217, T.D. 37860, of 1918.) *Beans* and *bean sauce* prepared or preserved in tins, jars, bottles, or similar packages, were also held free of duty under this paragraph, analysis of the samples showing them to be soya beans, either natural or prepared. (Abstract 41021, of 1917.)... A *black bean* known to the Japanese as *Kuromame,* was held not to be free of duty under this paragraph, the evidence being insufficient to prove that the merchandise was soya beans. (Abstract 42852 of 1919)." Address: Washington, DC.

2077. Johnson, Wynonah B. 1921. Dining 'round the world in Los Angeles. *Los Angeles Times.* Jan. 1. p. VI9.
• ***Summary:*** The section titled "In Chinatown's alleys" describes it as appealing to the tourist, inscrutable, and intriguing. "Of course the main standby of the oriental cafe is chop suey, in one of its fifty-seven disguises. Don't ask me. I don't know what it's made of... I leave it to luck and the almond-eyed chef, and proceed to mix it with the mound of snowy rice in its companion dish, and drench the whole with soy-sauce, and get a firm hold on the chop-sticks–and we're off." "The long slender black ones [chopsticks] give a final flavor of the celestial kingdom to these mysterious dishes..."

The section titled "In Little Tokyo" begins: "... there is something very different about Chinese and Japanese eating places. Heavy carvings and somber hangings give place to lighter and more artistic furnishings, and the inscrutable waiter is replaced by a smiling boy or glossy-haired maiden who will serve you just as deftly, but somehow with a subtle difference." Some of the delicate little confections "are made right here in the Japanese district, where they are in big demand. These centers look and taste like chocolate, but they are made, the polite clerk assures us, of [azuki] bean-paste, which also forms the foundation of many others." Seaweed is on the menu and "each plate is a delight to the eye, at least. The surroundings are immaculate;..."

2078. Adkins, Dorothy Margaret. 1921. The soya-bean problem. *Science Progress* (*London*) 15(59):445-51. Jan. [9 ref]
• ***Summary:*** This is a popular article. Contents: Introduction. Practical applications of the bean: Food uses include Tofu, or bean cheese (Japanese), Miso similar to chiang (Chinese), Shoyu (Japanese) and chiang-yu (Chinese), Natto (Japanese), whole dry soya-beans, soya-beans canned as a green vegetable (see description below), vegetable milk, soya-beans roasted, ground and used as a coffee substitute in Switzerland and the USA, soya flour, soya in diabetic diets and macaroni. Utilisation of soya-bean oil: In Italy, China, Manchuria. Utilisation of soya-bean cake and meal: As fertilizer in China and Japan, for feeding stock. Food value of the bean. The cultivation of the soya bean: China, Japan, United States, Australia (New South Wales), South Africa, West Indies, British East Africa, West Africa, Burmah [Burma], England.

"In Japan beans are germinated until the sprouts are about five inches long, and eaten with vinegar; beans, germinated and treated with brine, have also been noted in Spain." Note: It is not stated clearly that these beans in Japan or Spain are soya beans.

"Soya-beans may be cooked and used in the same way as haricot-beans, and may also be picked when young and treated like green peas, in which condition they may be canned."

"In South Africa success has been achieved in growing the plant; in 1910 the outlook was so hopeful that a project for constructing oil mills was suggested. Unfortunately the bean was not taken up by farmers, who preferred to cultivate maize, as it was an easier crop to produce. Thus no extensive culture of the bean was attempted, and the subject was dropped.

"In other parts of the Empire, for example the West Indies, British East Africa and West Africa, trials of soya-beans have proved successful, but in no district have

© Copyright Soyinfo Center 2014

promising early experiments been followed by tests on a larger scale."

"In certain parts of India, for example Burmah, soya-beans are grown on a large scale and are consumed by the natives."

Note: "Lower Burma is a historical region, referring to the part of Burma annexed by the British Empire after the Second Anglo-Burmese War, which took place in 1852... Lower Burma was centered at Rangoon, and composed of all of the coast of modern Burma, and also the lower basin of the Irrawaddy River, including Prome. The area was also known as British Burma" (Source: Wikipedia, Oct. 2010). Address: Royal Holloway College, London.

2079. Oshima, Kokichi. 1921. Re: Description of Japanese foods pickled in miso or shoyu, imported to New York. Letter, probably to Margaret B. Church, Bureau of Chemistry, USDA, Washington, DC, Feb. 12. 2 p. Handwritten. [Eng]

• ***Summary:*** Mentions daikon misozuke (white radish), taimiso (sea bream), youkizuke (Miscellaneous vegetables in shoyu).

Note: According to Dr. Charles Thom's personal papers from about 1922-23, Kokichi Oshima spent 7-8 months at the Microbiological Laboratory of the USDA Bureau of Chemistry doing research related to food fermentation, such as quantitative determination of industrial mold enzymes. Oshima was a graduate of Hokkaido Imperial University (Sapporo, Japan). In Dec. 1922 and Feb. 1923 Oshima was back in Sapporo. Address: Apt. 42, 604 W. 139th St., New York City, NY.

2080. Armstrong, Robert B. 1921. Wants tariff on soy bean: American growers seek bar against Orient, Japanese control Manchuria and undersell. *Los Angeles Times.* Feb. 15. p. I4.

• ***Summary:*** The National Board of Farm Organizations asked the government's Ways and Means Committee for permanent high protection against "all oriental vegetable oils, especially the soya bean of Manchuria and its products." Charles W. Holman, chairman of the tariff committee of this farm organization, made this plea in behalf of American producers. He presented a long list of facts and figures about "the soya bean industry" which he gathered first hand by investigations in Manchuria and Japan. These included historical statistics on production and trade of soya beans, soya bean oil, and soya bean cake.

He said that about 90% of the soya bean oil from all of China comes from the Manchurian territory. During the war [World War I], the USA imported nearly all of that oil. Manchurian production of soya beans has already reached a point "where it taxes the mills of Japan and Manchuria to crush the beans."

Manchuria is rapidly falling under the domination of the Japanese due to their successful policy of controlling transportation, and establishing Japanese town settlements all along the rail lines. The Japanese imperial government cooperates closely with Japanese bankers and traders, and with the network of purchasing agents, located even in remote villages.

Japanese control the ports of Dairen, Antung, Fusan, and (to some extent) Vladivostok. "Their virtual seizure and operation of the Chinese Eastern Railway, the Russian Railway through Northern Manchuria, connecting with the Japanese-owned South Manchurian Railway at Chang Chun (Changchun), gives them control over the inland transportation of the beans and makes it exceedingly difficult for European or American firms to compete with Japanese firms in interior transactions."

Chinese farmers are paid little for their raw soya beans, and Japanese traders can lay down oriental oils on America's Pacific Coast ports at prices low enough to depress the market and discourage production by U.S. farmers.

2081. Meekins, Lynn W. 1921. Favorable outlook for American trade in Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 24(41):983-93. Feb. 18. See p. 989-91.

• ***Summary:*** "The South Manchuria Railway Co., the largest purchaser of American products, proposes to spend more than $200,000,000 gold upon improvements and extensions of its enterprises within the next five years... In spite of Japan's special advantages in Manchuria there is an excellent opportunity for the marketing of many lines of American goods,..." Manchuria is made up of three provinces having an area of some 365,000 square miles.

"American trade with Dairen–Dairen versus Vladivostok: The share of the United States in the trade of Dairen is much larger than that shown by the Maritime Customs statistics, owing to the extensive shipments of goods to and from the United States credited to Japan as the country of immediate destination and origin. The direct trade between Dairen and the United States exceeded $38,000,000 in 1919, of which imports [to Dairen] comprised two thirds and exports one third."

"As between Dairen and Vladivostok, at present a greater risk is involved in using the Vladivostok route. Costs of handling cargo at that port are higher than at Dairen; there is no market at Vladivostok itself for produce shipped there, wharves and warehouses are inadequate, and shipping services are irregular. Until these conditions are improved Dairen will probably continue to handle most of the exports of Manchurian products, as well as the imports of American goods for sale in Manchuria.

"If Vladivostok were made a free port and provided with facilities which Dairen now enjoys, full advantage could be taken of it as a real open door to Manchuria. Vladivostok, rather that Dairen, offers the more promising outlook to

© Copyright Soyinfo Center 2014

American firms seeking non-Japanese business in Manchuria and eastern Siberia."

"It is estimated that 2,500,000 tons of soya beans are produced annually in the three Provinces of Manchuria. The wheat and millet crops generally approximate 1,000,000 tons each. The Japanese firm of Suzuki & Co. has sold 100,000 tons of Manchurian wheat to the United Kingdom and 50,000 tons to Italy during the last few months."

"The products of the soya bean include bean curd [tofu], flour, milk, cheese, soy sauce, oil, and cake. The Chinese are concerned chiefly with the food products mentioned and the Japanese use large quantities of the cake for stock feed and fertilizer. The United States is the principal purchaser of the oil, a substitute for cottonseed and linseed oil employed in the manufacture of soap and paint and also as a lubricant."

"How bean trade is conducted: In Tiehling and Sunkiatai (Fengtien) and Kwanchengtze (Kirin) there are about 300 Chinese wholesale bean companies whose capital averages from $100,000 to $200,000 Mukden currency. Four Chinese banks–the Bank of China, the Bank of Communications, the Government Bank of the Three Eastern Provinces, and the Hsing Yeh Bank of Mukden–negotiate loans upon the joint guarantee of two of these companies without security; other Chinese banks require in some cases that the beans be pledged. Such loans are for three months or six months, sometimes one year, and the rate of interest has been less that 10 per cent. The Japanese banks lending money to bean dealers are the Yokohama Specie Bank and the Bank of Chosen [Korea], the former issuing Newchwang notes and the latter gold notes. It is estimated that between 60 and 70 per cent of the loans made by the Japanese banks is to Chinese and between 30 and 40 per cent to Japanese companies.

"The bean business may be said to commence in September, when buyers visit the producing districts and pay from 10 to 20 per cent of the stipulated price in advance. To the towns mentioned above, from 1,000 to 2,000 cartloads of beans are brought daily from November to January. The average price during the past two years has been $2 Mukden currency per 27 catties (36 pounds), exclusive of the production tax and the cost of transportation to Dairen and Newchwang. Mukden currency–that is, small coin dollars–exchanges for Mexican dollars at an average value of $1.40 to $1. At the present rate they are equivalent to about 40 cents in United States currency.

"Owing to the lack of good roads in Manchuria the beans must be carried to the market centers during the winter months, when the fields and streams are frozen. By March the crop has been collected and stored and exports become most active.

"Through the system of mixed storage, the South Manchuria Railway Co. has effected a great improvement in the handling of beans. When brought to the railway stations the beans are examined and graded according to quality and size. A certificate issued to the depositor entitles him to draw from the mixed-storage depot at Dairen or Newchwang an equivalent amount of beans of the same quality and size. The bags used in packing are also examined, and when the grade of bags deposited and that of the bags delivered is different the loss or gain thereon is adjusted by paying to or collecting from the depositor the difference in value. The new system saves the railway the trouble of transporting and storing each consignor's cargo separately. It also saves the shipper from the risks attending delay in transportation and from searching for his goods after they have arrived at their destination.

"Production of oil: The 60 bean mills at Dairen produce daily nearly 400 tons of oil and 3,700 tons of cake. Newchwang and Harbin are next in importance as oil-mill centers. The most widely used method of production is the expression system, by which one picul (133.33 pounds) of beans yields about 12 pounds of oil and 122 pounds of cake (in two equal pieces of 61 pounds each). By the chemical extraction system one picul of beans yields an average of 17 pounds of oil and 116 pounds of meal. The specific gravity of the oil is from .922 to .930.

"Sapan-wood, hemp seed, sesamum, and bean oil are being used by the Manchuria Paint Factory in Dairen, organized in February, 1920, with a capital of 1,000,000 yen, to manufacture paints for the South Manchuria Railway Co. and for various markets. The daily output is about 7,000 pounds, or 250 tins containing 28 pounds each. The colors produced include white, 'iron rust' red, and brown.

"The Japanese initiated the export trade in soya beans from Manchuria and developed the business to its present proportions. These middlemen, conversant with oriental ways, studied occidental needs and learned enough about western business methods to deal successfully with American and European firms. their strong position is due to their control of railways, their banking connections, their oil mills, and, in general, their special organization in South Manchuria for handling the business. Eventually it may be possible by exporting beans and oil through Vladivostok for Chinese sellers and American buyers to deal directly with each other. Meanwhile the most effective methods to be employed involve the development of selling and buying organizations able to cope with the situation now existing."

"About two thirds of the population of Manchuria is in the Province of Fengtien, which composes, in general, South Manchuria." Address: Trade Commissioner, Peking.

2082. Morse, W.J. 1921. Hahto soy bean a promising new variety for food. Washington, DC. 2 p. Unpublished manuscript. Feb. 23. 28 cm.

• ***Summary:*** "Attention farmers in the Southern and Central States is being attracted to the Hahto variety of soy beans as a most palatable and nutritious green vegetable similar to lima and butter beans. A small packet of seed of this variety was obtained by a missionary at a county agricultural

© Copyright Soyinfo Center 2014

exhibition in Japan about five years ago and sent to the Department. In the variety trials it appeared exceedingly promising for use as a green vegetable and was found very prolific. During the past two years it has been grown extensively by the boys' and girls' canning clubs of the Southern states and the past year was in general distribution. Reports indicate a large number of successful results with the Hahto 'both for man and beast' as stated in many of the reports. Its popularity has caused it to be listed the present season by two large seed houses in the Eastern States.

"Although the Hahto is best adapted to the Southern States and the southern part of the corn belt, it may be successfully produced as a green vegetable much further North. As a green vegetable, the pods should be picked when the seed is almost full grown. These beans may be canned like green peas and make an excellent green vegetable for the winter.

"The Hahto is a bush variety, very prolific and suitable for forage and produce. It requires about one hundred and thirty days to reach full maturity but may be used as a green vegetable in about one hundred and fifteen days. In addition to its use as a green bean, the mature seeds make an excellent dried bean more easily cooked and a better flavor than the varieties of soy beans ordinarily obtained on the market."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 92–Morgan-Morse.

2083. Suzuki, Keiko. 1921. Daizu no shihan ryû o shôzuru genin ni tsuite [Studies on the cause of "shihan" (purple speck) of soybeans]. *Chosen Nokaiho* (*Chosen* [*Korean*] *Agricultural Association Report*) 16(2):24-28. Feb. [Jap]
• ***Summary:*** Suzuki believed that the cause of the purple speck [stain] disease of soybeans might be due to the mechanical stress exerted by the pod in consequence of unequal growth between pod and seed. Thus, climatic conditions were considered the chief cause of the disease. Note 1. Suzuki was wrong. Kikuchi soon showed that the real cause of the disease was a fungus of the genus *Cercospora.*

Note 2. This is the earliest document seen (Feb. 2006) concerning the purple stain of soybeans. Address: Korea.

2084. Thom, Charles; Church, Margaret B. 1921. *Aspergillus flavus, A. oryzae,* and associated species. *American J. of Botany* 8(2):103-26. Feb. [54 ref]
• ***Summary:*** Introduction. "The numerous strains align themselves into groups of closely related forms which may for convenience be considered here under three series names."

Aspergillus flavus-oryzae series. The saké industry of Japan is based upon the diastatic power of *A. oryzae* (Ahlb.) Cohn. When "numerous cultures from the soy or shoyu industry of Japan and China are brought together, a whole series of forms are found which bridge the gap morphologically between *A. oryzae* as the saké organism and *A. flavus* as described and distributed also by Wehmer. Material taken directly from fermenting vats in China by Dr. Yamei Kin, formerly of the Bureau of Chemistry, shows strains of this character. Inoculating material furnished by Dr. Teizo Takahashi for experimental work on the fermentation of soy sauce or shoyu proved to be a member of this series. Dr. Takahashi had selected his strain for this type of fermentation from among several recognized and studied by him in Tokyo... All of these strains are regarded by him as varieties of *Aspergillus oryzae*, not *A. flavus."*

Aspergillus oryzae series. "In the Oriental industries in which it has been long used, the separateness of this form is largely lost. It becomes, therefore, a gigantic race in a group in which other members possess the same habits, the same essentials of structure, but differ slightly in color and greatly in size... *Aspergillus flavus* was first described by Link (1809) in terms vague enough to baffle any attempt at certain identification."

Aspergillus Wentii and related forms. "The Java culture originally sent by Went to Wehmer was used in rice and soy fermentation on that island by Chinese workmen." *Aspergillus tamari* and allies. "A second brown series of forms is more closely associated in occurrence and in habit with *A. flavus* and its allies than is *A. Wentii.* Many cultures in this series have been obtained in forage and feeding stuffs, from the Oriental soy fermentations... In size of colony, habit, and appearance aside from color, these forms resemble *A. flavus.* In the markings of conidia they suggest *A. niger*... Kita (1913) described as *A. tamari* a culture discovered as a contamination in a Japanese fermented product, tamari-koji."

A photo (photomicrograph) shows the wide variety of heads in a species and in a strain of *Aspergillus tamari.* Includes a calyptrate head. Note: This is the second earliest study seen of a fermented food published by USDA researchers. Address: USDA Bureau of Chemistry, Washington, DC.

2085. *Agricultural News* (*Barbados*). 1921. The soya-bean problem. 20(492):73. March 5. [4 ref]
• ***Summary:*** Begins by summarizing articles from three other publications on the importance of having root nodule bacteria in the soil if the soybean plants are to bear root nodules and give a good yield of soybeans. Concludes by summarizing the many uses of the soybean, especially in Japan and China, including vegetable milk, oil, meal, and non-food industrial uses, as in the manufacture of linoleum, explosives, water-

proof goods, rubber substitutes, and printing inks. "If vegetable milk is kept for several days, it turns sour, and can be used as butter milk. One firm in England is engaged in the production of a vegetable condensed milk, which is prepared from soya beans." Address: Barbados, West Indies.

2086. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1921. Bean trade reports from the Orient. 3(10):34. March.
• ***Summary:*** Source: Commerce Reports. Discusses the effects of World War I on the trade of soya-beans, soya-bean oil, and [soya] bean cake from Manchuria.

There was a decline in shipments of soya bean oil due to "the high rate of exchange in Dairen and the low rate of exchange between the United States and Europe." Much of the oil imported from Manchuria "by the United States was shipped to Europe in the form of sauces, etc. Moreover, when the armistice was declared, large stocks of soya-bean oil were accumulated in the United States.

"Bean oil and bean cake industries: At present there are 20 bean-oil mills in Antung, with an estimated total capital of $1,077,000 and a daily capacity of 22,100 bean cakes (weighing about 62 pounds each) and 160,251 pounds of bean oil. These mills employ 1,100 men, paying to the great mass of laborers an average monthly wage of $8.60 with food and lodging and to some of the expert workmen operating hydraulic presses, etc, as much at $36.40 per month with food and lodging and to some of the expert workmen operating hydraulic presses, etc. as much at $36.40 per month with food and lodging.

"At present there are 20 [soya] bean-oil mills in Antung, with an estimated total capital of $1,077,000 and a daily capacity of 22,100 bean cakes (weighing about 62 pounds each) and 160,251 pounds of bean oil. These mills employ 1,100 men, paying to the great mass of laborers an average monthly wage of $8.00 with food and lodging and to some of the expert workmen operating hydraulic presses, etc. as much at $36.40 per month with food and lodging.

"Of the 20 mills operating in 1919, 2 were equipped with locally-made hydraulic presses and the remainder with native hammer and wedge presses and hand-operated screw presses. All the mills are equipped with steam or oil driven rollers for crushing beans, most of the engines being of Japanese make with a few large engines of English make. The new mills are obtaining equipment in Darien from a Chinese machine shop which specializes in bean-oil presses and allied material. Until the world trade in vegetable oils has settled into its new post-war channels, there is small likelihood of supplanting present equipment in Antung mills by more modern machinery.

"Bean cake as fertilizer: The local bean-oil market was greatly stimulated by the war; and while local trade will probably suffer a setback from post-war readjustments, the trade in bean cake seems more certain, as Chosen (Korea) and Japan are using increasingly large quantities for fertilizing rice fields, the high prices for rice strengthening this demand. In urging its use by farmers, the Japanese Government estimates that Korea's rice output may be increased 40 per cent, thus assisting materially in solving Japan's food problem."

The new system saves the railway the trouble of transporting and storing each consignor's cargo separately. It also saves the shipper from the risks attending delay in transportation and from searching for his goods after they have arrived at their destination."

2091. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1921. Soy bean makes its way north to colder climes. 3(11):51-52. April.
• ***Summary:*** "The soy bean, an Asiatic importation, popularly associated with the South, is making its way north, and is being well received.

"Most of the varieties first brought to this country were from parts of Asia, whose climate corresponded more nearly to the southern states. Within the last seven or eight years the department [USDA] has obtained about 300 introductions of soy beans from Manchuria, Korea and Japan, some of which grew as far north as the 52d parallel. The most promising northern varieties are the Black Eyebrow, the Mandarin, and the Manchu, all native to a latitude of about 46 degrees, on account of which they are adapted to our most northern states. A large number of samples of Black Eyebrow soy bean were sent to northern farmers last year, and out of 551 reports returned more than 400 were favorable. Reports promise a great increase in acreage in northern states this year. Seedsmen are laying in supplies of these more northern varieties; but many farmers, if unable to obtain northern seed, will plant old varieties, such as Ito San. From 90 to 95 per cent of soy beans are raised for hay, silage and pasture, although they are prolific seed producers."

2092. Dickver, E.R. 1921. Hydrogenation of oils in Japan. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 24(114):972. May 17.
• ***Summary:*** "The hardening of fish and vegetable oils by hydrogenation is a comparatively recent industry in Japan, having been started in 1912, with one factory under foreign management. Originally the industry was intended to furnish hardened oils for soap making, but... there is now a small surplus for export."

Eight plants in Japan now hydrogenate oils; their combined capacity is 62 tons per day. "The raw materials used by most of these plants are whale and fish oils, although a few also harden vegetable oils (principally coconut and soya bean), or fish and vegetable oils mixed."

The future depends on the soap industry (both toilet soaps and laundry soaps), which has tripled in size during the past 10 years.

2093. Miura, Michiya. 1921. Manshû shuyô nôsakumotsu no byôgai [Diseases of Manchuria's principal agricultural crops]. *Minami Manshu Tetsudo K.K. Nôji Shikenjô Ihô* (*South Manchuria Railway Co., Agricultural Experiment Station Bulletin*) No. 11. 56 p. English abstract in Japanese Journal of Botany 1(1):9. (1923). [Jap]
• ***Summary:*** The first section (p. 1-29) is about soybean diseases. This is the world's earliest document seen (April 2002) that mentions downy mildew on soybeans. Discusses: Peronospora trifoliorum, Mitiya, Bacterial blight, downy mildew, Sclerotinia rot, ring spot, silk rot, rust, gray spot, brown spot, frog-eye leaf spot (*Cercospora daizu* Miura), yellows, soil sickness, Minami Manshu Tetsudo K.K. the manufacture of artificial tallow, and the new company at Dairen hope to sell large quantities of this tallow in the Fat East. The well-known firm of Suzuki & Co., of Kobe, among numerous other interests, are also interested in fat-hardening They are the principal shareholders in the Hodogaya Soda Works and are now utilizing the hydrogen from these works for fat-hardening purposes. Other firms largely engaged in the new industry are Lever Brothers... and Nihon Glycerine Company."

2096. Butts, Halleck A. 1921. Edible oils and bean cake in Japan. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 24(139):1558-59. June 16.
• ***Summary:*** The Asano Bussan Co., of Tokyo, which operates its own mills and does an extensive import and export business, "states that practically all the soya beans used in Japan by the Japanese mills are imported from Manchuria and the local beans are scarcely used in the manufacture of oil.

"The [Japanese] Department of Agriculture and Commerce lists 21,304 vegetable oil mills in Japan, employing 28,663 persons. These figures, however, include the vast umber of small hand-powered mills using primitive crushing methods and scattered throughout the country districts. Accurate statistics from these mills are practically impossible to obtain. There are about 40 oil mills in Japan of commercial importance; (the Department of Agriculture and Commerce lists 33). Of these, 20 are located in the Kobe consular district... The 34 largest mills have a capacity of about 3,570,200 gallons of oil per month. The production of oil for 1918,... which was a banner year for the industry and the mills were practically working at full capacity, was 547,671 koku (1 koku = 47.6 gallons)." So 26,069,139 gallons in 1918.

A table (p. 1558) shows production by type of oil (in koku): Coconut 181,121. Rape seed 156,455. Soya bean 147,188. Perilla 21,514. Sesame seed 18,358. Cottonseed 16,152. Peanut 12,883. Total: 547,671.

"Of the 33 mills listed by the Department of Agriculture and Commerce, 14 use the pressure method, 17 use the benzine extraction method, and 2 use both processes." The many small mills do not obtain oil from soya beans. Address: Trade Commissioner, Tokyo.

2097. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1921. Chinese trade and economic notes. 24(151):1844-45. June 30.
• ***Summary:*** "Reduction in railroad freight rates to Dairen: In order that Dairen may be able to compete with Vladivostok for the purchase of produce, the South Manchuria Railway Co. has announced that the freight rate on beans, bean cake, bean oil, wheat, and flour, if these products represent through traffic from stations north of Tao Lai Chao, on the Chinese Eastern Railway, to either Dairen of Newchwang, has been reduced approximately 34.2 per cent, writes Consul Kirjassoff.

"Conditions in Dairen bean trade: In the weekly commercial report of the Nisshin Oil Mills (Ltd.), Dairen, dated May 14, 1921, which was forwarded by Consul Karjassoff, attention is drawn to the serious effect upon Dairen of the formidable rivalry of Vladivostok, to which port beans and bean cake from the interior markets are being forwarded and exported to Japan at lower quotations that in Dairen. The stocks of beans at the Dairen wharf godown of May 12 are given as 82,992 short tons, compared with 139,554 short tons at the same time in 1920."

Address: Sapporo, Japan.

2099. Hoshino, T. 1921. Wealth of Manchuria not in beans alone: Yields of various crops being greatly increased as vast areas become cultivated. *Trans-Pacific* 4(6):72-76. June.
• ***Summary:*** "Soy beans and kaoliang are by far the two most important products of Manchuria. Broadly speaking, the latter feeds the people while the former fetches them money, so they may be well compared with silk and rice in Japanese economy. But beans do perhaps more for Manchuria than silk does for Japan, for, without beans, the trade of Manchuria would shrink at once to one-half its actual amount...

"According to one authority a total of no less than 5,126,655 acres or about 19 per cent of all the cultivated land in Manchuria is devoted to the cultivation of beans, and the yield, averaging 21 bushels per acre, amounts to something like 108,000,000 bushels, of which 70 per cent is produced in South Manchuria. Though South Manchuria thus produces far more beans than North Manchuria, they are mostly grown in its northern part, the districts bordering on North Manchuria... Something like 2,000,000 bushels are added to the crop every year...

"The most important food-stuff of the native population, kaoliang, ranks next to beans even as an article of trade, though, last year for once, it was ousted from the position by wheat. It is also the principal grain food of the numerous animals so important in Manchurian agriculture. Out of it is made kaoliang spirit, the most popular drink in the country. The stalk is used for fuel and roofing material, and is also women into Chinese mats, indispensable in native households.

"Before soya beans attained their present importance, half the total area of the cultivated land in Manchuria is said to have been devoted to Kaoliang."

The main livestock animals in Manchuria are pigs

• ***Summary:*** "What actuates us in our endeavours to open up Manchuria and Mongolia lies in realizing our ultimate ideal in the enlightenment and development of Manchuria and Mongolia. It will not do only to develop the natural and industrial resources, but the ethical and intellectual culture of the inhabitants must also be carefully husbanded and nourished, so that both mind and matter may be developed in harmony.

"It is urgently important that the truths regarding Manchuria and Mongolia should be made known clearly not only to Japan and China, but also to Europe and America. On this account, the establishment of the Manchuria Enlightening Society is bound to have a serious significance of international character."

The Society also helps travelers and observers wishing to visit Manchuria, Mongolia, Siberia, Chosen (Korea), China, etc. All officials of the Society are Japanese.

2106. Berczeller, Laszlo. 1921. "Manna" food. Products of the soya bean. Bread, flour, and milk. *Times* (*London*). Sept. 28. p. 11-12.
• ***Summary:*** Contents: Preface. Introduction. Animal experiments. An ideal food. "Manna" milk. Children's food.

"We give below a statement which Dr. László Berczeller, a young Hungarian who was assistant to the late Professor Franz Tangl, has made to our Vienna Correspondent on the new foodstuffs which are being made from the soya bean. Dr. Berczeller is working in a laboratory specially placed at his disposal by the Austrian Minister of Public Health, and his studies are being watched with lively interest by the British Minister and the American High Commissioner in Vienna.

"It was in 1913, in Berlin [Germany], that I first turned my attention to the soya as a food. I was the guest of the Japanese Club and a Japanese professor showed me soya food and told me that a milk was made from the bean in Japan... Professor Riegler, also in Hungary, had invented a synthetic milk made from the gluten of wheat. I saw these products were not satisfactory as they only had qualities in the sense of the old theory of calories and protein value of foods."

Note: This is the earliest English-language document seen (Sept. 2011) that contains the term "soya food" or the term "soya as food."

"We have fed white rats on beans, peas, and lentils, and we have found that animals fed on beans live shortest and those on lentils longest." When animals are allowed to follow their instinct, and choose between "the several kinds of legumina... they eat most lentils, less peas, and least beans."

"It is well known that in the time of the Greeks men still used, of cereals, chiefly barley. Barley was followed by rye, especially in the Middle Ages, and both barley and rye were supplanted by wheat, as in England, as is the case today on

© Copyright Soyinfo Center 2014

the Continent."

"An ideal food–We now endeavored to apply this knowledge to the soya bean with a view to the food shortage problem. In the chemical sense, the soya is an ideal food. It contains 40 percent albumen and 20 percent fat, and at the same time can be obtained very cheaply. In Japan and China the soya is worked up into a number of very valuable foodstuffs by small industrialists. These foodstuffs do not meet European taste. Probably the Mongolian race has accustomed itself to this food.

"The European foodstuffs industry has made repeated efforts to produce out of the soya a good and palatable food, but every attempt has failed, because the biological factor has been ignored. We could show that most of the processes used for this purpose and for which patents were also taken out, such as for extraction and roasting, only lead to one result; the rats fed with this food have a much shorter life than even those fed with the raw soya.

"We have been successful in creating three foods: bread, flour and milk, in which these principles were taken into account. These foods have been tested not only in the laboratory, but also on man; man, because one does not even yet know to what extent of certainty one may conclude from animal experiments to human beings."

"The new 'Manna' bread which has been produced by Mr. Robert Graham and myself–Mr. Graham's technical and scientific experience in bread making rendered it alone possible to work out this problem–is the solution of the old standard bread controversy. We do not use the bran, which is already disintegrated by the milling process. We use better proteids than those contained in the bran and we introduce a great quantity of fat into the bread. The bread is cheaper than any other at present on the market."

"Manna flour contains 40 per cent proteid and 20 percent fat. In the raw state it has a sweet and pleasant taste. It can be used for soups and cooking vegetables."

"'Manna' Milk–If we give animals the choice between the best milk powder and manna flour, their instinct leads them to eat largely of the later; and if we feed them on eggs or meat and manna flour in a similar colloidal state, they consume more manna flour and less eggs or meat. We deduce therefrom that human beings will find it pays them better to use manna flour. Manna milk is in its proteid, carbohydride, and fat contents, and in its colour, very similar to cow's milk. It has an almond-like taste. Used with tea, cocoa, or puddings, ice creams and pastry, one cannot detect any difference from fresh milk. It is now being manufactured and its cost in Vienna will be six times less than fresh milk. It is merely a question of scientific research and manna milk will be biologically perfect also."

"It is indisputable that the food of the white race is very costly, especially when one compares it with the food which the yellow race is accustomed to. We observe the evil consequences of this difference above all in the United States. It is therefore a matter of the highest political importance that the West should learn the lesson of cheaper living as taught them by the East in the adaptation of the soya bean as an article of food."

"For fighting the Russian famine the aforementioned foodstuffs commend themselves for widely different reasons: -

"1. They can be produced very cheaply.

"2. No other albuminous food can be transported in such concentrated form.

"3. In the form of rusks it would obviate all difficulties arising out of a shortage or stoppage of fuel.

"4. To make a beginning, the foodstuffs could be very quickly produced in Vienna.

"5. The diffusion of these foodstuffs would lead to the permanent cultivation of the soya bean in Ukraine. This would be of great importance to the future provisioning of the whole of Europe."

Note: "The Russian famine of 1921, also known as Povolzhye famine, which began in the early spring of that year and lasted through 1922, was a severe famine that occurred in Bolshevik Russia. The famine, which killed an estimated 6 million, affected mostly the Volga and Ural River region.

"The famine resulted from the combined effect of economic disturbance, which had already started during World War I, and continued through the disturbances of the Russian Revolution of 1917 and Russian Civil War" (Source: Wikipedia, Russian famine of 1921, Nov. 2013). Address: Vienna, Austria.

2107. *Times* (*London*). 1921. "Manna" food. The soya bean in England. Sept. 29. p. 7, col. 6.

• ***Summary:*** "Experiments in the growing of the soya bean–the 'manna food' which formed the subject of an article in *The Times* yesterday–in this country have been made by the Board of Agriculture, but one of the varieties tried so far appears to be suitable for the English climate."

"The following is an account of the experiments of growing the bean in England given by the Ministry of Agriculture.

"'Previous to 1909 a few attempts had been made to grow the crop in England, but without any success... With the object of securing the hardiest sorts in cultivation the Board of Agriculture obtained from an experimental station in North Japan seed of 16 varieties, together with a small quantity of the soil in which the crop had been grown. These were sown at the Midland Agricultural and Dairy College and on the Cambridge University Farm. At both centres the results were similar–many of the varieties grew well, but none formed flowers. Where the Japanese soil had been applied, the nodule formation was all that could be desired, but where no inoculation had taken place no nodules were formed. In 1910 the Board obtained seeds of several varieties

© Copyright Soyinfo Center 2014

from Manchuria. These were grown at the same centres as before. At the Midland College the crop grew vigorously, but formed no seed, while at Cambridge the plants ripened a small quantity of seed. This seed was sown in 1911, but the crop made little growth, and in spite of the hot season, no seed was produced.'"

"The conclusion come to from these experiments by the Ministry of Agriculture is that the Japanese and Manchurian varieties of the soya bean cannot be relied on to produce seed in this country. But it is admitted that, as the plant appears to be a very variable one, it is not impossible that a variety suited to the climate and agricultural conditions of this country may yet be produced.

"Apart from the production of beans for use as human food, the plant might have some value in this country as a forage crop."

2108. Grinenco, Ivan; Capone, Giorgio. eds. 1921. Produits oléagineux et huiles végétales: Etude statistique sur leur production et leur movement commercial [Oleaginous products and vegetable oils: Statistical study on their production and trade]. Rome, Italy: Institute Internationale d'Agriculture, Service de la Statistique Générale. xxxii + 421p. See p. XX-XXI, 140-41, 144-47, 442-43, 480-81. Sept. 15. Index in front. [Fre]

• ***Summary:*** In Sept. 1921 the IIA (*Institute Internationale d'Agriculture*) published this monograph in French. Two years later, by popular demand, an updated English-language edition was published. Contents: Introduction. Northern hemisphere: Europe, America, Asia, Africa, Oceania (Hawaii, Guam). Southern hemisphere: America, Asia, Africa, Oceania. Recapitulative tables of commerce, 1910-19. Note 1. All import and export statistics are given in quintals. 1 quintal = 100 kg.

The soybean (introductory information, p. xxii-xxiii, xxxii). Northern hemisphere–Europe. Germany (imports of soybean and soy oil 1910-14, p. 4). Denmark (production of soy oil in 1917, p. 17; imports and exports of soybeans and soy oil 1910-19, p. 18-20). France (imports and exports of soybeans and soy oil 1910-19, p. 28-31). Great Britain and Ireland (treated as one country; imports, exports, and reexports of soybeans and soy oil 1910-19, p. 32-35). Norway (imports of soybeans 1910-19, p. 47). Netherlands (Pays-Bas, imports and exports of soybeans and soy oil 1910-19, p. 49-52). Romania (In 1915 production of soybeans on 3 hectares was 3,600 liters). Russia (in Europe and Asia, imports of soy oil 1909-17, p. 70-71). Sweden (imports and exports of soybeans and soy oil 1910-19, p. 74-76).

Note 2. This is the earliest document seen (Jan. 2009) that gives soybean production or area statistics for Eastern Europe.

America: Canada (imports of coconut, palm, and soy oil {combined} for the production of soap {in hectoliters} 1915-19, p. 88-89). Cuba (various attempts have been made to introduce the soybean, p. 94).

United States (area and production in 1909 {659 ha}, then from 1917-1920, p. 97-98). An overview of soybeans in the USA (p. 103, 105) states that the soybean, known in the USA since 1804, has become of great economic importance during the past few years. It is becoming popular mainly as a forage plant, but also for its seeds, for extraction of oil, and for making other products. Statistics have been published regularly since 1917. The census for 1909 showed 659 hectares cultivated in soybeans. During the years from 1917 to 1919 the cultivated area surpassed 60,000 ha. The three main states for soybean cultivation are North Carolina, Virginia, and Mississippi, which in 1919 cultivated respectively 33,185, 12,141, and 3,238 hectares; this was almost 75% of the total cultivated to soybeans in the USA. In 1910, the seeds were used for the extraction of oil in the USA, and for the first time the seeds were imported from Manchuria. In 1915, domestically grown soybean were used as a source of oil. This industry is developing rapidly, because the extraction of the oil is easily adapted to existing facilities that press oil from cottonseed and linseed. A table (p. 106) shows production of 16 vegetable oils in the USA from 1912 to 1917. Soybean oil production (in quintals) has increased from 12,537 in 1914, to 44,996 in 1916, to 190,843 in 1917. Figures are also given for peanut oil, sesame oil, etc. Other tables (p. 108-10) show imports, exports, and reexports of soybeans and soy oil from 1910 to 1919.

Asia: China (exports of soybeans and soy oil 1910-19, p. 161-62). French Indo-China (overview, esp. Cambodia and Tonkin, p. 187). Japan (area planted and production of soybeans 1877-1919, p. 190; overview, p. 191; production of soy oil 1909-18, p. 192; imports and exports of soybeans and soy oil 1910-19, p. 192-93). Korea (area planted and production of soybeans 1909-1918, p. 194; imports and exports of soybeans and soy oil 1909-11, p. 195). Formosa [Taiwan] (area planted and production of soybeans 1901-06, p. 196; imports and exports of soybeans and soy oil 1909-17, p. 197. In 1901 10,888 ha produced 8,056,400 liters of soybeans. In 1904 21,960 ha produced 24,401,700 liters of soybeans). Note 3. This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for Formosa (Taiwan; ceded to Japan in 1895 after Japan won the Sino-Japanese War).

Kwantung [Kwantung Leased Territory in Manchuria] (area planted and production of soybeans 1911-17, p. 198. In 1911 14,627 ha of soybeans produced 102,112 quintals. In 1916 29,902 ha produced 153,995 quintals of soybeans).

Africa: Algeria (in recent years, trials have been made to introduce soybean culture to Algeria, p. 238). Egypt (imports of soy oil 1919, p. 244-47).

Southern hemisphere–America: (Note 4. Soy is not mentioned at Argentina, Brazil, or any other South American country). Asia: Netherlands Indies. (A) In Java

© Copyright Soyinfo Center 2014

and Madura, the area planted to soybeans was 162,800 ha in 1916, 175,696 ha in 1917, and 157,844 ha in 1918. Gives imports of soy oil (1,085 quintals in 1914) and exports of soybeans (46 quintals in 1913) (p. 297-98). (B) In outlying territories, gives imports of soybeans from 1913 to 1919 (p. 299). Africa: Southern Rhodesia (attempts have been made to introduce soybeans and several other oil plants from temperate climates, p. 317). Oceania: Soy is not mentioned at Australia, New Zealand, British New Guinea, former German New Guinea [later Papua New Guinea], or any other country in southern Oceania. (p. 297). Recapitulative tables–Imports and exports from 1910-1919. Soybeans, p. 368-69. Peanuts, p. 370-75. Sesame seeds, p. 376-79. Palm fruits (*Amandes de palme,* from which palm oil is obtained), p. 392-93. Peanut oil, p. 414-17. Corn oil, p. 416-17. Sesame oil, p. 418-19. Soy oil, p. 420-21. Other oils covered in detail by this book are: Cottonseed, hempseed, linseed, rapeseed (*colza* and *navette*), poppy (*pavot* or *oeilette*), castor, olive, coconut, palm, and other–non-specified. Address: 1. Doctor of Agronomics; 2. Doctor of Economics. Both: IIA, Rome, Italy.

2109. Nagai, Isaburo. 1921. Daizu hinshu no yô menseki to seisanryoku to no kankei [Relationship between the leaf area and productivity of soybean varieties]. *Nogaku Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 228. p. 603-24. Sept. [9 ref. Jap]

• ***Summary:*** The author did an early scientific experiment using many soybeans gathered throughout Japan. He pointed out that soybeans grown in northern Japan have larger seeds and leaves than those from southern Japan.

2110. Wester, P.J. 1921. The food plants of the Philippines. *Philippine Agricultural Review* 14(3):211-384. Third quarter. See p. 360.

• ***Summary:*** "Soya. *Glycine max* M. Leguminosae. An erect, annual herb 35 or more cm tall, the beans of which are made into flour or otherwise prepared in various ways for the table in India, China and Japan, and from which a valuable culinary oil is obtained. Of limited distribution and rarely cultivated. Has proven very productive in Bukidnon and Lanao below 700 meters altitude. A crop of undoubted value for the Philippines, both for human food and as a stock feed. Said to have been introduced during the Spanish régime. The Soy bean."

Note: The Spanish ruled the Philippines for about 100 years (putting down many revolts) until Dec. 1898 when the Spanish-American War brought the archipelago under American control; the revolts continued. Address: Agricultural Advisor.

2111. *Light of Manchuria.* 1921. Present Manchuria and Mongolia, Series II. Oct. 1. p. 12-14, 30-31, 46-47.

• ***Summary:*** This article, continued from the September number, notes that one of the principal agricultural products of Manchuria and Mongolia [probably Inner Mongolia] are soya beans. "Yellow (Soya) Beans belong to the most common species. They contain a good percentage of oil and are also good as an article of food and also for the expression of oil. The Manchurian (Soya) Beans have become widely known all over the world. Hitherto they used to be used by Manchurian inhabitants as a food-stuff and for the expression of oil as a source of light. The residue left after oil was obtained served as cattle feed. Since the residue popularly known as Bean Cake came to awake demand in Japan as fertilizer, and Bean Oil began to be exported to the Western countries as industrial material, a marvellous development has been noted in the cultivation of Soya Bean. This belongs to only a recent date...

"The Chinese not only use Beans and Bean Oil in their daily cooking, but also *tofu* (bean curd palatable also to the Western palate and pronounced by the qualified chemist as similar in its composition to cow's milk), *miso* (an article of the staple food to both Japanese and Chinese), and *soy* are also made from Beans...

"Beans put out in Manchuria and Mongolia are put at about 20,000,000 *koku* (1 *koku* being equivalent to 4.96 bushels), but the outputs are increasing rapidly year by year, and there is a vast area of territory awaiting cultivation."

Page 30, under "Manufacturing Industry," notes that "Bean milling ranks foremost in manufacturing industry... Bean milling is best developed at Dairen, which is now possessed of sixty mills. In the interior of the country, the old primitive system by which a few head of mules or donkeys and a few hands do the work of expressing oil from Beans is still found in vogue. Such is only a domestic bye-industry. However, such extensive mills as use steam engines and express oil by hydraulic pressure are mostly found at Dairen. The Suzuki Bean Mill at Dairen is operated on the chemical extraction system which is the latest scientific method. The round-shaped cake left after the expression of oil weighs 46 *kin* a piece, which is the standard weight for export cake. In the fiscal year 1919, 19,693,000 piculs valued at 43,029,000 *Hk. taels* [Haikwan taels] were exported to Japan. Bean Meal, which is put out at the Suzuki Mill, is good for use as it is. Bean Cake is used by the Chinese for cattle-feed, and by the Japanese as fertilizer."

On pages 46-47 are tables giving exports and imports at Dairen. The three exports with the greatest value (in Haikwan Taels) were Bean Cake (36,851,244), Beans (Soya) (24,750,377), and Bean Oil (17,369,655). Imports included Miso and soy [sauce] (97,305).

2113. North, J.L. 1921. To solve the cost-of-living problem? A magic bean. *Illustrated London News* (*The*)**.** Oct. 8. p. 476-77. [1 ref]

• ***Summary:*** "The leading article and letter in the *Times* of Sept. 28 from its Vienna correspondent about Manna flour, manna bread, and milk substances made from the Soya bean, are likely to do good if they help us to realise how much we are losing by our neglect of this, the most valuable–for the uses to which it can be put–of all legumes.

"In the letter giving the details of the researches of Dr. László Berczeller of Vienna, there is no reference to the fact that these 'Manna' or Soya bean products were first made in England before the war. Samples of the flour and biscuits are to be seen in the cases of the London Institute of Hygiene, and Manna milk has been for years–and, no doubt, still is–sold here under the name of 'Solac' at a price considerably lower than that charged for milk by dairymen. The appearance and rapid rise into importance of the Soya bean is one of the most remarkable commercial events of modern times."

"In 1790 the [soy] bean was brought to Europe when its cultivation was first attempted by Young [Arthur Young, lived 1741-1820 in England], the father of British Agriculture, though without success. In 1878 an Austrian professor, Haberlandt, tried it, but failed [Note 1. Haberlandt did not fail; he successfully cultivated soybeans in Austria as early as 1875, and many times thereafter.] When the bean came here in 1908 there was an immediate rush to grow it both in Europe and America. Experiments were started by our Board of Agriculture, the Royal Agricultural Society, and many semi-public bodies. The early experiments failed completely, for the reason that they were made with seed whose climatic origin was unknown, as well as the orthodox Chinese methods of growing it. Later, this was remedied..."

By 1918 Europeans were aware of 500 different soybean varieties that were growing experimentally at Arlington, Virginia.

"My interest in the Soya bean began in 1913 with a visit from an agent of a German cultivator at the office of the Royal Botanical Society at Regent's Park. He was, he said, trying to form a syndicate to grow what he called an acclimatised Soya bean, brought from China in 1910, and already in cultivation in Germany. He refused seeds for testing, but sent from Hamburg a plant which had been carefully cleared of the seed, though the *empty* pods, nearly sixty in number, were left. The syndicate never materialised, and I thought no more of the matter, until later on, whilst examining the dried plant, I noticed a tiny pod, scarcely half an inch long, which contained a seed no bigger than a pin's head. Going over the plant I found other pods which evidently had been thought too insignificant to be of use, and from these I obtained thirteen seeds. These were sown in 1914 and resulted in thirteen plants, which produced four hundred and forty seeds. From thirty-three plants in 1915 one thousand seeds resulted, and in 1916 no less than twelve thousand. Many experiments as to the value of different methods of growing them were made in several countries, and with no less than twenty-one different foreign varieties. One thing came clear throughout the tests, and that was that the original variety started with was by far the best. It says a good deal for German astuteness that they should have gone to Manchuria and, from hundreds of varieties, chosen the one best for them and for us."

The future of the Soya bean in England is uncertain. "Natural selection helps the plants that mature earliest produce most seed; those that mature late die out. It is noticeable that the plants experimented with in England fruit earlier now than they did at first, and this is a very hopeful sign. Another satisfactory fact is that there is no lessening in the number of pods produced, but rather a gain. This year there are plants with three times the number of pods shown in a photograph of the best German-grown specimen of 1912."

In China and Japan the Soya bean "enters into the composition of most dishes, and in one form or another, as Soy sauce, bean paste, bean cheese, bean curd, bean milk, bean wafers, bean cakes and confectionery, is used everywhere. For a hundred years Soy sauce has been imported–the principal ingredient in the well-known Worcester [Worcestershire] sauce."

Apart from its value as a food, it is used in the manufacture of glycerine, explosives, enamels, varnish, varnish, waterproofs, linoleum, paints, soaps, celluloid, printing inks, and as a lubricant."

Photos (all but #1 by Frank N. Meyer of the USDA) show: (1) A typical pod from a soya bean plant grown by Mr. J.L. North at Chiswick, England, in 1921. (2) Two large, thin "blocks of tofu (bean curd)" on a round, wooden table. "Soya bean cheese for human food... Ready to be cut up into squares for sale to the public. Tofu, or Soya bean curd, is made by adding magnesium or calcium salts (about a 1 per cent. solution) to hot Soya bean milk; the product is drained and pressed. (3) "Varieties of soya bean cheese on a bamboo tray. Tofu, or Soya bean curd, forms the basis of many fermented, smoked, and dried cheeses in China and Japan." (4) "Soya bean cheese [fermented tofu] in preparation: A pile of wooden trays full of bean curd in a dark room of even temperature." (5) "Used by the Chinese as a green vegetable: A basketful of sprouted soya beans." (6) Soy bean plant with leaves, many pods and roots, grown at Chiswick.

Note 2. This is the earliest document seen (March 2002) written by Mr. J.L. North, the pioneer in cultivating soybeans in England.

© Copyright Soyinfo Center 2014

Note 3. This is the earliest English-language document seen (April 2013) that uses the term "soya bean cheese" or the term "soya bean curd" to refer to tofu.

Note 4. This is the earliest English-language document seen (July 2007) that uses the term "magic bean" or that uses the word "magic" as an adjective to refer to the soybean.

Note 5. This is the earliest English-language document seen (Jan. 2013) that uses the term "sprouted soya beans" to refer to soy sprouts.

Note 6. Concerning Arthur Young. He was the author of many books on agriculture, which were very influential in their day. He was an important advocate for the progressive agricultural practices of his time, advocating such innovations as the seed drill, improved crop rotations, the use of marl as fertilizer, and the enclosure of open fields. In 1767 he undertook the management of a farm in Essex. He conducted various experiments and published the results in *A Course of Experimental Agriculture* (1770). In 1784 he began the publication of the *Annals of Agriculture,* a periodical which was continued for 45 volumes and had many contributors. Young traveled to France during 1787-89 and in 1792 published an important book about his travels and observations there. The soybean was first grown in Paris, France, perhaps as early as 1740, definitely by 1779. So he may have learned about soybean from fellow agriculturalists in Paris while on this trip. Address: Curator of the Royal Botanic Society of London.

2114. Togano, Meijiro. 1921. Quick method for brewing soy. *U.S. Patent* 1,394,236. Oct. 18. 2 p. Application filed 19 Feb. 1920.

• ***Summary:*** Soy-bean or its cake is first soaked in water for about 8 hours and then boiled for about the same length of time. It is cooled to 30ºC, then the spores of *Aspergillus oryzae* are mixed with it. If desired, about 20% of wheat or other grain may be added to this mixture. The mixture is kept for 3 days at 30ºC in a warm, damp chamber. During the latter period the soy-bean becomes covered with a soft, greenish-yellow mycelium, produced by germination and development of the *Aspergillus oryzae.* The result is "soy-bean koji." To this soy-bean koji is added an equal volume of salt water having a temperature of about 60ºC and a specific gravity of 20 degrees Baumé (SG = 1.16). This mixture is then kept at a temperature of from 30 to 70ºC and stirred 1-3 times a day. By this treatment, the albumin of the soy-bean "is properly decomposed in a period of less than 10 days from the time the salt water was added to the soy-bean koji, and the soy-mash will produce the particular flavor of soy. Therefore, after the albumin is decomposed, soy is squeezed out or extracted from the soy-mash and the product thus produced is heated by means employed in the ordinary process, for the purpose of preparing the soy for use and sale." Address: No. 1686 Sugamomachi, Tokyo, Japan.

2115. Nakayasu, Kyoichi. 1921. Gyûnyû-chû no tônyû no kani kanshiki ni tsuite [On the simple detection of soymilk in cow's milk]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 476. p. 880-87. Oct. 26. (Chem. Abst. 16:1469). [Jap]

• ***Summary:*** On adding 4-5 drops of 28% potassium hydroxide solution to 10 cc of milk, a yellow color develops if soybean protein is present; 5% of the protein can be detected. To render the test more definite, the albumins may be precipitated from the milk by acetic acid, filtered off, and treated in a dish with 2-3 drops of the alkali. A light yellow color indicates the presence of soybean protein; the protein from pure milk gives a yellow color only on heating.

2117. Satow, Sadakichi. 1921. Researches on oil and proteids extraction from soy-bean. *Tohoku Imperial University, Technology Reports* (*Sendai, Japan*) 2(2):1-124 (41-164). Oct. 28 cm. [Eng]

• ***Summary:*** Contents: 1. General description of the soy-bean: The use of the soy-bean (as a food-stuff [shoyu, miso, tofu, natto], soy bean oil [for the manufacture of soap, hydrogenated oils, paints, varnishes, oil-cloth, and rubber substitutes], and bean cake or waste residue from the manufacture of soy-bean oil [nitrogenous fertilizer, as a cattle food, Solite–a water-based paint]). 2. Classification and analysis of soy beans and their standardization: By color, by protein / proteid content, conclusion of analysis (the best soy-beans are Tsurunoko and Kauro grown in Hokkaido): Standardization of the raw material, content of proteids, color of the raw material, moisture, regularity of the grain, specific gravity of the soy-bean, impurities. 3. Microscopical observations of soy-beans: Colour reactions of cellular substances, distribution of proteids and fatty acids, distribution of fatty oils. 4. Oil extraction (p. 17): Influence of hulls, influence of moisture, influence of oxidation, comparison of the dissolving power of various solvents, to find the best conditions for the extraction of oil by means of benzine, how to extract the oil technically without denaturing the proteids and how to remove the retained solvent, on the apparatus employed in oil extraction, working of the extracting apparatus, recovery of solvent by application of the vacuum system, separation of oil from the solvent and oil refining, reserving the oil-freed soy-bean meal.

5. Isolation of proteids out of oil-freed soy-bean (p. 35):

© Copyright Soyinfo Center 2014

General discussion, necessary and sufficient conditions for the extraction of proteids (on the quality of isolated proteids [plasticity, solubility, coloration], on the purity of isolated proteids, to obtain a maximum yield). 6. The extraction of proteids by means of water (p. 41): General properties of bean meal, on gummy substances and their properties (saccharo-colloids, incl. stachiose [stachyose], araban, galactan; p. 43), quantitative estimation of water-soluble proteids and carbohydrates, determination of the volume of water necessary for the extraction of soluble carbohydrates, relation of the duration of extraction to the quantity of extractable proteid and carbohydrates, effect of the process of water-extraction. 7. On the extraction of proteids by means of alkaline reagents: General properties of glycinin against alkaline reagents, classification of alkaline reagents, comparisons of dissolving power of alkaline reacting compounds, relations of the plasticity and coloration of the proteid to various kinds of extracting agents, standardization of plasticity of isolated proteid, on the relations between plasticity and chemical reagents, comparative experiments relating to the extracting process by means of sodium sulfite and sodium hydroxide.

8. The determination of the concentration, quantity, and other factors of Na_2SO_3 [sodium sulfite] in the process of extraction (p. 69): Determination of the concentration of sodium sulfite, the determination of the relation between the plasticity of the protein and the concentration of sodium sulphite, to determine the relation between the yield and the time of extraction, to find out the actual yield of proteid, as well as the volume of sodium sulfite solution provided the bean meal is previously extracted by water, then extracted with sodium sulphite, conclusion of this chapter. 9. Extraction of proteids by means of caustic alkalies [alkalis] (p. 80): To determine the concentration of the caustic soda [sodium hydroxide] solution, determination of the relation between the time of extraction and the yield of proteid, to determine the volume of caustic soda, the systematic extraction of proteids (using water, sodium sulphite, or alkali). 10. Clarification of extracted proteid solution and precipitation thereof (p. 86): Precipitation of proteids, precipitation by means of alkaline earth metals (such as magnesium sulphate), by means of colour base (such as malachite green, methyl violet, brilliant green, auramine, or new fuchin), by means of alcohol, by means of heating, by means of formaldehydes, by means of fermentation, by means of acids (choice of acid, yield of precipitated proteid, quality of proteid). 11. Quantitative investigations on the precipitation of proteids (p. 101, 11 experiments with summary of conclusions). 12. Effect of heating on the yield of proteid (p. 115). 13. Separation of excess water from the proteidal precipitate (p. 118). 13A. Process for drying the proteidal mass and for drying the residue (p. 121). 14. Pulverizing the dried proteid (p. 122). 15. Recovery of carbohydrates from waste liquid (p. 123).

World soybean production (in short tons): Manchuria 1,850,000 (25% is used in Manchuria as food; 75% is exported to all parts of the world in the form of "bean cakes or bean meal"). Japan 450,000. Korea 322,500. Kantoshu 15,400. Total of the above: 2,640,000 tons valued at more than 200 million Japanese yen (p. 2).

The author investigated the use of soy-bean proteins in plastics. There are upwards of 30 varieties of soybeans which may be classified into yellow, blue, and black. The first contain the most protein and oil, the last the least. The protein content varies from 35-40.5% and the oil content from 15.4 to 20.9%. The mean analysis of 16 different varieties was: Water 10.2%, proteins 37.8%, oil 18.9%, carbohydrates 23.5%, fiber 5.2%, and ash 4.4%. The carbohydrates consist mainly of non-reducing sugars with little or no starch. The cell membrane consists of galactan or hemicellulose, with a little free cellulose. The presence of the hulls in the crushed bean reduces the speed of extraction of the oil and the yield, and gives the oil and protein a brown color. Note: This is the earliest document seen (May 2004) containing the word "hemicellulose." *Webster's Dictionary* defines hemicellulose, a word first used in 1891, as "any of various plant polysaccharides less complex than cellulose and easily hydrolyzable to simple sugars and other products." The sugar molecules in this polymer each contain 5 carbon atoms.

Oil extraction: Benzene is the most suitable commercial solvent; the solvent must not be recovered by direct steaming of the meal, but by the use of a vacuum.

Protein extraction: The soluble carbohydrates are removed from the meal by washing with very dilute acetic acid. The protein is then extracted in 3 stages, i.e. with water, with 0.2-0.4% sodium sulphite solution, and with 0.2% sodium hydroxide solution. 20-30% of the total available protein is extracted in the first stage, a further 50% in the second, and the total yield is about 95%. The protein is finally dried at the lowest temperature and highest vacuum and in as short a time as possible. The dry protein is very tenacious and can only be ground in high-speed disintegrators; it is then suitable for the manufacture of plastic materials, lacquer, enamel, or imitation leather. The soluble carbohydrates, which amount to 10-12% of the meal treated, can be worked up into syrup or converted into alcohol or lactic acid by fermentation. The bean residue consists of fiber, galactan, and protein and can be used for cattle feed or as an ingredient of linoleum-like products.

Note: This is the earliest document seen (Sept. 2010) concerning isolated soy proteins (other than simply isolation as part of nutritional research).

Continued. Address: Kôgakuhakushi.

2118. Satow, Sadakichi. 1921. Researches on oil and proteids extraction from soy-bean: Illustrations and tables (Continued). *Tohoku Imperial University, Technology*

© Copyright Soyinfo Center 2014

Reports (*Sendai, Japan*) 2(2):1-124 (41-164). Oct. 28 cm. [Eng]

• ***Summary:*** Continued: Illustrations show: (1) The cells of the soy-bean (after Winton, p. 55). (2) The effect of various chemicals on soy-bean cells (8 figures, after p. 16). (3) A rotary drum extractor used with solvent and a vacuum system (p. 68). (4) An endless belt system for drying proteid precipitate.

Tables show: (1) Percentage of proteids and fat found in 23 samples of beans. The varieties are: Akakiji bean, Nagaaneko bean, Kintoki bean, Shônembo bean, Biruma ingen bean, Chûnembo bean, Maru uzura bean [speckled], Naga uzura bean, Kumamoto ingen bean, Azuki, Chûnaga uzura bean, Aneko bean, Shiromarufuku bean, Green pea, Dainenbô bean, Daifuku bean, Chûfuku bean, Red pea, Black soy-bean (38.61%), Yellow soy-bean from Manchuria {2 samples, 38.65% and 39.12%}, Yellow soy-bean from Korea (41.00%, and 22.826 fat–the highest fat of any bean tested), Yellow soy-bean from Hokkaido, Japan (41.92%–the highest proteid of any bean tested) (p. 6-7). (2) Previous analyses of the chemical composition of 16 soybean samples from Manchuria, Korea, and Japan. For each, gives the district, variety (mostly yellow but one "Blue variety"), water, proteids, fat, carbohydrate, fiber, ash, name of analyst (an organization) (p. 8). (3) Analyses by Sato of the chemical composition of 14 soybean varieties from Manchuria, Korea, and Hokkaido (Japan). For each, gives the varietal name, growing region, "moisture, total protein, soluble proteose, available protein, non-proteidal nitrogenous matter, fat, nitrogen-free extract, fiber, ash, color and shape (all yellow), producing organization (Korean Central Experimental Station or Sapporo), date of production. Named varieties include: Harupin, Shoshu bean, Utsuzan bean, Ampen bean, Chogei bean, Ryusan bean, Turunoko [Tsurunoko], Kanro, Yoshioka, Otanizi [Otaniji] (41.92% total protein and 37.53% available protein, both the highest of any bean tested) (p. 11). (4) Effect of hulls on solvent extraction of soy-bean oil with 3 varieties: Kanro, Otaniji, Yoshioka (p. 18). (5) Influence of moisture on solvent extraction (ether) of soy-beans (p. 19). (6) Effect of using benzine in place of ether in solvent extraction of soy-bean oil. The best moisture content is 7.5% to 12.5% (p. 20). (7) Substitution of vacuum drying for open air drying in removing moisture. Shows that the smaller the quantity of moisture contained in the bean, the greater the yield of oil, provided that the oil is protected from oxidation (p. 22). (8) Effect of different solvents on oil extraction: Carbon bisulphide (flammable and expensive), ether (flammable and expensive), benzine (boiling point 75ºC), carbon tetra chloride [tetrachloride]. (9) Separation / distillation of benzine from oil solution (p. 34).

(10) Chemical composition of "soy bean meal" from which the hull and oil have been removed (p. 42). (11) Composition of carbohydrates or saccharo-colloids, based on S. Yukawa (p. 43). (12) Composition of para-galacto-araban / gummy substances in 9 varieties (p. 44-45). (13) Percentage of water-extractable substances and reducing sugars in flattened and powdered soy-beans (p. 46-47). (14) Sugars in soy-beans (p. 48). (15) Proteids and soluble carbohydrates in soy-beans (p. 49). (16) Effect of acetic acid in retarding dissolution of the globulins (p. 50). (17-18) Dissolving power of alkaline reagents on proteids in bean meal (p. 54-56). (19) Effect of reagent on plasticity and coloration of proteids (p. 56).

(20-22) Amount of proteid extracted in 3 consecutive extractions, or with pressure (p. 63-65). (23) Effect of 4 consecutive washings in removal of ash (p. 66, 68). (24-26) Percentage of proteid extracted with sodium sulfite after 1 or 2 hours (p. 70-71). (27) Concentration of sodium sulfite, mark of plasticity [rating], and color of precipitate (p. 73). (28) Relation between time of extraction and yield of nitrogen and proteid (p. 74). (29-30). Yield of proteid with water or sodium sulfite and 5 or 6 consecutive extractions (p. 76).

(31) Test to maximize yield of proteid using sodium sulphite solvent; the weight of the solution must be 16 times that of the meal, and the yield will be 52.20 (p. 78). (32) Effect of adding acetic acid on yield (p. 79). (32-33). Effect of caustic soda (sodium hydroxide) on percentage of proteid extracted (p. 81) (34-37) Relation between time of extraction and yield of proteid using caustic soda (p. 82-83). (38) Volume of caustic soda consumed by different volumes of bean meal solution (p. 83). (39) Volume of caustic soda solution needed in three extraction processes: water, sodium sulphite, or alkali (p. 85).

(40) Extraction with magnesium sulphate for 1, 2, or 3 hours (p. 90). (41) Percentage of proteids precipitated by different precipitants; "isolated proteid," "glutinizing chemicals" (p. 95) (42). Effects of sulphurous acid, formaldehyde, and formalin (p. 96). (43) Effect of different precipitants on quality of precipitate; "sulphurous acid gives proteid of the whitest and best quality, and most suitable for the manufacture of plastic products" (p. 100). (44) Yields of proteid with different volumes of sulphurous acid; all yields are very unsatisfactory (p. 103). (45-47) Effect of adding sulfur dioxide to sulphurous acid at various concentrations; remarkable increase in yield (p. 104-06). (48-51) Precipitation of water extracted protein using acetic acid (p. 107-10). (52-55) Effect sulphuric acid for precipitation of proteids (p. 111-14). (56-57) Effect heating on yield of proteids (p. 116-17).

Note: Horvath (1937) states: "The extraction of protein from soybean meal, its subsequent precipitation and properties, as well as its industrial applications have been extensively studied by S. Satow, and the results published (in English) in 1921-23 in two voluminous reports [*Technology Reports, Tohoku Imperial University* (Japan): 2(2) and 3(4)]. These reports continue to serve as an unsurpassed source of information on this subject, and a number of discoveries

© Copyright Soyinfo Center 2014

during the last 15 years can be traced to the researches of Satow." Horvath then summarizes many of Satow's key findings. Address: Kôgakuhakushi.

2119. Agricultural Experiment Station, Kunchuling, South Manchuria Railway Co. 1921. Bringing up new breeds of soya beans in Manchuria. *Light of Manchuria* No. 15. p. 24-42. Nov. 1.
• ***Summary:*** Soya beans were first cultivated in Manchuria less than a century ago. At first they were "grown only to meet the need of making Bean Oil for household use. Subsequently, with the advance of chemical and manufacturing industry, uses for oil steadily increased. After the Sino-Japanese War, Bean Cake, being the residue left after the expression of Bean Oil, began to be exported from Manchuria to Japan, and the demand for Beans, Bean Oil, and Bean cake rose by leaps and bounds."

"The principal varieties of Beans cultivated in Manchuria may be roughly classified into the kinds of yellow, blue [green], and black beans." The yellow soybeans are produced in the greatest abundance; only a nominal quantity of black soybeans are produced. Kaiyuan and Changchun are the two largest soybean-producing areas along the South Manchuria Railway lines. The Experiment Station started breeding experiments in 1915, and after 6 years three pure stocks of superior quality were obtained. Photos show: 3 improved breeds of soy beans, No. 2213, 738, and 1103 (p. 25). Improved breed of soy bean, with pods and roots exposed (p. 41). Address: Manchuria.

2120. Nakao, M.; Ikebe, S. 1921. Bean oil as merchandise. *Light of Manchuria* No. 15. p. 1-23. Nov. 1. [18 ref]
• ***Summary:*** "Bean Oil is made from Soya (Manchurian) Beans (Glycine hispida Maxim) which originated in China..." Contents: Introduction. Kinds of beans and bean oil. Expression of oil and bean oil. Expression method: Wedge method, screw method, hydraulic pressure method. Extraction method (Suzuki Mill, Dairen). Indices of bean oil produced in Manchuria: Free fatty acid of bean oil, moisture and bean oil, receptacles and bean oil, precipitations and bean oil Publications on bean oil. Conclusion.

Poor-quality photos show: (1) Receptacles of [soy] bean oil outdoors at Dairen mill compound; drums, tin cans and baskets (p. 3). (2) Large bean oil tanks outdoors at Dairen Branch, Mitsui Bussan Kaisha (p. 5). (3) Oil tanks inside a Dairen Mill (p. 6). (4) Oil tank cars in Nisshin Oil Mills Compound (p. 8). Address: General Lab., South Manchuria Railway Co.

2121. Nagai, Isaburo. 1921. A genetico-physiological study on the formation of anthocyanin and brown pigments in plants. *J. of the College of Agriculture, Tokyo Imperial University* 8(1):1-92. Nov. 5. See p. 48-78. [21 ref. Eng]
• ***Summary:*** Under "Genetical Study," part 2 is titled "The mode of inheritance of anthocyanin and brown pigment in the seed coat of *Glycine soja.*" The author discusses the color types of the seed coat, a cross between blue tinged yellow x brown, and the reciprocal, and a cross between buff and black.

Table 21 is titled "Chromogen content in the extract of unripe, green seed, and leaf of *Glycine soja.*" For each entry is given: Name of variety, colour of seed when mature, chromogen in seed (incl. oxidation colour), and chromogen in leaf. The two basic types of chromogenic substance are P (abundant) and F (very scarce or absent). Seed colors include solid black, brown, red brown, black mottled brown, black patched, green, and yellow. The variety names are: "Kurodaidzu-ko, Goishi (incl. with flower purple), Nedzumi-meta, Akazuka, Cha, Haiiro, Beni-iro-daidzu, Akanedzumi, Madara, Juseita, Kura-kake, Achumuri, Tanishi, Tora-mame, Goku-ao, Aobishi, Uma-daidzu, Goyo, Ao, Toyo-naga, Dateao, Yoshioka, Shakujo, Shiro sota, Omejiro, Yuki-no-shita, Chogetsu, Kimusume, Sennari, Kariya-takiya, Shiro-nedzumi, fukui-shiro, shonai-wase, shiro-hachikoku, abura mame."

Note 1. This is the earliest document seen (July 2012) concerning anthocyanin (or anthocyanins) in soybeans or in black soybeans (soybeans with a black seed coat).

Note 2. Anthocyanins (also anthocyans; from Greek: anthos = flower + kyanos = blue) are water-soluble vacuolar pigments that may appear red, purple, or blue depending on the pH. They belong to a parent class of molecules called flavonoids synthesized via the phenylpropanoid pathway; they are odorless and nearly flavorless, contributing to taste as a moderately astringent sensation. Anthocyanins occur in all tissues of higher plants, including leaves, stems, roots, flowers, and fruits. Anthoxanthins are their clear, white to yellow counterparts occurring in plants. Anthocyanins are derivatives of anthocyanidins, which include pendant sugars. (Source: Wikipedia, at anthocyanin, July 2012).

Note 3. A vacuole is a membrane-bound organelle which is present in all plant and fungal cells and some protist, animal and bacterial cells. Vacuoles are essentially enclosed compartments which are filled with water containing inorganic and organic molecules including enzymes in solution,... (Source: Wikipedia, at vacuole, July 2012). Address: Imperial Agric. Exp. Station, Japan.

2122. *Commerce Reports* (*U.S. Dep. of Commerce*). 1921. Bean-oil shipments from Dairen. 24(10):583. Nov. 7.
• ***Summary:*** "Consul Max D. Kirjasoff, at Dairen, reports

© Copyright Soyinfo Center 2014

that for the first six months of the current year there was a total of 61,839,000 pounds of bean oil shipped from that post. Of this amount, the United States received 15,507,000 pounds; the Netherlands, 12,516,000 pounds; the United Kingdom, 6,336,000 pounds; Belgium, 5,136,000 pounds; and Japan, 5,051,000 pounds."

• ***Summary:*** Bitter principles could be removed by soaking beans in vinegar or dilute acetic acid.

2124. *Olien, Vetten en Oliezaden* (*Amsterdam*). 1921. Wereldproductie van Sojaboonen [World production of soybeans]. 6(22):254. Nov. 26. [Dut]
• ***Summary:*** The most recent [1920] annual statistics for world production of soybeans are (in metric tons): China 3,352,400. Japan 430,933. Korea 348,000. United States 58,000. Total 4,189,333 tons.

In 1918, Japan absorbed 77% of the Chinese production, American and Europe 7%, and China itself 16%.

During the last 10 years the amount of soya oil exported from China has risen from 25,000 tons to about 400,000 tons. Before the World War, this oil was sent to England, the United States, Belgium, Japan, and Russia. During this same decade, exports of soya-cake have increased from 400-500 tons to over 1 million tons.

2126. *Trans-Pacific.* 1921. Making bread from Manchuria's beans. 5(5):43-44. Nov.
• ***Summary:*** "In a recent speech in London Mr. Winston Churchill insisted that 'it is a matter of the highest political importance that the West should learn the lesson of cheaper standards of living which is taught them by the peoples of the East in the adoption of the soya bean as an article of food.' He then went on to say that in a recent statement to the Times' Vienna correspondent by Dr. Berczeller, a young Hungarian, the latter professed to have succeeded in making both flour and milk from the soya bean, and that the bread made from soya bean flour is both palatable and easily digested and can be placed on the market at a price below that of any other kind."

Note: This is the earliest document seen that mention's Winston Churchill's speech about the soya bean. Address: Tokyo.

2127. Akita, M. 1921. Bean oil and its products: I-V. *Light of Manchuria* No. 16. p. 10-58. Dec. 1. [8 ref. Eng]
• ***Summary:*** Contents: 1. Material (varieties of soy beans). 1. How to make Bean Oil: By expression (oil making methods in Manchuria, bean expressing method in Japan), by extraction (conditions regarding extraction of oil). 3. How to refine Bean Oil: Refining by means of sulfuric acid, of soda, of clay, of sunlight, refining by heat, precipitation method and sunlight bleaching method, refining by means of acids, of alkali, bleaching by means of clay, by means of oxidation, settlings produced from Bean Oil while refined by means of sulphuric acid. 4. Characteristics of Bean Oil: Physical characteristics (specific gravity, freezing point and melting point, refractive value, viscosity, dryness), chemical characteristics (saponifying value, Reichert Meissl value, Hehner value, acid value, other Polenske values). 5. Composition.

The "extraction method was first invented in Germany. The South Manchuria Railway Company, alive to the promising character of the new invention, sent Mr. G. Uyehata of the Company's General Laboratory, Dairen, to Germany to investigate it on the ground. In March, 1914, the Company established an experimental mill at Jijiko at the east end of Dairen. The new plant proved industrially and commercially workable, and on September 1, 1915, it was transferred to Messrs. Suzuki & Co., to be maintained as a private enterprise." The solvent is benzine. The Suzuki Bean Mill is the only one in Manchuria using solvent extraction.

Photos show: (1) Interior of a "Bean Noodle Factory, Dairen" with workers (p. 13). (2) The South Manchuria Railway Co. General Laboratory at Dairen (p. 14). (3) Junk wharves, Dairen (p. 15). (4) Exterior of the Dairen Produce Exchange building (p. 16). (5) Exterior of Chinese Bean Mills, Dairen (p. 17). (6) Wind mill at salt fields, Pulantien (p. 18). (7) South Manchuria Railway Co.'s wharf at Newchwang (p. 22). (8) Chinese maritime customs at wharf in Newchwang (p. 24). (9) "Mountains of beans" in sacks in Changchun Station Yard (p. 35). (10) Chinese customs at wharf in Antung (p. 42). Tables show experimental results, chemical compositions and characteristics of bean oil and its products. Address: Late of the South Manchuria Railway Co., General Laboratory.

2128. Furusawa, J. 1921. Present and future of bean milling industry in Manchuria. *Light of Manchuria* No. 16. p. 1-10. Dec. 1.
• ***Summary:*** "The Chinese have been accustomed from early times to use vegetable oils as food and also as a source of light. The expression of oil from soya beans has therefore been carried on practically throughout the whole country on a small scale, to meet local needs."

"About the time the South Manchuria Railway was placed under the present management, the port of Yingkow [Yingkou], or Newchwang, drew most of the Manchurian

© Copyright Soyinfo Center 2014

products, and it was the main entrepot of Manchurian trade. Consequently, the bean milling industry was first established there and about the time of the Chino-Japanese War [Sino-Japanese War, 1894-95], there were already more than 30 mills at that place. But then donkeys were used to turn the stone mills for grinding beans, and the beans thus ground were steamed and then put under the hand press.

"After the close of the war, Messrs. Butterfield & Swire, the British firm, foresaw a great future in bean milling. They installed a steam roller and expressed oil by means of a screw turned by hand. This was perhaps the first mechanical appliance brought into use in Manchuria for the purpose.

"Then came the Russo-Japanese War, and not a few Japanese visitors to Manchuria became interested in this industry. On the close of the war, Mr. F. Kodera, now on the directorate of the Kodera Bean Mill, Dairen, founded a bean mill worked by hydraulic pressure at Yingkow. He was the first Japanese to start mechanical milling in South Manchuria.

"As the railways passed under the management of the South Manchuria Railway Company, it planned to make Dairen the chief gateway of trade and has taken measures to execute its plan. It was under such circumstances that bean mills began to come into being at Dairen as well as in other places.

"The first local mill was the Shuanghochan Mill established at Hsiaokangtsu-Chinese Quarter of Dairen-in 1906. In 1908, the railway company announced a system of specific tariffs to seaboard ports, and this induced a number of Japanese to follow suit. The Mitsui Bussan Kaisha organized the Santai Bean Mill conjointly with some Chinese capitalists. About the same time, Okura & Co., jointly with Mr. K. Matsushita of Yokohama, founded the Nisshin Oil Mills, Ltd. The Kodera Mill, at Yingkou, erected another factory at Dairen, followed by Mr. K. Saito with still another mill. In the course of a few years, the mills maintained by Japanese and Chinese numbered about 20. This industry has kept developing, and now the local mills total 60."

Also discusses industrial uses of soybeans. Photos show: (1) Piles of beans in sacks, covered with tarps, on Dairen wharves. (2) Loading of goods at Atung Wharves. (3) Exterior of good sheds and warehouses at Dairen Wharves. (4) Men loading round bean cakes and beans into a steamer ship on Dairen wharves. Address: Managing Director, Nisshin Oil Mills Ltd., Dairen.

2129. Nisshin Oil Mills. 1921. The Nisshin Oil Mills, Ltd. Exporters & Crushers (Ad). *Light of Manchuria* No. 16. p. 60 (Rear cover). Dec. 1.
• ***Summary:*** A full-page ad. "Capital: Six million yen. Soya beans. Bean oil. Perilla oil. Peanut oil. Hempseed oil. Refined castor oil–and all Manchurian cereals. Shipment in tight barrels, our specialty. J. Furusawa, Director. We buy any quantities of hempseed & hempseed oil." Address: Dairen, Manchuria.

2130. *Oil and Colour Trades Journal* (*London*). 1921. The soya bean industry of S. Manchuria: Consular news. 60(1207):2080. Dec. 3.
• ***Summary:*** "The annual production of soya beans in Manchuria is estimated at 2,500,000 tons, of which about three-fourths is exported, 30 per cent. in the form of beans, and the balance in the form of bean cake or bean oil." A table shows the weight (in piculs) of these three products exported in 1919 and 1920. For 1920: Beans 10,224,437. Bean cake 21,479,033. Bean oil 1,805,107. The total value of exports in 1920 was approximately 92,350,000 taels.

Until the Russo-Japanese War of 1904-05 [soya] beans were only exported from South Manchuria in the form of bean cake and bean oil, and the sole market for them was in China, the cake being used as a fertiliser in the sugar-cane fields of the Canton and Fukien [Fujian] Provinces, and the oil chiefly as a food and an illuminant. The valuable properties of bean cake as a fertiliser were then discovered in Japan, to which the market for the product extended, the demand from Japan soon exceeding that from China. In 1908 a trial shipment of beans to England also opened the eyes of British oil-seed manufacturers to the value of the soya bean for the same purposes for which cotton and linseed oil were used, with the result that in that year 400,000 tons of beans were shipped to England. Since then the trade has never looked back. The demand soon extended to the Continent of Europe, and finally to America, which for a time became the chief market for bean oil, though the exports to that country have laterally declined."

A second table shows the destination and amounts of beans, bean cake, and bean oil exported from South Manchuria in 1920. The destinations (listed alphabetically) are: Denmark, Dutch Indies, Egypt, Germany, Great Britain, Hong Kong, Japan and Korea, Netherlands, United States, Chinese ports, other countries. The top four importers (in piculs) of soya beans are Japan and Korea (5,637,882), Chinese ports (2,490,727), Denmark (682,297), and Dutch Indies (546,186). The top four importers (in piculs) of bean cake are Japan and Korea (17,781,698), Chinese ports (3,430,483), United States (182,669), and Denmark (83,285). The top four importers (in piculs) of soya bean oil are Netherlands (616,204), United States (460,379), Japan and Korea (279,823), and Chinese ports (167,598).

This "table includes the exports by steamer from Dairen, Newchwang, and Antung and across the Korean frontier through Antung, Hunchun, and Lungchingtsun, but excludes those by native jung which were also considerable and went almost entirely to South China. All the exports to Europe and America and the bulk of those to Japan were shipped from Dairen, while Newchwang was the chief port of shipment for the exports to Chinese ports. The export of bean oil to the Netherlands is a new trade. It is possible that the ultimate

© Copyright Soyinfo Center 2014

destination of the bulk of the oil was Germany."

• ***Summary:*** The first section discusses tests on soy oil (*Daizu abura ni taisuru shiken*). A mixture of the sample and finely powdered Japanese acid clay is charged into an iron retort and covered with the same clay. The retort is gradually heated under ordinary pressure, the distillation being completed at about 700ºC. The product has a greenish fluorescence and an odor very similar to that of the artificial petroleum obtained from fish oils. Soy bean oil (specific gravity 0.9268, saponification value 192.3) gave 55% distillate, which was further fractionated into 10% light oil (boiling point below 150ºC, specific gravity 0.7380, saponification value 7.7); 17.3% illuminating oil (boiling point 150º-250ºC, specific gravity 0.8173, saponification value 18.8); and 27.7% neutral and heavy oil (boiling point above 280ºC, specific gravity 0.8903, saponification value 22.3).

Note: This is the earliest document seen (April 2007) concerning artificial petroleum made from soybean oil. M. Sato and others investigated this subject in great depth starting in 1922. Address: Kôgaku hakase, Japan.

2140. Bank of Chosen, Seoul, Korea. 1921. Economic history of Manchuria, compiled in commemoration of the decennial of the Bank of Chosen. Seoul, Korea: Bank of Chosen. x + 303 p. See p. 140. Illust. No index. 20 cm. [Eng]
• ***Summary:*** In Chapter 5, titled "Agriculture," the section on "Population" (p. 140) notes that Manchuria has a population of 20,112,110, which averages about 53 per square over the whole country. A table compares this with population densities of 618 in England and Wales, 589 in Belgium, 374 in Japan (Mainland), and 31 in the USA. However Manchuria's population is growing rapidly; it increased by at least 6 million during the 10 years ending in 1916. A table (p. 135) shows that [soy] beans are typically used in the second year of a four-year rotation on large farms. In 1916 and 1917 an experimental agricultural station of the South Manchuria Railway Company asked some "dozen farmers in the neighbourhood of Szupingchieh and Kungchuling to cultivate native seeds of soya beans according to the purely native method, and the result was in 1916, 4.104 bushels,

© Copyright Soyinfo Center 2014

and in 1917, 3.724 bushels per *tan* (0.245 acres). Now the average bean crop in Korea is about 2.978 bushels, and in Japan 4.02 bushels per *tan..."*–quite similar. In Japan, intensive methods are carried to the extreme, however "in Japan the farmer does not generally devote their best land to bean cultivation" (p. 135).

The section on "Agricultural products" (p. 135) begins: "Of the cereals and pulse which Manchuria produces the principal are [soy] beans, *kaoliang,* and millet, and these are followed by maize, sorghum, buckwheat, wheat, rice, and peas." Other products include sesamum seeds. A table (p. 136) shows the amount (in bushels) of each of these major crops produced in 1915 in Mukden, Kirin, Amur, and total. For soybeans this was 39.2, 17.6, 17.1, and 74.0 million bushels, respectively. Exports of soybeans are 79.11 million bu from South Manchuria, 29.67 million bu from North Manchuria, and 108.78 million bu total. Note: Chinese characters are given with every place name.

The subsection titled "Soya Beans" (p. 137-48) has the following contents: The importance of beans and their products. Cultivation of soya beans. Amount of production. Different species [sic, colors, and varieties]. Composition of different varieties. Uses of the soya bean. Uses of beans, bean cake, and bean oil in the Far East. Uses of beans and their products in Europe and America.

The section titled "Manufacturing products of Manchuria" contains a subsection (p. 183-87) on [soya] "Bean oil and bean cake" which begins: "The industry has a very remote origin and we have it on record that, as early as 1860, Swatow, a port in South China, imported from Manchuria bean cake to the amount of 379,009 piculs, valued at $783,762 (Chinese)."

The oil-mill (*yufang*) is found almost everywhere in Manchuria. The traditional method of making soya bean oil and cake involves steaming the beans then pressing out the oil. The modern method involves using a solvent, benzene. "Then, by heating the compound, the oil is separated from the benzene. By this method nearly all the oil in the beans is extracted, and not only is there no waste of oil, but the residue, in this case not in the form of cake but in bulk, is better fitted for manure, since the small quantity of oil remaining in it makes its absorption underground so much the easier; moreover, the trouble of breaking it up into pieces before using it is spared. The drawbacks to the new method lie in its requiring a greater working capital, and the necessity for packing the residue for shipment, thereby greatly adding to the shipping expenses. The new method is at present employed by only one company in Dairen, Suzuki & Co., which firm by the way operates the largest bean-mill in Manchuria."

A table (p. 185) gives statistics for the following in four locations in Manchuria: No. of soya bean mills. Capital (1,000 yen). No. of workmen. Production of bean cake (1,000 pieces, value in 1,000 yen). Production of bean oil (1,000 pieces, value in 1,000 yen). The four locations are: Dairen, Kwantung Province (Dairen excluded), Railway Zone, Total of the above three. More than half of the 105 mills are in Dairen.

Photos (between p. 138-39) show: (1) A field of soya beans. (2) Piles of soya beans in the open air, Kaiyuan. (3) Soya beans awaiting shipment at Dairen wharves. Tables show: (1) Composition of yellow and green soy beans (p. 141). (2) Composition of bean cake based on analyses by laboratories in Japan, Scotland, and South Manchuria Railway Co. (p. 144). (3) Exports of soya beans, bean cake, and bean oil from 1908 to 1917 from Dairen, Newchwang, Vladivostok, and total (p. 147-48).

Photos (between p. 184-85) show: (1) The Suzuki Bean Oil Factory at Dairen. (2) Casks of bean oil awaiting shipment on Dairen wharves.

Note: This book, like others in this series, was written by Mr. Tokuji Hoshino, manager of the Research Department, Bank of Korea; however his name does not appear on the title page, but only in the Foreword. Also published in 1920. Address: Korea.

2141. Jumelle, Henri Lucien. 1921. Les huiles végétales: Origines, procédés de préparation, caractères et emplois [The vegetable oils: Origins, processing methods, characteristics, and use]. Paris: Librairie J.-B. Baillière et Fils. 496 p. Illust. 18 cm. [Fre]

• ***Summary:*** In the section titled "Huile de soja," soybean oil is discussed on pages 346-351. The great center of production for the exportation of seeds, oil and cakes is Manchuria, although there are still large crops in many provinces of the New China (Chan Toung [Shandong / Shantung], Kiang Sou [Shanxi / Shansi], Hou Pé [Hebei / Hopei], Ho Nan [Henan / Honan], etc.).

The soybean is known as *teou* in China, *daizu* in Japan, *dau nanh* or *dau tuong* in Indochina, *katjang kadele* in China, and *pak tau* in Hong Kong.

The author was born in 1866. An illustration (line drawing by Thiebault) shows a soy bean plant, with an inset of the pods. Address: Prof., Faculté des Sciences de Marseille, Directeur du Musée Colonial.

Medicine Publishing Co. 950 p. See p. 302-03. 24 cm.
• ***Summary:*** "In Japan infants are sometimes nourished artificially on milk prepared from the soy bean by methods for a long time kept secret. Soy milk is now well known and quite extensively in use in France and England, and likely soon to be introduced into this country. The writer has prepared, experimentally, a quite palatable milk from the soy bean, and has for twenty-five years made use of milk prepared from the almond and other nuts.

"The beans may be prepared either by grinding to a fine flour or by soaking over night and crushing to a pulp between rollers. The dry meal is most convenient. Add to the dry meal sufficient water to a little more than saturate. Allow to soak for two hours. Add five times the quantity of boiling water. Boil for ten minutes, stirring. Filter through a fine cloth. The milky liquid thus obtained has properties very closely resembling cow's milk. It is rich in protein and fats. The fat is well emulsified and easily digestible, and the protein very closely resembles that of milk, being what is known to chemists as a complete protein which may replace the casein of milk as food. The soy milk is rather deficient in salts, both lime and iron. It contains vitamins but less than milk, and it contains no carbohydrates. To be used as milk it should be sweetened by the addition of 2 per cent of cane sugar or 4 per cent of milk sugar. To suit most palates a little salt should be added also. The flavor is different from that of cow's milk, but it is wholesome and not unpalatable and may to a considerable extent take the place of cow's milk by persons who are sensitized to milk or when milk is not available. A similar preparation may be made from peanuts.

"Soy bean milk, according to Adolf and Kiang, has the following percentage composition: Protein 4.22, fat 1.87, salts 0.40, water 93.51.

"The composition of the milk will vary, of course, with the amount of water used in its preparation. It will be noted that soy milk contains no sugar and is very poor in salts, containing only half the amount of salts found in cow's milk. All these may be easily added, however, and so soy milk is a possible resource for lacteal food in case of scarcity of the bovine product; but it seems to the writer doubtful that soy milk will ever be able to compete with cow's milk as a nutrient for human beings, and especially the feeding of infants." Address: Battle Creek, Michigan.

2147. Morse, Hosea Ballou. 1921. The trade and administration of China. 3rd revised ed. Shanghai, China: Kelly and Walsh. xv + 505 p. Illust. Index. 22 cm.
• ***Summary:*** One of the most important early books on this subject. The "Preface to the Third Edition" notes that "China is everywhere in a disturbed state, divided against itself, with a weak government dominated by a lawless soldiery;..." Contains much interesting information about Chinese history, including the complex history of the currency (taels) and weights (piculs, catties, and taels). The author (lived 1855-1934) is an American, who was sometimes Commissioner of Customs in China. He arrived in China in about 1874 with three friends, shortly after graduating from Harvard University (Massachusetts).

Listed in the index under "Beans, bean-cake and bean-oil," soybeans are discussed extensively–especially in Chapter 8, "The provinces and the treaty ports (p. 225-296). "China Proper is divided into eighteen provinces, and to distinguish it from the rest of the Empire this part is commonly and even officially referred to by the Chinese as 'The Eighteen Provinces.' The events of the last few years, since 1894, have brought into commercial and political prominence the region which we call collectively Manchuria, divided for administrative purposes into three provinces; these are called by the Chinese 'The Three Eastern Provinces,' lying east of the eastern end of the Great Wall, where it comes to the sea at Shanhaikwan, built to protect the Eighteen Provinces forever from invading hordes from the north, whether Mongol or Manchu." The population of the 18 Provinces is about 385 million. Most early trade with China was conducted at Canton. "The British Treaty of Nanking (1842) opened the first "treaty ports," five in number: Canton, Amoy, Foochow, Ningpo, and Shanghai. These five ports have now grown to over forty..." (p. 226-27).

© Copyright Soyinfo Center 2014

Manchuria: Of the three eastern provinces, two, Heilungkiang and Kirin are not very important. "The southern province, Shengking [Lioaning], is the most important, and contains, probably, nine-tenths of the total population of Manchuria;" an estimated 10-25% of these people are the original stock of the conquering Manchus, but the great majority are "immigrants from Shantung and Chihli, and their descendants. The western part of this province is made up of the plain of the Liao and the valleys of its tributaries, and grows wheat and durra for food, and beans from which are made an esculent and illuminating oil, and bean-cake shipped to restore exhausted fertility to the fields of Japan and of Kwangtung."

Newchwang: "This port, situated 13 miles above the mouth of the Liao River, was opened officially in 1861, but actually in 1864, at Yingtze or Yingkow [Yingkou], 30 miles below the unimportant city of Newchwang. Recently the port has been distinguished as Yingkow, but Newchwang is and has been the name officially given to the Treaty Port, the Custom House, and the Post Office." A table shows the value of its imports and exports from 1864 to 1918. "Of products of the district finding their outlet at Newchwang the principal are [soy] beans (value in 1904 Tls. [Haikwan or Custom taels] 6,577,000), bean cake (Tls. 4,589,000), bean-oil (Tls. 2,133,000), silk (Tls. 2,005,000)..." (p. 230).

"Moukden [Mukden] is the Manchu name of what in Chinese is known as Shengking (the Sacred Capital), and administratively was from A.D. 1625 called Shenyang, and is now officially termed Fengtien. The old capital of the Manchus before they marched to the conquest of China and migrated to Peking, it still (as of 1906) remains a sleeping capital..." It is situated in the heart of the plain of the Liao valley, 100 miles from Newchwang (p. 231). Note: As of Feb. 2000 it is officially called Shenyang.

"Harbin, the junction of the railways from Irkutsk to Vladivostock [Vladivostok], and from Harbin to Kwanchengtze, where it joins the Japanese line to Dairen, has been made the seat of a Custom House to control the railway traffic" (p. 231). Dairen has been under Japanese control since 1905, but a Chinese Custom House controls its trade under regulations similar to those in force at Tsingtau [Kiaochou] (q.v.) (p. 232).

The major farm products of Shantung are [soy] beans, opium, silk, wheat, and millet (p. 241). Confucius was born in Shantung. "Within its limits are the treaty port of Chefoo and the foreign 'leased territories' of Kiaochow and Weihaiwei. Chefoo, "the treaty port, opened in 1863, is not at Chefoo, which is on the north side of its harbor, but at Yentai on the south side." A table shows the value of its imports and exports from 1864 to 1918. Among the principal exports in 1904 were [soy] beans and bean-cake (Tls. 2,794,000), wild silk (Tls. 4,803,000), straw braid, and vermicelli. Kiaochow is at the head of a wide, shallow bay. Among its important exports are yellow silk, bean-oil, and ground-nut oil. In Nov. 1914 Japanese troops occupied the port and forts of Tsingtau (p. 245).

In Hupeh ("North of the Lake") province, Hankow opened as a treaty port in 1861; the British were given the original concession, 62 acres. A table shows the value of its imports and exports from 1864 to 1918. In 1905 the principal exports originating in Hankow were tea (Tls. 9,729,000), [soy] beans (Tls. 7,089,000), bean-cake (Tls. 868,000), wood-oil (from seeds of *Aleurites cordata,* Tls. 3,320,000), sesamum seed (Tls. 3,172,000), etc. "Of the steamers entered and cleared at Hankow during 1905, a total of 3,715,710 tons, 50 per cent. was under the British flag," 17% under the Chinese, 16% under the Japanese, and 13% under the German." An important product of Kiangsi province is hemp. Important natural products of Kiangsu province are silk, rice, opium, and [soy] beans (p. 260). In Kiangsu province, Chinkiang was opened to foreign trade in 1861. A table shows the value of its imports and exports from 1864 to 1918. The principal exports in 1904 were [soy] beans (Tls. 535,000), bean-cake (Tls. 781,000), ground nuts (Tls. 1,804,000), ground nut-oil (Tls. 911,000), sesamum oil (Tls. 876,000), etc. (p. 262).

"Shanghai, 'By-the-Sea,' is now far removed from salt water, but is the first point on entering the Yangtze at which a port can be established." "Shanghai is mentioned in history 2,150 years ago, and 900 years ago was a mart of sufficient importance to be made a Customs Station. It was occupied in 1842 by the British forces on their way to Nanking, and, having been declared a treaty port by the Treaty of Nanking, was formally opened to trade on November 17th, 1843." Not long thereafter, the French (1849) and Americans established foreign residences and settlements in Shanghai (p. 263-64). Address: LL.D., Camberley [England].

2148. Rouest, Leon. 1921. Le soja et son lait végétal: Applications agricoles et industrielles [The soybean and its vegetable milk. Agricultural and industrial applications]. Carcassone (Aude), France: Lucie-Grazaille. 157 p. Illust. No index. 25 cm. [42 ref. Fre]

• ***Summary:*** Contents: Preface, by Louis Forest. Introduction–What is soya? 1. History of the dissemination of soya: In 1712 the naturalist Kaempfer introduced soya, introduction of soya to France and Europe, soya is cultivated in Austria in 1875 by Prof. Haberlandt, soya is the object of many trials in France from 1876 to 1881, the study and acclimatization of soya becomes widespread, the causes of setbacks in the cultivation of soya.

2. Cultivation of soya: Botanical characteristics of soya, the varieties of soya, Chinese varieties and soya in China, Japanese varieties and soya in Japan, American varieties and soya in America (varieties: Mammoth, Hollybrook, Ito San, Guelph, Haberlandt, Medium Yellow, Wilson, Peking, Tokio, Mandchu [Manchu], Black Eyebrow, Barchet), soya in Europe–France and Italy, seven varieties of soya tested

© Copyright Soyinfo Center 2014

in France, soya in the experimental farms for new crops (*les Fermes Expérimentales de Néoculture;* Many varieties from the USA were tested, including Manchu, Wilson Five, Haberlandt, Tokio, Virginia, Hato [Hahto], Early Medium Green), the cultural and geographical appearance of soya, its production worldwide, planting soybeans, heat units (*degré thermique*) and the germination of soya, the importance of spacing between plants, number of seeds per hectare, soya during its vegetative stage, the vegetation of soya compared with that of the haricot at high altitudes, rolling the seeds and types of crop maintenance, growth of the plant, acclimatization, the enemies of soya.

3. Composition of the soybean plant. 4. Soya forage: Green soya forage, soya hay, soya as a plant for soil improvement. 5. Harvesting soybean seeds: Maturity of the seed, harvesting soya, the food value and composition of soya seeds. 6. Soya as an oil plant: Richness in oil, defatted soybean cake, imports and exports of soya cake from 1915 to 1919 (Imports to: Sweden, Canada, Korea, Japan, Formosa. Exports from: England, China, Korea), production of soya cake from 1915 to 1919 (Denmark, Great Britain and Ireland, Netherlands, Sweden, USA, Japan, Formosa, Korea, Java and Madura).

7. Soymilk: Its manufacture (in 1910-1913 Li Yu-ying installed a factory named "La Caséo-Sojaïne" at Vallées {Asnière-Seine} near Paris. Rouest visited this factory and saw them make soymilk, which was filtered using a filter-press resembling those used in sugar refineries), its properties and composition, composition compared to other types of milk, powdered soymilk, soymilk in the nursing and feeding of animals, soymilk related to tuberculosis in animals and in humans, soymilk would allow the milk and butter from animals to be reserved exclusively for human foods and could be used for raising many piglets, manufacture of non-dairy milk in Canada (a factory is now under construction). 8. Soya in Industry: Soymilk and soy casein, Sojalithe (like Galalithe).

9. Soya in human nutrition: Soy flour and its applications (incl. Li Yu-ying's usine de la Caséo-Sojaïne, and bread made of soya and wheat), soya compared to dry legumes (such as lentils, haricots, peas, beans), soya used as a legume (whole soybeans), the food value of soy sprouts, preserves and confections made from soya, soya chocolate and coffee, the amount of nutrients produced by soya and other crops from a unit of land, a meal of soya served in France (prepared and served some years ago by Li Yu-ying's soyfoods plant La Caséo-Sojaïne for the major print media, the medical press, the National Society for Acclimatization, etc.; it consisted of 2 soups {one with 'soya meat' and one with soymilk}, 2 entrees {an omelet with smoked soya ham, and fritters stuffed with soy meat}, soy [actually mung bean, *lüdou*] sprouts in a salad and sauteed, 3 desserts {soya cake, biscuits, and confection}, and soy coffee; a recipe for each is given; soya meat is smoked tofu).

10. Use of soya in East Asia: Tofu (*fromage végétal*), soy-based condiments (such as natto {Ping ming Natto and Tokio-Natto}, miso, Chinese miso or tao-tjiung [doujiang], and shoyu {Soyou or Schozou}), making soy sauce in Kwantung, China (from Groff).

11. The opinions of several authors concerning soya (from the French medical and hygienic press): Introduction–E. Maurel. Soya and soy bread in diabetic diets–Dr. Dujardin-Beaumetz, Dr. Bloch, Dr. J. Le Goff, L. Beille, M. Gautier. Soya used as a bean–M. Gautier. Soy sauce used in place of meat extracts. The state of cheese. The popularization of soya in Europe–A. Paillieux.

Conclusions: The influence of cultural technology on variation. Appendix: Advice to experimenters on the acclimatization of soya in France. Other methods of obtaining early-maturing soybeans.

The author concludes (p. 140): We must make every effort to acclimatize soya in France. We must develop the will and learn from past mistakes. Most soybean varieties now available in France are too late. We must get varieties from Manchuria, whose climate is similar to that of southeastern France, and from the northeastern USA. It is urgent that, in the near future, we start a Soybean Experiment Station to take responsibility for this work. The setbacks since 1830 can be overcome by present science and genetics. The first step is to introduce better varieties.

On the last page is a full-page advertisement for various seeds sold by Mr. Rouest, including 30 varieties of soybeans (*Soja hispida*)*;* the names of the individual varieties are not given.

Illustrations show: (1) A soy bean plant with many pods (title page). (2) Flowers and pods of the soy bean plant (p. 29). (3) Soy pods and beans (p. 30). (4) A soy bean plant drawn by a Chinese artist (p. 32, from Li Yu-ying). (5) Pods of the Hato [Hahto] variety of soy bean (p. 51). (6) Germinating soy bean seeds (p. 54, from Li Yu-ying). (7) Soy bean roots with nodules (from a photo by Dr. Le Goff; p. 73). (8) Soy bean pods, opened to show 3 beans in each (p. 82).

Tables show: (1) Production of soybeans by color in China in 1916 and 1917 (p. 35, in quintals, from the International Yearbook of Rome, Vol. 1, 1919): In 1917: Yellow 4,069,822. Other 953,012. Green 181,190. White 71,234. Black 40,066. Total: 5,315,324.

(2) Percentage composition of various oilseed cakes (p. 95, from Kellner). (3) Imports and exports of soybean cake, by country, from 1915 to 1919 (in quintals, p. 96). Imports are given for Sweden, Canada, Korea (from 1916), Japan, and Formosa [Taiwan]. Exports are given for England (6 quintals in 1915), China (including Manchuria, by far the biggest exporter, from 1916), and Korea (from 1916).

(4) Production of soybean cakes, by country, from 1915 to 1919 (p. 97, in quintals, based on statistics from the International Bureau of Agriculture, Rome, 1919). In

descending order of production in 1915 (in quintals): Japan 5,439,337. Korea 3,209,238. Great Britain and Ireland: 1,513,059. Denmark 921,782. Java and Madura 503,025. Note that China is not listed. Netherlands 144,523. Formosa [Taiwan] 62,131. Sweden 1,733. USA 0, but 501,822 in 1916.

Note: When Alsace was occupied by the Germans during World War I, the Rouest family moved from Alsace to Paris. Mr. Rouest brought soybeans from Africa and adapted them to France. He paid for the publication of this book. Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

2149. Rouest, Leon. 1921. Le soja et son lait végétal: Applications agricoles et industrielles [The soybean and its vegetable milk. Agricultural and industrial applications]. Carcassone (Aude), France: Lucie-Grazaille. 157 p. Illust. No index. 25 cm. [42 ref. Fre]

• ***Summary:*** This is a summary of interesting points throughout this book. The main early use of soy in Europe was more therapeutic than nutritional (p. 3); it was used mainly in diabetic diets.

Nothing remains of the early trials conducted 20 years ago in France and Austria. The reasons for the crop's failure were lack of understanding of the laws of acclimatization and genetics, and the fact that soya (*soja*) was introduced as a new food legume, when actually it can only be utilized as a forage plant and industrially (for oil, cakes, and casein). Later, when the plant has been adapted, when it is understood that soya is not being propagated to competed with other dry legumes, that it is not being cultivated to extract from the seeds a vegetable milk for people, but simply as a forage plant–and the most remarkable one that exists (p. 3).

The English are trying to acclimatize soya to their colonies, especially those in southern Africa. In 1908 some 200,000 tonnes (metric tons) of soybeans were exported from China [including Manchuria] to Europe, followed by 500,000 tonnes in 1909. One can extract from soybean seeds a vegetable milk (*lait végétal*) which has the same value as animal milk for use in raising young animals. Its seeds and forage are also fine for raising farm animals and for industrial products. The author thanks all those who have helped him to acclimatize the soybean to France and to create new varieties of soya in France (p. 4).

Introduction of the soybean to France and to Europe (p. 6-7): A good but brief review of the literature on this subject. In 1739 Buffon was made director of the Jardin des Plants in Paris. Shortly thereafter, Christian missionaries in China sent him specimens of seeds and plants. The soybean must have been among them. The soybean has very probably been cultivated at the Museum since 1779, certainly in 1779 and later from 1834 to 1880. In 1855 Baron de Montigny was charged by the Society for Acclimatization to distribute five varieties of soya sent from China by Mr. Montigny; these were from northern China. The plants first bore seeds in France in 1854; their acclimatization is assured. In 1857 Mr. Lachaume transmitted to the Society for Acclimatization details of the success he obtained at Vitry-sur-Seine with soy culture. The seeds were planted in 1856. In 1858 a report to the Society for Acclimatization indicated that the acclimatization of the soybean was complete. In 1859 Mr. de Vilmorin reported on cultural trials sent from China by Mr. Perny. The varieties matured too late. The same year Dr. Turrel harvested soybeans at Toulon. In 1862 the Society for Acclimatization received seeds from Mr. Guillemin; the yellow soybean was said to be used for making tofu. Following the events of 1870, the cultivation of the soybean in France was apparently discontinued. Note 1. The brief war of 1870 between France and Bismark's Germany ended in France's defeat and the ceding to Germany of Alsace-Lorraine.

In the long section on Prof. Haberlandt's work with soya, starting with his cultivation of it there in 1875, is a quotation from him: "I don't know, in this history of cultivation, any example of a plant which has, in so few years and to such a high degree, excited such general interest" (p. 8).

From 1876 to 1881, the soybean was the object of numerous trials in France by the Society of Horticulture at Etampes (Seine-et-Oise). During this same period, one Dr. H. failed with varieties sent from Japan but succeeded in cultivating a yellow soybean sent from China, and used the latter to make his own tofu (*fromage végétal*) for use at home. In 1880 Messrs. Vilmorin-Andrieux introduced in their catalog a species cultivated in Austria-Hungary (p. 17-18).

In 1878, Japan, China, and the Indies (*les Indes*) presented all the varieties of Soya at the Universal Exposition, and their seeds filled more than 20 boxes. In 1880 the National Society for Acclimatization was able to distribute soy in France and tests were conducted in 24 regions; they were largely successful, especially in central and southern France (p. 19-22).

Tests were then abandoned from this time until about 1888, when the soybean started to grow in the southern states of the USA. That same year Messrs. Lecerf and Dujardin-Beaumetz first had the idea of using soy bread in diabetic diets (p. 22).

Causes of setbacks in soybean culture (p. 24-27): First, the varieties used matured too late and were not acclimatized in a progressive manner. We must choose varieties from northern China and adapt them to the south of France (*le Midi*) [which is on the same latitude as Toronto, central Wisconsin, or southern Minnesota]. From these, we must develop hybrids, and gradually move them northward.

The soybean has been ostracized in France. Major commercial, financial, and social interests have viewed with terror the production of an inexpensive food and have

© Copyright Soyinfo Center 2014

retreated into the egotistical "Malthusian agriculture." This is the truth! (p. 26).

Soy cheese is even feared by the cheese industry in France. They ask if they should abandon their excellent cheeses in order to adopt a vegetal cheese (*fromage végétal*).

A long quotation from the *Chinese Imperial Encyclopedia of Agriculture* (p. 34) gives the various colors of soybeans, including black, white, grey, and even some speckled / mottled with blue. The black ones can be used for medicine. And they are used as an ingredient in the condiment called fermented black soybeans (*Chi* [*douchi*]), made of soybeans, ginger, and salt.

In 1910-1913 a factory named "La Caséo-Sojaïne" was installed near Paris. I (Rouest) visited this factory in which were installed all the modern conveniences (*tout le confort moderne*), and presented the best guarantees of hygiene. The milk was filtered using a filter press similar to those used in sugar factories (p. 99).

Note 2. Rouest has borrowed a great deal of material from earlier publications by Li Yu-ying, usually without acknowledgment and often arriving at very different conclusions, especially on the question of using soya to make human foods (Li) vs. foods and milk for animals (Rouest).

Rouest strongly recommends the use of soymilk to feed young domesticated animals. For us, soy will not replace green beans, milk or cheese. During World War I, the Germans were actively involved with the study of soymilk. A translation of an article from the *Schweizerische Milchzeitung* (Nov. 1918) tells how to make soymilk and tofu (p. 102). By using soymilk, there is no fear of transmitting tuberculosis. Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

• ***Summary:*** Soy bean oil is discussed in Chapter II, on drying oils. A table shows it has a flash point of 556ºF (the highest listed on p. 270). "Soy bean oil, also known as Soya Bean Oil, Soja Bean Oil, Chinese Bean Oil and Bean Oil, is imported into this country from Manchuria, Japan, China and Korea. In 1917 we imported 265,000,000 pounds, at a cost of about $27,000,000. More soy bean oil is imported by us than any other vegetable or animal oil. It is largely shipped from the Orient in metal cans packed in wooden cases. With us, its production is a comparatively undeveloped industry, but it will doubtless grow very rapidly. In fact, in 1914, we produced 2,764,000 pounds, and in 1917, 42,074,000 pounds, which certainly indicates a healthy growth.

"Soy beans, from which the Soy Bean Oil is expressed, have been cultivated in China since 2800 B.C., and are the world's most important oleaginous seeds. The beans (there are over 500 varieties) contain 18% to 20% of oil, but by pressing, only 10% to 13% is expelled. Extracting with solvents to obtain the remainder of the oil is done quite extensively, but it spoils the presscake, which is a very valuable cattle food.

"In recent years quite a large quantity of soy beans have been imported and soy beans have been planted to a considerable extent in the South. As the beans keep quite well, they can be pressed *after* the cottonseed oil season is over, which is an economic factor of considerable importance. Ordinary cottonseed oil machinery is excellently adapted for soy bean pressing, and the refining process is also quite similar.

"Chemically speaking, Soy Bean Oil lies midway between Linseed Oil and Cottonseed Oil. Its iodine value varies from 137 to 143, which is rather close to that of Linseed Oil, 173 to 201. It is classed by Lewkowitsch as a *drying* oil, that is, a film will dry in four days, but even then it is still tacky. It is mixed with tungstates and cobalt driers to accelerate the drying process.

"In this country it is mainly used as an adulterant of, or substitute for linseed oil, and, like linseed oil, it is boiled and blown. Soy bean oil is also used extensively in soap and candle making.

"It is also an excellent edible oil, but it has to be deodorized, as its beany flavor is objectionable. Soy bean oil is now hardened for use in butter substitutes."

2153. *Light of Manchuria.* 1922. Central Laboratory of South Manchuria Railway Co. No. 17. p. 2-24, 29-31. Jan. 1.

• ***Summary:*** Includes a discussion of the history of the laboratory, its research division (which is studying "bean oil," i.e. soybean oil) and the constituents of soya bean press cake. Section V, titled "Beans and Bean Products," discusses the benzine extraction method, hardened oil, and Solite (a water based paint "manufactured by use of the albumen contained in Bean Cake" with calcium hydroxide and pigments added. It is being made and sold at the Solite Manufacturing Co. in Dairen).

The Central Laboratory was originally established by the Government General of Kwantung [Leased Territory]

© Copyright Soyinfo Center 2014

in July, 1908, and was taken over by the Railway Company in May, 1910. Its organization was then resolved into eight divisions. A Bean Mill (for soybeans) was founded on the chemical extraction system, and a fatty acid factory was appended to it. The above-mentioned Experimental Bean Mill, with its Fatty Acid Factory, was transferred to private management in September, 1915, upon the completion of the series of experiments, for which it had been established. Also improved koji for sorghum alcohol was based upon the laboratory's investigations.

Photos show: (1) A large, 2-page spread of the Central Laboratory (present premises). (2) Central Laboratory (old premises). (3) Electro-Chemical laboratory (of Research Division). (4) Bacteriological room (of Research Division) (5) Exhibition room.

2154. Lasseter, Dillard B. 1922. Depression of bean trade of Antung. *Commerce Reports* (*U.S. Dep. of Commerce*) 25(1):8-9. Jan. 2.
• ***Summary:*** "The [soya] bean industry of the Antung district has gradually lapsed from the condition of unequaled prosperity which began in the early months of 1919 to a present state of depression that would be serious had not the demand for bean cake as a fertilizer for rice and sugar cane in South China and Japan continued brisk throughout the year. The trade in bean oil, which was formerly the foundation of the industry, has now given place to the exportation in cake form of the residue after the oil is extracted. The total shipments of bean oil in 1920 were only 601,000 pounds, as compared with 4,802,000 pounds in 1919, whereas exports of bean cake amounted to 247,774,000 pounds in 1919 and 240,300,000 pounds in 1920.

"The output of Antung bean oil for 1921 is estimated at 89,000,000 pounds. The oil produced locally is greener in color than and of inferior quality to that produced in Dairen and other ports, requiring more refining."

"The export phase of the industry is, with the exception of one British firm, in the hands of the Japanese."

"The port of Swatow, in South China, has been the principal destination of the bean cake exported from Antung this year, with Japanese ports second."

"Beans constitute 35 per cent of the field crops produced in this district. The crop for 1921 has been quite good, being estimated at 95 per cent of a record year. Of the different varieties produced, only the soya and the yellow beans are pressed into cakes, the others being used for food purposes alone.

"Red beans [azuki] are still produced in large quantities, owing to their popularity with Japanese consumers, but recent exports do not compare favorably with those of 1919. The total amount of beans exported in 1920, of which the red and yellow varieties constitute the largest single item, decreased from 71,509,000 pounds in 1919 to 44,971,000 pounds in 1920. An even larger decrease is indicated for the 1921 export figures." Address: Vice Consul, Antung, China.

2155. Evans, Edward E. 1922. Some soy bean experiments. *Bean-Bag* (*The*) (*Lansing, Michigan*) 4(8):31-32. Jan.
• ***Summary:*** Source: Michigan Farmer [periodical]. "My soy bean trials cover a period of more than a quarter of a century, during which I have grown more than one hundred and thirty varieties. Many of these proved of no value in Ogemaw county (latitude 44), and some would not mature in the southern tier of the state. Of the varieties included in the 1920 trials I have had Early Black since 1897; Ogemaw and Ito San, 1898; Merko, 1909; Manchu and Black Eyebrow, 1912; Wilson has been grown four times within ten years. All the numbered varieties, Peking and Wisconsin Black were grown for the first time in 1920.

"The land on which the trials were made consists of a surface soil of eight to fifteen inches of clear sand. Under this did lay a stratum of hard brown hardpan, varying in thickness from ten to twenty-four inches. This hardpan was broken up shortly before planting, by the use of a stick of dynamite every fifteen feet. Under this lies a heavy clay subsoil. The previous crop on this land was corn. It had grown three previous crops of soys since 1911. It is thoroughly impregnated with the bacteria of many species of legumes. The fertilizer used was four hundred and eighty pounds of bone black per acre. Planting was made on May 28, or about ten days later than usual. Had I been able to plant on May 14 or 15 the period of growth would have been shortened fifteen to twenty days on all these varieties which did not reach maturity before September 15, because of the cloudy weather and great humidity later.

"In the following table, 'Maturity' refers to the time when the plants have attained their maximum growth and development, at which time they contain the maximum amount of protein and are at the correct stage for the silo. The weight at maturity was taken at this stage. Air-dry weight was taken when the preceding had attained a consistency approximating tinder. The weight of seed is from the crop after becoming thoroughly ripe and dry. The wide variation in the per cent of moisture at maturity is in some measure due to the variety; also to the amount of humidity in the atmosphere on different days; and to the presence or absence of large numbers of capillaries on the stalks, pods and leaves.

"Of the seeds planted Merko, Manchu, Black Eyebrow, Ito San, Ogemaw and Early Black were grown in Ogemaw county and are thoroughly acclimated. Wilson No. 5 and Peking were Virginia grown. Mandarin and the numbered varieties, though originally from northern Manchuria, a considerably colder climate than Ogemaw county, had been grown at the United States trial grounds at Arlington, Virginia, thus in a measure lengthening their period of growth. From past experience I believe that two or three seasons here in Michigan will very materially shorten their

© Copyright Soyinfo Center 2014

growing time. It seems probable that both Mandarin and No. 30600 will be among the earliest of the species, while the others will probably ripen along with Manchu, Ito San and Medium Green.

"Bearing in mind that one season's trial is not conclusive proof in any instance, nevertheless some of the figures obtained are quite startling. No. 30600, though attaining a height of only twenty-eight to thirty inches, was so widely branched as to create a square flat head, overlaid by clusters of pods. This variety is one of the erect, rigid type, as distinguished from the slender, willowy Ito San and the decumbent Merko. It seems probable that several of the numbered varieties may in future displace a number of our standard sorts. Ten to twelve tons of soy ensilage per acre, from rows three feet apart, certainly looks good. The seed is not available as yet and should not be distributed until more thoroughly tried out.

"The trials very forcibly illustrate the necessity of knowing where one's soy seed was grown. Home-grown Merko matured its crop fully. Maryland-grown Merko seed, while it produced large healthy plants, still lacked two weeks of maturity when killed by the frost, the last week in October. Wilson also matures here, occasionally, when Michigan seed is planted. This variety was just forming pods when killed by frost. While the bulk or weight of these late or undeveloped soys is often great, it should be remembered that they simply make bulk in the silo and do not balance the ration, as the protein content is low at that stage. I very much doubt if the 21,050 pounds of green Pekings contained anywhere near the amount of protein that was in the 8,900 pounds of fully developed and practically ripe Early Blacks. The varieties that are densely covered with capillaries (fine hairs) have the greatest resistance to both extremes of temperature, but the ripening up process requires longer.

"Of the standard varieties included in the trials Ito San (my introduction of 1901) has been longer in cultivation. It is probably the most widely disseminated variety, having been grown in nearly all agricultural countries of the world. It seems to be a general favorite, though inferior to Manchu and Black Eyebrow. These are both a little earlier and during eight years' trials have continuously produced heavier crops of both forage and seed than Ito San. Manchu produces the heavier crops of seed and Black Eyebrow a slightly heavier crop of forage. During the past three years Manchu has given very satisfactory results in Michigan, Wisconsin, Iowa, Nebraska and South Dakota. When acclimated Mandarin will prove earlier than my Ogemaw, which it far outyields in both forage and seed. Mandarin, in common with all the numbered varieties, retained their foliage until fully ripe. Mandarin had not shed any leaves thirty days after all the pods were dry.

"Several old standard sorts were not included in these trials for various reasons. Medium Green, introduced from Japan by Dr. Brooks, of Amherst, Massachusetts, in 1888, still remains the favorite in the New England states. It was grown continuously in Michigan from 1897 to 1915. It is a superb variety for the silo, but in this state shatters seed badly. By crossing this variety with Dr. Brook's dwarf brown I produced (1898) Olive Medium (Evans No. 13). By crossing Olive Medium with Medium Green the Ohio Station produced Ohio No. 9035, very popular in central and southern Ohio, Indiana and Illinois, but too late for Michigan. Medium Early Yellow, introduced from Japan by Prof. Georgeson, of Kansas, about 1890, was included in my trials from 1896 to 1899, but never passed the blossom stage before killing frosts. Ebony (Black Beauty) still occasionally grown, at one time very widely, was generally discarded because of inferior crop production. Hollybrook or Mongol, also occasionally called "Medium Early Yellow," has never been popular north of latitude 39, but is still a favorite in central Indiana and Illinois. It is too late for Ogemaw county."

A table shows maturity dates and yields of numerous soy bean varieties–some named, the rest numbered. The table contains five columns: Maturity date, weight at maturity (of one acre), air dry weight, weight of seed per acre. The named varieties and maturity dates are: Ogemaw–Aug. 25. Early Black–Sept. 1. Mandarin–Sept. 5. Wisconsin Black–Sept. 15. Ito San–Oct. 1. Manchu–Oct. 1. Black Eyebrow–Oct. 5. Merka (Michigan)–Oct. 5. Wilson No. 5–Did not mature. Peking–Did not mature.

2156. Oshima, Kokichi. 1922. Promising development of soya bean sauce: Studies on the protease of the *Aspergillus oryzae-flavus* group and its role in shoyu brewing. *American Food Journal* 17(1):30-31. Jan. [10 ref]

• ***Summary:*** "Editor's note.–The author of this article has been engaged for some time in experimental work in the laboratories of the Pathological Division of the Bureau of Animal Industry and the Microbiological Laboratory of the Bureau of Chemistry, U.S. Department of Agriculture. He is studying in Europe at the present."

The article begins: "Shoyu (soya bean sauce) is a most important seasoning in Japan and China, where it is widely used instead of vegetable or meat extract and salt. It is a fermented product made from soya beans, wheat and salt which are acted upon by *Aspergillus flavus* and related forms. The finished product contains about 20 per cent sodium chloride, 5 per cent glucose and 3 per cent protein cleavage products. Being highly palatable, nutritious and cheap, it will probably be used more and more extensively in many countries."

Note. This is the earliest English-language document seen (April 2012) that uses the term "soya bean sauce" to refer to soy sauce.

From "analysis of 'moromi' at different ages and from the fact that *Aspergillus flavus* and related forms which are used in 'shoyu-koji' preparation, produce a very strong

© Copyright Soyinfo Center 2014

proteolytic enzyme, it may be assumed that the protease from such *Aspergilli* is the most important one."

A table (p. 30) shows three different species of *Aspergillus* and their characteristics: *Aspergillus oryzae.* Amylase production: strong. Growth: quick. *Aspergillus effusus.* Amylase production: very weak. Growth: slow. *Aspergillus parasiticus.* Amylase production: very weak. Growth: quickest.

"Influence of cooking on glycinin digestibility [by protease enzymes]: In 'shoyu' brewing soya beans are generally cooked 2 to 3 hours in open kettles. Cooking in the autoclave [pressure cooker] at 15 pounds pressure for 1½ to 2 hours is coming into vogue."

"Summary: 1. Proteolytic enzymes prepared from *Aspergillus oryzaeflavus* group can digest native proteins such as beef muscle, egg white, glycinin, edestin and casein as well as paoepton [peptone?] with the production of amino acids... The glycinin is favored by the presence of sodium of sodium chloride because the salt keeps the protein in solution..."

Acknowledgment: "The author is greatly indebted... to Drs. William N. Berg, Margaret B. Church and Charles Thom.

"Many thanks are due to Dr. Jokichi Takamine, in whose laboratory many practical experiments were made on Taka-diastase." Address: Was at USDA Bureau of Chemistry Microbiological Lab. Now studying in Europe. By 23 Feb. 1923 he is in Sapporo, Japan.

2157. Sato, Masanori. 1922. Daizu abura shibô-san sekkai no kanryû ni yoru sekiyu ruiji nenryô no seihô ni tsuite [Preparation of a liquid fuel resembling petroleum. I. Distillation of the calcium salts of soya-bean oil fatty acids]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 25(287):13-24. Jan. [5 ref. Jap; eng]
• ***Summary:*** By the dry distillation of 100 gm of the calcium salts of soybean oil fatty acids, about 73 cc of oily distillate and about 8 liters of combustible gas were obtained. The oily distillate has an odor resembling that of cracked petroleum and a pale greenish-yellow color with a fluorescence similar to that shown by petroleum. Its characteristics are as follows: Specific gravity = 0.8261 at 15ºC, iodine value = 117.4, acid value = 0.3, refining loss with concentrated sulfuric acid (15% by volume) and sodium hydroxide (specific gravity 1.555, 5% by volume) = 22.0%, calorific value = 9956 calories. The gas contains 2.4% (by volume) carbon dioxide, 4.0% oxygen, 18.1% heavy hydrocarbons, 10.3% carbon monoxide, 1.4% hydrogen, 50.7% methane, and 12.3% nitrogen.

Note: He gives his company's name (p. 4) as "S. M. R. Co." [South Manchuria Railway Co.]. Address: Kôgakushi, Manshû Tetsudô Chûô Shikenjo (Central Lab. of South Manchuria Railway Co.).

2158. Sato, Masanori. 1922. Manufacture of artificial petroleum from [soy] Bean Oil. *Light of Manchuria* No. 18. p. 36-51. Feb. 1. [3 ref]
• ***Summary:*** Contents: Introduction. Laboratory experiments: Characteristics of distillation crude oil, characteristics of fractionated oil, constituents of dry distillation gas, dry distillation residue and water distilled out. Conclusion.

When 100 gm of the calcium salt of Bean Oil fatty acids is dry distilled at about 500ºC, a maximum of 67 cc of distillation crude petroleum will be obtained, together with about liters of dry distilled gas. The average calorific value of this crude petroleum is 9,965 calories, so it compares well with that of petroleum and heavy petroleum, and renders it available for sundry uses as a liquid fuel. The dry distillation gas resembles natural gas in having methane for its principal compound. When distillation petroleum is fractionated, about 20% light oil, 60% middle oil, and 10% heavy petroleum can be obtained. The main obstacle to making this process on a commercially viable is the high price of Bean Oil. Address: Central Lab., South Manchuria Railway Co., Dairen, Manchuria.

2159. Yamamoto, Yoshitaro; Mizusawa, Isoma. 1922. Procédé de préparation d'huile de fèves [Process for preparation of oil from beans]. *French Patent* 533,107. Feb. 22. 2 p. Application filed 30 March 1921. [Fre]
• ***Summary:*** Describes how to prepare an odorless and colorless oil and flour from soya beans (*fèves de soja*) by treating them with a dilute solution of organic acid.

For details in English see their 1922 U.S. Patent No. 1,433,168. Address: Japan.

"44597-44599. From Japan. Presented by Rev. Christopher Noss, Wakamatsu, Iwashiro, Japan. Received April 23, 1917.

"'Under date of November 24, 1916, you asked that I should obtain for you a quantity of the *Hato-koroshi-daizu* soy bean for experimental planting. I inquired at Kawamata, the town where I first found this variety, and asked our Japanese pastor to make a thorough search. No one could be found who knew anything about a bean called *Hato-koroshi-daizu* or who could exactly match the sample. Finally the pastor sent me 6 quarts of a variety which, he said, seemed to be about the same. This variety is called *Uba-no-kantsu-bushi* (nurse's mastication), referring to its flattened shape, as though mashed between the teeth of a nurse for a little child. (Japanese mothers and nurses are accustomed to masticate food that is hard before feeding it to their little ones.)

"'I appealed to another of my Japanese workers, who is a graduate in agriculture and has served the government as an agricultural expert. He undertook to find the bean for me and made one special trip to look it up. He, too, reported that he could not find *Hato-koroshi-daizu,* and that the variety which seemed to be identical with it was in his district called *Shiroishi* (white stone, the name of a noted river in northern Japan). Of this variety he sent me about 4 quarts which he said was all that he could find.

"'I wrote to the chief agricultural school in my province and to the leading seedsmen of Sapporo, the place from which we generally buy seeds for use in the north, and could find no trace of *Hato-koroshi-daizu.* "I judge that the bean must have come from the south."' (*Noss.*)

"44597. From Wakamatsu.

"44598. From Odaka.

"44599. From Kawamata." Address: Washington, DC.

2166. *Times of India* (*The*) (*Bombay*). 1922. Korean progress: Agriculture and farming. March 24. p. A7.
• ***Summary:*** "It is in southern Korea and especially in the South-Western district that agriculture has prospered, the climate being comparatively mild. The cultivated area is only 10,640,000 acres, being about one-tenth of the total area. About 36 per cent. of this is rice paddy and the remainder farm-land. There is enormous scope for extending cultivation if the difficulty of irrigation, which is the greatest obstacle, is surmounted. Since 1907 [Korea is now a Japanese protectorate], Government have adopted a policy of encouraging the exploitation of state-owned

© Copyright Soyinfo Center 2014

uncultivated lands, by renting them from the state to anyone regardless of nationality for a term of not more than ten years, for tillage, stock-raising, afforestation [planting seeds or trees to make a forest on land which has not been a forest recently, or which never has been a forest; different from reforestation], etc. Rice is the main food of the Korean and is the staple product,... the annual produce being about 60 million bushels. Wheat is another crop. But that of Soya beans is important." In 1918, about 30 million bushels were produced, twice as much as in 1910. Soya oil and soap are made from these soybeans "in Japan to which they are chiefly exported."

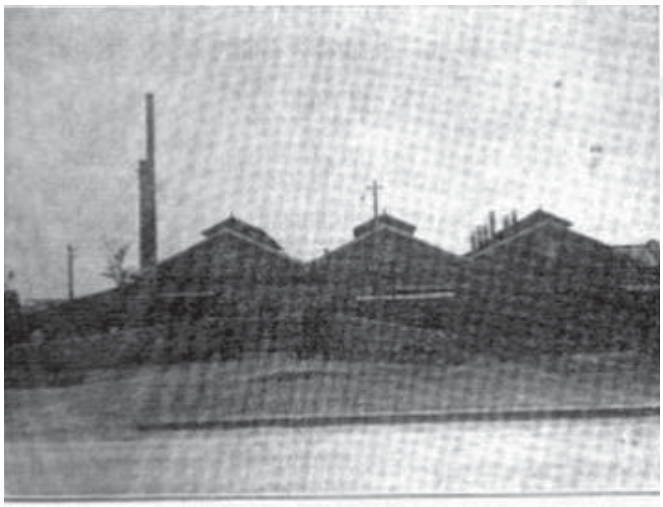
South Manchurian Railway's Experimental Bean Mill



Nisshin Oil Mill, Dairen

• ***Summary:*** Contents: Introduction. Classification of beans and bean oil. Expression of oil and bean oil: Expression, extraction method ("... a solvent is used for the extraction of oil from beans"). Literature on bean oil (produced in Manchuria. Note: Filled with errors!). Free fatty acid of bean oil. Moisture and bean oil. Receptacles and bean oil. Bean oil, 2 inches deep, measured by Robibont Tintometer. Precipitations and bean oil. Conclusion.

Interior of the Nisshin Oil Mill, Dairen

The article begins: "Bean oil is made from soya (Manchurian) beans (glycine hispida maxim) which originated in China and have been transplanted in Japan, Chosen (Korea), India, etc. Manchuria is highly suited to the cultivation of beans, the aggregate production being estimated at between 12,000,000 and 18,000,000 *koku* (1 *koku* is equivalent to 4.96 bushels), of which, half is consumed by the bean mills, and the oil exported. The mills at Dairen consume over 500 tons a day."

Tables show: (1) Composition of seven different colors of soybeans (p. 180). "The yellow varieties are commonest and yield the greatest percentage of oil." (2) Three different types of bean cake and meal: Round bean cake, found everywhere in Manchuria. Oblong bean cake is made at the Kabalkin Mill in Harbin. Bean meal is made at the Suzuki Mill in Dairen. For each type is given: Maximum pressure per square inch of surface. Percentage of oil left in residue. Moisture content of residue. (3) Free fatty acids.

Photos show: (1) South Manchurian Railway's experimental bean mill. (2) Kodera Bean Mill (Dairen). (3) Works of the Dairen Oil and Fat Industry Company at Dairen, where the oil is hardened [hydrogenated], and glycerine, etc., manufactured. (4) Nisshin Oil Mill, Dairen. (5) Interior of the Nisshin Oil Mill, Dairen. (6-7) Interior of the Santai Bean Mill, Dairen (2 views). (8) Interior of the extraction room. (9) The filter presses. 2170. Sato, Y. 1922. Bean industry and its scientific study. *Light of Manchuria* No. 20. p. 1-33. April 1.
• ***Summary:*** Contents: Introduction. 1. Bean [soya bean] industry: Utilization of fat and bean oil, refining of bean oil (clarification of bean oil by precipitation, bleaching of bean oil {bleaching by clay, by carbon, by sun's rays, by heat, by chemicals}, refining by alkali, deodorizing), manufacture of derivatives (bean oil for paint manufacture, making of water proof from bean oil, substitute of India rubber from bean oil, substitute for hardened oil, lard and butter, manufacture of liquid fuel [petroleum] from bean oil). 2. Chemical industry using legumin: Industrial uses of bean cake, manufacture of plastic substance from legumin. 3. Beans as a food stuff: Introduction, bean milk (artificial milk; Melhuish 1915 British Patent, Goessel 1917 Dutch Patent, Japanese Patent no. 28,346), bean coffee and bean chocolate, food made from bean flour (bean powder or flour, roasted bean flour, and fat-free bean flour), hints on manufacture of food from nutritive point of view. Conclusion.

"What is now in the highest demand in Europe and the United States is not [soya] Beans themselves, but Bean Oil or various products made therefrom." "It may be said that the rapid development of the economic Manchuria has been accelerated by [soya] Beans. The future of the Manchurian industry may well be said to depend a good deal on Beans." Address: South Manchuria Railway Co., Agricultural Office.

2171. Berczeller, L. 1922. Die Untersuchung des Sojamehles [Investigations on soy flour]. *Biochemische Zeitschrift* 129:313-19. April 17. See also p. 239. (Chem. Abst. 16:2532). [Ger]
• ***Summary:*** Since Haberlandt introduced the soybean to Europe in 1878, there have been many experiments to try to make this wonderful plant (according to its chemical composition) useful to the white race. All of these efforts remain without success, due to a lack of biological research on the soybean. The ideal that this plant represents with respect to its protein and calorie content, is not attained by its other biological qualities–a supposition that must first be proved.

In Japan and China, where the soybean has been used as a food for thousands of years, its production for food lies in the hands of an extensive industry of small processors, which acquired their experience, as is the case in Europe with bakers and brewers, from generation to generation. But because Europe tastes did not accept each of those foods, in their various forms, their popularity did not spread. The European food industry had the same negative results in trying to make use of the soybean. This failure is not surprising since our food industry, partly only practical, partly borrowing its requirements from chemistry, is just becoming able to determine how one should manufacture a new food, but is not good at judging when one food is good and another is not. In these respects, dietetics could also do nothing differently... In the following laboratory experiments, the primary goal is to clarify the circumstances with respect to animals, and from these to draw some conclusions with respect to humans.

The soybean must, above all, be a food for the people, like the potato, and it seems to be called to this role when its biological shortcomings are eliminated.

Rats, given the choice of soy beans, soy bean flour (*Sojamehl*), and a new soy bean flour with almond flavoring (designated *Sojamehl O*), consumed the latter in the largest amount and the soy bean flour hardly at all.

Berczeller concludes: It should be noted that for its low cost per high nutritional value, and extreme ease of use in cooking, the soybean meets all requirements which could be placed on a food today. It now rests on practical research to decide if it can prove itself in human nutrition. The scientific prospects are most probable that it can. Address: Physiologischen Inst. der Universitaet Wien.

Quality of Manchurian bean oil. Graduating standards for bean oil. American standards. To unify and improve quality of bean oil. Mixed storage system of S.M.R. Co.

Before World War I, the two principal uses of "Bean Oil" (soybean oil) were as material for paint and soap making. Its price of the oil was very low. "Originally the bean milling industry was founded for the production of Bean Cake mainly to supply Japan as fertilizer. And on occasion, with the brisk export of Bean Oil, Bean Cake was produced quite in excess of demand. But, it is to be regretted that the disposal of Bean Cake has always exercised a restraining influence upon the production of Bean Oil." One table (p. 6) shows production of lard and "substitute lard" in the USA from 1914 to 1920. Production of lard increased from 826,000 tons to 968,000 tons. Production of substitute lard decreased from 568,500 tons to 500,000 tons. About 93% of this substitute lard was made from vegetable oil. A second table (p. 6) shows production of butter and "artificial butter" in the USA from 1914 to 1920. Production of butter decreased from 853,000 tons to 721,200. Production of artificial butter [margarine] increased from 71,950 tons to 185,500 tons. A third table shows that the amount of artificial butter made in the USA from vegetable oil only skyrocketed from 971 tonnes in 1916 to 95,760 tons in 1920.

Photos show: (1) South Manchuria Railway Library, Dairen. (2) Bean oil tanks at the Dairen branch of Mitsui Bussan Kaisha. (3) Loading bulk oil into a steamer at the Inflammable Goods Pier, Dairen. (4) A bean oil tank car owned by the Mitsuis (Mitsui) at Seattle, Washington.

Note: This is the earliest English-language document seen that uses the term "artificial lard" to refer to shortening. Address: Mitsui Bussan Kaisha, Dairen, Manchuria.

"46770/46780. From Canton, China. Presented by Mr. G. Weldman Groff, Canton Christian College. Received November 26, 1918. Quoted notes by Mr. Groff.

"46770/46779. 'A collection of beans procured on the Canton markets.'

"46770. 'No. 15036a. *Haak pei tseng tau.* One of the common beans of Kwangtung; said to be very nutritious. Planted in Kwangtung in March and April and again in August and September.'

"46776. 'No. 15036g. *Wong tau.* Used to make various bean products. Planted in Kwangtung in March and April.'"

No. 46779 (p. 32) is Adsuki bean (*Phaseolus angularis*). It is planted in Kwangtung in March and April. Note: Kwangtung is a province in southeast China containing the city of Canton. In pinyin it is written Guangdong. Address: Washington, DC.

2177. Sanka, I. 1922. Import of Manchuria bean oil into the United States and its uses. *Light of Manchuria* No. 22. p. 29-53. June 1.

• ***Summary:*** Contents: History of Manchurian Beans [soybeans] in the United States. Output of Manchurian Beans. Beans as an oil yielding agent. Output of Manchurian Bean Oil. Exports of Manchurian Bean Oil to the United States: Exports from Dairen (from 1915-1920) to various countries and total, exports from Yingkou, and from Antung, exports from Japan to the USA, channels of import, principal deals (in Manchuria, Japan, and the USA), importers and commission merchants in the USA by city, rules for regulating business of soya bean oil, market fluctuations.

© Copyright Soyinfo Center 2014

Quality of bean oil: Indices (constants and properties), method of detection. Uses of Bean Oil in the U.S.A.: As soap-making material, as paint making material, as edible oil, other uses (e.g., glycerine for gun powder).

A table (p. 38) lists the cities in Manchuria where soybean mills are located; after each is given the number of mills, the daily capacity of Bean Cake, and the total output of Bean Cake and Bean oil in 1919. The cities with the most mills are Dairen (60), Harbin (24), Liaoyang (22), Yingkou (21), and Antung (18).

In the West, Bean oil is used mostly in making soaps, but also in the manufacture of paint, varnish, linoleum, substitute for ebonite, candles, machine oil, oleomargarine, salad oil, oil for packing sardines, glycerine, substitute for lard, etc.

Photos show: (1) Exterior of the Santai Bean Mill (with a tall smokestack; owned by Mitsui & Co.) in Dairen (p. 31). (2) Hydraulic presses at the Nisshin Oil Mills in Dairen (p. 35). (3) Bean crushers at the Nisshin Oil Mills in Dairen (p. 37). Address: South Manchuria Railway Co., Agricultural Office.

2178. Remy, E. 1922. Ueber Sojabohnenmilch [On soymilk]. *Zeitschrift fuer Untersuchung der Nahrungs- und Genussmittel* 43(12):380-81. June 15. (Chem. Abst. 16:3714). [2 ref. Ger]

• ***Summary:*** Gives a chemical analysis of soymilk and compares it with cow's milk. A sample of soy bean milk, yellowish-white in color and having a sickly sweet taste and a faintly acid reaction, gave the following results on analysis: 88.93% water, 11.07% dry matter, 3.06% fat, 8.01% non-fatty solids, 2.96% protein, 0.57% starch, 2.48% glucose, 0.63% mineral matter, 6.44 cc of 1 normal acid alkalinity of ash, 4000 germs per cc. The gross energy content was 54 calories (cow's milk 70 calories). Content of food- units was 27 (cow's milk 34). The price of the soy bean milk at the time of the investigation was the same as that of cow's milk. It cannot therefore be considered to be an economical substitute for cow's milk. Address: Chemical Dep., Hygienic Inst., Univ. of Freiburg.

2179. Ockel, Reinhold. 1922. Die Oelindustrie Japans und der Mandschurei [Oil industry of Japan and Manchuria]. *Chemische Umschau auf dem Gebiete der Fette, Oele, Wachse und Harze* 29(26):201-02. June 28. (Chem. Abst. 16:3005). [Ger]
Address: Dipl.-Ing.

2180. Guillaumin, A. 1922. Les variétés de soya d'Extrème-Orient: Origine probable du soya [The varieties of soybeans in East Asia: The probable origin of the soybean]. *Revue de Botanique Appliquee & d'Agriculture Coloniale* 2(10):254-58. June 30. [10 ref. Fre]

• ***Summary:*** "The soybean (*Le Soya; Glycine Soja* Sieb. et Zucc., *Dolichos Soja* L, *Soja hispida* Moench, *S. angustifolio* Miq.) has been cultivated in the Far East since antiquity. Shen-Nung (*le Shénon*), written up by Houandi in about 3,000 to 3,500 years before Jesus-Christ, already mentioned the soybean. Since then, its culture has expanded to Indochina, India, Malaysia, Europe, America, and Africa.

"Long ago, in Austria and in France, varieties such as *Soja d'Etampes,* were selected for their high yield. In America, efforts have long been made to obtain, for the diverse climates, both forage varieties and seed varieties. And the U.S. Department of Agriculture has assembled in its test fields more than 500 varieties, of which about 20 are currently in commerce. Among the forage varieties are (Ball 1907): Early Brown, Black Eye Brown, Peking, Wilson Five, Virginia, Barchet, Biloxi, Laredo, Atoo San [sic, Ito San?], Tarheel Black, and Wisconsin Early Black. Among those grown for their seeds are: Ito San, Manchu, Elton, Medium Yellow, Mikado, Hollybrook, Haberlandt, Mammoth, Tokyo, Guelph, Austin, Easy Cook, Morse, Hahto, Early Medium Green, Mandarin, and Chiquita.

Note 1. This is the earliest document seen (Aug. 2013) that mentions the soybean variety Black Eye Brown. However, it does not appear in Ball (1907) as stated, nor does any name even vaguely resembling it appear. The Black Eye Brown variety is mentioned in only 3 known documents, all published in France in 1922.

"Note that the forage varieties all have black- or dark-colored seeds, whereas the seed varieties have yellow or greenish seeds.

"In Turkestan it seems that the only varieties are ovoid (5.7 x 3.7 mm), brilliant yellow, with brown hilum and traversed longitudinally by a bright line." Note 2. Turkistan or Turkestan is an historical region of Central Asia, usually thought to comprise Turkmenistan, Uzbekistan, Kyrgyzstan, Tajikistan, southern Kazakhstan, western China, and northeast Afghanistan.

Note 3. This is the earliest document seen (April 2008) concerning soybeans in Turkestan, or the cultivation of soybeans in Turkestan (not including Chinese Turkestan). This document contains the earliest date seen for soybeans in Turkestan, or the cultivation of soybeans in Turkestan (not including Chinese Turkestan) (1922). The source of these soybeans is unknown. Unfortunately, it is not clear in which part of Turkestan the soybeans were grown.

"In India, soybeans are cultivated in the United Provinces and at the foot of the Hamalayas from Kashmir to Darjeeling." David Hooper (1912) distinguished five different soybean races in India.

"In Cambodia, the only known variety is ovoid (6.3 x 4.2 cm), dull yellow, brown hilum, with a long, clear white line, known as *Sandek sieng* in Cambodian and *dau nanh in Annamite.* It is cultivated along the steep banks of the Mekong River.

"In Cochin China, the soybean is cultivated only on the

© Copyright Soyinfo Center 2014

red soils of the provinces of Chau-doc, Baria, and Bien-Hoa; in the western provinces, cultivation is insignificant and the seeds come from Cambodia. It seems that there is only one variety, closely related to that of Cambodia, called *dau nanh* or *dau-xa,* but it is not well established / widely grown, for it bears black or brown seeds.

"In the province of Baria one can obtain two harvests in a wet year–one in September, the other in December-January. In the province of Bien-Hoa, there is only harvest.

"In Annam, there is one variety similar to that cultivated in the lower parts of the provinces of Bin-dinh, Thua-hien, Dong-hoï, and Tanh-hoa.

In Tonkin, the soybean is known as *dau tuong;* in the [Mekong] delta, one can distinguish a small, ovoid variety (5.1 x 3 mm), with a yellow seed coat and a hilum surrounded by a brownish black aura that sometimes overflows the sides. In the region of Lang-son, on the plateaus 100-500 meters in height, it is replaced by a larger variety, ovoid (7.1 x 5 mm), dull yellow, and a hilum that is uncolored [pale] or brownish; one variety is also cultivated at Lao-kay.

"In Laos, the soybean is known as *Mok toua kon* and *Ta tone,* according to Dr. Spire, but precise information is lacking.

In the territory of Kwang-cho-wan (French: *Kouang-tchéou-wan,* in southeast China) the soybean is cultivated in the region of Taï ping, at an altitude of 30 meters. It is planted in the spring and harvested in the summer. One can distinguish two varieties here. One is very elongated (8 mm x 4.6 mm), dull yellow with a very clear brown hilum, called *Wong tao* or *Wong tao tsaï* in Cantonese. The other is small, flat (6.4 mm x 3.7 mm), dull black, with a large hilum, called *Hat tao* in Cantonese; it is absolutely the same as the variety Nigra cultivated at the botanical gardens of Cluz (Romania), and in Trieste (Italy), but different from that which is cultivated under this name at the botanical gardens of Cracow / Krakow (French: *Cracovie*) (Poland), Tabor (Czechoslovakia), and Delft (Netherlands), which is fatter, more round (7 mm x 4.8 mm) and of a velvety black color.

Note 4. This is the earliest document seen (Feb. 2005) concerning the cultivation of soybeans in Czechoslovakia (which became a country in 1918). This document contains the earliest date seen for the cultivation of soybeans in Czechoslovakia (June 1922). The source of these soybeans is unknown.

"In China, in Szechwan, only the yellow and green varieties are known. In the region of Shanghai, R.P. Courtois, of the Museum of Zi-ka-wei, has assembled an important collection of soybean varieties. Descriptions are given of varieties with the following colors and names: (1) Yellow: *Ta hoang téou* (large, yellow, almost round), *Kiu hoang téou* (ovoid, brilliant yellow). (2) Green: *Tsing pi téou* (roundish, 7.1 x 5.5 mm, clear green with clear hilum). (3) Brown: Large, ovoid (9.1 x 6.4 mm), reddish brown, with a slightly clearer hilum; no name given. (4) Black: Many varieties. (4A) Large ovoid seeds (9 x 4.3 mm), with large hilum; indigenous name unknown; (4B) A little smaller and bulging (8.3 x 5.4 mm), with ornate hilum and a longitudinal white line, named *Ta hé téou;* (4C) Ovoid (8.1 x 4.7 mm) with a wide hilum traversed by a white line, called *Hé téou;* (4D) Small (6.7 x 3.1 mm) and brownish black named *Siao hé téou;* (4E) And finally a very small, flat (6 x 2.7 mm), brownish black named *Ni téou.* By their shape, form, and color, the seeds of these last appear very similar to the American variety Laredo."

"In Europe, soya has its apostles, but it will never amount to anything more here than a small-time vegetable. Despite the Caséosojaïne at Vallées near Paris, France (Li Yu-ying, 1911) and the Soyama Werke at Bockenheim, Germany (1914), the milk, cream, butter, and cheese [tofu] made from soya will never be more than ersatz. The "soy bread" is only good for diabetics and the "soy ham" (*jambon de Soja*) in nothing but a weak imitation of pork. Soybeans themselves are indigestible and require a very long time to cook–even the yellow or white varieties. Soy sprouts (*germes de Soja*), which enjoyed some popularity before the war and deserved it, for they are a nice hors d'oeuvre, are actually nothing but mung bean sprouts."

Based on other sources (most of which are cited), the writer also discusses the soybean varieties of Manchuria (Hosie 1901), and Japan (Lemarié 1910), and discusses soybeans briefly in Korea, Philippines, Netherlands Indies.

In Europe, the soybean has its apostles: Caséosojaïne at Vallé near Paris (1911), and Soyama werke at Bockenheim (Germany) (1914). The latter makes milk, cream, butter and cheese (*le fromage de Soja* [tofu]), which are nothing but imitations. Soy bread has a good taste, especially for diabetics. Soy ham (*jambon de Soja*) is but a vague imitation of the pork product. The seeds, themselves, are hard to digest and take a very long time to cook, even the yellow or white varieties. As for the soy sprouts (*germes de Soja*), which enjoyed some popularity before the war, which they deserved as an agreeable hors d'oeuvre, they are nothing but young mung bean sprouts (*de jeunes germinations du Haricot Mungo*).

Also mentions foods such as soy sauce, fermented tofu, and tofu, made from soybeans in India, Indo-China, China, and Japan. Tofu is known as *dau phu* in Annamite, *tao fou* in, Cantonese, *téou fou* in Chinese, and *to fou* in Japanese. A significant amount was being exported from China before the war. In Manchuria soybeans occupy 1/5 of the cultivated land. Speculates on the origin of the soybean. Address: Asst. to the Crop Service, Museum of Natural History (Assistant du Service de culture au Muséum d'histoire naturelle).

2181. Ishikawa, T. 1922. Manufacture of hardened oil in Manchuria. *Light of Manchuria.* July 1. p. 12-19.
• ***Summary:*** The manufacture of hardened [hydrogenated]

© Copyright Soyinfo Center 2014

oil has advanced the furthest in Great Britain and Germany. The industry in the United States made remarkable strides during the War, and American products dominated the oil market at London during the War.

Although Manchuria is a major world center of vegetable oil production, it makes almost no hardened oil–largely because a lack of interest in chemical industry. Mr. T. Okada (formerly on the staff of the South Manchuria Railway Company Central Laboratory) applied to Manchurian Beans [soybeans] a chemical process developed by himself after years of research. In 1915 he decided to organize an enterprise on an industrial scale. In May 1916 a company was established for the manufacture of hardened oil on the basis of his investigations. This company is known as the Dairen Oil & Fat Industry Co. The factory was completed in December 1916 and was opened for trial operation in Jan. 1917. However many technical problems were encountered. At present, the plant has a capacity of 400 tons/month of hardened oil. From March to July 1921 some 420,000 *kin* [1 *kin* = 1.323 lb] were exported to Europe for sale on commission, and 210,000 *kin* were shipped to Japan–where an import duty of 20% *ad valorem* is imposed. In Europe the business depression since 1920 has hurt exports. Yet in the long run there are many good reasons that an efficient hydrogenation plant in Manchuria should thrive. Address: South Manchuria Railway Co., Commercial & Industrial Office.

2182. Komatsu, H. 1922. Tantalus from bean oil. *Light of Manchuria* No. 23. p. 20-27. July 1.
• ***Summary:*** Tantalus is a substance used for waterproofing mortar, cement, or concrete, developed from soybean oil by Mr. T. Suzuki, then in the service of the South Manchuria Railway Co. The chief constituent of Tantalus is fatty acid of aluminum, and it is a pale yellow liquid of somewhat viscous consistency, giving a very weak alkaline reaction to litmus paper. "When mixed in water, it readily forms an emulsion. If this Tantalus solution is used instead of water in kneading up cement, mortar, and other calcareous substances, the particles of cement, sand, and lime are enveloped by fatty acid of aluminium which has a strong repelling power against water, and so once the mixture has grown hard and got dried, the permeation of water among the particles will be absolutely stopped. Besides the mortar is not at all coloured."

The author also discusses how Tantalus is manufactured, its many applications or uses, characteristics, how much and how to use it, and results of testing. It is presently manufactured and sold throughout East Asia by the Dairen Solite Manufacturing Co. Address: Works Manager, Solite Manufacturing Co., Dairen, Manchuria.

2183. Seki, K. 1922. Bean cake exporters and bean mills at Dairen. *Light of Manchuria* No. 23. p. 1-12. July 1.
• ***Summary:*** About 96% of the Bean Cake exported from Manchuria is shipped to Japan proper and Formosa [a Japanese colony since 1895] for use as manure by the farming classes. The demand for Bean Cake in Japan is increasing partly because the comparative advantage of Bean Cake fertilizer has come to be more widely appreciated by the farmers, and partly because, during war time, it is difficult and expensive (due to the rise in silver) to import chemical fertilizers. Of the bean mills in Dairen only 7-8 are under Japanese- or Sino-Japanese management, and they have a total capacity of about 30,000 pieces of bean cake per day. The majority of the mills, about 61, are under Chinese management (mostly Chinese from Shantung), and they have an output of about 110,000 pieces of bean cake per day. Chinese policies therefore control the market. The Gold Standard replaced the Silver Standard on the Dairen Exchange in the autumn of 1921; the Chinese mills did not like this.

"Prior to the great World War, there were only a small number of the first class Japanese capitalists such as the Mitsuis (Santai Mill), the Okuras (Nisshin Oil Mills), the Koderas, etc., who had a good hang of the trade. As to the others, they have come after the Russo-Japanese War with practically empty hands."

2184. *San Francisco Chronicle.* 1922. Chronicle shipping news. July 20. p. 20.
• ***Summary:*** The section titled "Shipping notes" states: "The cargo of the Japanese steamer Mandasan Maru, arriving from Yokohama, consisted in pat of 6,586 chests of tea, 1,041 packages of groceries, 2,560 tubs of shoyu, 1,478 cases of canned crab, 2,420 sacks of beans [probably soy beans], 1,875 sacks of linseed cake, 3,808 bags of bean cake."

• ***Summary:*** Soy bean introductions: *Soja max* (L.) Piper. Fabaceæ. (*Glycine hispida* Maxim.)

"47436-37. From Wakamatsu, Japan. Presented by Rev. C. Noss. Received April 29, 1919.

"47436. Received as *Ogon daizu.* Seeds large, nearly spherical, golden yellow. The seeds, however, agree with those of S.P.I. No. 40371, *Dekisugi.*

"47437. Received as *hato koroshi daizu.* The seeds agree, however, with those of S.P.I. No. 40119, *Usuao.*"

No. 47510 is Botor tetragonoloba (L.) Kuntze. Fabaceæ. Goa bean. (*Psophocarpus tetragonolobus* DC.). From Zamboanga, Philippine Islands. Presented by Mr. P.J. Wester, agricultural adviser. Received May 12, 1919. Quoted notes by Mr. Wester. *"Seguidilla.* A climbing bean with 4-winged pods which, when used as string beans while tender, are of excellent quality. They should be of great value in Porto Rico and Panama." Address: Washington, DC.

© Copyright Soyinfo Center 2014

2186. Keimatsu, K. 1922. Bean cake as cattle-feed, instead of fertilizer. *Light of Manchuria.* Aug. 1. p. 1-4.
• ***Summary:*** The soybean complex in Manchuria is in bad shape due to high prices. The author hopes that soybean cake will be used more as cattle feed in the future, rather than as fertilizer, as has previously been the case. "Now at Dairen alone, more than 110,000 pieces of Bean Cake are being put out daily, and their chief utility has been as fertilizer in Japan. If they should be made into cattle-feed, the market therefore may be extended from Japan to Europe and America." He would also like to see new solvent extraction equipment installed to replace the old mechanical presses, and the quality of soy oil improved. And "it is heartily hoped that bean milling in the future will be founded with the production of Bean Oil for the primary object and that of cattle-feed for the secondary one, and this on a more comprehensive scale, amalgamating a number of minor mills."

"At the same time, the manufacture of hardened oil, as now carried on by the Dairen Oil & Fat Industry Co., makes another enterprise having great possibilities. The hardened oil of this Company has not yet earned a wide and high reputation, but the Company is now turning out an excellent product. Soap, margarine, glycerine, and several other chemical products are made from hardened oil. Moreover, shipment in the form of hardened oil is far more convenient than in the form of crude oil." Address: Ex-superintendent-general, South Manchuria Railway Co. Central Lab.

2187. Satow, Sadakichi. 1922. Process of manufacturing vegetable proteid substances (from the soybean or other proteid containing substance). *U.S. Patent* 1,427,645. Aug. 29. 4 p. Application filed 20 Aug. 1918.
• ***Summary:*** "The object of the invention is to provide vegetable proteid substances of improved quality and a simple, efficient and economical process of manufacturing the same from vegetable substances, such as cereals, leguminous products or other material for food purposes or for use in the manufacture of celluloid-like substances, linoleum-like substances, lacquer, varnish, artificial rubber, artificial leather and the like." Address: Sendai, Japan.

• ***Summary:*** Following Dakin's butyric acid method, Onuki isolated from 100 gm of dry protein matter, 5.47 gm of Beta-hydroxyglutamic acid, but was unable to determine from which individual protein it was derived and the full amount present. Address: Nôgakushi, Shoyu Kenkyusho-in.

2190. *Christian Science Monitor.* 1922. Japanese finance conquers rich province of Manchuria: Practical monopoly of soya bean oil secured, while Bank of Chosen [Korea] issues most of paper money. Oct. 4. p. 4.
• ***Summary:*** "Harbin, Manchuria, Sept. 1–What Japan has accomplished in the peaceful pursuit of conquering Manchuria is eloquently shown in the statement of the companies operating and their aggregate capital. At the end of July, according to official figures, there were 458 companies with a subscribed capital of 634,230,000 yen, of which 408,480,000 was paid up.

"With the practical suzerainty that has been obtained over the Chinese Eastern railroad by the rate agreement now in effect, there will doubtless be a decided impetus given to the investment of capital in North Manchuria. The stock in the Russian steamship companies that ply the Amur has been bought by the Japanese, and they are being operated under the names of dummies..."

"Soya bean monopoly: Should diplomatic pressure cause the withdrawal of the rate that has caused so much concern, Japan will still have much of the best of the business and financial situation in the best province in all of China. The oil that comes from soya beans is almost exclusively in Japanese hands, for the reason that they control the cake, which is 90 per cent of the total output. They have some competition in the raw beans, as the Danes are heavy purchasers, shipping them to Copenhagen [via the East Asiatic Company] to be milled. The Chinese oil mill owners are unprogressive and the use of obsolete machinery gives them a kind of cake that can only be used in Japan, the oil remaining therein causing sourness [rancidity] in long shipments.

"Many of the best buildings in Harbin are falling into Japanese hands through mortgage foreclosures." "Most of the business of Manchuria is done with Bank of Chosen paper money,..."

• ***Summary:*** Contents: Introduction. The film-forming Zygosaccharomyces. Non-film forming Zygosaccharomyces. Asporogenic Zygosaccharomyces (?): Fermenting faculty. Torula: Film-forming variety, non-film forming varieties (7 varieties). Red yeast. Willia. Mycoderma. Saccharomyces. Oidium and Sachsia. Summary.

© Copyright Soyinfo Center 2014

The author claims to have found two new varieties of film forming zygosaccharomyces and one new variety of non-film forming zygosaccharomyces. He proposes to call the latter *Zygosaccharomyces soja var. saccharoraffinosum.* He has also isolated four new varieties of asporogenic zygosaccharomyces. Of the various organisms studied, zygosaccharomyces produce the most alcohol. This paper was submitted in Jan. 1915. Ten photos (plate VII; last page) show the budding fungi of *Shoyu-Moromi,* including asporogenic *Zygoasaccharomyces, Mycoderma,* and *Torula.*
Address: Japan.

2192. Yamamoto, Yoshitaro. Assignor to Isoma Mizusawa and Tatsuzo Kano. 1922. Process of preparing odorless and colorless oil and flour from [soja] bean. *U.S. Patent* 1,433,168. Oct. 24. 2 p. Application filed 26 Nov. 1919.
• ***Summary:*** Yamamoto assigns one-fourth to Isoma Mizusawa, of Hyogo Ken (Prefecture), Japan, and one-fourth to Tatsuzo Kano. of Kobe, Japan.

"The object of this invention is to obtain bean flour suitable for use as material for making bread, cake, and the like, or as material for preparing washing powder, soap and the like, for which purposes the flour thus manufactured is best adapted as it has no disagreeable odor and is almost white. The oil extracted during the process is also almost colorless and retains no trace of the disagreeable odor inherent in the bean."

First "soja bean is broken into coarse meal, and the bran removed therefrom. Then the bean meal is steeped in an aqueous solution containing .025–.075% of organic acid. A solution that has been found to produce good results is a mixture of 200 to 600 c.c. of table vinegar in 20 litres of water or of 7½ to 15 grams of glacial acetic acid in the same quantity of water. The liquid may then be heated, if desired, to a temperature not exceeding 60ºC..." Address: No. 5, Zitchome, Taikaidori, Hyogo, city of Kobe, Japan.

Foreign Name: Nishii Super Shoyu, and Miso.
Manufacturer's Name: Nishii Super Shoyu.
Manufacturer's Address: Renovacion 101-A, La Victoria, Lima 13, Peru.
Date of Introduction: 1922.
Ingredients: Water, soybeans, wheat, salt.
Wt/Vol., Packaging, Price: 750 ml bottle.
How Stored: Shelf stable.
New Product–Documentation: Nishii Shoyu, located in the Victoria district of Lima, Peru, is owned by Mr. Shinji Kawakami, age 75, the second-generation Japanese owner. The outside and inside of his shop, and the process by which he makes 5 tonnes/week of shoyu in the traditional hand-made way, are shown. He also makes miso. A close-up shows the 750 ml bottle and its colorful label, orange, blue, and green on yellow. One bottle costs the equivalent of about 300 yen.

Talk with Mr. Kawakami by phone. 1991. March 21. His uncle founded this company at this location in 1922. He is the second generation owner. He runs it as an "individual business" so there is no real company name. His address is shown above. His phone is 14-31-81-05.

Letter from Marco Kamego of Kikko Corporation S.A. in Peru. 1998. Feb. 13. The present manager of this company is Mr. Cesar Kawakami.

Note 1. This is the earliest known commercial soy

• ***Summary:*** Chapter 15, titled Kitsune [Foxes] (p. 358-94). In front of the many Shinto shrines throughout Japan, the is usually a pair of seated foxes, in stone, on either side, facing one another. Such shrines and temples are dedicated to Inari, the God of Rice.

At Matsue there is the God of Coughs and Bad Colds. "And those who are cured of their coughs and colds after having prayed to him, bring to his temple offerings of tofu" (p. 362).

"At the rear of almost every Inari temple you will generally find in the wall of the shrine building, one or two feet above the ground, an aperture about eight inches in diameter and perfectly circular. It is often made so as to be closed at will by a sliding plank. This circular orifice is a foxhole, and if you find one open, and look within, you will probably see offerings of tofu or other food which foxes are supposed to be fond of" (p. 365).

"Strange is the madness of those into whom demon foxes enter. Sometimes they run naked shouting through the streets. Sometimes they lie down and froth at the mouth, and yelp as a fox yelps. And on some part of the body of the possessed a moving lump appears under the skin, which seems to have a life of its own. Prick it with a needle, and it glides instantly to another place. By no grasp can it be so tightly compressed by a strong hand that it will not slip from under the fingers. Possessed folk are also said to speak and write languages of which they were totally ignorant prior to possession. They eat only what foxes are believed to like–tofu, aburagé,* azukimeshi, etc.; and they eat a great deal, alleging that not they, but the possessing foxes, are hungry. *Footnote: "Aburagé is a name given to fried bean-curds or tofu. Azukimeshi is a preparation of red beans [azuki] boiled with rice" (p. 374).

Note 1. This is the earliest English-language document seen (April 2013) that uses the word "aburagé" to refer to deep-fried tofu pouches.

