Chapter 3, "Milk and milk products," includes subsections titled "Infants' milk, synthetic" (a recipe for a dry mix in which "Soya bean powder, 125 g." is the main ingredient), "Soya bean vegetable milk" and "Soya bean curd" (p. 89). Concerning the milk: "Soya bean meal after the oil is extracted or whole soya bean meal may be utilized quite as well as the whole bean. The milk can be used successfully in numerous preparations, such as breads and cakes, in creaming vegetables, in milk chocolate, and in custards. After separating the liquid from the solid material, the residue is still very rich in nutritive substances and can be dried and used for cattle feed or made into flour for human food."

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the term "Soya bean vegetable milk" to refer to soymilk.

Note 2. This is the earliest English-language document seen (Nov. 2013) that uses the term "soya bean meal" or the term "whole soya bean meal" to refer to whole soy flour.

Concerning the curd: "This curd, after being drained or pressed, represents bean curd of [sic, or] tofu, which is extensively eaten and forms the basis of numerous fermented, smoked, and dried cheeses in China and Japan... In many cities of the United States having a large oriental population fresh bean curd may be found in Chinese and Japanese markets."

Chapter 5, on canned foods, notes in the section titled "Dried beans" (p. 126) that "Soya" beans sold in cans.

Chapter 17, on "Bread" contains two formulas (p. 378-79) for "Soya bean flour bread," the first containing 260

© Copyright Soyinfo Center 2014

lb. wheat flour, 65 lb. "Soya flour," etc., and the second containing 25 lb. "Whole soya flour," 25 lb "Whole wheat flour," etc. The straight dough method is used.

Chapter 23, titled "Health foods" begins (p. 445): "Natural and vitamin-laden health-building foods and drinks are essential for healthy muscles, nerves, glands, and for the growth and maintenance of a healthy, vigorous, and sound mind." The best diets are those containing plenty of fresh foods and juices. "Nuts and soya beans are good substitutes for meats, fish, eggs, and sea foods." A section in this chapter on the "Soy bean" begins (p. 447): "The soy bean is justly entitled to be called the king of the legumes. Not only because it is lowest in starch but also because, firstly, it is the most complete and best protein for both growing children and adults and, secondly, because of its unusually high mineral content being quite high in alkaline potassium, calcium, and magnesium... it is an alkaline food."

Formulas for health foods include (p. 454-55): "Health dry cereals" (six formulas, two if which contain "Soy bean middlings" [medium size soy grits, probably made by cracking whole soybeans]). Coffee substitutes and health drinks (three formulas, the 3rd containing only 75 oz. roasted whole wheat and 25 oz. roasted soy bean middlings). The next health-food subsection, titled "Flour, meals, etc." states (p. 455): "Soy bean flour, with or without a high percentage of fat, is used to make bread, biscuits, noodles, mayonnaise, candy, etc."

Chapter 24, "Acid-forming and alkali-forming foods," states: "When foods yielding an acid ash predominate in the diet, a condition of acidosis may result unless the resulting constituents are neutralized with alkaline ash foods."

Next come two lists: (1) "Acid-forming foods, starting with those foods having the least amount of acid-forming ash." The foods with the *most* acid-forming ash are: 1. White bread. 2. Cheese. 3. Meat, chicken. 4. Fish, haddock. 5. Meat, venison. 6. Meat, beef, lean. 7. Meat, veal.

(2) "Alkali-forming foods, starting with those foods having the least amount of alkali-forming ash." The foods with the *most* alkali-forming ash are: 1. Soy bean. 2. Olives. 3. Beans, lima, dried. 4. Linseed oil meal. 5. Spinach. 6. Raisins. 7. Beans, dried. 8. Almonds. Address: 1. PhD, Food Research Chemist; 2. B.S., Consulting Food Chemist and Director of Shirley Labs., New York City.

3470. Hayashi, Yasushige. 1938. Zuihitsu: Tôfu no kara [Essays: Okara, the "shell" of tofu]. Tokyo: Modaan Nihon-sha. 310 p. 19 cm. [Jap]
• ***Summary:*** Essays and thoughts on various subjects, including okara and tofu. The title is taken from the title of the first essay.

3471. Japan-Manchoukuo Year Book. 1938. Tokyo, Japan: Japan-Manchoukuo Year Book Co. Index. 26 cm. Fifth annual issue. [Eng]
• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. This book was published in late 1937.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year.

Page xxii. A pie chart shows principal exports from Manchoukuo in 1936. In descending order of importance they are: Soya beans 41,0%. [Soya] bean cake 10.1%. Coal 6.7%. [Soya] bean oil 4.0%. Millet 3.5%. Groundnuts 3.0%. Other beans 2.8%, etc.

Page 341. Table 28 shows production of "Beans, potatoes and sweet potatoes" in hectolitres from 1931 to 1935. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya beans:

4.079 million hectoliters in 1935

Page 793. Two large tables show "Area under various crops (in hectares)" and "Amount of crops (metric tons)" in Manchoukuo yearly from 1924 to 1936. For soya beans: 4.175 million metric tons in 1936

The other principal crops shown in the tables are other beans, kaoliang, millet, maize, wheat, rice, upland rice, and other cereals.

Page 794. A large table gives the forecast (as of 1 July 1937) of major crops for crop year 1937-30 in all of Manchuria, South Manchuria, and North Manchuria. The text about soya beans is repeated.

Page 795. A table shows soya bean (exports in metric tons) from 1930 to 1936. Exports in 1936 were 1.963 million metric tons.

3482. Bloch, Kurt. 1939. Netherlands India takes advantage of soybean situation. *Far Eastern Survey* 8(3):34-35.
• ***Summary:*** Japanese expansion in East Asia and the worldwide economic depression have combined to encourage the cultivation of soybeans outside of Manchuria, especially in the Netherlands Indies [today's Indonesia] were soybeans have long been a basic foodstuff and where new land has become available because of the decrease in area planted to sugar cane. "The area devoted to soybean cultivation in Netherlands India has increased its relative position from less than 5% to more than 10% of the Manchurian area."

During the past eight years [since 1931], two main factors have influenced the international soybean market: (1) Japan's occupation of Manchuria has led to a sharp reduction of soybean acreage and production there; (2) Germany's *Fettwirtschaft* (edible fats' consumption regulation), initiated in 1933, resulted in a sharp reduction in the international demand for soybeans since Germany used to consume more than half of all European supplies. In addition, the fact that soybeans were dependent on a silver exchange standard has made them comparatively high priced, and soybean oil has been unable to compete with rival products.

"As a result soybeans have developed into a profitable crop in other areas, especially since in recent years the German-Manchurian barter trade has served to support the international level of prices in this commodity." There has also been a great expansion of soybean area in southeastern Europe–especially in Roumania and Bulgaria.

[The extraction of soy derivatives]. 14(158):76-77. Feb. [Fre]
• ***Summary:*** This communication from the French commercial attaché in Tokyo describes the activities of several large, modern Japanese soybean processing companies in Manchuria. The modern soybean crushing mills use solvents, such as benzol or ethyl alcohol. The latter process, studied since 1926 by Dr. Masayasu Sato of the Central Laboratory, South Manchuria Railway Company (SMRC), is patented in England, Japan, France, Italy, and Denmark. The Sato is used commercially by the Manchuria Soya Bean Engineering Co., a private company with capitalization of 1.5 million yen subscribed by the SMRC and by the Nippon Food Stuff Engineering Co., an affiliate of Nippon Sangyo K.K. The factory / mill, which processes 80 metric tons (tonnes) per day of soybeans, and has the capacity to be within 300 tonnes, is located on the outskirts of Dairen, Manchuria. The company has also studied the processes for extracting from the oil a number of special products such as lecithin, vitamin B, a food condiment, saponins, and sugars. The residual cake, which is in the form of flakes named Soya Rex Flakes, would be of great food value. These products are to be produced by an affiliate, with capitalization of £200,000, the Manchurian Society for Soya Products, which is presently constructing a factory at Kawasaki, near Yokohama.

The sodium glutamate which is extracted from the cake could rival a condiment widely used in Japan under the name Aji-no-moto. The Society for nitrogen based fertilizers created this last April an affiliated firm with a capital of £10,000,000, a fourth of which is paid out, called "the Soya Bean Chemical Engineering Co." that will produce, exclusively a dozen products all derived from the soy oil or soya cakes in a factory currently being built at Konan (in Korea), where the master company already owns a very important group of chemical industries. Among these new products, we quote: amino-acid, oil based paints, boiled oil and lecithin used in tanning hides.

Several factories, among them Honen, Nisshin, and Nikka, that up until now were just producing soja oil, will now start outputting derivatives. Mentioned are substitutes for butter, wheat flour, soap, oil for human consumption, boiled oil for the printing industry.

The Japanese chemical industry, as is being done in Germany, is thus throwing itself systematically into the exploitation of this very complex raw material, the soybean, that it will find at its door step, on the Manchukouo [Manchurian] territory.

for preparing soybean 'milk' circulate widely").

Note. This is the 3rd earliest English-language document seen (Jan. 2013) that contains the modern term "soy sprouts."

Industrial uses of soybean oil and residue: the regional industrial products in Urbana, Illinois

Figures show: (1) Bar chart of the world's principal soybean producing countries in 1924-25, and in 1935-36. In 1936, Manchuria was by far the leader, followed by the USA, Chosen [Korea], Japan (whose production has decreased since 1925), and Netherland India [today's Indonesia].

(2) A map of the eastern half of the United States, with carefully located 50,000-acre dots showing areas of heaviest soybean production. Between 1934 and 1939, the area increased 5-fold in Mississippi and 21-fold in Minnesota. The area in Oklahoma decreased.

(3) A graph shows that the number of combines used to harvest soybeans in Illinois skyrocketed from 0 in 1924, to about 20 in 1925, to about 75 in 1926, to about 300 in 1927; by 1935 the number had increased to an estimated 3,000. (4) A photo shows a combine harvesting soybeans.

(5) A photo of a "Superior field of Indiana soybeans probably cultivated for the last time as plants shade most of the field's surface. Two-row corn cultivators or "beet cultivators may till four such soybean rows simultaneously.

(6) A graph shows soybean oil imports into the United states; these imports increased dramatically during World War I, peaking in 1918 [at 335.98 million lb].

(7) A map shows the location of soybean oil mills in the United States. There are large numbers in Illinois, Indiana, Ohio, Iowa, and North Carolina.

(8) A bar chart shows "Utilization of soybean oil processed in the United States" in 1934, 1935, and 1936. In 1934 the 30 million lb was used mostly by the drying oil industry. In 1935 the 140 million lb was used mostly for [lard] compounds and vegetable shortenings. In 1936 the 280 million lb was still used mostly for compounds and vegetable shortenings, but a significant amount was used for oleo, other edible, the drying oil industry, and soap.

(9) A photo shows a mill for removal of oil from Corn Belt soybeans; the processing plant serves an area tributary to Champaign, Illinois, and ships the oil to Chicago factory area.

"Soybeans provided some of the none-too-kindly remembered 'coffee' rations to Union Civil War soldiers. Sausage makers, at times, put up to 50 per cent soybean flour in part of their product."

Note: This is the earliest English-language document seen (Dec. 2012) that uses the term "Salted Soys" to refer to soynuts.

• ***Summary:*** In Japan, the peasant has long "been largely dependent on the soy bean as his principal source of protein food, and his relative physical energy and powers of endurance as compared with the natives of other Oriental countries, such as India, who are also largely vegetarians, are well known. This difference is not due to the absence of legumes in India nor because the soy bean is not cultivated in the latter country, but to the fact that the Japanese are acquainted with a method of preparing this vegetable for human consumption in a manner which not only renders its palatable but highly digestible and nutritious.

"In place of cooking in the ordinary manner of the bean it is boiled and crushed and the resultant mash inoculated with a ferment which in the course of a few days converts it into a vegetable cheese, known as natto; this process of fermentation is actually one of predigestion which peptonizes and thus renders assimilable the whole of the vegetable protein in the bean so that no strain is thrown upon

© Copyright Soyinfo Center 2014

the digestive processes of the consumer."

There is no reason why this fermentation process should not be applied to beans grown in England.

Note 1. This is the earliest document seen (Jan. 2009) that mentions soy beans during World War II. This war would have a huge impact on production and utilization of soybeans worldwide.

Note 2. Aldeburgh is on the east coast of England, northeast of London, about midway between Lowestoft and Harwich. Address: Alde End, Aldeburgh.

English-language summary in Bulletin of the Agricultural Chemical Society of Japan 15:110, bound at the back of Nippon Nogei Kagaku Kaishi. [3 ref. Jap; eng]

• ***Summary:*** The authors isolated four different isoflavones from the ethanol extract of soybeans. Lecithin was salted out from the solution and a crude saponin was precipitated from the alcoholic filtrate by the addition of acid. The saponin-pigment complex was dissolved in alcohol and the saponin precipitated by the addition of lead acetate. The lead-saponin complex was removed from the filtrate after which the pigments were fractionally separated. The mixture of ethanol and ethyl ether was added to the solution which resulted in the separation of yellow insoluble needles melting at 265ºC. The product corresponded to the formula $C_{21}H_{20}O_{10}$ and was named isogenistein. On hydrolysis, glucose and an aglycone, isogenistein, melting at 302ºC were obtained. The aglycone corresponded to $C_{15}H_{10}O_5$ and gave a triacetyl derivative melting at 189ºC and a di-methyl ether melting at 120-125ºC. On the basis of these results, isogenistein was presumed to be 5,7,2'-trihydroxy isoflavone, isomeric with genistein.

The soluble portion yielded three other crystalline products. One of these, which was designated as tatoin, consisted of colorless needles melting at 318ºC and having the formula $C_{16}H_{12}O_4$. It gave a diacetyl derivative melting at 185ºC, a monomethyl-ether melting at 160-163ºC and a dimethyl-ether melting at 165ºC. These and many other reactions indicated the probable identity of tatoin with 8-methyl- 5,7,4'-trihydroxy isoflavone.

The second product, which was designated as methylgenistein, consisted of faintly yellow needles melting at 298ºC. The product was characterized by the preparation and analysis of a large number of derivatives on the basis of which it was concluded that methylgenistein was probably 8-methyl- 5,7,4'-trihydroxy isoflavone.

The third product consisted of faintly yellow lustrous needles melting at 255ºC and corresponding to the formula $C_{22}H_{22}O_{10}$ was designated as methylisogenistein. On hydrolysis it yielded glucose and an aglucone melting at 301-302ºC, corresponding to the formula $C_{16}H_{12}O_5$. The aglucone was converted into a series of derivatives, the analysis of which indicated it to be 8-methyl- 5,7,2'-trihydroxy isoflavone, isomeric with methylgenistein. Address: Central Laboratory, South Manchuria Railway Co.

3503. Morse, W.J. 1939. Soybeans–The world around. *Proceedings of the American Soybean Association* p. 39-44. 19th annual meeting. Held 11-12 Sept. at Madison, Wisconsin.