"It not unfrequently happens that the victims of fox-possession are cruelly treated by their relatives–being severely burned and beaten in the hope that the fox may be thus driven away. Then the Hôin or Yamabushi is sent for–the exorciser [exorcist]. The exorciser argues with the

© Copyright Soyinfo Center 2014

fox, who speaks through the mouth of the possessed. When the fox is reduced to silence by religious argument upon the wickedness of possessing people, he usually agrees to go away on condition of being supplied with plenty of tofu or other food; and the food promised must be brought immediately to that particular Inari temple of which the fox declares himself a retainer... As soon as the possessed has been freed from the possessor, he falls down senseless, and remains for a long time prostrate. And it is said, also, that he who has once been possessed by a fox will never again be able to eat tofu, aburagé, azukimeshi, or any of those things which foxes like" (p. 375).

"Indeed, the richest and the most successful farmer of Izumo, worth more than a hundred thousand yen–Wakuri-San of Chinomiya in Kandegori–is almost universally believed by the peasantry to be a kitsune-mochi. They tell curious stories about him. Some say that when a very poor man he found in the woods one day a little white fox-cub, and took it home, and petted it, and gave it plenty of tofu, adzukimeshi, and aburage–three sorts of food which foxes love–and that from that day prosperity came to him. Others say that in his house there is a special zashiki, or guest-room for foxes; and that there, once in each month, a great banquet is given to hundreds of Hito-kitsune. But Chino- miya-no-Wakuri, as they call him, can afford to laugh at all these tales. He is a refined man, highly respected in cultivated circles where superstition never enters" (p. 381-82).

"Curious advantages have been taken of the superstitions relating to the Fox-God.

"In Matsue, several years ago, there was a tofuya which enjoyed an unusually large patronage. A tofuya is a shop where tofu is sold–a curd prepared from beans, and much resembling good custard in appearance. Of all eatable things, foxes are most fond of tofu and of soba, which is a preparation of buckwheat. There is even a legend that a fox, in the semblance of an elegantly attired man, once visited Nogi-no-Kuriharaya, a popular sobaya on the lake shore, and ate much soba. But after the guest was gone, the money he had paid changed into wooden shavings.

"The proprietor of the tofuya had a different experience. A man in wretched attire used to come to his shop every evening to buy a cho of tofu, which he devoured on the spot with the haste of one long famished. Every evening for weeks he came, and never spoke; but the landlord saw one evening the tip of a bushy white tail protruding from beneath the stranger's rags. The sight aroused strange surmises and weird hopes. From that night he began to treat the mysterious visitor with obsequious kindness.

"But another month passed before the latter spoke. Then what he said was about as follows: Though I seem to you a man, I am not a man; and I took upon myself human form only for the purpose of visiting you. I come from Taka-machi, where my temple is, at which you often visit. And being desirous to reward your piety and goodness of heart, I have come tonight to save you from a great danger. For by the power which I possess I know that to-morrow this street will burn, and all the houses in it shall be utterly destroyed except yours. To save it I am going to make a charm. But in order that I may do this, you must open your go-down (*kura*) that I may enter, and allow no one to watch me; for should living eye look upon me there, the charm will not avail.

"The shopkeeper, with fervent words of gratitude, opened his storehouse, and reverently admitted the seeming Inari, and gave orders that none of his household or servants should keep watch. And these orders were so well obeyed that all the stores within the storehouse, and all the valuables of the family, were removed without hindrance during the night. Next day the kura was found to be empty. And there was no fire" (p. 384-85). Address: Matsue, Japan.

[Eng]
• ***Summary:*** "Preface: This handbook of the resources of Manchuria has been prepared for American readers in response to many requests for accurate and concise information concerning the opportunities for overseas trade and the facilities for travel in this ancient land of the Manchus.

"Perhaps nowhere else in the world today is there presented so amazing a transition from primitive agricultural life to twentieth century industry and scientific organization. Manchuria, since the close of the Russo-Japanese War [1905], when the policy of the Open Door was inaugurated, has gone forward with great strides, absorbing Western ideas and developing her rich material resources.

"The record of this fifteen-year achievement in colonial enterprise is here set forth in facts and figures, with a careful avoidance of debatable questions of international politics.

"In the preparation of this book, the South Manchuria Railway has made use of all available official and authoritative sources of information, and has drawn freely from the *Economic History of Manchuria,* published in 1921 by the Bank of Chosen."

Contents: 1. Geography, history and government. 2. Natural resources of Manchuria: Agriculture, forestry, fisheries, mining. 3. Development of manufacturing (incl. bean oil and bean cake). 4. Commerce and finance: Foreign trade of Manchuria, facilities for commerce. 5. The South Manchuria Railway and its work: A modern railway in an ancient land, the railway, harbors and ships, coal mines and steel works, gas an electricity, hotels (A modern hotel system–The Yamato Hotels), scientific research institutions (The Dairen Central Laboratory, agricultural experiment stations, farm improvement work), civic administration. 6. The open road in Manchuria.

Soya beans are mentioned on the following pages: p. 16 (11 times), p. 17 (6 times), p. 19 (7 times), p. 20, 40, 112 (5

© Copyright Soyinfo Center 2014

times), p. 41, 109 (4 times), p. vii, 28, 38, 55, 57, 111, 113 (2 times).

Bean oil is mentioned on pages 19 (4 times), p. 40 (2 times), p. iv, 12, 16, 41, 47, 57, 66, 109.

Bean cake(s) is mentioned on pages 40 (3 times), p. 41 (2 times), p. iv, 12, 19, 20, 55, 57, 59, 66, 83, 87, 109.

Soy [sauce] is mentioned only on p. 17 (diagram of the many uses of soya beans).

2218. U.S. Tariff Commission. 1922. Summary of tariff information, 1921, relative to the bill H.R. 7456. Washington, DC: Government Printing Office. 1625 p. See p. 152, 786-87, 802-03.

• ***Summary:*** "The principal sources of information have been the commodity surveys and reports of the Tariff Commission, especially the 'Summary of Tariff Information, 1920.' The material in the latter has been amplified and brought up to date."

Soybeans are more specifically dealt with in the 1920 Summary. Soybean oil, however, is considered in H.R. 7456.

The section titled "Soya-bean oil" (p. 152-53) states: "Description and uses... This oil "is a semi-drying oil used in paint either as a substitute for or mixed with linseed oil. Its greatest use is in soap making, for which it has largely replace cottonseed oil, but the purified oil is edible. After the oil is expressed the cake becomes a feed for dairy cattle or a fertilizer.

"*Production* of soya beans has increased greatly, but only a small portion of the crop is used for oil. In 1915 approximately 100,000 bushels of American-grown beans were pressed for oil. The domestic output of oil (inedible and edible) increased from 2, 764,000 pounds in 1914 to 42,074,000 pounds in 1917 and 79,861,000 pounds in 1918. Reports of the Bureau of the Census show that no crude soya-bean oil has been produced either from domestic or imported beans in this country from 1919 to September 30, 1921, inclusive. The oil is imported in the crude state and refined in this country.

"*Imports* have increased from 16,360,452 pounds in 1914 to 336,824,646 pounds in 1918, the great bulk coming from China and Japan. Imports since 1917, almost wholly from Kwangtung, China proper, and Japan, have been as follows:"

A table shows that imports fell rapidly after 1918 (and the end of World War I) to 195.8 million lb in 1919, 112.5 million lb in 1920, and only 16.3 million lb in the first 9 months of 1921. The value per pound plunged from $0.11 in 1918 to $0.04 in 1921.

Exports since 1918 have been chiefly to Italy, France, and Austria. A table shows the quantities: 27.7 million lb in the last 6 months of 1919, 43.5 million lb in 1920, but only 1.93 million lb in the first 9 months of 1921.

"Important changes in classification.–Soya-bean oil was exempt from duty under the Act of 1913 (par. 561); it is dutiable under the emergency tariff act of 1921 (par. 11)."

The next section, titled "Hempseed oil" (p. 152) states that this oil is obtained from the seeds of the hemp plant, cultivated in France, Belgium, Germany, southern Italy, Turkey, Algeria, North America, India, Manchuria, and Japan. It is used mainly in paint as a drying oil.

Soya beans are also mentioned under "Beans" (p. 786). Under "Beans, prepared or preserved" (p. 787) we read: "Soya beans are also made into various food preparations, especially for use by orientals." A table shows that imports of such soya beans increased from 1.43 million lb in 1918 to 3.4 million lb in the first 9 months of 1921.

The section on "Vegetables prepared or preserved" (p. 802-03) states: "Bean stick [probably dried yuba sticks] or bean cake is an oriental food product made from ground and fermented soya beans. Miso is a cooked and fermented combination of rice and soya beans, generally used in making soup." "Imports of bean stick or bean cake and miso were valued at $73,097 in 1914, soya bean cake constituting about 40%. Edible bean cake and miso are imported to meet the demand of the oriental population." A table shows that there was a 25% duty on such products and imports and value dropped from 1918 to 1921. Address: Washington, DC.

2219. *Atlanta Constitution* (*Georgia*). 1923. Dairen rivals Boston as great bean city: Japan's ice-free port in Manchuria, all-year-round shipping point for soy product of vast fields has grown from mud village. Jan. 21. p. 54.

• ***Summary:*** "Dairen and Boston–the world's premier bean towns." Dairen lives not on but by beans; it is the port of the greatest bean country in the world."

"Steamers come in an endless procession to Dairen wharves to carry away countless tons of [soy] beans, thousands of gallons of [soy bean] oil and the sauce you eat on your chop suey when you visit 'Chinatown,' and shiploads of great cartwheel-like disks of bean cake from the oil mills. The thousands of gallons of soy bean oil which leave Dairen annually, compete actively in world markets with American cottonseed oil as an olive oil substitute."

"To the Chinese it is Talien-wan; the Russians, who thought in 1899 they had established there their long-sought ice-free Pacific port, called it Dalny." The Chinese (and Japanese) characters mean "great connections," and "it is truly a connecting link between the China that was and the Japan that is."

"Russia, great power of the West, left Dalny at the end of the Russo-Japanese War an unhealthy, overgrown village with streets of mud. Japan, apt pupil of a more western West than Russia, gave the newly christened town paved streets, 20th century sanitation, forest-clad hills, electric lights and street cars, and an efficient municipal government.

"Politically, Dairen is the seat of administration of Japan's 99-year lease over the Kwang-tung or Liaotung peninsula [1,220 square miles], which forms the southern

© Copyright Soyinfo Center 2014

extremity of Manchuria,... It would be difficult to conceive of a port in a relatively undeveloped region of the world more strategically situated."

Japan "also has a 99-year concession for the South Manchurian Railway, which extends several hundred miles to the north through the center of Manchuria's almost matchlessly fertile plains. 'Railway' must be taken in something of a Pickwickian sense... In addition to its road it operates a line of ocean steamers and great warehouses, develops power, runs mines and manages lands." The railroad has all the conveniences of U.S. trains; it even has all-Pullman trains.

2220. Masakazu, Inouye. 1923. [Preparation of petroleum from fatty oils. II.]. *Nippon Kagaku Kaishi* (*J. of the Chemical Society of Japan*) 44(1):78-110. Jan. (Chem. Abst. 17:2953). [Jap]
• ***Summary:*** Obtained oils resembling petroleum by the dry distillation of the soaps of sardine, linseed, cottonseed, soy bean, and grape-seed oils.

2221. Miyake, Koji; Ito, Mitsuji. 1923. On the lethal temperature of koji-diastase in aquatic solution and the recovery of its action after heating. *J. of Biochemistry* (*Tokyo*) 2(2):255-70. Jan. [15 ref. Eng]
• ***Summary:*** The first real scientific study of the diastatic enzyme was made by Payen and Persoz (1833) who named it diastase. We have observed that the diastatic quality of Koji-extract was not destroyed by boiling the extract. Its lethal temperature was described by T. Takahashi to be 80-83ºC. Koji-diastase was killed by heating for 25 minutes at 70ºC. It seemed that the diastatic power of Koji-extract injured by heating at a temperature lower than lethal may recover its power to some extent by preserving it at room temperature. Address: Lab. of Agricultural Chemistry, Hokkaido Imperial Univ., Japan.

2222. Nakai, T. 1923. Inshokuhin toku ni shôyu-chû no beeta nafutooru no shin kenshutsu-hô [A new method for detection of beta-naphthol in foods and especially in shoyu]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 491. p. 17-26. Jan. (Chem. Abst. 17:3059). [Jap]
• ***Summary:*** About 1 part of Beta-naphthol in 500,000 can be detected with a reagent prepared by dissolving molybdic acid (5 gm) in concentrated sulfuric acid (100 cc). The naphthol is extracted from soy sauce by shaking the sauce (100 cc) with 200 cc of a mixture of ether and petroleum spirits (1:1) for 30 minutes, evaporating the solution to dryness, and dissolving the residue in warm water (7 cc); or better by distilling the sauce (100 cc) and collecting the distillate in fractions of 7 cc, the third and fourth fractions being used for the test. On adding the molybdic acid reagent to the solution along the wall of the vessel in a thin stream, a violet-red zone is developed between the two solutions when Beta-naphthol is present. α-naphthol gives no coloration with this reagent.

2223. Oshima, Kokichi; Church, Margaret B. 1923. Industrial mold enzymes. *Industrial and Engineering Chemistry* 15(1):67-70. Jan. [13 ref]
• ***Summary:*** "A new method for quantitative estimation of protease is described in this paper. Many strains of the *Aspergillus flavus-oryzae* group, which were separated from tane-koji used in shoyu manufacture and related industries, showed individually the production of amylase and protease of widely different strengths... Even on soy-bean flour, which contains no starch, strong amylase is produced."

The molds were cultivated on various media, including "soy-bean milk agar." "Experiments here show that extracellular and intracellular enzymes are the same, and after a certain period of growth all enzymes are excreted."

On page 68 is a reproduction of an interesting label, written in both Japanese and English, on an envelope containing "commercial mold ferment." The English-language portion reads: "Pure Cultured Aspergillus Soja. Registered Trade Mark." Illustrations show conidiophores of Aspergillus.

Photos show: (1) A worker in or near a koji room with koji trays inoculating the ingredients for making soy sauce with the mold ferment, *Aspergillus flavus.* (2) A series of modern, brick-walled koji rooms with wooden doors. Address: 1. Hokkaido Imperial Univ., Sapporo, Japan; 2. Bureau of Chemistry, USDA, Washington, DC.

2225. Oshima, Kokichi. 1923. Re: Their journal article and friendship. Letter to Margaret Church at USDA in the United States, Feb. 6. 2 p. Handwritten, with signature. [1 ref. Eng]
• ***Summary:*** Margaret Church sent him a copy of their joint paper titled "Industrial Mold Enzymes" published in *Industrial and Engineering Chemistry* (Jan. 1923). "It is the best memory of our friendship.

"Last summer I met with Mr. S. Konno, who is making commercial mold spore." When collecting the mold spores, many laborers got very sick (just like fever) due to the spore dust. "The sickness is caused by the spores of *Aspergillus flavus* and mostly by *Asp. ochraceus.* And when it is severe, a man vomits blood." Address: Kita-1, Higashi-1, Sapporo, Japan.

• ***Summary:*** This is the first comprehensive book about the soybean written in English, and the most important book on soybeans and soyfoods written in its time. Contains an excellent review of the world literature on soybeans and soyfoods with a bibliography on soy that is larger than any published prior to that time (563 references), a good description of the present status of the soybean worldwide based on the authors' extensive contacts, and a great deal of original information. It quickly became a key source for people and organizations working with soybeans and soyfoods in all countries, and a major factor in the expansion of the soybean in the western world. Because of its scope and influence, Soyfoods Center considers the year of its publication to mark the end of the "Early Years" of the soybean worldwide. It remained in print until about 1986.

Contents: Preface. 1. Introduction: Name of the plant, origin, literature, use by the Chinese and Japanese, present importance, future prospects in the U.S., recognition of the possibilities. 2. The commercial status of the soybean: Manchuria and China, Japan, Europe, U.S., other countries, summary of imports and exports of soybeans and soybean oil. 3. Botanical history of the soybean: History prior to Linnaeus' "Species Plantarum" 1753, Linnaeus' misunderstandings of the soybean, Prain's elucidation, other and the correct botanical name.

4. Agricultural history of the soybean: Vernacular names of the soybean, China, Korea, and Japan, India and neighboring regions, Cochin China, Malayan region, early introduction into the United States, later U.S. introductions, the early introduced varieties (grown in the USA by 1898–Ito San, Mammoth, Buckshot, Guelph or Medium Green, Butterball, Kingston, Samarow, Eda, Ogemaw or Ogema), soybean in Europe, varieties grown in Europe and identification, Hawaiian Islands, Australia, Africa, Argentina (p. 50), Canada ("Soybeans are grown in very small quantities in Canada and then usually as a forage crop"), Philippines, Egypt, Cuba (p. 52), British Guiana, Mauritius (p. 53), present culture distribution. 5. Culture of the soybean: Climatic adaptations, soil preferences, water requirement, preparation of seed bed, time of planting, methods and rate of seeding, seeding for pasturage, depth of seeding, inoculation, fertilizer reactions, cultivation, soybeans in mixtures (with cowpeas, sorghums, Sudan grass, Johnson grass, millet, corn, or sunflowers and corn).

6. Harvesting and storage of soybeans: harvesting soybeans for hay, silage, for the seed, seed yields, proportion of straw to seed, storing seed, separation of cracked from whole soybean seed, viability of soybean seed, pedigreed, inspected, registered, and certified seed. 7. Composition of the soybean: Proportions of stems, leaves and pods, composition of plant and seed, nutritive and mineral constituents, forms of nitrogen in soybean nodules, factors affecting oil content of seed. 8. Utilization of the soybean: Diversity of uses (a chart, p. 129, shows 59 products that can be made from soybean seeds, and 6 more that can be made from soybean plants), soybeans for green manure, pasturage, soiling, ensilage, hay, straw.

9. Varieties: Japanese classification of varieties, classification of varieites in Manchuria (3 yellow, 2 green, 3 black), botanical classifications, vital characteristics, descriptions of important varieties (43 varieties and 7 synonyms), key for identification, breeding and improvement, genetic behavior, oil content.

10. Structure of soybean seeds. 11. Soybean oil: Methods of extraction [Manchurian, and solvent], American oil mills, methods of shipping and marketing, prices, utilization in soap manufacture, food, paint manufacture, miscellaneous. 12. Soybean cake or meal: Feeding value, composition, use for feeding for dairy cows, cattle, swine, sheep, poultry, digestibility, injurious effects, fertilizer.

13. Soybean products for human food: Food value of the soybean, digestibility of the soybean and its products, mature or dry soybeans, immature or green soybeans (a "nutritious green vegetable"), soybean flour, digestibility of soybean flour, soybean bran (p. 225-26), soybean sprouts, soybean coffee, soybean or vegetable milk [soymilk] (preparation, composition, residue from the manufacture of vegetable milk [okara], utilization of soybean milk, condensed vegetable milk, vegetable milk powder, fermented vegetable milk), vegetable casein, tofu or soybean curd (names and brief history, method of manufacture, coagulating agents, manufacturing yields, digestibility, utilization of bean curd and manufactured products, bean curd brains or *tofu nao,* dry bean curd or *tofu khan,* thousand folds {*chien chang tofu*}, fried bean curd {*tza tofu*}, Fragrant dry bean curd {*hsiang khan*}, frozen tofu {*kori tofu*}, Chinese preparation, various dishes), natto, hamananatto [hamanatto], yuba, miso, shoyu [soy sauce], confections. 14. Table dishes of soybeans and soybean products: mature or dry beans, flour, tofu, sprouts (86 recipes). 15. Enemies of the soybean: bacterial, mosaic, fungous [fungus], and nematode diseases, insects, rodents. This last chapter is a comprehensive review of the literature on soybean diseases and insects published before 1922.

The Preface begins: "The soybean, also known as soya or soja bean, has assumed great importance in recent years and offers far-reaching possibilities of the future, particularly in the United States. It is, therefore, desirable to bring together in a single volume the accumulated information concerning this crop...

"The aim has been to present the information so as to make it useful from both agricultural and commercial standpoints, not omitting, however, much that is mainly of historical or botanical interest..."

The introduction begins: "There is a wide and growing belief that the soybean is destined to become one of the leading farm crops in the United States."

2233. Piper, Charles V.; Morse, William J. 1923. Introduction of the soybean to Europe (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 45-47.

• ***Summary:*** "The soybean has been grown experimentally at least in most of the European countries but in general the climatic conditions are not well suited to its culture. Some measure of success has been had however in south Europe, but the crop has never become of much importance.

"France: Paillieux (1880) has traced in detail the records of early attempts to introduce the culture of the soybean into France. Packets of soybean seeds from missionaries in China were received at the Jardin des Plantes, Paris, in 1739 and at frequent later dates beginning with 1834. The plants were very probably grown at the botanical garden since 1740, certainly so in 1779, and from 1834 to 1880 without interruption. In 1821, an unusually warm season, a Chinese variety had matured seed at Champ-Rond near Etampes. Beginning with 1855 the *Société d'Acclimatation* distributed numerous packets of seed, but did not succeed in establishing a permanent culture of the plant. In 1868 M. Chauvin cultivated several varieties at Cote d'Or, and the culture there has since continued. In 1874 the Society of horticulture of Etampes began experiments that continued until 1880. In 1879 a Chinese variety matured well at Marseilles. In 1880 Vilmorin-Andrieux & Company introduced into France one of the varieties tested by Haberlandt in Austria, which variety has proven well adapted to French conditions. This variety is presumably that now known in France as 'Yellow Etampes' which is the same as that known in the United States as 'Ito San.'

"The soybean is now rather widely grown in France but apparently is not an important crop. No definite statistics of its culture seem to have been published. Presumably it is grown more as a garden vegetable than as a field crop. Apparently only four varieties were cultivated in France before 1910 namely: Yellow Etampes (= Ito San); Early Black from Podolia (= Chernie); Brown (= Ogemaw); and Extra Early Black (= Wisconsin Black). All of these are short season varieties, indicating that the later sorts will not mature in France.

"Italy: The cultivation of the soybean in Italy dates from about 1840. [Question: What is the source of this date?] At the present time it is grown sparingly in the compartments of Liguria, Emilia, Marches, and near Naples. In no part of Italy does it seem to be a crop of prime importance.

"Austria and Germany: A great impetus was given to the culture of the soybean in Europe by the experiments of Prof. Friedrich Haberlandt (1878) of Vienna, in 1875 and subsequent years. Haberlandt obtained seed of nineteen

© Copyright Soyinfo Center 2014

varieties at the Vienna exposition in 1873. These were as follows:" Five yellow-seeded, three black-seeded, three green-seeded, and two brown-red-seeded varieties from China. One yellow-seeded and three black-seeded varieties from Japan. One black-seeded variety from Trans-Caucasia. One green-seeded variety from Tunis.

"Of these only four varieties matured at Vienna in 1875, namely, two yellow-seeded, one black-seeded and one brown-red-seeded, all from China. The black-seed sort was so late that it matured but few seeds. Of the other varieties some did not even come into bloom, while the remainder produced blossoms or young pods too late in the fall to mature.

"In 1876 the two yellow and the brown varieties were tested by cooperators in Hungary, Bohemia, Steirmark [Steiermark, Austria], Bukowina [an area divided between Romania and the USSR after 1945], Moravia, and Silesia, favorable results being secured in each case.

"In 1877 seeds of all four varieties were distributed to 148 cooperators, mostly in Austria-Hungary, but some in Germany and Russian Poland, and one each in Switzerland and Holland. Most of the tests gave promising results.

"Haberlandt (1878) published the results of his investigations in much detail, and his results had great influence in stimulating further investigations. All of the varieties that Haberlandt was able to mature were short season varieties, which in general are far less productive than later sorts.

"England: According to Aiton (1812) the soybean was grown as early as 1790 at the Royal Botanic Gardens, Kew, but merely as a botanical curiosity. The soybean has apparently never been grown as a crop in England, where indeed only the earliest varieties would be expected to mature.

"Investigations on the adaptability of the soybean have been carried on by Dr. J.L. North of the Royal Botanic Gardens during recent years. Early varieties were introduced from numerous sources. With careful selections two or three quite promising early strains have been obtained which mature fully and give good yields of seed under English conditions."

2235. Piper, Charles V.; Morse, William J. 1923. Soybeans in the Philippines (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 50-51.
• ***Summary:*** "Philippines: The soybean is not a native crop in the Philippines. Varieties imported from the United States, China and Japan, Java and India have been tried out at various times at the different experiment stations in Luzon. Variety trials at Singalong and Batangas gave returns of forage and seed that were unsatisfactory. At Alabang and Lamao, the plants grew normally in every way, but were one-third smaller than plants of the same variety in Virginia. Layosa (1918) and Norona (1919) have done considerable successful breeding work with strains of this crop. At the present time the soybean is not recommended for general culture in the Philippines."

2236. Piper, Charles V.; Morse, William J. 1923. Soybean coffee (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 227-28. [1 ref]
• ***Summary:*** "When properly roasted and prepared, the dried beans of any variety of soybeans make an excellent coffee substitute. As such the soybean has been used to a slight extent for many years in Europe, especially Switzerland, and in the United States. It is recorded that during the period of the Civil War the soybean was used rather extensively in the southern states as a coffee substitute. For a considerable while seedsmen sold the Ito San variety under the names Coffee Berry and Coffee Bean. In Japan and southern Russia soybean coffee is prepared and put up in small packages for the market. This product is ground very fine and has much the appearance of coffee essence.

"Prepared as coffee, the soybean gives a liquid of the same color and odor as coffee and somewhat the flavor of a cereal beverage. Those fond of cereal drinks pronounce the soybean beverage equal to the best of the preparations on the market. According to Li Yu Ying and Grandvoinnet (1911-1912) the soybean dried and roasted, such as is used in Switzerland, has the following composition: Water, 5.27; cellulose, 4.97; carbohydrates, 34.76; fat, 18.01; total materials soluble in water, 49.07."

Note 1. This is the earliest document seen (Nov. 2012) which states that soybeans were used as a coffee substitute during the Civil War in the United States. The source of this information is not given–and that is very surprising, since Piper and Morse are so careful about citing their sources in this book. Why did they omit this citation? Perhaps they had heard the story several times but were unable to find an early document to prove it.

Our 30-year search for documentation to verify the above statement has been unsuccessful. Soybeans had been cultivated in 9 southern states by 1865, however none of those states grew a significant acreage of soybeans in 1909–when soybean acreage statistics were first recorded. Therefore its hard to know where to start looking.

Note 2. This is the earliest English-language document seen (Nov. 2012) that uses the term "soybean coffee" to refer to soy coffee.

Note 3. This is the earliest English-language document seen (Aug. 2013) that contains the term "soybean beverage" which is used to refer to soy coffee.

2237. Piper, Charles V.; Morse, William J. 1923. The commercial status of the soybean in Europe (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 16-19.
• ***Summary:*** "While many earlier attempts had been made to introduce the soybean and its products into European countries, it was not until about 1908 that the bean received serious consideration as a product of economic importance. About 1900, however, soybeans were imported by an English firm as, on account of their being practically free from starch, it was thought they would make an excellent food for patients suffering with diabetes. Germany and Holland also imported small amounts of soybeans for the same purpose and many special food products were manufactured by firms in these countries.

"Growth of the trade.–Owing to the inferior quality of the product received, due principally to the poor shipping conditions, the first attempts to introduce the soybean as an oil seed were generally unsuccessful. The first large importation of beans, 400 to 500 tons, was made in 1907 by a crusher at Liverpool, the beans being shipped from Hankow [China] and delivered at Liverpool at a cost of $50.00 per ton. It was found that an oil valuable to soap manufacturers could be produced and that the by-products, cake and meal, both high in protein, could be utilized by manufacturers of mixed feeds.

"After 1907 importations gradually increased and the beans were received in much better condition than those of the first trial shipment. At this time also, impetus was given to the manufacture of soybean products by a shortage of cottonseed and linseed. In February 1908, a cargo of 9,000 tons of beans was received at Hull, the selling price of the beans being $32.00 per ton, C.I.F. It was found by importing in cargo lots, the price was lowered to $4.40 per ton. In June 1909 beans sold for $28.75 per ton but by January 1910 had risen to $41.00 per ton.

"At first England enjoyed the monopoly of trade in soybeans. nearly all of the first large importations of beans were taken by England where many of the large oil mills devoted their plants entirely to the crushing of soybeans. Several of these mills conducted series of tests, demonstrating the value of the cake, meal and oil.

© Copyright Soyinfo Center 2014

"Utilization of the soybean as an oil seed extended rapidly to other European countries. The fact that they were called beans, prevented them from having a wider market at the beginning of the large importations, since in Germany, France and Austria, oil seeds were on the free list, but beans were subject to a tax. These countries realizing the importance of the bean, soon placed it on the free list and the monopoly in the trade of soybean products was taken from England.

"Extent of the trade.–The importations of beans from Manchuria and Japan soon reached enormous proportions. In 1909, 412,757 tons; in 1910, 442,559 tons; and in 1911, 321,940 tons of beans were imported by European countries...

"Utilization.–The principal use of soybean oil at first was in the manufacture of soft soaps, as it was found that the oil did not chill easily and was difficult to handle in making hard soap... However, some European soap manufacturers soon claimed to have found a secret process by means of which they could utilize the oil in the manufacture of the best grades of hard soap. Other uses were found for the oil and it entered largely into the manufacture of butter and lard substitutes and edible oil.

"Soybean cake or meal in the beginning of the trade found its largest outlet in Denmark, about 150,000 tons having been purchased from English oil mills in 1910. The trade in the cake or meal extended rapidly to Sweden, Norway, Holland and the northern part of Germany. The United Kingdom is not a large user of the bean cake. It is however used to a considerable extent by Scotch farmers and to a small extent by Irish [from Eire / Ireland] and English farmers. The cake manufactured into a flour, has gradually assumed an important place as a foodstuff and as such is utilized in many European countries."

2238. Piper, Charles V.; Morse, William J. 1923. Miso (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 247-50.
• ***Summary:*** "In extent of use miso is said to surpass all other preparations from the soybean in the Orient. It forms an indispensable part of the daily menu of the rural population and wage earners but it is used somewhat less extensively among the people living in cities. It is the general custom of the people in rural districts to prepare miso for their own use. It has been estimated that the daily consumption of miso per person in rural districts of Japan is about 40 grams.

"The preparation of miso depends primarily upon the action of a fermenting agent known as *kojii* [sic, koji], containing certain forms of fungi, of which *Aspergillus oryzae* is the principal one. The *kojii* also contains diastatic and inverting ferments which change the carbohydrates of the raw material into maltose, glucose, etc., and a proteolytic ferment which acts upon the nitrogenous bodies, converting them into simpler and more soluble materials."

Describes the method of preparing miso in Japan, and two of the most important kinds of Japanese miso. The soybeans "are usually steamed for about 25 hours first with strong heat and later very gently." "White miso, which contains but little salt, is fermented with rice koji for 3 or 4 days only, and may be preserved for about 10 days. Red miso is red in color and contains a relatively large amount of salt. It is fermented usually with barley koji for 1½ to 2 years, and may be kept for several years." A table (from Kellner 1889) compares the composition of these two types of miso.

Photos show: (1) Five Japanese men making miso in a commercial shop; shows the steamer and a large miso fermentation vat. (2) Four men working at the "mill used for crushing the soybeans, yeast [koji] and salt mixture in the manufacture of miso. (3) Two Japanese men shoveling "early cured miso" out of a large vat and packing it into small wooden tubs, each ringed by 5 bamboo hoops.

Note: This is the earliest document seen (June 2004) in which Piper or Morse describe miso.

2239. Piper, Charles V.; Morse, William J. 1923. Natto (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 244-45. [1 ref]
• ***Summary:*** "Natto, a sort of vegetable cheese prepared from soybeans, has long been used by the Buddhists and is now used extensively by the Japanese. Although it is made throughout Japan, the method of manufacture varies somewhat with the locality, the different kinds being associated with the place of manufacture such as Tokyo natto, Kyoto natto, etc.

"In preparing natto, the soybeans are boiled in water for about five hours to render them exceedingly soft. The material while still hot, is wrapped in small portions (about a handful) in rice straw and the bundles tied at both ends (Fig. 70) are placed in a cellar or room (Fig. 71) heated by hot water or charcoal. The room is then closed for about 24 hours, the temperature ranging from 35 to 40ºC., this allowing the cooked beans to ferment in the warm, moist atmosphere.

"Another method is to put the cooked beans in a box with cut straw placed over and closed with a lid. The box is then placed in a stove for 24 hours at a temperature of 35 to 40ºC. The fermented product is a thick viscid mass having a peculiar but not offensive odor. The amount of natto produced is about double the quantity of beans used.

"Although the moderate heat of the cellar or rooms acts for only 24 hours, there is evidently a considerable bacterial fermentation. Yabe (1897) [sic, 1894 or 1895] made a rather extensive study of the microorganisms and chemical composition of natto. This investigator found one species of bacillus and three of micrococcus present...

"In addition to being a highly nutritious food, it is quite probable that Natto is more easily digested than the soybean, as it is very soft and contains more peptone. The average

© Copyright Soyinfo Center 2014

composition of natto is as follows: Water, 61.84%; albumen, 19.26; fat, 8.17; carbohydrates, 6.09; cellulose, 2.80; ash, 1.84.

"Natto is used commonly as a side dish and also as a material for confections. It is usually eaten with drops of soy sauce.

A table (p. 245, based on Yabe 1894) compares the nitrogenous substances in soybeans and natto made from those same soybeans. Unfortunately the table was reproduced incorrectly so that most of the values are wrong. For the correct values see Yabe 1894, "On the vegetable cheese, natto."

Photos show (p. 243): (1) About ten Japanese women and men sitting on bundles of straw in a room, "packing a handful of boiled soybeans into fresh rice straw wrappers in preparation of natto." (2) Two Japanese men in a brick-walled natto fermenting room. One is looking in through the small, low entrance door. Each holds a bundle of the straw wrappers.

Note: This is the earliest document seen (Jan. 2012) in which Piper or Morse describe natto.

2240. Piper, Charles V.; Morse, William J. 1923. Hamananatto (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 245. [1 ref]

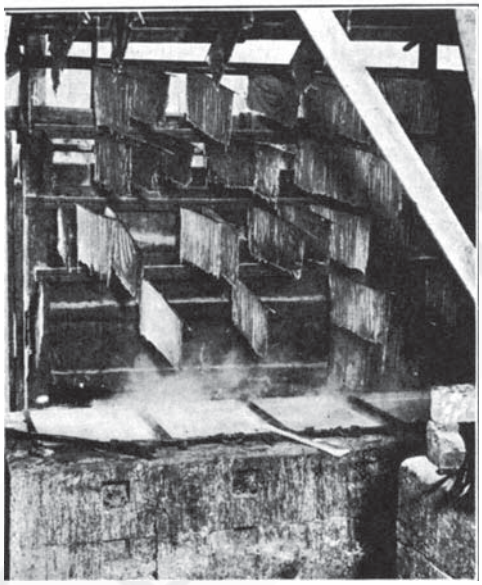
• ***Summary:*** "Hamananatto, a kind of vegetable cheese prepared from soybeans, is manufactured principally in the central provinces of Japan. Although prepared much like miso and natto, it has a somewhat different flavor and texture from either of these. It has an agreeable salty taste and a peculiar odor somewhat resembling that of the fresh crust of brown bread. The soybeans composing it form no compact mass and are of a brown color with a thin layer of a salty taste and a somewhat sticky consistency.

"In preparing Hamananatto the soybeans are thoroughly washed, boiled to softness, spread on straw mats and mixed with wheat flour (6 liters of flour to 10 liters of soybeans). Molds soon develop, after which the mixture is exposed to direct sunlight for 3 days, probably to kill the fungi, and then is put in flat tubs. After about 12 days some salt and ginger are added. The entire mass is then kept in tubs under pressure for about 30 days.

"Sawa [1902, citation not in bibliography] in his investigations found that at least three different kinds of bacteria are present in this product. According to this investigator [Sawa] Hamananatto has the following composition [sic, composition of dry matter only]: Albuminoid nitrogen 3.57%. Fat 3.44%. Fiber 6.87%. Total carbohydrates, excluding cellulose 8.40%. Total ash, including salt added 18.54%. Moisture of fresh sample 44.73%."

Note: This is the earliest document seen (Nov. 2011) in which Piper or Morse describe Hamananatto [Hamanatto].

2241. Piper, Charles V.; Morse, William J. 1923. Yuba (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 246-47.



• ***Summary:*** "When soybean milk is boiled, a film forms on the surface. This film, known as yuba, has been prepared since ancient times in China and Japan, and is a very popular foodstuff. It is very brittle and is sold in sticks, sheets, or small flakes. In cooking, yuba is used as a wrapper, cut into ribbons, or small pieces and either fried or used in soups.

"In the preparation of yuba, soybean milk of the best quality is boiled for about one hour in a copper pan over a slow fire. A small quantity of auramine [a bright yellow ketonimine dye] is added which tends to produce a thick film. The film is removed from the milk by passing a stick underneath the surface, the film thus hanging on in two-fold (Fig. 72). It is dried slowly on a galvanized net over charcoal fire, resulting in a thin yellowish sheet.

"The best quality of yuba is glossy and of a cream-yellow color. The first film is the best and the quality of the succeeding films gradually becomes inferior.

"The milk obtained from 3 lb. of beans is said to produce about thirty sheets of yuba. The [rather thick, semisolid] residue of the milk after the films are removed is still rich in nutrients, and is used mostly for food. It may also be used as animal feed.

"Yuba is valued chiefly on account of its high content of protein. It consists mainly of albuminoids and fat. The composition of yuba is shown in the following table" [Sources: Oshima / Nagao]: Water 18.31 / 22.85. Protein 49.65 / 51.60. Fat 18.00 / 15.62. Carbohydrates 11.82 / 7.31. Ash 2.22 / 2.82. Note: The source of the information from Nagao is not cited.

A photo (p. 246) shows "the boiling of soybean milk in copper pans over a mild fire in the manufacture of yuba."

© Copyright Soyinfo Center 2014

About 25 sheets of yuba are hanging in two-fold over sticks several feet or more above the pans.

Note 1. This is the earliest known photo of yuba being made commercially. It may well have been taken by Frank N. Meyer during one of his early trips as a USDA agricultural explorer to Japan or China.

Note 2. This is the earliest known practical and useful description of how yuba is made on a commercial scale.

Note 3. This is the earliest document seen (Oct. 2012) in which Piper or Morse describe yuba.

2242. Piper, Charles V.; Morse, William J. 1923. Tofu or soybean curd (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 234-44, 273-78. [6 ref]

• ***Summary:*** Contents: Introduction. Method of manufacture. Coagulating agents. Manufacturing yields. Composition of soybean curd. Digestibility of soybean curd. Utilization of bean curd and manufactured products. Bean curd brains or *tofu nao.* Dry bean curd or *tofu khan.* Thousand folds (*chien chang tofu*). Fried bean curd (*tza tofu*). Fragrant dry bean curd (*hsiang khan*). Frozen tofu (*kori tofu*). Chinese preparation. Various dishes.

Tofu, "a sort of white cheese or curd,... is called "Teou fu' by the Chinese, 'Tofu' by the Japanese, and 'Dan Phu' by the Annamites [in today's Vietnam]. It is said to have been originated by the Chinese philosopher, Whai Nan Tze, before the Christian Era, and was undoubtedly introduced into Japan from China by the Buddhists."

"The coagulating agents most generally employed throughout the Orient are the concentrated mother liquid obtained from the manufacture of salt from sea water, burned powdered gypsum, and magnesium chloride... The junior author (Morse) has obtained successful results with rennet and 1 per cent. solutions of acetic, tartaric, and lactic acids. Sour milk has also given satisfactory results as well as the water [whey] drawn from the bean curd after coagulation. By the use of pure salts or rennet the bitter taste which is generally found in the curd made by Oriental methods is avoided."

Yields: In commercial tofu production, 1 pound of beans is said to yield about 3.57 lb of tofu (i.e., the yield is 3.57). Champion (1885) got a yield of 1.53 and Paillieux (1880) got a yield of 1.50. Morse conducted many tests to determine the yield of curd from 19 different soybean varieties. His yields ranged from 0.686 to 0.282–extremely low.

Different types of Chinese tofu: (1) Dry bean curd or *tofu khan:* bean curd squares are dipped in burnt millet-sugar sauce until rich brown in color. "Fine salt also has been rubbed on them. This form of cheese can be kept for several days and is generally eaten in soups."

Note 1. This is the earliest English-language document seen (April 2013) uses the term "bean curd squares" to refer to Chinese-style pressed tofu. And this is the earliest English-language document seen (April 2013) that uses the term "soybean curd" to refer to tofu, or that uses the term "Teou fu" (or "Teou-fu"), or the term "Dan Phu" (or "Dan-Phu") to refer to Chinese-style tofu.

(2) "Thousand folds (*chien chang tofu*)*:* This product is prepared by placing very thin layers of the bean curds on cloths, on top of one another, and subjecting them to considerable pressure and allowing them to dry for a short time. The layers of bean curd are then removed and rolled together like a jamroll. It is said to be eaten cut into strips, like noodles, in soups. When allowed to mold for several days it is fried in sesame oil and has a meat like flavor."

(3) "Fried bean curd (*tza tofu*)*:* The fresh bean curd is cut into small squares and fried in deep fat. After a few minutes the bean curd pieces float on the surface and they are taken out. This product is often fastened on bamboo fibers (Fig. 65) and may be kept for several days. They may also be eaten with syrup as fritters." (4) "Fragrant dry bean curd (*hsiang khan*) [*wu-hsiang toufu kan*]*:* This form is made like the ordinary bean curd but great pressure is applied to drive out as much water as possible. The squares (Fig. 66) are first soaked in a weak brine or bean sauce to which powdered spices and burnt millet-sugar have been added and then are thoroughly dried out. The curd becomes very hard and can be kept indefinitely. It is said to be eaten sliced in soups and in various vegetable dishes."

(5) "Frozen tofu (*kori tofu*)*:* Frozen bean curd is an excellent example of the application of the freezing process for the drying or concentration of a food. Fresh bean curd contains rather a high per cent. of water and is therefore a very unstable product. The fresh bean curd is cut into small pieces and exposed to severe cold weather. By freezing, the vegetable proteid shrinks and forms a porous cake permeated with ice crystals. This frozen cake can be readily thawed out and dried. It forms a product much resembling gluten bread in appearance. If the tofu is not frozen, it is difficult to dry and the resulting material is dense and horn-like..." (6) "Chinese preparation:... Tofu is quite generally preserved in loaves (100 to 150 grams) which are cooked in a decoction of turmeric roots. It is also preserved with salt. Often the curd is cut into small pieces and preserved in rice brandy [to make fermented tofu]. When smoked, the curd also keeps very well and can be wrapped in tinfoil for the market. Smoked curd is prepared by cooking the curd in a sauce diluted with water (80 per cent. and 20 per cent. soy sauce) and after cooking the curd is smoked in the same manner as meat."

Various American- and European-style recipes: "When cut into small pieces and cooked with an egg, it furnishes an excellent omelet. It also may be used as the principal ingredient in baked stuffed peppers. The fresh tofu makes an excellent salad or sandwich filling if the curd is chopped finely and chopped olives, pepper, salt, and mayonnaise dressing are added. When cut into small pieces and cooked in

© Copyright Soyinfo Center 2014

tomato sauce or similar sauces, a very good meat substitute is obtained. Cooked with meat broth, the curd takes the flavor of the meat. It is readily seen that the fresh bean curd can be utilized in many ways and when the people of the western world become better acquainted with this simple method of manufacture, it will no doubt, become more generally utilized."

Nineteen tofu recipes are given on pages 273-78.

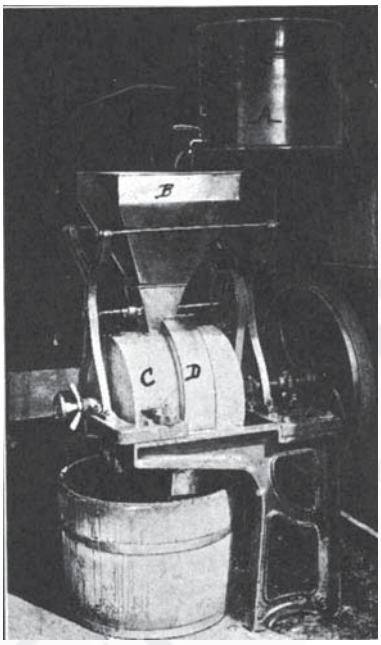
Photos show: (1) "Large blocks of freshly made bean curd 'Tofu' ready to be cut up into squares and sold for breakfast." (2) "A large bamboo tray full of various kinds of bean curd. In the little wooden tubs on the ground the watery sorts of curd are kept immersed in saline water." (3) "Squares of fresh bean curd fried in oil and put on a string of bamboo fiber. Called tza tofu (fried bean curd) and said to supply a 'snack' in between meals for hard working Chinese laborers." (4) "A semi-dry bean curd of the consistency of smoked sausage, called 'Hsiang khan' (fragrant dry) which is eaten sliced in soups, and with vegetable dishes." Two squares, each bearing a stamped mark, are shown next to an open pocket knife for size comparison. (5) "A semi-dry fresh bean curd, called 'Lao to fu' (old bean curd) said to be used by the poorer classes of Chinese for breakfast." One square (with a cloth-like texture on the surface) on a small plate, and a broken half square are shown. (6) A room in which fermented tofu is being made. "A dark room of even temperature where wooden frames, full of squares of bean curd are piled, one on the other, the lowest resting on a layer of somewhat damp rice straw." One tray is open, showing the rows of tofu cubes, each covered with a white mycelium. (7) "Large earthen jars, full of squares of bean-curd, which are covered over with spiced brine and soy-sauce. After several months' curing a new product has been formed, called 'Foo-yu'–Bean cheese [fermented tofu], which can be kept for many years and becomes better with age."

Note 2. This is the earliest English-language document seen (Oct. 2011) that uses the term "Foo-yu" to refer to fermented tofu.

Note 3. Each of these 7 photos was taken (probably in China) by Frank N. Meyer, Agricultural Explorer, USDA.

Tables show: (1) Yields of bean curd obtained by William Morse from different varieties of soybeans. Variety #37062 gave the highest yield of tofu. 50 grams of soybeans yielded 34.3 gm of tofu and 30.5 gm of "Cake" [okara]. Note 4. This yield of 0.69 is very low; it should be at least 2.5. Variety #38462 gave the lowest yield, 0.28. (2) Composition of tofu and tofu products, compiled from various sources: Five samples of fresh tofu (6.0% protein on average), one frozen tofu (48.65% protein and 28.65% fat), and one fried tofu (21.96% protein and 18.72% fat).

2243. Piper, Charles V.; Morse, William J. 1923. Photographs and illustrations (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p.



• ***Summary:*** Photos show: (Fig. 1) Typical soybean plant (p. 1). (2) Plant of wild soybean (p. 2). (3) A fleet of junks engaged in carrying soybeans to Newchwang, Manchuria, from different points in the interior, taking away bean oil and bean cake to other places * (p. 6). (4) Soybeans in sacks brought to a bean center by horses in winter in Manchuria (p. 8). (5) Chinese bean cart loaded with beans in wicker containers in Manchuria (p. 8).

(6) Type of cart and method of hauling soybeans with a horse in Manchuria (p. 10). (7) Manchurian farmers hauling the bean crop to market in winter on sleds (p. 10). (8) Plants of a soybean variety from India (p. 38). (9) Plants of the wild soybean from Soochow, China, grown at the Arlington Experimental Farm, 1908 (p. 38). (Fig. 15) Soybeans grown on the edges of a rice field in southern China * (p. 58).

(16) A man in a field of the Peking variety of soybean grown in rows and cultivated (p. 61). (17) A broadcast field of soybeans showing how weeds have overrun the field (p. 61). (18) The ordinary grain drill furnishes a most convenient method of seeding in rows or broadcast (p. 63). (19) Soybeans and corn grown in alternate rows for pasturage; a man in a hat stands between the rows (p. 65). (20) The roots of a soybean plant, showing abundant development of nodules (p. 66).

(21) A man standing in a plat of soybeans without inoculation (in the foreground) and an adjacent plat which had been inoculated, in the background (p. 67). (22) A man seated on a cultivator pulled by two horses doing the last cultivation on a field of soybeans (p. 79). (23) Soybeans and sorghums grown in mixture for forage purposes (p. 80). (24) A field of soybean and Sudan grass grown in mixture for hay (p. 81). (25) A field of soybeans and corn grown in the same row for ensilage (p. 82).

(26) Soybean hay on frames. Under favorable weather

conditions, hay can be successfully cured in this manner (p. 86). (27) A field of mature soybeans ready to cut for seed (p. 90). (28) Harvesting soybeans for seed with a bunching attachment on the mower (p. 90). (29) Self-rake reaper used in cutting soybeans for seed (p. 91). (30) Soybeans cut for seed with binder and soybeans placed in shocks for curing (p. 92).

(31) The ordinary gasoline threshing outfit which may be used in threshing soybeans (p. 92). (32) A special bean harvester used in gathering the soybean seed from the standing mature plants and also cleaning it (p. 94). (33) A special bean harvester by which the plants are cut, thrashed, and cleaned (p. 94). (34) A special soybean harvester used to gather soybean seeds from the standing mature plants, and which can be adjusted to level or ridged cultivation. On one side is written "The Little Giant Bean Harvester," manufactured by Hardy & Newsom, La Grange, North Carolina (p. 95). (35) Method of storing soybean seed awaiting shipment in Manchuria. The beans in sacks are stacked under Chinese mats (p. 98).

(37) Pasturing a corn and soybean mixture with sheep (p. 133). (38) Thrashing soybeans from the field and baling the straw (p. 141). (39) The larger plant is the Guelph or Medium Green which is very pubescent, while the smaller plant is a nearly smooth variety from Japan (p. 149). (40) Pods of soybeans showing the range in size and shape (natural size; p. 151).

(41) Seeds of the most important varieties of soybeans now grown in the United States showing the wide range in size and shape of seed. The name of each of the 20 varieties is given. A side view and a ventral view of each pair of seeds is given (p. 152). (42) Seeds of a black and white variety (Widower) from Korea. The white is due to the splitting of the outer later of the testa. A side view of six varieties is shown (p. 155). (43) A field of the Biloxi soybean, which requires a long season to mature (p. 163). (44) A man standing in a field of the Virginia variety of soybeans (p. 170). (45) Seeds of a natural soybean hybrid showing peculiar types of coloration (p. 175). (46) Pods of soybeans, hairy and smooth (p. 176). (47) A sterile soybean plant obtained from a natural hybrid (p. 176). (49) Seeds of an artificial soybean hybrid, showing peculiar types of coloration (p. 181). (56) An old style Chinese oil bean press, Manchuria (p. 195). (57) Coolies at Newchwang, Manchuria, carrying loads of soybeans from the junks to big stacks, where they are kept until the factory needs them for oil manufacture * (p. 196). (58) "Seeds and pods of the Hahto variety of soybeans, the seeds being especially valuable as a green vegetable" (p. 222). (59) Baskets of sprouted, small yellow soybeans and sprouted mung beans * (p. 226). (60) Men making soymilk, working with machinery with which the soybeans are ground and the milk strained. Note the 2 grinding stones and the cloth strainers suspended from the ceiling over the tub. The cabinet with rack for bottles is noted in the background (p. 228). (61) Motor stone mill for grinding soybeans in preparing tofu with brass water tank (A), funnel reservoir (B), stones (C), and brass guard (D) (p. 229). (62) Delivery coolies holding baskets full of bottles showing the way soybean milk is delivered by the factory in Changsha, China (p. 231). (76) A courtyard filled with large earthenware containers with cone-shaped wicker tops for ripening soy sauce mash [in Ichang (I-ch'ang or Yichang), Hupe / Hupeh / Hubei province, China]; a small, strong basket is placed into each, with its rim just above the surface of the mash. The soy sauce collects or accumulates in each basket and is then dipped out, ready for consumption * (p. 251). (77) A man standing next to an iron cauldron in which soybeans are boiled for the manufacture of soy sauce (p. 252). (79) Fermenting room for yeast and soybeans in preparation of soy sauce (p. 253). (80) Rows of pots with cone-shaped wicker lids filled with soybean and wheat mixture for soy sauce * (p. 254). (81) A box press in which sacks of fermented soybeans are placed for pressing out the liquid forming soy sauce * (p. 254). (82) A man next to a kettle for boiling the soy sauce. After it is boiled, the sauce is ready to be placed in kegs at left side (p. 255). (83) Rows of soybean sauce in jars ready for shipment (p. 255). (84) Root of a soybean plant showing rootknot caused by the nematode (*Heterodera radicicola*) (p. 285).

Note: * means photo by Frank N. Meyer in China or Manchuria.

Illustrations (line drawings) show: (Fig. 48) Flower of the soybean enlarged. Front view. Side view. Parts of the corolla, standard, wing, one of the keel petals. Stamens. Pistil (p. 177). Figures 50-55, from Kondo (1913) are described at Kondo.

Maps show where the soybean is extensively and successfully grown in: (Fig. 10) The Orient (p. 51). (11) North and South America (p. 52). (12) Europe and Africa (p. 53). (13) A map of Manchuria shows the soybean districts and seed production of different localities (p. 56). (14) An outline map of the United States shows the areas with shading to which the soybean is especially adapted as to varieties and purposes (p. 57).

A diagram (Fig. 36, p. 129) shows the various ways in which the plants and seeds of soybeans are utilized. Level 2: The first two categories are seeds and plants.

Level 3: Under seeds: Food products, oil, and meal. Under plants: Hay, ensilage, soiling.

Level 4: Under food products: green beans and dry beans. Under oil: Glycerin, explosives, enamels, varnish, food products, waterproof goods, linoleum, paints, soap stock, celluloid, rubber substitute, printing inks, lighting [illumination], lubricating. Under meal: Human food, stock feed, fertilizer. Under forage: Hay, ensilage, soiling.

Level 5: Under green beans: Green vegetables, canned, salads. Under dried beans: Soy sauce, boiled beans [from whole dry soybeans], baked beans [whole], soups, coffee

© Copyright Soyinfo Center 2014

substitute, roasted beans, vegetable milk, breakfast foods. Under soap stock: Soft soaps, hard soaps. Under oil–food products: Butter substitute, lard substitutes, edible oils. salad oils. Under meal–human food: Breakfast foods, diabetic foods, flour, infant foods, macaroni, crackers, [soy] milk.

Level 6: Under dried beans–vegetable milk: Cheese, condensed milk, fresh milk, confections, casein. Under meal–human food–flour: Bread, cakes, muffins, biscuit.

Level 7: Under cheese: Fresh, dried, smoked, fermented.

2244. Piper, Charles V.; Morse, William J. 1923. Seed yields. Proportion of straw to seed (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 95-97. Chap. VI. [1 ref]

• ***Summary:*** "In regard to the seed yield of the soybean, there is considerable variation in the figures given by authorities in different countries. In Manchuria experts estimate the yield from 1,100 to 1,600 lb. to the acre, commercial authorities from 1,600 to 1,800 lb., and Japanese agricultural experts from 400 to 2,000 lb. In the best bean-producing districts the average yield is said to be more than 1,800 lb. to the acre. The average yield of soybeans to the acre in Japan for the decade 1904-1913 is 15.7 bu. The highest average yield, 21.6 bu. is recorded on the west or Japan Sea coast, while the lowest average yield, that of the Soochoo Islands, is 8.48 bu.

"In South Africa at the Government Experiment farms as high as 2,000 lb. per acre were recorded, while in many instances the yield was well over 1,000 lb. to the acre.

"When grown alone for seed, the best varieties under proper culture in the United States yield from 30 to 40 bu. of seed to the acre. A maximum yield of 50 bu. to the acre has been reported from North Carolina."

Table 31 (p. 96) shows soybean seed yields (in bushels to the acre) of the more important varieties grown in the United States as reported by investigators at various Experiment Stations. "It will be seen that the yields vary greatly with the same variety at different stations. This in most cases may be attributed to the adaptability of the variety to certain localities for seed production. In general the figures given represent the average yield for a number of years, and indicate the best seed-producing sorts."

The varieties shown in Table 31 are: Aksarben, Black Eyebrow, Biloxi, Chiquita, Ebony, Elton, Habaro, Haberlandt, Hamilton, Ito San, Mammoth, Manchu, Midwest, Mikado, Medium Green, Morse, Mandarin, Peking, Tokio, Tarheel Black, Wilson, Virginia. The states are: Alabama, Arkansas, Connecticut, Delaware, Georgia, Illinois, Indiana, Kansas, Kentucky, Maryland, Minnesota, Mississippi, Missouri, Nebraska, New Jersey, North Carolina, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Virginia, Washington, West Virginia, Wisconsin.

In the section titled "Proportion of straw to seed," Table 32 (p. 97) gives the relative yields of straw to seed for different varieties of soybeans at the Ohio Experiment Station (5-year average). For each variety the average 5-year yield of seed (bushels) and straw (pounds) is given. The varieties are: Sable, Taha, Cloud, Yosho, Hamilton, Mikado, Amherst, Auburn, Midwest, Ito San, Ebony, Medium Green, Habaro, Ohio 9001, Ohio 9016, Elton. The four varieties with the top 5-year average seed yields are: Ohio 9016 (29.22 bushels/acre). Elton (26.51). Midwest (24.06). Ohio 9001 (24.00).

2245. Piper, Charles V.; Morse, William J. 1923. Structure of soybean seeds (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 187-193. Chap. X. [3 ref]

• ***Summary:*** Contents: Introduction. The structure of the soybean seed: The seed coat (incl. hilum, chalaza, micropyle, hypocotyl), microscopic structure of the seed coat, microscopic structure of the hilum, the embryo, microscopic structure of the cotyledons, identification of soybean meal, differences in structure of the seed varieties.

"The seed coat is smooth, often shiny, rather firm in texture, and closely enveloping the embryo. The *hilum* or seed scar is linear-elliptical in shape and nearly flat (Fig. 50). At one end is a small linear groove marking the *chalaza,* or point where the seed coat was joined to the body of the ovule. At the other end of the hilum is the *micropyle,* a minute orifice in the seed coat, through which the primary root of the young seedling emerges in germination. In many varieties of soybean the outlines of the *hypocotyl* may be seen through the seed coat" or testa.

"The cellular [microscopic] structure of the seed coat or *spermoderm...* consists of four layers of cells."

Illustrations (line drawings) show: (Fig. 50) Soybean seed (yellow variety from Japan and another variety) showing the hilum, chalaza, micropyle, and an outline of hypocotyl seed through the testa (p. 187, after Kondo 1913). (51) Cross-section of the testa of a yellow soybean. Horizontal section, showing the cuticle, light-line, palisade cells, hour-glass or column cells, spongy parenchyma, and aleurone layer (p. 188). (52) Cross-section of the hilum of a yellow soybean from China, showing outer palisade layer, inner palisade layer, asteroid parenchyma, spongy parenchyma, fibro-vascular bundle, fibro-vascular bundle of the testa, aleurone layer, and hour-glass cells (p. 189).

(Fig. 53) Embryo of a yellow soybean from Japan. Whole embryo from ventral side. Half of embryo from the inner side. The 2 leaves of the plumule, with cotyledons and hypocotyl (sprout; p. 189). (54) Soybean. Cells of the cotyledon filled with fat, protein, and starch (p. 189). (55) Cellular structure found in soybean flour and meal. Palisade and hour-glass cells in sections and surface views from above and below. Aleurone cells within seed-coat. Same with compressed parenchyma in section. Surface view of epidermal cells near the hilum. Parenchyma near the hilum. Tracheids from hilum furrow. Epidermis and underlying

© Copyright Soyinfo Center 2014

cells from flat and round sides of cotyledon. Epidermis and palisade cells in transverse section of cotyledon. Epidermis and mesophyll cells from rounded face of cotyledon. Oil drop. Crystal. Aleurone grains (p. 190).

Table 83 (p. 192) shows the "Variations in the cooking qualities of seed of different varieties of soybeans." For each of the 18 varieties (9 with names and 9 with numbers) is given: Weight of 100 beans (dry, in gm). Weight of 100 beans after soaking (gm). Amount of water taken up by 100 beans (gm). Texture of beans after cooking. The named varieties are: Tokio, Chiquita, Midwest, Manchu, Haberlandt, Ito San, Mammoth, Easycook, Hahto. One hundred seeds of each variety were used. The seeds were weighed dry then after soaking for 17 hours were weighed again. Each sample was cooked for 2 hours. The varieties with the largest seeds are Hahto and 37264: 100 dry beans weigh 35.95 gm. These two varieties also weighed the most after soaking: 92.80 gm and 86.70 gm, respectively. The 3 varieties with the softest texture ("Very soft") after cooking were Easycook, Hahto, and 37305.

"Studies on the structure of the seed of several of these varieties by Dr. Albert Mann, of the United States Department of Agriculture, showed that there was an appreciable difference in the structure of the Easy cook and other varieties. The most important difference was the much greater permeability of the skin or integument of the Easycook variety. This permeability is due to a very great looseness in the cells comprising the various layers of the integument; particularly so of the outer or palisade layer. The walls of all the cells of the integument are more delicate and, therefore, more permeable than those of the Mammoth Yellow, which does not cook up easily. The palisade cells on account of their external position doubtless play the most conspicuous part in this particular."

"In general, those varieties absorbing a large amount of water cooked rather easily, but in a very few instances varieties absorbing small amounts of water cooked quite easily. It was found that in addition to difference in structure, the varieties as the Easycook, Hahto and Tokio contained more starch, which was scattered more or less through the cotyledons."

Note: This is the earliest English-language document seen (Oct. 2004) that uses the word "chalaza" in connection with soybeans. An illustration (p. 187) shows that the chalaza, located at one end of the hilum on a soybean seed, is a small linear groove which marks the point where the seed coat was joined to the body of the ovule.

2246. Piper, Charles V.; Morse, William J. 1923. Soybean varieties (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 144-86. Chap. IX.

• ***Summary:*** Contents: Introduction. Japanese classification of varieties. Classifications of varieties in Manchuria: Yellow (*Pai-mei* or white eyebrow, *Chin-huän* or round golden bean, and *Hei-chi* or black navel), green (*Ching tou*), black (*Wu tou*). Botanical classifications: *Soja elliptica* Martens (*S. elliptica nigra, S. elliptica castanea* [*brown*], *S. elliptica virescens, S. elliptica lutescens*), *Soja sphærica* (*S. sphærica nigra, S. sphærica minor, S. sphærica virescens, S. sphærica lutescens, S. sphærica minima*), *Soja compressa* (*s. compressa nigra, S. compressa parvula, S. compressa virescens, S. compressa zebrina*). Varietal characteristics: Habit of growth, foliage, pubescence, flowers, pods, size and weight of seeds, color of seeds, frost resistance, period to maturity, disease resistance, classifications by lengths of life period, desirable characteristics in varieties, descriptions of important varieties, key for identification of varieties (Yellow group, green group, brown group, black group, bicolored group), breeding and improvement (pollination, mutations, natural hybridization, artificial hybridization), genetic behavior (flower color, pubescence, color of pods, color of seeds, color of cotyledons, oil content).

The section titled "Classification by lengths of life period" [maturity] states: "Based on the data from variety tests at the Arlington Experimental Farm, the varieties may be classified into seven groups according to their life periods:

"Very early–Maturing in 81 to 90 days.
"Early–Maturing in 91 to 100 days.
"Medium early–Maturing in 101 to 110 days.
"Medium–Maturing in 111 to 120 days.
"Medium late–Maturing in 121 to 130 days.
"Late–Maturing in 131 to 150 days.
"Very late–Maturing in more than 150 days."

Note 1. This is the earliest document seen (Aug. 2011) in which soybean varieties are classified into groups based on their maturity (number of days to mature) or "life periods."

The following 43 varieties (not including synonyms) are described in the section titled "Descriptions of important varieties" (p. 162-70): A.K., Aksarben, Barchet, Biloxi, Black Eyebrow, Chestnut, Chiquita, Columbia, Early Brown, Easycook, Ebony (same as Black Beauty), Elton, Guelph (same as Medium Early Green, Medium Green), Hoosier, Haberlandt, Hamilton, Habaro, Hahto, Hollybrook, Ito San (same as Medium Early Yellow), Laredo, Lexington, Mammoth Yellow, Mammoth Brown, Manchu, Mandarin, Merko, Minsoy, Midwest (same as Medium Yellow and Mongol; appears identical with Roosevelt, Banner, and Northern Hollybrook), Mikado, Morse, Ogemaw, Otootan, Peking (same as Sable), Pinpu, Tarheel Black, Tokio, Virginia, Wilson, Wilson-Five, Wisconsin Black, Wea, Yokotenn [Yokoten].

Note 2. This is the earliest document seen (Oct. 2013) that mentions the soybean variety Hamilton (one of two documents).

2247. Piper, Charles V.; Morse, William J. 1923. Early introduction of the soybean into the United States (Document

part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 39-41.
• ***Summary:*** "There are fortunately fairly complete records for the early history of the soybean in the United States. The facts emphasize the difficulties with which a new crop wins its way to recognition.

"The earliest records.–The first mention of the soybean in American literature is by Mease (1804), who writes 'The soybean bears the climate of Pennsylvania very well. The bean ought therefore to be cultivated.'

"Thomas Nuttall (1829) grew a variety with red flowers and chocolate brown seeds in the botanic garden at Cambridge, Massachusetts, and from his observations wrote a brief account concerning it. He writes:

"'Its principal recommendation at present is only as a luxury, affording the well-known sauce, soy, which at this time is only prepared in China and Japan.'

"In the same journal two years later, November 23, 1831, is an account of the successful culture of the plant at Milton, Massachusetts, the seed having been obtained from Nuttall.

"No further mention of the plant in America literature appears until 1853, when a brief account appeared under the name 'Japan pea' by Ernst [of Ohio] (1853), as follows:

"'The Japan pea, in which so much interest has been manifested in this country for a year or two past, from its hardihood to resist drought and frost, together with its enormous yield, appears to be highly worthy of the attention of agriculturists.'"

"The Perry Expedition to Japan.–The Perry expedition in the year 1854 brought back two varieties of 'soja bean' from Japan, one 'white' seeded, the other 'red' seeded. These, together with the Japan pea, were distributed by the Commissioner of Patents in 1854, (Browne 1854) and, thereafter frequent references to the plant occur in agricultural literature under such names as Japan pea, Japan bean, and Japanese fodder plant. Most of these articles speak of the plant as the Japan pea, none of them as the soy or soja bean. It is apparent from the early accounts that there were at least two Japan peas, one early enough to mature in Connecticut (Patent Office Report, 1854, p. 194), the other very late (American Agriculturist, 1857, vol. 16, p. 10). Judging from all the accounts, we suspect that the early Japan pea may be the Ito San variety, which, however, has red flowers, while the late variety may be the Mammoth. The Ito San is still occasionally called the Japan pea, while the introduction and source of the Mammoth has never been definitely determined. From these early accounts the Mammoth may well be the 'white-seeded' soja bean obtained by the Perry expedition. The 'red-seeded soja bean' was, probably, the adsuki bean (*Phaseolus angularis*), as no red-seeded soybean is known.

Later Introductions.–Prof. G. H. Cook, of New Brunswick, New Jersey, obtained seed of the soybean at the Bavarian Agricultural Station [in Germany] in 1878. In the same year Mr. James Neilson obtained seeds of several varieties at Vienna, Austria. Both of these gentlemen planted the seeds and gathered crops of the different varieties in 1879. These varieties were without doubt some of those grown and distributed through Europe by Professor Haberlandt of Vienna.

"A yellow-seeded soybean was grown at the North Carolina Agricultural Experiment Station in 1882 and reported on in some detail. The source of the variety is not given, but by implication it is the same as the variety stated to be grown by a number of persons in the State, and is probably the Mammoth.

"Two varieties, one black seeded, the other with white seeds, were grown at the Massachusetts Agricultural Experiment Station in 1888.

"In 1890 Prof. C. C. Georgeson (1890) secured three lots of soybeans from Japan which were grown at the Kansas Agricultural Experiment Station in 1890 and subsequently.

"Prof. W. P. Brooks, (1890) of Amherst, Massachusetts, brought with him from Japan in 1889 a number of soybean varieties, including the Medium Green or Guelph, and the Ito San. It is quite certain that other importations of soybeans from Asia were made by others, but no definite records have been found.

"Since 1890 most of the agricultural experiment stations have experimented with soybeans and many bulletins have been published dealing wholly or partly with the crop."

2248. Piper, Charles V.; Morse, William J. 1923. Composition of the soybean: Carbohydrates (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 109-12. [14 ref]
• ***Summary:*** "Many investigators have studied the nitrogen-free extract of the soybean from various points of view. In many cases, the published analytical data are somewhat conflicting. The soybean has a variety of carbohydrates, altogether amounting to from 22 to 29 per cent., depending on the variety and maturity of the bean. The most complete quantitative separation of the carbohydrates existing in the soybean has been made by Street and Bailey (1951).

"Considerable differences of opinion have existed among investigators with regard to the presence of starch in soybeans." Some found none, whereas others found small amounts. "Japanese chemists have not identified starch in the native soybean. Undoubtedly the discrepancies relative to starch content have been due to the maturity of the beans or rather the method in which they are allowed to mature." Harz (1885) found that mature soybeans generally contain little or no starch.

"Thoroughly mature seed of sixteen varieties of soybeans grown quite generally throughout the United States were submitted by the authors to Dr. Albert Mann of the United States Department of Agriculture for investigation

© Copyright Soyinfo Center 2014

as to starch content. Dr. Mann reported that in all cases where starch reaction was obtained, it appeared upon the inner (approximate) surfaces of the two cotyledons. It was intensest at the middle part of the line of separation and extended immediately under or behind the epidermal layer of these two surfaces. In the majority of cases only a trace of starch extended back into the thicker portion of the cotyledons, that is, midway the inner and outer surfaces. One variety, the Hahto, showed a distribution of starch throughout most of the cotyledon, although the color reaction was nowhere intense. No starch was found in the seed coats of any of the varieties and only a mere trace in the embryos. It will be noted in the following table that those varieties with black or brown seed coats (with the exception of the Black Eyebrow variety) are practically starch free while a general tendency toward relatively high starch content is exhibited by the yellow-seeded sorts."

Table 45, titled "Starch content of commercial varieties of soybeans in the United States" (p. 111), has three columns: Variety, seed color, and amount of starch, as follows: Peking, black, no starch. Virginia, brown, no starch. Wilson, black, no starch or merest trace. Biloxi, brown, trace. Early Brown, brown, small amount. Hollybrook, straw yellow, small amount. Guelph, green, small amount. Midwest, straw yellow, thin area covering 3/4 of inner surface. Ito San, straw yellow, similar to Midwest but the areas heavier in starch. Manchu, straw yellow, strong starch areas in inner surface of each cotyledon. Mammoth, straw yellow, decided starch band on inner surface of each cotyledon. Black Eyebrow, black and olive, pronounced starch band on inner surface of each cotyledon. Hahto, olive yellow, starch grains more or less through the cotyledons. Chiquita, straw yellow, very strong starch band on inner side of each cotyledon. Haberlandt, straw yellow, very strong starch bands on inner side of each cotyledon. Tokio, olive yellow, strongest starch reaction of all varieties tested. Easy Cook [Easycook], straw yellow, decided starch bands on inner surface of each cotyledon; more or less starch to outer side of cotyledons also; starch more or less distributed through the tissue of the bean.

2249. Piper, Charles V.; Morse, William J. 1923. Soybean cake or meal (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 204-17. Chap. XII.

• ***Summary:*** Contents: Feeding value, composition, use for feeding for dairy cows, cattle, swine, sheep, poultry, digestibility, injurious effects, fertilizer.

"Feeding value: In Manchuria, soybean cake or meal, mixed with bean and kaoliang (sorghum) stalks, is used as a feed for horses and mules, but only when very hard work is done. It is also recognized in Japan as a valuable feed for work animals and as a fattening feed for animals not employed in farm work."

"The use of the meal in America thus far has been confined almost entirely to the Pacific Coast states. It is considered a valuable feed not only by dairymen, but also by poultrymen. The meal has been used to some extent by kennel owners who have found it to be a highly satisfactory dog feed."

2250. Piper, Charles V.; Morse, William J. 1923. Agricultural history of the soybean: China, Korea and Japan (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 36-37.

• ***Summary:*** "The soybean is a plant of very early cultivation in China. According to Li-Yu-Ying and Grandvoinnet (1911-1912) the soybean is described in the book of Materia Medica 'She-non' written over 5,000 years ago. Note 1. This is probably the *Shennong Bencao Jing* (abbreviated *Benjing*) [Classical Pharmacopoeia of Shennong, the Heavenly Husbandman], which appeared in about AD 100.

"The celebrated dictionary of Sui Sham describes the plant under the name of *'tchouan.'* Note 2. This is the earliest document seen (July 2007) that mentions the name "Sui Sham." We have been unable to find any dictionary compiled by a man who name sounds even vaguely like his.

In another ancient dictionary, the 'Kouang-ia' [sic, *Guangya,* by Zhang Yi, AD 230] dating from the time of the Christian era, the soybean is called *ta-teou* or grand pea and also *sou.* It seems very probable that the names soi, soy, soya and soja are all derived from the ancient Chinese name sou.

"In Manchuria the soybean is grown to a greater extent than in any other country, and its culture there is doubtless ancient. From Korea there have been sent to the United States Department of Agriculture many distinct varieties, the large number indicating long cultivation in that country. The culture of the soybean in Japan is likewise very old and many species peculiar to that country are in cultivation.

"No comprehensive account of the agricultural history of the soybean in any of these countries has yet been attempted, but doubtless much information is contained in ancient Chinese and Japanese literature.

"Several varieties different from any secured elsewhere have been introduced into the United States from Formosa, and the plant has probably been cultivated there for a considerable period."

2251. Piper, Charles V.; Morse, William J. 1923. Tables (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p.

• ***Summary:*** Tables: (1) Acreage, production and yield of soybean seeds in the United States. Gives statistics for each for 1918, 1919, and 1920 for 14 states, other, and total. The states are listed in descending order of soybean acreage in 1921, as follows: North Carolina, Virginia, Alabama, Illinois, Ohio, Kentucky, Missouri, Tennessee, Wisconsin, Indiana, Georgia, Pennsylvania, S. Carolina, Mississippi.

© Copyright Soyinfo Center 2014

(2) Estimates of soybean production of Manchuria for various years (in million tons): 1906 = 0.6. 1907 = 0.6 to 0.9. 1908 = 1.150. 1909 = 1.150. 1910 = 1.4. 1913 = 1.2 1921 = 4.52.

(3) Cost of production of soybeans per acre in Manchuria, 1910. (4) Monthly capacity of steam oil mills at Newchwang, Manchuria, 1917. (5) Export of soybeans, bean cake, and bean oil from the principal ports of South Manchuria, 1909 to 1913, inclusive. (6) Five-year averages (1897-1919, inclusive) of acreage, production, and yield per acre of soybeans in Japan. (7) Amount and value of soybeans imported by Japan. (8) Importations of soybean cake and bean oil into Japan. (9) Quantity and value of exports of soybeans and soybean oil from Japan to foreign countries, 1913 and 1914.

(10) Quantity and value of exports of miso (bean cheese) and shoyu sauce, 1903 to 1907, inclusive. (11) Quantity and value of imports of soybeans, bean cake, and bean oil by European countries, 1912 to 1914, inclusive. (12) Comparative prices per ton of cottonseed and soybeans in European markets, 1911 to 1914, inclusive. (13) Quantity and value of soybeans, soybean cake, and soybean oil imported into the United States, 1910 to 1920, inclusive. (14) Quantity of imports of soybeans in the world's trade, 1920-1919 inclusive. (15) Quantity of imports of soybean oil in the world's trade, 1910-1919 inclusive. (16) Quantity of exports of soybean oil in the world's trade, 1910-1919 inclusive. (17) Quantity of exports of soybeans in the world's trade 1910-1919 inclusive. (18) Acre yields of seed and hay of soybeans at different dates of planting at Arlington Farm, Virginia. (19) Yields of soybeans variously spaced.

(20) Acre yields of soybean hay and seed when planted at different rates. (21) Germination of soybeans at different depths of planting at Arlington Farm, Virginia. (22) Influence of nodules on the composition of seed. Michigan Experiment Station. (23) Effect of various nitrogenous fertilizers on the yield of soybeans. Massachusetts Experiment Station. (24) Effects of different phosphatic fertilizers with and without lime. Rhode Island Experiment Station. (25) The influence of different potash salts on yields of soybeans. Massachusetts Experiment Station. (26) Effects of different kinds of lime on the yield of soybeans. Massachusetts Experiment Station. (27) Effect of fertilizers on soybeans. Delaware Experiment Station. (28) Composition of hay of Mammoth soybean at different stages of development. Arlington Farm, Virginia. (29) Comparison of the loss in moisture in 10-lb. samples of green forage of ten varieties of soybeans when air dried. Arlington Farm, Virginia.

(30) Tons of soybean hay to the acre at different experiment stations in the United States. (31) Bushels of soybean seed to the acre at different experiment stations in the United States. (32) Relative yields of straw to seed in different varieties of soybeans. Ohio Experiment Station. (33) Viability of soybean seed. (34) Proportions of stems, leaves, and pods. (35) Nutritive constituents contained in each part of the soybean plant. After Lechartier. (36) Composition of the different parts of the soybean plant at different stages of growth, at Arlington Farm, Virginia. (37) Total weights of mineral materials in 1,000 kilos of dry forage. After Lechartier. (38) Mineral Materials in 1,000 kilos of dry forage. After Joulie. (39) Percentages of nitrogen, phosphoric acid and potash contained in different parts of the soybean plant at different stages of growth, at Arlington Farm, Virginia.

(40) Composition of soybean seed compared with that of other legumes. (41) Composition of common American varieties of soybeans. (42) Percentage composition of the different parts of soybean seed. After Lechartier. (43) Percentage composition and comparison of the amino acids of the protein of the soybean and of cow's milk. (44) Percentage composition of the nitrogen-free extracts of the soybean. (45) Starch content of commercial varieties of soybeans in the United States. (46) Maximum, minimum, and average of the more important constants of soybean oil from 48 varieties, compared with those of other well-known oils. (47) Comparison of the more important constants of soybean oil by different observers. (48) Constants for soybean oil. (49) Composition of the ash of the soybean seed. After Pellet.

(50) Mineral content of the soybean seed compared with those of cowpea, navy bean, and peanut. (51) Oil content of soybeans gathered at various stages of maturity. (52) Oil content of soybeans as affected by partial defoliation. (53) Oil content of soybeans as affected by partial removal of very young seed pods. (54) Oil content of soybeans of large and small size seed from the same plant. (55) Oil content of soybeans planted at intervals of two weeks in 1911, at Arlington Farm, Virginia. (56) Varietal differences in the oil content of soybeans grown at Arlington Experiment Farm, Virginia, in 1907, 1908 and 1910. (57) Oil content of soybeans grown under different environmental conditions. (58) Oil and protein content of soybean varieties grown under different environmental conditions. (59) Fertilizing constituents of soybeans contained in crop and roots on one acre. Connecticut (Storrs) Experiment Station.

(60) Yields of hay of different legumes and content of fertilizing ingredients. Michigan Experiment Station. (61) Fertilizing constituents of soybeans cut at different stages of growth. Arlington Farm, Virginia. (62) Data and results of soiling experiments with milch cows. Iowa Experiment Station. (63) Soybean soiling experiment with milch cows, Pennsylvania Experiment Station. (64) Analyses of soybean, soybean and corn, and corn silages. (65) Digestibilities of soybean and other silages. (66) Digestible nutrients in 100 lb. of air-dry substance. (67) Digestible nutrients in 100 lb. of soybean straw and in other roughages. (68) Fertilizing constituents of soybean straw compared with those of wheat, oats, barley, and rye. (69) Number of seeds per bushel and

© Copyright Soyinfo Center 2014

weight in grams of 100 seeds of the most important varieties.

(70) Results of planting a single variety of soybean at different dates. Vienna, Austria, 1877. (71) Results of planting different varieties of soybeans at different dates at Knoxville, Tennessee. (72) Life period of soybean varieties grown at the Arlington Experimental Farm, Virginia, for eight seasons. (73) Life periods of American varieties of soybeans grown at Sabour, India, 1911 (from Woodhouse and Taylor, 1913). (74) Life period of soybean varieties planted at intervals of two weeks in 1911 at the Arlington Experimental Farm, Virginia. (75) Behavior of flower color in natural hybrids. (76) Behavior of pubescence colors in natural hybrids. (77) Behavior of amount and colors of pubescence in an artificial hybrid. (78) Behavior of the color of pods in natural hybrids. (79) Behavior of seed colors in natural hybrids.

(80) Soybean crosses in the study of seed color. (81) Behavior of cotyledons in natural hybrid selections. (82) Behavior of cotyledons in soybean crosses. (83) Variations in the cooking qualities of seed of different varieties of soybeans. (84) Consumption of vegetable oils by the soap industry in the United States. (85) Consumption of vegetable oils in the production of lard substitutes and oleomargarine in the United States (incl. coconut oil, cottonseed oil, peanut oil, soybean oil, and corn oil). (86) Composition of soybean cake, meal, and other important oil feeds. (87) Two 17-week comparisons of soybean meal with other supplements for fattening pigs. (88) Growth and nitrogen elimination of chicks fed varying amounts of meat scrap or soybean meal or both, in addition to a corn ration. (Indiana Experiment Station). (89) Comparison of the digestibility of soybean meal and other oil meals.

(90) Digestion coefficients of soybean meal obtained with sheep. Massachusetts Experiment Station. (91) Fertilizing constituents of soybeans, soybean meal, and cottonseed meal. (92) Analyses and calories of soybeans compared with those of other legumes and foods. (93) Composition of soybean flour in comparison with wheat flour, corn meal, rye flour, graham flour, and whole wheat flour. (94) Composition of the sprouts from the soybean and mung bean. (95) Composition of soybean milk compared with cow's milk. (96) Yields of bean curd obtained from different varieties of soybeans. (97) Compositions of tofu and tofu products. (98) Nitrogenous substances in natto. (99) Composition of hamananatto. After Sawa.

(100) Composition of yuba. (101) Composition of red and white miso. (102) Composition of shoyu or soy sauce. (103) Composition of soybeans of the same variety dried, soaked, and roasted.

2252. Piper, Charles V.; Morse, William J. 1923. Varieties: Japanese classification of varieties (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 144-46.

• ***Summary:*** "In Japan varieties of soybeans are distinguished largely according to the color, shape and size of seed, period of maturity; also according to use, as those which serve principally in making shoyu, tofu, miso, and those used for ordinary purposes.

"(A) The white (pale yellow) called in Japanese *Shiro-mame* or *Hakudaidzu,* includes the following important varieties:

"*Goguwatsu-mame* (five-months kind) also called *Tofu-mame,* because it is used chiefly in making tofu, is an early ripening sort with very small seeds.

"*Wase-mame* is another small-seeded early-ripening variety used in making tofu, and is also termed *Tofu-mame.*

"*Nakate-mame* (middle late bean) matures between the early and late varieties and has round seeds somewhat larger than the above early sorts.

"*Okute-mame, Maru-mame,* and *Teppo-mame,* or *Aka-mame* are late maturing varieties with round seeds which become harder and longer than the early ones. The *Teppo-mame* is used largely in making shoyu, while *Maru-mame* is valuable as horse feed.

"(B) The black varieties, Japanese *Kuro-mame* or *Kodu-daidzu,* are for the most part eaten boiled, with sugar, as a relish to rice. *Kuro-mame* is a middle-late variety with round or ellipsoid seeds and is somewhat similar to *Kuro-teppo-mame* which has large round seeds. There is also a late maturing sort with flat ellipsoid seeds known under several names.

"(C) The brown-seeded varieties, Japanese *Katsu-daidsu,* are much less grown than the white and black sorts, and are used like the latter. Varieties with reddish-brown, round seeds are called *Aka-mame,* while three light-brown sorts of small importance are termed *Cha-mame* (tea beans).

"(D) Greenish or bluish-green varieties, Japanese *Aô-mame* or *Seidaidzu* are mostly boiled with sugar like the brown and black varieties. Similar to the brown sorts, they are much less widely grown than the black and white varieties. The Japanese distinguish the following sub-varieties:

"1. *Sei-hito.* Epidermis green with yellow germ.

"2. *Nikuri-sei.* Epidermis green with green germ. Both of these sorts range from round-ellipsoidal to a bullet roundness and are of medium size.

"3. *Kage-mame.* Epidermis pale green, round with yellow germ.

"(E) The speckled or bicolored varieties. Japanese *Fuiri-mame* or *Han-daidzu,* is a group of small importance and their cultivation is confined to a small area in a few provinces. The following sub-varieties are recognized:

"1. *Kuro-kura-kake-mame.* Seed greenish, flat, ellipsoid with a black spot on the scar.

"2. *Aka-kura-kake-mame.* Seed yellowish green, flat, long with a brown spot on the scar.

"3. *Fuiri-mame* or *Udzura-mame.* Seed yellowish-green,

spotted with many dark flecks. This is a rare variety grown only in a few localities."

1914[4]	447,080	.....	....	4,107

• ***Summary:*** In production and utilization, the soybean occupies a most important position among the various legumes grown for seed in Japan. It is extensively cultivated from Hokkaido province in the north, to Formosa in the south. The data relative to the production and commerce of the soybean and soybean products in Japan are more extensive than for China and Manchuria, and furnish rather valuable information concerning the importance of this crop.

"Acreage and Production: The soybean is grown by the Japanese farmers mainly for grain and not to any considerable extent as a green manure crop. The average annual production of seed is about 18,000,000 bu. The following table shows the acreage and production in Japan during the decade [sic] 1897 to 1919. The principal bean-producing provinces are Hokkaido, Ibaraki, Saitama, Iwate, Niigata, Nagasaki and Kumamoto, but there is no province where the annual production does not exceed 50,000 bu. The province of Hokkaido has the largest acreage and produces the highest quantity and best quality of beans.

Utilization: The soybean forms one of the most important articles of food in Japan. It is one of the principal ingredients of soy sauce, miso, tofu and natto. The beans are eaten boiled or baked or in powder form for soups. Sometimes they are picked green, boiled and served cold with soy sauce, and sometimes as a salad. A vegetable milk is also produced from the bean forming the basis for the manufacture of vegetable cheese. The milk is not only used in the fresh state, but a form of condensed milk is also manufactured from it. All these foodstuffs are used daily in the Japanese homes. For the poorer classes they are the principal source of protein and considered indispensable as articles of food in the diet. Owing to their large utilization as human food, the domestic soybeans are used only to a limited extent in the feeding of live stock. To supply the protein ration for animals deficient in that nutrient, the beans are sometimes boiled and fed mixed with straw, barley and bran. The beans, especially those imported from China and Manchuria, are used extensively in the production of oil and cake. The oil is used as an article of diet and for various technical uses, while the residue or bean cake is used extensively as a fertilizer and as a cattle feed.

"Cost of production and market prices: Accurate data as to cost of production are not available, but estimates made by Japanese agricultural experts, place it about $10.00 per acre, exclusive of taxes, or about 65 cents per bushel. The beans produced in Japan are considered to be superior in quality to those of Manchuria and Chosen (Korea) and are used exclusively in the manufacture of food products. Prior to 1914 the prevailing wholesale price of domestic beans in Japan was about $1.00 per bushel while for imported beans it was about 70 cents per bushel.

TABLE X.—QUANTITY AND VALUE OF EXPORTS OF MISO (BEAN CHEESE) AND SHOYU SAUCE, 1903 TO 1907 INCLUSIVE[2]

Year	Miso (bean cheese)		Shoyu sauce	
	Quantity, lb.	Value,	Quantity, lb.	Value
1903	2,204,521.00	$ 34,647	5,922,357	$204,959
1904	4,884,691.68	88,880	7,892,802	276,837
1905	7,503,650.00	132,652	12,506,892	440,076
1906	5,923,855.00	111,020	12,425,367	476,176
1907	6,863,953.00	135,833	13,210,743	541,425

"Imports: Japan has always been a large consumer of soybeans from China and Manchuria, the greater part of the beans being used in the manufacture of oil and bean cake. In amount and value the importation of soybeans is second only to rice. The amounts and values of soybeans imported are shown in table VII for the years 1903 to 1907 inclusive, and 1911 to 1914 inclusive.

The bean cake manufactured in Japan forms only a small proportion of the total used by Japanese farmers. Large amounts of bean cake are annually imported as shown in the following table. Previous to 1903, bean cake was the largest in amount among imported fertilizers.

Exports: In addition to supplying domestic demands, Japan has exported beans, bean oil, miso (bean cheese) and soy sauce in large quantities to American and European countries as shown in the following tables. The exports of beans and bean oil have only become of importance since the development of the American and European trade. Prior to 1914, soybeans were not listed separately.

2254. Radoslavov, Al. 1923. Soiata (Glycine soja, iaponskii bob) [Soybean (Glycine soja, the Japanese bean)]. *Priroda* (*Sofia*) (*Nature*) 23(6):100-02. Feb. [1 ref. Bul]

• ***Summary:*** "In Bulgaria soybeans have been planted in small quantities in Panagyurishte, Gorna, Oryakhovitsa, and other places. Dr. As. Zlatarov carried out successful experiments in the village of Sestrimo (40 km west of Pzardzhik). He got 360 kg of soybeans from 2½ kg of seeds sown on two decares of arable land. [Note: 1 decare, a metric unit of area = 0.1 hectare or 10 ares or 0.2471 acres]. In Bulgaria more of the yellow variety is grown; it is richer in oil and better for... (*?dobra za ogoiavano*). It seems that in our country soybeans will be cultivated as an oil-bearing and forage plant. Soybeans are also grown in mixed (hybrid) cultures, most often with corn (maize). It is planted when the corn stalks reach a height of 20 cm. One kg of soybeans is planted with 6 kg of corn; the more a field is planted with soybeans, the more suitable it becomes for good soybean crops, because the roots are implanted with bacteria that enrich the soil with nitrogen.

"Footnote: According to the editors, a large quantity of soybeans was produced last year, and now the seed is being sold by 'Ganzin' Agricultural Bureau in Nova Zagora. This is for the information of those wishing to do experiments with soybeans."

A photo shows a single soybean plant growing. An illustration (labeled) shows 3 soybean leaves, 4 pods, 3 views of a seed, and soybean flowers.

Note: The first few pages give general information about soybeans; Bulgaria is not mentioned. The author does not say where his soybeans came from, but the title suggests Japan. Address: Bulgaria.

"50535. *'Kong* Bean.' For previous introductions, see S.P.I. No. 42059.

"50536. *'Kong* bean; this is used for making sauce.'" Address: Washington, DC.

2256. *Christian Science Monitor.* 1923. Manchuria raises big soy bean crop: Capital alone needed to develop industry, which has possibilities almost illimitable. April 24. p. 12. • ***Summary:*** Manchuria's 1919 soybean crop was estimated at 2,333,330 tons by the South Manchurian Railroad. Forecasts of the 1922 crop are over 3,500,000 tons. Yet such estimates are difficult to make for two reasons: (1) Statistics are not kept on crop production in China; (2) Handlers of soy bean are opposed to dissemination of any statistics concerning quantity.

"That there has been an almost sensational increase in soybean growing in Manchuria in the past two years is shown in the swelling receipts and shipments at and from Dairen, Vladivostok and Yingkou." The latter port plays only a small role in total exports of soy beans, bean oil, and bean cake.

"Soy beans have been the chief factor in making Dairen [run by Japan] the second port in China. There are 74 soy bean oil mills in Dairen alone, all fairly good size. Some of them are huge. Harbin has 54 bean oil mills, only one of which is modern, while the Dairen mills are almost all equipped with late machinery. The oil turned out by the Harbin mills is dirty in the extreme, and the cake is so poorly pressed that it will not stand shipment to a greater distance than Japan. The one foreign owned mill in Harbin is the exception and finds ready sale for its output in the United States and Europe; there are modern soy bean mills in Copenhagen (Denmark) and Hamburg (Germany).

The "Chinese mill owners, who inherently dread changes of any kind, are kept on the ragged edge of bankruptcy all the time, only managing to exist by reason of cheap labor and operating costs."

"If this were a technical story, details might be given of the nonuse of press cloth in the [Harbin] presses, grass serving the purpose, how the beans are not hulled or cooked, the unscientific rehandling of the beans, leaving in the cake 15 per cent of the oil, and how crudely the oil is handled.

"Why the soy bean industry has not attracted more attention from American capital interested in the manufacture of soap and in making lard substitutes is difficult to understand. The first reaction... is that the tariff runs against the importation of soy bean oil." This import tax shuts out soy bean oil from successful competition with cotton seed and peanut oil.

"This investigator makes the claim that the soy bean industry is where the crude petroleum business was when the chemists began separating it into its present many constituent parts." Japanese chemists have shown that soy bean oil can

© Copyright Soyinfo Center 2014

be many into many valuable products, which are listed.

2258. Church, Margaret B. 1923. Soy and related fermentations. *USDA Department Bulletin* No. 1152. 26 p. May 12. [27 ref]

• ***Summary:*** This long and very informative paper, with its excellent bibliography and review of the literature, is the third earliest study seen of a fermented food published by a USDA researcher. The focus is on Japanese fermentations because of the laboratory's contact with Japanese researchers, such as Dr. T. Takahashi and Dr. G. Kita. "The experimental work reported here was conducted under the direction of Charles Thom, mycologist in charge, Microbiological Laboratory, Bureau of Chemistry."

Contents: Introduction. Work of previous investigators. Experimental work: Apparatus, material, preparation of ingredients, shoyu-koji, peanut press cake koji, shoyu-moromi. Proportions of ingredients. Yields. Chinese soy sauce. Peanut sauce. Relation of enzymic activity to soy processes. Manufacture in the United States. Related fermentations (Miso, soy cheese [fermented tofu], natto). Summary. Bibliography. "Soy sauce is a dark-brown salty liquid made by the fermentation of soy beans with, as a rule, some additional starchy component. It is widely used as a seasoning throughout Japan, China, and Java [Indonesia], and has been introduced into the Philippines and Hawaii* (* = See letter from C.W. Carpenter, Sept. 23, 1918). Where the occidental would use a vegetable or meat extract and salt, the oriental daily uses soy sauce. Americans are familiar with soy sauce as it is used in the Chinese-American restaurants and as an ingredient which produces the characteristic flavor of the Worcestershire type of sauce." In Japan, the process of preparing "shoyu-koji," a mold-fermented product made from "tane-koji," takes 3 to 4 days. "The mold-fermented material is emptied into a strong brine, thus producing a mash. Constant daily attention is given to aeration, even distribution, and stirring of the solid ingredients. Progressive changes take place over a period of from six months to several years, until at last the mature 'moromi,' as the mash is designated by the Japanese, is produced. These changes are due partially to the activity of bacteria and yeasts, but chiefly to the enzymes of the mold introduced into the mash with the koji."

"Experimental work: The Department of Agriculture had certain strains of the *Aspergillus flavus-oryzae* group of molds known to be used in making soy sauce. Through the courtesy of W.T. Swingle, of the Bureau of Plant Industry, a can of commercial Japanese rice *tane-koji* designed for shoyu manufacture was also received. Dr. Gen-itsu Kita brought additional samples of shoyu *tane-koji* under sterile conditions directly from Japan. Provided thus with soy beans, wheat, and the mold ferment, experiments with soy sauce were undertaken by the Bureau of Chemistry in 1918.

(1) "Apparatus: The apparatus was made according to specifications drawn by Doctor [T.] Takahashi, of the Imperial University of Tokyo, who worked in the bureau for a month." "The usual Japanese koji room (fig. 2) is 32½ feet long, 11 feet wide, and 7 feet high. The walls are thick, and in the more modern factories are built of brick, which does away with fluctuations in the temperature from without. At one end of the room is an entrance and at the opposite end a window. In the ceiling several openings provide means of escape for the carbon dioxid [dioxide] and the damp air. Steam pipes along the floor make it possible to warm the room in cold weather. The ceiling is built with many layers of straw in order that the condensing moisture may be absorbed. One disadvantage of such a ceiling is that infection always occurs in the wet straw. A large area of infection directly over the piles of koji trays is detrimental to the production of sweet koji. In modern buildings, therefore, the surface of the ceiling is coated with cement. When a cement ceiling is used the condensed water drops on the trays of koji, which also is harmful... The burning of sulphur is useful in combating any infection of a koji room" (p. 5).

Material: "The mold ferment employed in shoyu-koji manufacture is *Aspergillus flavus* Link, occasionally *A. oryzae* (Ahlb.) Cohn, or strains intermediate between the two species." "Certain Japanese manufacturers add cultures of pure yeast belonging to the genus *Zygosaccharomyces* at the time of placing the first mold-fermented material in the brine."

Preparation of ingredients: While soaking the soy beans, the water should be changed at intervals of several hours to prevent the formation of spore-forming rods, which cause heating and souring. The spores of these bacilli are on the beans as they come from the field. "After being soaked for 20 to 24 hours the swollen beans are cooked in an open kettle or under pressure until they are soft enough to be easily pressed flat between the thumb and finger. This desired softness can be obtained by autoclaving at 15 pounds pressure for 50 minutes and also by much longer cooking in an open kettle. Autoclaving under pressure has the advantage of sterilizing the material." After roasting, the wheat is crushed or cracked. It is important to "reduce some portions of the kernel to a fine powder or dust." The cooked beans and cracked wheat are "mixed in large trays or on mixing tables." Hot beans "may be cooled with a draft of air directed over a thinly spread layer." These "two ingredients need to be thoroughly mixed, so that the wheat dust may form a coat over each bean. The lower water content thus induced on the exterior of the beans makes them better adapted to mold growth than to bacterial growth."

"Shoyu-koji–Ripening: After the beans and wheat

© Copyright Soyinfo Center 2014

are thoroughly mixed, a very small quantity of previously molded material, such as mature rice koji (tane-koji), some shoyu-koji, or a pure mold culture, is thoroughly mixed into the ingredients. The whole mass is then distributed into the small flat koji trays (Plate II, inserted between pages 4 and 5) which are immediately placed into the koji fermentation room before they cool further. Each tray holds about 1.8 liters, or about 2 quarts of raw material. The koji trays are placed in tiers along the wall of the room (Fig. 3)." They are usually stacked in a zigzag fashion to ensure adequate aeration. This is extremely important "because moisture and the lack of oxygen induce the development of mucors and bacteria, and are said to cause the diastatic enzyme to develop at the expense of the proteolytic enzyme. In some localities in Japan no such trays are used, but a broad straw mat with which very good koji can be secured." "The koji room or compartment is kept at a temperature of 24º to 25º C., with a definite humidity." Continued. Address: Microanalyst, Microbiological Lab., Bureau of Chemistry [USDA].

2259. Church, Margaret B. 1923. Soy and related fermentations (Continued–Document part II). *USDA Department Bulletin* No. 1152. 26 p. May 12. [27 ref]
• ***Summary:*** Continued from p. 9. Shoyu-koji: Ripening. The temperature of the koji starts at 24-28ºC. Eighteen hours after the trays have been stacked in the koji room, they should be examined; the temperature inside the koji should be 27 to 29ºC. "Any higher temperature is due to serious bacterial contamination, or to unsatisfactory conditions of temperature and humidity in the koji room. At the end of 18 hours the koji is stirred, the bottom being brought to the top and the beans are broken apart. Thorough stirring is necessary, for the beans and wheat are now bound by the mycelium or white threads produced by the shoyu-mold." Sporulation must not have begun. "This immature koji should be spread out and exposed by stirring until it has cooled down to 24º or 25º C. (70-72ºF) or lower." The koji should now be heaped in two piles extending the length of the tray (Plate II, B). "The material should come in contact with the sides of the tray as little as possible, since condensed water on the surface of the saturated wood induces bacterial growth when absorbed by the tray or retained by the beans and wheat."

The trays are left undisturbed in the koji room for 6-7 hours. The temperature of the room should be just under 30ºC while that of the koji should be 27-29ºC. "The mycelial growth is now heavier but no sporulation should be evident. At the end of this second incubation period, the koji is stirred thoroughly a second time, the beans and what being broken apart. The mass is cooled below 24ºC. After this stirring, four furrows, running the short way of the tray and forming three heaps, are made (Plate II, C). The trays of koji are again placed in the koji room."

"When examined at the end of 40 hours, 12 to 14 hours after the second stirring, the surface of the koji should be a clear 'flavus' or yellow color from the fruiting heads of Aspergillus... The temperature of the best koji should now be not much above 35ºC, although 35º to 36ºC is permissible... Mature koji has a clear yellow to yellow-green color on the surface and throughout the whole mass. If well ripened, it may be lifted from the tray as one entire block.

"The koji may become infected with *Rhizopus nigricans* if the atmosphere of the koji chamber is moist to the point of condensation as drops. A little Mucor or Rhizopus is disregarded in the material, unless a bad flavor or odor is also present. It is poor practice, however, to allow the Rhizopus to enter..."

Proportion of wheat: Japanese shoyu requires "at least one part of prepared wheat to three parts of prepared beans. This proportion of wheat is somewhat less than equal parts of the unprepared ingredients by volume."

"Color: Mold-ripened soybeans and wheat are usually clear yellow when prepared by the Japanese method for shoyu-koji. This coloration is due to pigments of the spores or seedlike bodies of the mold. Occasionally the color of the mass of beans and wheat is yellowish green. The reason for this variation is not easily defined."

"Bacterial count: Condemnation of batches of koji may be readily based on the presence or absence of an ammoniacal odor or evidence of putrefaction. Any odor of ammonia or of putrefaction, any sticky condition, or any appearance of rottenness in koji is due to bacterial and not mold activity. The bacteria involved in the ripening of shoyu-koji in these experiments belong to the *Bacillus mesentericus* and *B. vulgatus* groups." These are aerobic spore formers. The spores of these bacteria, which grow if the bean soaking water is not changed, can survive pressurized cooking at 15 pounds for 30 minutes."

The author successfully made koji from "commercial peanut press cake."

"Shoyu-moromi: The shoyu koji when mature is emptied into a tub of brine. In the experimental work conducted in cooperation with Dr. T. Takahashi one-half of a 65-gallon wooden cask was used for the tub or vat. The brine was a solution of commercial salt at a strength of 20º to 22º B [Baumé, a measure of specific gravity]... Each tub of moromi was inoculated on the first day with four flasks (450 cubic centimeters of wort extract broth and 5 per cent sodium chlorid in each) of a yeast culture of Zygosaccharomyces sp... In Japan sea salt is used. It is said that one part of the sea salt to two parts of water by volume gives a brine from 20º to 22º B., presumably because of the coarseness of the native Japanese sea salt."

Three different batches of experimental shoyu-moromi were made. Two were kept at the ambient temperature of the laboratories (20-24ºC). Mash C was made with a weaker brine and kept at a higher temperature. These mashes were stirred daily for 1 hour. "Also a blast of air was

© Copyright Soyinfo Center 2014

bubbled into the material in order to supply oxygen for the microorganisms present." The ripening lasted 10 months. Mash C was of inferior quality. "Doctor Takahashi stated that shoyu A compared favorably with the best commercial shoyu of Japan, while others thought that it resembled the heavy soy made by Japanese housewives in the country districts... The highest quality of shoyu in Japan is said to go under the label 'Mogi' or 'Kikkoman,' but chemical analyses in König (1904) and in the Bureau of Chemistry records indicate no consistent chemical composition."

Bacteriological examination: The main bacteria in this shoyu-moromi seemed to be *Bacillus mesentericus.* "In January 1920 two lots of sauce were started. One was composed of soy beans and wheat and the second of peanut press cake and, for the most part, wheat as a starchy substance." Dr. Edwin LeFevre of the Bureau of Chemistry helped with the bacteriological analyses.

Proportions of ingredients: Table 3, prepared by Dr. Takahashi, shows the proportion of ingredients by volume used in Japan to make 3 grades of shoyu: Best, good, and common. For the best grade use 100 parts (by volume) each of soy beans and wheat, 90 parts of Japanese sea salt, and 180 parts of water.

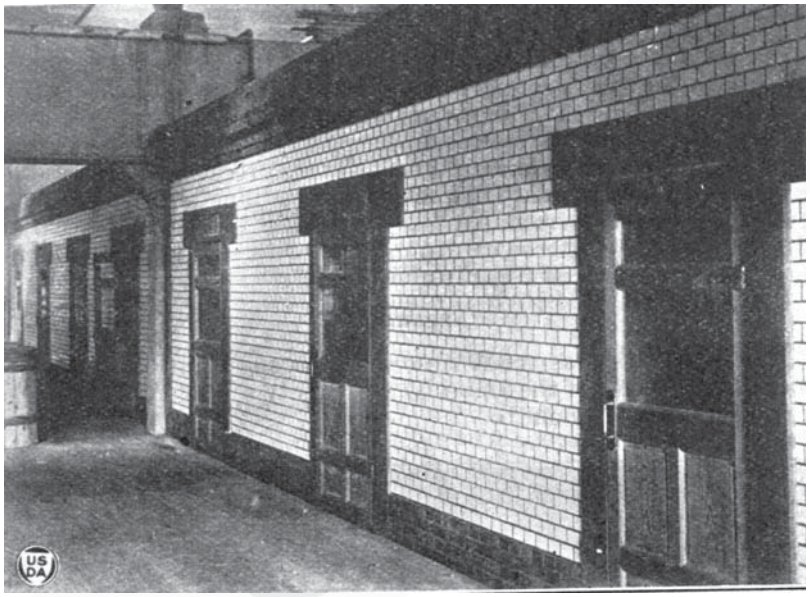
Yields: When pressed in sacks with a hydraulic press under 1,250 pounds per square inch for 23 hours, 100 liters of moromi yields, on average, 78.7% shoyu and 21.3% residue.

Note: This is the earliest document seen (April 2012) that describes how to make fermented soy sauce on a commercial scale–that will actually work. All known previous descriptions omitted the "mold culture" or koji stage. Address: Microanalyst, Microbiological Laboratory, Bureau of Chemistry [USDA].

2260. Church, Margaret B. 1923. Soy and related fermentations: Chinese soy sauce (Document part). *USDA Department Bulletin* No. 1152. 26 p. May 12. See p. 18-19. [27 ref]

• ***Summary:*** "The primary difference between the soy sauce of Japan and that of China, judging from the department's contact with Japanese and Chinese scientists and travelers, is that Japan has a generally standardized commercial product, while the soy of China is made on a smaller scale, varying with the locality and the producer to a much greater extent. Small-scale production, however, gives a choice product of uniform quality from certain factories or localities. The underlying principles of the Japanese and Chinese soy industries are the same. The Chinese soy-sauce manufacture has been discussed by Prinsen Geerligs" (1896) and Groff (1919). A long summary of Groff's article is given. Address: Microanalyst, Microbiological Lab., Bureau of Chemistry [USDA].

2261. Church, Margaret B. 1923. Soy and related fermentations: Photos (Document part). *USDA Department Bulletin* No. 1152. 26 p. May 12. [27 ref]



• ***Summary:*** Photos show: (1) Experimental koji room (wooden cabinet type) used in Bureau of Chemistry with doors, trays on racks, electric plate, thermometers, and tube for blast of cool air (p. 3).

(2) Exterior of Japanese koji room (brick-walled with large doors) (p. 4; see next pages).

(3) Large wooden tubs of shoyu-moromi in Japan, with beans floating on the surface of the mash (inserted between pages 4 and 5).

(4) A courtyard filled with large earthenware containers with cone-shaped wicker tops for ripening soy sauce mash in Ichang (I-ch'ang or Yichang), Hupe [Hupeh / Hubei], China; a small, strong basket is placed into each, with its rim just above the surface of the mash. The soy sauce collects or accumulates in each basket and is then dipped out, ready for consumption.

(5) Three different stages of shoyu-koji in wooden trays, each 17 by 8 by 2½ inches deep. This koji, "overgrown with a white mycelium of mold ferment," must be stirred and heaped at regular intervals (plate 2).

2262. Church, Margaret B. 1923. Soy and related fermentations: Related fermentations–Miso (Document part). *USDA Department Bulletin* No. 1152. 26 p. May 12. See p. 23.
• ***Summary:*** "Soy sauce is only one of the mold-fermented food products originating in the Orient, the majority of which are ripened by means of the molds represented by the yellow-green group of Aspergilli.

"Miso, one of these products, is one of the most common breakfast foods for children. There are two types of miso, white or shiro miso and red miso. Miso is prepared from a koji ripened by means of the *A. flavus oryzae* group of molds. The soy beans are cooked in miso before the fermentation is undertaken. The treatments subsequent to the cooking and preparatory to the fermentation doubtless varies in different localities. It is said that the beans may be made into a paste before being ripened by the mold. As bought in this country, however, miso shows the beans intact. White miso is said to be made from a koji of soy beans or soy beans and a starchy material, as rice or barley. The koji is ripened as is shoyu-koji and placed in a weak brine for 10 days. Unfinished rice wine may be added to improve the flavor and to preserve the product, which is rather perishable. Red miso is prepared in the same way as the white miso, but is ripened for from one to three months in a stronger brine. White miso has been bought in the United States in two forms. One type is very salty and therefore less perishable than the other. Probably because of longer fermentation red miso is dark red. It is very cheap, whereas white miso is expensive."

• ***Summary:*** The section titled "Silk leads from Orient" states: "American imports from Japan consist principally of raw silk, which is manufactured [into finished goods] in American mills. The next item is tea. These two constitute 70 per cent. of our purchases. The remaining 30 per cent. is made up of toys, some manufactured silk goods, Soy bean oil, canned crab meat and a number of miscellaneous items.

"The United States pays for these Japanese goods principally with exports of raw cotton... This trade has been the great balance wheel which kept Japan from financial chaos during several years when its Chinese markets were practically destroyed by the 'passive resistance' policy.

American trade with China has been increasing (it was $134,000,000 last year), despite the fact that China has been in a state of upheaval, with a bad financial situation, which grew steadily worse under four or five successive governments. The most important U.S. import from China is raw silk, followed by hides, skins, furs, and Mahjongg [mahjong] equipment. China's main import from the USA is machinery, such as cotton mill equipment and oil crushing machinery.

2266. Hamburger's 1923. To tempt the summer appetite (Ad). *Los Angeles Times.* June 15. p. I8.
• ***Summary:*** This large ad is an abbreviated menu without prices. "Fish and meat sauces: "Crosse & Blackwell's Harvey Sauce, mushroom and walnut catsup. A.I. and H.P. English Sauce. Crosse & Blackwell's Bengal Club Chutney.

"Shoyu Sauce, prepared at Choshi, Japan–delicious with chop suey, meat and fish or for soup flavoring."

Note: It is unclear which brand of "Shoyu Sauce" this is, made in Choshi, Japan. It could have been either Higeta or Yamasa.

"Hamburger's. Established 1881. Imported and domestic delicacies. Phone your order. Have it charged." An large illustration shows a man and wife dining in luxury, with a servant carrying in a platter of food. Yet Hamburger's is apparently not a restaurant. Address: Broadway, Eighth and Hill [Los Angeles]. Phone: Broadway 3940.

2267. *Los Angeles Times.* 1923. Japanese "Bean Town." June 17. p. XI38.
• ***Summary:*** "Dairen, a Japanese city in Manchuria, according to reports, is the port of what is becoming the greatest bean-raising country of today. The product, also used in making soy-bean sauce and soy-bean oil, is exported to various markets. The soy-bean sauce is familiar to patrons of 'Chinatown' restaurants."

2268. Brook, Harry Ellington. 1923. Care of the body. *Los Angeles Times.* July 8. p. XI30-35. Sunday magazine.
• ***Summary:*** The section titled "What workers eat" begins (p. 32): "Dr. Josiah Oldfield, an eminent English physician, has been investigating the diet of the world's workers. He obtained the following information from foreign legations in London:"

"From the Consulate General of Japan: Rice, barley,

© Copyright Soyinfo Center 2014

wheat, vegetables, miso soup (miso is prepared from the soya bean), sou [soy; soy sauce or shoyu] (Japanese sauce which is indispensable for cooking purposes), fish (fresh or salt, wet or dried), vegetables are chiefly cooked with soy, salt, sugar, etc. Rice is taken in the place of bread. Flesh-meat does not form an important part of the Japanese dietary."

After discussing food consumption information from 13 countries, Brook concludes: "These people are better nourished than the Americans, who subsist mainly on lean meat, bread made from refined white flour and refined white sugar, with tea and coffee and little vegetables"

2269. Katô, Naosaburo. 1923. Studien ueber den Einfluss des Glykokolls auf die Fermentwirkung eines Soja-urease-praeparates. II. Ueber den stabilen Bestandteil des Soja-urease-praeparates. I. [Influence of glycine on the fermentative action of soya-bean urease. II. Stable constituents of soya-bean urease. I.]. *Biochemische Zeitschrift* 139:352-65. July 15. (Chem. Abst. 18:405). [6 ref. Ger]

• ***Summary:*** The presence of 2 constituents in urease is confirmed. The urease system consists of a thermo-labile constituent which possesses fermentative properties, and a thermo-stable constituent with no fermentative action which the author calls "Stable component X." This last, at urea concentrations above the "equivalent urea concentration," increases the activity of the urease, but has no influence at substrate concentrations below this value; its action resembles that of glycine. The action of "Stable component X" is not due to alteration of the hydrogen ion concentration nor to the presence of mineral salts. Address: Kanazawa, Japan. Aus der biochemischen Abteilung des Staedtischen Krankenhauses am Urban zu Berlin [Germany].

2270. Miyake, Koji; Nakamura, Koji. 1923. On the effect of calcium oxide and calcium carbonate upon the decomposition of soy-bean cake and herring cake in two different soils. *J. of Biochemistry* (*Tokyo*) 3(1):27-54. July. [14 ref. Eng]

• ***Summary:*** Gives the results of experiments using these two cakes as a fertilizer at the Institute of Agricultural Chemistry of Hokkaido Imperial University, Sapporo. Conclusions: Calcium oxide and calcium carbonate stimulate the decomposition of organic matter, and stimulate the ammonification and nitrification of organic matter. The effect of lime differs according to the kinds of soil (loam or acid soil) but not according to the character of the organic matter (soy-bean cake or herring cake). "To ammonify the same amount of nitrogen of organic matter, twice the amount of organic carbon of soy-bean cake or of herring cake which was decomposed in loam had to be decomposed in acid soil to carbonic acid. On the other hand, to ammonify the same amount of nitrogen of organic matter, 1.5 times the amount of organic carbon of soy-bean cake which was decomposed to carbonic acid in loam or in acid soil had to be decomposed in the case of herring cake in the same soil." Address: Inst. of Agricultural Chemistry, Hokkaido Imperial Univ., Sapporo, Hokkaido, Japan.

2271. Church, Margaret B. 1923. Re: USDA research on mold cultures. Letter to Kokichi Oshima [Hokkaido Imperial Univ., Sapporo, Japan], Aug. 28. 2 p. Typed, without signature (carbon copy).

• ***Summary:*** "We received the cultures that you spoke of sending in your letter of May 23... we have every intention of continuing careful studies of Aspergilli, Penicillia, and other common saprophytic molds. Above all we were pleased to receive the cultures as they assured us that you still had within you the same spirit of open generous cooperation as we had learned to appreciate in you in the States."

"You spoke of Mr. Konno telling you of a fever-like sickness occurring among workers where *Aspergillus flavus* and *A. ochraceous* were prevalent. Would you keep your ears open for such reports and when possible run down the truth of such instances? Molds are being used in this country more than previously in their limited way and fields, and they are used more extensively in your country than mine because of shoyu and katsuo-bushi." Address: Microanalyst [Biological Lab., Bureau of Chemistry, USDA, Washington, DC].

2272. Naemura, Tokuji. 1923. Floor-cover composition. *U.S. Patent* 1,466,241. Aug. 28. 1 p. Application filed 30 Nov. 1921.

• ***Summary:*** "This invention relates to a floor cover something like linoleum, and consists of ordinary mat covered with a mixture of powdered soya bean or the like albuminous substances, ammonia, water, fibres as binding material, and any desired pigment, and the object thereof is to obtain a covering for floor which is cheap, rich in elasticity and hard to burn." Address: 138 Isobe-Dori, Sanchome, Kobe, Japan.

2273. Ishio, M.; Endo, Y. 1923. Shôyu to forumuarudehiido to no kankei ni tsuite [On the relation between shoyu and formaldehyde]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 498. p. 628-37. Aug. (Chem. Abst. 18:298). [Jap]

• ***Summary:*** The small amount of formaldehyde present in soy sauce, either intentionally added or derived from the caramel used for coloring the sauce, gradually decreases on keeping, and at last entirely disappears. This is attributed to combination of the aldehyde with amino acids present in the sauce. The decrease is proportional to the amount of amino acids in the sauce. Address: 1. Igakushi, Japan.

2277. Slosson, Edwin E. 1923. Catching up with China. *Scientific Monthly* 17:283-85. Sept.
• ***Summary:*** The soy bean "was first introduced to America in 1804, but it was a hundred years before we could be induced to take it seriously... But in the last ten years it has rapidly come to the front as one of our major crops and is likely in the next ten years to go ahead of oats in acreage in some of our states... The latest bulletin of the Department of Agriculture lists fifty different uses for soy products, and doubtless Yankee ingenuity can and will add more when we get our minds to working on it.

"Even the Japanese have not exhausted their ingenuity in this field, long as they have been at it. A Japanese scientist named Sato has invented a new plastic which he has called, according to American precedent, 'Satolite.' It is made by precipitating the protein with sulphite, hardening it with formaldehyde, and molding it under heat and pressure into combs, buttons and whatever we make from hard rubber or celluloid or the casein of milk.

"The soy bean is rich in protein and fat, and lacking in starch; in that more like animal than like vegetable food. You can make a milk out of it by simply soaking the dried beans till soft, then crushing fine in a meat grinder, boiling in three times the volume of water for half an hour and straining through cloth. If you do not like the flavor you can add vanillin or something else. This vegetable milk sometimes agrees with children when cow's milk does not. It can also be used for cakes and custards.

"The soy milk may be made into curds and cheeses of various sorts which form a large part of the diet of orientals, but for which we have not yet acquired a taste. Soy meal has come into common use in America, not only as a cattle food, but also for bread and pastry mixed with three parts wheat flour.

"Soy sauce has long been familiar but quite unknown to us. We did not recognize it under its aristocratic English name and its added flavors. But when the high cost of living drove us to the chop sueys, we became acquainted with the cruet of brown salty sauce called 'shoyu,' and we found, as the Chinese had found thousands of years before, that a sprinkling of it would make tasty a large lot of rice and serve as substitute for meat, both in taste and nutriment. Soy sauce is of several sorts. If you want it strong take the Korean. If you want it sweet take the Japanese. It is made by fermentation and the flavor depends upon the way it is brewed and the length of time it is left to ripen. To suit the palate of a Korean connoisseur the jars must be exposed to the sunshine by day and covered by night for a period of thirty years. We Americans, when we get to making it, will undoubtedly speed up the process.

"So far the oil is the most in demand of the soy products. The beans contain from 18 to 20 percent. of a fine palatable oil, which we have imported at the rate of a hundred thousand tons in a year, but which we are now growing for ourselves. It can take the place of cottonseed oil in vegetable substitutes for lard and butter, and of linseed oil in paints. Formerly the oil went mostly to Germany and England, but the war made a shift in the currents of Pacific trade, and we learned to appreciate its value. But we have a lot to learn yet before we catch up with the orientals in the utilization of this multifarious bean."

2278. **Product Name:** [Satolite (Soybean Plastic)].
Foreign Name: Satolite.
Manufacturer's Name: Solite Manufacturing Co.
Manufacturer's Address: Japan.
Date of Introduction: 1923 September.
New Product–Documentation: Edwin E. Slosson. 1923. Scientific Monthly. 17:283-85. "Catching up with China." "A Japanese scientist named Sato has invented a new plastic which he has called, according to American precedent, 'Satolite.' It is made by precipitating the protein with sulphite, hardening it with formaldehyde, and molding it under heat and pressure into combs, buttons and whatever we make from hard rubber or celluloid or the casein of milk."

2292. Bottari, Fulvio. 1923. La soja nella storia, nell'agricoltura e nelle applicazioni alimentari ed industriali [The soybean in history, in agriculture, and in food and industrial applications]. Torino & Genova, Italy: S. Lattes & Co. 243 p. Preface by Prof. Oreste Mattriolo (R. Università di Torino). With 34 illust. 22 cm. [25 ref. Ita]
• ***Summary:*** Contents: Preface. Reason for the work; its scope and limits. Part I: The origin and history of the soybean. Reason for this history, the origin of the soybean and its early dissemination, soya (including production statistics) in Oriental countries (China, Manchuria, Japan, Formosa, Korea, French Indochina), how the soybean was introduced to Europe, the cultivation of soya in France, Soya in England, Austria, Germany, Denmark, Holland, Russia, Sweden, Alsace-Lorraine (now in northeast France), Spain, Italy, America, Conclusion.

Part II: Cultivation of soya. Part III: Soya in the feeding and nutrition of humans and animals. 1. The analysis and physiology of metabolism as an element in the study of nutrition. 2. Soybean forage in the feeding of animals. 3. Soybeans (*il grano di soja*) and soy products in the feeding of humans and animals: Commercial and nutritional value and digestibility of the soybean, how to prepare and cook whole soybeans, soy broth, thick soups, salads, and meat dishes, soy purée (*puré di soja*), soybean cakes (*torté di soja*), soybean sprouts (*germi di soja*), roasted soybeans (*grano di soja come frutta secca*), soy coffee (*caffé di soja*), soy chocolate (*cioccolata di soja*), soy confections (*confetture di soja*), special soy sweets and chocolates for diabetics and tuberculosis patients, the soybean as a feed for animals.

Note: This is the earliest Italian-language document seen (Nov. 2012) that mentions soy chocolate, which it calls *caffé di soja.*

4. Flour, pasta, and bread in feeding. 5. Soymilk (*il latte di soja*) and its use in the feeding of animals and humans. 6. Tofu (*il formaggio di soja*). 7. Soy oil and oil-cakes (*panelli*). 8. Condiments and sauces: Natto, miso, soy sauce (*le salse,* called *Schogon* [sic] in Japan, *Tsinag-Yeou* [sic] or *Tao-yu* in China, *Ketjap* in Java, and *Tuong* in Annam). 9. Enzymes (I fermenti, incl. urease). 10. Conclusions.

Part IV: Industrial applications of soya.

Part V: General conclusions.

The first test of the lactation of calves with soymilk was conducted in the winter of 1916-17 by the Bonafous Institute in Turin. The results were splendid, and have encouraged eminent pediatricians such as Dr. Casalini, Prof. Dr. Alberto Muggia (teacher of clinical pediatrics at the University of Turin), and Dr. Enrico Gasca (vice director general of infants at Turin) to extend their experiments (p. 6).

In Italy vegetable oil production has decreased steadily from 1870 to 1920. Attempts were made to grow sesame, peanuts, and rapeseed, and to import oils from abroad. During World War I, unrefined soy oil was introduced to the market in large quantities, but its unappealing taste disgusted consumers and for a while nothing more was heard of it. Then in 1921 it began to be introduced again, but this time it was refined at Italy's national oil works. The good results obtained encouraged the Italian oil milling company, Sairo, and other oil works to make great progress in soy oil production. Several thousand quintals (i.e., several hundred metric tons) of the best soy oil, sold under the name "refined oil from seeds," were introduced in the first half of 1922 by the national oil works of Genoa.

Returning to the early history of soya in Italy, we find that in 1848 some missionaries brought soybean seeds and a little soil to Italy from Japan. They waited for the cultivation for several years, then nothing else was said. In 1880 the Italian Ministry of Agriculture recommended the cultivation of soybeans as a fodder crop for the future, as was being done in the USA, but their suggestion received no attention. In 1918, according to Mattei, a test of soybean culture was done at the Colonial Garden of Palermo on a parcel of 300 square meters.

Since 1912, after seeds had been brought by foreign delegates to the International Exhibition at Turin in 1911, repeated experiments with soybean cultivation have been conducted at the Bonafous Agricultural Institute in Turin, with the goal of developing two well adapted varieties, one for fodder and one for seed. Their green variety is for fodder and their yellow one for seed.

From 1920 the directorship of the cultural work was given to the head professor at the Institute, Venanzio Manvilli, also professor of the Germano Sommeiller Technical Institute, professor the faculty of agriculture, University of Turin. They worked with seeds already selected from the institute and with those obtained from Prof. Don Ricaldone, and from Tientsin, China, directly. Others who have done important work with soya in Italy are Paolo Bottari (with soymilk at the Bonafous Institute), Tamanini Guido, Mossello and Bellia, Prof. Cav. Giov. Batt. Allaria, Dr. Mose Miccinelli

A table (p. 31) shows soybean and cotton hectarage and production in Korea from 1909 to 1917. Soybean hectarage increased from 277,776 ha to a record 487,134 ha. Soybean production grew from 1,991,126 quintals (1 quintal = 100 kg

© Copyright Soyinfo Center 2014

or 0.1 metric tons) to a record 3,816,498 quintals.

Page 35: "Prof. Rouest of Luxey (Landes) in France wrote us on 30 Nov. 1921. 'I have finished only the period of acclimatization of the soybean. It remains for me to propagate it a little everywhere. The experiments of 1921 were extended in all the Departments, being viewed from an industrial and commercial point of view. I must now study which variety adapts among those I am cultivating. Soy flour will not be able to be made until we have many thousands of hectares under cultivation, and then we will be able to think of other applications as well... Actually the firm Hendebert de Lion sells its flour, originating in China, at 10 French francs per kg, a prohibitive price.'"

Page 206: At the pediatric congress held in Milan in Sept. 1922, the question of lactation (feeding children) with vegetable milk was discussed in a favorable way, proposed by Prof. Muggia and sustained by the illustrious Prof. Berghius, Director of the Pediatric Clinic of the University of Padua, and by Prof. Francioni of Bologna. We can also add that experiments on lactation are proceeding in Italy at the pediatric clinics of Turin, Bologna, Padua, Genoa, and Florence, and also at the Infant's Dispensary in Turin.

Photos show: (0) An infant fed soymilk in Turin in 1921, together with a table showing its weight gain from 18 July 1921 until 14 Jan. 1922 (p. 7). • ***Summary:*** In Sept. 1921 the IIA published a monograph on this subject in French. By popular demand, this English edition was published 2 years later. Contents: Introduction (p. VII-XXXII): General scope, general survey of the 9 principal crops (including soya beans) plus others, final points of consideration. Part I (p. 1-402) is an analysis by region, and within each region by country, countries of vegetable oil production and trade. Regions are Europe, North and Central America, South America, Asia, Africa, and Oceania.

Major countries: Denmark (p. 20-23; oil production 1916-1921, oil imports 1910-1922). France (p. 26-34). Germany (p. 35-40). Great Britain and Ireland (p. 41-43). Netherlands (p. 65-68). Norway (p. 69-70). Russia–European and Asiatic (p. 84-93). Sweden (p. 100-03). Canada (p. 111-15). United States (p. 131-47). Argentina (p. 179-85; no soy). Brazil (p. 187-90; no soy). Ceylon (p. 218-21; no soy). China (p. 222-26). Dutch East Indies (Java & Madura, Other islands; p. 229-33). Formosa (p. 238-39; gives soybean production and acreage from 1900 to 1921). Japan (p. 259-64; gives Japanese soybean production and acreage from 1877 to 1921, and production of soya oil from 1909 to 1920. Japan's leading oil produced domestically from 1895 was rapeseed oil). Korea (Chosen, p. 265-67). Kwantung Leased Territory (p. 268). Hawaii (p. 388; Hawaii produced 17 long tons of soybeans on 20 acres in 1909, and 10 tons on 15 acres in 1919).

Part II (p. 403-506) is recapitulatory tables for both soya beans and soya bean oil: Area and production by crop (1909-1922), Trade by crop (1909-1921). Cottonseed (p. 410-11). Linseed (p. 414-15). Soya beans (p. 442-43, 480-81).

Pages XX-XXI state: "In the absence of data from China, the chief grower of soya beans, it is impossible to make even the roughest estimate of the world's yield of this product. Among the few countries of any moment as producers of soya beans, we may mention: Japan, where this crop increased rapidly between 1877 and 1887 and then became nearly stationary at about 500,000 long tons [2,240 lb per long ton] per annum, although in the last few years some further increase has been noticeable; Korea, with a continuous increase in area and yield, from 1910 onwards, (the crop of 1920 was about 600,000 long tons); and United States, where from 1909 to 1921, the area under soya beans increased from about 1,600 to 186,000 acres with a production of about 70 thousand long tons. It may be observed that the increase of this crop during the last twenty years is supplemented by attempts already made and in progress for its introduction into countries with a favourable climate, especially into Africa."

"Exports are exclusively from China and Korea. The

© Copyright Soyinfo Center 2014

Chinese exports have increased very greatly during the last thirty years. Before 1890 they were insignificant, in 1901 they had reached a total of more than 100 thousand tons, and during the decade from 1909 to 1918 they averaged about 600 thousand tons and reached their maximum in 1919 with about 1 million, declining in the two following years to 600 thousand long tons.

"With regard to Korea although we have not a complete series of data for the period 1909-1918, the ever-increasing importance of its exports of soya beans may be emphasized; during the last few years these have been double the average of the years 1909-1911, and in 1921 they already equalled one third of the Chinese exports."

"The chief importers, in Europe are Great Britain, Denmark, and Holland, and, in Asia, Japan, and the Dutch East Indies. To these must also be added Russia-in-Asia as the Chinese Customs register large exports destined for the Russian Pacific ports."

"England, which at one time constituted the greatest market for the soya bean, has continually reduced its imports: these were 420 thousand long tons in 1910, 76 thousand in 1913, and about 60 thousand in the two years 1921-1922... In the Asiatic market, represented in this case by Japan and the Dutch East Indies, imports have continuously increased especially in the last few years of the period under consideration.

"The trade figures of *soya oil* (see tables on pages 480 and 481) indicate that China is the principal exporter, having quadrupled its shipment during the period from 1914 to 1919, attaining in the latter year a total of over 140 thousand long tons."

Other countries unrelated to soy (some no longer in existence): Europe: Esthonia [Estonia], Luxemburg [Luxembourg], Serb-Croat-Slovene State. North and Central America: British Honduras [named Belize after about 1975]. South America: Curaçao [Curacao], Falkland Islands, British Guiana, French Guiana. Asia: Aden [became part of independent Yemen in 1967], Andaman and Nicobar Islands, Bahrein Islands [Bahrain], Borneo (British Protectorates), Dutch East Indies, Federated Malay States, Formosa, French Settlements in India, Indo-China, Persia, Portuguese India [annexed in 1962 by India; became Union territory of Goa, Daman, and Diu], Protected Malay States, Russia, Japanese Saghalin (Karafuto), Siam [later Thailand], Straits Settlements [later Singapore], Timor and Cambing, Wei-Hai-Wei [Weihai, Wei-hai, or Weihaiwei; seaport in northeast Shandong province, northeast China]. Oceania: Australia, Fiji Islands, French Settlements in Oceania, Gilbert and Ellice Islands, Hawaii, Island of Guam, New Caledonia, New Hebrides, Papua, Samoan Islands (American Samoa), Solomon Islands, Territory of New Guinea (*Later German New Guinea*), Tonga, Western Samoa (*Formerly German Samoa*).

Note: This document gives a clear definition of the geographical region named "Oceania." A "quintal" is probably 100 kg. Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

2294. Capone, Giorgio; Grinenco, Ivan. 1923. Kwantung (*Leased Territory*) (Document part). In: G. Capone & I. Grinenco, eds. 1923. Oleaginous Products and Vegetable Oils: Production and Trade. Rome, Italy: International Institute of Agriculture, Bureau of Statistics. 545 p. See p. 268. [Eng]

• ***Summary:*** Area and production: Table 1, based on Japanese statistics, shows area and production of oil-yielding crops from 1911 to 1919. Soya was the leader by far in both categories throughout this period. Soya area increased from 36,145 acres in 1911 to a peak of 77,024 acres in 1913, falling to 55,538 acres in 1919. The only other crop shown is groundnuts (15,832 acres in 1919).

Soya bean production grew from 10,050 long tons in 1911 (Note: 1 long ton = 2,240 lb) to a peak of 19,251 long tons in 1912, decreasing to 9,373 tons in 1919. Groundnut production grew from 2,457 tons in 1911 to 7,034 tons in 1919.

"Trade: Since 1917 the territory of Kwantung has formed a Customs district under the Chinese Imperial Customs. The figures showing the imports and exports of this territory are included in the figures we have furnished for China." This data is based on the annual agricultural statistics of Japan–*Statistical Report of the Department of Agriculture and Commerce.* Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

2295. Capone, Giorgio; Grinenco, Ivan. 1923. Formosa (Document part). In: G. Capone & I. Grinenco, eds. 1923. Oleaginous Products and Vegetable Oils: Production and Trade. Rome, Italy: International Institute of Agriculture, Bureau of Statistics. 545 p. See p. 238-39. [Eng]

• ***Summary:*** Area and production: A table (p. 238) of Japanese statistics shows that the soya bean was the leader of 4 oil-yielding crop produced in Formosa (Taiwan) from 1900 (6,427 tons grown on 27,239 acres) to 1918 (18,414 tons grown on 86,306 acres). Note: 1 long ton = 2,240 lb. In 1919 groundnuts became the leader and held an increasing lead to 1921. Small amounts of sesamum and rapeseed were also produced.

Production of vegetable oils: In 1917 groundnut was the leader (1,552 tons), followed by sesamum oil (589 tons) and other (193 tons).

Imports of oleaginous products: The main such product imported was soya beans, which increased from 1,588 tons in 1909 to 10,421 tons in 1920. Also in 1920, 337 tons of groundnuts and 262 tons of sesamum were imported.

Imports of vegetable oils: These were small but increasing. In 1920 the main oils imported were wood oil, tea oil, soya beans oil, and rapeseed oil.

© Copyright Soyinfo Center 2014

Exports of oleaginous products: In 1909 the leader had been sesamum [sesame seeds; 827 tons], followed by groundnuts (123 tons, including a small quantity of soya beans). Small amounts of groundnut oil and sesamum were also exported.

Sources of statistics. Production: *The Statistical Summary of Taiwan* (1912), *The 35th Statistical Report of the Department of Agriculture and Commerce of Japan,* and *Taiwan Nôji-hô,* No 178, Sept. 1921, and No. 191, Oct. 1922. Trade: *Returns of the Trade of Taiwan* (*Formosa*) for the 25 years from 1896 to 1920. Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

2296. Capone, Giorgio; Grinenco, Ivan. 1923. Japan (Document part). In: G. Capone & I. Grinenco, eds. 1923. Oleaginous Products and Vegetable Oils: Production and Trade. Rome, Italy: International Institute of Agriculture, Bureau of Statistics. 545 p. See p. 259-64. [Eng]

• ***Summary:*** Production: Table 1 shows cultivated area under oil-yielding crops from 1877 to 1922. In 1877 soya was the only crop whose acreage was recorded (461,298 acres). In 1887 soya was still the acreage leader (1,142,788 acres), followed by rapeseed (409,986 acres), cotton (241,241 acres), hemp (36,367 acres), and linseed (62 acres). Acreage for groundnuts was first reported in 1905-07 (14,130 acres). Soya remained by far the acreage leader throughout this period. The figures for 1921 are: Soya 1,1260,384 acres, rapeseed 262,561 acres, linseed 76,421 acres, groundnuts 27,370 acres, hemp 25,560 acres, and cotton 5,667 acres.

Table 2 shows production of oil-yielding crops from 1877 to 1922. Again, soya was the leader throughout this period, with soybean production increasing from 240,618 long tons in 1887 (Note: 1 long ton = 2,240 lb) to a peak of 545,869 tons on 1920. In 1921 Japanese oilseed production was: Soybeans 544,735 tons, rapeseed 95,135 tons, unshelled groundnuts 16,555 tons, linseed 15842 tons, cottonseed 2,207 tons. Note that no production figures are given for hempseed.

Concerning individual crops: "Soya.–The cultivation of this plant has been carried on extensively since early times and continued to develop during the decade 1877-87; it attained its maximum extension [acreage] in 1908-1912, while in the following years it shows a tendency toward shrinkage, while remaining much the most important oil-yielding crop in the country. It is to be noticed, however, that soya is used as a food of the people as well as for oil production. The principal producing districts are in the department of Hokkaido, Ibaraki, Saitama, Iwate, Niigata, Nagasaki and Kumamoto." Rapeseed, introduced to Japan centuries ago, was more fully developed after 1600 A.D. Acreage has steadily decreased since 1887, as has production, though to a lesser degree. Linseed was introduced to Japan from America in 1874 as an experimental crop. Groundnuts were exported from Japan for the first time in 1890 (about 83 tons), and cultivation of the crop has steadily increased. Hemp has been cultivated since a very early date, mostly for its fibre. There are no data on production of the seed.

Production of vegetable oils in Japan: Since 1895, rapeseed oil has been the leading vegetable oil produced in Japan. Production was 38,711 long tons in 1895-97, decreasing to 28,213 tons in 1920. Figures for soya oil production are first given for the year 1909 (4,416 tons); the amount produced has increased steadily until by 1920 it was the second leading oil produced in Japan (26,436 tons). Other leading oils in 1920 are: Groundnut oil 22,779 tons, cottonseed oil 4,335 tons, sesamum oil 4,317 tons, coconut oil 2,445 tons, linseed oil 1,801 tons, and wood oil 728 tons.

Imports of oleaginous products: Soya beans have been by far the leading import from 1909 (213,960 tons) to 1922 (303,250 tons). Other imports in 1922 are: Rapeseed (including mustard seed) 45,558 tons, cottonseed 17,798 tons, sesamum seed 14,770 tons, groundnuts 12,982 tons, hempseed 7,617 tons, copra 4,978 tons, and linseed 3,475 tons.

Imports of vegetable oils: Only small amounts of vegetable oils are imported, but the leading one for most of this period was soya oil (4,072 tons in 1912 and 5,346 tons in 1921). Next most important was coconut oil, followed by castor oil and linseed oil.

Exports of oleaginous products: The leading export in 1909 was groundnuts (2,976 tons). The leaders in 1922 were rapeseed (2,889 tons), soya (1,994 tons), groundnuts (494 tons), and linseed (351 tons).

Exports of vegetable oils: The leader for most of this period has been rapeseed oil, with soya oil a close second. In 1909 4,077 tons of rapeseed oil were exported. Soya oil first passed rapeseed in 1911, with 3,819 tons. The leaders in 1922 were: Soya oil 5,911 tons, rapeseed oil 924 tons, cottonseed oil 138 tons, and linseed oil 108 tons. Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

2297. Capone, Giorgio; Grinenco, Ivan. 1923. Korea (Chosen) (Document part). In: G. Capone & I. Grinenco, eds. 1923. Oleaginous Products and Vegetable Oils: Production and Trade. Rome, Italy: International Institute of Agriculture, Bureau of Statistics. 545 p. See p. 265-67. [Eng]

• ***Summary:*** Area and production: Table 1 (p. 265) shows Japanese statistics for area and production of oil-yielding crops in Korea (Chosen) from 1909 to 1922. Soya was the leader by far in both categories throughout this period. Soya area increased from 686,409 acres in 1909 to 1,858,971 acres in 1919. The crop with the next largest area was cotton followed by hemp (which had 40,407 acres in 1909, increasing to 69,731 acres in 1921), then sesamum.

Soybean production grew from 195,967 long tons in 1909 (Note: 1 long ton = 2,240 lb) to 612,459 tons in 1920.

© Copyright Soyinfo Center 2014

The crop with the second largest tonnage was cottonseed (44,807 tons in 1920), followed by sesamum (4,000 tons in 1920). *Perilla ocymoides* is cultivated in almost all the provinces of Korea, where it is used for the manufacture of oil. In 1920 about 35,000 acres were devoted to this crop. About half of the seed produced is exported to Japan.

Imports of oleaginous products and vegetable oils: Small amounts of sesamum seed (2,772 tons in 1922) and groundnuts (1,063 tons in 1922) are imported. Smaller amounts of vegetable oils are imported. Imports in 1922 were: Soya bean oil 500 tons, rapeseed oil 391 tons, and linseed oil 155 tons.

Exports of oleaginous products: The main product exported by far is soya beans. In 1909 some 90,108 tons of soya beans were exported. Exports of this crop apparently ceased from 1912 to 1917 (during World War I), then rose from 122,471 tons in 1918 to a peak of 225,417 tons in 1921. The second largest export was cottonseed (2,602 tons in 1922), followed by very small amounts of sesamum. Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

2298. Capone, Giorgio; Grinenco, Ivan. 1923. Oceania (Document part). In: G. Capone & I. Grinenco, eds. 1923. Oleaginous Products and Vegetable Oils: Production and Trade. Rome, Italy: International Institute of Agriculture, Bureau of Statistics. 545 p. See p. 379-402. [Eng]

• ***Summary:*** Australia (p. 381-83). Table 1 shows cultivated area and production from 1903-1923; both were very small. In 1903-06 the leader in production was linseed (73 long tons; 1 long ton = 2,240 lb), followed by cotton (15 tons). Statistics for sunflower seeds were first given in 1910, and groundnuts in 1911. During the 1920s the main oilseed by far was cottonseed. A table of imports of oleaginous products and vegetable oils shows that the main oleaginous product imported was always copra (38,896 long tons in 1920-21); in 1920-21 it was followed by linseed and coconuts. The main vegetable oils imported in 1920-21 were linseed (1,619 tons) and rapeseed (522 tons).

Fiji Islands (p. 384-85): They grew mostly coconuts and small areas of cotton, and exported significant amounts of copra.

French Settlements in Oceania (p. 386) grew mostly coconuts on the Pacific islands and Marquesas Islands. Large amounts of coconuts and copra were exported.

Gilbert and Ellice Islands (p. 387) grew coconuts and exported copra. Note: The Gilbert and Ellice Islands Colony was a former British colony in the western Pacific Ocean consisting of the Gilbert Islands, Ellice Islands, Ocean Island, and three islands (Fanning, Washington, and Christmas) of the Line Islands, and the Phoenix Islands. Area: 238 square miles. Capital: Tarawa (later capital of Kiribati). 1978 population: About 56,213. Brief history: 1892–The two main groups were proclaimed a British protectorate. 1915–Made a colony. 1916–Fanning Island, Washington Island, and Ocean Island added. 1919-Christmas Island added. 1937–Phoenix group added. 1971–New constitution inaugurated. 1976–Divided between Gilbert Islands and Ellice Islands. -

Hawaii (p. 388): Table 1 shows area and production of oil-yielding crops compiled by the Bureau of the Census in 1909 and 1919. Concerning area in 1909, Hawaii had 32,777 coco palms in bearing, plus 37 acres of cotton, 20 acres of soya, and 20 acres of groundnuts. In 1919, Hawaii had only 7,197 coco palms in bearing, plus 14 acres of cotton, 15 acres of soya, and 275 acres of groundnuts.

Concerning production, in 1909 Hawaii produced 136,827 coconuts plus 17 long tons of soya (1 long ton = 2,240 lb), 16 tons of groundnuts, and 5 tons of cottonseed. In 1919 Hawaii produced 161,123 coconuts plus 10 tons of soya, 55 tons of groundnuts, and 10 tons of cottonseed.

Island of Guam (p. 389) grew coconuts. New Caledonia (p. 390-91) grew cotton, coconuts, and olives. Exports of copra are given from 1896-1919. The main import and the main export is copra.

New Herbrides (p. 392-93) grew mostly coconuts, followed by cottonseed, and exported copra.

New Zealand (p. 394-95) keeps statistics on only one oilseed, linseed. Production grew from 53 long tons in 1903 to 4,552 tons in 1920-21. The main imports of oleaginous products are whole coconuts and copra, and of vegetable oils are linseed oil, plus small amounts of castor oil.

Papua (p. 396). The main crop produced is coconuts, followed by small amounts of cotton. The main export is copra.

Samoan Islands (American Samoa–p. 398): The chief crop is coconut, which provides the only article of export in the form of copra. Solomon Islands (p. 398): The principal industry is copra. A table shows exports of coconut and copra from 1910 to 1922. Territory of New Guinea (Later German New Guinea–p. 399): One table shows the total area under coconuts from 1909 to 1922. A second shows exports of copra from 1912 to 1922.

Tonga (p. 400): Copra is the main industry of this group of islands. A table shows exports of copra from 1909 to 1919. Western Samoa (Formerly German Samoa–p. 401): The main crop of these islands is coconuts, and copra is the main export. Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

2299. Chinese Eastern Railway, Economic Bureau. 1923. The Chinese Eastern Railway and its zone. Harbin, Manchuria: C.E.R. Economical Bureau. 32 p. Illust. 27 cm. [Eng]

• ***Summary:*** Section III titled "Agriculture" contains a bar chart showing that [soy] beans comprise 20-30% of the total cultivated area in the seven districts along the rail lines; the 30% is in the southern districts. Yellow [soy] beans yield

© Copyright Soyinfo Center 2014

22.2 bushels/acre or 90.0 poods per dessiat. 39% of the total cultivated area is taken up by marketable crops for export; 22% by soybeans and 17% by wheat; the remaining 61% is taken up by Chinese native grains (p. 12).

About half of all soybeans exported from North Manchuria go to Japan, where bean-cakes constitute one of the most popular fertilizers for fields. The remaining 50% of these exported beans are either consumed in Asiatic markets (China, Netherlands East Indies) or shipped to oil mills in Europe (United Kingdom, Germany, Scandinavian countries). The demand for Manchurian [soy] beans is growing.

Flour milling is the biggest manufacturing industry along the railway zone, followed by oil milling. "The value of the output from oil-mills equals about 1/2 value of the value of products of flour mills. Bean oil and bean-cakes are in great demand on both the interior and the foreign markets. Exports of bean oil and bean cakes are made partly to Europe and mostly Japan."

Two graphs (p. 27) show transportation by the railway of [soya] "bean-oil" and [soya] "beancakes" (in 1,000 tons) from 1913 to 1922. Transportation of oil rose rapidly to a peak of 30,000 tons in 1919, dropped precipitously to 6,000 tons in 1921 (after the Great War [World War I]), then jumped to 22,000 tons in 1927. Transportation of beancakes rose rapidly to a peak of 140,000 tons in 1917, fell to 80,000 tons in 1918, then leaped to a record 230,000 tons in 1922. Address: Harbin, Manchuria.

2300. Fujiwara, Kyoyetsuro. 1923. Isolierungsversuche mit Soja-Aagglutinin und Antiagglutinin [Isolation of soy agglutinin and anti-agglutinin]. *Biochemische Zeitschrift* 140:113-31. (Chem. Abst. 18:1013). [4 ref. Ger]
• ***Summary:*** A study of the effect of soya extracts (*Sojaextrakten*) on animal organisms and the fate of soya urease in animal organisms. Soya agglutinin is absorbable by various absorptive substances: Kaolon, aluminum hydroxide, and calcium phosphate. The agglutinating effect of soya agglutinins is enhanced, after being brought to a boil, by boiling temperature. Through repeated injections of soya extract, one obtains from rabbits an antiserum which limits the effect of the agglutinins. Address: Niigata, Japan; From the Biochemical Lab. of the Moabit Hospital in Berlin [Germany].

Address: Manchuria.

2302. Kellogg, John Harvey. 1923. The natural diet of man. Battle Creek, Michigan: The Modern Medicine Publishing Co. 386 p. Illust. Index. 20 cm. [50+* ref]
• ***Summary:*** This classic of vegetarian literature contends that a vegetarian diet is the natural diet of man. Contents: 1. Man not naturally a flesh-eater: Modern civilized life unnatural and unbiologic, animal dietaries, lessons from the monkey, porcine wisdom in diet, animals classified by diet, the ancient family of primates, all mammals originally vegetable feeders, when germ diseases were unknown, kinship of higher apes and men, flesh-eating never a universal human custom.

2. Twenty popular delusions about flesh foods: D-1. That meat is superior as a blood-making food, and, hence, is needed in anemia. D-2. That meat is essential as a flesh-building food. D-3. That a flesh diet is essential to support severe or prolonged activity; that is, promotes endurance. D-4. That flesh-eating is necessary to produce physical courage. D-5. That vegetarian races are inferior physically and mentally to races using a mixed diet. D-6. That flesh foods are more refined and more easily digested and, hence, more nutritious than are foods of vegetable origin. D-7. That man is naturally omnivorous. D-8. That flesh foods are stimulating and thus supply an element needed especially by brain workers. D-9. That beef tea is a useful nutrient. D-10. That a meat diet is required to prevent or cure gastric acidity. D-11. That a meat diet is desirable in tuberculosis. D-12. That a meat diet is necessary in diabetes. D-13. That a flesh diet is essential in the treatment of obesity. D-14. That meat is required in beri-beri. D-15. That meat is essential as a "building-up" or restorative food. D-16. That meat is needed by growing children. D-17. That meats are needed as a stimulus to appetite. D-18. That the beef industry is a necessary part of our national economic system. D-19. That a meat diet is necessary to insure reproductive activity. The law of diminishing returns versus flesh-eating. D-20. That meat is a harmless luxury.

3. Scientific objections to the use of meat: Human liver not adapted to meat diet; important differences between meat and milk; meat deficient in vitamins and food lime; Eskimos eagerly seek vegetable food; ill effects of meat diet on Arctic explorers; meat saturated with tissue poisons; meat readily putrefies, natural foods do not; the poisons of meat; meat extracts; why viscera are especially objectionable; bacteriology condemns meat as food; vast numbers of bacteria in meat; putrefactive products of meat; why physicians forbid meat in cases of kidney disease and high blood pressure; how flesh-eating causes constipation ("partly because the flesh diet is lacking in the roughage or indigestible material required to stimulate the intestine to action").

4. Diseases due to flesh eating: Tuberculosis in animals, cancer from meat eating, cancer rare and appendicitis unknown among flesh abstainers, meat-eating causes disorders of nutrition, acidosis from a flesh diet, a meat diet and scurvy, meat eating and arteriosclerosis, pernicious

© Copyright Soyinfo Center 2014

effects of a meat diet experimentally proven, recognized meat contraindications, the peregrinations of a deadly parasite, typhoid germs in meat products, flesh poisoning, no protection for meat-eaters, oyster poisoning, converting sewage into food.

5. Experimental evidence against flesh eating: McCollum's experiments, Dr. S. Weir Mitchell endorses the meatless regimen, an eminent scientist on meat diet, Fauvel's observations, greater endurance of flesh-abstainers, the death rate reduced by meatless diet, flesh-eating does not develop intelligence, meat-eating and race degeneracy, meat-eating a city habit, non-meat diet best even for carnivorous animals, the Scotchman's dog, the effects of a meat diet on rats, the effects of a flesh diet on rabbits, flesh-eating animals short lived. 6. The ethical argument.

7. Historical facts and authoritative opinions: Biblical teaching about flesh eating, apostles who were flesh abstainers, the Essenes were flesh-abstainers, the diet of the ancient Greeks, King Cyrus a flesh-abstainer, Julius Caesar's army ration, diet of Peruvian soldiers, diet of athletes of ancient Greece, ancient philosophers were flesh-abstainers, Plutarch's essay on flesh-eating, fleshless diet of a Roman emperor, meatless diet endorsed by Gautier, views of Seneca, diet of the ancient Sumerians [today's Iraq], eminent modern flesh abstainers, vegetarian monks, Thoreau on the fleshless diet, a Chinese statesman's experience, the views of two great naturalists, the poet Shelley a food reformer, a child's natural repugnance to meat, Liebig on the advantages of a non-flesh diet, Sylvester Graham's diet reform movement.

8. Interesting facts concerning the dietary habits of various peoples. 9. The marvelous adaptation of the natural diet to human needs. 10. How to discard meats comfortably and safely.

11. Is the disuse of meat advisable from a practical standpoint? The U.S. Department of Agriculture shows the use of less meat to be safe and economic, the importance of planting nut trees, avoidance of meat is necessary to change the intestinal flora, vegetable substitutes for meat, the recent low protein movement in the United States, the half century experience of the Battle Creek Sanitarium with a fleshless diet.

12. Newspaper and magazine misinformation: An "eat-more-meat" campaign, Professor Fisher of Yale University [Connecticut] refuses to support the "eat-more-meat" campaign of the [Chicago, meat] packers, pernicious piffle.

Soy is mentioned in many places. The section titled "Flesh-eating never a universal custom" states (p. 33-34): "According to Mori, the Japanese peasant of the interior is almost an exclusive vegetarian. He eats fish once or twice a month and meat once or twice a year... The soy bean is held in high esteem and used largely in the form of *miso,* a purée prepared from the bean and fermented; also *to-fu,* a sort of cheese; and *cho-yu* [shoyu, soy sauce], which is prepared by mixing the pulverized beans with wheat flour, salt, and water and fermenting from one and a half to five years. The Chinese peasant lives on essentially the same diet, as do also the Siamese, the Koreans, and most other Oriental peoples. Three-fourths of the world's population eat so little meat that it cannot be regarded as anything more than an incidental factor in their bill of fare."

Page 45: Complete "proteins are found in milk and eggs as well as in most nuts, peanuts, and the soy bean..."

Page 73: "The protein of milk, of the soy bean, and of nuts is known to be superior to meat as a source of body nitrogen." Address: Superintendent of the Battle Creek Sanitarium, Battle Creek, Michigan.

2303. Kellogg, John Harvey. 1923. The natural diet of man (Continued). Battle Creek, Michigan: The Modern Medicine Publishing Co. 386 p. Illust. Index. 20 cm. [50+* ref]
• ***Summary:*** Continued: Page 74: "Vegetable extracts (yeast extracts and soy sauce) are now prepared which are finer in flavor than the best meat extracts..."

Page 191: "Complete proteins are found in the almond and also in the soy bean and the peanut, a fact which accounts for the large use of the soy bean and the peanut in China and other Oriental countries as a supplement to a diet of rice and green vegetables."

Page 198: "The soy bean contains more protein than does beef, and 20 per cent of oil."

Page 282: G. Yukawa reports that the diet of Japanese monks "consists exclusively of vegetable products, rice being the staple, supplemented with soy beans and vegetables. The diet contained an average of 70 grams of protein, 15 grams of fat, 514 grams of carbohydrates, an average energy intake of 2,500 calories. The experimenter concluded that the absolute vegetarian diet of the Buddhist monks of Japan is entirely adequate to maintain perfect health."

Page 285: "Some years ago (1899) the Emperor of Japan appointed a commission to determine by investigation whether it was necessary to add meat to the national dietary to improve the physique of the race, especially to increase their stature. As regards the use of meat, the commission reported 'that the Japanese had always managed to do without it, and that their powers of endurance and their athletic prowess exceeded that of any of the Caucasian races. Japan's diet stands on a foundation of rice.' The rice diet of the Japanese is supplemented by the free use of peanuts, soy beans, and greens, which supply all that rice lacks to constitute a wholly sufficient bill of fare."

Page 306: "The experiments of McCollum and numerous others have in recent years demonstrated the entire feasibility of living exclusively upon a diet of purely vegetable origin. It is only necessary to make such a selection of foodstuffs as will supply the body with all the elements necessary for complete nutrition; and this may be easily done, as has already been indicated. It has also been

© Copyright Soyinfo Center 2014

shown that two widely used legumes, the soy bean and the peanut, as well as nuts, supply complete proteins and may be used in supplementing the incomplete proteins of cereals and vegetables. This fact explains the great rôle played by the soy bean in the bills of fare of the Orientals."

Pages 313-14: "Certain proteins known as complete proteins, when taken into the body in proper quantities may be wholly utilized in tissue building, because they contain exactly the elements needed, no more and no less, for the building of muscles, nerves, glands, and other nitrogenous tissues." "The protein of the soy bean, the peanut, the almond, and various other nuts has, however, been shown to be of high quality, practically equal to the protein of flesh... When meat is discarded, it is evidently necessary that care be taken to supply in its place an adequate amount of protein derived from the soy bean, the peanut, the almond, or other nuts, or from milk or eggs. Four or five ounces of soy beans, peanuts, or almonds afford an abundance of protein for a day's ration. See also p. 320.

Page 322: "But even in the absence of milk and eggs, an abundant supply of protein could be readily secured by the planting of peanuts and the soy bean, two remarkable legumes which, pound for pound, supply more nourishment than beef or pork and of finer quality." "Nuts, together with the peanut and the soy bean, afford a protein which is equivalent to that of meat at a cost far below the cost of meat proteins. For example, an acre of very ordinary ground will produce twenty bushels, or twelve hundred pounds of soy beans, which contain 40 per cent, or four hundred and eighty pounds of excellent protein. It takes an acre of ground and two years to produce seventy-five pounds of dried protein in the form of beef. The same land will produce in the same length of time nearly one thousand pounds of soy bean protein. In other words, an acre of ground devoted to soy beans will produce more than thirteen times as much protein as the same ground used as a pasture for fattening steers..."

Page 338: The section titled "The recent low protein movement in the United States," notes that the daily protein requirement for a person weighing 120 pounds could be "provided by 2½ pints of milk or by 6 ounces of almonds, 5 ounces of peanuts, 6 ounces porterhouse steak, 6 ounces navy beans, 4 ounces soy beans, 5 ounces lentils, 5 ounces black walnuts."

Page 359: "Animals furnish us a good object lesson on this subject. Compare the agility, alertness, curiosity and intelligence of the fruit-eating chimpanzee with the dull stupidity of the lion and the tiger; or the vivacity and progressiveness of the rice- and soy-eating Japanese, with the dull-witted, decaying Eskimo."

Nuts are discussed favorably on pages 56, 297, 327-31 but neither peanuts nor peanut butter are mentioned specifically.

Dr. Kellogg was a pioneer in promoting the importance of dietary fiber. The following terms appear: Bran or wheat bran (p. 40, 155, 157, 201, 301). Bulk, bulky, or bulky diet (referring to "roughage") (p. 70, 135). Cellulose (p. 57, 70, 297, 303). Constipation (p. 10, 66, 135-138, 148, 157, 161, 332, 382). Roughage (p. 57, 135, 297, 301). But none of the following terms appears in the index: Laxative, laxatives.

The author lived 1852-1943.

Note: This is the earliest English-language document seen (June 2004) that contains the term "natural foods" and that also discusses soy. Address: Superintendent of the Battle Creek Sanitarium, Battle Creek, Michigan.

2304. Kempski, Karl E. 1923. Die Sojabohne: Geschichte, Kultur und Verwendung unter besonderer Beruecksichtigung der Verhaeltnisse in Niederlaendisch-Indien [The soybean: History, culture and use, with special attention to the situation in the Netherlands-Indies]. Berlin: Paul Parey. 88 p. Illust. Index. 22 cm. [101 ref. Ger]

• ***Summary:*** Contents: Introduction. Some remarks on the soybean's early history (p. 8). Overproduction of soybeans in Manchuria after the Russo-Japanese War–English oil mills make their first trials (p. 9). Soybean production in Manchuria (p. 10-11). Soybean production in Korea (p. 11-12). Soybean production in Japan (p. 13-15). Soybean production in America–Soybean meal and soybean milk are introduced (p. 16-22). Soybean production has also expanded in Africa, British India, and the Philippines (p. 22-23). The introduction of soybean cultivation to Europe (p. 23-25). The many uses of the soybean in Europe (p. 25-26). The many uses of soy oil (p. 26-27). Old and new methods of obtaining soy oil (p. 27-31). Soybean production and use of soybeans in the Netherlands-Indies (*Niederländisch-Indien*) (p. 31-61).

Appendix: Descriptions of how the most important soybean products are manufactured: In Java (tao-hoe [tofu]), tempeh, ketjap [soy sauce], tao-tjiong [or tao-jiung, a term, and perhaps a product, between *doujiang* and *tao-tjo,* Indonesian-style miso] (p. 62-65), in China and Japan (soy sauce, miso, tofu, frozen tofu, natto, soymilk) (p. 65-68). Supplements: I: Soybeans in Manchuria (p. 69-75). II; Hansamuehle [Hansa Muehle] in Hamburg, Germany. III: *The Soybean* by Piper and Morse (p. 75).

Note the extensive, early bibliography. Unfortunately, it contains many errors.

This book is largely a review of the literature, but with some original information, especially on Indonesia and Germany. In 1923 Java imported 150,000 to 200,000 tons of soybeans and had a population of 35 million. The area of soybeans planted in Java (including Madura) increased from 157,600 ha in 1918 to 164,700 ha in 1922 (p. 32). In 1921, 67.3% of Java's soybean acreage was in Central Java, 20.7% was in East Java, and only 5.7% was in West Java. (p. 35). Large quantities of soybeans are imported to the Netherlands-Indies from Manchuria: 35,105 metric tons (tonnes) in 1920, rising to 95,742 tonnes in 1922. From these and local soybeans are made tempeh [spelled like this!], tofu

© Copyright Soyinfo Center 2014

(*tahoe; Bohnenkäse*), soy sauce (*Ketjap, Sojasauce*), etc. In Java, mostly black soybeans are grown. To make tofu yellow, it is cooked in an extract of the *Curcuma* root / rhizome. Sometimes it is also sun-dried or fried/roasted (*gebraten*). Tempeh is inoculated with a piece of tempeh from a previous fermentation, and often fried in coconut oil. Detailed descriptions are given of the production of soy sauce (*ketjap;* which is made from black soybeans) and Indonesian miso (*taucho; tao-tjiong*). The author (p. 64) states that ketjap and tao-tjiung are both inoculated using *Hibiscus tiliaceus* (hibiscus) leaves, called *waroe* in Java. Today Germany, like America, produces fresh and dried soymilk, fresh and dried soya cream, meat analogs, and soy sauce (p. 25).

This book contains 17 interesting, old photos. Descriptions of those reproduced from other periodicals are omitted. (1) A soybean field on the farm Kikai Nojo near Sempo-Station, Korea, owned and run by Mr. Moegling (p. 12). (2) A combine used for harvesting regular beans in California in 1918 (p. 19). (3) Many hydraulic presses in a modern American oil factory (p. 29). (4) The equipment used in steaming the soybeans before they are crushed in an American "steam mill" type oil mill (p. 31). (5) The interior of a British oilmill (p. 33). (6) The electrical generators in a modern oilmill (p. 34). (7) Soybeans being harvested manually at Madioen [Madiun, in East Java], Java (p. 48). (8) Harvested soybeans being dried on racks in a field in Java, and carried away by one worker (p. 48). (9) Workers dividing up the harvest in Java (p. 50). (10) Threshing soybeans with bamboo flails in the courtyard of a small farmer in Java (p. 51). (11) Selling soybeans in a small market in Central Java (p. 51).

Tables show: (1) Imports of soybeans to Germany from 1910 (43,500 tonnes) to 1912 (more than 125,200 tonnes) (p. 24). (2) Soybean acreage in Java (including Madoera) from 1918 (157,600 ha) to 1922 (164,700 ha) (p. 32). (3) A breakdown of soybean area in Java in 1921 (of 226,186 bouws) into West Java (12,980 bouws), Central Java (152,154 bouws), and East Java (61,082 bouws) (p. 35). Note: 1 bouw = 1.754 acres (Johnstone 1975). (4) Imports of Manchurian soybeans to Java (including Madoera) and other parts of the Dutch East Indies (mainly Sumatra) from 1920 to 1922 (p. 36). (5) Yields (average or range) of soybeans in various countries: Germany, Italy, British Indies, Manchuria (incl. China and Korea), Japan, America (up to 2,700 kg/ha), Java (p. 52). (6) Comparison of the nutritional composition of soybeans, peas, and regular beans (Phaseolus varieties) (p. 53). (7) Comparison of the nutritional composition of soya cheese (*Sojakäse,* tofu), beef, and lean pork (p. 53). (8) The prices of white and of black soybeans in Java during January and December 1922 and the same two months of 1923 (in Gulden) (p. 56). (9) Comparison of yields, price, costs, and profit for peanuts (*Katjang tanah*) and soybeans in Java (p. 57-58). (10) Nutritional composition of canned frozen tofu (based on E. Senft) (p. 68). (11) Exports of soybeans from five Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe], and Sansing) in 1919, 1920, and 1921 (p. 70). (12) Exports and value of soybeans from all of China to four countries (Netherlands, Russia, Japan, Dutch East Indies) in 1919, 1920, and 1921 (p. 72). (13) Exports of soybean oil from five Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe], and Harbin) in 1919, 1920, and 1921 (p. 72). (14) Exports and value of soybean oil from all of China to five countries (England, Netherlands, Belgium, Japan, USA) in 1919, 1920, and 1921 (p. 72). (15) Exports of soybean meal from four Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe]) in 1919, 1920, and 1921 (p. 73). (16) Exports and value of soybean meal from all of China to three countries (Japan, Russia, USA) in 1919, 1920, and 1921 (p. 73). (17) Names of the five major railway lines in Manchuria (South Manchuria Railway, Chinese Eastern Railway, Peking Mukden Line, Kirin-Changchun Line, Saupingkai-Taonan Line) (p. 74). (18) Amounts (in tons) of soybeans, soybean cake, and soy oil (*Sojaöl*) shipped over the South Manchuria Railway, and the Chinese Eastern Railway in one year (p. 74). (19) Railway transport and production amounts of the mills (in tons) in Dairen and Newchwang of soybeans, soybean cake, and soy oil (*Sojaöl*) during the year 1921 (p. 74). Address: Agricultural Expert in Poerbasari te Pengalengan, Java.

2305. Kung, C.M. 1923. Some experiments about the purple patch of soybean. Dissertation, Japan. *
• ***Summary:*** Discusses purple stain. Address: Japan.

2306. Lewis, William S.; Murakami, Naojiro. eds. 1923. Ranald MacDonald: The narrative of his early life on the Columbia under the Hudson's Bay Company's regime; of his experiences in the Pacific Whale Fishery; and of his great adventure to Japan; with a sketch of his later life on the western frontier, 1824-1894. Spokane, Washington: Published for The Eastern Washington State Historical Society by The Inland-American Printing Co. 336 p. 25 cm. [127* ref]
• ***Summary:*** Ranald MacDonald was born on 3 Feb. 1824 at Fort George, a great trading post located at the mouth of the Columbia River, owned by the Hudson's Bay Company, and formerly called Astoria; this area is now in Oregon. His mother was an Indian (he believed that she was a daughter of the great Chinook Chief Com-comly) and his father, Archibald, was a Scotch highlander; he was born a British subject. His mother died a few months after his birth and he was raised by his mother's sister. In Sept. 1825 his father remarried and he was raised by a stepmother, Jane Klyne. He worked with the Hudson's Bay Company, of which his father was chief trader and chief factor. The Oregon Treaty of 1845 made him a citizen of the United States.

"In March 1833 a Japanese junk laden with crockery..., blown across the Pacific, was wrecked about 15 miles south

© Copyright Soyinfo Center 2014

of Cape Flattery [on the northwest coast of Washington] and all of the seventeen men on board lost except three who were seized and held as slaves by the local Indians... These Japanese were subsequently rescued from the Indians in May, 1834, by Captain William McNeil–the Boston skipper–on board the Hudson's Bay Company ship 'Llama' and taken to Fort Vancouver." Numerous primary sources for this information published in the 1830s are cited.
The kind Dr. John McLoughlin attempted to return these shipwrecked Japanese to Japan via London (England), and Macao, China–but Japan would not accept them. These were apparently the first Japanese in the U.S.A. and the incident inspired MacDonald to travel to Japan to learn more about the Japanese. At age 24, in July 1848, he arrived in the Japan Sea on the American whale ship 'Plymouth' under captain Edwards. He then left the whale ship alone in a small boat. After going ashore on 3 small islands (Teure, Yankeshiri, Rishiri) inhabited by Ainu off the coast of Yesso (Yeso, now called Hokkaido), he landed at Soya on the northernmost tip of Hokkaido. Then, treated as a prisoner, he was sent on the ship Tenjinmaru to Nagasaki and saw the small island of "Dessima" (Deshima, Dejima) in the harbor. He was confined to a sort of prison which he was never allowed to leave and made to wait about 7 months until the next Dutch ship arrived. During this time he taught English to various eager pupils and interpreters. He was the first English instructor in Japan. His best student was the brilliant Yeanosuke Murayama, who was already fluent in Dutch. He stayed in Japan until 26 April 1849 when he was removed on the American ship 'Preble' under commander James Glynn.

While in Japan MacDonald compiled a glossary or dictionary of about 550 Japanese words and their English equivalents. Among these were tofu (he wrote "tove"; see p. 288), and shoyu [soy sauce] (he wrote "shon" or "son"; see p. 297). After further travels to China, India, Australia and Europe, he returned to America in 1853 to live his later years in his native homeland near the Columbia River, in the Pacific Northwest.

Note: This book is extremely well written and carefully documented, with extensive scholarly footnotes. There are numerous appendixes, a glossary, and two bibliographies. One of the appendixes (II-C, p. 280-84) is a deposition taken by commander Glynn on 30 April 1849; it tells of MacDonald's life and the story of his stay in Japan up to that time. It appears in U.S. Senate, Executive Docket, 32nd congress, 1st session, No. 59, p. 25-28.

An illustration (p. 208) shows Maruyama and Tokojiro, two Japanese men in Edo period dress. Both pupils of Ranald MacDonald, they were the chief interpreters in negotiations with Commodore Perry.

Footnote 238 (p. 209) states: "During the period of exclusion, Occidental knowledge of Japan was derived through the Dutch. Three physicians attached to the Dutch factory at Nagasaki contributed principally to this knowledge of Japan: Englebrecht [Englebert] Kaempfer (Japan 1690-1692), author of a *"History of Japan and Siam,"* London, 1727; Charles Peter Thunberg (Japan, 1775-1776), author of *Travels in Europe, Africa and Asia;* and Philip [sic, Philipp] Franz von Siebold (Japan 1822-1830), author of *Nippon, an Archive towards the description of Japan.* In addition to these, three directors of the Nagasaki factory, Isaac Titsingh, J. F. van Overmeer Fisscher and G. F. Meijan, furnished further information. Additional information was received through Russian sources from the published account of Georg Heinrich von Langsdorff, a German physician attached to the Reasanoff expedition (1804), and from Captain Vasili M. Golownin's *Memoirs of His Captivity in Japan, 1811-1813.*

"In like manner whatever Japan received of the material civilization of the Occident during these years was obtained principally through the Dutch." Address: 2. Head, School of Music, Imperial Univ., Tokyo. Formerly head of the Dep. of Foreign Languages at the Imperial Univ.

(3) "Fermentation room: wooden vats holding fermenting soy sauce; note the planks on which the moromi stirrer would stand to perform his task."

(4) Running the mature moromi (mash) into strong sacks in preparation for pressing out the sauce.

(5) An older method of extraction and pressing, using many large stones at the end of a long wooden lever press; bags filled with moromi are in the porous-bottom wooden box near the fulcrum.

(6) Another method of pressing: "a windless type of device for applying pressure to a porous-bottom box (*age-fune*) in order to separate sauce from lees" (residue).

(7) Yet another method of pressing using a sort of windlass turned under foot.

(8) A modern method of pressing using hydraulic presses. Taken in 1923.

(9) A room partly filled with the presscake or residue remaining after the soy sauce has been pressed out.

(10) Soy sauce being run into wooden kegs to be sold.

(11) A line of bottles being filled with soy sauce. Bottles [and cans] were introduced by Noda Shoyu in 1923.

(12) Shallow wooden boats on the Tone River waiting to carry shoyu downstream to Tokyo. A railway had largely taken over this function, starting in 1911.

(13) Typical homes of factory workers in Noda.

These photos were sent by W. Mark Fruin (via Kikkoman) to Soyfoods Center in 1983 with permission to publish them. The photos are from the Kikkoman archives in Noda, Japan. Mark thinks that some of them may have been taken at Kikkoman's small *Goyo Gura* where the shoyu made for the Imperial Household was always made by hand. Several of the photos appeared in Fruin's classic history of Kikkoman titled *Kikkoman: Company, Clan, Community* (1983, Harvard University Press). See p. 32, 34.

2311. Sato, Masanori. 1923. Daizu abura shibô-san sekkai no kanryû ni yoru sekiyu ruiji nenryô no seihô ni tsuite [Preparation of a liquid fuel resembling petroleum. II. Distillation of the calcium soap of soya bean oil]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 26:297-304. [Jap; eng]

• ***Summary:*** By dry distillation of the calcium salt obtained by treating soy bean oil with lime, a liquid fuel was obtained. The yield of "crude oil" was about 70% by volume of the soy bean oil. The product contained a little oxygen and yielded on distillation 20.6% light oil, boiling point below 150º C; 58.5% middle oil, boiling point 150º-300ºC; and 20.3% heavy oil, boiling point above 300ºC. By refining the middle oil with sulfuric acid, it was found to contain 60% unsaturated hydrocarbons; the remaining saturated hydrocarbons were a mixture of paraffins and naphthenes. The "crude oil" contained about 4.4% acidic compounds in which naphthenic acids and phenols were detected. The heavy oil contained about 5% solid paraffin. Address: Manshû Tetsudô Chûô Shikenjo.

2312. Satow, Sadakichi. 1923. Manufacture of plastic products from proteid of soy bean. *Tohoku Imperial University, Technology Reports* (*Sendai, Japan*) 3(4):199-267. (Chem. Abst. 17:3574). [15 ref]

• ***Summary:*** Contents: Preface. 1. Properties of soy bean proteid. 2. On the relations between hydrolised proteid and its glutinization. 3. Effect of coagulation of proteid upon glutinization. 4. On the process of glutinizing. 5. Reactions of proteids with formaldehyde or other active methylene compounds. 6. Process of moulding. 7. Effect of other chemicals and ingredients on the product. 9. Properties of the plastic materials made from soy bean proteid and their physical and chemical tests. 10. Application of products manufactured from soy bean proteid.

The properties of the protein from soy beans, which is termed glycinin, are described, and its reactions with neutral salts, alkaline and acid reagents of various types enumerated. Phenols, naphthols, and the condensation products of formaldehyde with phenols and with other chemicals have the property of dissolving the glycinin with the formation of a thick viscous fluid, which is converted by heating into a hard, strong, insoluble and infusible substance. If the wet protein is used instead of the dry powder, a white, sticky substance is produced, which under the influence of heat and pressure gives a rigid, semi-transparent substance. Potassium bichromate glutinizes the wet protein into a very viscid adhesive paste of a reddish brown color, which is converted into an insoluble hard substance by autoxidation at the ordinary temperature. A transparent plastic material may be manufactured by subjecting the hydrolyzed protein directly to the action of formaldehyde, omitting the glutinizing process. Formaldehyde reacts with the protein in 2 stages, the first being almost instantaneous, but the second occurring slowly over the lapse of months. The result of the second reaction is an increase in the tensile strength of the substance.

Note: This is the earliest document seen (Oct. 2001) concerning hydrolyzed soy protein. Address: Kôgakuhakushi, Sendai, Japan.

2313. *Wochenschrift fuer Brauerei.* 1923. Ueber die Zerstoerungstemperatur der Koji-Diastase in waesseriger Loesung und die Wiederherstellung ihrer Wirksamkeit nach dem Erhitzen [On the lethal temperature of koji diastase in aquatic solution and the recovery of its action after heating (Abstract)]. 40(26):156. [1 ref. Ger]

2315. Loew, Oscar. 1924. The soy bean, a superior crop. *Porto Rico Agricultural Experiment Station, Agricultural Extension Notes* No. 64. p. 1-2. Jan. 15.

• ***Summary:*** "The soy bean originated in Eastern Asia and has been introduced during the past 30 years into different countries of the world. It can be grown successfully even in a rather poor soil, in the absence of nitrogenous manure, provided the specific root-nodule bacteria are present. This plant is far superior to other leguminous crops, even those very rich in protein, as the lupin, which it equals in protein and highly surpasses in fat content. In fact, the soy bean is richer in fat than all other leguminous crops and is, therefore, sometimes called the oil bean. The soy bean does not contain alkaloids and bitter tasting matters like the lupin..."

A table compares the nutritional composition of the pea, common bean, lupin, and soy bean. "From the analyses it would appear to be of great advantage for the people of Porto Rico to replace the common bean now serving as an essential part of the daily food, by the soy bean, it providing a higher percentage of protein and fat... Since the Soy bean needs prolonged boiling until it reaches a sufficient degree of softness, it is best soaked for a day in water to which some soda and common salt are added (about a teaspoonful of each to half a liter) followed by washing two to three times with fresh water and then boiling for an hour or so. The taste of this dish is very agreeable.

"In Japan the soy bean serves for several preparations, called 'tofu,' 'yuba' and 'miso,' which might be prepared in Porto Rico. Also, a dressing or condiment similar to the English Worcestershire sauce, is prepared from the seeds." The preparation of tofu is described. It is "generally fried like cakes and represents an excellent food."

"The milky liquid can also doubtless be used as a suitable nutrient, but it can never replace the mother's or cow's milk for children, since the lime content is exceedingly small and the protein differs widely from the casein of the milk.

"In our trials with soy beans at the Experiment Station, Mayaguez, the results at first were disappointing. This was found to be due to the fact that the soil was not inoculated with the proper bacteria for assimilating nitrogen for the roots. We now have inoculated soil, and before planting on ground new to this crop inoculating material should be secured from the Station for mixing with the seed at the time of planting. When the soil is once inoculated it will remain so for all succeeding crops."

Note: Who was Dr. Oscar Loew and how did he learn about soyfoods? From 1897 to 1906 he was a Professor of Agricultural Chemistry at the Imperial University of Tokyo, Japan, where he wrote articles about soy sauce, tofu, soymilk, and yuba. In 1911 he was in Munich, Germany, where he wrote an article about soymilk. When he speaks of "our trials with soy beans at the Experiment Station, Mayaguez," he seems to indicate that he was living at the Station in Porto Rico in about 1924. Address: Mayaguez, Porto Rico.

2316. Slosson, Edwin E. 1924. Soy. *Scientific Monthly* 18:109, 111. Jan.

• ***Summary:*** "The recent rise in restaurant prices has sent economical Americans flocking to the chop sueys, where a savory and satisfying meal can still be obtained for a small sum. The Chinese, in their efforts to keep three hundred million people above the starvation point for three thousand years, have been forced to figure closely on food values... With us Americans meat has been the main part of the meal with vegetables on the side. With the Chinese this is reversed, and meat has in many cases been reduced to a condiment...

"The chief difficulty of a vegetarian diet is to get a sufficient amount and variety of proteins. Beans and peas are the richest in proteins, but they are not of the sort and proportion found in meats and needed for our muscle-making.

"But there is one exception and that is the soy-bean... The soy bean resembles animal foods in being rich in fat and protein and devoid of starch. What is more remarkable, the soy bean contains a dozen kinds of protein compounds that are the same as those found in milk. In fact a 'vegetable milk' can be made from soy beans and from this vegetable curds and cheese. These form a large part of the diet of Chinese and Japanese who abstain from animal food either because they are Buddhists or because they are poor. By milking the soy bean they can get ten times as much lacteal fluid per acre as if they pastured cows on the land. Italian physicians who used soy milk as infant food during the war report that it was better tolerated than cow's milk by some of the babies.

"The soy milk products have not yet come into use with us, but the American patron of the chop suey has acquired a taste for another product of the bean, the little glass cruet of brown sauce that seasons the rice. It looks and tastes like meat extract, such as we use in making beef tea, and is really much like it in composition and nutritive value. This shoyu or soy sauce is made by long fermentation and ripening of a mixture of beans and wheat in brine. The longer the process the better the product. Six months or a year may suffice for the masses, but to suit the taste of the Oriental connoisseur

© Copyright Soyinfo Center 2014

it must be sunned for five years or even thirty, the jars being patiently uncovered every day and covered every night or whenever it rains. Over two million barrels of soy sauce are made in Japan every year."

2317. Omega. 1924. Soya bean oil: Its production, properties, and applications. *Chemical Trade Journal and Chemical Engineer* (*London*) 74(1917):187-89. Feb. 15. [17 ref]
• ***Summary:*** Contents: Introduction. The extent of the soya bean industry: Japan, Manchuria, The United Kingdom trade: Imports of soya beans and soya bean oil, exports of soya oil and soya bean cake. Methods of production. Solvent extraction processes. Composition of soya bean oil. Properties of soya bean oil. Identification of the oil. Uses and applications of soya oil. Future of the industry.

Tables show: (1) Imports of soya bean oil to the USA (1918-1921). (2) Exports of soya beans, soya bean cake and soya bean oil from Manchuria (1915-1919). 2321. Miyake, Koji; Tamachi, Ishio. 1924. On the nature of the acidity appearing after the addition of soybean cake to a rice field. *J. of Biochemistry* (*Tokyo*) 3(3):305-23. April. [18 ref]
• ***Summary:*** It is said that plants grow best in a neutral medium or soil. Therefore the effect of decomposing organic manure on the soil reaction has been examined by many researchers.

When soybean cake is added to a rice field, the soil water becomes more acidic, largely because of organic acid and carbon dioxide. "However, titratable acidity is due mainly to soluble iron, aluminium and manganese compounds combined with these acids." However, since the large amount of organic acid is largely combined with ammonia and other bases, the titratable acidity of the soil solution is not significantly affected. Address: Inst. of Agricultural Chemistry, Hokkaido Imperial Univ., Sapporo.

2322. F.H.H. 1924. A spring week-end at Choshi on the Cape Cod of Japan. *Christian Science Monitor.* May 6. p. 9.
• ***Summary:*** Describes a trip from urban Tokyo to rural Choshi. The tip of the promontory that juts out into the Pacific Ocean is crowned by a tall lighthouse of white stone, constructed 50 years ago. The pride of the neighborhood, the emblem "figures on all Choshi products, from the labels on the bottles of the excellent shoyu (soy sauce) to the bath towels that the Japanese inn presents to each departing guest."

Note: Choshi is a city located near the tip of a promontory on the Pacific Ocean, in Chiba prefecture, Japan. It lies almost due east of Central Tokyo, and is the easternmost city in the Greater Tokyo Area. The Tone River runs through it. Address: Special to the Monitor.

2323. Kodama, Renichi. 1924. Nature of the oil of soy bean miso. *Industrial and Engineering Chemistry* 16(5):523. May.
• ***Summary:*** This article begins: "Miso, a soy bean paste made by fermentation, is one of the most staple and nutritious food products of Japan. All the people like it, and it is used as a soup stock and seasoning in every home." Miso is made from polished rice fermented with *Aspergillus oryzae,* mixed with steamed soy beans, salt, and water. The yearly consumption amounts to about 400,000,000 kan (1 kan = 8.27 pounds), and its value is about 360,000,000 yen, or $180,000,000. There are two varieties of miso–the Edo or Tokyo miso, and the Sanshu or Haccho miso.

The preparation of both types of miso is described and the properties of the extracted oil studied. "The Sanshu miso is produced chiefly in the central part of Japan. It is made by inoculating the steamed soy bean with Koji mold and mixing with salt and water. This is also packed down under weights and kept for 1 or 2 years to ferment. The result is a dark brown paste with a salty taste."

The oil was extracted from the vacuum-dried miso of the two different varieties. Tables show: (1) The composition of

© Copyright Soyinfo Center 2014

"Edo miso" and "Sanshu" miso–in terms of the amount of rice, soy beans, salt, and water used to make each. (2) The properties of miso oils for the two types of miso. (3) The constants of soy bean oil, including specific gravity, melting point, solidification point, acid value, saponification value, iodine value, Hehner value, and R.M. value [Reichert-Meissl value].

The appearance of ordinary soy bean oil and of the oil of soy bean miso is practically identical. The decolorization of the oil with animal charcoal materially altered the above characteristics; the iodine value was greatly decreased, and the saponification and Hehner values were increased, the oil becoming nearly solid. The miso oil shows a greater Reichert-Meissl value and a smaller iodine value than soy bean oil.

Note: This is the earliest English-language document seen (March 2009) that uses the term "soy bean paste" to refer to miso, or that mentions "Edo miso" or "Sanshu miso." Address: Iwasaki Food Research Lab., Tokyo, Japan.

2324. *Chinese Economic Monthly.* 1924. Manchurian beans. 1(9):12-19. June. [Eng]

• ***Summary:*** "The principal export of Manchuria, and indeed of the whole of China, is the soya bean, which in its raw and manufactured states amounts to over 75 per cent of the value of the total exports of the Three Eastern Provinces. It would be no exaggeration to say, therefore, that the entire industry in this territory is concentrated on [soya] beans, their production, manufacture and barter. It is mainly the bean that provides the buying power of Manchuria, and stimulates its economic progress. From a primitive agricultural region Manchuria has developed along industrial lines mainly as a result of its stupendous [soya] bean resources."

Manchuria is "almost the sole supplier of soya beans to world markets. All attempts to cultivate beans out of China on any extensive scale have failed. 'Beans' is therefore always associated with Manchuria, and *vice versa.*

There are many soya bean varieties, but the yellow oliferous one (*huang-tou*) is the dominant variety; it is "subdivided into a number of kinds. The experimental field of the Manchurian Rural Economy Society cultivates no fewer than 200 varieties."

Chinese official statistics, which are usually low, estimate the area under soya beans in the whole of China [including Manchuria] at 12 million acres. Statistics from the Economic Bureau of the Chinese Eastern Railway, in the C.E.R. zone (Heilungkiang and a part of Kirin province), yellow soya beans are planted over an area of not less than 4.3 to 4.4 million acres, or 25% of the entire cultivated area, while in all 3 of the provinces of Manchuria the Bureau estimates that there are 8 million acres under cultivation. On average in Manchuria, 1 acre yields about ½ ton of soya beans. Thus, the total average production of soya beans in the whole of Manchuria may be estimated at more than 4 million tons, of which about 2.4 million tons (about 60%) are exported in raw and manufactured articles.

Owing to the density of the inner provinces of China, almost all the soya beans there are consumed locally. "Inner China looks not so much to the oil content of the bean as to the azotic stuffs [nitrogen] it contains. The export of soya beans and products from Inner China is very small and decreasing (5.5 million piculs in 1920 and 4.6 million piculs in 1922) while the exports from Manchuria continue to grow dramatically.

The world is now looking to the soya bean as one solution to its future food problems. Dr. Berczeller, a well-known Hungarian scientist, says: "It is a matter of the highest political importance that the West should learn the lesson of cheaper living as taught to them by the East in the adaptation of the soya bean as an article of food." After prolonged investigation, he claimed to have succeeded in creating from the yellow soya bean bread, milk, and flour, which were both inexpensive and palatable. Yet the taste of many soybean products (such as "bean flour" and "bean cheese") is unknown to Europeans.

"The extraction of oil from [soya] beans has as ancient an origin as the cultivation of the beans themselves. In the native Chinese mills it is still effected by means of the wedge press, the invention of which dates from the early days of the history of technics. The first steam bean-oil mill was opened toward the end of the last century at Yingkow [Yingkou]. At present such mills are counted in hundreds. Almost the entire bean oil export comes from steam mills. Several years ago the South Manchuria Railway Company erected a mill at Dairen for the extraction of oil with the aid of benzine. It is now under private management." Using the solvent method, 12% of the weight of the bean is extracted as oil, using the steam mill only 19%, and using the wedges presses less than 10%. Recently, due to perfected methods of refining, an oil named "Atzetko, made at Harbin by the Anglo-Chinese Company, has begun to be used in food by Europeans.

Before World War I, the price of soya beans was much lower than today. Today the main consumer of beancakes is Japan, were they are used as fertilizer on the rice fields. "However, there is one dark side of the picture" of soya beans in northern Manchuria. Manchurian bandits (*hunghutze*) are terrorizing and plundering the peasants.

Note 1. This is the earliest document seen (Nov. 2012) that uses the term "dark side" in connection with soya beans.

Tables show: (1) Soya bean cultivated area and production in the three provinces of Manchuria in 1923: Kirin province (center east): 1.6 million shan (1 shan = 1.8 acres) produced 1.5 million tons. Heilungkiang province (furthest north): 1.2 million shan produced 1.5 million tons. Fengtien province (later renamed Liaoning, furthest south): 1.2 million shan produced 1.5 million tons. Totals for Manchuria: 4 million shan (7,200,000 acres) and 3,700,000 tons.

© Copyright Soyinfo Center 2014

Note 2. This is the earliest document seen (March 2001) that gives statistics on soybean production in East Asia. (2) Export of soya beans and soya bean products from China proper. Source: 1922 Chinese Maritime Customs report. For the 3 years 1920, 1921, and 1922, gives the weight in millions of piculs (1 picul = 133.33 lb) and value in Hk. Tls. [Haikwan Taels; a monetary unit] of each of the following: Yellow [soya] beans: Grain [beans / seed], beancakes, bean oil, total. Black [soya] beans. Green [soya] beans. White [soya] beans. Other kinds. Total exclusive of yellow beans. Gross total. In percentages relative to 1920. (3) Exports from Manchuria only: Exactly the same years and products as Table 2. Note 3. One Haikwan Tael in 1920 equaled 6 shillings 6½ pence or $1.24 in gold coin; in 1922 it equaled 3 shillings 9 pence or $0.83 in gold coin.

(4) Re-import of soya beans and products into China in 1922. Yellow beans–4.9 million piculs worth 17.6 million Hk. Tls. Beancakes–6.3 million piculs worth 16.6 million Hk. Tls. Oil [soya]–0.2 million piculs worth 1.7 million Hk. Tls. Other [soya] beans–2.1 million piculs worth 7.1 million Hk. Tls.

(5) Net export of yellow soya beans from China in millions of piculs each year from 1920 to 1922: To Japan, To Dutch Indies, To Turkey, Persia, Egypt, etc. To Europe. To other countries. Via Vladivostok. Total. Note 4. Soya beans exported via Vladivostok are mostly directed to Europe (about 3 million piculs), with about 2.5 million piculs to Japan.

Note 5. In Table 5, "Turkey, Persia, Egypt, etc." is treated as one unit or geographical area. In 1920 this area imported from China 0.4 million piculs of soybeans, followed by 0.7 million in 1921 and 0.3 million in 1922. Although we know the amount of soybeans imported to the area, we cannot say for sure to which specific countries the soybeans were imported in this area (Turkey and/or Persia). Therefore, this may be the earliest document seen (Dec. 2007) concerning soybeans in Turkey. This document may contain the earliest date seen for soybeans in Turkey (1920-1922).

Note 6. This may be the earliest document seen (Dec. 2007) concerning soybeans in Persia (today's Iran). This document may contain the earliest date seen for soybeans in Persia (1920-1922).

Note 7. This is the earliest document seen (Dec. 2007) concerning soybeans in the Middle East / Near East (Persia, and/or Turkey–today's Iran). This document contains the earliest date seen for soybeans in the Middle East / Near East (Persia and Turkey) (1920-1922).

(6) Net export of [soya] beancakes from China in millions of piculs each year from 1920 to 1922: To Japan, To other countries, Via Vladivostok. Total. "Beancakes exported *via* Vladivostok are directed almost exclusively to Japan."

(7) Net export of [soya] bean oil from China in thousands of piculs each year from 1920 to 1922: To Japan, To Dutch Indies, To Turkey, Persia, Egypt, etc. To Europe. To United States of America. To other countries. Via Vladivostok. Total. A note states that Bean oil exported via Vladivostok is mostly directed to Europe and to countries of Asia Minor. All the other kinds of beans are distributed mostly in Japan, Korea, and along the coasts and islands of the Pacific Ocean.

(8) Chemical composition [as-is basis] of the three main soya bean varieties cultivated in North Manchuria: White Eyebrow (*pai mei*). Round Gold (*chin-yuan*). Dark Belly (*hei chi*). (9) Weight (in millions of poods) of soya beans and products carried on the Chinese Eastern Railway in 1920, 1921, 1922, and 1923. Also: Percentage of total carried. Weight of each exported to the South Manchurian Railway, and to the Ussuri Railway. Soya beans and their products are the principal cargo of the Chinese Eastern Railway; in 1923 they accounted for 49.0% of its total cargo, compared with only 24.6% in 1920.

2325. Tang, Chi Yu. 1924. An economic study of Chinese agriculture. PhD thesis, Cornell University, Ithaca, New York. 514 p. June. See p. 420-23. [2+ ref]

• ***Summary:*** In Part V, Chief Agricultural Enterprises, chapter 24 is titled "Soy beans." It begins: "China leads the world in the production of soy beans. Statistics on acreage and production of soy beans in China proper are lacking. The soy beans acreage in Manchuria, however, was estimated at 7,200,000 acres, and production 3,700,000 tons" (see *Chinese Economic Bulletin* No. 156, p. 9 {16 Feb. 1924}). "During the period 1891-1904, exports of soy beans and soy bean products were almost entirely absorbed by Japanese markets. The Russo-Japanese war in 1904 and 1905 stimulated the production of soy beans in Manchuria, After the war, the surplus beans had to be disposed of in some markets, and for the first time trial shipments were made by Japanese firms to English mills in 1908... During the period 1909-1922, acreage and production of soy beans increased by leaps and bounds" [in the USA].

The chapter then lists five major reasons that soy beans have become so important in China: "1. Soy beans thrive in a variety of climatic conditions. They do well in dry seasons and at the same time do not reduce greatly in yield in a wet season. 2. Since they are a leguminous crop, soy beans are grown to maintain soil fertility... 3. Soy beans have a high food value in comparison with other foods. They are especially rich in protein... 4. Many by-products are made from soy beans, including bean oil cake, bean meal, bean flour, bean bran, bean sprouts, bean coffee, bean milk and bean curd. Because of the large range of by-products that have been made, the price of soy beans has become stabilized... 5. Further expansion of soy bean production possible when North Manchurian lands are brought under cultivation."

Table 45 (p. 422) shows China's exports of soy beans,

© Copyright Soyinfo Center 2014

bean cake, and bean oil for the years 1913, 1920, 1921, and 1922 in piculs (133.33 lb) and taels (a monetary unit). Each of the three increased during this period which included World War. I. In 1922 exports of bean cake were worth the most, followed by soy beans and bean oil. Soy bean exports grew from 7,419,511 piculs in 1913 to 12,462,350 piculs in 1922. [Soy] bean oil grew from 49,817 piculs in 1913 to 12,294,006 piculs in 1922.

Table 46 (p. 423) shows the weight and value of these three products exported to various countries. Beans are mostly exported to Russia, Japan, and the Dutch Indies (in that order). Bean cake is mostly exported to Japan (86% of the total) and Russia. Relatively little bean oil is exported: it goes mainly to the "Turkey, Persia, Egypt, etc." [grouped as one unit] (380,000 piculs), Russia (250,000 piculs), Great Britain (246,000 piculs), the Netherlands (201,000 piculs), and the United States (116,000 piculs).

Note: This is the earliest English-language document seen (June 2013) that uses the term "bean bran" to refer to soy bran. Address: Cornell Univ., Ithaca, New York.

2330. Piper, Charles V. 1924. Forage plants and their culture. Revised edition. New York, NY: Macmillan Co. xxv + 671 p. Aug. See p. 571-96. Illust. Index. 19 cm. [9 ref]
• ***Summary:*** Contents of Chapter 27, "Soybeans": Agricultural history. Botany. Description. Soil preferences. Climatic relations. Importance. Statistics. Desirable characters in soybean varieties. Commercial varieties. Preparation of soil and cultivation. Rate of seeding. Time of seeding. Method of seeding. Depth of seeding. Inoculation. Life period. Time to cut for hay. Hay yields. Fertilizers. Soybean mixtures. Silage. Rotations. Feeding value of soybean hay. Pasturage. Seed production. Storage. Pollination. Seed yield. Feeding the seed. Seeds. Pests. Breeding. Soybeans and cowpeas compared.

"The soybean was first cultivated in the United States in 1804, but it apparently attracted but little attention until 1854, when two varieties were brought back from Japan by the Perry expedition. Other varieties were introduced from time to time, among them the Mammoth, which was introduced previous to 1882. It is largely due to the introduction of this variety that the soybean has become an important crop in the Southern States and a large percentage of the acreage there is still planted to this variety. Between the years 1900 and 1920, the United States Department of Agriculture introduced about 800 varieties from all portions of the Orient."

Chapter 7, "The statistics of forage crops for the United States," gives the following statistics for soybeans: (1) "Relative importance of major crop plants producing harvested forage according to the number of cattle each would support for one year, 1919" (p. 129): The top 10 are corn (50% of total), oats, alfalfa, timothy, clovers, wheat, wild hays, sorghums, misc. tame hays, barley. Soybeans are no. 15 (0.2% of total). (2) Major crops pastured off... 1919 (p. 130): In descending order of production (1,000 tons)– Corn 3,525, cowpeas 800, velvet beans 800, peanuts 750, soybeans 160. (3) Annual legumes cut for hay (1,000 acres, p. 133): Cowpeas 750, soybeans 550, peanuts 400, vetch 150. (4) Silage crops (p. 133-34): Probably more than 90% of the total silage preserved was corn. Very small quantities of sunflowers, cowpeas, soybeans etc. make up that balance. (5). Major hay crops in the United States, 1919 (million tons produced, p. 137). The top 10 are timothy 25.47, alfalfa 18.8, clovers 16.8, wild grasses 15.6, sorghums 7.9, oats 2.4, wheat 1.8, barley 1.3, sudan grass 1.0, millet 1.0. Soybeans are no. 14 at 0.5.

The chapter titled "Vetches and vetch-like plants" contains a section (p. 547) on Square-pod pea (*Lotus tetragonolobus*–later known as winged bean, *Psophocarpus tetragonolobus*).

The chapter titled "Other warm season annual legumes" contains a section (p. 602-05) on Florida velvet bean (*Stizolobium deeringianum*). It was introduced into Florida prior to 1875. An earlier maturing selection is called the Georgia velvet bean. Note: This book does not mention the regular velvet bean (genus *Mucuna*). Address: Agrostologist in Charge of Forage Crop Investigations, Bureau of Plant

2331. *Japan Magazine* (*The*)*: A Representative Monthly of Things Japanese.* 1924. Japanese child games: The "Oden-ya." 15(1):10-11. Sept.
• ***Summary:*** Page 10: "*Oden* is a kind of Japanese popular food." Among the many things it contains are *yaki-dofu* (broiled beancurd), *ganmodoki* (bean-curd fried with condiments), potatoes, etc., which are cooked in a soup of soy [sauce], after which they are skewered and eaten, usually with mustard. The seller of *oden* is called *oden-ya.*

In this game, "boys and girls imitate this familiar food hawking in their play. It is an outdoor game [played] by at least 6 or 7 children.

"There are two taggers chosen at first. One hawks *oden* and another buys, the rest forming the *hanpen, chikuwa, konnyaku, yaki-dofu, ganmodoki* and potatoes respectively. The *oden-ya* arranges in a line these foods beside him, waiting for one coming to buy them..."

Note 1. This is the earliest English-language document seen (April 2013) that contains the term *yaki-dofu* or the term "broiled beancurd." Both refer to grilled tofu.

Note 2. This is the earliest English-language document seen (April 2013) that contains the word *ganmodoki* (written as one word); it refers to deep-fried tofu burgers.

Note: This remarkable periodical was founded by Baron Hirayama, P.C., in 1910.

2332. Matsuoka, Chokichi. 1924. Japanese soy and method of making the same. *U.S. Patent* 1,514,554. Nov. 4. 3 p. Application filed 3 Dec. 1923.
• ***Summary:*** Crushed soy bean is extracted with boiling water, and the extract is treated with salt and *Aspergillus* and fermented at 30º-50ºC for 3 weeks. The product is filtered and sterilized by heating at 100ºC. Address: Los Angeles, California.

2333. Nishiwaki, Yasukichi. 1924. Soja-Bereitung mit *Oidium lupuli*, *Aspergillus oryzae*, und *Rhizopus japonicus* [Preparation of soy sauce with cultures of *Oidium lupuli*, *Aspergillus oryzae*, and *Rhizopus japonicus*]. *Zentralblatt fuer Bakteriologie. Series 2.* 63(1/8):28-30. Nov. 27. [2 ref. Ger]
• ***Summary:*** The author reports experiments concerning the production of soy sauce using three different types of mold: Oidium [one of the early names for Neurospora before the sexual stage was described in 1927], Aspergillus (the mold generally used in soy sauce production in Japan), and Rhizopus (the mold widely used to make tempeh). Surprisingly, the soy sauce fermented with Oidium was considered to be the best quality. It can also be used to make good quality miso. The quality of soy sauce made with Rhizopus molds was considered to be poor, and the yield of soy sauce was low. Onchom is not mentioned. Address: Professor, Technischen Hochschule zu Osaka, Japan.

2334. Nishiwaki, Yasukichi. 1924. Biologische Untersuchungen ueber den Koji-Pilz des Okazaki-Hatchomiso-Koji und der Kaboch-Bana des Tome-Koji [Biological investigations on the koji mold of Okazaki Hatcho miso koji and the "orange flowers" of "tome koji"]. *Zentralblatt fuer Bakteriologie. Series 2.* 63(1/8):25-28. Nov. 27. [2 ref. Ger]
• ***Summary:*** "On Tome-Koji, a type of koji produced during the warmer times of the year, one can often observe that the surface is covered with a red- to reddish-yellow mycelium of mold. Because of its yellowish-red [orange] coloring, which is reminiscent of the Japanese cucurbit [pumpkin] named Kabocha, this koji is usually called *Kabochabana* ("Kabocha flower"). Japanese koji manufacturers ascribe no significance to the appearance of this mold and consider it harmless since the quality of the Tome or Miso made from this koji is not found objectionable. In the production of koji for Okazaki Hatcho Miso, a large quantities of this yellowish-red mold appear and, in fact, the manufacturers consider this type of koji as the best, since the Okazaki Hatcho miso made from it is regarded as the best.

"In 1911, through the friendliness of manufacturers Aoki, Hayakawa, Hattori, and Ito, I obtained samples of *Kabochabana,* which I investigated. I became convinced that the mold in question was a type of fungi imperfecti, the *Oidium lupuli* Matthews & Lott = *Monilia sitophila* Mont. (Saccardo)." Note: The genera Oidium and Monilia were later renamed Neurospora.

The author concludes that this mold is especially found on Hatcho miso koji. He notes that in 1901 Went reported that in Java, this mold plays an important role, because of its enzymes, in the production of ontjom, a good-tasting cake made by fermentation of peanuts. Address: Prof., Technischen Hochschule, Osaka, Japan.

2335. Muramatsu, Syunsuke [Shunsuke]. 1924. On the composition of the soy bean. *Bulletin of the Imperial College of Agriculture and Forestry, Morioka* No. 7. 52 p. Nov. [15 ref. Eng]
• ***Summary:*** Contents: I. Chemical studies on the soy bean proteins (p. 1-23; 15 ref).

II. On the starch of soy bean (p. 25-30; 0 ref). Illustrations show (after p. 26): (1) Section of a green seed stained with iodine solution. (2) Section of a ripened seed stained with iodine solution. (3) Section of an imperfectly ripened seed stained with iodine solution. (4) Ditto. (5) Spermoderm of a green seed stained with iodine solution, showing that its palisade cells contain starch granules. (6) Spermoderm of a ripened seed stained with iodine solution. ps = Palisade cell. ed = Endosperm. (7) Section of a cotyledon of a green seed stained with iodine solution, showing the starch granules in it. (8). Ditto, a ripened seed.

© Copyright Soyinfo Center 2014

(9) Section of a cotyledon of a green seed showing the mode of aggregation of starch granules in the cell. (10). Starch granules X 1000 magnification.

III. On the natural soap occurring in soy bean (p. 31-41; 0 ref). Illustration (p. 38): Crystals of hispidic acid X 450 magnification.

IV. On the preparation of tofu (p. 43-52; 0 ref). Contents of part IV, "On the preparation of tofu." Introduction." Introduction. Raw materials: Soy bean, nigari (the composition of each is given). The method of preparation of tofu. An improvement for the preparation of tofu (using calcium chloride as a coagulant to increase the calcium content and quality). Conclusion.

It is said the method for preparing tofu was developed in China during the Han dynasty, and was brought to Japan during the rule of Toyotomi Hideyoshi (1585) from Korea. The author analyzed the composition of 7 varieties of soybeans used to make tofu. They contained on average 12.29% moisture, 43.18% crude protein, and 18.72% crude fat. The smaller beans contained more protein and gave higher yields of tofu. Address: Morioka Koto Norin Gakko, Nogei Kagaku Jikken-shitsu, Morioka, Japan.

2336. Slosson, Edwin E. 1924. Soy. *School Science & Mathematics* 24(8):855-56. Nov. Whole No. 208. [2 ref]
• ***Summary:*** This article is reprinted from *Scientific Monthly* (Jan. 1924, p. 109, 111).

2337. Dorsett, P.H.; Dorsett, Jim H. 1924-1927. Agricultural explorations–Japan, Korea, Manchuria and Northeastern China, 1924-26.
• ***Summary:*** This set of microfilms, located in the National Archives, is part of a larger collection titled "Expedition Reports of the Office of Foreign Seed and Plant Introduction of the [U.S.] Department of Agriculture 1900-1938." The records reproduced in the microfilm publication are from *Records of the Bureau of Plant Industry, Soils and Agricultural Engineering, Record Group 54*–also known as Microfilm M840.

The set is occasionally cited incorrectly as "Plant hunting in northeastern China." However, so far as we know, no book or PhD thesis, other than the report in the National Archives Record Group 54, has ever been published. Note: We highly recommend this important USDA expedition to East Asia as the subject of a PhD thesis or book. Many new soybean varieties were introduced by this expedition.

Dorsett kept a daily log of his activities during the years 1924 to 1927; the logs are in the custody of the National Archives and microfilm copies may be found on Microfilm M840.

An index to Microfilm M840, found in the National Archives & Records Administration (US) (NARA) microfilm catalog is available in PDF format.

The microfilms concerning the 1924-26 Dorsett expedition are found in RG-54 on Rolls 11-15, Volumes 40-54, and Roll 20, Volume 73.

Another part of this expedition is: "Clips from Motion Pictures Made by P. Howard Dorsett and Jim Dorsett, compiled 1925-1926.

"ARC Identifier 516517 / Local Identifier 54-FSD.

"Series from Record Group 54: Records of the Bureau of Plant Industry, Soils, and Agricultural Engineering, 1853–1977.

"Scope and Content: These surveys, conducted over several years by P. Howard Dorsett and W.J. Morse, respectively, resulted in the collection of some 3,000 new varieties of soybeans from China, Manchuria, Korea, and Sakhalin Island, U.S.S.R. The images in this series are a reference file, apparently produced by the Motion Picture Laboratory of the Department of Agriculture, from motion pictures produced during the surveys of P. Howard Dorsett. His son, Jim, accompanied his father on these surveys and shot the motion picture footage. After the 1926 survey, Jim Dorsett joined the staff of the National Geographic Society as a photographer; he died in 1927. The series consists of 1 to 4–frame opening segments from each film, with accompanying caption for the subject contents of each film. Covering the years 1925 and 1926, the films documented the Dorsetts' journeys to Manchuria, China, Ceylon, Java, and Sumatra. In addition to footage of different varieties of soybeans found during the surveys, these film clips also show examples of indigenous flowers, plants, and trees, including wild peony (500), sorghum (313), Dutchman's Pipe (331), the King Coconut (405), and the Cannon Ball Tree (480).

"The camera used 35mm film wound onto special cartridges, and produced 18 x 24mm images. Duplicate positives, negatives, and contact prints have been made from these film clips. The cellulose nitrate and cellulose acetate film (probably made in the 1950's as a copy) are unstable and should not be used. The whereabouts of the motion pictures, from which these clips were taken, are unknown."

2338. Dorsett, Palemon Howard. 1924-1930. Photographs, notes, and observations on vegetables and seasoning plants of northern China, Manchuria, and Japan compiled almost wholly from agricultural exploration reports, 1924-26 and 1929-30. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. *
• ***Summary:*** One microfilm copy is at the National Archives in Washington, DC, in Records of the Bureau of Plant Industry, Soils, and Agricultural Engineering, Record Group 54. 2356. Mikhoilov, I.A.; Lilliestrom, T.L.; Skerst, A.G. 1924. North Manchuria and the Chinese Eastern Railway. Harbin, Manchuria, China: Chinese Eastern Railway Printing Office (Economic Bureau). xvii + 454 p. Illust. Maps. No index. 30 cm. Reprinted in 1982 by Garland Publishing Co.

• ***Summary:*** Partial contents: Preface. 1. North Manchuria. 2. Economic structure. 3. Administrative division. 4. A brief history of the railway. 5. Agriculture. 6. The cereal trade. 7. Horses and cattle... 14. The [soy] bean oil industry... 16. Outline of the evolution of trade in North Manchuria. 17. Present status of the foreign trade. 18. The interior trade. 19. The currency system. 20. Credit. 21. Ways of communication. 22. The Chinese Eastern Railway.

Chapter 5: "Beans [soy], kaoliang and corn are usually sown by hand, the seeds being planted at certain intervals along the ridges." Beans are harvested at the beginning of September (p. 53).

In the section on "Field crops" is a long subsection which begins: "Beans: Soya beans unquestionably hold the foremost position among all the field crops" (p. 54-55).

A table (p. 63) shows the distribution of wheat, soybeans, and other crops in the seven regions of North Manchuria. The area of soybeans (in 1,000 acres) is as follows: Tsitsihar (165), Anta (1,230), Harbin (635), Lower Sungari (460), Potune (440), Southern (1,030), and Eastern (360). On average, 24.7% of the total area in each region is planted to soybeans. The total soybean area is 4.32 million acres.

Chapter 6: "Beans [soy] have been cultivated in North Manchuria for a long time, but the entire production of beans was formerly consumed locally. It was only after beancakes, in the middle of the 19th century, came into use for fertilizing purposes that beans found a wide market."

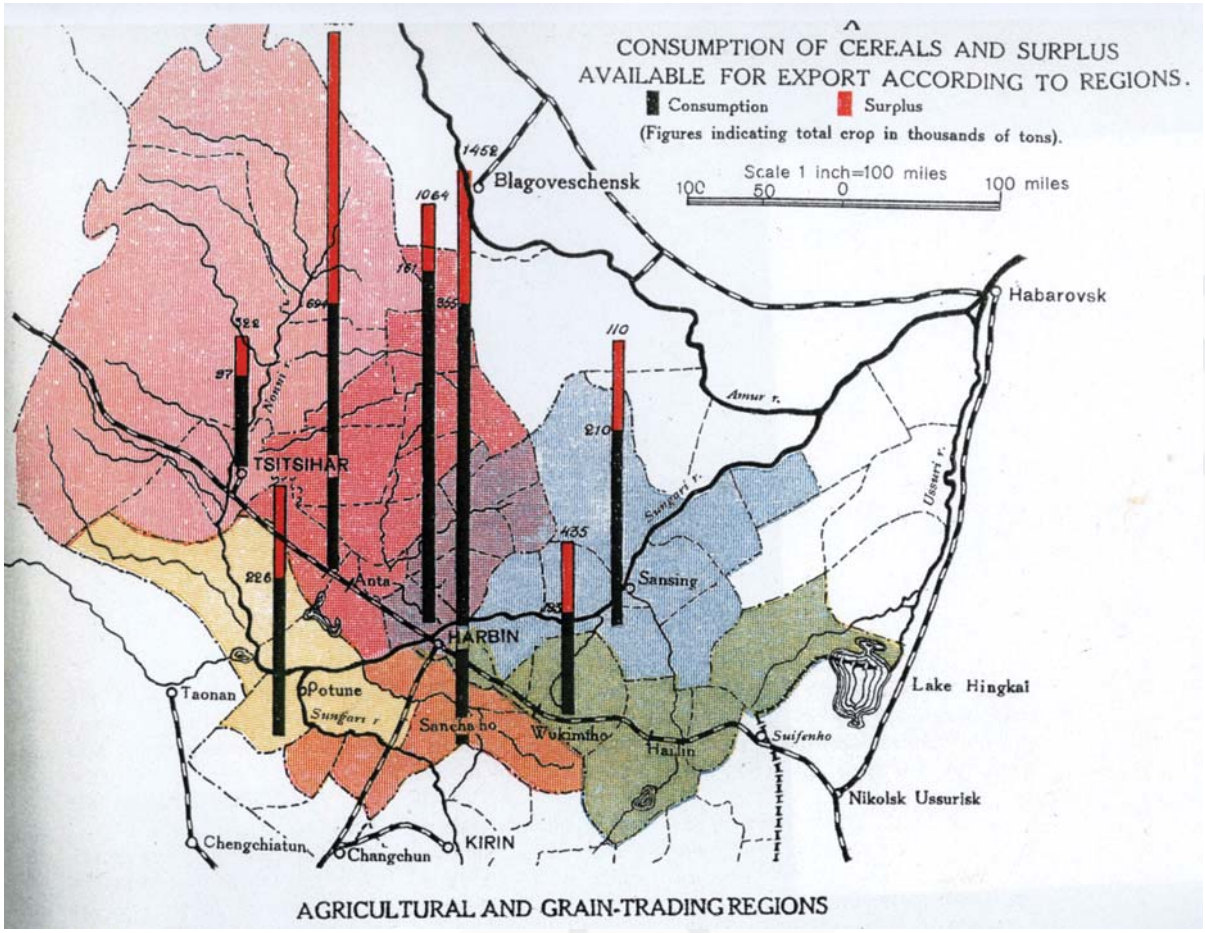
In the 1870s, the export of soybeans from all of Manchuria (South and North), according to Chinese customs figures, was limited to a yearly average of 100,000 tons of beans, 65,000 tons of beancakes, and 1,000 tons of bean oil, at a total value of approximately 1,350,000 gold dollars. After the Sino-Japanese War (in 1895), "beans and beancakes penetrated into Japan, and after the Russo-Japanese War (1904-1905), when the work of the Chinese Eastern Railway was already under way, these products found even more distant markets.

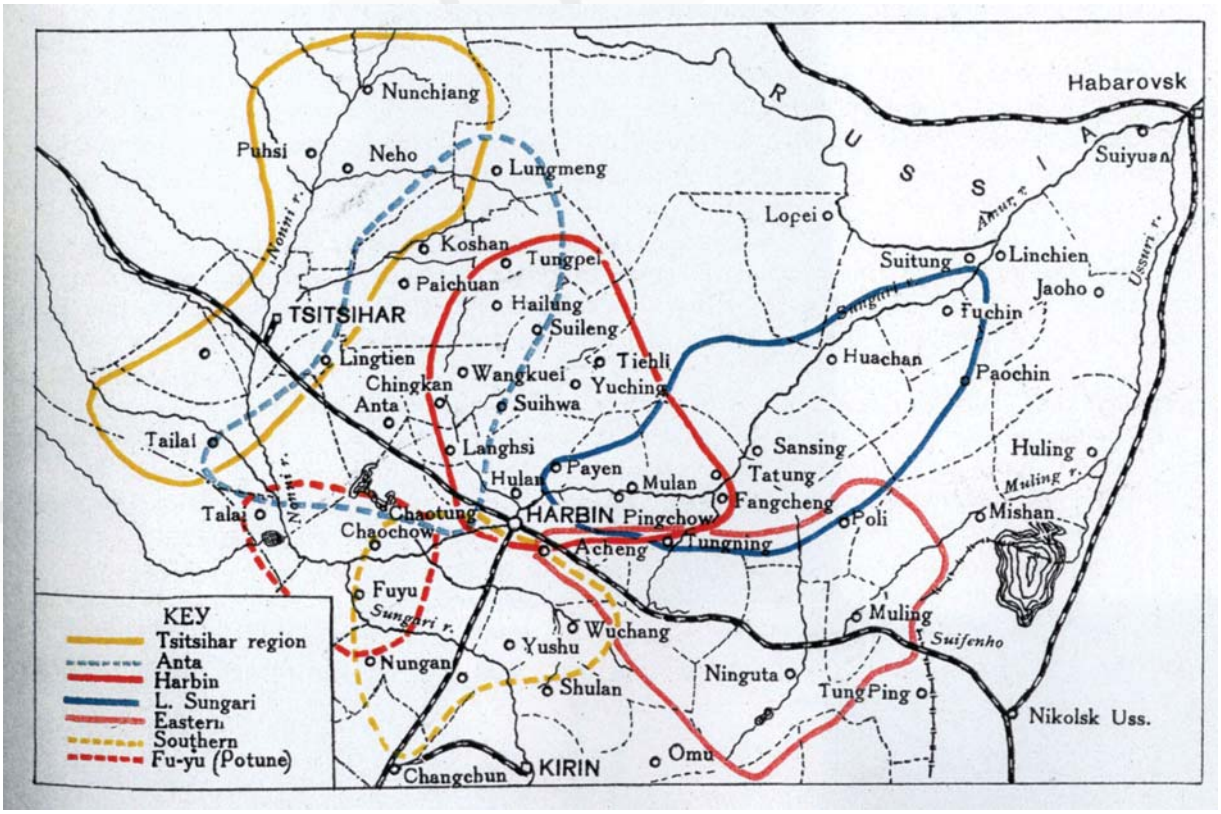
"The European war [1914-1918] served as a new impetus to the growth of the production of beans and the bean oil industry; the demand for bean oil became particularly strong" (p. 75).

Another section on [soy] beans (p. 111-14) discusses their important role as a export crop.

[Soy] beans and their changing price are also discussed in the sections on "Wheat" and on "Kaoliang" in Chapter 6

© Copyright Soyinfo Center 2014





© Copyright Soyinfo Center 2014

on pages 117-22.

In Chapter 22, the section titled "General development of the country" states (p. 408-09): "With the above in view three *agricultural experimental farms* were opened:

"1. At Harbin, in the neighborhood of Old Harbin, with a total area of 220 acres;

"2. At *Echo* station, with a total area of 270 acres,...

"In 1923 the cultivated area of these fields amounted to 177 acres at the Harbin farm, 208 acres at Anta and 143 acres at Echo station.

"Many hundreds of agricultural plants are being experimented with, such as: wheat, [soy] beans, rice, Indian corn (maize), flax and others with a view to selecting the best varieties.

"Special attention is given to the developing of beans yielding a maximum of oil, with a short growing period,..."

Note 1. The Echo Station, which was located near the Muktan Kiang valley in Manchuria, is also mentioned on other pages: The upper course of the Mutanchiang River flows from the city of Ninguta to its confluence with the Chinese Eastern Railway (C.E.R.) at station Echo (p. 384). A photo shows the apiary of the C.E.R. at Echo (p. 427). A photo shows the railway bridge over the river "at station Echo" (p. 433). A summer resort has been arranged on the C.E.R. at Echo (p. 434).

Note 2. There are many pages of large ads at the front and rear of this book. There are also some useful maps: A general map faces p. 8, an economic map faces p. 16, and an agricultural map faces p. 80. Address: Harbin, China.

2357. Minami Manshû Tetsudô K.K. Kôgyô-bu. Nômu-ka. [South Manchuria Railway Co., Industrial Div. Bureau of Agriculture]. 1924. Daizu no kakô [Soybean processing]. Dairen, Manchuria: SMRC. 777 p. 30 cm. (Sangyo Shiryo 21). [250 ref. Jap]

• ***Summary:*** Name of company with diacritics is: Minami Manshû Tetsudô K.K. Kôgyô-bu. Nômu-ka. This important, major work was written by Yoshitane Satô. Contents: Photos (on unnumbered pages at the front of the book) show 16 scenes of soybean transportation, storage, and processing in Manchuria, as follows: (1) Mule drivers whipping mules trying to pull carts loaded with large sacks of soybeans over muddy roads. (2) Cylindrical osier storage bins for soybeans. (3) Row upon row of sacks of soybeans piled high in storage near docks. (4) Soy sauce being made in a courtyard; each earthenware jar is covered with a woven conical lid. (5) The inside of a huge and modern soy sauce plant. (6) Wooden kegs and glass bottles of Yamasa shoyu. (7) Soy sprouts (*daizu moyashi*) growing in round woven baskets. (8-11) Soy oil being pressed using vertical screw presses [as an alternative to hydraulic presses]–four views. (12) Boilers used in a soybean mill. (13) A wooden barrel of soybean oil being sealed. (14) Soy oil packaged in many small containers, each surrounded by a wicker basket. (15) Round soybean cakes stacked high on railway flatcars. (16) The inside of a modern soy oil factory.

Note 1. This is the earliest Japanese-language document seen (Jan. 2013) that uses the term *daizu moyashi* to refer to soy sprouts.

Contents: 1. Current status of soybean production and consumption: A. Production: Overview (p. 2), Japan (p. 4), Korea (p. 12), Manchuria (p. 16), China (except 3 eastern provinces, but including Eastern Inner Mongolia, p. 31), USA (p. 34), British colonies (p. 37), European countries (p. 40). B. Consumption: Japan (p. 41), Korea (p. 52), Manchuria (p. 57), China (p. 59), Dutch East Indies (Indonesia, p. 60), USA (p. 61), European countries (p. 63).

2. Characteristics of soybeans: A. From a physical sciences viewpoint (p. 67): Structure (overview, cotyledons, hypocotyl, seed coat), contents of each system (p. 70), appearance (p. 73; color, gloss, shape, size, hilum (*fusuma*) color, young plumule leaf color, ratio of seed to seed coat). B. From chemical viewpoint (p. 82): General composition, structure of each component (p. 109; protein, oil, carbohydrate, ash/minerals, vitamins). C. Appearance and relationship between oil and protein content (p. 126): Oil and protein color related to color, glossiness, shape, size, hilum color, young plumule leaf color. D. Evaluating soybean quality (p. 140): Overview, key points (sizes, shapes, colors, glossiness, hilum color, young plumule leaf color, ratio of seed coat to seed, dryness of seed, volume, weight, smell, mixing of different varieties, ratio of imperfect seeds, amount of other types of seeds), collection of materials for testing, testing and evaluating commercial soybeans.

3. Soybean usage and processing (p. 175). A. One view of main usage of soybeans. B. Nutritional value of soybeans as food (p. 183): Nutritional value of soy protein. C. Processed soyfoods (p. 208): Soy sprouts (p. 208), natto (*itohiki nattô,* p. 212, Hamanatto, p. 224), types of tofu (regular tofu [*nama-dôfu,* p. 226], *kori-dofu* or *koya-dofu,* p. 240, aburaage, p. 245, tofu curds [*tofu nô,* p. 247], hard tofu [*tofu-kan,* p. 247], fragrant hard tofu [*kô-kan,* p. 248], *senchô tofu,* p. 249, fermented tofu [*nyûfu or funyû,* p. 249]), *tofu-p'i* or yuba (p. 256), soymilk and artificial cow's milk, p. 259, soybean flour raw, or roasted (kinako, p. 263), shoyu (p. 266; overview of miso and shoyu, Japanese traditional regular shoyu, p. 267, Japanese traditional special shoyu and tamari, p. 269, Chinese soy sauce, p. 272, recent shoyu research and development, p. 274), miso (p. 280; Japanese traditional regular miso, Japanese traditional special and processed miso, p. 282, Chinese miso, recent miso research and development, p, 285). D. Soybeans as feed or fodder (p. 287; green soybeans as feed, p. 290): Fresh forage, dried forage or hay. E. Soybeans as manure or fertilizer (*hiryô,* p. 297; in the Kaijô area of Manchuria, have been roasted and steamed, and mixed with compost, and used for green manure (*ryokuhi*) or soybean cake (*daizu kasu*). This method has also been used in the northeastern provinces (*Tohoku Chiho*) of Japan in rice

fields). F. Soybeans as oilseeds (p. 302). G. Use of soybean protein in industrial products (p. 304).

4. The soy oil extraction industry (p. 305): A. Methods of removing the oil (origins, traditional methods, hydraulic pressing, extraction method, p. 340). B. Advantages and disadvantages of each method (p. 348). C. The soy oil industry in Manchuria (p. 357): History of development, important places for soy oil on the Manchurian Railway, economic condition of the Manchurian oil industry (p. 420), oil extraction in Japan (history, p. 437, commercial factories, p. 442, development of these factories, p. 451).

5. Soybean meal or cake and its composition (p. 464). A. The varieties of soybean meal or cake and the composition of each. B. Evaluation of quality (p. 473). C. Soybean meal or cake as a fodder (p. 478): Feeding value and digestibility, incorrectness of the theory that there are bad effects from feeding soybean meal or cake (p. 479). D. Soybean meal or cake as a fertilizer (p. 490). E. Soybean meal or cake as food (p. 504): Use as a raw material for shoyu production (p. 506), use to make soy flour (p. 509). F. Soybean meal or cake as a source of protein in industrial products.

6. Soy oil and its processing (p. 526). A. Characteristics of soy oil: Composition, physical characteristics (p. 535), chemical characteristics, testing and evaluating soy oil (p. 564), the quality of commercial soy oil products (p. 577). B. Refining soy oil (p. 587). C. The use and processing of soy oil (p. 631): Overview, refined soy oil as a food, substitute for salad oil, or for deep-frying oil, as an illuminant, as a cutting oil, lard substitute, margarine, in paints, soap, hardened oil, for waterproofing, substitute for petroleum oil, glycerin, fatty acids, stearine.

7. Exports and imports of soybeans, soybean meal or cake, and soy oil (p. 708). A. Manchuria. B. Manchurian exports. C. China. D. Japan. E. Korea. Appendix: Bibliography of soybeans (Japanese-, German, and English-language works; p. 748). List of photos.

Note 2. This is the earliest Japanese-language document seen (Oct. 2011) that mentions fermented tofu, which it calls *nyûfu* or *funyû.*

Note 3. This is the earliest Japanese-language document seen (Feb. 2012) that uses the term *itohiki nattô* to refer to natto. Address: Dairen, Manchuria.

2358. Nagai, Isaburo. 1924. Observations on the somatic segregation in soy beans. *Japanese J. of Botany* 2(1):63-70. [7 ref. Eng]

• ***Summary:*** "Progenies of the hybrids in soy beans often manifest a marked fluctuation with respect to the colour characters of the seed coat, even in those seeds which are produced by a single individual. Breeding tests have been conducted and have proved that somatic segregation actually occurs both in homozygous and heterozygous plants."

Records 5 cases showing a marked fluctuation in seed coat color, which are considered to depend on gene mutations. The following words are used: Chromogen, chromogenic substances, homozygous. Address: Agric. Exp. Station, Omagiri, Japan.

2359. Piper, Charles V. 1924. Adzuki bean (*Phaseolus angularis*) (Document part). In: Charles V. Piper. 1924. Forage Plants and their Culture. Revised edition. New York, NY: MacMillan Co. xxv + 671 p. See p. 612-13.

• ***Summary:*** In Japan about 350,000 acres of adzuki beans are grown annually. "In Japan and Manchuria the adzuki bean is grown entirely for human food, and as a producer of seed it excels any other bean adapted to the region in which it will grow, excepting the soybean. On account of its heavy yield of seed it is likely to become of some importance in the United States, either for human food or for growing to feed animals. The plants are smaller than cowpeas or soybeans, so the yield of herbage is but moderate."

Note: The chufa (*Cyperus esculentus*) is described on p. 641. "Chufas are grown mainly in the Southern States. Practically all of the seed is produced in Georgia, the product in 1909 of 481 acres being 12,531 bushels." Address: Agrostologist in Charge of Forage Crop Investigations, Bureau of Plant Industry, USDA.

2360. Sanka, Isao. 1924. Daizu no saibai [Soybean cultivation]. Dairen, Manchuria: Minami Manshû Tetsudô Kôgyôbu Nômuka [South Manchuria Railway Co. {SMRC}, Bureau of Agriculture. 532 p. 22 cm. Series: Sangyo Shiryo 20. [Jap]*

Address: Dairen, Manchuria.

2361. May Co. (The). 1925. Grocery store (Ad). *Los Angeles Times.* Jan. 23. p. 8.

• ***Summary:*** "Listed below are many of the rare, out-of-the-ordinary delicacies to be found in this complete Grocery Store–helpful suggestions for the discriminating hostess."

"China and Japan: Jasmine tea. Hong Kong ginger in crocks. Shoyu sauce. Boiled bamboo shoots."

"Imported health foods–from Dr. Huedebert, Paris; Dr. Charasse, Marseilles; Brusson Jeune, Ville Mur–for diabetes, dyspepsia, constipation, indigestion and reducing weight." Includes Aleurone bread muffins, Gluten bread, Levulose powder, Mignonettes of gluten–small bread balls for soup.

"Battle Creek Sanitarium Health Foods [Michigan]. These famous preparations will also be found in our Health Food Section, and include Colax, an agar biscuit; Lacto auxiliary food; Lacto Dextrine, antitoxic food; Casein-Gluten Flour, a superior food; Canned fruits, vegetables for restricted diet; Charcoal tablets; Vegex–the wonderful vitamine food." Address: Broadway at Eighth. Grocery store–Fourth Floor [Los Angeles].

2365. *Crops and Markets* (*USDA*). 1925. Foreign crops and markets: British oilseed, oil, and fat trade. 3(15):240. April 11.
• ***Summary:*** "That the vegetable oil crushing industry of the United Kingdom has experienced a marked development since 1913 is evidenced by the increase in British imports of seeds, nuts, and kernels for crushing purposes. The oil crushed from such imports during 1924 amounts to 603,000 short tons as compared with 434,000 tons in 1913. The principal items in the British import trade in seeds, nuts, and kernels are linseed from Argentina, palm kernels from West Africa, cottonseed from Egypt, and copra from the Straits Settlements and the Dutch East Indies."

"In addition to its imports of seeds, nuts, and kernels, the United Kingdom imports large quantities of refined and unrefined oil. Palm oil from Nigeria is the most important of such imports. Other oils imported in important quantities are soya-bean oil from Japan, coconut oil from Ceylon and the Netherlands, and cottonseed oil from Egypt." Address: Washington, DC.

2366. Kinoshita, Asakichi. 1925. Y-ji gata shôyu sokujô-hô [Y-form method of quick shoyu brewing]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 2(9):797-99. [Jap]
Address: Jozo Shikensho, Gishi, Japan.

2367. Ito, Taro. 1925. The soya bean in Manchuria. *Far Eastern Review* (*Shanghai*) 21:236-37. May. [Eng]
• ***Summary:*** Contents: Production and trade of soya beans in Manchuria. Statistics on soya beans carried by the South Manchuria Railway (SMR), and export tonnage. Mixed storage system now in operation on railroads; adopted in 1919. Examination and grading of soya beans by examiners appointed by the SMR. Details of grading. Method of packing and storing; projected elevator system.

China now produces about 80% of the world's soya beans, and 70% of China's output is grown in Manchuria. Manchuria is therefore the world's leading producer of soya beans, with annual production estimated at 3,500,000 kilolitres. Note: 1 kilolitre = 1,000 litres.

In 1923 the South Manchuria Railway (SMR) carried 2,000,000 metric tons of soya beans. "Of this tonnage, 400,000 tons were exported to Japan, 150,000 tons to China proper, 80,000 tons to the South Sea Islands and Australia and 1,000 tons to America, chiefly to the port of Seattle [Washington] in the Pacific area, and 120,000 tons to Europe and Africa." These exports, which total 751,000 tons, amount to about 37% of the soya beans carried by the SMR; they were shipped by steamers from Dairen, the southern terminal of the railroad.

But what happened to the remaining 63%, or 1,250,000 metric tons carried? "They were consumed in oil factories called by the Manchurians *Yu-Fang,* factories which flourish in Dairen and Yingkou for the manufacture of oil and cakes." In 1923 about 140,000 metric tons of [soya bean] oil and 1,300,000 tons of bean cake were exported. The oil went mainly to Europe and America, and the cake to Japan for use as fertilizer.

The examination and grading of soya beans "is ordinarily carried on in the railroad yards by drawing a certain number of samples from one consignment which comprises 350 bags, each bag weighing not less than about 85.2 kg. (142 kins). The method now in use is practical, based upon the appearance of the beans to the naked eye and their moisture content as estimated by chewing between the teeth. The authorities have under consideration the introduction of a more scientific method by which all the complaints arising from the examination and grading will be eliminated.

"The standards are fixed at a certain time of the year annually by experts in agriculture at the agricultural experimental station of the company, who collect beans from different parts of Manchuria and take into consideration many conditions necessary to the standardization. The standards now in operation have three grades, A.B.C. Beans which come below C are not to be accepted as freight under the mixed storage system... Bags used as containers of soya beans are gunny-bags, mostly imported from India–needless to say, some are imported from Japan. The annual import reaches 20 million bags on the average, comprising, of course, old ones as well as new.

"The bags in which beans are packed are examined and graded together with the beans. The standards thereof are also three."

The SMR's "mixed storage system" has resulted in improvement of quality and facilitated the sale of beans.

Photos show: (1) South Manchuria Railway's experimental bean mill. (2) Mukden railway station. (3) Acres of bean cake stored in the open on Dairen wharves. (4) Small part of Dairen wharves showing warehouses and open storage. Address: Manchuria Railways Co., Manchuria.

2370. Horvath, A.A. 1925. Soybean oil as soap making material. *J. of the Association of Chinese and American Engineers* 6(7):65-69. July.
• ***Summary:*** "We differentiate between hard soaps (soda soaps) and soft soaps (potash soaps) according as to whether the base used for the saturation of the fatty acids be soda or potash." The vegetable drying oils and semi-drying oils are best for making soft soaps. Solid fats are used mainly for making hard soaps.

"In the manufacture of soft soap, soybean oil serves as an almost complete substitute for linseed oil. In the manufacture of hard soaps it can replace cotton seed oil to some extent only, as the soap is softer than one made from cotton seed oil."

"Most of the soybean oil which is exported from China to Europe, in particular to Great Britain, is now being imported again into the Orient in the form of soap. Lever Bros. (Port Sunlight) started in early years to use soybean oil, and the well known Sunlight soap contains a certain per cent of saponified soybean oil." This shows how backward the soap industries are in the Orient. "At the Lever Bros. soap factory at Amagasaki (Japan), soybean cake is crushed into powder, and the oil contained therein is extracted by means of benzine, using the oil so extracted as soap-making material. This soap is available on the market also as Sunlight soap and is of high quality."

Methods of making the various soaps from soybean oil and their characteristics are described. Note 1: This is the earliest document seen (Jan. 2001) that mentions Sunlight soap.

Note 2. This is the earliest document seen (May 2011) by or about Dr. A.A. Horvath in connection with soybeans.
Address: Peking Union Medical College.

Address: Nagano-ken Nôshi.

2372. Yamaha, G.; Sinotô, Y. 1925. On the behavior of the nucleolus in the somatic mitosis of higher plants, with microchemical notes. *Botanical Magazine* (*Tokyo*) 39(464):205-19. Aug. [74* ref. Eng]
• ***Summary:*** The diploid chromosome number of the soybean (Glycine Soja, Benth.) was found to be 38 (2n = 38). Illustrations 1-13 (p. 208) show changes in the nucleolus during somatic mitosis in various Japanese soybean varieties. The peanut is shown in figs. 22-23. Address: Dep. of Plant-Morphology and of Genetics, Botanical Inst., Faculty of Science, Tokyo Imperial Univ.

2373. Meharry, Charles L. 1925. Sixth annual field meeting: Washington, D.C.–September 1, 2 and 3, 1925. *Proceedings of the American Soybean Association* 1:52-54.
• ***Summary:*** "Soybean growers, representing eighteen states and Canada, convened at the Arlington Experimental Farm, Virginia, September 1, 1925, for their Sixth Annual Field Meeting." The "growers were welcomed to Arlington Experimental Farm by Dr. W.A. Taylor, Chief of the Bureau of Plant Industry." There followed two papers presented by Dr. C.V. Piper and Mr. E.C. Butterfield. After the meeting was adjourned for lunch, "the visitors had an opportunity of inspecting an extensive exhibit of soybean products, showing the numerous soybean products from the Orient and those manufactured in the United States. Charts were displayed illustrating the value of the soybean and its various products and enlarged pictures showed the manufacture of products in China and Japan, and the various ways in which the soybean is grown and harvested in the United States."

"After lunch, the growers were taken to the fields to inspect the variety tests, new introductions, inoculation plots, time of planting tests, breeding work and method of culture plots. Demonstrations were given of the various methods commonly used in the culture of the soybean."

"The evening meeting was called to order at 7:30 in the auditorium of the New National Museum..." The program included three motion pictures and seven papers. The second motion picture is titled "Four men and the soybean." The other two are "Uncle Sam, World Champion Farmer" and "Sheep in Psalm and Sage." Note: This is the earliest document seen (Nov. 2004) that mentions a motion picture about soybeans. Nothing is known about this movie except the title.

"On the second day, September 2, the growers assembled on Union Farm, near Mount Vernon, Virginia. This farm was originally part of George Washington's estate and played an important part in the early agricultural development of this country. It was on this farm that Washington carried on his experiments in soil improvement and practical methods of farming far in advance of his time. Union Farm is now owned by Mr. Harvey S. Clapp, a prominent breeder and grower of soybeans. The growers inspected Mr. Clapp's extensive variety, inoculation, and breeding plots, and fields of different varieties for seed production."

Five papers were then presented: Welcome to Virginia, by T.B. Hutcheson, Virginia. Soybeans in the Eastern states, by Nicholas Schmitz, Pennsylvania. Fertilizers for soybeans, by G.L. Schuster, Delaware. Relation between the grower

© Copyright Soyinfo Center 2014

and the oil mill, by F.A. Wand, Illinois. Seed frauds in soybean varieties, by R.W. Hamilton, South Carolina.

"The after noon was devoted to demonstrations of field machinery used by Mr. Clapp in the culture and harvest of the soybean. The broadcast soybean harvester, an invention of Mr. Clapp's proved an interesting feature of the demonstration. About 3:00 p.m. the growers adjourned to visit Mount Vernon, the home of George Washington.

On the third day, September 3, the growers met at the Maryland Experiment Station, College Park, Maryland. Dr. A.F. Woods, President of the Maryland State University, welcomed the visitors to Maryland."

Six papers were then presented: Community growing, handling and sale of soybean seed, by J.T. Smith, Illinois. Soybeans in Georgia, by W.J. Davis, Georgia. Soybeans in the Mississippi Delta, by W.E. Ayres, Mississippi. Small grains after soybeans, by W.E. Riegel, Illinois. Putting soybeans on the hoof, by Taylor Fouts, Indiana. The soybean mottling problem, J.B. Park, Ohio.

Long summaries of the welcome address by W.A. Taylor, and of the many papers presented are given on pages 54-129. Address: Secretary.

2374. Piper, Charles V. 1925. How we got our soybeans. *Proceedings of the American Soybean Association* 1:58-59. Sixth annual field meeting. Held 1-3 Sept. at Washington, DC.

• ***Summary:*** "In 1907, Dr. C.R. Ball of the United States Department of Agriculture, described twenty-three varieties of soybeans, all that were then known in the United States introduced up to 1905. These included fifteen introductions by the Department between 1900 and 1905, the remainder secured by miscellaneous individuals from the Orient, and several indirectly by way of Europe. Up to this time varieties had been called by such names as Early Yellow, Medium Yellow, Late Yellow, etc.; but with only twenty-three varieties this system of naming broke down hopelessly and a different system was adopted, which has been followed since. The naming of varieties mainly by the color of the seeds by oriental writers had disguised the fact that the varieties are not few but very numerous. This began to become clear about the time Ball's paper was published, and vigorous efforts were inaugurated to get additional varieties with the help of the Office of Seed and Plant Introduction. We got them through consuls, missionaries, seedsmen, etc., until by 1909 we had 175 varieties; by 1913, 427 varieties; by 1919, 629 varieties; by 1925, 1,133 varieties; and we probably have not half of them yet. Our records show that every Chinese village had its own distinct series of varieties. There is no seed trade in China; consequently, local varieties are never widespread. These were all tested at Arlington [Farm, Virginia], the poorer ones being continuously discarded.

"About 1914, we tried to get several experiment stations to test three hundred varieties, as we did not like to discard them purely on the basis of Arlington Farm tests; but at that time no experiment station was willing to take more than about twenty of the varieties which we considered the best. In late years we have checked over as far as possible the series that we discarded, and we do not believe we made any serious mistake, though at that time we had very inadequate knowledge of the behavior of each variety in different latitudes. Today many experiment stations are so interested that each wants to test every new soybean secured. Out of the agriculturally unexplored villages of China, Manchuria, and Japan will yet come many varieties some of which will likely replace the ones now used in the United States.

"With few exceptions, the varieties valuable in the United States today are all Department introductions. One important variety, the Mammoth Yellow, is of unknown origin; it was introduced as early as 1882. In the more than one thousand lots introduced since, this variety has never yet turned up again. Usually, when several varieties are obtained from the same village, they are much alike in habit; but exceptions to this rule are not rare.

"The results that have been secured by this wholesale search for new soybeans, notwithstanding its very considerable cost, have justified the work many times over. When the Department work began, the soybean was a very minor crop, and of importance only where the Mammoth Yellow variety matured. Today, its culture, due to varieties adapted to each region is widespread, and lends substantial basis to the belief that the soybean will yet become one of our major crops." Address: USDA, Washington, DC.

2375. *Far Eastern Review* (*Shanghai*). 1925. The Dairen bean oil industry. 21:666-67. Oct.

• ***Summary:*** "The first oil mill in Dairen, Shwang Ho Chan, located in the Chinese quarter, or Shikangtze Section, was started in 1906. This was followed by Chung Sheng Ho and Nisshin on the Wharves in the ensuing year, Nisshin being a Japanese concern with a capital of ¥3,750,000. In 1908, Chang Pen-ching a leading shipping merchant of Manchuria, started the Chingkee Mill. In the same year the South Manchuria Railway Company fixed the same freight rates for goods from any part of Manchuria to Dairen, Newchwang and Antung, with the object of making Dairen the trade center. Since then, oil mills in Dairen have grown in number, and Dairen has become the center for the distribution of beans and the center of export for beancakes and bean oil.

"A shortage of mill hands was felt when the industry started to develop, and the competition for men led to the organisation of the Dairen Oil Mill-Owners Association, in 1912 so as (1) to prohibit such competition, (2) to restrict the mill output, and (3) to limit the number of mills. Japanese authorities in Dairen rendered support to the Association in not granting any land for new oil mills without` the Association's concurrence. Restriction in output was

© Copyright Soyinfo Center 2014

enforced for a certain period of time, but the enforcement was not easily maintained. At present, any member of the Association can freely increase the output of his mill to any extent to suit his own requirements. Originally, the Association aimed at all possible means of developing the industry and protecting the mutual benefit of its members; but now, it is functioning merely to facilitate transportation and to conduct negotiations with other bodies. Since June, 1923 all mills, except seven, have joined the Association.

"Among the seven non-members, only the Dairen Oil Mill Co. and the Jih Hwa are operating regularly, while the other five operate only at irregular intervals... Of the 84 mills, only 60 are operating,, 58 by Chinese and 11 by Japanese, 15 having been suspended. The industry thrived during the World War [I], but has somewhat declined during later years."

"Oil is obtained by extraction with benzene, the most up-to-date method, only in the Susuki [Suzuki] mill. The other 32 mills, chiefly Japanese owned, employ hydraulic pressure machines, while 51 Chinese mills employ hand screw presses.

"Oil mills in Manchuria operating on a small scale date back nearly half a century, their output being sufficient only for local consumption. Modern mills appeared in Newchwang after the Sino-Japanese War in 1894. Newchwang was the center of the bean oil industry in Manchuria before the rise of Dairen. Mills in Newchwang have again increased during recent years, owing to the limitation of their number in Dairen. Two other important bean oil centers next to Dairen are Putung and Harbin."

Photos show: (1) "A busy day at the Bean Wharf at Dairen." (2) A front view of Nisshin Oil Mill, Dairen. (3) Interior of the Nisshin Oil Mill, Dairen. (4) The filter presses.

English-language summary. p. 404-05. [17 ref. Jap]
• ***Summary:*** Sawamura (1907) was the first to isolate Bacillus natto from natto. He was followed by Muramatsu (1912) and Iguchi (1917). This bacterium much resembles *Bacillus subtilis* morphologically and physiologically, but it produces a distinct flavor and mucilaginous substance on cooked soybeans. The analysis of natto shows the increase of soluble nitrogenous matter and the formation of strong protease, which makes soybeans more nutritive. This study analyzes the bacillus from the viewpoint of enzymic chemistry. Address: Hokkaido Teikoku Daigaku, Suisan Senmon-bu, Kagaku Kyoshitsu.

2397. Kikkawa, S. 1925. Shokuyô sakumotsu kakuron [Details on edible crops. Revised ed.]. Tokyo. [Jap]*
• ***Summary:*** Nagata (1960, p. 70) notes that Kikkawa described the vining and twining habit as the character transmitted from the wild soybean. He further states (p. 75-76) that Kikkawa points out that the differentiation of summer and autumn soybean types was found in Nara, Hiroshima, and Saga prefectures. It also suggests that soybeans in the northern part of Japan have a thinner seed coat than those in the south.

2398. Matsumoto, Takashi; Tomoyasu, Ryoichi. 1925. Studies on purple speck of soybean seed. *Nippon Shokubutsu Byori Gakkaiho* (*Annals of the Phytopathological Society of Japan*) 1(6):1-15. [7 ref. Eng; jap]
• ***Summary:*** First explanation of the cause of purple stain disease on soybeans, *Cercosporina Kikuchii.* Growth of a fungus on the seed coats. The symptoms and the morphology

© Copyright Soyinfo Center 2014

of the causal fungus, *Cercosporina kikuchii,* are described. The fungus turns glucose media purple and its mycelial extract in water contains a purple pigment which is insoluble in a number of solvents.

Suzuki (1921) believed that the cause of the disease might be due to the mechanical stress exerted by the pod in consequence of unequal growth between pod and seed. Thus, he considered climatic conditions to be the chief cause of the disease. R. Kikuchi, working with the same disease, expressed his opinion in a private letter sent to the senior author on 21 Nov. 1922, that the cause of the disease might be a fungus parasite belonging to the genus *Cercospora.* Subsequently Kung (1923) confirmed the responsibility of a fungus parasite. Address: Japan.

2399. Mogi family creed (16 articles) adopted (Early event). 1925.

• ***Summary:*** Reprinted with permission of the UMass Family Business Center, online at www.umass.edu/fambiz. This is another translation of the other creed we have; this has 16 articles whereas the other has 17–including one about patriotism and loyalty.

"Article 1. All family members desire peace. Never fight, and always respect each other. Ensure progress in business and the perpetuation of family prosperity.

"2. Loving God and Buddha is the source of all virtue. Keeping faith leads to a peaceful mind.

"3. All family members should be polite to each other. If the master is not polite, the others will not follow. Sin is the result of being impolite. Families–young and old, masters and workers–govern themselves by politeness; then peace will be brought of their own accord.

"4. Virtue is the cause, fortune the effect. Never mistake the cause for the effect. Never judge people on whether they are rich or not.

"5. Keep strict discipline. Demand diligence. Preserve order–young and old, masters and workers.

"6. Business depends upon people. Do not make appointments or dismissals using personal prejudices. Put the right man in the right place. Loving men who do what they should brings peace to their minds.

"7. Education of the children is our responsibility to the nation. Train the body and mind with moral, intellectual, and physical education.

"8. Approach all living beings with love. Love is fundamental to human beings and the source of a life worth living. Words are the door to fortune and misfortune. A foul tongue hurts oneself and others. A kind tongue keeps everything peaceful. Be careful in every word you speak.

"9. Keep humbleness and diligence, which have been handed down over the years from our forefathers. Make every effort to do as much as you can.

"10. True earning comes from the labor of sweat. Speculation is not the best road to follow. Don't do business by taking advantage of another's weakness.

"11. Competition is an important factor in progress, but avoid extreme or unreasonable competition. Strive to prosper together with the public.

"12. Make success or failure clear, judge fairly punishment and reward. Never fail to reward meritorious service, and don't allow a mistake to go unpunished.

"13. Consult with family members when starting a new business. Never try anything alone. Always appreciate any profit made by your family.

"14. Don't carelessly fall into debt. Don't recklessly be a guarantor of liability. Don't lend money with the purpose of gaining interest, because you are not a bank.

"15. Save money from your earnings and give to society as much as you can. But never ask for a reward or think highly of yourself.

"16. Don't decide important affairs by yourself. Always consult with the people concerned before making a decision. Then employees will have a positive attitude in their work."

2400. Mogi family creed (17 articles) adopted (Early event). 1925.

• ***Summary:*** In "The Kikkoman Chronicles" (1998, p. 37-38) author Ronald Yates states: "More than 70 years ago, the Mogi families and the Takanashi and Horikiri families adopted a written family code of business. It is an informal 17-pount document that has played an important role in Kikkoman's corporate governance since eight families merged to create the company [Noda Shoyu Co.] in 1917. This creed "is evidence of tradition and loyalty–qualities still highly regarded in Japan and Asia,..."

"The Mogi family creed is much more ambitious than one of those pithy vision statements that so many companies create... it remains a document that members of the Mogi family still conduct their professional and private lives by. It reads:

"1. Family members should recognize that harmony is of utmost importance. Harmony fosters mutual respect which permits family members to focus on prosperity in business and on the longevity of the fortunes of the families.

"2. Worshipping and respecting a Supreme Being is the foundation for nurturing virtue. Keeping faith nourishes your own mind.

"3. Loyalty and patriotism are an obligation. Respect and serve your country and observe the fundamental character of your country.

"4. Family members should recognize that courtesy is a fundamental element, If, as a senior member, you lack courtesy, junior family members will not give allegiance to you. If junior members lack courtesy, there may be serious repercussions. Mutual courtesy will result in a self-governing, peaceful family.

"5. Always keep in mind that virtue is the origin and wealth is its product. Do not judge a person by his wealth or

© Copyright Soyinfo Center 2014

lack of wealth.

"6. Strict discipline should be maintained. valuate each employee with fairness. Demand the utmost in diligence. The hierarchy in any organization must be maintained.

"7. Human resources are the most valuable treasure of a company. Each employee should be treated without personal prejudice and be placed in the most appropriate position according to his capability and achievements. Each employee should be respected and his self-worth should be maintained or enhanced.

"8. The education of our children is our responsibility to our nation and to our community. The body and the mind should be trained with moral, intellectual, and physical education.

"9. Benevolence should be extended to all living things. Benevolence is the source for discipline and the mother of virtue. Words are the door to both fortune and misfortune. A harsh tongue can hurt others and also yourself. A kind demeanor will make you feel at ease, even in times of turmoil. Be careful of each word you speak.

"10. Simplicity and frugality have been the time-honored tradition of the family for generations. Live within your means.

"11. True profit comes from hard work and maximum effort. Speculation is not the best road to follow. Business which is done contrary to social order and by taking advantage of others' weakness should be prohibited.

"12. Competition is essential to progress. Excessive and unethical competition should be avoided.

"13. Any judgment should be made clearly and fairly. Rewards and penalties should be fully recognized. Rewards will encourage challenges and penalties will discourage thoughtless mistakes.

"14. When beginning a new business, consult with family members. Do not make decisions by yourself. You should recognize that absence of a business loss is akin to making a profit.

"15. Do not fall into debt carelessly. Do not act as a guarantor for any loan. Never lend money to make a profit.

"16. Give as much money from your personal earnings as possible. Never ask for a reward or think highly of yourself.

"17. Do not decide important maters by yourself. Always consult with the people who have a direct interest in the subject matter prior to making a decision. Shared decision-making results in people having a positive attitude toward their work."

Letter (e-mail) from Kikkoman corporate office via Kikkoman Sales USA. 2012. May 14. The Mogi 17-point family creed was written in 1925.

Note: Article 3, whose content does not appear in the 16-point creed, may have been added at a later date.

2401. Ossendowski, Ferdinand; Palen, Lewis Stanton. 1925. From president to prison. New York, NY: E.P. Dutton & Co.; London: Allen and Unwin. viii + 338 p. No index. 21 cm. • ***Summary:*** Antoni Ferdynand Ossendowski was a Pole by birth, a chemist by training, and an adventurer by inclination. Known to lie and deceive quite frequently, he was a chemical engineer with the Russian railway in Manchuria in about 1902. When the Russo-Japanese war started in 1904, the Russian government asked him to organize at Harbin a central laboratory for the military area, where he was to work not only for the Chinese Eastern and Ussuri railways, but directly for the General Staff of the army. His principal occupation was to study thoroughly the supply of local raw materials, so that they could be used instead of similar materials that would have to be imported over the single line of railway 4,000 to 6,000 miles long. While in St. Petersburg, gathering supplies for his lab, he witnessed the birth of the Russian Revolution of 1905 in the massacre of peaceful demonstrators on 9 Jan. 1905 (p. 14-15).

Returning to Harbin in the spring of 1905, he finished organizing his lab to help produce supplies for army. "Orders from the General Staff ordered me to search out some local supply of oil for use as a lubricant in the artillery, for the transport wagons in the field and for the axles of the railway carriages, as well as for the manufacture of soap. The problem was shortly resolved by the discovery in the oil extracted from the soya bean of the qualities necessary for these purposes. Also these beans were produced in such a really fabulous amount in northern Manchuria that the question of quantity production for military purposes was thus taken care of. After having worked out a new method of manufacture, I organized and opened a factory at Harbin which turned out all sorts of oils and soaps by a cold press that was very simple and quick, and in such quantities as to meet all the needs in the war area and thus save the railway from the necessity of transporting these supplies from Europe...

"In the meantime my voracious soap factory was always demanding more and more of the soya bean oil. As it was then not available in sufficient quantity on the Harbin market, I determined to start out in search of a district where the oil was plentiful and from which it could be readily transported to Harbin. With my assistant and two Cossacks I journeyed up the Sungari River..." He eventually found large supplies of soya bean in the neighborhood of Hsin Ch'eng Fu or Petuna on the Sungari. His inventiveness gained him acclaim from the Army and promotion to the post of Chemical Expert of the General Staff.

The soya bean oil lubricants were actually used during the Russo-Japanese War. The author lived 1876-1944.

2407. *Official Record of the U.S. Dept. of Agriculture* (*The*). 1926. Dr. Charles V. Piper. 5(7):4. Feb. 17.
• ***Summary:*** Dr. Charles Vancouver Piper died Thursday evening, Feb. 11, at Emergency Hospital, Washington, DC. For some time he had been in poor health, but continued to carry on his work. He suffered a light stroke of paralysis at his office the previous Monday morning, was taken to his home, and then to the hospital the following day.

In charge of the Office of Forage Crop Investigations, Dr. Piper was connected with the USDA for 23 years, during which time he made a world-wide reputation as an authority on forage crops and grasses. Through his efforts, many plants and grasses of inestimable value to American agriculture were introduced from foreign countries and established in the United States.

Dr. Piper was probably best known to the general public through his work in developing the creeping bent grasses for use on golf greens. In 1919 he discovered a clump of bent grass growing on a green at the Washington Golf and Country Club. By the vegetative method of propagation he secured a quantity of roots of this grass and in 1921 distributed the stolons or roots to various gold associations for trial. "The grass has since become known as the Washington creeping bent and is now found growing on thousands of golf greens throughout the northern section of the United States. At the time of his death Doctor Piper was chairman of the greens committee of the United States Golf Association, which he was largely instrumental in organizing, and editor of the monthly publication issued by the association. Through its columns he brought about the use of these improved grasses for greens and by his efforts created golfing conditions enjoyed by thousands of golfers everywhere. Through this medium he also found an outlet for his characteristic philosophy, which he expressed under a monthly contribution called 'Meditations of a Peripatetic Golfer.'

"The contributions which Doctor Piper made to the forage and grass industry of practical agriculture are so numerous that it is difficult to single out the most outstanding achievement. However, it was the work of Doctor Piper that secured the introduction and establishment of the now widely known Sudan grass, which is native to Africa. In a comparatively short time this grass has become one of the very valuable hay and pasture grasses over a large part of the United States. Likewise the rapid spread of soy beans in this country can be credited to his introductions and investigations.

"Doctor Piper is the author of more than a hundred papers and books on botany, agriculture, and allied subjects."

"In his search for new forage plants and other crops

© Copyright Soyinfo Center 2014

Doctor Piper has traveled widely, having spent much time in Japan, China, India, Java, Egypt, the Philippines, and Alaska." Doctor Piper was born on 16 June 1867 at Victoria, British Columbia, Canada. In 1885 he received his B.S. degree at the University of Washington, and his M.S. in 1892. He remained at that institution as professor of botany until 1903, when he received his appointment to the U.S. Department of Agriculture in Washington, DC.

He was a member of the American Society of Agronomy, of which he was president in 1913-14; the Botanical Society of Washington and its president in 1908-09; the Biological Society of Washington; and the Society for the Promotion of Agricultural Science.

Experiments using oxides and carbonates of alkaline-earth metals as saponifying agent]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 29(3):109-15. March. [3 ref. Jap]
• ***Summary:*** A mixture of lime or calcium carbonate, or magnesia or magnesium carbonate, with the crude fatty acids of soy bean oil or with the oil itself, may be used instead of the purified calcium soap of soy bean oil (Sato 1922; Sato 1923). The fuel oil is obtained more easily than by the earlier method, and there is no notable difference between the properties, yield, and composition of the products resulting from the 2 methods. The amount of saponifying agent used should be more than 20% of the oil or fatty acids. For equal amounts of saponifying agent the magnesium compounds produce a better fuel oil than the calcium compounds. With the carbonates of the metals a longer time is required for the distillation than with the oxides, but there is no noteworthy difference in the properties of the distillates. By using the retort residue of the distillation instead of fresh saponifying agents the distillation time is shortened, but the quality of the product is slightly inferior. Address: Manshû Tetsudô Chûô Shikenjo.

Abst. 20:3356). [9 ref. Jap]
• ***Summary:*** The surface tension and lathering power of various soaps prepared from hydrogenated soy bean oils were studied for the purpose of comparing the oils with

© Copyright Soyinfo Center 2014

beef tallow. Hydrogenated soy bean oil having an iodine value of 60-69 is the best substitute for beef tallow for the manufacture of soap, although it differs somewhat in composition. The drop number and lathering power of the soap solutions vary with the progress of hydrogenation of the fatty oils used. Drop number and specific volume of lather diminish during the first stage of hydrogenation, then rise gradually to a maximum when the oil has iodine value 60-69, beyond which they again gradually fall until the iodine value of the oil becomes zero. Iso-oleic acid formed during the hydrogenation has no injurious effect on the properties of the soap. Soaps made from unsaturated fatty acids show a fall of drop number with rise of temperature, whereas those made from saturated acids of high melting point show the reverse effect, the maximum being generally at the temperature at which the solution becomes quite transparent. Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Yushi Jikken-shitsu.

Decomposition by hydrochloric acid]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 29(4):179-86. April. (Chem. Abst. 20:3302). [Jap]
• ***Summary:*** Soya beans from four different sources were treated with light petroleum and the resulting proteins decomposed by hydrochloric acid. With 38.5% acid at 100ºC, 9.1-9.7% ammoniacal nitrogen (calculated on total nitrogen) was obtained after 30 minutes treatment; and 67.4-68.9% of amino-nitrogen after 12 hours. 20% acid yielded at 100ºC about 10% ammoniacal nitrogen after 30 minutes and about 62% amino-nitrogen after 12 hours; and at 40ºC, 9.4% ammoniacal nitrogen after 38-48 hours, and 9.7% amino-nitrogen after 48 hours. About 1% of ammoniacal nitrogen and 4.3% of amino-nitrogen were formed by 0.4% acid at 40ºC after 48 hours. Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Kogyo Yakuhin Kenkyu shitsu.

2418. Mashino, M. 1926. Daizu tanpakushitsu no bunkai ni kansuru kenkyû. II. Ryûsan ni yoru bunkai ni tsuite [Decomposition of soya-bean protein. II. Decomposition by sulfuric acid]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 29(4):187-90. April. [Jap]
• ***Summary:*** Sulfuric acid (20%) yielded 8-9% ammoniacal nitrogen after ½-1 hour and 9-10% after 2-12 hour, and 52-54% amino-nitrogen. Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Kogyo Yakuhin Kenkyu shitsu.

2419. Yamada, Masakazu. 1926. Yûki enki bunri ni nafutooru o no ôyô ni tsuite (jiamin no shin bunri-hô) [Application of naphthol yellow to the isolation of organic bases. (A new method for the isolation of diamines)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 2(4):246-67. English abstract bound in the back. Vol. 2, No. 4. p. 39-41. [10 ref. Jap]
• ***Summary:*** The author applied to sake and shoyu the method proposed recently by A. Kossel and K.E. Gross (*Z. Physiol. Chem.*, 135, 167-74, 1924) for the isolation of arginine and aphthol yellow. He was able to obtain much crystalline precipitate in the shoyu, but none in the sake. This precipitate was easily recrystalized from boiling water in beautiful rosettes, which were found to be the mixture of the double salts of putrescine and cadaverine with the naphthol yellow. The precipitation in shoyu was caused by "salting out." The author also used naphthol yellow to precipitate bases (cadaverine picrate) from tamari shoyu, Hatcho miso, inaka miso, and natto. Address: Nôgaku-shi, Japan.

2420. Yamada, Masakazu. 1926. A new method for the isolation of diamines. *J. of the Agricultural Chemical Society of Japan* 2(4):39-41. April. Whole issue no. 19. [Eng]
• ***Summary:*** 1.08 g kadaverin pilerat is obtained from 1 kg of natto.

Note: At the top of p. 39 is written: "Abstracts from original papers."

2421. Mashino, M. 1926. Daizu tanpakushitsu no bunkai ni kansuru kenkyû. III. Kasei sooda ni yoru bunkai ni tsuite [Decomposition of soya-bean protein. III. Decomposition with sodium hydroxide {caustic soda}]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 29(5):248-251. May. [Jap]
• ***Summary:*** Soya-bean protein obtained from 4 different sources was decomposed by treating with 19.65% sodium hydroxide at 100ºC for 0.5-12 hours, and the amounts of ammoniacal and amino-nitrogen liberated were determined. The amount of ammonia liberated increases during the first 4 hours, but then remains almost constant. Ammoniacal nitrogen (4-12 hours) is 16.5%, 18.6%, 19.5%, and 17% in the 4 cases, respectively, of the total nitrogen. The rate of decomposition of the protein is nearly the same for the 4 samples. Amino-nitrogen (12 hours) is 65.6%, 68%, 68.6%, and 67.6% in the 4 cases, respectively, of the total nitrogen. Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Kogyo Yakuhin Jikken Shitsu.

2422. Mashino, M. 1926. Daizu tanpakushitsu no bunkai ni kansuru kenkyû. IV. Bunkai ni kansuru chiken (hoi) [Decomposition of soya-bean protein. IV. Addendum on knowledge of decomposition]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 29(5):252-254. May. [Jap]
• ***Summary:*** A discussion of previous work (Mashino 1926). The violet color of the biuret reaction for soya-bean protein is apparently related to ammonia in protein. When all the ammonia is evolved, no violet color is observed. The free carboxyl group in the protein molecule may be present in combination with an amino-group. The rate of decomposition

© Copyright Soyinfo Center 2014

of soya-bean protein is little affected by pre-treatment with superheated steam. Oil-extracted soya-bean cake is therefore used for producing amino acids. Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Kogyo Yakuhin Jikken Shitsu.

2424. Wolf, Frederick A.; Lehman, S.G. 1926. Brown-spot disease of soy bean. *J. of Agricultural Research* 33(4):365-74. Aug. 15. [6 ref]
• ***Summary:*** This disease was first described in Japan in 1915 by Hemmi, and later in North Carolina (USA) in 1922 by the authors. The causal fungus, *Septoria glycines,* reproduces by conidia; no ascogenous stage is known. Brown spot causes brown or reddish spots upon the blades of the leaves and sometimes also upon the stems and pods. It appears to be seed-borne and attacks the cotyledons and then the foliage. The disease has been established by artificial inoculation. The spores may pass through the stomata and the mycelium is intercellular. Address: 1. Office of Fruit Diseases, Bureau of Plant Industry, USDA; 2. North Carolina Agric. Exp. Station.

2428. Associated Press (AP). 1926. 'Sukiyaki' appears chop suey's rival. *Hartford Courant* (*Connecticut*). Sept. 27. p. 8.
• ***Summary:*** "Boston–The American public long ago accepted chop suey, chow mein, and even foo young (with various spellings) but sukiyaki has still to make itself generally known."

Boston [Massachusetts] has one Japanese restaurant (opened within the last 3 months, on the South End) compared with more than 20 that serve Chinese dishes. Ingredients in sukiyaki include "squares of yellow bean cake" [tofu] and some "soy bean sauce." Later the hostess brings "toasted crackercakes with a seaweed leaf wrapped about each as a special delicacy."

2429. Horvath, A.A. 1926. The soybean as human food. *Chinese Economic Monthly* 3(9):392-400. Sept. [Eng]
• ***Summary:*** Contents: Introduction. 1. General ingredients [composition] of the various Manchurian beans. 2. Composition of some Japanese soybeans and of the common American varieties. 3. Value of the soybean as food.

Introduction: "The soybean is a plant of very early cultivation in China. Its use dates back to the beginning of China's agricultural age under the Emperor Shen Nung. It is mentioned in the *Ben Tsao Gang Mu* [*Pen-ts'ao kang-mu*], the ancient materia medica, written by Shen Nung himself in the year 2838 B.C. The celebrated dictionary of Sui Sham describes the plant under the name of *tchouan.* In another ancient dictionary, the *Kouang-ia* [*Guangya,* 230 AD], dating from the time of the Han dynasty, the soybean is called *ta-teou* [*dadou*], or grand pea, and also *sou.* It seems very probable that the names soi, soy, soya, and soja are all derived from the ancient Chinese name *sou.*

Note 1. This brief history of the soybean in China (above) is largely borrowed from Piper and Morse. 1923. *The Soybean.* p. 36-37.

In numerous ancient books the philosopher Hamintze [Lord Liu An of Huai-nan], a prince of the Han dynasty, is given as the inventor of soybean curd. The soybean and the soybean curd (*tofu*) are mentioned in many of the ancient Chinese poems, as for example in the rhymes of the great poet Sou, of the 2nd century: 'The tender jade* gets perfumed by it in the kettle' and 'to boil the pea to milk and the seed to butter' (Li Yu-ying et Grandvoinnet)." (Footnote: *"The poet emphasizes the resemblance of the fresh *tofu* with jade.")

"In 1921 China produced 80 per cent of the world's soybean production, 70 per cent of the latter being harvested in Manchuria. The 1921 crop of soybean in Manchuria was approximately 4,500,000 tons. The total acreage of soybean in the three provinces was 8,000,000 acres, covering 25 per cent of the total cultivated area."

In the section titled "General ingredients of the various Manchurian beans," four long tables give the nutritional composition of some of the roughly 500 different varieties of Manchurian soybeans, including black soybeans. The Chinese names of the varieties are given. Most of the

© Copyright Soyinfo Center 2014

analyses were conducted by the South Manchuria Railway Co. Table 1 gives the names (all are Chinese names), composition (water, fats, and protein) of 26 Chinese soybean varieties. The averages are: Water 8.60%. Fatty substance 19.90%. Protein 42.84%.

Table II gives the composition of 15 soybeans grouped by color, including the Chinese name, place of production, water, protein, fat, carbohydrates, fibrous tissue, "ashy substance," and analyst (incl. Fengtien Experimental Farm, Mantetsu Experimental Farm, and Mantetsu Central Exp. Farm). "Generally speaking, yellow beans are richest in protein and fat, especially the latter, then comes green beans with black beans last.

In Table III the "Kung Chu Ling Experimental Station classified the different kinds of yellow soybeans produced in Manchuria by the colours of navel [hilum] and compared their chemical composition. No significant differences were found. Table IV shows the composition of mixed soybeans stored in Manchuria during 1919 and 1920. A Manchurian grading system is described based on five factors: Shape and size (15 points), weight of 1 *sho* (10 points), lustre (15 points), dryness (25 points), purity (cleanness) (30 points). Soybeans receiving a score of 90-100 points are graded as a Special Class, those with 80-90 points as First Class, and those with 70-80 points as Second Class (Nakao and Usami). This table shows the average composition to be: water 8.5%, fatty substance 18%, protein 40%, soluble non-nitrogenous substance and fibrous tissue 28%, ashy substance 5.5%. The higher grades contain more oil and protein.

In the section titled "Composition of some Japanese soybeans and of the common American varieties," table V (p. 397) gives the composition of four leading Hokkaido soybeans: Tsuru-no-Ko, Kanro, Yoshi-Oka, and Oh-Ya-Gi. The water content averages 16.47%, the protein content ranges from 39.34 to 36.86% (average 37.62%), and the fat content ranges from 19.08 to 17.86% (average 18.66%). Table VI gives the composition of six leading American soybean varieties: Mammoth, Ito San, Haberlandt, Guelph, Midwest, and Kingston. The water content averages 7.74%, the protein content ranges from 36.59 to 32.99% (average 35.00%), and the fat content ranges from 22.72 to 18.96% (average 20.37). Note that the Hokkaido soybeans contain more than twice as much moisture, 7% more protein, and only 91.6% as much fat.

The section titled "The value of the soybean as food," states: "One of the certain evidences that the soybean is making god headway in the Occident is the fact that about 10 years ago [during World War I] the French army replaced a large portion of the meat powder in the army ration pottage by soybean products, and has used it in several forms as part of the regular ration. Germany and Austria also tried to compensate the poor protein diet of their army and population during the Great War by using soybean products."

"The soybean contains a double amount of the protein and of calories present in beefsteak. Therefore, in Peking, where the retail price for soybean in 1925 averaged 4 cents (Mex.) per one pound, half of a pound, costing 2 cents, may provide for an adult the necessary protein minimum, which otherwise would have to be purchased in the form of one pound of meat, costing at least 20 cents. According to Li Yu-ying, author of the well-known monograph (in French), 'Le Soya,' and now connected with the Kai Cheng Bean Products Company in Peking, the market prices for an equivalent of 100 calories in soybean were, in Paris in 1912, thirty times cheaper than for the same 100 calories in beef." In Germany, Ehrhorn (a well-known soybean food specialist, formerly of the Aguma factories in Harburg, Germany) calculates that 500,000 tons of soybean residue [meal and cake] are available every year. Soybean protein in Germany is now 25 times cheaper than beef protein. In China, where undernutrition is found on a large scale and famine is a common occurrence, soybean cake is used mainly as a fertiliser for rice fields and sugar plantations–rather than as a low cost source of protein. Numerous famine relief committees in China "have come to the conclusion that one key to the famine relief problem in China is to stop the waste of precious soybean cake for fertiliser." Note 2. This is the earliest English-language document seen (Nov. 2002) that uses the word "undernutrition."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China).

Note 3. This is the earliest document seen (May 2011) in which Dr. Horvath gives his title as "M.D.

Note 4. This is the earliest document seen (June 2013) that mentions the soybean variety Kanro, or any other large-seeded variety–but only outside the United States. Address: M.D., Peking Union Medical College, China.

Address: Hiroshima Jozo Shikenjo, Gishi, Japan.

2431. *Chinese Economic Bulletin.* 1926. Soy industry in Foochow. 9(301):316-17. Nov. 27.
• ***Summary:*** Soy manufacturers in Foochow [pinyin: Fuzhou], the capital of Fukien [pinyin: Fujian] province, "total about 250, including 100 in the city and suburbs and 150 in the surrounding villages. The leading ones are Kwo Pen-yi (Cc = Chinese characters given), Tang Sen-hsing (Cc), and Tung An (Cc), the first two capitalized at upward of $100,000, and the third a little below $50,000. Mr. Kwo is an experienced soy manufacturer of Yuki (Cc), and Mr. Tang of Kwantow (Cc [pinyin: Guantou]). The former started the Foochow branch manufactory at Shangtuwei (Cc), Nantai (Cc), in 1920, and the latter at Tientangchieh (Cc) in 1925.

© Copyright Soyinfo Center 2014

Tung An is the oldest establishment in Foochow, having been operated at Howyangli (Cc), Nantai, by a Chuanchow (Cc) man for about half a century."

"These manufacturers are organized into two guilds: The City Guild (Cc) and the Nantai Guild."

The small manufacturers try to compete with the large manufacturers by offering a better product, but so far they have not been successful.

"Soy is a sauce manufactured from soya beans. The name 'soy' is derived from the Japanese *shoyu*, the Chinese name being *shi yiu* (Cc [for fermented black soybean sauce]) *chiang yiu* (Cc [for soy sauce]). The raw material used, especially by the manufacturers in Kwantow, is the green [soy] bean from Newchwang, sold in Foochow at $10 per 100 catties. The Foochow manufacturers, however, prefer the yellow [soy] beans from Tengchow (Cc), Shantung province, where they are cheaper than the green variety by several hundred cash per hundred catties.

"The method of manufacture is briefly as follows. The beans are first cooked, then mixed with wheat flour and table salt, and put in a slightly closed wooden jar. The contents of the jar are afterward sprinkled with salt solution, and then transferred into a porcelain *kong* [earthenware vessel], in which they are hard pressed. Finally they are heated in the sun: the longer they are exposed to sunlight, the better the taste of the soy produced.

The soy [sauce] produced in Foochow is inferior in quality to the Kwantow product. The general processes of manufacture are practically the same, the only difference being in details, which remain a commercial secret among the manufacturers."

Other reasons for the superiority of Kwantow soy sauce "may be enumerated as follows: (1) Absence of adulterants. Soy [sauce] is generally divided by its color into two kinds, the light color soy and the dark color soy. The former is pure and has a pleasant taste; it is sold at 1,280 cash per catty. The latter is adulterated with molasses, so as to reduce the cost of manufacture; it is therefore much cheaper in price, not exceeding 32 cash per oz.

(2) Longer exposure to the sun. The Foochow manufacturers are less spacious and less sunny than the Kwantow manufactories. The soy in the former is exposed to the sun for eight or nine hours a day, while the soy in the latter is exposed from sunrise to sunset." This partly accounts for the superior quality of the Kwantow soy.

(3) Long period of preservation. Having been prepared, the soy should remain in the sun for a year before being sold. Old soy is better than fresh soy, as old wine is better than new. However, small manufacturers cannot afford to keep their output for such a lengthy period and often sell it after a few months.

"While Tang Sen-hsing and Kwo Pen-yi confine their business to soy, the Tung An also deals in the following: Table salt; chiang [jiang] (Cc) a semi-solid soy, distinguished from *chiang-yiu*, which is a liquid soy; distiller's grain; vinegar; dried bean curd [probably Chinese-style pressed tofu, *doufu-gan*], pickled bean curd [probably fermented tofu]; salt eggs; salt vegetables and melons; prawn oil; samshu; sesame seed oil; salt turnip; &c. Tang Sen-hsing and Kwo Pen-yi are the best soy makers in Foochow, while Tung An produces excellent pickles.

"Soy and pickles in store are kept in porcelain *kongs* or sometimes wooden barrels. Soy to be transported to other cities is packed in glass bottles or bamboo bottles, the former having a capacity between half a catty and two catties, the latter between three catties and ten catties.

"Owing to the increase in the price of salt from $6 to $8 per 10 catties, soy manufacturers in Foochow have raised the price of soy by 16 cash per catty in May. Prices of other products have also been advanced by the following rates. Dried bean curd, from 8 cash to 10 cash a catty. Pickled bean curd, from 20 cash to 24 cash a catty..."

2432. Horvath, A.A. 1926. The soybean as human food. *Chinese Economic Monthly* 3(11):513-18. Nov. [Eng]

• ***Summary:*** Contents: Soybean oil for food: Refined soybean oil, crude soybean oil. Refined soybean oil: As substitute for salad or frying oil, as substitute for hardened oil or lard (hydrogenation), in oleomargarine and vegetable butters.

Until quite recently, the line between edible oils and industrial oils has been quite clear. "Originally soybean oil was used as an edible oil by the Chinese, but its strange smell has repelled Japanese and Western palates (Sato)." "The advance of science in recent times has quickened the development of methods of refining, deodorizing, decolouring, and hydrogenating oils. As a result, the partition that used to divide food oils from industrial oils has collapsed. Whale oil and fish oil, as well as soybean oil, are now in use in Europe and America as a regular constituent of edible oils and fats."

"The aggregate production of the bean mills in Manchuria is in the region of 200,000 tons of bean oil and over 50 million pieces of bean cake. All the bean mills in Manchuria, excepting the Suzuki Bean Mill, Dairen, which is worked on the so-called extraction system, are worked by the expression system." The process of pressing, however, leaves about 45% of the soybean oil remaining unused in the bean cakes, each of which weighs 61 lb. In Europe, and especially in England, the solvent method is used. In the 'Hanseatische Muhlwerke' [Muehlenwerke], Hamburg, Germany, pressing and extraction methods are combined. Extracted soybean oil generally for ½ to 1 cent per pound less than the expressed oil.

Soybeans contain the highly valuable fat-soluble vitamin. "In 1925 Hornemann showed that if the oil is taken from the beans by pressure, all the fat-soluble vitamin remains in the cake and the oil is free from it... But in case

© Copyright Soyinfo Center 2014

the extraction method is used, the soybean oil contains, according to Hornemann, all the fat-soluble vitamin... Moderate hydrogenation of soybean oil does not destroy the fat-soluble vitamin. Rancidity destroys it.

"Fresh soybean oil has a sweet smell, but, when the impurity is contained in a large quantity, it will emit a disagreeable odour. As time goes by, the change will grow more pronounced... In the case of the temperature being high, the same change occurs more quickly, and the colour of the oil becomes darker, the oil itself tasting also less palatable." Filtered oil is more resistant to undesirable influences. "At the present time the Harbin market includes only the filtered oil produced by the Anglo-Chinese Company. All the other oils are merely such as have settled."

Soybean oil as a substitute for salad or frying oil. "The improved methods of deodorizing and bleaching soybean oil have tended to remove a former prejudice against its use as a table oil. Several firms in Europe and America are packing soybean oil for sale to the retail trade, and it is claimed that a satisfactory market has been found (Piper and Morse)... The Nisshin Oil Mills Company, Ltd., at Yokohama and Dairen, purchased some modern oil refining machines from the U.S.A. in 1921 and a refined bean oil (salad oil) is being made which is claimed by the Japanese to be better in quality than the European or American make, by means of improved scientific methods and special skill... It is said that about 20 tons of the refined bean oil (superior salad oil) is manufactured every day at Dairen. In 1923 the refining of special soybean oil was also successfully begun in Harbin by the Anglo-Chinese Eastern Trading Company, Ltd., which had installed special equipment. The resulting product, known as 'Acetco,' is sold to the local preserve factory, is exported to Transbaikal [Transbaikalia or Zabaikal; a former Russian government located east of Lake Baikal–which is in southern Siberia], which is adjacent to Manchuria, and gradually appears to be conquering the local market as a substitute for the more expensive vegetable oils and animal fats. Acetco salad oil has been used at the Peking Union Medical College Hospital for a year and has been found in quality to be equal to Wesson oil, being at the same time much cheaper" (costing only 60% as much).

Frying oil is widely used in Japan to make "Tempura." "Fried *tofu* especially is made everywhere. Sesame-oil or refined rape-oil was formerly used in Japan for frying purposes but a few years ago the demand for bean-oil began to increase as a substitute for the above mentioned oil. (Footnote: In China refined soybean oil partly replaces the very expensive sesame oil in the diet)." "It is partly because the soybean oil manufactured in Japan cannot compete with that made in Manchuria for purpose of export and, consequently, the Japanese are obliged to extend the market at home."

Concerning lard substitutes: "The commercial lard substitutes consist chiefly of a mixture of lard or 'lard stearine' with 'beef stearine', cotton seed stearine and some vegetable oil... In the United States half of the total amount of all vegetable oils produced in that country is used as substitute for lard. Cotton-seed oil stands first in this respect... In hydrogenation, deodorization is practically complete. Therefore, the product made from cotton-seed oil has no intrinsic superiority over that made from soybean oil. The hydrogenation of soybean oil has tended to remove a former prejudice against its use for the kitchen. In 1918 the consumption of soybean lard substitutes in the United States amounted to over 56 million pounds."

"In oleomargarine and vegetable butters: The industry of butter substitutes owes its origin to experiments made by Mege-Mouries which were worked out to a manufacturing process in Paris in 1870. This industry duly spread to Italy, England, Holland, and other countries in Europe... Cow's milk is sometimes replaced by an emulsion prepared from the kernels of almonds or from soybeans, so that it is possible to prepare a margarine from vegetable products exclusively (Lewkowitsch)."

Note 1. This is one of the most important, original, and creative publications on soyfoods written in English before World War II. It is especially unique and valuable for the information it presents about soyfoods in Europe.

Note 2. This is the earliest document seen (March 2002) that refers to shortenings made with soy oil as "soybean lard substitutes."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China).

Note 3. In Jan. 1927 this journal merged with and became the *Chinese Economic Journal***.** Address: M.D., Peking Union Medical College, China.

2433. South Manchuria Railway Co. 1926. Soya beans in Manchuria. Dairen: SMRC Agricultural Office. 40 p. Nov. 26 cm. [Eng]

• ***Summary:*** Contents: 1. How Manchurian beans are produced: Soybean production in the world (Japan, Chosen {Korea}, Manchuria, China proper, United States), bean cultivation in Manchuria (how production has been increased, Manchuria suited for bean production {meteorological peculiarities, Manchurian soil and bean cultivation, local adaptability}). 2. World-wide demand for Manchurian beans: Supply and demand in Manchuria, bean demand in destination countries (demands in Japan, in China proper, in Java {Dutch East Indies}, in European countries). 3. Uses of beans: Introduction (gives uses as food, cattle feed, and fertilizer, and uses for the oil), general uses of beans (beans, bean oil, bean cake, food), value of beans as food (from general constituents, food value of beans from new dietetic point of view, conclusion), uses of bean oil (properties of bean oil, miscellaneous uses of bean oil {direct uses (native), refined bean oil for table use, substitute for lard, substitute for butter, paint solvent, soap,

© Copyright Soyinfo Center 2014

glycerine and fatty acid, candles, water proof, substitute for petroleum, substitute for India Rubber, etc.}), uses of bean cake (as fertilizer, bean cake as cattle feed, bean powder [probably defatted soybean flour] made from bean cake & its uses, "soy" made from bean residuum, "Aji-no-moto" made from bean residuum, water-paint made {Solite, invented by Mr. T. Suzuki and manufactured and sold by the Dairen Solite & Co. until several years ago}, protein products made from bean residuum {such as paper sizing, celluloid substitutes, and Satolite [soybean plastic]}). 4. Bean milling in Manchuria: History of development, oil milling processes (expressing process, by process of operation, by kinds of expressing devices, by chemical / benzine extraction at Honen Bean Mill, Dairen), advantages & disadvantages of different processes (wedge, screw, & hydraulic systems compared; round cake, plate cake, & extraction system compared {advantages & disadvantages of extraction system, advantages & disadvantages of bean plate, advantages & disadvantages of hydraulic pressure system}), bean mills in Manchuria. 5. Accumulation & distribution of beans, bean cake & oil: Produce movements in South Manchuria, produce movements in North Manchuria. 6. Business in Manchurian produce: Business on the Exchange (Japanese Exchanges, Chinese Exchanges), business outside the Exchanges (spot deals in beans {river beans, market beans, osier bin beans, train beans}, by forward contract {by future contract, business in the green field, by speculation}, business in bean cake & oil). 7. Export staple produce: Staple produce in Manchurian trade, exports of staple produce in South & North Manchuria compared, position of custom houses in Manchuria concerning export of staple produce.

In Chapter 4, "Bean milling in Manchuria," section 1 titled "History of development" states: The [soya] Bean milling industry was established in China a few hundred years ago. In Manchuria, hemp oil mills used to be practically all that existed up until about 60 years ago [i.e., until about 1866]. Around Tiehling and Changchun, which were important [soya] bean markets, the process for expressing oil from hempseed was applied to Beans with excellent results; this was the origin of the bean milling industry in Manchuria. As the demand for bean oil kept rising, hempseed oil found its uses gradually reduced, and in time the term "oil mill" came to refer to a bean oil factory. At that time, the object of the mills lay chiefly in producing Bean Oil; Bean Cake was regarded as a by-product, good only for cattle feed. Most of the demand was local and the milling process was primitive and on a small scale, often conducted by hand or by means of a donkey.

Phase II: The Sino-Japanese War (1894-1895) marked the start of Bean Cake exports to Japan. As its fertilizing value came to be recognized, demand for to Japan expanded rapidly. Starting at this time, Bean Cake came to be seen as the main product and Bean Oil as the by-product.

Phase III: In recent years, with the worldwide shortage of oils and fats, Manchurian Bean Oil has come to be exported worldwide; exports to the West have begun and increased dramatically. Demand reached its zenith during the Great War [World War I].

Photos show: Seed-bean field (Agricultural Experiment Station, Kunchuling). Soya beans in pods. Sowing of seed beans. Bean plant in harvesting season. Weeding in bean field. Beans being threshed in farm-yard. Beans harvested & carted away. Beans stored in Osier Bins in the yard of the local merchant. Bean carts wending their way the Market in the Interior. Old screw patterned presses in Manchuria. Hills of bags of beans in Changchun Station Yard. Train loads of bean cake to be shunted to quay of shipment. Hydraulic pressure system in Manchuria.

The section titled "'Aji-no-moto' made from bean residuum" (p. 17) states: "In the amino acid that constitutes [soy] bean protein is contained much glutamic acid that serves as the chief source of 'ajinomoto,' a very popular flavor at Japanese table. Thus, be decomposing the constituents of bean residuum [defatted soybean meal], the manufacture of glutamic acid soda will be easily accomplished." Note: This is the earliest document seen (Jan. 2014) concerning "aji-no-moto" / "ajinomoto" (mono-sodium-glutamate) made from soybeans.

2434. Stewart, Ralph T.; Wentz, John B. 1926. A recessive glabrous character in soybeans. *J. of the American Society of Agronomy* 18(11):997-1009. Nov. [4 ref]
• ***Summary:*** Soybeans are normally pubescent (hairy), however a number of smooth (glabrous) varieties are known to exist in Japan and the USA. A glabrous character is reported "which is thought to have arisen from a mutation in the germ cells in one of the parents in a cross between two varieties of soybeans. The inheritance seems to be due to a single pair of Mendelian factors, glabrousness being recessive." Nagai and Saito (1923) reported a dominant glabrous character. The reason for this discrepancy is not yet clear. Address: Iowa State College, Ames.

Address: Japan.

2459. International Institute of Agriculture. Bureau of Statistics. 1926. Production et commerce des produits oleagineux de huiles vegetales [Oleaginous products and vegetable oils–Production and trade]. Rome, Italy: Institut International d'Agriculture. Service de la Statistique Generale. 192 p. Index 24 cm. [30+ ref. Fre; Eng]
• ***Summary:*** The Introduction begins: "This volume is a continuation of a the monograph on oleaginous products (*produits oléagineux*) and vegetable oils, published in 1921 in French, then in 1923, with numerous amplifications and modifications, in English.

Soya is discussed in detail in English on pages 70-73. Tables show: (1) World production of soybeans in 1909-13, 1921, 1922, 1923, and 1924 in the following countries (in thousands of quintals): China (incl. Manchuria), Korea, Japan, United States, Java & Madura, and Kwangtung (French: Koung-Toung; today's Guangdong province in southern China). In 1923, China was by far the leading country (22,680), followed by Korea (6,466), Japan (4,378), USA (2,434), and Java and Madura (973). (2) Exports of soybeans worldwide (during the same 5 years as (1) above). (3) Exports of soy oil worldwide (during the same 5 years as (1) above). Note: This same basic information is given in French on pages 24-27.

Pages 60-63 give a worldwide overview in English. Tables show: (4) World production of primary oleaginous products (during the same 5 years as (1) above). The eight products are: Groundnuts, rapeseed, linseed, hempseed, cottonseed, sesamum, soya and copra. For sesamum, soya, and copra, values are given only for the year 1924. (5) World production of primary oleaginous products (expressed in terms of oil, in thousands of quintals). (6) World exports of primary oleaginous products (in thousands of quintals). (7) Excess of imports (+) or of exports (-) of primary oleaginous products terms of oil (in thousands of quintals). For the eight products for the years 1909-1913 and 1924 for: Europe, North and Central America, South America, Asia, Africa, Oceania. (8) World exports of vegetable oils (in thousands of quintals during the same 5 years as (1) above).

groundnuts (p. 64-68), and sesamum (p. 68-71). Address: Rome, Italy.

2460. Japan Transportation and Operation Bureau (Un'yukyoku). 1926. Daizu, kome, zakkoku ni kansuru chôsa [Survey of soybeans, rice, and small grains]. Japan. See p. 1-59. (Juyo Kamotsu Jokyo dai 1 hen). [Jap] Address: Tokyo, Japan.

2461. Kirtland, Lucian Swift. 1926. Finding the worth while in the Orient. New York, NY: Robert M. McBride & Co. xii + 462 p. See p. 77. Illust. Index. 20 cm.
• ***Summary:*** This is guidebook to Asia–but with the author's favorites clearly expressed. In Chapter 1, "Japan, Land of the Rising Sun," the author is discussing Nara and its many festivals year-round. However, certain dates are of major importance (p. 77). On the nights of February 2 and 3 all three thousand lanterns in the Park are lighted. On the second of these two nights the townspeople go "to the Kasuga-no-Miya shrine for the ceremony known as 'bean scattering,' everyone taking the precaution to be present as he or she becomes safeguarded against harm from evil spirits for a year."

Note: This is the earliest English-language document seen (Sept. 2011) that uses the term "bean scattering" to refer to *mame maki* (in Japan at the lunar New Year).

In the section titled "The Japanese menu," soy sauce is mentioned (p. 23).

Chapter 3 (p. 113-28) is titled "Manchuria, the kingdom of the soya bean." Page 113 states: "Manchuria's three provinces never were part and parcel of the Chinese empire. China 'proper' stops at the Great Wall. When the Manchu dynasty seized the Dragon Throne of China, it retained Manchuria as a private affair. The emperors did not lump their ancestral provinces in the common pool... They sought to keep the Chinese and everybody else out."

2462. Mallory, Walter H. 1926. China: Land of famine. *American Geographical Society, Special Publication* No. 6. 199 p. See p. 112-14. Foreword by Dr. John H. Finley.
• ***Summary:*** "A striking example of the introduction and utilization of new crops may be seen in the case of the soy bean. Until recent years, beans and bean products have not occupied a place of importance in commerce, although they have been used as an article of food by the Chinese for centuries past. It is chiefly due to experiments of the Japanese that the value of the by-products has been established... Modern Manchuria may be said to have been built on the soy bean." Discusses the merits of soy flour, and the work on its behalf of Dr. A.A. Horvath of the Peking Union Medical College, and by Dr. L. Berczeller, the Hungarian food physiologist. Address: Secretary, China International Famine Relief Commission.

2463. Mayerhofer, Ernst; Pirquet von Cesanatico, C. eds. 1926. Lexikon der Ernaehrungskunde [Dictionary of dietetics]. Vienna, Austria: J. Springer. viii + 1205 p. Illust. 25 cm. [Ger]*
• ***Summary:*** Included in the long list are: Akamiso, miso, shiromiso, tofukasu [okara], daizu [soybeans], fu [dried wheat gluten cakes], kingyo-fu, kiri-fu, kiri-mochi [frozen and dried rice cake], ame [malt extract], mirin, aburage [tofu fried in vegetable oil], natto–Bohnenkäse, Tofu–Sojatopfen, Tonyu–Sojamilch [soymilk], azuki [small red beans], kwansen-fu, kinako–Sojabohnenmehl, geröstet, amasake [amazake]–unvergorener Sake, umeboshi, koritofu [frozen and dried tofu], midzuame [soft ame = rice syrup], shoyu–Sojasauce, yuba–eine Bohnenspeise. Note that a number of these terms are Japanese.

Note 1. This is the earliest German-language document seen (Nov. 2005) that mentions amazake, which it calls "amasake."

Note 2. This is the earliest German-language document seen (April 2013) that uses the term *Sojatopfen* to refer to tofu.

Note 3. This is the earliest document seen (Aug. 2002) in any language that uses the term *tonyu* (or tônyû) to refer to soymilk.

Note 4. This is the earliest German-language document seen (Nov. 2102) that mentions kinako, which it defines as *Sojabohnenmehl, geröstet.*

2464. Saeki, Tadasu. ed. 1926. Progress of the science of nutrition in Japan. Geneva: League of Nations Health Organization. 387 p. Illust. 25 cm. *

2465. Saito, Akio. 1926. [Chronology of soybeans in Japan, 1900 to 1926, last half of the Meiji period and all of the Taisho period] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Feb. p. 12-14. [Jap]
• ***Summary:*** 1901–Crushing of soybeans starts in Japan. Owada Seisakusho of Tsuruga, Fukui prefecture, Japan, starts making soy oil and soybean cakes using the press method (*assaku-ho*).

1901–Nakahara Kota is issued a patent on his process for making dried-frozen tofu indoors in a freezer (*jinko kôri-dofu*). This makes it possible to produce a good-quality product year round. This year there are 453 makers of dried-frozen tofu in Nagano. Nagano prefecture encouraged production of this product during the Russo-Japanese War as a side home industry.

1901–Soybean production in Japan reaches 525,000 tonnes, topping 500,000 tonnes for the first time.

1905–After Japan's victory in the Russo-Japanese War, it is said that maybe, because of the victorious mood, tofu makers start to blow a horn while selling tofu.

1905–At about this time, soybean cake (*daizu kasu*) passes fish cake to become the main fertilizer for crops in

© Copyright Soyinfo Center 2014

Japan.

1905–Shin Sawamura (lived 1865-1931) discovers the main natto bacteria and names it *Bacillus natto* Sawamura.

1906–Neda Tadamasa of Akita prefecture develops a new type of soybean. Named the Akita, it is a cross between Shirosaya and Itoi's Ani.

1907 March–Nisshin Mamekasu is founded (initial capitalization is 3,000,000 yen). The next year its soybean crushing plant in Dairen, Manchuria, starts to operate. In 1918 the company merged with Matsushita Mamekasu to become Nisshin Seiyu K.K.

1908–At about this time the retail price of tofu in Tokyo is 1 *sen.* The average cake of tofu weighs over 100 monme (1 monme = 3.7656 gm or 0.1325 oz), so over 376 gm. In 1982 the average price of tofu is 100 yen per cake and the average cake weighs 300 gm.

1914–The Mogi Saheiji family in Noda starts to sell shoyu in 1-sho bottles (1 *sho* = 1.805 liters or 3.81 pints). Before this time a ceramic sake bottle (*tokkuri*) was used.

1914–Yamada Hikozaburo of Nagano prefecture succeeds in making dried-frozen tofu (*Koya-dofu*) for the first time in the *Shimi-dofu* area.

1915–From this year until 1919, the soybean oil industry in Japan is in a period of prosperity. In 1914 Japan produces 7,105 tonnes of soy oil and 92,325 tonnes of soybean cake. Just 5 years later, in 1919, these figures have risen to 30,658 tonnes of soy oil and 353,288 tonnes of soybean cake. Soybean cake becomes very widely used in Japanese agriculture.

1918–The mayor of Tokyo, Tajiri Inataro, recommends that people eat low-fat soybean cake cooked with rice (*mamekasu meshi*) to protect themselves from the rapidly increasing price of rice; he himself eats this dish every day. Hiroetsu? Takako (a woman educator, lived 1867-1949) cooked soybean cake and rice (*mamekasu gohan*). Dr. Saei Tadasuke (1876-1959, a nutritionist) introduces an inexpensive meal (it costs 3 *sen* 5 *rin* for 5 people) using tofu and fish bones for breakfast and dinner at the Inexpensive But Nutritional Cookery Seminar (*Eiyo Anka Ryori Koshukai*). This year 30-50% of Japanese don't have enough to eat. The demand for beef tendons and okara increases. The price of high-quality meat increases faster than the price of tofu.

1919–Artificially cultured pure-culture natto starts to be used. Hanzawa Jun of Hokkaido University (1879-1972), using this method, invents a new "Sanitary Natto Container" (*Eisei Natto Yoki*) made of thin slabs of wood (*kyogi*). He also founds the "Natto Container Improvement Association" (*Natto Yoki Kairyo-kai*)

1919–Soybean production in Japan reaches 502,200 tonnes, and soybean imports rise to 168,000 tonnes. Production of soybean oil reaches 8,853,600 gallons or 33,573,000 liters, equal to that of rapeseed oil.

1919–A machine or kit for making tofu or soymilk easily at home (*kateiyo tonyu-ki*) is marketed.

1920–Soybean production in Japan reaches a record 559,000 tonnes.

1920–Tsugano Akisaburo of Tokyo invents a quick method for fermenting shoyu (*shoyu sokujo-ho*). By adding salt water to soybean koji to make moromi, he is able to make shoyu in less than 10 days.

1922 April–The oil production department of Suzuki Shokai [which went bankrupt in 1922] becomes independent and founds Hohnen Oil Co., Ltd. (*Hohnen Seiyu*).

1923 Sept.–The Great Kanto / Tokyo Earthquake (*Kanto Daishinsai*) strikes. 70% of the miso factories in the area are burned down, causing a shortage of miso. But miso makers in other parts of Japan use this opportunity to ship their miso to Tokyo, and the people of Tokyo come to realize the good taste of miso made elsewhere in Japan.

1924–Kodama Shizutoshi? (or Shintaro) invents another quick method for fermenting shoyu (*shoyu sokujo-ho*) using acid or alkali to hydrolyze soybeans or soybean cake to make shoyu.

Note: This is the earliest document seen (April 2001) that mentions shoyu made by acid hydrolysis. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

2466. Stevenson, John Albert. 1926. Foreign plant diseases: A manual of economic plant diseases which are new to or not widely distributed in the United States. Washington, DC: USDA, Office of the Secretary. viii + 198 p. See p. 171-72. 23 cm. [soy ref]

• ***Summary:*** Pages 171-72, under "Soja," list 19 diseases attacking *Soja* spp. which are new to or not widely distributed in the U.S.: "*Aecidium glycines* P. Henn. Leaf rust on *S. max* in Tanganyika and Uganda." Note: This is the earliest document seen (Aug. 2009) concerning soybeans in Uganda, or the cultivation of soybeans in Uganda.

"*Ascochyta* sp. On *S. max* in Japan.

"*Bacterium* sp. A leaf-spotting disease of *S. max,* said to be due to a bacterium distinct from other species on this host, is reported from Japan.

"*Cercospora daizii* Miura. Leaf spot on *S. max* in Manchuria.

"*Cercospora glycines* Cke. Definite dark-brown leaf spots on *Glycine clandestina* in Australia.

"*Colletotrichum glycines* Hori. Anthracnose on stems and pods of *S. max* in Japan and Chosen.

"*Fusarium* sp. Causes ring spot disease of *S. max* in Manchuria.

"*Hypochnus centrifugus* Tul. Causes cankers on stems, blighting infected plants of *S. max* in Manchuria.

"*Hypochnus cucumeris* Frank. See Cucumis.

"*Mosaic.* Mosaic disease of *S. max* reported from Japan is probably the same as the mosaic and crinkling reported from the United States.

"*Mycosphaerella phaseotarum* Siem. See Phaseolus.

© Copyright Soyinfo Center 2014

"*Peronospora manshurica* (Naoum) Syd. (*P. trifoliorum* De B. var. *manshurica* Naoum.) Downy mildew on leaves of *S. max* in Siberia, India, Formosa, and Manchuria, causing premature leaf fall.

"*Phyllosticta sojaecola* Massal. (*Phaeosphaerulina sojaecola* Miura.) Subcircular, dull-brown leaf spots on *S. max* in Japan, Russia, Manchuria, and Italy.

"*Pseudomonas glycines* Nak. Circular yellow leaf spots, becoming brown to dark-brown with yellow margins on *S. max* in Japan. The spots may be as numerous as 70 to 80 per square centimeter, causing death of infected leaves.

"*Septoria glycines* T. Hem. Brown leaf spots on *S. max* in Japan and Manchuria.

"*Septoria sojina* v. Thuem. Irregular yellowish leaf spots on *S. max* in Italy, Japan, and Austria.

"*Trotteria venturioides* Sacc. Black mildew on leaves of *S. max* in the Philippines.

"*Uredo vignae* Bres. See Vigna.

"*Uromyces sojae* (P. Henn.) Syd. Brown rust pustules on leaves of *S. max* in Japan, Java, China, India, Formosa, Manchuria, and the Philippines." Address: Chief Pathological Inspector, Federal Horticultural Board.

2467. Takenobu, Y. 1926. Japan Year Book. Tokyo: Japan Year Book Office. 626 + 162 p. See p. 447, 449, 514. 22nd annual issue.
• ***Summary:*** The total area of Japan proper is 147,652 square miles (382,861 square kilometers). Japan's population (as of Oct. 1925) was 59,736,704. A large area of Japan is very mountainous, and it is estimated that the cultivated area is about 6 million hectares. According to Prof. Shimizu of Keio University the population density per square kilometer of cultivated area in Japan is much larger than various European countries. Japan 969. Belgium 394. Italy 305. Netherlands 273. England 226. Germany 195. Switzerland 168. France 108. Spain 90.

In chapter 29, Agriculture, the section titled "Beans, potatoes and sweet potatoes" (p. 449) begins with a table showing the production (in koku; 1 koku = 180 liters) of these crops from 1921 to 1923, inclusive. Soybean production decreased from:

4.261 million *koku* in 1921
3.628 million *koku* in 1922
3.434 million *koku* in 1923.

The text continues: "Among subsidiary farm crops there is perhaps nothing that plays so important a part in the Japanese kitchen as soy beans..."

In the section on "Breweries" (p. 512+) the subsection titled "Soy" [meaning shoyu or soy sauce] (p. 514) states: "For soy the prefecture of Chiba, which is contiguous to Tokyo municipality, heads all other places on the list as to output. Parched wheat mixed with salt and beans is a principal ingredient. The process is still far from scientific, requiring about 12 months before the liquid is ready for sale. It is also costly, as it does not much admit labor-saving appliances. To obviate these disadvantages have been tried several patented processes, but most of them have failed. In 1917 the leading soy manufactures of Chiba-ken combined and formed the Noda Soy Co., capital ¥7,000,000 p.u. with capacity of about 250,000 'koku' i.e. about 60 per cent. of the total output of the Prefecture."

A table (p. 514) shows production of sake, beer, and soy from 1919 to 1922 (year ending in March). Production of soy (in 1,000 koku) grew from 2,940 in 1919 to 3,268 in 1922. Address: Prof. at the Waseda Univ. and late of the "Japan Times".

• ***Summary:*** In this work, with its good bibliography, the authors "sought to bring together all of this taxonomic literature, as published before that date, and to present a critical opinion as to the proper relationship of the species described, whether retained in the genus or placed elsewhere. Some 350 names were thus accounted for, but the actual number of species accepted as known in culture or probably determinable from existing literature was given as 69 (p. 252). These were more or less arbitrarily considered in 11 groups."

Chapter 6 titled, "Enzymic and fermentative activities of Aspergilli and their industrial significance" (p. 58-75) includes sections on koji (incl. Takamine, Taka diastase), diastase, protease, soy fermentation (incl. soy sauce), and miso (with 7 references). Address: Microbiological Lab., Bureau of Chemistry, USDA.

• ***Summary:*** This document gives the best picture of the soy oil industry and market in the U.S. and worldwide up to this time. Part 1. Costs of production, Section 4, titled "Soya-bean oil" has the following contents: Rates

© Copyright Soyinfo Center 2014

of duty. Uses. Raw material and its sources: Foreign production, domestic production. Joint products. Domestic production and consumption: History, production statistics, geographic distribution of mills, domestic consumption. Imports. Principal competing country (Manchuria). Exports of domestic and foreign oil. Foreign production and consumption: Production (China [Manchuria], Japan, Europe), consumption. Costs of production: United States (proportion of the industry covered, cost data by companies, shipping charges), China (Manchuria; Introduction, verification of cost data, Dairen, shipping charges from Dairen to the U.S., Harbin, Newchwang, Antung), Japan, Great Britain, comparison of these cost data.

The Act of 1921, an emergency tariff that went into effect on 28 May 1921, placed the first tariff on soya-bean oil, at the rate of 20 cents per gallon (2.67 cents per pound). The Act of 1922 (which went into effect on 22 Sept. 1922) reduced this slightly to 18.75 cents per gallon (2.5 cents per pound). "For a number of years prior to 1921 soya-bean oil was used in the United States chiefly in the manufacture of soaps, and to a lesser extent in paint, varnish, and lard compounds... Since 1921 the domestic consumption of soya-bean oil has been chiefly in the manufacture of paints and varnishes and in foundry core oils. In lesser quantities it finds use in the manufacture of linoleum and of printing inks" (p. 55)

"Foreign production.–Chinese official statistics estimate that the area under soya beans in the whole of China in recent years has been 12 million acres (*Chinese Economic Monthly,* June 1924). Generally accepted show that China produces about 80 per cent of the world's production of [soya] beans, or from 3 to 4 short tons annually, of which Manchuria produces from 2 to 3 million tons. Japan and Chosen [Korea] grow the beans in about equal quantities, each producing approximately 600,000 tons per year or about 15 per cent of China's production. Some soya beans are grown in Central European countries, but there, as in the United States, they are used mainly for forage. Japan, Chosen, and the interior of China consume practically all of the beans they produce, but Manchuria, which is less densely populated, exports in the raw state or as manufactured products about 60 percent of its production. It is from Manchuria that the other nations of the world obtain their supply for crushing.

"Domestic production [USA].–The domestic soya bean crop is grown primarily for forage. The chief States harvesting soya beans in 1923 and 1924 were North Carolina, with 2,675,000 and 2,560,000 bushels, Illinois, with 1,722,000 and 1,548,000 bushels, and Indiana, with 790,000 and 650,000 bushels, respectively. Sixteen other States, of which Ohio and Missouri were the most important, produced soya beans in much smaller quantities... The total harvest in the United States was 8,944,000 bushels (268,320 short tons) in 1923 and 9,567,000 bushels (287,010 short tons) in 1924. Only about 20 per cent of the acreage planted is harvested, and of the quantity harvested less than 2 per cent is crushed for oil. This is because the seed necessary for the next crop of beans requires nearly all the beans that are harvested" (p. 55).

Note: This is the earliest document seen (Jan. 2005) that gives total soybean production or area statistics worldwide. However the information lacks detail, except for the USA.

Table 82 (p. 56) shows that the amount of soya beans crushed in the U.S. increased from 2,978 tons in 1922 (1.70% of the total soya beans harvested), to 3,724 tons in 1924 (1.3% of the total). Imported soya beans were first crushed in about 1910 on the Pacific Coast.

Table 83 (p. 57) shows that production of crude soya-bean oil in the U.S. rose from 751,108 lb in 1922 to 1,406,112 lb in 1925. "Domestic production has at all times been small compared with imports. In 1923 the domestic output was 4 per cent of imports; in 1924 and 1925 about 8.5 per cent."

The soy oil tariff of 1921 led to a rapid increase in soybean crushing in the U.S. "The commission's investigators interviewed the managers of eight domestic oil mills–all that had produced soya-bean oil since 1921. Four of these mills were located in Illinois, three in Indiana, and one in North Carolina. Of these, two had used the benzine extraction process and after extracting a few tons of beans had closed down because of mechanical difficulties, high cost of operation, and high cost of beans. Nearly all the other mills used Anderson expellers, although a few of them used hydraulic presses."

Table 86 (p. 58) shows imports of soya-bean oil into the U.S. by countries, 1918-1925. In 1918, the peak year for imports (335,984,143 lb), 68.7% came from the Kwantung Leased Territory (principally from Dairen on the southern tip of the Liaotung Peninsula in South Manchuria), 27.2% came from Japan, and 4.0% came from other parts of China. In Japan 19 mills are known to be crushing soya beans. Their production of soya-bean oil in 1922 was 44,714,000 pounds.

Table 88 shows imports of soya beans into Germany, United Kingdom, Denmark, and Holland 1919-1925. In 1925 Germany was by far the largest importer (370,585 short tons), followed by the UK (181,420), Denmark (121,389), and Holland (39,301).

Part I, Section 5, titled "Interest on capital invested in crushing vegetable oils," has a passage on soya-bean oil which gives that information for 1924.

Part 2. Economic Study of the Trade in and Prices and Interchangeability of Oils and Fats, includes references to the domestic production of soybean oil, net imports of oils, including soybean oil, into the United States 1910-1924; and 1916-1924; international supply and consumption of soybeans and soybean oil; price changes of soybean oil and beans; statistics of these price changes. The Interchangeability of Oils and Fats in Consuming Industries has scattered references to soybean oil, and a special section

© Copyright Soyinfo Center 2014

on soybean oil giving data received from questionnaires on the interchangeability of oils and fats.

This is the earliest document stating that soy oil, itself, is used in printing inks. Address: Washington, DC.

2472. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(1):24-32. Jan. [17 footnotes. Eng]

• ***Summary:*** Contents: The whole soybean as food: Immature or green soybeans, mature or dry soybeans, the digestibility of the boiled soybean seeds, boiled soybeans as a food of predominant importance in China, soybean coffee, soybean chocolate, soybean sprouts.

Concerning mature or dry soybeans: "In China the green seeded variety is soaked in fresh water or salted water and roasted, the product being eaten after the manner of roasted peanuts. In Japan the black soybeans are used chiefly for cooking, with sugar and soy sauce; the green variety is also used in this way, either in the fresh state or after being dried (Oshima). Generally speaking, the use of whole soybeans has not been attended with much success either in the Orient or Western countries, because, with the ordinary method of cooking, they remained hard and unpalatable. It has been found that cooking at a temperature somewhat above boiling breaks up the cellulose structure and develops a richness of flavor that is not obtainable at the lower temperature. Although this result can readily be secured in high pressure steam cookers [pressure cookers], the problem is to know how to accomplish this with ordinary household equipment."

Dr. J.H. Kellogg cooks the beans in a saturated solution of salt at about 107ºC. "The method of Durand does not require a special jar. The soybean seeds are soaked overnight in salt water and boiled in fresh water to which some sodium bicarbonate is added. If the foam is not allowed to flow over, the seeds will be ready for consumption in two hours. Lachaume claims that the removal of the skin of the beans after five minutes of immersion in hot water increases markedly the speed of boiling.

"Experiments by the Office of Home Economics, U.S. Department of Agriculture, and by the home economics departments of many colleges, have shown that mature or dry soybeans can be used satisfactorily after the manner of navy or other beans. Soybeans are very palatable. The lighter colored varieties, yellow and green, are best for food, as the dark ones usually have a stronger, less pleasant taste [sic]; some of the light brown varieties have a very agreeable flavor. Because of their high fat content and compactness, most varieties of soybeans do not cook soft as readily as the navy or field beans. The method of cooking, however, may cause the beans to remain hard and tough. If cooked properly, soybeans do not require much longer soaking and cooking than ordinary beans. One variety, the Easycook, has been found by the U.S. Department of Agriculture to cook fully as soft as the navy bean in less time after the preliminary soaking of 12 hours."

"Professor Haberlandt, the soybean pioneer of Central Europe, fifty years ago prepared a nourishing food, mixing boiled soybeans with potatoes or rice. This food was called *sojenta,* in analogy to the name of the Italian national food, *polenta.* At present in Central Europe boiled soybeans are mixed with boiled potatoes in the proportion of one to two, to which are added table salt and onions. Boiled soybeans may be also added to cereal gruels. In this way a food is obtained which is rich in protein and fat, and which can be completely substituted for products of animal origin.

"The digestibility of the boiled soybean seeds is, according to Lipsky, 80.5 per cent for protein and 80.8 per cent for fat. Goessman's figures of digestibility for protein and fat are on the average 90 per cent (Li Yu-ying). Oshima conducted two digestion experiments, which continued for three days. The diet consisted of cooked dried beans (outer skin not removed), eaten with a considerable amount of sugar and some shoyu (soy sauce). The per cent digested was: protein, 61.8-69.1 per cent; fat, 34.7-37.8 per cent; and carbohydrates (including fiber), 81.4-89.9 per cent."

"Liebig said that the method of preparing the food is of no less importance than its chemical composition. According to von Noorden and Salomon, the proteins of the beans give with calcium an insoluble compound; that is why hard water (rich in calcium) cannot be used for the boiling of leguminous seeds. It makes them hard and kernelly. If soft water is not available, it is necessary to add a little sodium bicarbonate, which precipitates the calcium salts. Richter demonstrated that from peas (the proteins of which behave toward calcium like those of the soybean) boiled in soft water, 10.2 per cent of the nitrogen and 19 per cent of the ash were eliminated in the stools. If boiled in hard water (the method of cooking remaining the same) the corresponding values for protein and ash in the stools were 16.6 and 42 per cent.

"The digestibility of the soybeans depends largely on the thoroughness of cooking and also on the state of division. The protein of boiled beans eaten as such is digested to 60 per cent, but if given in a state of fine division (puree) it rises to 90 per cent."

"According to von Noorden and Salomon: 'It will be correct to connect a satisfactory digestion of food with the presence and co-operation of a corresponding bacterial flora and it makes it clear why, especially in leguminous seeds, habit plays such a large and evident role.'"

"The water in China is known to be hard as a rule and this may be the chief reason why the Chinese are not using boiled soybeans in a noticeable amount. If soda [a natural product of China, being collected in Mongolia from soda lakes] were used in China for boiling the soybean seed soft, thus doubling the digestibility, it may revolutionize the nutrition of the Chinese population" (p. 31-35).

Concerning soybean coffee (p. 30-31): "During the

© Copyright Soyinfo Center 2014

period of the Civil War in America, the soybean was extensively used in the southern states as a coffee substitute. For a considerable time seedmen sold the Ito San variety under the name of Coffee Berry and Coffee Bean (Piper & Morse [1923]). Soybean coffee has been used in Western Europe, in Switzerland, and in the Alpine Provinces of former Austria since the introduction of the soybean to Europe. Horvath [probably the writer's father], 50 years ago [i.e., about 1877], was the first to prepare soybean coffee for the market in South Russia. In 1913 Marschner (Bohemia) put on the market a soybean 'coffee without caffein' [caffeine] under the trade mark 'Santosa.' In Germany, Fischer and Follmann (Dresden) also manufactured soybean coffee for the market... In China an 'artificial bean coffee' is prepared by the Kai Cheng Bean Products Company, Peking. (Note: Li Yu-ying is connected with the company). It is claimed to be 'a good substitute for real coffee, cures constipation, and improves the appetite."

Concerning soybean chocolate (p. 31): "In recent years the demand for cocoa has risen sharply and the supply has run short... Li Yu-ying's soybean products factory in the vicinity of Paris* succeeded in preparing a chocolate from soybeans, sugar, and cocoa butter. The chemical composition, the aspect and the taste are close to that of real chocolate (Footnote: *"Formerly *L'usine de la Caseo-Sojaine* [*Caséo-Sojaïne*], now *Société Française pour l'exploitation du soja et de ses dérivés,* 48 Rue Denis-Papin, Les Vallées-Colombes.)" Note: This is the earliest document seen (July 1996) that mentions Li's *Société Française...*

Concerning soybean sprouts: "Soybeans soaked in water and allowed to sprout are much relished as a vegetable by the Chinese." One kg of soybeans yields about 4 kg of sprouts. The yellow- or green-seeded varieties are generally used for growing sprouts.

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

2473. *Los Angeles Times.* 1927. Tokio sees odd pilgrimage: Young tradesmen parade to shrine in cold, clad only in thin garments and bathe in ice water. Feb. 9. p. 5.

• ***Summary:*** In Fukugawa, the ancient annual *kan-mairi* or pilgrimage to the Buddhist Fudo Temple is being celebrated in Tokio, Japan. The young pilgrims pour pails of ice water over their bodies as they patiently chant their prayers.

"Later, the devotions over, they leave the temple compound and partake of piping hot amazake, or unrefined sweet sake, which is served free of charge at a dingy little inn just outside the [temple] gates."

2474. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(2):175-92. Feb. [25 footnotes. Eng]

• ***Summary:*** Contents: Soybean cake, soybean meal, and soybean flour for food: Soybean press cake, soybean extraction meal, soybean flour (Berczeller, *Soyama, Aguma, Ehrhorn*), *Sojawurze* (*Suppenwurze,* Maggi cubes), digestibility of soybean flour, value for infants, some medical aspects of the use of soybean flour, soybean flour in diabetes (incl. Sarton).

Concerning soybean extraction meal (p. 177-79): This meal is shipped in bags and traces of benzine are easily removed. The process used at the Suzuki extraction plant in Dairen (the only extraction plant in Manchuria) is described; the solvent is benzine. "A new extraction plant (at the Borodin-Takata Alcohol Factory) is now under construction at Imienpo, in North Manchuria. By the new process, beans are first pulverized, then operated upon with alcohol, for the extraction of the oil content... The owner claims that 'there is no foreign taste left which would make the oil or the bean cakes unsuitable for human food.'" Analyses conducted at the S.M.R. Co. Central Laboratory, Dairen, show that this "bean meal" contains: water 7.90%, protein 57.04%, oil 3.41%, carbohydrates 16.92%, coarse fibre 8.63%, and ash 6.69%.

"The solvent method of extraction, involving the use of benzine or gasoline, is used by many of the large oil mills in European countries, especially England." Mills in the USA do not yet use the solvent method; they use traditional hydraulic and expeller processes. "The new process used by the Hansa Mill at Hamburg (Germany) called the Bollmann process, is so economical that the profits of bean milling can be enormously increased. By this process the beans are first pressed and then extracted. The extracted meal is utilized for the manufacture of a highly valuable soybean flour for food (Footnote: But extracted soybean meal (flour) does not contain any fat soluble vitamin, as shown by Hornemann [1925]). The oil is submitted to refining, during which crude lecithin is extracted. It is purified and sold in a form of pure lecithin.

(Footnote: "The soybean contains 1.64 per cent lecithin (an organic phosphorus compound), the price of which in China is about $18.00 (Mex.) per pound. It shows that the value of the lecithin contained in soybeans is greater than the market price of the beans themselves. Extracted soybean meal is therefore deprived of lecithin, which is a highly valuable food constituent, especially for the nervous system. Ordinary beans (navy beans, etc.) contain only 0.81 per cent lecithin)" (p. 178).

Note 2. This is the earliest English-language document seen (March 2001) that contains the term "crude lecithin."

Page 182 states: "Soybean flour is also utilized in the manufacture of breakfast foods and can be used in the preparation of vegetable milk and bean curd."* (Footnote: *"In the United States some very good breakfast foods and an excellent finely powdered soybean milk powder "Soy Lac" is made by J.A. Chard, Soy Products, 263 W. 12th St., New York City, who has been experimenting for some time

© Copyright Soyinfo Center 2014

with soybeans.)" Note 3. This Soy Lac appears to be the first commercial soymilk made in America.

Berczeller (p. 183-84): "A few years ago the Hungarian food physiologist, Prof. L. Berczeller, elaborated a process for manufacturing a soybean flour containing a large percentage of fat. This does not become bitter if kept for over a year, and has a very pleasant taste. The process is patented in nearly all the countries of the world. Its chemical composition is given in the above table and its food value in a previous chapter. This flour contains the expensive fat-soluble vitamin which is deficient in the food of the white race. It is of yellow colour, has a sweet, agreeable nutty taste, and does not produce obesity, notwithstanding the fact that it contains a high percentage of fat. According to Berczeller, the uses of this soybean flour "O" are as follows:

"1. As roasted flour, with an equal part of wheat flour for soups or vegetables;

"2. For pastry, 10-15 per cent soybean flour is mixed with wheat flour. In this case no eggs or only a few need be added. The soybean flour gives to the dough a beautiful yellow colour;

"3. As an addition to meat, 25-50 per cent of soybean flour can be mixed with chopped meat for meat balls, sausage stuffing, etc.

"4. All sorts of flour dishes can be baked with the addition of soybean flour. The taste of the dishes thus prepared becomes better and the nutritive value higher (besides the economy in butter, eggs and sugar);

"5. The addition of even 5 per cent soybean flour in making wheat bread causes a much longer keeping capacity of the bread in a fresh state, the fat preventing the bread from getting stale;

"6. The soybean flour can be used also on a large scale in the foodstuff industry, and in different ways; e.g., in the manufacture of paste products (as a substitute for eggs), cakes, biscuit products, milk-bread (10-16 per cent soybean flour instead of milk), sausages and pastry products (as a substitute for meat).

"Berczeller's soybean flours can be manufactured with little trouble in rice mills or pea mills, where they are decorticated. Eighty-five per cent of soybean flour can be recovered from soybeans. The residue forms a valuable food for animals. According to Berczeller, the cost of production of soybean flour in a European country is as follows:

"One ton of soybeans: 245 shillings. Ten per cent milling expenses: 25 shillings. Total: 270 shillings. Subtracting the value of the bran: 20 shillings. Cost of 850 kg of soybean flour: 250 shillings. Or one ton costs: 294 shillings.

"According to Berczeller, soybean flour is an ideal concentrated food for soldiers, sailors, tourists, etc., in the form of biscuits, etc., because it furnishes a substitute for animal foodstuffs which spoil easily. Berczeller points out that soybean flour is not a substitute for wheat flour but a natural vegetable complement to wheat flour, and one which can be substituted for expensive animal foodstuffs for lowering the living rates [cost of living] of humanity to a degree that could not be reached either by potatoes, maize, or by intensive farming. Austria and Hungary are planning to start a very intensive utilization of Berczeller's soybean flour. This flour, being cheap and easy to manufacture in native rice mills, may be of great importance to China."

Note 1. This is earliest document seen (May 2010) showing that Dr. A.A. Horvath was aware of the work of Prof. Berczeller, who patented a process for improving the flavor / palatability of soya flour.

Page 185 states, in a discussion of soybean flours: "In Bollmann's process the oil is completely removed from the soybean material and the flour is therefore deprived of both the lecithin and the fat soluble vitamin."

Sojawurze (p. 187-88): "The profit from Ehrhorn's process could be much increased if part of the soybean flour were used for the manufacture of products similar to beef extracts, called in German 'Suppenwurze.' They are able to give to soup the taste and flavour of beef bouillon. They are used extensively in Germany, e.g., the well-known 'Maggi' cubes, and were manufactured in large quantities in pre-War and War time from soybean flour at the Aguma factory under Ehrhorn's supervision."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

2475. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(3):298-309. March. [24 footnotes. Eng]

• ***Summary:*** Contents: Soybean milk for food: Introduction. Preparation of soybean milk. Properties (Yu-P'i is Chinese for yuba; Laxa). Market prices. Composition. Nutritive value. New methods in the manufacture of soybean milk (Prof. Laxa in Prague [Czechoslovakia], Li Yu-ying, Soyama). Some dietetical advantages and applications of the soybean milk. Condensed soybean milk and milk powder (Soy Lac soybean milk powder made in America by Chard). Soybean cake, soybean meal and soybean flour as material for soybean milk. Yu p'i and yu ba (yuba; also fu chu).

"In 1905, Li Yu-ying submitted a paper on the subject [of soybean milk] to the 2nd International Milk Congress in Paris, in which he emphasized that the introduction of soybean milk to Western countries 'will be highly beneficial to public health as well as to the budget of the poor.' Also by those who advocate and urge a vegetarian diet, a very strong case can be made for this Oriental substitute" (p. 298).

According to Prof. Laxa: "Soybean milk, supplemented with lactose and inoculated with a culture of yoghurt [yogurt] bacteria, coagulates at 40º C. in 4 hours and gives a curd-like acid mass" (p. 300).

"Market prices. In Peking soybean milk is sold in small bottles in portions of about 200-220 cc. labeled 'Bean milk,

© Copyright Soyinfo Center 2014

a Chinese product, the most nourishing food, made by...' For such a bottle, delivered daily, the big factories of Peking asked in 1925 $1.00 (Mex.) per month. One liter of such milk costs, therefore, about 15 cts. (Mex.)... A fine soybean milk powder, called *Soy Lac,* has recently been prepared in America by Chard" (p. 300-01). Note: This company (Chard) was first referred to by Piper and Morse in 1916 in *USDA Bulletin* No. 439, "The soy bean, with special reference to its utilization for oil, cake, and other products." Soy Lac is mentioned again by Horvath on p. 307.

A table (p. 302) compares the composition of soymilk made in 3 locations (Tsinanfu, China; Peking, China; and Japan) with that of human, cow, and goat milk. Human milk has the lowest protein content (1.25%) and ash content (0.25%); soymilk has about the same protein content as cow's milk (3.3%) but an ash content (0.40%) which is higher than that of human milk but lower than that of cow's milk. Footnote: "To supplement the deficiency of the soybean milk in mineral constituents [such as calcium], it is recommended by von Noorden and Salomon to add to it the salt mixture of Pirquet, which consists of: sodium chloride, 0.3 gm.; potassium chloride, 1.1 gms.; calcium glycerophosphate, 1.7 gms.; magnesium lactate, 0.5 gm.; ferrum glycerophosphate, 0.1 gm. This mixture is called *Nemsalz.* If diluted in 1 liter of water it gives the same percentage of salts as in women's milk" (p. 302).

"In Germany the Soyama factory (in Frankfurt) manufactures soybean fresh milk (mostly from soybeans), soybean normal cream, and also condensed bean milk and cream. Soyama bean milk looks like cow's milk, contains the same constituents, even in larger amount and in a state of finer dispersion. Only its taste is different. According to Fuerstenberg, Soyama milk can be qualified as a special, very valuable dietetic nutrient. The high lecithin content of this preparation adds to its value too" (p. 306). A table (p. 306, based on the analyses of Dr. G. Popp of Frankfurt) shows the nutritional composition of 6 types of Soyama milk and cream preparations: Normal milk. Milk for diabetics. Milk for baking purposes. Normal cream. Cream for diabetics. Cream extra rich in fat (especially for diabetics). "According to von Noorden and Salomon, Soyama preparations may be kept as long as almond milk and Paranut milk. Soyama milk looks just like cow's milk. By keeping, cream separates and it must be shaken before using" (p. 306).

"In using Soyama milk and cream preparations, v. Noorden confirms the following statement of Fischer (for vegetable milk in general): '1. In the stomach soybean milk gives a much finer flocculent precipitate than does cow's milk, produced by acid or even rennet. 2. The ingestion of soybean milk results in a feebler (smaller) secretion of gastric juice; the period of secretion is also shorter. 3. The period of stay in the stomach of the finely flocculent precipitate of the soybean milk is shorter than that of the casein-fat coagulum of cow's milk. 4. The peristaltic motion of the stomach is less after the ingestion of soybean milk and more coordinated than in the case of cow's milk, as shown by X-ray investigation'" (p. 307).

"On the basis of these observations soybean milk is recommended by v. Noorden in cases of gastric and duodenal ulcer, states of peritoneal irritation, hypersecretory conditions of the stomach, disturbances of the motility of the stomach, uric acid diatheses, kidney disturbances, conditions with edema where a food poor in sodium chloride is required, Basedow's disease, cholecystitis, cirrhosis of the liver, diabetes, and in cases where a very nutritious diet is required" (p. 307).

"Soybean milk powder will undoubtedly have a successful future in the Orient as well as in European countries and the United States. Its great advantage in comparison with cow's milk powders is its cheapness. Soybean milk powder can be easily stored and transported... It is believed that at present some of the commercial milk powders contain an admixture of soybean milk powder" (p. 307-08).

"*Yu P'i* and *Yu Ba* are the Chinese and Japanese names of the pellicula formed on the surface of soybean milk when the latter is gently heated. Good *Yu Ba* has a bright yellow color when properly dried. The best *Yu Ba* is that obtained after the first heating. In repeating the heating of the remaining soybean milk, pellicules of gradually inferior quality and color are obtained. As much as 30 pellicules can be secured from the same portion of soybean milk. In China, a product called *Fu Chu* is manufactured in a way similar to *Yu Ba* (Footnote: See this journal, Vol. VIII, 1926, p. 179). Recently an improved method for the manufacture of *Yu Ba* was patented in Japan, consisting in the use of an electric fan adjusted over the surface of a kettle containing the soybean milk heated to a temperature of 90ºC.