• ***Summary:*** Contents: Introduction. Asia: China, Manchoukuo [Manchuria], Chosen (Korea), Japan, Netherlands Indies [Indonesia], Philippine Islands. Europe. Rumania. North and South America. Africa. Australia.

In Europe, production is presently "confined largely to European Russia, Bulgaria, Yugoslavia, Czechoslovakia, and Rumania. In Europe as a whole, slightly more than 3 million bushels of seed were produced in 1938, 80 per cent of which was produced in Bulgaria, Rumania, and Yugoslavia. The largest increase has been in Rumania, due chiefly to the fact

© Copyright Soyinfo Center 2014

that Germany, by guaranteeing purchases, has given a certain stability to cultivation... Russian scientists have for the past several years carried on extensive experiments with the soybean. At the present time the principal areas of cultivation are the Ukraine and certain regions in northern Caucasus.

"Previous to the World War, Europe absorbed about 50 per cent of the exports of soybeans from Asiatic countries, the largest of the imports being taken by the United Kingdom, with Denmark and the Netherlands taking the remainder. In the post-war period [after World War I] important changes took place, Germany taking first place as an importer and other nations entering into the international trade in the bean and its products. At present Germany still holds first place as an importer of soybeans, followed by Denmark, England, Sweden, and the Netherlands. Among other countries that have increased their imports are France, Norway, Latvia, and Italy...

In South America, soybeans are at the experimental stage. "Successful results have been obtained in Cuba, Argentina, Brazil, Chile, and in some parts of Mexico."

"Africa: Extensive experiments have been conducted with the soybean in various parts of Africa for many years but as yet it is an unfamiliar crop to the majority of African farmers. It has been successfully cultivated in the upland, midland, and coast districts of Natal and throughout Gambia, Sierra Leone, Nigeria, and the Gold Coast Colony. In the cotton and corn growing districts of Belgian Congo the soybean has been grown successfully for forage and food purposes. Results in all cases, however, indicate that more and better varieties, and improved methods of culture and harvesting are essential before the soybean becomes a factor of much economic importance in African agriculture. The crop is advised more as a crop for domestic use than the European market. It is of interest to note that in 1938 nearly 4 million pounds of soybean meal were used in native rations in the mine compounds of South Africa.

"Australia: Successful results have been obtained with a few American varieties in Victoria and Queensland, but thus far efforts to establish the soybean as a commercial crop have been disappointing. At the present time, however, more extensive tests are being conducted to obtain adapted varieties in order to produce beans on a commercial scale."

A table (p. 43) gives "Acreage, production, and imports of soybeans by countries (Compiled from official sources)," based largely on 1938 statistics. The countries are: Austria, Belgo-Luxembourg [Belgium], British Malaya, Bulgaria, Canada, China, Chosen (Korea), Czechoslovakia, Denmark, Estonia, France, Germany, Hongkong, Italy, Japan, Kwantung, Latvia, Manchoukuo, Netherlands, Netherlands Indies, Norway, Poland-Danzig, Rumania, Sweden, Taiwan (Formosa), United Kingdom, United States, U.S.S.R. (Russia), Yugoslavia.

Leading soybean producers are: China 217,192,000 bushels (1936), Manchoukuo 170,269,000 bushels, United States 57,665,000 bushels, Chosen 18,480,000 bushels, Japan 13,473,000 bushels (1937), Netherlands Indies 9,873,000 bushels (production minus seed for planting), U.S.S.R. 2,502,000 bushels, Rumania 1,804,000 bushels.

Leading soybean importers include: Germany 28,766,356 bushels (the world's largest soybean importer), Japan 27,796,787 bushels (#2 worldwide), Estonia 195,475 bushels, Latvia 86,347 bushels, and Poland-Danzig 19,106 bushels.

Note: This is the earliest document seen (Feb. 2005) concerning soybeans in Estonia. This document contains the earliest date seen for soybeans in Estonia (1938). Address: USDA Bureau of Plant Industry, Washington, DC.

3506. Otani, Yoshio. 1939. Microbiological studies on the "nukamiso-pickles." *Zentralblatt fuer Bakteriologie. Series 2.* 101(4/8):139-51. [8 ref. Eng]
• ***Summary:*** To make nukamiso pickles, vegetables are put in a mixture of rice bran, salt, and water, then fermented and ripened. Miso is not typically used, but the bed has a consistency similar to that of miso. Inoue (1895) first analyzed nukamiso pickles and described their chemical components. Sawamura (1904) isolated a species of scum yeast and 4 species of bacteria from both fresh and old nukamiso. Address: Inst. of Zymomycology, Imperial College of Agriculture, Tottori, Japan.

3509. Hennefrund, Helen E. comp. 1939. The peanut industry: A selected list of references on the economic aspects of the industry, 1920-1939. *USDA Bureau of Agricultural Economics, Agricultural Economics Bibliography* No. 80. viii + 238 p. Nov. 28 cm. [641 ref]
• ***Summary:*** This bibliography was compiled under the direction of Mary G. Lacy, librarian at the Bureau of Agricultural Economics. Contents: Foreword, by Mary Lacy. Sources consulted. General. United States: General, Agricultural Adjustment Program, cost of production and labor requirements, grading and standardization, legislation, markets and marketing, mechanization, periodicals, Philippine Islands, statistics, storage, utilization (general, feed and its nutritive value, peanut butter, peanut oil).

Foreign countries: General, Algeria, Argentina, Australia, Belgium and Belgian Congo, Brazil, British Empire, British East Africa, British West Africa, Bulgaria, Canada, Ceylon, China, Colombia, Cuba, Denmark, Egypt, France, French West Africa (incl. Senegal, French Guinea), Germany, India, Indo-China, Italy, Japan and Manchuria, Malaya, Mexico, Morocco, Netherlands and Dutch East Indies, Palestine, Poland, Portugal and Colonies, Rhodesia, South Africa, Spain, Sudan, Sweden, Thailand (Siam), Tunis [Tunisia], Turkey, Union of Soviet Socialist Republics, Uruguay, West Indies (British), Yugoslavia.

Pages 1-145 contain 641 bibliographic references (partially annotated), arranged by subject as shown above. Pages 146-238 are indexes.

The Foreword notes: "This bibliography supersedes and brings up to date a typewritten list by Vajen E. Hitz issued in 1931 entitled 'The peanut industry: Selected references on the economic aspects of the industry... 1920 to date.' It contains references to books, pamphlets, and periodical articles relating to the economic aspects of the peanut industry in the United States and in foreign countries from 1920 through the first five months of 1939... Call numbers following the citations are those of the U.S. Department of Agriculture Library, unless otherwise noted. 'Libr. Congr.' preceding a call number indicates that the publication is in the Library of Congress." Address: USDA Bureau of Agricultural Economics.

Address: Brewing Laboratory, Noda Shoyu Co. Ltd., Noda-machi, Chiba-ken, Japan.

3511. Morse, W.J.; Cartter, J.L. 1939. Soybeans: Culture and varieties. *Farmers' Bulletin* (*USDA*) No. 1520 (Revised ed.). 39 p. Nov. Revision of April 1927 edition, further revised in 1949.
• ***Summary:*** Contents: History. Description. Distribution and production. Climatic adaptations. Soil preferences, Varieties (classified by length of growing season into 7 groups, and divided within each group into "Seed, forage, green vegetable, and dry edible" types). Description of varieties (describes 125 varieties). Preparation of the seedbed. Fertilizers and lime. Inoculation. Time of seeding. Methods of seeding. Rate of seeding. Depth of seeding. Cultivation. Soybeans in rotations. Soybeans in mixtures. Soybeans drilled in small grains. Cost of production. Insect enemies of soybeans. Soybean diseases. Other enemies of soybeans.

"History: Ancient Chinese literature reveals that the soybean was extensively cultivated and highly valued as a food centuries before written records were kept. The first record of the plant is contained in a materia medica describing the plants of China, written by Emperor Sheng Nung in 2838 B.C. Methods of culture, varieties for different purposes, and numerous uses are repeatedly mentioned in later records, indicating the soybean to be of very ancient cultivation and perhaps one of the oldest crops grown by man. It was considered the most important cultivated legume and one of the five sacred grains essential to the existence of Chinese civilization. Soybean seed was sown yearly with great ceremony by the emperors of China, and poets through the ages have extolled the virtues of the plant in its services to humanity.

"The soybean was first made known to Europeans by Engelbert Kaempfer, a German botanist, who spent 2 years, 1691-92, in Japan. Seed sent by Chinese missionaries was planted as early as 1740 in botanic gardens in France..."

"Distribution and production: The soybean is grown to a greater extent in Manchuria than in any other country in the world. It occupies about 25 percent of the total cultivated area and is relied upon by the Manchurian farmer as a cash crop. China, Japan, and Chosen [Korea] are large producers and the soybean is cultivated more or less also in the Philippines, Siam, Cochin China, Netherland India [later Indonesia], and India. In other parts of the world, particularly Germany, England, Soviet Union, France, Italy, Czechoslovakia, Rumania, Mexico, Argentina, Cuba, Canada, New South Wales, New Zealand, Algeria, Egypt, British East Africa, South Africa, and Spain, various degrees of success have been obtained."

The section on diseases discusses the following: Purple spot of seeds, bacterial blight, bacterial pustule, mosaic, wilt,

© Copyright Soyinfo Center 2014

brown spot, sunburn or aphid injury, downy mildew, pod and stem blight, anthracnose, sclerotial stem rot, frog-eye spots, and *Pythium* root rot.

A table (p. 6-7) shows different varieties of soybeans recommended for four different uses (seed, forage, green vegetable, or dry edible), classified by the length of the growing season. Green vegetable–Very early (100 days or less): Agate, Sioux. Early (101 to 110 days): Bansei, Chusei, Goku, Kanro, Waseda. Medium early (111 to 120 days): Fuji, Hakote, Hiro, Hokkaido, Jogun, Kura, Osaya, Sato, Shiro, Sousei, Suru, Toku, Willomi. Medium (121 to 130 days): Chame, Funk Delicious, Imperial. Medium late (131 to 140 days): Aoda, Hahto, Higan, Rokusun. Late (141 to 160 days): Nanda.

Dry edible–Early (101 to 110 days): Bansei, Chusei, Goku, Kanro, Waseda. Medium early (111 to 120 days): Hokkaido, Jogun, Osaya, Sousei, Suru, Toku, Willomi. Medium (121 to 130 days): Funk Delicious, Imperial. Medium late (131 to 140 days): Easycook*, Haberlandt*, Higan, Rokusun, Tokyo*. Late (141 to 160 days): Nanda. Note: All dry edible varieties except three (Easycook, Haberlandt, and Tokyo–which are followed by an asterisk (*)) are also included in the green vegetable group. But many in the green vegetable group are not included in the dry edible group.

Detailed descriptions of the following 125 varieties are given (p. 7-17): Agate, A.K., Aksarben, Aoda, Arksoy, Avoyelles, Bansei, Barchet, Biloxi, Black Beauty (same as Ebony), Black Eyebrow, Cayuga, Chame, Charlee, Chernie, Chestnut, Chiquita, Chusei, Clemson, Columbia, Creole, Delnoshat, Delsta, Dixie, Dunfield, Early Green (same as Medium Green), Early Virginia Brown (same as Virginia), Early Wilson (same as Wilson), Early Wisconsin Black (same as Wisconsin Black), Early Yellow (same as Ito San), Easycook, Ebony, Elton, Fuji, Funk Delicious, George Washington, Georgian, Goku, Guelph (same as Medium Green), Habaro, Haberlandt, Hahto, Hakote, Harbinsoy, Hayseed, Herman, Higan, Hiro, Hokkaido, Hollybrook, Hongkong, Hoosier, Hurrelbrink, Illini, Ilsoy, Imperial, Indiana Hollybrook (same as Midwest), Ito San, Jogun, Kanro, Kingwa, Kura, Laredo, Large Brown (same as Mammoth Brown), Large Yellow (same as Mammoth Yellow), Late Yellow (same as Mammoth Yellow), Lexington, Macoupin, Mamloxi, Mammoth Brown, Mammoth Yellow, Mamredo, Manchu, Mandarin, Mandell, Mansoy, Medium Early Green (same as Medium Green), Medium Early Yellow (same as Ito San), Medium Green, Medium Yellow (same as Midwest), Midwest, Minsoy, Missoy, Monetta, Morse, Mukden, Nanda, Nanking, Norredo, Northern Hollybrook (same as Midwest), Ogemaw, Old Dominion, Oloxi (formerly Coker's Black Beauty), Osaya, Otootan, Ozark, Palmetto, Pee Dee (Coker's 31-15), Peking, Pine Dell Perfection, Pinpu, Richland, Rokusun, Sato, Scioto, Shiro, Sioux, Sooty, Sousei, Southern Green, Southern Prolific, Soysota, Suru, Tarheel Black, Toku, Tokyo, Virginia (selection {19186-D} from the Morse variety at Arlington Experiment Farm in 1907), Waseda, Wea, White Biloxi, Willomi, Wilson, Wilson-Five, Wisconsin Black, Woods' Yellow, Yelredo (a nonshattering selection, Coker's 319), Yokoten. Address: 1. Senior Agronomist; 2. Assoc. Agronomist, Div. of Forage Crops and Diseases; Both: USDA Bureau of Plant Industry, Washington, DC.

3543. Abend, Hallett. 1939. Chaos in Asia. New York, NY: I. Washburn, Inc. 313 p. See p. 29. Illust. (map). 22 cm.
• ***Summary:*** Chapter 2, "How Japan carries on" (p. 26+) is about conditions inside Japan, since the Manchurian "incident" of 7 July 1937, as it fights a war in China. Gasoline is rationed to 12 gallons/month. Gaiety is strictly banned and dance halls are closed. Taxes are high and the country's gold reserves have been exhausted. Wages are sky-high and the "pinch of the unofficial American and British boycotts of Japanese-made goods is making itself felt." In short, the island nation is in dire straits.

"The Army is so much better fed, these days, than the civilians that Japanese informants say a marked change is noticeable in all the conscripts before they have been three months in uniform. They fill out, they broaden, their color improves, their eyes have new luster. For the conscripts get meat once each day, they are fed eggs, they are given raw fish in plenty, and they get all the nourishing soya bean curd that they can eat." Address: Author of books on East Asia.

3544. Embree, John Fee. 1939. Suye Mura, a Japanese village. Chicago, Illinois: University of Chicago Press. xxxi + 354 p. Index. 21 cm. Reprinted in 1964 with new Foreword.
• ***Summary:*** This is the earliest known detailed anthropological study of Japanese village life. John Embree is a pioneer anthropologist who lived (with his wife) in the remote mountain Japanese farming village of Suye Mura in Kumamoto prefecture (on Japan's southern island of Kyushu) from Aug. 1935 to Dec. 1936. Mr. Toshio Sano, a graduate of Tokyo Language School, lived with Embree and acted as his interpreter and translator.

Soybeans and soyfoods (particularly tofu) are discussed throughout the book.