"*Yu Ba* has a great nutritive value, as it contains a high percentage of protein and fat,..."

A table (p. 309) gives the nutritional composition of five types of yuba: Common yuba, Kyoto yuba, Shimada yuba, Peking yuba, and Fu chu.

Note: The values for Fu chu are based on those previously reported by Adolph. Fu chu contains much more water (53.68%) than any of the other four types of yuba; common yuba contains only 21.85% and Peking yuba only 9.15%. So it is either fresh or reconstituted.

"In Japan, Kyoto and Nikko are noted for *Yu Ba. Yu Ba* is in much demand in China and Japan and is used in numerous ways as an essential ingredient in many very palatable dishes. Its price is high and therefore yuba is used only by the rich."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

• ***Summary:*** Both *Hypochnus sasakii* and *H. centrifugus* are known to be pathogenic to soybeans in Japan. Morphological studies and cross inoculation tests on the two fungi from both rice and soybean revealed no significant difference, and accordingly it was considered that only one species was involved. Optimum temperature for the growth of the fungus was found to be 30º C., for sclerotial development 28º C. Address: Moto Kyoto Teikoku Daigaku, Shokubutsu Byorigaku Kenkyushitsu.

2477. Horvath, A.A.; Liu, Shin-Hao. 1927. The effect of soy sauce on blood sugar and phosphorus. *Japan Medical World* 7(4):105-08. April 15. [18 ref]

• ***Summary:*** "Introduction: Shoyu, or soy sauce, is a dark-brown, moderately thick liquid, very popular in China and Japan as relish or condiment to increase the flavor and palatability of the diet (Footnote: The now famous Lea and Perrins Worcestershire Sauce is a highly spiced soy sauce). In order [sic, odor] and taste it is not unlike a beef extract of good quality."

"Summary: 1. In rabbits, subcutaneous injections of Taka-Diastase gives no definite results for conclusions, but seems to be capable of affecting the blood sugar in both directions. 2. In men the results of oral administration of soy sauce are varying and at present no definite conclusion concerning the effect of soy sauce on blood sugar and phosphorus can be drawn. But in some cases soy sauce seems to be capable of affecting the blood sugar and blood phosphatides." Address: Dep. of Medicine, Peking Union Medical College, Peking, China.

2478. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(4):415-25. April. [34 footnotes. Eng]

• ***Summary:*** Contents: Soybean curd (tofu) for food: Preparation and types ("The Chinese classical name for *tofu* is *li chi,* probably meaning 'the morning prayer'"), historical, present state (of tofu in China), chemical composition, digestibility, utilization (incl. frozen tofu and fried tofu).

Fermented soybean products for food. Soy sauce: Kibiki and sobiki tamari, composition of various soy sauces. Natto. Miso. Conclusion. Bibliography.

Tofu–Historical (p. 416): "The manufacture of soybean curd (*tofu*) was started in China in 164 B.C., during the reign of the Emperor Han Wen, by a man named Liu An, the duke of Hwai Nan. Liu An was a great friend of the Buddhist monks, and it seems quite probable that he made this bean curd to provide a change or delicacy to break the monotony of the monastic ration (Adolph). *Tofu* was introduced into Japan from Korea for the first time during the Toyotomi government, and Buddhist priests and some other people used it for their daily food among others before it was generally used in Japan.

Tofu–Utilization (p. 418-19): "Both the composition and the digestibility of *tofu,* therefore, prove it to be a very nutritious food material. In the Orient *tofu* forms a very popular and almost indispensable dietary article for the Buddhist priests, as well as the strict adherents to Buddhism, who eat no animal food [i.e., are vegans]. A common saying in some parts of China terms 'bean milk the poor man's milk, and bean curd the poor man's meat.' *Tofu* is also called 'the meat without the bones.'

Note: This is the earliest English-language document seen (April 2013) that contains the phrase "the meat without the bones" (or a similar phrase containing the words "meat" and "bones"); it is used to refer to tofu, not to soybeans.

In Indo-China the daily consumption of *tofu* by an adult is about 3/4 of a pound. *Tofu* in its various forms is also used very extensively by all classes of Japanese. In the interior of the country where fish cannot be easily obtained, it is a most important source of protein.

"In the Orient *tofu* is eaten in a fresh condition simply with a little *shoyu,* though it is also frequently cooked in soup. Fried *tofu* is also a very popular article of food. Rape-seed oil, sesame oil or soybean oil are generally used in frying.

"*Tofu* may also be prepared for preservation and transportation. For this purpose fresh *tofu* is cut into smaller pieces and exposed to severe cold weather, to remove the water by freezing, and is then dried in an oven. As thus prepared it can be preserved for several years. When the *tofu* is frozen the water collects in fine needles of ice distributed throughout the mass. When the ice melts and the water runs out, it leaves the *tofu* porous and it may be easily dried. If it is not frozen, it is difficult to dry and the resulting material is dense and horn-like. The *tofu* also cooks very well if cooked in diluted soy sauce and smoked in the same manner as meat. The resulting product forms in the Orient the basis for the manufacture of various 'artificial meat' preparations.*" Footnote: * "In Germany, the Soyama factory prepared during the Great War [World War I] a meat supplement from soybeans. It was cheaper than beef, contained less carbohydrates and had a nutritive value of about 1500 Calories in 1 kilo."

"In Peking, at the Kai Cheng Bean Products Company, various preparations manufactured from tofu may be purchased, such as different kinds of soybean meat, soybean sausages, etc. The company has established a restaurant in Peking (at 86 Morrison Street, the name is written in Chinese characters) where one can get a Chinese dinner of numerous dishes prepared mostly from soybean products (chicken meat, pork, ham and beef, manufactured from *tofu*). Also discusses Dr. Yamei Kin.

A note at the end of this April issue states: "A reprint of Dr. Horvath's paper in booklet form may be obtained from the Bureau of Economic Information. Price $1, Peking Currency.–Ed." Thus, these six articles were reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

2479. Morse, W.J. 1927. Soy beans: Culture and varieties. *Farmers' Bulletin* (*USDA*) No. 1520. 34 p. April. Revised 1939 and 1949. Supersedes Morse 1918b. The Soy Bean. USDA Farmers' Bulletin No. 973. [36 ref]

• ***Summary:*** Contents: History of the soy bean. Climatic adaptations. Soil preferences. Varieties: Descriptions of varieties (59 varieties and 44 synonyms). Varieties recommended for different areas. Preparation of seed bed. Fertilizers. Inoculation. Time of seeding. Methods of seeding. Rate of seeding. Depth of seeding. Cultivation. Soy beans in rotations. Soy beans in mixtures: Soy beans and corn, cowpeas, Sudan grass, millet. Insect enemies of soy beans: Grasshoppers, blister beetles, Mexican bean beetle, other beetle enemies, leaf hoppers, army worms and other caterpillars, the green clover worm, chinch bugs. Diseases of the soy bean: Bacterial blight, bacterial pustule, mosaic, fusarium blight or wilt disease, stem rot, pod and stem blight, sunburn, downy mildew, anthracnose, root knot (caused by a tiny eelworm or nematode, *Heterodera radicicola*). Other enemies of soy beans (rabbits, woodchucks).

The soy bean is "also called the soja bean, the soya bean, and in North Carolina the stock pea." "Previous to 1908 the trade in soy beans was largely confined to oriental countries, particularly China, Manchuria, and Japan. Since that time the value of the soy bean and its products has gradually been realized in other countries, and during the last decade they have attained considerable importance in the world's commerce. At the present time the soy bean is cultivated principally in China, Manchuria, Japan, Chosen (Korea), and the United States, but it is also of more or less importance in northern India, Indo China, and the Malayan Islands. Soy beans are grown also in Italy, France, southern Russia, Hungary, Hawaii, Egypt, South Africa, and in a few countries of South America, but the acreage in these countries is very limited.

"The soy bean was introduced into the United States as early as 1804 and for several decades was regarded more as a botanical curiosity than as a plant of economic importance. Since 1890 nearly all of the State Agricultural Experiments have experimented with soy beans and many bulletins have been published dealing wholly or partly with the crop."

"The soy bean has been used mainly for forage purposes in the United States, but as a forage crop alone it would not likely become one of the major field crops. The acreage in soy beans has increased very rapidly during the last decade. Previous to 1917 considerably less than 500,000 acres were grown. In 1924 there were more than 2,500,000 acres, of which 1,000,000 were grown for hay, 932,000 for pasture and silage, and 613,000 for the production of seed. More than 10,000,000 bushels of soy-bean seed and about 1,360,000 tons of soybean hay were produced in 1924."

The 103 soy bean varieties and synonyms described on pages 5-11 are as follows (in alphabetical order): A.K., Aksarben, Arlington, Austin, Banner–same as Midwest, Barchet, Biloxi, Black Beauty–same as Ebony, Black Eyebrow, Black Sable–same as Peking, Bopp–same as Chernie, Brown–same as Mammoth Brown, Chernie, Chestnut, Chiquita, Columbia (from China), Columbian–same as Columbia, Dixie, Dunfield, Early Brown, Early Green–same as Medium Green, Early Virginia Brown–same as Virginia, Early Wilson–same as Wilson, Early Wisconsin Black–same as Wisconsin Black, Early Yellow–same as Ito San, Easycook (from Shantung province, China in 1894), Ebony, Elton, Essex–same as Peking, Extra Early Black Eyebrow–same as Black Eyebrow, Extra Select Sable–same as Peking, Giant Brown–same as Mammoth Brown, Goshen Prolific, Green–same as Medium Green, Guelph–same as Medium Green, Habaro, Haberlandt, Hahto ("Introduced under S.P.I. No. 40118 from Wakamatsu, Japan, in 1915. It is commonly known in Japan as 'dove killer,' and is said to be used boiled in the green stage... Especially valuable as a green vegetable bean when three-fourths to full grown"), Hamilton, Herman, Hollybrook, Hongkong, Hoosier, Illini, Ilsoy, Indiana Hollybrook–same as Midwest, Ito San, Jet, Laredo, Large Brown–same as Mammoth Brown, Large Yellow–same as Mammoth Yellow, Late Yellow–same as Mammoth Yellow, Lexington, Mammoth–same as Mammoth Yellow, Mammoth Black–same as Tarheel Black, Mammoth Brown, Mammoth Yellow, Manchu, Manchuria–same as Pinpu, Mandarin, Medium Early Green–same as Medium Green, Medium Early Yellow–same as Ito San, Medium Green, Medium Yellow–same as Midwest, Merko, Midwest, Mikado, Minsoy, Mongol–same as Midwest, Morse, Ogemaw, Ohio 9035–same as Hamilton, Old Dominion, Otootan, Peking, Perley's Mongol–same as Midwest, Pinpu, Red Sable–same as Peking, Roosevelt–same as Midwest, Roosevelt Medium Early Yellow–same as Midwest, Royal–same as Wilson Five, Sable–same as Peking, Shanghai–same as Tarheel Black, Sooty, Southern–same as Mammoth Yellow, Southern Prolific, Soysota, Tarheel–same as Tarheel Black, Tarheel Black, Tarheel Brown–same as Mammoth Brown, Tokyo, Virginia, Virginia Early Brown–same as Virginia, Wea, White Eyebrow, Wilson, Wilson-Five, Wisconsin Black, Wisconsin Early Black–same as Wisconsin Black, Wisconsin Pedigreed Black–same as Wisconsin Black, Yoko–same as Yokoten, Yokoten, Yellow–same as Mammoth Yellow.

Note 1. This is the earliest document seen (Aug. 2013) that mentions the soybean varieties Black Sable, Early Virginia Brown, Extra Early Black Eyebrow, Giant Brown,

© Copyright Soyinfo Center 2014

Large Brown, Tarheel Brown, Virginia Early Brown, or Wisconsin Pedigreed Black.

Note 2. This is the earliest document seen (Aug. 2013) which states that Black Sable is the same as Peking, or that Brown, Giant Brown, Large Brown, and Tarheel Brown are the same as Mammoth Brown, or that Early Green is the same as Medium Green, or that Early Virginia Brown and Virginia Early Brown are the same as Virginia, or that Early Wisconsin Black and Wisconsin Early Black and Wisconsin Pedigreed Black are the same as Wisconsin Black, or that Extra Early Black Eyebrow is the same as Black Eyebrow, or that Mammoth Black is the same as Tarheel Black, or that Yellow is the same as Mammoth Yellow.

Photos show (unless otherwise stated): (1) A typical soy-bean plant growing alone. (2) "Outline map of the United States showing by numerals the areas to which the soy bean is especially adapted. The varieties suited to the various areas for different purposes are discussed on page 11. Outside the unnumbered areas the soy bean either can not be grown profitably or it is in the experimental stage." A vertical line shows that the soybean grows east of the 99th meridian. The area east of this line is divided into 5 zones by 4 lines parallel to the latitudes. Soybeans can also be grown in small parts of Arizona, New Mexico, and California, where extremely hot weather prevails during the period when the seed is forming. (3) Roots of a soy-bean plant showing abundant development of nodules.

(4) Soy beans and corn planted in alternate rows; two men and waist-deep among the plants. (5) "The ordinary grain drill may be used for sowing either in rows or in close drills." It is pulled by horses and a man, seated on top, is looking backward. (6) Seeds of the 22 more important varieties of soy beans now grown in the United States showing the wide range in the size of the seed. Soybeans range from 1,250 seeds to the pound for the Hahto (large) to 9,950 seeds to the pound for Barchet.

(7) "The rotary hoe is an excellent implement for either solid or row plantings." This one is pulled by two horses; a man is seated on top. (8) "Soy beans seeded in the same row with corn. They are more generally grown with corn than with any other crop." A man is standing in front of the tall plants. (9) "A field of soy beans and Sudan grass grown in mixture for hay." (10) Roots of a soy-bean plant showing galls caused by the nematode *Heterodera radicicola.* Address: Agronomist, Office of Forage Crops, Bureau of Plant Industry, USDA, Washington, DC.

Kudo sekken to no kanryû seiseki hikaku [Preparation of a liquid fuel resembling petroleum by dry distillation of the calcium soap of soya bean oil. IV. Comparison with the magnesium soap]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(4):242-45. April. [Jap]

• ***Summary:*** The use of the dry distillation products of the magnesium and calcium soaps of soy bean oil in the preparation of fuel oil has been investigated. The best result was obtained by heating either of the soaps at temperatures below 450ºC for several hours, followed by distillation above 500ºC. The time required for completing the distillation of the magnesium soap was less than that for the calcium soap at the same distillation temperature; similarly, the specific gravity of the distillate of the magnesium soap was somewhat greater than that of the calcium soap. Address: Manshû Tetsudô Chûô Shikenjo.

2481. Sato, Masanori; Matsumoto, H. 1927. Daizu abura shibô-san sekkai no kanryû ni yoru nenryô yu no seihô ni tsuite. V. Kanryû yu no suiso tenka to seibun [Preparation of a liquid fuel resembling petroleum by dry distillation of the calcium soap of soya bean oil. V. Hydrogenation of the distilled oil]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(4):245-52. April. [5 ref. Jap]

• ***Summary:*** The light oil (100-175ºC) and middle oil (175-300ºC) obtained earlier (Sato 1927, Part IV) were hydrogenated in liquid or vapor phase, using nickel reduced at about 370ºC as catalyst, and the products examined. The hydrogenation of the light oil began at about 60ºC and was rapid at 80ºC. In vapor phase it was readily reduced to saturated hydrocarbons at 190ºC, forming a colorless oil having no disagreeable odor. The middle oil could be hydrogenated in liquid phase at 140ºC with 2% nickel, its iodine value being decreased to about 60; similar results were obtained in vapor phase at 320ºC. Heptane, octane, and nonane were isolated from the hydrogenated light oil. The existence of aromatic hydrocarbons, such as benzene, toluene, and xylene, could not be confirmed. From the hydrogenated middle oil were isolated those constituents which had the boiling point and ultimate composition analogous to those of 11-, 13-, and 14-carbon paraffin (saturated) hydrocarbons, but the specific gravity of each fraction was greater than that of the corresponding hydrocarbon. It is inferred that some hydrocarbons of the naphthene series accompany the paraffin hydrocarbons, which are the main constituents of the oil. Address: Manshû Tetsudô Chûô Shikenjo.

2482. Sato, Masanori. 1927. Daizu abura shibô-san sekkai no kanryû ni yoru nenryô yu no seihô ni tsuite. VI. Sekkai-en yori keton e no bunkai kikô to ondo [Preparation of a liquid fuel resembling petroleum by dry distillation of the calcium soap of soya bean oil. VI. Reaction mechanism of thermal decomposition of the calcium and magnesium salts of some higher fatty acids]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(4):252-60. April. [8 ref. Jap]

• ***Summary:*** Calcium and magnesium stearates were heated at 450-480ºC in a partial vacuum (5-7 mm of mercury). By the isolation of stearone from the distillates obtained, the

© Copyright Soyinfo Center 2014

formation of the ketone by the thermal decomposition of the stearates is confirmed. By similar experiments the formation of oleone from the corresponding oleates was confirmed. The decomposition temperatures of these salts were measured, the results being expressed as curves relating acetone-soluble matter (%) and temperatures. Address: Manshû Tetsudô Chûô Shikenjo.

2483. Sato, Masanori; Ito, C. 1927. Daizu abura shibô-san sekkai no kanryû ni yoru nenryô abura no seihô ni tsuite. VII. Keton yori tanka suiso e no bunkai kikô to ondo [Preparation of a liquid fuel resembling petroleum by dry distillation of the calcium soap of soya bean oil. VII. Reaction mechanism of thermal decomposition of the calcium and magnesium salts of some higher fatty acids]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(4):261-67. April. [6 ref. Jap]
• ***Summary:*** Rates of thermal decomposition of calcium and magnesium stearates and oleates at 400ºC have been measured, and the results are expressed by graphs. Analysis of the gases formed by the decomposition of stearone and oleone at different temperatures showed that the rate of formation of carbon monoxide from the ketones was very small at 300-350ºC, and increased gradually with temperature. Thus, the carbon monoxide formed during 1 hour from stearone and oleone heated at 500-550ºC and 550-600ºC, respectively, was 48.10% and 66.96% of the theoretical quantity. Saturated and unsaturated hydrocarbons and small quantities of hydrogen and carbon dioxide were also formed by the thermal decomposition of the ketones. Address: Manshû Tetsudô Chûô Shikenjo.

2484. Horvath, A.A. 1927. The soybean as human food. Peking and Shanghai, China: Chinese Government Bureau of Economic Information. Booklet Series No. 3. 86 p. May. Reprinted from Chinese Economic Journal, Sept. and Nov. 1926, and Jan. to April 1927. No index. 21 cm. [38 ref]
• ***Summary:*** A very original and important book. Contents: Preface by Macey F. Deming, Tappan New York, from an address at a meeting of the National Soybean Growers', held at Washington, DC, Sept. 1925. Introduction. 1. General ingredients of the various Manchurian beans. 2. Composition of some Japanese soybeans and of the common American varieties. 3. Value of the soybean as food. 4. Soybean oil for food. 5. Refined soybean oil: As substitute for salad or frying oil, as substitute for hardened oil and lard (hydrogenation), in oleomargarine and vegetable butters. 6. Whole soybean as food: Immature or green soybeans, mature or dry soybeans, the digestibility of the boiled soybean seeds, boiled soybeans as a food of predominant importance in China, soybean coffee, soybean chocolate, soybean sprouts.

7. Soybean cake, soybean meal and soybean flour for food: Soybean press cake, soybean extraction meal, soybean flour (Berczeller, Soyama, Aguma, lecithin, Ehrhorn), Sojawurze (Suppenwurze, Maggi cubes), digestibility of soybean flour, value for infants (p. 53, based on the research of Dr. Ruhrah in the USA), some medical aspects of the use of soybean flour, soybean flour in diabetes. 8. Soybean milk for food: Introduction, preparation of soybean milk, properties (incl. inoculation with a culture of yoghurt [yogurt] bacteria to give a curd-like acid mass), market prices, composition, nutritive value, new methods in the manufacture of soybean milk (Prof. Laxa in Prague [Czechoslovakia], Li Yu-ying, Soyama), some dietetical advantages and applications of the soybean milk, condensed soybean milk and milk powder (Soy Lac soybean milk powder made in America by Chard), soybean cake, soybean meal and soybean flour as material for soybean milk, yu p'i and yu ba (yuba; also fu chu).

9. Soybean curd (tofu) for food: Preparation and types (classical name is *li chi*), historical, present state (of tofu in China), chemical composition, digestibility, utilization. 10. Fermented soybean products for food. Soy sauce: Kibiki and sobiki tamari, composition of various soy sauces. Natto. Miso. Conclusion. Bibliography.

On page 9 we read: "An industry which promises to be of importance in a further utilization of the soy bean is the manufacture of 'vegetable milk.' At the present time a factory in New York State is being equipped for this purpose." Address: Peking Union Medical College, China.

2492. Dorsett, P.H. 1927. Soybeans in Manchuria. *Proceedings of the American Soybean Association* 1:173-76. Eighth annual field meeting. Held 9-12 Aug. 1927 in North Carolina.
• ***Summary:*** "Mr. W.J. Morse, soybean specialist of the United States Department of Agriculture, is responsible for my being with you on this occasion, and I am delighted that such is the case, for it affords me an opportunity to learn a great deal about the progress of the soybean industry in America. You will also have to hold Mr. Morse responsible for the valuable time I consume, not only in connection with the few remarks I have to make concerning our agricultural explorations in the Orient, but also that taken up in showing you the motion pictures we secured of the Chinese practices employed in the growing and handling of this important crop in Manchuria.

"On account of our personal friendship for Mr. Morse, supplemented by his enthusiastic letters about the success of the soybean at home, we were impelled to give this crop special attention. We not only made observations and notes and secured seed samples where possible, but also visualized as best we could by means of still and motion pictures, the methods and practices followed in the growing and handling of soybeans in Manchuria, a country which leads the world in their production.

"Manchuria, in extreme northeastern China, is embraced practically between the 39th and 53rd degrees North latitude. Between these same lie the portions of the United States north of an imaginary line passing Carson City, Nevada; Colorado Springs, Colorado; Kansas City, Missouri; and a little south of Baltimore, Maryland. The natural features of the two regions are, in many respects, quite similar, and on this account, it is logical to expect that much of the plant material in our two-and-a-half years' explorations of northeastern China may find a congenial home throughout the region noted, and it is hoped, after naturalization, that some of them may prove not only interesting, but also of real value and economic importance to American farmers.

"The total area of Manchuria is given as 365,000 square miles, and its cultivated area as something over 27,000,000 acres. It is estimated that of this amount something like 8,000,000 or 9,000,000 acres are devoted to the cultivation of soybeans.

"The soybean is the cash money crop of the country. The yield from the immense acreage planted is handled primarily as a grain crop for export and crushed for oil and bean cake. Almost the entire output of bean cake is consumed in Japan for fertilizer. The climate of Manchuria is classed as 'continental' The country is subject to decided extremes of temperature, with hot summers and long, severe winters, the mercury sometimes falling 40 to 50 degrees Fahr. below zero.

"Manchuria has been classed as the 'Garden Spot of China' and also as 'The most favored spot for agriculture in the Far East.' From our observation and experience in connection with our work of general agricultural explorations from Shanghai almost to the Mongolian border, we feel safe in saying that it surely is a land of opportunity with very great potential possibilities.

"The principal staple farm crops of Manchuria and their yield as given for 1920 areas follows:"

A table shows:

"Kaoliang, a species of sorghum, 6,730,000 tons.

"Millet 5,128,900 tons.

"Soybeans 3,789,500 tons.

"Corn 1,724,000 tons.

© Copyright Soyinfo Center 2014

"Barley 1,552,000 tons.

"Wheat 1,093,100 tons.

"Small beans, primarily mung beans, 361,200 tons.

"Seeing is believing, but as it is quite probable that few, if any, of you have visited Manchuria and seen for yourselves, you will have to take my word for it that all of the above crops, as well as all others grown, are harvested with a small harvest hook, threshed with rolling stones, and cleaned by the wind.

"Through the cooperation of American government officials, Chinese authorities, fruit growers and farmers, and especially that of Prof. W.E. Chamberlain, then in charge of the agricultural work of the Peking University, we were successful in securing a fine collection of seed and plant material from Peking and vicinity for trial in America. In Harbin, Manchuria, we not only had the cooperation and assistance of those in the same walks of life, but also that of Russian scientists, scientific institutions, the Chinese Eastern Railway, and the Postal Commissioner and his assistants.

"The officials of the Chinese Eastern Railway supplied us with a special car, without expense either for the car and attendant or for transportation. In this car we were sidetracked at the stations along their lines in the regions where we wished to explore, and, using it as headquarters, worked out into the country in any direction. When our work there was finished, we were taken to another station and repeated the operation. By this means we were able to visit localities and to accomplish results which, under the existing conditions, otherwise would not have been possible.

"The Postal Commissioner and his assistants at Harbin became interested in our undertaking and worked hand in hand with us in our endeavor to obtain four ounce samples of seed of four of the staple farm crops of Manchuria:– wheat, barley, soybeans and mung beans. The first two are staple crops in America and the other two are promising new crops of very great economic importance. Through this channel seed samples were secured from the majority of the five hundred rural post offices scattered through the two north provinces of Manchuria-Kirin and Heilung Kiang [Heilongjiang]. The expense to our Government, incident to securing this collection of upwards of 1200 to 1500 seed samples exclusive of postage, was a bill from one Chinese farmer for 14 cents Mex., about 7 cents in United States gold.

"Through the activities of the officials of the Manchurian Research Society, which is supported by the Chinese Eastern Railway, we obtained something over 500 seed samples of commercial soybeans, from their railway stations in the principal soybean-growing sections in North Manchuria. The value to the farmers of the United States of this large collection of something like 1500 numbers of soybean introductions, from nearby and far-distant regions of northeastern China, remains for Mr. Morse's work and the future to determine, but we hope for the best and sincerely trust that some of them will prove to be of economic importance. As to the interest and value of the motion pictures visualizing soybean production in Manchuria, its native home, which will now be shown, it remains for you to judge." Address: United States Dep. of Agriculture.

2493. Mashino, M.; Shishido, T. 1927. Daizu tanpakushitsu no bunkai ni kansuru kenkyû. V. Kaenka ni okeru ryûsan ni yoru bunkai [Decomposition of soya-bean protein. V. Decomposition of soya-bean protein by sulfuric acid]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(8):552-60. Aug. (Chem. Abst. 22:1602). [1 ref. Jap]

• ***Summary:*** Soya bean from which oil had previously been extracted with light petroleum was treated for 6 hours with dilute sulfuric acid (1-20%) at 4.7 atmospheres pressure. The action of the acid was much more rapid and the amounts of ammonia and amino-nitrogen formed were much larger than at atmospheric pressure. The amount of nitrogen appearing as ammonia increased with increasing time of treatment, reaching 11.63-20.05% of the total nitrogen at the end of 6 hours. With 20% sulfuric acid the amount of amino-nitrogen formed increased rapidly at first, reached a maximum (about 80% of the total nitrogen), and then decreased gradually to about 60% at the end of 6 hours. With more dilute acid no maximum was found. Address: Tokyô Kôgyô Shikenjo, Dai 2 bu, Tanpakushitsu Kenkyu Shitsu.

2494. Mashino, M.; Shishido, T. 1927. Daizu tanpakushitsu no bunkai ni kansuru kenkyû. VI. Kaenka ni okeru yûki-san ni yoru bunkai [Decomposition of soya-bean protein. VI. Decomposition of soya-bean protein by organic acids]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(8):561-64. Aug. [7 ref. Jap]

• ***Summary:*** When soya-bean protein was treated with acetic, lactic, citric, tartaric, or oxalic acid for several hours at 2.66-5.8 atmospheres, the ammonia-nitrogen liberated was nearly the same in every case (10-13% of the total nitrogen). The amino-nitrogen liberated varied from 3.1 to 25.1% of the total nitrogen, according to the acid used, and increased in the order given above (from acetic to oxalic acid). Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Tanpakushitsu kenkyu shitsu.

2495. Mashino, M.; Shishido, T. 1927. Daizu tanpakushitsu no bunkai ni kansuru kenkyû. VII. Sansei hakudo ni yoru bunkai [Decomposition of soya-bean protein. VII. Decomposition by Japanese acid clay]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(8):565-68. Aug. [4 ref. Jap]

• ***Summary:*** When soya-bean protein was heated under pressure with acid clay and water, or with acid clay and sodium chloride solution, the ammonia-nitrogen and amino-nitrogen liberated was about 8.5% and about 5% of the total

© Copyright Soyinfo Center 2014

nitrogen, respectively. With acid clay and hydrochloric acid the amount of amino-nitrogen liberated was somewhat less than with the acid alone. Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Tanpakushitsu kenkyu shitsu.

2496. Morse, W.J. 1927. The present outlook of the soybean industry in the United States. *Proceedings of the American Soybean Association* 1:167-71. Eighth annual field meeting. Held 9-12 Aug. in North Carolina.
• ***Summary:*** "In 1907, the soybean was considered but a minor crop in America, less than 50,000 acres being devoted to its culture. North Carolina had the largest acreage at that time, and produced at least 90 per cent of the seed, possibly more."

Note: This is the earliest document seen (May 2008) that gives statistics for soybean production in the USA before 1909. It is also the earliest document seen (May 2008) that mentions the number "50,000 acres" in connection with the year 1907–statistics that were repeated by many subsequent publications. Yet we have been unable to find Morse's source for these earliest baseline statistics. He may have somehow derived the figures from those in: U.S. Department of Commerce, Bureau of the Census. 1913. Thirteenth census of the United States taken in the year 1910. Volume V. Agriculture, 1909 and 1910.

"Not more than six varieties were being grown [in America]. The most important of these were the Mammoth Yellow, Ito San, Ogemaw, and Medium Green, varieties limited as to soil and climatic conditions, and also as to purpose. At this time, it seemed unlikely, to all except a few soybean enthusiasts or 'soybean cranks' as they were then called, that the soybean would ever amount to much more than a minor or emergency crop. Several experiment stations had conducted tests with the crop as pasture, hay and silage, and with the seed as a concentrated feed... One soybean enthusiast, the late Dr. C.V. Piper, then Chief of the Office of Forage Crops, United States Department of Agriculture, had a remarkably clear vision of the great potential value of the soybean as a major crop in American agriculture. After studying the soybean in the Orient, it seemed to Dr. Piper that more and better varieties were essential to meet the widely diverse conditions found in the United States... Through the Office of Foreign Plants, therefore, numerous introductions were made from the soybean regions of China, Manchuria, Korea, and Japan."

"The soybean undoubtedly will be utilized primarily for forage purposes, and by forage purposes is meant as hay, pasture, ensilage, and soilage."

"To me, the production of soybean seed for oil and oil mill appears to be one of the bright spots in the future of the soybean which will firmly establish it as a major crop. Increasing imports of soybeans, soybean oil, and soybean cake from China and Japan, in spite of a tariff on the beans and oil, indicate a ready market for these products in the United States. Soybean oil is a strong competitor of other vegetable oils and is used extensively in the manufacture of butter and lard substitutes, paints, enamels, waterproof goods, rubber substitutes, linoleum, and edible oils; and constantly new uses are being found for this valuable oil."

"Soybean seed is employed for various other purposes and its uses, no doubt, will further increase. There are established in the United States several factories for the manufacture of soy sauce, which in previous years was imported in large quantities from China and Japan." Address: USDA, Washington, DC.

2497. Haga, Soji. 1927. Kassei tanso ni yoru yushi no bunkai [Catalytic decomposition of soy bean oil by active carbon]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(9):618-24. Sept. (Chem. Abst. 22:1245). [Jap]
• ***Summary:*** Soy bean oil was decomposed by heating with Merck's animal charcoal as catalyst. The cracked oil produced was yellow, had density 0.812, acid value 11.5, refractive index 1.4551, and was composed of gasoline, 14.7-23% (containing 71.7% saturated hydrocarbons, 3.7% aromatic hydrocarbons, and 24.6% unsaturated, non-benzenoid hydrocarbons); kerosene, 34.7-38% (containing 72% paraffin [saturated] hydrocarbons, 5% aromatic hydrocarbons, and 22% unsaturated, non-benzenoid hydrocarbons); and neutral oil, 38-46.6%. Address: Kôgaku-shi. Waseda daigaku Oyo Kagaku, Dai-3 Kenkyu Shitsu.

2498. Mashino, Minoru; Nishimura, Shunsuke. 1927. Daizu tanpakushitsu no chisso bunpu jôtai ni tsuite [Nitrogen distribution of soya-bean protein]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(9):607-10. Sept. (Chem. Abst. 22:1602). [1 ref. Jap]
• ***Summary:*** The nitrogen distribution of several varieties of soya-bean protein has been determined by the Van Slyke method. Address: Tokyo Kogyo Shikenjo, Dai 2 bu, Tanpakushitsu kenkyu shitsu.

2499. Mashino, Minoru. 1927. Daizu tanpakushitsu no seisei ni tsuite. I. [Purification of soybean protein. I.]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(9):610-17. Sept. (Chem. Abst. 22:1602). [Jap]
• ***Summary:*** Soya bean, from which oil had previously been extracted with light petroleum, was treated with various solvents to remove constituents other than the protein. Methyl alcohol proved best. The amount of extraction increased with temperature. Extraction by methyl or ethyl alcohol (ethanol) at 67-68ºC or at 82-83ºC was almost complete in 1 hour. Soya-bean protein purified with methyl alcohol is no longer hygroscopic, is odorless, and has only a light color.

Note: This is the earliest document seen that mentions the use of ethyl alcohol for solvent extraction of soybeans. Address: Tokyo Kôgyô Shikenjo, Dai 2-bu Tanpakushitsu

2504. Zavitz, C.A. 1927. Forty years' experiments with grain crops. *Ontario Department of Agriculture, Bulletin* No. 332. 98 p. Oct. See p. 36-37, 49-51, 84-87.
• ***Summary:*** The section titled "Dates of seeding soy beans" (p. 36-37) contains a table showing the results of sowing three varieties (Early Brown, Early Yellow, and O.A.C. No. 211) on four different dates from May 8 to May 28 during the three years 1924, 1925, and 1926. For each variety is given the date of maturing and the yield of grain. The highest yield came from O.A.C. No. 211, sown on May 14 and matured on Oct. 8; it yielded 27.91 bu/acre.

The section titled "Soy beans, Dent corn and sunflowers grown alone and in combination for grain and fodder" (p. 49-51) "The highest total yield of green crop per acre was obtained from the Soy beans, Dent corn and sunflowers when grown in combination, the average being 18.8 tons or 1.7 tons per acre more than sunflowers when grown alone." An interesting phase of this line of investigation is the value of a combination of Soy beans and Dent corn. The average 7 years for the following crops were: Soy beans, 7.9; Dent corn, 13.8; Soy beans and dent corn, 13.8. The average for the 7 years gives exactly the same total weight for corn alone as for corn and Soy beans combined. The Soy beans being rich in albuminoids will make a much richer and better balanced ration for feeding purposes when mixed with corn.

When everything is taken into consideration for grain production, it is preferable to grow Dent corn and Soy beans separately rather than in combination. Three acres of corn and 2 acres of Soy beans would give a greater total production of each crop than if 5 acres of the 2 crops were grown in combination.

The section on "Soy beans grown with millets, sorghums, etc., for fodder (p. 51) notes that in each of the past two years the O.A.C. 211 variety of Soy bean has been grown alone and with seven other fodder crops, whose names are given. The results are unclear.

The section titled "Varieties of Soy beans" (p. 84-87) states: "We have tested in all fully one hundred varieties of soy beans, most of them for five years or over. The Early Yellow variety has been under test for thirty-one years [i.e., since about 1896], during which time it gave an average annual yield of grain per acre of 16.78 bushels, or 1,006.8 pounds. In a twenty-two-year test the average annual yield of grain per acre was 1,055 pounds for the Early Yellow Soy, and 950 for the Ito San. In another test, running twenty-two years, the Early Yellow gave 5.9 and the Ito San 7.5 tons of green crop per acre per annum. It will be seen that... the Early Yellow was higher in production of grain and the Ito San in production of fodder.

"Eight varieties, which have been grown under similar conditions in each of the past fourteen years. The following table gives the average results for the fourteen-year period." For each variety is given the average height (inches), weight per measured bushel (lbs), yield per acre of green fodder (tons), and of grain (bushels by weight). The eight varieties are listed in descending order of grain [seed] yield: Habaro No. 20405 (20.38 bu/acre), O.A.C. No. 111 (19.92), Tsurunoko (19.91), Early Yellow (19.81), Quebec No. 92 (18.64), Brown (17.94), Ito San (17.30), Medium Green (13.51).

"The Habaro was imported from the United States Department of Agriculture at Washington. It was first introduced in 1906 from Khabarovsk, Siberia. The O.A.C. No. 111 was obtained through selection work from the Early Yellow variety, the latter being originally obtained from Dr. C.C. Georgeson, then connected with the Agricultural Experiment Station at Manhattan, Kansas. This was one of

© Copyright Soyinfo Center 2014

the leading varieties imported by Dr. Georgeson from Japan a few years previous.

"The Tsurunoko variety, third on the list, was started 19 years ago, from 4 ounces of seed obtained directly from the College of Agriculture, Sapporo, Japan. The Quebec No. 92 was originated by selection by Dr. Leonard S. Klinck, when in charge of the agronomy work at Macdonald College, Quebec. The Medium Green has been growing at the College for a long time, but owing to its late maturity does not give satisfactory results as a grain producer."

A second table (p. 85) gives the average yields of fodder and seed of thirteen varieties grown at the College in the last five years. These include the eight listed above plus (in descending order of seed yield): O.A.C. No. 211, Manchu, Habaro, Minnesota No. 167, Early Soja (Steele, Briggs), Early Soja (Bruce). The top six varieties in seed yield are: O.A.C. No. 211 (28.1 bu/acre), Manchu (27.38), Tsurunoko (26.43), O.A.C. No. 111 (25.97), Habaro (25.97), Early Yellow (25.82). Note that O.A.C. No. 211 has the highest average seed yield. "This variety has now been accepted as eligible for registration by the Canadian Seed Growers' Association. It is the only variety of soy beans which has been so honoured."

The Manchu was imported in the U.S. in 1913 from Niguta, Manchuria, and was entered into the College tests in 1922... The Manchu has a black, and the O.A.C. No. 211 what is usually termed a yellow eye. Other than the color of the eye, both of these varieties are of a beautiful yellow appearance."

A table (p. 87) shows 26 varieties of soy beans that have been under test at the Ontario Agricultural College experimental grounds in the three years 1924, 1925, and 1926. Those not mentioned above are (in descending order of seed yield): North's, Black Ontario, Mandarin, Black Eyebrow (Jeffrey), Black Manchurian (Jeffrey), Oyaji, Shiro Kotsubu, Kuro-otsubu aka, Argyle (Jeffrey), Ogemaw, Hollybrook (Jeffrey), Chagara, Wasa-Otsura, Washe Otuku. The top eight varieties in seed yield are: O.A.C. No. 211 (1,821 lb/acre), Manchu (1,746), North's (1,737), Black Ontario (1734), Mandarin (1,699), Black Eyebrow (Jeffrey) (1,670), Habaro No. 20405 (1,629), O.A.C. No. 111 (1,618). "It will be seen that the O.A.C. No. 211 variety stands at the head of the list in yield of grain, and second highest in yield of green fodder."

Photos show: (1) The Field Husbandry Building at O.A.C. (cover). (2) Soy bean plants growing with Dent corn for fodder (p. 50). (3) A man standing in an acre plot of O.A.C. No. 211 Soy Beans grown for grain (p. 86).

Note: This is the earliest document seen (Oct. 2013) that mentions the soybean variety Black Ontario. Address: B.S.A., D.Sc., Prof. of Field Husbandry and Director of Plant-Breeding and Field Experiments, Ontario Agricultural College, Guelph.

2505. Millard, Bailey. 1927. Awakening of Manchuria: II. *Los Angeles Times.* Dec. 8. p. A4.

• ***Summary:*** "Standing upon the treaty rights by which they acquired long lease-holds of large railroad, mining and agricultural property in Manchuria, the Japanese will not permit the irresponsible Chinese war lords to abrogate or in any way violate those historic agreements under which Japan began the development of the country after the Russian evacuation."

Manchuria owes much to Japan in terms of development of natural resources, welfare work, education, and construction. Manchuria has entered a new industrial era. "There is no question that Japan would like to annex Manchuria, and may do so in time; but at present she would have the powers to reckon with... though most economists consider it would be better all around if Japan were in possession."

"Japan is offering every encouragement to American trade and industry in Manchuria." The population as increased greatly, largely due to immigration from other parts of China in part to escape the wars devastating those areas. Though there is much cheap labor, Japan is short on capital. In Manchuria's three provinces, there are nearly 30 million acres of primeval forests. When John Muir went there 20 years ago from California to study these forests, he was astonished at the height and bulk of the trees.

Milling of soya beans ranks foremost among Manchuria's new industries. "Products of the Manchurian soya bean–oil and bean cake–have become of importance in world trade." About 4,000,000 tons of soya beans are now raised annually in Manchuria.

2506. Hashi, Koro. 1927. Daizu abura kenkyû. I. Daizu abura shibôsan no seibun [Studies on soya bean oil. I. The composition of fatty acids]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 30(12):849-855. Dec. (Chem. Abst. 22:2478). [7 ref. Jap]

• ***Summary:*** The fatty acids of soya-bean oil were separated into a solid (10.6%) and a liquid (85.4%) part by means of Twitchell's lead salt-alcohol method. The solid fatty acids were esterified with methyl alcohol and the esters fractionated. They were found to consist of much palmitic acid, an appreciable amount of stearic acid, and a little arachidic acid. Bromination of the liquid fatty acids shows the presence of linolenic acid, 2.9%; linoleic acid, 51.5%; oleic acids, 35.6%; and solid fatty acids, 11.1%. Address: Kyoto Teikoku Daigaku, Kogyo Kagaku Kyoshitsu, Kita Kenkyu Shitsu.

2517. Horvath, A.A. 1927. The soybean as stock feed and human food. *Vestnik Manchzhurii* (*Manchuria Monitor*) No. 8. p. 5-7. English edition. p. 13-23. Russian edition. [19 ref. Eng; Rus]
• ***Summary:*** A brief but good introduction to soybeans and soybean products including soybean meal, soybean flour, soybean oil, bean milk [soymilk], to-fu, frozen to-fu, soy sauce, and mizo [sic, miso] or tsiang [jiang].

"When boiled with gypsum or chlorate of magnesia bean milk curdles, and is known as 'to-fu.' Its constitution varies dependent upon the method of preparation employed. Fresh soy curd contains on the average, 8% protein and 3% fat. 'To-fu' when smoked or fried, owing to loss of water, becomes somewhat allied to meat, thereby substantiating the Chinese proverb that–'to-fu is meat without bones.'"

"Frozen 'to-fu' prepared during the cold season contains up to 50% protein. Bean curd is almost totally assimilated, and may be used in the preparation of a considerable number of European dishes, the recipes for which have been published by the U.S. Department of Agriculture. The Chinese prepare an unlimited number of dishes based upon this comestible, including artificial meat. In order to obtain the specific taste of meat, smoking soybean sauce is used."
Address: Manchuria.

2518. Morse, W.J. 1927. Soy-bean varieties newly developed for U.S. farms. *Yearbook of Agriculture* (*USDA*) p. 676-79. For the year 1926.
• ***Summary:*** "The acreage of soy beans in the United States increased from about 500,000 acres in 1917 to over 2,500,000 acres in 1924. This enormous increase in the use made of soy beans in this country has been largely due to

© Copyright Soyinfo Center 2014

the development of better-adapted varieties. The number of real or supposed varieties has increased very rapidly in the United States during the past few years, resulting in much confusion concerning varietal names and characters. In many instances disapointment and loss have been caused to the grower by the lack of reliable information, and the soy bean brought into disfavor in some localities. At the present time about 60 varieties of soy beans are handled by growers and seedsmen in the United States. Varietal names greatly exceed the number of true varieties, for different varieties are often sold under the same name and different names are often applied to the same variety. It is therefore essential not only to know the name of a desired kind, but also its varietal characteristics in order to prevent substitution in purchasing seed. Varieties of soy beans are differentiated largely by the color and size of seed, though they also differ in time of maturity, habit of growth, disposition to shatter their seed, disease resistance, oil and protein content, and in yield of forage and seed. They vary also in their adaptation to climate and soil. Some varieties are especially suitable for fertile land, others for less productive land; some for early planting, others for late planting; some for a seed crop, others for forage; some for planting with corn, others for planting with Sudan grass and sorghum. One may find a few varieties or even a single variety adapted to the climate of a certain section which will fill all the local requirements of the crop. No single factor has greater influence upon the success of the crop than the selection of the right variety to meet the needs and the conditions of the section where it is to be grown.

"Only Eight Varieties Grown in 1898: Previous to the numerous introductions made by the United States Department of Agriculture, beginning in 1898, there were not more than 8 varieties of soy beans grown in the United States, namely, Mammoth Yellow, Ito San, Butterball, Guelph or Medium Green, Eda, Ogemaw, Buckshot, and Kingston. All of these varieties were rather limited in adaptation, and at present the Ito San and Mammoth Yellow are the only ones grown to any appreciable extent. In 1907, 23 varieties of soy beans were being grown, and of these 15 were introductions made by the department prior to 1905. Vigorous efforts were inaugurated about 1907 to obtain additional varieties through consuls, agricultural explorers, foreign seedsmen, and extensive correspondence with missionaries and others until in 1909 the department had in its trials about 200 distinct varieties; by 1913, 400 varieties; by 1919, 600 varieties, and by 1925, about 1,200 varieties.

"The records of introduction indicate that every Chinese village has its own distinct varieties. There is no seed trade in China, consequently local varieties are never widely disseminated. Undoubtedly numerous varieties are yet obtainable from the agriculturally unexplored villages of China, Manchuria, Korea, Japan, and India.

"When new introductions are received they are thoroughly tested at Arlington Experiment Farm the first year, and if mixed, single plant selections are made for the second year's test. After three years' work with these selected strains, those giving the best results in comparison with standard varieties are disseminated among the State experiment stations, where they are grown again under careful observation and test conditions. Finally seed is distributed among farmer cooperators who assist the department in its practical field investigations. Varieties that appear promising in these field trials ultimately are assigned suitable varietal names and made available for general use and distribution in the localities to which they are adapted.

"One thousand varieties introduced: During the past 20 years more than 1,000 varieties have been introduced into the United States from China, Japan, Manchuria, India, Korea, Siberia, and the East Indies. Several of these have become established in American agriculture, either as direct introductions or as selections from introductions. Others, introduced in the past year have proven so valuable in trials that they are deemed important acquisitions and doubtless will become widely grown. It is universally appreciated and acknowledged by all soy-bean authorities that the annual introductions of soy beans into the United States have been of fundamental importance in the rapid rise of the crop in public favor.

"The soy bean lends itself readily to improvement. Considerable breeding work is being carried on by the department, several State experiment stations, and a few soy-bean growers. Although the Orient abounds with varieties, it is evident that they are the result of natural crossing and selection, as very little breeding work has been done. Introductions, for the most part, are admixtures, containing two or more varieties. The progeny of individual plants has shown decided differences in yield of forage and seed, in tendency to shatter, in maturity, and in oil and protein content. Many new varieties have been introduced into the seed trade of the United States as a result of selection work. Some of these varieties originated from natural hybridization and a few are almost certainly mutations or sports. The most important of such varieties are Chestnut, Dixie, Goshen Prolific, Hamilton, Herman, Illini, Ilsoy, Lexington, Mikado, Minsoy, Peking, Sooty, Soysota, Virginia, Wilson-Five, and Wisconsin Black. Introductions without selection have given us the following important varieties: Biloxi, Black Eyebrow, Chiquita, Columbia, Haberlandt, Hahto, Hoosier, Laredo, Manchu, Mandarin, Morse, Old Dominion, Otootan, Southern Prolific, Tarheel Black, Tokio, Wea, and Yokoten.

"Work justified by results: The results that have been obtained by this wholesale search have justified the work and expense many times over. When the department work began, the soy bean was a very minor crop, and of importance only in limited areas, owing primarily to the lack of suitable varieties. To-day, its culture, due to a wide range of excellent varieties, is widespread and lends substance to the belief that the soy bean will become one of our major crops.

© Copyright Soyinfo Center 2014

"Table 24 shows the total value of soy-bean seed and hay produced in 1924 by varieties introduced and developed by the department. These data, which do not include the value of the soy beans pastured or fed as silage, indicate that over half (52 per cent) of the total soy-bean hay and seed produced in the United States was obtained from these new varieties. The wide use that is being made of these varieties shows most conclusively the effect this introduction and breeding work has exerted on the development of the soy-bean industry in the United States."

Photos show: (1) Field trials of varieties of soy beans at Clemson College, South Carolina. (2) Two men standing in a "field of Otootan soy beans, one of the newer introductions by the United States Department of Agriculture."

Table 24 has six columns: 1. Variety (18 varieties). 2. Year introduced. 3. Estimated value as seed. 4. Estimated value as hay. 5. Estimated value, total. 6. Percent of value of all soybean hay and seed. Those with the highest percent of value are: Midwest 11.4%. Manchu 6.8%. Virginia 6.7%. Wilson 6.2%.

The 18 varieties, listed alphabetically, are: Biloxi, Black Eyebrow, Ebony, Hamilton, Haberlandt, Laredo, Lexington, Manchu, Midwest, Minsoy, Mandarin, Morse, Peking, Tarheel Black, Tokio, Virginia, Wisconsin Black, Wilson. Address: USDA, Washington, DC.

2519. Skvortzow, B.V. 1927. The soy bean–Wild and cultivated in Eastern Asia. *Vestnik Manchzhurii* (*Manchuria Monitor*) No. 11. p. 1-4. English edition. (From materials furnished by the M.R. S-ty). [Eng]

• ***Summary:*** The soy bean has been subjected to many classifications. Contents: Classification of soybeans by the Chinese: 1. Seeds yellow, named "Huan-tou." A. White hilum, named "pai-mei" or white eyebrow. A. Golden hued hilum, named "chin-huan" or golden round bean. C. Black hilum, named "hei-chi" or black navel. 2. Seed coat green, cotyledons yellow, named "P'i-ch'ing tou." 3. Seeds, epidermis, and cotyledons green, named "Ching-tou" [Ch'ing-tou]. 4. Seeds black, cotyledons yellow, named "Hei-tou." 5. Seeds black, cotyledons green, named "Wu-tou." 6. Seeds tawny, named "Chi-tou." 7. Seeds spotted, variegated, named "Pan-tou."

Classification by Martens (1869) divides the Soya hispida Moench species into three sub-species by seed shape, and 13 varieties by seed color. Classification by Harz (1880) based upon the form of the pod and the structure and color of the seeds. He divides the soybean into two species (pods flat, and pods swollen), and numerous sub-species. Classification by Tanaka (Japanese), 13 species based upon the color of the pods and seeds plus the period of maturity. Classification by Jamasito Vakindo (Japanese), who divided soybeans into 3 main groups (pure forms, mixed, abnormal) and 150 species. Novel classification by the author, based on the structure of the stem, leaf, flower clusters, blossoms, pods, and seeds, plus pubescence. This yields 31 varieties, each of which is described. Address: Harbin, China (Manchuria).

• ***Summary:*** The Taisho era has ended; the Showa era has begun. A full page near the front of this volume is about the late emperor Yoshihito, who died on 25 Dec. 1926. It contains a portrait photo and a statistical review of his reign, including: Territorial expansion. Population growth. Industrial progress. Expansion of trade. Specie reserve. Currency. Finance. Education. Transportation (railways, shipping), and Electric generation.

The next full page is about his son and successor, His Imperial Majesty Hirohito, and H.I.M. Empress Nagako. There is a portrait photo of each.

Page 467. In the chapter on Agriculture, a table titled "Beans, potatoes and sweet potatoes" shows the production (in koku; 1 koku = 180 liters) of these crops from 1923 to 1925, inclusive. Soybean production increased from:

3.434 million *koku* in 1923
3.242 million *koku* in 1924
3.609 million *koku* in 1925.

The text below the table is the same as in the 1926 Japan Year Book.

Page 593. A table shows the value of imports in yen, including Beans and peas, and "oil materials."

Page 662. In the section on Manchuria, a table titled "Principal crops" shows the production of soya beans from 1922 to 1924. Figures for 1922 and 1923 are in Chinese koku; 1 Chinese koku = 1.7 Japanese koku.

On the same page, under "The South Sea Islands," we read: "Japan acquired through the Treaty of Peace the mandatory right over the former German South Sea Islands north of the Equator... It consists of three groups of Mariana, Marshall, and Caroline, covering altogether an area of 960 square miles with 49,576 natives." Address: Prof. at the Waseda Univ. and late of the "Japan Times".

2521. Horvath, A.A. 1928. Soybean feeding and blood calcium. *Japan Medical World* 8(1):1-5. Jan. 15. [32 ref]

• ***Summary:*** "It is a general belief that soybeans are poor in calcium. This belief is supported by Forbes (1909), Osborne and Mendel (1917), Adolph (1922) and others." Yet various chemical analyses show that the soybean seed contains about 0.25% of calcium oxide, which is higher than most foods, including whole cow's milk. Rabbits were fed a diet of raw yellow soaked soybeans for 4 weeks, and of other soybean preparations ("sprouted soybeans" and "soybean curd" made with calcium sulfate) given for three weeks more. The blood calcium level generally fell. Possible reasons for this are discussed.

"In China the black soybean has been used for feeding

© Copyright Soyinfo Center 2014

animals since ancient times and is thought to be more suitable than the yellow variety. It is known that the black variety contains much less fat than the yellow soybean."

Note: This is the earliest English-language document seen (Jan. 2013) that uses the term "sprouted soybeans" (or "sprouted soybean") to refer to soy sprouts. Address: Dep. of Medicine, Peking Union Medical College, Peking, China.

2534. Nakazawa, Ryoji. 1928. Nanyô-san ontjom, tempeh o tsukuru shijôkin ni tsuite [On the filamentous fungi used to make ontjom and tempeh in the South Pacific (Java and Sumatra)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 4(4):252-63. April. See also Zentralblatt fuer Bakteriologie. II. 80:114 (1930) and Biological Abstracts 4:25213 (1930). [13 ref. Jap]
• ***Summary:*** Discusses *Mucor, Aspergillus, Rhizopus,* and *Penicillium* molds.

Onchom is made from peanuts and tempeh from soybeans. The author notes that Prinsen Geerligs (1896) had reported that these foods were fermented using *Rhizopus oryzae,* whereas Went (1901) had said they were fermented using *Monilia sitophila.*

In 1912 Nakazawa had asked a person from Southeast Asia to bring him samples of tempeh and ontjom (made from peanut presscake). He analyzed their microorganisms and repeatedly found *Penicillium,* a grayish-brown mold, to be the predominant genus.

In 1924 Yoshito Takeda, Nakazawa's co-worker, obtained more samples of these foods from Southeast Asia, and again found *Penicillium* to be predominant. *Monilia* (which in 1901 Went had said was the predominant microorganism) was not found; Takeda assumed it had died during transport.

In April and May of 1926 (Taisho 15) Nakazawa took a research trip to Java and Sumatra and carefully collected (in sterile containers) 59 samples of soy tempeh and onchom from various markets and small manufacturers. Tempeh was collected from Medan, Semarang, and Soerabaya [Surabaya], while ontjom was collected from only Buitenzorg and Medan. Nakazawa and Takeda analyzed the microorganisms in these fermented foods and in this document reported that they found the onchom microorganisms to be almost exclusively *Penicillium* and the tempeh microorganisms to be mostly *Penicillium,* but with substantial amounts of *Mucor, Rhizopus* (all light grayish-brown) and *Aspergillus* (dark green) as well. No *Monilia* was found and no species names were reported. Dr. Grounewege at the Buitenzorg Agricultural Research Laboratory confirmed that these were the predominant species.

Note 1. This is the 2nd earliest document seen (Sept. 2011) worldwide which uses the spelling "tempeh" to refer to this fermented Indonesian soybean food. This word, written in roman letters, appears throughout the publication and by the 1960s had become the standard spelling in English and most other European languages.

Note 2. This is the earliest Japanese-language document seen (Sept. 2011) (one of two documents) that mentions

© Copyright Soyinfo Center 2014

tempeh.

Note 3. Today most tempeh is made with *Rhizopus* species and most ontjom with *Monilia* species.

Note 4. Dr. Nakazawa never made tempeh, probably for lack of a suitable inoculum. Address: Taiwan Sotokufu Chuo Kenkyujo, Kogyo-bu Hokoku.

• ***Summary:*** About the many restaurants of foreign-born Americans visited by the writer in Los Angeles. "The last compromise which foreign groups make to the customs of an American city is in their food."

Chinese restaurants are found on San Pedro street, south and east of the Plaza. "A vegetable soup is safe to start with, being a watery, peculiar dish with strange and delightful vegetables and soya bean curd it. Each dish is prepared to be eaten with rice as American eat bread, for soya bean sauce, which is used extensively, is too strong to be pleasant without it."

"Japanese food is similar to Chinese, but, because of the Buddhistic laws against the taking of life, no meat except fish, is eaten. As with the Chinese, soya is the important flavoring. Suimono, a bean-curd soup, a broiled fish and an omelette, or boiled chestnuts and rice, form the typical Japanese dinner." Japanese restaurants are "found in the Japanese section on First street, east of Los Angeles street, or on Weller street, just south of First street."

2538. Grey, Egerton Charles. 1928. The food of Japan. Geneva: League of Nations, Health Organisation. 161 p. May. Index. 24 cm. [82 ref. Eng; fre]
• ***Summary:*** Detailed information and analysis. Contents: Preface. 1. Quantity of food in Japan: Exports, imports, production and consumption of food in Japan in the year 1925. 2. Quality of food in Japan: Definition of quality. 3. Distribution of food in Japan: Natural and artificial distribution. 4. Chemical composition of Japanese foods as consumed: Methods of analysis. 5. Chemical composition of Japanese food as purchased. Appendices: I. Literature relating to the chemical and physical properties of the food of Japan, with list of authors. II. Food materials and the plants and animals serving as sources of food in Japan.

The Preface begins: "This work... was carried out in the Imperial Institute of Nutrition, Tokyo (director, Dr. Tadasu Saiki). It comprises statistical data relating to the food supply of Japan and analytical data derived from the writer's personal examination of the food materials."

Table 7 (p. 25) shows the amounts of major foods consumed in Japan. The percentage of the total food consumed is: Rice 50.83%, barley 10.15%, potatoes 8.63%, wheat 6.63%, soy bean 4.76%, other beans 3.71%, other cereals 3.24%, fish 1.72%, seaweed 1.23%.

On page 54, the author discusses the "Alkalinity of the ash [of foods]. This figure is of considerable importance as indicating the capacity of the food material to produce alkali in the body." On pages 61-111 the author lists the nutritional composition of all major Japanese foods, grouped by food type: 1. Cereals and cereal products. 2. Legumes, pulses, and legume products. 3. Roots, greens, and other vegetables. 4. Mushrooms and seaweeds. 5. Fruits, nuts, and seeds. 6. Vegetable oils. 7. Other vegetable products. 8. Dairy products. 9. Eggs. 10. Meat and animal fat. 11. Fish. 12. Condiments, beverages, etc. The name of each food is given in both English and French, usually with a brief explanation.

In a table (p. 65-69), in category "II. Legumes, pulses, and legume products," the section titled "Fresh legumes" includes (p. 64-65): Edamame (Soy bean in pod) = *Fève de soya en cosse.* The section titled "Dry legumes (pulses)" includes (p. 64-67): Azuki (Small red bean) = *Petit haricot rouge.* Dainagon (Small red bean) = *Petit haricot rouge* Ao daizu (Soy bean [with green seed coat]) = *Fève de soya.* Kuro daizu (Black soy bean) = *Fève de soya noire.* Shiro Daizu (White soy bean) = *Fève de soya blanche.* Rakkasei (Pea nut) = *Pistache de terre.*

The section titled "Bean products" includes (p. 66-69): Aburage (Fried-bean curd) = *Pâte de haricots frite.* Aka miso (Soy-bean paste) = *Pâte de fèves de soya.* Gammodoki (Fried-bean curd) = *Pâte de haricots frite avec mixture d'algues marines.* Kinako (Soy-bean powder) = *Poudre de fèves de soya.* Kori dofu = *Pâte de haricots séchée.* Namaage (Fried-bean curd) = *Pâte de haricots frite.* Natto (Fermented soy bean) = *Fève de soya fermentée.* Sarashian (Red-bean powder) = *Poudre de haricot rouge* [Sarashi-an from azuki beans]. Shiro miso (White soy-bean paste) = *Pâte blanche de fève de soya.* Tofu (Soy-bean curd) = *Pâte de fèves de soya.* Tofu kasu (Soy-bean residue) [okara] = *Déchets de fèves de soya.* To nyu (Soy-bean milk) = *Lait de fève de soya.* Yuba.

© Copyright Soyinfo Center 2014

Note 1. This is the earliest English-language document seen (April 2013) that contains the word *gammodoki,* which refers to deep-fried tofu burgers, or that contains the word *namaage,* which refers to deep-fried tofu cutlets.

Also: Mushrooms and seaweeds includes (p. 73-75): Arame, Asakusanori [Asakusa nori], aonori, hijiki, kanten, kombu, mozuku, ogonori, tororo kombu, wakame. Fruits, nuts and seeds includes (p. 77): Asanomi (Hemp seed), Goma (sesame, white and black). Vegetable oils includes (p. 79): Daizu yu (Soy bean oil) = *Huile de fève de soya.*

Condiments includes (p. 92-93): Hamana natto [fermented black soybeans]. Kiriboshi (Dried daikon). Misozuke [miso pickles]. Narazuke. Shoyu [soy sauce]. Takuan (Pickled radish). Umeboshi (pickled plum) = *Prune confite.* Beverages includes (p. 92-93): Amazake. Mirin (fermented rice). Sake (Rice wine).

For each food, the following values are given in both English and French: Water, protein (N x 6.25), fat, carbohydrate, ash, calories, alkali value, total nitrogen, water-soluble nitrogen, phosphoric acid (anhydrous), sodium chloride (salt), water-soluble ash, water-insoluble ash, alkalinity due to soda and potash, alkalinity due to lime and magnesia, calcium oxide, ferric oxide, factor for converting to dry food.

Note 2. In Japan, the typical person is well aware of which foods are alkaline (*arukari-sei*) and which are acidic (*san-sei*). The alkaline foods are generally considered more healthful and health-protecting. For the alkaline values given by Grey for many basic Japanese foods, see SoyaScan Notes. 1991. Sept. 20.

Note 3. This is the earliest English-language document seen (March 2009) that uses the term "soy-bean paste" to refer to miso.

Note 4. This is the earliest English-language document seen (June 2009) that uses the term "Edamame" to refer to [green] soy beans in their pods.

Note 5. This is the earliest English-language document seen (April 2013) that uses the term "kori dofu" to refer to dried-frozen tofu.

Note 6. This is the earliest English-language document seen (Dec. 2006) that uses the term "pickled plum" to refer to umeboshi salt plums.

Note 7. This is the earliest English-language document seen (Nov. 2011) that uses the term "Hamana natto" to refer to fermented black soybeans. Address: M.A., D.Sc., F.I.C., M.R.C.S., etc..

2539. Kurono, Kanroku; Fukai, Tôshi. 1928. Shôyu no kôki seibun ni kansuru kenkyû [On the flavorous substances of shoyu]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 5(4):361-83. May. [Jap]
Address: Jozo Shikensho.

Changes of nitrogenous compound in germination of soybean]. *Bulletin of the Agricultural Chemical Society of Japan* 4(5):394-99. May. Bound in the back of Nippon Nogei Kagaku Kaishi (J. of the Agricultural Chemical Society of Japan). [8 ref. Jap]
Address: Nôgaku-shi, Japan.

2541. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1928. Oils and oilseeds: The soy bean situation in Manchuria. 16(26):947. June 25.
• ***Summary:*** "Latest reports of the 1927 production of soy beans in Manchuria are for a crop not greatly in excess of the 1926 crop of about 4,000,000 short tons, according to a report to the Foreign Service of the Bureau of Agricultural Economics from Paul O. Nyhus, Agricultural Commissioner in the Orient. Early reports for 1927 had predicted an increase as high as 40 per cent, but subsequent unfavorable weather reduced prospects considerably.

"A slow market for bean cake and smaller takings by Japan reduced milling operations considerably in the latter part of 1927, but improvement has been shown in recent months. The lack of demand was attributed more to the low prices of rice and silk in Japan than to a sudden increase in the use of mineral fertilizers. The gold equivalents of Manchurian bean and bean oil prices have been somewhat higher than a year ago. Bean cake prices, which were below last year during the early months of the season, increased during 1928 and in March surpassed the corresponding quotations for last year, due largely to the approach of the period for supplying fertilizer to the Japanese fields and a consequent increase in Japanese demand. See Foreign Service releases, F.S./FO-29 and 30, dated June 18 and 22 respectively."

2542. Kurono, Kanroku; Fukai, Tôshi. 1928. Shôyu no kôki seibun ni kansuru kenkyû (Zokunô) [On the flavorous substances of shoyu]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 4(6):415-36. June. [24 ref. Jap]
• ***Summary:*** Discusses Soyanal. Address: Jozo Shikensho.

2543. Mazume, T. 1928. Kôkayu kenkyû. VII. Daizu abura suiso-ka ni okeru iwayuru isoorein san no shôchô [Hydrogenation of fatty oils. VII. Formation of isooleic acid by the hydrogenation of soybean oil]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 31(6):467-69. June. (Chem. Abst. 23:534). [5 ref. Jap]
• ***Summary:*** Formation of isooleic acid was less when the temperature of hydrogenation was low, and increased with the amount of catalyst used. When the nickel catalyst contained a small amount of copper (0.3%), the formation of the acid was very great; large amounts of copper (4%)

© Copyright Soyinfo Center 2014

considerably reduced the amount of acid formed. Nickel catalysts that had, after reduction, been exposed to air at a low temperature produced more isooleic acid than those exposed at high temperatures. Address: Kyoto Teikoku Daigaku, Kogyo Kagaku Kyoshitsu, Riken Kita Kenkyu-shitsu.

2544. Mazume, T. 1928. Kôyaku kenkyû. VIII. Orein-san oyobi rinôru-san mechiru esuteru no suiso-ka [Hydrogenation of fatty oils. VIII. Hydrogenation of the methyl esters of oleic and linoleic acids]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 31(6):470-72. June. [1 ref. Jap]
• ***Summary:*** During the hydrogenation of methyl oleate a large amount of isooleic acid was formed at the beginning of the process, and the acid so formed was gradually transformed into oleic acid by further hydrogenation. In the case of the methyl ester of linoleic acid the transformation was linoleic acid to oleic acid to isooleic acid to stearic acid. Soy oil is mentioned. Address: Tokyo Teikoku Daigaku, Kogyo Kagaku Kyoshitsu Riken Kita Kenkyushitsu.

2547. Tadokoro, Tetsutarô; Yoshimura, Katsuji. 1928. On the differences in physico-chemical properties of various proteins in plant seeds. III. On the differences in the physico-chemical properties of the different kinds of soy-bean proteins. *J. of the College of Agriculture, Hokkaido Imperial University* 20(5):355-362. June. (Chem. Abst. 22:3672). [2 ref. Eng]
• ***Summary:*** The ash and phosphorus contents decrease, and the nitrogen content increases, in the order legumelin, glycinin, glutelin. The free amide-nitrogen decreases in the order glycinin, glutelin, legumelin. The melanin-nitrogen is highest in glycinin, the histidine-nitrogen in legumelin, and the lysine-nitrogen in glutelin. Glycinin is the most highly condensed protein present. "Glycinin, which is the main protein of soy bean, has the highest pH value, greatest specific rotatory power, nitrogen, free amino and melanin nitrogen content. From these chemical properties, glycinin seems to be the most polymerized amongst these proteins." This research was funded by the South Manchuria Railway Co. Address: Sapporo, Japan.

2548. Yamamoto, Yoshihiko. 1928. Nattô seisei-kin ni kansuru kenkyû. III. Gerachin ekika-ryoku ni tsuite [Studies on natto microorganisms. III. On the liquification power of gelatin]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 5(11):819-26. [9 ref. Jap]
Address: Hokkaido Teikoku Daigaku, Nôgaku-bu (Sapporo), Japan.

2549. Oota, Kiyoshi. 1928. Shôyu no bôbai-ryoku to kagaku kôzô ni kansuru shiken [Relation between the antiseptic action and chemical structure of shoyu]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 5(12):914-29. (Chem. Abst. 23:1697). [16 ref. Jap]

2550. Togano, Meijiro. 1928. Shôyu, miso oyobi kyarameru seizô-hô [Production methods for shoyu, miso, and caramel]. *Kojo Kenkyu-kai, Sokki-roku* (*Factory Research Society, Collected Notes*) No. 38. 46 p. July. [Jap]
• ***Summary:*** On this document, Kôjô Kenkyu-kai is translated as "Japan Workshop Committees Association;" They published this lecture. The author's last name is romanized as "Tsugano."

2551. McCoy, Frank. 1928. Health and diet advice. *Los Angeles Times.* Aug. 8. p. A6.
• ***Summary:*** The section titled "Cheese without pie" notes that cheeses from which the cream [fat] has been partly removed are most easily digested. "Cottage cheese is very wholesome, and is often used by vegetarians as a substitute for meat."

"Even the Japanese, who are too crowded in their picturesque island islands to raise cows, have a kind of cheese [tofu] manufactured in much the regulation manner by souring soy bean milk." Note: Tofu is made by coagulating soy bean milk with a salt (such as magnesium chloride and/or calcium sulfate), not by souring it. Address: Dr., author of "The Fast Way to Health".

2552. *Far Eastern Review* (*Shanghai*). 1928. Soy bean casein, Japan. 24:381. Aug. *
• ***Summary:*** This news item describes an attempt to produce soybean casein commercially in Japan.

2553. Oshima, Kokichi. 1928. Shôyu kôji daiyô-hin toshite

no kani kanzô ni tsuite [Liver of crab as a substitute for shoyu koji]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 6(1):21-24. [Jap]
Address: Hokkaido Teikoku Daigaku, Suisan Senmon-bu, Kyoju Nôgaku hakase, Japan.

2554. Kuwayama, Satoru. 1928. Notes on *Laspeyresia glycinivorella* Matsumura, the soy bean pod borer. *J. of the College of Agriculture, Hokkaido Imperial University* 19(5):261-82. Sept. [19 ref. Eng]
• ***Summary:*** "The soy bean pod borer (*Laspeyresia glycinivorella* Matsumura) is probably the most serious pest of more than 70 species of insects destructive to the soy bean culture of Japan. The larvae injure the seeds of the soy bean prior to harvest."

"The earliest reference to this insect appeared in 1898, when Matsumura issued a report in which he states that the larvae are considered as a serious pest to soy beans in Hokkaido, and described it as a new species under the name of *Grapholitha glycinivorella.* In Honshu, the main Island, injury to soy beans was not noticed until recent years. However, Matsumura in the same report recorded it as it occurs on that Island. It is probable that this insect has occurred in Japan for a long time."

2555. Izume, Seiichi; Yoshimaru, Y.; Komatsubara, I. 1928. Studies on experimental rickets. II. The influence of ultra-violet irradiation on the antirachitic value of soybean oil. *J. of Biochemistry* (*Tokyo*) 10(1):177-82. Oct. [10 ref. Eng]
• ***Summary:*** "The purpose of the present investigation was to determine the value of soybean oil for its antirachitic property and to ascertain whether its antirachitic value could be increased by means of irradiation with the ultra-violet light, and furthermore, to see whether the phytosterol isolated for the unsaponifiable constituents of the oil could acquire the antirachitic property by irradiation."

Oil extracted by pressure has the highest, and by alcohol the lowest, antirachitic value; petroleum affords an oil of intermediate value. Refining does not appreciably destroy the vitamin content. The antirachitic potency of the oil is much increased by ultraviolet irradiation. Phytosterol isolated from the oil was rendered antirachitic by irradiation, and exhibited the ergosterol absorption band in the ultraviolet. Address: Central Lab., South Manchuria Railway Co., Dairen, Manchuria.

2556. Matsumoto, Takashi. 1928. Beobachtungen ueber Sporenbildungen des Pilzes, *Cercosporina kikuchii* [Observations on spore formation in the fungus *Cercosporina kikuchii*]. *Nippon Shokubutsu Byori Gakkaiho* (*Annals of the Phytopathological Society of Japan*) 2(2):65-69. Oct. [1 ref. Ger; jap]
• ***Summary:*** Temperatures between 15º to 20º C. and potato dextrose agar were found to be most suitable for the production of conidia in culture. Address: Japan.

2557. Dorsett, P.H.; Morse, W.J. 1928. Agricultural explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon (Log–unpublished). Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished typescript log. Illust. Partially indexed. 28 cm.
• ***Summary:*** Also called the "Log of the Dorsett Morse Expedition to East Asia" and (by the National Archives) "Dorsett-Morse Expedition to the Far East, 1929-31," this is one of the most important documents ever produced on soybeans and soyfoods. Covering the period from late 1928 until 1932, it consists of 17 volumes of typewritten unpublished manuscript plus handwritten notebooks.

The two explorers, who were gone on the expedition for a little more than two years, initially planned to be gone for about three years. They took 3,369 photos of which 95% appear in the report; the original prints are pasted on the pages, each with a number and a caption. The first negative number is #43196 (p. 238) and the last is #46514. The last numbered page of the report is #8818, but most of the index pages are not numbered and some special reports at the end of the main report each start with page 1.

The first quarter of the pages (to about page 2,500) are indexed, using 4 separate indexes. The only original and 2 microfilm copies were at the American Soybean Assoc. (St. Louis, Missouri), however as of Aug. 2011 they are on permanent loan to Rare and Special Collections at the National Agricultural Library (Beltsville, Maryland)–which also has 7 photograph albums that accompany the 7 log books. A list of the missing pages has been compiled. One photocopy of a microfilm copy is at the Soyinfo Center (Lafayette, California). One microfilm copy is at the National Archives in Washington, DC, in Records of the Bureau of Plant Industry, Soils, and Agricultural Engineering, Record Group 54. See: "National Archives Microfilm Publication No. M840. Expedition Reports of the Office of Foreign Seed and Plant Introduction of the Department of Agriculture, 1900–1938." Rolls 16-20, volumes 56-73. These microfilm rolls may also be available for viewing or duplication at one of the various regional branches of the National Archives (e.g. San Bruno, California).

A brief itinerary of the trip is as follows: 1929 Feb. 18–The party of 5 people leaves Washington, DC, for Los Angeles by train. It consists of Morse, his wife Edna, their daughter Margaret (age 7), Dorsett, and his daughter-in-law Ruth (Bobbie; the widow of Dorsett's son, she served as Dorsett's secretary and general helper).

March 1–They sail from San Francisco to Yokohama on the S.S. *President Grant* of the Dollar Steamship Lines. March 29–Arrive in Yokohama, proceed directly to Tokyo, establish headquarters with rooms at the Imperial Hotel, and

© Copyright Soyinfo Center 2014

hire an interpreter, Mr. Suyetake, who works with them for the next 2 years. May 21–The Morses go to Hokkaido, the Dorsetts to Kyoto, by sleeper train. Morse returns to Tokyo.

Aug. 17–The entire party arrives in Hokkaido and establishes headquarters in Sapporo to study soybeans. Oct. 8–Leave Hokkaido for the Northeast Provinces, then arrive in Tokyo on Oct. 15. Oct. 22–Arrive in Keijo (Seoul), Korea, then take many side trips. Note: 1929 Oct. 29–Great Depression begins in USA with stock market crash. Dec. 8–Return to Japan via Kyushu, then to Tokyo to study soyfoods. They buy and photograph many!

1930 April 1–Travel by steamer to Dairen, Manchuria, where they set up headquarters. Dorsett very sick from April 11 to June 11; taken to a Japanese hospital in Dairen, he almost dies of double pneumonia. Morse does the work of both men and does not inform USDA of Dorsett's critical condition. June 24–Morse takes a quick trip to northern Korea, via Mukden and Antung (Tan-Tung), to look for Zoysia grass.

July 1–Returns to Manchuria via Mukden. July 21. Dorsetts leave for Peking by train; Morses and Mr. Suyetake stay in Dairen. Aug. 21–Morse party travels to northern Korea, staying in Heijo (Pyongyang / P'yongyang); takes a 4-day side trip to Seoul. Sept. 28–Morse returns to Dairen, Manchuria.

Oct. 19–Morse party leaves Dairen, arriving in Peking the next day. Nov. 9–Morse party returns to Dairen. Nov. 30–Morse arrives in Harbin, north Manchuria, then passing through Mukden, returns to Dairen. Dec. 18–Morses leave Dairen for Japan, passing through Kobe on Dec. 21 and arrive in Tokyo on Dec. 23.

1931 Jan. 12–Travel to Kyoto, Himeiji, and Tatsuno Shoyu. Jan. 16–Visit Okazaki and Hatcho miso. Jan. 17–Return to Tokyo. Feb. 17–Morse party leaves Tokyo by boat for the USA, arriving in San Francisco on March 4. March 15–Dorsett party leaves Peking for Tientsin, Shanghai, and Hankow. March 27. Dorsetts sail from Shanghai to San Francisco.

Note 1. The title of this report is puzzling since the expedition never went to Taiwan, Singapore, Java, Sumatra, or Ceylon. It was proposed several times that they visit these places, but the plans did not work out.

Note 2. This is the earliest log (unpublished) seen (Oct. 2001) that mentions soy. Address: Agricultural Explorers, USDA, Washington, DC.

2558. Dorsett, P.H.; Morse, W.J. 1928. Foreign agricultural explorations: Introduction (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5. No author, date or place are given. "The United States has perhaps accomplished more in this important field of agricultural research than any of our sister countries, and yet she has but yet touched the fringe of its possibilities, both as to plant introduction and adaptation.

"It has been stated on good authority that more than 90% of the cultivated plants now being grown in the United States, are directly or indirectly the result of plant introduction. Under these conditions it is self evident that Foreign Plant Introduction is one of the most important lines of research investigations now being pushed by the United States Department of Agriculture."

Page 8. "Through plant introduction, selection and breeding, soybean culture in the United States is being rapidly extended throughout both the cotton belt of the South and the corn belt of the North. The acreage devoted to the growing of this plant alien in the United States has increased from 500,000 acres in 1917 to approximately 4,000,000 acres for the year 1928. The Virginia, Manchu and Laredo soybean selections made from introductions made by the late Mr. Frank N. Meyer, Agricultural Explorer of the Office of Foreign Plant Introduction, in 1906, 1911 and 1914 respectively, returned in the aggregate in money value, to their adopted country in 1924, for hay and grain alone upwards of $7,700,000.00" [$7.7 million].

Note: The soybean was probably the most import and best known of the many plants introduced to the United States.

Pages 9-10. "... there are two principal objectives which it is hoped the expedition can accomplish. They are First to round up, in so far as possible, the work of observation, investigation and seed collection of desirable varieties, strains, etc. of the Soyabeans in the Orient, and also to secure data and photographs not alone of field operations but also of practices and methods of the utilization of the soybean for food and all other byproducts, especially those industrial. Second, to study the persimmon industry of the Orient..."

Pages 11-12. "The work of agricultural exploration in northeastern China during the period from August 1924 to December 1926 [by P.H. Dorsett] resulted in the introduction of valuable types of soybeans, mung beans, wheat, rice, barley, chestnuts, pears, jujubes, persimmons, and other deciduous fruits, vegetables, forest trees, and ornamental shrubs and vines. All were adapted for trial in the temperate regions of the United States..."

"The observations made, data, and still and motion pictures secured, concerning the Chinese practices of growing, harvesting, handling, and storing soybeans in a country which leads the world in its production has materially stimulated the interest in N.E. China, Japan, Korea & Formosa."

A similar paragraph (p. 12) discusses the importance of agricultural exploration in 1924-1926 on the Chinese persimmon, and has helped to make the persimmon an

© Copyright Soyinfo Center 2014

important crop in California.

"Regions to be covered [by this expedition]: Japan, Chosen (Korea), Taiwan (Formosa), and Northeastern China..."

Page 13. "Objectives: It is proposed to conduct extensive agricultural investigations in the previously mentioned regions, primarily on the following crops:

"1. Soybeans: No one factor has contributed more to the increase of the soybean in America than the development of new varieties through introductions from the Orient. The soybean is a crop of local adaptation, as shown by the numerous varieties in Asiatic countries and the results of extensive tests in the United States. Although grown primarily for forage in the United States, many sections are looking forward to the production of soybeans as a cash crop for oil and oil meal, and for human food and industrial uses. It is quite generally predicted that the soybean will become one of our major crops, particularly in the South of the boll weevil sections and in the Corn Belt states through the menace of the corn borer. To attain this importance in American agriculture high yielding varieties for different uses and adapted to a wide range of soil and climatic conditions are essential..."

Pages 14-15. 2. Mung bean: 3. Kudzu: 4. Persimmon. 5. Forage, green manure, and cereal crops; fruits, vegetables, trees, and other crops and plants of potential value to American agriculture.

Personnel: The Office of Foreign Plant Introduction plans to send on the proposed Agricultural Explorations to Japan, Chosen, Northeastern China and Formosa in 1929, Mr. W.J. Morse, Agronomist in the Office of Forage Crop Investigations–in charge of Soybean, Mung Bean, Kudzu and other Oriental leguminous crops, and Mr. P.H. Dorsett, Horticulturist in the Office of Foreign Plant Introduction. leader of the Agricultural Exploration work in N.E. China in 1924 to 1927.

Pages 26-28: Regions to be explored: "... provided conditions are favorable, a short time will be spent in the Dutch East Indies, especially Java and Sumatra [Note: This never happened]. Manchuria: Chosen (Korea): Japan: Formosa (Taiwan): Dutch East Indies:"

Pages 28-29: "Prospective crops: Soybeans: The rapid expansion of soybean culture has been one of the outstanding developments in the recent history of American agriculture." "While the soybean is primarily grown for hay and forage its use for oil is also increasing and oil mills are being erected (see map 2). In Manchuria and Japan the soybean oil meal ranks first in importance as a soybean product, being especially valuable for animal feed and fertilizer. Soybean oil, now imported, is being used in lard and butter substitutes, paints and varnishes, glue, linoleum, rubber substitutes and also is refined as an edible oil.

"Varieties for expanding present area: The area in which soybeans are grown in this country can be greatly expanded provided drought resistant types can be found for the southwest and early maturing types for the northern and northwestern regions. The prevalence of the soybean throughout the widely varying districts of Manchuria and Japan gives ample promise of supplying these types.

"Soybeans are being extensively cultivated throughout Java for food and green manure. It is a highly important article in the products of the country. It is believed that types can be found here that will be successful in the milder, moist-summered southern states."

"Leaf, stem, and root diseases are gradually increasing in some of our older soybean production regions. In the event these diseases [become] prevalent, a special study and selection of resistant strains is highly desirably." Address: Agricultural Explorers, USDA, Washington, DC.

Address: Jozo Shikensho. 1. Gishi; 2-3. Joshu (Assistant).

2560. Ryerson, Knowles A. 1928. Re: Memorandum for W.A. Taylor (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. See p. 61-64. Dec. 19. Unpublished log.
• ***Summary:*** This letter, dated Dec. 19, begins: "In accordance with tentative plans discussed at various times during the past month, I wish at this time to ask formal approval for the proposed expedition of Mr. Dorsett and Mr. Morse to Manchuria, China, Chosen, Japan and also the Dutch East Indies."

"Of the plant material to be sought, new soybean varieties are the most important. The extension of the area where they can be grown in this country, both in the northwest and southeast, depends upon securing drought resistant strains."

According to reports of workers in Japanese Experiment Stations and to Consular reports, there are at least 500 varieties of soybean in Japan. Not more than 50 of these have been introduced into this country. Breeding work has been under way at the Japanese Experiment Stations for the past decade. Few of the new types developed have been obtained. On the North of the Island of Hokkaido, 250,000 acres of early maturing varieties are grown. Experience of a cooperator in Canada indicated that these varieties are better suited to the northern conditions than any of the varieties grown in the United States.

"Manchurian varieties vary from 90 to 130 days in the time required for maturity. In China, exclusive of Manchuria,

© Copyright Soyinfo Center 2014

the time to maturity ranges from 125 to 175 days. Many introductions have been made from Northern Manchuria but better varieties with a longer maturing period are needed in the southern part of the corn belt and the northern part of the northern part of the cotton belt. Japanese Experiment Stations in Korea have carried on extensive breeding work. At least 300 varieties are known in that country, many of which appear promising for the southern corn belt and adjacent cotton belt. Late maturing varieties are also grown extensively in the Island for Formosa."

Page 62. "According to various Dutch reports, soybeans are extensively grown in Sumatra and Java, principally for green manure purposes. There are many varieties of the late, yellow-seeded type which are of low oil content and are grown for forage, pasture, and soil improvement."

Page 63. "Personnel: It is proposed to head the expedition by Mr. P.H. Dorsett, Office of Foreign Plant Introduction, who led the expedition to Northeastern China and Manchuria in 1924 to 1927. He would be accompanied by Mr. W.J. Morse, a Bureau specialist in soybean and other Oriental legumes. In addition it is desired to send Mr. C.C. Thomas, of the Office of Foreign Plant Introduction who as specialized in the study of Oriental persimmon varieties, culture and storage problems, to spend six months, either in the fall of 1929 or 1930, to cooperate with Dorsett in the study of Korean varieties and the root stock problem in both Japanese and Chinese persimmon districts."

"Mr. Morse has planned to have Mrs. Morse accompany him and Mr. Dorsett has tentatively planned for his daughter-in-law also to go on the trip. This is a matter, however, which I wish to talk over with you.

"If approved, it is hoped to have the expedition sail from San Francisco, March 1, 1929, to be gone for two to three years."

"Expenses: The salaries of the men will be carried by the Offices concerned. Field expenses for the remainder of the fiscal year, 1928 and 1929, are estimated at $4,025 for the two men. Of this sum, the Office of Forage Crops will contribute $1,000 and the Office of Foreign Plant Introduction the balance."

"Concurred in (Signed) A.J. Pieters, Acting in Charge of Forage Crops." Address: Senior Horticulturist in Charge [Div. of Foreign Plant Introduction, USDA].

2602. Kinjiro Aoyagi scattering soybeans on Setsubun in Tokyo, Japan (Photograph). 1928? Undated.
• ***Summary:*** In Japan, setsubun is celebrated each year on Feb. 3, which is the eve of the beginning of spring, therefore at the very end of the dark, cold period (winter) and just before the beginning of the season of rebirth. Through its association with the Lunar New Year, setsubun can be thought of (as indeed was previously thought of) as a sort of New Year's Eve, and so was accompanied by a special ritual to drive away evil spirits and bring in good luck for the new year. This special ritual, called *mamemaki* (lit. bean scattering), is always performed with roasted soybeans.

This black-and-white undated photo (see next page) is of Akiko Aoyagi's grandfather. Born 1 Oct. 1890 (Meiji 23) in Shiba, Tokyo, Japan, he is about 38 years old here. He is about to scatter roasted soybeans (*irimame*) with his right hand from a wooden measure (*masu*) on a tray (*sanbo*) held in his left hand. On the wooden measure is written "Akabane Assoc."–of which he was one of the founders. The photo was taken at Akabane in central Tokyo.

As a "specially chosen / famous" man (*toshi otoko;* or the "man of the house," or the men who are born in the animal sign [one of 12 in Chinese astrology; tiger, rabbit, dragon, snake, etc.]) of the coming year he is wearing the only traditional clothing suited for the occasion: A light-colored *kamishimo* (with wing tips at the shoulders) over a dark, wide-sleeved kimono on top, and a man's formal divided skirt called a *hakama* on the bottom. On his feet are tabi (white, split-toed cotton socks) on *zori* sandals.

At age 19, Mr. Aoyagi started selling fresh produce as a street vendor. At age 31 (1921, Taisho 10) he became one of the founders of Produce Association, a new concept. He soon became a high ranking officer in the Tokyo Produce Association (*Tokyo-Fu* (*Shi*) *Seika Jitsugyo Kumiai Rengokai*). This became part of a larger organization, which is now the famous Tsujiki fresh produce market. In 1941 (Showa 16) he became the first director of the Tsukiji branch of this organization. Fresh fish are also now sold in the market, which is a major tourist attraction in Tokyo. Throughout his life he was known for his selfless service to others. During World War II he brought food from the countryside and distributed it among the hungry in Tokyo.

In April 1955, at big public ceremony at the Tsukiji market in Tokyo, he was given a special award by the Tsukiji Market Association in the unveiling of metal statue of his portrait (bust, from the waist up) on a stone base (*Juzo Jomakushiki*). This statue still stands in Tsukiji.

On 7 June 1957 he received an even more important honor, an award (*kunsho*) from the Emperor of Japan; it was called the Yellow Ceremonial Cord Medal of Honor (*Ooju hôshô*). He received the actual medal at home from a member of the Prime Minister's Office, when he was quite weak, just one month before he passed away. This medal is usually presented by the Japanese emperor himself in a ceremony at the Imperial Palace in Tokyo. Kinjiro Aoyagi died on July 4, 1957 (Showa 32) in Tokyo at age 67 of cancer.

At his funeral, held in Tsukiji Market and sponsored by the Tsukiji Market Association, more than 1,000 people filed past to offer incense and pay their respects. It took more than an hour. Nichiren Buddhist (*Hokke-shu*) priests were invited to conduct the ceremony. The mayor of Tokyo and many important leaders from government and industry were present.

2603. Dorsett, P.H. 1929. Re: Letter notifying Mr. Matsumoto of forthcoming trip to East Asia (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Jan. 25. Unpublished log.
• ***Summary:*** Page 113. This letter dated 25 Jan. 1929 is to Mr. H. Matsumoto, Central Laboratory, South Manchuria Railway Co., Dairen, Manchuria.

"Dear Mr. Matsumoto. I greatly appreciate the receipt of your kind favor of December 1928, and was delighted to learn of your safe arrival back in Dairen after your visit to the United States..."

"Mr. Morse and I plan on sailing from San Francisco on

March 1 for Yokohama, Japan. After a year spent there and in Chosen (Korea), we expect to get over into Manchuria and will probably, at least for a time, make our headquarters at Mukden, and later get down to Dairen. We are looking forward with pleasure to meeting you then.

"If in the meantime, you, for any reason, desire to get in touch with us, address your communications in care of the American Embassy, Tokyo, Japan. We plan, while in Japan, to receive our mail through that source.

"With kindest personal regards, I remain very truly yours,..." PHD/p. Address: Agricultural Explorer, USDA, Washington, DC.

2604. Jardine, William M. 1929. Re: Letter of introduction for William Morse, Agricultural Explorer, Bureau of Plant Industry, USDA–to be used on trip to East Asia. Letter to whom it may concern, Jan. 26. 1 p. Typed, with signature on letterhead.

• ***Summary:*** "Be it known that Mr. William J. Morse, Agricultural Explorer, in the Bureau of Plant Industry, of the United States Department of Agriculture, whose signature appears on the margin hereof, will, in the immediate future, visit Japan, Ceylon, Formosa, Manchuria, China, Chosen, the Dutch East Indies, and other foreign countries, in connection with the work of this Department.

"He is hereby introduced and cordially commended to all persons with whom he may come in contact, whose good offices on his behalf are earnestly requested."

Morse's signature does indeed appear in the margin, and document is signed and sealed by Mr. Jardine.

Note: William M. Jardine of Kansas was secretary of agriculture (1925-29) under President Calvin Coolidge. William Marion Jardine (seventh president of Kansas State University) served as U.S. Secretary of Agriculture (1925-1929) under President Calvin Coolidge.

This digital image (see next page) was sent to Soyfoods Center by Joyce Garrison (William Morse's granddaughter) of West Hartford, Connecticut (July 2004). Address: Secretary of Agriculture.

2605. Jardine, William M. 1929. Re: Letter of introduction for Mr. William J. Morse. 1 p.

• ***Summary:*** A letter of introduction for William Morse, dated 26 January 1929. "Be it known that Mr. William J. Morse, Agricultural Explorer, in the Bureau of Plant Industry, of the United States Department of Agriculture, whose signature appears on the margin hereof, will, in the immediate future, visit Japan, Ceylon, Formosa, Manchuria, China, Chosen, the Dutch East Indies, and other foreign countries, in connection with the work of this Department.

"He is hereby introduced and cordially commended to all persons with whom he may come in contact, whose good offices on his behalf are earnestly requested."

Morse's signature does indeed appear in the margin, and document is signed and sealed by Mr. Jardine. Note: William M. Jardine of Kansas was secretary of agriculture (1925-29) under President Calvin Coolidge. Address: Secretary of Agriculture [USA].

Address: Jozo Shikensho Gishi.

2607. U.S. Department of Agriculture, Office of Information, Press Service. 1929. Plant explorers of the United States Department of Agriculture start for the Orient. Release immediately (News release) (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. See p. 223. Feb. 18. Unpublished log.

• ***Summary:*** Page 223. P.H. Dorsett veteran agricultural explorer of the United States Department of Agriculture, and W.J. Morse, soybean specialist of the department, left Washington [DC] February 18 on a two year expedition to the Orient. They will sail from San Francisco March 1, going direct to Tokyo, Japan.

"The soybean culture of Japan, Chosen [Korea], Manchuria and Java will be one of the main features of the exploration program. New varieties will be sought for expanding the present acreage of the United States, methods of handling and preparation of a wide variety of by-products will be investigated.

"The varieties of the Oriental persimmon of Chosen will be sought."

2608. Rea, George Bronson. 1929. [Soy] beans: Their relation to Manchuria's prosperity and new railway construction. *Far Eastern Review* (*Shanghai*) 25:56-57, 79. Feb. [Eng]

• ***Summary:*** "For many years, Japan has relied largely upon bean cake imported from Manchuria, as the chief fertilizing material for her rice farms. In fact the prosperity and development of Manchuria is based upon the cultivation of the soya-bean, the extraction of its oil and the use of the residue [soybean cake] for fertilizing and other purposes. Before the Japanese created a market in Europe for this product in 1907, Manchuria was a sparsely populated waste land with no economic outlook."

"The Manchurian bean crop for the last three years has averaged over 5,000,000 tons per year, valued at 450 to 500 million Mexican dollars. The disposition of the 1926 crop

The United States of America,

DEPARTMENT OF AGRICULTURE.

To all who shall see these presents, Greeting:

Be it known that Mr. William J. Morse, Agricultural Explorer, in the Bureau of Plant Industry, of the United States Department of Agriculture, whose signature appears on the margin hereof, will, in the immediate future, visit Japan, Ceylon, Formosa, Manchuria, China, Chosen, the Dutch East Indies, and other foreign countries, in connection with the work of this Department.

He is hereby introduced and cordially commended to all persons with whom he may come in contact, whose good offices on his behalf are earnestly requested.

W. J. Morse

In witness whereof I have hereunto subscribed my name and caused the seal of the Department of Agriculture to be affixed. Done at the City of Washington, District of Columbia, this twenty-sixth day of January, A. D. 1929, and of the Independence of the United States of America the one hundred and fifty-third.

W. M. Jardine

Secretary of Agriculture.

© Copyright Soyinfo Center 2014

was approximately as follows:

"Crop: North Manchuria, 3,300,000 tons [60%]; South Manchuria, 2,200,000 tons. Total crop, 5,500,000 tons.

"Export of beans 1,900,000 tons.

"Export of bean cake 2,250,000.

"Export of oil 150,000.

"Local consumption 242,000.

"Local fodder 363,000.

"Seeding 495,000 tons.

"Carried over 100,000 tons.

"Total 5,500,000 tons.

"These figures show that approximately one-half of the total bean crop of Manchuria is passed through the local bean mills..."

"The Chinese are reluctant to admit that Japanese initiative opened up an export market for soya beans that has made possible the tremendous development and enrichment of North and South Manchuria during the past twenty years. In denouncing Japan for 'exploiting Manchuria and attempting to annex the territory under cover of economic necessities,' the Chinese give no consideration of the operation of economic and industrial laws that may once more change the entire aspect of the Manchurian problem. They fail to realize that the prosperity of Manchuria is erected upon a foundation laid by Japanese masons and that what Japan has so carefully built up, she can just as easily demolish. For, unless all sign fail, China will soon have to find other uses and markets for her soya bean oil and cake or face economic ruin in Manchuria.

"The handwriting is writ large upon the wall. Within the next five years, Japan will have little further use for bean cake as fertilizer. Unless new markets are found for the cake, the oil milling industry n China is doomed. Extraction of the oil alone is not enough to justify the continual operation of the mills." Address: Shanghai.

• ***Summary:*** A superb bibliography of 2,424 citations listed chronologically by year, and within each year alphabetically by author. Part 1, 1929, covers the years 1729 to 1920 and contains 1,655 references. At the end of the last installment (1930) there is a complete author index. Continued in the Jan. 1930 issue. Address: Japan.

2612. Dorsett, P.H.; Morse, W.J. 1929. Re: Letter notifying Mr. Peter Liu in China of trip to East Asia including China (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. March 12. Unpublished log.
• ***Summary:*** Pages 343-45. Neither the address, title or affiliation of Mr. Liu are given. However, Peter Liu was Mr. Dorsett's Chinese interpreter on his 1924-25 trip in China.

"Dear Liu: Well here we are on the way back to the Orient. We left Washington [DC] February 18th, and came by way of Los Angeles, California to San Francisco, California and left there March 1st. We are now about half way between Honolulu and Yokohama, Japan where we are scheduled to arrive on the morning of the 18th. As soon as practicable after landing we will go to Tokyo and arrange for making headquarters there at least until we can get acquainted officially and learn what part of the country we should first get to work in.

"Our present plans contemplate a stay of a full year in Japan and Chosen (Korea) and in the spring or early summer of 1930 we will get into Northeastern China and make headquarters there in Mukden, at least for a while. Later in the season we will likely move headquarters to Dairen and remain there until fall and then hope to get over to Peking and be there during the winter of 1930-31. From there we will likely work south to Nanking, Shanghai, Han Kow (Hankow; pinyin Hankou, as of Aug. 2011 part of Wuhan), Hong Kong and then to Taiwan (Formosa) where we may spend the winter of 1931-32. From there we will likely go to Singapore, Penang, Java, Sumatra, and Ceylon then back to America by England.

"We are wondering if you and the other two boys, Yey and Gow, would like to be with us while we are in China at least until we are ready to start South from Peking. Please let us know.

Page 345. "I copy the following from a letter from Mr. Julian Arnold under date of January 16, 1929, which I consider a high compliment and feel sure that you will appreciate.

"'I wish to commend the expeditious and thorough manner in which Mr. Liu handles this whole matter. His work and attitude were most commendable.'

"We are wish that you could speak Japanese for if you could we would have arranged to have had you meet us in Yokohama and helped us with our work in Japan and Korea.

"All of the party joins me in kindest regards. Very truly yours, Dorsett and Morse." Address: Agricultural Explorers, USDA, Washington, DC.

2613. *Japan Advertiser* (*Tokyo, Japan*). 1929. Fruit and beans lure scientists: American botanists here to study persimmon and lowly soy bean. Would popularize them. State most American flowers and ornamental shrubbery foreign in origin. March 24.
• ***Summary:*** "Mr. P.H. Dorsett and Mr. W.J. Morse, two American botanists who know as much about certain plants and seeds as any other men alive, have set up their headquarters in Tokyo and are ready to commence an extensive examination of Japan's flora and fauna."

"Mr. Dorsett is known officially as the persimmon expert of the Bureau of Foreign Seed and Plant Introduction of the United States Department of Agriculture, and Mr. Morse is the soy bean expert of the same bureau."

Mr. Morse hopes to find and send back to the United States many new soybean varieties. He also hopes to learn new ways of using the soybean, especially as human food.

Note: This is the earliest document seen (July 2009) with the adjective "lowly" in the title, used to describe the soy bean.

• ***Summary:*** This book contains many interesting photos. Address: Noda, Japan.

2616. *Japan Advertiser.* 1929. Farm experts talk to Pan-Pacific Club: W.D. Morse and T.H. Dorset [sic, P.H. Dorsett] are here to study agricultural conditions. April. 13. [Eng]
• ***Summary:*** At this talk in Tokyo, Morse notes that has been working at the USDA on the soybean and other Oriental crops for 22 years. He is interested in their utilization and adaptation. Soybean cultivation in the United States has increased tremendously during the last ten years. One of Morse's principal tasks in the Orient is to find soybean varieties with a low oil content, which will not produce soft pork.

"I doubt if we will ever use the soy bean as you use it here. We are using the soy sauce; we have a Japanese who has established a factory, and his shoyu sauce is becoming quite popular all over our country. He is also canning little bean sprouts, as we can peas and beans."

Note 1. Reprinted in the Log of the Dorsett Morse expedition to East Asia, p. 628-29. The Japanese date on this article is Taisho 13, first month, 9th day.

Note 2. The Japanese man to whom Morse is referring is probably Mr. Shinzo Ohki of Oriental Show-You Company in Columbia City, Indiana. The "bean sprouts" he made were mung bean sprouts.

2617. Dorsett, P.H.; Morse, W.J. 1929. Soy sauce (shoyu) in Japan, China, and Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 655 (16 April 1929). "A representative of a Shoyu Sauce Company called on us and wished to give us a demonstration of a new process of soy sauce manufacture. This company had developed a chemical compound which when added to the regular soy sauce doubles the amount and makes an excellent soy sauce." However, in exchange, the company wanted the Americans' endorsement to use in advertising. He was politely refused.

Page 847 (May 2). Visited the soy sauce and rice wine experiment station [*Jozo Shikensho*] at Nishigahara. Met Prof. Dr. K. Kurono, who was said to be in charge. His young assistant took them through the soy sauce factory and rice winery. "We were able to get considerable data about the making of soy sauce as all the various steps involved were in operation and we were able to obtain seed of the soybeans and wheat used especially in making soy sauce.

Page 1222 (May 27). Dr. Ito made arrangements for Morse to visit a large soy sauce factory on the outskirts of Sapporo, Hokkaido. The Tomoe Shoyu Factory consisted of several large buildings covering several acres. Morse was shown through the entire plant. The wheat and soybeans are grown in Hokkaido, but each consists of a mixture of varieties; samples were sent to the USA. This factory uses the most modern machinery and methods. "In one of the large vat rooms more than 120 vats were counted in which the wheat and bean mash [moromi] is cured for about 18 months. The mash from which the soy sauce was pressed out is sold as cattle and hog feeds around Sapporo. The manager was interested in the possibility of selling soy sauce in the United States." A photo shows the outside of the factory's headquarters in Sapporo.

Note 1. This is the earliest English-language document

© Copyright Soyinfo Center 2014

seen (July 2011) that contains the term "bean mash" or the term "wheat and bean mash." The latter almost certainly refers to *moromi*.

Page 3341 (24 Dec. 1929). "Today [in Tokyo] Morse and Suyetake went to call upon soy sauce and natto manufacturers for the purpose of getting acquainted and also if possible to arrange for getting still and motion pictures of their places, equipment, and operations."

Page 3499 (9 Jan. 1930). They got six good photos of steps in the making of soy sauce at the Noda Shoyu Co. It is probably "the first time that such a picture has been made." "Detailed notes and descriptions of these soybean products will be found in the special report on soybean and soybean products which is a part of this report."

Page 4341 (March 11). A photo (neg. #45026) shows numbered specimens of various ingredients (in bottles) used in the manufacture of soy sauce, including soybeans, wheat, soy mash [moromi], malt from curing tub, soy sauce, soy sauce oil, and a small wooden cask. Purchased in Tokyo.

Page 4356. Photo (neg. #45033) of "a small quantity of mash left after the sauce has been pressed out. It is known locally as 'shoyu kasu.' It is used for feeding hogs and cattle and also for a fertilizer."

Page 4357 (March 17). "About 11 a.m. we went to the Yamasa Shoyu Factory at 576 Nakano-machi, Tokyo, Japan. There we met Mr. S. Yamaguchi, the manager, who allowed us to make pictures in the factory culture room and storage and curing sheds."

Pages 4358-4366. Photos (negatives #45034-42) of Yamasa Shoyu Sauce Factory in Tokyo. 1. Hydraulic press with thin bags for pressing out the sauce. 2. Factory interior, incl. cookers, pump, large casks. 3. Interior of wheat roasting and preparation room, with roaster, pile of small [koji] trays, huge wooden rafters. 4. Interior of culture room, with lines of small boxes [koji trays] on both sides. 5. Large iron double-boilers in which soy sauce is cooked [pasteurized?]. 6. Storing and aging room containing 4 rows of 16 casks each, taken at level of rim of casks. Each cask is about 8 feet across and 8-10 feet deep. The company has 8 such rooms and all are kept at full capacity. 7. Storage and curing shed (same room), taken from ground level. 8. Pile of "roasted wheat mixed with bacterial germs for shoyu sauce." Note 2. Actually, this contains soybeans and koji mold spores, about to be put into trays to make koji. Morse failed to understand these two basic facts. 9. Small wooden casks "ready for filling with shoyu sauce."

Page 5649-50 (28 Aug. 1930). Heijo, Chosen [Pyongyang, North Korea]. Morse visited the branch office of the Grain Inspection Office of the Neian Nando Prefecture to learn about soybeans. Last season (1 Nov. 1928 to 1 Nov. 1929) some 263,090 bags of soybeans (of 2 bushels each) were inspected and shipped out from various points in the prefecture. "The Noda Soy Sauce Co. obtains most of its soybeans from here. The beans are shipped entirely to the Main Island [Honshu, Japan] for miso, soy sauce, and natto. Note 3. Chosen has been a Japanese colony since 1910.

Pages 6339-43 (3 Nov. 1930). In Peiping [Beijing], China. After tiffin they visited the Lan Hsin Chai "soy sauce, soy jam [chiang / jiang], and pickle" factory of Mr. Wang in the outer city to the southwest–not far from Hsuan Wumen Street. It is about 300 years old and many of the large earthen glazed jars are the same age as the establishment.

Note: This is the 2nd earliest English-language document seen (Nov. 2011) that uses the word "jam" to refer to *chiang / jiang*.

Pages 6341-45 (negatives #46157-61) show photos of this factory. 1. Side view "of one of a number of old Chinese lever soy sauce presses." 2-3. Other views of soy sauce press, with jar in foreground. 4-5. Many large earthen jars, some covered with reed grass matting, in outdoors compound / courtyard.

Page 6802 (16 Dec. 1930). At Dairen, Manchuria, Morse met Dr. Kato at the Central Laboratory of the South Manchuria Railway Co. Concerning Japan, Dr. Kato said Ajimoto [a type of HVP] was made from wheat proteins, not soybean proteins. However, in and around Kyoto a product named Soyamint was very similar to Ajimoto but was made from soybeans.

Pages 7008-09 (21 Jan. 1931). In Tokyo, Morse visited the Institute of Physical and Chemical Research, where he met Dr. U. Suzuki, Prof. of Biological Chemistry at Tokyo Univ. "With reference to Soyamint, Dr. Suzuki advised that it is a soy sauce substitute–one half chemical and one-half fermentation" [i.e., a mixture of equal parts HVP and fermented shoyu].

Pages 7035-36 (24 Jan. 1931). In Tokyo, Morse "learned that soy sauce is prepared in nearly 12,000 establishments throughout the Japanese Empire and in addition it is made in private homes, especially farm homes. When 5 koku [1 koku = 47.6 gallons or 180 liters] (liquid measure) of soy sauce are made, a permit must be obtained from local authorities. Various sections in Japan are noted for brands of soy sauce such as Noda, Chiba Prefecture, for its "Kikkoman' and 'Higeta' soy sauces. In the Kwansei [Kansai, Osaka-Kyoto] district the 'Marukin' soy sauce is made while in the Tatsuno district [in western Japan's Hyogo Prefecture] the light colored [*usukuchi*] soy is made. The various brands are made in slightly different ways regarded as trade secrets by the various companies. Many experiments by chemical laboratories are being conducted to make artificial soy sauce and also to shorten the period of fermentation.

"Considerable quantities of Japanese soy sauce are exported, China being the chief market. Recently America and Europe have made increasing demands. In shipping to some countries, especially America, condensed soy sauce is exported, then water added and bottled."

Pages 7066-67 (30 Jan. 1931). In Tokyo, Morse has been trying for some time to locate the company that makes

© Copyright Soyinfo Center 2014

Soyamint. Finally, Mr. Suyetake found that it was made by the Japan Fertilizer Co. Morse visited the main office and met one of the directors, Mr. Koshiro Horie, who said that "his company supplies 65% of the commercial fertilizers used in Japan. One of the principal by-products of the manufacture of fertilizers is used with soybean oil meal in producing an artificial soy sauce. The process of manufacture is more or less secret so that it is not possible to visit the factory. As yet 'Soyament' is not on the market in large quantities as it is of only recent manufacture. It is said that soy sauce can be made in slightly over one month with this process, allowing one month for curing. It has quite a different flavor from that of soy sauce and it may take some time to establish it on the market. It can be produced much more cheaply than the ordinary soy and being cheaper may help it to take more quickly with the poorer classes." Mr. Horie gave Morse some literature about Soyament and promised to send samples of two grades of commercial products which differ principally in specific gravity. Address: Agricultural Explorers, USDA, Washington, DC.

2618. Morse, W.J. 1929. Re: Travels in Japan. Letter to Dr. A.J. Pieters, USDA, April 17. 4 p. Typed, without signature.
• ***Summary:*** Thoughts about Japan and Japanese culture, incl. Buddhism. Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 93–Morse-Napier. Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Tokyo, Japan.

2619. Morse, W.J. 1929. Re: Soybeans and Japan. Letter to R.A. Oakley, USDA, Washington, DC, April 27. 3 p. Handwritten, with signature on hotel letterhead.
• ***Summary:*** "Have been thinking about writing you for more than two weeks but just couldn't get around to it. Sure do keep busy night and day... As we are sending our first lots of seed, bulbs, etc. in which are many soybeans, adsuki, etc., thought I had better write about the planting.

"Before leaving Washington, I explained to Mrs. Donavan about taking small samples of each number as it came for our sample cases. All of the soybeans can be grown at Arlington Farm [Virginia] even if they are not planted before June 20." He gives planting instructions for the adsuki beans, mung beans, cowpeas, hyacinth beans (*Dolichos lablab*), jack beans and sword beans; they "can be planted at the Sandhill in Columbia, South Carolina, and also at McNeill, Mississippi."

"This trip has more than opened my eyes on the soybean plan. Soy sauce, the green vegetable bean, and possibly miso are the only products now used extensively in the Orient that have possibilities in the United States as foods. The oil industry, of course, will be our great development... I just saw an article in one of the daily papers here where soybean oil meal led all fertilizers used in the Japanese Empire and is the largest imported one... The main object in the Orient as I see it is to obtain as many varieties as possible to fit in our diversified conditions and then work out the other problems so they fit in with the sections.

"I have taken about 500 feet of motion picture films with the DeVry which Dr. Pieters bought for me and have had very good results."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 93–Morse-Napier. Folder–Morse, W.J.-#4 F.C.I.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: The Imperial Hotel, Tokyo, Japan.

2620. Dorsett, P.H.; Morse, W.J. 1929. Green vegetable soybeans and Edamame varieties in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 802-03 (24 April 1929). While in Tokyo, Dorsett purchases from T. Sakata & Co. in [Yokohama] Japan eleven varieties of soybeans (8 oz each), one variety of Dainagon Azuki, and 2 varieties of swordbeans. Vegetable soybean varieties are: Edamame Wase Aosakigake, Edamame Wase Kurome Oxaya, Otsubu Wase Aojiro Edamame, Daikoku Edamame, Edamame Wase Higanmame, Tsurunoko Daizu, Edamame Wase Kurosakigake, Edamame Wase Chamame.

Page 892 (7 May 1929). A photo shows two commercial retail bunches of soybean vines and pods, bound at the bottom with rice straw. The soybeans are "used as a green vegetable."

Pages 1201-02 (26 May 1929). While visiting the Hokkaido Agricultural Experiment Station at Kotoni, Sapporo, Mr. Morse notes: "The soybeans grown in Hokkaido are used entirely for food purposes, such as natto, bean curd, green vegetable bean, soy sauce, miso, bean paste and roasted beans."

Page 1270 (30 May 1929). In Hakodate, Hokkaido, in northern Japan, the authors visited a store where pickles were sold. There they saw "a tub of pickled soybean pods, the seeds of which were about full grown. These pods were pickled in the same manner as we pickle cucumbers and sauerkraut, that is by salting down. This is the first time we have ever heard of or seen this kind of soybean product. According to Mr. Suyetake [their guide], this form of soybean product is eaten along with refreshments, the

© Copyright Soyinfo Center 2014

kind we no longer have at home [alcoholic beverages]. It seems rather ironical that we should come to study soybean products for the United States and find so many that, to enjoy them most, they should be eaten along with the refreshments of the pre-prohibition era of our country, but such is fate."

Pages 1869, 1871, 1878-79 (15 July 1929). "Left the hotel about 7:45 for a day's agricultural exploration in one of the trucking areas in the vicinity of Tokyo, where the growing of soybeans as a vegetable is an important industry." From Nishiaria they set out cross country on foot. "Saw many plantings of soybeans from just coming up to ready to pull for market. It is extremely interesting to note how they are planted for succession. We saw many plantings of beans ready for pulling for market with rows interplanted as seedlings or transplants just coming into bloom. One photo shows "Vegetable soybeans only recently transplanted. The light color between the rows is caused by fertilizing with liquid night soil." Two other photos show soybeans "quite probably planted for use as a vegetable."

Page 1897-98 (17 July 1929). They learn from the officers of the agricultural association at Kitasenju station that "around Takenotsuka [near Tokyo] soybeans were grown extensively for green vegetable beans." At a village agricultural fair they saw and photographed forty bundles of soybean plants, "30-50 plants to the bundle representing several varieties used only for green vegetable beans. The two most common varieties use for green vegetable beans were the Sodefuri and the Chamame. The bundles were judged by color, size and shape of pod, and size and yield of each plant. Pods should be bright green and plump, that is the seed full grown. The size of the bundle for market purposes depends on the desire of the individual farmer. Three crops of vegetable soybeans are grown during the season–early, medium and late season. Perilla spikes and plants were also seen.

Pages 1925-26 (19 July 1929) show photos of "A native Japanese woman pulling soybeans to be bunched and sold as a fresh green vegetable." Page 1927 (19 July 1929) shows two photos from the village of Hanabata: (1) "Children with their hands and aprons full of soybeans which have been boiled in the pod; they are eating them like we eat peanuts." (2) Details of how a farmer, sitting on the ground in his yard, bundles vegetable soybean plants for market and ties them with a grass string using a frame for support. See also page 2065 (Black and white movie film, DeVry camera, spool 23, description of 8 shots of vegetable soybeans taken in Japan; undated). Also Page 2071. Page 2080 (July 1929) shows a photo whose caption reads: "Piled bundles of soybeans, one of the commonest vegetables in the market. They are to be found at every turn."

Pages 3501-02 (10 Jan. 1930). The authors leave Tokyo for Urawa, the capital of Saitama prefecture in Japan, where they visit the Saitama Prefecture Experiment Station. The horticulturist explains that they have "three varieties of vegetable soybeans. These are grown especially as green vegetables. Plant seed in hot in hot beds about the middle of April and transplant to the field when danger of frost is over."

Page 3683 (24 Jan. 1930) state that at the Shizuoka Agricultural Experiment Station the authors "secured considerable information about vegetable and green manure soybeans for the Shizuoka prefecture."

Page 6911 (3 Jan. 1931). Morse writes from Tokyo: "At one of the department stores, in the vegetable market section, we found small bundles of soybean sprouts and also some bundles of green vegetable soybean plants. There were only 6 plants to a bundle, about 8 inches long and with 6 to 8 pods per plant. The seed in rather large pods seemed only about one half developed.

Pages 6931-32 (7 Jan. 1931). Morse went to the Imperial Department of Agriculture in Tokyo and met the director, Mr. A. Manabe, who provided information, statistics, and recent publications on soybean acreage, production, utilization, and industries in Japan, Chosen [Korea], and Taiwan. The beans from Japan proper and Chosen are utilized primarily for food, such as bean curd (Tofu), confections, flour and green vegetable beans [edamamé]. A table shows that less than 1% (0.8%) of the soybeans used in Japan are consumed in the form of "Green vegetable beans."

Pages 7102-03 (2 Feb. 1931). Morse is in Urawa, capital of Saitama prefecture. "The green vegetable soybean work, so much of which has been done at Urawa, has been transferred to the branch station at Koshigawa. A very extensive acreage of green vegetable soybeans is grown in the Saitama Prefecture. The beans are started in hot beds about March 1 and when warm weather sets in the plants are transplanted in the fields."

Note 1. This is the earliest English-language document seen (June 2009) that uses the term "Vegetable soybeans" (entry of 15 July 1929), or "green vegetable soybean" (3 Jan. 1931) or "green vegetable soybeans" (Feb. 1931).

Note 2. No mention is made of "edamame" (except in variety names; Apparently Dorsett and Morse don't yet understand the meaning of this word) nor of "vegetable-type soybeans" or "edible soybeans" as a larger category of soybeans. Address: Agricultural Explorers, USDA, Washington, DC.

2621. Morse, W.J. 1929. Re: Impressions of Tokyo, Japan. Letter to Lena and John Morse (his parents), Washington, DC, May 10. 10 p. Typed, without signature (carbon copy).
• ***Summary:*** "Dear Folks, Well things have been going so fast since I last wrote that I hardly know where to begin and so much that to tell it all would take a book, seems to us that there is always some festival going on, a holiday or something.

"On May 5 was the boy's festival and one sees fish, paper or cloth, flying from houses where there is a boy."

© Copyright Soyinfo Center 2014

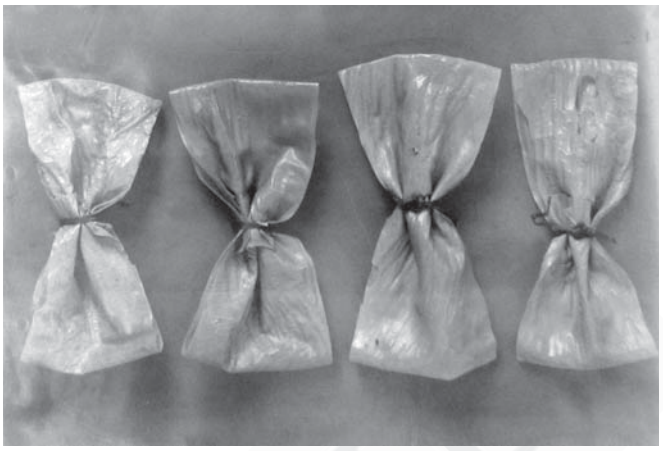
Describes a visit to an experiment station to see the manufacture of soy sauce (experiments carried on in a small factory size) and many journeys in the Japanese countryside. Morse is struck by the beauty of the countryside, temples, gardens, and flowers, and by the strong smells in villages from the "manure pits" containing well-rotted night soil (human excrement). Signed: Will, Edna and Margaret– Morse, is wife and daughter. Address: Imperial Hotel, Tokyo, Japan.

2622. Dorsett, P.H.; Morse, W.J. 1929. Yuba in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Pages 1009-10 (14 May 1929, Tokyo). "Copied from Mr. Morse's diary... We were also quite surprised to find a bean vermicelli made from soybean flour, as we did not know soy flour could be used for this on account of the small starch content. The number of adsuki [azuki] bean products seemed unlimited and we plan to collect these later. We were also able to collect three kinds of yuba, a thin skin-like product (very rich in protein) obtained in the boiling of soybean milk."

Page 1061. "One-half natural size picture [photo] of a package of yuba rolls. Beside the picture are some of the rolls showing character of the bean-curd skin (Yuba). This form of yuba is known as 'Maki-yuba' [as written on the label]. Meaning yuba rolls and is used in making soups and in other dishes" (neg. #43666).

Page 1066. "Between ½ and ¼ natural size picture [photo] of a package of yuba sheets, rich creamy yellow in color. Beside the package is a tied small bundle of the yuba sheets which after being moistened are used to wrap rice in



for lunches. Yuba is very rich in protein" (neg. #43671).

Page 1069. "Natural size picture [photo] of a package of yuba in ribbon-like rolls. Beside the package are rolls showing the manner of rolling the thin narrow sheets of yuba. This form is used in soups" (neg. #43674).

Page 3480. "Small dried sheets of soybean 'Yuba' arranged in the shape of bow ties. Purchased at small grocery store in Tokyo, Jan. 6, 1930. Native name is 'Yuba.' Yuba is the film obtained when boiling soybean milk. Used most commonly in soups. This is a natural size picture" (neg. #44740).

Pages 3555 to 3560. (15 Jan. 1930). "Today we visited a yuba factory for the purpose of getting information as to how this soybean product is made, and also to try and get still and motion pictures of the equipment and processes... Details as to the method of making yuba will be found in the special report on soybeans and soybean products." A boiler was used in this yuba factory. Bamboo trays placed over a heater were used to dry the yuba. Photos taken in Tokyo show:

Page 3557. "An interior view of a yuba factory showing at the left the mill surrounded by a hopper and an extending small pipe to supply a small stream of water for grinding to the right in the cooker, also tube and long handle knife" (neg. #44771).

Page 3558. "An interior view of the portion of the factory where the bean milk is evaporated. A part of the furnace is shown in the foreground; across this lays two bamboo trays with bits of broken yuba on them. Back of these can be seen four evaporating trays or pans" (neg. #44772).

Page 3559. "A nearby view of two half-sheets of yuba hanging across a small bamboo strip. The sheets before being cut are just the size of the evaporating pan (neg. #47773).

Page 3560. "A nearby view of broken pieces of yuba on a bamboo tray. This is a little nearer than [neg.] #44772, otherwise the same (neg. #47774).

Page 3585. "Two packages of yuba and two rolls and sections of a roll which is sold commercially in this manner. Length of packages: 9 inches. D & M. #3292.

Page 3590. "The sheets of Yuba as they come from the

© Copyright Soyinfo Center 2014

pan measure about 16 x 20 inches and are put up in various forms for the market. This view shows folded and sectional views of Yuba (neg. #44782).

Pages 3595-97 (17 Jan. 1930, Tokyo). "Went out to the Yuba making plant this morning to try and get some still and motion pictures... We found the owner and his wife were busily occupied. He was taking up the sheets (17 x 21 inches) of Yuba from the evaporating pans and hanging them up to dry. The pans are of copper, about 3 inches deep by 17 inches wide and 21 inches long. The evaporating pans are filled from ½ to 2/3 full of soybean milk, and evaporated over a slow fire. As the Yuba or layer of scum forms over the surface of the heated milk, it is loosened at the edges by running a small bamboo knife around the sides. A small split stick of bamboo is then run under the film the long way, and the scum or sheet of Yuba, which laps down over the stick like a wet sheet of paper, is lifted and the stick stuck into a crack so that the sheets hang over the evaporating pans to dry.

"Do understand that as many as 25 or 30 sheets of Yuba may be taken from one pan of milk. However, from 10 to 15 is the usual amount taken. Those taken in excess of these amounts are not considered to be of very good quality." Photos show:

Page 3597. Tokyo. These sheets of Yuba have just recently been lifted from the evaporating pan and hung up to dry. They are about 17 by 21 inches" (neg. #46786). The sheets shown from a different angle (neg. #44787).

Page 3639. Tokyo. "A nearby view of a tray of broken pieces of Yuba. Not quite so close a view as #44744 (neg. #44803).

Pages 6924-25. Notes by Mr. W.J. Morse, Tokyo, Japan. Today was set aside for studying miso. However, in the process: "At several stores we found Yuba in abundance, more so than last season. A number of different forms of miso [?] Yuba were found at one store, among which was one we had not observed before." Address: Agricultural Explorers, USDA, Washington, DC.

2623. Dorsett, P.H.; Morse, W.J. 1929. Miso in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Pages 1009-10 (14 May 1929, Tokyo). "Copied from Mr. Morse's diary. In the afternoon we went to Matsuzakaya store to look over bean products and as a result we secured seventeen different soybean products. We found that they had 20 different forms of miso, a product which we think may have possible value at home."

Page 1053 (16 May 1929, Tokyo, Japan). A photo shows a natural sized picture of a small wooden box of miso. The Japanese name is given but is illegible.

Page 1054. "Natural sized picture of a small wooden box of miso. Native name: "Kansai miso." It is made in the Kansai district [the Kyoto-Osaka area] and is used in making miso soups (neg. #43659).

Page 1068. Photo of a "small wooden box of 'Edomiso' [Edo miso] which is made in the Tokyo District. Miso which is quite salty is used in making soups. In the city, miso soup is used for breakfast, which in the country miso soup is used for lunch and supper."

Page 1070. Photo of a small wooden box of "Shiromiso" [shiro miso], meaning white miso. "This form contains rice and is used in making miso soup."

Page 1202 (26 May 1929, Sapporo, Japan). Mr. Morse visited the Hokkaido Agricultural Experiment Station at Kotoni. Mr. Takatsugo Abiko explained that "The soybeans grown in Hokkaido are used entirely for food purposes such as natto, bean curd, green vegetable bean, soy sauce, miso, bean paste and roasted beans."

Page 2004 (29 July 1929). Morse visited the Saitama Experiment Station at Urawa, Saitama prefecture. Met Mr. Tadashi Hashigawa, who is in charge of the soybean work of this prefecture, which is third in soybean acreage in the Japanese Empire. His main work is developing varieties to be used for making soy sauce, tofu, miso, and natto. This station grows about 50 varieties, nearly all yellow-seeded and medium in size.

Page 2445-46 (19 Sept. 1929). Visited the Tokachi Branch Experiment Station in Hokkaido. Met Mr. Seiji Kawase and Yoshio Fujine. 60% of the crops grown in Hokkaido are legumes; of these, field beans are first, followed by soybeans, then field peas. The Tokachi district is very well adapted to soybean culture. There are five grades of soybeans plus a special grade for beans that will be used for soy sauce, miso, etc. Of the 1,837,325 bushels of soybeans produced in Hokkaido, 58% is exported [to outside of Hokkaido] and 42% is consumed in Hokkaido as follows: Miso 9%, soy sauce 9%, seeding 6%, tofu and other products 18%. In 1923 Hokkaido was Japan's leading soybean producing region with 17% of the nation's production, followed by Ibaragi [Ibaraki] 5%, Saitama 5%, Nagano 4%, Kumamoto 4%, Aomori 4%, Niigata 4%, etc. Address: Agricultural Explorers, USDA, Washington, DC.

2624. Dorsett, P.H.; Morse, W.J. 1929. Roasted soybeans in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 1051, 1059 (16 May 1929). "Slightly larger than natural size picture [photo, taken in Tokyo] of a package of roasted soybeans imbedded in very small rice

a different arrangement of the items (neg. #44988). Address: Agricultural Explorers, USDA, Washington, DC.

2627. Dorsett, P.H.; Morse, W.J. 1929. Hama Natto and Daitokuji Natto in Japan and salted soybeans in Peiping, China (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 1053 and 1055 (16 May 1929). Tokyo, Japan. A photo shows: "A little more than one-half sized picture of a box of Natto–native name 'Hama Natto.' It is made in the Hamamatsu District [Shizuoka Prefecture, central Japan]. It is known as dry natto. The beans are soft and of a flavor like dill pickles. The beans are eaten as a relish. D. & M. #246" (neg. #43660).

Note 1. This is the earliest English-language document seen (Nov. 2011) that contains the term "Hama Natto" (unhyphenated, regardless of capitalization); it refers to a type of traditional Japanese fermented black soybeans.

Pages 3229, 3230, and 3231 (10 Dec. 1929, Kyoto). Contains long lists of the vegetables and fruits seen in the Kyoto morning market. "We got two nice soybeans, one a fine large black one, the other as nice a yellow one as we've seen."

"We then went to a Natto manufacturing place near an old temple known as Daitokuji. Here we tried out a kind of natto [Daitokuji natto = fermented black soybeans] which we think might take with the American people, also miso, both are different from any we have previously seen. A detailed account of the manufacture of these products is to be found in our special report concerning the soybean and its products."

Note 2. This is the earliest document seen and the earliest English-language document seen (Nov. 2011) that mentions Daitokuji as a place that manufactures fermented black soybeans in Kyoto, Japan, near the old temple named Daitokuji. Daitokuji is a Rinzai Zen Buddhist temple in northern Kyoto. Here "Daitokuji natto" have long been made as both a seasoning in the vegan diet of the monks and as a well-known souvenir for tourists.

Page 3231. "We left Kyoto on the 10:14 p.m. train and are due to arrive in Tokyo about 9:00 a.m. tomorrow morning, Wednesday, December 11, 1929." Pages 3469 and 3483 (8 Jan. 1930). Tokyo, Japan. A photo shows: "Box of dried form of Natto sold under the name of 'Hama-natto.' Purchased at the railway station of Hamamatsu, Japan, December 11, 1929. This form is only made in the

Hamamatsu district. Eaten as it is, when one drinks tea. Box 7½ inches long and 4¼ inches wide. D. & M. #3442" (neg. #44743).

Page 3484. "Box of soybean 'Natto' purchased from a Natto factory in Kyoto, Japan, December 10, 1929. Native name 'Tsubunatto' [Tsubu-natto; slightly crushed natto] or 'Daitokuji' Natto. This is a dried form of Natto, commonly known as 'Hamanatto,' and is only made in Kyoto and Hamamatsu, Japan. The name 'Daitokuji' Natto is taken from the Daitokuji Temple, of which a priest first made this product. Generally eaten when drinking tea. Box is 7 inches long and 4 inches wide D. & M. #3071" (neg. #44744).

Page 3486. Box of Natto, known as 'Hamanatto,' purchased at a small store in Tokyo, Japan, December 24, 1929. This is a dried form of Natto and is made in Hamamatsu, Japan. Hamanatto is eaten when one drinks tea. Box 6 inches wide; 7½ inches long. D. & M. #3073" (neg. #44746).

Page 6264 and 6274 (24 Oct. 1930). Peiping, China. P.H. Dorsett. A photo shows: "Soja max. Salted soybeans... Life sized pictures. Dry form, D. & M. #47531; moist form D. & M. #47530. Dry form consists of small flat black beans cured like string natto and then dried. Moist form, soybeans cured like string natto" (neg. #46124). Note 3. Natto (stringy natto) is unknown in modern China. The salted black soybeans may well be fermented black soybeans (fermented, salted black soybeans).

Page 6945 and 6946 (13 Jan. 1931). Kyoto, Japan. "Notes by Mr. W.J. Morse... We were taken to the Chemical Laboratory where Mr. Katagiri is doing some work on soybean products, especially soy sauce. Concentrated soy sauce is shipped to the United States in rather large amounts and then diluted and bottled. We were shown a sample of soyamint which is a practical soysauce product and made in about three months. It is said that the soybeans are treated with an acid solution, then neutralized and rice Koji added. After three months of curing, the soy sauce is ready for use.

Note 4. This is the earliest English-language document seen (April 2012) that contains the word "soysauce" (spelled as one word).

"After lunch we went to the Taitokuji [sic, Daitokuji] Temple where the famous Taitokuji Natto [sic, Daitokuji Natto] is said to have been originated by one of the Temple priests more than 400 years ago.

"Mr. Sekkai Ota, one of the temple priests, very kindly explained the history of the dried form of Natto as well as the whole process of its manufacture. This form of Natto will keep indefinitely and is eaten when sprinkled with a mustard sauce or sweet liqueur. The Hamamatsu Natto is made in the same manner but is allowed to dry more."

Page 6947 (13 Jan. 1931). Soybean Natto. Photo shows: "Group at the Kyoto Imperial College of Agriculture: Prof. Matsumoto, Prof. Kamikawa, W.J. Morse, U.S. Department of Agriculture, Washington, D.C. and Mr. Sekkai Ota, Priest of the Taitokuji [sic, Daitokuji] Temple at Mr. Morse's right, who explained the method of manufacture of Taitokuji [sic] Natto. A dried form of Natto originated at the Temple more than 400 years ago" (neg. #46446). Address: Agricultural Explorers, USDA, Washington, DC.

2628. Dorsett, P.H.; Morse, W.J. 1929. Soybean cultivation in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 1147-48 (22 May 1929, Tokyo). "Copied from Mr. Morse's diary:... At Ichinoseki we purchased from a lunch boy, some soybean products. This place is said to be a center of production of a large number of soybean food products. It is in the Iwate-ken prefecture which is second in soybean acreage and production in the Japanese Empire."

"This mountainous section soon gave way to a general farming region, more or less hilly, but extensively cultivated in soybeans, adsuki beans, rice, barley... The beans were planted in rows on ridges about 18 inches apart and after planting the ridges were packed by tramping as indicated by the close foot prints the entire length of the rows."

Page 1201-02 (Sunday, 26 May 1929). "Copied from Mr. Morse's diary: Sapporo, Japan. In the morning we went to the Hokkaido Agricultural Experiment Station at Kotoni, where we met Dr. Takatsugu Abiko, chief of the Agronomy and Horticultural Sections. He explained to us in detail, by maps, the different sections of Hokkaido where soybeans are grown extensively. He advised that most of the soybean experimental work is carried on at the Tokachi Branch Station, one of the northern stations.

"We were shown the exhibit of various crop products grown in Hokkaido, and also the seed of new varieties of crops developed by the Kotoni station. This station is working with about 50 varieties of soybeans, and has developed two large very fine looking yellow varieties. We were also shown samples of about 275 varieties being grown at the station. Dr. Abiko informed us that we can obtain seed of all these varieties after harvest this fall.

The principal insect enemy of the soybean, and one which does much damage to the mature seed in the field is the 'Mame shinkui ga' (moth into bean), a moth *Laspeyresia* (*grapholitha*) *glycinivorella.* It is a small moth, the larva of which cut into the mature bean. In general it causes about 10% loss to the Hokkaido soybean crop. The early plantings are injured about 40% while the late plantings are only injured about 10%.

"The principal soybean diseases which cause much damage to the crops, are a leafspot, *Peronospora manshurica* and a mosaic *Heterodera schachtii.*

"The soybeans grown in Hokkaido are used entirely

© Copyright Soyinfo Center 2014

for food purposes such as Natto, bean curd [tofu], green vegetable bean, soy sauce, miso, bean paste and roasted beans."

Page 1236-37 (28 May 1929). "After breakfast we made two rounds of seed stores and small grocery stores, and succeeded in obtaining several varieties of soybeans, garden beans, and more flower seed."

"We visited Sapporo's large department store seeking food products. Tokyo's large stores to us seem to have about everything under the sun, but today's store has everything. We found some new soybean products and quite a variety of other bean products."

Page 1692 A photo shows (negative #43941): "Inspecting soybeans which are about to be plowed or dug."

Page 1759 (30 June 1929). A photo shows (neg. #44008 and #44009) "In the vicinity of Shojiko. Turning under soybeans which are 10 to 12 inches in height in preparation for planting rice, the men and horse approaching the camera."

Page 2183 (22 Aug. 1929) We "left for the Hokkaido Agricultural Experiment Station." We arrived at Kotoni, The Station is located within about 5 minutes walk of the train station. On arriving at the experiment station we met Mr. Tambo, the specialist in soybean investigations, who with the soybean expert and another man went with us over the station" which covers 108 acres. They are conducting a "very large varietal test of soybeans. The time spent thus from about 9:30 to after 2:00 p.m. was most interesting and instructive.

Page 2215 (26 Aug. 1929). "Went to the office this a.m. between 7 and 8 and attended to work there. At 10:00 a.m. we went over to the Hokkaido Imperial University to call on Dr. Ito relative to conditions at the various Hokkaido Experiment Stations and the best time for us to visit them to inspect the soybean planting to best advantage. We also submitted a list of plants in the Botanical Garden of which we would like to get seed or other plant propagating material.

Page 2417 (14 Sept. 1929). At 8:30 they "met Mr. Yutaka Tamayama, of the Hokkaido Agricultural Experiment Station, chief Director of the Kamikawa Branch Agricultural Experiment Station, and spent several hours talking with him about soybeans and other crops."

"We were much interested in the soybean work at the Station, but especially in the two non-hairy late forms growing there. Of one of these we secured a motion picture. We also got motion pictures and still picture shots showing soybeans growing on paddy ridges and of harvesting and racking rice for curing.

"We left Asahigawa at 5:39 p.m. and arrived at Sapporo at 10:27 p.m."

Page 2425 (neg. #44263). "Soybeans as they appear on the ridges of rice paddies in this region. This is a common practice of growing soybeans throughout many regions of Japan. Nagoya-mura, Japan."

Page 2445 to 2447 (19 Sept. 1929). "Between 8 and 9 this morning we walked out to the Tokachi Branch Agricultural Experiment Station. We met Mr. Seiji Kawase, the director, and Mr. Yoshio Fujine, the soybean expert, and spent a very pleasant forenoon with them in the reception room at the laboratory.

"We were informed that in Hokkaido there are about 1,000,000 cho of land suitable for cultivation and that of this amount 130,250 acres are actually under cultivation. Of the important agricultural crops grown, legumes are rated as 60%; grain (except rice) 17%; rice (paddy) 7%, root crops 6%; miscellaneous farm crops 11%. Of the legumes, field beans stand first, soybeans second and field peas third.

"The climatic and soil conditions of the Tokachi district or region are better adapted to soybean culture than other parts of Japan.

"Here a family of four handle by hand 38 acres of soybeans and other crops.

"The soybeans of the Tokachi region and elsewhere in Hokkaido are utilized almost entirely for export" [since Japan has huge soybean imports from Manchuria].

"Soybeans are of five grades and those which fall without the fifth grade are what is known as waste grade, and are used locally for stock feed. These five grades are for commercial handling. Beans for special purposes such as for soy sauce, miso, etc., are of special grades and not necessarily of the ones noted.

"After the beans are cut they are permitted to lay on the ground for about ten days before being taken in to be

© Copyright Soyinfo Center 2014

threshed. Soybeans are, as a rule, flailed or beaten out. The beans are cut when fully ripe but just before the seed shatters. Harvesting usually begins about September 15th and may continue until about October 15th.

"Beans are planted in shallow furrows, 17 to 18 inches apart in the rows and covered with the feet.

"There are two cultivations during the season, the first about June 2nd, and the second about the middle of July. Hand hoeing and horse cultivation are employed, depending upon conditions.

"Acid phosphate is used (when used) at the rate of about 30 to 40 pounds per quarter of an acre once every three or four years.

"Farmers receive six yen per hundred pounds for their soybean seed.

"The beans are sold to merchants or are handled through agricultural societies and of the 1,837,325 bushels of soybeans produced in Hokkaido 58% is exported and 42% consumed at home [in Japan].

"The domestic use of the non-export beans is as follows: for Miso 9%; soy sauce 9%; seeding 6%; tofu and other products 18%." "Soybean production of Japan in 1923 amounted to 3,433,908 koku, which is equivalent to about 17,000,000 bushels.

"The following table gives the percent of this production within the noted regions: Hokkaido 17%; Miyagi 9%; Ibaragi 5%; Saitama 5%; Nagano 4%; Kumamoto 4%; Aomori 4%; Niigata 4%; Chiba 4%; Fukushima 3%; Nagasaki 3%; all others 28%.

"Soybeans are stored in bags in storage ware houses. Nine varieties are grown commercially in the Obihiro region [of Hokkaido]. These are in two colors, black and yellow. Of the black varieties, they have the Early black, Midseason black (cheese [tofu]) and Black. Of the yellow they have, Ayachi, Ishikarishiro, white; small white bean; Akazaya, red pod; Yoshioka, large; Kanro, sweet dew.

"Soybeans in Hokkaido are troubled more or less with several leaf diseases and at least one insect, the pod borer moth. Sometimes the pod moth injury amounts to 40%.

"The Experiment Station has a collection of 240 varieties on which they are working." Continued. Address: Agricultural Explorers, USDA, Washington, DC.

2629. Dorsett, P.H.; Morse, W.J. 1929. Natto, and soybean cultivation in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 1179 and 1180 (25 May 1929). Sapporo, Japan. "Copied from Mr. Morse's diary:..." "After our visit with Dr. Ito we went to the Natto Laboratory of which Dr. [Jun] Hanzawa is in charge. We were given bulletins regarding the history, making and varieties of Natto, and served bottles of different sizes of Nattokin [Natto bacteria] (liquid pure culture) for the making of different kinds of Natto. We were then shown the various forms of Natto and taken through the various rooms and given detailed information on the various steps involved in the production of natto."

Page 1202 (26 May 1929). Sapporo, Japan. Mr. Morse visited the Hokkaido Agricultural Experiment Station at Kotoni. Mr. Takatsugo Abiko explained that "The soybeans grown in Hokkaido are used entirely for food purposes such as Natto, bean curd, green vegetable bean, soy sauce, miso, bean paste and roasted beans."

Pages 2003 and 2004 (29 July 1929). "I (Dorsett) worked at the office changing herbarium specimen, packing plant material and writing official letters. Mr. Suyetake and Mr. Morse went to look over the section near Tokyo where soybeans are quite extensively grown as a grain crop."

A letter from Mr. Ryerson dated 3 June 1929 noted that at least some of the colored motion pictures were good. "He wrote as follows: 'The last material received from Vitacolor was a great improvement. The azalea scenes were gorgeous.'"

"We were deeply grieved to note in the same letter the following paragraph concerning Dr. Galloway: 'Dr. Galloway has had to give up and go home. He will be leaving for a cooler section within a week. His nerves have gone back on him and he is facing the same siege that he had 10 years ago, much to the regret of all of us.'"

Mr. Morse added: "A visit was first made to the Saitama Experiment Station located at Urawa, Saitama Prefecture. We met here Mr. Tadashi Hashigawa, Agricultural Engineer, who is in charge of the soybean work of the Saitama Prefecture, which is the third in acreage of soybeans in the Japanese Empire. The work with soybeans consists mainly of developing varieties for seed to be used in making soy sauce, tofu, miso, and natto. This station is growing about 50 varieties nearly all yellow-seeded sorts with seed of medium size. In looking over these varieties in the trial grounds we found some very excellent varieties that no doubt will have value in the United States from southern Virginia southward. Especially North Carolina, Tennessee, and the upper delta of Mississippi. Mr. Hashigawa promised to send us samples of seed of all the varieties being grown at the station."

"We were told by Mr. Hashigawa that soybeans were grown very extensively about Kumagaya to which place we went. We found, however, that soybeans were not grown very extensively about Kumagaya. Soybeans had given way to mulberry plantings. The reason given by the farmers was that the continuous growing of soy beans made the soil to rich. About half way between Kumagaya and Fukiage [in Saitama Prefecture] soybean plantings were very extensive and extended well past Fukiage. This will be an excellent place to come a get [film] harvesting scenes in the fall. By

© Copyright Soyinfo Center 2014

getting off at Fukiage the best observations can be made. At the present time the plants are just in bloom and it will be at least October before the beans are ready for harvest." At the Imperial Government rice station at Kokosu they are "doing some work with soybean varieties for green manure, and it will be possible to obtain varieties."

Page 3341 (24 Dec. 1929). "Today Morse and Suyetake went to call upon soy sauce and natto manufacturers for the purpose of getting acquainted and also if possible arrange for getting still and motion pictures of their plants, equipment and operations."

Page 3479 (8 Jan. 1930). Tokyo, Japan. *Soja max.* soybean. Photo of: "Three specimens of 'String Natto' [itohiki natto], one package (made of rice straw) unopened; one opened; and the natto without the package. These were purchased at a Natto factory, Tokyo, Jan. 6, 1930. The [rice-straw] packages are 15 inches long and 2½ inches wide. String natto is eaten after having mixed it with a mustard paste" (neg. #44739).

Note: This is the earliest English-language document seen (Jan. 2012) that uses the term "String Natto" to refer to natto or *itohiki natto,* or that uses the word "string" in connection with natto.

Pages 3925, 3929 (18 Feb. 1930). "It is one year ago today since we left Washington for Japan... We have found much of interest in connection with our special line of work, much more even than we expected, and therefore the time has passed all too quickly..."

"Morse and Suyetake searched for soybean products today, and were successful in bringing in a collection of two dozen things slightly or entirely different from those previously secured."

Page 3929. Photo shows: "Small triangular packages, one as purchased, the other unwrapped. They contain string Natto. The native name is 'Hygienic Miyako Natto.' There is at one side a small triangular paper containing dried mustard; this is inclosed [sic] with the Natto. Purchased in Tokyo, Feb. 16, 1930. Soybean dish measures 3 inches across" (neg. #44937).

Pages 6822-23 (22 Dec. 1930). Kyoto, Japan. Mr. Morse's notes. At the Imperial Agricultural College they met Isawo Namikawa, Professor of Horticulture, who said that Kyoto is noted for several special soy products such as white miso, soy sauce, and natto.

Page 6937 (10 Jan. 1931). Tokyo. Notes by Mr. Morse. Spent most of the day in the Shinjuku district looking up soybean products. "More String Natto in rice straw packages was observed in this section than any we have visited." Address: Agricultural Explorers, USDA, Washington, DC.

Address: Jozo Shikensho.

2631. Morse, W.J. 1929. Japan travel notes, April 5 to May 17. Handwritten manuscript. 27 p. Unpublished manuscript.
• ***Summary:*** Morse wrote these notes by hand in ink, early in the trip to East Asia, in a personal unlined notebook that was about 9 cm (3.62 inches) wide and 14.5 cm (5.75 inches) high. Most of the pages are unnumbered, no date or place is given for many of the entries, and the handwriting is occasionally faded or hard to read.

The purpose of this notebook and how Morse used it is unclear. These may have been his field notes that he used each evening as the basis for his official typewritten USDA trip report. Or was this a personal diary in which he kept personal observations that would not become part of the official report? This seems less likely.

This is apparently the first notebook in a series of many that Morse wrote. He kept the notebook after the trip and in April 1986 his daughter, Mrs. Walter A. Thalman (22 Interlaken Dr., Eastchester, New York 10709), who kindly photocopied it for Soyfoods Center.

© Copyright Soyinfo Center 2014

Here are some quotations: "After a few minutes, we were served tea and cigarettes. Dr. Anda told us where the soybean work is being conducted. The soybeans are grown mostly in northeastern Japan, and specially on the island of Hokkaido where considerable breeding work is being done. At the Imperial Station in Tokyo, much chemical work is being done in the study of the manufacture of shoyu sauce and miso.

"After a visit to the Exper. Station we went to Ueno Park to visit and look over the cherry trees. The trees are in bud and should be in full bloom in about one week. Many of the trees are very large and quite old."

Food show: The International Food Show was being held in the large building in the park [Ueno]. A small admission fee was charged. The show lasts from April...

"Soybean products: The manufacture of shoyu or soy sauce was shown in several different booths. In one booth, samples of soy sauce made by the various soy manufacturers was shown in various sized bottles and kegs. In another booth, the ingredients used and the method of manufacture were shown. Large yellow soybeans were shown, a bottle of wheat, a bottle or jar of the rice ferment [sic, wheat ferment, koji], the product consisting of roasted wheat, cooked soybeans, after addition of the ferment. Then a jar of the product after the addition of salt and water, and curing for a certain length of time [shoyu moromi]. Then a jar of the sauce was shown which was pressed out of the preceding jar. The cake or ___ which was left after pressing out the liquid was shown.

"Tofu or bean curd: The different materials used in the manufacture of bean curd were shown. 1st were shown a bushel tub of large yellow soybeans (sample sent to Washington as coming from the national food show). 2nd was shown the beans soaking in water. 3rd was shown the bean milk. 4th was shown a jar of magnesium sulfate water used in precipitating the protein of the tofu milk (as it is called in Japan)... salts in precipitating the protein. Then were shown the blocks of tofu or bean curd. Many kinds of bean curd are made, depending on the amount of pressing. The soaking of beans in warm water or longer soaking in cold water. The amount of the water added in making the bean milk. Tofu is not made in large factories, but in small factories or stores scattered throughout the city. Small dealers or hucksters with the two tubs one at each end of a pole slung over their shoulder. Tofu (blocks) are in these tubs and the huckster has his route passing along blowing a horn which has a peculiar sound. He also passes back in alleys to his customers, leaving his tubs on the street. He cuts off from the slabs of bean curd whatever amount his customer desires."

"Buddha's Birthday. Hibiya Park, Tokyo. April 8, 1929." "... it is quite generally agreed that the Buddha was born in the sixth century B.C. The birthday is known as Hanamatsuri or Floral Festival..." Address: USDA, Washington, DC.

• ***Summary:*** Extraction with a solvent such as ethanol is done at a temperature above the boiling point of the solvent (preferably at about 85ºC) but below 120ºC. The mixture of solvent and oil [miscella] is drawn off and cooled to below 50ºC to separate the oil and obtain a liquid residue containing lecithin, coloring matter, and sugars. Address: Dairen, China.

2638. Sato, Masanori; Ishida, Y. Assignors to Minami Manshu Tetsudo K.K. (South Manchuria Railway Co.) (Dairen, Manchuria, China). 1929. Extraction of oil, etc., from soy-beans. *British Patent* 336,274. (Chem. Abst. 25:2016). *

• ***Summary:*** The oil from soybeans can be extracted with a solvent such as alcohol mixed with benzine or benzene of such concentration and quantity that the water in the resulting liquor is less than 10%. The extraction temperature is above 65ºC and the oil is separated by cooling. Address: Dairen, China.

2639. Dorsett, P.H.; Morse, W.J. 1929. Soybean oil and cake in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Pages 1899-1900 (17 July 1929). At a fertilizer exhibit the authors see: "Herring fish bone meal, German phosphate, ammonium sulfate, soybean oil cake, mustard seed oil cake, flaxseed cake. The oil cakes ground into meal are used almost entirely for fertilizing rice. For soybeans liquid night soil and raw ammonium phosphate are used" [as fertilizer].

They also see perilla spikes (small bundles which are used for garnishing), perilla plants with purple foliage (10 bundles, which are used for dyeing pickled plums [umeboshi], ginger, etc.) and perilla plants (white; which are used for pickling and as greens).

Pages 2278 to 2280 (31 Aug. 1929). The authors visit the Otoguro Oil Company in Garugawa, Japan. This small oil mill makes Brassica oil (from *Brassica japonica*), mustard seed oil and sesame oil. They pack and sell soybean oil from a supply secured in Manchuria. It "is apparent that Japanese grown soybeans are much too valuable as human food and green manure to be used for oil production. Soybean oil is considered more or less a by-product with the oil cake the more important product. The oil is imported from Manchuria by Japanese firms having oil mills in the leased territory or by oil firms distributing various kinds of oils. The oil is refined, put up in different types of glass or tin containers, branded with the firm's trade mark, and distributed to various parts of the Japanese empire. The Nisshin Oil Company, Tokyo, Japan, has branches throughout Japan, and even a branch in Seattle, Washington, U.S.A. This firm places on the market a pure soybean salad oil." Address: Agricultural Explorers, USDA, Washington, DC.

placing a piece of bean curd which he has just sold, into a vessel of water. We have a motion picture of this" (neg. #44095).

Page 2335-37 (4 Sept. 1929). Tokyo. "We were out this morning at 4:00 a.m. and visited a tofu and soybean curd factory. We spent a most interesting 2½ hours observing the various operations. The soybeans are put to soak about 5:00 p.m. the day before they are to be used, and about 4:00 a.m. the" next day "they are ground. This is accomplished by means of a special apparatus which grinds the beans very fine while a small stream of water is running on the beans in the chopper.

"It looks as though they grind about half a bushel of beans for each batch of curd. After grinding it is put into a large open kettle and brought to a foaming boil. The foaming mass is stirred down several times. In one of the foaming processes a small amount of mustard [rapeseed] oil and some kind of flour (we were unable to learn what kind) is sprinkled over the foaming mass and while foaming, about two gallons of water (cold) is added to the mixture. It is then strained through a bolting cloth sack into another receptacle in which there is two bolting cloth bags. A rather light pressure is

applied to the first bag of solid matter and after it is drained for a time, 15 or 20 minutes, the solid portion is put back into the kettle, a little water is added, and it is again put into the bolting cloth bag and the liquid portion pressed out into the other two bolting cloth bags.

"The solid portion is then put to one side and later utilized in other food products or for cattle feeding period."

Page 2336. "To the white liquid bean milk, which by the way is pretty good, about a gallon and a half of water, to which has been added a solution–we could not learn the proportions because of its being a trade secret–three cups, we should say (guessing) about a quart of a solution of sulphate of magnesia [sic, magnesium, i.e., magnesium sulphate] is added to the soybean milk. The solution is added slowly and well distributed through the hot bean milk. By rule of thumb the operator tests with his ladle the coagulation of the milk and just before it is finished he adds about a teacup of the sulphate of magnesia solution to the mixture. He then places a bamboo or wicker basket in the tub and dips off all the liquid (whey) that he can.

"Nearby, which has been previously fixed, is a false bottom box about 12 inches wide, 24 inches long, and 6 inches deep. There is an addition [wooden frame] of about 2 inches added to [the height of] the first box and over the whole a piece of bolting cloth is placed. The curd in the large tub is carefully transferred by means of a ladle from the tub to the box, which is large enough to hold the batch. The liquid is gradually pressed out by rather light weight and in a short time the 2 inches added height to the box is taken away. The bolting cloth is then laid back and with a flat broad knife the rough edge around the sides and ends are sliced off and placed in a row along the center. The cloth is then folded back smoothly and a board and weights are placed on the box of curd. In about half an hour this box of curd is cut through into squares something like 6 inch bricks.

© Copyright Soyinfo Center 2014

The box and contents is lifted off and placed upside down in cool water. It is readily slipped out of the box and the bolting cloth is removed. These blocks of curd [tofu] can then be disposed of as is or can be cut into still smaller squares.

"Another operation in this establishment is the frying of the curd.

"We watched them cut 1- by 6- by 6-inch blocks up for frying in deep fat (Mustard oil). Some of the 1 by 6 by 6 inches were cut into three pieces each about 1 by 2 by 6 inches and these in turn were split in two to make two pieces each about ¼-inch by 2 by 6 inches. Other 1 by 6 by 6-inch pieces were cut into squares about 1 by 2 by 2 inches and these were split. They used two frying kettles and transferred the curd from the first to the second, cooking it about half done in the first and completing the cooking in the second.

We tried some of this hot tofu (curd) with a little soy sauce and found it quite good.

"This concern works up five bushels of soybeans daily into curd and tofu.

"About 6:30 a.m. we went out to 23rd street and walked through the farmers open market."

Page 2371 (8 Sept. 1929). Tokyo. "Soybean harvest in Hokkaido is supposed to begin about September 15th so from now on we plan to spend the greater part of our remaining time in this region, in the field..." We leave tomorrow morning and "expect to be away about a week."

Page 2693-95 (18 Oct. 1929). Left Ueno station in Tokyo en route to Kagemori in the mountains, where we hope to see soybeans and get motion and still pictures of their harvesting in that region. We arrived at Kagemori at 10:45 and conferred with the village committee who advised that we were about two weeks too early to see the harvesting of soybeans."

Page 2695. Two photos show: "Mr. Masoi, a Japanese bean curd man, slicing and laying bean curd on a bamboo rack for pressing." Kagemori (neg. #44392 and #44393).

In addition to fees, these schools are financed by generous admirers, and even during a match there are frequent interruptions while it is announced that this or that patron has given to a favorite giant or to the school in general, say, 10 bottles of *saké,* five sacks of rice, a barrel of *Shoyu* sauce, a few legs of pork,..."

2646. Dorsett, P.H.; Morse, W.J. 1929. Plans for further exploration (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 2273-75 (30 Aug. 1929) "In view of the number of soybeans we have already collected and the large number which we have been promised by Japanese Experiment Stations this fall, as well as the very rapid increase of the soybean industry in the United States, Morse does not feel that it will be advisable or possible for him to remain in the field away from his work at Washington [DC] for more than two years. Dorsett does not have any special work which needs his attention at Washington and can remain in the Orient for another year or two if that appears necessary or desirable by those in authority at Washington.

"We are considering the following two plans of operation for the remainder of the time Morse feels that he can spend in the foreign field.

"1. Complete the work in Hokkaido which will possible require a month or six weeks longer then return to Tokyo and as soon thereafter as practicable make a trip into Chosen (Korea), and do what we can there within a week or ten days. Return to Tokyo and complete operations there by not later than December 15th or January first, 1930. Then leave for Formosa (Taiwan) and spend the remainder of the winter there. In early spring, April or not later than May 15th, proceed to Dairen and our headquarters there for the remainder of the time Morse can remain in the Orient. From Dairen work southern Manchuria and as far north as Mukden [now Shenyang], even making a short trip up to Harbin and vicinity. Also go from Dairen into Chosen during the spring or summer season and in the fall or early winter of 1930 get over to Peking to clean up the work of soybean milk production and other soybean products, in time for Morse and Dorsett too, if it is deemed advisable, to leave for America so that they will reach there in time for Morse to take up his spring work with soybeans.

#2. Complete our work here within the next six weeks or two months if possible. At any rate return to Tokyo as soon

© Copyright Soyinfo Center 2014

this fall as the work here is completed. Then at the earliest possible opportunity get over to Chosen (Korea) and do what we can there this fall, Return to Tokyo and complete our work there with soybean products, making when practicable excursions of a week or so into other parts of Japan for the purpose of picking up information and seed and pictures where possible or persimmons, green manure and cover crops as well as other features of Japanese horticulture.

"In early spring move headquarters to Dairen and work South Manchuria and the central portion as far north as Mukden and Chen Chung [Changchun], the region which was not worked by the Dorsetts in 1925-26. Chosen (Korea) might also be given additional attention throughout the summer and fall as opportunity permits. Dairen is perhaps the best place in the Orient to data if all kinds on soybean storage, handling, and by-products. Complete this work then get over into Peking to work up soybean products, especially soybean milk production. In the early winter go to Taiwan and work that region until Morse feels its time for him to leave for the states. If it is deemed advisable, Dorsett can return then or he could remain and finish up the work in Taiwan (Formosa) in case that was not done before Morse left. He could get in touch with McClure at Canton, which is nearby Canton, and together they might handle the *Placanea cornea,* edible Chinese acorn, and Tonkin cane proposition. Dorsett could then go to Java and look after the soybean and green manure and cover crop work..." Address: Agricultural Explorers, USDA, Washington, DC.

2647. Morse, W.J. 1929. Letter from Dr. [sic] Morse. Tokyo, Japan, July 20, 1929. *Proceedings of the American Soybean Association* 2:50-52. Tenth annual field meeting. Held 22-23 Aug. at Guelph, Ontario, Canada.

• ***Summary:*** This letter from W.J. Morse was read before the 1929 convention of the American Soybean Association at Guelph, Ontario, Canada. This is the first annual ASA meeting he has missed. He begins with a brief description of the "Oriental Agricultural Exploration Expedition" headed by Mr. P.H. Dorsett and himself. They plan to study soybeans in Japan first. "The largest soybean section is the Island of Hokkaido which has an acreage of 215,212 [planted to soybeans] and produces 3,184,245 bushels of beans" [yield = 14.8 bushels/acre].

"On our arrival and after establishing headquarters in Tokyo, we first began to look up varieties which we might send back to the United States for the 1929 planting. We succeeded in packing up about 100 lots which are now growing in the variety plots at Arlington Farm [Virginia]. In hunting out this seed, we were very much surprised to find the soybeans listed with the garden beans and as garden beans. For the most part these are grown as green vegetable beans. These sorts are black, brown, greenish yellow, and yellow seeded varieties of early, medium, and late types. Some of the yellow seeded varieties are listed as most suitable for bean curd, soy sauce, miso, natto, and confectionery purposes, such as sweet bean paste, candied beans, roasted beans (like our peanuts), and sugared beans."

Note 1. Azuki beans, rather than soybeans, are usually used to make "sweet bean paste" in Japan.

"It is amazing, the extent to which the soybean is used for food in Japan. Whether or not it can be used in the United States in all of the ways used here is extremely doubtful, that is for human food." There is no doubt that American soybeans will be used mostly to produce oil and oil meal. "It may interest you to know that the beans produced in Japan are used entirely for human food, green manure, and planting purposes. The grain varieties have seed of higher quality than those produced in Manchuria and are not used for oil and oil meal production as [are] the beans of Manchuria. The great soybean oil and meal production of the Orient is confined almost entirely to Manchuria.

"Another thing which surprised us greatly was the extent to which soybeans are used for green manure purposes in the rice paddies." The plants are turned under in the mud after water has been run into the paddies.

"Another extensive use of the soybean is for bean curd, or tofu, which is manufactured only... in small shops scattered about the cities and country villages. This curd is used in many ways, being the meat of the poorer classes. It is used, however, quite generally in making bean-curd soup [miso soup with tofu] which is sometimes served at breakfast and nearly always at supper. The bean curd is peddled about from house to house by men with two tubs suspended from a bamboo pole over their shoulders. The sound of the little horn of the bean curd man as he announces his coming has become quite a familiar sound to our ears as we go along the streets or hear him pass under our office windows.

"Soy sauce is manufactured on a very large scale and is universally used by the Japanese, rich and poor. We have had the pleasure of visiting the large experimental laboratory of an experiment station given wholly to soy sauce and saké experiments. In Hokkaido we visited a soy sauce factory, the buildings of which covered several acres. In one of the curing vat buildings where the mash is allowed to cure for about 18 months, we counted ninety large vats.

"Soybeans are used to a very considerable extent for confectionery purposes. The large black, brown, and green seeded varieties are used in making sweet bean paste which is put up in small thin slabs and then done up in very attractive packages. Roasted beans, similar to our roasted peanuts, may be found at nearly all confectionery stores. Roasted beans are also sugar coated and others are sprinkled with small pieces of sea-weed during the roasting, which gives an appearance of mottled beans (rather a familiar sight to our mid-west farmers). Then, there are the candied beans, that is, beans which have been boiled in syrup.

"Miso and natto are two forms of bean foods in which the beans are first cooked and then treated with certain

© Copyright Soyinfo Center 2014

bacteria [sic, microorganisms]. Miso is used largely in soups which are consumed at breakfast. Both of these foods are quite largely used.

"Other products used for food are roasted soybean flour, soybean vermicelli, pickled green beans in the pod, yuba–the film produced by boiling soybean milk, and dried frozen bean curd."

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "dried frozen bean curd" to refer to dried-frozen tofu.

Note 3. This is the earliest English-language document seen (Nov. 2012) that contains the term "roasted soybean flour."

"Another surprising thing is the very extensive use of the soybean as a green vegetable bean. As early as May, small bundles of plants with full grown pods were seen on the market. At the present time the market is virtually flooded with bundles of plants with full grown pods, the seeds of which are also full grown. The pods are boiled in salt water and the beans eaten from the pods.

"During the past two weeks we have visited large sections near Tokyo where soybeans are grown for green vegetable purposes. The beans are grown in rows 2 feet apart and in 95 per cent of the cases there are other crops planted between the bean rows, such as early cabbage, onions, lilies (for the edible bulbs), late varieties of soybeans, late plantings of soybeans, and other early truck crops." Address: USDA, Washington, DC.

2648. Squirrell, W.J. 1929. Experience with soybeans in Ontario. *Proceedings of the American Soybean Association* 2:43-44. Tenth annual field meeting. Held 22-23 Aug. at Guelph, Ontario, Canada.

• ***Summary:*** "The soybean crop has been grown experimentally at the Experiment Station at Guelph since 1894 and variety material has been distributed for co-operative experiments to farmers since 1900. In all over one hundred varieties of soybeans have been under test at this station, in addition to experiments in dates of seeding, rates of seeding, methods of cultivation and mixture experiments. The O.A.C. No. 211 variety, which is a plant selected strain of the Habaro variety which latter variety was imported direct from Japan by the Ontario Agricultural College, has been the outstanding variety under test... It is now grown to a limited extent in southwestern Ontario and is the only variety eligible for crop registration in Canada...

"In order to bring this crop into greater prominence and to convince farmers of the value of both the forage and the grain a number of demonstrations under the direction of Dr. G.I. Christie were planned in the spring of 1929. These demonstrations were placed in the principal counties of central and southwestern Ontario, in most cases three in each county. Each demonstration consisted of an area of two acres, one acre growing the O.A.C. 211 and the other acre the Manchu varieties. One-half of each variety was cut for forage and the other half cut for seed...

"One of the factors effecting the increase in area of the soybean crop in Ontario is the lack of machinery to remove the oil from the soybean. A greater appreciation of the value of this crop by farmers and industrialists will before many years undoubtedly result in a greatly increased acreage of soybeans in Ontario." Address: Prof., Dep. of Field Husbandry, Ontario Agricultural College [O.A.C.].

with a four tooth marker, distributing fertilizer, dropping the beans, and covering as dropped with the feet, also covering with the weeding harrow, all of which we made black and white motion pictures. We also secured motion pictures of cutting and shocking soybeans as well as special scenes." A line drawing at bottom of page, with dimensions in inches, shows a "horse" soybean market. See also photo #44285.

Page 2454. "The rows when finished for soybean seeding are 21 inches in center and about 3 inches deep, beans are dropped in hills three or four beans in each hill, about 12 inchees apart in the rows.

"Looking over the various experiments our attention was attracted to an open air cooking demonstration near the main building of the station. As this was the first demonstration of this kind we had seen since coming to Japan, curiosity impelled us to see just what sort of foods were being prepared. Noticing a large bamboo basket of black soybeans (very large seeds), we asked the use to be made of them. We were told that wine or soybean juice was being made. This is a product not made commercially but made only in the homes.

"Generally a bushel (or smaller quantity if desired) of black soybeans and twice the amount of water are used. The beans are boiled for about an hour. The juice, a blackish purple liquid, is drained off. A small amount of citric acid is added and sufficient sugar is added (sufficient sugar to suit the taste of the individual). When soybean wine is desired, more sugar is added, and the juice is placed in a warm room to ferment. The fermented juice is then treated as that of other fermented juices.

"This is the first instance we have come across of soybeans being used to make a home brew. The juice is very generally used without fermentation. Taking it all in all we spent a most interesting and valuable day.

"Dr. Seiji Kawase, the director, and Mr. Fujine joined us at a restaurant in the city at 7:00 p.m. for dinner."

Page 2483 (23 Sept. 1929). "We left Obihiro by train at 7:50 a.m., arrived at Ikeda at 8:41 a.m.," changed cars "and arrived at Nokkeushi [Hokkaido], our destination, at 3:38 p.m. Went to the Kurobe Hotel."

"From Takashima until about two hours before arriving at Nokkeushi we saw very many more soybeans than we have previously seen on this trip. The last one and a half or two hours was spent in running through rice paddies."

Page 2505 (27 Sept. 1929). "Morse with the interpreter went to the Kotoni Agricultural Experiment Station to make observations and take notes as to the progress of soybeans and other crops. Dorsett got the Vitacolor motion picture camera and his 3¼ x 4¼."

Page 2605 (9 Oct. 1929). "We left the Yamagataya Hotel about 7:00 a.m. among many 'sayonaras' from the management and nesans ["older sisters" in Japanese], and 'goodbyes' from us. We found... in the six weeks or more we have been here that we have become very much attached to the place and to the nesans."

"We really felt keenly the leaving of our friends, but also hated to leave Sapporo and especially Hokkaido, because we have only pretty well completed but one feature of agricultural activity 'That of soybean Culture.' The other branches of agricultural activity and the field of general agricultural explorations, we have scarcely had time to do more than touch." Address: Agricultural Explorers, USDA, Washington, DC.

2650. Coville, Frederick V. 1929. Soybean cheese. *Science* 70(1812):282-83. Sept. 20.

• ***Summary:*** Describes fermented tofu and its preparation. "It is probable that the Chinese are the best empirical dieticians in the world... At any Chinese restaurant one may obtain, by asking for it with sufficient diligence, a cheese made not from the animal protein of milk but from the vegetable protein of the soybean. Persistence in the asking is usually required, because the Chinese manager of the restaurant keeps this food on hand for his own use. It is only in rare instances that his American customers know or ask for it.

"Soybean cheese is highly salted and its use by the Chinese corresponds very closely to our use of Roquefort cheese. The Chinese do not serve salt on their own tables, but they salt and at the same time season their food by the addition of one of two substances, soybean cheese and soybean sauce... Soybean cheese is excellent when served with salad, meats, vegetables or bread."

"Protein is extracted from the soybean in the form of a milky liquid by a process of grinding, boiling and straining." The protein in this "soybean milk" is coagulated or precipitated to form white curds by adding brine made from impure salt [nigari] containing as impurities magnesium chloride and calcium chloride, in much the same way that cheese curds are precipitated from dairy milk by adding rennet.

From the firmly pressed soybean curds, soybean cheese is made through the process of fermentation described in a forthcoming paper titled "A New Species of Monomucor, *Mucor sufu,* on Chinese Soybean Cheese." The author of this paper, Mr. Nganshou Wai, chief chemist of the National Hygienic Laboratory, Shanghai, is a native of Chekiang Province, China, and was graduated in 1924 from the Japanese Imperial University, Kyoto, where he became especially interested in biochemistry." He then worked for two years in Kyoto in the laboratory of Professor Genitsu Kita, whose studies of fermentation are well known.

"Mr. Wai has isolated from soybean cheese [fermented tofu] a mold which uniformly accompanies the proper fermentation of this cheese." He "has grown the mold in pure culture, and by inoculating fresh soybean curd with it, he has produced soybean cheese of characteristic flavor and texture.

"The original account of the experiments was published in Chinese, with illustrations, in December, 1928, in the Agricultural Journal of the Agricultural College, National Central University, Nanking. Mr. Wai's paper, an abstract of the original, is the first presented in English."

Note 1. See the next issue of the this journal, Sept. 27, p. 307-08.

Note 2. This is the earliest published English-language document seen (Oct. 2011) that uses the term "soybean cheese" to refer to fermented tofu.

2651. Wai, Nganshou. 1929. A new species of mono-mucor, *Mucor sufu*, on Chinese soybean cheese. *Science* 70(1813):307-08. Sept. 27. [1 ref]

• ***Summary:*** "The utilization of fermentation micro-organisms was known so early in China that we can trace it back to the Hsia Dynasty, 2000 B.C... From the scientific point of view, the old manufacturing methods seem to be fundamentally sound. For example, the regulation of temperature, the purity of the culture and the means of pasteurization and preservation are conducted so skillfully that we can not but be impressed with the painstaking and accurate observations on natural phenomena in the past. The application of mono-mucor in the manufacture of 'sufu' is such an example.

"'Sufu' or 'tosufu' is a well-known dish in the Chinese dietary. It is made from soybeans and sold everywhere in groceries." Soymilk is coagulated with brine to make tofu. "The tofu is pressed in wooden molds into blocks of desirable sizes, which are then arranged on bamboo trays and left in the fermentation chamber for about a month. The manufacture of sufu begins in December and ends in February. The average temperature of the fermentation chamber is found to be 14ºC. After this treatment these blocks are transferred to large earthenware barrels, each having a volume of seven hectoliters. Then salt and Shoushing wine are added one after the other to the blocks, mainly for the purpose of preservation. The barrels are

© Copyright Soyinfo Center 2014

finally closed, covered with wooden plates and left unopened for about three months. After this procedure the blocks, having acquired a peculiar flavor, are ready for sale. The products seen on the market are usually red or white blocks 2 to 4 cm square and 1 to 2 cm in thickness. The white ones are untreated, while the red ones are colored with 'hung chu' *ch'ü,* which is derived from the culture of another mold, *Monascus purpureus,* on rice.

"Sufu is manufactured in large quantities in the region of Shoushing [Shaoxing] in Chekiang Province [Zhejiang, a coastal province in central eastern China] and Soochow [Suzhou], Wushih [Wuxi], and Changchow [Changzhou] in Kiangsu Province [Jiangsu, a coastal province in central eastern China]. The native manufacturers know how but not why such flavored sufu is produced. They believe that the fermentation is controlled by one of the gods, to whom they make prayers for its success.

"Early in my research on sufu I found in the fermentation chamber of a factory in Shoushing gray mycelium about 2 cm in height covering the whole surface of the blocks. As I deemed this mycelium to be valuable for scientific research, I made a culture of it on the spot and brought the culture back to Nanking. The mold which produces this mycelium was isolated. It appears to be an undescribed species of Mucor for which the name *Mucor sufu* is proposed...

"From the observations recorded above I conclude that the transformation of tofu into sufu is due to the growth of this Mucor. It is also interesting to note that the mono-mucor on sufu manufactured in Shoushing in Chekiang Province and that in Soochow, Wushih, and Changchow in Kiangsu Province is all of the same species. In ancient times traveling was handicapped by lack of railway connections between Chekiang and Kiangsu nearly three hundred miles apart. It is remarkable that the mold on sufu manufactured in these two provinces should be of the same species, a coincidence of historical as well as biological importance."

Note 1. This is the earliest English-language document seen (Oct. 2011) that uses the word "sufu" or the word "tosufu" to refer to Chinese-style fermented tofu.

Note 2. Usage of these terms seems to be largely confined to the area in and around Shanghai. In Mandarin, this product is widely called *doufu-ru* or *furu* (*pinyin*), *fu-ju* (Wade-Giles), *rufu,* or *dou-ru.* In Cantonese (and in most Western tofu shops run by Chinese–who come from Canton) it is called *fuyu, fu yu* or *funan.* The first Westerner to use the term *sufu* was Walter T. Swingle (1945), a brilliant plant pathologist and plant physiologist with the USDA–as well as an agricultural explorer and sinologist. The first Western microbiologist or food scientist to use the term was Dr. C.W. Hesseltine in his classic 1965 paper "A millennium of food, fungi, and fermentation." From that paper and from the ongoing research on this food by Hesseltine and his co-workers, the term spread rapidly among Western scientists and writers. We feel this is unfortunate, since few Chinese know the meaning of the term *sufu.*

Note 3. Frederick V. Coville, in his article titled "Soybean Cheese" (*Science,* 20 Sept. 1929, p. 283), states, in reference to this journal article, that "Mr. Nganshou Wai, chief chemist of the National Hygienic Laboratory, Shanghai [the same city where the term *sufu* is most widely used!], is a native of Chekiang Province, China, and was graduated in 1924 from the Japanese Imperial University, Kyoto, where he became specially interested in biochemistry. He then worked for two years in the laboratory of Professor Genitzu [Gen-itsu or Genitsu] Kita, at Kyoto, whose studies of fermentation are well known... The original account of the experiments was published in Chinese, with illustrations, in December, 1928, in the Agricultural Journal of the Agricultural College, National Central University, Nanking. Mr. Wai's present paper, an abstract of the original, is the first presentation in English."

Note 3. The mold *Mucor sufu* was renamed (actually, first reported as being identical to) *Actinomucor elegans* in 1965 (See Hesseltine, C.W. 1964. "A millennium of fungi, food, and fermentation"). Address: National Hygienic Lab. [Shanghai], China.

2652. *Chinese Economic Journal.* 1929. Soya beans and bean oil industry in Manchuria. 5(3):791-805. Sept.
• ***Summary:*** "According to their order of importance, the agricultural products of Manchuria are as follows: soya beans, *kaoliang* millet, corn, wheat, barley, rice, buckwheat, hemp, tobacco, cotton, sugar beets and other minor crops."

The yellow bean (*Huang Tou*) is by far the most common, growing in abundance in North and South Manchuria. When the hilum and seed scar is colored white, it is called *Pai Mei* (meaning white eyebrow) *Huang Tou.* When the hilum is golden hued, it is called *Chin Huang tou.* The seed of this variety is almost globular. When the hilum is black, it is called *Hei Chi Tou* or black belly. All the three varieties produce oil and fat, the first two named being specially good for the preparation of bean-curd [tofu], one of the most palatable vegetable dishes of the Chinese.

"The green bean (*Ch'ing Tou*) has two varieties. When the seed is green and the cotyledon is yellow, it is called *Pi Ch'ing Tou.* It is said that this variety yields more legumine in the preparation of bean curd than the two varieties of the yellow bean, but of inferior quality. When the seed, the epidermis and the cotyledon are all green, it is called *Ch'ing Tou.* The hilum of this variety is generally tawny or black.

"The black bean (Hei Tou or Wu Tou) has three varieties: When the epidermis is black and the inside green, it is called *Ta Wu Tou.* It yields oil or fat, and when boiled with millet or rice it is used for food. When the epidermis is black and the inside yellow and of much smaller size, it is known as *Hsiao Wu Tou.* It yields oil, and is used for horse feed, and the refuse for pig feed. When the epidermis is black and the

© Copyright Soyinfo Center 2014

inside yellow, the bean assuming a flattened and elliptical shape, it is called *Pien Wu Tou,* and is used for horse feed, and when pickled for human food."

"Yellow or green soya beans are used in the manufacture of bean curd, a product of universal consumption in China. The by-product, bean milk, which is highly nutritious, is drunk as milk by many Chinese in the morning. The bean-curd skin [yuba], or the scum of the bean milk, is used for culinary purposes, and is greatly relished on the table."

"The most important product of the beans is bean oil, which has contributed in no small measure to the prosperity of Manchuria. It has attracted foreign capital, and the annual export of oil is enormous. there are altogether more than 300 bean oil mills in South and North Manchuria, including steam mills and oil-fashion, small plants. In Dairen there are 60 bean oil mills, of which only two are Japanese owned, the rest being Chinese. While other manufacturing industries have passed into Japanese hands with the acquisition of the Leased Territory of Kwantung. Chinese still retain a firm hold on the bean oil industry. Harbin has about 50 oil mills, two of which belong to Russians, the rest being entirely operated by Chinese. Other centers like Mukden, Antung, Newchwang and cities along the Chinese Eastern Railway, the South Manchuria Railway and fourteen other railways have bean oil mills in varying numbers, which go to make the total number of 300 oil mills. Beans harvested in the C.E.R. and the S.M.R. regions and even in the remote hinterland where only mule carts can go, are finally transported to various destinations in freight cars. Each car contains 52,000 catties of beans, which can produce about 5 thousand catties of oil and 1,000 bean cakes, every cake weighing 46½ catties. The 50 oil mills in Harbin consume annually about 490,000 tons of beans, valued at $35,000,000."

"The steam oil-mill and the old-fashioned mill differ from each other in mechanical equipment and in the number of presses employed. The old-fashioned mill has only one or two presses, while the steam mill has over twenty press machines. The largest having as many as a hundred. The screw press much in use in the former mill consists of a primitive wedge, that is now being replaced by the metal screw. The screw is turned by hand by the man in charge of the machine. In modern steam mills a steam pump operates a hydraulic press that puts great pressure on the prepared beans underneath. As the hydraulic presses are of larger dimensions, the cakes produced are greater in diameter and thickness than those made from screw presses."

2653. Sumiki, Yusuke. 1929. Studies on the saponin of soy-bean. I. *Bulletin of the Agricultural Chemical Society of Japan* 5(6-9):27-32. June/Sept. [Jap]
• ***Summary:*** The author received a large quantity of the alcoholic extraction of soy-bean from the Central Manchurian Research Lab. (*Mantetsu Chûô Shikenjo*). By neutralizing a 70% ethanol solution of free saponin with sodium hydroxide, he isolated from soybeans the sodium salt of a saponin, melting at 222-224ºC and corresponding to the formula $C_{55}H_{80}C_{21}$. The hemolytic power (against horse's blood) of the free soybean saponin was found to be relatively weak compared to standard Merck saponin. Hydrolysis of the saponin yielded the equivalent of one molecule of sapogenin melting at 228-241ºC and corresponding to the formula $C_{32}H_{50}O_3$, together with one molecule each of glucose, rhamnose, arabinose, and an acid which was presumed to be mesoxalic acid.

Note 1. This is the earliest English-language document seen (July 2009) concerning the presence of saponins in soybeans. The author has not yet clearly identified their uniqueness and chemical composition.

Note 2. *Webster's Dictionary* defines saponin (derived from the French *saponine,* which is from the Latin *sapon-, sapo* = soap, and first used in 1831) as "any of various mostly toxic glucosides that occur in plants (as soapwort or soapbark) and are characterized by the property of producing a soapy lather; esp: a hygroscopic amorphous saponin mixture used esp. as a foaming and emulsifying agent and detergent."

Note 3. *Webster's Dictionary* defines glucoside (a term first used in 1857) as a glycoside that yields glucose on hydrolysis. A glycoside (first used in 1930) as any of numerous sugar derivatives that contain a nonsugar group attached through an oxygen or nitrogen bond and that on hydrolysis yield a sugar (as glucose).

The saponin consists of 1 molecule each of sapogenin, dextrose, rhamnose, arabinose, and another substance, possibly mesoxalic acid. Address: Agricultural Chemical Lab., Tokyo Imperial Univ., Japan.

• ***Summary:*** Page 2621-2622 (10 Oct. 1929). On Oct. 9 they arrived in Akita City, Akita Prefecture, Japan, in northeastern Japan. "We got out to the Agricultural Experiment Station between 9 and 10 o'clock, and met the director, Mr. K. Adachi. He is an expert on soybeans as well as director of the Station [at Akita]. He spent something like 8 years in Manchuria studying the soybean there and has published a volume of 1000 pages or so on the results of his work. The title of the book is 'Soybean: Its Cultivation and Industry,' by K. Adachi.

"Mr. Adachi advised that we were in time for the harvesting of soybeans, but that the crop is not yet an extensive one here and that it will be necessary to go out some distance to see farmers harvesting and even then it will not be possible to see the harvesting on as extensive a scale as could be done in a region where soybean growing is more important than it is here.

"Much of the detailed information acquired today in regard to soybean varieties and soybean growing and harvesting is omitted from this report because it will be incorporated in a special soybean report which is in the course of preparation.

"Mr. Adachi is of the opinion that Japan, as in the past, will of necessity have to obtain her proteins from vegetable sources and especially the soybean, for the reason that she does not have the space to produce animals enough to produce animal protein for her population. We are wondering if this to a very large extent is not false reasoning.

"From our observations, during our limited stay and travels in northern Japan, Main Island, and in the Island of Hokkaido, there appears to be immense areas, in the hill and mountain districts, apparently not well or not at all adapted to the cultivation of farm products, but from appearances most admirably suited to animal husbandry.

"We are also wondering if a mixed vegetable and animal protein diet might not be most advantageous to the Japanese nation."

"Mr. Shimade gave us considerable detailed information concerning their trials with soybeans as a green manure in orchard plantings. This information in considerable detail will be incorporated in the special soybean report" [which, so far as we can determine, was never completed].

Page 2629 (11 Oct. 1929). In "Mr. Adachi's room, after the accustomed bowing and greeting, we preceded to get the information on soybeans for which the interview was granted." Previously soybeans were planted after the planting of rice, which normally was the second week in June. This date, however, "proved to be too late as the beans require a longer season for maturing... Largely through the efforts of this experiment station, the farmers growing soybeans have been prevailed upon to plant their beans before they do their rice.

"By planting the first or second week in May the growing season has been sufficiently lengthened to enable the beans to fully mature before frost, which frequently was not the case when the planting of the beans was delayed until after the rice was planted.

"When the old method of planting was in vogue, the yield of beans was from 2½ to 3 bushels to the quarter of an acre. Under the new practice of planting before the rice is planted, the increase in the crop frequently amounts to as much as 30%.

"Planting: Formerly beans were planted thickly in rows about 25 inches apart. The rows now are about the same distance but the beans are dropped so as to stand 4 or 5 inches apart in the row. As a usual practice the rows are opened with a hoe, the beans dropped by hand and covered with a hoe to depth of about one inch.

"Cultivating and weeding: The first cultivation and weeding is when the beans are from two to three inches in height. The second weeding and hoeing is when the plants are 6 to 8 inches in height. The third and final weeding and hoeing is in late June to the first of July. All the weedings and cultivation are by hand.

"Fertilizing: Cow and horse manure are the only fertilizers used in this region in connection with the planting of soybeans. This is used at the rate of 40 to 50 kan (1 kan = 8.27 lbs.) per quarter of an acre. The manure is spread in the rows by hand before the beans are dropped and covered.

"Condition of the beans at time of harvest: In this region, the beans are fully ripe when harvested. The time for harvesting may be determined by the [?]anking of the plants. If the beans rattle in the pod when the plants are shaken, they are in condition to harvest. In the Akita district, soybeans are pulled and laid in small piles on the ground where they are allowed to remain for two or three days depending on the condition of the weather.

"When sufficiently dried, the pile of beans are taken in and stored in a building or under temporary cover, where they remain until after the rice is harvested, threshed, and cleaned. The beans are then threshed. The practice followed in threshing soybeans in the Akita district is primarily that of

© Copyright Soyinfo Center 2014

flailing or beating them out. The farmers do not use rollers in connection with threshing their beans. All litter from the threshing of soybeans, except the pods, which are fed to stock, is burned.

"Diseases and insect pests: Thus far, there is little or no injury resulting to soybeans in the Akita district either by insect pests or fungus diseases.

Storage (p. 2631-2632): Soybeans, in the Akita district, are stored in rice straw bags the same as are used for rice. The weight of a bag of beans is 17 kan [140.6 lb], about 2 to 2½ bushels. Farmers sell their beans direct to merchants and receive for them about Yen 17.00 to 18.00 for 5 bushel. This price, however, depends on the quality, season, and the prevailing price of rice.

Page 2669 (16 Oct. 1929). "This morning Mr. Morse and Mr. Suyetake went to the soybean district outside of Tokyo to get a line on conditions. Dorsett worked at the laboratory with plant material, herbarium specimen and in writing legends and numbering the still pictures made while in Hokkaido, Japan.

"Copied from Mr. Morse's diary: At the Saitama Prefecture Experiment Station located at Urawa, it was found that the soybeans had been harvested. About forth [?] varieties or middle season types are grown at this station and Mr. Hasegawa, in charge of soybean and sweet potato investigations, promised us seed of these varieties.

"It was thought that possibly we might obtain soybean harvesting and threshing scenes in the vicinity of the Tamai Branch Experiment Station which is a breeding station. We went by train to Kumagaya and then by bus to Tamai; along the way no soybeans were noted. In August during a trip numerous fields of soybeans were noted." They were told by Mr. Morihara Nomura that all the soybeans had been harvested. "The farmers in this region get the soybeans out of the way before rice harvest. This is quite different from Akita region" where the soybeans are harvest after the rice. "Mr. Nomura is quite an expert on soybeans and adsuki beans." Address: Agricultural Explorers, USDA, Washington, DC.

2658. Dorsett, P.H.; Morse, W.J. 1929. Whole dry soybeans used as beans in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 2640 (11 Oct. 1929, Yotsugaya, northeast Japan). "One of the principal forages used on the farm is soybean hay and bush clover (*Lespedeza bicolor*). We also learned from the director that soybeans are largely used by the farmers of this prefecture for the feeding of horses in place of oats. For this purpose the beans are soaked over night and 4 or 5 pounds fed to each animal during the day; in addition the horses are also given a ration of [soy] bean hay or some other forage.

Page 3478 (8 Jan. 1930, Tokyo). "This soybean product is sold in tubs in Tokyo small stores. It is named 'Gomoku Mame.' It consists of a mixture of five cooked products, namely: soybeans, lotus root, fish sausage, seaweed and burdock roots. Purchased at a small grocery stand in Tokyo, Jan. 6, 1930. It is eaten just as it is. Product is on bamboo leaf which measures 8 inches long and 5 inches wide" (neg. #44738).

Native name is 'Taikoshi' [seabream candy]. Wholesale price is 8 for 5 sen, Dish of soybeans measures 3 inches across" (neg. #44940).

Page 3942 (19 Feb. 1930, Tokyo). "Wheat flour cakes in the form of rabbits with black soybeans for eyes. Purchased in wholesale confectionary store in Tokyo, Japan, February 18, 1930. Native name is 'Usagikoshi' [rabbit candy]. Wholesale price is 8 for 5 sen. The dish of soybeans measures 3 inches across" (neg. #44941).

Page 4028 (23 Feb. 1930, Tokyo). "Soaked soybeans flattened and covered with dough and baked. Small pieces of [nori] seaweed distributed over the surface. Native name 'Noritsuke mame.' Purchased in confectionary store in Tokyo, Japan, Feb. 22, 1930. Sell for 20 sen per pound" (neg. #44973).

Page 4037 (25 Feb. 1930, Tokyo). "Soybean product #3878. A life sized picture of soaked soybeans flattened, covered with rice dough and baked. Covered with ground seaweed. Purchased in Tokyo, Japan, Feb. 24, 1930. Native name 'Noritsuke mame.' Price 28 sen a pound" (neg. #44982).

Page 4342 (15 March 1930, Tokyo). "A nearby view of soybean products left to right bottom row; #4242, pink color; #4243, white color; #4244, brown color. Images made of millet in the colors noted. The millet is sugared and the eyes are of black soy beans. The images measure 3 inches across and 3½ inches high. The upper row (back view) is of pink and white colored images. Purchased at a stand in the Tamelike Temple grounds. Native name 'Daruma Okashi.' (neg. #45027). Note: Daruma is the Japanese name for Bodhidharma, the Buddhist monk who lived during the 5th/6th century CE and is traditionally credited as the transmitter of Ch'an (Sanskrit: Dhyana, Japanese Zen) to China.

Page 4343. "Life sized picture of small and large images made of sugared millet with soybean eyes... Native name 'Daruma okoshi'" (neg. #45028).

Page 6826 (24 Dec. 1930, Tokyo). "During the day we visited different sections to see if there are any special soybean products put out for the Christmas and New Year celebrations. We found no new special products but did learn that large quantities of the black soybeans which are soaked in syrup are used by the Japanese on New Year's day. This product is eaten at the first meal and is supposed to bring good health during the coming year." Address: Agricultural Explorers, USDA, Washington, DC.

2659. Hollowell, E.A. 1929. Re: Meeting with Dr. Burlison in Urbana, Illinois. Interest in soy bean utilization. Letter to Mr. W.J. Morse, c/o American Consul, Tokyo, Japan, Oct. 23. 1 p. Typed, without signature (carbon copy).

• ***Summary:*** "On a recent trip to the Middle West I had occasion to stop at Urbana, and while there I had some discussion with Doctor Burlison about soy beans. Next year the National Soy Bean Association [ASA] is going to meet at Urbana, and it appears that utilization of the soy bean is the phase of the industry which should be stressed.

"Doctor Burlison is asking our cooperation in assisting him to secure as complete an exhibit as possible of soy bean products. I told him I should be glad to send him the names of all the different manufacturers of the different products we have on file here, and in addition write you asking that you send him as many of the soy bean products as you can secure in Japan. Doctor Burlison is anxious to secure a permanent museum of soy bean products and told me that he would be glad to pay for them, if it is possible to secure them. Of course, we are willing to loan him any of the products which we now have here at the office. However, Doctor Burlison is anxious to secure products which might remain their property."

"With best personal regards, I remain, Very truly yours,..."

2660. Han, John E.S. 1929. Monosodium glutamate as a chemical condiment. *Industrial Engineering and Chemistry* 21(10):984-87. Oct. [9 ref]

© Copyright Soyinfo Center 2014

• ***Summary:*** Contents: Glutamic acid. Properties of monosodium glutamate. Uses as a condiment. Commercial production. Problems of Chinese manufacture.

All proteins yield amino acids when hydrolyzed. When any given protein is hydrolyzed, whether by acid, alkali, or steam, the same amino acids are produced and in the same proportion. *d*-Glutamic acid was discovered by Ritthausen in 1866, when he hydrolyzed wheat gluten with sulfuric acid. It is one of the main constituents of meat and vegetable broths. Ikeda, during his research on the seaweed *Laminaria japonica* (*Jap: kombu*), found that the univalent ion of glutamic acid has a decidedly meatlike taste. It has such an intense taste, that 1 part of monosodium glutamate dissolved in 3,000 parts water is just perceptible to human taste. Thus its flavoring power is 15 times stronger than cane sugar and 7 times stronger than table salt. In 1908 the first patent was issued to Ikeda and Suzuki. In 1909 they applied for a U.S. patent, which was issued in 1912. The inventors emphasized the superiority of monosodium glutamate over shaved bonito (*katsuobushi*), which is widely used in Japanese cooking.

"In China and Japan monosodium glutamate is manufactured on a commercial scale and consumed as a condiment." In East Asia it is widely used to season foods by housewives, restaurants, Buddhists, vegetarians, etc. Monosodium started to be manufactured in China about 8 years ago. In 1928, the Chinese alone used $1,130,000 worth of this condiment. Today monosodium glutamate is sold as "Ajinomoto," which means "the basis of flavor," and is made on a large scale by S. Suzuki & Co. In China, trade names include "Ve-tze-sin," "Gluta," "Aji," and "Chuyu." Substantial and increasing amounts of Chinese-made monosodium glutamate are now exported to the Dutch Indies [later Indonesia], Singapore, the Philippines, etc. Pure monosodium glutamate is currently made in the USA and Europe.

Ikeda pioneered the commercial production of solid monosodium glutamate. "Gluten and soy bean are the preferred proteins and hydrochloric or sulfuric acid the hydrolyzing agent."

Photos show: (1) One of the three plants of the Tien-Chu Factory in China. (2) Furnaces for heating oil at the Tien-Chu Factory. (3) Stoneware vessels for hydrolyzing gluten, China Chemical Works.

A table shows the value of "chemical condiment" imported from Japan and manufactured in China, from 1924 to 1928. "The figures also include a special sauce made from the mother liquor after the crystallization of glutamic acid hydrochloride." The value of the amount made in China increased from $200,000 in 1924 to $630,000 in 1928. The value of the amount imported from Japan increased from $300,000 in 1924 to a peak of $700,000 in 1925 to 1927, then dropped to $500,000 in 1928 due to a boycott of Japanese goods. Address: Y-1065c North Szechuen Road, Shanghai, China.

• ***Summary:*** Chotan soybeans are a variety of soybeans that come from Chotan prefecture in Korea. Address: Kyonggi-do, Seoul, Korea.

2662. Lovell, John H. 1929. Soy bean as a honey plant. *Gleanings in Bee Culture* 57(10):646-48. Oct.
• ***Summary:*** The soy bean "belongs to the same family as the pea, bean, and clovers, plants which produce their seeds in a legume or pod."

"Up to the present time it has been cultivated chiefly as a hay or forage crop; but, with our population increasing twenty times faster than the food production, it must soon become important as a food for the human race.

"Soy beans, before they have fully ripened, may be shelled and used as a green vegetable like green peas. A few hills might well be planted in every garden. They may also be canned and used in winter, or they may be sprouted and the sprouts used like asparagus tips, to which, however, they are much inferior. The dried beans when cooked also make a palatable dish, and more than 100,000 bushels are packed annually by American canning factories. As the seeds are used as a substitute for coffee, soy bean is often called coffee berry."

"By boiling the crushed beans in water a vegetable milk may be obtained, which may be used in making cakes and custards... From the milk a curd or cheese [tofu] is prepared, which is on sale in the Chinese markets of America. This may be flavored with fruits and jams and made into puddings, and used for sandwiches and luncheon novelties.

"But of all the preparations made from the soy bean, none is more widely distributed or better known than soy sauce, a dark brown liquid which in odor and taste resembles a good meat extract. In Japan alone the annual production is more than 2,000,000 barrels. While it is largely consumed by the Chinese and Japanese it has been introduced into both Europe and America and may be purchased at all Chinese markets."

There is conflicting evidence as to whether or not soybean flowers are a source of sugar-rich nectar from which bees make honey. The soy bean plants "grown in my garden, had small inconspicuous flowers, with the corolla hardly visible. They were odorless and apparently nectarless and wholly unattractive to bees. Plants under glass from which all insects were excluded formed pods in great abundance which were well filled with large seeds. The soy bean is self-fertile and not dependent on bees for pollination.

"The flowers, the young leaves, and the stems are densely hairy as can be seen in the illustration [photo], but the older leaves are smoother. The specific name *hispida* was

© Copyright Soyinfo Center 2014

evidently selected because of the roughness of the stems. But this coating of hairs is not sufficient to defend the plants from insect attack."

"If it is honeydew which is stored by the bees from soy bean, then the erratic, scattering and infrequent reports of honey flows would be fully explained." Note: Honeydew is a sugar-rich sticky substance, secreted by aphids and some scale insects as they feed on plant sap.

"Therefore without more reliable evidence than is at present available, the writer does not think that soybean should be ranked as a honey plant."

A photo shows the upper part of a soy bean plant with stems, leaves, and blossoms. Address: Waldboro, Maine.

2663. Yoshida, K. 1929. Extracting oils such as soybean oil by pressure. *British Patent* 341,079. Oct. 29. *

2664. *Daily Advance* (*The*) (*Elizabeth City, North Carolina*). 1929. Story of how soy beans were introduced here is told by Mrs. Outlaw, Sr. C. Wilson Hollowell recalls how they were planted at Bayside; Production of soy beans as farm crop increasing tremendously in America. Nov. 2. p. 1.
• ***Summary:*** "The production of soy beans, first grown as a farm crop in this country in North Carolina 50 years ago, is increasing tremendously according to an article by Harry R. O'Brien in the November [1929] issue of the Country Gentleman.

"In 1917 it was estimated that there was a total acreage of 500,000 which by 1928 had grown to 3,000,000...

"The story of the introduction of the first soy beans into the Albemarle is told by Mrs. E.R. Outlaw, Sr., of Riverside Drive [Elizabeth City], whose husband received some which had come from Japan in the 1880's, and began to raise them on his farm in Bertie County. Japan peas is what they were called then and Captain Outlaw sent a flour bag full of them to C.W. Hollowell of Bayside [on "Dec. 23, 1886" is penned in by hand by Margaret Hollowell].

"C. Wilson Hollowell of this city [Elizabeth City] remembers when his father first received the seed and planted them on his farm. He thinks that it was in about 1885. Mr. Hollowell raised soy beans every year afterward, and as there were no harvesting machines for them then they were cut and threshed in a cradle, and the beans used for feeding the farm mules through the winter, it being found that with the beans it was unnecessary to use corn."

Note: At the bottom of the article pasted in her scrapbook titled "Who am I?" Margaret Hollowell has written: "Lucy R. Outlaw (now Mrs. Samuel Wheeler Worthington) brought the bag of 'Japan peas' to C.W. Hollowell when she came to spend Christmas holidays with Mr. H."

2665. Morse, W.J. 1929. Re: Impressions of Korea. Agricultural exhibition. Suigen experiment station and Dr. Nagai. Letter to R.A. Oakley, Office of Forage Crops, USDA, Washington, DC, Nov. 3. 3 p. Typed, with signature on USDA letterhead.
• ***Summary:*** "Just a few word to let you know that I am still in the land of this living but this is sure a strenuous life." Morse arrived in Keijo (Seoul), Chosen, the morning of Oct. 23. "The conditions in Korea, or Chosen, as they now call it, are quite different from those we have observed in other parts of Japan. This is surely one poor country, not only from the point of view of soils but also the people... at first it was very interesting to us to see the men in their funny 'happy Hooligan' hats and both the men and women dressed all in white.

"The Korean Agricultural Exhibition was still on when we reached here so we spent two days studying the agricultural products of the different prefectures of Chosen as well as some of the products from other parts of Japan... We also found a very large exhibit of soybean varieties from all over Chosen. It was the largest and nicest collection that I have ever seen. There were between four and five hundred samples and as many more of adsuki beans, mung beans, sorghums and millets." Through the American Consul–"We went to see the Japanese in charge of the agriculture exhibits and we were promised the seed desired. Mighty busy times ahead for several folks.

"We have been down to see the Suigen experiment station which is about an hour's run on the train from Keijo. This is the main station of Korea and surely is a fine one. We found that they are doing a very large amount of work with soybeans and have in the past few years tested out about one thousand varieties."

"We do not know just how long we will be in the 'Hermit Kingdom' but it is getting rather cold..."

"We are stopping at the Chosen Hotel which is a government railway place. When coming in the lobby the other night a man rushed up to me and called me by name. It was Dr. [Nikolai] Vavilov, Director of Applied Botany, Leningrad, Russia and whom I had met two or three times in Washington. He was touring Japan and had spent time in China and Turkestan... We went out to the Suigen [agricultural experiment] station with him and had quite a visit.""

2666. *Nature* (*La*) (*Paris*). 1929. Le lait végétal japonais [Japanese vegetable milk]. 57(Part 2):476. Nov. 15. [Fre]
• ***Summary:*** Describes how to make soymilk in three steps. 1. Soak the soybeans for 24 hours, in pure water, free of

© Copyright Soyinfo Center 2014

limestone / calcium, stirring often.

2. Grind the soybeans (made soft through soaking) coarsely using a wood mill, then put the ground material (*ce mortier*) back in the soaking liquid where it must be stirred often for the next 24 hours.

3. Finally, press this paste (*pâte*) hard with a filter-press; the extracted liquid resembles milk and smells like malt; the product, that by its physical properties to cow milk, contains 3.13 percent casein and 9.89 percent lipids (*matière grasse*) which, however cannot be churned / whipped (*le battage*) into butter (Note 1: *barrate* is an old French term indicating a pot with a stick in it to stir the milk and make butter). It however can be made into cheese which, through special ferments, can be assigned the desired flavor. Further more, this soya milk (*lait de Soja*), being rich in phosphates, is particularly recommended for the feeding of children, according to a German Doctor.

Note 2. This is a poor description of how to make soymilk.

2667. Dorsett, P.H.; Morse, W.J. 1929. Okara in Chosen [Korea] and Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. • ***Summary:*** Page 3043-3044 (21 Nov. 1929). In Keijo, Chosen [Seoul, Korea]. A photo (p. 3045) shows a metal pan piled high with round white "Balls of the refuse after making Tofu" [okara] (neg. #44610).

Page 3499-3500 (9 Jan. 1930). Tokyo, Japan. A photo (p. 3500) shows: "A wagon load of Tofu curd residue being carted off for stock feed. View on a street near the Sankaido Building."

Note: This is the earliest document seen (June 2013) that uses the term "refuse after making Tofu" or the term "Tofu curd residue" to refer to okara. Address: Agricultural Explorers, USDA, Washington, DC.

2668. Morse, W.J. 1929. Re: Collection of soybean products. Dr. Burlison. Korea. Soybean variety collections. Letter to Dr. E.A. Hollowell, Office of Forage Crops, USDA, Washington, DC, Nov. 21. 2 p. Typed, with signature on USDA letterhead.

• ***Summary:*** "Dear Holly: I have your letter of October 23 with reference to your visit to the Middle West and the discussion with Dr. Burlison concerning soybean products. I note that you say we are willing to loan him the products which we have at the office. Holly, I have had quite a bit of experience in the loaning of products and also enlarged pictures for special exhibits and I must say that most of such experiences have not been very pleasing, in spite of the many promises made. Many of the products and even the pictures were never returned, and more were broken or spoiled through lack of proper care. I have taken quite a little trouble to collect the various products we have on hand and it would be extremely difficult to duplicate many of them. Therefore, I think it the best plan not to loan out our products, for I have in mind to have in our office one of, if not the best, collection of soybean products in the world..."

"With regard to the products that I have sent in so far from the Oriental trip, I have written Oakley that he have Mrs. Donavan [Verna; Morse's secretary] and Miss Cruickshanks place them in the case in their room as the products are received. I am sending them in tins as much as I am able to or in other sealed boxes. I have asked that they be set aside thus so that they will not be opened until my return. After my return I want to have uniform containers to place the various products in and properly labeled... I wish, therefore, that you would also keep a kindly eye on these various products coming in from time to time to see that they are taken care of as I wish until my return. when I can fix them up for a permanent exhibit. I am sending duplicates of all, for if I sent only one there would be sure [sic] something happen to it. I wish the duplicates taken care of the same as the other."

"If Dr. Burlison, we can send him numerous products from Japan for Tokio seems to be quite a center for the manufacture of soybean products."

"We are finding Korea one big soybean country and we are getting so loaded up with the native varieties that I do not know 'where I am at.' The station at Suigen will already have for us on the 25th inst. samples of one thousand numbers. The station at Shariin is going to send us more than two hundred numbers. Various stations in Japan are sending in their best varieties this winter so I do not know where this variety business will end."

"In Korea one sees very few horses, for bulls are used almost entirely as beasts of burden. My point is that boiled soybeans are used as feed for these animals. The

© Copyright Soyinfo Center 2014

boiled beans are mixed with chopped rice or millet straw or sometimes kaoliang stalks. In fact the whole mixture is boiled. In Japan soybeans are rarely used for cattle feed. In the northern prefecture [sic] the boiled beans are quite extensively used for horse feed, especially the stallions. I do not know how many note books I have full of soy notes and only hope that I can find time to get them in ship-shape. We also have a great collection of movie film and still pictures from the planting to harvesting, threshing, marketing, and shipping, and also on to the manufacture of many products."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 93–Morse-Napier. Folder–Morse, W.J.-#4 F.C.I.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Agricultural Explorer, Keijo (Seoul), Chosen / Korea; c/o American Consulate, Tokio, Japan.

2669. Dorsett, P.H.; Morse, W.J. 1929. Year's end in Tokyo, Japan. Early 1930 in Korea (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 3341 (24 Dec. 1929). "Today Morse and Suyetake went to call upon soy sauce and natto manufacturers for the purpose of getting acquainted and also if possible arrange for getting still and motion pictures of their plants, equipment and operations.

"Dorsett worked at the office packing seed and making packages to go in the next outgoing diplomatic pouch..."

"The streets of Tokyo are a-blaze with colored banners, price lists, decorations and gaily dressed women and children." All this in preparation for the New Year. "The streets and stores are packed from early morning until late at night.

"At the Matsuya Department store on the Ginza, they have a spruce Christmas tree in the stairway well which looks to be fully... 50 feet or more in height. It is really very attractive and beautiful."

Page 3369 (31 Dec. 1929). "Introduction cards were finished on the 1,003 samples of soybeans secured from the Suigen Agricultural Experiment Station, Suigen, Chosen [Korea]. These samples showed a wide range in size, color and shape of seed, and also in the color of the hilum. Some most excellent and interesting varieties are included in this collection.

"One of the most interesting is a very small seeded yellow sort, the seed being about the size of a mung bean. This is the smallest seeded variety of soybean we have ever seen and it should prove valuable as a bean for sprouting. We are in hopes that in this collection will be found the high oil strains for our oil mills and low oil strains for our hog and cattle feeders in the United States. All in all we consider the collection the most interesting and valuable in our exploration work thus far." Address: Agricultural Explorers, USDA, Washington, DC.

2670. Chung, H.L.; Ripperton, J.C. 1929. Utilization and composition of Oriental vegetables in Hawaii. *Hawaii Agricultural Experiment Station, Bulletin* No. 60. 64 p. Dec.

• ***Summary:*** Soybeans are discussed as follows: (1) Large or soybean sprouts (*Glycine hispida*) (p. 3-4). Chinese name: Dai-tau-nga. Japanese name: Not given. A photo shows these sprouts, together with "Small or mungo bean [mung bean] sprouts (*Phaseolus aureus*). The stem and root are 3 to 3½ inches long. "The large bean sprouts are prepared daily for the vegetable market in Honolulu. The sprouts are obtained by germinating the soybean" for 4-6 days. "The beans are washed, submerged in water in a container for 24 hours, and then drained. A damp cloth, sack or grass-woven mat is placed over the container. A fresh supply of water is added to the container at 6-hour intervals during the 24 hour period to prevent the beans from heating. In the market the sprouts are kept submerged in water so that they may retain their crispness and succulency." A recipe is given for "large bean sprouts" with pork.

Green soybeans in the pods (p. 42-43). Chinese name: Chang-wong-tau. Japanese name: Daizu or soya mame. This "is a rather unusual Orient-grown vegetable. Unlike the snap bean, green soybeans are sold in their pods attached to the plant. The plants with their pod-laden branches are tied in bunches of 4 to 10. Each plant is about 15 inches long and has very hairy stems and leaves. The pods also are hairy and are borne in clusters. Each pod contains three to four seeds. The soybean is an all-season crop in Hawaii. It makes its best growth, however, in April. It requires about 75 days from the date of planting to reach the green-pod stage."

"*To cook plain.*- Wash one-half pound fresh soybean pods, and boil until they are soft. Season with soy sauce and sugar, and serve in the pod. The beans are removed for the pods when eaten."

A photo shows two uprooted soybean plants with pods attached.

Other vegetables of interest are also described, each with a photo: Ginger bracts (*Zingiber mioga*). Japanese name: Mioga (p. 12). Mugwort (*Yomogi,* p. 19). Perilla (*Perilla frutescens*). Japanese name: Shiso (p. 20). Cowpeas (*Vigna sinensis*). Japanese name: Sasage. Goa beans (*Psophocarpus tetragonolobus*). "Although the Goa bean, also known as asparagus pea and winged bean, has long been known and used in the Orient, it has only recently been introduced into Hawaii, where it is as yet little known" (p. 40). Chinese name: See-kok-tau. Japanese name: Not given. Note:

© Copyright Soyinfo Center 2014

This is the earliest document seen (Aug. 2006) giving the name "winged bean" as one of the names of *Psophocarpus tetragonolobus.*

Kudzu (*Pueraria thunbergiana, P. hirsuta, Dolichos japonica*). Chinese name: Fan-kot. Japanese name: Sasage. Oriental radish (*Raphanus sativus longipinnatus*). Chinese name: Loh-bak choi. Japanese name: Daikon. Yam (*Dioscorea batatas*). Also known as Chinese yam, Chinese potato, and cinnamon-vine. Chinese name: Tai-sue. Japanese name: Naga-imo.

In the section titled "Composition" (p. 57-63), tables give nutritional analyses of all foods discussed in this bulletin, including calcium, phosphorous, iron, and "alkalinity" (expressed as cubic centimeters of normal acid solution required to neutralize excess of base per 100 grams of fresh vegetable). The analysis of the green soybeans is with the pods removed. Address: 1. Agronomist; 2. Chemist. Both: Honolulu, Hawaii.

2671. *Gazette* (*Indiana, Pennsylvania*). 1929. Soybeans.
• ***Summary:*** This article seems to be based on a USDA press report of early 1929: "W.J. Morse, forage-crop specialist, Bureau of Plant Industry, U.S. Department of Agriculture, who has been in Japan for several months collecting new varieties of soybeans, reports that to date he has collected more than 5,000 lots, representing every type of soybeans grown in Japan."

"Samples from every lot of seed collected by Mr. Morse will be planted at the United States experiment farm at Arlington, Va. [Virginia], this spring, and when the seed is harvested tests will be made for oil content. In this way it is hoped that selections may be made which will ultimately develop into varieties with a wide range of oil content.

"Mr. Morse writes that the Japanese use the soybean in a number of ways in their diet. They grind the beans and make flour, they serve the green beans as we would green lima beans, and they cook the dried beans in a manner similar to navy beans. Besides this, they make soy sauce, soybean curd [tofu], beverages, and bean sprouts from the soybean. He believes that the use of soybeans as a human food in this country will increase steadily.

"Mr. Morse is now spending the winter in Tokio [sic], studying the Japanese methods of utilizing soybeans. While he expects soybeans to grow in favor as a feed for livestock and food for people, he feels that the largest future development of the crop in the United States will be in the utilization of the oil and meal in industry.

"Samples of the seed collected in Japan will be sent to some of the State experiment stations for trial, but will not be available for distribution to individuals."

2675. N.I. Vavilov's collection of soybeans in 1927 and 1929. 1929.
• ***Summary:*** From 1927 to 1929 N.I. Vavilov collected soybeans in four countries; these soybeans are now at the VIR (N.I. Vavilov Research Institute of Plant Industry, St. Petersburg, Russia). Information about these trips and soybean collecting was sent to Soyinfo Center Irina Seferova, Soybean Collection Curator at the VIR.

(1) Trip to Italy on business. Vavilov obtained 1 accession from Japan (number k-602).

In early June 1929 Vavilov left on a trip for East Asia. "In a whirlwind tour of western China, Japan, Formosa (now Taiwan) and Korea, he collected 3,500 kilograms of seed and Herbarium samples and also several thousand photographs of the farming and geography. He did not return until December. He concluded boldly that the crop diversity in these countries was 'wholly unique, that the cultivated plants were absolutely atypical, that the cultivation techniques were unmatched and that the ancient cultural center of East Asia was completely independent with its uncommon plants species and genera..." (Pringle 2008, p. 150)

(2) On his trip to Chinese Turkestan (western China), Vavilov, who was head of the expedition, collected 15 soybean seeds (numbers k-2944–2946; 3017-3028). The table also states: "Coll. Popov M.G."–meaning that M.G. Popov (Mihail Grigor'evich Popov) was a member of the expedition and also collected soybean seeds.

(3) On his trip to Korea, Vavilov collected 41 soybean seeds (numbers k-2949–2989).

(4) On his trip to Japan, Vavilov collected 30 soybean seeds (numbers k-2990–3016).

In total, on these four trips, he collected 87 soybean accession from East Asia.

The sequence of these trips was as follows (Irina Seferoa, Dec. 2010, personal communication): "Vavilov visited Japan in October 1929. Then he visited Korea and Taiwan (China). In November he returned to Japan, then left for the USSR. It was a business trip or expedition." Address: St. Petersburg, USSR.

2697. Mashino, I.M. 1929. Soybean oil extraction. *J. of the Society of Chemical Industry, Japan* 32:256B. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]*
• ***Summary:*** The residue after the extraction of soybean oil with an azeotropic mixture of hydrocarbons and lower alcohols is suitable for the raw material of foodstuffs. After extraction at 40-50ºC with a mixture of gasoline and methyl alcohol, the azeotropic mixture separates into two layers: The upper, gasoline, layer contains soybean oil; the alcohol layer contains carbohydrates, phosphatides, coloring matter, and other impurities. The lowering of the separation temperature increased the concentration of the oil in the upper layer, which process is also aided by the water content of the soy bean.

Talk with Walter Wolf, PhD. 2002. July 28. Lower and higher alcohols depend on the chain length. The following are the first seven in the series, from lower-chain to higher-chain length: As the chain length increases, so does the boiling point. 1. Methanol–a single carbon alcohol. Methane is the hydrocarbon gas. 2. Ethanol is a two-carbon alcohol. 3. Propanol. 4. Butyl alcohol. 5. Pentyl alcohol. 6. Hexanol. 7. Heptanol.

2698. Mashino, Minoru. 1929. The purification of soybean protein. II. Influence of water on the purification by lower alcohols. *J. of the Society of Chemical Industry, Japan* 32:312B-23B. (Chem. Abst. 24:2152). Supplemental binding to Kogyo Kagaku Zasshi. [4 ref. Eng]*
• ***Summary:*** The amount of carbohydrate extracted from crude soya-bean protein by aqueous methyl or ethyl alcohol increases with increasing dilution until it reaches a maximum at 70% or at 40% alcohol, respectively. The crude protein extracted also increases with increasing dilution, about threefold and tenfold with the respective solvents.

2701. Okano, V.K.; Ninomiya, M. 1929. [Denaturation of the protein in soy beans during the extraction of oil with alcohol]. *Minami Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) 14:7-9. (Chem. Abst. 25:1694). [Jap]*
• ***Summary:*** The protein matter is denatured by the action of alcohol, heat, and steam, the latter being blown into the grains to recover the solvent. The relative proportions of protein soluble in water, in 10% sodium chloride solution, and in 0.2% caustic soda, contained in soy bean after extraction with alcohol, benzine, or alcohol-benzine mixtures have been determined. It is shown that the water- and brine-soluble fractions decrease, while the alkali-soluble and the insoluble fractions increase. The change produced by steaming is similar and is proportional to the duration and the temperature of the steaming. No change in the amino-acid partitions of the raw bean and the grist could be detected, and digestion of the purified protein with pepsin and trypsin revealed no significant differences in the various preparations.

2703. Otomo, Sajiro. 1929. [Occurrence of vitamins A and B in soybean oil and cake]. *Minami Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) 14:13-15. [Jap]*
• ***Summary:*** Soybean oil has been shown to contain a definite amount of vitamin A, although it is less effective than cod-liver oil. Oil obtained by extraction was richer than the expressed oil. The vitamin is destroyed by bleaching. Soybean cake does not contain any appreciable amount of vitamin A, but does contain vitamin B.

2704. Otomo, Sajiro. 1929. [Nutritive value of soybean cake and purified soybean cake]. *Minami Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) 14:10-12. [Jap]*
• ***Summary:*** Although the protein constituent of soy beans is denatured by the extraction of oil, it has been found that the cake still possesses nutritive value. Solvent-extracted cake is of less value than the expressed, and purified cake than the original. Artificial digestion with pepsin and trypsin showed that the nutritive value is lowered by alcoholic extraction.

2705. Otomo, Sajiro. 1929. [The proteins and vitamins in the embryo of the soybean (Abstract)]. *Manimi Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Company, Central Laboratory Report*) p. 15-17. (Chem. Abst. 25:1871). *

2706. Sasaki, S. 1929. [Mummy disease of black spot of soybean]. *Annals of the Agricultural Experiment Station, Government-General of Chosen* 4:1-28. [Jap]*
• ***Summary:*** The disease is due to a *Phomopsis,* the imperfect stage of *Diaporthe sojae* (=D. paseolorum var. sojae). Symptoms and morphology of the fungus are fully described.

2707. Sato, Masanori; Seto, I. 1929. Separation and recovery of phosphatides and carbohydrates from alcoholic extract of soya bean (Abstract). *Abstracts of Reports, Central Laboratory, South Manchuria Railway Co.* (*Dairen, Manchuria*) p. 6. *

2708. Sato, M.; Sakai, H. 1929. [Extraction of soybean oil with alcohol. II. (i) Solubility of soybean oil in alcohol]. *Minami Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) 14:1-3. [Jap]*
• ***Summary:*** The optimum concentration of alcohol for the extraction is 92 weight-% or over and the temperature should be near the critical solution temperature. After extraction, cooling to 30ºC gives the most efficient separation of oil.

Note: This is a very early article on alcoholic extraction of oilseeds. One of the authors made measurements on the mutual solubilities between soybean oil and ethyl alcohol, and developed a new idea of the oil extraction process, in which the oil is extracted in the hot state and separated into two layers upon cooling the miscella. Address: Dep. of Organic Chemistry, The Central Laboratory, South Manchuria Railway Co., Dairen.

2709. Sato, M.; Yokochi, M. 1929. [Extraction of soybean oil with alcohol. II. (ii) Extraction of soybean oil with alcohol]. *Minami Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) 14:3-6. [Jap]*
• ***Summary:*** Extraction is best carried out with 96 volume-% of alcohol at temperatures above 75ºC, the extract being cooled to 25Cº to separate the oil. An apparatus for large-scale operation is described.

2710. Sato, M.; Seto, I. 1929. [Extraction of soybean oil with alcohol. II. (iii) Separation and recovery of phosphatides and carbohydrates from alcoholic extract of soy beans]. *Minami Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) 14:6-7. [Jap]*
• ***Summary:*** On cooling after extraction with alcohol, the alcoholic layer contains 1.07% phosphorus, 1.27% nitrogen, and 27.53% carbohydrates (as invert sugar), the total representing about 6% of the soy bean. As methods of recovery, alcoholic extraction, alcoholic distillation, and coagulation with sulfuric acid and with calcium chloride were tried. Distillation with added alcohol gave the best recovery (carbohydrates 91.5%, phosphatides 96.8%), but coagulation by calcium chloride was probably the most practical (carbohydrates 82.7%, phosphatides 90.8%).

2717. Ferrée, Christian Johan; Tussaud, J.T. 1929. The soya bean and the new soya flour. London: William Heinemann (Medical Books) Ltd. xi + 79 p. Illust. No index. 22 cm. Revised translation from the Dutch by C.J. Ferree and J.T. Tussaud of Die Sojaboon en Duurzaam Sojameel. [29 ref]
• ***Summary:*** Contents: Foreword, by Sir Wm. Arbuthnot Lane, President of The New Health Society. Preface, by C.J. Ferrée (London). 1. Introduction. Literature. Name of the plant. Origin. Botanical particulars. Assimilative power of the soya plant. Inoculation. Soil requirements. Production and cost. 2. General ingredients of the various Manchurian beans. Composition. The value of soya protein. Vitamin in the soya bean. Digestibility of the soya bean and its products. 3. Use in China and Japan: Bean sauce, soy, or shoyu, Chinese chiang (paste), tou-fu or beancurd, beans consumed as a table vegetable, bean refuse and bean cake are used as a fertiliser and for fattening hogs, bean oil is used as an illuminant (where it has not been superseded by kerosene), as a substitute for lard in cooking, and as a lubricant for greasing axles and parts of native machinery, miso and natto. First imports into Europe. Exports during the last five years from China and Japan. Imports during the last five years into Europe and America. The increasing rate of its cultivation. Manchuria–Production. Estimate of the world's production of the soya bean. London the principal market. Future importance.

4. America. Australia. South Africa. Other British possessions and protectorates. Java (Dutch East Indies). Europe. 5. Unsuccessful experiments with soya flour. Ordinary soya flour. Extracted soya flour. Dr. L. Berczeller's discovery. The new soya flour. Comparison with other cereal flour and other foods. Comparison in price with other cereal flour and other foods. Comparison in price of soya protein compared with other cereal foods. Comparative analysis of cereals. 6. Soya milk. Vegetable casein. Lecithin. 7. Increase in food value. Savings. Industrial application in foodstuffs. The importance of Dr. L. Berczeller's soya flour for the food industry. Soya flour and the food laws. Uses of soya flour in: Bread, pastry, cake, biscuits, confectionery, sausages, infant foods and food for invalids, cocoa, chocolate, soup cubes, pudding flour. Uses in the kitchen. Soya flour recipes (for flour made using the Berczeller process), soya flour for diabetics, recipes for diabetics.

The Preface states: "In the following pages the writer has endeavoured to give an account of the numerous uses to which the soya bean has so far been put, and to visualise its future service to humanity through the means of a totally new and practical process by which this legume... may in future be used as an important article of food for general consumption throughout every quarter of the globe.

"In compiling the details relative to the soya bean flour, with which this brief summary principally deals, he trusts that he has succeeded in giving sufficient data to enable the reader to fully realise its value as a staple food from the economic point of view, as well as from the more domestic standpoint, so that the important fact may be fully realised that a new foodstuff of a very valuable nature... has now been brought within the reach of all nations to serve them in a most practical manner as an economic article of food."

The book includes statistics on the imports and exports from 1923 to 1927 of "soya beans, soya oil, and soya cake in various countries including China, Japan, England, France, Germany, Holland, Norway, Denmark, Sweden, and USA.

The "new soya flour" is that developed by Dr. Berczeller. This book repeatedly praises that flour. "A few years ago Dr. Laszlo Berczeller, a Hungarian physiologist in Vienna, succeeded scientifically in finding a method which enables us to prepare from the soya bean a digestible and pleasantly flavoured flour without detracting from its nutritive value, and this method entirely succeeds in preserving all the good qualities contained in the bean itself. Physiological experts and analysts withhold no praise, as the following extracts will show: -" There follow words of praise from: (1) Dr. Alfred Schwicker, M.P., Royal Hungarian

© Copyright Soyinfo Center 2014

State Institute, Central Depot for Experimental Chemistry. (2) Dr. Stefan Weisser, King's Counsellor, Royal Veterinary Physiological Experimental Station, Budapest. (3) Prof. A. Durig., The Physiological Institute, University of Vienna.

Marakujew (1928) estimates the production of soya beans in "Manchuria at 6 million tons at the utmost, the production of the whole of China at 16 million tons, and he is led to this figure by the conclusions of the Economic Bureau of the South Manchuria Railway, which estimates that the Manchurian crop in 1927 amounted to 37.1 million kobu (5.88 million English tons), of which 2.6 million tons originated from South Manchuria, 3.3 million tons from North Manchuria" (p. 32). A table (p. 33) gives estimated world production of soya beans from 1923 to 1929 (6.6 million tons, forecast). The leading producers in 1929 (in million tons) are: China 5.250. Japan 0.580. USA 0.250. Java and Dutch East Indies 0.120. Other Asiatic countries 0.400. A soya milk factory was recently established in Denmark (p. 54). Although this book contains a bibliography of 29 references, most are very incomplete.

Photos show: (1) A soybean plant with roots, pods, and leaves. (4) Nodules growing on soybean roots. (5) One pod and seed each from inoculated and uninoculated soybean plants. (7) An immense field of soya beans in Manchuria. (8) Soya beans awaiting shipment, in house-shaped stacks under tarps, at Dairen. (13) Seeds of the most important varieties of soya beans now grown in the United States. (10) Two horses and a farmer cultivating a field of soybeans. (11) Harvesting soya beans. (12) Well selected, clean soybean seeds.

A map (frontispiece) shows where soybeans are cultivated worldwide. An illustration (facing p. 2) shows "Shen-Nung. Emperor [of China] in 2838 Before Christ, called 'The Heavenly Farmer.' Reproduced from a print in a Vienna museum."

One bar chart compares the nutritional composition of soya flour with that of cereals and animal products, and other foodstuffs (p. 13), another compares the calories (p. 46), and a third compares the cost of 1,000 calories (p. 48). Marakujew (probably spelled Marakiev or Marakuyev), in "The Export of Manchurian Soya Beans and its Finance" (1928, in Russian, probably an article rather than a book) "estimates the production of Manchuria at 6 million tons at the utmost, the production of the whole of China at 16 million tons, and he is led to this conclusion by the Economic Bureau of the South Manchuria Railway, which estimates that the Manchurian crop in 1927 amounted to 37.1 million kobu (5.88 million English tons), of which 2.6 million tons originated from South Manchuria, 3.3 million tons from North Manchuria. According to the calculations of this bureau, the home consumption of North Manchuria is something like 40 per cent. of the production, viz., 1.3 million tons; the remaining 2 million tons are for export. The exports of South Manchuria were estimated at 1 million tons" (p. 32). Address: London.

• ***Summary:*** "From our correspondent. Tokyo, December 10." Japan is preparing to return to the gold standard. Wholesale prices continued to move downward last month. But Japanese prices are still about 20% higher than British or American prices. "The higher Japanese price level is accounted for largely by such 'sheltered' goods as red beans [azuki], miso, dried bonito, Japanese paper, mattings and tobacco (Government monopoly), prices of which, in most cases, are kept high for special reasons" (p. 24, col. 1).

• ***Summary:*** Pages 3465-67 (7 Jan. 1930). "Today we really got started on our work of looking up and getting information about soybean products. In accordance with plans made yesterday, we left Tokyo this morning (Ueno Station) at 8:15 for Noda-Machi, Japan, where we arrived at 9:45. We went direct to the office of The Noda Shoyu Company, Ltd., of Noda-Machi, Prefecture of Chiba, Japan, makers of the famed Kikkoman Shoyu.

"This company embracing 19 plants, is one of, if not the largest plants in the world brewing shoyu sauce. According to their literature, Kikkoman Shoyu was first brewed by Mr. Saheiji Mogi, in the second year of Meiwa [sic, Hoei?] (corresponding to the year 1704) in Noda-Machi, Japan.

"We met Mr. Ota, one of the assistant directors, we also met Mr. Hichizaemon [Shichizaemon] Mogi, President and Director, also a Mr. Jutaro Namiki. We spent about 1½ hours with these gentlemen in the office. Then Mr. Ota and Mr. Namiki showed us over one of their large plants. It impressed us as an up-to-date modern institution. We were in the grading and mixing room. They have 30 incubating chambers or curing rooms where the germ on the 50-50 mixture of soybean and wheat mash is grown.

"The cement vats, or aging vats, of which there are 1,500 under one roof, are made of cement and are 12 feet square and about 8 feet in depth.

"In the manufacture of shoyu sauce, this concern uses annually about 20,000 bushels of soybeans, primarily from Manchuria, and also 20,000 bushels of wheat, Japanese grown when available. They import from Australia. This year, however, they are getting their supply of wheat from Canada.

"They have 200 square (about 4 ft. by 4 ft.) hydraulic presses and 200 oblong ones about 4 ft. by 6 ft. They age their shoyu sauce 1½ years in the curing vats."

Page 3466-68. Photos show: (1) Racks of small trays, outdoors, each about 2 inches deep, 18 inches long, and 10-12 inches wide, used to cure soybean and wheat mash [koji] for making shoyu sauce (neg. #44709). (2) A nearby view of the interior of one of the small trays (neg. #44710). (3) Many round bundles of cask stock of spruce, stored outdoors. The wood will be used to make kegs for storing shoyu sauce. A part of one warehouse of the Noda Shoyu Co. is in the background (neg. #44711). (4) A horse pulling a cart on a railroad track. On the cart are bundles of spruce stock that will be used to make soy sauce casks (neg. #44712). (5) A nearby view of portions of ricks or bundles of short pieces of spruce for staves, tops and bottoms of small casks for shoyu sauce (neg. #44713).

Page 3474. A 5 by 7-inch photo (taken Jan. 9) shows: 1. Small bottle (with label) of soy sauce made by Noda Shoyu Co., and materials used in its manufacture. 2. Salt from Formosa. 3. Mixture of boiled beans and crushed roasted wheat with white mold [shoyu koji]. 4. Mixture of boiled soybeans and cracked wheat after one day in fermentation room. 5. Cracked roasted wheat. 6. Roasted wheat. 7. Wheat (Canadian). 8. Soybeans (Manchurian variety). (neg. #44734).

Page 3974-75 (Feb. 21). Visit Sendai Miso Jozo Jo, Sendaitenai, Oimachi, Tokyo. "Learned that much of their miso for local consumption is only aged for a week or ten days to two weeks, but that Miso for export trade to Canada, the United States and other countries is aged much longer, a year or more. This concern uses annually about 50,000 bushels of soybeans and an equal amount of rice for making Miso–plus 25,000 pounds of salt. Their yearly output is about 12,000,000 pounds. The wooden casks used to pack the Miso contain 200 pounds net weight and sell wholesale at Yen 10.00 to 13.00 per cask. For shipment abroad they use the standard 4½ gallon soy sauce wooden cask. It has a capacity of about 40 pounds and sells delivered at San Francisco at Yen 2.50 to 3.00 per cask."

Pages 3978-79. Photos taken at Sendai Miso Jozo in Tokyo show: (1) Steamed rice spread on out rice straw mats in a wave pattern covering the entire floor of a large room.* After cooling, rice bacteria (Koji [sic, koji starter]) is added, and after three days the malted rice is mixed with boiled or steamed soybeans in the making of soybean miso. (2) Miso mashing tubs (*usu*) used for mashing boiled soybeans when making miso.* Each tub is made from a hollowed tree trunk and first used by Lord Governor Date in the "Year of Kaiei" about 300 years before the start of the Meiji Period (in 1868). Note: Daté Masamune (DAH-tay Mah-sah-MU-nay; lived 1567-1636) of Sendai was the first Japanese to make miso in a factory, starting in the early 1600s.

• ***Summary:*** Page 3469 (8 Jan. 1930). Tokyo, Japan. "Worked at the office until about 10 or 10:30 then took our camera and went out to get pictures and information about Tofu, soybean curd.

"We visited a place not more than half a dozen blocks from the Sankaido Building and got a nice lot of information about making tofu. Also secured a few pretty good pictures.

An elderly Japanese lady fried (or seared as we would say) the cakes about 3 by 9 by ½ to ¼ of an inch in thickness, over a charcoal fire [to make grilled tofu or *yakidofu*] on the street or side walk in front of their house.

"Detailed information about the making of this tofu will be found in the special report on soybeans and soybean products, which will be a special report added at the end of our exploration work.

"We saw for the first time fried Tofu which had had chopped carrots added to it [ganmodoki]. We had not prior to this known of vegetables of any kind being added to or mixed with the bean curd or Tofu before frying.

Pages 3470 to 3471. Photos show: (1) "Soja max. Tofu, bean curd. Tokyo, Japan. A nearby view of an elderly Japanese lady frying Tofu on the street. Children and Mr. W.J. Morse are looking on." (2) An elderly Japanese lady frying or searing Tofu. To the right, children are watching the operation, and so are Mr. Morse and Suyetake, in the background. (3) "A fairly nearby view of an old Japanese lady fanning a charcoal fire over which she is frying or searing tofu." (4) "Cakes of soybean curd piled upon bamboo strip supporters [arranged on bamboo mats] and weighted to express the surplus moisture before frying. A metal two prong piece [skewer] is run through each to handle them with" (negatives #44714 to #44717).

Pages 3472 to 3473. Tofu in Tokyo. Photos show: (1) "A fairly nearby of an old Japanese lady turning the cakes of Tofu she is frying [sic, grilling] over a charcoal fire." Note 1. The rectangular charcoal brazier appears to be about 14 inches long, 8 inches wide, and 8 inches deep. This is the same old Japanese lady described on pages 3470-3471. (2-3) "An old Japanese lady fanning a charcoal fire and frying [grilling] Tofu on the street, not far from the Sankaido Building.

(4) A nearby view of five large cakes of skewered tofu being grilled on a brazier over a charcoal fire. (negs. #44718 to #44721).

2728. *Prairie Farmer* (*Indiana Edition*). 1930. Our pioneer soybean grower: Adrian A. Parsons experimented with soys forty years ago. 102(2):6, 26. Jan. 11.

• ***Summary:*** This story was published about five months after Adrian Parsons died. "The man who probably exerted the greatest influence on the early development of the soybean industry in Indiana was the late Adrian A. Parsons of Hendricks county. He it was, as nearly as I can learn, who first imported soybean seed from Japan to Indiana, and grew the crop–first in a garden, and later on a scale so large that he sold beans by the carload. He experimented with the crop for years, and as he learned he wrote up the results of his work for the farm papers. He firmly believed that he had found one of the best legume crops that could be grown in Indiana, and he wanted other farmers to learn about it.

"Mr. Parsons had an insatiable curiosity regarding plant life, and his experiments with corn and soybeans and other plants gave him pleasure and recreation. A severe gunshot wound, sustained during his Civil War days, had left him far from robust, and the fact that he was unable to stand a heavy day's work in the field gave him more time for studying and writing.

"One of his sons, Norman E., who is a large farmer and soybean grower in Hendricks county, says that as nearly as he can figure out, it was in 1886 or '87 that his father

© Copyright Soyinfo Center 2014

bought his first batch of seed, and it is his impression that he imported them from Japan. It was believed that soybeans could be used as a substitute for coffee, among other things, and Mr. Parsons' curiosity was thoroughly aroused.

"The new plant did well. Mr. Parsons read everything he could find on the subject of soybeans, and as he enlarged his acreage he was delighted to find that both the hay and the beans were eagerly eaten by all classes of livestock. He began to grow the crop in earnest.

"During all of the early years he was forever experimenting, and his writings indicate that he was familiar with all problems of inoculation, cultivation and utilization of the crop. It was unfortunate that clippings were not kept of his articles on soybeans, but among his effects there was found a collection of manuscripts, a number of which doubtless appeared in the farm press."

One manuscript revealed that Parsons had tried for a number of years, unsuccessfully, to get red clover bacteria to grow on and inoculate soybeans. "His work with soybeans led to acquaintance and friendship with the late Joseph E. Wing, the 'apostle of alfalfa.' In later years he began to grow alfalfa, probably through Mr. Wing's influence, and in a clipping from 'The Ohio Farmer' which unfortunately is not dated, Mr. Parsons went on record as listing the soybean second to alfalfa, which he characterized as 'king of the legumes.' That by no means meant that he had lost his enthusiasm for soybeans, as he continued to grow this crop in large quantities. He sold seed by the carload to the Wing Seed Company of Ohio."

Another undated manuscript, which was marked 'For the Department of Agriculture,' was written after he had grown 24 successive crops of soybeans. His highest yield had been 30 bushels/acre and his lowest 10 bushels. He grew one acre of soybeans the first year he tried them and 140 acres the year this manuscript was written.

"In another manuscript, which was apparently written in 1902, and which was marked 'for the Farmer's Guide,' Mr. Parsons stated that the seed should be covered very lightly, that he found that drilling in rows gave best results, and the early cultivation was exceedingly important.

"Mr. Parsons passed away last August. He lived to see the soybean develop to a crop almost of major importance in Indiana, and his satisfaction in seeing his own community become a leader in soybean production must have been great. He was a prophet who was recognized in his own community. The entire state may well give him credit for the big part he played in developing soybean growing into an industry which is destined to add millions to the wealth of Indiana."

A photo shows: "Adrian Parsons of Plainfield, Indiana, pioneer soybean grower of the Middle West. Originator of Mikado soys. He was past 80 when this picture was taken."

Letter from Lee Parsons, great-grandson of Adrian Parsons. 2000. April 4. "I believe it was *Prairie Farmer* writer Dave Thompson who wrote this article. Dad remembered Thompson's visit and interviewing people in Hendricks County about Adrian."

2729. Morse, W.J. 1930. Re: Soybean products collected. Trip to Manchuria and China. Letter to Dr. E.A. Hollowell, Office of Forage Crops, USDA, Washington, DC, Jan. 12. 2 p. Typed, with signature on USDA letterhead.

• ***Summary:*** "Dear Holly: I have your letter of December 16 with reference to the soybean products and the more I collect over here the less inclined I am to loan them out... In my last such experience, I fitted up a soybean product exhibit for some sort of health food show in New York City and I never did get it back although we had considerable correspondence about it. As I recall I even took it up with the Secretary [of Agriculture] because they wanted it for a permanent exhibit and so I was out a nice exhibit which it took me considerable time to get up. After that I would not let anything go out unless I had several products of the same kind but it cured me of fixing up exhibits for any one or letting out products or pictures that I could not easily duplicate.

"Therefore, even with Dr. Burlison I do not know of any of the products we have in the office that I care to let out..."

"Last week we visited a large soy sauce factory [almost certainly Kikkoman] at Noda-Machi, about a three hours' run from Tokio... They use twenty thousands of bushels of soybeans annually and the same amount of wheat."

"I was rather anxious about the work but as you state if the Arlington [Farm in Virginia] work can be arranged, you and Lee can hold things until I return. I think that this can be arranged so that Lee will not be over-loaded with the work now on hand and the new introductions we are sending in...

"Dorsett is making pictures of the various [soybean] products as they are collected and making pictures that can not be beat.

"The beancurd, miso and natto factories are mighty interesting and we are getting lots of good data and pictures as well as samples of the varieties of beans used. The beancurd factories are only small places but they are very numerous and each has its own way of making the curd."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 93–Morse-Napier. Folder–Morse, W.J.-#4 F.C.I.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Tokio, Japan.

Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 3553 (14 Jan. 1930, Tokyo). "Worked at the office today preparing, packing and sewing up five parcel post packages of soybean and other plant products to go to Washington [DC].

"We will have a good sized shipment for the diplomatic pouch about two weeks hence.

"Got the five backs for our picture albums finished up tonight. By tomorrow night we think we can use them to cover the leaves on which we have already mounted our pictures.

"Today Ruth [Dorsett's daughter-in-law; the widow of Dorsett's son] completed our field trip report for October and expects to page it tomorrow.

"We got behind in our trip report for October, November and December on account of not developing the pictures made in Chosen [Korea] until after our return to Tokyo. However we hope to get this work pretty well up to date before we transfer over to Dairen, Manchuria, this coming March." Address: Agricultural Explorers, USDA, Washington, DC.

• ***Summary:*** Page 3270 (28 Jan. 1930). A photo (neg. #44859) shows the front of a half-gallon can of Nisshin Salad and Frying Soybean Oil, sold by Nisshin Oil Mills Ltd. of Tokyo.

Pages 3555 and 3556 (15 Jan. 1930). The authors visited the Office of the Nisshin Oil Mills Ltd. of Tokyo and met the Director, Mr. L. Sera. "The output of their small mills in Japan are used at home, and all the bulk of that made by their 19 mills in Manchuria. Mr. Sera admitted that they are very much interested and concerned about what the American Congress will finally do about putting a tariff on soybean oil and cake. He told us that their company sends considerable oil cake to America. Japan proper imports from Manchuria upwards to 15,000,000 tons of oil and cake. He also told us that Manchurian oil cake brings $40.00 per ton f.o.b. Seattle." Address: Agricultural Explorers, USDA, Washington, DC.

• ***Summary:*** Contents: Part I. Introduction. Physico-chemical properties of soybean oil: Changes in specific gravity, changes in viscosity, changes in colour, changes in acidity, changes in saponification value, variation of the oxy-acids-content of the soya bean oil, changes of the R.-M. [Reichert-Meissl] and the Polenske values, changes in the refractive properties of the soya bean oil (Refractive Index), changes in taste and odour, changes of the unsaponifiable matter content, changes of the iodine value, the influence of low temperature and of the old sediments from the factory tanks upon the soya bean oil. The refining of crude soybean oil: Clarification (incl. removal of heavy impurities or foots), bleaching by clay, deodourizing. Hardened (hydrogenated) bean oil.

Part II. The uses of soybean oil for food: Refined bean oil, lard substitutes, oleomargarine, vegetable butters (consisting of fats exclusively of vegetable origin). Soybean oil as a lubricant. Soybean oil for lighting purposes. Soybean oil as soap-making material (incl. Lever Bros. makes Sunlight Soap from soy oil {p. 157}, and soap factory at Amagasaki, Japan; and Yamaguchi Co. bath soap made in Port Arthur). Soybean oil in making waterproof cement (similar to "Tantalus" of Suzuki). Glycerine from soybean oil. Rubber substitutes from bean oil. Bean oil as a paint-making material. Artificial petroleum from bean oil ("In 1908 the theory was advanced that the petroleum found in nature was produced underground by the decomposition of organic fat and oil combined with limestone. In the last decade M. Sato, a prominent bean oil chemist of the Central Laboratory, Dairen [in Manchuria], devoted his attention to the manufacture of artificial petroleum from bean oil with very good results"). Address: M.D., China.

2736. Morse, W.J. 1930. Soybean utilization. *Farmers' Bulletin* (*USDA*) No. 1617. 27 p. Jan. Revised 1932.

• ***Summary:*** Contents: Introduction. Soybeans for human food: Dried beans ("The Easycook and Hahto varieties, however, cook fully as soft as other beans." Also used as a substitute for coffee or for salted peanuts), green or vegetable beans ("The Hahto and Easycook varieties have been found especially valuable for use as green beans"), soybean flour, soybean oil, soy sauce, soybean sprouts, soybean vegetable milk ("used so extensively in China." Also mentions the residue [okara]), soybean curd. Soybeans for livestock: For swine, dairy cattle, beef cattle, sheep, poultry. Soybeans for oil: Methods of processing beans for oil, utilization of soybean oil. Soybean meal: Soybean meal for human food, soybean meal for stock feed, for swine, for dairy cattle, for beef cattle, for poultry. Soybean meal as a fertilizer. Miscellaneous uses of soybean meal. Soybeans for hay: Soybean hay for dairy cattle, for beef cattle, for horses and mules, for sheep, for swine, for poultry. Soybeans for pasturage: Swine, sheep, or poultry on soybean pasturage. Soybeans for silage. Soybeans for soilage [green crops for feeding confined animals; a term first used in 1928]. Soybeans for soil improvement. Soybean straw: Feeding value, and fertilizing value of soybean straw.

"Soybean milk in the form of a powder is a commercial product in some European countries, and in parts of the United States it has been used in special feeding cases" (p. 5). "In many cities in the United States having a large oriental population fresh bean curd may be found in the Chinese and Japanese markets" (p. 6).

Photos show: (1) Six men steaming soybeans while making miso in Japan. (2) Muffins made from wheat flour and soybean flour. (3) Making soy sauce in a Chinese courtyard. (4) Grinding soybeans with a stone mill to make soybean milk in China. (5) "Blocks of freshly made bean curd, 'tofu,' as sold in the markets of the Orient." (6) Loading soybean oil in tanks at a soybean oil mill, Harbin, Manchuria. (7) Soybean cakes awaiting shipment at a Manchurian port. (8) Hogs in a field of soybeans. (9) "Pasturing soybeans and corn with sheep is a common practice in the Corn Belt states." (10) Corn and soybean plants growing together for use as silage; a boy is standing by the plants. (11) "A fine growth of soybeans to be used for soiling." Address: Senior Agronomist, Office of Forage Crops and Diseases, Bureau of Plant Industry, Washington, DC.

• ***Summary:*** This is the 1930 continuation of a superb bibliography of 2,424 citations listed chronologically by year, and within each year alphabetically by author. Part 1, 1929, covers the years 1729 to 1920 and contains 1,655 references. At the end of the last installment (1930) there is a complete author index. Address: Japan.

2738. *Unknown Tokyo newspaper.* 1930. Ancient bean-throwing rite will be observed tomorrow: Many who still believe in practice to take part in traditional ceremony in their homes and at shrines and temples. Feb. 2. p. 1-2.

• ***Summary:*** In his personal scrapbook, Morse included with this English-language article with no date or newspaper name: "All the streets in towns and cities of the Empire, will, according to tradition, be infested with devils tomorrow and many persons will attempt to drive them out of their houses with a time-honored ceremony of bean-throwing known as tsuina."

Note: Setsubun rituals include *tsuina* and *mame-maki* (bean-scattering), also known as *mame-uchi. Tsuina* (also referred to by other names like "oniyarai," is an exorcism rite. Introduced from Tang China, tsuina was originally held on the eve of the New Year. Mame-maki, the custom of scattering roasted beans to expel evil spirits, seems to have begun in the Muromachi Period {1392-1573}. Although members of the court and upper classes maintained a distinction between tsuina at the end of the year and bean-throwing at setsubun, commoners in many locations often blended the two customs. Source: *Encyclopedia of Shinto,* at Setsubun).

"Dried [soy] beans are roasted during the day and prepared for use in the evening.

"When dusk sets in the head of the family may be heard shouting 'Oni was soto, fuku wa uchi. Oni was soto, fuku wa uchi,' throwing beans as he shouts. This means 'Out with devils; come in good luck.' Then children are heard shouting and running about in an effort to gather the greatest possible amount of beans as their father throws them at the devils in each corner of the rooms in the house."

One of the most prominent Shinto shrines at which the bean-throwing will take place is the Kompira Shrine (*Konpira Jinja*) in Toranomon, about one mile north of Shiba Park, Tokyo. "At this shrine more than 2 bales of [soy] beans are expected to be thrown at the crowds which will throng in front of the shrine. Several professional wrestlers, well known actors and musicians will act as *toshi-otoko* (bean throwers).

"The bean-throwing ceremony at the Gojo Tenjin Shrine in Kameido is extremely interesting. It preserves the most primitive form of the custom." The custom is said to date back to 706 A.D. when a deadly epidemic swept Japan.

On the same page as article, Morse included several photographs: (1) 1931–W.J. Morse feeding deer in Nara, Japan. (2) K. Murochi, W.J. Morse and K. Matsushima at a soybean seed fair in Kung Chuling, Manchuria. Note: Kungchuling, Chilin -> Gongzhuling, Jilin. (3) 1930 July–Suyetake, W.J. Morse, and P.H. Dorsett in Dairen, Manchuria.

Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 3785 (3 Feb. 1930–Tokyo). "Today is 'Setsubun' or 'Division of Seasons' and is to all Japanese a change of seasons according to the lunar calendar. Spring begins tomorrow and winter ends today. It is also known as 'Mame-Maki' or 'Bean Scattering Day.' In the evening, every Japanese home practices a traditional and peculiar ceremony called 'Mame-Maki' or 'Bean Scattering.'"

Note 1. This is the earliest English-language document seen (Dec. 2012) that uses the term "bean scattering" (or "bean-scattering ceremonies") to refer to the Japanese practice of *mame-maki.*

"The people in the house scatter parched soybeans in and out of the houses loudly shouting 'Fortune in, Devils out,' thus calling in the year's fortune and driving out any probable misfortune from the household. Bean-scattering ceremonies (it is considered a religious rite) were held in all temples and we understand a large temple in Shiba Park used twenty-five bushels of parched soybeans in the bean scattering ceremony. So we will have to score another use of the soybean as 'Devil Chasers!'"

All of the following describe photos unless otherwise stated: Page 3788. "Twisted oblong pieces of white sugar candy with greenish yellow roasted soybeans. This candy is made after the manner of peanut candy at home. Size of paper bag is 7 by 9½ inches."

of Okame-san (Goddess of Happiness). Native name is 'O-kame mame rakugan.'"

Page 3962. "Kuronegimame." Address: Agricultural Explorers, USDA, Washington, DC.

2740. Dorsett, P.H.; Morse, W.J. 1930. Soybean sprouts in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Pages 3801 to 3802 (5 Feb. 1930). "We had some difficulty in finding the soybean sprout man, but finally succeeded in locating him in the village of Zoshiki. He has transformed one of the rooms in his house into a forcing chamber, and is sprouting soybeans in flats. This method we haven't seen before.

"The bottom of a flat, about 12 by 18 inches, is covered to a depth of about half an inch with [soy] beans, which have been soaked until plump, about 10 or 12 hours. These trays are then placed on shelves and covered with burlap. The room is kept at a temperature of about 70º [F.]. The beans sprout and are ready to market in 10 or 12 days. They are ready to dispose of when they get about even with, or a little above, the sides of the two flats, which are about three of four inches high. Photo: "Soja max. Soybean sprouts. A fairly nearby view of two flats of soybeans, the one in the foreground containing soaked soybeans, the one in the background sprouted soybeans, but past the marketing stage– they are too far advanced. On the edges of the two flats at the center are three small bunches of sprouted soybeans. This is the way Mr. Katakura puts them up for the market (neg. #44892).

Page 3802. "A nearby view of the same two flats... The picture really shows how the sprouts should *not* be treated. Mr. Katakura sprouts his mung beans in tubs, and he occasionally handles his soybeans in this way. He told us that it required more attention to grow bean sprouts in tubs than in flats" (neg. #44893). Page 3824 (5 Feb. 1930) Tokyo. "A nearby (about life size) picture of a commercial bunch of long stem soybean sprouts. This bunch is over all about 4 inches wide and 11 inches long. Purchased at a vegetable stand in Komato, Japan, Feb. 7th, 1930. D. & M. #3786 (neg. #44900).

Page 3825, "About a three-quarter life size picture of a commercial bunch of rather short stemmed soybean sprouts. Purchased at a vegetable stand in Komato, Japan, Feb. 7, 1930. D. & M. #3785 (neg. #44901).

Page 3865. (12 Feb. 1930). "Morse and Suyetake were all smiles when they reached the office this morning, for they had great success yesterday. They corralled nine different soybean products."

"After lunch we called on Dr. T. Nakai, Botanist at the Tokyo Botanical Garden. We talked with him about soybeans of Quelpaert Island [*Jeju-do* in Korean. As of Aug. 2011 it is part of Korea; it lies in the Korea trait between South Korea and Kyushu, the southernmost of Japan's four main islands]. He told us that there they grow small soybeans only about the size of mung beans. He thinks it is a case of stepping down (degeneration) in place of up.

Page 6911 (3 Jan. 1931). Morse writes from Tokyo: "At one of the department stores, in the vegetable market section, we found small bundles of soybean sprouts..."

Page 7071 (31 Jan. 1931). Morse writes from Tokyo: "After our visit to the Botanic Gardens, we visited some market sections. At some we found soybean sprouts (6 inches long) in small bundles." Address: Agricultural Explorers, USDA, Washington, DC.

2741. *Guardian* (*England*). 1930. Miscellany: Chemical "meat." Feb. 10. p. 7.

• ***Summary:*** A correspondent writes: The movements to "Eat more meat" and "Eat more fish" may soon be followed by an "Eat more monosodium glutamate" campaign. "A few years ago this queer chemical, made by hydrolysing gluten [sic] of soy beans with hydrochloric or sulphuric acid, was a mere academic fact."

Lately, however, it has come to be manufactured on a huge scale in China and Japan because of its meatlike taste. In Japan, where it is called "Ajinomoto" (the Element [Basis] of Taste) it has come to be used almost as commonly as sugar or salt. Restaurateurs in China find they can substitute it for meat flavoring or extracts (it is much cheaper) without diners knowing the difference. Perhaps the meatless sausage or the fishless rissole have already begun to appear in our own teashops.

2742. Dorsett, P.H.; Morse, W.J. 1930. Re: Zoyzia / zoysia. Collecting soybean products in Japan. Letter to Dr. A.J. Pieters, Office of Forage Crops, USDA, Feb. 15. 2 p. Typed, with signature on hotel letterhead.

• ***Summary:*** "Oftimes [Ofttimes] in the midst of our strenuous times in chasing down soybean products, we bear in mind *Zoyzia pungens.* We came across a clue today." Dr. Nakai, Botanist of the Imperial Botanic Gardens, Tokyo, knows Zoysia grass well. Being tender, this "grass does not even survive the winter at Tokyo and is found only in the southern parts of the Japanese empire."

The species of Zoyzia that is hardy and grows well in Korea is *Zoyzia Japonica*, a native of Korea. The seed is not viable. The plant is propagated with the plant roots.

"Our efforts in collecting soybean products are yielding excellent results and by the time we return home we should be able to open a candy store, bakery, drug store, meat shop, feed store and voodoo shop. The voodoo shop needs a little explaining.

"'Setsubun' or 'Division of the Seasons' falls on

© Copyright Soyinfo Center 2014

February 3rd and spring commences according to the lunar calendar. In the evening of the 3rd a traditional and peculiar ceremony called 'Mame-Maki' or 'Bean Scattering' is practiced in every home. The people in the house scatter parched soybeans in and out of the house shouting loudly, 'Fortune in and Devils out...' While the person is scattering the beans he or she holds in one hand a small bundle of threshed soybean plants and holly branches. To the holly branches are attached small sardines or herring. After the devils are driven out of the house by the scattering of the beans, the bundle of straw and holly with the dried fish is placed over or at the side of the house door to keep the devils out. The devils are said to be quite fond of herring or sardines. When they are about to enter the house, they see the fish and quite naturally stop to get a bit of their favorite food. In trying to get the fish, however, the spines of the holly stick in their eyes and blind them. Thus blinded, the devils cannot find their way into the house, so there you are, a cheap and easy way of ridding your house of devils. We have, therefore, scored another use for the soybean.

"Rather elaborate bean-scattering ceremonies are held at all of the shrines and temples. One of the large temples in Shiba Park, not very far from the hotel, used twenty-five bushels of parched soybeans in their bean-scattering ceremony. We are told that each house uses about one pound of soybeans for devil-chasing. We obtained a package of the 'devil-chasing' beans and sent them in with our products."

2744. Morse, W.J. 1930. Re: Exports of soybeans from Manchuria. Proposal of trip to Europe. Collecting soybean products in Japan. Letter to Mrs. Verna M. Donavan, Office of Forage Crops, B.P.I., USDA, Feb. 15. 2 p. Typed, with signature on hotel letterhead.

• ***Summary:*** "Dear Mrs. Donavan: At the head office of one of the large soybean oil companies in Tokyo we recently received considerable information concerning the export of soybeans from Manchuria to European countries, especially Germany, France, and England. It seems that these countries are taking so many soybeans that the Chinese government is considering the placing of an export duty on the seed in order to protect the soybean oil industry of Manchuria... we think it might pay us to return by way of Europe and look into the soybean industry.

"In our soybean files and also in our general letter files, I think we have the names of firms and people interested in soybeans in several European countries. I wish that you would look up the names and addresses of such firms and persons so that I can write them and obtain some detailed information about the soybean situation in Europe."

"There is a Dr. J.L. North in London, England, with whom I have had considerable correspondence during the past several years."

Morse thinks that his collection of soybean products from Japan will number about 200 products ore more.

"Received Mr. Lee's letter recently which you typed for him in the winter and I am glad to hear that everything is going along so nicely. I feel now that the work is going along so fine that I can at least stay over here three or four more years. The soybeans are calling in the U.S. and I suppose that a year from now we will be on our way home or getting packed up to go."

P.S. [handwritten]. It has occurred to me that the products being sent in should be placed in the large tin boxes in which we store seed to keep it away from the mice. If the mice are as bad as formerly, I am afraid that unless the products are stored in the tin boxes, the mice will play havoc with them..."

• ***Summary:*** Addition of 1 part of 0.1 normal hydrochloric acid to 4 parts of 60% methyl alcohol reduces the amount of crude protein dissolved by the latter medium to 0.41%. With 60% ethyl alcohol (4 parts) and 0.25 normal hydrochloric acid (1 part) the figure is 2.24%. Address: Japan.

2750. Dorsett, P.H.; Morse, W.J. 1930. Re: There is just too much to do and see concerning soybeans in Japan. Letter to Mr. Knowles A. Ryerson, Principal Horticulturist in Charge, USDA, March 5. 3 p. Typed, without signature (carbon copy).

• ***Summary:*** "I have been kept rather busy writing up and packing the material that has been coming in from many sources in Japan, Hokkaido and Chosen (Korea) in spite of the opinion that the Japanese are better receivers than givers. We think... that exactly the opposite is true. If you do not think that we have been busy, please note the number of packages that have been sent in since the first of the year. These are merely a start, for in winding up our work in Japan, we expect to send in quite a few packages.

In regard to plans for the coming year,... So many new things keep coming up during the work in Tokyo and adjacent districts that our plans change almost daily in trying to get the most out of our work for the soybean industry in the United States... We simply can not do it all and to do the most important that is of the most value to the new soybean industry in our country, we must change our plans from time to time to meet the new conditions constantly arising."

"We think it would be well worth our time to return by way of the Trans-Siberian to Germany, France and England as a sort of clean-up of our Manchurian investigations."

"Mr. Lee, who is bearing the brunt of testing the new introductions, writes us to keep up the good work."

Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 4337-39 (15 March 1930, Tokyo, Japan). "In our study of soy sauce manufacture, we received information about a factory manufacturing an artificial soy sauce. A visit was made to this factory which is known as Nippon Jojo Kogyo & Co., Ltd., 102 Omoto-cho, Koishigawa-ku, Tokyo. We were taken to the office of the President, Mr. Togano, who was a student at the Nishigahara Agric. Experiment Station Soy Sauce Laboratory. Mr. Togano made a special study of soy sauce brewing under Dr. Kurono, Chief of the Soy Sauce Laboratory, and is recognized as an expert on the brewing of this sauce.

"It was learned through Mr. Togano that his method of manufacture is not an artificial one but merely a different method whereby only one-sixth of the time is required in the curing, and less wheat is required. Mr. Togano in his investigations found that by certain changes in the old method of making soy sauce, economy in time or curing and in amount of wheat used could be gained. In the old method, the cracked roasted wheat and steamed soybeans are mixed and treated with the rice culture. In the improved method the cracked roasted wheat and the steamed soybeans are treated separately with the culture, and then mixed. The treatment of the roasted wheat is a secret process and has been patented in Japan and the United States.

"After the mixing of the treated soybeans and roasted cracked wheat, salt and water are added. This mixture is then placed in the curing vats, and only 20 days of curing are required for a good quality of soy sauce. However, the mixture is left in the tubs for 60 days before being removed for pressing out the sauce. This time is one-sixth of that used by other soy sauce factories, as most of them cure the mash for at least one year and in some cases, a year and a half is allowed.

"Three grades of the ordinary sauce are manufactured by the Nippon Jojo Kogyo & Co. A special brand known as "Marujo Kanro Shoyu" [a brand of saishikomi] is also made. This sauce is much heavier than the common sauce and is made by adding to the soybean-roasted wheat mixture, the ordinary sauce instead of salt and water. Note: This is the earliest document seen (April 2012) that mentions "Kanro Shoyu" or "Marujo Kanro Shoyu" or any type of saishikomi shoyu. Yet the word "saishikomi" is not used.

"The Nippon Jojo Kogyo Co. soy sauce sells much cheaper than that of other factories. A two litre bottle sells for 45 sen, whereas the soy sauce of other companies sells for 60 sen for two litre bottle. This company has four factories in the Tokyo District, and has several more distributed about in different parts of the Japanese Empire. There is also a large factory near Hongkong, China. This company uses about 150,000 koku (750,000 bushels) of soybeans yearly in the manufacture of soy sauce at its four Tokyo factories.

"Mr. Togano asked much about the soy sauce and soybean situation in the United States. He advised that he sells considerable rice culture for soy sauce manufacture in Los Angeles, Chicago and San Francisco. From information gathered, he evidently has looked into the proposition of starting a soy sauce factory in the United States.

"The advertising of products by this firm is the most extensive of any of the firms putting out soybean products we have yet seen in Japan. Attached herewith is a folder used in advertising. The wrestler represents the health and strength of the Japanese people while the cask of soy sauce he is holding represents the health and strength of Japanese foods for the people."

A label of the company's Maru-Jo soy sauce (in a wooden keg) appears on p. 4339. A sumo wrestler is holding a large keg of the product over his head. On his right leg is written "miso" and on his left leg, "shoyu." Address: Agricultural Explorers, USDA, Washington, DC.

2752. Pickford, Mary. 1930. Mary completes world tour: Homeward bound, Mary and Douglas [Fairbanks] celebrate two Christmases in 48 hours, and fall in love with Hawaii. *Washington Post.* March 30. p. SM11.
• ***Summary:*** Of all the places Mary and Douglas visited on their trip around the world, "Honolulu is the most beautiful and alluring." After departing: "We celebrated our second Christmas with chopsticks. The ship gave a sukiyaki party on deck... while our table steward prepared the national dish of his country in a chafing dish before us." The ingredients (beef, bamboo sprouts, onions, mushrooms) are listed but neither tofu nor soy sauce are mentioned. "A sukiyaki dinner on deck in one of the regular events on every Japanese liner... I must confess that, except for rice, most Japanese dishes are an acquired taste."

2753. *Fortune.* 1930. House of Mitsui. 1(2):72-81. March.
• ***Summary:*** A good analysis and history of Mitsui Bussan, the giant Japanese conglomerate and trading company, including a photo of their modern headquarters at Suruga-cho No. 1 in Tokyo. "There is no business enterprise anywhere which is at once so vast and so diverse as the House of Mitsui in Japan. Its agencies abroad outnumber the embassies and consulates of the Empire... A quarter of Japan's commerce, both import and export, is handled by the Mitsui Trading Company... The House of Mitsui is thus a merchant empire. It has been prosperous for thirteen hundred years and conspicuously rich for more than a quarter of a millennium–roughly since Shakespeare's time. Today the House is ruled by the Senior Baron Hachiroyemon, 14th Baron Mitsui. He does rather less work than the King of England. His prime minister of trade is Baron Takuma Dan, sometimes called the 'Morgan of Japan.'"

The Cereals and Fertilizers Department handles soybeans. "They shipped the first Manchurian soy beans to

© Copyright Soyinfo Center 2014

Europe in 1907. Today the beans, bean oil, and bean cake are international staples. Everyone who has sailed past Port Arthur and into Dairen has seen the batteries of Mitsui bean oil tanks bulking houses high. Sacks of beans piled twenty deep stretch away illimitably along the quays, crisscrossed by railways... War has always proved a good tonic for Mitsui Bussan. After a long swig of the Russo-Japanese fight brew, the company not only quadrupled its business but became so sanguine of future profits as to increase its capital one hundredfold, from yen 200,000 to yen 20,000,000 ($10,000,000). Most of the Great War was fought upside down on the other side of the globe from Japan. But it once more quadrupled the business of Mitsui Bussan, and the capital was promptly quintupled to its present figure of yen 100,000,000 ($50,000,000)."

Note: This is the earliest article on soy seen (Aug. 2002) in *Fortune* magazine.

2754. Miura, Michiya. 1930. Manshû shuyô nôsakumotsu no byôgai [Diseases of Manchuria's principal agricultural crops]. *Minami Manshu Tetsudo K.K.* (*South Manchuria Railway Co., Agricultural Experiment Station Bulletin*) No. 11. 56 p. Ed. 2. [Jap]

• ***Summary:*** The first section (p. 1-36) is about soybean diseases. Symptoms, causes, and control measures are given for diseases caused by the following pathogens: Bacterium sojae var. japonicum (=Pseudomonas glycinea), Peronospora manshurica, Sclerotinia libertiana (=Whetzelinia sclerotiorum), Gibberella sp., Hypochnus centrifugus, Uromyces sojae (=Phakopsora pachyrhizi), Septoria glycines, Cercospora sojina, Cercosporina (=Cercospora) kikuchii, Heterodera schachtii, Pleosphaerulina sojaecola, and Cuscuta chinensis. Other diseases not occurring in Manchuria are also noted. Address: Minami Manshu Tetsudo K.K. Nôji Shikenjô (South Manchuria Railway Co., Agric. Exp. Station).

2755. Dorsett, P.H.; Morse, W.J. 1930. In Dairen, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 4525 to 4526 (10 April 1930, Dairen, Manchuria). "This morning we called at the office of Mr. K. Matsushima and a little later, in company with Mr. Yoshitane Sato of the Bureau of Agriculture of the South Manchuria Ry. [Railway Co.; S.M.R.] we visited the soybean exchange.

"Here, as in all other grain exchanges, of which we have had an opportunity to see everything, pandemonium raged on the floor of the chamber.

"The room looked to be 40 feet or more in width and 75 or so in length, with a gallery extending around the entire room." Of the 100 members, 60 are Chinese, 30 Japanese and 10 are of other nationalities–Russian, Danes, British, etc.

Page 4526. "From the exchange, we went to one of the research laboratories of the Agricultural Branch of the S.M.R., where we met Mr. Takamori, also the assistant director of the Bureau of Economic Research, Mr. Igarashi. These gentlemen offered to assist in any way possible; both speak good English and understand a good deal. We next visited Dr. Y. Nakanishi, Secretary of the Soybean Oil Association."

"After lunch we visited a good sized shoyu sauce factory and looked over the plant, including culture chambers and ageing mash vat rooms. They demonstrated for us their method of vat mash stirring by compressed air. It is a simple method. The air passes through a one-inch pipe to the bottom of the tank, as the pipe is moved about over the bottom the air expelled from the pipe forces its way up through the mash, which gives the impression of boiling. The practice appears to be much more effective and easier than the hand or paddle method of stirring the mash which is pretty generally followed.

"The refuse left after pressing out the soy sauce is sold for cattle feed (we understand primarily for hog feeding). It is also resoaked and used for making a much inferior and cheaper grade of soy sauce, for which this concern has quite a demand."

Page 4541 (15 April 1930, Dairen). In the morning visited Mr. Satoh of the S.M.R. with reference to soybean oil mills and soap factories using soybean oil in Dairen. Arrangements were made to visit the oil mill of the Mitsubishi Trading Co."

"This Oil Company crushes about 300,000 tons of soybeans yearly, producing about 270,000 tons of bean cake and about 30,000 tons of bean oil."

Page 4542. "For Japanese trade, where bean cake is used chiefly for fertilizer, and to a slight extent for poultry feed, the cakes are ground into a very coarse meal. Permission was given to take any pictures we might wish within the mills or mill yard."

Page 4543 (16 April 1930, Dairen). "In the morning visited the Mangylku Soap Mfg. Co. where crude soybean oil and hydrogenated soybean oil are used in the manufacture of soap."

"Mr. Satoh suggested that we get in touch with Dr. Satoh, botanist and author of the bulletin [on wild legumes which shows 28 genera and 102 species] as he might be of assistance to us in our collections of wild legumes in Manchuria, North China, and Chosen" [Korea].

Page 4546. "The wild soybean is very abundant throughout this vicinity." "Mr. Nakatomi assured us of his hearty cooperation in our studies of Manchurian agriculture."

Page 4558 (21 April 1930, Dairen). "This morning we went to the office of Mr. Satoh of the S.M.R. and found a package of fifteen varieties of soybeans that had been sent

© Copyright Soyinfo Center 2014

to us from the S.M.R. Experiment Station at Kungchuling. This station is the principal soybean breeding station and the varieties sent us represent selected varieties from their 1929 variety test of over five hundred varieties." A table gives the D. & M. number, varietal name, and use of each of the 15; the three uses are grain, forage, and pasture.

"In the afternoon samples of different forms of soy bean oil cake and oil cake meal were received from Mr. Yoshida, manager of the Mitsubishi Soybean oil Mills." They are: (1) "Coarse flakes. Made for export to Japan for cattle feed and fertilizer. Moisture 11%. Protein 44%. Fat 7.5%." (2) Finely cracked like cracked corn. Made for export to Japan for cattle feed; 10%, 44.5%, 7%. (3) Coarse meal for export to the United States for cattle feed. 9.11%, 45.6%, 7%. (4) Finely ground meal for export to the United States. 9.10%, 45.6%, 7%. (5) Medium coarse flakes for export to Japan for poultry feed. 10%, 44.5%, 7%. (6) Coarse flakes for export to Japan for fertilizer. 11%, 44%, 7.5%.

Page 4565 and 4566 (25 April 1930, Port Arthur, Manchuria). "We then visited the museum and looked over the agricultural exhibits of the Kwantung Province. The Nisshin Oil Mills of Dairen has rather an extensive exhibit of various forms of soybean oil and oil cake. The Manchuria Paint Co. has a very good exhibit of many kinds of paints, enamels, varnishes and plastic paints in the manufacture of which soybean oil was used." Address: Agricultural Explorers, USDA, Washington, DC.

2756. Takamine, Jokichi; Takamine, Jokichi, Jr.; Fujita, Nobuchika. Assignors to Takamine Ferment Company (New York, NY; a corporation of West Virginia). 1930. Vitamine product and process of obtaining the same. *U.S. Patent* 1,756,574. April 29. 5 p. Application filed 18 April 1924.
• ***Summary:*** The 1st inventor is: Jokichi Takamine, deceased. The patent application was filed, after his death on 22 July 1922, by his wife and administratrix, Caroline Takamine, of New York, N.Y.

This invention related to obtaining water-soluble vitamines, in a chemically pure state, from the propagation of vegetable fungi.

"A further object is to combine protein containing materials such as cereals, grains, soya beans, and the like, or the husks, brans, germs, and other portions thereof..."

"1. The process of obtaining vitamines which consists in developing and propagating vegetable fungus of the genus Aspergillus upon a culture medium, then extracting the vitamine product and other water soluble products contained in the resulting mass."

Note: The term "soya beans" appears several more times in this patent. They are used as one ingredient in a "culture medium upon which the vegetable fungus is propagated..." Address: 1. Deceased, late of Passaic County, New Jersey; 2. Administratrix; 3. Clifton, New Jersey; 4. Tokyo, Japan.

materia sólida, el residuo.

Note 3. This is the earliest Spanish-language document seen (April 2013) that uses the term *cuajada de soya* refer to tofu.

Soybeans for livestock (*la soya para el ganado*)*:* For swine, dairy cattle, beef cattle, sheep, poultry. Soybeans for oil: Methods of processing beans for oil, utilization of soybean oil. Soybean meal: Soybean meal for human food, soybean meal for stock feed, for swine, for dairy cattle, for beef cattle, for poultry. Soybean meal as a fertilizer. Miscellaneous uses of soybean meal. Soybeans for hay: Soybean hay for dairy cattle, for beef cattle, for horses and mules, for sheep, for swine, for poultry. Soybeans for pasturage: Swine, sheep, or poultry on soybean pasturage. Soybeans for silage. Soybeans for soilage [green crops for feeding confined animals; a term first used in 1928]. Soybeans for soil improvement. Soybean straw: Feeding value, and fertilizing value of soybean straw.

Address: USDA, Washington, DC.

2760. Dorsett, P.H.; Morse, W.J. 1930. Re: Request for photographic supplies from Eastman Kodak Co. (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. June 16. Unpublished log.

• ***Summary:*** Page 5176. Letter dated 16 June 1930 from Dairen, Manchuria, to Eastman Kodak Co., Shanghai, China. "Gentlemen: Please forward to us, at your earliest convenience, by express, the following photographic supplies:

"15 spools Eastman No. 10 Cartridge Motion Picture Film, length 100 foot, perforated, for use in standard (35 mm.) Automatic Motion Picture Camera.

"100 Packs Eastman Kodak Films No. 518, 3¼ x 4¼ for use in Eastman Graflex Camera.

"25 spools film No. 122, 3¼ x 5½, 10 exposures for use in Eastman No. 34 Panoramic Kodak.

"Please ship the above material addressed to Dorsett and Morse, c/o U.S. American Consulate, Dairen, Manchuria. Upon receipt of goods and invoice, we will send you a post office money order for the amount of your bill.

"Very truly yours, Dorsett & Morse." PHD/rd. Address: Agricultural Explorers, USDA, Washington, DC.

2761. *Fortune.* 1930. Soy beans: Which may be glue, milk, cheese, sauce, varnish, axle grease, fertilizer, soap, soup, buttons, artificial leather, enamel. 1(5):102, 104. June.

• ***Summary:*** Discusses the history of the soybean in various countries. Its uses in the United States are outlined. A plastic named Satolite is used to make combs and buttons. In "Paris there is a cheese factory that makes Rocquefort [Roquefort] from soy bean curd." Soy bean "milk has more proteins than cow milk and little danger of contamination. Its flour contains four and one-half times more fat, four times more proteins, half as much water, and nearly half as many carbohydrates as the flour of wheat. These chemical ingredients make it a food, more interesting, perhaps, than palatable. Though the milk is supposed to be good for one (it arrests cases of retrogression, causes normal growth), it has generally to be drunk sweetened with sugar. Soy bean sauces are better spiced. (For the Chinese taste Lean & Perrins Worcestershire is too hot. The Chinese themselves make their sauces by exposing the crushed bean to sunlight and actually melting it. Certain Korean sauces are thus matured thirty years before they are considered palatable.) But if the bean's chemical make-up only indirectly contributes to its success as human food, it is nevertheless the basis of the bean's industrial importance. Because of its nitrogen, the bean is valuable as fertilizer and also as poultry and stock feed. And the bean's hereinbefore mentioned oil has proved of value to many a manufacturer of paints, enamels, lacquers, and even explosives."

The Anglo-Chinese Company at Harbin and the Suzuki Mill at Dairen, both of which use chemical solvent extraction, have succeeded in extracting virtually all of the oil from the soybean; Manchuria's traditional crude stone presses were able to extract only about half the soybean's oil content.

"Perhaps the greatest economic and industrial triumph of the soy bean occurred, oddly enough, in Denmark. Until some thirty years ago this pleasant country was more than self-supporting in the production of cereals, especially wheat. But U.S. mass production and low prices made for perilous and in some cases disastrous competition, even in Denmark's home markets. The Danes bethought themselves of raising live stock, imported the soy bean (using the oil for its usual purposes), and used it as feed for their live stock and poultry. Today 70 per cent of Denmark's export trade consists of live stock and animal products: milk, butter, cheese, bacon, ham, eggs, and the like. And for their country's regained economic health Danes give thanks to the soy bean...

"In the United States the paramount importance of soy bean is still its agricultural use. But it is significant that 75 per cent of the soy bean oil consumed in United States is being used by paint and varnish industries and in manufacture of linoleum, oil cloth, artificial leather. Lesser quantities are utilized in printer's ink, liquid soaps. Few soy beans are imported into this country."

Note: This is the earliest English-language document (Feb. 2007) seen that contains the term "mass production."

2762. Kawakami, J. 1930. Mame-ka shokubutsu senshokutai sûhyô [Chromosome numbers in Leguminosae]. *Botanical Magazine* (*Tokyo*) 44(522):319-28. June. [2 ref. Jap; eng]

of soybeans, and found the diploid chromosome number to be 40. Address: Kyushu Teikoku Daigaku, Nôgaku-bu, Sakumotsu-gaku Kyoshitsu, Kyushu, Japan.

2763. Dorsett, P.H. 1930. Re: He tires easily after illness. Plans have been materially changed (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. July 2. Unpublished log.

• ***Summary:*** Pages 5086-5087. This letter from Dairen, Manchuria, is a reply to Mr. Paul Russell. Assistant Botanist, Foreign Plant Introduction, Bureau of Plant Industry, USDA, Washington, DC.

"This is a belated reply to your kind letter under date of March 20th, which arrived in Dairen on the day that I was taken to a Japanese hospital [in Dairen], and where I remained in a critical condition for approximately two months."

"I am beginning to feel in pretty good shape, but find that I tire rather quickly under exertion. Our plans for work during the remainder of the year, as you may already know, have been materially changed. Morse will remain with headquarters at Dairen and continue his research work with soybeans. I plan to leave Dairen shortly after July 15th for Peiping, for the purpose primarily of exploring in that region for wild legumes. At present Mr. Morse is in northern Chosen [Korea] getting seed and plants of what is supposed to be Zoysia" grass.

"I can do light work here in the laboratory and gradually getting such supplies packed as I am to take with me to Peiping."

Page 5090 to 5091. A letter of July 2 from Dairen to Mr. George M. Darrow, Senior Pomologist, Horticultural Crops and Diseases, Bureau of Plant Industry, repeats much of the above information in more or less detail. "I was taken sick with double pneumonia on the night of April 11th, and on the 14th was taken to a Japanese hospital, where I remained critically ill for the greater part of two months. I left the hospital on June first but am still under the doctor's care, though going to the laboratory and doing light work part time." Address: Agricultural Explorer, USDA, Washington, DC.

2764. Dorsett, P.H. 1930. Re: How he caught double pneumonia in Dairen, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. July 5. Unpublished log.

• ***Summary:*** Pages 5122-5124. This letter from Dairen, Manchuria, is a reply to Dr. A.J. Pieters, Senior Agronomist, Acting in Charge, Forage Crops and Diseases, Bureau of Plant Industry, USDA, Washington, DC.

"I trust that you and other officials at the Department of Agriculture will not be too severe in your censure of Mr. Morse for not advising the office of my illness. He has had worries enough at this end of the line without causing him more from Washington. I can readily understand how Morse felt when I went down so suddenly and was so severely ill. He had to pick up the details of my work and carry them on at the laboratory and in the field to the best he could without any advice or assistance. In addition to these numerous troubles, he was worried almost sick on account of my condition."

"On arrival in Dairen on April first, we went several days searching for a suitable laboratory room and finally found one in the Cohin building. As it was near Spring, the heat had been turned off in the building and the room was quite chilly and sometimes really disagreeable. However we went to work fitting it up with a temporary darkroom and shelves. On the 11th our official baggage was received and we got it unpacked and practically put away on that day. During the afternoon I spoke to Mr. Morse who was not feeling at all well, and cautioned him about over-doing. Just after quitting, between four and five o'clock but before leaving the office, I felt a shiver run up my spinal column, but felt no pain and had no symptoms of a cold (as far as I know).

"That night I took a couple of Aspirin and the next day called in a physician. On the 13th Dr. K. Kondo, the Japanese doctor who was attending me, pronounced my trouble as double pneumonia, and on the 14th I was taken to the Doctor's private hospital where I remained for practically two months. During the major part of the time I was more or less delirious and critically ill. In fact the doctor for a week or more did not give me any hope of recovery. However, I was pulled through and on June first I left the hospital and went to the Yamato Hotel... to recuperate. I spent ten days there, returning to the Yamato Hotel in Dairen where we are stopping, on the evening of the 10th of June."

Knowles Ryerson has developed new plans for Dorsett and Morse, which Dorsett describes. Address: Agricultural Explorer, USDA, Washington, DC.

2765. Sakuma, Futoshi. 1930. Studies on glyoxalase. *Journal of Biochemistry* (*Tokyo*) 12(2):247-79. July. [20 ref]

• ***Summary:*** There as been great interest in the question "as to the importance of methylglyoxal in the sugar metabolism of plant and animal bodies." The enzyme glyoxylase has been found in both plants (including soy-beans) and animals.

In order to examine how the glyoxalase content of seeds might change during germination, soy-beans were kept moistened at 25ºC and the glyoxylase content of the

© Copyright Soyinfo Center 2014

bud, bean-rest and whole bean including bud and root were examined daily (p. 250). Chart 1 (p. 21) shows the results during 9 days of germination. The glyoxalase content of the bud increased rapidly until the 6th or 7th day of germination; then it began to decrease. "This increase in glyoxalase may be attributed to the increase of co-enzyme rather than to that of the enzyme itself."

Pages 265-66 discuss the effect of co-enzyme on soybean glyoxalase. Table 7 shows that the co-enzyme causes a greater decrease in methylglyoxal.

Note: The glyoxalase system is a set of enzymes that carry out the detoxification of methylglyoxal and the other reactive aldehydes that are produced as a normal part of metabolism (Source: Wikipedia, Oct. 2008). Address: Dep. of Biochemistry, Niigata Medical School, Niigata, Japan.

2766. Suzuki, Bunsuke; Nishimoto, U. 1930. The kephalins [cephalins] of the soybean. *Proceedings of the Imperial Academy* (*Tokyo*) 6(7):262-65. July. [Eng]

• ***Summary:*** Details are given for the extraction of the kephalins [cephalins] from the oil-free alcoholic extract of soya bean. Hydrolysis of these with 3% sulfuric acid gives cholamine, stearic, linoleic, linolenic, and Beta-glycerophosphoric acids. Treatment of the cephalins with bromine in light petroleum affords (a) soluble and (b) insoluble fractions, hydrolyzed to (a) stearic and tetrabromostearic acids, and (b) stearic and hexabromostearic acids. The original mixture contains, therefore, α-stearo-gamma-linoleo- and α-stearo-gamma-linoleno-Beta-cephalins. Address: Biochemical Lab., Faculty of Agriculture, Kyoto Imperial Univ., Japan.

2767. Morse, W.J. 1930. Re: Heat and humidity in Manchuria are unbearable. Keeping good notes (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Aug. 3. Unpublished log.

• ***Summary:*** Pages 5458 to 5461. This letter dated Aug. 3, is from W.J. Morse in Dairen, Manchuria to P.H. Dorsett in Peiping, China. "With regard to the hot weather... In all of our tramps about Fuji and other places [in Japan] I did not suffer nearly as much from the heat as I have here in Manchuria. The heat from the sun seems to be so much more intense and seems to go right through one. Suyetake made the remark how hot it is here compared to the main island [Honshu, Japan]. The humidity also seems to be rather high and our clothes, suit-cases and other leather goods have to be cleaned of mold about every other day. My experience thus far with the Manchurian weather is quite different from that which I expected to find after reading volumes on Manchuria agriculture."

"In South Manchuria soybeans are planted mostly with corn although I have seen many fields of sorghum and soybeans, and millet and soybeans. It is quite likely that I may come across this practice between Mukden and Antung and also between Mukden and Changchun for soybeans are grown more or less with sorghums in these regions. I have picked up so much information and seed [sic, seen] so many things along the soybean line that I have never read or heard of during my trips that it almost bewilders me. With such conditions, Dorsett, I am indeed thankful that I am not burdened with the collection of much other material and can devote my short time here in this wonderful soybean country wholly, at least almost wholly, to my friend the soybean. Little do the people back in Washington [DC] realize just what there is in the soybean line over here. The references in letters the past winter and spring to the effect that we have gathered sufficient seed samples and products has made me rather worry."

"With reference to my field notes and pictures, I still try to keep up with you. As to office routine I will omit that and confine my notes to my field activities along with the pictures. I do not care for the notes after they are typed as I keep full notes every day in my daily note-book [notebook] and would not have any use for the notes sent you as I take them out of my books. So just destroy these after you have finished with them."

"Very sincerely, W.J. Morse." Address: Agricultural Explorer, USDA, Washington, DC.

2768. Dorsett, P.H.; Morse, W.J. 1930. Roasted soybeans and soy coffee in Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5353 (5 Aug. 1930–Dairen, Manchuria). W.J. Morse's notes. "During our visit with Mr. Arakawa in Hsiungyaocheng [Manchuria], July 31, he served us a cold drink which he said was made from roasted soybeans and barley. The product was manufactured in Germany and he bought several boxes at a Russian store in Mukden [Manchuria]. He could not remember the name of the product but he said it came in a green paper package."

"At a Japanese food store we found an instant coffee substitute known as 'Health Coffee' made from soybeans and [word omitted] by a Japanese farmer living outside of Dairen. The same store also had another coffee substitute made from 50 per cent roasted soybeans, and the remainder, coffee and chicory. We were advised to try a Chinese food store for the German soybean coffee. At a large Chinese store we found the same kinds of coffee substitute as at the Japanese store." Address: Agricultural Explorers, USDA,

Washington, DC.

2769. Dorsett, P.H.; Morse, W.J. 1930. Tofu, soybeans in the pod, and soybean sprouts in Peiping, China (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 5431 and 5432 (13 Aug. 1930). "We visited an open street market in the northwestern part of the city this morning." Vegetables include: (1) "Soybeans in the pod, quite abundant." Also: "Pea sprouts. Soybean sprouts." "In the afternoon we went to the Temple of Heaven grounds and got more seed..."

Page 5434. Vegetable market scene. Hei Tan Pai Lou, Peking. Cucumbers, eggplants, soybeans,... displayed on the ground for sale" (neg. #45540). At the same market, photo of bean curd. "This Chinese bean curd looks firmer than the Japanese curd" (neg. #45541).

Page 5435. "Peiping. Square cakes of brown bean curd. The cakes of white curd are put into cold soy sauce and when the combination is brought to a boil the cakes are of a brown color" (neg. #45543).

Pages 5436 and 5437. Four photos taken in an open-air show: "Southern soybean curd, Peiping. This curd appears quite firmer than the ordinary curd. The curd, that is the grain, appears to be finer and is considered much better than ordinary curd. It also sells for more money." (2) "White and brown cakes of soybean curd in a Chinese market." (3) "To the left is a pile of shredded soybean curd, on the right a pile of the sheets of curd from which the shredded curd is made" (negs. #45544-46). Note: Pressed tofu sheets are called (in Wade-Giles transliteration) *pai-yeh* or *ch'ien-chang p'i.* Pinyin: *Qian zang pi.* Tofu is pressed into very thin sheets that look like a 6-to-12-inch square of canvas.

Page 5455 and 5456. Letter dated 14 Aug. 1930 written by P.H. Dorsett in Peiping to W.J. Morse. c/o Yamato Hotel, Dairen, Manchuria. "Yesterday we visited an open street fruit and vegetable market which extends for several blocks along Chien-men [Chienmen] Street. It was surely an interesting experience. We saw bean curd at quite a number of stands, also soy sauce. The curd was in several different forms. The white, in somewhat thinner and smaller pieces, small pieces in different forms fried, also round and square brown cakes which they call dry curd [*doufu-gan*]. It is not really dry but is pressed much dryer than the ordinary curd and can readily be handled without breaking, The brown color, we learned, is the result of putting the curd in cold soy sauce and bringing the sauce to a boil."

Pages 5779 and 5780 (18 Aug. 1930). Letter from Mr. W.J. Morse in Dairen, Manchuria, to Mr. P.H. Dorsett, c/o U.S. Legation, Peiping, China. "Today by mail I sent you all of the negatives of pictures that I have taken up to date. The negatives were sent in two lots–one of the 3¼ by 4¼ and the other of the panoramas. Tomorrow I will send you the field reports to date which may be destroyed after they are copied in the report.

"I am planning to go to Korea for two to three weeks in the very near future to complete our movie story of the soybeans as well as the still picture story. We lack the connecting links–scenes of varieties, fields, methods of culture and harvesting–and I hope to get these if possible in a short time to complete the whole soybean story of Korea. I also desire to get some data on the growing varieties for you will recall that we did not see the beans growing at all. The Manchurian maturing season soon will be here and again I want to take notes on varieties and make a complete story of the Manchurian soybean. You can rest assured that I am going to collect all possible data, seed and products of the crop. I trust that my allotment holds out for I do not want to miss anything."

"I regretted very much to learn of Dr. Harvey Wiley's death [on 30 June 1930] as I knew him very well. Several years ago he came to see me about soybeans for his dairy farms up at Bluemount [Note: After leaving government in 1912, Wiley raised dairy cows became head of the laboratories at *Good Housekeeping* magazine]. I started him with the Virginia as a silage bean and it was a great success. He became quite a soybean man and occasionally came around to talk soybeans with me.

"Your comments on the bean-curd at the Chinese market are very interesting and I hope to be able to see some of these different things when I come down to [China] some time this fall. I doubt if I will find anywhere in the Orient such a collection of products as we picked up in Japan last year. You will note in the field reports being sent you that lately we have stumbled across a few new products and we are always on the lookout for new ones." Address: Agricultural Explorers, USDA, Washington, DC.

unsaponifiable matter and 95.7% fatty acids (thiocyanogen value 83.1, iodine value 139). Solid fatty acids were determined by the lead salt-alcohol method, and the following composition was calculated: saturated fatty acids 11.8%, oleic acid 25.9%, linoleic acid 58.8%, linolenic acid 3.8%. Address: Chemischen Inst. der Kaiserlichen Universitaet, Kyoto.

2772. Dorsett, P.H. 1930. Re: Collecting seeds and herbarium specimens (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Sept. 9. Unpublished log.
• ***Summary:*** Pages 5775 to 5778. This letter dated Sept. 9 is from P.H. Dorsett in Peiping, China to W.J. Morse, c/o Yamato Hotel, Dairen, Manchuria.

"Dear Morse: Come on over, the weather is cool and it is fine here."

"We spent a week in the vicinity of Hankou, the Chinese Great Wall, Ming Tombs and Tang Shan [Tangshan, a city in today's Heibei province], and secured some seed, a few pictures, and quite a number of herbarium specimens. We also spotted quite a number of plants of which we hope to get seed later."

Page 5776. "In a recent letter from Ben... he voices the opinion that all think I should return to Washington [DC] in December. Oh well, I guess I can stand it!

"Perhaps we had better give some consideration to the time and arrangements for our making the trip home. If you will, as soon as you conveniently can, let me know when you will be ready to sail and whether or not you will leave via Peking or Shanghai, Kobe or Yokohama. I will arrange my affairs so as to take the same steamer" with you are Margaret.

"One evening last week we took dinner with Dr. Yamei Kin, and during the course of the conversation, which drifted, among other things, to soybeans and soybean products, the Doctor challenged my statement to the effect that I thought the Japanese utilized soybeans as human food more extensively than do the Chinese. She said the Chinese have a large number of soybean jams [jiang] and other products which are used extensively. Well, when you get to Peking, you will have to look these matters up. The Doctor may be right about this matter but I have my doubts."

Page 5777. "I am pleased to learn that you are there and are getting along so nicely in filling in the gaps of our Chosen [Korea] work last fall where additional data and pictures are required to round out a complete story of the soybean work in that region.

"We, to my surprise, find that throughout the regions we have visited about Peiping, that the soybean is grow here in conjunction with practically all other farm crops, but primarily with kaoliang, corn, millet, sesame, peanuts, etc. Jim and I did not observe this when we were here in 1924-25."

"I suppose you will get seed of the large wild soybean. We expect to get seed here of the large leaved tall growing form."

Page 5778. "We will arrange to collect as many small samples of soybeans as is possible from the regions we visit... Very sincerely yours." PHD/rd. Incls. [Inclosures]. Address: Agricultural Explorer, USDA, Washington, DC.

2773. Dorsett, P.H.; Morse, W.J. 1930. Soybean milk in Heijo (Pyongyang), Chosen [Korea] (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 5905-06 (22 Sept. 1930, Heijo, Chosen). W.J. Morse's notes. "After lunch we went to the Prefecture Seed and Nursery Farm. On the way we found mature seed of the wild soybean and collected a fair sized sample.

"At the station we met the director, Mr. Shiramura, and asked concerning the harvesting of soybeans. He thought we would have a better chance of seeing the harvest of beans around Junsen, which is an extensive soybean section and is in a mountainous region. When the soybeans are grown alone, the plants are allowed to become fully mature before harvesting.

"After returning from the Seed and Nursery Farm we visited a soybean curd factory. In addition to selling bean curd this factory sells about five gallons of soybean milk daily during the summer months. This factory runs two stone grinders and uses 4-5 bushels of dry beans daily. Various forms of fried bean curd are also sold by this factory. The same process of making bean curd and milk is used on the Main Island. In the milk, however, less water is used, thus giving a higher quality of milk. The milk is used only by the Japanese and sells for 4 sen per bottle (5 bottles to the quart)." Address: Agricultural Explorers, USDA, Washington, DC.

2774. Kellogg, John Harvey. 1930. Soybeans as human food. Paper presented to the American Soybeans Grower's Association, Sept. 11. 20 p.
• ***Summary:*** Dr. Kellogg shows that he has an excellent knowledge of the world literature on soybeans and soyfoods, much of which he summarizes in this speech. "Many years ago (1899), the United States Department of Agriculture, called upon me to undertake the preparation of a vegetable meat. The Assistant Secretary, Dr. Charles Dabney, wrote me, suggesting that the navy bean might be used for the purpose. I found, however, as I expected, that this legume

© Copyright Soyinfo Center 2014

was not suited to the purpose. At that time the soybean was not grown to any extent in this country, I was wholly unacquainted with it, and so naturally sought to find in nuts, especially the peanut, a solution of the problem, and succeeded in producing a vegetable meat, Protose, of which several thousand tons have since been made and consumed. But the introduction of the soybean renders quite unnecessary any other substitute for flesh meats." The author discusses his belief that primitive man subsisted wholly upon plant products (i.e. ate a vegan diet "according to Prof. Elliot of Oxford University, Prof. Ami of Montreal, and other distinguished paleontologists"), and the nutritional value of soybeans and their basic-ash quality. "All meats yield a highly acid ash. The excess of acid in these foods produces a lowering of the alkalinity of the blood and tissue fluids when they are freely used, a condition which is known as acidosis." He also discusses soya sauce (which is now being manufactured in the USA), miso (which like soy sauce has a flavor resembling that of the osmazomes found in meat and meat sauces), roasted soy nuts (resembling roasted peanuts), pressure cooking whole soybeans, adding soy meal (flour) to breads, soy milk (which, in certain parts of China and Japan, "is made in quantities and distributed in bottles like milk in this country"), soy cheese [tofu], and the many health benefits of soy milk described in the medical literature, the many health problems caused by consuming flesh foods.

"Von Noorden, the world famous German physician, has demonstrated that the soy bean is of very great service in changing the intestinal flora." Note 1. This is the earliest document seen (June 2003) concerning soy and changing the intestinal flora. It is also the earliest document seen (June 2003) that uses the phrase "changing the intestinal flora" in connection with soy.

"In spite of the frantic efforts of vested interests to promote the uneconomic live-stock industry, it will no doubt gradually disappear as a true science of agriculture is developed and the country becomes more densely populated. The conversion of vegetable into animal protein by feeding to steers and pigs, is one of the most wasteful of all human activities. Armsby has shown that 100 pounds of digestible vegetable protein are required to produce 3 pounds of meat protein..."

Discusses Stefansson's absurd so-called meat-eating experiment, which was really a publicity stunt. Stefansson took no more than 20% of his calories in the form of lean or muscle meat. The rest of his diet was fat. "Excessive meat consumption is one of the begetting sins of the people of this country. Our per capita meat consumption is 5 ounces per day, just 5 times that of Italy (1.0 oz.) and ten times that of North China (0.5 oz.), while the average native of South China eats no meat at all, and is one of the hardiest and most industrious of workers."

"Thanks to the efforts of our efficient Plant Introduction Bureau, the soybean is beginning to get a start toward recognition and appreciation in this country; but it is evident that a plant possessed of such superlative values and such astonishing versatility and adaptability should receive far more serious attention than has heretofore been given it by the agriculturalists of this country... There can be no doubt that it is destined to play a large part in the feeding of America's millions..."

Note 2. This is the earliest English-language document seen (Dec. 2012) that uses the term "soy nuts" or the term "roasted soy nuts" to refer to soynuts. Address: Battle Creek, Michigan.

2775. Morse, W.J. 1930. La utilizacion de la soja en diversas industrias [The utilization of soya in various industries]. *Hacienda* (*La*) (*Buffalo, New York*) 25:298-301. July; 25:347-49. Aug; 25:394-96. Sept. [1 ref. Spa]
• ***Summary:*** This is a translation of USDA Farmers' Bulletin 1617, but with excellent new illustrations. Contents: Introduction. Soybeans in the human diet: Whole dry soybeans, green vegetable soybeans, soy flour, soy oil, soy sauce, soy milk, tofu (*cuajada de soja*). Soybeans in the feeding of domestic animals. Soy oil: Extraction, use. Soybean cake: as a human food, as a livestock feed, as a fertilizer. The value of soybean forage. Soybean in silage. Soya as green forage. Soybeans for the improvement of soils. Soybean straw.

This article contains many interesting photos: 1. A man with a hand turned stone mill in China grinding soybeans to make soymilk. 2. Soybean cakes stacked and partly covered with tarpaulins at a port in Manchuria. 3. Earthenware vats used for making soy sauce in a courtyard in China. 4. Steamed soybeans being cooled to make miso in Japan. 5. Soybeans intercropped with corn. 6. Manchurians outside a soy oil factory in Dairen. The equipment was installed by the French Oil Mill Machinery Co. 7. Carrying round soybean cakes in a cart at the same factory. 8. A soybean mill at Yokohama, Japan. 9. An Anderson Expeller for the extraction of soy oil. 10. A tractor pulling rotary disks for cultivating soybeans in the USA. 11. Harvesting soybeans with a tractor in the USA. 12. A tractor pulling a harvester-thresher combine in the USA. Address: USDA, Washington, DC.

2776. Morse, W.J. 1930. Soybeans in the Orient. *Proceedings of the American Soybean Association* 3:96-100. Eleventh annual field meeting. Held 10-12 Sept. 1930 in Illinois.
• ***Summary:*** This letter (which appears on pages 5196 to 5199 of the unpublished Dorsett-Morse Log) was written by William Morse on 20 July 1930 from Dairen, Manchuria, to Dr. W.L. Burlison, President of the American Soybean Growers Assoc. at the University of Illinois. It describes the travels of Dorsett and Morse as agricultural explorers for the USDA, studying soybeans and soyfoods, in Manchuria, Japan (Hokkaido and Tokyo), and Korea (Seoul).

"It is recalled that last season the use of the soybean as

© Copyright Soyinfo Center 2014

a green vegetable was described. Throughout the season, it was found that the green vegetable was a very popular food with the Japanese from one end of the Japanese Empire to the other. The vegetable soybean is classed as a garden bean and as such is extensively grown by the Japanese truck farmers."

The authors were in Hokkaido from mid-August until early October, and they visited all the principal soybean sections. "The Obihiro station in the eastern part of the island [of Hokkaido] is conducting the most extensive work in breeding and variety testing. We succeeded in collecting a very large number of varieties and selections of this northern region as well as information on culture, harvesting, threshing, insect pests, and diseases. To supplement this material, we obtained a large number of still and motion pictures of very interesting scenes of the Hokkaido soybean industry."

They arrived in Korea on 20 Oct. 1929 and established headquarters at Keijo (Seoul). "We found Korea to be a most interesting country and different from anything we had seen in Japan. One of the most amazing things was the extent to which soybeans are grown. Almost equally amazing was the large number of native Korean soybean varieties we found in the various sections and at the experiment stations. At the Suigen Experiment Station, they have more than one thousand native Korean varieties and selections under test. The authorities were very generous and gave us samples of each. In addition to this collection, we obtained a few hundred samples from Korean farmers, grain merchants on village market days and from village and city grain dealers. The Korean Department of Agriculture added about 300 samples to our collection by obtaining seed of the principal varieties from the village agricultural societies in each of the prefectures of Korea.

"Altho the Koreans do not use the soybean as extensively for food as do the Japanese, considerable quantities are used and in quite different ways. The beans are used principally boiled with other grains such as millet or kaoliang. They are also used in making miso and soy sauce, but these products are made quite differently from those of Japan or China. Soybean sprouts are found very abundantly in all of the markets and at all of the small food stores. The beans produced in Korea are for the most part excellent quality and are largely shipped to Japan for the manufacture of miso, soy sauce, bean curd, and natto. Soybeans when soaked with chopped millet or kaoliang straw are used universally for feeding oxen and cows, the common work animals of Korea.

"We left Korea about the first week of December [1929] for our Tokyo headquarters and collected seed samples and products as we went along. From the latter part of December until the latter part of March, we put in full time collecting soybean products and learning of their use and manufacture. We succeeded in collecting a large number of interesting products, as the Japanese use the soybean very extensively in their daily diet. In the making of cakes, candies, and numerous other confections, the roasted soybean is used in a similar manner to the peanut in America. Of course, soy sauce, miso, bean curd, and natto are the principal soybean products and the ones most extensively used. As an example of the large use of miso, which is used as a breakfast soup with vegetables and also in preserving fish, vegetables, and meat, we visited three large miso factories in the Tokyo district and found that each produced about one million pounds of miso yearly. In addition to these three large factories, there were numerous small factories scattered thrughout the same district.

"As the planting time was approaching in Manchuria, we left Tokyo the latter part of March and arrived in Dairen, Manchuria, the first of April... This country is the real land of the soybean and Dairen, the real city of the soybean. In 1929, 29.2 percent of the total cultivated area of Manchuria was devoted to the growing of soybeans, producing more than 178,000,000 bushels of seed, thus leading all other crops in acreage and production. The Port of Dairen handles about eighty (80) percent of the exports of beans, bean cake, and bean oil.

Note: This is the earliest document seen (Aug. 2011) that uses the term "land of the soybean" in connection with or to refer to Manchuria.

"The planting season for soybeans in Manchuria begins about the first of May and extends to about the 25th of May in some northern sections. We, therefore, had an opportunity before the planting season, to study the methods of grading, storage and transportation of [soy] beans, bean cake and bean oil in the oil mills. The storage yards and warehouse yards of the South Manchurian Railway cover several hundred acres and the immense quantities of bags of beans and bean cakes stored in the open storage yards and in the warehouses are well worth seeing..."

"We had rather expected to find a large number of products made from beans, bean cake, and bean oil but our findings thus far have been very meager. The oil is used in the manufacture of soaps, paints, lard substitutes, and salad oils, but only a very few factories are engaged in producing these products. The beans are used chiefly for oil and oil cake, but during the last three or four years, the demand of European mills for beans has had a serious effect, not only on the Dairen soybean oil mills, but also on the oil mills throughout North and South Manchuria. In Dairen, at the present time, only about forty-five soybean mills are active during the crushing season, whereas four years ago there were about ninety. The oil cakes are for the most part shipped to the Japanese Islands for feed and fertilizer (chiefly fertilizer), to China and the East Indies for fertilizer, and to America and Europe for cattle and poultry feed."

"Our experience in the field up to the present time has been the study of methods of planting and cultivation

© Copyright Soyinfo Center 2014

practiced in different sections of North and South Manchuria."

"We have collected quite a large number of seed samples during our travels thus far in Manchuria and have obtained some very interesting types. It may interest the members to know that we have visited Yingkou (Newchwang), the source of the Virginia and Wilson varieties... At the Kunchuling Experiment Station, more than one thousand varieties and selections have been tested but at the present time only five hundred are under test. The Manchurian varieties do not succeed in the Japanese Islands or Korea and neither do the Japanese varieties succeed in Manchuria or Korea..."

"With this letter we are sending some lantern slides illustrating various scenes of the soybean industry in oriental countries... With best wishes for a most interesting and successful 1930 meeting."

Note 2. This is the earliest English-language document seen (Feb. 2004) that uses the term "vegetable soybeans" (not preceded by the word "green") to refer to green vegetable soybeans.

Note 2. This letter was reprinted in *Soybean Digest* (April 1945, p. 11-12). Address: USDA, Washington, DC.

2777. Tsao, Lien-en. 1930. The marketing of soya beans and bean oil. *Chinese Economic Journal* 7(3):941-71. Sept.
• ***Summary:*** A brilliant and very informative article. The amount of Manchurian soybean production as compared with the other leading soybean producing countries, and a discussion of the marketing of soybeans, cake and oil on the world market, are included. "Tea and silk once dominated the world market and today, from China's Three Eastern Provinces (Manchuria) have created a world demand" (p. 941).

"The cake saturated with from 7 to 9 per cent. of oil is of no industrial use except as cattle feed and fertilizer in the fields. The oil thus obtained is still crude. Although some large and modern mills at Harbin and Dairen produce purified and refined oil for table use, the bulk wanted by Europe is the crude variety, which is there to be made into margarine butter, gun-powder, and other industrial articles. The cake in the very early days of the industry was shipped to Ceylon for trial as fertilizer in the tea fields as remarked before, but owing to the presence of the large percentage of oil it softened and became damaged when crossing the tropics" (p. 956).

Page 969 states: "Experiments are now being made to cultivate soy beans in the French and British Sudans of Africa [later named Mali and Sudan], in unreclaimed areas of Australia, in Europe, South America, and by the time the trials will bear fruit, the Manchuria market will be irretrievable... The beancake as a fertilizer will also lose its market in Japan, now that industrialized Europe is thrusting out a chemical fertilizer in the form of powder sold at much lower prices than the beancake... Chinese oil manufacturers naively believe that the chemical as fertilizer is not suitable for the soil in Japan, but poisons it, so that the crops become of inferior quality year by year." Once continued application of chemical fertilizer assures good results, "the market for Manchurian beancake is doomed."

Note: This is the earliest document seen (Aug. 2009) concerning the cultivation of soybeans in Sudan.

An appendix (p. 970-71) lists in Chinese characters the names of the oil mills in Manchuria, by city: Dairen (41 mills), Harbin (28), Antung (20), Newchwang (19), Dairen west suburb (11), Dairen east suburb (7), Anta (7), Ashihi (3), Mankou (2), Maotangkiang (2), Angangchi (2), Tsitsihar (2), Changchun (1), Fularki (1), Imienpo (1).

2778. Mashino, Minoru; Shishido, Tadao. 1930. Effect of carbohydrates and other impurities on the crystallization of glutamic acid hydrochloride from decomposition products of soy bean protein. *J. of the Society of Chemical Industry, Japan* 33(10):421B-22B. Oct. (Chem. Abst. 25:746). Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** The addition of the methyl alcohol extract from soybean cake considerably reduces the yield of glutamic acid hydrochloride obtainable on recrystallization; the addition of carbohydrates does not reduce the yield so much. By purifying soybean cake with methyl alcohol before decomposition, a high yield (90%) of the salt is obtainable, whereas an unpurified cake yields only small amounts of the crystalline product. Address: Tokyo Imperial Industrial Research Inst., Yoyohata, near Tokyo, Japan.

2779. Nakazawa, R; Takeda, Y. 1930. Ueber die Schimmelpilze welche bei der Herstellung des Leckerbissens "Ontjom" und "Tempeh" (Java und Sumatra) mitwirken [Molds that assist the production and fermentation of the delicacies "ontjom" and "tempeh"] (Abstract). *Biological Abstracts* 4(10):2379 (Abst. #25213). Oct. [1 ref. Ger]
• ***Summary:*** Tempeh and ontjom are the names of foods produced by the natives of Java and Sumatra. Tempeh is made from soybean and ontjom from groundnuts (peanuts). Geerligs reported that *Rhizopus oryzae* is the mold used to produce both these foods, but Went reported it was *Monilia sitophila.* However Nakazawa and Takeda identified *Penicillium brevicaule* as the main mold involved, together with small quantities of *Rhizopus, Aspergillus,* and *Mucor.*

2780. Suzuki, Bunsuke; Yokoyama, Y. 1930. Soy bean lecithins. I. The separation of α- and β- series. *Proceedings of the Imperial Academy* (*Tokyo*) 6(8):341-44. Oct. [4 ref. Eng]
• ***Summary:*** Experimental details are given for the isolation of lecithins from an alcoholic extract of soya beans as cadmium chloride double salts, from which fatty acids (saturated 44%, unsaturated 56%), α- and Beta-glycerophosphoric acids, and choline are obtained. The

© Copyright Soyinfo Center 2014

saturated acid is palmitic acid, and the unsaturated fraction contains oleic acid (47% of total acids), and smaller quantities of 2 acids which, on bromination, yield hexa- and tetra-bromostearic acids, melting points 177-178ºC and 112-113ºC, respectively. Separation of the cadmium chloride salts of the α- and Beta-lecithins is effected by acetone, in which the α-complex is far less soluble. From the α-lecithins palmitic, di-, tetra-, and hexa-bromostearic acids have been obtained in the proportions 24.3, 32.4, 44.2, and 1.1%, while in the Beta-series the proportions are 20.1, 53.8, 24.8 and 1.4%.

Note: This is the earliest English-language document seen (Oct. 2003) that contains the word "choline" in connection with soy bean lecithin. Address: Biochemical Lab., Faculty of Agriculture, Kyoto Imperial Univ., Japan.

2781. Suzuki, K.; Hatano, Tadashi. 1930. Manshû daizu kasu (maru kasu) no yokei shiryô toshite no kachi [Nutritive value of round Manchurian soy-bean cake for hens. II.]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 6(10):900-09. Oct. Also published in Proceedings IV World's Poultry Congress, 1930, 288-91. [5 ref. Jap]
• ***Summary:*** "Soy-bean oil cake was given as protein source of the feed. Twelve parts of bone powder, 4 parts of calcium carbonate and 4 parts of NaCl for 100 parts of the cake were supplied. The nutritive value was similar to that of fish meal. It gives results on egg production and weight of eggs similar to those of other animal feeds... The chicks hatched from the eggs as above mentioned were also fed with soy-bean oil cake. No abnormal signs were noted."

2782. Suzuki, Kôzô. 1930. Buta no shiiku shiryô toshite no manshû-san daizu kasu (maru kasu) no kachi [The value of round Manchurian soy-bean cake for fattening swine]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 6(11):975-86. Nov. [45 ref. Jap]
• ***Summary:*** "Soy-bean oil cake as 20% and 30% was added to a feed consisting of korean 47%, maize 30%, bone powder 2%, and NaCl 1%. The nutritive value of the feed with soy-bean oil cake was as good as that with fish meal. The results in fattening were rather superior. Vitamin A, C1, Na and Ca should be supplied."

2784. *USDA Plant Inventory.* 1930. Plant material introduced by the Office of Foreign Plant Introduction, Bureau of Plant Industry, April 1 to June 30, 1929 (Nos. 80019 to 80810). No. 99. 46 p. Nov.
• ***Summary:*** Soybean introductions: *Soja max* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.

No. 80455-80498. "From Japan. Bulbs and seeds collected by P.H. Dorsett and W.J. Morse, Agricultural Explorers, Bureau of Plant Industry. Received May 27, 1929.

No. 80459-80498 are all soybeans. Six of these PI numbers came to have special significance; all were large-seeded and were introduced in the USA.

"80472. No. 38. From the Yamato Seed Co., Takadacho, Tokyo, April 15, 1929. *Chusei O Saya Eda Mame.* A large yellow-seeded variety said to be the largest soybean used for garden purposes and to have a sweet flavor. It is said to be used principally as a green bean, being cooked in the pod. Note: Renamed "Chusei" by 7 March 1936.

"80473. No. 39. From the Yamato Seed Co., Takadacho, Tokyo, April 15, 1929, and originally from the Tokyo district. *Cha Mame.* A large brown-seeded variety, said to be used as a green bean when boiled in the pod. Note: Renamed "Chame" by April 1936.

"80475. No. 41. Obtained from the Yamato Seed Co., Takadacho, Tokyo, April 15, 1929, and originally from the Tokyo district. *Higan mame.* A rather late yellow-seeded variety, said to have white sweet meat and to be used as a green bean, being cooked in the pod. Note: Renamed "Higan" by April 1936.

"80476. No. 32. Obtained from the Imperial Seed Co., Takinogawa, Tokyo, April 15, 1929, and originally from the Tokyo district. *Sousei O Saya Eda Mame.* One of the earliest varieties of garden soybeans with large pods and large yellowish-green seeds. It is said to be very sweet as a green bean, being cooked in the pod. Note: Renamed "Sousei" by April 1936.

"80480. No. 63. From the Tokyo Seed, Plant & Implement Co., Konon, Tokyo, April 19, 1929, and originally from the Saitama Ken. *Gokuwase Daihosan Shinbon Daizu.* One of the earliest varieties with an abundance of pods containing yellow seeds. It is said to be used especially as a green vegetable and is the earliest of the varieties used for that purpose. Note: Renamed "Goku" by April 1936.

"80481. No. 64. From the Tokyo Seed, Plant & Implement Co., Konon, Tokyo, April 19, 1929. *Rokusun Daizu.* Six-inches soybean, meaning that 10 beans equal six inches. A large, flat, yellow-seeded variety used as a green vegetable like the green lima bean." Note: Renamed "Rokusun" by April 1936.

Japanese names of other soybeans in this set, arranged by P.I. Number: *Maru Kuro, Mimame* [*sic, Nimame*]*, Wase Eda Mame, Furisode, Tsurunoko, Hira Sata Kuro Daizu, Chusei O Saya Eda Mame, Okuro Maru Daizu, Ao Daizu, Tsurunoko Daizu, Kuro Maru Daizu, Souseikurome O Saya Daizu, Sousei Kuro Sakigake, Shiro Tsubu, Sousei Ao Sakigake, Chusei O Saya Daizu, Shikoku Obbikuri Daizu, Sousei O Saya Daizu, Sato Daizu, Chusei Hattoku Daizu, Bansei Gokudai Tsukimi Daizu, Shin Honen Daizu, Eda Mame Uase Chaurame, Eda Mame Uase Ao Sakigake,*

© Copyright Soyinfo Center 2014

Tamba Otsubu Daizu, Eda Mame Uase Kuro Sakigake, Eda Mame Uase Kurome Dzaya [*Daizu?*]*, Daikoku Eda Mame, Tsurunoko Daizu, Otsubu Murinabe, O Tsuba Uase Aoshiro Eda Mame, Yedamame Uase Higanmame, O Tsubu Aojiro Daizu.*

Note: The word "Uase" would now (June 2011) be spelled "Awase," and "Yedamame" would probably be spelled "Edamame." Address: Washington, DC.

2785. [Introduction of soybeans to Cuba from Manchuria (via Chile) on 29 Nov. 1930 (Document part)]. 1930. In: *Introductiones,* 1928 to 1933-34. Unpublished register of seeds received by the Agricultural Experiment Station (*Estacion Experimental Agronomica*) at Santiago de las Vegas, Cuba. 134 p. See p. 53, no. 216. Unpublished manuscript. 41 cm. [Spa]*

• ***Summary:*** These soybeans were sent by the Cuban Ambassador in Chile to Alfredo Herrera at the Department of Agriculture experiment station at Santiago de las Vegas, Cuba. The ambassador in Chile had received the seeds from Southern Manchuria, which was under Japanese administration. Planted in Cuba on 13 Jan. 1931, the seeds did not germinate. The varieties are: Yellow Gem = Nyoi Gem. Ssupingkai Black Novel = White Flower Tsotzu. White Flower = Mukden White Eyebrow (Eyeiou). Address: Estacion Experimental Agronomica, Santiago de las Vagas, Cuba.

2786. Dorsett, P.H.; Morse, W.J. 1930. Miso in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 6820 (21 Dec. 1930, Kobe, Japan. Mr. Morse's notes). "Mr. Saito at Dairen had advised us that there were many places in Kobe where meat was preserved in soybean miso." Had no difficulty in finding three such places, where "we found the men busy in packing meat in white miso. In the Kobe and Kyoto districts white miso is manufactured quite extensively. Small meat shops are the only establishments putting up the miso-preserved meat. For this product beef is used and white miso. Small slices of beef about the size of the palm of the hand and about ¼ inch thick are placed on a layer of miso (about ¼ inch thick), then a layer of miso and another layer of meat. About 1½ pounds of beef are packed with miso in each tub which sells for two yen. The meat is best after being preserved in miso about 7-10 days and does not keep well after two weeks except in rather cold weather. Miso preserved meat is always boiled. White miso is always used for preserving fish and meat (beef) while red miso is used for preserving vegetables, the red miso being considered too salty for meat. Several meat shops were visited and we always found the same products and same methods of preserving the beef. Apparently this product is very popular in the Kobe district. At one of the shops we were advised that there are some miso-meat preserving places in the Tokyo district." Photo: Small tubs of miso preserved meat displayed in front of a meat shop in Kobe.

Pages 6822-23 (22 Dec. 1930, Kyoto, Mr. Morse's notes). At the Imperial Agricultural College they met Isawo Namikawa, Professor of Horticulture, who said that Kyoto is noted for several special soy products such as white miso, soy sauce, and natto. Kyoto soy sauce is lighter in color, not so heavy, and not quite as salty as soy sauce made in other parts of Japan. "In looking around Kyoto in our little spare time we saw no places where meat is preserved in miso."

Pages 6931-32 (7 Jan. 1931). Morse went to the Imperial Department of Agriculture in Tokyo and met the director, Mr. A. Manabe, who provided information, statistics, and recent publications on soybean acreage, production, utilization, and industries in Japan, Chosen [Korea], and Taiwan. These are the most complete yet received. Mr. Manabe stated that soybean acreage and production is gradually decreasing in Japan proper. This is due mainly to the increased acreage of more intensive farming, especially truck crops and rice. However the acreage of soybeans for green manuring purposes is increasing rapidly, especially in the southern half of the main Island and Kyushu Island.

Japan proper produces more than 2,500,000 koku of soybeans but uses over 7,500,000 koku; the difference is imported from Chosen and Manchuria. The soybeans imported from Manchuria are "are of much lower quality than beans from Japan proper and Chosen and are used primarily for the manufacture of soy sauce, miso, bean oil and bean cake. The beans from Japan proper and Chosen are utilized primarily for food, such as bean curd (Tofu), confections, flour and green vegetable beans. The following table gives the ratio in percent of soybean utilization in Japan:

Miso 22.7%. Soy sauce 22.7%. Bean oil and bean cake 21.6%. Bean curd [tofu] 15.4%. Green vegetable beans 0.8%. All other food uses 6.0%. Feeding purposes 6.2%. Green manure 2.5%. For planting [seed] 1.6%. Miscellaneous uses (other than food) 0.5%. Note: These figures total 100%. Thus, 22.7% of the soybeans used in Japan are used to make miso, 22.7% are used to make soy sauce, 21.6% are crushed to make soybean oil and cake, etc.

Page 6937 (10 Jan. 1931, Tokyo, Notes by Mr. Morse). Spent most of the day in the Shinjuku district looking up soybean products. "More String Natto in rice straw packages was observed in this section than any we have visited. At the stores we found considerable quantities of fish preserved in white miso and also fish preserved in sake mash. The latter is said to keep much longer than the miso preserved fish and if it keeps long enough might afford a good article of export

© Copyright Soyinfo Center 2014

to the United States, for undoubtedly it would prove far less harmful than some of the products [alcohol] now used in violation of the 18th amendment... Nearly all food stores carried a variety of vegetables preserved in red miso."

Page 6943 (12 Jan. 1931, Kobe). Visited a large miso meat preserving place that packs 5,000 to 6,000 tubs of miso preserved meat yearly. The proprietor said that about 3,000,000 tubs are sold each year in the Kobe district. The small tubs, costing 70 sen each, hold about 2 pounds of beef. The Kobe district is noted for its fine quality of beef. Photos (p. 6946-47) show these small flat tubs.

Page 6945-46 (13 Jan. 1931). Kyoto, Japan. Visited a large miso factory, where both red and white miso are made. White miso is manufactured quite extensively in the Kyoto and Kobe districts; it keeps only about 1 month in the summer, but about 3 months in the winter. A table shows the most famous forms of miso made in Japan: Sendai miso–red. Kanto miso–red. Okazaki miso–black. Country miso–red. Kinzanji miso–red. White miso–white.

Pages 7003-04 (19 Jan. 1931). Tokyo, Japan. Morse's notes. "At evening supper we had for dinner beef preserved in white miso. After broiling, the flavor of the meat reminded one of that of the sugar cured hams of the Southern States. The meat had been cured just eight days and was well flavored through."

Page 7116 (29 Jan. 1931). In a letter to Dorsett in Peking, Morse states that the broiled, miso preserved beef was "delicious" and tasted like ham. "I also had some white miso preserved fish. Although it was good, I did not care nearly so much for it as I did the beef." Address: Agricultural Explorers, USDA, Washington, DC.

• ***Summary:*** The characteristics of soybean oil polymerized by heating at 290-295ºC in carbon dioxide are given. The rate of decrease of iodine value is considerably smaller than in the case of fish oils, but in both cases this rate decreases with the duration of heating. The yields of hexabromide and solid tetrabromide decrease to nil as polymerization progresses, but the amount of viscous brownish-black bromide insoluble in light petroleum (which is regarded as an unsaturated polymerized product of linolenic acid) increases to an amount nearly equal to that of the hexabromide in the original oil. The increase in molecular weight (Rast) of the fatty acids is smaller than that of the original glycerides. The surface tension of a solution of the soap increases, and the (Hillyer) drop number and the lathering power (Stiepel) decrease with increasing polymerization. Thus polymerization reduces the detergent power of the soap, but as the soap does not deteriorate on keeping and has remarkable tenacity, it may with advantage be added to soaps of better washing power but of a brittle nature, e.g. hydrogenated soybean oil soap.

Chemical Society of Japan). Original article on pages 737-53. [Eng]
• ***Summary:*** This appears to be an English-language summary of the Japanese-language article by Y. Sumiki (1929, p. 27-32)–which see. The author "has been able to isolate the saponin easily as crystals" from a large quantity of alcoholic extract of soy-bean received from the Central Research Laboratory of the South Manchuria Railway Company (*Mantetsu Chûô Shikenjo*). The sodium salt of saponin, decomposing at 259-60º, crystallizes as hexagonal plates by neutralization with sodium hydroxide from the 70% alcoholic solution of free saponin.

Note: This is the earliest English-language document seen (Sept. 2007) uses the word "saponin" (or "saponins") in connection with soybeans. It is also the earliest English-language document seen (Sept. 2007) that uses the word "haemolytic" (or "hæmolytic" or "hemolytic") in connection with soybeans. Address: Agricultural Chemical Lab., Tokyo Imperial Univ., Tokyo, Japan.

2812. Takayama, Y. 1930. Utilization of soy beans. III. *J. of the Society of Chemical Industry, Japan* 33:91B-92B. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]*
• ***Summary:*** Results are summarized of the experiments previously described (Takayama 1928) on the separation of glutamic acid (as the dibasic calcium salt) from the products of hydrolysis (with 25-50% sulfuric acid) of crude soybean protein. Hydrolysis with more concentrated acid gave greater yields. The solubility of dibasic calcium glutamate in water was found to be 1.322, 1.928, 1.979, 3.943, and 5.698 gm of anhydrous salt per 100 gm of solution at 0ºC, 19ºC, 21ºC, 61ºC, and 100ºC, respectively. Incipient decomposition, with liberation of ammonia (as sulfate), was observed on prolonged heating of pure glutamic acid with 10 normal sulfuric acid at 100ºC and 135-145ºC.

2817. Capus, Guillaume. 1930. Les produits coloniaux d'origine végétale [Colonial products of vegetable origin]. Paris: Larose. 499 p. See p. 80-83. 26 cm. [Fre]
• ***Summary:*** The soybean (*soja*) is mentioned on 11 pages in this book: p. 1, 74, 78 80-83, 420, 484. 488, 496.

Contents: Introduction. Uses of the soybean (industrial uses and food uses): oil, cake, soymilk, tofu, fermented tofu, sauce, coffee substitute, green vegetable soybeans, whole dry soybeans, soy flour used to make bread for diabetics. The leaves and stems make an excellent green forage. Finally, in the USA, the soybean is cultivated as a forage plant, for use as silage, and also as green manure to enrich the soil for other plants.

Capus Guillaume lived 1857-1931. Address: Doctor of Science, former Director General of Agriculture in Indochina.

2818. Hara, Kanesuke. 1930. Pathologia agriculturalis plantarum [Diseases of agricultural plants]. Tokyo. 950 p. [Jap]*
• ***Summary:*** Includes descriptive accounts of the following soybean diseases: *Peronospora manshurica, Cercospora sojina, Colletotrichum glycines, Gloeosporium* sp., *Septoria glycines, Ascochyta* sp. causing leaf spot, *Phakopsora pachyrhizi, Fusarium roseum, Bacterium glycines, Bact. sojae* var. *japonicum, Ascochyta* sp. causing pod blight, *Hypochnus centrifugus, Cercosporina kikuchii,* brown spot of seeds of unknown cause, *Macrophoma mame, Mycosphaerella sojae, Phyllosticta sojaecola, Ascochyta sojae, Phomopsis sojae, Peckia* sp., *Ophionectria sojae,* mosaic, *Heterodera schachtii,* and *Cuscuta chinensis.*

• ***Summary:*** In about 1897 Mr. Kohei Yamamori started making shoyu in San Jose, California (on North 6th St.). The prospects looked good since good quality wheat, soybeans, and salt could be purchased inexpensively. But he ran into business problems and had to work in a Japanese grocery

© Copyright Soyinfo Center 2014

store in San Francisco to earn some money while continuing to run his shoyu business. Eventually the business failed, but in about 1907 many other shoyu makers started in various other parts of the country. This time, some succeeded, but others failed. Address: San Francisco, California.

2820. Tupikova, G.P. 1930. Soya [Soya]. Leningrad, USSR: All Union Academy of Agricultural Sciences. 154 p. 23 cm. [53 ref. Rus]
• ***Summary:*** Contains 88 illustrations. Page 12 states: In the Caucasus (see Wuchino) the first commercial cultivation of soybeans dates from the 1880s. The soybeans were sent by Sturua from Japan to the Tblisi Botanical Garden [in Georgia]. In 1927 the soybean started to be processed for its oil. Note: Tupikova is a woman. Address: USSR.

2821. *Los Angeles Times.* 1931. Why import soy? We can grow this bean to perfection. Jan. 11. p. J6.
• ***Summary:*** This article seems to be based on: Morse, W.J. 1927. "Soy beans: Culture and varieties." *USDA Farmers' Bulletin* No. 1520. 34 p. April. It begins: "Californians are accustomed to thinking of the soy bean as a cover crop. It is interesting to note that in its native land, Manchuria, this use of the soy bean is of small importance." There the soy bean is used mainly as a food product; only the by-products, such as bean cake and straw, are used as fertilizer.

Food products include a paste [jiang], fermented for about 2½ months, soy [sauce], bean curd [tofu], dry bean curd cakes, bean curd wafers, flour, and "milk." The expressed oil is used locally mainly for illumination [in lamps]. The better grades are used for cooking and the poorer grades for lubricating, for making printer's ink and varnish, and "as a waterproofing material in the manufacture of cloth, paper umbrellas, and lanterns.

The bean cake is used to fatten pigs and cattle. In Japan, the cake is used as a fertilizer for mulberry trees and rice fields. "In Manchuria the cake is crushed and mixed with oil and arsenic and placed on the roots of trees to poison insect pests." This insecticide is used to kill the pests that injure the wild trees where silkworms live.

The soy bean was grown in the United States as early as 1804, but only as a curiosity. In Europe it was mentioned as early as 1790. The soy bean first became known worldwide during the war between Russia and Japan [1904-05]. During the war, the may troops quartered in Manchuria created a large demand for soybeans as food. Local farmers increased their acreage. But after the war they found they had a surplus that was for too great for the demand in the local market or the Orient. The price dropped and a trial shipment was sent to London. The timing was perfect, since English vegetable oil mills were running part time because of a small crop of cottonseed and the failure of linseed in the USA and the Argentine. For the rest of that season, the English mills ran full time on soy beans.