Page 41: "Tôfu (soy-bean curd) is prepared in the *mura* by several *tôfu*-makers and sold to the rest of the villagers. It is made by grinding soybeans in a stone quern. It is eaten a great deal in soup and is used as a cheap substitute for fish at some social gatherings.

"The diet is largely vegetarian, though fish and occasionally chicken accompany a banquet. Plenty of proteins are available in the many foods made of soy beans, especially the soy-bean soup (*miso-shiru*), soy-bean sauce (*shôyu*), and soy-bean curd cake (*tôfu*) (see Table 1).

Pages 42-43: Table 1, titled "Agricultural products by season," has four columns for each of the four seasons. Azuki beans and sasage are harvested in summer and autumn; soy beans and sesame seed in autumn. Note: Edamame is not mentioned.

"Page 45: "Pigs are raised for outside sale by most of the *tôfu* makers. A piglet is bought for 5 yen from some city

© Copyright Soyinfo Center 2014

broker, fed on *tôfu* waste [tôfu waste, okara] and general garbage (very scanty in a farmer's house) for about a year, after which time the broker comes back and buys the grown pig for from 15 to 20 yen." The "villagers never think of eating pig meat themselves." "Some people make flour at home on revolving grind-stones (*hikiusu*), similar to those used in making the bean-curd *tôfu.*

A photo (facing p. 52) shows the front of a local *tôfu* shop (Kakui), with two ladies seated on the low wooden platform. The caption reads: "This woman makes *tôfu* daily. Her shop carries a few tinned goods, some candy, beer, geta, thongs, etc. It is a favorite gathering-place for people to sit about and talk."

Page 53: "Some widows and farmers' wives, usually of the poorer families, make *tôfu* as a means of increasing the family income. Such a family has only a little farmland, otherwise the wife would not have the time to devote every morning to making and selling *tôfu.*" "Each *buraku* [village, community] has a *tôfu* maker." Sometimes the wives of fishermen make *tôfu.*

Pages 60-61. In the *yakuba* (village office) there are frequent parties. Two man, paid as messengers, go to buy *tôfu* for these parties.

Page 115: On Kwannon Day, a party is held and a square of *tôfu* is served with *shôchû* to each person present. Tofu is also served at other types of parties and sometimes taken as a gift (p. 118, 122, 124, 128, 147).

Page 160: The author identifies six social classes in this village. Small shopkeepers and *tôfu* makers belong to the 4th class, the "lower middle."

Page 241: Of the Seven Gods, Daikoku and Ebisu are the patron saints of shopkeepers and *tôfu* makers.

Page 254: Inari is the god of crops, especially of rice. "People always refer to Inari as *Oinarisan* (Honorable Inari)."

Pages 292-93. "The eleventh month" of the lunar calendar. On the 15th day is the old Ichifusa Shrine Day. On the evening of the 14th day, *tôfu* is roasted on special bamboo sticks in the fire pit. This preparation, called *dengaku* is made in honor of Otakesan (Ichifusa Shrine).

Page 315: Most *tôfu* makers specialize in doing just that, but some shopkeepers also make *tôfu.*

Page 318: Household expenses. Most miso is made at home. Tofu and other goods purchased at local stores may be paid for with rice instead of money.

3551. International Institute of Agriculture. 1939. Oils and fats: Production and international trade. *Studies of Principal Agricultural Products on the World Market* No. 4. Part I. 345 p. See p. 59-76. [Eng]
• ***Summary:*** Nine major oilseed crops and their respective oils are discussed: cottonseed, groundnut, linseed, soya beans (p. 59-76), sunflower seed, colza seed–rapeseed–mustard seed, sesame seed, castor seed, perilla seed, others (hemp seed, poppy seed, maize/corn). I. Grinenco wrote section IV titled "Soya beans and soya bean oil." Contents: I. Production (p. 59-68). Areas of production: Table 18 shows "Areas cultivated for soya." Average 1924-1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, in China, Manchukuo, Chosen [Korea], Japan, Netherlands Indies [Indonesia], United States, USSR, Europe.

Table 19 shows "Areas cultivated for soya" during the same time periods shown above. In 1936 the world's leading soybean producing countries (in 1,000 metric tons) were: China 5,911.0, Manchukuo [Manchuria] 4,175.5,

© Copyright Soyinfo Center 2014

United States 816.0, Chosen [Korea] 487.1, Japan 339.8, Netherlands Indies (Java and Madura) 247.4, USSR 44.3, Kwantung 17.7, Taiwan 4.4.

Table 20 shows "Area and production of soya in China by provinces (average 1931-1935)." The leaders in total production are (in 1,000 metric tons): Shantung 1,980.7, Kiangsu 1087.4, Honan 765.0, Szechuan 517.0.

Table 21 shows "Production of soya in Manchukuo by provinces in 1936 (in 1,000 metric tons):" Northern provinces: Pinkiang 1,083.9, Kirin 980.8, Lungkiang 464.9, Sankiang 260.6, Chientao 91.4, Heiho 2.7. Total north: 2,884.3. Southern provinces: Fengtien 985.4, Antung 154.7, Chinchow 151.1. Total south: 1,291.2.

Table 22 shows "Area cultivated for the production of soya bean in the United States (in 1,000 ha):" Figures are given for Illinois, Indiana, Iowa, Ohio, North Carolina, Mississippi, Missouri, Other states. Total.

II. Trade (p. 68-76). Principal countries exporting soya beans: Manchukuo, Chosen [Korea], The United States. Principal countries importing soya beans: Germany, Denmark, Sweden, Netherlands, France, Norway, Latvia, Italy, Japan, Chosen, Netherlands Indies. Principal countries exporting and importing soya oil: Manchukuo, Japan, United Kingdom, Austria, Czechoslovakia, Finland, French Morocco, Hong Kong. III. Conclusion (p. 76).

Concerning Norway: Table 24 (p. 71) shows "Net world imports of soya beans (in 1,000 metric tons)," yearly from 1929 to 1936, plus average 1909-1913, and average 1924-1928. A footnote shows that in 1910-11 Norway imported 700 tonnes of soybean oil, followed by an average of 100 tonnes in 1924-28. Norwegian imports of soybean oil were zero from 1929 to 1932, then 2,200 tonnes in 1933, rising to 15,300 tonnes in 1934, then 15,700 tonnes in 1935, and 22,900 tonnes in 1936.

Concerning Finland: Pages 74-75 state that Finland imports soya oil. Finland's first recorded imports were in 1931, when 684 metric tons (tonnes) were imported. By 1936 Finland was importing 2,565 tonnes of soya oil a year. Note: This is the earliest document seen (May 2002) concerning soybean products (soy oil) in Finland; soybeans as such have not yet been reported. This document contains the earliest date seen for soybean products (soy oil) in Finland (1931).

Concerning Latvia: Page 72 states: "Among the countries that have increased their imports of soya beans are France, Norway, and Latvia, although the quantities imported up to the present are relatively small." They are so small that no statistics are given. Address: Villa Umberto I, Rome, Italy.

3552. International Institute of Agriculture. 1939. Oils and fats: Production and international trade. *Studies of Principal Agricultural Products on the World Market* No. 5. Part II. 423 p. [Eng]

• ***Summary:*** Contents: Section II. Land animal fats. Butter. Pig fats. Beef and mutton fats. Trends in world production of and world trade in fats of land animals. III. Marine animal oils and fats. IV. Production and consumption of fats and oils in certain countries. V. Utilisation of fats and oils. VI. Prices of fats and oils (with graphs). Address: Villa Umberto I, Rome, Italy.

3553. Japan Year Book 1939-40. 1939. Tokyo: The Foreign Affairs Association of Japan. 26 + 1220 + 26 p. With fold-out map of Japanese empire. See p. 412-13.

• ***Summary:*** The Preface indicates that this book was published in about Sept. 1939. The editor's name is not given.

Pages 412-13. "Leguminous plants:... Area of leguminous plants in 1937 was 606,184 cho and the production was valued at ¥96,048,470. During the past decade the area planted has been pursuing a slow downward movement, while a sharp reduction experienced by production was more than made good by the increase of 1933. Soy-beans and azuki (red) beans are predominant both in area and production. In 1937

Soy-beans were planted on 331,572 cho which produced 2.842 million koku worth 50,848,576 yen.

Azuki beans were planted on 104,288 cho which produced 0.833 million koku worth 17,272,620 yen.

Note: Production of azuki beans in 1937 in Japan was 29.3% that of soy-beans.

3554. Japan-Manchoukuo Year Book. 1939. Tokyo, Japan: Japan-Manchoukuo Year Book Co. xxiv + 1202 p. Index. 26 cm. Sixth annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. This book was published in late 1938.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year. The Foreword states: "A special feature of this issue is the supplement entitled Japan's Economic Position in China."

Page 332. Table 23 shows production of "Beans, potatoes and sweet potatoes" in hectolitres from 1927 to 1936. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya beans:

4.751 million hectoliters in 1936

Page 760. In the chapter on Railways. Table 5 shows "Staple commodities hauled" from 1931-1938.

1931–4.927 million metric tons (mmt) soya beans & other beans, 0.739 mmt bean cake, and 0.103 mmt bean oil.

1932–7.435 million metric tons (mmt) soya beans & other beans, 0.851 mmt bean cake, and 0.091 mmt bean oil.

1933–7.643 million metric tons (mmt) soya beans & other beans, 0.566 mmt bean cake, and 0.030 mmt bean oil.

1934–5.102 million metric tons (mmt) soya beans & other beans, 0.601 mmt bean cake, and 0.029 mmt bean oil.

© Copyright Soyinfo Center 2014

1935–5.427 million metric tons (mmt) soya beans, 0.502 mmt bean cake, and 0.026 mmt bean oil.

1936–4.407 million metric tons (mmt) soya beans, 0.428 mmt bean cake, and 0.025 mmt bean oil.

1937*–2.676 million metric tons (mmt) soya beans, 0.233 mmt bean cake, and 0.022 mmt bean oil. * = Excluding North Chosen Line.

1938*–2.640 million metric tons (mmt) soya beans, 0.321 mmt bean cake, and 0.024 mmt bean oil. * = Excluding North Chosen Line.

Below this table is a section about the new freight rates.

Page 761. Table 6 shows "Soya-bean freight rates in yen per metric ton. Table 6A shows rates F.O.B. Rashin [Rason, Rajin, a port city on the east coast of Korea, 20 miles from the Russian frontier] from 12 localities Table 6B shows F.O.B. Dairen. from the same 12 localities.

Below that and on page 762 is a history of the South Manchuria Railway Company.

Page 759. A large table shows "Area under various crops (in hectares)" yearly from 1924 to 1938. In 1938 soya beans were planted on 3.784 million hectares.

Page 760. A large table shows "Output of principal of crops (metric tons)" in Manchoukuo yearly from 1924 to 1938. The latter year is an estimate. For soya beans: 4.381 million metric tons in 1938.

The other principal crops shown in the tables are other beans, kaoliang, millet, maize, wheat, rice, upland rice, and other cereals. The text about "Soya beans" is repeated on this page and the next.

Page 761. A table shows soya bean exports (in metric tons) from 1930 to 1937. Exports in 1937 were 1.974 million metric tons.

3557. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [Soya and soya industries: Food products, soy oil, vegetable lecithin, and vegetable casein]. Paris: Gauthier-Villars. x + 390 p. Illust. 18 cm. [300 ref. Fre]

• ***Summary:*** Contents: Introduction. 1. The agricultural, industrial, and commercial history of soya: Asiatic origins and propagation in Europe, soya in America (its cultivation and industries), soya in Europe, Asia, Africa, and Oceania (1936) (1. Admission of soya in the agriculture and industry of European nations (p. 35): Soya in France, soy industry and commerce in central and northern Europe {England, Germany, Holland, Denmark, Sweden, Poland, Austria and Hungary, Switzerland}, penetration of soya into southern Europe {Iberian peninsula, Italy, Balkan countries of Dalmatia, Istria, Yugoslavia, Greece (p. 47), Bulgaria, Romania, Ukraine}, the grandeur and decadence of soya in Russia. 2. Soya in modern Asia (p. 51): China and Manchuria, Japan, Korea, Formosa, French Indochina {Tonkin, Cambodia, Cochin China}, the British and Dutch Indies {Siam, Assam, Bengal, Burma, Ceylon, India, Straits Settlements [later Singapore] / Malacca}, western Asia {Turkestan, Persia (p. 57)}. 3. Soya in Africa and Australia (p. 57-58): South Africa, Rhodesia, Nigeria, Gold Coast [later Ghana], Cote d'Ivoire, Dahomey, Togo, Algeria, Tunisia, Morocco, Egypt, Australia {Queensland, New South Wales, Victoria}, Tasmania, New Zealand, not yet in British New Guinea [later Papua New Guinea], Philippines, Java).

2. The botany and agronomy of soya: The plant, its names, its botanical characteristics, its varieties (original and created by selection), the cultivation of soya.

3. The general chemistry of soya: Chemical composition of the plant, structure and chemical composition of the beans.

4. Using soya in soyfoods and soyfood products: Whole soybeans (whole green, dry, sprouted, roasted and salted {*soja á l'état vert, fève de soja sèche, fève grillée, fève salée de soja, fèves de soja salées,* p. 166-67}, soynut butter {*un mélange rappelant les beurres végétaux*}, soy coffee, soy confections {*confiture de soja*}, soy chocolate, soy sprouts {*fèves de soja germées, germes de fèves de soja*}), soymilk and tofu (*le lait et le fromage de soja;* soymilk cream, concentrated soymilk, soymilk powder / powdered soymilk, fermented soymilk {*lait fermenté, yoghurt, kéfir, koumys,* p. 189}, fermented tofu {*fromages de soja*}), okara (*pulpe résiduaire de la préparation du lait de soja*), fermented soy products (solid, paste, and liquid condiments; natto, miso, and shoyu [soy sauce]; kiu-tsee and lactic ferments), soy flour and bread.

5. The soy oil industry and products derived from it: Extraction and refining of soy oil, properties and use of soy oil.

6. The vegetable lecithin industry: Extraction of vegetable lecithin, properties and use of vegetable lecithin.

7. The vegetable casein industries and plastic materials based on soya: Soybean cakes and flours from which the oil has been removed, use of such cakes and flours, in the crude state, as a raw material for plastics, manufacture and use of

© Copyright Soyinfo Center 2014

vegetable protein, soybean cellulose for artificial silk, soya furfural and furfuraldehyde (phenolic resins). Conclusion: How to launch soya industries in France. Important terms. A bibliography appears at the end of each chapter.

Note 1. This is the earliest French-language document seen that uses the terms *Fève grillée, fève salée de soja,* or *fèves de soja salées,* "roasted soy beans" to refer to soynuts.

Note 2. This is the earliest French-language document seen (April 2005) that mentions soynut butter, which it calls *un mélange rappelant les beurres végétaux.*

Summary: Matagrin wrote two previous books: *Manuel du Savonnier* (Paris, no date given) and *L'Industrie des Produits chimiques et ses Travailleurs* (Paris, 1925).