2822. Morse, W.J. 1931. Visit to Kyuemon Hayakawa Miso Co. in Okazaki, Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. See p. 6997-7000. Unpublished log.
• ***Summary:*** W.J. Morse took notes and photos of his visit to Okazaki on 16 Jan. 1931. He was told by an innkeeper in Okazaki that there a "two factories in Okazaki making the famous Okazaki black miso... We found the Kyuemon Hayakawa Miso Co. factory about 3 miles from the inn. The master of the factory took us through the plant and explained each step of manufacture. Okazaki miso is made entirely from soybeans while other forms of miso are made from rice and soybeans. It takes twenty months to cure black miso. This company sells about 50,000 kan yearly.

"Okazaki miso keeps indefinitely and is used in making soups and preserving vegetables. At breakfast at the inn this morning we had black miso soup and found it had a much better flavor than red miso soup. The black miso is also sometimes used in making forms of soy sauce [tamari] by adding water."

Photos (p. 6999-7000) show: A large wooden cask or tub filled with Okazaki black miso and held together by many wide braided bamboo hoops. The cask is several feet taller than the miso maker (wearing an apron with a crest symbol or *mon* on the front) standing next to it. The top of each cask is piled high with about 1,200 pounds of stones to weight the miso (3 photos).

Page 7031 (17 Jan. 1931, Tokyo). In a letter to Dorsett in Peiping, China, Morse comments on the two factories making black miso in Okazaki.

Page 7053 (27 Jan. 1931). Morse notes in a cover letter accompanying two parcels sent from the American Consulate in Tokyo to Mr. K.A. Ryerson, Foreign Plants, B.P.I. [Bureau of Plant Industry], Washington, DC: "Of the products the most interesting is the famous Okazaki Black Miso under [product] numbers 6670 and 6671 which were obtained on a recent trip to Okazaki to learn the process of manufacture. This form of miso is the only one made wholly from soybeans as other forms are made with soybeans and rice. Black miso has been made at the same factory for about three hundred years and no improvements have been made in the methods of manufacture." Address: Agricultural Explorers, USDA, Washington, DC.

2823. Morse, W.J. 1931. Re: Money. Returning home (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant

Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Jan. 28. Unpublished log.
• ***Summary:*** Pages 7112 and 7113 (28 Jan. 1931). Letter from Mr. W.J. Morse in Tokyo, Japan to Mr. P.H. Dorsett, c/o U.S. Legation, Peiping, China.

"I have gone over the expenses thus far and figured what it would take to get me home and I figure roughly that it will cost about $1000 more than I was assigned... I owe much to Mr. Sato of Dairen for assistance in this work for if I had left Dairen immediately for the U.S., as I thought I would do, I would have missed a very important part of the soybean work though it has been rather nerve-racking in collecting the data."

Page 7113: "When I think of the amount of soybean data I have to assemble, I almost get cold feet for I recall what work it takes to write a small bulletin and here are two years' data to assemble.

"In your letter to Ryerson, a copy of which you sent to me, you state you desire to have the glory, etc., accorded to the first return. If that is your idea, I am going to hide somewhere along my journey home and wait until you are in Washington [DC] and then return. Glory, honor, etc., have not been in my mind for all I ask is to settle down with my soybean and other legume work and work quietly and in peace. Others can have the glory, but give me simply soybeans."

Mrs. Morse reminds her husband to than Mr. Dorsett for the clippings he has sent from time to time.

"In Ryerson's letter I notice he advises you not to throw rocks at St. Peter's gates... I think in the spring, Dorsett, you threw [roasted] soybeans [mame-maki] and St. Peter didn't hear you or thought it was hailing."

"We trust this finds you all well and with best wishes from all to all, I am

"Very truly yours,..." Address: Agricultural Explorer, USDA, Washington, DC.

2824. Dorsett, P.H.; Morse, W.J. 1931. Soybean cultivation in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 7062 (29 Jan. 1931). "Genge clover is grown as a winter crop on the rice paddies while the soybean is grown as a summer crop in the uplands and also in the rice paddies in certain sections.

"The acreage of genge clover occupies about 65 per cent of the total area of all green manure crops in Japan."

"Soybeans are planted in may between rows of wheat or barley when the wheat or barley are just heading. When the bean plants are in bloom, they are turned under, generally the middle part of June." Address: Agricultural Explorers, USDA, Washington, DC.

2825. Takayama, Yoshitaro. 1931. Utilization of the soybean. IV. Electrolytic oxidation of the hydrolysate of proteins. I. *J. of the Society of Chemical Industry, Japan* 34(1):31B-32B. Jan. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** Crude soybean protein was hydrolyzed with sulfuric acid and the filtered hydrolysate electrolyzed with a peroxidized lead anode and a lead cathode in an undivided cell and then steam-distilled. The volatile acids of the distillate (9.6% of the crude protein) contained formic, acetic, and isovaleric acids, and probably also propionic and butyric acids in small amounts. Ammonium chloride was the only base recoverable from the residue of distillation. Small amounts of other volatile materials present were probably benzoic acid and an acetone-like substance. Formic, acetic, and valeric acids were obtained similarly from the gluten hydrolysate. Address: Chemical Lab., Suzuki & Co., Ltd.

2826. William Morse examining four wooden boxes of Okazaki miso [Hatcho miso] at Hayakawa Kyuemon Shoten in Okazaki, Japan, 16 Jan. 1931 (Photograph). 1931.
• ***Summary:*** See next page. This 6½ by 8½ inch black-and-white photo has been dated from the log of the Dorsett-Morse Expedition (p. 6997). There are three rectangular wooden boxes and one round wooden box. Three of the four are closed and on the front of each is an illustration showing a man with a raised sword on a bridge in Japan; a young boy is at his feet. On one pillar of the bridge is written in large Japanese characters "Yahagi Hashi," since the Yahagi River flows underneath it.

Note 1. According to *The Book of Miso* (Shurtleff & Aoyagi, 1976, p. 219): "A Kabuki drama tells of how Hideyoshi Toyotomi (1536-1598), the child of poor farmers in central Japan's Aichi prefecture, rose to become one of Japan's most powerful feudal lords. When only ten years old, the child is said to have fallen asleep one night on a bridge near his home, wrapped only in a straw mat. A famous robber passing over the bridge scornfully kicked the urchin, who awoke and intrepidly grabbed the man's spear commanding him to stop such cruelty. The robber, impressed with the boy's courage, decided to raise him as his own son. In the play, the straw mat bears the trademark of one of the nearby Hatcho miso shops where it was used to prepare koji. Historians cite the incident to prove that Hatcho miso was being made as early as 1546." On one pillar of the bridge is written in large Japanese characters "Yahagi Hashi."

Note 2. No trademark can be seen on the straw mat on the front of the Hatcho miso boxes in this photo. Perhaps the story was created after 1931.

2827. Yokoyama, Yoshikuni; Suzuki, Bunsuke. 1931. Soy bean lecithins. II. Lecithins of α-series. *Proceedings of the Imperial Academy* (*Tokyo*) 7(1):12-14. Jan. [4 ref. Eng]

© Copyright Soyinfo Center 2014

• ***Summary:*** The bromides of palmito-linoleo-, oleo-linoleo-, dioleo-, and dilinoleo- (melting point 113-114ºC) -α-lecithin are isolated by fractional extraction (with various solvents) of the brominated α-lecithins of the soya bean (separated as their double salts with cadmium chloride; Suzuki 1930). The structures are proved by hydrolysis to tetrabromostearic and palmitic; di- and tetra-bromostearic; dibromostearic; and tetrabromostearic acids, respectively. Address: Biochemical Lab., Faculty of Agriculture, Kyoto Imperial Univ., Japan.

2828. Dorsett, P.H.; Morse, W.J. 1931. Roasted soybeans and bean-scattering ceremonies in Tokyo (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 7104 (3 Feb. 1931–Tokyo). W.J. Morse's notes: "We succeeded in collecting several fancy colored posters put out by street car companies and railroads announcing bean scattering ceremonies at several big shrines in Tokyo, Nikko and some nearby places. If all the homes, temples and shrines celebrate this day, throughout Japan, the amount of soybeans must run into a considerable item."

A sample leaflet, in Japanese, is included. An illustration (line drawing) shows a man scattering soybeans with his right hand from a small tray held in his left hand, two stations on a street car line (Narita on the left, Oshigami on the right), and the face of Okame, a symbol of fun and happiness. This "specially chosen / famous man" (*toshi otoko*) is wearing the only traditional clothing suited for the occasion: A wide-sleeved *kamishimo* on top and a man's formal divided skirt called a *hakama* on the bottom. Shadowy devils run away. An illustration of street car line is shown.

The text of the leaflet, an ad printed by the railroad line, reads: Feb. 4. Setsubun get-together. The No. 1 place in the greater Tokyo area for scattering soybeans (*mame-maki*) is Narita Mountain. A train will leave from Oshigami station to Narita station every 15 minutes all night long. The number of connecting trains has been increased for the occasion. For more information, contact the person in charge of customer relations at Keisei Railway's Oshigami branch office at Sumida 3005. Fast. Cheap. No waiting. 86 sen one way.

Page 7129 (7 Feb. 1931–Tokyo). "During the day we visited the Shiba district and found several stores dealing in beans and bean products. For the most part the soybean

© Copyright Soyinfo Center 2014

products were roasted beans, sugared roasted beans, roasted soybeans in cakes and candies and roasted soybeans in balls of baked rice dough. The greenish yellow variety was used, the beans being soaked until fully swollen before being roasted." Two photos (p. 7130) related to Setsubun, show: "A small bundle of dry soybean straw or stems and holly-like plant branches above a door of a home. To a stem of the soybeans is attached a fish head. This is used to keep out the devils which were chased from the home on the night of "Mame Maki" bean scattering night. Parched soybeans were scattered about to chase devils out of the house." The second photo includes Mr. Suyetake–their Japanese interpreter. Address: Agricultural Explorers, USDA, Washington, DC.

2829. Dorsett, P.H. 1931. Re: The real work. Some advice. Congratulations (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Feb. 7. Unpublished log.

• ***Summary:*** Page 7132 to 7133 (7 Feb. 1931). Peiping, China. Letter from Dorsett to Morse, c/o Imperial Hotel, Tokyo, Japan. "Many thanks for the letter of January 31st... Shortly after this, the real work of gleaning the grain from the chaff and preparing it for use begins.

"By the time we get back it will be... just two years, lacking a day, from the time you left Washington [DC] for the Orient until you leave the Orient on your return home.

"In the past two years we have seen much, learned a lot, accumulated much interesting and valuable data, and made many pictures. I gamble, dear fellow and friend, that it has been the most interesting, greatest and grandest two years of your life.

"Please, Morse, listen to one who has been through the experience and do not continue the pace until you board the ship."

"You have done a wonderfully nice piece of work, Morse, and I congratulate you most heartily on the results of your efforts. And remember, if I can help you here, or in any way in Washington after our return, call on me and I will be delighted to do what I can."

"We wish you all a delightful ocean voyage, a pleasant visit with the Oakleys and a safe and pleasant trip across country back to Washington and Home in Takoma Park. With sincere good wishes from all to all, as always. Sincerely yours..."

Note: During the expedition a strong friendship and deep mutual respect grew up between Morse and Dorsett, 22 years his senior. Address: Agricultural Explorer, USDA, Washington, DC.

2830. Dorsett, P.H.; Morse, W.J. 1931. Sending parcels. Translating soybean documents in Tokyo, Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 7166 (10 Feb. 1931, Tokyo). Morse's notes: "We took parcels numbered 241, 242, 243 and 244 to the Embassy to send by diplomatic pouch on today's boat, President Taft.

"During the day worked with Mr. Suyetake on translations of soybean and data from Japanese publications from Manchuria, Korea and Japan." Address: Agricultural Explorers, USDA, Washington, DC.

2831. Morse, W.J. 1931. Re: Sayonara. Outline for part of a "special report" on soybeans in the Orient (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Feb. 16. Unpublished log.

• ***Summary:*** Pages 7231 and 7232. Letter dated 16 Feb. 1931 from Mr. W.J. Morse, c/o American Consulate, Tokyo, to Mr. P.H. Dorsett, c/o Wagons-Lite Hotel [Wagons Lit Hotel, or *Grand Hotel des Wagons-Lits*], Peiping, China.

"Our last night in Japan and this is my 'Sayonara' letter in the Orient. Two years tomorrow or rather day after tomorrow we left Washington, DC, and embarked on agricultural exploration work. After two years I agree with the words I often heard you say:

"It's a great life"–if you don't weaken. Morse quotes the entire poem.

Note: This poem was created by cartoonist Gene Burns and syndicated by the *New York Evening Telegram* from 1915 to 1919; the phrase became a rallying cry for American soldiers during World War I.

"At odd times I have been raking over the accumulation of data collected in Japan, Korea, Hokkaido and Manchuria and written up tentative outlines which I want to revise somewhat going back [to the USA]. I am enclosing a copy of the one on Manchuria which you may glance over to see the kind of data I have been collecting. It is not for the report (quarterly) but merely an outline for separate reports and I thought you might be interested. I may have gotten myself in 'Dutch' [in trouble] getting so detailed information on the soybean in the soybean country of the world (and where they look on America as their soybean enemy), but I secured it here, there and everywhere."

Note 1. The "Agricultural Report on Manchuria" mentioned above was finished by Morse in 1932 and titled "Soybeans–Manchuria." It contains 181 pages (28 cm = 8½

© Copyright Soyinfo Center 2014

x 11 inches), 174 numbered photos with excellent captions, and 28 tables. Typewritten, but never published, it was attached to the end of this long log. A detailed description is given. This report on Manchuria is probably only a part of the "special report" referred to on pages 3230, 3497, 3555, and 6196 of this main report, since that "special report" promised to contain detailed information on the processes used to make different soyfoods such as miso, shoyu, yuba, and tofu. Morse apparently was never able to find the time or will to write the complete "special report," however this part of it is very detailed, useful, and impressive.

Note 2. Talk with Knowles A. Ryerson. 1983. Aug. 28. W.J. Morse definitely did not write the entire special soybean report he intended to after returning from his trip to the Orient. Why? He got swept up in the growth of the U.S. soybean production and processing industries and had no one to help him with his work during the Great Depression. He was swamped! Address: Agricultural Explorer, USDA, Washington, DC.

2832. Dorsett, P.H. 1931. Re: Outline for an "Agricultural Report on Manchuria" (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Feb. 23. Unpublished log.

• ***Summary:*** Pages 7228 to 7230. This letter Feb. 23 is from P.H. Dorsett in Peiping, China to Mr. W.J. Morse, Forage Crops and Diseases, Bureau of Plant Industry, USDA, Washington, DC.

"Dear Morse: When we came up from breakfast this morning we were handed your 'Sayonara' letter from Japan [written on Feb. 16 from Tokyo]. It sure is a great one, and is most heartily appreciated."

"Your tentative outline for an 'Agricultural Report on Manchuria' is very broad and exceedingly complete, but a lot of work will be required to whip it into shape. However, when completed it will be most interesting and no doubt very valuable."

"My dear good friend, I hardly know how to begin or what to say to you on account of the death of Lee [Charlie Lee], your friend and trusted assistant for so many years... a trusted, honored and able assistant in your life's work.

"Be brave and bear the shock and loss as the man I am sure you will prove yourself to be under this almost breaking load of sorrow, and in the end all will be well." Address: Agricultural Explorer, USDA, Washington, DC.

2833. Found, N. 1931. A cheap substitute for milk. *China Medical Journal* 45:144-46. Feb.

• ***Summary:*** This review of five articles on soybean milk was originally contributed to the *Mansen no Ikai,* June 15, 1930.

"Only in 1900 was it scientifically studied and found to have a high protein content, reaching 44% in the soy bean flour.

"In Japan it was found that nitrogen from this source was easily absorbed, especially if taken in a mixed dietary.

"John Ruhrah of Baltimore first recommended and used it as a supplementary infant food in 1909.

"Dr. Ernest Tso (Peiping Union Medical College) used soy bean milk as the main diet of an infant six weeks old for eight months and showed that this allowed the occurrence of rickets, which, however, could be cured by adding calcium and cod liver oil to the diet.

"In Peiping in 1928 he made metabolic studies on two such infants and confirmed chemically the lack of calcium, sodium and chlorine as well as vitamines other than A and B. He also showed that the phosphorus content was adequate. The nitrogen absorption is up to 90% of the intake and nitrogen retention is from 17% to 26% of the intake. His conclusion was that soy bean milk proteins are easily digested by a young infant and are capable of producing continuous growth. For best results calcium must be added and cod liver oil fed for vitamines.

"Following this, formulae were made out to correct the deficiencies.

"Dr. VanBuskirk has shown that the mortality rate per 1000 Korean children during the first five years of life are, 180, 127, 102, 59 and 39, which is especially high for the second and third years as compared with most other countries.

"Recently at the Evangelistic Center, Seoul, a practical experiment has been made in feeding large numbers of children with this milk and it is found that the cost per feeding is only about three sen as compared with 10 sen for canned cream.

"The method of preparation used is as follows:

"Soak the beans over night in 8 times their weight of water.

"In the morning remove the shells [hulls] and grind in a mill.

"Boil for five minutes.

"Filter through a sieve.

"For 1000 grams of the filtrate:

"Add 20 grams of starch, previously made into a paste with a little of the filtrate and add 60 grams of sugar.

"Add 1.5 grams of calcium lactate.

"Add 1 gram of salt.

"This gives a mixture with 4.4% protein, 1.8% fat and 1.5% carbohydrate, the pH is 6.8.

"Codliver oil [Cod liver oil] must also be given.

"Drs. Hill and Stuart in Boston have also worked out a formula for a dried powder which gives good results in cases where cows milk is not tolerated. They report the main protein in soy bean as *glycinin* and give a detailed chemical analysis." Address: Severance Union Medical College,

2838. United States Department of Agriculture (USDA), Office of Information, Press Service. 1931. U.S. plant explorer collects new soybean varieties in Orient (News release). Washington, DC. 2 p. March 28.
• ***Summary:*** "After a two-year search for new varieties of soybeans in Japan, Korea, and Manchuria, Wm. J. Morse of the U.S. Department of Agriculture has returned from the Orient with a collection of about 4,000 lots of seed and more than 300 samples of products made from soybeans.

"Mr. Morse, who is in charge of soybean investigations for the Bureau of Plant Industry, hopes that some of the many varieties represented in his collection will meet the needs of the wide range of industries using soybeans in this country."

Note: This is the earliest document seen (Aug. 2011) stating that W.J. Morse is "in charge of soybean investigations" (or "head of soybean investigations" or "director of soybean investigations") at USDA.

"Oil manufacturers, he says, want soybeans with high oil content, whereas farmers who feed hogs want low oil content. Packers discriminate against hogs fed or pastured on soybeans because of the soft pork which results from the oil. Few varieties of soybean grown on a large scale in this country have an oil content less than 15 per cent or more than 20 per cent. Some of those grown in Manchuria, however, run as high as 22 per cent in oil...

"The manufactured products in Mr. Morse's collection range from high-quality oils to beans specially treated to drive devils away during certain religious festivals [*mame-maki* at *Setsubun*].

"'Next to rice,' he says, 'the soybean is the principal food crop in the Far East, and it is the principal source of protein in the Oriental diet. No one variety is adapted to all parts of the Orient, nor is any one variety suited to all the many uses to which the beans are put. For instance, certain varieties are grown solely for oil, those that thrive in Manchuria being noteworthy for their high oil content. Other varieties are planted with a view to making soy sauce, a condiment already in favor in the United States, bean curd, used by Buddhists as a meat substitute, or miso, a common ingredient of Japanese soups. Some varieties are grown to provide a green vegetable that is to the eastern table what green peas are to the western table. Part of the crop in certain sections is roasted for use as a coffee substitute or in confections where it answers the same purpose as peanuts in American candy and cakes.'

"The beans were gathered from a wide territory varying greatly in climate and in cultural conditions. As soon

© Copyright Soyinfo Center 2014

as they reached Washington [DC] they were sent to the experiment farm at Arlington, Virginia, for observation and quarantine. When it has been determined that they harbor no insect pests or plant diseases the beans will be grouped and sent to the department's field stations, each group to the section best suited to its growing requirements, and planted. Recommendations for their ultimate introduction into the United States will depend on the results of these field tests. If they do as well here as in their native fields, Mr. Morse says, some of these new introductions will probably become staple sorts here." Address: Washington, DC.

• ***Summary:*** Sodium chlorate is an herbicide. Soybeans and vetch are relatively resistant to injury from it. Address: Nishigahara (near Tokyo), Japan.

2843. McCoy, Frank. 1931. Health and diet advice: The Oriental vegetable meat. *Los Angeles Times.* April 7. p. A6.
• ***Summary:*** For centuries Chinese and Japanese have been living on a diet that contains very little meat. They have been able to do this by using the soy bean to supply a large amount of the protein in their diets. "This bean is superior to all other dried beans inasmuch as it contains little or no starch and a very large amount of balanced protein." A table shows the high food value of soy bean flour by comparing its composition with that of spring wheat and lean beef. Soy beans almost always contain less than 2% starch, "the mature beans having no starch. This is one of the reasons why soy bean flour is often preferred over other flours in the diet of those suffering with diabetes." It is not possible to make bread of "entire soy bean flour" because it tends to agglutinate instead of forming a paste.

"The Chinese make a kind of cheese [tofu] of the soy curd which closely resembles our cheese in appearance and food value, but has an entirely different flavor. The Japanese prepare a vegetable milk by grinding the soaked beans and boiling thirty minutes in three times their bulk of water and then straining. This milk compares favorably with cow's milk and is often used for feeding infants."

Soy beans tend not to cause flatulence "because they do not contain much of the hemicelluloses which are abundant in other beans. The carbohydrates of the soy bean seem to be much more digestible."

Also from soy beans the Japanese manufacture a sauce known as shoyu. "This is made by mixing cooked and ground soy beans with salted water and inoculating the mixture with a rice ferment. The sauce tastes a good deal like a salty meat extract."

There follows a recipe for making soy bean muffins using soy bean flour, baking powder, salt, egg, and milk. No wheat flour is used. Address: Dr., author of "The Fast Way to Health".

2844. Satow, Teikichi. 1931. Apparatus for treating soy beans. *U.S. Patent* 1,799,256. April 7. 3 p. Application filed 23 Jan. 1926.
• ***Summary:*** In order to preserve the proteins in the cake, the (cracked) seed is dried by hot air until the water content is reduced to 12.5-13% before extracting with light petroleum solvent (such as benzine or carbon tetrachloride) at not above 45ºC in a steam-heated rotary drum (details given). The solvent is removed from the extracted meal by hot dry air, the temperature being raised to 115-120ºC. Address: Tokyo, Japan.

2845. South Manchuria Railway. 1931. Soya beans. *Report on Progress in Manchuria.* Second, to 1930. 307 p. See p. 4, 5, 8, 40, 76, 137, 144, 152, 154-55. (Dairen, Manchuria). [1 ref. Eng]
• ***Summary:*** "The soya bean, to-day commanding a world market, and kaoliang, used as the staple food of the native population and also as cattle fodder, are the most important among agricultural products. The production of soya beans, amounting at present to about 221,000,000 bushels, or 5,300,000 tons, annually, has doubled during the last 14 years... The commercial importance of the soya bean and its products–oil and cake–has made Manchuria famous. They are so predominant that they now constitute more than 60 per cent. in value of the entire export trade of Manchuria.

© Copyright Soyinfo Center 2014

Of 4,721,000 tons of beans and bean products exported in 1929, more than 41% went to Japan, about 44% to Europe, 13% to China, and the rest to the United States and other countries. Next to beans, millet is now the most important crop producing 171,000,000 bushels every year."

"Manchuria is often described as the 'granary of Asia,'... But its agricultural destiny was not generally realized until the South Manchuria Railway Company, running through the valley of the Liao River, brought large supplies of Manchurian [soy] beans to Dairen, whence they were shipped to waiting markets in Europe.

Soya beans (Chapter 94) is one of ten chapters in section VII titled agriculture. "The story of the Manchurian bean is a striking romance in economic history. The Japanese, though naturally regretting the loss of the Liaotung, the 'legitimate fruit' of the Sino-Japanese war, found some compensation in the discovery of the Manchurian bean, which revolutionized the fertilizer industry and became a substitute in the Japanese rice-field for the dry-herring fertilizer then extensively used. Ever since, the Japanese have been the heaviest purchaser of the Manchurian bean. The first trial shipment of this legume was made in 1908 by the Mitsui Firm of Japan, being sent from Dairen to Liverpool, and this was the beginning of a new industry in England, Germany, Denmark and Holland. The major portion of the beans destined for Europe was for the mills at Liverpool and Hull, England; for those at Copenhagen, Denmark, and Rotterdam and Amsterdam, Holland. Germany's consumption subsequently became greater than all, and this, though interrupted during the European war, is recovering. At the time of the universal shortage of food during the great war, the Manchurian bean played a very important part in the world's food supply."

"The influence of the Manchurian bean on national economy is remarkable. Denmark was more than self-supporting in the production of cereals, specially wheat, until 30 years ago. But Danish products found themselves unable to compete with American large-scale production, even in the home market. Aided by the Manchurian bean, the Danes turned extensively to stock breeding. The bean is imported, the oil extracted and used for manufacturing margarine (vegetable butter), soap, etc., while the residue of cake is extensively used as feed for live-stock, which totaled as many as 18,524,000 head in 1926, besides many million run of poultry. The consequence was the development of an enormous export trade in animal products, butter, cheese, bacon, ham, eggs, and also live-stock. The value of this great trade is some 1,027 million kroner [krone], or more than 70% of Denmark's total export. Holland, to some extent, is in a similar position."

Total world production of soybeans in 1928-29 was estimated at 353,842,000 bushels, of which Manchuria accounted for 63% (22 bushels/acre), China proper 25% (16 bu/acre), Korea 6% (12 bu/acre), Japan 5% (19 bu/acre), and the USA 1% (16 bu/acre).

Manchurian soya beans are divided into 4 classes according to color–yellow, white eye-brow [yellow with white hilum], green, and black. The chemical composition of these beans, according to analyses made in 1927 by the Central Laboratory at Dairen is: Yellow (18.19% crude fat/39.94% crude protein), black (14.74/41.00), green (18.96/40.12). Thus the green are highest in oil and the black are lowest. The black are highest in protein and the yellow are lowest. Address: Dairen, Manchuria.

• ***Summary:*** Soybean introductions: *Soja max* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.

No. 81008-81051. "From Japan. Bulbs and seeds collected by P.H. Dorsett and W.J. Morse, Agricultural Explorers, Bureau of Plant Industry. Received July 2, 1929.

No. 81021-81045 are all soybeans. Three of these PI numbers came to have special significance; all were large-seeded.

"81029. No. 271. From the Yamato Seed Co. *Chuseikurome daizu.* A middle-season, black-eyed soybean used as a green vegetable."

"81031. No. 274. From the Yamato Seed Co. *Banseiosayada mame.* A large-podded late variety used as a green vegetable." Note: Renamed Bansei by March 1936.

"81042. No. 299. From the Sapporo Engei & Co. *Kurakake daizu* (saddle soybean). Used as a green vegetable." Renamed Kura by April 1936. Address: Washington, DC.

2848. Horvath, A.A. 1931. The soy bean as human food. *Industrial and Engineering Chemistry, News Edition* 9(9):136. May 10.

• ***Summary:*** Contents: Historical background. Properties and uses. Growing interest in soy bean preparations in different countries. Soya foundation proposed.

This article begins: "The soy bean is a plant of early cultivation in China. Its use dates back to the beginning of China's agricultural age under the Emperor Shen Nung. It is mentioned in the *Ben Tsao Gang Mu,* the ancient 'Materia Medica' written in the year 2838 B.C. This bean is remarkable for its richness in oil (average 20 per cent), protein (average 40 per cent), and ash (average 5.5 per cent), and the almost complete absence of starch.

"Since time immemorial the soy bean has been the most universal article in the Chinese dietary. It is also extensively

© Copyright Soyinfo Center 2014

used for food in Korea, Japan, Indo-China, the Philippine Islands, the Dutch Indies, Siam, and India. The Chinese make practically no use of dairy products, and the bulk of the people consume a very meagre amount of meat. Yet, in spite of this, they have lived for centuries on what appears to be a remarkably well-balanced diet by the use of the soy bean."

"Soy bean milk has been extensively used throughout the Orient since its discovery by the Chinese philosopher Whai Nain Tze long before the Christian era. This milk does not coagulate on boiling, but acids and rennet produce a curd-like precipitate. According to Fisher, soy bean milk gives a much finer flocculent precipitate in the stomach than cow's milk. Its period of stay in the stomach is shorter. Its ingestion results in a feebler secretion of gastric juice; the period of secretion is also shorter. The peristaltic motion of the stomach is less after the ingestion of soy bean milk and more coordinated than in the case of cow's milk.

"If soy bean milk is boiled with a solution containing magnesium chloride or calcium sulfate its proteins are precipitated. The cheese-like product obtained by pressing this precipitate is generally known as bean curd and is called in China 'tofu.' If fresh, it contains approximately 8 per cent of protein and 3 per cent of fat, and is digested, according to Oshima, to an extent of over 95 per cent. Fried tofu resembles beef in its content of protein and fat, and is called in China "the meat without the bones."

"In the Orient tofu forms a very popular and almost indispensable dietary article." Also discusses: Miso, chiang, Worcestershire sauce ("liquid soy sauce... when spiced, is sold under the label 'Worcestershire sauce.'"), W.J. Morse of the USDA, soy bean foods in Europe, Prof. Berczeller, and work at the Physiological Institute of the University of Vienna under Prof. Durig and Dr. Wastl.

"In Russia, the soy bean is fondly called 'our young revolutionary Chinese ally.' 'Plant soy beans and you plant meat, milk, egg omelets,' is the newspaper cry. Efforts have been made all year to introduce soy bean dishes to restaurants and homes. A Soy Institute was recently organized in Moscow, as well as a special exhibition of soy foods at which 130 varieties of soy dishes, including cutlets, pastry, salads, candy, and beef, were shown. A dinner, prepared entirely of soy beans, was served to representatives of trade unions, factories, Red Army, and the Soviet press. The food was unanimously declared excellent...

"Soya foundation proposed: There are reasons to expect that the United States will become the leader in introducing the soy bean in the daily diet of the white race. An important step should be the establishment of a soya foundation in order to promote the creation of a national soya food research institute." Address: Health Section, Bureau of Mines, Pittsburg, Pennsylvania.

2851. Kinney, C. 1931. The omnipotent bean. *Canadian Geographical Journal* 3(1):46-56. July.
• ***Summary:*** This is an excellent study, with many original photographs, of soya beans and soy products in Manchuria. The author, an American journalist, has been associated for some years with the South Manchuria Railway, and has made a study of economic conditions in Manchuria.

Manchuria, a huge region of about 382,000 square miles, includes 3 of China's wealthiest provinces: Mukden (Fengtien), Kirin, and Amur (Heilungkiang). Sometimes known as the "North-Eastern Provinces of China," Manchuria is ruled by Chang Hsueh-liang, popularly known as the "Young Marshal." He is progressive and wants to see the 3 provinces developed.

The original soya bean "producing centres are said to be Cochin China and Java. The beans were first grown in China Proper about 4,000 years ago and were used locally to feed the natives and animals. To-day the chief zones are Manchuria, China, Japan and Korea, but the amount of soya beans produced in Manchuria alone is much greater than the product of the three other countries combined."

After the Russo-Japanese was (1904-05), victorious Japan, through the Portsmouth Treaty, became the lessee of the Kwantung Leased Territory (1,337 square miles), the southernmost point of Manchuria. It contained the greater part of the southern branch of the Chinese Eastern Railway, which is now known as the South Manchuria Railway. Note: The key ports of Dairen (Dalian) and Port Arthur (Lüshun) are in this Leased Territory.

In about 1905 the last remnants of the Chinese ban on immigration of Chinese into Manchuria were removed. Few came, however, until the early 1920s, "when warfare broke out on a large scale in China proper, and hundreds of thousands of Chinese fled from the famine, war-stricken and bandit infested areas of that country into the peaceful and

© Copyright Soyinfo Center 2014

undeveloped, yet fertile provinces of the Manchus." Today it is said that about 70% of Manchuria's population are working directly or indirectly on cultivation of soya beans. "There is no doubt in the minds of all that were it not for the soya bean, Manchuria would be an insignificant country."

The origin of soya bean cultivation in Manchuria is unclear, although most agricultural experts believe the soya beans were brought from districts of Central China. The question as to why they thrive in Manchuria, while in other parts of the world with similar climatic conditions, they fail to give good results, has never been fully answered.

European and U.S. buyers of Manchurian soya beans have long complained that they are not properly cleaned or graded. Soil, poor quality beans, and even large stones have been found mixed with Grade One beans. This problem must be fixed quickly if Manchurian dealers expect to continue to sell their beans to Occidental countries. In 1930 an association was formed, with inspectors placed at major centers to see that soya beans are graded correctly.

Genetic improvement of Manchurian soya beans began shortly after 1905 when the Japanese established the Agricultural and Experimental Station at Kungchuling. Soon Japanese scientists developed a larger soya bean with a much higher oil content. It was widely planted by farmers and prices rose accordingly. The Russians, followed by the Chinese, have founded several soya bean and agricultural stations, where material and advice can be obtained by local farmers. The Central Laboratory of the South Manchuria Railway Co. at Dairen is a leading scientific institution for studying soya beans; it has discovered many new uses for the beans, and developed a process for extracting the oil using alcohol as a solvent. The uses of the soya bean, its oil ("bean oil") and its cake ("bean cake") are discussed, as is its composition.

In Manchuria today there are 465 soya bean mills for extracting the oil and making bean cakes. They are located as follows: In Dairen 59, Yingkou 22, Antung 21, and Harbin 46. Along the South Manchuria Railway Line 252. Along the Chinese Eastern Railway Line 28. Along the Ssupingkai-Taonan- Anganchi Line 37.

"The latest statistics gathered by the South Manchuria Railway Co. for the year 1929 show that:–10,065,370 acres of land in Manchuria were planted to soya beans; 5,320,555 tons of soya bean were produced... 3,087,320 tons of soya beans, 133,854 tons of soya bean oil, and 1,568,552 tons of soya bean cakes were exported during 1929."

As "soon as the business depression that is sweeping the entire world is over," soya beans are expected by experts to be in great demand in Europe and America.

The captions to the various photos read as follows: "(1) An aerial view of the Port of Dairen, showing many ships at anchor awaiting their turn for berth space. The city of Dairen is in the background. (2) Soya beans in [osier] bins [12-15 feet high and cylindrical in form] at Kaiyuang, one of the produce centers of Manchuria. Many native carts carrying bags of soya beans are shown among the bins. (3) Bags of soya beans are brought on carts from the interior to the railway stations or marketing places. Due to bandits, Chinese guards are hired [one is shown standing on the cart with a rifle] to protect the beans from being stolen. (4) Coolies carrying bean cakes [that look like cartwheels about 2 feet in diameter and 3 inches thick, in high stacks] from the South Manchuria Railway Company warehouse to the freight steamers. (5) Open storage for soya beans near Dairen wharves [in shapes like houses, each covered with a tarpaulin]. During the busy season, beans are brought down from the interior in large quantities, and are placed in the open storage to await shipment. (6) Interior of a soya bean mill. Presses, or oil compressors, crush the beans, which have first been heated, and oil is extracted. The crude oil is pumped into a large vat where the impurities are removed. [The resulting cakes look like cartwheels] (7) Dumping soya beans into [osier] mat bins, North Manchuria. (8) Due to civil warfare, bandits, high taxation and famine, hundreds of thousands of Chinese immigrants have migrated to peaceful Manchuria. Most of the newcomers are farmers and the majority of them cultivate soya beans. (9) A section of the Kungchuling Agricultural Experimental Station, the largest in Manchuria. For years this organization has experimented on the bean and has succeeded in giving the world a larger and better oil producing bean. This station was established and is still financed by the South Manchuria Railway Company, for the betterment of agricultural products in Manchuria. (10) Primitive method of sorting soya beans [they are flailed on mats in a courtyard]. (11) Oil tanks [and barrels] where soya bean oil is placed prior to shipment. Over 133,000 tons of oil are manufactured annually by the various bean oil mills in Manchuria. (12) Hoisting bags of soya beans from Dairen wharves into the holds of the ships. (13) Soya beans in open storage, awaiting shipment at Ssupingkai station, one of the produce centres in Manchuria. (14) Modern railway tank cars bring bean oil to the wharves where it is deposited into large sea-going oil tankers. (15) Unloading soya beans [from railroad flatcars] at Dairen wharves. The bags of beans are brought from the interior of Manchuria to Dairen, the largest port in Manchuria, the beans are then transported by steamers to various parts of the world." Address: American journalist.

2853. The Manchurian Incident (also called the Mukden

© Copyright Soyinfo Center 2014

Incident) used by the Japanese as an excuse for occupying Manchuria (Important event). 1931.
• ***Summary:*** "Manchurian Incident," also called the "Mukden Incident," was provoked by Japanese military officers in order to justify a Japanese takeover of Manchuria. The incident took place on the night of 18 September 1931. A bomb exploded on the tracks of the Japanese railway north of Mukden. A Japanese Colonel "ordered a full-scale attack against the Chinese troops in Mukden, and General Honjô, hearing of the crisis, called out the whole Kwantung Army"– which proceeding to take over Manchuria.

"By early 1932 the conquest of all Manchuria had been completed. In March 1932 Manchuria was proclaimed an independent state [named Manchoukuo or Manchukuo] under the last Ch'ing ruler (P'u-yi).

"The Lytton Commission of the League of Nations visited Manchuria in the spring of 1932 and condemned Japan as an aggressor. The report was adopted by the League of Nations, from which Japan withdrew in protest the following year. By this time the Japanese armies had already moved west from Manchuria to occupy about 5,000 square miles of the Inner Mongolian province of Jehol."

to be Manchukuo, with its capital at Changchun. Its ruler, the former Chinese Emperor, Hsuang Tung... crab meat, decorated china, silk fabrics, straw for hats, dried beans, certain flowering bulbs and seeds..."

Cover title: "Prepared under the supervision of the Geneva Research Information Committee."

2858. Mashino, Minoru; Nishimura, Shunsuke. 1931. Studies on the improvement of soy bean oil extraction. II. Relation between the boiling point of gasoline and the optimum proportion of gasoline and methanol in the mixture. *J. of the Society of Chemical Industry, Japan* 34(10):402B-04B. Oct. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** Mixed with methanol, the optimal proportions of gasolines of boiling point 60-70ºC, 70-80ºC, and 80-90ºC are 54, 52, and 50 weight-%, respectively; as the boiling point rises, the solubility of the gasoline in the methanol decreases and the two layers separate more easily. Address: Tokyo Imperial Industrial Research Inst., Yoyohata, near Tokyo, Japan.

2859. Mashino, Minoru; Nishimura, Shunsuke. 1931. Studies on the improvement of soy bean oil extraction. III. Effect of the boiling point of gasoline on the extraction with azeotropic mixture of gasoline and methanol. *J. of the Society of Chemical Industry, Japan* 34(10):404B-05B. Oct. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** Results of extractions with azeotropic mixtures of boiling point 69.6 to 112.6ºC are tabulated. The weight of gasoline in the azeotropic mixture at the transition point is 31%; under such conditions the solvent separates into two layers after the extraction, if the boiling point of the gasoline is below 104ºC. Address: Tokyo Imperial Industrial Research Inst., Yoyohata, near Tokyo, Japan.

2860. Herbette, François. 1931. L'expérience du soja et la situation en Mandchourie [The experiment with soybeans and the situation in Manchuria]. *Revue Politique et Parlementaire* (*Paris*) 149(444):275-81. Nov. 10. [1 ref. Fre] Address: France.

2861. Mashino, Minoru; Nishimura, Shunsuke. 1931. Studies in the composition of soy bean protein: Butyl alcohol extraction method. *J. of the Society of Chemical Industry, Japan* 34(11):433B. Nov. (Chem. Abst. 26:1319). Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** Fat-free soya-bean, purified with methanol, was decomposed by 25% concentrated sulfuric acid; tyrosine crystallized from the neutralized concentrated product. Extraction of the filtrate by butyl alcohol yielded arginine, histidine, and lysine; leucine and phenylalanine were separated from the soluble part, and proline from the insoluble part of the butyl alcohol extract. Dibasic amino acids were not extracted by butyl alcohol. Omission of the methanol purification prevented the extraction and crystallization of the components. Address: Tokyo Imperial Industrial Lab., Yoyohata, near Tokyo, Japan.

2862. Mashino, Minoru; Shishido, Tadao. 1931. Studies in the composition of soy bean protein: Ester method. *J. of the Society of Chemical Industry, Japan* 34(11):433B-34B. Nov. (Chem. Abst. 26:1319). Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** The authors have studied the composition of soy bean protein by the ester method and "tried to distil the methyl esters of amino acids of soy bean protein." An unknown substance was crystallized suddenly when an "ether solution of methyl esters of amino acids was evaporated."

On evaporation of the ethyl ether solution of the methyl esters of the amino acids from purified soy bean protein, a crystalline (monoclinic) substance was obtained with formula $C_{10}H_{16}O_8$, and melting point 78ºC (soluble in water, ethyl ether, methanol, and benzene, and insoluble in light petroleum). The glutamic acid isolated had a specific rotation at 2ºC of +12.4º. Valine, leucine, proline, and phenylalanine were isolated by the ester method.

Note: This is the earliest English-language document seen (Sept. 2007) that uses the term "methyl esters" (or "methyl-esters" or "methyl ester") in connection with soy beans or soy bean protein. Address: Tokyo Imperial Industrial Lab., Yoyohata, near Tokyo, Japan.

2863. Andrews, A.E. 1931. Tells of first soy-bean tests. *Indiana Farmers' Guide* (*Huntington, Indiana*) 87(43):18. Dec. 1.
• ***Summary:*** The story of soy beans in Hendricks country, Indiana, goes back to the Civil War. Near the battlefield of Franklin, Tennessee, Adrian A. Parsons, a young man of high-school age with the Union cavalry, was wounded when a bullet entered his right side and clipped a piece from his spine. Taken to a log house and left to die, he made a miraculous recovery, but never became robust and rugged again. "Though a farmer, much of his time was devoted to the lighter tasks, to his garden, study and experiment.

"Forty-five years ago [i.e., in 1886], Parsons sent to Japan for soy-bean seed. For years he raised soys in his garden, and the sons of the family, Norman, William, Chester, Lester and Bert, can recall those early experiments and the derision of men who thought him visionary. The United States Department of Agriculture for a long time kept in touch with Mr. Parsons.

"Mammoth Yellow soys were obtained and, after much thought and detailed work, a strain of this bean was acclimated to Hendricks county. Later Ito Sans were used for the farm crops. A strain finally was developed by Mr. Parsons known as the Mikado, and these beans were sold in Iowa and Ohio through seed houses.

© Copyright Soyinfo Center 2014

"Many years ago Mr. Parsons recognized the soy bean as an excellent hay plant. He also found it a good soil builder, and practiced the theory of inoculation while most men scoffed at it."

"Soy beans were a joke in former years, but they are no joke in Hendricks county to-day, with the acreage devoted to them larger than the area sowed to wheat..."

"Mr. Parsons was like many a man of the best and most practical intentions–he was criticized by those who did not fully understand him; but to-day his county follows the path he blazed; and who can measure his influence on the nation's agriculture?"

2864. *Washington Post.* 1931. Japan held to need food of Manchuria for her existence: Native writer says Nippon must have territory to assure edibles. Starvation threatens if expansion is denied. Nation is fighting for life and property of citizens in conflict zone. Dec. 27. p. M13-14.
• ***Summary:*** Japan is fighting for a stable food supply for her 67 million people who live in Japan proper–so says Kinnosuke Adachi, the first Japanese to attain a desk position on an American newspaper. Mr. Adachi recently explained Japan's position to a *Washington Post* reporter. Japan is fighting "bandit gangs" who threaten to destroy Manchuria's peace and decent Japanese administration. Japan has no interest in colonizing Manchuria. After 20 years of government encouragement and subsidies, there are today only 240,000 Japanese in Manchuria, and most of them are merchants or officials–not farmers. So what Japan wants are stable conditions in Manchuria so Chinese farmers can produce their crops in peace. But for the past 20 years, the "warlord" government that rules Manchuria has threatened this stability. The governors of each of Manchuria's three provinces (Kirin, Heilungkiang, and Jehol) and of Taonan are "all eminent graduates of the 'warlord' school; children of the wild, untainted by the effete touch of lettered culture." The warlords rule Manchuria only to enrich themselves.

The peak of warlord exploitation started a little less than a decade ago, when the warlords started printing money, the fengpiao or Mukden notes, which had no backing in silver or gold. Then they organized a governmental purchasing bureau or agency, which compelled the farmers to sell their entire soya bean crop to this new agency and "forbade them to sell to any other individuals or corporations, under heavy penalty." The warlords then turned around and sold the same beans to the Japanese and European exporters for real money–gold and silver. In 1920, 100 fengpiao bought 100 Japanese yen. At the beginning of 1931 it took more than 13,000 fengpiao to buy 100 Japanese yen. This has ruined Manchurian farmers, who now face starvation, and it is destroying Japan's food and fertilizer imports from Manchuria.

Japan now imports more than 27 million tons of Manchurian bean cakes, the residue of Manchurian soya beans after the oil has been pressed out, to fertilize her rice fields. But it is not enough; Japan now has to import 30 million bushels of rice each year (even from California) to feed its people. Food shortage is Japan's most serious problem. 67 million people must survive on a mountainous island that is smaller than California and only 15% of which is arable. Japan values American public opinion infinitely more than Americans realize. New York is Japan's best source of capital, and the USA is a crucial market for Japanese silk. A photo shows Mr. Adachi.

2865. Harada, Taichi. 1931. Preparation of *Aspergillus oryzae* enzymes. *Industrial and Engineering Chemistry* 23(1):1424-27. Dec. [29 ref]
• ***Summary:*** *Aspergillus oryzae* enzymes are widely used in the food and textile industries in the Far East. They are used to make soy (Shoyu) sauce, miso, and saké. The source of the enzymes [koji] contains two important enzymes–diastase and protease. This paper describes "certain properties of *Aspergillus oryzae* enzymes which were obtained by Takamine's method" (described in this journal, 1914). Address: Dep. of Biochemistry, New York Post-Graduate Medical School, Columbia Univ., New York, N.Y.

• ***Summary:*** Manchuria, the largest soybean-producing country in the world, had a production of more than 5,000,000 tons of which more than 400,000 tons were used for food, 253,000 tons for feed, and 225,000 tons for seed. The remainder, more than 4,000,000 tons, was used in the production of oil and oil meal and for export. Japan in 1929 used over 39,000,000 bushels of soybeans of which only 13,000,000 bushels were grown in Japan proper, the difference being imported from Manchuria and Korea. The following shows the various ways in which this large amount of beans was utilized by the Japanese people: Miso, 22.7%; soy sauce, 22.7%; soybean oil and oil cake, 21.5%; bean curd, 15.4%; confections [roasted whole soy flour], 6.1%; forage, 6.2%; green vegetable beans, 0.8%; green manure, 2.5%; seed, 1.6%; miscellaneous, 0.5%.

Note: This is the earliest document seen (Oct. 2001)

2870. Photographs of the Amano Brothers / T. Amano Co. soy sauce factory in Vancouver, British Columbia, Canada. 1931-1937. Vancouver, British Columbia, Canada.
• ***Summary:*** These four photocopies of black-and-white photos were sent to Soyfoods Center in 1981 by T. Amano Co. of British Columbia, with permission to reprint.

(1) Ca. 1928-31 showing the end and roof of a building (at far left) with a sign that reads "Amano Brothers. Shoyu Bean Sauce." A street is in the foreground.

(2) A sign about 12 feet long in the lower window of a building, ca. 1935. The three lines read: "T. Amano Co. Manufacturer of soya bean sauce. Bean & rice products."

(3) The inside of the shoyu plant in 1937 showing many wooden vats and koji trays. A board walkway along the side of three tanks is used by the person stirring the moromi. A wooden ladder leans against a fourth vat. No people are present.

(4) Five Japanese men working in the shoyu plant. Three are standing on top of or near the top of the vats, apparently stirring the moromi. A fourth, wearing suspenders, is standing on the floor. Address: Vancouver, British Columbia, Canada.

2881. Tao, Wei-Sun; Komatsu, Shigeru. 1931. Biochemical studies on the soy bean. I. Chemical changes of the protein during the germination of the soy bean in darkness. *Memoirs of the College of Science, Kyoto Imperial University, Series A* 14A:287-92. (Chem. Abst. 26:1640-41). [Eng]*

© Copyright Soyinfo Center 2014

• ***Summary:*** Germination results in loss of weight, mainly due to decrease in fat and nitrogenous matter, in hydrolytic fission of part of the protein, especially globulin, and in liberation of small amounts of ammonia and urea. During germination, some proteoses in the seeds are converted into soluble nitrogen compounds. When the seeds germinate in the dark, some of the proteins, especially globulin, are converted by partial hydrolysis into simpler forms, such as proteose and peptone.

2882. Tao, Wei-Sun. 1931. Biochemical studies on the soy bean. II. Action of the enzymes in soy-bean seedlings on glycinin. *Memoirs of the College of Science, Kyoto Imperial University, Series A* 14A:293-96. (Chem. Abst. 26:1640-41). [Eng]*
• ***Summary:*** The changes in nitrogen distribution are due to the action of proteolytic enzymes on glycinin, the protein of the beans. Seedlings exhibit a urease activity greater than that of the seeds.

• ***Summary:*** Food words that are not related to soy:
akameshi: see sekihan.
amanatto: sugared red beans [a very popular snack of cooked azuki beans coated with sugar].
ama-zake: sweet liquor (made from fermented rice).
an: bean jam. [an no haitte iru]: stuffed with bean jam. [an o ireru]: to stuff (a cake) with bean-jam. [an ni kurumu]: to cover (a cake) with bean-jam.
anko: bean-jam = an.
anko: not listed.
azuki: a red bean; an India bean. [azuki-iro no]: reddish brown, russet. [azuki meshi] = sekihan.
beni-shôga: not listed.
goma: a sesame; a gingelly (plant); *Sesamum orientale;*

© Copyright Soyinfo Center 2014

a sesame seed. [goma abura]: gingelly oil. [goma-suri]: a flatterer, a toady, a sycophant. [goma o suru]: to pound sesame seeds; to flatter.

gomashio: not listed.

kaiseki: not listed (at least not using modern characters).

kaisô: seaweeds, marine plants; algae.

kombu: a tangle; a tang; a devil's apron. *Laminaria.*

konbu: not listed.

mochi: rice-cake. [mochi-tsuki]: rice-cake making. [mochi o tsuku]: pound boiled [glutinous] for rice-cake. [mochi ni tsuku]: cannot manage (handle); do not know what to do with. [mochitsuki saichû-datta]: we were in the middle of pounding [rice to make] mochi. [mochi wa mochi-ya]: Every man has his forte = Every man to his trade.

nankin-mame: a groundnut; a peanut; a monkey nut.

nori: laver, sloke. [hoshi (ajitsuke) nori]: dried (seasoned) laver.

okowa: not listed.

sekihan: rice boiled together with red beans [azuki beans].

sembei: a cracknel [of wheaten flour]; a rice-cracker; a wafer.

senbei: not listed.

shiruko: red-bean soup with rice cake. [shiruko-ya]: a *shiruko* shop.

shôjin (3): abstinence from animal food; religious abstinence; lenten fare; vegetable diet; maigre food. [shôjin ryôri]: a vegetable diet. [Nihon no sôryo wa taitei shôjin o suru]: Japanese priests usually eat vegetarian food. [Uchi de wa kinyôbi wa shôjin de gozaimasu]: At my home we eat vegetarian meals on Friday.

soramame: A broad bean; a horse bean; a straight bean.

wakame: *Undaria pinnatifida.*

zôni: rice-cake boiled with vegetables. [zôni on iwau]: take the New Year's breakfast of rice cakes boiled with vegetables [to celebrate New Year's Day with zoni (mochi soup)]. Address: General editor, Japan.

2894. Takenobu, Yoshitaro. ed. 1931. Kenkyusha's new Japanese-English dictionary. 2nd ed. Tokyo: Kenkyusha. iv + 2280 p. 19 cm. Title also in Japanese: *Shin Wa-Ei Daijiten.* [Eng; jap]

• ***Summary:*** The first edition of this dictionary (titled *Takenobu's Japanese-English Dictionary*) was published in 1918. In 1931, Kenkyusha undertook a major revision in the dictionary by expanding upon former entries and adding newer ones. The British diplomat George Sansom, who later became a renowned historian of Japan, was a major contributor to and editor of this 2nd edition.

Soy related words:

abura[a]ge = aburaage or aburage: fried bean-curd. [Tonbi ni aburaage o sarawareta yôni]: with a stupid look of surprise. [literally, as when a kite {a bird of prey} snatches away your aburaage]. This is the earliest English-language document seen (April 2013) that uses the word *aburaage* to refer to deep-fried tofu pouches.

atsuage: not listed.

age [tôfu]: fried bean-curd.

ama-miso: not listed.

Daitokuji-natto: not listed.

daizu: a soya (soy) bean. [daizu kasu]: a [soy] bean cake [a co-product of soy bean oil].

daizu abura: not listed.

dengaku: baked bean-curd daubed with miso. [dengaku-zashi ni sareru]: to be transfixed; be pierced through (with a spear).

eda-mame: green soy-beans.

ganmo: not listed.

ganmodoki: not listed.

Hamana-natto: not listed.

Hama-natto: not listed.

hiryozu: not listed.

[inari-zushi]: a kind of 'sushi' (fried bean-curd stuffed with boiled rice).

kinugoshi no: strained through silk cloth [no mention of tofu].

kogori-dôfu: not listed.

koi-kuchi [shoyu]: not listed.

kôji: malt (mugi); yeast; leaven (kôbo); [kôji-ya]: a maltster [a maker of kôji]. [kôji ni suru]: [to] malt.

kôri-dôfu: frozen bean-curds.

kuro-mame: a black soy-bean.

miso (chomiryô = seasoning): bean paste; miso.

[miso shiru]: miso soup.

[miso o kakeru]: to put miso on (some food); (shuppai asuru): to make a mess (sad work) of it; put one's foot in it.

[]: mash the miso.

[]: to speak meanly of (a person); speak of (a person) in the most disparaging terms; say everything bad about (a person); denounce scathingly (roundly).

[]: a pretty mess you have made of it. [miso mo kuso mo isshoni suru]: his ideas are confused; He confuses one thing with another. [miso no miso kusaki wa, jô miso ni arazu]: The secret of art lies in concealing art [Akiko never heard this saying].

misokoshi: a miso strainer. [misokoshi de mizu o sukuu]: weave a rope of sand; attempt impossibilities [literally, to try to scoop up water with a miso strainer].

miso-mame: a soja (soy) bean.

miso-zuke: anything pickled in miso.

momen: cotton [no mention of tofu].

nama-age: not listed.

nattô: fermented soy-beans.

nigari: bittern, brine.

nori: [nori no tsukudani]: laver boiled down in soy [sauce].

oboro: not listed.

okabe: not listed.

© Copyright Soyinfo Center 2014

okara: not listed.

saishikomi [shoyu]: not listed.

shimi-dôfu: not listed.

shiro-shoyu: not listed.

shitaji: soy [shitaji sosogi]: a soy pot [soy sauce dispenser].

shôyu: soy [sauce].

suki-yaki: sukiyaki: slices of beef cooked *à la japonaise.* Note: Grilled tofu is an essential ingredient in sukiyaki but is not mentioned in the definition.

tamari: (a kind of) soy.

tôfu: bean-curds; tôfu.

[tofu itcho]: a piece (cake) of bean-curds.

[tofu-ya]: a bean-curds dealer (seller).

[kare ni iken shita totte, tôfu ni kasugai da]: advice to him is like water sliding off a duck's back. It is a mere waste of words (It is just as well to pour water into a sieve) to advise him.

[tofu-ya e ni ri, saka-ya e san ri to iu tokoro da]: there is no human habitation within five miles of the place. [It's out in the boondocks].

unohana: (1) Flowers of the *Deutzia scabra.* (2) [tofu no kara]: bean-curd refuse.

usukuchi shoyu: not listed.

yaki-dôfu: broiled bean-curd.

yuba: dried bean-curds [sic, the film that forms atop soy milk when it is heated].

Note: This is the earliest English-language document seen (April 2013) that uses the term "broiled bean curd" to refer to grilled tofu. Address: General editor, Japan.

2895. Takenobu, Yoshitaro. 1931. Japan Year Book. Tokyo: Japan Year Book Office. 508 + 12 + 192 p. See p. 406, 348, 504-05, 27th annual issue.

• ***Summary:*** The Preface (by Mume Takenobu, his wife) begins: "It is my sad duty to announce the death on the 26th of April last of my husband, Professor Yoshitaro Takenobu, who has edited this work for twenty-five years since it was started by him in 1905."

"Arrangements are in progress now with every prospect of a successful issue for perpetuating the publication of this work. This makes me feel very happy, because I know how much time and energy my lamented, husband so ungrudgingly bestowed upon this favourite offspring of his active mind." Dated: December, 1930,

Page 348. In the chapter on Agriculture, a table titled "Beans, potatoes and sweet potatoes" shows the production (in koku; 1 koku = 180 liters) of these crops from 1926 to 1928, inclusive. For soya beans:

2.999 million *koku* in 1926

3.263 million *koku* in 1927

2.977 million *koku* in 1928

Other crops whose production is shown in the table are red [azuki] bean, pea, horse bean (broad bean, *soramame*), sweet potato, and Irish potato. In 1928 production of red bean is 24.7% of the production of soya bean, and Irish potato is 27.1% of the production of sweet potato.

Page 496, in the chapter on "Industry" is a table titled "Statistics on Sake, beer & soy" [sauce] in koku for the year ended in March 1926-1928. For soy sauce:

2.826 million *koku* in 1926

2.304 million *koku* in 1927

2.384 million *koku* in 1928

In 1928 production of soy sauce in Japan was 46.3% that of saké, and production of beer was only 17.5% of saké.

Above this table is a long paragraph titled "Soy" which states: "In 1917 the leading soy manufacturers at Noda combined and formed the Noda Soy Co., [Noda Shoyu Co.] capital ¥7,000,000 p.u. [paid up] with capacity of about 250,000 "koku" i.e. about 60 per cent. of the total output of the Prefecture. The Company has now a capital of 30 million yen and produces 500,000 "koku" a year. The commodity is recently exported to European countries and China to the extent of about 18,000 koku (¥1 million) annually. The number of factories is about 12,600 throughout the country."

Page 504. In the chapter on South Manchuria, a long paragraph on "Soya beans" states: "The yield of beans in Manchuria amounts to about 28,000,000 "koku" (4,000,000 tons) including all species and the output of bean-cakes about 60,000,000 pieces valued at ¥110,000,000. In the Leased Territory and the railway zone alone bean cakes and oil were produced to the amount of 50,000,000 pieces and 250,000,000 "kin" respectively in 1927, the bulk going to Europe, Japan and China through Dairen and Newchwang.

"The principal industries in the Leased Territory and the railway zone are bean-oil making and flour milling, followed by iron foundry, cotton spinning and weaving, hemp dressing, soap, glass, and bricks"

The text below the table is the same as in the 1926 Japan Year Book.

Page 593. A table shows the value of imports in yen, including Beans and peas, and "oil materials."

Page 662. In the section on Manchuria, a table titled "Principal crops" shows the production of soya beans from 1922 to 1924. Figures for 1922 and 1923 are in Chinese koku; 1 Chinese koku = 1.7 Japanese koku.

On the same page, under "The South Sea Islands," we read: "Japan acquired through the Treaty of Peace the mandatory right over the former German South Sea Islands north of the Equator... It consists of three groups of Mariana, Marshall, and Caroline, covering altogether an area of 960 square miles with 49,576 natives.

Page 505. A 1-page section gives basic information and statistics about "The South Manchuria Railway Co." As part of the Russo-Japanese War (1904-05) the existing railway was ceded by Russia to Japan as on 5 Sept. 1905 as part of the Treaty of Portsmouth, which formally ended the war. "It was renamed the South Manchuria Railway by the Japanese

© Copyright Soyinfo Center 2014

Government which issued regulations for converting it into a semi-private concern, and with the formal organization of the company in Sept. 1906 the Field Railway Office transferred the railways and all belongings to the Company on April 1, 1907."

The total length of the lines operated by the company is 698 miles, as follows:

Dairen-Changchun main line–438.5

Antung-Mukden main line–161.7

Port Arthur branch line from Choushuitzu [a suburb of Dairen]–31.6

Yingkow branch line from Tashihchiao–13.9

Yentai Colliery branch line–9.7

Fushun branch line from Hunho–32.9

Total–698.0 miles. Address: Prof. at the Waseda Univ. and late of the "Japan Times".

2896. Tawada, Shinjun. 1931. Okinawa yakuyo shokubutsu yakukôzan [Medicinal uses of Okinawa pharmaceutical plants. 1st ed.]. Naha, Okinawa: Okinawa Shoseki. 205 p. See p. 102. Illust. [Jap]

2906. Lovell, Philip M. 1932. The care of the body. *Los Angeles Times.* April 24. p. I20. Sunday magazine.
• ***Summary:*** In the section titled "Soy bean" (p. 21) the following letter is reprinted in full: "Torrance, California. Dear Dr. Lovell. In the health section of the Los Angeles Times Magazine several weeks ago I read an article about soy beans.

"As a Japanese farmer I raised and used soy beans for many years but since coming to this country I have not seen soy beans grown. I believe this is too bad, as I believe soy beans are a valuable crop.

"For many centuries the people in Japan used this product for their main supply of protein. They also used it for nitrogen for their lands.

"Contrary to common belief, the Japanese have not used much fish for their diet and no animal meat at all, for Buddhism does not recommend its followers to kill and eat their fellow animals.

"Many due to Buddhism or the difficulty in transporting fresh fish, did not use much fish. The only thing they could depend upon for the protein was a cake made of soy beans, called tofu. We also make a sauce of the soy beans [soy sauce].

"In the Orient this is a staple crop. The farmers raise it as one of the rotating crops. I should really like to see more soy beans raised here but on account of the lack of popular usage there is not much demand for them.

"Could you give me more information about the use of this product which would appeal to the popular taste? I would appreciate it very much.

"Sincerely yours, Tatsuo Inouje [Inouye].

Lovell responds that, as he has stated before, 80% of the people worldwide are "vegetarians, either by religion or economic necessity." The Japanese are a progressive race. What they have accomplished during the past 70-80 years is "a miracle of the century. Yet they have done it essentially on a vegetarian diet."

The soy bean has replaced animal protein for the Japanese and for most followers of Buddhists and Confucianism. "It is the roast beef of the Orient. It contains twice as much protein as the richest of meats. It is a very fine food indeed. The health food stores are slowly building up a sale for it. Recently I ran across a soy bean bread. I believe the average health food store can procure it." Address: N.D. [Naturopathic Doctor].

2907. Sasaki, K. 1932. Daizu no yûki enki-rui ni tsuite [Organic bases of soya bean]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 8(4):417-20. April. (Chem. Abst. 26:4307). [3 ref. Jap]
• ***Summary:*** Korean soya bean (1930) contained 11.2% water, 16.6% crude fat, 7.03% total nitrogen, 6.48% protein nitrogen, 0.55% non-protein nitrogen. 5 kg yielded 1.40 gm adenine (picrate), 0.31 gm guanine, 0.62 gm histidine (dichloride), 9.55 gm arginine (nitrate), 25.36 gm choline (gold salt), 0.33 gm trigonelline (hydrochloride), and 0.80 gm of an unidentified base (from the lysine fraction; melting point 214ºC; platinum salt, melting point 235ºC; picrate, melting point 206-208ºC).

"The soy bean is destined to become an important supplementary crop in Hawaii's increasingly diversified agriculture." "As human food, the soy bean may be cooked either green or dried like snap or shell beans, and as such offer possibilities for canning commercially. The mature seeds are also ground into culinary meals and bolted for flour. The Orientals utilize vast quantities of soy beans for the manufacture of a number of nutritious and highly-priced foodstuffs, including the well-known tofu, miso, and soy sauce. The Japanese of Hawaii import about $70,000 worth of the beans annually from Japan for the above purposes, the manufacture of which could be greatly extended if the soy bean were grown locally. A considerable amount of soy bean cake meal is also imported for poultry and dairy stock feeding. It is estimated that Hawaii could consume to advantage at least a half million dollars worth of soy bean products annually if the crop were grown extensively enough."

• ***Summary:*** Subtitle: "The 25th anniversary number containing a survey of the Manchurian Incident and League Council's Proceedings."

Note: The "Manchurian Incident," also called the "Mukden Incident" took place on the night of 18 September 1931. A bomb exploded on the tracks of the Japanese railway north of Mukden. A Japanese Colonel ordered a full-scale attack against the Chinese troops in Mukden, and General Honjô, hearing of the crisis, called out the whole Kwantung Army–which proceeding to take over Manchuria. "By early 1932 the conquest of all Manchuria had been completed. In March 1932 Manchuria was proclaimed an independent state under the last Ch'ing ruler (P'u-yi). The Lytton Commission of the League of Nations visited Manchuria in the spring of 1932 and condemned Japan as an aggressor. The report was adopted by the League of Nations, from which Japan withdrew in protest the following year. By this time the Japanese armies had already moved west from Manchuria to occupy about 5,000 square miles of the Inner Mongolian province of Jehol." (Fairbank, Reischauer, and Craig. 1973. *East Asia: Tradition and Transformation.* p. 707-08). Address: Dairen, Manchuria.

table titled "Soybean meal consumed in Japan for fertilizer" shows that it increased from 1,262,250 tons in 1921 to a peak of 1,525,538 tons in 1923, then by 1930 had fallen to 1,087,476 tons.

A second table shows factory consumption of soybean oil in 1929 and 1931. In 1929 the main uses were soap (6,396,000 lb), paint and varnish (5,815,000 lb), linoleum and oilcloth (3,229,000 lb), miscellaneous (2,032,000 lb), textiles (267,000 lb), [lard] compounds and vegetable shortenings (82,000 lb), printing ink (71,000 lb), and oleomargarin (11,000 lb). By 1931 these had changed dramatically: Compounds and vegetable shortenings (10,869,000 lb), paint and varnish (6,256,000 lb), soap (3,816,000 lb)... oleomargarin (623,000 lb).

A third table shows soybean oil consumption in the USA from 1920-21 to 1931-32. It decreased steadily from a peak of 5,324,644 gallons in 1920-21 to only 1,339,521 gallons in 1927-28, then began to rise, reaching 4,193,352 gallons in 1930-31. Address: President, National Soybean Oil Manufacturers' Assoc.

2920. Satow, Teikichi. 1932. Plywood board and process of making the same. *U.S. Patent* 1,877,202. Sept. 13. 5 p. Application filed 24 April 1930. 2 drawings.
• ***Summary:*** "The object of my invention is to produce a composite or plywood board consisting of a plurality of sheets secured together in a flatwise relation by the use of dry glue and the application of heat and pressure." This process avoids the typical use of two drying operations. "I have found that vegetable proteidal substances, such as soya bean proteid,... when treated with an active methylene compound,... may well serve the purposes of my invention."

"To, say, 100 pounds of soya bean meal is added a few pounds of diluted solution of ammonia or caustic soda, to serve as a glutinizing agent therefor. To this mass is added from 5 to 15 pounds of beta naphtholor its sodium salt to impart a desirably high degree of thermo plasticity thereto. Then I add from 8 to 15 pounds of formaldehyde solution or its equivalent. The whole mass is then thoroughly kneaded into homogeneity and is finally dried into powder form." Address: Tokyo, Japan.

2921. Itano, Arao; Arakawa, Sachiyo. 1932. Yûki-shitsu hiryô ni kansuru biseibutsugaku-teki kenkyû. II. Daizu kasu no bunkai ni tsuite (1) [Microbiology of organic manures. II. 2923. Lothrope, Leon. 1932. Soya beans. Alleged cause of war in Manchuria and soft pork in Ontario, interest in Western Canada now centres around growing them on prairies. Their strong points and weaknesses are recorded herein. *Nor'-West Farmer and Farm & Home* (*Canada*) 51(18):8-9, 29. Oct.
• ***Summary:*** Discusses the possibilities of the soybean crop in western Canada, the value and importance of soybeans in various countries, their uses, amount of production in the United States, and the prices which might be expected if soybeans are grown in western Canada.

"There was something over a million pounds of soya bean oil imported into Western Canada last year which is about 35 tank carloads. It is largely used in the manufacture of soaps, shortening and salad oil. Contrary to popular opinion, only very small amounts are utilized in paints and varnishes, due to its slow drying qualities and lack of hardness...

"It is not surprising, then, that when the National Government in Great Britain imposed a ten per cent tariff on soya bean oil, cake and meal imported from foreign countries, and they are without duty from Empire countries, that the industries affected would look around for new sources of supply. Nor is it surprising that Canadian railroad officials and other business interests would evince some enthusiasm in the establishing of a new industry in Canada that has such potentialities as to cause a war in Manchuria and to be directly responsible for placing the Japanese Merchant Marine in third place among the nations. If Canada could 'horn in' on such an industry it should be all to the good.

"This accounts for the visit of a member of the Corn Exchange, of Liverpool, to Canada in recent months whose firm deals in soya beans and soya bean products, and owns large warehouses along the South Manchuria Railway. His visit was for the express purpose of seeing if Canada could supply soya beans for the European trade."

"The Manitoba Agricultural College commenced work with soya beans fifteen years ago [about 1917]. Professor Southworth, who is now in England, developed a strain of Ogema [Ogemaw], known as Manitoba Brown, that consistently ripens seed at the College and in several other parts of the West where they have been grown. The only other strain that has shown much promise in the Prairie Provinces are selections of Wisconsin Black. Some success has been obtained with this latter variety at the Dominion Experimental Farm, Brandon [Manitoba] and by Don Bark of the C.P.R. [Canadian Pacific Railway] Demonstration Farm

© Copyright Soyinfo Center 2014

at Brooks, Alta. [Alberta; Brooks is a town located 100 miles southeast of Calgary]. The three stations mentioned above are the only ones that report at all favorably on this crop and we have had communications from most government institutions in the West... The returns received from the three Dominion Experimental stations in British Columbia are neither more nor less encouraging than from the Prairie Provinces.

"Dr. McRostie of the Manitoba Agricultural College, who was formerly in charge of all the forage crop work for Dominion Experimental Farms system, has probably done as much on the growing of soya beans as anyone, states that 'fifteen bushels to the acre is a reasonably good yield to expect under field conditions in Manitoba with the early varieties so far developed.'"

"A World Crop: The best argument in favor of endeavoring to grow soya beans in Western Canada lies in the fact that it is a world crop and if we can grow it in competition with the world as we do wheat it is worth trying as it will give us greater diversification. The Agricultural Section of the Winnipeg Board of Trade is making arrangements to distribute small amount of soya bean seed to different districts in the Province of Manitoba. They hope to have in 100 acres next year for a trial. Mostly home grown seed of the black and brown types will be used."

A photo shows 5 products that contain soya bean oil or meal, including Vi-Tone Malt Chocolate Flavor, Domestic brand Shortening (purely vegetable), MacDowell's Soy Bean Flour (Brockville, Ontario), Pearl White Naptha [Naphtha] Soap, and Jif Flaked Soap.

Note 1. This is the earliest English-language document seen (March 2000) that uses the word "shortening" to refer to such a product made from soy oil.

Note 2. This is the earliest document seen (Oct. 2013) that mentions the soybean variety Manitoba Brown. Address: Canada.

2928. Stewart, C.L.; Burlison, W.L.; Norton, L.J.; Whalin, O.L. 1932. Supply and marketing of soybeans and soybean products: Tables 1-19 (Document part). *Illinois Agricultural Experiment Station, Bulletin* No. 386. p. 425-544. Dec.

• ***Summary:*** Tables show: (1) Value of the soybean crop in Illinois, 1928-31. (2) Soybean production in selected countries, average 1909-13, annual 1920-31 (in tons of 2,000 lb). The countries: Manchuria, Korea, Dutch East Indies, Japan, United States, total for these 5 reporting countries. (3) Soybean production in the United States by geographic divisions, 1929. The greatest production was in the "East North Central" states; 4.977 million bushels comprising 57% of total U.S. production.

(4) Production of gathered soybeans in selected states and in the United States, 1922-1931 (thousand bushels). In 1922 the top six soybean producing states were North Carolina (1,600), Illinois (812), Ohio (465), Indiana (240), Virginia (208), and Missouri (165). Total USA: 4,333. In 1924, Illinois (1,380) passed North Carolina (1,160) to become the leading U.S. producer. In 1931 the top six states were Illinois (6,055), Indiana (3,062), North Carolina (1,498), Missouri (1,080), Iowa (578), and Ohio (560). Total USA: 14,917.

(5) Total equivalent solid acreage of soybeans grown in selected states and in the United States in 1922-1930 (thousands of acres). In 1922 the top 4 states were North Carolina (224), Illinois (169), Tennessee (154), and Indiana and Alabama (113, tie). Total USA: 1,226. In 1923 Illinois passed North Carolina to take first place. In 1930 the top 4 states were Illinois (719), North Carolina (478), Iowa (463), and Indiana (402). Total USA: 3,758. (6) Yield per acre of

© Copyright Soyinfo Center 2014

gathered soybeans in selected states and in the United States, 1922-1931 (bushels per acre). In 1922 the U.S. average was 13.8 bushels. Iowa had the highest: 22 bushels. In 1931 the U.S. average was 15.6 bushels. The top 4 states were Ohio (20), Indiana (17.8), Illinois (17.5), and Iowa (17).

(7) Proportion of soybean acreage gathered for beans, cut for hay, and interplanted with other crops, Illinois, 1922-1931. Gathered for beans rose from 32.1% in 1925 to 55.7% in 1930. Cut for hay rose from 41.4% in 1922 to 54.4% in 1931. Interplanted with other crops dropped from 20.1% in 1922 to 1.3% in 1931. (8) Production of soybeans in twelve leading Illinois counties, with rank by years, 1929-1931. The top four counties were Christian (692,200 bu in 1931), Champaign, Piatt, and Moultrie. (8A) Soybean varieties in Illinois: Varieties gaining favor: Illini, Manchu, Dunfield, Mansoy, Laredo. Holding their own: Ebony, Virginia, Ilsoy, Peking, Black Eyebrow, Wilson V [Wilson-Five], Hurrelbrink. Losing favor: Haberlandt, Mammoth Yellow, Hamilton (Ohio 9035), Ito San, A.K., Midwest.

(9) Varieties of soybean seed offered for sale by growers, in order of frequency of offers printed in Farm-Bureau publications, Illinois, 1921, 1925, and 1931. For each year the varieties are listed under nine crop reporting districts, and also for the entire state. In 1921 for the entire state, in descending order of frequency: Midwest, Ebony, A.K., Peking, Ohio, Ito San. In 1925: Manchu, Midwest, A.K., Ebony, Virginia, Ilsoy, Ohio, Black Eyebrow, Haberlandt, Peking, Wilson, Ito San. In 1931: Illini, Manchu, Virginia, Ilsoy, Ebony, A.K., Mansoy, Dunfield, Peking, Wilson, Midwest, Black Eyebrow, Haberlandt. (10) Average cost of producing soybean in Illinois and Indiana for specified periods, 1921-1930. The highest return above computed cost per acre (profit) is from soybeans gathered for seed using a combine: $9.55/acre. When soybeans are cut for hay, a loss usually results.

(11) Imports of soybean oil, soybean oil meal and cake, and soybeans, United States, 1915-1931. (12) Duties levied on soybean oil, soybean oil meal and cake, and soybeans under recent tariff acts, United States, 1909-1930. In 1909 and 1913 all three commodities were on the "Free list." In 1921 oil the tariff on oil was 20 cents per gallon (2.67 cents per lb); the other two were free. In 1922 the tariff on oil was reduced to 18.75 cents per gallon (2.5 cents per lb), the tariff on soybeans was ½ cent per lb (30 cents per bushel), and meal was free. In 1930 the tariff on oil was increased to 26.25 cents per gallon (3.5 cents per lb, not less than 45% *ad valorem*), the tariff on meal and cake was $6/ton, and the tariff on soybeans was increased fourfold to $1.20/bushel.

(13) Domestic production of soybean oil and other vegetable oils from domestic materials, United States, 1912-1931 (thousands of pounds). Statistics are given for cottonseed oil (the leader by far during the entire period), peanut oil, olive oil, corn oil, linseed oil, soybean oil, and total vegetable oil. Soybean oil rose from 751,000 lb in 1922 (the first year for which figures are given) to 39,129,000 lb in 1931. The ranking in 1931 was: Cottonseed oil (1,417,226 x 1,000 lb), linseed oil (203,613), corn oil (113,145), soybean oil (39,129), peanut oil (13,730), and olive oil (1,509).

(14) Imports of foreign vegetable oils, oil equivalent being used for oil-bearing materials, United States, 1910-1931 (thousands of pounds). Statistics are given for soybean oil, coconut oil and copra, peanut oil, olive oil (edible), olive oil (inedible, including olive oil foots), palm oil (incl. palm kernel), linseed oil and flaxseed, all other vegetable oils and materials, total vegetable oils and materials. For net soybean oil imports, the earliest figure is 24,784 in 1912; it peaked at 335,439 in 1918, and had fallen to 4,018 in 1931. Total vegetable oils and materials imported increased from 440,412 in 1910 to 1,525,114 in 1931.

(15) Exports of soybean oil and five other leading vegetable oils, United States, 1919-1931 (thousands of pounds). Statistics are given for soybean, cottonseed, coconut, linseed, corn, and peanut. The leading export throughout this period was cottonseed oil. For soybean oil exports, the figure for the last half of 1919 is 27,715 and fir 1920 it is 43,512. Thereafter the amount exported each year is very small, rising from 1,944 in 1921 to 5,448 in 1931.

(16) Total production, imports, exports, and net balance of vegetable oils and animal fats, exclusive of butterfat but inclusive of fish oils, United States, 1912-1931. (17) Use of soybeans, by acreage, United States, 1915, 1929, and 1930 crops. The percentages of the entire crop acreage in 1915 are: Hay 52%, grazed 15%, plowed under 4%, and gathered for beans 29% (of which: Seed 18.2%, human food 0.9%, and feed 9.9%). In 1930: Hay 56%, grazed 14%, plowed under 4%, and gathered for beans (11,975,000 bushels) 30% (of which: Seed 10.5%, crushed or ground 11.5%, and feed 8.0%).

(17A) Commodities in which soybeans or soybean products are used (p. 460): Food products (USA and Canadian), feed products, industrial products. (18) Soybean oil meal produced and imported into the United States, 1922-1930 (tons of 1,000 lb). Domestic production increased from 3,811 tons in 1922 to 110,000 tons in 1930. Imports increased from 15,612 tons in 1922 to 55,107 tons in 1930. Total of domestic production + imports increased from 19,423 tons in 1922 to 165,107 tons in 1930.

(19) Adaptability of soybean oil to use in various products (p. 464): The products are: Drying products (paint, varnish, linoleum and oil cloth, waterproof goods), soap products (hard and soft soaps), edible products (Lard compounds, cooking oils {if odor permanently eliminated}, salad oils, fountain drinks, candy, mayonnaise, margarin), miscellaneous (core oil, printer's ink). Four levels of adaptation and a maximum percentage are given for each use: Probable, inferior, satisfactory, and superior. The two superior adaptations are paint (to prevent yellowing), and soft soaps. Note: "The margarin industry was one of the first

© Copyright Soyinfo Center 2014

to use considerable amounts of soybean oil and at present it absorbs in the United States approximately 750,000 pounds annually."

2929. Stewart, C.L.; Burlison, W.L.; Norton, L.J.; Whalin, O.L. 1932. Supply and marketing of soybeans and soybean products: Tables 20-49 (Document part). *Illinois Agricultural Experiment Station, Bulletin* No. 386. p. 425-544. Dec.
• ***Summary:*** Tables show: (20) Total industrial utilization of soybean oil and percentages used in specified industries, United States, 1916-1931. The total pounds used rose from 143.34 million in 1916 to a peak of 335.44 million in 1918, then fell to a low of 7.53 million in 1924, rising slowly to 35.50 million in 1931. In 1917 (the peak year) soybean oil comprised 10.3% of all oils used in soap industry. In 1918 it comprised 4.6% of all oils used in the lard-substitute industry and 2.6% of all oils used in the margarin industry.

(21) Iodin [iodine] numbers, saponification numbers, acid numbers, and uses of oils and fats (p. 471). Values are given for: Chinese tung or wood oil, coconut oil, corn oil, cottonseed oil, fish oil, linseed oil, palm oil, palm kernel oil, peanut oil, soybean oil, tallow, whale oil. For soybean oil: Iodin number 124-148. Saponification number 189-194. Acid number 2-7. Uses: "Considerable quantities go into paint, varnish, enamel, linoleum, and waterproofing products. Used in soaps. Utilized in a large variety of food products. Used in core oils."

(22) Utilization of soybeans and soybean products by amounts, United States, 1930 crop: Beans (bushels)–Feed, seed, ground (for food {200,000 bu}, for feed), crushed, total (11.975 million bu). Oil (lbs): Edible purposes (Oleomargarine {750,000 lb}, lard substitutes {500,000 lb}, other food products {4,750,000 lb}), paint and other industries (paint and varnish, linoleum and oil cloth, other uses), soap kettle, increased stocks including oil equivalent, total (37.2 million lb). Meal (tons): Feed (commercial feeds, other feeds), food (flour {850 tons}, infant and diabetic foods {50 tons}), other uses including glue, total (110,000 tons).

(23) Estimated distribution of gathered soybeans according to use, Illinois, 1926-1931 crops. The four categories for each year are (with figures for 1931): Used by oil mill and feed manufacturers (50%), used for seed in state (22%), used for seed outside state (13%), used for feed on farm (15%).

(24) Extent to which soybeans came from local sources or were shipped in from outside the locality, and extent to which beans sold went to local purchasers or were shipped out of the locality, 151 identical country elevators and local seed dealers, Illinois, 1930 and 1926 crops. (25) Soybeans purchased by 151 country elevators and local seed dealers, Illinois, 1931 crop. Gives figures for 10 crop reporting districts. (26) Proportion of soybean crop leaving growers' hands that was out of their hands by middle of November, December, and January, Illinois, 1922-1932 (crop storage). Typically about 60% (range 30-70%) was out of their hands by Jan. 15.

(27) Estimated proportion of soybean seed shipped out of the locality by wholesale dealers and jobbers before specified dates in January, selected states and United States, 1919-1931 crops. The states are: Illinois, Indiana, Missouri, and North Carolina. For the USA, 38.9% on average had been shipped by Jan. 26. (27A) Soybean varieties marketed in different sections of Illinois, 1926 crop (11 localities) and 1930 crop (13 localities). The leading varieties of soybeans marketed in Illinois are Illini, Manchu, Midwest, A.K., Virginia, and Ebony.

(28) Estimated costs (cents per bushel) of handling soybeans for all purposes by 166 identical country elevators and local seed dealers, Illinois, 1930 and 1931 crops. For 9 crops reporting districts gives the percentage recleaned (23-30%) and the costs of recleaning and other costs. (29) Costs of handling soybeans other than cleaning by identical country elevators and local seed dealers in leading producing counties, Illinois, 1926, 1930, and 1931 crops. Costs 3.2 to 4.4 cents per bushel.

(30) Costs of raw materials and other items of soybean oil production, United States and selected foreign countries, 1923-1924 (per bushel of soybean crushed). The foreign countries are Manchuria (All Manchuria, Dairen only), Japan, Great Britain. The total cost is lowest in all Manchuria (6.26 cents) and highest in the USA (10.21 cents). (31) Estimated cost of handling soybeans used mainly for seed, 151 identical country elevators and local seed dealers, Illinois, 1926 and 1930 crops. (31A) Cost per bushel of moving soybeans from central Illinois on board boat at New Orleans [Louisiana], 1931 crop.

(32) Carloads of soybean federally inspected in leading soybean producing states, 1928-1932. The states are Illinois, Missouri, Indiana, North Carolina, Ohio, and Virginia. The most carloads were inspected in Illinois (in Peoria (2,412) and Chicago (1,284)). (33) Federal grade requirements for yellow, green, brown, black, and mixed soybeans (Grades 1-4 plus sample grade and Extra No. 1).

(34) Digestible nutrients in feed products of soybeans (soybean hay, seed, straw, seed and straw, oil meal; incl. yield per acre and digestible protein). (35) Digestible nutrients in soybean oil meal and other protein feeds (Incl. linseed meal {old process}, cottonseed meal {41%}, gluten meal, wheat middlings, wheat bran, tankage). Only tankage has a higher "feeding value" than soybean meal. (36) Total gross value of products obtained from a bushel of soybeans at different prices of oil and meal. Gives figures when the price of a pound of soybean oil ranges from 2½ cents to 10 cents per pound, and the price of meal ranges from $15 to $40 per ton.

(38) Average farm prices of soybeans by seven selected crop reporting districts, Illinois, January-May, 1925-1931. The average price over the years ranges from $1.70 to $2.07

© Copyright Soyinfo Center 2014

per bushel. The lowest price in one year was $0.97/bu in 1931 in Champaign. (39) Average monthly farm prices of soybeans in three crop reporting districts important in soybean production, Illinois, October-June, 1925-1930 crops. The price is always lowest in October and highest in June. So storage pays.

(40) Average prices paid to producers for soybeans by 151 identical country elevators and local seed dealers, Illinois, October-July, 1930 and 1926 crops (Dollars per bushel). (41) Average yearly wholesale selling prices of soybean seed, selected markets; quotations given for first five months of the following year, 1919-1931 crops. The places are: Chicago, Illinois; Louisville, Kentucky; Kansas City, Missouri; Minneapolis, Minnesota; and Baltimore, Maryland. The average price of the ten year period at various cities ranged from $2.25 (Baltimore) to $2.80 (Minneapolis). Prices were highest in 1920, lowest in 1932.

(42) Retail selling price of good-quality soybean seed in selected states, March-May, 1926-1932. The states are: Illinois, Indiana, Iowa, Kentucky, Missouri, Ohio, Tennessee. (43) Average prices paid to producers for thresher-run soybeans and average wholesale and retail selling prices, Illinois, 1925-1931 crops. Prices were highest in 1925, lowest in 1930. In 1925 the average price paid to farmers was 63.6% of the retail price, and the average wholesale price was 90.9% of the retail price.

(44) Average advertised price of soybean seed offered for sale by producers, by varieties, Illinois, March-June 1920-1930. The varieties are: Illini, Manchu, A.K., Midwest, Ebony, Virginia, Wilson, Black Eyebrow, Peking, Ito San, Ilsoy, Haberlandt, Ohio, Dunfield, Mansoy.

(45) Exports of soybeans from eight selected exporting countries, 1923-1930. Gives figures (1,000 lb) for total, China, Japan incl. Chosen [Korea], and Netherlands. (46) Imports of soybeans into selected countries 1913, and 1919-1931. Gives figures (1,000 lb) for total, Denmark, Japan incl. Korea, France, Germany, Netherlands, United Kingdom, United States. Figures in footnote for Sweden and Italy. The leading importers are now Germany, Denmark, and United Kingdom.

(47) Imports of soybean oil into seven selected countries, 1913 and 1919-1931. Gives figures (1,000 lb) for total, Denmark, Japan (incl. Chosen), France, Germany, Netherlands, United Kingdom, United States. Gives figures in footnote for Algeria, Austria, and Sweden. (48) Exports of soybean oil from eight selected countries, 1913 and 1919-1931. Gives figures (1,000 lb) for total, China, Denmark, Japan incl. Chosen, France, Germany, Netherlands, United Kingdom, United States. Figures in footnote for Algeria, Sweden, Austria, and Italy.

(49) Exports of soybean cake from Manchuria as a whole and from the port of Dairen, with destination of bean cake from Dairen, 1926-1931 (tons of 2,000 lb). Exports from Dairen to Japan, Korea, Europe, United States, China, Other destinations.

2930. Toa-Keizai Chosakyoku (East-Asiatic Economic Investigation Bureau). 1932. Manchuria year book 1932-33. Tokyo, Japan: Toa-Keizai Chosakyoku. 530 p. [Eng]

• ***Summary:*** The Preface begins: "Those who have been following the development of events in Manchuria since the fateful September of 1931 will not fail to understand in what circumstances we have compiled this volume... The last issue, which was the first published, appeared in November, 131, while Manchuria was in a chaotic condition, but the manuscripts for it were completed before the Sino-Japanese dispute over Manchuria occurred in September." There was the establishment of Manchuokuo in March, the signing of the Japan-Manchuokuo protocol in September, and the despatch [dispatch] of the League [of Nations] Commission of Enquiry and the publication of its report."

Chapters 2 and 3 give a Japanese version of the history of Manchuria, in four periods, from 311 B.C. to the present, and of its administration.

In Chapter 7, "Agriculture," the section on "Agricultural products" contains tables: (2) Agricultural production of 9 major crops in 1930 (incl. soya beans) in three provinces, total, Kwantung Leased Territory and South Manchuria Railway (S.M.R.) Zone, and grand total. (3) Cultivated area classified by crops, 1930. (4) Production of ordinary crops, 1924-1930. (5) Cultivated area of ordinary crops, 1924-1930. (6) Production index of ordinary crops, 1924-1930. (7) Index number of cultivated area of ordinary crops, 1924-1930. (8) Percentage of production and cultivated area of ordinary crops, 1924-1930. (9) Production and cultivated areas of ordinary crops classified by districts, 1930. (10) Value of exports of agricultural products (Haikwan taels), raw products and manufactured goods. (11) Exports of agricultural products (metric tons and Haikwan taels), 1921-1930. (12) Exports of principal agricultural products classified by destination (metric tons and Haikwan taels), 1930. (13) Amount of soya beans and cereals consumed in the three eastern provinces, 1930 (as food, fodder, or seed; in South and in North Manchuria). (14) Percentage of agricultural products shipped to the markets (in South and North Manchuria). Map of distribution of crops [and railways] in Manchuria (p. 111). Sub-section titled "Soya beans" (p. 110-12). A photo (facing p. 112) shows Soya bean at Tailai, piled in sacks near a railway. The soybean is the principal resource of Manchuria in terms of both production and acreage. In recent years, the annual production has reached more than 5 million tons, which is 60% of world soybean production.

Chapter 12, "Industry," includes table (6) Manufacturing production in the Kwantung Lased Territory and the S.M.R. Zone, 1926-1930 (both volume and value). Products include [soya] bean oil, [soya] beancakes, miso, and soy [sauce]. In Section 2, "Oil and fat industry" is a subsection (p. 188-

© Copyright Soyinfo Center 2014

97) titled "Oil milling" with these contents: Introduction. Diagram of utilization of soya beans. History. oil extraction methods, table (7) "Beancake producing capacity of oil mills per 24 hours, 1925-1931" (in major cities), table (8) "Beancake production in Manchuria (1,000 pieces), 1926-1930, in major cities and regions, table (9) "Exports of beans and bean oil from Dairen, Antung, Yingkow and Vladivostok, 1920-1931," table (10) "Exports of soya beans, beancake and bean oil (1927-1931)," table (11) Exports of beancake classified by ports, 1929-32," table (12) "Export of beancake classified by destination, 1929-1931" (Japan gets 62%), table (13) "Export of bean oil, 1931, by destination, "Solidified bean oil industry" [hydrogenated], table (14) "Production of solidified bean oil (by the Dairen Oil Fat Manufacturing Co., established 1916)." Miso and soy [sauce] manufacture (p. 230).

In Chapter 15, "Foreign trade, table (9) shows the "Quantity and value of exports at Manchurian ports (Value in H.K. taels). The main exports are soya beans, other beans, maize, kaoliang, and millet. The ports are Antung, Dairen [the main port for soya beans], Newchwang, Harbin, Aigun, Hunchun, and Lungchingtsun. The main destination countries are British Empire, USA, Germany, France, Russia, Other countries, Total, Chinese ports, Grand total. Note that Japan is not mentioned; it is probably concealed within "Other countries." The source of the statistics in table 9 is: Research Office of S.M.R. Co. *Trade Returns of North China,* 1930 and previous issues.

A large fold-out map at the end of the book shows all of Manchuria, incl. province boundaries, railways, steamer routes, and cables.

• ***Summary:*** Glycinin is denatured almost completely into a glutelin-like protein, soluble in 0.2% sodium hydroxide, by the oil-extraction process. The rates of digestion of natural and denatured glycinin by enzymes, and the action of papain and castor-seed powder on the oil, were studied. Viscosities of mixtures of the oil with organic solvents were measured.

Soy as a livestock food. Appendix.

"As early as 1918 a Spanish public official, Don Julio de Palencia, the Spanish Consul in Shanghai, sent the State Department (*Ministeria de Estado*) a magnificent report specifying the great attention that representatives of the principal countries of the world were giving to this crop [the soya bean], and the relevance that it would have in the agricultural economy of the future. What a pity that Spain has been the only civilized country to ignore the study of the soya bean and its exploitation on a large scale" [p. 5].

"Finally we must make public our thanks to the spokesmen of this foundation/board (*Patronato*) for the special work they have done in writing this booklet: Don José Maria de Soroa, secretary of the Special School for Agricultural Engineers (*Escuela Especial de Ingenieros Agrónomos*), and Dr. Don José Abadal, chief of the Bureau for the Inspection of Pharmaceutical Services of the Ministry of War (*Negociado de la Inspección de Servicios Farmaceuticos del Ministerio de la Guerra*)" [p. 6].

"In 1917 the Spanish Consul in Shanghai, Don Julio Palencia, sent to the State Department a study on cultivation of soya, proposing that tests be done to acclimatize this

© Copyright Soyinfo Center 2014

valuable crop to our country.

"In Motril and later at the southern agricultural station of Malaga, the agricultural engineer D. Arsenio Rueda has been cultivating soya for the past 10 years [i.e. since 1923] in plots of 5 ares [1 are = 100 square meters], obtaining 60 liters (each liter weighing 780 gm) in each one.

"The white as well as the black varieties give good results, though the white ones do best. The seeds have been distributed to farmers who have noticed that, even though at first the goats that were given them as food rejected them, after a few days of getting used to this grain preferred them to such an extent that one must avoid growing this plant near the herd's path lest the herd be attracted and devour it all.

"Although soya is a legume which draws many nutrients out of the soil (*esquilmante*), it has according to Mr. Rueda, sufficient interest since it allows usage of terrains where field beans cannot be used due to the invasion of the pest called *Orobanche speciosa,* commonly called 'Jopo.' This parasite does not attack soya...

"Besides the quoted trials, it has been more than 25 years since soy has been grown in Spain with success due to the interest and zeal that in their patriotic work, the agricultural engineer Mr. Eduardo Noriega undertook with his partner, Mr. Ortiz, on the farm of 'Jerez.'

"He was successful during many years using the yellow and black varieties, later on also cultivating it in the Spanish central region.

"We think it useful also to state in writing the following data about soy grown by Dr. D. Jose Abadal in Lerida during the years of 1925-1926.

"The experiment was done only out of curiosity, with the intention of seeing if it could be grown in said province. Japanese seeds of the hirsute soy variety, yellow seed, used as food for diabetes, were used. The planting was done in a garden with seeds that had been soaked for ten hours, with no more care or fertilizers than those used for all the existing plants of that garden. The terrain of course was one of easy irrigation and located in Lerida where it is very hot all during the summer.

"This brief essay demonstrates that soy can be grown in irrigated terrain in very hot places and with little care.

"Fifteen years ago, the agricultural Engineer D. Jesus Andreu, in the province of Pontevedra [in the northwest corner of Spain, just north of Portugal, bordering the Atlantic ocean], did some tests with good results on growing soy as a forage plant.

"We also have news, though not concrete, of other successful tests done in the provinces of Madrid and Toledo." Address: 1. T.C. Farmaceutico Militar; 2. Ingeniero Agronomo e Ingeniero Sanitario, Spain.

Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon (Log of Dorsett-Morse Expedition). 181 p. Illust. 28 cm.

• ***Summary:*** Continued: The "History" section of this book (p. 30) states: "According to Chinese literature, the soybean was grown as a farm crop in China proper more than 5,000 years ago. The origin of soybean culture in Manchuria is not definitely known but is supposed to have been brought from Central China districts many centuries ago. At first the beans were grown only for food but when they became a source of oil, production gradually increased. The production of soybeans, however, was more or less localized until after the Chinese-Japanese war [first Sino-Japanese war, Jan. 1894 to Jan. 1895] at which time Japan began to import the oil cake for fertilizing purposes, resulting in a sudden expansion of demand for this product. The Japanese-Russian War [Russo-Japanese war, 1904-05] brought about a wider interest in the soybean and its products, successful shipments being made to Europe about 1908, and the soybean soon assumed world-wide attention. Acreage and production increased by leaps and bounds so that the soybean became one of the most important staple crops and exports of Manchuria.

"Importance: The soybean is the most important agricultural crop in Manchuria today and business circles depend to the greatest extent upon the market situation of the soybean and its products oil and oil cakes. Soybeans make up more then one-fourth of the staple crop acreage of Manchuria, the annual production of seed being around 180,000,000 bushels. As the big cash crop of the region providing fully one-half of the farm income in northern Manchuria and more then one-half of the total volume of freight handled by Manchurian railways, the soybean is a dominating factor in the economic life of the country. From two-thirds to three-fourths of the soybean crop is exported."

Maps: Map of Manchuria (p. 2).

Tables: (1) Climatic conditions in the most important regions in Manchuria. These are: Dairen, Mukden, Changchun, Harbin, Tsitsihar. For each region is given: Latitude. Temperature in July and in August. Growing season (days). Rainfall (inches). Warm season rainfall * (percent). * Period from May to August inclusive.

(2) Area, total population, and population per square mile of the Three Northern Provinces. They are: Liaoning (Fengtien), Kirin, and Heilungkiang [Heilongjiang]. The latter has by far the largest area (211,385 square miles), but by far the smallest population (5.134 million), and by far the lowest population density (24 people per square mile).

(3) Total acreage of cultivated and uncultivated land in the Three Northeastern Provinces. Liaoning 19.1% cultivated. Kirin 22.9% cultivated. Heilungkiang 6.9% cultivated.

(4) Percentage of production and cultivated area of ordinary crops in Manchuria, 1930. Source: Manchuria Yearbook, 1932-33. Gives both sets of figures each year from 1924 to 1930 for soybeans, other beans, kaoliang, millet, maize, wheat, and other cereals. In 1926 production of soybeans first passed production of kaoliang to become the leading crop in Manchuria.

(5) Percentage of principal crops by agricultural regions in North Manchuria for 1929 and 1930. The agricultural regions are: South of Harbin, Harbin, East of Harbin. Below Sungari River, Hu-hai, West of Harbin. other places. Soybeans are the leading crop for both years in most of these regions. Data furnished by R. Kadono, Research Office, South Manchuria Railway, Harbin, Manchuria.

(6) Acreage of principal crops by agricultural regions in Manchuria, 1929. Figures are given for 15 regions; most are not the same as those in Table 5.

(7) Agricultural production in Manchuria in 1930.

© Copyright Soyinfo Center 2014

Figures are given for the three provinces, the total of the three, and for the Kwantung Leased Territory & South Manchuria Railway (SMR) Zone. Kirin province is by far the leading soybean producer with 2.364 million metric tons. Total soybean production in this area in 1930 was 5.318 million metric tons.

(8) Estimated production of soybeans by districts in Manchuria, 1931 (in bushels). Manchuria is divided into South Manchuria (where 79.783 million bu were produced) and North Manchuria (where 116.952 million bu were produced). Each of the two parts of Manchuria is divided into about 8 districts. By far the biggest soybean producing district is the Chinese Eastern Railway–eastern section in North Manchuria (41.361 million bushels).

(9) Soybean introductions [to the USA] from China, Japan, Manchuria, and Chosen (Korea) classified according to seed color. Fifteen different seed colors are given. By far the most common seed color (2910 out of 4578 total, or 63.5%) was straw yellow. The total number of introductions from each country were: Chosen (Korea) 3379 (or 73.8% of the total). Japan 577. Manchuria 511. China 111.

(9a, p. 39) Named native varieties of soybeans grown in different sections of Manchuria. Thirty-six names are given, in alphabetical order.

(9b, p. 42), Criteria for soybean plant selection each fall at Kaiyuan Experiment Station. Seven criteria, each of which is record for each selection.

(9c, p. 45). Time of planting soybeans. Ranges from April 25 to May 10 at Changchun to May 15 to May 20 at Laiyang.

(10) Number of labor units expended for staple crops of Manchuria. Gives figures for soybeans, wheat, kaoliang, millet, and corn. For each crop gives: Labor units per acre. Value of crops per acre in 1922, 1923, and 1924. Return per "labor unit" in 1922, 1923, and 1924. Soybeans usually gave the highest return per "labor unit"–but sometimes wheat gave the highest return.

(11) Future and spot transactions of the produce exchanges in Manchuria under Japanese supervision. Gives figures for the years 1913, 1918, 1923, 1928, and 1929. For each year gives: Amount of future delivery in silver yen. Amount of spot delivery in silver yen. Total. The total increased from 41.3 million in 1913 to 16,538 million in 1929. Part of this increase was clearly due to inflation.

(12) Soybean inspection grades of the South Manchuria Railway, 1923-1929, inclusive. Figures are given for each year. The three main categories are perfect seed, imperfect seed, and dirt. Under perfect seed, the two subcategories are yellow and colored. Under each of those are Excellent, 1st grade, and 2nd grade. Under imperfect seed, the two subcategories are injured and immature. Under each of those are Excellent, 1st grade, and 2nd grade.

(13) Physical analysis of standard samples from mixed storage soybeans for 1931-32.

(14) Physical analysis of standard samples for 1931-32. There are five classes of soybeans: Special, 1st class, 2nd class, 3rd class, and 4th class. For each class there is a column for yellow beans, green beans, brown beans, black beans, worm-eaten beans, unripe beans, and foreign matters.

(15) Physical analysis of soybeans in mixed storage for the year 1930-31. The five classes and seven columns are the same as for table 14.

(16) Results of physical analysis of Manchurian soybeans during the last ten years. Starts with 1923-24 and ends with 1931-32. The eight columns given for each year are the seven in table 14 plus one for "discolored beans."

(17) Amounts of bean oil and bean cake obtained from 100 kin (132.2 pounds) of soybeans by different milling systems. The 3 systems are round cake system, plate cake system, and [solvent] extraction system.

(18) Composition of bean cake or meal produced by three different milling systems.

(19) Total production of bean cake (pieces) in Manchuria in 6 localities for 1926-1930 inclusive. Source: The Manchuria Yearbook, 1932-33, p. 194.

(20) Location, number, systems, and production of soybean oil mills in 6 localities in Manchuria, 1926.

(21) Bean cake (pieces) producing capacity of oil mills in 6 localities in 24 hours, 1925-1931.

(22) Principal Manchurian exports for 1929, value in Haikwan taels. Soybeans are #1 with 40% of the total value. Ban cake is #2 with 15%. Ban oil is #4 with 5%.

(23) Exports of staple products through Dairen during the first 7 months of 1930, 1931, and 1932. Both quantity (short tons) and value (dollars).

(24) Exports of soybeans, soybean cake, and soybean oil from Manchuria to foreign countries, 1909-1930.

(25) Amount of soybeans of 1929 crop rejected for various reasons by the Chinese Eastern Railway. Eight different reasons are given with the amount rejected in tons for each reason. No. 1 reason is "Mixture of earth," followed by "short weight."

(26) Comparison of bean cake exports from Dairen, Newchwang, and Vladivostok from Oct. 1929 to March 1930, with same previous season. Figures given for the following countries: Japan proper, China proper, Formosa, Chosen (Korea), and other countries.

(27) Bean cake (pieces) exports according to destination (same destinations as in Table 26).

(28) Exports of soybean oil according to destination, 1931 (same destinations as above). Address: USDA, Washington, DC.

2958. Ryerson, Knowles A. 1932. Plant explorers bring valuable new species and varieties to U.S. *Yearbook of Agriculture* (*USDA*) p. 297-302. For the year 1930. See p. 298.

• ***Summary:*** "In the spring of 1931, P.H. Dorsett, of the

© Copyright Soyinfo Center 2014

Division of Foreign Plant Introduction, and W.J. Morse of the Division of Forage Crops and Diseases, returned from the Orient after a search of more than two years for new varieties of soybeans. Their travels took them to Japan, including Hokkaido, the northernmost island, the peninsula [sic, island] of Saghalin [Russian: Sakhalin; Japanese: Karafuto], to Manchuria, Chosen (Korea) and China. Almost 3,000 soybean varieties were obtained in these great soy-producing areas.

"Special attention was also paid to other legumes of possible value to American agriculture, and important collections of mung beans, lespedeza, alfalfas, and Melilotus varieties were made. Other valuable field-crop introductions resulting from this expedition include collections of barleys, wheats, and grasses.

"A number of valuable horticultural contributions were also obtained. A special study was made of the oriental persimmon and about 200 introductions were made from Japan, China, and Chosen. In Peiping the expedition discovered the fruit being processed on a large scale to remove astringency, and made a thorough study of the methods used. Investigations of the outdoor storage of this fruit, begun during a previous expedition, were continued." Address: Bureau of Plant Industry, USDA.

2959. *Times* (*London*). 1933. Official record of dealings. Jan. 12. p. 19, col. 5.
• ***Summary:*** The section titled "Banks and discount companies" contains the following entry: "Indust. of Japan (SOY), 43/-++." Note: The meaning of this is not clear. This entry last appeared on 22 June 1938 (p. 27, col. 5).

2960. Sakurai, Yoshito. 1933. Miso no seibun (yohô). Sendai miso jukusei-chû no henka ni tsuite [The constituents of miso (Preliminary note). On the changes during ripening of Sendai miso]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 9(1):5-6. [Jap]
• ***Summary:*** A table shows the nutritional composition for 13 nutrients of Sendai miso at the start of fermentation, and after 1, 3, 6, 9, and 12 months. Address: Nôgaku-shi, Japan.

2961. *Commerce and Finance.* 1933. Jap and the bean-stalk. 22(6):147. Feb. 8.
• ***Summary:*** Discusses the soy bean in East Asia, soy bean oil, soy bean milk ("fed to thousands of Chinese and Japanese babies"), tofu, soy bean coffee, and soy bean flour. "It is not generally known that the soya bean was used during the American Civil War as a coffee substitute."

"Soya bean flour is a concentrated food... In soups it resembles beef extract; one of the most famous European brands of soup cubes has a soya bean base.

"For troops in the field the bean is almost indispensable. Soya bean oil is used in the manufacture of explosives. Bean soups, curd, flour, meal and coffee can be a field diet in themselves. Many a city besieged by bandits has survived on stores of bean cake originally intended as fertilizer." Note: This is the earliest English-language document seen (June 2008) which states that bandits survived on soybeans–in this case bean cake in a besieged city.

2962. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1933. The Manchurian soy bean situation. 26(7):184-88. Feb. 13.
• ***Summary:*** "The Manchurian soy bean acreage for 1933 probably will be no larger than that of 1932, according to Assistant Agricultural Commissioner Fred J. Rossiter at Shanghai. Unsettled political conditions are expected to continue to restrict the acreage. A large number of farmers have left their homes, while others have lost their work animals and will leave the land uncultivated."

"The amount of soy beans and bean products available for export during the crop year ending September 30, 1933 is considered to be about 30 per cent less than the amount available in 1931-32."

"Review of the 1931-32 season: While the United States disposed of [exported to Europe] over two million bushels of soy beans in Europe during the crop year, which ended September 30, 1932, Manchuria shipped to the same destination fifty-six million bushels of beans and the equivalent of over fifteen million bushels in the form of bean oil."

Tables show: (1) Manchuria: Exports of soy beans, bean cake and bean oil, by countries, year ended September 20, 1932. Includes exports from Dairen, Newchwang, Vladivostok and Manchuli. The exports are to Europe, Leningrad, Japan (incl. Chosen [Korea] and Taiwan), China, East Indies [Indonesia], United States, Others, and Total. Soy bean exports totaled 2,993,923 short tons, with the largest amount going to Europe (1,477,033). Soy bean cake exports totaled 1,503,395 short tons, with the largest amount going to Japan (980,911). Soy bean oil exports totaled 154,418 short tons, with the largest amount going to China (101,784).

(2) Manchuria: Average monthly price of soy beans and soy bean products at Dairen in silver yen and United States currency, 1929-30 to 1932-33.

• ***Summary:*** This early publication on soyfoods in Africa describes food uses and methods of preparing soymilk, in both condensed and powdered forms. Tunisia was a French protectorate from 1881 to 1956, when it became independent. France grew soybeans there, apparently at about the same time it started growing them in Algeria (p. 214).

At the exposition of Nanking in 1910 some 400 varieties of soybeans were assembled (p. 214).

In 1908 the firm of Mitsui was the first to try to transport, by sea, soybean seeds from Dairen to Liverpool. It was the beginning of a new industry in England (Liverpool and Hull), in Germany, Denmark (Copenhagen), and Holland (Rotterdam & Amsterdam).

A former Belgian missionary in Jehol (West Mongolia), Father De Preter (*Le T.R.P. Fl. De Preter, Supérieur de la Maison des Pères de Scheut à Yvoir*) has corresponded with the author about soybeans, tofu, and soybean cake in that city. Soybeans are not cultivated on the best soils, which are reserved for wheat. One of his colleagues at Jehol, Father Cyr. De Puydt has worked to improve the soybean crop (p. 219).

Father De Preter has often helped in making tofu (*fromage de soja*), using magnesium chloride as a coagulant. If one uses calcium sulfate, the tofu is softer and the taste seems better. Father de Puydt has improved the manufacture

© Copyright Soyinfo Center 2014

of tofu by using magnesium salts (probably Epsom salts) in place of magnesium chloride. The tofu is eaten after being boiled in water or fried in fat. It is best when fresh. In winter, it is allowed to freeze [frozen tofu in northeast China] so that it can be kept for a long time; it becomes spongelike. But fresh tofu has a special aftertaste to which the European palate finds it difficult to get accustomed. This taste does not come from the coagulant but from the soybeans. When one eats more than two pieces of tofu in succession, one experiences indigestion. It does not produce gas like the beans. Notes that the factory of the Caséo-Sojaïne near Paris, of which Mr. Li Yu-ying is the director, makes tofu and various tofu products. Cooked with eggs, tofu makes an excellent omelet. Cooked with the juice of meat, it takes on entirely that flavor. It can be used to make patés or smoked. Use firm tofu and cook in a mixture of 4:1 water to soy sauce. Then smoke it like meat. This can, for example, replace ham or bacon in an omelet. Tofu paté has much the same consistency and taste as paté de foi gras. Thus, there are many ways that tofu can replace meat (p. 221-24).

Using caséine or légumine of soymilk, the French pioneered industrial soy protein isolates in 1911 (see Beltzer). They were used in various glues, and in coating paper (p. 224-25).

The margarine industry employs only the finest quality oils. Soy oil was not introduced to margarine manufacture in Europe until about 12 years ago [i.e., 1921], but it has rapidly taken an important place on account of its good properties and low cost. Describes how to make synthetic rubber from soy oil. One of the main uses of soy oil in Europe is in making soaps. Some is also used to make explosives. Mr. Tihon is the distinguished director of the Laboratory of Industry and Commerce at Leopoldville, Belgian Congo (p. 227-28).

Soybean cake (*Tourteau*)*:* Father de Preter in Jehol has assured me that soybean cake is used there to nourish and fatten beasts. For horses, this cake has a surprising effect. If a horse, returning from a trip lean and exhausted, is put on a regimen of soybean cake, it will return to normal in 15 days (p. 230).

Just like the oil, the cake is more and more in demand in Europe, and in certain countries the effect of soybeans on the economy is quite remarkable. Until about 30 years ago, Denmark was a super producer of wheat. But Dutch products were defeated by the lower prices of American goods. Aided by soybeans, the Danes were able to expand their livestock. Soybeans are now imported, the oil is extracted and used to make margarine, while the cake is used to feed livestock–some 18.5 million heads in 1926, not including poultry The result has been the development of an enormous trade in animal products, butter, cheese, ham, bacon, lard, eggs and even livestock–all accounting for about 70% of Danish exports. Holland is in a similar position (p. 230-31).

In 1912 the "Dairen Mill Owners Association" was founded, By June 1923 all but 7 of the mills in Dairen were members of the association. The oil in the Suzuki mill is extracted using benzine solvent, the most modern method. 32 of the mills, mostly owned by Japanese, use hydraulic presses, while those owned by the Chinese generally use hand-turned screw presses (p. 231-32).

A large table (p. 323) shows exports of soybean seeds, cake, and oil from the ports of Dairen, Newchwang, Vladivostok, and total, from 1908 to 1917. During this time, because of Manchurian mills, the amount of seed decreased, while the exports of cake and meal increased.

Condiments: Shoyu (*shoyou*) is the main one. Several processes for making soy sauce are described in detail. Lea & Perrins Worcestershire Sauce is nothing but a highly seasoned soy sauce (p. 234).

Continued (p. 365): Mr. L. L'Heureux is director of the chemical service of the Belgian Congo. Let's see what the soybean is doing in the Congo. M. Tihon of Leopoldville, said in an interesting report titled *A propos du soja hispida:* Encountered 30 years ago [i.e., about 1903] at Stanleyville by commander Lemaitre, it figured in the collection of the botanical garden of Eala and was the object of experiments at Sankuru in 1914-15 (p. 365).

In this report, Tihon analyzed 3 varieties of soybeans from the plantations of Eala. The soybean would be good for all our [Belgian] colonies; it could replace meat and be used in the rations of black workers (p. 366-67).

Soymilk: Describes how to prepare it and its properties. According to Prof. Laxa of Prague, fresh soymilk has an acid reaction. Mentions the work of Li Yu-ying. Notes that by adding lactose and a bacterial culture, Yogourth [yogurt] can be made from soymilk (p. 370).

In Peking, soymilk is sold in small bottles of 200-220 cc carrying the title *Lait de pois–Un produit chinois. La nurriture la plus nourrissante. Préparé par ___.* In 1925 one bottle of soymilk daily cost 1 dollar Mex per month. In 1919 in Shanghai, Peking and Dairen, Chinese companies furnished hospitals and private individuals 8-10 oz of concentrated soymilk in bottles (p. 371-72).

A table (p. 373) compares the composition of 3 types of soymilk with mother's milk, cow's milk, and goat's milk; all but the cow's milk (87.00%) contain 90.71% water. The soymilks are: (1) From Tsinan fu, China. (2) From Peking, China. 3. From Japan. The soymilk from Peking was low in fat, so yuba had probably first been removed from it (p. 372).

In China, soymilk is habitually drunk sweetened with sugar. Li Yu-ying reports that one of his parents was nourished from birth with soymilk and for 37 years he has always been in excellent health (p. 374).

A new method for making soymilk. In 1916 Prof. Laxa of Prague develop a method for making soymilk in homes in Europe. The cost of a liter of soymilk in Prague in 1916 was estimated by Laxa as being about 40 centimes if it was homemade. Before the war, there was in London a soymilk

© Copyright Soyinfo Center 2014

factory which intended to place its products regularly on the market. Plans were made to construct two other plants, one in Manchester and one in Liverpool. The synthetic milk syndicate launched a soymilk on the market that was adapted to European tastes. The syndicate's factory, established in Liverpool, used the method of F. Goessel to make 100 liters of soymilk using the following formula (which is given). A Dutch patent (No. 2122 of Sept. 1917) and a Japanese patent (No. 28346) are also cited (p. 375-77).

A table shows the composition of 6 types of Soyama soymilk according to the analyses of Dr. G. Popp of Frankfurt. The protein ranges from 2.5% to 3.77%. Normal soy cream contained 11.5% fat, whereas that which was extra rich for diabetics contained 30% fat. It is very difficult to tell the difference between tea, coffee or chocolate to which one has added Soyama soy cream compared with regular dairy cream (p. 379).

In using the Soyama milk and cream, von Noorden confirms the following statement of Fischer, who studied vegetable milks in general: 1. In the stomach, soymilk gives a flocculent precipitate which is finer [smaller clumps] than that produced by cow's milk. 2. The digestion of soymilk requires only a weak secretion of gastric juice; the period of secretion is therefore short. 3. The time that soymilk protein resides in the stomach is shorter than that of cow's milk protein. 4. The peristaltic action of the stomach is less after ingestion of soymilk and better coordinated. Therefore, based on these observations, von Noorden recommended soymilk over cow's milk (p. 380).

Hatmaker made powdered soymilk. A table shows its composition, as analyzed by a laboratory in Paris (p. 380).

Yu P'i and Yu Ba are the Chinese and Japanese names of yuba, respectively. Recently a new method for making yuba has been patented in Japan. It consists in the use of an electric ventilator [or fan] placed above the surface of the cooking pot containing soymilk that is not heated above 90ºC. A table (based on analyses of the Tokyo Laboratory of Hygiene, of Embrey, and of Adolph) then gives the nutritional composition of 5 types of yuba, including Fu Chu (dried yuba sticks) which (surprisingly) contain 53.68% water.

Note: Maybe this Fu Chu was either fresh or reconstituted yuba. Address: Directeur du Service Chimique du Congo Belge.

2973. Meade, Mary. 1933. Sukiyaki party is novel idea in entertaining: Japanese dishes are still as much of thrill to the hostess as to guests. *Chicago Daily Tribune.* April 30. p. D1.
• ***Summary:*** Among Nipponese foods, Sukiyaki is "the greatest temptation of all." One key ingredient is "soy sauce (sometimes known as chop suey sauce)." "Japanese diners are much nearer being vegetarians than we are." The writer gives a detailed recipe for Sukiyaki; the Otsuyu (soup) includes: "4 cups boiling water, ½ teaspoon ajinomoto {a powdered seasoning on the market}, ½ tablespoon soy sauce, etc.

Note: Tofu is not mentioned anywhere in this article.

2974. Sakurai, Yoshito. 1933. Miso no seibun ni tsuite. II. Sendai miso (ichi nen jukusei) no yûki enki ni tsuite [On the constituents of miso. II. Tokyo.

2980. Ishimaru, Yoshio. 1933. Shôyu jôzô ni kansuru saikin no kenkyû. I. [Research on the bacteria involved in shoyu fermentation. I.]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 11(6):439-65. [Jap]
• ***Summary:*** Discusses 28 species of bacteria involved in shoyu fermentation. The main genera involved are *Bacillus, Pediococcus, and Micrococcus* species. Part I discusses: 1. *Bacillus mesentericus vulgatus var. Soya* No. 1. 2. *Bacillus mesentericus vulgatus var. Soya* No. 2. 3. *Bacillus mesentericus vulgatus var. Soya* No. 3. 4. *Bacillus mesentericus fuscus var. Soya.* 5. *Bacillus mesentericus niger var. Soya.*

Note: This is the earliest document seen (Jan. 2009) which mentions that *Pediococcus* bacteria are involved in the shoyu fermentation. Address: Nôgaku hakase, Japan.

2981. Mashino, Minoru. 1933. Studies on the improvement of soya bean oil extraction. IV. The extraction with azeotropic mixtures adding lower alcohols before or after extraction. *J. of the Society of Chemical Industry, Japan* 36(6):309B-10B. June. Supplemental binding to Kogyo Kagaku Zasshi. [1 ref. Eng]
• ***Summary:*** Azeotropic mixtures of aliphatic or aromatic hydrocarbons with methanol or ethanol can be used for the extraction of soybean oil, if lower alcohols are added to the azeotropic mixture before or after the extraction, and the azeotropic mixture is evaporated off from the miscella, which separates into two layers after cooling, so that oil and alcohols can be recovered. The purest and palest oil is obtained by using methanol in the mixtures.

Note: This is the earliest English-language document seen (Feb. 2010) that contains the word "miscella" which refers to a mixture of unrefined oil and solvent, usually from a solvent extractor. Address: The Tokyo Imperial Industrial Research Inst., Hatagaya, Shibuya-ku, Tokyo.

2982. Asari, T. 1933. [Preservation of soybeans]. *Japanese Patent* 101,895. July 7. [Jap]*

2983. *Christian Science Monitor.* 1933. Popular dishes of Japan. July 7. p. 6.
• ***Summary:*** "These Japanese recipes comes to us by way of a resident in the legation quarter of Peiping, China. We have been told that American and European residents in China enjoy Japanese food and often patronize Japanese restaurants there. Japanese food is nourishing yet light. The mainstays of their diet are fish and vegetables" [sic, rice].

The recipe for "Suimono, or Japanese consomme" calls for: "Soy sauce, which is easily obtainable from Japanese and Chinese grocers or other importers. If not, any good fish-and-meat sauce such as Worcestershire will produce a similar effect if desired."

The recipe for Teriyaki states: "(A fish recipe whose name means merely 'Broiled' [sic, it means 'shining broiled' or 'glazed broiled']).

"Wash thoroughly and cut into pieces: 1 piece tunny fish or salmon of medium size. Soak [marinate] for about 10 hours in a mixture of: 1½ cups sweet white wine-flavoring (non-alcoholic) [perhaps mirin] and

"¼ cup soy sauce or other fish sauce, such as Worcestershire. Then broil the same liquid mixture over a slow fire for about 15 minutes, or until the fish appears done when poked lightly with a fork. The recipe need not be salted unless desired, as the soy or other sauce contains salt flavoring."

The recipe for "Mitsu mame ('Honeydew beans')" states: "The sweet red beans known as *adzuki,* which are similar to our dried [kidney] beans and dried peas, are a predominant ingredient in many Japanese sweets."

Note 1 The main ingredient in this teriyaki dish is fish, not beef or poultry.

Note 2. The teriyaki [sauce] is extremely simple compared with later recipes.

Also contains recipes for: Rice–Japanese style. Chawan mushi.

2984. Iinuma, Toru; Mashino, Minoru. 1933. On the properties of soya bean protein. II. Solubility of soya bean protein in calcium thiocyanate solution. *J. of the Society of Chemical Industry, Japan* 36(7):373B. July. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** 69% of the protein in soy bean is dissolved by treatment for 3 hours at 98ºC with 30% aqueous calcium thiocyanate, and under these conditions the cellulose remains undissolved. The total nitrogen in solution is equal to that dissolved by successive treatments with water, ethanol, 10% aqueous sodium chloride, and 1% aqueous sodium hydroxide, and almost the whole is precipitated by ethanol. Address: Tokyo Imperial Research Inst., Hatagaya, Shibuya-ku, Tokyo.

2985. Iinuma, Toru; Mashino, Minoru. 1933. On the properties of soya bean protein. III. Shearing strength of soya bean protein as adhesive. *J. of the Society of Chemical Industry, Japan* 36(7):373B-75B. July. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** "The authors have wished to explain a reason why the soya bean protein has not been used in generally for adhesive as well as casein. Moreover the authors have studied to use the soya bean protein as adhesive." Glue prepared from the soybean protein remaining after extraction of the oil with benzene plus methanol has a shearing strength equal to that of casein glue. Address: The Tokyo Imperial Industrial Inst., Hatagaya, Shibuya-ku, Tokyo.

• ***Summary:*** "The term lard substitutes is used here... to refer to all lard compounds, vegetable shortenings, and other lard substitutes."

"European interest developed last year in soybean oil lost ground in 1933. An important contributing factor has been the restrictions under which the German margarine industry is now working. The oriental export trade in soybeans to Europe lagged behind 1932 figures for the first 7 months of 1933. Indications are for a new crop of Manchurian beans larger than the flood-damaged crop of last year."

Soybean oil (crude and refined) is also mentioned in the following tables:

U.S. factory consumption of animal and vegetable fats and oils, 1929-1933 (p. 322).

U.S. factory production of animal and vegetable fats and oils, 1929-1933 (p. 323). The leading vegetable oil by far is cottonseed oil.

U.S. stocks of animal and vegetable fats and oils, 1928-1932 (p. 324).

Wholesale price per pound of some of the principal animal and vegetable fats and oils, by month Jan. 1931 to July 1933 (p. 326).

U.S. imports of animal and vegetable fats and oils, 1928-1932 (p. 327).

Imports of vegetable oils and oil materials, by countries, 1913, 1928-1932 (p. 330-31). For soybean oil, the main importers in 1928 were Japan, China, Kwantung, and "Other countries."

2999. Abe, Zyubei [Jubei]. 1933. Bread and butter for Manchuria. *Rotarian* (*The*) 43:9-10. Sept.
• ***Summary:*** It was in the autumn of 1907, following the Russo-Japanese War (1904-06), that Mitsui & Co. made a trial shipment of several hundred tons of soybeans to Hull, England. So well received was it that in the following year the export increased to 500,000 tons at one bound. Recent yearly export of soybeans from Manchuria has been in the neighborhood of 2,500,000 tons, of which about 1,500,000 tons are sent to Europe; while that of bean cake is about 1,500,000 tons, Japan taking nearly two-thirds of it. Thus stimulated, the export of soybeans and cake, meal, and oil has become the most important business of Manchuria."

"Soybeans have high nutritive value, containing 38 per cent protein and 18 per cent fat. It was natural, therefore, that Orientals, who live chiefly on vegetables, particularly the Japanese–in deference to the Buddhist doctrine, should regard soybeans with favor. They are prepared in various ways, and anyone who has lived in Japan must have had experience with bean curd, bean milk, soy (Japanese sauce), fermented beans [natto], bean paste [miso], bean flour [kinako], bean candy, and other foods in which this versatile legume is an ingredient.

Photos show: (1) The writer, Mr. Jubei Abe, seated at his desk in Dairen. He says that Mitsui & Co. is the largest commercial enterprise [*zaibatsu*] in Japan. (2) Acres covered by bags of soybeans in open storage at Kaiyuang awaiting local consumption or export to foreign ports. (3) Soybeans stored in huge round storage bins, under conical tops, in the native manner at Kungchuling. (3) Batteries of giant [hydraulic] presses crushing the beans for their oil. The residue becomes the valuable meal or cake. Address: Manager of local branch, Mitsui and Co., Dairen, Manchuria.

• ***Summary:*** "Since mid-July the movement of [soy] beans to Europe has been unusually small in view of the German restrictions on imports of the bean and its products."

Tables show: (1) "Manchuria: Exports of soy beans and bean products, by quarters, seasons 1931-32 and 1932-33." Shows [soy] beans, bean cake, bean oil, and total. These exports are from Dairen, Newchwang, Vladivostok, and Manchouli [W.-G. Man-chou-li, Manzhouli]. Note: Manzhouli is an inland port in Nei Monggol {Inner Mongolia}, northern China, near the border with Russia. As of Jan. 2008 Manzhouli is China's busiest land port of entry, and is responsible for 60% of all imports from and exports to Russia and Eastern Europe. They apparently travel by rail on an east-west axis.

(2) "Manchuria: Exports of soy beans and bean products by countries of destination, Oct. to June, 1931-32 and 1932-33." The countries are Japan [incl. Korea and Formosa], Europe [incl. exports via Manchouli to Leningrad], China, America [USA], Malaysia, and Others. Europe buys the most whole soy beans, Japan the most bean cake, and China the most bean oil.

3004. *Foreign Crops and Markets* (*USDA FAS Bureau of Agricultural Economics*). 1933. The world situation in oils and oilseeds. 27(14):352-76. Oct. 2.
• ***Summary:*** German trade in soy beans has increased. Two full page tables show: (1) Netherlands: Imports of fats and oils, 1928-1932 (includes 20,000–54,000 short tons of soybeans and large amounts of soybean oil). (2) Netherlands: Exports of fats and oils, 1928-1932 (includes 231–344 short tons soybeans and 11,000–17,000 short tons of soybean oil).

The section titled "Soy beans" states: (p. 367) "The total production of soy beans last year in the five leading soy bean producing countries: Manchuria, Chosen [Korea] and Dutch East Indies, each shows a substantial increase, Chosen producing 677,326 short tons against 634,506 in 1931 and Dutch East Indies 165,345 short tons compared with 141,602 during the previous year. In the United States, on the other hand, 397,350 short tons were harvested, a reduction of about 13 per cent from that of 1931 but about 8 per cent larger than the quantity harvested in 1930. The amount produced by Japan during the past year is not available at the present time. See table, page 374."

A 3rd table (p. 368) shows the production of oilseeds in terms of oil in major producing countries from 1929-30 to 1932-33. The amount stayed about constant during this period, ranging from 1.24 to 1.37 million pounds.

A 4th table, titled "Soybeans" (p. 368) shows the production of soybeans in major producing countries in 1909-1913 (average), 1921-1925 (average), and yearly from 1929-30 to 1932-33 (estimate). The amounts in 1931-32 were (in short tons): Manchuria 3,289,657. Chosen [Korea]: 634,506. USA 458,130. Japan 381,551. Dutch East Indies (today's Indonesia): 141,602.

has a high supplementary value. It has a somewhat higher supplementary value than "kôridôfu (frozen soy-bean curd)" but somewhat lower than fish protein.

Note 1. This is the earliest English-language document seen (March 2009) that uses the term "soybean paste" to refer to miso, or that mentions Sendaimiso, Yedomiso, Inakamiso, or Hatchomiso (spelled that way).

Note 2. This is the earliest English-language document seen (April 2013) that uses the term *kôridôfu* to refer to dried-frozen tofu. Address: Agricultural Chemical Lab., Tokyo Imperial Univ., Komaba, Tokyo, Japan.

3008. Miller, Carey D. 1933. Japanese foods commonly used in Hawaii. *Hawaii Agricultural Experiment Station, Bulletin* No. 68. 43 p. Nov. See p. 1-10, 28-43. [18 ref]

• ***Summary:*** Contents (p. 1-10): Introduction. Soybean products. Edamame (green soybeans). Tofu (soybean curd). Kirazu (tofu residue) [okara]. Tonyu (soybean "milk"). Aburage (fried soybean curd). Miso (fermented rice and soybeans). Natto (fermented soybeans). Shoyu (soybean sauce). Koji (fermented rice). Pages 24-15: Kinoko (mushrooms). Fu (gluten cakes). Goma (sesame seeds).

Pages 28-43: Recipes with the nutritional composition of each: Miso soup with tofu. Miso soup with wakame. Miso soup with daikon. Miso soup with [cow's] milk. Tofu soup with lemon. Tofu shoyu soup. String bean shirae [shira-ae] (with tofu and miso). Carrot shirai. Konnyaku shirai. Eggplant with miso. Green onions with miso. Fish cakes with miso. Sesame seed sauce for vegetables (with shoyu). Nishime (with shoyu). Nigome (with aburage and shoyu). Kirazu with vegetables (with okara, aburage, shoyu). Noodles (somen or udon, with shoyu). Vinegar sauce for sushi. Inari-sushi (with aburage and shoyu). Maki-sushi.

Note: This is the earliest English-language document seen (June 2013) that calls for okara [which it calls *kirazu*] as an ingredient in a recipe.

Appendix: Composition of some Japanese foods used in Japan.

Concerning edamame: "The Japanese use several varieties of fresh green soybeans. In Honolulu whole plants are purchased from the vegetable market. The pods are removed from the plants, placed in boiling salted water, and boiled for about 25 minutes. They are then drained and cooled, and the beans are kept in the pods until eaten. Often children eat them out of bags as they would candy. The fresh green soybeans appear to be an excellent food. They are good sources of calcium, phosphorus, and iron, yield a basic ash, and, as compared with other fresh vegetables and fruit, have a remarkably high protein content. Vitamin tests in progress at the nutrition laboratory of the Hawaii Agricultural Experiment Station show that the cooked beans are very good sources of vitamins A, B, and G. The more general use of green soybeans should be encouraged in the home, and their consumption may be increased by selling them in school cafeterias."

Concerning Kirazu (tofu residue) (p. 5): "Kirazu, or the residue of the soybeans left when tofu is made, has a crude fiber content of 3 to 4 percent, contains 4 to 5 percent of the protein of the beans, more than 1 percent of the fat, and 5 to 6 percent of the carbohydrate. Only a small part of kirazu is used for human food in Hawaii, by far the greater part being used as hog feed. Kirazu, however, is a utilizable, inexpensive food and might be more generally used than it is... Kirazu is used in combination with vegetables, or with fish, or dried shrimp, and seasonings."

Concerning Tonyu (soybean "milk"): The milky liquid obtained by grinding soybeans with water and heating and straining off the insoluble residue has the appearance of skim milk. Early reports from China and from Japan stated that soybean milk may be used as a substitute for cow's milk for children, but Wan (16, p. 360), in more recent scientific reports from China, indicated that, whereas soybean milk is richer in vitamin B than is cow's milk, soybean milk is lower in vitamin A and still lower in calcium content. The biological value of the protein of the soybean milk is not comparable with that of the protein of cow's milk. Chemical analyses of local soybean milk obtained from the tofu-manufacturing shops showed it to be low in fat and in carbohydrates. Chang and Tso (3, p. 199) demonstrated that, when properly supplemented with the necessary minerals, vitamins, fat, and carbohydrates, soybean milk can be used successfully for infant feeding where cow's milk is not available or where the infant is anaphylactic to the protein of cow's milk. In Hawaii there is no need to use soybean milk as a substitute for cow's milk and, considering its dietary qualities, it should not be so used without the needed supplements"

Concerning natto: Describes the process for making natto on a commercial scale in Honolulu. After cooking (without soaking) for about 8 hours in a large iron kettle, the "beans are thoroughly drained and placed on paper plates covered with wax paper. The plates are stacked one above another in large wooden boxes, covered with rice straw mats, and kept at a temperature of approximately 30ºC. for 35 to 36 hours, when the product is ready for use... The fermented product is covered with a gray, slimy substance that forms strings or threads when the beans are pulled apart, indicating good quality... Although no molds or yeasts are added to the cooked soybeans, O.N. Allen, of the botany department of the University of Hawaii, who examined several samples of fresh natto from Honolulu, found 2 molds, 4 bacteria, and an aspergillus present. The enzymes of some of these organisms probably caused the conversion of a small part of the protein to simpler substances."

Concerning Inari-sushi (p. 37): The "ingredients required for this dish are rice, water, salt, aburage, carrots, mushrooms, string beans, gobo, flaked bonito, water, sugar, shoyu, and vinegar sauce." A detailed recipe is given.

© Copyright Soyinfo Center 2014

Photos show the following (each food accompanied by its Japanese name written in both Chinese characters and *katakana*)*:* Edamame, in the pods on the plant, and shelled in a dish. Tofu kasu [okara] on a plate. Tofu on a dish. Tonyu (soybean "milk") in a glass. Three triangles of aburage on a dish. Miso on a dish. Natto in a white rectangular commercial paper tray about 3½ by 6 by 1 inch deep. Koji on a plate.

Note 1. This is the earliest English-language document seen (June 2009) that uses the term "fresh green soybeans" to refer to green vegetable soybeans.

Note 2. This is the earliest document seen (July 2003) that mentions commercial natto production in Hawaii.

Note 3. This is the earliest English-language document seen (Jan. 2012) that uses the term "tofu residue" to refer to okara.

Note 4. This is the earliest English-language document seen (Jan. 2012) that uses the word "strings" or "threads" in connection with natto. Address: Specialist in Nutrition, Honolulu.

3009. Okamo, Koji; Ohara, Iwao. 1933. Daizu no ni shu no saponin ni tsuite [Two saponins from soya beans]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 9(11):1249-58. Nov. [9 ref. Jap]
• ***Summary:*** A crystalline saponin (with chemical formula $C_{48-50}H_{77-81}O_{18}$, melting point 225-227ºC), and an amorphous saponin (formula $C_{45-51}H_{79-83}O_{19}$, melting point 216-218ºC) were obtained. On hydrolysis the former yields a sapogenin, formula $C_{30-32}H_{48-52}O_3$, glycuronic acid, galactose, and rhamnose. The amorphous saponin yields a sapogenin, formula $C_{31-33}H_{50-54}O_4$, and glycuronic acid, galactose, and rhamnose. Five sapogenin isomerides, melting point 201ºC, 235ºC, 239ºC, 260ºC, and 248-249ºC, were isolated according to the duration of hydrolysis. When heated with copper oxide or lead chromate, the saponins and sapogenins yield methane and ethane. The saponins have no hemolytic power. Address: Nôgaku-shi, Minami Manshu Tetsudo K.K. (South Manchuria Railway Co.), Chuo Shikenjo, Nosan Kagaku-ka, Jikkenshitsu.

3010. Okano, Kôji; Ohara, Iwao. 1933. Daizu no nishu no saponin ni tsuite [Two varieties of soybean saponins]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 9(11):1249-58. Nov. English-language summary in Bulletin of the Agricultural Chemical Society of Japan 9:177-80, bound in Nippon Nogei Kagaku Kaishi. [9 ref. Jap]
• ***Summary:*** The authors examined the ethanol extract of soybeans, from which the oil was removed, with the object of identifying the soluble glycosidic materials, or glycosides. A crystalline saponin was obtained which melted at 225-227ºC and corresponded to the formula $C_{48-50}H_{77-81}O_{18}$. On hydrolysis, there was obtained a crystalline sapogenin corresponding to the formula $C_{30-32}H_{48-52}O_3$, glucoronic acid, galactose, and rhamnose.

Eventually 5 isomeric sapogenins were obtained, depending on the degree of hydrolysis of the original saponin. Neither of the original saponins exhibited any hemolytic power.

decline in reducing sugar content, a steady decrease in sucrose, stachyose, and galactan, and an increase in starch, dextrin, pentosan, and crude fiber. The total carbohydrate content of the seeds did not change appreciably during the first 10 days of germination. Address: Biochemical Lab., Dep. of Agriculture, Kyûshû Imperial Univ.

3016. Bailey, Ethel Zoe. 1933-1966. Glycine soja–Foreign sources. Part I. Ithaca, New York: L.H. Bailey Hortorium. 3 cards. Unpublished.

• ***Summary:*** *Glycine soja* is the scientific name for the wild soybean, an annual plant. This name has never been used for the cultivated soybean.

These three hand-written index cards are in the Bailey Hortorium's index system of nursery catalogs and/or botanic garden seed lists developed by Ethel Zoe Bailey. In this index system, there are eleven major cards and eight minor cards related to the soybean. On each card are two-part coded entries referring to botanic gardens or nurseries.

Part 1 is the code for the name of the botanic garden, and part 2 is the last two letters of the earliest year in which the plant for that card appeared in this garden's catalog. For example "Buit 33" refers to the 1933 catalog from Buitenzorg, Java. [LR 1982] means that a list of seeds and plants (whether or not it contained soy) was "Last Received" from that source [Buitenzorg] in 1982. There are 72 listings for *Glycine soja* from foreign sources. As of Nov. 1997 most of the catalogs and seed lists mentioned below are available in the Bailey Hortorium, located in Mann Library, Cornell University, Ithaca, New York.

3017. Bailey, Ethel Zoe. 1933-1982. Glycine max–Foreign sources. Ithaca, New York: L.H. Bailey Hortorium. 2 cards. Unpublished.

• ***Summary:*** These two hand-written index cards are in the Bailey Hortorium's index system of nursery catalogs and/or botanic garden seed lists developed by Ethel Zoe Bailey. In this index system, there are eleven major cards and eight minor cards related to the soybean. On each card are two-part coded entries referring to botanic gardens or nurseries.

Part 1 is the code for the name of the botanic garden, and part 2 is the last two letters of the earliest year in which the plant for that card appeared in this garden's catalog. For example "Kew 33" refers to the 1933 catalog of the Royal Botanic Gardens at Kew, England. [LR 1982] means that a list of seeds and plants (whether or not it contained soy) was "Last Received" from that source [Kew] in 1982. There are 55 listings for *Glycine max* from foreign sources. As of Nov. 1997 most of the catalogs and seed lists mentioned below are available in the Bailey Hortorium, located in Mann Library, Cornell University, Ithaca, New York.

3035. Fukuda, Yasona. 1933. Cyto-genetical studies on the wild and cultivated Manchurian soy beans (Glycine L.). *Japanese J. of Botany* 6(4):489-506. [15 ref]
• ***Summary:*** Contents: Introduction: Three *Glycine* species are treated in this paper: 1. *Glycine hispida* Max (*Glycine Soja* Benth.). 2. *Glycine gracilis* Skvortzow. 3. *Glycine Soja* Siebold et Zuccarini (*Glycine ussuriensis* Regel et Maack). Material and methods. Number and morphology of chromosomes. Development of the pollen grains. Weight of seeds of the *Glycine* species. Genetical difference among the *Glycine* species. Origin of soy beans. Summary. Literature cited. Explanation of plates XXI-XXII.

Describes the first reported cross between *Glycine* species made by Nakatomi and Nibe around 1917–and not yet published. They crossed the soybean (*Glycine soja*) with the wild soybean (*Glycine ussuriensis*), making hybrids of these two species with the object of making a new commercial form; their observations reached the F-4 generation. Fukuda considers *G. gracilis* to be the intermediate species between the domesticated soy bean and *G. ussuriensis,* the wild annual soybean which grows in Manchuria and has 40 somatic chromosomes.

Fukuda suggests that soybeans originated in Manchuria, probably from the wild species, and he argues strongly for a soybean gene center in Manchuria, where soybeans were first domesticated. His reasons are as follows: (1) *Glycine gracilis,* the weedy form is distributed widely in Manchuria but less frequently in other regions of China; (2) Numerous

© Copyright Soyinfo Center 2014

soybean varieties are grown in Manchuria; (3) Many of the soybean varieties in Manchuria appear to have primitive characteristics. Hymowitz (1970, p. 417) attempts to refute Fukuda's theory. Address: Manchuria Medical College, Japanese Concession, Mukden, Manchuria.

3036. Hattori, Kenzô; Ogimura, M.; Okumura, M. 1933. Daizu no saponin ni tsuite [Soybean saponins]. *Nippon Eisei Kagaku Kaishi* (*J. Hyg. Chem. Society of Japan*) (*Eisei Kagaku*) 5:313-22. [Jap]
• ***Summary:*** The authors isolated two saponins from soybeans which they designated saponins I and II. Saponin I melted at 265ºC and gave, on hydrolysis, a sapogenin melting at 249ºC, whereas saponin II melted at 217-218ºC and gave a sapogenin melting at 241ºC. Address: Tokyô Teikoku Daigaku, Igaku-bu, Yakugaku-ka, Eisei-gaku Kyôshitsu (Tokyo Imperial Univ.).

3037. Inahara, K. ed. 1933. Japan Year Book. Tokyo: The Foreign Affairs Association of Japan. 18 + 1383 + 51 p. See p. 201-223. 21 cm.
• ***Summary:*** This book has a new editor and a new publisher. The Preface states: "This Year Book has no connection with that published by the late Prof. Tukenobu under the same title, which is now defunct. Both in selection and classification of material, an attempt has been made to incorporate in this book some of the best features of similar publications throughout the world, together with certain original ideas as to modern requirements in a Year Book. The book thus represents an entirely new venture, breaking, in some respects, entirely new ground.

"Such being the case, it is feared that some of the overlappings and wiser defects which seem, despite the greatest editorial vigilance, inseparable from the first issue of a publication of the kind, may have crept in. Every effort will be made in subsequent issues of the Year Book to remedy such defects.

"Tokyo, November, 1933. K. Inahara, Editor."

Chapter 6 (p. 201-223) is a detailed account of the "Manchurian Incident" of 18 Sept. 1931 (which the Japanese government used as an excuse for taking control of Manchuria and renaming it Manchoukuo)–told from the Japanese point of view. When the League of Nations rejected Japan's explanation for its aggression, Japan promptly withdrew from the League.

3038. Japan. Nôrinshô, Beikokubu. 1933. Shina ni okeru Gisô oyobi Shasô, shimin seikatsu, kôchi seido, kokumotsu no meishô no kenkyû [A study of the Giso and Shaso storage houses, and the life of the Shimin people, the cultivated field system, and the names of grains]. Tokyo: Dai Nihon NoÄkai 212 p. See p. 148, 166. Series: Beikoku shiryô No. 19. [Jap]*
• ***Summary:*** Page 148 states that "shu" includes both soybeans and azuki beans, and page 166 states that before the 6th century, both soybeans and azuki beans were cultivated. The "Five Grains" always includes "shu." Address: Japan.

3039. *Japan Times Year Book.* 1933. Serial/periodical. Published by The Japan Times, Tokyo. 27 cm. [Eng]
• ***Summary:*** Merged with: Japan Year Book (Tokyo, Japan: 1905), to form: Japan-Manchoukuo Year Book. This book has a larger format than the Japan Year Book. On the title page is printed "(Third Edition). Near the front are nine maps (black and white): Japan (incl. Chosen [Korea] and Manchokuo) [sic] with each of Japan's provinces numbered and named, Karafuto (southern half), Hokkaido, Northern Hondo [Honshu], Central Hondo, Western Hondo, Kyushu, Taiwan, and Chosen [Korea].

Facing p. 72 is Appendix XII: Japanese weights and measures. 1 koku = 1.80391 hectolitres.

Page 140. A table shows the "Principal agricultural crops" of Japan and the quantity and value produced in 1928-30. For "soya beans":

5.370 million hl [hectoliters] in 1928
4.789 million hectoliters in 1929
5.473 million hectoliters in 1930.

Production of "azuki beans" was 24.6% that of soya beans in 1928.

Another table (p, 141) shows cultivated area, production, and value for soya beans, azuki beans, and foxtail millet in 1929 and 1930. For soya beans:

4.789 million hectoliters in 1929
5.478 million hectoliters in 1930

Page 213. In the section on the foreign trade of Japan in 1931, important items include "Beans" (worth 37.677 million yen compared with 49.734 million yen in 1930, a decrease of 12.1%) and "Bean cakes" (worth 44.179 million yen compared with 66.417 million yen in 1930, a decrease of 22.2%).

Page 221. About agriculture in Chosen [Korea]. "Soya beans are exported chiefly to Japan for manufacturing soy [sauce], the export amounting to 4.490 million koku valued at 17.554 million yen in 1930.

Page 301. Chapter 43 is titled " Kwantung Leased Territory and Railway Zone." Japan believes that it now (since 1931) controls these two parts of Manchuria. The latter is officially known as the "South Manchuria Railway Zone."

Page 307. Contains a table that lists the principal agricultural products in the Kwantung and the Railway Zone. They are (in descending order of total production in both areas: peanuts (1.032 million koku), maize (921,071 koku), kaoliang (270,529 koku), millet (216,644 koku), soya beans (156,895 koku). Note that soya beans are much less important than they were 20 years ago.

Page 308. "The most important Manchurian industry is the [soya] bean oil industry, and in this field, the Kwantung territory occupies a very important position. The capacity of

© Copyright Soyinfo Center 2014

bean oil produced at Dairen is nearly 70 percent of the entire bean oil producing capacity of Manchuria." A table gives the number of oil mills at Dairen (1924-1931), their capacity in terms of [soy] bean cakes, and the percentage of the total Manchurian capacity controlled by Dairen. The number of mills increased from 82 in 1924 to a peak of 84 in 1926, then decreased to 53 in 1931. The capacity in bean cakes increased from 285,000 cakes in 1924 to a peak of 297,400 cakes in 1931. The percentage of total capacity increased from 55% in 1924 to 69% in 1931.

A second table [which makes no sense] gives the actual production of cakes in Dairen mills from 1924 to 1931: It increased from 27.087 million cakes in 1924 to a peak of 40.939 million cakes in 1926, then decreased to 22.980 million in 1930.

3040. Kincaid, Zoë. 1933. Tokyo vignettes. Tokyo & Osaka: The Sanseido Co., Ltd. [8] + 284 p. See p. 101. Illust. No index. 23 cm.
• ***Summary:*** Page 2: When the author is at her home in Tokyo: "Into the morning's routine comes the call of the bean-curd seller, announcing to every household that he is at hand to supply its wants;..."

Page 67: "My hostess served me with soba... which the farmer had made himself, together with relish of seaweed, and soy [sauce] of their own manufacture."

Pages 100-103: At the Kwannon Temple in Tokyo, seven old women sell soaked or sprouted beans and rice for a few small coins, and the visitors to the temple throw the food to the birds. "Well the doves know the ways of their benefactors, and divine prospective distributors of largess, for they watch with bright eyes for the bean scattering and fly from all directions to be in on the banquet! The charge for the contents of one bean tray is two sen."

Page 209: "For breakfast there is soup made from slightly fermented beans, miso, thick with vegetables, tasty and hot. Later the tofu vendor runs thorough the streets calling out that he has white bean curd to sell."

Page 212: Among the ingredients of oden were "fried bean curd." Address: Tokyo, Japan.

3041. Matsuura, Hajime. 1933. A bibliographical monograph on plant genetics (Genic analysis; 1900-1929). 2nd ed. Sapporo: Hokkaido Imperial University. 787 p. 2077 references total. [24 soy ref. Eng]
• ***Summary:*** For soybeans, see p. 100-10, 779. A very complete and interesting treatment of all early papers, worldwide, on soybean genetics. The Japanese took an early lead in research on soybean genetics (especially Nagai). This is the first comprehensive study. Only 2-3 groups in the USA were interested, especially at the University of Illinois. Not much practical use was made of soybean genetics before about 1930.

Contents of soybean section: Seed color and pattern. Cotyledon color (it is either green or yellow; green is dominant). Pubescence on the plant surface. Other characters (See Table VIII. Flower color, pod color, hair color, leaf color, leaf form, number of leaflets, plant height, fasciation of stem, branching habit, dehiscence of pods, maturing time, seed coat surface, hilum character, seed size, sterility). List of genes and linkage relations.

The "Foreword to the First Edition," by K. Fuji (Emeritus Professor of Botany, Tokyo Imperial University) begins: "With the rediscovery of Mendel's laws in the year 1900 opened a new era in the development of the science of heredity and variation, and there is nothing in the history of biology comparable to the rapidity with which the new principle has spread and the enormous influence it exerted on other principles of biology, other than the case witnessed in the years following 1859 on the appearance of Darwin's 'Origin of species by means of natural selection.' In these respects Mendelism and Darwinism show a singular coincidence." Address: Prof. of Botany, Hokkaido Imperial Univ., Sapporo, Japan.

3042. Morimoto, Rokuji. 1933. Kokurui o dashita tateana [The pit from which grains were excavated]. In: Rokuji Morimoto, ed. 1933. Nihon Genshi Nogyo (Japanese Primitive Agriculture). Tokyo: Tokyo Kokogakkai (Tokyo Archaeology Society). 135 p. See p. 132-33. [Jap]*
• ***Summary:*** According to Taichi Fukazawa's report, naturally carbonized soybeans were found in a pit at the Komoriyama ruins, Senya Village, Senhoku-gen, Akita prefecture, Japan. These soybeans, dating from the first to second centuries A.D., were the second oldest ever found in Japan. They were dated by Dr. Nobuo Ito of Tohoku University. Address: Japan.

3043. Morse, W.J. 1933. Soybeans now a major crop in United States; Few grown before 1898. *Yearbook of Agriculture* (*USDA*) p. 198-205. For the year 1933.
• ***Summary:*** Contents: Variety adaptation. Variety utilization (incl. bean curd, bean milk, soy sauce, miso (bean paste), bean sprouts, green vegetable beans, bean flour, roasted beans, bean confections [made using roasted whole soy flour], beverages, oil and meal, special fermented bean products). Soybean oil and meal industry. Soybean meal. Soybean oil. Soybeans for human food. Soybeans as an export crop.

"Variety adaptation: The Virginia, Laredo, Manchu, and Biloxi have a greater range than most other varieties. The Virginia, Mansoy, and Harbinsoy varieties excel on the less productive types of soil, while on better soils the Mansoy and Harbinsoy give inferior results.

"Since the Department of Agriculture began to introduce soybean varieties more than 7,000 samples of beans have been collected from Japan, Chosen [Korea], Manchuria, China, Taiwan (Formosa), Java [in today's Indonesia],

© Copyright Soyinfo Center 2014

Sumatra, and India. There are more than 2,000 distinct types in this large collection, ranging from 75 to more than 200 days in reaching maturity. At present about 40 varieties are generally grown in the United States."

"In Japan, where the soybean is used extensively as a green vegetable, more than 60 varieties, ranging in maturity from 75 to 160 days and differing in flavor, are grown solely for this purpose. The soybean in used in the United States primarily as forage, being preserved either as hay or silage, or cut and fed green as soilage, and is also pastured extensively with hogs and sheep."

"Soybeans for human food: In Asiatic countries the soybean is grown primarily for the beans, which are used largely in the manufacture of numerous food products that supply the principal source of protein in the Asiatic diet as that in the diet of western people is furnished chiefly by meat and dairy products. "Oriental people use very few dairy and meat products, yet for many centuries they have lived on an apparently well-balanced diet of which the protein is derived largely from the soybean.

"The most commonly used soybean foods in the Orient are soy sauce, miso or bean paste, bean curd, bean milk, bean flour, roasted-bean confections, green-vegetable beans, bean sprouts, roasted bean flour, boiled beans (with rice, millet, or sorghum), coffee substitute, and health drinks made from roasted soybeans.

"In the United States the soybean and its products have attracted attention as an article of food at various times, but only within the last three or four years have there been any extensive investigations along this line by commercial interests. Soybean flour, made by grinding either the whole bean (preferably yellow-seed varieties) or the press cake after the oil has been removed from the beans, is finding increasing favor in the manufacture of various products, such as malted milk, macaroni, vermicelli, spaghetti, noodles, crackers, cookies, ice-cream cones, breakfast foods, health foods, diabetic foods, and infant foods. Within the last year several large baking companies have began using 15 to 20 per cent of soybean flour in making bread and cakes." Address: Bureau of Plant Industry, Washington, DC.

Supplementary effect of miso protein on the protein deficiency in rice]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 12(1):6-14. Jan. [8 ref. Jap]
Address: Osaka Teikoku Daigaku Kogakubu, Jozogaku Kyoshitsu, Takada Kenkyushitsu, Japan.

3045. Narahara, Hanbei. 1934. Shôyu moromi no jukusei ni tsuite [On ripening of shoyu moromi]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 12(1):57-63. [Jap]

3046. *Times of India* (*The*) (*Bombay*). 1934. Baroda Gaekwar visits H.O.H. fete: Tribute to Japanese. Feb. 26. p. 4.
• ***Summary:*** The importance of the soya bean as a potential food for India was brought to the attention of visitors to the Bombay H.O.H. Fete when the Gaekwar of Baroda visited the Fete on Sunday night.

"During his visit to the Japanese Village, he inspected the stall which has been erected there to show the public what can be done with soya beans, a crop which His Highness is encouraging in Baroda." The Gaekwar recently made a tour of Japan.

3047. Tetsumoto, -. 1934. Chômiryô no chô-chifusu-kin oyobi korera-kin ni taisuru sakkinryoku [The sterilizing power of various seasonings toward typhoid Salmonella bacteria and cholera bacteria]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 10(2):123-27. [1 ref. Jap]
• ***Summary:*** Worcestershire sauce, an important constituent of which is soy sauce, is reported to have a strong sterilizing action.

3048. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1934. Manchurian soybean output larger than last year. 28(11):288-92. March 12.
• ***Summary:*** Tables show: (1) "Manchuria: Estimated soy bean acreage and production, 1927 to 1933." Final statistics are given for each year. Production was 4,899,560 short tons in 1927. It rose to a peak of 5,838,197 short tons in 1930, then fell gradually to 5,736,000 short tons in 1933. Source: South Manchuria Railway. (2) "Manchuria: Soybean production and distribution, 1929-30 to 1933-34." For each of the five crop years is given: Production, carryover from last crop year, total supply, total exports, carryover at end of crop year, home consumption and seed. Note: Home consumption and seed is about 20% of production.

"The demand for beancake during 1933-34 is not expected to improve substantially. In Japan low prices of agricultural products and cheap commercial fertilizers will no doubt prevent increased takings." "South China boycott restrictions have been relaxed..."

(3) "Manchuria: Total exports of soy beans and bean products, 1927-28 to 1932-33." For soy beans, exports grew from 2,534,000 short tons in 1927-28 to a peak of 3,014,859 in 1931-32, then fell to 2,491,681 in 1932-33. For soy-bean cake and meal, exports rose from 1,822,000 short tons in 1927-28 to a peak of 1,900,000 in 1930-31, then fell to 1,054,965 in 1932-33. For soy-bean oil, exports rose from 136,000 short tons in 1927-28 to a peak of 170,000 in 1930-31, then fell to 73,379 in 1932-33.

There follows a review of the 1932-33 crop year.

(4) "Manchuria: Exports of soy beans and products by countries of destination, 1931-32 and 1932-33." Each year, statistics are given for soy beans, bean cake, and bean oil.

© Copyright Soyinfo Center 2014

Destinations are: Europe, Leningrad, Japan, China, East Indies, United States, Other, Total. Europe imported the most soy beans, Japan the most soy bean cake, and (in 1931-32) China the most soy bean oil. But in 1932-33 China imported only 31% as much [soy] bean oil as in 1931-32. This was because of the "Manchurian incident" of 18 Sept. 1931, in which Japanese troops occupied Manchuria. In response, in 1932, China boycotted Manchurian goods. (5) "Manchuria: Average monthly price of soy beans and soy bean products at Dairen, in silver yen and United States currency and price of crude soy-bean oil at New York, 1931-32 to 1933-34."

3049. Howell, G.C.L. 1934. The soy bean: A dietary revolution in China. *China Journal* 20(3):140-46. March.
• ***Summary:*** A Chinese proverb states that "Bean-milk is the poor man's milk, bean-curd is the poor man's meat." The Chinese "use practically no dairy products and the bulk of the nation eats little meat. The meat consumption of China is estimated at about 20 grams per head per day, as against 149 grams in the United States of America, 130 in Great Britain, 92 in France, 29 in Italy, and 25 in Japan." But the author contends that the Chinese have never learned to make sanitary products which keep well. "The flour, oil, and milk made in China quickly become rancid and unpalatable." Thus China is starving in the midst of plenty. No country in the world has had less benefit from the soy bean as treated by modern methods as that of its origin. In northern China, soy flour is used in a ratio of 2 or 3 to 8 with millet flour to make wo-tou steamed bread, and in a ratio of 1:5 with wheat flour to make man-tou steamed bread. A modern factory, such as the Aguma Works in Germany, could be established in China to make these products on a large scale at low cost. High quality soy-fortified macaroni, rice flour, soy oil and soya milk should also be produced. "Research has done its work. And China only awaits the pioneer, a commercial man, who will use the discoveries of science on a commercial scale. His coming is certain. The time of his coming rests on the knees of the gods."

3050. Kouda, Seihei. 1934. Keizai saibai kara mitaru edamame no kenkyu [Research on green vegetable soybeans from an economic perspective]. *Nogyo Oyobi Engei* (*Agriculture and Horticulture*) 9(3):705-12. March. [Jap] Address: Yamagata Kenritsu Nôji Shikenjô Saijô Bunjô, Japan.

3051. Suzuki, Umetaro; Nakahara, W.; Sahashi, Y. 1934. The occurrence of vitamin E in soy bean oil. *Scientific Papers of the Institute of Physical and Chemical Research* (*Japan*) 23(491):270-73. March. [1 ref. Eng]
• ***Summary:*** In a feeding experiment with rats, incorporation of a liberal amount of soya-bean oil to a synthetic diet deficient in vitamin E prevents the development of testicular degeneration characteristic of vitamin E deficiency.

Note: This is the earliest document seen that is primarily about vitamin E in soybeans or soybean oil. Address: Japan.

3052. Tomiyama, Tetsuo; Hanada, Minoru. 1934. The distribution of methionine in several proteins of feeding-stuffs and casein. *J. of Biochemistry* (*Tokyo*) 19(2):345-51. March. [9 ref. Eng]
• ***Summary:*** Methionine is a sulphur containing amino acid that was discovered by Müller (1921) and has been found to be present in casein, etc.

"As far as we know, this amino acid has not yet been isolated in a pure state from the proteins of feeding-stuffs such as muscle," silk-worm pupae, or soy bean.

The writers isolated methionine in crystalline form from these feeding-stuffs and from casein, and identified it by elementary analysis of both the free amino acid and of its derivatives, i.e., copper salt and alpha-naphthylisocyanate.

Its distribution was as follows:
Muscle protein of sardine 0.52%.
Muscle protein of whale 0.37%.
Protein of silk-worm pupa 0.43%
Protein of soy bean 0.08
Casein 0.41%.

Note: The soybean has long been known to be a poor source of methionine and cysteine–both essential sulfur-containing amino acids. Address: Imperial Fisheries Inst., Tokyo.

3053. LeClerc, J.A. comp. 1934. Partial list of processes for removing the bitter taste from soybeans. Washington, DC: Food Research Div., Bureau of Chemistry and Soils, USDA. 1 p. April 9. Revised 1938, 2 p. Unpublished manuscript. [22 ref]
• ***Summary:*** This is a list of 21 patents and 1 article in *Chemiker Zeitung* on this subject related to production of soy flour. The following countries have the following number of patents: USA 12, Britain 3, Austria 2, France 1, Japan 1, Switzerland 1, and Yugoslavia 1.

Note: Joseph Arthur LeClerc was born in 1873. Address: Food Research Div., Bureau of Chemistry & Soils, USDA.

3054. Adolph, W.H.; Kao, Hsueh-chung. 1934. The biological availability of soybean carbohydrate. *J. of Nutrition* 7(4):395-406. April. [26 ref. Eng]
• ***Summary:*** Approximately 40% of the carbohydrate in soybean is utilizable by rats. The three soy materials investigated were ground yellow soybean (Peking variety), fat-free soybean (the meal "was defatted in a Soxhlet apparatus"), fat-free soybean curd (soybean cheese, which is essentially soybean protein–glycinin). The four methods used to estimate the biological availability of soybean carbohydrate give values ranging from 27 to 50 for the fraction of total carbohydrate used by the animal body. Experiments with phlorhizinized rates gave a utilization

© Copyright Soyinfo Center 2014

coefficient of 38%, which was "somewhat higher than the figure obtained by in vitro digestion with taka-diastase."

Note: This is the earliest English-language document seen (April 2004) that contains the word "defatted." Address: Dep. of Chemistry, Yenching Univ., Peiping, China.

3055. Iguchi, T.; Sato, M. 1934. Studies on soy-bean lecithin. III. Coagulation of lecithin sol by electrolytes. *J. of the Society of Chemical Industry, Japan* 37(4):198B-99B. April. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** The Couette viscosity of the sol (2 gm per 100 cc) decreases on the addition of electrolytes, giving a minimum value at the end-point of coagulation, which can be more accurately determined by this means than by visual observation. The lecithin particles are negatively charged in colloidal solution, and the coagulation value decreases with increased valency of the cations of the electrolyte.

Note: *Webster's Dictionary* defines sol (derived from *solution* and first used in 1899) as "a fluid colloidal system; esp: one in which the continuous phase is a liquid." Address: Dep. of Organic Chemistry, Central Lab., South Manchuria Railway Co.

3056. Minatoya, S.; Kurahashi, N. 1934. Daizu reshichin no gomu ryûka ni taisuru eikyô oyobi daizu reshichin ni yoru gomu funmatsu-ka to sono riyô [The effect of soya-bean-lecithin on the vulcanization of rubber, and the manufacture and uses of powdered rubber prepared by the use of soya-bean-lecithin]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 37(4):477-79. April. English-language summary in Supplemental Binding, p. 207B-08B. [1 ref. Jap; eng]
• ***Summary:*** Soya-bean lecithin has the same effect as the lipin of Hevea latex on the vulcanization of rubber. Soft rubber articles made from raw rubber powder prepared with the aid of this lecithin are inferior in physical properties to those manufactured from standard raw rubber, e.g. smoked sheet, but ebonite so prepared compares favorably with that from ordinary rubber except in electrical qualities... Powdered rubber by the use of soya-bean lecithin has various uses in the construction of filters, diaphragms, and the like, and in the preparations of paint, chlorinated rubber, etc. Researches are now in progress in this sphere. Address: Government Electrochemical Laboratory, Tokyo.

Address: Tokyo Kogyo Daigaku, Oyo Kagaku-ka, Kenkyu-shitsu.

3060. Uchida, So; Shimoyama, K.; Hsu, T.T.; Toyoda, E. 1934. Constituents of waste fatty oil from soy-manufactory. I-II. *J. of the Society of Chemical Industry, Japan* 37(4):195B-97B. April. Supplemental binding to Kogyo Kagaku Zasshi. [2 ref. Eng]
• ***Summary:*** In the production of soy [sauce], "fatty oils contained originally in the soy-bean and wheat separate out as an almost black coloured layer. This is called 'soy-oil,' and owing to its dark colour and strong odour characteristic to soy, it is less valued on the market. It is used chiefly as a raw material for manufacturing detergent soap, especially powdered soap. The other use is found in the mechanical workshop as a cutting oil."

The dark, mobile, odorous waste oil from soy [sauce] production consists largely of ethyl esters of higher fatty acids. The orange oil obtained after refining with concentrated sulfuric acid and Japanese acid clay deposited a white precipitate (ethyl esters of saturated fatty acids) on keeping at 0ºC, and this had acid value 32.3, saponification value 193.2, unsaponifiable matter 1.4%, including a sterol, melting point 137-137.5ºC (corrected). Hydrolysis yielded glycerol 2% and ethanol 9% (on the oil). Palmitic, stearic, arachidic (very little), oleic, linoleic, and linolenic (small amount) acids were identified. Address: Dep. of Applied Chemistry, Tokyo Technical Univ., Tokyo-Okayama.

3061. Wilson, J.K. 1934. Longevity of *Rhizobium japonicum* in relation to its symbiont on the soil. *Cornell University Agricultural Experiment Station, Memoir* No. 162. 11 p. April. [11 ref]
• ***Summary:*** "The larger part of our knowledge concerning the root-nodule bacteria and their relation to leguminous plants has been gradually developed during the past seventy-five years. Lockmann observed that the cells of nodules from

© Copyright Soyinfo Center 2014

leguminous plants are filled with small, elongated bodies. Woronin described these bodies more fully, noting certain changes which they underwent when suspended in water. Eriksson made drawings of these bodies, which today are recognized as the nodule bacteria, while Beijerinck isolated and cultivated these bacteria from a number of species of leguminous plants. The role that these soil bacteria play in the nitrogen nutrition of the Leguminosae was studied by Hellriegel.

"Since these bacteria are found in the soil where leguminous plants are growing, and because they play such an important role in the nitrogen nutrition of the plant, methods were devised for their distribution to other fields where the symbiont of the nodule bacteria was to be grown. The first method was probably the transfer of soil from a field where a certain legume had grown, to another field which was to be seeded to the same legume. Perhaps Salfeld was the first to do this in a practical way...

"When soybeans were first grown on the farms at Cornell University, no nodules were ever observed on their roots. Following Salfeld's method, Professor L.A. Clinton, who, with the Director of the College of Agriculture, I.P. Roberts, had charge of the work, asked Professor G.W. Gilmore, who was visiting Japan in 1901, to send him a sample of soil from a field in Japan which was growing soybeans. In response to this request, Professor Gilmore mailed about 700 grams of soil. This was used by Professor Clinton as an inoculum for soybeans which were 6 to 8 inches high at the time of inoculation. The soybeans were growing in seven large earthenware containers embedded in the ground... The treatment was so successful that the inoculated soil from the four containers was carefully saved to be spread over larger areas the following year...

"Although a growing crop may liberate in the soil a very large bacteria population when the nodular tissue decomposes, this population is transitory and probably does not exist for as long a period as one year. The root-nodule bacteria dwindle almost to extinction in certain cases." Address: Ithaca, New York.

3062. Yamada, Teikichi. 1934. Removal of solid components from fatty oils and drying properties of the residual oils. I. On soya-bean oil. *J. of the Society of Chemical Industry, Japan* 37(4):190B-92B. April. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** The more saturated components of soya bean oil were removed by repeated fractional crystallization from acetone at -20ºC; after 10 extractions the soluble portion had iodine value 152.

3063. *Christian Science Monitor.* 1934. Manchoukuo soya bean trade has steadily declining trend: Hit by competition from artificial fertilizers, drop in buying power of Japanese peasant and by silver currency stabilization. May 17. p. 13.
• ***Summary:*** On 4 Sept. 1933, Japan's Ministry of agriculture announced that it would subsidize imports of sulphate of ammonia–an artificial fertilizer. This subsidy has "struck a very severe blow to the oil-mill industry of Manchuria..." A table shows exports of soya beans, cakes and oil from Manchoukuo from 1927 to 1933 (in 1,000 tons). Exports of soya beans were up 38.9%, but export of bean cakes had dropped to only 31.7% of its 1927 level, export of soya bean oil had dropped to only 79% of its 1927 level, and the total tonnage had fallen to only 50.9% of its 1927 level.

Exports of soya bean cakes to the Netherlands, Formosa, and Europe fell; sulphate of ammonia is taking the place of bean cakes as a fertilizer. Increasingly, European countries are buying soya beans from Manchuria and crushing them in their own mills.

• ***Summary:*** The isolation of albumin, glycinin, and glutelin is described. The hydrolysis of glycinin at different temperature and pH yields varying proportions of soluble protein, proteose, and peptone, and of insoluble substances. Minimum amounts of soluble matter are obtained at 120ºC at the isoelectric point. The reaction at 150ºC is reversible. Address: Kyoto Teikoku Daigaku.

• ***Summary:*** The changes, due to polymerization and oxidation (if access of oxygen is permitted), observed in expressed (crude and refined) oils and oils extracted by ethanol and benzine on exposure for 60-100 hours to ultraviolet light are recorded in detail. Address: Central Lab., South Manchuria Railway Co., Dairen.

3072. Inaba, T.; Kitagawa, K.; Sato, M. 1934. Studies on the alcohol-extracted soy-bean oil. III. Effect of ultra-violet light in the atmosphere of oxygen, hydrogen and nitrogen. *J. of the Society of Chemical Industry, Japan* 37(7):374B. July. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** Bleaching occurred if hydrogen or oxygen was passed through the oil, but not when nitrogen was used. Address: Dep. of Organic Chemistry, The Central Lab., South Manchuria Railway Co., Dairen.

3073. Komatsu, Shigeru; Hibino, T.; Yamaguchi, Saburô. 1934. Tanpakushitsu no kenkyu. XIV. Daizu glycinin ni kanetsu-sui no sayô [Studies on proteins. XIV. Action of superheated water on glycinin from soya beans]. *Nippon Kagaku Kaishi* (*J. of the Chemical Society of Japan*) 55(7):791-801. July. (Chem. Abst. 29:484). [4 ref. Jap]
• ***Summary:*** Hydrolysis of glycinin at 120-150ºC yielded meta-protein, proteose, peptone, and polypeptides, the proportion of soluble products increasing with rise of temperature. At 150ºC part of the amino- and diamino-nitrogen changed to amide-nitrogen. The nitrogen distribution of meta-protein and proteose resembled that of the original protein. Proteose had more amide-nitrogen and less diamino-nitrogen. The composition altered considerably when proteose was converted into peptone.

Note: Diamino nitrogen is created by the hydrolysis of proteins. Address: Kyoto Teikoku Daigaku.

Address: Raion Sekken K.K. Kenkyujo (Lion Soap Research Lab.).

3077. Takei, Toshiro. 1934. On the composition of "soy" [sauce] oil. I. *J. of the Society of Chemical Industry, Japan* 37(7):356B-57B. July. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** "Soy oil is obtained as a by-product of soy [sauce] brewing. The oil is found floating on the surface of soy after pressing. It has dark brownish red colour and appears opaque on reflected light. Its odour bears resemblance to that of soy. It has hitherto been considered to be very difficult to bleach the color and remove the objectionable odour by either chemical or physical processes.

"Soy oil finds its chief industrial applications in lubricants and in manufacture of powdered soaps of low grade. Hitherto it has been believed that the oil is a mixture of the oils of soy-bean and wheat which are the chief raw materials of soy and contains some decomposition products."

Three samples of the oil had acid value 39.15-45.19, saponification value 186.12-186.66, iodine value 102.13-132.12, density at 15ºC 0.89266, refractive index at 20ºC 1.4630, relative viscosity 13.155/16ºC, flash point 76.5ºC. The oil is soluble in ethanol at room temperature and consists chiefly of ethyl esters of various fatty acids with about 16%

© Copyright Soyinfo Center 2014

free fatty acids and a small amount (0.29%) of glycerol. It can be refined by distillation, typical fractionations being detailed. Address: Lab. of Lion Soap Co.

3078. *Times of India* (*The*) (*Bombay*). 1934. Agricultural topics: Exploring. Aug. 11. p. 12.
• ***Summary:*** Dr. David Fairchild of the USDA was recently awarded the Marcellus Hartley Gold Medal for the year 1934 for excellence in the application of science for the public welfare.

The following is a quotation from the speech he gave upon receiving the medal: "It is with a thrill that I remember, each time I drink a glass of soybean milk, that in 1898, before we knew how to grow soybeans in this country [USA], I sent to Tokyo for soil with which to inoculate the root systems of our experimental plantings of them, little thinking that I should see the day when four million acres of soybeans would be grown in America."

3079. *Arkansas Gazette* (*Little Rock*). 1934. Soybean experts in national meet: Delegates from every producing area in U.S. at opening session. Value as food shown. Convention will adjourn to Stuttgart today and will conclude Saturday at Marianna. Aug. 23. p. 1, cols. 3-5.
• ***Summary:*** "Representatives from every section of the soybean producing area of the United States attended the opening session of the 1934 meeting of the American Soybean Association at the Hotel Marion last night."

"Special interest in the soybean as human food is being shown at this time because of the shortage of grain crops, Dr. P.A. Webber of the Nashville Agricultural Normal Institute at Madison, Tennessee, secretary-treasurer of the association, said before last night's meeting.

"He had several samples of products from the soybean, such as meat substitutes, crackers and flour. Dr. Webber said the production of soybeans is his hobby. He spent several years in Japan doing educational work and at this time studied the production of soybeans."

"Walter Godchaux of New Orleans, La. [Louisiana], vice president of Godchaux Sugars Inc., said he has been using soybeans on his sugar plantations for the past 10 years for a cover crop and for fertilization purposes. Mr. Godchaux has approximately 15,000 acres planted in sugar. Last year, he said he purchased approximately 3,000 bushels of soybeans."

"Chikayoshi Nagakura of Tokio, Japan, representative of the South Manchuria Railway Co. in New York city, attended last night's meeting to obtain information on the production of the American soybean. He said that practically the entire tonnage of his railway in Manchuria consisted of soybeans."

"Lunch will be served at Stuttgart. Speakers there will include: Jacob Hartz of Stuttgart and Dr. J.E. LeClerc Sr., chemist of the Bureau of Soils and Chemistry of the Department of Agriculture, Washington, D.C."

Photos show: Walter Godchaux and Chikayoshi Nakagura.

3080. Ishimaru, Yoshio. 1934. Shôyu no chozô-sei ni tsuite [On the preservability of shoyu]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 12(8):610-16. [Jap]
Address: Nôgaku hakase, Japan.

3081. Shinozaki, Yuichi; Sato, Masanori. 1934. Studies on the soy-lecithin. II. The hydrogenation under high pressure. *J. of the Society of Chemical Industry, Japan* 37(8):432B-33B. Aug. Supplemental binding to Kogyo Kagaku Zasshi. [1 ref]
• ***Summary:*** Hydrolecithin containing 3.82% phosphorus, 2.23% nitrogen, 0.1% amino nitrogen, 64.63% carbon, 11.33% hydrogen, iodine value 0.38, and melting point 84ºC can be prepared successfully by hydrogenating soya lecithin with a nickel catalyst under a pressure of greater than 80 atmospheres. Experiments on partly hydrogenated products show that hydrolecithin has a greater effect than lecithin in lowering the interfacial tension of cacao butter towards water (Donnan drop method), the advantage increasing with the saturation of the hydrolecithin. The increase in relative viscosity of cacao butter (at 60-70ºC) is proportional to the amount of added hydrolecithin and its degree of saturation, when the amount added is > 1%; if < 1% is used the relative viscosity is decreased.

Note: This is the earliest English-language document seen (March 2001) that uses the term "soy-lecithin."
Address: Dep. of Organic Chemistry, The Central Lab., South Manchuria Railway Co., Dairen.

3082. Suzuki, Umetaro; Nakahara, W.; Sahashi, Y. 1934. Further evidence for the occurrence of vitamin E in soy bean oil. *Scientific Papers of the Institute of Physical and Chemical Research* (*Japan*) 24(517):283-86. Sept. 1. [1 ref. Eng]
• ***Summary:*** Rat breeding tests indicated that soybeans contain the antisterility vitamin, E. The vitamin E content is low, since pregnancy in female albino rats with soybean oil as sole source of vitamin E is frequently terminated by abortion. Address: Japan.

3083. Adriano, F.T.; Oliveros, S.B.; Santos, D.S.; Villanueva, E.R. 1934. The physical characteristics and chemical composition of various brands of toyo (soy sauce) sold in the Philippines. *Philippine J. of Agriculture* 5(3):171-86. July/Sept. [14 ref. Eng]
• ***Summary:*** Gives detailed descriptions of methods of manufacture of soy sauce, and an analysis of 21 samples (18 from Philippine factories, two from China, and one from Japan). Table 3 (p. 179) gives the brand name, and the name and address of the manufacturer of these 21 sample products. Most Philippine soy sauce is made in and around

© Copyright Soyinfo Center 2014

Manila using traditional Chinese methods, including large earthenware jars with conical, woven bamboo covers; these jars are left in the open for sunning. Most of the soy beans used are imported from China, the yellow variety being the most commonly used. When ready, the "brown liquid is siphoned off with a foot valve made out of bamboo at the intake end of the siphon. The drawn sauce may be boiled, but generally it is bottled without heat treatment to be sold as first-class toyu. The residue is brined and sunned again to obtain succeeding lower grades of toyo. The practice of admixing molasses is widespread. Of the 21 samples analyzed, 12 contained reducing sugars analyzing about 10%.

Toyo is not as widely used in the Philippines as it is in other Oriental countries because in the Philippines there is a counterpart of toyo, the native *patis* (a Tagalog word), which is a high protein extract from brine-fermented small fish and shrimps. But "with the growing consciousness of the real nutritive value of the soy bean as a human food, the increasing popularity of the properly made toyo is assured."

Table 4 gives the physical characteristics and chemical composition of each of the 21 samples tested. The average specific gravity at 28ºC is 1.2624. Total solids: 37.31%. Proteins: 4.56% (N x 6.25). Sucrose: 0.59%. Sodium chloride: 19.90%. Address: Labs. of Agricultural Chemistry, Bureau of Plant Industry, Manila.

• ***Summary:*** The value of miso production in Japan in recent years is more than 20 million yen per year. Address: Brewing Laboratory, Noda Shoyu Co. Ltd., Noda-machi, Chiba-ken, Japan.

3085. Mogi, Masatoshi. 1934. Miso jozo ni kansuru saikin no kenkyu ni tsuite. I. [Studies on the microorganisms in the manufacture of "miso." I.]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 10(9):983-996. [20 ref. Jap]
• ***Summary:*** All the organisms isolated appear to play a part in the maturation of miso. Address: Kikkoman.

3086. Ueno, Sei-ichi. 1934. On the negative catalysers [catalysts] of hydrogenation of oils. X. On the inhibiting influences of dyestuffs at a lower temperature. *J. of the Society of Chemical Industry, Japan* 37(9):497B-505B. Sept. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** Inhibition of hydrogenation (nickel) of soy-bean oil by dyes (1%) is less at a low than at high temperature. Basic and sulfur dyes are most effective. Amino- or nitro-groups, but not both together, confer anticatalytic properties. Address: Dep. of Applied Chemistry, Faculty of Engineering, Imperial Univ. of Osaka.

3087. Kahn, Dorothea. 1934. Marko can cook in many languages: As chef of the International House, University of Chicago, he feeds students of 47 nationalities from his 'melting pot of menus.' *Christian Science Monitor.* Oct. 10. p. WM10.
• ***Summary:*** About Mr. Marko Yerkovitch, who ancestry goes back to Yugoslavia. A recipe is given for Egg foo yung, which includes "Soy bean sauce to flavor."

"Now it wouldn't do to give a Chinese recipe without a Japanese one to follow... Miss Doris Foresman, who is in charge of the catering department of the House, says she has learned to be very careful to serve Japanese soy bean sauce at Japanese parties, and Chinese soy bean sauce at Chinese parties." There follows a recipe for Tempura (served with "Japanese soy bean sauce").

3088. Inaba, T.; Kitagawa, K.; Sato, M. 1934. Studies on soy-lecithin. IV. Emulsifying action for oil-water mixture. V. Properties of lecithin soap solution. *J. of the Society of Chemical Industry, Japan* 37(10):595B. Oct. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** With increasing concentration, the viscosity of lecithin solution increases and the drop volume against soya-bean oil falls. Lecithin added to sodium soap solution increases surface tension, foam number, stability, and gold number; it lowers the turbidity and clearing temperature by 3-5ºC. The drop number against kerosene passes through a maximum at 0.25% lecithin. Address: Dep. of Organic Chemistry, Central Lab., South Manchuria Railway Co.

3089. Koerber, Lili. 1934. Japanese banquet: Translated from the *Prager Tagblatt,* Prague German Language Daily. *Living Age* (*The*) 347:117-20. Oct. See p. 118.
• ***Summary:*** "At this point the girls begin preparing the main dish, the *skiaki* [sukiyaki]... Then they put a frying pan on the stove, cover it with a generous layer of fat and add green onions, beans that look like earth worms, sugar, soya-bean sauce, and finally pieces of meat." Note 1. This is the earliest English-language document seen (April 2012) that uses the term "soya-bean sauce" to refer to soy sauce.

Note 2. This is the third in a series of three articles in this issue titled "A Mirror to Japan."

3090. Sato, M.; Inaba, T.; Kitagawa, K. 1934. On the alcohol extraction process of fatty oils. I. Mutual solubilities of some vegetable oils. *J. of the Society of Chemical Industry, Japan* 37(11):718B-21B. Nov. Supplemental binding to Kogyo Kagaku Zasshi. [1 ref. Eng]
• ***Summary:*** This is an early article on alcoholic extraction of

© Copyright Soyinfo Center 2014

oilseeds. "One of the authors [M. Sato] made measurements (Report of this Laboratory 1929, Vol. 14, 1) [See: *Nan Manshu Tetsudo K.K., Chuo Shikensho Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) 1929. vol. 14, p. 1-9] of mutual solubilities between soy-bean oil and ethyl alcohol, and developed a new idea of the oil extraction process, in which the oil is extracted in hot state and separated into two layers on cooling the miscella. This paper is the sequel of the above experiment." Address: Dep. of Organic Chemistry, The Central Lab., South Manchuria Railway Co., Dairen.

3091. Shinozaki, Y.; Kubo, H. 1934. Studies on the high pressure hydrogenation of soy bean oil. I. On the reaction products by copper catalyst. *J. of the Society of Chemical Industry, Japan* 37(11):677B-78B. Nov. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** The iodine, saponification, acid, and acetate values have been determined for the products obtained by reduction (under 125 kg/square cm pressure) of soya-bean oil at various temperatures, using copper carbonate on infusorial earth as catalyst. At less than 250ºC hydrogenation of unsaturated linkings is the chief reaction; at 300-325ºC the acid value increases sharply, indicating the formation of free fatty acids. Alcohol formation predominates at 300-350ºC, but above 375ºC alcohols are reduced to hydrocarbons. Address: Dep. of Organic Chemistry, The Central Lab., South Manchuria Railway Co., Dairen, Manchuria.

3092. Shinozaki, Y.; Kubo, H. 1934. Studies on the high pressure hydrogenation of soy bean oil. II. On the properties of the sodium salt of sulphuric ester of higher fatty alcohol. *J. of the Society of Chemical Industry, Japan* 37(11):678B-79B. Nov. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** Comparison of aqueous solutions of the crude sodium salts of the sulfuric esters of the higher alcohols produced from soya-bean oil and of the sodium salt of pure octadecyl sulfuric ester indicate that impurities in soya-bean oil reduce the colloidal properties of the solutions (e.g. surface tension against kerosene or air), but such effect is negligible in solutions more dilute than 0.025%. Address: Dep. of Organic Chemistry, The Central Lab., South Manchuria Railway Co., Dairen, Manchuria.

3093. Takei, Toshio; Tomiyama, Shin-ichi. 1934. On the composition of Tamari soy oil. *J. of the Society of Chemical Industry, Japan* 37(11):650B. Nov. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** "Tamari soy oil is obtained as a by-product of Tamari soy [sauce] brewing. The oil is found floating on the surface of Tamari soy after pressing. Tamari soy is a sort of soy which is made from soy bean only. A large quantity of tamari soy is brewed in the prefectures of Aichi, Gifu, Miye [Mie], Shizuoka and Nagano. Tamari soy oil resembles soy oil in colour and in odour, yet these oils differ considerably from each other in viscosity. On account of its dark colour and strong odour Tamari soy oil is estimated at a low price."

A sample, consisting of glycerides, ethyl esters of fatty acids, and free fatty acids (50%) yielded approximately 2.13% crude glycerin and 2.46% ethanol, and had (values for ordinary soy oil in parentheses) acid value 105.9 (41.9), saponification value 185.6 (186.3), iodine value 149.4 (102.1), refractive index at 20ºC 1.4749 (1.4630), density at 15ºC 0.9172 (0.8926), flash point 218ºC (76.5ºC), Redwood viscosity (50 cc at 20ºC) 5 feet 57 inches (1 foot 17.6 inches).

Note 1. This is the earliest English-language document seen (Jan. 2000) with the term "soy oil" in the title. However it refers to the dark oil that rises to the surface during soy sauce fermentation, rather than to the clear vegetable oil to which it refers today.

Note 2. This is the earliest English-language document seen (March 2012) that uses the term "tamari soy" to refer to tamari soy sauce. Address: Lion Soap Co., Ltd.

3094. Shinozaki, Y.; Kubo, H. 1934. Studies on the high pressure hydrogenation of soy bean oil. III. On the formation of wax-ester. *J. of the Society of Chemical Industry, Japan* 37(12):780B-81B. Dec. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** High-pressure hydrogenation of soy bean oil at greater than 300ºC (350ºC) with a copper-chromium catalyst gives octadecyl stearate. Above 350ºC an unsaponifiable substance is the chief product. Address: Dep. of Organic Chemistry, The Central Lab., South Manchuria Railway Co., Dairen, Manchuria.

3095. *Japan-Manchoukuo Year Book.* 1934-1941. Serial/periodical. Published by The Japan-Manchoukuo Year Book Co., Tokyo. 26 cm. [Eng]
• ***Summary:*** Formed by the union of: Japan Year Book, and: Japan Times Year Book. Continued by Orient Year Book. Each year book is divided into two main parts: Japan, and Manchuokuo.

3096. Yamaguchi, H.S.K.; Garis, Frederic de; Sakai, Atsuharu. 1934-1950. We Japanese: Being descriptions of many of the customs, manners, ceremonies, festivals, arts and crafts of the Japanese, besides numerous other subjects. Yokohama, Japan: Yamagata Press. 592 p. 889 illust. Index. 21 cm.
• ***Summary:*** "Written with great style, this work brings traditional Japan to life in a way that no contemporary guide book can, explaining all the curious features of daily life in Japan." This is a combination of 3 books. Book I (p. 1-183), written by Frederic de Garis for H.S.K. Yamaguchi, was first published in Dec. 1934. Book II (p. 183-375), written

© Copyright Soyinfo Center 2014

by Atsuharu Sakai for H.S.K. Yamaguchi, in June 1937. Book III (p. 377-592), with the same authorship as Book II, was first published in June 1949. All contain entertaining information on Japanese culture and foods.

They discuss: Red rice (*sekihan,* with azuki beans, p. 36). The Broken Needles Mass or Hari-Kuyo (p. 160, needles are stuck into tofu on Feb. 8 or Dec. 8), Sukiyaki (p. 264-66, incl. its origin and history), sembei (p. 267, senbei or rice crackers, incl. shoyu), Miso or bean-paste (p. 269-70), Shoyu or Japanese soy (p. 271-73, incl. Kikkoman, Higeta, Yamasa, Kagi-Yamasa, and Marukin logos and wooden kegs), Sekihan and hot water (p. 292, azuki beans as part of a taboo for Japanese girls), Setsubun or Bean-Throwing Ceremony (p. 554-55, mame-maki held on setsubun).

Note: This is the earliest English-language document seen (March 2009) that uses the term "bean-paste" (not preceded by the word "soy" or "soya") to refer to miso.
Address: Manager, Fujiya Hotel, Miyanoshita, Japan.

3129. Adachi, Isamu; Sakurai, Shigeru. 1934. Nihon shokumotsu-shi [History of Japanese foods]. Tokyo: Yuzankaku. 480 p. [Jap]
• ***Summary:*** This is the best book seen on the history of Japanese foods. The following soyfoods are discussed: Firm tofu, soymilk and okara (p. 290-91; discusses the *Teikun Orai* by Iseno Teijo, tofu-kan, tofu-jiru = soymilk, setsurun-sai = okara), yuba (p. 336), shoyu and tofu (p. 370-71), unohana (okara, p. 377), tofu and natto (p. 382-83).

3130. Blunden, Edmund Charles. 1934. The mind's eye: Essays. London: Jonathan Cape. 284 p. See p. 108-09. No index. 21 cm. Life and Letters series, no. 80.
• ***Summary:*** This book is divided into 4 parts. Part two, "Japan," contains essays written during the 1920s and 1930s; most have been previously published in periodicals. The chapter titled "On some humorous prints by Hiroshige" (written in 1926), contains a description of two apprentices, one from a "fried-*tofu* shop" and one a fishmonger's boy, fighting each other in the street. One boy hits the other on the nose, while his opponent pulls out a handful of his hair. But "whichever wins, both have lost, for a dog is slinking away with the fishmonger's *bonito,* and two hawks have raided the *tofu."* Address: [Sussex, England].

3131. Dominion Bureau of Statistics, Ottawa, Canada. 1934. Imports into Canada for consumption, years ended 31 March 1929 to 1933. *Trade of Canada.* Fiscal year ended March 31, 1933.
• ***Summary:*** Under Imports–Sauces–Soy, Soya (Table 36, p. 285), statistics are given from 1929-1932 for gallons and dollar value from United Kingdom, Hong Kong, China, Japan, Syria, United States. Japan was the leading supplier for all four years. In 1929, the peak year, 104,606 gallons were imported worth $45,359. The leading supplier by far was the Japan (67,541 gallons), followed by Hong Kong (33,396 gallons). No statistics are given for soy sauce imports from Syria for 1929, 1930, 1931, or 1932. However, for total imports and for general tariff, under *montant,* a figure of 132 gallons is given for Syria.

Imports of peanut oil and soya bean oil [grouped together as one, so we cannot tell how much was soya bean oil] (p. 300). The United Kingdom was the leading supplier for all four years. In 1931, the peak year, 197,753 gallons were imported worth $129,581. The leading supplier by far was the United Kingdom (118,480 gallons), followed by China (38,941 gallons).

Imports of soya beans, soya bean cake and soya bean meal, for use exclusively in the manufacture of cattle food and of fertilizers (p. 338, in cwt = hundredweights; 1 cwt = 112 lbs). China was the leading supplier for all four years. In 1933, the peak year, 46,129 cwt were imported worth $57,097. The leading supplier was China (25,491 cwt), followed by the United States (15,899 cwt).

Imports of peanut oil and soya bean oil for the manufacture of soap, and peanut oil for canning fish [grouped together as one, so we cannot tell how much was soya bean oil] (p. 342). The United States was the leading supplier for all four years. In 1929, the peak year, 941,072 gallons were imported worth $652,323. The leading supplier by far was the United States (743,866 gallons), followed by the UK (100,590 gallons) and China (96,616).

Note: This is the earliest document seen (Dec. 2007) concerning soybean products (soy sauce) in Syria. This document contains the earliest date seen for soybean products in Syria (1932); soybeans as such had not yet been reported by that date. Address: Ottawa, Canada.

3132. Inahara, K. ed. 1934. Japan Year Book. Tokyo: The Foreign Affairs Association of Japan. 29 + 1356 p. See p. 1083, 1168, 1172.
• ***Summary:*** Page 454. "Leguminous plants:... During the past decade area has been pursuing a slow, downward movement, while a sharp reduction was experienced by production. More than 72% of the total area and 67% of the total production were occupied by soy-beans and red beans."

Soy-beans were planted on 341,752 ha which produced

© Copyright Soyinfo Center 2014

4,351,806 hectoliters worth 31,724,890 yen.

Red [azuki] beans were planted on 119,101 ha which produced 1,002,988 hectoliters worth 9,752,490 yen.

Page 1083. The section on Chosen [Korean] agriculture [Korea is a Japanese colony] states that rice and barley plus wheat are the two most important crops. "Third in importance comes the soy bean. In earlier times it was far from being an important produce owing to ignorance on the part of Korean farmers of the proper method of preparation, such as drying and assorting. It is now, however, in high esteem on the Japanese market where there is a demand for it not only as food, but for chemical industrial purposes, and thus the amount exported to Japan is yearly on the increase. In 1930 the total area under cultivation was 803,000 cho and the amount produced reached 4,410,000 koku, which was an increase of more than six times, compared with the year 1910.

"Millet is for most Koreans What rice is for the Japanese people. They depend more upon it than upon rice on account of its cheapness in price. The Korean farmers sell their rice, but use their millet crops for their daily diet,..." Note: Do they voluntarily sell their rice?

Page 1168. In the section on Manchoutikuo [sic] agriculture, the great majority of exports go to Japan, with China a close second. The principal export commodities include soy beans (worth 143.899 million Haikwan taels in 1932; #1 in value), bean cakes (66.311 million HT; #2 in value), and soy bean oil (24.511 million HT; #4 in value after coal).

Page 1172. A large table shows "Export of agricultural crops, 1929-1931" from Manchuria. For each is given the quantity in piculs (1 picul = 133.33 lb) and value in yen. For soya beans:

46.012 million piculs in 1929
33,536 million piculs in 1930
46.897 million piculs in 1931

The first section below this table states: "Soy beans: Manchoutikuo produces about three-fifths of the total production of soy beans in the world. The beans contain about 10 per cent. of oil, and the cake which is obtained in pressing the beans is exported as fertilizers. The latest figure for production of soy beans in Manchoutikuo was 4,430,000 tons and its total plantation area 3,878,000 hectares. The average crop [yield] per hectare was 1,122 kg.

Kaoliang comes next in importance after soy beans. "It serves as the diet of the people. Its production is 3,722,000 tons a year..."

3133. Japan-Manchoukuo Year Book. 1934. Tokyo, Japan: Japan-Manchoukuo Year Book Co. 26 cm. First annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. The Preface begins: "The far reaching political and economic changes which have taken place in the Far East within recent years have created the need for a year book covering the Japanese Empire and Manchoukuo [pronounced mahn-CHO-ku]. Especially to be noted is the growing relationship between Japan and Manchoukuo; hence any volume which discusses one, without consideration of the other, would be incomplete."

A table near the front gives "Weights, measures, and moneys." 1.80391 hectoliters = 1 koku = 5.11902 dry bushels (USA). 1 yen = $0.4984 dollars (USA) = 2.583 French francs = 2.0924 German marks.

A large color map (2-page spread) shows Japan, Manchoukuo, Chosen [Korea], Karafuto, and Taiwan–as well as the railways in each country.

Page 360: A large table shows the yield (in koku per tan) of 15 major Japanese crops, from 1904-08 to 1931–including rice, barley, naked barley, wheat, soya beans, red beans, etc. The yield of soya beans increased from 0.77 in 1904-08 to 0.86 in 1930.

Page 364. A table shows the production (in hectoliters) of beans, potatoes, and sweet potatoes in Japan from 1927 to 1931. For soya beans:

5.886 million hectoliters in 1927
5.370 million hectoliters in 1928
4.780 million hectoliters in 1929
5.473 million hectoliters in 1930
4.481 million hectoliters in 1931.

Production of red [azuki] beans in 1931 was 25.2% of soya beans.

Pages 626-34. The chapter on Agriculture in Manchoukuo begins: Widely different views are entertained as to the possibilities of Manchoukuo as a field of agricultural enterprises. Undoubtedly, they are immensely greater than those of mountainous Japan or Korea, but to liken them to those of the great agricultural regions found in North and South America seems to have no ground. The soil is not in general so rich, and in many places has been much exhausted, nor is the area of arable land so extensive, nor the climate so moderate. One great advantage it has had over most other countries in Eastern Asia is the comparative thinness of its population, but this advantage is fast being diminished by the constant influx of Chinese immigrants from the South. Taking all these things into consideration, Manchoukuo is yet the most favored spot for agriculture in the Far East, and its opportunities may well be termed 'immense,' which epithet is often met with in Japanese publications on that country.

"The great mass of level land, extending over the whole of Central Manchuria and comprising the basins of the Liao, Sungari, Nonni, and Hulan, the productiveness of which can compare favorably with any part of Japan or Korea, is by itself as large as the whole of the Chosen Peninsula or of the mainland of Japan,..." The forecast for soya bean production in Manchoukuo in 1933 is 5.216 million metric tons. Manchuria is divided into north and south. About half of the

© Copyright Soyinfo Center 2014

total crop production is grown in each area.

Page 627. A table shows "Production of crops in Manchoukuo, 1931." For soya beans:

1.175 million metric tons in Mukden.
2.414 million metric tons in Kirin.
1.637 million metric tons in Heilungkiang.
5.227 million metric tons total.

Soya beans had the largest production of any crop in the country in 1931, followed by kaoliang (4.497 mmt) then millet (2.960 mmt).

Page 628. A large table gives "Crop output in Manchoukuo," 1922-1931. For soya beans:

3.088 million metric tons in 1922.
3.088 million metric tons in 1923.
3.448 million metric tons in 1924.
4.173 million metric tons in 1925.
4.775 million metric tons in 1926.
4.816 million metric tons in 1927.
4.834 million metric tons in 1928.
4.849 million metric tons in 1929
5.297 million metric tons in 1930.
5.227 million metric tons in 1931.

Page 629. A large table shows "Cultivated area in Manchoukuo classified by crops, 1931. (Hectares)." For Soya beans:

Mukden 960,030
Kirin 1,902,210
Heilungkiang 1,338,350
Total: 4,200,590 ha

Previous year 4,118,450. "In one of the publications of the Chinese Maritime Customs" [*The Soya Bean of Manchuria,* 1911, p. 6] we read: "But when the Manchurian farmer pulls out the whole plant by the roots, or, having cut the crop with his sickle, proceeds to cut up the roots with a mattock for fuel, he is preventing the work of the bacillus radicicola from bearing its fruit and depriving his land of the provision made for it by nature. Thus, the soil in South-west Manchuria, where agriculture has been carried on for 400 years, has been bereft of all vegetable and organic matter and no longer bears harvests. The wonderful natural loaminess of the soil in the newer regions further north–for instance, at Shwangchengpu, where it is said that no manure is or ever has been used by the farmers in the 40 years since the land has been cultivated–this loaminess will assure good harvests for many years to come; but in the course of time even the richest soil will become exhausted, and to prevent such a disaster steps should be taken to inform the ignorance of the peasants who are at present deriving such great profits from their crops. If they could be shown the value of the process of 'turning under' the green bean plants after the harvest, the fertility of the land might be preserved."

Page 630. In this chapter on Agriculture, a section on "Soya beans" appears on pages 630-34. Contents: Introduction. Cultivation of soya beans. Different species. Uses of the soya bean. Bean oil. Bean cake. Near the start of the Introduction we read: It was the soya bean that introduced Manchuria into world trade, "and it is still the soya bean that makes Manchuria famous. So predominant is the position of the soya bean and its products, bean oil and bean cake, in the trade of Manchoukuo, that these three articles now constitute nearly one-half the value of the entire exports of the country. Sir Alexander Hosie called them, 'the Wealth of Manchuria.' They are indeed the wealth of the country, which has been growing ever since the time of Sir Alexander, and is still growing. Without the 'three articles,' by which term [soya] beans, bean cake, and bean oil are collectively called by the Japanese, the trade of Manchoukuo would, at a stroke, shrink to one-half its present amount, not only in export but most probably in import also, for experience has shown that Manchoukuo seldom buys more than it sells."

A large table (p. 630) titled "Soya bean output in Manchoukuo: Classified according to districts" is divided into South and North Manchuria. It shows how many metric tons were produced in each district in 1931 and 1932.

On page 634 is a long, interesting discussion of: "Kaoliang: Apart from its trade value, kaoliang or tall millet may be considered even more important than soya beans, in that it is the staple food of the native population, and the principal grain food of the numerous animals engaged in the farm-work and in the immense carrying trade of the three provinces.

"Before soya beans attained their present importance, half the total area of the cultivated land in Manchuria was devoted to kaoliang, and a large amount of it was exported to the provinces of China. Of late, however, the cultivation of kaoliang has given place to that of [soya] beans in many places, so that at present, in the northern part of South Manchuria, where beans are cultivated most extensively, about 50 per cent. of the whole cultivated area is devoted to beans, and only 20 to 30 per cent. to kaoliang. It is said that 8 pounds of seed suffice to sow an acre of land, producing in good years 10 to 12 cwt. [hundredweight] of grain. In a bad year or on poor soil, only a third of this quantity will be harvested. The crop is easily affected by climatic and soil conditions, and for this reason its cultivation is confined chiefly to Mukden Province, and in that province, too, it does not grow well in the Liaotung Peninsula or in the mountainous south-east.

"Kaoliang is not only used as a food-stuff for man and beast in Manchoukuo, but the native spirit is also made out of it. Nor are the grains the only useful part of it; the stalks play a very important role in Manchoukuo. The outer leaf layers, are woven into mats, so much required in the trade of the country, for roofing ricks and packing loads of grain and beans, and for numerous other purposes. The stalks are also utilized for fencing, bridging, and housebuilding, and where wood and coal are unobtainable or dear they are used for

© Copyright Soyinfo Center 2014

fuel.

"Kaoliang spirit, extensively used in both Manchoukuo and Mongolia, is colorless and transparent, and possesses a strong flavor, which peculiarly appeals to the taste of the natives.

"Kaoliang used to be an article of home consumption, and its market outside Manchuria was at most confined to China proper, but after the outbreak of the European War a trial shipment was made to Europe as grain food for horses, and being successful it has since continued to be exported. It is also exported to Japan, and the demand for it there is constantly increasing."

3134. Lee, Frank Herbert. 1934. A Tokyo calendar: with impressions of an impressionable. Tokyo: The Hokuseido Press. 288 p. Illust. 20 cm. 2nd ed. 1937 (290 p.).

• ***Summary:*** In the chapter titled "February," *Mamemaki* is discussed on pages 42-45. In Japan, the Japanese people, regardless of socio-economic class, generally spend their holidays in the same way.

"The most important event celebrated in February is the *Setsubun,* which falls on the third or fourth of the month. On this day takes place the household ceremony, known as the *mamemaki.* About one thousand years ago, that is to say, in the Encho era, the ceremony was in great favour at the Imperial court. Devils were held to have a special aversion to beans and sardines (*iwashi*), so that by throwing showers of beans it was easy to expel any devils which might have taken up their abode in the house. As it was inadvisable to throw sardines on the spotless tatami, it became customary to place them just outside the entrance, together with a small holly tree, as an additional precaution against the possibility that the devils, having once been driven out by the beans might endeavour to return.

"This old court ceremony has been extended to the general public and to-day in every house the head of the family takes a handful of beans and scatters them, with a downward motion of the arm, in each room, repeating in loud, commanding tones, *'Fuku wa uchi, oni wa Soto,'* which apparently is an invocation to the spirit of happiness to enter and an order to the devils to depart. It is further customary for each member of the family to pick up and eat as many of the beans as are his or her years of age.

"The *mamemaki* is also practised in the temples and in various streets by the *'toshi-otoko'* many of whom are famous actors, and who wear on this occasion an old-fashioned dress with wide shoulder pieces and long flowing sleeves. Such then is the outward and visible ceremony in connection with the *Setsubun,* but that day has a far deeper inward and spiritual meaning. It is the day believed to mark a change in the lives of men and women.

"There is something portentous about it, just as in the old days in Europe when the astrologer cast the horoscope of a child he marked down certain days in certain years, which he described as critical, so in the same way the *Setsubun* being the last day of winter in the lunar calendar, starts a critical new year, for a man in his 25th, 42nd, or 61st year and for a woman in her 19th, 33rd, and in her 37th. Such years are known as *yakudoshi,* or fateful years, and are so critical that there have been cases, so I have been told, where a cabinet has resigned when the premier reached his *yakudoshi,* and officials in the service of the government have been transferred to other posts under similar circumstances.

"Anyhow, putting aside all these deeply-rooted convictions, the most that I can say is that in the calendar the *Setsubun* marks the ending of the *daikan* or great cold and ushers in spring, though I must also say, and I am sure no one will contradict me, that February is the coldest and most unpleasant month in the year."

An illustration (p. 42) shows a man scattering soybeans while a small devil flees.

Note: The author is an Englishman who has lived in Japan since 1919 and taught English. Address: Kojimachi, Japan.

3135. *Manchoukuo Year Book* (*The*)**.** 1934. 1934. xxix + 852 p. See p. 234-35, 256-59, 267-79, 350-51, 396-97, 399-409, 466. Published by Minami Manshu Tetsudo Kabushiki Kaisha, Toa-Keizai Chosakyoku (South Manchuria Railway Co., East-Asiatic Economic Investigation Bureau), Tokyo. [Eng]

• ***Summary:*** Chapter 10, "Agriculture," discusses soya beans in detail. Some 34% of the "value of the manufacturing products represent the products of bean oil mills using soya beans as raw material" (p. 234).

Table 1 shows that agricultural products occupy about 50% (of the value in Haikwan taels) of total exports from Manchuria during 1929, 1930, and 1931. Of the manufactured products, [soy] beancake, [soy] bean oil and bran, which are directly produced from agricultural raw materials, constitute 80% of the total (p. 235).

The South Manchuria Railway (S.M.R.) has played a leading role in developing Manchurian agriculture (especially [soy] bean production) and expanding exports. A table (p. 256) shows the SMR's revenues from passengers and freight for selected years from 1907-1931. Freight revenues are, overall, about seven times as large as passenger revenues. The main source of freight revenues is coal, followed by [soy] beans and beancake (Source: SMRC Business Report). "The export of soya beans, beancake, and bean oil has increased three to four times in the past twenty years." The SMRC as established an Agricultural Experiment Station where crops (such as beans) and animals have been improved, bringing much benefit to Manchurian farmers. SMRC's work has contributed both directly and indirectly to the agricultural development of Manchuria by Han Chinese and by Korean settlers (p. 256).

© Copyright Soyinfo Center 2014

Before the Manchurian incident, Japanese farmers were oppressed by the Northeastern military leaders and found it practically impossible to farm outside the South Manchuria Railway zone. Thus, before the Manchurian incident, only 730 Japanese households were engaged in agriculture in Manchuria. "The contribution made by Koreans to the development of agriculture in Manchuria cannot be overlooked... their entrance into the interior of Manchuria began only after the Russo-Japanese War" [1904-05]. A table (p. 257) shows the number of Japanese settlers and Korean settlers in Manchuria from 1908 to 1930. The number of Japanese settlers increased from 56,433 in 1908 to 288,784 in 1930. The number of Korean settlers increased from 51,070 in 1910 to 607,119 in 1930.

The Wanpaoshan incident happened just before the Manchurian incident (p. 257). Note: The Wanpaoshan Incident (Jap: *Manpozan jiken*) was a minor dispute between Chinese and Korean farmers which occurred on 1 July 1931, prior to the Mukden Incident [best known in Japan as the Manchurian Incident]. Although the issue was trivial, it was highly sensationalized in the Japanese and Korean press, and used with considerable propaganda effect to increase anti-Chinese sentiment in the Empire of Japan prior to the invasion of Manchuria [in Sept. 1931] (Source: Wikipedia, May 2009). As of May 2009 Mukden is known as Shenyang.

"The agricultural development in Mongolia was suddenly brought about after the Russo-Japanese War, and particularly after the establishment of the Republic of China [on 1 Jan. 1912], as the former policy of protecting the ancient kings of Manchuria was abolished, and the settlement of the Han [Chinese] race was encouraged. The Mongolians were more and more oppressed and obliged to retreat gradually to the inner desert districts, and the barren fields of Mongolia came to be rapidly cultivate by the Han settlers.

"Manchuria was made a great agricultural country by the joint efforts of the Hans, Japanese, Koreans, and Russians, with the Hans as the main factor; Manchuria came to have intimate relations with the world economy through its export agricultural products."

Agricultural products in the three provinces of Fengtien, Kirin, and Heilungkiang: Among the legumes are soya beans, Indian beans, and green peas. Table 13 shows the cultivated area (hectares) and production (metric tons) of these crops: (1) In the three provinces: Soya beans: 4,102,990 ha and 5,124,760 metric tons. Other legumes: 353,190 ha and 54,467 metric tons. (2) In the Kwantung Leased Territory and South Manchuria Railway Zone: Soya beans: 31,923 ha and 17,595 metric tons. Other legumes: 54,467 ha and 160,193 metric tons. Statistics are also given in Table 13 for Kaoliang (#2 crop after soya beans in area and production), millet (#3), maize (#4), wheat (#5), etc. Soya beans account for nearly 30% of the total acreage (p. 258-59).

Table 22 (p. 267) shows that area and production of soya beans in 1933 was larger Northern Manchuria than in Southern Manchuria. A long section titled "Soya beans" (p. 267-70) gives details about all aspects of soya beans, bean oil, and beancake, including exports.

Table 23 (p. 278), titled "Exports of principal agricultural products," gives statistics from 1922 to 1931 for quantity exported and value (in H.K. Taels) for 9 major products. The leading every year is either soya beans or beancake; bean oil is also important.

A section titled "Export of soya beans, beancake, and bean oil in recent years" (p. 279) includes Table 24, "Export of soya beans, beancake, and bean oil through the four ports of Dairen, Yingkow, Antung, and Vladivostok," total tons and relative index from 1926-27 to 1932-33.

The Dairen Agricultural Company, established in 1929, brings Japanese immigrants to Manchuria and helps them to become land-owning farmers; it does not operate any farms directly (p. 300).

The origin of Japanese administration on the Liaotung peninsula, the southern end of Manchuria, started in 1905 during the Russo-Japanese War. In Nov. 1906 Japanese first began to administer agricultural programs in Manchuria by issuing the regulations for the Kwantung Government Agricultural Experiment Station, and the establishment of the agricultural experiment station at Dairen. This station is now located at Chinchow (Chin-chou, or Jinzhou, in Liaoning province, as of 2009) (p. 300-01). On p. 302 is a full page of references to Japanese documents that served as the sources for the tables in this chapter on agriculture in Manchuria. Almost all were compiled and published by the South Manchuria Railway Co. (SMRC).

Chapter 14, "Industry," begins with a "General outline" (p. 350-51). Although Manchuria is rich in natural resources, modern industry did not develop until about 30 years ago. Before that, small enterprises supplied the needs of immediate neighborhoods. With the eastern advance of Russian influence and the establishment of Russian administration in Manchuria near the end of the 19th century, several modern industries appeared. "Before any general industrial development could take place, however, the Russo-Japanese War (1904-05) broke out, and as the result of the war, Japan came to administer the Kwantung Leased Territory and the railway zone. Since that time modern industry has developed in Manchuria"–including oil milling. Industry in North Manchuria [where Harbin is located] is inferior to that in South Manchuria in capital and equipment. Discusses the North Manchuria Railway.

A section on "Chemical industry" (p. 396-409) discusses oil milling in great detail.

Page 466 shows miso and soy sauce production in Manchuria. The 17 Japanese-run plants make 2,800 tonnes of miso and 4,550 tonnes of soy sauce. The 44 Manchurian-run plants make no miso and 1,381 tonnes of soy sauce. The number of factories in each major city and the capital

© Copyright Soyinfo Center 2014

assets of the companies are listed. Dairen is the main center of Japanese miso and soy sauce production, followed by Mukden, then Port Arthur. Hsinking is the main center of Manchurian soy sauce production.

Note: This Year Book was published from 1931 to 1941 by Japanese interests (SMRC) to justify the Japanese occupation and development of Manchuria after the "Manchurian incident."

3136. Matveeff, G.N. 1934. [Varieties of soybeans in Georgia]. Tblisi, Georgia: Georgian Press. 146 p. Scientific Research Works, Series A, Issue No. 1. [51 ref. Geo]
• ***Summary:*** Table 1 (p. 8-9) shows the increase in the area planted to soybeans in Georgia from 1930 to 1933. Part 1 shows the area planted to soybeans only ("pure sowings"); this value increased from 626 ha in 1930 to 1,653 ha in 1933. Part II shows the mixed plantings converted to pure sowings; this value decreased from 49,544 ha in 1930 to 28,878 ha in 1933. Part III shows the total planted area (pure + mixed); this value decreased from 50,170 ha in 1930 to 30,531 ha in 1933. Part 4 shows soybean area as a percentage of total area; this figure decreased from 5.09% in 1930 to 3.05% in 1933. A note (p. 9) explains that this table is based on statistical data received from the Narcomzem (Agricultural Department) of Georgia.

Page 10 states that in 1932 a soymilk manufacturing plant was established in Tblisi. Page 11 states that soybeans exported from the port of Batumi (Georgia, on the Black Sea) to Germany and Denmark sold for ¼ to ½ to price of soybeans purchased from Manchuria.

Table 2 (p. 12) shows soybean production in Georgia in 1931 and 1932, and how these soybeans were utilized. Soybean production was 10,760 tons in 1931, and 3,611 tons in 1932. For the two years (respectively), 32.6% and 48.8% were exported (outside the USSR), 21.2% and 22.5% were exported to other countries inside the USSR, 27.9% and 2.6% were delivered to various organizations in Georgia for use in making edible oils and confections.

Page 10 states that G. Struev [G. Sturua] (1882) gave the names of some varieties he obtained from Japan. According to G. Japardize, S. Timofeev, and E. Wuchino, soybeans were introduced to Georgia during the 1870s.

Page 20 states: The first information about the soybean in Russia was from the year 1874 (See G. Tupikova). Address: Georgia.

3137. Mukai, Seizo. 1934. Manshû daizu oyobi sono seihin [The soybean of Manchuria and its products]. Tokyo: Iwamatsudo Shoten. xvii + 340 p. Illust. 28 cm. [Jap]
• ***Summary:*** Contents: Preface. Part I: Introduction. The position of soybeans in the world and in Manchuria. Soybeans in Manchuria and Japan.

Part II: Soybeans: Outline, varieties, cultivation, character, quality and appraisal, usage of soybeans, packaging and shipping, demand of the production and foreign trade (Manchuria, Japan, Korea, Taiwan, China, South Pacific Ocean, Europe and USA), the custom of selling and buying.

Part III: Soybean cake and soybean oil. Outline, varieties, method of production, quality and appraisal, usage (Cake: Fertilizer, fodder, raw material for foods, for drugs, and for the chemical industry. Table of soybean cake usage. Oil: Table of soybean oil use), packaging and shipping (pulp and oil), production, consumption, and trade (supply and demand in Manchuria, Japan, Korea, Taiwan, China, South Pacific and India, Europe and USA), the custom of selling and buying.

Part IV: Remarks. Bibliography.

Appendix: Table of equivalents in Manchuria, money system, rate of exchanging money, about the money the Central bank makes in Manchuria, money exchange, amount of exporting, soybean and soybean cake related exchange rate table, important Japanese & Manchurian market weight and volume exchange rates, general or Manchurian abbreviation of words. Address: Manchuria.

3138. Takahashi, Eiji; Iguchi, K.; Mitamura, K.; Shirahama, K. 1934. The influence of soy bean cake upon milk production and the quality of butter. Dairen?: South Manchuria Railway Co. 66 p. [59 ref. Eng]
• ***Summary:*** Soya-bean cake fed to stock at the rate of 20, 35, and 50% of the production ration (calculated on the Hansson standard) caused progressive increase in milk yield and no ill effects on quality of milk or health of the cow, but at the highest level the butter was too soft.

"About 1,500,000 tons of soy bean cake are imported into Japan proper every year from Manchuria. Hitherto this has been mainly for the purpose of manure. But recently the value of nitrogen in soy bean cake has risen above that of ammonium sulphate by about 30-60%. The result has been that the manurial value of soy bean cake is now less than that of ammonium sulphate...

"The Manchurian Railway Company allocated the study of the feeding value of soy bean cake... to a number of institutions in Japan proper. This experiment was begun at the farm of this Imperial University in Sept. 1931 and was ended in April, 1933."

3139. Woodhead, Henry George Wandesforde. ed. 1934. China year book. Shanghai, China: North China Daily News & Herald. xxvi + 854 p. Vol. 16. Index. 22 cm.
• ***Summary:*** In Chinese, the title of this book is *Chung-hua nien-chien.* In chapter III, "Soy-beans and bean products are discussed on pages 41-42.

A table (p. 55) shows exports of vegetable oils from China in 1931. In descending order of weight (thousand piculs) they are: [Soy] bean oil 1,463. Wood oil 865. Groundnut oil 814. Unclassified 36. Tea [seed] oil 21. Castor

© Copyright Soyinfo Center 2014

oil 14. Sesamum seed oil 3.

The three most valuable oils in descending order of value (1,000 H. Taels) are: Wood oil 20,416. [Soy] bean oil 16,991. Groundnut oil 12,734.

In Chapter 5, a multi-paged table titled "Principal exports, 1932 and 1933," shows (p. 129): Exports of yellow [soy] beans to Egypt (incl. Anglo-Egyptian Sudan), Formosa, Germany, Great Britain, Hongkong, Italy, Japan, Korea, Netherlands, Netherlands India [Dutch East Indies; Dutch: *Nederlands-Indië*], Philippine Islands, Straits Settlements and F.M.S. [Federated Malay States], U.S.S.R. (Russia) Asiatic Routes, Other countries. The five leading importers of yellow [soy] beans, in descending order of weight imported (in million piculs), are: U.S.S.R. (Russia) 4.479. Japan 3.331. Germany 3.222. Korea 0.759. Netherlands India 0.555. Total: 17.269.

On the same page are exports of beancake to Japan, Korea, Norway, USA, U.S.S.R. (Russia) Asiatic Routes, Other countries. The three leading importers, in descending order of weight imported (in million piculs) are: Japan 5.854. U.S.S.R. (Russia) 2.119. Other countries 1.979.

In Chapter 7, a table (p. 153) shows the foreign and domestic trade at seven major Manchurian ports: Aigun, Harbin, Hunchun, Lung-Chingtsun, Antung, Dairen, Newchwang. Dairen does by far the largest volume of trade, followed by Harbin, then Newchwang.

On page 153 a table shows the quantity (piculs) of [soya] beans, bean oil, and beancake exported from (1) China including Manchuria, and (2) Manchuria alone. For each of the three products and two categories the amount sent to Japan, Europe, and Other countries is given. Europe imports almost all of the bean oil. Other countries get the largest amount of the beans and the beancake.

Also discusses Mongolia: Religious organization (Chapter 4, p. 70-71), including Lamaist Buddhism and "Living Buddhas." Also discusses Tibet (Chapter 4, p. 88-91). This section begins: "Geography: Tibet, sometimes called the 'Roof of the World,' consists of (1) the Lama kingdom of Tibet with its provinces and dependencies; (2) the semi-independent native states of Kam, under Chinese protection; and (3) the Kokonor [Koko-nor / Koko Nur] Territory, under the control of the Chinese Amban [a Manchu word meaning "high official"] residing at Hsi Ling, in Kansu. Note: Wikipedia states (June 2008): "The Qing Emperor appointed the amban in Tibet, who represented Qing suzerainty over the Buddhist theocracy of Tibet, and commanded over 2,000 troops stationed in Lhasa. The chief amban was aided by an assistant amban (Bangbàn Dàchén) and both of them reported to the Qing Court of Colonial Affairs. Their duties included acting as intermediary between China and the Hindu kingdom of Nepal (Ghorkhas Country); a secretary (Yíqíng zhangjing) dealt with native affairs. Three Chinese commissioners (liángtái), of the class of sub-prefects, were stationed at Lhasa, Tashilumbo and Ngari.

"The Qing imperial resident in Tibet was introduced in 1727 and most ambasa [high officials; A Manchu word, plural of amban] were appointed from the Manchu Eight Banners, a few were Han Chinese or Mongol. The Emperors used ambasa to influence Tibetan politics, and the Qianlong, Jiaqing and Daoguang Emperors each decreed that the Dalai Lama and Panchen Lama were bound to follow the leadership or guidance of the ambasa in carrying out the administration of Tibet."

A brief biography of Li Yu-ying (Courtesy name: Shih-tseng) appears on p. 693. Address: 1. B.A., formerly editor of the "North-China Daily News"; 2. M.J.I., Editor of the "Peking and Tientsin Times".

3140. Yamaguchi, H.S.K.; Garis, Frederic de. 1934. Oddities in Japan. "Believe It or Not." Memorial services. Broken Needles Mass (Hari-Kuyo) (Document part). In: H.S.K. Yamaguchi. 1934. We Japanese. Yokohama, Japan: Yamagata Press. 592 p. See p. 160. Book I.

• ***Summary:*** "Yearly, on December 8th, but more generally on February 8th, services for broken needles are held in many girls' schools, and in some private homes, to comfort the spirits of needles broken during the year–the needle being regarded as a living thing whose body has been sacrificed in service. An altar consisting of two or three steps is set up. In front of it is the Sacred Staff and Rope, *gohei* (cut-paper strips) being suspended from it. On the top step offerings of cake and fruit are placed. On the second step is a plate on which is a cube of *tofu* (bean-curd)–a jelly like substance–into which the broken and crooked needles are thrust, the idea being to give the needles a soft rest after their hard work. Sewing accessories are displayed on the lowest step. In a Buddhist school a sutra is read to calm the spirit of the needles. In Tokyo, the *tofu,* with its needles, is offered to a Awashima shrine: at Asakusa, Shimo-Kitazawa, and elsewhere.

"The ceremony, or ones nearly similar, is one of the traditional services observed by girls in Japan, which, with some lapses, can be traced back for about 1600 years to the time of Emperor Nintoku, and the Awashima shrines of the land are chosen for the offerings because it is said that the main Awashima Shrine, in the province of Kii (Wakayama) is dedicated to Emperor Nintoku." Address: Manager, Fujiya Hotel, Miyanoshita, Japan.

3141. White, William C. 1935. The Japanese in America: A close-up. Citizens or aliens, it is hard for them to join in the life of the country. *New York Times.* Jan. 6. p. SM9.

• ***Summary:*** Begins by describing "Little Tokyo," the Japanese section of Los Angeles–which is just 3 blocks from the main business section of Los Angeles. Includes a description of the chrysanthemum festival, drug, stores, newspapers, and restaurants which "serve hamburgers and hot dogs as well as soya bean curd [tofu] and rice."

© Copyright Soyinfo Center 2014

About 135,000 Japanese live in America, and 97,000 of those (72%) live in California. Only about 6,000 live in New York. More than 45,000 live in or near Los Angeles, where they are considered a problem. They live by themselves in certain sections and have no social contacts with white Americans–except that their children attend public schools.

Significant numbers of Japanese began to arrive in California after 1880. By 1910 more than 80,000 had entered as immigrants. The 1906 "gentleman's agreement" stopped almost all Japanese immigration and the Congressional act of 1924 stopped it entirely. But all Japanese born in the USA (*nisei*) are American citizens, and this latter group now slightly outnumbers those immigrants born in Japan [*issei*]–who are barred by law from becoming naturalized citizens.

The average age of the *issei* in America is less than 45, yet they are prevented by law from owning land in most Western states. "The laws which prohibit marriages between any two races apply to them." Children offer one way of getting around the land laws. The parents simply buy land and register their children as the legal owners. Unlike German immigrants, for example, they make little effort to assimilate, yet they also take care of themselves and rarely appear on charity rolls.

The feeling in California against Japanese is based primarily on two issues: (1) They are believed (incorrectly) to have a high birth rate, which could lead to the "yellow peril." (2) They can live more simply than whites and therefore "undersell the whites" in goods and labor. There is growing conflict between Japanese-American youth, educated in American schools and often wanting to become part of American culture, and their parents–who want to keep Japanese culture alive.

"Within recent weeks there have been terroristic raids on Japanese families settled around Phoenix, Arizona. There have been similar affairs at various times in California. There have been night riders, occasional bombs. Part of the Arizona terror is directed at the fact that the Japanese, 750 of them, half of them born in this country and therefore American citizens, are making a living on land where white farmers, settlers from Oklahoma and Texas, have failed."

Note 1. See also interview: Tadano, Mary; Tadano, Michiko. 2002 "History of Showa Shoyu Brewing Co.: Sept. 17.

Note 2. This is the earliest document seen (Feb. 2012) that concerns the Tadano family (later makers of soy sauce) near Phoenix, Arizona–however it does not mention the family by name.

3142. Gray, George Douglas. 1935. The soya bean in international trade. *Foreign Affairs* 13(2):340-42. Jan.
• ***Summary:*** This article begins: "The soya bean has been described as unquestionably the most important food plant in the world." The soya bean is Manchuria's principal crop. "Under Japanese management [in part, since shortly after 1905], its culture has been developed and its uses extended. It has had a dominant part in drawing 30,000,000 Chinese to Manchuria, and it has aided them in building there a prosperous community. The profit from its transport and sale has in large measure supported the Japanese adventures on the mainland of Asia.

Table 1 gives "World soya bean production." Manchuria, with 10,184,928 acres under cultivation produces 208,298,428 bushels or 20.4 bushels/acre, which is 59.3% of world production. China proper, with 5,635,000 acres under cultivation produces 89,340,000 bushels or 15.8 bushels/acre, which is 25.4% of world production. Japan, with 913,836 acres under cultivation produces 15,238,873 bushels or 16.6 bushels/acre, which is 4.3% of world production. Korea (a province of Japan since 1910), with 1,942,922 acres under cultivation produces 20,431,754 bushels or 10.5 bushels/acre, which is 5.8% of world production. The U.S.A., with 1,373,000 acres under cultivation produces 18,146,000 bushels or 13.2 bushels/acre, which is 5.2% of world production. The world, with a total of 20,049,686 acres under cultivation produces 351,355,046 bushels of soybeans.

Note: This is the earliest document seen (Jan. 2005) that gives detailed total soybean production or area statistics worldwide.

Table 2, "Trade of Manchuria (in millions of Haikwan taels)" shows Manchuria's imports, exports, total trade, and balance of trade for the years 1907, 1917, and 1927-1932. In 1907 Manchuria had a negative balance (-8.6). In 1917 the balance began to be positive (+2.5), but by 1927 the balance was strongly positive (+139.0) rising to +255.0 in 1931.

Table 3, "Exports of Manchuria (in millions of Haikwan taels)" shows Manchuria's 5 main exports (both value and percentage of total) from 1927 to 1932. In descending order of value in 1932 they are soya beans, coal, kaoliang, millet, and pig iron. In 1927 soya beans, with a value of 219.5 accounted for 54.5% of exports. In 1932 soya beans, with a value of 234.6 accounted for 60.8% of exports.

Table 4, "Imports of soya bean and soya bean oil" [from Manchuria] shows the imports of each, in tons, in 12930 and 1930, by the following countries: United Kingdom, United States, France, Holland, Denmark, Germany, Italy, Belgium, and Japan. In 1932 the world's top 4 importers of soya beans were Germany (1,168,300), Japan (481,600), Denmark (288,864), and the UK (159,938). In 1932 the world's top 4 importers of soya bean oil were Japan (72,240), UK (27,343), Belgium (5,600), and Germany (3,739).

3143. Iwamura, Iwao. 1935. Biochemical studies on "miso", fermented soybean paste. II. Influence of temperature upon the ripening of "miso". *Bulletin of the Agricultural Chemical*

© Copyright Soyinfo Center 2014

Society of Japan 11(1):1-7. Jan. Bound in the back or front of Nippon Nogei Kagaku Kaishi (J. of the Agricultural Chemical Society of Japan). [8 ref. Eng]
• ***Summary:*** "In order to ascertain the influence of temperature upon the ripening of 'miso,' 5 series of samples were kept for fermentation at 55º, 35º, 27-32º, 25º and 15-25ºC respectively. The samples taken at different intervals were analyzed and at the same time the chemical changes during the steeping and boiling of the soybeans were determined.

"It has been confirmed that the fermentation at 55ºC proceeds most rapidly, attaining the maximum after 8-12 days; at a lower temperature the fermentation proceeds more slowly, thus needing 15-25, 20-30 and 40-60 days of ripening at 35º, 25º and 15-25ºC respectively. The amount of ammoniacal nitrogen and free acid was comparatively large at 35ºC.

"It has also been observed that the ripening of 'miso' is much accelerated by the enzyme action of 'koji.' By the steeping of the soybeans the increase of reducing sugars and free acids is noticeable and by boiling them some proteins, reducing and non-reducing carbohydrates are dissolved in water." Address: Agricultural Chemical Lab., Tokyo Imperial Univ., Komaba, Tokyo.

Les préparations à base de graines de soja dans l'alimentation des Annamites [Preparations based on soybeans in the diet of the Annamites (of Central Vietnam)]. *Bulletin Economique de l'Indochine* (*Hanoi*) 38:66-86. Jan/Feb. Also in Annales de Medecine et de Pharmacie Coloniales (1935) 33. p. 34-57. [11 ref. Fre]
• ***Summary:*** An excellent, very precise and detailed discussion of the subject. Contents: Introduction, botany of the plant, nutritional composition, and utilization. Soymilk (used to make tofu–*le fromage de soja–dau-phu*). Tonkin soy sauce (*La sauce de soja = dau-tu'o'ng.* It is made by fermentation of a mixture of glutinous rice and roasted soybeans {*graines de soja grillées*}. It is made on a family level. It corresponds roughly to Japanese shoyu and Chinese soy sauce (*téou-yeou*). Describes exactly how it is made). Soy cream [yuba] (*La crème de soja = dau-phu-chuc;* [dried yuba sticks]). It comes in the form of sheets.

Note. This is the 2nd earliest French-language document seen (Dec. 2012) that mentions roasted soybeans, which it calls *graines de soja grillées.* Address: Chef du Laboratoire de Chimie de l'Institut Pasteur, Hanoi.

3148. Otomo, Sajiro. 1935. Daizu kasu no kabi ni tsuite [The molds on soybean cake (Aspergillus, Penicillium, Monilia)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 11(2):124-46. Feb. [11 ref. Jap] Address: Tokyo Daigaku Nôgaku-bu, Nogei Kagaku Kyoshitsu, Tokyo, Japan (Agricultural Chemical Lab., Imperial Univ. of Tokyo).

3149. Satow, Teikichi. 1935. Waterproof glue product and method of making the same. *U.S. Patent* 1,994,050. March 12. 3 p. Application filed 9 Jan. 1930.
• ***Summary:*** In making a "glue from soya bean meal, if the glycinine [glycinin], which is the main constituent of soya bean proteid, is converted into methyl compounds a maximum binding or adhesive strength, as well as a

3151. MacConkey, C.A. 1935. Soybeans. Ottawa, Canada: Div. of Research Information, National Research Council, Ottawa. 93 p. March. 28 cm. [152 ref]

• ***Summary:*** A very important and interesting book. In 1932 the first two sections of this report were prepared; in 1934 the third section was added in order to bring it up to date. Contents: Summary of Part I. Summary of Part II. Summary of Part III. Part I (p. 14): Cultivation, utilization and trade. Introduction. Cultivation: Varieties, differences, maturity, hardiness, color of bean, climate, soil, seeding, harvesting. Production of oil and cake. Applications: Introduction, the plant (forage, hay, pasturage, silage, soilage, straw, soil improvement and fertilizer), the bean (grain, flour, soy sauce, bean curd [tofu], vegetable beans, other uses), the cake (cattle feed, flour, fertilizer, other uses), the oil (general, the soap industry, the paint and varnish industry, the food industry). The soybean industry in the United States: Importance of the crop, history and development (incl. Henry Ford who is said to have 10,000 acres under cultivation), standards (classes of soybeans), production of oil and cake, consumption of soybean oil, export trade in soybeans. Statistics of world trade: Beans (production, exports, imports [statistics, pre-war average {1909-13} + 1926-1931 for Germany, Japan, Denmark, UK and British Empire countries, Dutch East Indies, Sweden, Italy, Formosa, and Holland], consumption [net imports], prices), oil (production, exports, imports, consumption, prices), cake (production, exports and imports). Statistics of the German oil seed industry: Oil seeds in Germany [by far the world’s largest soybean importing country and largest European producer of soybean oil] (imports and exports), vegetable oils (production, consumption and value), oil cake and meal (production, imports, exports, consumption and relative values), soybean experiment stations in Germany.

Part II (p. 56): Development in Canada. The difference between growing soybeans for forage and for seed. Present status of soybean cultivation in Canada. The future for soybeans on the Prairies. Extent of Canadian Experimentation. Varieties suitable for Canada. The climates of Manchuria and Canada. Planning the development of soybeans in Canada. Consumption of vegetable oils in Canada by industries. Consumption of oil cakes in Canada. Firms engaged in the soybean industry in Canada. Casein in Canada.

Part III (p. 69): Survey of the Literature, 1931-34. Cultivation. Green manure. Breeding. Germination of seeds. Diseases and parasites. Soil. Manufacture of oil cake. Composition of the soybean. Properties and composition of soybean oil. Feedstuffs. Edible products. Detection in food (e.g. detection of soybeans in wheat flour, pasta, meat products, etc.). Inedible products. Economics. Table (p. 79-80)–Imports of soy products into Canada: Soy sauces (1931-1933), edible peanut and soyabean oil, peanut and soyabean oil for the manufacture of soap and peanut oil for canning fish, soybeans, soyabean cake and soyabean meal for use exclusively in the manufacture of cattle food and of fertilizers. References (102). Other references (Nos. 103-117). References not consulted (35).

The section titled “Development in Canada” (p. 56-62) states: “Soybeans are at present being grown for seed on a commercial scale in southern Ontario, chiefly in Kent and Essex Counties [the Niagara Peninsula]. Prior to 1931 the acreage under soybeans was about 1000 or 1500. The efforts of persons interested in establishing oil mills increased this to about 5000 in 1931 and to 6000 or 7000 in 1932. The average yield of seed has been about 23 bushels per acre, which is quite equal to yields in the U.S., while another variety, the A.K., has yielded at the rate of nearly 40 bushels per acre during a six-year test at Harrow, Ontario.”

“T.B. Macaulay, President of the Sun Life Assurance Company of Canada has been experimenting for a number of years on the growing of soybeans in the hopes of being able to make the western farmer more free from his dependence on wheat, and believes that he is near to discovering suitable varieties...

“A statement appearing in the *Montreal Financial Times* (Nov. 18, 1932) reports that a number of varieties introduced from Urbana [Illinois] and tried in various parts of Alberta made an excellent growth of forage...

“The work being carried out at T.B. Macaulay’s experiment farm at Hudson Heights, Quebec, is particularly worthy of mention. Here the testing of varieties has been in progress for 8 years. Mr. Macaulay’s method of approaching the problem consists in obtaining samples of hitherto untried varieties from the most northerly regions where soybeans grow and the earliest varieties from Asia and elsewhere... Mr. Macaulay has a new variety which he calls Toyanaga. It matures 5 days to a week earlier than the variety called Manchu, which is being grown to a small extent in southern Ontario.”

“Varieties suitable for Canada: Besides O.A.C. 211 which is the one outstanding variety that has shown itself suitable for cultivation in Canada albeit only in southern Ontario, a number of other varieties have been tried and experimented with such as Mandarin, Manchu, Wisconsin Black, Quebec 92, Quebec 537, Early Yellow, Early Brown, and Manitoba Brown, but none of these have been very satisfactory.”

Table 29 (p. 60) gives a summary of current (1932) Canadian experiments with soybeans: Ontario Agricultural College (Guelph), grown for 39 years (i.e. since 1893), tested

125 varieties. Dominion Experimental Farms (Ottawa and Harrow, Ontario), 9 years, 100 varieties. Macdonald College (Quebec), 20 years, 16 varieties. Manitoba Agricultural College (Winnipeg), 10 years, 12 varieties. University of Alberta, Edmonton, 3 years, 7 varieties. Brooks (Canadian Pacific Railway Irrigation Experimental Station, Alberta), unknown number of years and varieties. Pointe Platin (Quebec, by J. deLothinière [deLothiniere]), unknown number of years and varieties. Hudson Heights (Quebec, by T.B. Macaulay), 8 years, 100 varieties. University of Saskatchewan, 10 years, 25 varieties.

Page 65 lists "Firms Engaged in the Soybean Industry in Canada." The Soy Bean Oil and Meal Co-operative Company of Canada, Ltd., Chatham, Ontario; Canadian Soyabeans Ltd., Milton, Ontario; The Vitone Co., Hamilton, Ontario; Dominion Soya Industries, 355, Place Royale, Montreal, Quebec.

Note 1. In *Shepherd's City of Chatham* (*Ontario*) *Directory 1934-35* (p. B-166) we read: "Soyabean Oil & Meal Co-operative Co Ltd, G E Biles, mgr, Colborne n, w cor Adelaid."

Note 2. This is the earliest document seen (Jan. 2010) that mentions Dominion Soya Industry, Ltd. (Montreal, Quebec, Canada) in connection with soybeans.

Table 33 (p. 67) gives "Consumption of oilseed cake and meal in Canada" for the calendar years 1926 to 1931. Figures (taken from *Trade in Canada*) are given for cottonseed, linseed, palm nut, soya and total. Consumption of soya cake and meal (in tons) were: 200 in 1926 (0.6% of total); 680 in 1927; 560 in 1928; 1,560 in 1929 (5.0% of the total); 1,190 in 1930; and 2,500 in 1931. The value in dollars role from $8,000 in 1926 to about $50,000 in 1931. Apparently all of this soyabean cake and meal was imported.

Note 3. This is the earliest English-language document seen (Dec. 2005) that uses the term "soyabean meal" to refer to ground, defatted soybeans. Address: Div. of Research Information, National Research Council, Canada.

3152. Kawahara Co. 1935. Sundried Kelp: Also kelp vermicelli (Ad). *California Health News* (*Hollywood, California*). April 19. p. 11.

3153. *Manchester Guardian* (*England*). 1935. The soya bean. April 20. p. 10.
• ***Summary:*** The new Budget puts a 10% duty on soya beans, which were previously on the free list. Mr. Chamberlain [Neville, Chancellor of the Exchequer, 1931-37] has not given an explanation. In Feb. 1932, when the tariff was being debated, "the Government accepted the pleas of the agricultural members that the soya bean should be put on the free list because they are used in the feeding of stock."

Last month, however, the Liverpool Chamber of Commerce argued that the reasons for opposing a duty are no longer valid. They contend that the increasing imports of soya beans from Manchuria, China, and Japan have decreased the use in Britain of palm oil and groundnuts, which come from Britain's West African colonies.

If the government agrees with Liverpool, then this new tariff "is nothing but a roundabout way of helping British West Africa by punishing Japan and her puppet State Manchukuo, to say nothing of China. If in the process the British Farmer finds himself squeezed he should be the last person to complain."

3154. *Los Angeles Times.* 1935. Foreign "atmosphere" and fine food at home: Novel cafes discovered. April 25. p. B5.
• ***Summary:*** In the Japanese quarters of Los Angeles, several cafes specialize in sukiyaki–the "national dish that Americans know best. At one of the best, a Japanese girl, wearing a kimono, escorts you into a private room, separated by sliding panels in the true oriental fashion.

At one end of the table is a glowing brazier, surrounded by platters of sukiyaki ingredients. "Soon the pungent odor of soy bean sauce pervades the atmosphere as a dainty Japanese maid mixes the beef, soy bean cakes [tofu, probably grilled tofu], bamboo shoots, Japanese horse-radish, green onion, etc., in the brazier." Warm saki [sake] is served soon after the food. The girls will be more than happy, if encouraged, to return after the meal to play Japanese music on their peculiar stringed instrument.

Note. This is the earliest English-language document seen (April 2013) that uses the term "soy bean cakes" to refer to regular tofu or to grilled tofu.

3155. Chin, -; Lin, -. 1935. [The Togano or Y-type process of soy sauce fermentation]. *Kung Yeh Chung Hsin* (*Industrial Research, Nanking, China*) 4(4):170-73. April. [Chi]

(2) The improvement of soya-bean oil extraction. (3) The decomposition and decomposition products by hydrolysis of soya-bean protein. (4) The properties of soya-bean proteins."

Note: This is the earliest English-language document seen (Aug. 2003) that contains the term "soya-bean proteins" (or "soya-bean protein"). Address: Tokyo Industrial Research Inst., Hatogaya-Honmachi, Shibuya-ku, Tokyo, Japan.

3169. Chin, -; Lin, -. 1935. [The Togano or Y-type process of soy sauce fermentation]. *Kung Yeh Chung Hsin* (*Industrial Research, Nanking, China*) 4(7):384-89. July. [Chi]
• ***Summary:*** Most of the soy sauce research in recent years as been dedicated to finding a way to shorten the fermentation process. The one that deserves special mention is Togano's process which has been widely used in Japan and which is recently introduced to China under the name of 'Y-type' process. Address: China.

3170. Morse, W.J. 1935. Green vegetable soybeans. *Proceedings of the American Soybean Association* p. 44-45. 15th annual meeting. Held 21-22 Aug. 1935 at Evansville and 23 Aug. at Lafayette, Indiana.
• ***Summary:*** "The green, immature soybean is used extensively as a green vegetable in oriental countries. Experiment stations in Japan have developed many varieties solely for use as green beans which are classified by growers and seedsmen as garden beans. About 60 such varieties have been collected during agricultural explorations in Japan by the U.S. Department of Agriculture. These varieties, which range from 75 to 170 days in maturity, have been found to differ markedly in flavor, ease of cooking, and soil and climatic adaptations. Cooperative studies with state experiment stations and special cooperators during the past two years indicate some very promising early, medium, and late green vegetable types for regions adapted to the soybean. The most valuable of these varieties are being increased by several state experiment stations for more extensive studies.

"For green vegetable beans, the soybean should be picked when the beans have reached full size and are still green and succulent. The green beans resemble young, tender Lima beans but they have a richer and more nutty flavor... The immature beans are difficult to shell but if first boiled for about 3 minutes they shell quite readily... The usual oriental way of cooking green soybeans is to boil the beans in the pods, in water flavored with soy sauce or salt and serve them to be eaten from the pod. Many people prefer to cook the beans in the pods, boiling them in salted water for 20 to 30 minutes. The beans then shell readily and may be used as a vegetable, in salads or in soups.

"When soybeans are planted in the garden for table use, it is best to use varieties recommended for green beans. One may, however, use the common varieties although they are smaller, not so easily cooked, and usually lack the distinctive flavor of green vegetable varieties. Green soybeans are not available before midsummer and for continued use, a succession of plantings of the same variety or of varieties of different periods of ripening would be desirable. The Hahto, a medium variety, is the only green vegetable variety at present handled by growers. The Rokusun, a late type, and two or three early Japanese varieties are being increased rapidly and should be in the hands of growers and seedsmen in the near future."

Note 1. This is the earliest document seen (June 2013) that mentions the soybean variety Rokusun, or any other large-seeded soybean variety in the United States.

Note 2. This is the earliest English-language document seen (June 2009) that uses the term "vegetable types" or "green vegetable types" or "green, immature soybeans" to refer to green vegetable soybeans. It is also the earliest English-language document seen (June 2009) that with the term "Green vegetable soybeans" in the title. Reprinted in *Good Health,* Oct. 1937. Address: Bureau of Plant Industry, USDA, Washington, DC.

3171. Rokusun: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. Occasionally misspelled Rokusum. 1935. Seed color: Yellow (straw), hilum brown.

• ***Summary:*** Contents: Introduction. Acreage, production, and price of soybeans in the United States (Table II shows production in Manchukuo, Chosen [Korea], Japan, and the Dutch East Indies from 1929-1934). Uses for soybeans (incl. in ice cream, ice cream cones, candies, puddings, salad dressings, sausage filler). Chemical composition of soybeans. Processes for the removal of the bitter taste from soybeans. Extraction of soybean oil (by hydraulic pressure, Anderson expeller, or new European solvent process). Yield of oil and meal from soybeans. The method of analysis of soybean flour. Chemical composition of soybean flours: Soybean flour output in the United States, minerals, carbohydrates, quality of the protein, vitamins, lecithin and fats in soybean flour. Soybean flour in the diet: Cost of protein and fat, calcium, and carbohydrates in soybean flour. The use of soybean flour in baking. Effect of enzymes of soy flour on bread: Digestibility of soybean bread, increased absorption claimed for soybean flour, cost of soybean bread. Conclusions.

"The most expensive food constituents are minerals, vitamins, proteins, and fats. Soybeans flour is rich in all of these food constituents and yet relatively cheap. The moderate cost of soybean flour makes it possible for people of small incomes to obtain the maximum of these essential nutritional constituents required by the body which in the form of other foods might be beyond their reach."

"The first successful attempt to prepare a soybean flour which would be free from the disagreeable beany taste, which would remain fresh almost indefinitely (that is, not develop rancidity), and which would retain, practically unchanged, the original composition of the bean is described in the Berczeller patent (1924). This process consists in subjecting the cleaned soybeans to the action of saturated steam for 10 to 15 minutes. The beans are then dried, cracked in order to remove the hulls, and ground into flour. Such flour has a sweet, pleasant, nut-like taste (a characteristic of most flours obtained from soybeans which have been subjected to a special beany-taste removing treatment) and may be kept for many months without spoilage due to the development of rancidity. A later patent (1932) issued to this inventor consisted in subjecting soybeans (dry or soaked) to steam distillation (see also Berczeller, 1933). In making soybean flour by this process in this country, the beans used, generally the yellow variety, are first treated to destroy insects and insect eggs. The beans are then cleaned or freed from impurities, washed to remove the dirt, and subjected to the patented process. The beans are then dried and passed through cutting machines and the hulls are removed by aspirators and bolting machines. The cut beans are then aerated with warm air and ground in a special air-cooled mill, the fine flour being bolted through a special bolting machine" (p. 446).

Soybean oil mills in ten U.S. states now have a total annual crushing capacity of about 10 million bushels (p. 448).

Tables show: (1) Acreage, production, and average price per bushel of soybeans (1932-33, for 10 leading states and the USA total). (2) Annual soybean production, in bushels, in 5 countries (USA, Manchukuo, Chosen [Korea], Japan, Dutch East Indies, 1929-34). (3) Chemical composition of soybeans (minimum, maximum, and average). (4) Fat and protein content of soybeans grown in 15 different U.S. localities. (5) Mineral content of various legumes and grains (air-dry basis). (6) Composition of the component parts of soybeans (cotyledons, embryo, seed coat). (7) Composition of many soybean flours. (8) Composition of high fat, press cake, and solvent-extracted soybean flours. (9) Composition of solvent-extracted soybean flour and other legume flours (bean, pea, lentil). (10) Mineral content of selected foods, incl. soybean flour. (11) Composition of the mineral portion of grains and other seeds. (12) The composition and the mineral and vitamin content of selected foods. (13) Composition of selected foodstuffs. (14) Retail cost of foods and their components [soybean flour is by far the least expensive source of protein and calcium]. Formula and method for making soybean bread (using 20% soybean flour). Formula and method for making whole wheat bread.

(15) Composition of representative flours. (16) Composition of representative types of bread. (17) Correlation of loaf volume and urease content of soybean flour used in making bread. Address: Food Research Div., Bureau of Chemistry and Soils, USDA.

3174. Hatano, Tadashi. 1935. Effect of feeding vegetable protein [soy bean cake] on copulation and fertilization in the fowl. *Bulletin of the Agricultural Chemical Society of Japan* 11(9):125-28. Sept. Bound in the back or front of Nippon Nogei Kagaku Kaishi (J. of the Agricultural Chemical Society of Japan). [Eng]
• ***Summary:*** The test ration was composed of 45% yellow corn, 30% soybean cake, 17% rice refuse, 15% rice bran, and 3% mineral mixture. Compared with a ration containing animal protein, number of copulations per day by a cock was much less, number of fertilized eggs per day was less by 0.9, and time during which fertilized eggs were laid by a hen was shorter by 2.5 days. Address: Imperial Zootechnical Experiment Station, Japan.

3175. Iwamura, Iwao. 1935. Biochemical studies on "miso", fermented soybean paste. III. On the effect of cystine upon the nutritive value of miso. *Bulletin of the Agricultural Chemical Society of Japan* 11(9):128-34. Sept. Bound in the back or front of Nippon Nogei Kagaku Kaishi (J. of the Agricultural Chemical Society of Japan). [8 ref. Eng]
• ***Summary:*** The nutritive value of the miso-protein, when used as a supplement to a rice diet for albino rats, is increased by addition of cystine. For young rats the optimum amount of cystine is about 0.1% (> 0.5% is harmful), but for adult rats 0.5% is favorable. Address: Agricultural Chemical Lab., Tokyo Imperial Univ., Komaba, Tokyo.

3176. Kobata, Yotarô. 1935. α-oxycaprinsaeure no shôyu bôbai sayô ni tsuite [The antiseptic action of α-oxycapric acid on shoyu]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 11(9):789-90. Sept. [4 ref. Jap]
Address: Kyôdai Nôgaku-bu Seibutsu Kagaku Kenkyû-shitsu (Kyoto Univ.), Japan.

3177. Miyaji, Kenji; Kaneko, Mamoru. 1935. Tamari abura-chû no fukenka-butsu tokuni suchirooru ni tsuite [Unsaponifiable substances, especially sterol, in tamari oil]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 11(9):715-19. Sept. [6 ref. Jap]
Address: Agricultural College of Gifu, Japan.

3178. Nakamiya, Ziro. 1935. Gadusene, an unsaturated hydrocarbon occurring in animal and vegetable oils. *Scientific Papers of the Institute of Physical and Chemical Research* (*Japan*) 28(597):16-26. Sept. [6 ref. Eng]
• ***Summary:*** The hydrocarbon gadusene was isolated from the non-saponifiable fraction of soy oil, rice germ oil, and some fish liver oils. It had the same absorption spectrum as the samples that Tsujimoto and Drummond et al. had prepared from other sources.

Table 1, titled "Saturated hydrocarbons and perhydrocarbons," gives constants for Shoyu oil. These are further detailed on pages 19 and 21. Address: Japan.

3179. Tomiyama, Tetsuo. 1935. Chemical studies of the proteins of feeding-stuffs. V. The contents of cystine and tryptophane. *J. of Biochemistry* (*Tokyo*) 22(2):341-42. Sept. [7 ref. Eng]
• ***Summary:*** "In the first report (1934), it was shown that the protein of soy bean contained a far smaller amount of methionine than does either protein of silk-worm pupa or that of sardine. As regards lysine- and histidine-content, the second report (1934) showed that there was practically no difference among the proteins except that the lysine content of soy bean protein was little lower than the others.

"The present work has been carried out in order to compare these three proteins with one another as to their contents of the other indispensable amino acids, namely cystine and tryptophane. The role of cystine in nutrition can be replaced without fail by methionine (1932), so that it is necessary to take the sum of these two sulfur containing amino acids as a criterion for the comparison of nutritional value of proteins."

Table 1 (p. 342) shows the results: C+M = cystine + methionine; T = tryptophane.

Protein of silk-worm pupa: C+M = 3.83; T = 1.50.

Protein of sardine: C+M = 3.90; T = 1.40.

Protein of soy bean: C+M = 3.01; T = 1.35. Address: Imperial Fisheries Inst., Tokyo.

3180. Wilson, Judith. 1935. Ingenuity makes novel dishes of simple ones. *Gazette* (*The*) (*Montreal, Quebec, Canada*). Oct. 18. p. 9.
• ***Summary:*** The section titled "Sukiyaki" describes this as a delightful and economical "Japanese stew." "The unusual items called for are bamboo sprouts and soya bean sauce, but these can be found at most delicatessens and in many ordinary grocery stores." Place an electric grill on the table. Bring in the colorful uncooked ingredients on a large platter. Describes how to make sukiyaki. A "mound of lean beef cut into thin shavings" is one ingredient. Tofu is not mentioned.

3181. A.J.F. 1935. La culture du soja en Roumanie [Soybean culture in Romania]. *Agronomie Coloniale* (*L'*) (*Paris*) 24(214):119. Oct. [Fre]
• ***Summary:*** According to the Romanian review *Bursa* (16 June 1935), a campaign is being actively conducted by the well-known personalities of Romania to intensify the cultivation of soya in that country. The soybean seeds have been planted on 25,000 ha in all the counties of Romania,

© Copyright Soyinfo Center 2014

as follows: Bessarabia 9,500 ha, Dobrogea [Dobruja or Dobrudja] 6,100 ha, Valachie [Vilcea] 5,350 ha, Moldavie [Moldavia, Moldova] 2,600 ha, Oltenia [Olt, Aluta] 1,000 ha, Transylvania 450 ha.

This crop is spread over more than 100 communes and employs nearly 17,000 workers. In a brochure published about 4 years ago [1931], a Romanian specialist M. Chiritescu-Arva gave interesting details on the resistance of Japanese soybeans. "The promoters of soybean culture in Romania have every reason to be satisfied with the results of their efforts."

• ***Summary:*** The exchange of hydrogen in soya beans by deuterium has been observed by leaving the beans in contact with dilute deuterium oxide (heavy water, D_2O). The exchange corresponds with a water content of 25%, whereas analysis gives 10%, probably because of the replacement in the beans of hydrogen other than those of water by deuterium. Address: Physikalisch-Chemisches Laboratorium der Kaiserlichen Universitaet zu Osaka, and Schiomi Institut fuer Physikalische und Chemische Firschungen.

3188. *Manchester Guardian* (*England*). 1935. Mould and foodstuffs: Research work on activities of fungi. Dec. 7. p. 17.
• ***Summary:*** The section title "Ripening cheese" states: Moulds "were widely used in Japan and China for the conversion of starch into sugar before alcoholic fermentation, and in the fermentation of soya bean during the manufacture of soya sauce."

3189. Kellogg, John Harvey. 1935. Re: Growing and canning shell soy beans. Making condensed soy milk and soy acidophilus milk. Letter to Mr. William J. Morse, Bureau of Plant Industry, USDA, Washington, DC, Dec. 9. 3 p. Typed, without signature (carbon copy).
• ***Summary:*** "We have been doing some experimenting this year with growing and canning shell soy beans. I am having a couple of cans sent you so you can see what our product is like. We think it is very fine. The few thousand cans we put up went off like hot cakes.

"We are thinking of doing rather extensive planting this year. We shall not have any seed to sell but may need to buy some more seed.

© Copyright Soyinfo Center 2014

"Here are some points on which I should like information: 1. Do you know of anyone in this country who is putting up shell soy beans? 2. Are shell soy beans canned in Japan and China, and if so can they be purchased there and brought to this country?..."

"I should also be glad to know if you have other varieties of shell beans of good quality with a growing period of about the same length.

"I am also having sent to you samples of our condensed soy milk. Diluted with two or three times its volume of water, it is, I think you will agree, a very palatable product. We supply this to people who are interested in soy acidophilus milk and willing to take the trouble to make it at home. We supply them with the culture. They simply put the condensed milk into a clean fruit jar, add hot water, let it cool to body temperature and then add the culture and wrap it up in a blanket and set it on the kitchen table and the next day the buttermilk is ready.

"Soy milk produces a much more vigorous growth of the bacillus acidophilus than does cow's milk. The organism is more than twice as large and it grows twice as fast and does not require the long training, 25 to 30 transfers, required when cow's milk is used for the culture medium. In other words, the bacillus acidophilus seems to like vegetable products for a culture medium better than animal.

"I shall be glad to know how you like the milk. If you would like to try making it at home, I will have some more cans and cultures sent to you. The process is so simple any housewife can do it. Slight contamination occurs, of course, but by using a large inoculum this does not matter for the first culture; but a fresh pure culture has to be used every time. If an attempt is made to make a culture from a home made culture it will be likely to fail because of the contamination likely to occur.

"Thanking you in advance for any information you may be able to give me, I remain, dear Sir, Very sincerely yours,

"P.S. Soy acidophilus milk has become so popular at my institution here that dairy milk rarely appears on the table. Everybody likes the soy milk better, and of course when people have been properly informed they want the soy acidophilus milk to change their flora and to get rid of intestinal putrefaction and to encourage bowel action. The effect of the soy acidophilus milk in this particular is very remarkable. In cases of very chronic constipation I have observed complete recovery with two or three normal bowel actions daily.

"The Canadian quintuplets are taking soy acidophilus milk at every feeding and have been doing so since last September when they had an attack of bowel trouble which disappeared as soon as they began taking the soy acidophilus milk which I sent them and have supplied to them ever since.

"I am accumulating evidence to the effect that the soy bean encourages the growth of the protective organisms in the human intestine to a very pronounced degree and by producing acids not only prevents putrefaction but encourages bowel action.

"I think every effort possible ought to be made to spread information among the people respecting the value of the soy bean, which I am sure is some time destined to become one of the most important staple foods in this country as well as in China and Japan.

"Here is another question: One of the difficulties in the way of the soy shell bean business is the expense of picking from the vines and shelling the pods. Do you know of any machinery that is used for either of these purposes?"

Note 1. This is the earliest English-language document seen (June 2009) that uses the term "shell soy beans" to refer to shelled green vegetable soybeans.

Note 2. This is the earliest document seen (June 2009) that mentions machinery or equipment for picking / harvesting or shelling green soybeans in the pods. However it only asks a question about this machinery.

3214. Burkill, I.H. 1935. A dictionary of the economic products of the Malay Peninsula. 2 vols. Published for the Malay Government by Crown Agents, London. 2,400 p. See p. 1080-86.
• ***Summary:*** These two densely-written volumes might be described as updates to the works of Sir George Watt. In the Malay peninsula, the soy bean is generally known as *Kachang bulu rimau* or *Kachang jepun* [the Japan bean]. In Java it is called *Kachang kedele, Dele, Gadele, Dekeman,* or *Dekenan;* in Sundanese, *Kachang bulu, Kachang jepun,* or *Kedele;* in Sumatra, *Kachang rimau* or *Kachang ramang;* and in Siam, *Tua luang* or *Tua praluang* [accents are included by Burkill].

"The word 'soy' came from a Japanese name for this plant, through the Dutch, who made it [the word 'soy'] known to Europeans. The first account was a result of the residence of their embassy surgeon, Kaempfer, in Japan, in 1691 and 1692; the second of the long service of their merchant, his contemporary, Rumpf, in Amboina."

The soy bean "is frequently cultivated in Siam, and seems to be a familiar plant in Kelantan [a state of Malaysia bounded on the north by Thailand]. Repeated experiments have been made with it elsewhere in Malaya; the Chinese, indeed, continually make them, usually without success, their failure being conspicuous when any available seed is used, instead of seed of races known to stand more or less tropical conditions. In 1918 advantage was taken of experiments in the Philippine Islands, to try, in Singapore, races which succeeded there and grew well. Races from the warmer parts of the United States were on trial in Selangor [Malaysia] in 1922. In 1924 a Chinese race was successfully grown by settlers in villages in the southern parts of Pahang [a state of Malaysia, bounded on the north by Kelantan and Trengganu].

"The soy bean has long been cultivated in Java, and in recent times this cultivation has become almost universal except at the western end of the island, where the climate is most uniformly humid. Probably it came to Java from India, for the name by which it is most known is Tamil and the seed is flattened as are North Indian races, while the Manchurian races have round seeds."

Note: Roxburgh (1832), in discussing the earliest known date for cultivation of soybeans in India states: "Reared in the Honourable Company's Botanic garden [across the Hooghly / Hugli River from Calcutta] from seeds received from the Moluccas [in today's Indonesia] in 1798.

"In Java a soy crop immediately follows rice, and this was the rotation apparently which Spring found the Chinese to use in Pahang."

The seed of the soy bean is rich source of nutrients. It "replaces meat very largely among the Chinese; and as rations for Japanese troops has played a large part." Because the ripe seed contains little or no starch, it is widely used in diabetic diets. "A kind of artificial milk can be made from the seed, and is in common use in Japan and China... This milk has only three-quarters of the full nutritive value of cow's milk." Soy-bean coffee, made from roasted soy beans, "is sold regularly in Japan, and into the coffee can be put soy-bean milk. The Chinese germinate the beans and eat the seedlings.

Legumin, or vegetable casein is best made commercially from defatted soy beans. The casein is precipitated from the milky fluid [soy-bean milk] by calcium sulphate. "The liquor is strained through muslin, and the precipitate treated with soda lye, which dissolves the casein; filtering gets rid of the impurities and acetic acid precipitates the casein from the filtrate in a more or less pure state. This casein is fit for use in all the industrial processes for which casein from cow's milk is used."

Soy beans can also be fermented to make témpé or "flavourings used in small quantities to make uninteresting dishes appetizing... Témpé is a food product made in Java from soy beans. It occupies a very important place in the diets of those who live in central and east Java." Detailed descriptions are given of two methods of preparation. (1) Initially, the seeds are parboiled then left soaking in water for 2-3 days. The "mush" [sic, cooked beans] is spread upon frames in flat cakes and inoculated with the fungus *Aspergillus oryzae* by the addition of some of the previous preparation. The cakes are wrapped in banana leaves; (2) This method requires greater care and time. "Meanwhile,

© Copyright Soyinfo Center 2014

a preparation of the fungus has been made in a somewhat elaborate manner, as follows: a portion of an older preparation is wrapped in a rather young teak leaf freely punctured with holes; this preparation is allowed to dry for two days, during which the fungus spreads to the teak leaf. Next, the soy-kernel mush [sic, the cooked soybeans] being ready, the teak leaf is emptied of its contents and sprinkled over the mush in order to convey the fungus. The mush is now put up in packets in banana leaves, heaped together, and covered up for twenty-four hours, after which it is exposed again to the air and cooled; the packets are then ready for sale." Note: This is the second English-language work to contain information about tempeh.

"The Chinese, throughout their own country and those domiciled in Malaysia, make a yet greater variety of preparations. Chief among these is teou-fu [tofu, usually precipitated with imported calcium sulphate]. "The 'teo-fu' does not keep well in a moist state, but can be treated for preservation. First, the cakes are colored yellow by a solution of turmeric or Gardenia flowers, then they are wrapped in cotton cloth and submitted to pressure. Thus made drier, they keep better. The use of this preparation is spreading."

The Chinese also make tao-cho and soy kechap (each fermented with an *Aspergillus* mould). K. Heyne describes how kechap is made in Java using black soy beans, hibiscus leaves, and *Aspergillus oryzae* mold. Finally the sauce is boiled with Arenga sugar, star anise, and other flavourings until the solution is so thick that the salt begins to crystallize.

Large amounts of soy-bean oil ("kachang oil" [perhaps soy sauce]) are imported to Malaya. "In the East [East Asia] it is used chiefly as food, but has other uses such as lubricating, varnish-making, making printer's inks, waterproof goods (Chinese umbrellas and lamps) and also for illumination. A process was patented 20 years ago for making artificial rubber, starting with soy oil. Note: Burkill was a British authority on the flora of southern and southeastern Asia.

"Criminal use: The hairs on the pods seem to be capable of causing a certain amount of irritation within the digestive tract. Gimlette (Malay Poisons, ed. of 1929 p. 169) records a case of administration of them with food in a criminal attempt to poison. He calls them a substitute for bamboo hairs in such circumstances.

"Joss-sticks: Ash of the stem, mixed with resin of *Canarium,* is said to make joss-sticks in Indo-China (Crevost and Lemarié, Cat. Prod. Indochine, 1917 p. 106)."

3215. Japan-Manchoukuo Year Book. 1935. Tokyo, Japan: Japan-Manchoukuo Year Book Co. Index. 26 cm. Second annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. On the title page, just below the title but in small letters we read: "Cyclopedia of General Information on the Empires of Japan and Manchuokuo." Below that is a small map showing the Japanese empire, circled, as part of East Asia–under which is printed: "Neither is Understandable Without the Other." Below that are listed the cities and names of 15 agents worldwide. This book was published in mid-December 1934.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture (p. 353 and 713). In each case, information given the previous year is updated one year: See p. 359, 363 (Soybean production in Japan in 1932 was 4,351,814 hectolitres).

Page 716. Soybean production in Manchoukuo in 1933 was 4.601 million metric tons on 3.747 million hectares.

Page 717. Export of soya beans in 1932 was 42.536 million piculs [1 picul = 133.33 lb weight Avdp] worth 144.304 million Hk. Tl. [Haikwan taels]. Export of soya beans in 1933 was 39.111 million piculs worth 169.095 My [Manchoukuo yen?].

A large table (p. 717) shows "Staple exports as classified by destinations in 1932 (in piculs). Soya beans were exported to the following countries–in descending order of amount exported:

Germany 10.474 million piculs
Soviet Russia 7.520 million piculs
China 7.246 million piculs
Egypt 6.997 million piculs
Japan 5.568 million piculs
Great Britain 1.348 million piculs
Chosen [Korea] 0.905 million piculs.
Netherlands India [today's Indonesia] 0.849 million piculs
Netherlands 0.369 million piculs
Hongkong 0.355 million piculs
Denmark 0.340 million piculs
Italy 0.212 million piculs
Belgium 0.145 million piculs
Central America 0.125 million piculs
France 0.030 million piculs
Straits Settlements 0.022 million piculs
Philippines 0.0088 million piculs
Norway 0.0082 million piculs
British India 0.0028 million piculs
Sweden 0.0024 million piculs
United States 0.0012 million piculs
Siam [today's Thailand] 0.00028 million piculs.

Other major export crops were kaoliang, maize, millet, groundnuts, wheat and buckwheat.

Page 714 is all about "Soya beans" which are the most important staple product of the country and has been grown for many years before the opening of Newchwang while some had been exported to the ports of South China. At the time of the Russo-Japanese war (1904-05) the Japanese became aware of the value of the bean, especially of the bean cake for use as fertilizer, but the article did not enter upon its

© Copyright Soyinfo Center 2014

career as an important factor in international trade until 1910 when the Mitsui Bussan Co. made a trial shipment of 100 tons to England. Since then, mainly through the continued experiments of the Central Laboratory, maintained in Dairen by the S.M.R. [South Manchuria Railway], many new uses, have been found for soya bean until today the articles manufactured either wholly or partially from beans, bean oil and bean cake include more than thirty items, among which the following may be mentioned: soy [sauce], sauces, soups, condensed milk, casein, cheese, salad oil, crackers, macaroni, flour, confectionary, glycerine, explosives, enamels, varnishes butter and lard substitutes, edible oils, salad oils, water-proof material, linoleum; paints, soap, celluloid, rubber substitutes, printing-ink, lighting and lubricating oils, etc. Bean cake is also used extensively for fodder and as fertilizer.

"The S.M.R. Agricultural Experiment Station at Kunchuling and elsewhere have through continuous experiments and distribution of superior seeds to Manchurian farmers increased the crops by 10 to 20 percent 'while the oil content of such improved beans have been increased by more than ten percent. The use of these improvements is being advocated by means of poster campaigns and other forms of propaganda, while demonstrations are being carried out to instruct the farmers in new methods. At the same time a new industry of manufacturing beans into oil and cakes has sprung up, the modern methods rapidly replacing the old-fashioned presses.

"Soya bean output in 1934 is as follows:

A large table (p. 718) titled "Output of soya bean" [in Manchoukuo, according to districts] is divided into South and North Manchuria. It shows the following for each district in 1934: Cultivated area (hectares). Output per hectare (kgs.). Output in 1934 (metric tons). Actual output in 1933 (metric tons). Increase or decrease (metric tons). Rate of increase (1933 = 100).

3216. Makino, Tomitaro; Nemoto, Kanji. 1935. Nippon shokubutsu sôran [Flora of Japan]. Tokyo: Shunyô-dô. xix + 1936 p. See p. 571-72. Illust. 23 cm. [Jap]
• ***Summary:*** Early or first proposal of Manchuria as center of soybean origin. "A manual of the flora of Nippon." Note: Tomitaro Makino lived 1862-1957.

3217. Morphy, Marcelle. comp. and ed. 1935. Recipes of all nations. New York, NY: William H. Wise & Company. 824 p. 22 cm. Index at the end of each nation.
• ***Summary:*** Contains recipes from 18-20 nations–each with a thumb cut or thumb index or cut-in index. Soy is mentioned frequently in the chapter on Japan (p. 751-69). "One sauce reigns supreme in Japan–*Shoyu,* which replaces salt in many dishes and which is used in the cooking of almost everything: soup, fish, poultry, meat, and vegetables. It is the popular condiment with cold fish or meat and is added to salad dressing. It is made from the Soya bean seeds, wheat, and pure salt, and has a pleasant and distinctive flavor, unlike that of any of our European bottled sauces."

Soy-related recipes include: Nan yoy kow yook (Broiled pork steamed with Chinese cheese [fermented tofu], p. 737). Misoshiru (miso soup with tofu and miso, p. 755). Misozuke (fish with red or white bean curd and red or white miso, p. 758). Seki han (with azuki beans, p. 759). Suki yaki [Sukiyaki] (beef and vegetables, with tofu and shoyu, p. 761). Yokan (Japanese cakes with azuki beans, p. 762). Misso (miso, homemade with soya beans, malt, and salt, p. 763). Tofu (dried bean curd, p. 763).

Miso is said to be made as follows: "The proportions are 1 bushel of Soya beans, 1 bushel of malt, and 3 bushels of salt. The beans are squeezed and mixed with the malt and salt and kept in a cask for 6 months to mature."

Concerning tofu: "Cubes of tofu are frequently mentioned in Japanese recipes. Tofu is made by soaking the dry beans in water for a day, pounding them in a stone mortar, straining into square molds and mixing with brine. They are then boiled till they become hard and firm." Address: Countess.

3218. Murasaki, Lady (Shikibu). 1935. The tale of Genji. A novel in six parts. Translated from the Japanese [Genji Monogatari] by Arthur Waley. 2 vols. Boston and New York: Houghton Mifflin Co. 1135 p.
• ***Summary:*** Lady Murasaki Shikibu's brilliant 11th century novel colorfully describes the florescence of art and literature in Japan during the Heian period (794-1185). More specifically, these "amorous adventures of the peerless prince Genji" describe the life of Heian court nobility. Reischauer and Fairbank (1960, p. 516-17) call this "the greatest work of all Japanese literature." Fairbank, Reischauer, and Craig (1973) state: "The greatest work [of Heian literature] was the massive *Tale of Genji* by Lady Murasaki [born ca. 978], which recounts with great psychological subtlety and aesthetic sensitivity the life and loves of the imaginary Prince Genji, and in the process gives us a detailed picture of the court life of the time. The *Tale of Genji* has exerted immeasurable literary influence throughout Japanese history and in Arthur Waley's masterful translation has become one of the great world classics."

The Kodansha Encyclopedia of Japan says of the *Genji Monogatari* "By general repute the supreme masterpiece of Japanese prose literature. Written in the early 11th century, when prose literature scarcely existed in the West, it has been called the first great novel in the literature of the world. A very long work, upwards of 1,000 pages in translation, or some three-quarters of a million words, it has an essentially simple plot, describing the life and loves of an erstwhile prince known, from his family name, as 'the shining Genji,' and, after his death, the less successful loves of a youth who passes before the world as his son, but is in fact the grandson

© Copyright Soyinfo Center 2014

of his best friend.

"The earliest surviving texts are fragmentary, from late in the Heian period (794-1185), and it is only from the medieval period (13th -16th centuries) that complete texts can be put together. The absence of a holograph manuscript and the absence as well of detailed information about the author, a court lady known as Murasaki Shikibu, means that no final answers can be given to questions concerning the circumstances of composition. From evidence in the work known as *Murasaki Shikibu nikki* (Murasaki Shikibu Diary), it does not seem possible to deny that at least a part of the work is from the hand of Murasaki Shikibu, or that at least a part of it was written before she entered court service, in the first decade of the 11th century. From the Sarashina Nikki, the diary or memoirs of another court lady, it seems equally certain that a long prose work, approximately the length of the present *Genji,* had been completed and widely circulated by the end of the first quarter of the 11th century." Address: Kyoto, Japan.

3219. Nagata, Hisajirô. 1935. Doitsu to Manshû daizu [Germany and Manchurian soybeans]. Dairen, Manchuria: Minami Manshû Tetsudô K.K., Chihobu, Shokokuka. 166 p. [Jap]*
Address: Minami Manshu Tetsudo K.K., Dairen, Manchuria (South Manchuria Railway Co.).

3220. Nippu JiJi (Honolulu). 1935. Golden jubilee of the Japanese in Hawaii. Honolulu, Hawaii: Nippu JiJi. 10 + 142 p. Illust. [Eng; Jap]*

3221. Ikkyuji. 1935? Ikkyuji ryaku den engi [Ikkyuji fermented black soybeans]. Kyoto, Japan. 3 p. Unpublished manuscript. Undated. [Jap]
• ***Summary:*** At some time during the 1930s, these three documents were donated (apparently by Ikkyu-ki) to the Kyoto Prefectural Library and Archives (Call No. K272 188.85 Sh 99). Since all three were from the same source, the library decided to catalog them together under one call number.

Makiko Kageura, who found these documents for Soyinfo Center, says the they are written in the "old style" and thus a difficult for her to translate into English. She writes: "Shu oh an, or ikkyuji is a sister temple of Daitokuji. So it is said that the Daitokuji natto was originated from ikkyu-ji natto, or takigi natto (the area name of ikkyuji). I can't see the name Daitokuji natto in any of the three documents but I can see 'ikkyuji natto' or 'takigi natto.'" Address: Kyoto, Japan.

3222. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1936. Manchurian soybean situation. 32(3):80-86. Jan. 20.
• ***Summary:*** Contents: Introduction. Quality of the crop. Prices. Destination of exports. Domestic consumption. Outlook for soybean production. Review of the 1934-35 crop year.

Tables show: (1) Soybeans: Area and production in Manchuria, 1929-1935. Production has fallen since a peak of 5,908,493 tons (of 2,000 lb) in 1930. Sources: SMR [South Manchuria Railway] Crop Estimates for 1929 to 1932. The Manchurian Agricultural Crop Investigation Association 1933 to date.

(2) Soybeans in Manchuria, 1929-30 to 1935-36: For each year has six columns: Production. Carry-over from last crop year. Total supply. Exports. Carry-over end of crop year. Home consumption and seed. Source: Shanghai Office, Foreign Agricultural Service.

(3) Soybeans and products: Exports from Manchuria 1929-30 to 1934-35. For each crop year (Oct. to Sept.) has five columns: Soybeans, soybean meal and cake, soybean oil, total exports. Total exports reached a peak of 4,749,958 tons (of 2,000 lb each) and have been decreasing since. Sources: "Compiled in Shanghai office, Foreign Agricultural Service from Chinese Maritime Customs Quarterly Trade Returns 1939-30 to 1931-32; American Consular Reports, Dairen, 1932-33 to 1934-35."

(4) Soybeans and products: Exports from Manchuria, by countries, 1931-32 to 1934-35. Countries: Europe, Japan, China, United States, Others, Total. Europe is the leading importer of soybeans from Manchuria, Japan of [soy] bean cakes, and China of [soy] bean oil.

(5) Soybean and products: Average monthly prices at Dairen in silver yen and United States currency, Oct. 1932 to Nov. 1935. Source: *Finance and Commerce* (a Shanghai weekly trade journal).

3223. Shinozaki, Yuichi; Kagawa, S.; Sato, M. 1936. Studies on the high pressure hydrogenation of soya bean oil. V. On the preparation of light hydrocarbon oil. *J. of the Society of Chemical Industry, Japan* 39:22B. Jan. Supplemental binding to Kogyo Kagaku Zasshi. [Eng]
• ***Summary:*** A catalyst was essential for the production of a transparent light oil at > 430ºC by this process. Higher initial pressures of hydrogen favored the reaction, which was complete in 1 hour. Experiments with stearic acid and various catalysts (zinc, copper, nickel, iron, and chromium salts) showed that nickel (not less than 3%) gave the best results, the product having density less than 0.7 and 90% of it distilling at < 200ºC. Address: Dep. of Organic Chemistry, The Central Lab., South Manchuria Railway Co., Dairen, Manchuria.

3225. Bansei: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1936. Seed color: Yellow (straw), hilum pale/colorless to light brown.
• ***Summary:*** Sources: Morse, W.J. 1936. Re: Chusei and Bansei soybean varieties, and making soy milk. Letter to Dr. John Harvey Kellogg, Miami Springs (Miami), Florida, March 7. "I have your letter of February 13... Concerning variety 81031, which I wrote you had given such good results in making a high quality milk, we have given the varietal name Bansei to this number. I think that we shall be able to furnish you with 4 or 6 pounds of seed and I feel that it should mature in ample time at Battle Creek."

Morse, W.J. 1936. "Re: Evaporated soymilk, soybean varieties, and green vegetable soybeans." Letter to Dr. John Harvey Kellogg, The Miami-Battle Creek, Miami Springs, Florida, March 26. 2 p. "I have your letter of March 9 and with reference to the Bansei soybean, I will say that we will try to spare you as many pounds as possible." There are no longer large sources of either the Chusei or Bansei soybean in this country at present... we obtained the seed from The Yamato Seed Co., Tokyo, Japan. The Bansei was obtained from them under the name *Bansei O Sayada Mame* [probably *Bansei O Saya Eda Mame*] and the Chusei under the name *Chusei O Saya Eda Mame.* Note 1. In Japanese, *Bansei* and *Chusei* mean "late grower or late development" and "medium grower or medium development" respectively. Interestingly, Morse (1938, p. 32) reported that both varieties mature in the same time–110 days. *O Saya* means "large pod." *Eda Mamé*–pronounced ay-dah-MAH-may–means "green vegetable soybean." Note 2. Kellogg apparently wrote Morse first on 9 March 1936 to ask about the Bansei soybean.

Morse, W.J. 1936. *Soybean introductions named in January 1936.* Washington, DC: USDA, Bureau of Plant Industry, Div. of Forage Crops and Diseases. 2 p. April 7. See p. 1. F.P.I. No. 81031. Name: Bansei. Seed color: Straw yellow. Maturity: 110 days. Use: Green vegetable and dry edible bean. States grown: Northern and North Central.

Morse, W.J. 1938. "Edible varieties of soybeans." *Proceedings of the American Soybean Assoc.* p. 30-33. A table (p. 32) shows: F.P.I. No.: 81031. Days to ripen: 110. Seed color: Straw yellow. Hilum: Pale. Seeds per lb: 1,936. Oil and protein content (moisture-free basis): 21.72% and 39.12%. Use: Dry edible or green vegetable.

Lloyd, J.W.; Burlison, W.L. 1939. "Eighteen varieties of edible soybeans: Their adaptability, acceptability, culture and characteristics." *Illinois Agric. Exp. Station, Bulletin* No. 453. p. 385-439. March. See p. 394-97, 413, 423.

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 8-9. Bansei is in the USDA Germplasm Collection. Maturity group: II. Year named or released: 1936. Developer or sponsor: USDA. Literature: 07, 11. Source and other information: 'Banseiosayada Mame' from Sapporo, Japan, in 1929. Prior designation: PI 81031. Address: USA.

3226. Chusei: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1936. Seed color: Yellow (straw), hilum yellow.
• ***Summary:*** Sources: Morse, W.J. 1936. Re: Chusei and Bansei soybean varieties, and making soy milk. Letter to Dr. John Harvey Kellogg, Miami Springs (Miami), Florida, March 7. "I have your letter of February 13 with regard to the variety of soybean which you have been increasing at Battle Creek [Michigan] for the past three or four years. The sample of beans was recently received from Battle Creek and in checking it over with our samples I find that it is identical with the type we are now calling Chusei. I may say that the seed is now being distributed under this varietal name.

Morse, W.J. 1936. "Re: Evaporated soymilk, soybean varieties, and green vegetable soybeans." Letter to Dr. John Harvey Kellogg, The Miami-Battle Creek, Miami Springs, Florida, March 26. 2 p. "I have your letter of March 9 and with reference to the Bansei soybean, I will say that we will try to spare you as many pounds as possible." There are no longer large sources of either the Chusei or Bansei soybean in this country at present... we obtained the seed from The Yamato Seed Co., Tokyo, Japan.

Morse, W.J. 1936. *Soybean introductions named in January 1936.* Washington, DC: USDA, Bureau of Plant Industry, Div. of Forage Crops and Diseases. 2 p. April 7. See p. 1. F.P.I. No. 80472 (19976). Name: Chusei. Seed color: Straw yellow. Maturity: 110 days. Use: Green vegetable and dry edible bean. States grown: North and North Central.

Morse, W.J.; Cartter, J.L. 1937. "Improvement in soybeans." *Yearbook of Agriculture* (*USDA*). p. 1154-89. For the year 1937. See p. 1163. "In Japan, certain varieties of soybeans were found that were used solely as green shelled beans... The vegetable soybean offers an excellent food of high nutritional value, especially in the fall when other green beans are lacking... As a result of selection, cooking tests, and adaptation studies, eight green vegetable varieties... have been introduced in various sections of the country." One of these is Chusei.

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 8-9. Chusei is in the USDA Germplasm Collection. Maturity group: III. Year named or released: 1936. Developer or sponsor: USDA. Literature: 07, 11. Source and other information: 'Chusei O Saya Eda Mame' from Tokyo, Japan. Prior designation: PI 80472. Address: USA.

© Copyright Soyinfo Center 2014

Typed, without signature (carbon copy).
• ***Summary:*** Dr. Kellogg thanks Morse for his letter or March 7. "I am very glad to know about the Bansei bean. I shall be greatly pleased if you will send me as many pounds as you can of this seed and tell me if it is possible for me to get a larger quantity for planting this year.

"We are using very considerable quantities of soy beans for milk and at the rate it is increasing will soon be requiring about a ton a week.

"I am anxious to get started with your new bean as raw materials as soon as possible. I should also like to know whether the bean you call Chusei can be obtained in quantity for seed. I am hoping to plant two hundred acres of this bean this year to be used chiefly as a shell bean for canning. Can this be obtained in quantity either in this country or in Japan? Can the Bansei bean be obtained in Japan? I should also like to know if you can give me information about a bean which I am purchasing through a local agency here under the name of Tokyo. It comes from Norfolk here and I am informed that it is imported direct from Japan."

"I consider the soy bean one of the most remarkable of the world's food products and expect to make increasingly large use of it. I have been experimenting with it for many years, but have made rather slow progress because of the multiplicity of other matters requiring my attention. I think from now on I shall make much more rapid progress.

"Could you tell me if anyone has succeeded in making a satisfactory dry evaporated soy milk which will keep?

"Hoping I am not troubling you too much, I am

"Sincerely yours," Address: Miami, Florida.

3228. Morse, W.J. 1936. Re: Evaporated soy milk, soybean varieties, and green vegetable soybeans. Letter to Dr. John Harvey Kellogg, The Miami-Battle Creek, Miami Springs (Miami), Florida, March 26. 2 p. Typed, with signature.
• ***Summary:*** "I have your letter of March 9 and with reference to the Bansei soybean, I will say that we will try to spare you as many pounds as possible." There are no longer large sources of either the Chusei or Bansei soybean in this country at present... we obtained the seed from The Yamato Seed Co., Tokyo, Japan. The Bansei was obtained from them under the name *Bansei O Sayada Mame* [probably *Bansei O Saya Eda Mame*] and the Chusei under the name *Chusei O Saya Eda Mame."*

Note: In Japanese, *Bansei* and *Chusei* mean "late grower or late development" and "medium grower or medium development" respectively. *O Saya* means "large pod." *Eda Mamé*–pronounced ay-dah-MAH-may–means "green vegetable soybean."

"The sample of seed which you enclosed is the Tokyo variety and has been grown in this country for many years. During the past two or three years it has increased to a considerable extent especially in North Carolina, Tennessee, and Mississippi. It is not imported from Japan. All of the seed which is in this country was grown in the states mentioned above. It may interest you to know that in North China and southern Manchuria this light, greenish yellow bean is used in the manufacture of bean milk and bean curd. I am quite sure that you will have no difficulty in obtaining almost any quantity of Tokyo through North Carolina growers and seed dealers... In North Carolina and Virginia you can obtain the Tokyo through the following: T.W. Wood & Sons, Richmond, Virginia, Geo. Tait & Sons, Norfolk, Virginia, The Buxton White Seed Co., Elizabeth City, North Carolina, and F.P. Latham, Belhaven, North Carolina."

"Mr. J.H. Strawser of the Washington Sanitarium, Takoma Park, Maryland, sent me one of the nicest samples of evaporated soy milk that I have ever seen... I understand that Dr. Miller, who is associated with the Missionary College and now stationed in China, has one or two factories producing this soy milk powder. While Mr. Strawser was experimenting with the milk I understood that the soy milk was evaporated through the regular process used in evaporating cow's milk."

Note: This is the earliest document seen (Aug. 2013) concerning the work of Dr. Harry Miller with soyfoods or soy milk.

"The Seaboard Airline Railway, at its experimental farm near Hamilton, North Carolina, has been testing some of our green vegetable soybean varieties. Last year they froze some of the beans and have been sending samples to various places. From all reports it is evident that the frozen bean is a most excellent food product."

Note: This is the earliest document seen (March 2001) concerning the work of a small Seventh-day Adventist food company (the Washington Sanitarium, Takoma Park, Maryland) with soyfoods. Address: Senior Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, USDA, Washington, DC.

Address: USA.

3240. Morse, W.J. 1936. Soybean introductions named in January 1936 (Leaflet). Washington, DC: USDA, Bureau of Plant Industry, Div. of Forage Crops and Diseases. 2 p. April 7.
• ***Summary:*** A table (p. 1-2) lists the following 25 soybean varieties, sorted by F.P.I. numbers. For four varieties, the FC (forage crop) number is given in parentheses after the F.P.I. number: Georgian, Palmetto, Monetta, Creole, Waseda, Osaya, Chusei (FC 19976), Chame (FC 19977), Higan (FC 19978), Sousei (FC 19979), Goku, Rokusum [Rokusun], Fuji, Bansei, Shiro, Hakote, Sato [black seeded], Kura [black], Kanro, Hokkaido, Hiro, Toku, Jogun, Suru, Nanda.

For each variety the following information is given: F.P.I. Nos., seed color, days to maturity, use, and states grown (such as southern, north and north central, etc.). Use codes: G = Grain. F = Forage. G.V. = Green vegetable. D.B. = Dry edible bean. Color codes: S.Y. = Straw yellow. O.Y. = Olive yellow. Gr. = Green. Bl. = Black. Br. = Brown. Note: Black soybean varieties are Sato, Kura, and Hiro.

An attached page, titled "Soybeans named in January, 1936," by W.J. Morse, lists 21 soybean varieties in a 3-column table, along with the F.P.I. numbers and (in some cases) the FC [forage crop] number in parentheses. All of these varieties appear among the 25 varieties listed above.

Note 1. This is the earliest document seen (Aug. 2013) that mentions the following soybean varieties: Chame, Fuji, Goku, Hakote, Higan, Hiro, Hokkaido, Jogun, Kanro (in USA), Kura, Nanda, Osaya, Sato, Shiro, Sousei, Suru, Toku, and Waseda.

Note 2. This is the earliest document seen in which soybeans are classified by use as "green vegetable" or "dry edible bean" or both. The difference between the two is not explained. Eight varieties are classified as "green vegetable" only: Chame, Hakote, Hiro, Kura, Nanda, Sato, Sousei, and Waseda. Twelve varieties are classified as both: Bansei, Chusei, Fuji, Higan, Hokkaido, Jogun, Kanro, Osaya, Rokusun, Shiro, Suru, and Toku. No varieties are classified only as "dry edible bean." By "dry edible bean" Morse apparently means that this variety is suited to be made into various types of food. The next year, in the 1937 *USDA Yearbook of Agriculture* Morse and Cartter, in an article titled "Improvement in Soybeans" state (p. 1163): "Experiments by commercial firms have shown that these varieties are superior to commercial varieties for the manufacture of food products, such as bean flour, roasted beans, bean milk [soy milk], and bean curd [tofu]." Address: Div. of Forage Crops & Diseases, Bureau of Plant Industry, USDA [Washington, DC].

3241. Osaya: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1936. Seed color: Yellow (straw), hilum yellow.
• ***Summary:*** Sources: Morse, W.J. 1936. *Soybean introductions named in January 1936.* Washington, DC: USDA, Bureau of Plant Industry, Div. of Forage Crops and Diseases. 2 p. April 7. See p. 1. F.P.I. No. 80465. Name: Osaya. Seed color: Straw yellow. Maturity: 115 days. Use: Green vegetable or dry edible bean. States grown: North Central.

Morse, W.J. 1938. "Edible varieties of soybeans." *Proceedings of the American Soybean Assoc.* p. 30-33. A table (p. 32) shows: F.P.I. No.: 80465. Days to ripen: 115. Seed color: Straw yellow. Hilum: Brown. Seeds per lb: 1,792. Oil and protein content (moisture-free basis): 18.14% and 46.30%. Use: Dry edible or green vegetable.

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 16-17. Osaya is in the USDA Germplasm Collection. Maturity group: III. Year named or released: 1936. Developer or sponsor: USDA. Literature: 07, 11. Source and other information: 'Chusei O Saya Eda Mame' from Tokyo, Japan, in 1929. Prior designation: PI 80465. Address: USA.

© Copyright Soyinfo Center 2014

England. *J. of the Ministry of Agriculture* (*Great Britain*) 43(1):24-30. April. [4 ref]

• ***Summary:*** Cultivation of maize and the soya bean in England began at a relatively late date. "Much important work on selection and hybridization of these crops has been done by Professor W. Southworth, formerly of the Manitoba Agricultural College [in Canada], and now of the Rothamsted Experimental Station." Some 30 years ago [about 1906-10] Professor [James] Hendrick tried to grow the soya bean at "Aberdeen [Scotland], using Manchurian seed; in the greenhouse a few plants grew and even flowered, but they never produced seed, while in the open the seeds hardly germinated.

"Further south, at Kingston and Kegworth in the Midlands, Mr. Golding obtained better results with Japanese seed, and indeed he used the plant for some of his pioneering investigations on nitrogen fixation by leguminous plants, working with a culture supplied by Hiltner, then of Munich [Germany]. Although it was useful for laboratory investigations the crop held out little promise to the practical farmer. Similar negative results were obtained by Sir Rowland Biffen at Cambridge. A summary of these tests was given in this Journal in April, 1912 (p.33). A little later in the summer of 1912 and 1913, soya bean was tried at the Woburn experimental farm, but although the seed germinated satisfactorily and the plant grew, as in Mr. Golding's experiments, only a few pools were produced, and it was clear that the varieties tested were useless to this country. Still further south, in the old Royal Botanic Society's Gardens, Regent's Park, Mr. J. L. North, the Curator, was more successful than any of his predecessors: he began in 1914 and within a few years was growing a number of varieties and found some that ripened seed ready for harvesting in September. A brown variety seemed so promising that by 1929 it was taken up for further trial by the National Institute of Agricultural Botany and by Messrs. Sutton and Sons. Meanwhile Mr. North received other varieties from Professor McRostie, of Ontario [Canada], and these were included in his trials-but they all failed.

"This brown variety had been obtained by Professor Southworth about 1916 at the Manitoba Agricultural College, and was fully tested and ready for distribution by 1922. It was a selection from Ogemaw, a hybrid between an early black and a dwarf brown variety produced by E.E. Evans at West Branch, Michigan, in the opening years of the present century. Like all hybrids, it is variable, and Professor Southworth's selection differed in such important respects from the parent material that it was issued as a distinct variety under the name Manitoba Brown. This was sent to Mr. North and grown by him: he described it in the *Quarterly Summary* of the Royal Botanic Gardens, for April, 1929, as having 'in the course of seven years' trials here proved to be not only the most reliable cropper, but the earliest of any of the sixty varieties of soya tested by me for growth in this country for the last fourteen years.' Although Mr. North gives no estimate of yields he quotes Messrs. Chivers' estimate of 12 to 15 cwt. [1 cwt = hundredweight = 112 pounds] of grain per acre, and soya beans sold at that time at £13 per ton. Mr. North states also that the soya bean has been grown successfully in the Home Counties, Oxfordshire, Hampshire and the Channel Islands, but gives no figures of yields in any of these places. The National Institute of Agricultural Botany grew it in 1924, 1925, and 1926 from Mr. North's seed, and each year had a fair crop of seeds: in 1928 large plots were grown and the yield was estimated at 900 lb. per acre without inoculation and 1,150 lb. per acre with inoculation. The results seemed so promising that half an acre was sown in 1929, but the plants ripened irregularly and produced little seed. The trial was then discontinued."

Mr. North continued his trials and "was fortunate in enlisting the sympathy of Mr. Henry Ford, who in 1932 had purchased some 2,000 acres of agricultural land at Boreham in Essex and proceeded to sow some Michigan varieties of soya bean. These failed, but in the meantime Mr. Ford discovered Mr. North, who furnished him with the above variety and three others, and these have been grown since 1933... Meanwhile in 1932 Professor Southworth, the originator of the most successful of these varieties, had retired from the Manitoba Agricultural College and joined the Rothamsted Staff. He started growing his best selection at the Woburn Experimental Farm... Professor Southworth himself has been growing the crop both at Rothamsted and at Woburn since 1934." Cultures for inoculating soya beans are obtainable from Messrs. Allen and Hanbury, 3 Colts Lane, Bethnal Green, London, E.2.

Note 1. This is the earliest document seen stating that the soya bean was grown at Rothamsted, the world's first agricultural experiment station, established in 1843.

Note 2. This document contains the earliest date seen for soybeans in Scotland, or the cultivation of soybeans in Scotland (About 1906-1910). The source of these soybeans is unknown (One of two documents).

Note 3. This is the 2nd earliest document seen (March 2010) concerning soybeans in the Channel Islands, or the cultivation of soybeans in the Channel Islands. This document contains the 2nd earliest date seen for soybeans in the Channel Islands, or the cultivation of soybeans in the Channel Islands (April 1936). The source of these soybeans was Mr. North. Address: Sir, D.Sc., F.R.S., Director, Rothamsted Experimental Station [England].

3243. Sato: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1936. Seed color: Black, hilum black.

Year named or released: 1936. Developer or sponsor: USDA. Literature: 07, 11. Source and other information: 'Wase Eda Mame' from Tokyo, Japan, in 1929. Prior designation: PI 80461-1. Address: USA.

3249. Karasawa, Kotaro. 1936. Crossing experiment with Glycine soja and *G. ussuriensis. Japanese J. of Botany* 8(2):113-18. May 31. With 3 photos. [5 ref]
• ***Summary:*** The cultivated soy bean might have been derived from the wild soybean (*Glycine ussuriensis*) through the accumulation of qualitative and quantitative changes due to gene mutation, unaccompanied by any chromosomal change. *Glycine soya* has 40 chromosomes. Address: Biological Inst., Furitsu Koto-Gakko, Muguro, Tokyo.

3250. Iwata, Hisayoshi. 1936. [Comparison of nutritive value of fodder protein]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 12(5):415-20. May. (Chem. Abst. 30:7153). English language summary bound in the front of this volume, p. 58. [19 ref. Jap; eng]
• ***Summary:*** "The nutritive value of proteins in protein rich fodders, such as sardine cake, soy bean cake, extracted soy bean [meal], rape seed cake, sesam [sesame] cake, wheat bran and rice bran and their mixtures, were experimentally compared by feeding young albino rats." For the purpose of finding the correlation between the nutritive value of protein and its amino acid composition, the latter was also examined. Address: Imperial College of Agriculture and Forestry, Morioka, Japan.

3251. Mogi, Masatoshi. 1936. Miso jôzô ni kansuru saikin no kenkyû. II. [Studies on the microorganisms in the manufacture of "miso." II.]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 12(5):367-77. May. English-language summary in Bulletin of the Agricultural Chemical Society of Japan 12(5):54-55, bound at the front of Nippon Nogei Kagaku Kaishi. [1 ref. Jap; eng]
• ***Summary:*** The soluble breakdown products of starch and protein in miso may be produced equally well by bacteria or by koji molds. Three experiments were made using the aerobic bacteria isolated from miso: (1) Diastatic and starch liquefying power. (2) Liquefying power of gelatine (all the bacteria liquefy gelatine). (3) Liquefying power of "Tofu" (The degrees of liquification are not always parallel to the liquefying power of gelatine). Address: Nôgakushi, Brewing Laboratory, Noda Shoyu Co. Ltd., Noda-machi, Chiba-ken, Japan.

3252. Udo, Shigezo. 1936. Nattô no seibun ni tsuite. I. Nattô-chû ni jibikorin-san no sonzai to sono eikyô [Studies on the constituents of natto. I. On the occurrence of dipicolinic acid produced in natto and its influence]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 12(5):386-94. May. (Chem. Abst. 30:6887). English-language summary in Bulletin of the Agricultural Chemical Society of Japan 12(5):55-56, bound in the back of Nippon Nogei Kagaku Kaishi. [8 ref. Jap; eng]
• ***Summary:*** Udo isolated an organic acid from the ether soluble fraction of natto and identified it as dipicolinic acid. He also found that this acid did not exist in the soybean and was produced by *B. subtilis* (*natto*) at concentrations of 0.3% to 0.8% and that this acid prevented the growth of many microorganisms.

Accumulation of dipicolinic (pyridine-2,2'-dicarboxylic) acid to a concentration of 1.2-1.5% completely suppresses the growth of *Bacillus natto,* which is also partly inhibited by the viscous substance produced around the soya-bean grains. The growth of *B. subtilis* and of *Penicillium glaucum* is also inhibited by dipicolinic acid. Address: Morioka Koto Norin Gakko, Nogei Kagaku Kyoshitsu (Agricultural College of Morioaka, Japan).

June 4. p. 11.

• ***Summary:*** Contents: Introduction and early history in China. Teaches proper methods. Clipper first to export soybeans. Civil war "coffee." Introduced as a legume. Extra dividend.

"How far back man began to cultivate the soybean plant no one knows–one authority estimates 25,000 years. Ethnologists tell us that the original Chinese wandered down from the Tarim basin and settled in the fertile valleys of the Yangtze and Huai rivers. There, where wild soybeans grew in abundance, flourished for centuries a family type of civilization which consistently repelled the attack of hungry barbarians from the south and north.

"This fact alone typifies the breadth of soybean usage.

"The 'little honorable plant,' in which Chinese legend places one of the invisible Gods, provided food products to serve all the needs of the family group and made it possible for the Chinese to enter into agricultural society without going through a pastoral stage of development. Chinese students tell us their civilization was in existence for centuries before Sin Jen, the 'fire-producer' who learned to kindle fire from watching a bird make sparks by pecking at a tree (and by the discovery got himself accepted as king about three thousand years before Christ), began to teach his people the arts of pastoral life–hunting, fishing, gathering of fruits and domestication of animals.

"About two hundred years later Emperor Shen Nung, the third of a line firmly seated in the king's chair through a series of inventions (as musical instruments, a system of writing, a counting method and a calendar), branched out a bit to write the first Chinese remedy book. This materia medica contained over 300 remedies made from soybeans and is the earliest written record of the soya max."

"Clipper First to Export Soybeans: In 1804, a wandering New England clipper ship, whose Presbyterian master canvassed the Chinese sea coast for a return cargo without success, bunkered several bags of soybeans for a coffee substitute and a food reserve. This was the first time the soybean went abroad. Note: This is the earliest document seen (Aug. 2002) that embellishes the myth of the "clipper ship" with phrases like "Presbyterian master" "canvassed the Chinese coast for a return cargo" "bunkered several bags of soybeans for a coffee substitute and a food reserve"–all supposedly in connection with the introduction of the soybean to the United States.

"The seeds found their way into the hands of botanists who were very much interested in the trifoliate leaves of the plant. Soon every self-respecting botanical garden–which were the fad of those days–exhibited at least one 'oriental' plant. Apparently, no interest was taken in the cultivation of the soybean, which is not surprising, for the American pioneer was ever reluctant to experiment with new crops. Several of the plants indigenous to the Americas were first cultivated in Europe and the seeds imported years later when the crop began to find acceptance in its homeland.

"When, following the religious missionaries, traders came looking for the products which only China then could produce, as tea, opium and silk, the soybean was completely overlooked.

"Two years after the first group of foreign treaties were signed, near the middle of the last century, an English captain of a Danish tramp freighter, filled the voids in his hold with a few bags of beans and a quantity of soybean cakes, then a commodity regularly traded in the street markets of China."

"No one in England would take any interest in the meal much less in the yellow beans and the captain set about planting some of the beans with, as it has been reported, a Scottish oath to demonstrate the merits of the crop to all England. But his garden was gone for decades before any real interest was taken by Englishmen."

"Civil War 'Coffee': During the Civil War, Union soldiers were fed a coffee which they disliked. It tasted like coffee but did not stimulate or keep them awake as the black coffee which they had back home. The substitute coffee was made from soybeans smuggled through the lines of a blockade by the English who, through their shipping facilities, then controlled the movement of coffee from South America.

"Most of the Union soldiers returned from the war with a hatred of the 'so-so' beans which was only exceeded by their dislike of the quarter-master's department. A Union veteran, now ninety-four years old, recently said, when asked about the soybean, 'I won't have them on my farm. I still can taste that darn coffee we had to drink in the army.'

"When the Japanese, just newly initiated to western methods and under the press of food needs, invaded the Asiatic continent near the end of the last century, one of the first spoils of war sent home, consisted of quantities of soybean seeds and the food products of the plant.

"The production of soybeans in Japan rose so rapidly that, by the time of the Boxer uprising and the crash of the Manchus, the versatile bean was one of the principal food crops of the island empire and exports of the derived products had absorbed enough of the foreign market to bring hard times to Chinese farmers." Address: Staff member, Chicago Journal of Commerce.

• ***Summary:*** "Professor Tasasu Saiki, director of the Imperial Government Institute for Nutrition in Tokyo, broadcasts recipes for concentrated food, and he is paving the way for a peaceful revolution in Japan, the revolution of nutrition." "Dr. Saiki also is preparing for time of war." Recipes include Grasshoppers "served with soy-bean sauce..." He was formerly attached to the League of Nations Health Office at Geneva.

3256. Kaltenbach, D.; Legros, J. 1936. Soya: Selection, classification of varieties, varieties cultivated in various countries: Western Europe (Document part). *Monthly Bulletin of Science and Practical Agriculture* (*International Institute of Agriculture, Rome*) 27(6):216T-28T. June.
• ***Summary:*** "1. Germany. In spite of numerous attempts extending over a long period of time, and particularly since 1920, soya cultivation in Germany has remained in the experimental stage. From a practical standpoint it cannot be said that economic cultivation of soya exists...

"All the varieties introduced for trial have failed as they were not adaptable to the climatic conditions of the country. Certain growers, however, (Schurig at Stedten; Brandt at Gierdorf; Heinemann; Winkler, etc.) and several professors of State Institutions (Professor Riede of the Bonn University; Professor Sessous of the Giessen University; Professor Berkner of the Breslau University; Dr. Heinze of the Chamber of Agriculture of Halle) have carried out breeding work and have obtained lines superior to the varieties which were used as the point of departure. These lines are at present being tested in various regions in Germany.

"Several varieties have been obtained by the botanical station of the Higher School of Agriculture of Bonn-Poppelsdorf:

"Yield per hectare of Bonn 373 is 20.9, and yield per hectare of Bonn 456 is 19.1.

"2. Austria. Soya cultivation was introduced in 1870 by F. Haberlandt. Since that time breeding work and tests in acclimatisation have been carried out at various times. The most important work of this kind was started in 1923 by Dr. Fritz Drahorad and his assistant M.F. Brillmayr [Brillmayer]. Trials were made with 28 varieties in various parts of the country and the results centralized at Platt (Lower Austria) at the Leguminous Plant Breeding Station dependent from the Federal Station of Plant Cultivation and Seed Selection. In this way early varieties were bred at Platt with a growth period of 110-125 days.

"The principal varieties bred are: Platter Schwarze Soja, Platter Kleine Gelbe Soja, Platter Gelbe Riesen.

"In Austria the only varieties that may be cultivated with success are those selected in the country which have a growth period of from 130 to 145 days at the most.

"3. France. Soya was introduced into the Botanical Garden at Versailles in 1740. Several trials in cultivation have been made since 1855. L. Rouest in Aude and Charles de Carbonnières, in Tarn, carried out test of some importance from 1918 to 1925. But it was not until 1932 that the first scientific investigations were made on the possibilities of acclimatising soya in France. These researches were carried out chiefly by M.H. de Guerpel, in Basse-Normandie. The results obtained in the first year were so encouraging that it was decided to sow 5 hectares of soya in ten communes in Normandy, the principal being: Cagny, Saint-André-sur-Orne, Vieux-Fumé, Percy-en-Auge, Villons-le-Buissons, Saint-Contest, Beny-sur-Mer. The seed was taken both from the harvest of the previous year and also from seed from Poland... Yields varied from 1400 to 1800 kg per hectare.

"Another trial was made with a variety with yellow seed from Manchuria.

"In 1934 trials were made in the Department of Eure with the variety Tokio with black seeds.

"4. Great Britain (and Colonies). One of the first tests in acclimatisation of soya in Great Britain took place at the Royal Botanical Garden, Regents Park, in 1914. During these tests Mr. North found that certain varieties were sufficiently early to mature at the end of September. By careful selection with these varieties for several years lines were obtained which were particularly early. In 1928, a hybrid was introduced from Canada which proved to be earlier than any of the 60 varieties tested up to that time. By sowing the seed the first week in May it was possible to harvest the beginning of September. Good results were obtained in Middlesex, Essex, Berkshire, Oxfordshire and Hampshire.

"The most important researches were made at Boreham in Essex in 1933 where 47 varieties were grown originating from North America, Canada, Manchuria and Japan. Trials were also made with the varieties already bred by Mr. North. Interesting results were obtained.

"The investigations were continued in 1934 with the 4 best varieties acclimatised, known as Jap, 'C,' 'O,' and 'J.'

"6. Italy. Sporadic trials in soya growing were made in Italy from 1740 to 1880, but it was chiefly at the beginning of this century that an attempt was made to introduce this crop into the national economy. Soya has been the object of patient and continuous research at the Bonafous Institute in Turin, where two varieties were selected, well adapted to the region, one with yellow and the other with green seeds, large and spherical in shape. In the district of Spoleto, the Marquis G. Marignoli obtained good results, in 1926, with this plant and is of the opinion that soya cultivation for seed production would be completely successful in Puglia and the

© Copyright Soyinfo Center 2014

South. He found that the American variety Mammoth Yellow is easily acclimatised in Central Italy and he has undertaken mass selection of this variety which is of great importance on account of its precocity and yields. In respect of forage production, he has successfully experimented with a variety with green seeds which, owing to its great development, is doubtless the same as the variety that gave good results in Piedmont. According to information received from the Director of the Travelling Chair of Agriculture of Cagliari, similar trials have been made in the Sanluri farm and certain other private farms. In 1928, a Yellow Japanese variety gave 3.3 quintals of seed per hectare at Sanluri. This same variety, grown at Santa Margherita di Pula, only gave 2.3 quintals. At Simacis, in 1919, a light coloured variety of soya yielded 3 quintals per hectare. In the experimental plots of the Faculty of Agriculture of the Perugia University, small trials have been made with 4 varieties of soya which had already been tried and selected before the war by Professor Bottari at the Bonafous Agricultural Institute. Note: 1 quintal = 100 kg.

"Soya was grown for the first time at the Agricultural Station of Bari in 1921. Seeds obtained from Professor Borzi were used. This variety proved to be very productive, but rather late. In the following years Professor Pantanelli, Director of the Station, procured 45 varieties from the United States and India.

"7. Netherlands. Soya growing is not widespread in the Netherlands and only small trials in acclimatisation are carried out. It is not yet known whether soya can be grown on a remunerative basis in the humid climatic conditions of this country.

"10. Switzerland. The first trials in soya growing in Switzerland date back to the time of the Universal Exhibition of Vienna in 1873, in fact, a great quantity of soya seeds belonging to different Manchu varieties were shown. In 1878, Professor Haberlandt, who had carried out cultivation trials in various countries in Europe, made a few tests in the town of Coire [Chur]. A little later, Professor Kraemer made a few trials in Zurich for three years and published a pamphlet in 1880 giving the results obtained. In practice, soya growing had not developed and it is only recently that further efforts in soya cultivation have been made.

"At present trials are carried out solely by the Establishment of Agricultural Research of Oerlikon-Zurich, foreign varieties being the principal object of study. There are no native Swiss varieties. The first varieties tried were those obtained by the German breeder Dieckmann at Hamburg. Late an Austrian variety was introduced: Platter Gelbe Riesen, and a whole series of American varieties obtained from Professor Wiggans of the Cornell University, Ithaca. Finally, 3 Polish varieties from Vilna were introduced which, it appears, came from the Botanical Garden of Basle [Basel, Switzerland]...

"*Soya grown for seed:* There are also wide variations in seed yields. With the 22 varieties tested in 1935, they varied from 1.5 to 16.5 quintals per hectare.

"In Switzerland, forage production is the principal object of soya growing. There are, however, factories which are interested in soya for the production of foods for persons suffering from diabetes. Local production of soya cannot compete with the present imports from abroad." Address: Rome, Italy.

3258. Breedlove, L.B. 1936. Soy bean–The magic plant: Grower, elevator, transportation and processing cost. Article XVI. *Chicago J. of Commerce and La Salle Street Journal.* July 9. p. 14.

• ***Summary:*** Contents: Introduction (profitability and acreage expansion from 1921 to 1930). Costs of soy bean production. Elevator costs. Transportation costs. Cost of processing. Capital costs of plant.

"From 1921 to 1930 soy beans were less profitable on the better land of the corn belt than were corn, wheat, alfalfa, or red clover...

"During the 20's the expansion in soy bean acreage occurred largely at the expense of the two less profitable crops–timothy and oats...

"Since 1930 the mill demand for soy beans steadily has grown. The fall in farm labor and power costs, the decline in land values, the use of higher yielding varieties and improvement in cultural methods have combined to reduce the costs of production sufficiently to make soy beans for the crushing or commercial market profitable to the farmer even in the face of the tremendous increase in acreage due largely to federal limitations of acreage for the growing of our usual grain crops."

"Cost of processing: Cost of processing a bushel of beans was reported by the United States tariff commission to be in 1923-1924 27.1 cents (factory costs 17.1 and general expense 10.0 cents). The processing cost in the Japan mills was 17.8 cents, at the mills of Great Britain 15.3 cents and at the mills of Dairen, Manchuria, 8.5 cents [by far the lowest, and only 31% of the U.S. processing cost]. The import duties of $6 per ton for meal, $1.20 a bushel for beans and $0.03½ a pound for oil, established by the traffic law of 1930 have been continued in the latter traffic schedules." Address: Staff member, Chicago Journal of Commerce.

• ***Summary:*** Contents: Introduction. Methods of germination of soy-bean seeds. General analysis of nitrogenous compounds of the seeds and the seedlings by general analysis. Quantitative determination of amino-acids in the proteins of the seeds and the seedlings by the Van Slyke method. Amino-acids isolated from the hydrolysate of the protein of the seeds. Organic bases of the seeds. Monoamino-acids and acid-amide in the juice of the etiolated seedlings. Organic bases in the juice of the etiolated seedlings. Transformation of carbohydrates during germination. Starch produced during germination. Transformation of oil during germination.

Sasaki investigated the changes in composition occurring in Japanese and Korean soybean varieties during germination up to 12 days. There was no change in total nitrogen at the end of 5 and 10 days. However after 5 days, a decrease of 21% in protein nitrogen and a corresponding increase in non-protein nitrogen was observed. After 12 days of germination, 5% of the starting soybean weight was isolated as asparagine; this is in agreement with the results obtained by Dunn et al. (1948).

The total carbohydrates increased from 22.6% in the seed to 25.8% by the 5th day, based on the starting weight of the seed, and then decreased slightly to 25.1% by the 10th day. Stachyose and sucrose were used up during the first 5 days, at which time reducing sugars reached a maximum of 4.7% and then decreased. Starch and dextrin increased steadily from 0.4to 9.0%, based on the starting seed weight, during the first 10 days of germination. Petroleum ether extractables [fat] had decreased 17.0% by the 5th day and 37.0% by the 8th day of germination. From this study it appears that during the first 5 days of germination the loss in oil weight is equivalent to the gain in carbohydrate weight. Address: Dep. of Agriculture, Kyushu Imperial Univ., Japan.

3264. *Literary Digest.* 1936. Invading bean: Soya crops exported from America give Japanese case of jitters. 122:14-15. Aug. 8.
• ***Summary:*** The increase in American production of soybeans and their exportation at lower prices than the Manchukuo product are discussed. The uses for the crop in American industry are brought out, and it is said that "Manchukuo's production has dropped from 5,227,000 tons in 1931 to 3,822,00 tons in the last twelvemonth; and even the America's invasion of the world market may be, as the Japanese hope, only temporary, it has shaken them terribly."

countries: Netherlands Indies (Document part). *Monthly Bulletin of Science and Practical Agriculture* (*International Institute of Agriculture, Rome*) 27(8):288T-89T. Aug.
• ***Summary:*** "In Java, the black varieties of soya are predominant; those with light coloured seeds are of importance only in a few districts, namely Tegal, Brebes, Demak, Koedoes, Loemadjang. The majority of native varieties have black seeds and mature, on an average, in 80 to 90 days.

"It appears that the predominance of black seeded varieties is due to the nature of the soil and extent of the rainfall; the varieties with light coloured seed require more water and therefore are generally found in regions with considerable rainfall, or in irrigated zones. In addition, trade is an important factor in the distribution of varieties.

"Since 1915 seeds of Buitenzorg have been selected in the Selection Garden, and native varieties have been improved. Their distribution throughout the island, from West to East, is as follows:

"Only black seeded varieties are grown in the Regency of Banojemas, Regency of Zuid-Bagelen, Regency of Salatia, Government of Djokjakarta, Government of Soerakarta, Regencies of Madioen and Ponorogo, Regencies of Ngandjoek and Kediri. Attempts are being made to introduce white seeded varieties into the last two sets of regencies. Mostly black seeded varieties are grown in the Regencies of Pati, Grobogan, and Blora (Mentik, black, is the most widely grown variety), and in the Regencies of Bangil and Pasoeroean. Both black and white seeded varieties are grown in the Regency of Pekalongan, the Regencies of Djombang, Madjokerto, and Sidoardjo, and the Regency of Djember. Most of the native varieties have white or light colored seeds in the Regency of Loemadjang (Lumadjang; in East Java), and the Regencies of Demak and Koedoes.

"Improvement trials with native varieties not having been satisfactory, trials were carried out with varieties imported from other countries and particularly from Japan, Formosa, and the United States. On the other hand, the Formosa varieties have been successful, and it is from these varieties that the selected varieties No. 27 with black seeds, No. 29 with white seeds were obtained. As has already been said, these varieties are now grown throughout the whole island.

"In 1928, the Selection Station again undertook breeding work with native varieties. With the help of experts, 82 samples of soya seed have been collected from various centres of cultivation; 52 being black, 38 white, and 2 green. Comparative trials in cultivating these varieties are being carried out at present at Buitenzorg.

"Table XXVII indicates the characteristics of the 5 principal improved varieties, bred from varieties introduced from Formosa.

"In the course of trials all the selected varieties have proved to be superior to the native varieties. Varieties No. 27 and No. 29 are superior to No. 16 and No. 17. The black seeded variety No. 27 is the best of all.

"In other parts of the Netherlands Indies, native varieties with black or white seeds and either early or late are generally grown: but in certain districts selected varieties are being increasingly cultivated, No. 27 in particular. It gives a yield higher by 3 to 5 quintals than those of native varieties, unfortunately it is not early (growth period: 90 to 95 days). The cultivation of Nos. 17-28-29 is also increasing, chiefly No. 29. These varieties give high yields, but the seeds are considered too small." Note: 1 quintal = 100 kg. Address: Rome, Italy.

3268. Kaltenbach, D.; Legros, J. 1936. Soya: Selection, classification of varieties, varieties cultivated in various countries: Oceania (Document part). *Monthly Bulletin of Science and Practical Agriculture* (*International Institute of Agriculture, Rome*) 27(8):294T-97T. Aug.
• ***Summary:*** "1. Commonwealth of Australia: A. Southern Australia. Apart from a very few trial plots, soya growing is not practised in this State as the conclusion has been reached that local climatic and soil conditions are not suitable for this crop.

"B. New South Wales. Several years ago, the Department of Agriculture tried to introduce soya into the agricultural economy of the State, either as a green manure or forage or for the multiple uses of the seed. During the last 20 years, numerous varieties have been introduced and many trials have been carried out in all parts of the country. Generally speaking, the results were not satisfactory and efforts to introduce soya into the economy of the country were not successful. The growth of the soya plant was very poor and the yields in seed low. One of the reasons why soya does not succeed seems to be the absence of the bacteria of root nodules in the soil of this State. Utilised as a spring green manure, soya is inferior to cow peas in the coastal regions. In the Table-lands soya cultivation appears to give better results.

"C. Queensland. Soya has been grown experimentally in this country for a great number of years, but the results were more or less negative and the areas now cultivated with soya are almost negligible.

"A few very tall varieties, such as Biloxi and Otootan, have proved to be suitable as forage, but they have not been adopted by farmers, who obtain forage more easily in cultivating cow peas or other leguminous plants.

"Trials in inoculating soya seeds do not appear to have given any results though other trials should be carried out in the agricultural districts before this crop can be said to be quite unsuited to this State.

"The internal market for soya and its derivatives is limited as it is supplied by imports from Manchuria and Japan.

© Copyright Soyinfo Center 2014

"Owing to the abundant production of all kinds of feeds for live-stock, the use of soya will be difficult to establish unless it is utilised in crop rotation with cotton or maize.

"D. Victoria. No systematic attempts have yet been made to introduce soya growing into this State. Various trials previously made for experimental purposes showed that this crop was not of sufficient economic interest to replace the existing crops of leguminous plants.

"In 1933, however, the Department of Agriculture undertook a series of trials in soya growing in East Gippsland...

"Imports into Australia are of no great importance. In 1932-1933, 40,808 gallons of soya [soy sauce] were imported; value £1778. Of these imports 90% came from China. During the same period 12 tons of seed were imported from Japan; value £148.

"3. New Caledonia. Soya cultivation was introduced in 1928. No native varieties are grown, only foreign varieties, seeds of which were introduced on two occasions by the Chamber of Agriculture and the Administration. The principal variety is *Soja hispida.* Medium yields are obtained. There appears to be no future for soya as New Caledonia is abundantly provided with similar products which are in current use."

Note: This is the earliest document seen (March 2010) concerning soybeans in New Caledonia, or the cultivation of soybeans in New Caledonia. This document contains the earliest date seen for soybeans in New Caledonia, or the cultivation of soybeans in New Caledonia (1928). The source of these soybeans is unknown. The history and present status of the cultivated soybean, *Glycine max* is unclear. Address: Rome, Italy.

3269. Okano, Koji; Ohara, Iwao; Kato, Jiro. 1936. Daizu abura kasu no seibun kenkyû. I. Sutakiosu oyobi isshu gotai (shibô–rinshitai–shibôsan–haibun–budo-to) no bunri, narabini sono kô-shitsu kagaku-teki seijô ni tsuite [Studies on the composition of soy-bean oil foots. I. On the isolation of stachyose and an organic complex / polymer (fat–phospholipids–fatty acids–ash–glucose) and the chemical properties of the colloidal substance]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 12(8):714-20. Aug. [7 ref. Jap]

• ***Summary:*** The foots consist of water (11%), oil (16%), stachyose (45%), and a loosely bound organic complex (24%); the last-named contains phosphatides, fatty acids (probably myristic acid), fats, inorganic acids (mainly phosphoric and silicic acid), and glucose.

Note: *Webster's Dictionary* defines silicic acid (a term first used in 1817) as "any of various weakly acidic substances obtained as gelatinous masses by treating silicates with acids." Address: Minami Manshu Tetsudo K.K. (South Manchuria Railway Co.), Chuo Shikenjo, Nosan Kagaku-ka, Kenkyu-shitsu.

3270. Ramsbottom, J. 1936. The uses of fungi. *British Association for the Advancement of Science, Annual Report.* Sept. 9-16. p. 189-218. See p. 206-08, 212. 106th year.

• ***Summary:*** This was an address to Section K (Botany) of the British Association for the Advancement of Science at Blackpool, Sept. 10, 1936. Discusses: Koumiss (effervescent drink), Egyptian Leben, Arrack, Japanese koji, shoyu, tamari, and miso, fermented tofu.

"There is a wide range of oriental foods produced by fermentation with *Aspergillus.* Chinese curd, To-fu, is made from soy-bean milk fermented with mould and ripened in brine. The curd is cut into squares which soon become covered with fungus. They are then placed in brine for further ripening. The curd is canned as white or red squares in a salty liquid."

In Japan, four large industries are built on the use of *Aspergillus oryzae.* Their approximate total yearly output is as follows: Saké (rice wine) 812,000 kiloliters, shoyu (soy sauce) 902,000 kiloliters, miso (soy cheese) 1,690,000 kilograms, and shocho (distilled alcoholic liquor) [sic, shochu or shôchû, cheap spirits] 39,700 kiloliters. The annual value of all the fermentation industries is approximately £40,000,000.

"Molds of the genus *Penicillium* play a large part in the ripening of the Camembert-Brie, and the Roquefort-Gorgonzola-Stilton series of cheeses. Milk is first coagulated with rennet or dried calf-stomach linings." Also: Mycorrhiza, Takadiastase, production of glycerin and yeasts in Germany during World War I. Address: O.B.E., President of the Botany Section.

3271. Desai, Mahadev. 1936. Soya bean for the poor. *Harijan* 4(33):259. Sept. 26.

• ***Summary:*** "Sir Courtney Terrell, Chief Justice of the Patna High Court, had a long interview during his visit to Japan with Prof. Saiki, Director of the Japanese Bureau of Nutrition, who showed him the various processes of making simple food products from soya bean for the poor people of India. Sir Courtney, it is interesting to note, writes with special reference to Bihar. The first is the preparation of *satu* [which resembles roasted soy flour] and the second is the preparation of milk. About the *satu* preparation he writes:

"'About two seers [i.e. 4 pounds] of bean preferably of the large white hard Manchurian variety, were heaped upon an iron or earthenware dish and this dish was placed over a fire, the dry beans being continuously stirred with a wooden spoon. When they assumed a golden brown colour they were allowed to cool and then ground in a small stone hand mill of the kind commonly seen in Indian prisons for preparing *atta.* The beans were reduced to a fine soft powder and the entire bean was ground without any waste. The flour so produced is already cooked and it may be used in any of the ways now known in India in connection with *satu.'*

© Copyright Soyinfo Center 2014

"The process of preparing milk that Sir Courtney describes is rather elaborate. Far simpler is the recipe by Benjamin Hansen, the well-known Viennese Food Scientist." Address: India.

3272. Nippu JiJi-sha (The Nippu Jiji). comp. 1936. Hawai nenkan [Hawaiian Japanese annual and directory (1936-1937)]. Honolulu, Hawaii: Nippu JiJi-sha (The Nippu Jiji). [Jap]

• ***Summary:*** This directory (see next page) is mostly in Japanese characters with very little English or romanization. It is read from back to front. Unlike all other directories of Japanese in the USA, this one does not give any business names. Rather it (Part II) is a directory of Japanese living in the Hawaiian Islands; for each person it gives, in Japanese, his or her name, prefecture of origin in Japan (e.g., from Hiroshima-ken; *-ken* means prefecture), and occupation in Hawaii. Thus, there are many entries for the occupation of "tofu maker." But it is not clear how we should interpret this. In 1936-37 Hawaii, a territory of the United States, was in the midst of the Great Depression. Tofu makers in Japan have traditionally lived under the same roof where they made tofu. In Honolulu (on Oahu) there are 20 entries for "Tofu maker," one for "Tofu merchant," and one for "Tofu shop" (p. 222). Many of the addresses given for tofu makers were probably the addresses of their tofu shops. Although we cannot be sure, we will assume that each tofu maker owned and operated his or her own tofu shop. There were probably 18-21 Japanese-owned tofu shops in Honolulu in 1936-37.

In smaller towns outside Honolulu (on both Oahu and the other islands), many of which were quite distant from any other town, its seems even more likely that the address of the tofu maker was also the address of his tofu shop; we will assume that it was.

We have one other powerful tool for analysis–86 existing records in this database for the names and addresses of tofu shops in Honolulu from 1923 to 1984. We have tried to match up those names and/or addresses to the names and addresses given in this 1936-37 Hawaiian directory in order to link a name here with an existing shop.

Contents: Four unnumbered pages of ads. Fold-out maps of Honolulu and of the Hawaiian Islands. Pages 1-7: Table of contents. 12 unnumbered pages of monochrome photos.

Part I: Pages 1-274: Overview of economy of Honolulu. Geography, history, population and occupations, elections, military, law, jails, budget, taxes, sanitation, industries, fishery, airline industry, construction industry, import / export, banks and financial institutions, insurance industry, air time, radio, transportation, postal ad telephone information, religions, churches, athletics / sports, literature, entertainment. Organizations on various islands: Honolulu, Oahu, Hawaii, Maui, Kauai, Molokai, Lanai. Newspapers and magazines (Honolulu), list of people who died last year, information about regulations and laws, Japanese council members on various islands, holidays, time, phone rates, gas and water prices, Japanese holidays, Japanese year names, etc.

Part II: Directory of Japanese in Hawaii. Honolulu (p. 1-228). Island of Oahu (p. 1-54). Island of Maui (p. 1-52). Islands of Lanai and Molokai (p. 1-8). Island of Kauai (p. 1-44). Island of Hawaii (the big island, p. 1-96). Kona and Kau, on the Island of Hawaii (p. 1-20). Publication information (p. 21). Hotel ads on p. 22-24. Address: 920-928 Nuuanu St., Honolulu, Territory of Hawaii.

3273. Ishimaru, Yoshio. 1936. Shôyu jôzô-jô kûki-chû no kinga ni tsuite [Microorganisms in the air in shoyu breweries]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 14(9):737-50. [Jap]

3274. Kibi, Masajiro. 1936. Shôyu jôzô-yo kôji-kin ni tsuite. I. Kakuchi jôzô-jô shiyô-kin no keitai [On the koji molds used in shoyu fermentation. I. Morphology of Aspergilli used for brewing in several provinces]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 12(9):885-97. Sept. English-language summary in Bulletin of the Agricultural Chemical Society of Japan 13(8):130-31, bound at the front of Nippon Nogei Kagaku Kaishi. [12 ref. Jap]

• ***Summary:*** The author isolated 54 strains of molds from many samples of koji, the starter used in manufacturing shoyu (Japanese soy sauce). Morphological and physiological investigations show that these molds belong to 28 varieties of *Aspergillus oryzae.* A table shows the morphological characteristics of these 28 varieties, including length of stalk in mm, and diameter of conidia in micrometers. General characters: Colonies green. Stalks colorless and not septate. Outer walls of stalks pitted or rough (except No. 6). Vesicles globose or subglobose. Sterigmata in 1 series. Conidia globose. Conidial wall smooth at first (except No. 6). Address: Yamasa Shoyu K.K. Kenkyusho, Biseibitsu Jikkenshitsu, Japan (Microbiological Lab. of Yuasa Shoyu Co.).