Francis G. Beltzer, a practical chemist, became a major force in visualizing new industrial uses for the soybean in the West. By contrast, Li and Grandvoinnet (1912) paid little attention to soy oil in their book, devoting only 3 pages out of 150 to the subject, and only ½ page to industrial uses, while largely ignoring lecithin. These two books had a great influence on soy in France and they nicely complement each other (p. vi).

The Soybean, by Piper & Morse (1923), was published in both New York and London. Horvath was a Russo-American chemist. Italians who made important contributions to the soybean were professors Bottari, Mattei, Panatelli, and Tito Poggi (p. vii).

Leon Rouest, French the agronomist, wrote an important book titled *Le soja français et ses applications agricoles et industrielles* (Chateauroux 1936). Since 1920 he has devoted himself to the culture of soybeans and to the selection of acclimatized varieties. He was director of the Laboratory of Soja in the north Caucasus from 1930 to 1935, and in 1921 he had already published a book, *Le soja et son lait végétal.* His new (1936) book benefitted from the collaboration of Henry de Guerpel, an agricultural engineer and mayor of Percy-en-Auge, who was also an indefatigable prophet of soybeans in France, until his untimely death in Jan. 1937.

Anyone in the world can order (from the U.S. Government Printing Office in Washington, DC) the many U.S. publications about soybeans from the USDA or state agricultural experiment stations. These substantial works are based on careful research and enriched with numerous tables and photos–a fine example of the key role that governments can play in introducing and popularizing soya. Recently J.A. LeClerc (of USDA's Bureau of Chemistry and Soils) said the soybean has become a naturalized American (p. viii).

More than a century ago lord Byron wrote *Beppo,* the first Western poem on soy. It was an account of a carnival at Venice, Italy, in 1818. He advised the tourists to bring "Ketchup, Soy [sauce], Chili-vinegar."

Maurice Druel was one of the young engineers who worked with competence to launch a soy industry in France (p. x).

For an early chronology of soybeans and soyfoods in France (1856+, see pages 8-12). 1857-58: Lechaume planted soybeans at Vitry-sur-Seine and got encouraging results. A report by the National Society for Acclimatization declared: "The acclimatization of the soybean is complete."

1859–Setback for the first tests by Vilmorin with Chinese beans that were too late, but success by Dr. Turrel in le Var.

1862-69–Success of Mme. Delisse, in Gironde.

Then the Franco-Prussian war arrested these tests, so the center of interest moved to central Europe. The world exposition of Vienna in 1873 and Haberlandt. In his book one finds the first analyses of the seed by Steuf, of the cake by Woelker / Voelker, the results of texts by Berndt on oil extraction (p. 9).

Podolie is in the Ukraine.

Of Haberlandt's 148 trials in 1877, only 12 failed for lack of warmth. Much new agronomic information was accumulated.

Back in France: 1874-80–Society of Horticulture d'Etampes (Seine-et-Oise) grew a yellow Chinese variety which succeeded. This "soja d'Etampes" was studied intensively from the chemical and agronomic points of view by Lechartier and various authors. A doctor from the region prepared, for his personal use, a vegetable cheese (tofu). But the grain did not find buyers so its cultivation did not spread. There now remain only 2 or 3 innovators to cultivate soybeans and on 5-10 acres maximum. But Chinese soybeans mature in the region of Paris, as in 1879 at Marseille.

1880–While the tests of Boursier in l'Oise have succeeded. and while Olivier-Lecq, ardent propagator of soybeans, distributed 100 kg to farmers in the north, the national Society of Acclimatization organized cultural trials all over France. Results were obtained in each of the regions, some with record yields. The general objection of the farmers was the difficulty found in using the soybean as a legume (it was too hard) or to find buyers.

As Paillieux said so well: "Our point of departure has not been happy one; the soybean has been presented simply as a new legume" (p. 10).

The German successes in soybean cultivation were studied by Wein in 1881 (p. 10).

In the 1880s there was a big growth of interest in vegetarian diets in Europe. Compare this with the USA (p. 11).

Li Yu-ying: After his 1905 speech, in 1908 he created a laboratory for studies, which soon founded the factory La Caseo-Sojaine at Vallees, near Colombes (Seine), administered by a French-Chinese company. This establishment made soyfoods using imported soybeans, especially tofu (p. 12).

Dr. Bloch of France recommended thin sheets of pressed tofu as a reserve ration for troops.

Lever Bros. soap works used lots of soy oil in Britain (p. 12).

© Copyright Soyinfo Center 2014

The British did some cultural trials in India, Burma, Siam (Thailand), and South Africa.

Japan, in effect, annexed Korea in 1895.

It was only after 1905 that soybean tests took place, first in Guyana, where the soybean matured easily.

Soybeans were grown for forage more in the South of USA than in the north. Continued. Address: France.

3558. Matagrin, Am. 1939. Le soja et les industries du soja: Le soja en Afrique et en Australie [Soya and soya industries: Soya in Africa and Australia (Document part)]. Paris: Gauthier-Villars. x + 390 p. See p. 57-58. 18 cm. [Fre]

• ***Summary:*** There are no indigenous soybean varieties in Africa, but soybeans were introduced by the English to the Cape [South Africa]; then to the Orange Free Province, Rhodesia, and Transvaal, and also to Nigeria, the Gold Coast [later Ghana], and Côte d'Ivoire. Likewise, they were introduced by the French to Dahomey [later Benin] and Togo. Today soybeans seem to offer good promise everywhere, but production has been developed only in southern Africa. In northern Africa, earlier trials, which were rather indecisive due to the lack of selection and lack of human experience (except for those of Asian peoples), have been undertaken more seriously since 1918 in Algeria, then in Tunisia and then in Morocco; the coastal regions, where irrigation is unnecessary, seem more favorable.

Elsewhere, it is important to get early maturing varieties in order to avoid dehiscence of the pods under the influence of the summer heat. Note: Seedpods of some soybean varieties dehisce at maturity. That is, they split lengthwise along the natural line of the pod and discharge the contents of the pod–the soybean seeds.

The sandy and rocky soils, which are sometimes well tolerated by soybeans grown in the USA (North Carolina, etc.), are poorly suited in Algeria.

Following the advice of Mr. Rouest, we could try planting the seeds in two rows (20 to 25 cm apart), leaving between the two rows a space of about 1 meter of fallow (unplanted) land. In Tunisia, the climate and the vast territory offer advantages to many soybean varieties, and the trials which began in the 19th century, have now reached a certain amplitude / developed prosperously.

Note: Haberlandt (1878, p. 6) states that he obtained one green-seeded soybean from Tunis [later renamed Tunisia] in 1873 at the Vienna World Exposition (*Wiener Weltausstellung*).

In Morocco, where 35,000 to 50,000 tonnes per year of other beans (*d'autres fèves*) are produced, at least one-third of which is exported (including the bean of Safi, which reminds one of the horse bean or dry kidney bean {*féverole*} of Egypt), this crop succeeds in the regions that are rather cool zones or that allow irrigation. This crop could enrich the soils with nitrogen in the valley of Sebou and the area around Fez, the small market-garden valleys of Mogador, perhaps even on the plains or plateaus of the Chaouïa and of the Doukala [Doukkala; the latter two places are now both in Morocco].

As for Egypt, it has already been worked over by the English propaganda, and soy has spread in the valley of the Nile, beside the horse-beans (*féveroles*) which have an ancient reputation.

In Australia this Asian legume is finally being cultivated successfully. It began at the start of the 20th century in the southeast, and today it grows all along the eastern coast (Queensland, New South Wales, Victoria). From there it somehow spread a bit to Tasmania and toward Adelaide, and above all to New Zealand, where it was welcomed. It does not seem that British New Guinea [later renamed Papua New Guinea] contributed its transmission, although the Dutch region of this large insular territory [Dutch New Guinea, later named Irian Jaya = Irian Barat or West New Guinea] did adopt the soybean, either from Mindanao (Philippines) or from Java [Indonesia].

Tables show: (1) Production and utilization of soybeans in the USA in 1934 and 1935, by states (in 100 metric tons) (p. 18-19). (2) Quantity and value of soybeans, soybean cake, and soybean oil imported into the USA from 1909 to 1928 (p. 26). (3) Importation of soybeans and soy oil into Great Britain (from 1913), Germany (from 1922), Netherlands (from 1913), Denmark (from 1913), and Sweden (from 1930) (all in Europe) in 1913, 1922, 1925, 1930, 1933, 1934, and 1935 (p. 41). (7A) Production of soybeans in China, Manchuria, Korea, and Japan (all in East Asia) in 1928 and 1935 (p. 51). (7B) Soybean trade among countries in Asia in 1909-13, 1922-23, 1924-25 incl. China and Manchuria, Japan, Korea, Dutch Indies, Java and Madura, Formosa, British and French possessions (p. 51).

Note 1. This is the earliest document seen (Aug. 2009) concerning soybeans in Dahomey (later Benin), Côte d'Ivoire (Ivory Coast), or Togo, or the cultivation of soybeans in Dahomey, Côte d'Ivoire, or Togo. This document contains the earliest date seen for soybeans in Dahomey, Côte d'Ivoire, or Togo, or the cultivation of soybeans in Dahomey, Côte d'Ivoire, or Togo (1939; one of two documents for Côte d'Ivoire). The source of these soybeans is unknown. Unfortunately, the author gives no documentation for this early cultivation of soybeans in Dahomey, Côte d'Ivoire, and Togo.

Note 2. Matagrin says (without citing any source) that soybean trials were conducted in Tunisia (a protectorate of France from May 1881 to 1956) in the 19th century. If that were true, this document would contain the earliest date seen for the cultivation of soybeans in Tunisia. In 1869, Tunisia declared itself bankrupt. An international commission, with representatives from France, the United Kingdom, and Italy took over its economy. In 1878 Friedrich Haberlandt wrote that he had obtained 20 varieties of soybeans at the Vienna World Exposition in 1873; at least one of these, he said,

© Copyright Soyinfo Center 2014

came from Tunis (Tunisia). How did soybeans get to Tunisia in order to be tested there? One possibility is that they were sent there from France by the Society for Acclimatization, which reported that it was conducting soybean trials in neighboring Algeria a few years before 1880. Address: France.

3559. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [Soya and soya industries: Food products, soy oil, vegetable lecithin, and vegetable casein (Continued–Document part II]. Paris: Gauthier-Villars. x + 390 p. 18 cm. [300 ref. Fre]

• ***Summary:*** Continued. The agricultural experiment stations and the scientific labs have played an important role in the U.S., also the farm equipment manufacturers.

The experiment stations in many states have helped the farmers to clarify cultural questions which greatly influence yields, preparation of the soil, type and proportion of fertilizer use, dates and methods of planting, how many seeds per acre, choice of varieties according to the climate and soil, role of the soybean in mixed cultures and in crop rotation, etc.

In this book, Matagrin always says "fèves de soja."

1936 listing of soyfoods firms (p. 27): Fearn Soya Foods Co., Chicago, Illinois. Soybean Health Prods Co. Oakland, California (tofu). Soyex Co. Nutley, New Jersey. La Sierra Industries, Ontario, California (soymilk). American Lecithin Co., Atlanta, Georgia. Ten soy flour companies (p. 29).

American Lecithin Co. in 1936 was in Atlanta, Georgia. From when to when was it in Illinois?

Soy in France (p. 36): Prof. Beille of Bordeaux published a good work on soy but it is no longer available. Also the books of Prof. Jumelle of Marseille on colonial crops and vegetable oils. Prof. R. Lepine of Lyon in 1919 in *Revue Scientifique,* wrote about soy culture in Algeria and the preparation of soymilk.

Mr. Rouest perfected again the selections of yellow or green varieties that he had undertaken from 1907, with success. Using American seeds, others who experimented were Messrs. Brioux at Rouen, Carle of Carbonniere in le Tarn, and Semichon at Carcassonne; he likewise cultivated it at l'Aude from 1918. A list of 42 of Rouest's varieties (chosen from 2,000 others) were given in Rouest's book *Le Soja Francaise* showing that he was more qualified than anyone to write a book of this tile. He pursued his cultures and selections in France from 1921-30, in the Caucasus from 1930 to 1935, and thus fulfilled the efforts started by the Society for Acclimatization and its successors. He worked with another apostle, Henry de Guerpel, and agronomist and mayor of Percy-en-Auge (Calvados), who developed and perfected during 5 years the culture of the best varieties of soybeans in the regions surrounding his country house at Plainville, near Mézidon. He did not only collaborate on the book with Rouest, but also published interesting articles in several reviews in France and the colonies. Also Mr. Denaiffe of Carignan (Ardennes), author of the esteemed book *Les Haricots,* did important culture work and provided information.

Today production of soybeans in France is no more than several thousand hectoliters of beans = several 100,000 liters. For forage, the crop / culture has developed only in North Africa. It was encouraged by Rouest and de Guerpel.

Caseo Sojaine's products were excellent but expensive.

The products of Heudebert (probably diabetic products made with soyflour?), were well known in England as in France (p. 39).

Since 1913 the oil mills of Marseille, France, have started to use soy oil (mainly for hydrogenation) and those of the north (mainly for manufacture of soft soaps).

Recently the foundation (at Chateauroux) of a Society of Friends, Producers and Technicians of Soja has been announced by M. Druel.

In England the fine botanist J.L. North tested with success 13 Manchurian soybean seeds in 1913 and in the third harvest expanded these to 12,000 seeds, which he sent in 1917 to a farm at Uxbridge in Middlesex and to the Ogilvie Farm in Essex. There was a remarkable harvest in 1921, followed by good development of the enterprise. It advanced thanks to Piper and Morse's 1923 book *The Soybean* which to told of American successes. North succeeded in 1928 in getting 20-80 pods per stalk. In 1921 North's work drew the attention of the Ford establishment in Boreham which was not able to obtain good yields with American soybeans but succeeded with North's. Today England cultivates soybeans on about 15 hectares and yields are 1,400 to 2,500 liters per ha.

In England. Lever Bros. are big users of soy oil in soap. The main oil mills using soybeans are J. Bibby and Sons in Liverpool, three others in Hull, one in Erith and one refinery on the outskirts of London. Huge amounts of soy oil and meal are imported by a subsidiary of Lever Bros.

Germany: The recent agreement between Germany and Japan foreseeing an exchange of arms, explosives, etc. in exchange for soybeans which can furnish explosives (for nitroglycerine, naturally) is a barter / swap (of cannons for soybeans) analogous to that with Manchuria in 1934. What is certain is that the agents of I.G. Farbenindustrie A.G. under the patronage of the Economic Federation of Central Europe has been enforcing for 3 years soybeans culture in the Balkans which trade voluntarily with Germany.

Spain was rich in other oil sources (mainly olive oil). so not pay much attention to soy.

Italy: In 1918 a trial by Prof. Borzi, on a parcel of 2.5 acres at the Colonial Garden in Palerme / Palermo gave a yield of 20 liters/ha. In 1918-20 at the Institute Bonafous in Turin, a scientific research center, did research on yellow soybeans. Then trials were done in Liguria, Lombardia

© Copyright Soyinfo Center 2014

and Capo d'Istria, and Palerme about 1920s–a total of a dozen localities. Retaking in 1922 these tests of 1884 in Piedmont, Prof. Tito Poggi seeded 8 parcels in Monferrat, then helped to popularize soybeans in Italy. By the mid-1920s soy flour was widely used in baking. In March 1926 a "Bread for ammunition = pagnotto di munizione" containing 10% soy flour was heartily welcomed by the garrison in Rome. Already an official tasting by Mussolini (of the bread by him?) has been commented upon by the Italian press. The success of the campaign to promote use of wheat limited, after that, the outlets for soy in human foods, but the oil remained widely used by industry and the cake for production of milk.

Bulgaria and Rumania were influenced by the example of the Ukraine = Podolie?

The grandeur and decadence of soja in Russia: The book by L. Rouest, who was director of the Soy Laboratory in the North Caucasus from 1930 to 1935, brings together, but in a somewhat dispersed way, a very instructive documentation on soya in Russia. He described the grandeur and decadence. Soya was cultivated, it seems, since the victory of the Tcherkesses? (p. 48) and the incursions in east Turkestan, about 1860, then introduced into the Ukraine and Bessarabia, either from the Caucasus or from Hungary in the following years. Finally better known when the construction of the Transsiberian railroad connected (*conduisit*) Russia and Manchuria (1896-1900) But the soybean could not fail to interest the higher government officials. Before the universal success of the soybean after World War I, it was seen not only as an interior resource but also as an export crop. However in 1931, of the 5,970,000 ha in Russia used to grow oilseeds, less than 1,100 were used to grow soybeans versus 5.2 million used for sunflowers, 300,000 for castor oil, 140,000 for sesame, 30,000 for peanuts, and 350,000 for others such as rapeseed. But the industry began to demand soybeans. A large furniture factory in Oklanskaia made glues of vegetable proteins. The oil was studied for use in soaps and paints. The famine which menaced the working population because the moujiks [muzhiks, mujiks], resisted the exploitation of the lands into collectives, was able to be prevented or delayed by the progress in the culture of soybeans. Also the 5-year plan foresaw the extension of this crop onto 3-5 million ha with harvests of at least 1,500 kg per ha. To guide the farmers and perfect management techniques, specialists were recruited and concessions were granted to Germany in diverse regions. For how would the USSR itself have harvested the 1935 crop of about one million quintals = 100,000 MT. The number is enormous by comparison with the rest of Europe. (Did the Soviets see themselves as pioneers of a revolutionary new crop?)

Here, according to the agronomist Rouest, are the causes of the Russian setback. 1. Negligence and ignorance of the Russian peasant. 2. Disadvantages of the communist regime, 3. The general ideological method, always little reconcilable with the needs of the changes and hazards of agriculture (e.g., research to find varieties permitting the use of large harvesters). 4. Poorly chosen cultural methods. 5. Use of most of the harvest for food. The best literature concerns the moujik [muzhik, mujik] peasants, and one long study of 1911, of which we have a copy, written by a Russian doctor,... Sowed in the black earth of the Caucasus and the Ukraine, these soybeans, said Rouest, evidently saved the lives of thousands of people... We have been told that the Russians are disgusted at the compulsory use of soybeans, result of unskilled cooks...? Address: France.

3560. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [Soya and soya industries: Food products, soy oil, vegetable lecithin, and vegetable casein (Continued–Document part III]. Paris: Gauthier-Villars. x + 390 p. 18 cm. [300 ref. Fre]

• ***Summary:*** Continued. Japan: The great oil mills of Kobe. In Japan, for cooking, sesame oil is preferred and for illumination rapeseed oil.

French Indochina: From 1931. It is estimated Tonkin cultivated about 12,000 ha of soybeans and harvested an average of 7,500 metric tons per year. The low yield of only 625 kg/ha, compared with a world average of 1,000, is explained by the fact that soybeans are generally cultivated with corn in a 1:1 mixture. Some soybeans are exported to Hong Kong. Since 1933 Paul Braemer, chief of agricultural services in Hong Kong, is exerting himself to propagate more this nutritious plant. Up till now the strong flavor of the soy protein deters colonials from using soy for food and soymilk. Made experimentally at the Maurice Museum, these have not attained but a relative success in the European colony. However the natives use many products. The village of Cu-da / Cuda 10 km from Hadong [in today's Vietnam] specializes in a type of soy sauce which cannot be made except from April to July, and which must be kept in sealed containers.

English and Dutch Indies: Today Prof. D. Kanga of Gujerat College of Ahmedabad, recommends warmly this economical and fortifying food. Soy is now used increasingly in industrial dining rooms and universities (he lists names). It is likely that India will acclimatize varieties rich in oil, develop extraction mills in its centers of industry, and deliver a large tonnage to the English soap makers.

Soybeans, propagated by the Russians, have long been grown on the plains of Turkestan [today's Afghanistan] and tests have been done in Persia [today's Iran] and the Soviet and Chinese republics of Central Asia northeast of there.

Soy in Africa: The French tried growing soybeans successfully in Dahomey and Togo. In North Africa trials have been taken more seriously since 1918 in Algeria, then in Tunisia and Morocco. In Tunisia, the tests which began in the late 19th century, are now growing. In Morocco lots of

© Copyright Soyinfo Center 2014

other beans are grown.

Australia is finally cultivating soybeans since the start of the century in the southeast, and today on all the east coast (Queensland, New South Wales and Victoria).

Soybean etymology: Low Countries = Sojaboon. Russia = Soia. Italy = Soia or (better) soja.

At the start of this century, when the German industry launched "Nitragine," a liquid culture of nitrogen fixing bacteria, there was much interest. The American practice, founded on the research of Norman Shaw (1910) and on the experience at the agricultural experiment stations at Michigan (1905), Wisconsin (1907, 1922). etc. consists of inoculating new soil with soil from former soybean fields.

Matagrin has a lengthy and excellent review of soybean agronomy. Also one of the best bibliographies; the most extensive of any European book to date on all aspects of soybeans and soyfoods.

The USA and the USSR were the first two countries to mechanize soybean planting and harvesting.

On the diseases and enemies of the soybean (p. 108): Earliest citation is 1919 from J. of Agricultural Research, and from the Nebraska Agricultural Experiment Station. Third is Wolf and Lehman 1920.

Most of the early studies on soybean diseases and enemies are analyzed in Morse (1927) "Soy Beans: Culture and Varieties." In the same publication is found a summary of U.S. work on insect enemies of soybeans established by H.R. Walton, Bureau of Etymology, Washington, DC.

The early research on the chemical composition of the soybean plant was to determine its value as forage. The key work in France was done by Lechartier and Joulie. The latter also studied the composition of the soybeans from Etampes, as did Giljaranski. and H.L. North.

The structure of the soybean cells was studied in France by Colin and Blondel (1888).

Matagrin has a strong historical dimension running through every chapter.

The median oil content from Asian soybeans is not more than 17%, while that of American soybeans attains 19%.

In about 1920, West and Levene developed the chemical formula and structure for animal lecithin.

The importance of soybeans as a protein source was not pointed out by researchers for 69 years, i.e., until the 1880s, and was not considered from an economic point of view until the World War I put into relief the problems of feeding populations and armies. Then interest and patents multiplied. For example, in 1910 the processes of S. Satow of Sendai, Japan for the precipitation of soymilk by a ferment or by sulfuric acid.

Most legumes contain only 1.6 to 2.9% oil, with the exception of peanuts which contain 45%. Soy contains 20%.

Concerning soy lecithin, From 1870 to 1910 W. Koch (1902), Fraenkel, (p. 152) not only verified the initial conclusions of Thudichum about this agent of nutritional assimilation. Koch showed in 1902 that this phosphatide was important.

At the start of the 20th century, soy pap was prescribed with success for diabetics in the hospitals of Algeria, as in Japan and Austria.

Page 158: Number of calories costing 15 centimes in 1938. Li Yu-ying had a similar chart but he omitted potatoes.

Potatoes: 80 grams give 224 calories

Soybeans: 40 grams give 188 calories

Rice: 50 grams give 180 calories

Bread: 45 grams give 145

Followed by 16 other foods.

Etymology: Matagrin (p. 160-61) says "fève de soja" and "soja à l'etat vert" (for green vegetable soybeans).

Miss Ellen Kingsley (p. 161) of the U.S. Bureau of Home Economics published many recipes using whole dry soybeans.

Durand (no citation) discussed cooking whole soybeans in water with sodium bicarbonate. This well-known process for all legumes leaves an unpleasant taste. So he recommended pressure cooking. Then he gives recipes for whole dry soybeans.

At whole dry soybeans, there is considerable discussion of their use in vegetarian diets. Was Matagrin a vegetarian?

Etymology: Matagrin (p. 166) says "la farine des fèves grilles" for roasted soy flour.

At the Iowa College of Agriculture, Nelson made a soynut butter as follows: Deep-fry soybeans in oil at 100-110ºC for about 5 minutes. Grind the soybeans finely. Then grill at 160ºF for about 20 minutes. Finally mixing these with some of the deep-frying oil.

Soy coffee is cafe without caffeine. Matagrin uses lots of information from Li Yu-ying; likewise information from Li appeared in countless later articles. Li was one of the two original sources; Paillieux was the second.

Is soymilk presently consumed more widely that animal milks in China? Not in Japan.

Carles (note spelling) was not a Frenchman who did work on soymilk.

Soymilk (p. 172): According to an article by Prof. R. Lepine of Lyon (1919), concerning a communication of Mlle. Castet of the Society of Horticulture of Alger (Algiers).

Rouest was director *du Laboratoire du Soja* in Russia's North Caucasus.

Castagnol (soymilk) in Bulletin of Indochina, uses a centrifuge.

Soymilk patents from France. G.D. Thevenot (1920-25), A. Serault (1931), M. Adler (1933).

Arao Itano (1918). Made soymilk from soy flour with *Bacillus* inoculum. So it was fermented soymilk developed by a Japanese.

Etymology: *Fèves de soja entieres* = whole soybeans.

Li Yu-ying used cold extraction of soymilk, Chinese style.

© Copyright Soyinfo Center 2014

Matagrin has an excellent review of all the various ways of making soymilk.

Muggia and Gasca (1921) made soymilk with a bland flavor in Italy.

1933 process for making soymilk in Russia by Bogatskij, Storozhuk and Morumtzev.

In raising animals, soymilk renders a great service. It is very wildly used now in USA and in Asia. but its use is limited by that fact that it is more economical to feed the animals the bean itself or the cake.

Adding lecithin to soymilk gives it a light flavor of butter.

Etymology: Matagrin unfortunately calls yuba *Crème de lait de soja* (Phu-chuc of Indochina) [dried yuba sticks]. According to an analysis by a pharmacist, Monnier, of the Pasteur Institute of Hanoi, it contains 64.62% oils, 8.98% Nitrogen. It is often prepared with fish bladders or minced meat.

Just. Hatmaker (p. 190) made powdered soymilk, as did three other processes, including a spray process of Bevenot and Neveu. This process was also widely used in English soap factories. Matagrin gives 3 analyses of powdered soymilk, the earliest from Li Yu-ying.

Pages 192-93: Discusses soy yogurt (*Yoghourt au lait de soja*), soy kefir (*Kéfir au lait de soja*), and soy koumis / koumiss (*koumys*).

Matagrin gives detailed descriptions of many methods of making tofu and 9 pages of information (p. 194-202)

Bloch said the best coagulant is magnesium chloride. Beltzer preferred acids to calcium salts.

Ellen J. Kingsley (1935) of the USDA gives a method for making tofu.

Drs. Labbé (Labbe) and Marchoisne have shown that vegetable albumines, despite current opinion, are very assimilable.

Matagrin gives a number of nice tofu recipes including French-style tofu in Petits-fours (fancy biscuits; p. 201) and Tofu meringue. Address: France.

3561. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [Soya and soya industries: Food products, soy oil, vegetable lecithin, and vegetable casein (Continued–Document part IV]. Paris: Gauthier-Villars. x + 390 p. 18 cm. [300 ref. Fre]

• ***Summary:*** Continued. Etymology: For "okara" Matagrin says *Pulpe residuaire de la preparation du lait de soja.*

Dr. Bloch showed okara contained 88.75% water. Beltzer gave a microscopic analysis. Mlle. Castet, in tests with okara in 1918 in Algiers, added sugar and cooked for at least one hour to get something like an almond paste, which she used in patisserie. Also in 1918 Holmes of the USA used dried okara in biscuits. Since then many recipes have appeared in America. Souffle, Salad with apples, Sandwich filling, etc.

Koenig did two analyses of miso, not stated when.

Matagrin gave many detailed descriptions of process for making various soyfoods by various authors in many countries.

Chinese Yeast, Kiu-tsee. This product, described by Daby de Thiersant, according to the practice in Kwantung.

Lots on soy flour; processes and recipes.

Berczeller carried on the work of Haberlandt in Central Europe. But did Berczeller know of Haberlandt?

Lecerf made bread entirely from soy flour and Bourdin, of Reims, made "soy gluten" bread rich in carbohydrates. Heudebert made dietetic products from soy flour. Breads for diabetics were made by Menudier (1890), Bloch, Labbe, Dujardin-Beaumetz, Martinet, Cazalis, Le Goff, etc.

By 1930 solvent extractors were processing 1,000 tonnes/day. The great oil mills of Hamburg-Harburg were processing up to 1,200 tons per 24 hours. A system consumes 5.5 tonnes of steam and 30 kwh of power per ton of soybeans.

At the Ford Motor Co., the Flumerfelt continuous extractor, inspired clearly by that of Ford (the former = U.S. Patent 1,920,499 of 1 Aug. 1933.) with a screw in a tube. For the Ford system it required only 1 man to process 1,800 kg in 8 hours. Remarkable! The Ford extractor is very economical and all manual. Ford hopes it can be sold for about $3,000.

Soy oil as food: In Haberlandt, C. Berndt submitted to pressure Chinese soybeans, which he had obtained from Japan and which also served as the first European analysis of soybean samples, due to Steuf. Without ignoring the eventual industrial interest, in this oil, Berndt was interested in food uses. He said: "And I have also found a large proportion of oil in the cake, the pressing having been insufficient. I had a fried food / fritter (*friture*) prepared with the oil and found not the least after taste." Better to translate directly from German. The experiment was not decisive. Nutritive properties of soy oil: Some (Dr. Petit among others) say soy oil is purgative. Kaempfer noted well in 1690 the medicinal use of black, dwarf? soybeans as an antiasthmatic powder. At Nutrition: Dr. Bloch showed that consumption of 100 gm of this oil causes no laxative effect. but rather a mechanical effect that lubricates the intestines.

The abundance of olive oil in France has led to limited adoption of soy oil.

As cottonseed declined, soy oil gradually replaced it. Is the decline of cotton related to synthetic fabrics or only to the boll weevil?

Soy oil is most widely used in soaps in the USA and USSR where cotton oil use is dropping and imports of palm oil and coconut oil are large; they do not use soy oil alone. Is it usually or often hydrogenated?

Tests on destructive distillation of soy oil started in Japan. In 1920-21 S. Satow formed a calcium soap with soy oil and submitted it to the usual procedure for cracking,

© Copyright Soyinfo Center 2014

obtained below 150ºC various fractions' 20% light oil; 150-300ºC 60% kerosene type oil; 300-330ºC heavy petrole fraction.

Artificial rubber: In about 1915 Grosse and Sauer in Germany developed a process for making artificial rubber from soy oil. In 1921 a Canadian process was developed (W.G. Wright, British patent 142,416).

Various processes for making plastics with soy flour. In 1920 Hager in Portland, Oregon, developed and patented (British patent No. 140,781) a process for making a charge, for bandages, and rubber from soy flour.

The Ford Motor Co. uses annually in making its cars 2,500 kiloliters of soy oil (of which about 1,625 kl for paint and enamel and the rest for foundry cores) and will also absorb 2,180 metric tons of soybean meal (defatted), 3/4 of which for window pane frames–as of Jan 1937. Only at the River Rouge plant in Dearborn, Michigan.

In Japan in 1938 many of the big companies such as Nippon Denko Kaisha, Allied Showa Industry, Japan Oil and Fats, Hohnen Oil, and Bean Chemical Industry, are starting to make soy casein (*caseine de soja;* p. 336.8).

Li Yu-ying who, at least, would point out "Sojalithe," soy glue, the fabrication of isolates (*isolants*) as applications of vegetable protein (p. 337). Preparation of vegetable casein (etymology). Beltzer wrote voluminously on this subject. So he may have preceded Li Yu-ying.

Page 342: Process of H. Beaufour, 1929 French patent for ultrafiltration for separation in colloidal solution, but no mention of soy.

Lots being done by 1939 with isolates for industrial use. Long chapter on it and many patents. Much of the information is from Beltzer's book *Les Industries de la caseine et du lactose.* Then we go on (p. 349). Utilization of *la caseine vegetale du soja.*

A. Food and Pharmaceutical uses. Curded products like tofu, long used in East Asia, are well suited for boulangerie and patisserie = for baking and making pastry. Their addition to flour creates no difficulties and gives a less special flavor than whole soy flour (*la farine entiere de soja*). Etymology. Who first used this. Li Yu-ying? `

It can be added to powdered foods such as milk, cocoa, or to food tablets. In the pharmaceutical industry, it serves also as an excipient (an inert substance that forms a vehicle, as for a drug). Presently several hundred tons a year are used in these two ways in Central Europe and the USSR.

B. Technical uses of vegetable casein (p. 350). In the US in 1936 consumption of vegetable casein approached 30,000 tonnes, nearly 2/3 going to paper making and to plywood glues. The rest going to paints or plastics. The future looks to be in plastics.

Manufacture and utilization of sojalithe: This as well as Galalith was invented by Spitteler (German Patent 127,942) when Trillat recognized in 1892 that formol hardened albumenoids. International Galalith of Harburg and Gennevilliers only perfected the demineralization of casein. From 1901 to the present, via many processes, mostly German and French, have perfected the initial method. Beltzer designed an entire factory, with floor plans and machinery for treating / processing 10 tonnes a day of soybean vegetable casein. It requires defatted soybean meal. Washed in cold water, coagulated with gypsum. Break curd into pieces and wash over cloth with cold water. The casein is then dissolved in, then reprecipitated with acetic acid. and run through a filter press. The vegetable protein, after swelling for 10-12 hr in hot water, can be pressed into tablets and made insoluble by formol gas, or mixed with an aqueous solution of 24-42% formaldehyde, then add phenol as in the Ford process.

Glues of vegetable protein: Add alkali to make it soluble. Paper glues. Glidden has a 1936 French patent.

Paints and coatings of casein. Water-based, or whitewash.

Soy cellulose for artificial silk.

Lots of research on plastics from soybean oil and meal done at Iowa State College. Dailey 1933. Enemark 1935. Forster 1935, Campbell 1926 (p. 365-66). Zenor and Tillson 1931; protein adhesives from soybean meal.

Serious explosions in the USA with soy oil extraction. In Chicago on 7 Oct. 1935, 11 workers were killed and 55 injured at the Glidden plant, while material damage was estimated at $600,000. Two months later an explosion of the same type in an extraction plant at Momence, Illinois, took four victims, killing 2!

Li Yu-ying was right in his vision for starting a soy processing industry in France at Caseo Sojaine. He threatened many commercial industries, arousing the hostility of the dairies.

This is a remarkable, fine, complete detailed book, covering on all aspects of soy. Address: France.

3562. Matsumoto, Kenji; Nonomura, Seiichi. 1939. Gyofun shiyô shôyu shiken [The use of fish meal for brewing shoyu (Abstract)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 15:A152. [1 ref. Jap]

3570. Webber, P.A. 1940. Are soy beans a good food? *Madison Health Messenger* (*Madison, Tennessee*) 2(3A):1, 4. Undated.
• ***Summary:*** "There is probably no legume which has been more universally used, and justly so, than the soy bean. In the earliest Oriental records that go back to the beginning of the Historical Period its use is frequently mentioned. Today after thousands of years, in hundreds of recipes, it is finding its way into the daily dietary of upwards of half the population of The world.

"Only within the last few years has this interesting food received any emphasis in the Occident, but now it is at last receiving at least a part of the attention that it so much deserves. Methods for its use are daily being perfected and presented to the people of Europe and America. United States government agencies and State Experiment stations are spending much time and money to bring this unique legume and its use to the attention of the people of the United States.

"Considerable research with experimental animals and humans has shown beyond a doubt its high value as a food. Its impressive chemical analysis 20% fat, 40% protein, 5% minerals, with its cheapness makes it one of the most economical and best sources of fat, protein, and mineral elements that can be found in any food. Combined daily in its various forms in the diet with plentiful supplies of vegetables, fruits, and grains, it contributes to a well-balanced ration providing adequate protein, fat, carbohydrate, minerals, and vitamins.

"Despite the above mentioned facts proven by many thousands of years of human experience and corroborated by the experimental evidence of scores of research laboratories, recently most adverse but unfortunate criticism has been published concerning the soy bean, attempting to lead the public to an unfavorable attitude toward this most useful food by cleverly covering the facts.

"Even the warmest enthusiast for this food would hardly think of it in terms of supplying all the needs of the human dietary. An All-Wise Providence has provided a great variety of foods, and nature indicates a generous and liberal intake from this bountiful supply. Far be it from those who know the nutritional values of the soy bean best, and are most vocal in its praise to divert attention in any way from any other worth-while food.

"We have been cited to the use of soy beans when fed to test animals, producing high blood pressure, indigestible

© Copyright Soyinfo Center 2014

wastes in the intestines, and albumin and casts appearing in the urine, showing kidney degeneration. It is unfortunate that along with this statement covering soy beans, it was not told the reader that excessive protein of whatever source in the diet, animal or vegetable in origin, will produce like results. This has been proven conclusively by Dr. Newburg of the University of Michigan Hospital and others. It would seem fair, to say the least, that the quantity of protein fed to these test animals would have been reported also, that the reader may know that the experiment was conducted to show what an 'excess' of soy bean protein would produce. In apprehension of this unscientific attempt calculated to mislead the reader, your attention is called to the word 'excess' which is the key to the whole situation. When too many soy beans are used over a long period of time these conditions may develop. This is true also of any of the rich protein foods such as meat, eggs, cheese, etc. Here as in other things the rule of moderation can be well taken. As yet soy beans are not being used extensively enough in the United States to be considered a cause for the alarming growth of high blood pressure, kidney degeneration, etc., so it is hardly fair to lay the blame of these prevalent conditions in Americans today on the humble soy bean. It is plain to even the unscientific mind that these conditions are being brought on, at least to some extent, by the excessive use of other high protein foods and habits that bring about general health degeneration.

"A clear statement of truth on this subject instead of a half truth would have given the reader the proper impression; but half truths seem to be in vogue today; nevertheless such methods of deception are most reprehensible, and call forth a statement of the whole truth as recognized scientists report it. In spite of what has been written to the contrary, briefly the following facts still remain:

"1. The soy bean has been used successfully for thousands of years in the dietary of hundreds of millions of human beings.

"2. It is a high protein food and along with other high protein foods should be eaten in moderation.

"3. It is one of the cheapest and best sources of complete protein, fat, minerals, and vitamin B-1.

"4. Its proper use is being encouraged by Federal and State Agencies.

"5. Scientific, experimental and clinical evidence show that when eaten in proper combination with other foods it provides a most valuable adjunct to the diet.

"6. Scientifically trained dietitians and other medical experts are increasing their use of the soy bean in diet therapy. For twenty-five years the famous Battle Creek Sanitarium has been serving soy bean foods in many ways.

"7. Many manufacturers of soy bean foods are properly representing their foods to the public and are producing fine tasty foods.

"8. The public need not 'beware' of soy beans any more than they would beware of an excess of any other kind of protein food provided for our nourishment.

"In conclusion I wish to assure the reader that my acquaintance with soy beans covers many years, sixteen of which were spent in the Orient where I had a first-hand opportunity to observe soy beans as they were used in the diets of hundreds of millions of people and certainly if soy beans were such a dangerous food there would be little of the population of China and Japan left, considering that they have been using soy beans for thousands of years; however, instead today they are growing in numbers faster than Americans. I have been using soy bean foods for nearly twenty-five years and none of the symptoms which were so misleadingly presented to the reader are present in my body.

"The reader's attention is cited [called] to thousands of pages of scientific literature found in any large public or other library, in corroboration of the above stated facts."

Note: two different issues of this periodical are shown to be Volume 2, No. 3. the earlier of these two, which we have decided to call 2(3A) was published after Sept. 1939 (see last page) and before 15 Feb. 1940. We have estimated the publication date to be Jan. 1940. the second of these two, which we have decided to call 2(3B) was published after March 1940 (see 1st page). We have estimated the publication date to be April. 1940–3 months later. Address: PhD, Head of Chemistry Dep., Madison College.

3571. Ozouf, René. 1940. Le soja [The soybean]. *Journal des Instituteurs et des Institutrices* (*France*) 86(12):47. March 2. [2 ref. Fre]*

• ***Summary:*** This article appears in the section of this issue titled "Partie Scolaire," in the subsection titled "Pour les Grandes et les Adultes." Contents: Introduction. Its cultivation (one of the oldest cultivated plants in the world, widely cultivated for ages in East Asia (especially Manchuria)), it is an annual, which prefers temperate climates, there are more than 1,200 varieties, cultivated in the Corn Belt of the USA, and in Korea, Japan, Java, the USSR, Romania, Hungary, Bulgaria, Yugoslavia, and France (but yields here are low).

Its utilization: The bacteria in the nodules on its roots are a source of nitrogen fertilizer. It can be used as a green forage crop, like lucern / alfalfa. If this is dried, it can be made into hay or silage. Pigs can be raised on soybean pasture in the open air. It is much appreciated as a green manure. Because the seeds are rich in nitrogen, protein and oil, it is utilized in the form of beans or of oilseed presscake for the feeding of all farm animals. It also has many uses as an industrial product. Above al, it is used as a source of oil and cake / meal.

The modern soybean utilization industry is most highly developed in Manchuria, where the principal centers are (in order of importance) Dairen, Harbin, Antung and Yingkou (W.-G. Ying-k'ou; formerly Newchwang or Niuchwang);

© Copyright Soyinfo Center 2014

in China, above all in Nanking and Shanghai; in Korea at Konan (in today's North Korea) and in the ports of Seishin (Ch'ongjin, Chongjin, in today's North Korea), and Rashin; in Japan at Kobe-Osaka and Tokyo-Yokohama; in Siberia, in the Russian Far East at Khabarovsk and Vladivostok.

In Europe, Germany is in first place in the various soy industries, and especially of oil, lecithin, and cakes. Hamburg and its surroundings are the leading center, followed by Bremen, Stettin [Szczecin, in Poland as of Jan. 2011], Berlin, etc. In the years immediately preceding the war of 1939, the Reich imported 40-50% of the soybeans produced in Manchuria. Hull is the principal soybean crushing center in England. Throughout Scandinavia the soybean is transformed into cake and margarine, as well as in the Netherlands and in Belgium. In France, two factories that make oil and lecithin are in operation near Arras and Lille.

In the United States soybean processing industries are developed everywhere, particularly in Chicago [Illinois] and Milwaukee [Wisconsin] and in the towns of Illinois and New York. Ford automobile factories use soybeans to make plastic accessories.

Soybean trade and commerce.

3572. Kajita, Toshiji; Inoue, Ryohei. Assignors to Showa Sangyo K.K., Yokohama, Japan. 1940. Process for manufacturing artificial fiber from protein contained in soya bean. *U.S. Patent* 2,192,194. March 5. 2 p. Application filed 8 Sept. 1937.
• ***Summary:*** "The invention relates to a process of manufacturing artificial fiber form protein contained in soya bean and consists in extracting the protein, with dilute alkaline solution, from the residue of the soya bean after the oil content has been extracted. The protein is then precipitated by adding acids or metallic salts thereof to said solution. The precipitate is washed with water, allowing a suitable amount of water to remain with the precipitate. Lecithin is added thereto and then the mixture is dissolved in alkaline solution. The resulting solution is then allowed to mature after which the solution thus obtained is spun into an acid bath which may contain suitable organic coagulation agents. The object of this invention is to obtain a fiber of remarkably increased tensile strength and to employ the lecithin as stabilizer."

Note 1. This process is very similar to that patented later by Robert Boyer, William Atkinson, and Charles Robinette, and assigned to the Ford Motor Company. The Boyer patent (U.S. Patent 2,377,854) was applied for on 7 June 1941, and issued on 12 June 1945. Address: Tokyo, Japan.

• ***Summary:*** Contents: List of 11 things that the future of the soybean as an important Illinois crop is dependent upon–according to G.L. Jordan, Dep. of Agricultural Economics, Univ. of Illinois. Where do we go from here in soybean production? Table 1–Annual production of soybeans in five leading countries from 1925-1939: USA, Manchuria, Chosen [Korea], Japan, Netherland India. Table 2–World production of soybeans in 1,000 bushels (excluding China) from 1925-1939, including percentage increase each year over 1925. These figures include, in addition to the countries shown in Table 1, Kwantung, Taiwan, USSR, Rumania, Bulgaria, Yugoslavia, and certain other small countries in Europe. U.S. soybean production as a percentage of world production. Why this rapid increase in U.S. soybean production? Rapid increase in U.S. soybean production during the past 6 years. Research leads the way: List of typical research projects at larger corn belt agricultural experiment stations.

Extracts from letters on the future of soybeans in Illinois from thoughtful observers: H.G. Atwood, Allied Mills, Inc., 26 Dec. 1939. G.G. McIlroy, President, American Soybean Association, 7 Dec. 1939. W.J. O'Brien, The Glidden Co., 8 Dec. 1939. N.P. Noble, Swift and Company Soybean Mill, 8 Dec. 1939 (Swift has now built soybean mills at Cairo, Illinois; Des Moines, Iowa; and Fostoria, Ohio. Swift is using larger quantities of soybean oil in their various products). Edward J. Dies, National Soybean Processors Assn., 14 Dec. 1939. D.F. Christy, Acting Director, USDA Office of Foreign Agricultural Relations, 17 Feb. 1940. E.F. Johnson, Ralston-Purina Company, 21 Dec. 1939. H.P. Rusk, Dean and Director, Illinois Experiment Station, 22 May 1940. J.W. Hayward, Archer-Daniels-Midland Company, 24 May 1940.

Growth in the number of soybean crushing mills in the USA from about 10 in 1925 to approximately 75 in 1939. Increase in soybean yields in Illinois from 13.5 bushels/acre in 1925 to 24.5 bushels/acre in 1939. Growing industrial utilization of soybeans. Conclusion: "The importance of soybeans to American agriculture is bound to be of greater significance as the years go by."

Concerning research: "Our research program on soybeans in this country is nothing less than remarkable. In 1937 a list of soybean projects was published by H.M. Steece, Specialist in Agronomy, Office of Experiment Stations, U.S. Department of Agriculture." In 1937 some 53 agricultural experiment stations were conducting 258 separate investigations on soybeans. "By far the largest number of these have to do with the varieties and methods of production." A photo (p. 29) shows a tractor pulling a combine harvesting soybeans in Indiana.

Note: This is the earliest English-language document seen (March 2003) that uses the term "soybean research" (see subtitle) to refer to research on soybean production. Address: Head, Dep. of Agronomy, Univ. of Illinois.

3582. D.P. 1940. Le soja. Note complémentaire sur son utilisation dans l'industrie des fibres artificielles [The soybean: A note on its use in the artificial fiber industry]. *Revue Internationale des Produits Coloniaux et du Materiel Colonial* 15(173-76):105-06. May/Aug. [1 ref. Fre]
• ***Summary:*** Soybeans can be used to make cellulose and rayon. R. Inouye in Japan has patented a process.

3583. Morse, W.J. 1940. Soybeans around the world. *Proceedings of the American Soybean Association* p. 72-74. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan.
• ***Summary:*** The areas where soybean production has recently increased are the East Indies, Rumania, Austria, Bulgaria, Czechoslovakia, and Yugoslavia. "Soybean production in the Danube Basin in 1939 amounted to approximately 5 million bushels. The acreage in Bulgaria, Hungary, Rumania, and Yugoslavia increased more than 60% in 1940, this being attributed to the activities of two German companies which distributed selected seed and inoculation culture, and contracted in advance for taking the entire production at increased prices. The Greek government planned extensive cultivation of soybeans in 1940, providing for importation of seed, requiring compulsory cultivation of the crop, and the purchase of the entire crop from farmers at remunerative prices."

The increase in production has been largely due to the development of adapted soybean types through introduction, selection, and hybridization. "Soybean breeding programs have been carried on extensively in Germany, Russia, Netherland Indies, Rumania, Japan, Manchuria, South Africa, Canada, and some of the Balkan countries, and to a lesser extent in Sweden, England, Holland, France, Italy, Poland, Australia, India, and the Philippines."

"The outbreak of hostilities in Europe and the resulting interference with the flow of Manchurian soybeans into European markets brought about a rather critical situation to the producers in that part of the Orient. Moreover, Manchurian authorities on November 1, 1939, set up a soybean monopoly whereby the government purchases all soybeans for sale, fixes the price, and makes all export sales... Soybean exports from Manchuria for the first 8 months of the 1939-40 marketing year amounted to

© Copyright Soyinfo Center 2014

approximately 24 million bushels as compared with 59 million bushels for the corresponding period last season. Exports to Europe during the 8 months of this season were estimated at about 4 million bushels as compared with actual exports of 32 million bushels for the same months in 1938-39. About one million bushels were exported this year to Germany via Trans-Siberian Railway, and over 2.5 million bushels to Europe by sea, a major portion of which went to Italy.

"With practical cessation of direct shipments to European countries, Japanese and Manchurian officials began concentrating on the development of new industrial outlets for soybeans. The process of making usable protein from soybean material as a substitute for imported milk casein has been widely studied by government and industrial agencies in Manchuria and Japan. At present the principal ways in which soybean protein is substituting for milk casein are as glue for wooden articles, furniture, veneer, plywood, etc., paper sizing, as the adhesive element in insecticides and water paints, and as material for artificial wool and plastics. In 1938 more than 22 million pounds of soybean glue were used. A few Japanese companies have industrialized the manufacture of protein on rather an extensive scale. In Japan only one firm is reported to be producing soybean plastics, and these are not entirely satisfactory. Soybean fiber, or casein fiber as it is known in Japanese trade circles, is manufactured exclusively by one concern which sells its products to a spinning firm for making into yarn and cloth. The present capacity of the factory is about 22,000 pounds per day although actual daily production is said to be only about 13,000 pounds. The fiber known as 'Silkool' has not yet been exported. The domestic prices range from 33 to 35 cents per pound.

"A sample of 'Soyalex' recently received from Japan was said to contain not less than 60% pure lecithin. This new soybean product may be used in making butter, chocolate, for dressing of leather, making of shoe polishes and toilet foods such as face creams and soaps, for cooking, making noodles and macaroni, and in the preparation of valuable chemicals."

A portrait photo shows W.J. Morse.

Note 1. This is the earliest document seen (Jan. 2000) concerning the cultivation of soybeans in Sweden.

Note 2. This is the earliest English-language document seen (Dec. 2004) that uses the term "soybean fiber" to refer to spun soy protein fiber used like a textile fiber. Address: USDA Bureau of Plant Industry, Washington, DC.

3584. A.C. 1940. La culture de la fève soja [Cultivation of the soybean]. *Croix* (*La*) (*Paris*). Sept. 7. p. 2, col. 2. [Fre]
• ***Summary:*** Would this not be the moment to introduce into France the cultivation of this Oriental legume?

For 5,000 years the soybean has constituted a substantial prepared dish for the Chinese, and for the last 30 years its renown has become international. It has been exported in bulk and in sacks from all the ports of Manchuria and mainly from Dairen, the terminus of the "South Manchuria Railway." Among the farm products sent from Manchuria, whose value is about $500 million a year, the soybean occupies by far the first place.

The Japanese are also interested in this crop. Millions of immigrants from the provinces of Shantung and Zhili (Chili, Chihli; dissolved in 1928) come to harvest it.

In their laboratories at Dairen, Japanese chemists have discovered numerous ways of utilizing the soybean: not only for feeding man and beast, but it can also be used for making soap, cheese [tofu], varnish and paints, ink for printing, enamel, linoleum, explosives and motor fuels, and lubricants. It is made into bread; the flour is used in Italy for macaroni as well as for biscuits. An exquisite table oil is extracted from the soybean. Some flavors in a bowl of soup give the aroma and the taste if true bouillon. Japan must nourish a constantly increasing population with the products of its old, exhausted fields. The waste products from the soybeans [i.e., from pressing out the oil], pressed into large cakes, make an excellent fertilizer and contribute largely to the solution of the problem. The Japanese continue their research into obtaining a more abundant harvest and improving the soybean oil.

I believe that the soybean is cultivated in Ireland. Why is the cultivation of this modern manna not introduced into France?

Note: Amazing that by Sept. 1940 the writer is unaware of all the work since 1855 to introduce the soybean to France!

3585. Noda Shoyu K.K. 1940. Noda Shôyu K.K. Nijûnen-shi [Twenty-year history of Noda Shoyu, Inc.]. Noda, Japan: Noda Shoyu K.K. 733 p. Illust. No index. 22 cm. [Jap]
• ***Summary:*** This is the earliest known major history of Kikkoman, written largely by Mr. Morio Ichiyama. Contents: Preface. 1. History: Before the establishment of Noda Shoyu K.K. (The origin and its changes {Thoughts on its origin, Tokugawa period, Meiji period, beginning of the Taisho period}, development of shoyu industry and the town of Noda, Noda Shoyu Jozo Kumiai, family trees and family traditions of the Mogi, Takanashi, Horikiri, and Ishikawa families, virtues of the family), foundation of Noda Shoyu K.K. {the opportunity to unite, the establishment of a joint undertaking}, 20 years after the establishment. 2. Organization and management. 3. Plants (17): Korea, Jinsen?, Keijo plants. 4. Fermentation process: Special products (mirin, miso, sauce), testing center. 5. Business. 6. Cultural welfare facilities. 7. Connected enterprises: K.K. Noda Shoyu Ginko, Sobu Tetsudo K.K., Noda Transportation K.K., Gomei Company Senshukai, Foundational Juridical Perdon Kofukai, Manchuria Noda Shoyu K.K., Choshi Shoyu K.K.

Appendixes. Timeline / time table / chronology: Ranking of capital investments of shoyu producing companies in Japan, graph of yearly shoyu production in Japan, sales of shoyu, mirin, and miso by the company, sales of the company's shoyu comparing by area and also container, the company's shoyu exporting map, average sales of the company's shoyu, prices of raw materials of shoyu production, prices of shoyu in different type containers.

Pages 461-65 give an introduction to and description of each of the major brands produced by companies presently in the Noda Shoyu group. Under the Kikkoman brand, we learn that the producer of this brand of shoyu is the Saheiji MOGI family. It is said that the logo was designed by Manpei SARANUMA. It is said that the meaning and origin of the brand is as follows. The first "big army of God" in Japan was honored at a place named *Shimousa no Kuni, Kikkô mountain* (*Kikkô-zan*), *Katori Shrine* (*Jingu*). The name of the mountain, Kikkô, was used in the brand. The tortoise (*kamé*) symbolizes long life and is thus a symbol of happiness. It is said that a tortoise lives for 10,000 [*ichi-man*] years. The grace with the tortoise is born shows high-class dignity with supernatural power.

Pages 466-480 show all of the shoyu brands (including minor ones) produced by companies in the Noda Shoyu group. For each brand, the name, year of introduction, quality rank, and area where sold are given. Early brands, those introduced before the start of the Meiji period (1868), are read from top to bottom, right to left.

The Saheiji MOGI line produced a total of 15 shoyu brands. The earliest was introduced in 1784. Early brands were: Kikkôman (Tenmei 2 = 1784), Kikkôdai (Tenmei 2 = 1784), Azumaichi (Tenmei 2 = 1784), Yamataika (Tenmei 2 = 1784).

The Shichirouemon MOGI line produced a total of 58 shoyu brands. The earliest was introduced in 1772. Early brands were: Kihaku (Anei 1 = 1772), Kagikashiwa (Anei 1 = 1772), Fujikashiwa (Anei 1 = 1772), Shôchikuba (Anei 1 = 1772), Kikkôkashiwa (Tenmei period = 1781-89), Hôzan (Kaei 2 = 1849).

The Shichizaemon MOGI line produced a total of 30 shoyu brands. The earliest was introduced in 1830. Early brands were: Kushigata (Tenpo 1 = 1830).

The Hyôzaemon TAKANASHI line produced a total of 39 shoyu brands. The earliest was introduced in 1772. Early brands were: Jôjû (Anei 1 = 1772), Betatakara (Anei 1 = 1772), Tachitakara (Anei 1 = 1772), Jigamisakari (Anei 1 = 1772), Fundonokina (Genji 1 = 1864), Fujitakara (Kaei 2 = 1849).

The Fusagoro MOGI line produced a total of 48 shoyu brands. The earliest was introduced in 1753. Early brands were: Minakami (Ansei 2 = 1855), Fujimasa (Hôreki 3 = 1753).

© Copyright Soyinfo Center 2014

The Noda Shoyu Goshi Gaisha produced a total of 13 shoyu brands, the Keizaburo MOGI line produced a total of 7 shoyu brands, the Monjiro HORIKIRI line and the Kanzaemon YOSHIDA line each produced one brand, and the Nihon Shoyu K.K. produced 2 brands, but all were introduced after the start of the Meiji period (1868).

A section on exports (p. 650-) notes that it is not clear when direct exports of shoyu from Japan to the western world began, but at some time during the Bunsei (1818-1830) or Tempô (1830-1844) periods it was shipped to Holland along with other goods. In 1854 (at the start of the Ansei period, 1854-1860) an American ship came to Japan and during the stay they bought some Japanese shoyu. Also during this same Ansei period it is said that special shoyu was made for export. Made by Sairinko SHIMAZU, it was bottled and shipped via Holland House (Oranda Yashiki) in Nagasaki.

Contains many photos and illustrations. Two of these, on unnumbered pages near the front of the book, are of special interest: (1) MOGI Shichirouemon (lived 1860-1929) was the first president and CEO (*shodai torishimaru shacho*) of Noda Shoyu Inc., which began operations on 1 Jan. 1918 and was the forerunner of today's Kikkoman. An inspiring tribute and eulogy to him appears in: Fruin, W. Mark. 1983. *Kikkoman: Company, Clan, and Community* (Harvard University Press, see p. 129-54). In 1889 he assumed headship of the Kashiwa family branch, then became the most influential director of the Noda cartel. After 1900 he was probably the most widely known and respected shoyu maker in Japan.

(2) MOGI Saheji was the first senior executive manager (*jomu torishimaruyaku*) of Noda Shoyu Inc. Saheji succeeded Shichirouemon as president of Noda Shoyu Inc. Saheiji is the name of a *bunke* or branch family. Anyone born or adopted into the family takes the name. So at one time this Saheiji was the head of a branch family of the Mogi clan that had among its brands, the Kikkoman brand.

Note 1. Fruin (1983, p. 302-03) further clarifies the relationships: Since the establishment of Noda Shoyu, Inc. "in 1918, kinship has been employed not for interfamily cooperation but for interfamily rivalry. Household membership has become all-important in determining access to the upper reaches of corporate power. Consider the following statistics... Of the twenty-eight main and branch households in the three Mogi, Takanashi, and Horikiri *dôzoku* (see figure A-1),... the percentage of households" by lineage that engage in shoyu manufacture is as follows: "Horikiri, 13; Takanashi, 50; Mogi, 53." But "within the overall Mogi clan one main and two branch households contend. The importance of the subdivisions within the Mogi clan is revealed by the fact that, although eight of the company presidents to date have been Mogis, within the greater Mogi lineage 63 percent of the company presidents can be traced to the Kashiwa branch household of Mogi Shichirouemon, 25 percent from the Mogi-sa group of Mogi Saheiji, and only 12 percent from the main house of Mogi Shichizaemon. Household hegemony was reflected as well on the first board of directors, with 67, 22, and 11 percent representation for the households of Mogi Shichiroeumon, Saheiji, and Shichizaemon respectively."

Note 2. A *dôzoku* is a lineage or clan composed of several stem families or descent groups, called *ie* (Fruin, p. 343, Glossary). Address: Noda, Japan.

3586. *Ohio Farmer.* 1940. Now its soybean milk! This and other foods produced by new Ohio plant. 186(11):10. Nov. 30. Whole No. 4606.

• ***Summary:*** About the work of Dr. Harry W. Miller (of Ohio and China) with soymilk. Today, because of the Japanese invasion of Shanghai, there now stands in Mt. Vernon, Ohio, a plant producing soybean milk, powder, and a number of products from the edible soybean. The head of this company, International Nutrition Laboratory, is Dr. H.W. Miller, who was born in Miami County, Ohio, and educated as a surgeon. For many years he was head surgeon in an American mission hospital in China. During this time he saw the need for milk and other dairy products in China; they were unavailable to most people due to the high cost and short supply. So he and his associates started a plant in Shanghai for the production of soybean milk. In 1937, at the time of the Japanese invasion, they had 15 delivery boys going out each day on bicycles to deliver the soybean milk to thousands of customers.

When Japanese bombs destroyed the plant in 1937, Dr. Miller decided to relocate near Mt. Vernon, in Knox County, Ohio. He and his sons built the plant, and also designed and built much of the equipment in it. According to Dr. Miller, soybean milk "is more quickly assimilated by the body than animal milk, it gives a quick recovery from exhaustion and fatigue, and is especially desirable as a food for infants and invalids. The liquid and powdered soybean milk produced in this plant is sold to doctors and hospitals all over the United States..." The steps in the process are described. They also make Mien Jing, based on wheat gluten, to which are added fresh vegetables and soya sauce to make a nutritious food with a meat-like flavor.

"During the past summer this plant also packed a quantity of edible soybeans. These were canned, both as green beans, and dried beans with tomato sauce added. Another product is a soybean flour..."

Some of the edible soybeans used in this plant were grown on the farm run by Dr. Miller near Mt. Vernon and by farmers in the neighborhood. However it has been necessary to import a large portion of the soybeans from other states.

Dr. Miller's organization is presently establishing another plant for the production of soybean milk in the Philippines. Moreover, 2,000 pounds of powdered soybean milk were recently shipped to China from Mt. Vernon.

3589. Rabbit, James A. 1940. Rice in the cultural life of the Japanese people. *Transactions of the Asiatic Society of Japan* 19:187-257. Dec. Series 2. Plus 6 pages of unnumbered plates at end. A lecture delivered before the Asiatic Society of Japan, Nov. 1939. [33 ref]
• ***Summary:*** This is an in-depth article by an expert on the subject. Contents: Foreword. The sacredness of rice. The honorable rice throughout the year. Rice in Japanese literature. Rice and religion. Socio-economic influences.

Page 243: "Intercourse with foreign countries, limited as it was from the 16th to the middle of the 19th centuries, has not been without its influence on the national cookery, as is evidenced by the introduction of such exotic foods as *sukiyaki* or *gyûnabe* (beef and vegetables fried in a flat pan with *shôyu* sauce), *torinabe* (fowl and vegetables fried in a flat pan with *shôyu* sauce), tempura (fried in batter) and many other dishes which are still considered to be almost a part of the Japanese menu, particularly in the thousands of eating houses of the metropolitan cities."

Page 244: "The trinity which constitutes the bulk of Japanese daily fare consists of rice, *miso* (bean paste) [sic, soup], and *tsukemono* (pickled vegetables cured with salt or a mixture of rice bran and salt)."

On p. 245 is an interesting discussion of *genmai* (uncleaned rice [brown rice]). "This *genmai* with a generous mixture of wheat was for a long time the staple food among farmers... Although the superior nourishment of *genmai* is well known at the present time and has received much publicity, those who favor its universal adoption are looked upon as faddists, similar to the attitude toward vegetarians in western lands."

Page 255: In Japan there a huge variety of places to eat, "which range from a street stall selling soba (hot buckwheat noodles covered with soy [sauce] with a sprinkling of green onions) to the semi-private club-like *machiai* (waiting house)...

Pages 256-57 discuss the origins, history, and present status of sushi. Today there are an estimated 1,500 to 1,600 sushi shops in Tokyo alone; in addition to these about 500 small stalls appear each night. Describes the arts of making and eating sushi. "After dipping it into a dish of *shôyu* (soya bean sauce), place the dripping sushi into your *kuchi* (mouth) without the loss of one drop of sauce and in such a manner that the fish side comes in contact with the tongue before the rice." Address: Japan.

• ***Summary:*** The Preface indicates that this book was published in about Oct. 1940. The editor's name is not given.

Page 424. "Leguminous plants: Area of leguminous plants in 1938 was 589,167 cho and the production was valued at ¥96,820,990. During the past decade the area planted has been pursuing a slow downward movement. Soya-beans and azuki (red) beans are predominant both in area and production." In 1938

Soy-beans were planted on 329,674 cho which produced 2.700 million koku worth 51,119,383 yen.

Azuki beans were planted on 102,997 cho which produced 0.677 million koku worth 16,800,777 yen.

Pages 955-56. Two large tables show "Cultivated area and production of cereals" (in hectares and metric tons), 1934-1938. For soya beans:

3.889 million metric tons in 1935
4.175 million metric tons in 1936
4.173 million metric tons in 1937
4.185 million metric tons in 1938
4.050 million metric tons in 1939

Other crops in the table are other legumes, kaoliang, millet, maize, wheat paddy-field rice, upland rice, and other cereals.

3603. Japan-Manchoukuo Year Book. 1940. Tokyo, Japan: Japan-Manchoukuo Year Book Co. Index. 26 cm. Seventh annual issue. [Eng]
• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. This book was published in late 1939.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year.

Page 290-91. In the chapter on "Agriculture and stockbreeding" in Japan, Table 19 shows "Production of various grains, potatoes, etc." in koku from 1927 to 1938. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya bean:

2.700 million koku in 1938

Table 19B gives the value of each crops (in yen) from 1927 to 1938. Other crops in this table are oats, millet, barnyard millet, proso millet, maize, buckwheat, red bean, sweet potato, and Irish potato.

Page 391. In the chapter on "Chemical industry" Table 3 shows the "Production of chemical fertilizers" (in metric tons) from 1926 to 1937. The quantity (in metric tons) and value (in yen) of each is given. These fertilizers are: Sulphate of ammonia [ammonium sulfate], calcium cyanamide, superphosphate of lime, and muriate of potash [potassium chloride].

Table 5, "Imports of commercial fertilizers" from 1931 to 1938 include "Bean-oil cake," the imports of which steadily decreased from 1.032 million metric tons in 1931 to 0.623 million metric tons in 1938.

Page 403. In the same chapter Table 38 shows "Vegetable oil production" with quantity in metric tons and value in yen, from 1930 to 1937. Soya bean oil production increased from 36,977 metric tons (mt) in 1930 to 65,455 metric tons in 1937–making it the leading vegetable oil produced in Japan. The other leading vegetable oils made in Japan in 1937 were:

Rapeseed 28,893 metric tons
Perilla 23,206 metric tons
Cottonseed 23,154 metric tons
Coconut 16,112 metric tons
Peanut 7,648 metric tons
Sesamum [Sesame] 6,653 metric tons
Linseed 4,254 metric tons
Hempseed 329 metric tons

Paulownia 76 metric tons

On the same page, Table 39 shows exports and imports of vegetable oils from 1933 to 1938. Exports of soya bean oil decreased from 2.242 million kin in 1933 (1 kin = 0.6 kg) to 1.795 million kin in 1938. Imports of soya bean oil increased from 128,000 kin in 1933 to 321,000 kin in 1938. The three main vegetable oils imported into Japan in 1937 were cottonseed oil (10.324 million kin), coconut oil (2.400 million kin), and paulownia oil (1.439 million kin).

Page 444, in the chapter on "Commerce," Table 13 shows the "Average wholesale price of staple commodities in Tokyo" in yen per koku, average December each year from 1934 to 1938. The brand of soya beans was "Manchu White." The price dropped from a high of 19.37 yen in 1936 to a low of 7.70 yen in 1937.

Page 454, in the chapter on "Foreign Trade," a table shows trade of "Oil cake" from 1927 to 1938.

Pages 470-71 in the same chapter contain a very large table titled "Imports by countries of origin" in yen from 1937 to 1938. Categories include "Beans & Peas," "Oil yielding materials" and "Oil cake." For each of the three categories, Manchoukuo is the main country of origin, followed by Kwantung Province, then China, then British India, then D.E.I. [Dutch East Indies].

Page 714, in the chapter on "Agriculture" in Manchoukuo, a large table shows "Output of principal of crops (metric tons)" from 1924 to 1938. For soya beans: 4.612 million metric tons in 1938.

The other principal crops shown in the tables are other beans, kaoliang, millet, maize, wheat, rice, upland rice, and other cereals.

Page 715. The text about "Soya beans" is repeated on this page.

Page 739, in the chapter on "Commerce," Table 12 shows "Wholesale prices of principal staple commodities in Hsinking [Changchun, in Jilin province] from 1934 to July 1939 in M¥ [million? yen]. The price of 1st grade soya beans went from 3.36 per 100 kin in 1934 to 7.76 per 100 kin in July 1939. That of bean cake rose from 0.90 per piece in 1934 to 2.68 in July 1938. The wholesale price of bean oil increased from 10.50 per kin in 1934 to 20.88 per kin in July 1939.

Page 779-80, in the chapter on "Manufacturing industries," has a long section "IV. Bean oil & cake." The four principal cities of manufacturing in Manchoukuo are Dairen, Yingkow, Antung, and Harbin. Table 22 shows "Output of bean oil at the principal cities" in 1,000 kin [1 kin = 0.6 kg] from 1932 to 1938. The leading city by far was Dairen. The total bean oil produced decreased at the four centers decreased from 221.061 million kin in 1932 to 97.255 million kin in 1938.

The text below this table states (p. 779-80): "At first the main business of the industry was the extracting of linseed oil. The primitive linseed oil extraction method was applied to soya beans in Tiehling and Changchun (present Hsinking) districts, important market of beans, some sixty years ago. As the result obtained was satisfactory, the bean oil industry commenced. At that time, the bean oil was directed for local consumption alone, and was used for cooking, lighting, and other domestic purposes.

"The original method of pressing oil out of beans was very simple and primitive, only hand or mule operated wedge or screw system being used. But with the rapid progress made in the utilization of bean oil and the increased demands abroad, the method of oil extraction was improved. Hydraulic power came to be used in place of human labour or mule power, in operating the presses. Then a more scientific method of extraction by means of chemical solvents was discovered by the Central Laboratory of the South Manchuria Railway Company. Under this new extraction method, benzine, benzol or alcohol is used to extract and dissolve oil contained in beans.

"Uses of Bean Oil.–The uses of soya bean oil have increased markedly in the last three decades. At present they are used for such diversified purposes as the manufacture of soap, as a lard and butter substitute, as a constituent of paint, varnish and shellac, glycerine, water proofing, and as substitutes for rubber and petroleum.

"Bean Cake.–Soya bean cake is used for various purposes, the principal uses being fertilizer and animal feed, while with further processing it is manufactured into a celluloid substitute, medicine, sizing for paper-making and for Ajinomoto. It is also used extensively for the manufacturing of sauce material, bean flour and shoyu and miso.

Below this (p. 780) is a large Table 23 "Output of bean cake in the principal cities" from 1932 to 1937 in 1,000 pieces (1 piece weighs 27.6 kg). Again, Dairen is by far the leading city. The total decreased from 44.744 million pieces in 1932 to 20.585 million pieces in 1938.

Below this (p. 780) is a large Table 24 "Number of bean-cake mills and productive capacity" in major South and North Manchuria [customs] districts from 1923 to 1937.

Page 782. In the same chapter, Table 29. "Production, etc. of soy and miso (bean paste) in Kwantung" gives values from 1931 to 1937. The number of plants increased from 16 in 1931 to 22 in 1937. The volume of miso increased from 646,691 kwan in 1931 to 1,485,739 kwan in 1936. The volume of soy sauce increased from 20,950 koku in 1931 to 116,734 koku in 1936.

Above this table is a brief section on "Soy" sauce: "In sympathy with the rapidly increasing number of Japanese residents since the foundation of the country, the soy industry has made marked developments. The output of soy was 44,253 koku in 1937. Imports of soy were valued at ¥1,564,000 in 1938."

Page 798. In the chapter on "Foreign trade" we read: "Soya beans constituted in 1938 the most important export

© Copyright Soyinfo Center 2014

article, representing 32% of the total export value, and 44% if other varieties of bens and derivatives are included. The most important customer for beans was Japan, followed by Egypt and Germany. In bean cakes and oil, Japanese imports concentrated on cake whilst European countries such as Germany, the Netherlands, and Great Britain mostly bought oil."

On the same page (p. 798) Table 4, "Volume of principal articles imported and exported" from 1934 to 1938 gives values for soya beans (decreased), bean cakes (decreased), and bean oil (decreased).

Page 800. In the same chapter, Table 6, "Exports of principal commodities" 1934-1938 by country of destination shows that the total increased from 160,349 million yen in 1934 to 234,363 million yen in 1938.

3611. Prescott, Samuel Cate; Dunn, Cecil Gordon. eds. 1940. Industrial microbiology. New York, NY: McGraw Hill Book Co. x + 541 p. Illust. Index. 23 cm. [53* ref]
• ***Summary:*** In Chapter 8, titled "Yeast: Its manufacture, vitamins, and uses," p. 155 states that soybeans, freed of bitter principles, sugar-beet juice, and various other substances have been proposed either to increase the yield of yeast or to act as the source of nutrient material (See Chrzaszcz and Janicki 1936).

Chapter 24 titled "The molds" (p. 339-57) discusses: Some important Aspergilli (members of the *Aspergillus flavus-oryzae,* especially strains of the *A. oryzae* series are of major industrial importance in the Orient [East Asia]). They are used to make sake, shoyu, miso, and *mizuame,* a sugar syrup made from rice (p. 350). Divisions of Penicillia (the genus Penicillium). The genus Rhizopus (used in the amylo process for converting starch to sugar by the use of selected molds–see p. 48-50). Mold enzymes. Apparatus for cultivating molds. References on molds (42).

Chapter 32 titled "Mold enzyme preparations: Uses and products" (p. 419-24), has the following contents: Introduction. Commercial amylase and its preparation. Koji and its preparation. Some mold products (in Japan): Soy sauce or shoyu, tamari, miso. The uses of mold enzymes (industrially): Amylases, invertase, proteases, and pectinase. The authors cite the industrial applications of members of the *Aspergillus flavus-oryzæ* group especially strains of *Aspergillus oryzæ.* Commercial amylase or diastase is marketed under a variety of trade names such as Taka-diastase, Kashiwagidiastase, Digestin, Polyzyme, Protozyme, and Oryzyme. These are generally mixtures of enzymes, however purified enzyme preparations (such as Taka-amylase) may be obtained.

Koji may also be used to make sake (rice wine) and shocho (distilled alcoholic liquor). "The use of *koji* in the United States was introduced by Takamine" (p. 420).
Address: Cambridge, Massachusetts.

3612. Sampaio, Sebastiao C. 1940. Soja [Soybeans]. Sao