3275. Morse, W.J. 1936. Soybeans in the United States: In relation to world production and trade. *Proceedings of the American Soybean Association* p. 55-64. 16th annual meeting. Held 14-16 Sept. in Iowa. [2 ref]

• ***Summary:*** The slow advance of soybean "cultivation in Western Countries was undoubtedly due to the lack of adapted varieties for various soil and climatic conditions. Increase of acreage and production in the United States is closely correlated with the introduction of varieties from the Orient. In less than thirty years the acreage of soybeans in the United States has increased a hundred fold–from about 50,000 acres in 1907 to nearly 5½ million acres in 1935. During this period the United States Department of Agriculture has brought about 10,000 introductions of

© Copyright Soyinfo Center 2014

© Copyright Soyinfo Center 2014

soybeans from the soybean regions of the Far East and the culture of the crop has spread from a few states in the early days to twenty-seven states at the present time.

"In Manchuria, often called 'the land of beans,' the soybean is grown to a greater extent than in any other country. It occupies about 25 per cent of the cultivated area and is relied on by the Manchurian farmer as a cash crop. With its rise as an international trade commodity, it is truly the 'Wealth of Manchuria.' Chosen [Korea] and Japan are large producers and southward from China the soybean is cultivated to some extent in India, Siam [later renamed Thailand], the Philippines, Cochin China, and during the past decade the production has nearly doubled in the Dutch East Indies. In Siberia extensive experiments have been under way to extend the cultivation of the crop but progress has been slow and Siberian beans have not yet been a factor in international trade.

"The production of soybeans in the Western World is concentrated largely in the Corn Belt States of the United States. Beginning with the experiments of Haberlandt in Austria in 1877, the soybean has been grown experimentally in most of the European countries but in general the climatic conditions are not well suited to its culture with the possible exception of certain regions, such as the Ukraine in the U.S.S.R. Varying degrees of success have been obtained in different regions of Africa, especially South Africa where yields of 25 to 35 bushels per acre have been obtained. Experiments in nearly all South American countries and Mexico have shown some successful results [as] in Argentina and Cuba but acreage is not extensive. In Canada, considerable interest had been shown in the crop but its culture–about 15,000 acres–is confined chiefly at present to the Province of Ontario. The future trend of the crop for commercial purposes undoubtedly will be concentrated largely in the United States, Canada, and certain regions of the U.S.S.R."

A table (p. 56) shows the increase in production of soybeans (in million bushels) during the 10-year period from 1925 to 1935 in the world's top five producing countries: Manchuria 92.67 -> 140.4. United States 5.190 -> 39.64. Chosen (Korea) 18.72 -> 21.96. Japan 18.31 -> 13.31 (1933). Netherland India [later Indonesia] 3.536 -> 6.676 (1934).

"Bean trade was an ancient and flourishing institution when the ports of China were first opened to the commerce of the Western World. In 1835, Newchwang (Yingkow, Yingkou), in South Manchuria, was an important port of shipment for the great coastal trade in beans, bean cake, and bean oil to the ports of southern Chinese provinces and other oriental regions. Manchuria is still the chief source of world trade in soybeans and from here the beans and bean products oil and cake move principally to other provinces of China, Japan, the Philippines, the East Indies, and to other countries of Northwest Europe. In 1908, about 7,000,000 bushels of beans were shipped out through the port of Dairen, chiefly to Chinese and Japanese ports. For the period 1925-1929, the average annual shipments to China, Japan, and European countries were 62,353,566 bushels. The first successful shipment from Manchuria to Europe was made to an English oil mill in 1907, and as an important source of vegetable oil and animal feed the beans soon found a market not only in English oil mills but in other European countries and America. Since 1931, when American-grown soybeans were first exported to European markets, chiefly to the oil mills of Germany, there has been an open European market to the American farmer. With economical methods of production and high quality beans, America is in a position to compete for the 50,000,000-bushel trade in European markets."

Two tables (p. 58) show international imports and exports of soybeans by major trading countries for an average 5-year period (1925-29) and for 1934. The leading importers in 1934 (preliminary, with imports in million bushels) are: Germany 33.57. Japan 20.29. Denmark 9.910. United Kingdom 6.615. Netherlands 4.695. Sweden 3.426. Italy 0.739. United States 0.006. The leading exporters in 1934 are: Manchuria 44.21 (down from 62.35 in 1925-29). Japan 0.025. Netherlands 0.0009.

"In recent years, the oil milling industry of Manchuria has declined quite markedly. During the height of processing beans for oil and cake, more than 90 mills were in operation, while late in 1930 not more than 25 mills were crushing beans. The decline in this industry has been due chiefly to a decreased demand for bean cake as fertilizer, the low price of silver, and almost the entire suspension of bean oil export due to the development of the oil extraction industry in Europe. In European countries it has become more profitable to import soybeans than to import bean oil."

Two tables (p. 59) show international imports and exports of soybean oil by major trading countries for an average 5-year period (1925-29) and for 1934. The leading importers in 1934 (preliminary, with imports in million lb) are: Netherlands 44.00. Belgium 27.60. United Kingdom 24.13. Austria 22.07. Morocco 20.28. Sweden 12.55. Also listed are: Norway 8.701. Algeria 0.004. The leading exporters of soybeans in 1934 (preliminary, with imports in million lb) are: Manchuria 122.6. Denmark 41.80. Netherlands 26.05. Germany 24.99. Sweden 8.98. Japan 7.95 United States 2.040.

"Practically all exports of soybean cake and meal have originated in Manchuria and average about 1,375,000 tons for the five-year period 1926-31. About 70 per cent of this exportation went mainly to Japan, Chosen, and China. Cake and meal shipments to European countries went chiefly to Germany, although considerable quantities were exported to Denmark, Sweden, the Netherlands, and Finland. The average importation of soybean meal and cake into the United States for the five-year period 1930-1935 was 31,726 tons."

"The rise of the soybean to a crop of special importance

© Copyright Soyinfo Center 2014

in the world's commerce and in the industry of the United States is one of the most remarkable agricultural developments of recent times." Address: Bureau of Plant Industry, USDA, Washington, DC.

3276. Slawson, H.H. 1936. Agriculture's Jack of all trades: Introducing the versatile soybean with which you may either build automobiles or run them and in which many people see possibilities for farm relief without benefit of subsidy. *Nation's Business* 24(9):24-26, 94. Sept.

• ***Summary:*** Contents: Introduction. A program for soybeans (Regional Soybean Laboratory, Urbana, Illinois). Wood glue from soybeans (I.F. Laucks). Helps bread stay fresh. A twenty-year development.

Five years ago at the Univ. of Illinois soybean researchers searched the USA and Canada for commercial soy products; they collected about 100. "Today that list numbers more than 300 and the ball seems just beginning to roll."

On 1 July 1936 a systematic research program on soybeans was started at the University of Illinois at Urbana. Funded by the federal government, with 12 midwestern state agricultural colleges cooperating, an industrial research laboratory as been established in Urbana. Dr. O.E. May of USDA's Bureau of Chemistry has been placed in charge, with the "help of Dr. W.J. Morse, government scientist, who has made the study of soybeans his life work." The program will have three objectives: "1. Improvement of present industrial uses and development of new industrial uses for soybeans." 2. Research on the effects of different processes on the quality and quantity of soybean processes. "3. Facilities for testing different varieties as to adaptability for industrial use."

In 1930 a research chemist in a private laboratory developed a new method for improving the head of foam on beer–using soy flakes. "Today soybean beer flakes are being made on a commercial scale in Chicago and from there they are pouring into many of the country's biggest breweries."

In the Pacific Northwest, five new fir plywood factories (making a total of 23) have been constructed this year–because glue made from soybeans is less expensive than and superior to (incl. more water resistant) traditional plywood glues. Together with several pine plywood factories in California and British Columbia, they are using tons of the new soybean glue each day.

The initial impulse for this new industry came from automobile manufactures who complained that the plywood they were buying was not sufficiently water resistant. So the Pacific Coast Plywood Manufacturers Association sponsored a contest to find a new glue. A newcomer, I.F. Laucks, Inc., of Seattle [Washington], won with some soupy stuff that did not look like glue at all. And "today this soybean glue–its formula a trade secret–is the standard glue of the plywood industry. Mr. Laucks discusses the reasons for the success of this new glue: (1) Most important is its low cost. (2) Since soybeans are an annual crop, "production can be increased as the demand grows. This is not true of casein or blood, which are by-products of other industries more or less fixed in their production." (3) It is more uniform. (4) It is more "foolproof" than other water-resistant bases.

At Iowa State College, Dr. O.R. Sweeney is producing gasoline from soybean oil; he cracks it by heating to 350ºC using animal charcoal as a catalyst. He then distils one of the fractions. The first person to make petroleum from soybean oil was the Japanese scientist Satow, who made a calcium soap from the oil then subjected it to destructive distillation to get light, middle, and heavy grades of petroleum. Forty gallons of soybean oil yielded about 25 gallons of soybean petroleum, 33 pounds of glycerine (for use in explosives), and 480 cubic feet of combustible gas.

The U.S. paint industry was one of the first to make large use of soybeans–especially in Illinois. Soybean flour helps bread to stay fresh longer. Soybean lecithin is used by confectioners. Tanners use soybeans to increase the grease-absorbing properties of chrome leather. Textile manufacturers use it to make their fabrics soft, supple, and lustrous. It is also used by rubber makers, linoleum makers, soap makers, and sausage and wiener makers. Doctors prescribe soybean 'milk' (which is practically free of starch) for some babies and many diabetics. Even the family dog now consumes soybeans, which are less expensive than meat and make his [or her] coat sleek and shiny.

"Not half the story of this amazing development has been told here. U.S. soybean production jumped from around 5 million bushels in 1925, to 18.6 million in 1934 and 39.6 million in 1935. Illinois is the leading sate.

"Almost two decades ago, when the first president of the American Farm Bureau Federation, James R. Howard, was beginning that organization's constructive efforts to aid agriculture by other means than politics, he made a remark which is just beginning to be appreciated at its full significance.

"'The surest relief for agriculture,' Mr. Howard said, 'will come from the production of new agricultural output that will go to industry rather than to the human stomach.'

"The response to that, so far as soybeans are involved, is seen in a recent government statement that at present more than 120 industrial concerns are making soybean products. They include about 35 soybean mills in ten states and a number of cottonseed mills which crush soybeans for oil and meal; 15 soybean flour mills; 20 soybean food products factories and more than 50 plants where various industrial commodities are fabricated from the magic soybean.

"It looks as if industry is beginning to know its beans."

Photos show: (1) A tractor in a field of piles of soybean hay pushing a device designed to speed the job of getting the hay to the baler. (2) A warehouse in Manchukuo filled with piles of round soybean cakes. Two men are carrying

3281. Lehmann (R.) Co., Ltd. 1936. Display ad: The finest appetiser you can include in any meal: Kikkoman. *Observer* (*London*). Nov. 22. p. 21.
• ***Summary:*** "A product of the wonderful Soya Bean, rich in Vitamins A, B and D. Kikkoman assists the gastric juices in correct assimilation of food. It induces healthy appetite, nourishes the blood stream, and tones up the system..."
Note: This is the last mention of Kikkoman seen (Sept. 2008) in the *Observer* (London) or *Manchester Guardian* until Nov. 1981. Address: Peninsular House, Monument St., London, E.C. 3.

3282. International Institute of Agriculture (IIA). 1936. Use of leguminous plants in tropical countries as green manure, as cover and as shade. Villa Umberto 1, Rome: IIA. 262 p. See p. 124-25, 130-31, 209-10. Index. 24 cm. [50+* ref]
• ***Summary:*** In the Belgian Congo, Lupins and *Soja hispida* are practically the only plants used in Kivu as soil improvers in coffee plantations. "*Soja hispida* was introduced in 1931, it gives very good results in the coffee plantations as green manure. This plant yields 25,000 kg. of green material per hectare, and sows itself in such a degree as to ensure the establishment of the crop. It gives results even in districts where the lupin will not grow" (p. 124-25).

Page 131 notes, in the chapter on "Tea," that in about 1905, on the suggestion of Dr. H.H. Mann, the first Scientific Officer employed by the India Tea Association, Mr. Claud Bald of Tukvar Tea Estate, Darjeeling [as of 1994 in West Bengal, India], introduced *Glycine soja* as a green crop in the hill districts. It is listed as one of the leguminous plants (ground crops) now commonly used for shade and green manure in tea cultivation.

Pages 209-10 describe the use of *Glycine max* Merr. in 10 tropical countries: "India: In Assam, it is grown as a garden crop in the hills, has been tried as a green manure for sugarcane in limed soil with success. It is used as a rotation crop with sugarcane, and also as a green manure in Bihar. In Patna, it is cultivated as a fodder crop and green manure plant, grown in rotation with spring cereals. In the United Provinces, it is sparingly cultivated for its pods which are used as green vegetable. Introduced within comparatively recent times into Bombay; not used as a green manure, established in an acclimatisation station, but has not got beyond that stage of introduction. Only sparingly cultivated in Punjab for its fruit, not used in any other way. Grown only for seed in Burma, never as a cover or green manure plant, date of introduction unknown, probably indigenous. Used for green manuring of tea in the Darjeeling districts. At Tocklai, the plant was found to do best in shady places; it is considered very effective in keeping down weeds and preventing soil erosion.

"Ceylon: A white-seeded variety is reported to have made good growth at Peradeniya, but on another occasion, the crop was completely destroyed by Kalutara snails.

"Netherlands Indies: Has long been cultivated in Java, and is now almost universally grown in the drier parts of the island. It is to be recommended as a green manure for rubber and also for perennial plants. Experiments are being carried out on its use as a green manure for irrigated rice at high altitudes, where other green manure plants (*Crotalaria juncea, C. anagyroides, Tephrosia candida*) have not such a vigorous growth. It is too soon to obtain any results.

"Philippines: It has long been grown in the Batangas Province and is of considerable local value as a food. Its use as a green manure and as a temporary cover crop is of recent date. When grown on rich soils, covers spacings of 60 cm. The crop was found very productive in Bukidnon and Lanao, below 700 metres altitude.

"Mauritius: Introduced many years ago, but not much grown in the island; not utilized as a green manure.

"Nyasaland: Used as a rotation crop with tobacco and

© Copyright Soyinfo Center 2014

cereals, and also in various other ways; good results are obtained.

"Sierra Leone: It was introduced from Russia in 1913 and from England in 1928, but without success. Note: This document contains the earliest clear date seen for soybeans in Sierra Leone, or for cultivation of soybeans in Sierra Leone (1913) (one of three documents). The source of these soybeans was Russia.

"Belgian Congo: Introduced into Kivu in 1931; gives very good results when utilized as a green manure for coffee. It furnishes about 25 tons of green material per hectare; it is self-sowing; results are obtained where even the lupin will not grow. At Uele, it was found to be of little value, being too susceptible to disease and it is also a host plant for *Helopeltis.*

"Trinidad: Occasionally cultivated as pulse, but is not used at all for other purposes.

"Peru: Experiments are now being carried out for the acclimatisation of this species."

At the end of this book is an excellent "Index of leguminous plants" with scientific names only listed alphabetically. Includes: *Arachis hypogea* Linn, p. 155, 178. *Psophocarpus tetragonolobus* D.C., 237. *Pueraria Thunbergiana* Benth, see *P. hirsuta* Schneider. p. 238.
Address: Rome, Italy.

3284. Russell, Lindsay. 1936. Beneficent soybean. *New York Times.* Dec. 6. Section 4. p. 8.
• ***Summary:*** Russell believes that "John Havens, a miller in Beaufort County, was the first to bring the soybean to North Carolina, and the experiments of August Heckscher resulted in bringing the soybean to the attention of the Midwest." Note 1. Russell (who is probably wrong) does not say when Havens first brought soybeans to North Carolina or from whom he obtained his soybeans. Note 2. The city of Washington is the capital of Beaufort County, in eastern North Carolina on the Pamlico River. The Havens Oil Co. in Washington, North Carolina, first crushed soybeans in 1916 (C.B. Williams, Dec. 1916; E.G. Funk, 1949).

Although the soybean originated in China, "it remained for Japan to vastly extend the use of the soy bean and introduce it to the world... In 1905 Japan turned the South Manchurian Railway into a Department of Agriculture and started a drive to develop the soy bean..." Also mentions tofu (also called "milk curd") and "mesu" (probably miso) "a six-month ferment and substitute for lactic acid milk." Address: Wilmington, North Carolina.

3285. *Detroit News.* 1936. Perry first to bring soybean to America. Dec. 13. Section 1. p. 25, col. 4.
• ***Summary:*** "In 1853 when Commodore Matthew Perry sailed from China with the American fleet, he had in his sea chest a vegetable which, some 60 years later, was to prove of extraordinary character–the soybean." It was long treasured in the Orient for use as a food. Today it is used to make shortenings, baked goods, confectionary, cereal, beverages, paper, animal foods, cosmetics, and countless other products. "The oil from this bean is used extensively [in the USA] in the production of paints and varnishes."

3293. **Product Name:** Soyalex (Lecithin).
Manufacturer's Name: Manchuria Soya Bean Industry Co.
Manufacturer's Address: Dairen, Manchuria.
Date of Introduction: 1936.
New Product–Documentation: Akagi, Roy. 1936. Bean Oil Industry in Manchuria. South Manchuria Railway Co. 1937. Bean Oil Industry in Manchuria. p. 2. "A new process of extracting oil by using alcohol as solvent was recently discovered by the Central Laboratory of the South Manchuria Railway Co. This method is now utilized by the Manchuria Soya Bean Co. at Dairen." p. 4. This method produces the largest amount of oil of fine quality, and the best quality cake for use as food or feed. It is the only method that "produces priceless lecithin as a by-product."

W.J. Morse. 1940. Proceedings of the American Soybean Assoc. p. 74. "A sample of 'Soyalex' recently received from Japan was said to contain not less than 60% pure lecithin."

• ***Summary:*** Based on a thesis presented by Mr. Ni to the Faculty of Fukien [Fujian] Christian University in partial fulfillment of BA degree, January 1936. Because the importance of soy sauce, both economically and in the human diet, many scientific studies on its method of production have been carried out in recent years, in both Japan and China. "However the major amount of research on soy bean sauce was confined to the finding of means by which time for fermentation might be shortened, since either by the original Chinese of by the Japanese methods the time required to carry out fermentation was about 1 year. As a result of these efforts, about 120 new modifications on the process have been proposed and 110 of them patented. A critical study made by Togano (1931-34) on these modifications revealed that nearly all of them have but little practical value. The one that deserves special mention is Togano's process which has been widely used in Japan and which is recently introduced to China under the name of 'Y-type' process."

"The Kwantou process of soy beans sauce manufacture uses soy bean alone as its raw material and carries out the fermentation at room temperature for not more than 3 months, yielding a product of high quality and of a flavor superior to that obtained by Togano's method. In spite of all these superiorities, the Kwantou process is little known and it has not received the attention it deserves."

In the first stage of manufacture using the Kwantou process (the preparation of koji), the main changes are hydrolysis of the protein and carbohydrate of the bean meal by molds. The subsequent washing and soaking of the koji (unique to the Kwantou process) results in the removal of mold mycelia which would, if retained, give an unpleasant flavor to the sauce. The loss of enzymes is regained in the second fermentation. In the final fermentation, when the koji is mixed with common salt (NaCl) in wooden vats,

© Copyright Soyinfo Center 2014

further protein and carbohydrate decomposition occurs. Concentration of raw soy bean sauce by heating was accompanied by chemical changes which will be of much interest for further study. The fat constituent of soya beans has no important role in the processes of manufacture. Address: Dep. of Chemistry, Fukien [Fujian] Christian Univ., China.

• ***Summary:*** Page 169: In Japan "the necessities of life are relatively low in price and existence is simple. The laborer's diet of rice, fish, and soya bean curd [tofu] comes easily and directly from the soil and sea, and his yen is relatively more effective than our dollar. 'A Japanese worker can live just as happily and comfortably as an American workman who receives six times his wage" (Eldridge 1934).

The excellent chapter on Japan's problem of population pressure contains two very interesting graphs (p. 46-47). The first shows the number of births and deaths each year from 1877 to 1932. The difference between the two is the "natural increase" in population, which was largest from 1918 to 1932, as deaths decreased steadily and births rose dramatically.

The second shows the "Rate of population increase in Japan proper" from 1873 to 1929. This rate showed a general increase from 5 in 1873 to about 14 in 1911–but with sudden, sharp decreases as follows: From cholera in about 1879, 1887, and 1891. From the Russo-Japanese War in 1904 and 1905 (Japan won). And (the biggest decrease of all) from influenza in 1918 (the international Spanish Flu pandemic, which killed an estimated 390,000 Japanese). Address: Asst. Dean of Harvard College, Instructor and Tutor, Dep. of Government, Harvard Univ., Asst. Prof. of International Law, Fletcher School of Law and Diplomacy.

• ***Summary:*** Page 1081. The section on Chosen [Korean] agriculture states that the soy bean is one of the most important crops, after rice, barley, wheat and rye. "In 1934 the total the total area under cultivation was 795,000 cho and the amount produced reached 3,813,000 koku, which was an increase of more than five times compared with the year 1910."

Pages 1178-79. The pages on "Foreign trade" show that in 1933 imports to Manchoukuo first surpassed exports, and this new trend has continued until the most recent year, 1935, when imports were valued at 604 million Haikwan taels, compared with exports of only 421 million.

Page 1182. A large table gives production of major crops in Manchoukuo, 1929-1935 in metric tons. For soy beans:

4.849 million metric tons in 1929.
5.298 million metric tons in 1930.
5.227 million metric tons in 1931.
4.268 million metric tons in 1932.
5,205 million metric tons in 1933.
3.841 million metric tons in 1934.
3.822 million metric tons in 1935.

Other crops in the table are other legumes, kaoliang, millet, maize, wheat paddy-field rice, upland rice, and other cereals.

In 1935 soy beans were grown on 3.249 million ha with a yield of 1,180 kg/ha.

The country now has an abundance of food to feed the roughly 30 million inhabitants. The surplus crops are exported every year.

A large table shows "Exports of agricultural products,

© Copyright Soyinfo Center 2014

1931-1935." Exports of soy beans in 1935 were 29.203 piculs worth 130.053 million yen.

At the end is a large, colored fold-out map of the Japanese empire. There are many ads on unnumbered pages.

3323. Institut International d'Agriculture (International Institute of Agriculture). 1936. Le soja dans le monde [The soybean in various countries of the world]. Rome, Italy: Imprimerie de la Chambre des Deputes, Charles Colombo. viii + 282 p. Bibliography, p. 276-82. No index. 25 cm. [90 ref. Fre]

• ***Summary:*** A superb early work, containing extensive original information, looking at developments with soybeans and soyfoods country by country, worldwide. Contents. Preface (p. 1). A. Culture of soy (*soja;* p. 4): 1. Botanical description, selection, classification of the varieties. 2. Culture properly said. 3. Enemies and illnesses.

4. Culture in the various countries: 4a. The Americas (p. 38): Antigua, Argentina, Bermuda, Brazil, Canada, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, USA (gives details on all varieties grown, and describes production, history, varieties, and cultural practices in North Carolina, Illinois, Indiana, Iowa, Maryland, Massachusetts, Mississippi, Missouri, New York, Ohio, West Virginia, Wisconsin, Conclusion), Guadeloupe, Guatemala, British Guiana, Dutch Guiana, British Honduras [Belize], Jamaica, Barbados, Martinique, Mexico, Montserrat, Peru, Puerto Rico, El Salvador, Trinidad and Tobago, Uruguay.

4b. Europe (p. 101): Germany, the Danubian countries, Austria, Spain, France, Great Britain, Hungary, Italy, Netherlands, Poland, Romania, Switzerland, Czechoslovakia, Turkey, USSR.

4c. Asia (p. 128): Ceylon, China and Manchuria, Cyprus, Federated States of Malaysia, British India (incl. Punjab, Bihar and Orissa, Burma, Berar, Madras Presidency, Bombay Presidency, Bengal (incl. Nepal, Bhutan, Sikkim, and the district of Darjeeling), Assam, North-West Frontier Province, United Provinces), Netherlands Indies, Indochina (incl. Tonkin, Annam, Laos, Cambodia, and Cochinchine), Japan, Palestine, Siam.

4d. Africa (p. 146): French West Africa, Algeria, Belgian Congo, Cyrenaica, Egypt, Eritrea, Madagascar, Morocco, Mauritius (Ile Maurice), Reunion (Réunion), Rhodesia, Anglo-Egyptian Sudan, Tripolitania, Tunisia, Union of South Africa.

4e. Oceania (p. 153): Australia, Fiji Islands, Hawaii, New Caledonia, New Zealand, Philippines.

B. Utilization of soya (p. 158): 1. The soybean in human nutrition and in industry: Whole soybeans, chart of the uses of whole soybeans, use of soya in the green state (green vegetable soybeans), soy sauce (*dau-tuong* of the Annamites, or *toyo,* named shoyu by the Japanese, or *chau-yau* or *chiang yoo* by the Chinese), condiments and sauces based on soya in the Netherlands Indies (*tempe, ontjom, tempemori* and *tempe kedele* [various types of tempeh and onchom, p. 168-70]), *tao tjo* [Indonesian-style miso], *tao dji* [fermented black soybeans], *ketjap, ketiap benteng* [Indonesian-style soy sauce], soymilk (*le lait de soja*), yuba (*crème de lait de soja*), tofu (*le fromage de soja*) and fermented tofu (*des fromages fermentés,* made by Li Yu-ying near Paris), soymilk casein (*caséine du lait de soja,* for industrial use, including vegetable albumin, or galalithe [galalith]" [isolated soy protein], and artificial wool), soy lecithin (*lécithine de soja*), soy flour (*la farine de soja,* incl. soy bread, soy pastries, and soy cocoa).

Note 1. This is the earliest document seen (Sept. 2010) that uses the term *benteng ketiap benteng* to refer to an Indonesian-style soy sauce.

2. Soy oil (p. 194): Food uses, industrial uses (including soaps, products resembling petroleum, paints, varnishes, linoleum, and artificial rubber), extraction, directory of U.S. manufacturers of materials and equipment for soybean processing, directory of U.S. and Canadian manufacturers of food products based on soya (*produits alimentaires à base de soja,* p. 205-06), directory of U.S. manufacturers of industrial soy products (p. 206-07).

3. Soybean in the feeding of domestic animals (p. 207): Forage, hay, silage, pasture, soybean seeds, the minerals in soybeans, soya as a feed for dairy cows, cattle, buffaloes, sheep, hogs, horses and mules, poultry.

4. Use of soya as fertilizer (p. 257). C. The trade of soya and of its by-products (p. 363): Production of soybeans in the principal countries, economic importance of soybean culture in the USA, soybean trade/commerce including tables of the major importers and exporters, and amounts traded annually in 1931-1934, price of soybeans, cost of production.

List by region and country of people and organizations that responded to a questionnaire sent by IIA (p. 273-76). Bibliography of main publications consulted, listed by region and country of publication.

Reunion (*Ile de la Réunion*)*:* "The soybean (Le Soja) is only cultivated as an experimental crop, on a few square meters at the agronomic station" (p. 148).

Fiji (*Iles Fidji*)*:* Soybean cultivation is not yet practiced in this colony; however soybean seeds are currently being imported in order to conduct a trial.

New Caledonia: In 1928 soybean cultivation was introduced to New Caledonia.

Note 2. This is the earliest document seen (Dec. 2007) concerning soybeans in Bhutan, Costa Rica, Dominican Republic, El Salvador, Guatemala, Israel, Jamaica, Madagascar, Morocco, New Caledonia, Palestine, Peru, or Réunion, or the cultivation of soybeans in Bhutan, Costa Rica, Dominican Republic, El Salvador, Guatemala, Israel, Jamaica, Madagascar, Mexico, the Middle East. Morocco, New Caledonia, Palestine, Peru, or Réunion. It is also the earliest document seen (Dec. 2007) concerning soybeans in connection with (but not yet in) Cyprus; it is stated that

© Copyright Soyinfo Center 2014

soybeans are not grown on the island of Cyprus. Soybean culture is not practiced in the Italian colonies of Eritrea (Erythrée, now part of Ethiopia) or Cyrenaica (Cyrénaïque, now part of Libya).

Note 3. This document contains the earliest date seen for soybeans in Bhutan, New Caledonia, or Réunion, or the cultivation of soybeans in New Caledonia (1928), or Bhutan or Réunion (1936) (One of two documents).

Note 4. This is the earliest French-language document seen (Sept. 2011) that mentions tempeh, which it calls "tempe" (p. 168). It notes that, in general, the indigenous people of the Netherlands Indies use soybeans mainly to make *tempe,* a product which, throughout central and eastern Java, takes the place reserved for *ontjom* in western Java. Tempeh is found in two forms: either in large flat cakes which are cut at the time of sale into small square morsels, or wrapped in folded banana leaves. A detailed description of the preparation of each of these two types of tempeh is given as well as another type of tempe, called *tempemori,* which is made with soybeans and coconut presscake.

Soybean culture is not known to be practiced in the following countries or colonies: Antigua, Barbados, British Honduras (renamed Belize in about 1975), Trinidad and Tobago. Address: Rome, Italy.

3326. James, Grace. 1936. Japan: recollections and impressions. London: George Allen & Unwin Ltd. 285 p. See p. 140, 155. Illust. No index. 22 cm.
• ***Summary:*** This book has three parts: I. Reflections of Tokyo (1885-1895). II. Japan revisited 1934. III. Impressions and conclusions. The author's father was an officer of the British Navy. She was born in Japan.

In Part II, Chapter 6, titled "Otsuka San," refers to Miss Shiwo Otsuka, who gave her Japanese lessons. "... I knew from the significance of his long-drawn cries if it was the *tofu* (bean curd) seller, the flower-seller, the scissors-grinder, the pipe-cleaner, or the gold-fish vendor, who was coming down our lane" (p. 140).

"*O Sushi* consists of cold boiled rice, delicately flavored with *shôyu* or vinegar and with various additions, such as shreds of [pickled] ginger, chopped pickled melon or cucumber, or fragments of raw fish. The honourable *Sushi* is made up into rolls or balls convenient for handling and covered with edible wrapping. *Inari Sushi..."* "... a thin coating of *abura tofu* (oiled bean curd) and *nori maki,* as their name denotes, are wound in seaweed" (p. 154-55).

3327. Japan-Manchoukuo Year Book. 1936. Tokyo, Japan: Japan-Manchoukuo Year Book Co. xii + 1258 p. Index. 26 cm. Third annual issue. [Eng]
• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. On the title page, just below the title but in small letters we read: "Cyclopedia of General Information on the Empires of Japan and Manchuokuo. Appendices: Who's Who Business Directory." Below that is a small map showing the Japanese empire, circled, as part of East Asia–under which is printed: "Neither is Understandable Without the Other." Below that are listed the cities and names of 18 agents worldwide. This book was published in late-December 1935.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year.

Page 359. A large table gives the yield of rice and other cereals in koku per tan from 1904-08 to 1933. For soya beans the yield in 1933 was 0.86.

Page 364. Table 29 shows production of "Beans, potatoes and sweet potatoes" in hectolitres from 1929 to 1933. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya beans:

4.789 million hectoliters in 1929
5.473 million hectoliters in 1930
4.481 million hectoliters in 1931.
4.352 million hectoliters in 1932.
5.053 million hectoliters in 1933.

Page 767. A large table shows "Crop output" (metric tons) in Manchoukuo yearly from 1922 to 1935* (* = estimate). For soya beans:

3.088 million metric tons in 1922
3.262 million metric tons in 1923
3.448 million metric tons in 1924
4.174 million metric tons in 1925
4.776 million metric tons in 1926
4.817 million metric tons in 1927
4.834 million metric tons in 1928
4.849 million metric tons in 1929
5.298 million metric tons in 1930
5.227 million metric tons in 1931
4.268 million metric tons in 1932
5.205 million metric tons in 1933

© Copyright Soyinfo Center 2014

3.500 million metric tons in 1934
3.995 million metric tons in 1935

The other principal crops shown in the table are other beans, kaoliang, millet, maize, wheat, rice, and other crops (incl. groundnuts).

Page 788. A large table gives a crop forecast for 1935. Production of soya beans is expected to increase 17%.

On p. 788-89 is a long section of text on "Soya beans" identical to that in the 1935 Year Book. Soybean production in Manchoukuo in 1933 was 4.601 million metric tons on 3.747 million hectares.

Page 717. Export of soya beans in 1932 was 42.536 million piculs [1 picul = 133.33 lb weight Avdp] worth 144.304 million Hk. Tl. [Haikwan taels]. Export of soya beans in 1933 was 39.111 million piculs worth 169.095 My [Million yen? / Manchoukuo yen?].

A large table (p. 717) shows "Staple exports as classified by destinations in 1932 (in piculs). Soya beans were exported to the following countries–in descending order of amount exported:

Germany 10.474 million piculs
Soviet Russia 7.520 million piculs
China 7.246 million piculs
Egypt 6.997 million piculs
Japan 5.568 million piculs
Great Britain 1.348 million piculs
Chosen [Korea] 0.905 million piculs.
Netherlands India [today's Indonesia] 0.849 million piculs
Netherlands 0.369 million piculs
Hongkong 0.355 million piculs
Denmark 0.340 million piculs
Italy 0.212 million piculs
Belgium 0.145 million piculs
Central America 0.125 million piculs
France 0.030 million piculs
Straits Settlements 0.022 million piculs
Philippines 0.0088 million piculs
Norway 0.0082 million piculs
British India 0.0028 million piculs
Sweden 0.0024 million piculs
United States 0.0012 million piculs
Siam [today's Thailand] 0.00028 million piculs.

Other major export crops were kaoliang, maize, millet, groundnuts, wheat and buckwheat.

Page 714 is all about "Soya beans" which are the most important staple product of the country and has been grown for many years before the opening of Newchwang while some had been exported to the ports of South China. At the time of the Russo-Japanese war (1904-05) the Japanese became aware of the value of the bean, especially of the bean cake for use as fertilizer, but the article did not enter upon its career as an important factor in international trade until 1910 when the Mitsui Bussan Co. made a trial shipment of 100 tons to England. Since then, mainly through the continued experiments of the Central Laboratory, maintained in Dairen by the S.M.R. [South Manchuria Railway], many new uses, have been found for soya bean until today the articles manufactured either wholly or partially from beans, bean oil and bean cake include more than thirty items, among which the following may be mentioned: soy [sauce], sauces, soups, condensed milk, casein, cheese, salad oil, crackers, macaroni, flour, confectionary, glycerine, explosives, enamels, varnishes butter and lard substitutes, edible oils, salad oils, water-proof material, linoleum; paints, soap, celluloid, rubber substitutes, printing-ink, lighting and lubricating oils, etc. Bean cake is also used extensively for fodder and as fertilizer.

"The S.M.R. Agricultural Experiment Station at Kunchuling and elsewhere have through continuous experiments and distribution of superior seeds to Manchurian farmers increased the crops by 10 to 20 percent 'while the oil content of such improved beans have been increased by more than ten percent. The use of these improvements is being advocated by means of poster campaigns and other forms of propaganda, while demonstrations are being carried out to instruct the farmers in new methods. At the same time a new industry of manufacturing beans into oil and cakes has sprung up, the modern methods rapidly replacing the old-fashioned presses.

"Soya bean output in 1934 is as follows:

A large table (p. 718) titled "Output of soya bean" [in Manchoukuo, according to districts] is divided into South and North Manchuria. It shows the following for each district in 1934: Cultivated area (hectares). Output per hectare (kgs.). Output in 1934 (metric tons). Actual output in 1933 (metric tons). Increase or decrease (metric tons). Rate of increase (1933 = 100).

3328. Kale, F.S. 1936. Soya bean: Its value in dietetics, cultivation and uses. With 300 recipes. Baroda State, India: F. Doctor & Co. xxxi + 375 p. Illust. Index. 22 cm. 2nd ed. 1937.

• ***Summary:*** Contents: Preface. 1. Deficiencies in the Indian diet and soya bean as a means to rectify them. 2. History of the origin and growth of soya bean. 3. The use of soya bean. 4. World trade in soya bean. 5. Botany of the soya bean plant. 6. Classification of soya bean. 7. Cultivation of soya bean. 8. Diseases and pests of soya bean. 9. Cultivation of soya bean in India. 10. The constituents of soya bean. 11. Soya bean milk. 12. Soya bean flour. 13. Industrial uses of soya bean. 14. Enriching soil by addition of nitrogen and use of soya bean as fodder. 15. Food requirement of the human body. 16. European and American soya bean recipes. 17. Diabetic dishes, Mahatma Gandhi's experiments at Magan Wadi and opinion of scientists on soya bean. 18. Chinese and Japanese soya bean dishes. 19. Indian soya bean dishes: Hindustani dishes, Moglai dishes, Gujarati dishes, Maharashtrian dishes,

Bengali dishes, Goa dishes, Tanjore dishes. Appendix.

For a more detailed table of contents and summary of the work, see the 2nd edition (1937).

Photos on unnumbered pages show: (1) H.H. the Maharaja Gaekwar of Baroda, the first Indian ruler to inaugurate the soya bean planting ceremony in his state–24 Nov. 1933. (2) H.H. The Maharaja of Baroda, seated in a chair, lecturing on the dietetic and industrial importance of soya bean. (3) The mature soya bean pods of Mammoth Yellow variety grown in Baroda territory. (4) Map of Baroda state showing areas of soya bean cultivation. (5) Map of Baroda state showing local distribution of soya bean. (6) A field of soya bean in rows grown by Patel Hargovan Bavabhai of Achisara Baroda District (with two white bullocks) who has been awarded the first prize for his good cultivation.

(7) Bavabhai B. Patel, a farmer age 65 who is interested in cultivation of soya bean; dressed in white, he is standing in a field of soya beans behind two large white bullocks. (8) The author's own child, three months old, fed on soya bean milk.

(9) Mahatma Gandhi who uses soya bean at Maganwadhi; he is seated in a chair reading.

Note 1. This is the earliest English-language document seen (Sept. 2006) that uses the term "soya bean" in a new way–as a singular noun, like the words "corn" or "wheat," not preceded by "the." Examples: "2. History of the origin and growth of soya bean. 3. The use of soya bean. 4. World trade in soya bean... 6. Classification of soya bean. 7. Cultivation of soya bean. 8. Diseases and pests of soya bean." This usage originated in developing countries.

Note 2. This book was written as the princely state of Baroda was studying the possibility of growing the soya bean plant for food, feed, and fodder. It looked promising, but little headway was actually made in either production or utilization. Address: Food Survey Officer, Baroda State, India.

3331. North, James L. 1936. Introductory chapter. In: G.D. Gray. 1936. All About the Soya Bean: In Agriculture, Industry and Commerce. London: John Bale, Sons & Danielsson Ltd. 144 p. See p. 1-9.

• ***Summary:*** This is the story of early attempts by Dr. North and others to grow soybeans in England. "In 1913 chance put in my hands thirteen small seeds of a variety of soya bean said to have come from North China in 1910 and to have ripened pods in Germany for two successive years. Sown by me the following May the plants grew to a height of 1½ feet and ripened seed in October. This took place at the Gardens of the Royal Botanic Society, of which I was then Curator. I was aware that of the many attempts to grow soya which had taken place in this country, all had failed, also that no others were being attempted, since it was the considered opinion of the Ministry of Agriculture and the Royal Agricultural Society that the soya bean was quite unsuited for growth here, as it required heat that would ripen maize.

"The podded beans were brought to the notice of Professor Bottomley, of King's College, and Professor Greenish, of the Pharmaceutical Society, and both considered the matter to be important. They pointed out that this country possessed no oil plant and was importing soya from Manchuria to the extent of half a million tons per annum... They advised me to increase my stock as rapidly as I could.

"The result of the first year's crop was four hundred seeds from the original thirteen seeds; the second year four thousand and the third twelve thousand. In 1917 it became a question of finding space to grow them and it was decided to have part grown by a firm of market growers at Uxbridge, Middlesex and the rest on a farm at Manningtree, Essex, belonging to Mr. C.P. Ogilvie. Both were failures." The first crop failed because the land had been too heavily manured and the seeds were sown too far apart. The second crop, sown in the middle of a field of wheat, had been eaten by rabbits. Rabbits are still a major pest for soya beans.

Since little was known about the soya bean, Mr. North tried to gain experience by sending seeds to the Chelsea Botanic Gardens, the Horticultural Society at Wisley, the Cambridge Botanic Gardens, Messrs. Sutton and Sons, Reading, and to a friend in Hampshire. But the reports received were not encouraging. "That same year I got in touch with the United States Department of Agriculture at Washington [DC], I received from it not only soya bulletins and seeds of a number of American soya varieties for trial in England, but the promise of further assistance. I owe a very great debt of gratitude to that department and to Dr. W.J. Morse, its agronomist and soybean expert, the man who, more than any other, has made the United States the soya bean centre of the world and now a growing competitor with Manchuria as world exporter.

© Copyright Soyinfo Center 2014

"The results of 1917 were better than those of the previous year and in 1918 I had sufficient seed of my one variety to plant half an acre on land lent by Mr. Clark at Virginia Water. These were sown in company with 12 American varieties, half being inoculated with a nodule culture supplied by Professor Bottomley."

Following some poor years, 1921, a drought year, was the best year to date. "Accounts of my success appeared in the Press and I wrote an article which came out in the *Illustrated London News* in October. As a result many applications for seed reached me and I sent samples to over one hundred places, among others to Professor Southworth of Manitoba College, Winnipeg [Canada]. He found my variety better than anything he had had there, both for fodder and seed, but not early enough in seasons with early frost. In return he sent me seed of a brown variety 'Manitoba Brown,' a selection from a well-known American variety 'Ogemaw.'"

1922 was a wet year and at his plot and not one person to whom North had sent seed reported success. On his own plot at Chiswick, where he had twenty varieties under test, only one, "Manitoba Brown," succeeded.

"In 1923 appeared Messrs. Piper and Morse's encyclopædic work, 'The Soybean,' in America; it solved a good many of my problems and I determined to follow American practice in future. From it I learned that two-thirds of the American crop was consumed as fodder upon the farm; that every variety had a fixed time ranging from 80 to 160 days for maturing; that in industry the chief value of the bean rested upon its oil content; and that the plant possessed what is now called 'local limitations,' meaning that a variety that grew well in one place could not be depended upon at another and that in American agricultural practice it was usual to test two or more varieties before growing it as a crop. This last was particularly interesting to me because it explained the erratic behaviour of some of my varieties when sent to other places.

"Convinced by the failure of my 1922 trials that soya was not yet ready to put forward as a crop plant, I extended my search to new sorts and with the help of friends abroad obtained many varieties from China, Manchuria, Japan, South Africa and India." North then began to specialize in short season varieties. "My friend Dr. Morse approved the plan and from then onward sent me only varieties which in America took less than one hundred days to mature... Using Manitoba Brown Soya as a standard I was able to select several varieties as early or even earlier than it." In 1930 Messrs. Sutton and Sons of Reading [seedsmen] decided to put the variety Brown C in their catalogue.

"In 1931, Mr. A.F. Secrett, a Twickenham market grower, offered the use of a piece of land at Brentford, Middlesex; it enabled me to grow on a larger scale than had been possible previously. In September the same year a photograph of the crop appeared in the *Evening News.* By chance it was seen by Sir John Davis, a Director of the Ford Motor Co. and manger of the Ford Estate at Boreham, Essex, who at the request of Henry Ford had tried to grow soya with American seed and had failed. At his request I agreed to supply acclimatized seed and to superintend its growing. All my four varieties of soya were used and under field conditions the crop was a success. From 2 acres the first year it was increased to 12 acres in 1934 and to 20 in 1935, the last two crops being grown without assistance. The Boreham trials were visited by farmers from every part of the United Kingdom and visitors from America pronounced the crops to be as good as any grown in that country. The seed was distributed in 1935 and that year saw it being grown in quantity in some hundreds of places throughout the British Isles."

A photo facing page 1 shows Mr. J.L. North standing in a field with soya bean plants which he has grown. Address: 60, Grove Park Terrace, Chiswick, London, W.4, Engalnd. Late curator, Royal Botanic Gardens, Regent's Park, London.

3332. Read, Bernard E. 1936. Chinese medicinal plants from the "Pen ts'ao kang mu" of 1596. 3rd edition of a botanical, chemical and pharmacological reference list. Peking, China: Peking Natural History Bulletin. Sales Agent: The French Bookstore. xvi + 391 p. See p. 114-18. Index of romanized Chinese plant names. Index of common English plant names–Foreign names are in italics. Index of Latin plant names. 27 cm. [180*+ ref]

• ***Summary:*** This book is largely one huge table (p. 1-288) titled "Chinese medicinal plants." It has seven columns: (1) Latin name. (2) Chinese name. (3) Part used. (4) Constituents. (5) Habitat. (6) References (highly abbreviated). (7) Remarks.

Contents: Introduction in Chinese. Introduction to the third edition (Shanghai 1935). Provincial abbreviations. Abbreviations for parts of plants. Bibliographical abbreviations (journals and books). Secondary references helpful to a study of Chinese materia medica. Comparative table of Western, Japanese, and Chinese dates (1868-1935). Table of classes, general, and species for which references are listed.

References related to soybeans are subdivided as follows (p. 114-18, 256): Soybeans, black variety (var. *nigra;* the fresh hulls used in medicine are known as *Ta Tou P'i*). Soybean sprouts, black variety (Ta Tou Huang Chüan). Bean relish, black variety (Ta Tou Ch'ih). Bean ferment, black variety (Tou Huang ["bean yellow"]; Natto in Japanese [sic]). Yellow soybean (Glycine soja S. et Z., var. flava; Huang Ta Tou). Soybean oil (Tou Yu). Soybean sauce, yellow variety (Chiang Yu; thick or thin). Soybean paste (Chiang). Bean curd, yellow variety (Tou Fu). White soybean (Glycine soja, S. et Z., var. alba). Soy sauce made with wheat flour (p. 256).

References for azuki beans (red mung bean, P. mungo, L. var. subtrilobata, Fr. et Sav. [HN. Br.]) are given on page

© Copyright Soyinfo Center 2014

122. References for wheat gluten (Mien Chin) are given on page 256.

This book is largely a list of references relating to plants listed in the Pen Ta'ao Kang Mu. It is not a translation or summary of the latter work.

Note: This is the earliest English-language document seen (June 2013) that uses the term "the fresh hulls" to refer to soy bran. Address: PhD, Head of the Div. of Physiological Sciences, Henry Lester Inst. of Medical Research, Shanghai, China.

3333. Rouest, Leon; Guerpel, Henry de. 1936. Le soja français et ses applications agricoles et industrielles [The French soybean: Its agricultural and industrial applications]. Chateauroux, France: G. Langlois. xxiii + 99 p. 28 cm. [42 ref. Fre]

• ***Summary:*** Contents: Preface, by L Brétignière (Prof. at Grignon, Member of the Academy of Agriculture). Preface to the first edition, by Louis Forest (1921). Introduction to this new edition: Soviet Russia and the soybean (*le Soja;* includes the story of Rouest's stay in the Northern Caucasus, Russia, from 1930 to 1933), Germany and Poland take up the soya question, the canons [guns] of Germany versus the Manchurian soybean, a secret contract to provide the weapons of war, organization of a Polish bank in Manchuria, Germany cultivates soybeans in Romania and Bulgaria in preparation for the war, France and the cultivation of soybeans.

1. What is soja? 2. History of the propagation of soja: Introduction of the soybean into France and Europe, the soybean is cultivated in central Europe, in Austria, in 1875, in France the soybean is the object of numerous trials from 1876 to 1881, its cultivation worldwide, the study and acclimatization of soya become generalized.

3. Botanical characters of the soybean: And the varieties of soybeans. 4. Chinese varieties: The soybean in China, the production of soya in China in 1916 and 1917, production of soya in the Far East during the year 1928, exportation of soya from the Far East to Europe.

5. Japanese varieties: The soybean in Japan, varieties of soya from Indochina and from other Asian countries. 6. The soybean in America: American varieties, cultivation of soybeans in Ohio, selection of soya using pure lines in Connecticut.

7. The soybean in Europe: Italy, Russia, France, French climatic zones for the cultivation of Soja hispida, the Atlantic zone, the continental zone, the Mediterranean zone and climate, can the soybean be cultivated in all the French climates including those in the north, northeast, and northwest, speedy production of soybeans in view of agricultural production and of the creation of early varieties for the regions in north and northeast France.

8. Instruction for growing soja in France. 9. Soja in Manchuria. 10. Soja seeds. 11. Selection of soja. 12. Varieties of soja. 13. Different ways of planting soya seeds. 14. Soy yield. 15. Nitrogen fixation in soya seeds. 16. Tilling and preparing the earth. 17. Soja fodder. 18. Soja, striking and improving. 19. Harvesting soja grain. 20. Soja oil. 21. Soja oil-cake for animal feeding. 22. Vegetable milk, soja milk and industrial casein.

23. Soja in human food: Soy flour and its applications, soy bread with wheat, nutritional composition of soja compared to dry legumes, soy viewed as a dry legume to replace meat, comparative production of nutritive elements among the various legumes used for human food, comparative value in calories of the usual foods and of soja, preparation of soy soups and meals in compressed tubes, what varieties of soy can serve the special needs of human nutrition, Sojenta, potatoes stuffed with soy, force meat balls (*boulettes*) of rice and soy, bread of rice and soy, pudding of soy and rice, soy sprouts and their food value, fresh soy sprouts in a salad, soy sprouts with vegetables, soy preserves and confections, soy chocolate, soy coffee, soybeans conserved in containers, soy with smoked fish, soup with soy vegetable meat, soymilk soup, omelet with smoked soy vegetable ham, green soy sprouts, soy cake, soy force-meat fritters.

24. The utilization of soja in the Far East: Vegetable cheese (tofu), soy-based condiments, Japanese natto (2 types), Japanese miso, Chinese miso, soy sauce (*soyou* or *schoziou*), making soy sauce in Kwantung, China, making soy sauce in Japan, koji or molded rice.

25. The culture of soja in North Africa (Rouest has varieties that would grow and yield well in the French colonies of Tunisia, Algeria, and Morocco). 26. Opinions of some authors on soja. Conclusions. Bibliography on soja.

A small photo on the "Dedication" page shows Léon Rouest (born in Paris on 11 Nov. 1872).

Concerning soy in Russia (USSR) (p. 52-53): In Russia, the soybean has been known for quite a long time, specially in the Ukraine and Bessarabia, but it was never grown over a large area, and was given a back seat (low priority) in agriculture until after the revolution of 1917. It was not until 1926-27 that cultural trials were conducted on farms in the state of Northern Caucasus (*d'Etat du Caucase du Nord*). In the regions of Rostov-on-Don (*Rostow-sur-Don; Rostov-na-Donu*), Eisk (near Krasnodar), Stavropol, Prim-Koumsk, Yessentuki / Essentuki in the Kuban and Kuban River area of the North Caucasus region of southern Russia, the yields were 11 to 16 quintals.

In 1927 there were 600 ha planted to soybeans, increasing to 17,000 in 1928, in the *kolkhoz* (collective) farms or the *sovkhoz* (state owned) farms.

In 1929-1930 and until 1932-1933 there were very laudable / praiseworthy efforts to propagate soybeans in favorable regions, especially in the North Caucasus, but the soils of this region, although they are very rich and well suited to soybeans are also very rich in bad weeds and the

© Copyright Soyinfo Center 2014

results obtained up to the present do not seem favorable. As I said earlier, the soybean is a technical plant of the intensive cultivation type. It is very well suited to the soil and climate of Russia, but it is less well suited to the indolent character of people who are accustomed to cultivating only small parcels and who are suddenly, through collectivization, thrown into cultivating immense fields. In spite of the remarkable efforts at mechanization, the peasants who submit to collectivization and who do not yet understand it very well, the cultivation of soybeans does not assume the importance hoped for (p. 52).

Note: This is Rouest's first book about soy since 1930. Address: France.

3334. Sano, Kunio. 1936. Miso jôzô no eiyôgaku-teki kôsatsu. X. Miso jukusei-chû no shisuchin no shôchô [Nutritional observations on miso fermentation. X. • ***Summary:*** Abstracted from *Rikagaku Kenkyu Hokoku* 14(9):872 (1935).

3337. Tezuka, Kaneko. 1936. Japanese food. Tokyo: Maruzen Co. Ltd. 84 p. See p. 28. 20 Cm. Half-title: Tourist Library: 14. [Eng]
• ***Summary:*** The chapter titled "Common everyday food" (p. 22+) notes that the three breakfast dishes are boiled rice, *misoshiru* (bean-paste soup [miso soup]), and *kô-no-mono* (pickles). With them are served "shell-fish *tsukudani* (foods boiled down in soy [sauce]), *shiokonbu* (the laminaria boiled in brine and soy), *nori* (laver), *nimame* (boiled beans [soy]), various kinds of bean-paste [miso] dishes, pickled plums [umeboshi], etc." A brief description of how to make miso and miso soup is given (p. 24). Under "Dinner dishes" we read: The most simple of foods is bean-curd." Fresh raw fish, "cut into shining thin slices (*sashimi*) is served with fresh grated radish or horse radish, and eaten dipped in vinegar or soy."

The section titled "How Bean-curd is Made" (p. 28) states: "Tôfu (bean-curd) is made by soaking soy beans in water, mashing them, straining the mass through cloth and solidifying with the addition of magnesium chloride. It is a very nutritive food. The mush left over after straining *tôfu* is called *u-no-hana* (deutzia flowers) [okara] and is used in cooking vegetables." A photo shows a "Vendor cutting bean-curd."

A photo (p. 64) shows a hall full of Buddhist priests dining at Soji-ji temple, Tsurumi, Japan. In Japan, March 24 and Sept. 24 are national holidays–Spring and Autumn Worship of the Imperial Ancestors. To worship all the Imperial Ancestors, the people hang out the Japanese flag and "to honor the spirits of their own ancestors, make *Inari-zushi* (vinegar-spiced rice wrapped in fried bean-curd) and *botan-mochi* (boiled rice slightly kneaded and covered with [azuki] bean jam). They offer these to the spirits of the dead by placing them before the Buddhist altar in the home and sending them to the family temple and the homes of relatives."

The chapter titled "Japanese Cakes" notes that the two basic types are *higashi* (dried cake) and *namagashi* (undried cake). *"Namagashi* is made of [azuki] bean-jam for the most part. Bean-jam is just like a cream made of red beans and sugar. *Namagashi* is divided into *yôkan* and others." Yôkan is made of bean-jam gelled with agar (Japanese isinglass). A photo (p. 83) shows a bean-jam factory and show case of products.

Note 1. Editorial note signed: Board of Tourist Industry, Japanese Government Railways.

Note 2. This is the earliest English-language document seen (June 2013) that uses the word "mush," or the term *u-no-hana,* or the term "deutzia flowers" to refer to okara.

Note 3. This is the earliest English-language document seen (March 2009) that uses the term "bean-paste" to refer to miso.

Note 4. This is the earliest English-language document seen (March 2006) that uses the term "bean jam" (or "bean-jam") to refer to sweet azuki bean paste [*azuki-an*]. Address: Prof., Japan.

• ***Summary:*** Page 420: "... aniseed bean, cold jellied meat, fried beancurd, and spiced blue fish." "Whenever I come back, I laugh at myself," he said with a slight smile, his cigarette held in one hand, and a cup of wine in the other. "When I was young and saw an insect at rest,..."

Note: This is the earliest English-language document seen (April 2013) that contains the term "fried beancurd."

3339. Shih, You-Kuang. 1937. Study on the molds concerned in the fermentation of wheat gluten in China. *Lingnan Science Journal* 16(1):27-38. Jan. 13. [21 ref. Eng; chi]
• ***Summary:*** The author begins by discussing the research of others on "the well known foodstuff *Fu-Yu* [fermented

© Copyright Soyinfo Center 2014

tofu, 2 Chinese characters are given] or preserved soy bean curd. Wei (1930) isolated the same species of *Mono-Mucor* from different samples obtained from Shaoshing of Chekiang [province] and Suchow of Kiangsu Province.

He adds that P.W. Liu, in his unpublished work, "isolated a species of *Mucor* from Mei-Tou-Cha [meitauza; Chinese characters are given], or naturally fermented dregs of soy bean curd [i.e., naturally fermented okara], which is a common foodstuff in Wuchang and Hankow." It is prepared by frying in vegetable oil or animal fat.

"No mention of the so-called Minchin [W.-G. *mien chin,* pinyin *mianjin*] fermentation has been made as yet in literature. Minchin is, chemically speaking, the gluten of wheat." Rich in protein, it has a delicious taste. In some districts it is commonly eaten as a substitute for meat by Buddhists who do not eat meat. It is also occasionally used as a palatable dish at banquets. "Although we do not know definitely when it came to be used as an article of diet, it probably was at least hundreds or even thousands of years ago. Recently it has become a canning industry in large cities, San-Loh Wusih Minchin of Kiangsu province being a well-known example."

The author then gives a detailed description of how raw wheat gluten is made in China. To the high-protein wheat flour, about 0.5% to 1% by weight of table salt is added before any water is added in a large earthen jar. The dough is allowed to stand for 1-2 hours under water before the starch is removed in a strainer. A high grade of minchin is one that is almost free of starch content, pale in color, and very sticky and flexible.

Raw wheat gluten is typically made into one of four end products: (1) Fresh minchin: The raw minchin is kneaded into desirable shapes then boiled and seasoned for eating. When prepared for sale at a market in hot weather, it is usually preserved in water to prevent rapid spoilage by bacteria; (2) Roasted minchin is prepared by roasting raw minchin in a flat pan over a fire. A small mass of raw minchin will bubble up into a large globose shape with a very loose and porous texture. It is usually used to prepare soups, or cooked with other foods, and can be purchased even in small grocery stores in some localities; (3) Fried minchin is prepared by frying raw minchin with vegetable oil and seasoning. Recently the preparation of this kind of minchin has become a canning industry, as noted above. It has an excellent taste and is especially appropriate for travelers; (4) Fermented minchin (fermented wheat gluten) is made by putting fresh minchin into a suitable container, usually an earthen jar, and covering it tightly. After 2-3 weeks at room temperature, it will be overgrown with molds and bacteria. Then an excess amount of table salt (sodium chloride), more than 10% by weight of the molded minchin is added. After thoroughly mixing the salt into the minchin, it is allowed to stand for 2 more weeks to age. It is then commonly cut into thin strips and used as a condiment with other foods. Usually the fermentation is carried on during the winter because in hot weather it spoils rapidly due to bacteria.

Minchin is most commonly eaten by the people in northern China, however fermented minchin is rarely heard of except in Wuchang, Hankow and Hanyang of Hupeh Province so far as the author knows. According to the "Investigation of diet nutrition of Chinese in Manchuria" by Lu (1934), the average amount of Minchin consumed a day by one person of different classes, and its nutritive value are as follows (Table 1): Physicians 14.4 gm of minchin, 3.2 gm of protein; Members of the bank 13.8 gm, 3.1 gm of protein; Officials 11.2 gm, 2.5 gm of protein; School teachers 3.7 gm, 0.8 gm of protein; Middle class families 1.8 gm, 0.4 gm of protein.

Minchin appears to contain a mixture of molds including *Paecilomyces varioti, Aspergillus flavipes, Cladosporium elegans, Fusarium orthoceras, Syncephalastrum racemosum, Trichothecium roseum,* and *Penicillium* species.

Note 1. This is the earliest English-language document seen (Oct. 2011) that uses the term "Fu-Yu" to refer to fermented tofu.

Note 2. This is the earliest document seen (Sept. 2011) concerning okara tempeh (which it calls Mei-Tou-Cha), and the earliest English-language document seen (Sept. 2011) that uses the term "Mei-Tou-Cha" to refer to okara tempe. Address: Lab. of Applied Mycology, College of Agriculture, Hokkaido Imperial Univ., Sapporo, Japan.

• ***Summary:*** Soybean oil was prepared by the alcohol extraction method. Gives an analysis of the sugars of soybean syrup (which is an industrial by-product of soybean oil produced by alcohol extraction). This syrup contains 17.4% water, 5.2% protein, 2.3% fat, 70.1% carbohydrate, and 5.0% ash. The carbohydrates were found to contain: Direct reduced sugar (glucose) 2.86%. Indirect reduced sugar (invert sugar) 41.73%. Other carbohydrates 25.50%

© Copyright Soyinfo Center 2014

consisting of fructose, galactose, rhamnose, arabinose, glucuronic acid, and stachyose. Sucrose (a disaccharose) and stachyose (a tetrasaccharose) were present in the ratio of 3.5 to 1.9. In addition, the author found a monosaccharose [monosaccharide] among the carbohydrates. Address: Dep. of Food Chemistry, Osaka Municipal Hygiene Lab., Osaka, Japan.

Studies on the fermentation of soybean syrup]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 13(3):233-35. March. English-language summary in Bulletin of the Agricultural Chemical Society of Japan 13:24-25, bound at the back of Nippon Nogei Kagaku Kaishi. [3 ref. Jap; eng]
• ***Summary:*** The soy-bean syrup was then fermented using eight different microorganisms. Some alcohol was produced, especially by yeast. Address: Dep. of Food Chemistry, Osaka Municipal Hygiene Lab., Osaka, Japan.

3344. *Los Angeles Times.* 1937. Japan: Japanese make ritual of dining–Harmony of color stressed in dainty servings. April 21. p. B16.
• ***Summary:*** "Soya beans provide shoyu, the favorite sauce which replaces salt in many dishes and which is used in the preparation of meat, vegetables, soup, fish and poultry."

Gives six Japanese recipes including: Vegetable soup (*Misoshiru*) (with "tofu {dried bean curd}"). Beef and vegetables (Suki Yaki) (with "tofu {dried bean curd}" and shoyu).

3345. *Los Angeles Times.* 1937. Japanese serve fish at main meals. April 21. p. B16.
• ***Summary:*** A typical Japanese home menu is show. "Breakfast: Misoshiru [miso soup] and rice. Tamago-yaki [fried eggs]. Baked fish. Nori (seaweed). Pickles."

At the bottom of the menu is a separate item (a filler) titled "Rice and red beans (Seki Han [sekihan])." Note: These red beans are azuki beans.

3346. *Contemporary Manchuria.* 1937. Bean oil industry in Manchuria. 1(1):15-42. April.
• ***Summary:*** Contents: Methods of oil extraction: Wedge system (round cake), screw system (round cake), hydraulic system (round cake or plate cake; the plate cake system, which is the most advanced method of pressure extraction, is used only by Nisshin Oil Mills at Dairen and Anglo-Chinese Trading Company {Kabalkin Oil Mills} at Harbin), benzine-benzol system, alcohol system (recently developed by Central Laboratory of the SMRC and now utilized by the Manchuria Soya Bean Industry Company at Dairen). Characteristics of the various extraction methods (merits and demerits): The hydraulic system is gradually displacing the screw system, the alcohol extraction system is the best and it produces priceless lecithin as a by-product, most of the soybean oil mills in Europe use the benzine system. Varieties of bean cake: Round cake (6 types), plate cake, flake cake [soybean meal], refined bean cake (Soyalex; extracted with pure alcohol. Its use as a raw material for shoyu, miso, candy, or noodles adds a high degree of nutritive value). Utilization of soya beans (a chart on page 27 shows many uses): Uses of soy beans, uses of bean cake (as fertilizer, for manufacturing shoyu, for making bean flour {*kinako*}, as raw material for Ajinomoto, in making liquid paint {Solite as invented by Mr. Yosei Suzuki and manufactured by the Solite Company at Dairen}, as a raw material for various protein products {including sizing for paper}), uses of bean oil (food oil, lard substitute, butter substitute or margarine, paint diluent, soap, glycerine and fatty acid, waterproof material {Tantalus}, petroleum substitute, gum substitute and other), lecithin. Factory construction expenses.

In the Far East, the solvent extraction system is used by only 3 firms: (1) The Honen [Hohnen] Oil Manufacturing Company with mills at Dairen (capacity 200 tons/day), Naruo (200 tons), and Shimizu (610 tons); (2) the Nikka Oil Manufacturing Company with its mills at Wakamatsu (200 tons); and (3) the Manchuria Soya Bean Industry Company with its mills at Dairen (100 tons). The total capacity of these 3 companies is 1,310 tons/day, of which Honen has 77%. Their combined annual production of Flake Cake [soybean meal] is about 270,000 tons, which is negligible in comparison with the total amount of round-cake production in Manchuria.

The latest method of extracting oil from soya beans is by the use of benzine or benzol as chemical solvents. The Honen Oil Mills at Dairen is the only one which uses this method at present.

Candies and noodles are already being manufactured from soybean flour. An experimental station of the

© Copyright Soyinfo Center 2014

Department of Agriculture and Commerce has experimented with the use of Flake Cake in the manufacture of shoyu and obtained encouraging results in terms of cost and quality.

3347. Go, Yukichi; Nakamura, Seiji. 1937. Saikin no nenshitsu-butsu seisei ni kansuru kenkyû. I. Kakushu nattô seisei-kin no bunrui [Studies on the creation of mucilaginous matter by microorganisms. I. Classification of natto microorganisms]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 13(4):295-304. April. [7 ref. Jap]
Address: Osaka Teikoku Daigaku, Rigaku-bu, Japan.

3348. Miyasaka, Munemaro. 1937. Daizu saponin no agurikon ni tsuite. I. [On the aglycone of soybean saponins. I.]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) 57(4):464-74. April. [6 ref. Jap]
• ***Summary:*** This article has a translation of the title in German: "Ueber die Aglykone des Sojasaponin." The author demonstrated that the apparently homogeneous saponin derived from soybeans could yield at least three different sapogenins (Sojasapogenol-A, B, or C), depending on the conditions of hydrolysis. He assigned formulas corresponding to C_{29}, C_{27}, and C_{23} to his products. Address: K.K. Takeda Chôbei Shôten Kenkyû-shitsu.

3349. South Manchuria Railway Co. 1937. Bean oil industry in Manchuria. South Manchuria Railway Co., English Section. 37 p. April. 29 cm. See also original 1936 edition with same author and title. [Eng]
• ***Summary:*** Contents: I. Methods of bean oil extraction: Wedge system (round cake; the most primitive and small scale but still extensively used in remote interior districts), screw system (round cake; the most widely used method in Manchuria), hydraulic system (round or plate; the latter allows application of much greater pressure. Used only by the Nisshin Oil Mills at Dairen [capacity 150 tons/day of soybeans] and the Anglo-Chinese Trading Co. [Kabalkin Oil Mills] at Harbin, capacity 220 tons/day), benzine-benzol system (only used by Honen [Hohnen] Oil Mills at Dairen), alcohol system (a new process discovered by the Central Laboratory of the South Manchuria Railway Co. and now used by the Manchuria Soya Bean Industry Company at Dairen).

II. Characteristics of various extraction methods: 1. Comparison of wedge, screw, and hydraulic systems. 2. Comparison of round cake (hydraulic), plate cake, benzine extraction, and alcohol extraction systems: Constituent elements of bean cakes, merits and demerits of each type. Alcohol is considered the best. It gives the best quality oil and meal, and is the only system that "produces priceless lecithin as a by-product. The only demerit of this system at present is the high cost of production as compared with other systems. This is due to the large amount of capital required in the installation of machinery and plant and the necessity of using expensive alcohol as solvent." p. 5.

III. Varieties of bean cake. 1. Round cake: This is the original Chinese bean cake, which comes in several specialized forms: Fodder bean cake used as feed, "Pien Ping" (untrimmed cake), "Kuang Ping" (junk wharf cake), dried round cake (patented by the Dairen Soya Bean Industry Research Inst.), crushed cake, miscellaneous cakes. 2. Plate cake (rectangular). 3. Flake cake (from solvent extraction). In East Asia only 3 companies and 5 mills use solvent extraction. Daily capacity of these mills is as follows: Honen [Hohnen] Oil Manufacturing Co.–Dairen 200 tons, Naruo 200 tons, Shimizu 610 tons. Nikka Oil Manufacturing Co.–Wakamatsu 200 tons. Manchuria Soya Bean Industry Co.–Dairen 100 tons. The total annual production of flake cake is about 270,000 tons and is negligible in comparison with round cake production. 4. Refined bean cake ("Soyalex"). Resulting from alcohol extraction, it is considered to be the best quality for use in foods (shoyu, miso, candy, noodles) or feeds.

IV. Utilization of soya beans. 1. Uses of soya beans (a chart shows many uses): Foodstuff, animal feed, refined oil, lecithin. 2. Uses of bean cake: Directly as fertilizer (it contains nitrogen, phosphoric acid, and potassium, put is being replaced by ammonia sulphate), and as or animal feed. Processed for making foods such as shoyu, miso, bean flour ("kinako"). To make Ajinomoto, Solite liquid paint, and various protein products such as paper sizing, celluloid substitute, or medicine. 3. Uses of bean oil: "The bean oil was used originally by the Chinese people for cooking, lighting, and lubricating (carts) purposes and the demand was limited within China. In less than 30 years, however, it began to occupy an important place in the world market." The chief reasons are its relatively low cost and many potential uses for foods (lard substitute, butter substitute) or industrial products such as soap or paint, glycerine or fatty acids, waterproof material, petroleum substitute, gum substitute, etc. 4. Lecithin: Used for making leather, margarine, or restoratives. The alcohol extraction process produces lecithin, vitamins, and saponins as by-products. The yolk of an egg contains 7-10% lecithin. "The soyalex lecithin, obtained through the alcohol extraction method, is the most excellent lecithin produced through applied chemistry. It contains 3 to 10 times more lecithin than egg yolk and is more economical for general use.

V. Factory construction expenses: Machinery, installation, and building for a plant that can process 100 tons of soya beans per 24 hours. Screw system round cake, 102,880 yen. Hydraulic system round cake, 111,856 yen. Alcohol or benzine extraction, 719,365 yen.

Tables of statistics: Exports of soya beans, bean cake, and bean oil from 1926-1935: A. From individual ports (Dairen [by far the largest], Yingkou, Antung, Vladivostok, total). B. To various countries (Japan, Europe, China,

© Copyright Soyinfo Center 2014

USA, others, total). Value of exports in 1935 (M. yen; p. 36): Soya beans 130,053,055, beancakes 51,370,086, bean oil 20,132,208. Soya bean crop area and production in Manchoukuo, 1924-1935 based on statistics compiled by the Manchoukuo Dept. of Industry.

On the last page is written, Dr. Roy H. Akagi, S.M.R. Co., as if he were author.

Note: This is the earliest English-language document seen (March 2002) that uses the word "beancakes" to refer to ground, defatted soybeans.

3350. Chamberlin, William Henry. 1937. The wide horizon: Oh, to be in Japan–! *Christian Science Monitor.* May 1. p. 18.
• ***Summary:*** "The innumerable street vendors who sell noodles, sweet potatoes, beancurd soup and fish in the streets, each provided with his special cry or horn, gather more open-air customers, will to pay two or three sen for a bowl or soup or a hot sweet potato." Spring has come.

3351. Holmes, Marie. 1937. Cooking chat: Artistic dishes delight Occidental when dining in Japanese manner. *Toronto Daily Star* (*Canada*). May 20. p. 36.
• ***Summary:*** Several weeks ago, the writer was served a complete, authentic Japanese meal at a Japanese restaurant in New York City. Sukiyaki was cooked at her table. Over the simmering vegetables, the waiter poured "some soy or shoyu sauce,..." Floating in her delicious soup was "a little flower of pink bean curd, and a slice or two of white mushroom." She finds that Japanese food is the most artistic in the world, and artistically served. "Since modern hostesses are turning more and more to dishes of other countries and, in fact, placing before their guests whole foreign menus," now is a good time to start learning about the dishes of Japan. The recipes for a Japanese menu are given, including: Beef sukiyaki (with "¼ cup soy sauce" and "1 square piece bean curd") prepared in a frying pan. Japanese directions for Miyako sukiyaki (seasoned with "shoyu sauce").

A small portrait photo shows Marie Holmes.

3357. Shih, You Kuang. 1937. Untersuchungen ueber eine neue *Mucor*-Art auf "Meitauza" aus China [Investigations on a new type of *Mucor* mold on meitauza from China]. *Transactions of the Sapporo Natural History Society* 15(1):13-23. July. [51 ref. Ger]
• ***Summary:*** Contents: Introduction. 1. On the material to be investigated and its preparation. 2. Morphological. 3. Physiological: Properties of the culture, influence of temperature, influence of hydrogen ion concentration [pH], influence of the carbon source, influence of the nitrogen source, investigation of the fermentation of sugars, formation of alcohol and acids, saccharification of starches. 4. Diagnosis (conclusion).

Meitauza is okara, fermented with a *Mucor* mold. The product is traditionally made in many places in China such as Wuchang, Hankow, and Hanyang, preferably in winter, as follows: Form okara into round cakes 4½ to 5 inches in diameter, 1 inch thick at the center and 3/8 to ½ inch thick at the edges. Place the cakes in a vessel of the same size and allow to ferment in a room with moderate aeration until, after 10-15 days they are covered with a white mycelium of *Mucor meitauza* Shih. It is said that the best meitauza cannot be prepared in hot weather; it is usually prepared in winter. At higher temperatures bacteria can grow faster than the desired mold, and thus spoil the fermentation. Dry the cakes in the sun for several hours, then sell. Meitauza is served either fried (*gebraten*) in vegetable oil or cooked with vegetables then seasoned; it is widely considered to be tasty and nutritious.

"I received the research material [cakes] by post from Wuchang. It was still covered with a thick mycelium, which was downy and grayish white. Its form and size were about the same as described above. Through the usual culture methods, I isolated a type of *Mucor.* I then investigated its morphological and physiological characteristics."

Shih (working in the laboratory of Professor Dr. Jun Hanzawa in Hokkaido, Japan–with assistants Y. Tamura and S. Yoshimura) described the *Mucor* mold he isolated as a new species. He tried growing it on tofu (*Soja-Bohnenkäse*) but found that it grew best on moist rice and okara. The optimal temperature is 27-32ºC, and pH 5-6.

A full page of illustrations shows at least 9 views of *Mucor meitauza,* including the sporangiospores, columella, branching of the spore-carrying parts, and chlamydospores.

Note 1. Hesseltine (1965, p. 190) noted that from the fresh product, Shih isolated a *Mucor* which he carefully studied and described as a new species, *M. meitauza.* However a comparison of his species illustration and his observations indicate it is a synonym of *Actinomucor elegans,* already noted as one of the principal fungi involved in the preparation of fermented tofu.

Note 2. This is the earliest document seen (Sept. 2011) that contains the word "meitauza" (spelled like this, without hyphens).

Note 3. Meitauza is apparently a type of (or close relative of) okara tempeh. Address: Laboratory for Applied Mycology, Agricultural Institute, Hokkaido Imperial Univ., Sapporo, Japan.

Photos show: Edwin West Allen (1864-1929, frontispiece). Henry Leavitt Ellsworth (p. 23). Isaac Newton (p. 41). First main building of the Department of Agriculture (p. 46). Norman Jay Colman (p. 61). Samuel William Johnson (p. 69). Eugene Woldemar Hilgard (p. 72). Wilbur Olin Atwater (p. 83). William Henry Hatch (p. 124). Henry Cullen Adams (p. 167). James Wilson (p. 186). New main building of the Department of Agriculture (p. 189).

The first move to aid agriculture in the United States was inaugurated by George Washington in his message to Congress of 1790, and more elaborately in his last message of 7 Dec. 1796 (p. 18-19). Organizations were established to collect and diffuse information. In 1797 a House of Representatives committee recommended the creation of an American Society of Agriculture, funded by the federal government, with headquarters in Washington, DC; it never happened.

Meanwhile agriculture was promoted through the patent office from 1836 to 1862. The first commissioner of patents, Henry L. Ellsworth, was very active and helped to lay the foundations of the present USDA. As commissioner (1835-1845) he immediately began to collect new and valuable seeds and plants, and to distribute these with the aid of congressmen and others. "Naval officers, consuls, and private citizens traveling abroad were frequently bringing to this country seeds and plants which might be used in our agriculture but which were largely lost because there was no agency for their preservation and distribution. In his report for 1837 Ellsworth therefore suggests the creation of a public depository for such articles, 'whence they may be dispensed to every part of the Union'" (p. 24). "In 1840 more than 30,000 packages of seeds were distributed. That year the Commissioner urged 'the importance of an annual report of the state of the crops in different sections...'" (p. 25) In 1845 Ellsworth resigned. "In 1847 more than 60,000 packets of seed were distributed, including some contributed by the French minister of agriculture commerce" (p. 27). Subsequent commissioners continued Ellsworth's work. "In 1852 Congress gave special authority for the purchase of seeds, and in 1854 included cuttings" (p. 28).

From June 1853 to 1860 the Agricultural Division of the patent office was in the charge of Daniel Jay Browne, son of a New Hampshire farmer. He emphasized the importance of the "introduction and naturalization of new and useful vegetable products, hitherto unknown in the United States," and justified the distribution of many small seed packets to encourage propagation (p. 29).

"Beginning in 1856 the language of the agricultural appropriation item was broadened to include 'the collection of agricultural statistics, investigations for promoting agriculture and rural economy and the procurement and distribution of cuttings and seeds'" (p. 31).

"In 1858 preparation was made for a propagating garden on five acres of land between Missouri Avenue and Four and a Half and Sixth Streets in Washington. This was tile drained and a hothouse was erected. Primarily it was intended to grow there the tea seeds from China and cuttings of grapevines collected in the United States" (p. 31-32).

In 1850 the Agricultural Division of the Patent Office received its first funds, $5,000, appropriated by Congress, increasing to $10,000 in 1854. "Up to that time the money had been taken out of the Patent Office fund, but in 1855 reimbursement was made to the extent of $40,078.78. After that, the agricultural appropriation was paid directly from the Treasury. Between 1856 and 1862 the appropriation varied from $30,000 to $75,000" (p. 34).

Note: Browne distributed Admiral Perry's seeds (including soybeans) from Japan. And in the Report of the Commissioner of Patents, Agriculture, he wrote numerous articles about new plants, including one about soybeans in 1855.

In the early 1860s a movement started to form a U.S. Department of Agriculture as a separate organization, outside the Patent Office. The idea became a Act which was approved by President Abraham Lincoln in 1862 (p. 37-40). Its first era was 1862-1888, with Isaac Newton as the first commissioner of agriculture in 1862, and again in 1867. He was promoted from chief of the agricultural section of the

© Copyright Soyinfo Center 2014

patent office.

"The initial appropriation for the department was $60,000... For the fiscal year 1867 the appropriations aggregated to $199,000. The Department [USDA] had six rooms in the basement of the Patent Office building [in Washington, DC], which had formerly been occupied by the agricultural division, and gradually acquired possession of the property of that Division, including the propagating garden at Sixth Street and Missouri Avenue NW. There was also assigned to it a tract of land, lying between Twelfth and Fourteenth Streets from B Street SW to the canal (now Constitution Avenue), which was being used by the War Department as a yard for army animals. This tract, now forming the Department grounds, did not come into its possession until April 1865, when it was made an experiment farm" (p. 42). Tests were made that summer. Continued. Address: USDA, Washington, DC.

3359. Horvath, A.A. 1937. The chemistry of soybean protein extraction. *Chemistry and Industry* (*London*) 56(33):735-38. Aug. 14. [27 ref]

• ***Summary:*** "The extraction of protein from soybean meal, its subsequent precipitation and properties, as well as its industrial applications have been extensively studied by S. Satow, and the results published (in English) in 1921-23 in two voluminous reports [Technology Reports, Tohoku Imperial University (Japan): 2(2) and 3(4)]. These reports continue to serve as an unsurpassed source of information on this subject, and a number of discoveries during the last 15 years can be traced to the researches of Satow." Horvath then summarizes many of Satow's key findings. Address: Chemist, Agric. Exp. Station, Newark, Delaware.

3360. *Contemporary Manchuria.* 1937. Studies on the alcoholic extraction of soya bean oil. 1(3):83-101. Sept.

• ***Summary:*** Contents: General remarks. Principle of the oil extraction method. The solubility of soya bean oil in alcohol. Experiments on the alcoholic extraction of soya bean oil. Conclusion.

Before World War I, pressure was used to extract soybean oil in Manchuria. When the war ended, "a grave crisis threatened the bean oil industry [in Manchuria] owing to the development of the nitrogen fixation industry and to the increased popularity of sulphate ammonia as fertilizer throughout the world. Bean-cake, which had been occupying the premier position in the Japanese fertilizer market, was compelled to yield its place to sulphate of ammonia, resulting in a decline of the bean-oil industry. Thus the need of a technical improvement of the oil extraction industry came to be keenly felt in order to extend the uses of bean-cake as foodstuffs and materials for industries.

"It was under such circumstances that the Central Laboratory of the South Manchuria Railway Company in Dairen commenced in April, 1927, researches and experiments on the alcoholic extraction of soya bean oil in an effort to contribute to the development of the oil extraction industry." It was found that soya bean oil dissolves rapidly in ethanol at temperatures above 60ºC. If benzine is added to alcohol, the rate of solubility increases according to the amount added. In practice, the suitable concentration of alcohol is around 96% by volume. The temperature for oil extraction must be over 75ºC and the cooling temperature below 25ºC. The oil extracted by the circulating alcohol method and the meal are both light in color and do not have the odor peculiar to soya beans. "They can be used as raw materials for the manufacture of food. Furthermore the oil contains very little fatty acid and is similar to semi-refined oil."

The new process developed by the SMRC laboratory is now used commercially by the Manchuria Soya Bean Industry Company in Dairen.

Note: This is the earliest document seen describing the commercial use of ethanol as a solvent for soybean oil. The plant in Dairen, Manchuria, uses a batch extractor.

3361. Funk Delicious: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. Also spelled Funk's Delicious. 1937. Seed color: Yellow (straw), hilum pale.

• ***Summary:*** Sources: Woodruff, Sybil. 1937. "Edible varieties of soybeans." *Proceedings of the American Soybean Assoc.* p. 19-22. See p. 22. Table 1, titled "Superior varieties of soybeans for food use" (p. 22) shows that Funk's Delicious was a late maturing green soybean. Trials in 1936 showed that the date for best use was Sept. 10 to 25.

Morse, W.J. 1938. "Edible varieties of soybeans." *Proceedings of the American Soybean Assoc.* p. 30-33. A table (p. 32) shows: F.P.I. No.: None. Days to ripen: 125. Seed color: Straw yellow. Hilum: Pale. Seeds per lb: 1,600. Oil and protein content (moisture-free basis): 17.40% and 41.31%. Use: Dry edible or green vegetable.

Lloyd, J.W.; Burlison, W.L. 1939. "Eighteen varieties of edible soybeans: Their adaptability, acceptability, culture and characteristics." *Illinois Agric. Exp. Station, Bulletin* No. 453. p. 385-439. March. See p. 394-97, 413, 425.

Morse, W.J.; Cartter, J.L. 1939. "Soybeans: Culture and varieties." *USDA Farmers' Bulletin* No. 1520 (Revised ed.) 39 p. Nov. See p. 10. "Funk Delicious–Introduced by the Funk Seed Farms, Bloomington, Ill., in 1932. Maturity, about 125 days; pubescence, gray; flowers, purple appearing in 50 to 55 days; pods, two-seeded; seeds, straw yellow with pale hilum, about 1,600 to the pound; germ, yellow; oil, 17.40 percent; protein, 41.31 percent. Suitable as a green shelled bean and a dry edible bean."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 10-11. Funk Delicious is in the USDA Germplasm Collection. Maturity group: IV. Year named or

released: 1932. Developer or sponsor: Funk Brothers Seed Company, Bloomington, Illinois. Literature: 11. Source and other information: From Japan by 1932. Prior designation: None. Address: USA.

3362. Giant Green: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1937. Seed color: Green, hilum black.

• ***Summary:*** Sources: Ridgway, Frank. 1937. "Day by day story of the experimental farms: Edible soy beans." *Chicago Daily Tribune.* Aug. 11. p. 24.

Woodruff, Sybil. 1937. "Edible varieties of soybeans." *Proceedings of the American Soybean Assoc.* p. 19-22. See p. 22. Table 1, titled "Superior varieties of soybeans for food use" (p. 22) shows that Giant Green was the earliest maturing green soybean that was studied. For this reason it was included in the table, even though it did not rank among the 17 superior varieties. In 1936 it was at its peak of flavor and texture before Aug. 26

Woodruff, Sybil; Klaas, Helen. 1938. "A study of soybean varieties with reference to their use as food." *Illinois Agric. Exp. Station, Bulletin* No. 443. p. 421-67. May. See p. 430, 466. "Altho not ranked with the superior varieties, Giant Green is included in the table because it was the earliest maturing green soybean" (p. 430). In the green stage, it was rated Fair in 1935 and Good in 1936. In the dry stage, it was rated Fair in 1935 and 1936. Its color, texture, and flavor were not very good.

Lloyd, J.W.; Burlison, W.L. 1939. "Eighteen varieties of edible soybeans: Their adaptability, acceptability, culture and characteristics." *Illinois Agric. Exp. Station, Bulletin* No. 453. p. 385-439. March. See p. 394-97, 413. "The only year in which Giant Green was included in all collections it was singled out as the most satisfactory variety, in reports from counties in the north, west, east, and southern parts of the state [Illinois], thus indicating its adaptation to all parts of the state. Some specific reasons given for preferring this variety, besides its good quality and extreme earliness, were that it was especially drouth-resistant, that it developed before the bad weather came, and that it was ready to use before grasshoppers arrived in destructive numbers."

Morse, W.J. 1941. "Shanghaied... a super food." *Soybean Digest.* July. p. 4-5, 10. See p. 5. Giant Green is an early variety, maturing in 101-110 days.

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 10-11. Giant Green is in the USDA Germplasm Collection. Maturity group: I. Year named or released: 1938. Developer or sponsor: J.W. Lloyd, Illinois AES (Agric. Exp. Station). Literature: 09, 10, 13, 14. Source and other information: From the Takii Seed Company, Kyoto, Japan, to the Illinois AES (Agric. Exp. Station) in 1935. Prior designation: None. Address: USA.

3363. Morse, W.J. 1937. Soybean variety studies of the United States Department of Agriculture. *Proceedings of the American Soybean Association* p. 16-18. 17th annual meeting. Held 14-16 Sept. at Urbana, Illinois.

• ***Summary:*** "One of the outstanding results of soybean improvement work in the United States has been, the realization of the importance of varietal adaptation... Varietal adaptation is obviously the reason why practically every locality in the soybean regions of the Orient has its own local varieties... Of the large number of introductions obtained from Asia, the same variety rarely has been secured a second time unless introduced from the same locality... Before numerous introductions were made by the Department, beginning in 1898, there were not more than eight varieties of soybeans grown in this country, and the culture of these varieties was confined to limited areas in a few states... Seed samples were obtained through consuls, missionaries, seedsmen, government agencies, and foreign explorers until by 1909 we had 175 varieties; by 1913, 427 varieties; by 1919, 629 varieties, by 1925, 1133 varieties, and at the present time more than 2,500 distinct types. Since 1989 the Department of Agriculture has made more than 10,000 introductions of soybeans from China, Manchuria, Japan, Chosen [Korea], Java, Sumatra, Siberia, and India. This large collection, ranging in time of maturity from 75 to 200 or more days, has show wide differences in adaptation to soil and climatic conditions..."

After preliminary testing at Arlington Farm, Virginia, the introductions are sent to various experiment stations for cooperative studies...

"The soybean has been used chiefly as a forage crop in the United States and for many years breeding work tended largely toward the development of varieties for hay, silage, and pasture. With the rapid development during the past few years of the soybean for oil, food and industrial purposes, acreage for bean production has increased greatly. The improvement and development of varieties adapted to a wide range of conditions and uses undoubtedly has been one of the most important factors in increased acreage and seed production."

"Extensive cooperative investigations with more than 3,000 introductions and selections of soybeans have been carried on during the last three or four years with experiment stations and special cooperators in 44 states and the insular possessions, Hawaii and Puerto Rico. Many of these selections gave outstanding results when compared with standard varieties in different sections and are being increased for more extensive field tests. Several of the varieties in different sections were found especially suitable for use as green shelled beans, dry edible beans, or beans of high oil and protein content, as commercial beans.

"In 1936, more than 5,000 individual soybean plant selections from introductions and natural hybrids were under test at Arlington Farm. Although improvement

© Copyright Soyinfo Center 2014

work at Arlington has been largely plant selection, some hybridization work has been started, especially with the wild soybean and the most promising cultivated types. Oil and protein studies have been conducted along with the breeding work, analyses being made of introductions grown in the same and under different environmental conditions. An extensive series of varieties, introductions and selections at Arlington Farm ranged from 12 to 26 per cent oil and from 28 to 50 per cent protein... In view of the interest in soybean oil for paint purposes, studies were conducted to show the range in iodine number. The results of these investigations showed a range from 118 to 143 for domestic varieties and 155 for the wild soybean.

"The increasing use of soybeans for food has resulted in a demand for varieties especially suited for various food purposes. Extensive cooperative cooking experiments with the Bureau of Home Economics of the Department of Agriculture and with several state experiment stations have shown considerable variation in flavor and cooking quality in both the green and dry beans of edible varieties from the Orient. The most promising of these have been named and distributed to special cooperators by several state experiment stations. Some of these varieties are especially valuable as green shelled beans, flour, dry edible beans, roasted salted beans [soynuts], bean curd, bean milk, and bean sprouts." Address: Bureau of Plant Industry, USDA, Washington, DC.

Comparison of acid formation capability]. *Jozogaku Zasshi* (*J. of Brewing, Osaka*) 15(9):812-13. [Jap] Address: Osaka Teidai, Kôgaku-bu, Jôzôgaku Kyôshitsu, Osaka, Japan.

3365. Ochiai, Eiji; Tsuda, Kyosuke; Kitagawa, Seikichi. 1937. Ueber Sojabohnen-Saponin. I. [Soybean saponins. I.]. *Berichte der Deutschen Chemischen Gesellschaft* 70B(1):2083-92. Oct. [13 ref. Ger]
• ***Summary:*** A comprehensive investigation of the saponins in soybeans which can be obtained after removing the oil and lecithin. They are of two forms: one crystalline and the other amorphous. Hydrolysis of each type shows, by analysis of the hydrolyzed products, that saponins are built up from rhamose and galactose as the sugar components, coupled with glucoronic acid and neutral sapogenols.

Most of the research focused on investigating the chemical origin of the soybean sapogenols, since these are the essential and characteristic component of the saponins. Four different sapogenols were identified, their only chemical difference being in their oxygen content. Their chemical reactions and the composition of their oxidation and reduction products show that they are triterpene alcohols. This relates them chemically, and as plant products, to the great class of terpenes and terpenoids which includes turpentine, camphor, and many essential oils from which flavors and perfumes are made. It also settles the question as to whether soy bean saponins were derived from sterols or from terpenoids, and will be helpful for directing the research into uses of saponins as soybean products (From: *Food Industries.* Dec. 1937, p. 739).

The authors also isolated the phenolic glycoside genistin and reported it to have a melting point of 298-300ºC.

Note: Previous to its isolation from soybeans, genistein was synthesized by Baker and Robinson (1926, 1928), who established it to be identical with prunetol and 5:7:4'-trihydroxyflavone. Address: Pharmaceutical Institute, Imperial Univ. of Tokyo, Japan (Aus d. Pharmazeut. Institut d. Kaiserl. Universitaet Tokyo, Japan).

3366. Ochiai, E.; Tsuda, K.; Kitagawa, S. 1937. Ueber Sojabohnen-Saponin. II. [Soybean saponins. II.]. *Berichte der Deutschen Chemischen Gesellschaft* 70B(10):2093-96. Oct. [8 ref. Ger]
• ***Summary:*** The authors reported the results of dehydrogenation of the four saponins described in the previous pages of this journal (p. 2083-92). They concluded that the sapogenins obtained from soybean saponin by acid hydrolysis were triterpenoid alcohols, genetically related to one another and to many similar sapogenins belonging to the hederagenin series. Address: Aus d. Pharmazeut. Institut d. Kaiserl. Universitaet Tokyo, Japan.

white (Letter to the editor). *British Medical Journal* ii:996-97. Nov. 13.
• ***Summary:*** The writer acknowledges the nutritional deficiencies of white bread then goes on to state: "May I enter a plea for closer consideration of the benefits which can be gained from adding 20 per cent. flour milled form soya beans to 80 per cent. wheat flour? This mixture possesses all the physiological characteristics of dark whole-meal flour, and bread made from it surpasses the nutritive value of bread made from whole wheat as well as being more palatable and tasty. These qualities are due to the large amount of soya protein (glycinin), which is a complete protein containing all the essential amino-acids necessary for the building up of proteins of the human organism. In the above proportions of soya flour with white flour the protein of ordinary bread is increased by over 60 per cent." Soy flour is also a good source of vitamins A and B, and of lecithin.

"The ash of soya is alkaline while that of cereals is acid; the ash is rich in phosphorus, calcium, and magnesium. Because of this alkaline value, soya flour is especially useful in combating the fatigue of muscular exertion, and herein lies the Oriental's ability to do a long day's work at low cost. The yield of protein pound for pound is more than twice that of beefsteak; four times that of eggs, wheat, and cereals; twice that of lima beans; and twelve times that of milk.

"The soya flour most commonly used in England is made in accordance with the formula of Professor Berczeller of Vienna [Austria]... The widespread use of soya food in Japan and China down the ages, and the example of other countries that consume it in annually increasing quantity, are factors that should lead us to a better appreciation of the high nutritional qualities of this legume." Address: Edinburgh [Scotland; M.D., Scotch physician].

• ***Summary:*** Table No. 37 (p. 283) gives figures (gallons and dollar value) for imports of soy sauce to Canada each year from 1932 to 1935 from United Kingdom, Hong Kong, China, Japan, Syria, and the United States. Total soy sauce imports (in gallons) were as follows: 1932 = 78,581. 1933 = 72,389. 1934 = 89,249. 1935 = 79,321.

Page 289 shows imports of soya beans in 1935 only from United Kingdom, Hong Kong, Japan, and United States. Some 259,460 lb of soybeans were imported worth $7,822. The main source country was Japan, followed by the USA.

Page 299 gives import figures for soybean oil in 1934 and 1935 from United Kingdom, China, Germany, Japan, Netherlands, and the USA.

Page 335 shows imports of soya bean cake and meal from 1932 to 1935 from United Kingdom, China, and USA.

Page 340 shows imports of soya bean oil (and peanut oil) for the manufacture of soap in 1934 and 1935 from the United Kingdom, China, Denmark, Germany, Netherlands, and United States. Address: Ottawa, Canada.

• ***Summary:*** Pages 21-22 repeat the information from Morita 1915 about Haruhachi Shimada being the first to brew shoyu in Hawaii.

Page 95 in the "people" section states: "Nobuyuki Yamagami was born in 1882 and came from Fukuoka prefecture. He studied in Fukuoka and also in Tokyo. Later he developed ambition and traveled to England, France, Germany, and other European countries for several years. Next he went to Australia, and finally to the USA. In San Francisco he opened a seafood products store and studied foods. In 1905 in Honolulu, Hawaii, he founded Yamakami/Yamagami Shoyu Jozo-sho, which was successful. Later he changed the company's name to Hawaii Shoyu Kaisha. He delegated the work to Tashiro Kumataro, and went to China for fun. In Korea he founded a soap factory and succeeded in getting orders from the army and navy. His shoyu was developed based on his original research, and suited for the tastes of modern people. He called it 'kenfu,' which means 'wise wife/women.' It became very popular. His elder brother, Sogen Yamakami/Yamagami, was a great Zen monk/priest. Also he was very famous for his great kindness to his parents."

3382. Inahara, K. ed. 1937. Japan Year Book. Tokyo: The Foreign Affairs Association of Japan. 1240 + 32 p. See p. 474-76, 625, 987, 1071-72, 1076-78.

• ***Summary:*** The Preface indicates that this book was published in about Sept. 1937.

Pages 475-76. "Leguminous plants:... During the past decade area planted has been pursuing a slow, downward movement, while a sharp reduction experienced by production was more than made good by the increase of 1933. Soya beans and azuki (red) beans are predominant both in area and production.

Soy-beans were planted on 335,345 cho which produced 2.261 million koku worth 34,333,000 yen.

Azuki beans were planted on 109,389 cho which produced 5.333 million koku worth 10,620,000 yen.

Note: It is surprising that Japan produced a much larger volume of azuki beans than of soy-beans. Perhaps azuki bean production should be 0.533 million koku.

Page 625. A large table shows production of vegetable oils in Japan (in yen) from 1936 to 1935. In 1926 rapeseed oil was the most valuable oil in Japan (13.474 million yen) followed closely by soya bean oil (13.386 million yen). The same general relationship existed in 1935; rapeseed oil was still the most valuable oil in Japan (20.019 million yen) followed by soya bean oil (15.329 million yen).

Next in value in 1935 were perilla oil (10.494 million yen), cottonseed oil (7.129 million yen), other oils (6.743 million yen), copra oil (5.376 million yen), sesameseed oil (2.835 million yen), linseed oil (3.691 million yen), groundnut oil (0.595 million yen), camellia oil (0.439 million yen), and paulownia oil (0.227 million yen).

A second table shows production of animal oils and tallow (in yen) from 1926 to 1935. These were much less important than vegetable oils, being worth only about one-sixth as much in total. Beef tallow and cod oil were the two most important animal oils in 1935.

Page 987. The section on Chosen [Korean] agriculture states that the soy bean is one of the most important crops, after rice, barley, wheat and rye. "In 1935 the total the total area under cultivation was 791,857 cho and the amount

© Copyright Soyinfo Center 2014

produced reached 4,375,278 koku, which was an increase of more than five times compared with the year 1910."

Page 1071. A large table shows "Values of principal articles exported abroad (in Manchoukuo yuan)," in 1935 and 1936. The export item of greatest value was soy beans, which increased from 130.053 million yuan in 1935 to 216.474 million yuan in 1936.

The item of 2nd greatest value was [soya] beancake, which increased from 51.370 million yuan in 1935 to 53.126 million yuan in 1936.

The export item of 4th greatest value (after coal) was [soya] bean oil, which increased from 20.132 million yuan in 1935 to 21.282 million yuan in 1936.

Page 1072. A large table on "Quantities of principal articles exported abroad" (from Manchoukuo in piculs; 1 picul = 133.33 lb) are: The export item of greatest weight was soy beans, which increased from 9.203 million piculs in 1935 to 32.539 million piculs in 1936.

The item of 2nd greatest weight was [soya] beancake, which decreased from 16,925 million piculs in 1935 to 14,026 million piculs in 1936.

Another important export item was [soya] bean oil, which decreased from 1.479 million piculs in 1935 to 1,109 million piculs in 1936.

Page 1076. Two large tables show "Cultivated area and production of cereals" (in hectares and metric tons), 1929-1935. For soy beans:

3.822 million metric tons in 1935–grown on 3.249 million ha.

Other crops in the table are other legumes, kaoliang, millet, maize, wheat paddy-field rice, upland rice, and other cereals.

Page 1077 gives "Crop forecast by provinces (metric tons)." Soy beans is the first crop on the list. The provinces are:

Pinkiang 1,083,886 metric tons
Fengtien 985,362 metric tons
Kirin 980,789 metric tons
Lungkiang 464,940 metric tons
Sankiang 260,592 metric tons
Antung 154,664 metric tons
Chinchow 151,108 metric tons
Chientao 91,383 metric tons
Heiho 2,729 metric tons
Total 4,175,453 metric tons.

Also on p. 1077 a table shows "Exports of agricultural products, 1933-1935." (Quantity in piculs, value in yen). Soy beans was by far the leading export:

39.111 million piculs in 1933
41.308 million piculs in 1934
29.230 million piculs in 1935

Page 1078. "Soy Beans: Manchoukuo produces about 60 per cent of the total production of soy beans in the world. The beans contain about 10 per cent of oil, and the cake which is obtained in pressing the beans is exported as fertilizer. The latest figure for production of soy beans in Manchoukuo was 3,820,000 metric tons and its total plantation [planted] area 3,249,000 hectares. The average crop per hectare was 1,180 kg."

3383. Japan-Manchoukuo Year Book. 1937. Tokyo, Japan: Japan-Manchoukuo Year Book Co. 32 + xiii + 1304 p. Index. 26 cm. Fourth annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. On the title page, just below the title but in small letters we read: "Cyclopedia of General Information on the Empires of Japan and Manchuokuo. Appendices: Who's Who Business Directory." Below that is a small map showing the Japanese empire, circled, as part of East Asia–under which is printed: "Neither is Understandable Without the Other." Below that are listed the cities and names of 18 agents worldwide. This book was published in mid-November 1936.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year.

Page 359. A large table gives the yield of rice and other cereals in koku per tan from 1904-08 to 1935. For soya beans the yield in 1935 was 0.67.

Page 369. Table 27 shows production of "Beans, potatoes and sweet potatoes" in hectolitres from 1929 to 1934. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya beans:

3.902 million hectoliters in 1934

Page 846. Two large tables show "Area under various crops (in hectares)" and "Amount of crops (metric tons)" in Manchoukuo yearly from 1924 to 1935. For soya beans: 3.822 million metric tons in 1935

The other principal crops shown in the tables are other beans, kaoliang, millet, maize, wheat, rice, upland rice, and other cereals.

Page 847. The section on "Soya beans" has a new paragraph on the end: "Soya beans are exported to Japan, China, Europe, the South Seas and almost al other countries of the world. Their exports for the last few years are given below:

2.207 million metric tons in 1930
2.834 million metric tons in 1931
2.562 million metric tons in 1932
2.523 million metric tons in 1933
1.976 million metric tons in 1934
1.892 million metric tons in 1935

Page 915. A pie chart shows principal exports from Manchoukuo in 1935. In descending order of importance they are: Soya beans 30.9%. [Soya] bean cake 12.2%. Coal 9.6%. [Soya] bean oil 4.8%. Groundnuts 3.6%. Other beans 3.1%, etc.

© Copyright Soyinfo Center 2014

Page 893 is all about soya beans in Industry in Manchoukuo. In recent years, exports of bean cakes have "been hard hit by the world-wide economic depression and the growth of the sulphate of ammonia [ammonium sulfate fertilizer] industry.

"There are more than 3,000 bean oil mills throughout Manchoukuo, but those with worthy equipment are 402 in number as may be seen from the following table (as shown by the returns of the Dairen Bean Oil Association).

The large table, titled "Bean oil mills" shows the number of mills in each locality for each for the following localities: Dairen 50, Yinkow 20, Antung 23, Harbin 43, South Manchuria 238, North Manchuria 28. Total: 402. Also given for each locality are the number of pressing machines (hydraulic or screwing [screw presses]) and the production capacity per day of beancake (pieces) and bean oil (kin).

A small table (p. 893) shows the "Output of bean-cake and oil" in 1932. Bean cake was worth 72.1 million yen whereas bean oil was worth 31.6 million yen.

Four large tables (p. 893-94) show "Exports of bean oil and bean-cake by countries, 1932-1935. About 70% of the soya bean oil (by weight) is exported to China, whereas about 48% of the bean-cake is exported to Japan & Chosen [Korea] and about 34% is exported to China.

Page 897. A long section titled "Soy" [sauce] states: "In sympathy with the rapidly increasing number of Japanese residents since the foundation of the country [Manchoukuo], the soy industry has made marked developments. The output of soy in Kwantung Province, which was as limited as 14,500 koku in 1931, increased to 22,000 koku in 1932, to 25,000 koku in 1933 and to 27,000 koku in 1934. It is observed that 30 per cent. of the output is exported to Manchoukuo and 10 per cent. to China. The shipments to the former have of late begun to shrink in contradistinction to the increase in the local consumption. This is due to the growing development of soy brewing in Manchoukuo. Prior to the 1931 incident there was almost no production of soy in Manchuria, but at present it is produced to the extent of about 30 per cent. of the output of Kwantung Province. Thus, the Manchoukuoan soy is gradually invading the market along the S.M.R. line hitherto monopolized by the Kwantung brewers. The import of soy from Japan is reckoned at 10,000 koku a year. In 1935 the Kwantung Province Soy Brewing Association was composed of fifteen members. Principal soy breweries in whole Manchoukuo are the Dairen Soy Co., the Ikeda Shoten and the Shimaki Shoten, Dairen, and the Mukden Shoten and the Iyokoku Shoten, Mukden the Manshu Shoyu, Hsinking; and the Okada Shoten, Liaoyang.

"According to the Manchurian Industrial Statistics, in 1932 there were 79 soy breweries, which were responsible for the production of 105,778 hectolitres, valued at ¥1,599,548."

3384. Kale, F.S. 1937. Soya bean: Its value in dietetics, cultivation and uses. With 300 recipes. 2nd ed. Baroda State, India: Baroda State Press. xxx + 375 p. Illust. (35 leaves of plates, described in a separate record). Index. 22 cm. 2nd ed. 1937. [66 ref]

• ***Summary:*** Contents: 1. Deficiencies in the Indian diet and soya bean as a means to rectify them. 2. History of the origin and growth of soya bean: Derivation of the word soya bean, origin of soya bean, literature, primitive man and soya bean, name of the plant, home of soya bean and its expansion, varieties of soya bean, the culture of soya bean is very remote (It "has been the chief article of diet in China for over 7,000 years."), reference of soya bean in old Chinese records, how and when soya bean became known to Europeans, soya bean in England (from 1890; J.L. North and Henry Ford), soya bean in France (from 1739), soya bean in Italy, soya bean in other countries of Europe, soya bean in United States of America, India and soya bean.

3. The use of soya bean: Importance of soya bean, dietetic importance, industrial importance, agricultural importance (Russia, Mussolini in Italy), medical importance, soya bean is alkalising in its effect ("Soya bean milk as well as its flour is used in foods for invalids and infants, like Nestle's food"), longevity and soya bean.

4. World trade in soya bean: Imports to Europe, production of soya bean in Manchuria (58% in North Manchuria), exports from Manchuria, oil and cake industry in Manchuria, soya bean production in Japan, in America, in Africa, in Australia, in Europe, in Java, in India, in other British possessions, estimate of world production of the soya bean, the desirability of the expansion of soya bean cultivation, imports and exports of soybeans, soya bean oil, and soya cake–1913-1927: Denmark, Holland, United States, Great Britain, Japan, France, Russia, China, Germany, Norway, Korea. Source: International Institute of Agriculture, Bureau of Statistics, 1921, p. 420-21. A table (p. 38) shows statistics for world production of soybeans "as estimated by the leading firm of London soya bean dealers" for various years from 1923 to 1929. This includes individual statistics each year for China [incl. Manchuria], Japan, and USA. The world totals in tons are: 3,095,000 (for 1923-25). 3,397,000 (for 1926). 4,325,000 (for 1927). 6,000,000 (for 1928), and 6,570,000 (for 1929; incl. China 5,250,000; Japan 550,000; USA 250,000; Java & Dutch East Indies 120,000; Other Asiatic countries & Africa 400,000).

5. Botany of the soya bean plant. 6. Classification of soya bean. 7. Cultivation of soya bean. 8. Diseases and pests of soya bean. 9. Cultivation of soya bean in India. 10. The constituents of soya bean. 11. Soya bean milk. 12. Soya bean flour. 13. Industrial uses of soya bean. 14. Enriching soil by addition of nitrogen and use of soya bean as fodder. 15. Food requirement of the human body. 16. European and American soya bean recipes. 17. Diabetic dishes, Mahatma Gandhi's experiments at Magan Wadi and opinion of scientists on soya bean. 18. Chinese and Japanese soya bean dishes:

© Copyright Soyinfo Center 2014

Toffu [tofu] or soya bean curd: Digestibility, utilization, toffu khan, toffu nao [doufu nao], tze toffu (fried bean curd), chien chang toffu (thousand folds), hsiang khan, kori toffu (frozen toffu), preservation of toffu. Natto. Tokio natto and Kyoto natto etc. Hamanan natto [Hamanatto]. Yuba. Misso [miso]. Soya sauce. Soya bean confectionery. Roasted beans (Chinese).

19. Indian soya bean dishes: Hindustani dishes, Moglai dishes, Gujarati dishes, Maharashtrian dishes, Bengali dishes, Goa dishes, Tanjore dishes. Appendixes. 1. Acreage of soya bean in Manchuria during the last 5 years. 2. Total figures of export during last 5 years. 3. Bibliography. 4. Some opinions about the first edition of this book.

The preface begins (p. iii): "This little book is written in response to innumerable inquiries I have had from time to time after the inauguration of the plantation ceremony of Soya Beans at the State Agricultural Experimental Station by H.H. the Maharaja Gaekwar of Baroda in November 1933.

"A few months after this a food exhibition was held in Baroda where many Soya Bean dishes–Indian, European and Chinese–were exhibited. The leading papers and journals all over the country spoke in very glowing terms about the Soya Bean dishes that were exhibited... Later on at the request of Messrs. Mitsui Bussan Kaisha Ltd., a leading Japanese Firm in Bombay, a Soya Bean Exhibition and Restaurant were run in the Japanese village at the H.O.H. fete. So keen was the interest and enthusiasm evinced by the cosmopolitan public of Bombay that seats in the restaurant had to be reserved in advance. The presence of H.E. the Governor and Lady Brabourne and many Indian princes was an additional evidence of the ever growing popularity of the tasty Soya Bean dishes served there.

"At the closing of the H.O.H. fete many prominent people of Bombay requested me to continue the restaurant at a convenient place in the city, and asked me to open soya-bean milk centres for the children of the poor who could not afford to buy cow's milk. Many were ready to finance any scheme that I would propose, but unfortunately my time was not my own as I had to attend to my duties in the State and could not take advantage of their generous offer.

"The Departments of Agriculture of the various provinces of India as well as many Indian States asked me to supply them with literature regarding the cultivation and the uses of this most useful bean. The Department of Commerce and Industry of the Government of Bombay inquired if I could furnish them with information about the machinery for the extraction of Soya-bean milk. Letters of inquiries from private individuals kept pouring in daily from all parts of India. All this has induced me to undertake the preparation and the publication of this book...

"From the number of experiments carried on in the Baroda territories and outside it, I feel sure that the Indian soil is most suitable for the cultivation of soya bean...

"The leading thought of the day in India is, 'Village uplift,' and 'Rural reconstruction.'

"Baroda, 7th January 1936, F.S.K. (p. iv)

"Preface to the Second Edition: I feel grateful to the public for having given such a hearty reception to the first edition of my book. It is running into a second edition within a year...

"Now, Soya Bean Bakeries and Restaurants have been started in the city of Bombay and in many other towns in India, and Soya Bean products are exhibited in almost all the exhibitions...

"I feel highly thankful to His Highness the Maharaja of Baroda who gave me an opportunity last year of visiting Russia, where I have seen that seven to ten per cent. of Soya Bean flour was being added to the wheat flour in order to enhance the nutritive value of the bread. The Soya Research Institute at Moscow is making researches into the nutritive, industrial and economical values of Soya Bean. I have seen there the actual working of the Soya-bean milk extracting plant. They make casein out of Soya-bean milk. Soya-bean cream is sold in the market.

"I visited the dietetic clinics in England, France, Germany, Austria and other European countries, where doctors prescribe Soya Bean bread for diabetic patients. In Russia, rickets and consumption are treated by Soyolk extracted out of Soya Bean...

"France is growing Soya Bean on côlt de jura [sic, Côte d'Azur, on the Mediterranean?]. In England, through the efforts of Mr. J.L. North, Soya Bean is realised as a field crop for the last two years.

"Paris, 3rd April 1937. F.S.K. (p. ix)." Address: Food Survey Officer, Baroda State, India.

• ***Summary:*** Abstracted from Jozogaku Zasshi 15:453 (1937).

3387. Morse, W.J.; Cartter, J.L. 1937. Improvement in soybeans. *Yearbook of Agriculture* (*USDA*) p. 1154-89. For the year 1937. [67 ref]

• ***Summary:*** Contents: History of the soybean. World distribution and production. Utilization of the soybean (with chart). Improvement of soybean varieties. Methods in breeding: Natural and artificial crossing, mutations. Inheritance studies and cytology: Plant characters (flower, stem, pubescence, and foliage; height of plant and maturity; pod-bearing habit and pod characters; sterility, growth habit), seed characters (color of seed coat, hilum, and cotyledon; other seed characters), yield of seed. Disease resistance. Identification of genes and chromosomes. Selected references on genetics of the soybean. Appendix: 1. Workers identified with soybean improvement: United, States, foreign countries. 2. List of soybean genes (table). 3. Linkage of soybean characters (table). 4. Soybean varieties: Origin and varietal characteristics (table listing 101 named soybean varieties; for each is given the place and date of introduction or origin, days to mature, flower color, pubescence color, and seed characters {coat color, germ color, hilum color, seeds per pod, seeds per pound}, uses {dry-edible beans, forage, green-vegetable beans, grain}).

The section titled "History of the Soybean" states: "The early history of the soybean is lost in obscurity. Ancient Chinese literature, however, reveals, that it was extensively cultivated and highly valued as a food for centuries before written records were kept. It was one of the grains planted by Hou Tsi, a god of agriculture. The first record of the plant is contained in a materia medica describing the plants of China, written by Emperor Sheng Nung [sic, Shen Nung] in 2838 B.C. The crop is repeatedly mentioned in later records and it was considered the most important cultivated legume and one of the five sacred grains essential to the existence of Chinese civilization. Seed of the plant was sown yearly with great ceremony by the Emperors of China, and poets extolled its virtues. The records of methods of culture, varieties for different purposes, and numerous uses indicate that the soybean was perhaps one of the oldest crops grown by man."

Note 1. This is the earliest English-language document seen (Nov. 2013) which states that: (1) The soybean was one of the "five sacred grains." (2) "The early history of the soybean is lost in obscurity." (3) The soybean was planted at an early date by "Hou Tsi, a god of agriculture." (4) The "soybean was perhaps one of the oldest crops grown by man." It is also the earliest document seen (June 209) in which William Morse mentions the mythical Chinese emperor "Sheng Nung" in connection with soybeans.

More broadly, this entire story linking Shen Nung with the earliest written record of the soybean, is completely incorrect. Yet because the story was written by Morse (highly regarded as America's leading authority on the soybean) in a USDA publication, it has unfortunately been repeated, and this source cited, again and again down to the present day (see Hymowitz 1970; Hymowitz and Shurtleff 2005).

Note 2. This is the earliest document seen (June 2003) in which the emperor's name is spelled "Sheng Nung."

Note 3. This is the earliest document seen (July 2007) in which William Morse tries to write an early history of the soybean in China. Unfortunately, he does not cite his sources.

The section titled "Improvement of soybean varieties" states: "In the United States, more than 50 percent of the acreage devoted to soybeans is used for forage and pasture; breeding work, therefore, has tended largely toward the development of varieties for hay, silage, and pasture. The

© Copyright Soyinfo Center 2014

development of such varieties as Virginia, Laredo, Otootan, Wisconsin Black, Manchu, Wilson-Five, Kingwa, Peking, and Ebony by selection from introductions has been the principal factor in the increased use and acreage.

"Beginning with 1929, the use of soybean seed by oil mills has led to a demand for yellow-seeded varieties of high oil content. Agronomists and plant breeders have attempted to meet this demand by making large numbers of selections from foreign introductions and locally grown varieties and by analyzing these for oil content. This has brought about the development of several superior oil varieties and has resulted in a large increase in production of beans for milling purposes. The most popular of these varieties are Illini, Dunfield, Mukden, Mandell, Scioto, Mansoy, Manchu, Mamredo, Delsta, and Mandarin. Results of analyses with more than 1,000 selections and varieties have shown a range of from 12 to 26 percent in oil content. From studies of the oil content of varieties grown in a given locality, it seems possible, from the breeding standpoint, to produce varieties high or low in oil, at least within the known ranges of variation exhibited by common varieties." (p. 1161-62).

Soybean varieties that have excellent flavor and become soft in less than 2 hours of cooking include Easycook, Bansei, Rokusun, Jogun, Chusei, and Sousei. These are "now in the hands of growers and seedsmen. Experiments by commercial firms have shown that these varieties are superior to commercial varieties for the manufacture of food products, such as bean flour, roasted beans, bean milk, and bean curd [tofu].

"In Japan, certain varieties of soybeans were found that were used solely as green shelled beans. Ranging in maturity from 75 to 170 days, many of these introductions, and selections from them, have been found especially promising for the various sections of the United States. The vegetable soybean offers an excellent food of high nutritional value, especially in the fall when other green beans are lacking and in sections where the Mexican bean beetle prohibits the growing of garden beans. As a result of selection, cooking tests, and adaptation studies, eight green vegetable varieties–Hahto, Kura, Kanro, Hokkaido, Higan, Chusei, Sousei, and Jogun–have been introduced in various sections of the country" (p. 1163).

Photos show: (1) "The late Charles Vancouver Piper, agronomist, United States Department of Agriculture, 1902-26. Pioneer in the introduction and development of soybean varieties for United States conditions." (2) "Storage yard of a Chinese grain merchant near Kungchuling, Manchuria. More than 80 osier bins, each holding four cartloads of soybeans, were in this yard." (3) A Manchurian farmer and how he harvests, threshes and cleans soybeans by methods learned from his ancestors; comparison with modern U.S. machine harvesting. (4) "Millions of soybean oil cakes are stored in warehouses in Manchuria awaiting shipment to Japan, Chosen, China, and the East Indies, where they are used for fertilizing purposes and for cattle feed." A person looks up at the towering stacks. (5) Coolies loading large sacks of soybeans on a freighter for shipment to the oil mills of Europe. One man has hoisted a huge sack onto his back. (6) Five Manchurian farmers who have been awarded certificates and prizes for producing high-quality soybeans. (7) Twenty seeds of a natural soybean hybrid showing peculiar types of coloration. (8) Illustration (line drawing) of a soybean flower and its parts enlarged. Front view, side view, parts of the corolla (standard, wing, one of the keel petals), stamens, pistil. (9) A. Stems and pods of fasciated soybean plants; B. Determinate pod-bearing type; C. Indeterminate pod-bearing type. 10. Chromosome chart showing four groups of linked genes in soybeans.

A table (p. 1157) shows: "Increase in production of soybeans over an 11-year period, 1924-25 to 1935-36, inclusive, in the principal producing countries of the world" (Manchuria, Chosen [Korea], Japan, United States, Netherland India).

Soybean seed size (p. 1177): "The range in size of soybean seed varies according to the variety, each variety having its own typical seed size. Varieties and introductions tested at the Arlington Experiment Farm ranged in average weight of 100 seeds from about 4 grams for the smallest to about 40 grams for the largest." Address: 1. Senior Agronomist; 2. Assoc. Agronomist. Both: Div. of Forage Crops and Diseases, Bureau of Plant Industry [USDA, Washington, DC].

• ***Summary:*** This table lists 101 named soybean varieties; for each is given the place and date of introduction or origin, days to mature, flower color (pink or white), pubescence color (gray or tawny), and seed characters (coat color {black, black (dull), brown, green, olive yellow, straw yellow, plus combinations such as black and brown}, germ color {green, yellow}, hilum color {black, brown, pale to brown, yellow, yellow to brown}, seeds per pod {2-3 or 2-3-4}, seeds per pound {ranges from 1232 for Hokkaido to 9950 for Barchet}), uses (dry-edible beans, forage, green-vegetable beans, grain).

For example, the first variety listed is Agate. Origin: Introduction, from Japan. Year: 1929. Days to mature: 90. Flower color: Purple white. Pubescence color: Tawny. Seed coat color: Straw yellow + brown. Germ color: Yellow. Hilum color: Brown. Seeds per pod: 2-3. Seeds per pound: 2816. Use: Green vegetable beans.

The following varieties are listed alphabetically. All varieties are introductions from East Asia unless otherwise noted. (* = green vegetable; ** = dry edible): Agate*, A.K., Aksarben, Arlington, Arksoy, Avoyelles (Selection by Gray, Louisiana, 1932), Bansei*, Barchet, Biloxi, Black Eyebrow, Cayuga, Chame*, Chernie, Chestnut (Selection by Arlington Experiment Farm, 1907), Chiquita, Chusei*, Columbia, Creole, Delnoshat (Selection by York, Mississippi, 1925), Delsta (Selection by York, Mississippi, 1925), Dixie (Selection by Arlington Experiment Farm, 1914), Dunfield, Easycook**, Ebony, Elton, Fuji**, George Washington (Selection by Clapp, Virginia, 1921), Georgian, Goku*, Habaro, Haberlandt**, Hahto*, Hakote*, Harbinsoy (Selection by Arlington Experiment Farm, 1922), Hayseed, Herman (Selection by Herman, North Carolina, 1915), Higan*, Hiro*, Hokkaido*, Hollybrook (Selection by Wood, Virginia, 1902), Hongkong, Hoosier, Hurrelbrink (Selection by Hurrelbrink, Illinois, 1902), Illini (Selection by Woodworth, Illinois, 1921), Ilsoy (Selection by Smith, Illinois, 1913), Ito San, Jogun*, Kanro*, Kingwa (Selection by Garber, West Virginia, 1921), Kura*, Laredo, Lexington (Selection by Arlington Experiment Farm, 1907), Mammoth Brown (Selection, North Carolina, date unknown), Mammoth Yellow, Mamredo (Selection by York, Mississippi, 1925), Manchu, Mandarin, Mandell (Selection by Cutler, Indiana, 1926), Mansoy (Selection by Arlington Experiment Farm, 1915), Medium Green, Merko, Midwest, Mikado (Selection by Parsons, Indiana, 1905), Minsoy (Introduction, from France, 1910), Monetta, Morse, Mukden (Selection by Arlington Experiment Farm, 1920), Nanda*, Nanking, Norredo (Selection by unknown person, date unknown), Ogemaw (Selection by Evans, Michigan, 1902), Old Dominican, Oloxi (black seeded; Cross by Wilds, South Carolina, date unknown), Osaya*, Otootan, Ozark, Palmetto, Pee Dee (black seeded; Cross by Wilds, South Carolina, date unknown), Peking (Selection by Arlington Experiment Farm, 1907), Pine Dell Perfection (Selection by Grisenauer, Virginia, date unknown), Pinpu, Rokusun*, Sato*, Scioto (Selection by Park, Ohio, 1925), Shiro*, Sooty (Selection

© Copyright Soyinfo Center 2014

by Arlington Experiment Farm, 1907), Sousei*, Southern Prolific, Soysota (Introduction, from Italy, 1910), Suru**, Tarheel Black, Toku**, Tokyo**, Virginia (Selection by Arlington Experiment Farm, 1907), Waseda* (Selection by Arlington Experiment Farm, 1907), White Biloxi (Selection by York, Mississippi, 1925), Wilson, Wilson-Five (Selection by Arlington Experiment Farm, 1912), Wisconsin Black (Selection by Wisconsin Experiment Station, 1898), Yelredo (Cross by Wilds, South Carolina, date unknown), Yokoten.

Note: This is the earliest document seen (June 2013) that mentions the soybean varieties Agate, Oloxi, Pee Dee, or Yelredo. It is also the earliest that describes the Haberlandt as a "dry edible" soybean variety. Address: 1. Senior Agronomist; 2. Assoc. Agronomist. Both: Div. of Forage Crops and Diseases, Bureau of Plant Industry [USDA, Washington, DC].

3390. Woertge, Karl Heinz. 1937. Entwicklung und weltwirtschaftliche Bedeutung der Sojabohnenerzeugung und -verarbeitung [Development and international economic significance of soybean production and processing]. Thesis, Friedrich Alexander University, Erlangen, Coburg, Germany. 119 p. 28 cm. [112 ref. Ger]

• ***Summary:*** Contents: Foreword. Part I: History and culture of the soybean. 1. History, natural requirements and technology of soybean production; chemical composition of the soybean. 2. Occurrence of the soybean and methods of production in various countries: Asia (Manchuria and China, Japan, Korea, Formosa, Dutch East Indies, other Asian countries incl. British India, Cochin China, Ceylon), America, Europe (Southeast Europe, Austria, USSR, France, Italy, England, Poland, Switzerland, Czechoslovakia, Germany), Africa and Australia.

Part II. Scale and global economic significance of soybean production in the main producing areas. 1. General overview of world soybean production: Production for seeds, for fodders. 2. Scale of soybean production in the main producing areas: Asia (Manchuria, Japan, Korea, Formosa, Dutch East Indies [Java and Madura/Madoera]), America, Europe (Southeast Europe, USSR).

Part III. Development and global economic significance of soybean processing. 1. Soybean processing possibilities: A. Processing soybeans to make foods: Asia (general, methods used in China and Japan to make vegetable-type soybeans and salads, koji, soymilk, shoyu [soy sauce], miso, natto, tofu, methods used in the Dutch East Indies), Europe (general overview, preparation of soybean meal, soymilk, coffee- and chocolate substitutes). B. The soybean as an oilseed: General, methods of obtaining the oil (in Asia, Europe, USA), use of soy oil (as human food, other). C. Obtaining lecithin from the soybean. D. Use of soybean press-cake for livestock feed. E. Use of the soybean meal for fertilizer. 2. World trade in soybeans, soy oil and soybean cake/meal (*Sojakuchen/Sojaschrot*)*:* World trade in soybeans (Manchuria, Asia, Europe, USA), world trade in soy oil, world trade in soybean meal.

Closing remarks: The state of the world soybean market with special consideration for the current German conditions. Appendixes and tables. Address: Nuerenberg, Germany.

3391. Yamaguchi, H.S.K.; Sakai, Atsuharu. 1937. Shoyu or Japanese soy (Document part). In: H.S.K. Yamaguchi. 1937. We Japanese. Yokohama, Japan: Yamagata Press. 592 p. See p. 271-73. Book II.

• ***Summary:*** "Neither the origin of shoyu nor the date of its invention is known for sure, but it is first mentioned in a record found in the Shoso-in, of the Totai-ji [Todai-ji] Temple, where the personal belongings of the Emperor Shomu (the 45th) and some other emperors are preserved. Also, it is mentioned in the Engishiki, a book of regulations of the Engi era (901-922). Chinese shoyu was imported during the early days of the Ashikaga regime (1338-1574), and it was in large quantities manufactured at Kyoto during the Shogunate of Yoshiharu Ashikaga (1521-1545). But it is certain that shoyu in those early days was not in liquid form, and it was not until the early period of the Tokugawa regime (1603-1867) that liquid shoyu was first made in Japan.

"Tradition has it that in 1228 Gakushin, a Buddhist priest from China, taught the people of Wayakama the method of making shoyu, and the village of Yuasa in that province is known to be the oldest centre of shoyu manufacture. Shoyu was manufactured for the first time at Choshi, another centre, in Chiba prefecture, in 1616, and one shoyu maker, Hamaguchi by name, came to Choshi from Wakayama in 1645 to coach others in shoyu manufacture. Noda in the same prefecture of Chiba began the manufacture of shoyu during the era of Genroku (1685-1703), and it is now the largest centre of shoyu manufacture in Japan. Shoyu was much used during the Tokugawa period (1603-1867) and greatly improved during the Meiji era (1868-1912). In 1933 Japan produced 512 million litres of shoyu valued at 57 million yen, of which the share of Chiba prefecture where Choshi and Noda are situated, amounted to 111 million litres valued at 17 million yen. These figures are not inclusive, as the farmer makes shoyu for his own use.

"Professor L. Lunge and A. Langgardt [sic, Langgaard], who taught at the Tokyo Imperial University, in the early years (about 1877) took such a great interest in the manufacture of shoyu that they often visited the shoyu centres to study it in the making. Professor A. Langgardt on his return home to Germany, made an imitation of Japanese soy and got it patented in Germany and 'Moggi' [Maggi] now manufactured in Europe is a corruption of the name Mogi, who was a shoyu- maker of Noda...

"There are several brands of Japanese soy, of which the following are the chief: Yama-sa [Yamasa], Kikko-man [Kikkoman], Higeta, Kagi-yamasa, Maru-kin [Marukin]." An illustration of each brand and its meaning is given.

© Copyright Soyinfo Center 2014

There are illustrations of Kikkoman, Higeta, and Yamasa brand shoyu in wooden kegs. Photos shows a shoyu bottling factory and a yard filled with wood for shoyu barrels. Address: Manager, Fujiya Hotel, Miyanoshita, Japan.

3392. Yamaguchi, H.S.K.; Sakai, Atsuharu. 1937. Miso or bean-paste (Document part). In: H.S.K. Yamaguchi. 1937. We Japanese. Yokohama, Japan: Yamagata Press. 592 p. See p. 269-70. Book II.

• ***Summary:*** "It is generally believed in Japan that miso or bean-paste is responsible in a great measure for the generally sound physical health of the Japanese. It is indispensable to Japanese cuisine... What bread and butter is to a foreigner, boiled rice and bean-paste soup [miso soup] are to the Japanese...

"The word 'miso' is of obscure derivation, but it is usually taken to mean 'immature bean-soy.' People often attribute it to the invention of Priest Kanshin, a Chinese Buddhist, who was naturalised in Japan during the Nara days (710-784). Priest Ingen (1591-1673), who introduced the Wobaku [Obaku] sect of Buddhism to Japan [and erected the Manpuku-ji temple at Obaku in 1661], and after whom the haricot beans are named 'ingen,' was such a great admirer of bean-paste that, it is said, he took its soup every day instead of a certain Chinese medicine that he had used many years...

"The longer the paste is kept, it is believed, the better it tastes. In the rural districts, every farmer makes bean-paste for his own use, but in the urban districts it is supplied by the maker, and according to a report issued by the Government, Japan manufactured hundreds of million kilograms, valued at tens of million yen every year. A table gives the nutritional composition of Hatcho miso, Sendai miso, and Inaka miso. Other types of miso on the market are Aka (red) miso, Edo miso, and Shiro (white) miso.

"A few sayings about miso: Miso wo tsukeru = to put miso on (to make a mess of it). Temae miso = one's own miso [tastes best] (all geese are swans). Miso no Miso kusaki wa jo-miso ni arazu = Miso savouring of miso is no good miso."

Illustrations show: (1) Five men making miso in a traditional commercial shop. (2) A maid kneeling and preparing miso soup in a suribachi mortar with a long wooden pestle. Address: Manager, Fujiya Hotel, Miyanoshita, Japan.

3393. Yamaguchi, H.S.K.; Sakai, Atsuharu. 1937. Sukiyaki: How "sukiyaki" is served. Origin of "sukiyaki" (Document part). In: H.S.K. Yamaguchi. 1937. We Japanese. Yokohama, Japan: Yamagata Press. 592 p. See p. 264-66. Book II.

• ***Summary:*** To create the Japanese atmosphere at the Sukiyaki party, the guests must sit on cushions on the floor. For a party of four guests, a circular table is best, with the charcoal brazier (on which a *nabé* is set) or electric cooker in the middle. On plates surrounding the *nabé* are the ingredients required for the meal: Tender beef, thinly sliced. Cut leeks and often some onions mixed with the leeks. "Now comes the highly nutritious bean-curd known as *tofu* in Japan. This is very light and digestible, and of great value in Japanese soups and other dishes." *Konnyaku,* a gelatin-like vegetable, is cut into strings (*shirataki*) that look like silvery spaghetti. Japanese doctors say that *konnyaku* has considerable medicinal value.

"As seasoning the Japanese usually put a little of what is called *Ajinomoto,* along with a little soup stock. This *Ajinomoto* is one of the most marvelous seasonings in the world, recognized even by the French as superior to their *sel de celeri,* in which French chefs have so much faith. It ought to be better known to housewives throughout the world. Housewives travelling make inquiries about it and buy quantities in Japan to take home.

"Now come two important liquids. The first, *shoyu* or *soy,* is indispensable. It is the Oriental sauce which is the basis of almost all sauces in the world, with the difference, however that whereas so many Western sauces are strongly spiced and therefore too piquant, and consequently harmful to delicate stomachs, the Japanese *shoyu* is a natural soy bean-sauce, highly nutritious and an irresistible appetizer." Address: Manager, Fujiya Hotel, Miyanoshita, Japan.

3395. Read, J.W.; Haas, L.W. 1938. Studies on the baking quality of flour as affected by certain enzyme actions. V. Further studies concerning potassium bromate and enzyme activity. *Cereal Chemistry* 15(1):59-68. Jan. [11 ref]

• ***Summary:*** This article gave the first indication of a protease inhibitor in plants, and the first indication that this inhibitor was or resembled a protein. In discussing the effects of an aqueous extract of soya bean flour on gelatin proteolysis, the authors state: "The soya bean contains a very potent fat peroxidizing enzyme which is water soluble. Some liquefaction tests were made with a 10% extract of soya bean flour to ascertain if such an extract contained any factor or factors which might affect the activity of several proteases... Trypsin appeared to be the most affected."

In the section title "Bromate and diastasis," Table 7 shows the "Saccharogenic activity as influenced by the bromate and persulfate of potassium." The dosage of potassium bromate ranged from 0.2 mg per 5 gm of wheat flour to 4.0 mg. Bromate was shown to increase diastasis.

"Summary:... Bromate and persulphate of potassium, when present in suitable amounts, promoted saccharogenic

© Copyright Soyinfo Center 2014

activity.

"An aqueous extract of soya bean contained some factor or factors which repressed the activity of trypsin, pepsin and the protease of Taka diastase, but did not inhibit the activity of papain and bromelin. Like trypsin and pepsin the proteinase of malt was also repressed."

Note 1. Haas did pioneering research in both trypsin inhibitors and lipoxygenases in soybeans. This is the earliest document seen (Jan. 2010) that discusses a protease inhibitor or a trypsin inhibitor in soya beans.

Note 2. This is the earliest document seen (Sept. 2007) that mentions potassium sorbate as a dough improver in connection with the addition of soya bean flour in baking. Address: The W.E. Long Company, Chicago, Illinois.

3400. *Industrial and Engineering Chemistry, News Edition.* 1938. Artificial fiber from soybean cake [Ryohei Inouye receives Fuji prize for 1937]. 16(8):232. April 20.
• ***Summary:*** On March 5, Ryohei Inouye received the Fuji prize award from the Physical and Chemical Study Council of Kyoto Imperial University for his discovery of a process by which it is economically possible to produce artificial fiber from the proteins of soybean cake. The council believes this is an outstanding contribution to the development of Japan's chemical industry in 1937. These researches were stimulated by the Italian process of producing fibers from casein and by researches in Germany which aim to produce textile fiber from fish protein. A company has been formed to undertake the production of the fiber from soybean cake and hopes to be producing 20 to 30 tons/day by autumn.

Note 1. On 8 Sept. 1937 Toshiji Kajita and Ryohei Inoue of Japan applied for a U.S. patent titled "Process for manufacturing artificial fiber from protein contained in soya bean." This patent (No. 2,192,194) was issued on 5 March 1940 and assigned to Showa Sangyo K.K. of Yokohama. On 5 March 1938 Ryohei Inouye of Japan received the Fuji prize for artificial fiber made from soybean proteins. At the same time, Robert Boyer of the Ford Motor Co. in Dearborn, Michigan, must have been researching and developing an identical product, which he first exhibited in May 1938. Yet it would seem that Inouye (and Kajita) of Japan should be given the credit for invention of the product. But was Inouye's product ever sold commercially?

Note 2. This is the earliest English-language document seen (Dec. 2004) that uses the term "artificial fiber" to refer to spun soy protein fiber used like a textile fiber.

Note 3. This is the earliest document seen (Jan. 2014) that concerns the work of Showa Sangyo K.K. with soybeans.

3405. *Science News Letter.* 1938. New fiber made from soybean protein to be used in autos: Ford factories already have half-a-dozen good jobs for Chinese legume's products; Good mixer with tung oil. 33:302. May 7.
• ***Summary:*** "A new synthetic fiber, made from the protein material of soybeans, was exhibited for the first time by Dr. R.A. Boyer of the research department of the Ford Motor Company before the meetings of the Fourth Annual Conference of the Farm Chemurgic Council, at Omaha [Nebraska in April 1938; Proceedings were never published]. The new fiber, destined for use in automobile upholstery, was developed as an outgrowth of work by Italian chemists in making a synthetic wool from milk casein." In 1937 some 400,000 pounds of soybean meal were used in the manufacture of parts for motor cars, probably largely as a filler. "The enamel on Ford cars contains 35 per cent soybean oil and 300,000 gallons of this oil were needed in 1937. The foundry uses some 250,000 gallons yearly in its operations. Soybean meal, from which the oil has been extracted, is widely used in the plastic molding compounds from which are made steering wheels and other parts of motor cars. Last year 400,000 pounds of soybean meal were used in this way. Soybean meal is also being used in the foundry of the steel mill, where large-sized cores in the molds are made of this material. A million pounds of this core binder, containing a large proportion of soybean meal, was used by the Ford plants last year. Soybean meal finds additional use as an impregnating agent for gaskets. A water-soluble paint, using soybean oil as the carrying agent for paint pigment, has been developed and is being employed in the Ford factories."

Note 1. This is the earliest document seen (June 2011) concerning the Ford Motor Company's work with soy protein fiber. Notice however that on 8 Sept. 1937 Toshiji Kajita and Ryohei Inoue of Japan applied for a U.S. patent titled "Process for manufacturing artificial fiber from protein contained in soya bean." This patent (No. 2,192,194) was issued on 5 March 1940 and assigned to Showa Sangyo K.K. of Yokohama. On 5 March 1938 Ryohei Inouye of Japan received the Fuji prize for his earlier discovery of soy protein fiber. His research was stimulated by the Italian process of producing fibers from casein and by researches in Germany which aim to produce textile fiber from fish protein.

Note 2. This is the earliest English-language document seen (Dec. 2004) that uses the term "synthetic fiber" to refer to spun soy protein fiber used like a textile fiber.

• ***Summary:*** Discusses the structures of sapogenols obtained from soybeans (incl. Soya Sapogenol B [*Soja-Sapogenol* B] and C) and proves the triterpenoid hydropicenic nature of these compounds. Address: Aus d. Pharmazeut. Institut d. Kaiserl. Universitaet Tokyo, Japan.

3418. United Press (UP). 1938. Chinese dump Japan soy beans in water. *Los Angeles Times.* July 5. p. 3.
• ***Summary:*** "Penang (Straits Settlements) July 4." The Chinese are having a soy bean party, their equivalent of the Boston Tea Party in the British colonies of North America.

"While a crowd of cheering Chinese lined a wharf here today, demonstrators seized a cargo of Japanese soy beans and dumped it into the harbor as a protest against the Japanese invasion of China."

Note: Penang, an island near Singapore, was the first British settlement in Malaya, acquired in 1786 by the East India Company from the sultan of Kedah. In 1826 the British combined Penang, Melaka and Singapore to form Straits Settlements.

3419. *Times* (*London*). 1938. Rioting at Penang: Bonfires of Japanese goods. July 7. p. 15, col. 1.
• ***Summary:*** From a correspondent in Singapore. Two days of anti-Japanese rioting at Penang have left a British policeman wounded. "The trouble began in a shop which was suspected of dealing in Japanese soya beans." A Chinese mob ransacked many shops and burned the Japanese goods.

Note: Penang is in today's (2005) Malaysia. It was later occupied by Japanese during World War II. The Chinese were angry because Japanese troops had already invaded Manchuria and China. The Japanese rape of Nanking, China, was in Dec. 1937. Address: [London].

3420. *Science News Letter.* 1938. Fiber and cloth made from soybean protein [in Japan]. 34:105. Aug. 13.
• ***Summary:*** A Japanese company is preparing to start production in the fall of 1938 on a small commercial scale of another new synthetic fiber, produced this time by chemical means from the soybean. The company plans to manufacture fibers and cloth at the rate of 20 to 30 tons a day. The process for converting soybean protein into fiber was developed by Ryojei Inouye, who was recently awarded the Fujii prize of the Physical and Chemical Study Council of Kyoto Imperial University, one of Japan's "big six" universities.

The drive to produce the new material as soon as possible was inspired by German success in making a fiber that contains 50% fish albumin and 50% cellulose, and by an Italian process which makes yarn out of casein.

3423. Esselen, Gustavus J.; Scott, Walter M. 1938. Modified plastics 1918-1938. *Chemical Industries* 43(3):258-59, 261-63, 265-67. Sept. [29 ref]
• ***Summary:*** "The public has become plastic conscious within the last few years and many writers have made the statement that we are now entering upon an Age of Plastics."

"Bitumen or pitch holds the undoubted distinction of being the oldest known plastic. Students of our early civilizations have discovered that bitumen was used as a plastic many years before Christ in ancient Babylon."

"Casein as a plastic material dates to 1897, when 2 Germans, W. Krische and A. Spitteler, working at first independently and then together upon the problem of waterproofing casein coatings, discovered the casein-formaldehyde reaction. A patent was granted in Oct. 1897 and attention was then given to the production of plastic casein in the form of masses, rather than as protective coatings. The process was soon acquired by the Galolith [Galalith] Company, and commercial development [of Galalith] was started in Germany."

"Estimates of the output of casein plastics in various countries of the world for selected years from 1913-1935, inclusive are given in Table V." The leading producers of casein plastics in 1935 (in million lb) were thought to be France (7.7), Germany (4.5), England (3.7-4.5), Japan (1.5), and Italy (1.3). World production in 1930 was about 22 million lb.

"The protein material from soybeans is analogous in its properties to casein and to zein. Soybean meal, from which the oil has been extracted, can be used as the basis for plastic molding material. If plasticized with 5% or more of water it behaves in a similar manner to casein, but it is necessary to modify the casein procedure somewhat and the product is not as good... It appears that the best plastic material is obtained by removing all moisture and plasticizing the soybean protein with some anhydrous organic agent.

"Plastics from soybean meal or protein have not yet been marketed on any large scale in this country. However, it has been stated (*Science News Letter* 33, 302, 1938) that in 1937, 400,000 lb of soybean meal were used in the manufacture of parts for motor cars, probably largely as filler." Address: Consultants, Boston, Massachusetts.

• ***Summary:*** "The Chinese and other Eastern peoples have solved the problem of food seasoning without the use of meat. They have found that a meaty flavor can be obtained from the soybean through a fermentation process. Soy sauce is to the Chinese what gravy is to the American. Even more important is soy sauce in China because the use of food flavors and condiments in that country is much more restricted than with us. The Chinese have simple tastes. Soy sauce, salt and pepper are the only food flavors commonly used by them.

"While the chemist has made but little study of food flavors and the physiologist has done but little also, enough is known of the problem so that soy sauce can be made by chemical methods as well as by the ancient fermentation process. The chief meaty-like taste of soy sauce is known to be the salt of an amino acid, mono-sodium-glutamate. This salt is now manufactured for use as a condiment. The process involves the disintegration of the soybean of other protein, preferably wheat gluten, with hydrochloric acid. A mixture of about 20 amino acids is obtained among which mono-sodium-glutamate makes up about one-fifth in the case of soybean protein and two-fifths in the case of wheat gluten.

"The mono-sodium-glutamate can be crystallized from the mixture by adjusting the acidity to pH 3.2, or the mixture can be neutralized to a desired acidity and used without refining just as soy sauce is used" (p. 25).

"In Japan mono-sodium-glutamate of good purity is sold at a wholesale price of about two dollars a pound under the name Ajinomoto" (p. 26).

A diagram (p. 28) shows "Some possible food products from the soybean," including sprouts, soybean milk, soybean curd, soybean cheese, soy sauce, meat sauce, meal, flour (for use in breakfast cereal, bread, sausage, meat loaves, or ice cream), refined oil (for use in lard substitutes), crude oil (for us in margarine or dressing), and lecithin (an anti oxidant or emulsifier). Columbus, Ohio.

• ***Summary:*** "Although the soybean had attracted attention at various times as an article of food in the United States, it was not until the World War [World War I], when a cheap source of protein was being sought, that the soybean was really considered seriously as an article of diet for Americans. The dried beans were prepared in many ways but owing to the time required for cooking, the peculiar taste, and improper methods of processing, soybean products were not generally accepted. During this period cooking tests were conducted with all of the varieties and introductions then available in an attempt to find varieties lacking the unpleasant bean taste and which would cook quickly. Only two such varieties were found–the Easycook and Hahto. Some progress was made in getting people to eat these varieties..."

"Oriental varieties of soybeans are distinguished not only according to seed and plant characters but also according to use, such as for curd [tofu], sprouts, green vegetables, roasted beans, and numerous other food products. Attempts to obtain suitable edible varieties from oriental countries through correspondence met with but little success. During agricultural exploration work in the Orient from 1929 to 1931, many varieties of soybeans were found in Japan and Chosen [Korea] which were used solely as green shelled or dry edible beans. These edible types, ranging in maturity from 75 to 145 days, have been under test for the past six years at various experiment stations throughout the United States." In addition, "extensive investigations of the cooking qualities and composition of the green shelled and dry edible beans have been made by various Departments of Home Economics. Many of these varieties were judged much superior to the commercial varieties in flavor, texture, and ease of cooking. Moreover, tests indicate that the flour from most of the edible varieties has a better flavor than the available commercial soybean flours... Thirty-one of the varieties introduced as edible beans have been found sufficiently promising to be assigned varietal names, shown in table 1, and have been distributed into those regions to which they seem especially adapted. Although the supply of seed of these varieties at present is quite limited, seed stocks are being increased rapidly at several experiment stations and by various growers to meet the growing demand for edible soybeans... Both the green (immature) and dry beans contain much more fat and protein and less carbohydrates than other leguminous seeds. Few naturally occurring foods are as rich in protein as soybeans... The soybean is also a good source of some of the mineral elements, containing more calcium and phosphorus than any of the cereals and excelling most foods as a source of available iron. Because of the alkaline elements in soybeans, they belong to the class of alkali-forming foods.

Table 1, titled "Characteristics of edible varieties of soybeans" (p. 32) lists the following 31 varieties: Agate, Aoda, Bansei, Chame, Chusei, Easycook, Fuji, Funk Delicious, Goku (the smallest bean in this table; 3,216 seeds/lb), Haberlandt, Hahto (the second largest bean; 1,250 seeds/lb), Hakote, Higan, Hiro, Hokkaido (the largest bean; 1,232 seeds/lb), Imperial, Jogun, Kanro, Kura, Nanda, Osaya, Rokusun, Sato, Shiro, Sioux (the next to smallest bean in this table; 3,000 seeds/lb), Sousei, Suru, Toku, Tokyo, Waseda, Willomi. For each variety the table shows: F.P.I. number, number of days to ripen, seed color (green, straw yellow, olive yellow, brown, black), hilum color (brown, black, pale), seeds per pound, oil content and protein content (% on moisture-free basis), and use (green vegetable, or dry edible).

"Some commercial concerns are now canning the green beans and at the Illinois Agricultural Experiment Station attempts to preserve green soybeans with freezing storage methods have been very successful.

"Extensive nutritional studies revealing the unique dietary value of the soybean and its products during recent years have had much to do with the rapid and growing popularity of the soybean as a food."

Note: This is the earliest document seen (July 2013) that mentions the soybean varieties Aoda or Sioux. Address: Bureau of Plant Industry, USDA, Washington, DC.

3428. Sioux: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1938. Seed color: Yellow (olive), hilum black.

© Copyright Soyinfo Center 2014

• ***Summary:*** The German Press reported that an agreement has been concluded between the Snia Viscosa of Italy and a Japanese industrial group under which the latter acquires the right to manufacture "Lanital" in Japan and Manchukuo. It has been proved that casein from the soya bean is a good substitute for milk casein in Lanital manufacture. Ferretti, the discoverer of Lanital, and part owners of the patent rights, has been experimenting with soya bean casein with successful results. The Lanital industry in Italy is also widening the Lanital patent basis to include soya casein.

• ***Summary:*** Part II: Beans. The maltase, saccharifying and liquefying power of both germinated and ungerminated seeds of various kinds of beans were investigated, including mature and immature (green) soy-beans, azuki- and mung beans.

Maltase and the liquefying enzyme were never found in ungerminated seeds. Only germinated mung beans had the powerful capability to liquefy starch. During germination, the globulin nitrogen of all seeds was decreased and nonprotein nitrogen was always increased. It was concluded that the saccharifying power of mung beans could be estimated from the amount of total nitrogen, or more exactly the amount of albumin nitrogen, of the ungerminated seeds–as was already found with the seeds of kaoliang (see 14:1237). • ***Summary:*** About Madison College near Nashville, Tennessee. About 500 people now live on the campus, of

© Copyright Soyinfo Center 2014

which 300-350 are students. About 90% of the vegetables (including soybeans) consumed by all these people are grown by student labor. The college has its own mills for whole-grain products and its own bakery, "which also serves whole-wheat and soy-bean bread to over one hundred retail stores in the nearby city of Nashville."

"The address Madison College, Tennessee, has become familiar to patrons of health food stores as the place of origin of a distinctive line of products made from soy-beans." The reason for that grew out of an interesting combination of circumstances. First, the college was founded upon the idea that the "students should by their own labor produce as nearly as possible all their own food supply for a completely nourishing diet. Second: Madison College and Sanitarium are strictly vegetarian, and, as at the Battle Creek Sanitarium, the vegetarianism has been worked out as part of the school dietary as well as the sanitarium dietary. To students and patients alike the importance of proper food for the body is emphasized.

"Third: one phase of the work at Madison College has to do with the training of medical missionaries. That has not only brought to the teaching staff people who have had experience in the Orient, but has also brought students from those countries. (At present there are six Japanese and ten Chinese students.)

"Out of these circumstances came the development of a new line of foods which we may call the Americanization of the second most important food material in the Eastern world and the greatest of all vegetarian sources of protein–the soy-bean."

To Madison College, with its interest in perfecting a vegetarian diet, came Perry A. Webber, as professor of chemistry. He had taken his doctor's degree at Michigan State College after a fourteen years' residence in Japan. It was a happy combination of circumstances, and the American chemist, with his Japanese experience, set to work to Americanize the soy-bean as a source of human food.

"It also happened that one of Dr. Webber's Chinese friends, Philip S. Chen, was a fellow student of chemistry at Michigan State College, having come to America to study science. When he had completed his chemical work for a doctor's degree at Michigan, he entered Madison College as a special student to take up practice teaching in the Department of Chemistry under Dr. Webber. The two men, each with a knowledge of soy-beans as used in the Orient, now worked together as chemists in the American college.

"After two years of this cooperation Dr. Webber was called back to Japan to become the head of a school there. Dr. Chen then became the professor of Chemistry at Madison College and continued to work on soy-bean products."

Though Dr. Chen says soy-bean milk has been used in China for 3,000 years, the type made at Madison "is new because it is different and superior to the older forms of the Oriental product." It has been made "more acceptable to American tastes and to the more exacting demands of present-day nutritional science. This also applies to the substitutes for meat and the cheese products made from soy-beans, and to the use of soy-bean flour as an ingredient in bakery and cereal products. Today all this is of special interest to vegetarians and to those who follow the latest forms of health foods. These advances in food science will later become of far greater significance."

Dr. Frances L. Dittes, head of the Department of Nutrition, specializes in soybeans, "both in nutritional research and menu applications. Thus, the new food products developed from soy-beans, along of course with other vegetarian dishes, were worked out and tried out in the students' dining hall and also in the Madison Sanitarium. Patients cured at the sanitarium naturally wished to continue the use of the food products after returning home. This gave the nucleus of a health food manufacturing business.

"This, in turn, provided another campus industry for the work-your-way college, giving occupation for the students in which they could take an especial interest and pride, since the business grew out of the research work of the college and was closely tied in with both their agricultural and their health work."

• ***Summary:*** A table (p. 177) shows Soya bean yield in quintals per hectare, from 1931-32 to 1936-37, in China and Japan. 1 quintal = 100 kg. In China the yield increased from 10.9 in 1931-32 to 12.9 in 1936-37. In Japan the yield increased from 9.1 in 1931-32 to a local peak of 11.2 in 1933-34, then decreased to 8.8 in 1935-36.

A pie chart (p. 177) shows the position of leading soybean producing countries in total world soybean production in 1936-37. China proper: 50.0%. Manchuria: 35.5%. U.S.A.: 6.5%. Japan: 2%. Others: 7%.

A table (p. 178) gives the same statistics as the pie chart, but adds the actual production in 1,000 quintals.

• ***Summary:*** This little encyclopedia begins with an outline of Japanese history (p. xi-xx). Under Agriculture–rice (p. 3-4): Other cereals grown in Japan include barley, wheat, rye, oats, the soy-bean (*Daizu*) used chiefly for making [soy] sauce, and the small red bean (*Azuki*)**.**

Under Festivals and holidays–February (48): "About the 3rd of 4th *Setsubun* (Bean-Throwing Rite) the last day of winter according to old lunar calendar. On this night a religious rite called *Tsuina,* or driving away the evil spirits and calling in fortune is held at many temples and shrines, and people scatter [soy] beans, one for each year of their age over the rooms of their houses shouting *'Fukuwa uchi, oni wa soto'* (Welcome good luck, out with demons!)."

September 1st. *Ni-hyaku-tô-ka,* 210th day from *Setsubun.* Rice harvesting begins.

Under Food–rice (p. 59) soy sauce is mentioned.

In the front of the book is a map of "Old Japan" and in the rear a map of "Modern Japan."

3466. Dominion Bureau of Statistics, Ottawa, Canada. 1938. Imports into Canada for consumption, years ended March 31, 1933 to 1937: Agricultural and vegetable products. *Trade of Canada.* Fiscal year ended March 31, 1937.
• ***Summary:*** Table No. 37, titled "Imports into Canada for consumption, Years ended March 31, 1933 to 1937, shows: Imports of soy sauce–from United Kingdom, Hong Kong, China, Japan, Syria, United States (p. 287). It shows that 133 gallons of soy sauce with a value of $15 were imported from Syria in 1933, but none in 1934, 1935, or 1936.

Imports of soya beans (*Fèves de soja,* p. 288). Imports of peanut oil (*Huile d'arachide,* p. 303). Imports of soya bean oil (*Huile de soja,* p. 300).

Imports of soya bean cake and soya bean meal, for use exclusively in the manufacture of cattle food and of fertilizers (Included "Soya Beans" prior to April 1, 1934; to April 1936, p. 339.7).

Imports of soya bean oil meal, for use exclusively in the manufacture of cattle food and of fertilizers (From May 1, 1936, p. 339.8).

Imports of soya bean oil meal (*Tourteaux d'huile de fèves de soja*) and soya bean flour (*Farine de fèves de soja*), when imported by manufacturers of glues or adhesives for use exclusively in the manufacture of such glues or adhesives (From May 1, 1936, p. 339.9; Note: 5,600 cwt was imported from the USA only) [1 cwt = hundredweight = 112 pounds].

Imports of peanut oil and soya bean oil for the manufacture of soap, and peanut oil for canning fish (p. 344.1). Imports of soya bean oil for the manufacturing of soap (p. 344.5). Address: Ottawa, Canada.

• ***Summary:*** This wonderful book, an autobiography of David Fairchild, also tells the story of the early days of the USDA and its Section of Foreign Seed and Plant Introduction, and of the pioneering work with plant introduction to the United States. It contains about 207 black-and-white photos, mostly taken by the author. One of these (p. 472A) shows Howard P. Dorsett (standing) and David Fairchild (seated), who "spent twenty happy years in close association, trying to increase the number and improve through introductions the quality of the fruits and vegetables of the United States."

Contents: 1. Background. 2. Kansas. 3. I enter government service. 4. I meet Barbour Lathrop and reach Naples [Italy]. 5. Breslau, Berlin, and Bonn [Germany]. 6. Java ho! 7. The Lathrop-Fairchild odyssey begins. 8. The Cannibal Isles (Incl. Hawaiian islands). 9. American interlude (in 1897 his father resigned as president of Kansas State College of Agriculture after the wave of Populism engulfed the college). 10. The West Indies and South America. 11. Cotton in Egypt. 12. Across the Java Sea. 13. From Finland to Dalmatia. 14. Land of the Pharaohs. 15. Malta, Tunis, Algiers, and Spain. 16. England, America, and west to the Orient once more. 17. The Persian Gulf and Bagdad [Baghdad. Note: Iraq was established in 1921 out of former Turkish territory]. 18. A glimpse of Saïgon [Saigon] and a long stay in Japan. 19. I visit Luther Burbank and circumnavigate Africa. 20. I meet Alexander Graham Bell. 21. A grand tour of these United States. 22. Mostly personal. 23. Washington, Madeira, and "In the Woods." 24. Baddeck, Nova Scotia. 25. Mostly aviation. 26. Lacquer and wild wheat. 27. Aaron Aaronsohn and Joseph Rock. 28. More plants, introduction gardens, and Mr. Bell. 29. Florida in 1912. 30. Monsters of the backyard. 31. The flowering cherry trees are planted in Washington. 32. Quarantine increases and war [World War I] begins. 33. Seeds from Afghanistan. 34. The plains of Canada. 35. The war and dried vegetables. 36. The Allison Armour expeditions. 37. Aloha.

In 1889 Beverly T. Galloway, head of USDA's Division of Plant Pathology, brought David Fairchild, age 19, to Washington, DC, to join five plant pathologists who were working in attic rooms of the old red brick department building. P. Howard Dorsett, Galloway's Wisconsin classmate, soon joined the group. Soon shy and scholarly Walter T. Swingle, Fairchild's Kansas State classmate and close friend since their student days in Germany, arrived with his growing library of agricultural references in 5 or 6 languages. Seeking an opportunity to learn about the flora of foreign countries, Fairchild accepted a Smithsonian fellowship to study entomology in Naples, Italy, and resigned from the USDA. Fairchild's pioneering work with plant introduction traces its roots back to late 1893. On board a ship, the young plant pathologist met Barbour Lathrop, a wealthy San Francisco gentleman who later took him on an extended tour of the Pacific and showed him fruits, grains, and ornamental plants that could be valuable in America. In 1895 Lathrop gave Fairchild the money to begin his study of the plant treasures of the tropics. Returning to the USA in 1897 (with Mr. Lathrop), after an absence of 4 years, David Fairchild knew exactly what he wanted to do with his life. He visited his parents in Manhattan, Kansas, and learned that a wave of "Populism" (resembling Bolshevism) had caused his father to resign as president of the college (p. 105). In August 1897 he reached Washington, DC–without a job. James Wilson, the Secretary of Agriculture, firmly believed that "what agriculture needed most was more knowledge." "The idea of plant introduction as a government activity was germinating in other minds besides Lathrop's and mine" (p. 106). Secretary Wilson's first act after taking office had been to send N.E. Hansen to Russia in search of cold-resistant cereal grains and fruits for America's great plains. Swingle has recently presented a paper on introducing subtropical plants to Florida.

Fairchild and Swingle conceived a plan to divert $20,000 dollars of the funds appropriated for the wasteful Congressional Seed Distribution Service (which was already spending several hundred thousand dollars a year) in order to finance a section for the specific purpose of introducing new, useful, and carefully selected crops into the United States. He enthusiastically presented the idea to Secretary Wilson, who approved the plan and asked him to organize the new Foreign Seed and Plant Introduction Section (p. 107). Housed on the fifth floor under the eaves of the old Department of Agriculture building and staffed by one teenage secretary, it became a reality when Congress passed the revised appropriation bill in July, 1898.

"In 1899, all that existed of the Department of Agriculture was housed in an ugly old building with a mansard roof topping its red-brick walls. It was situated in a park south of Pennsylvania Avenue, just beyond one of the most disreputable quarters of the city" (p. 18).

In 1916 David and Marian Fairchild purchased a piece of property located in Coconut Grove on Biscayne Bay, Florida; they named it The Kampong. On the property was a very old stone barn, a huge stone entrance gate, and many fine old tropical trees (p. 452-53, 456A, 472C). A Kampong is a Malay word (first used in English in 1844) meaning "a native hamlet or village in a Malay-speaking country."

Good photos show: (1-4) Members of the USDA Section of Plant Pathology taken in the early 1890s: Walter T. Swingle, Joseph James, David Fairchild, Theodore Holm, Beverly T. Galloway, Merton B. Waite, and P. Howard Dorsett (p. 26A-B). (5) Barbour Lathrop and David Fairchild in the cabin of a boat, off Sumatra, Christmas, 1895. (6) The uniform of a worker at Mr. Suzuki's nursery in Tokyo, Japan. The back is decorated with large Chinese characters. / Hubei province in Central China (p. 256F, probably taken by Frank N. Meyer in 1917). (6) page shows "A prolific Soy Bean plant ripe for harvest" and loaded with pods (p. 256F). (7) David Fairchild (seated) and Howard Dorsett (standing), each in two-piece suits, by at a desk, examining various fruits (p. 472A). Address: USDA.

3468. Fairchild, David. 1938. A long stay in Japan: Encounters with soy beans, tofu, soy sauce, and green soy beans in the pods (Document part). In: D. Fairchild. 1938. The World Was My Garden: Travels of a Plant Explorer. New York, NY: Charles Scribner's Sons. xiv + 494 p. See p. 258-59, 327-28. Assisted by Elizabeth and Alfred Kay.
• ***Summary:*** In 1902 at Kusafuka, Japan, Fairchild visited the home of Mr. Tsuboi. He had "considerable difficulty digesting the raw fish and seaweed, but became very fond of the egg dishes, the bean cheese or 'tofu,' and the universal soy sauce... But the dish which I afterward served in Washington [DC] was a delicate variety of the soy bean. The young, flat, rather hairy pods–much smaller than the lima bean–are boiled in salted water and served in the pod in a little lacquer bowls. I enjoyed opening the pods and taking out the delicate green beans, which have a pleasant, nutty flavor. Some Americans complain that it takes too long to empty the pods, and of course there is no reply to such an objection" (p. 258).

Japanese "cuisine is conspicuous for the absence of gravies, for which they substitute a sauce made from the soy bean by a complicated process of fermentation. Almost every meal includes boiled rice, often served with delicate, soy bean curds [tofu]... and pretty bits of colored soy bean candy" (p. 259).

Note: This is the earliest English-language document seen (April 2013) that uses the terms "soy bean curds" to refer to tofu.

"From Mr. Tsuboi's delightful home, we journeyed to a branch experiment station at Anjo where there were fields of the chief agricultural crops of the country. The soy beans particularly interested me, as in 1898 I had imported both beans and some soil from a Tokyo soy bean field. Waite [Merton B. Waite, of the USDA Section of Plant Pathology] and I discovered that root nodules could be induced on soy bean plants by growing them in Japanese soil, but, when they are grown on new soil, they will not develop the nodules unless the soil is inoculated. In Virginia, Maine, Michigan, and Kansas, a general interest in the soy bean and its possibilities had developed among the experiment station workers, although it was only used as cattle food.

"I hope that a book will be written describing the vast soy bean industry which has developed in America since those early beginnings, and the important part played by the varieties introduced by Frank Meyer and later by W.J. Morse and P.H. Dorsett. Morse has devoted the best years of his life to a careful and penetrating study of the soy bean, and he should receive the full measure of credit for his contributions to an industry now measured by millions of acres under culture in America each year" (p. 259).

After Fairchild was married, he and his wife, Marian, started a garden by their home in Maryland, about 10 miles outside of Washington, DC. A delightful Japanese peasant boy names Mori served as their gardener. In the garden: "We grew soy-beans as a vegetable and had to endure the criticism that they took too long to shell (p. 327-28).

A photos show: Mr. Tsuboi, an authority on bamboo, enjoying his dwarf plants in charming porcelain bowls and trays (p. 256D). A prolific soy bean plant with many hairy pods (p. 256F). Address: USDA.

3469. Fiene, F.; Blumenthal, Saul. 1938. Handbook of food manufacture: A handbook of practical food information... New York, NY: Chemical Publishing Co. vi + 603 p. See p. 89. Index. 24 cm.
• ***Summary:*** This book contains many commercial scale formulas / recipes. Chapter 2, "Description of raw materials," includes brief descriptions of "corn oil (maize oil), cottonseed oil, arachis oil (also called peanut, ground nut, and earth nut oil), sesame oil (gingli oil, teel oil), soy bean oil, and rape oil" (p. 70-71).
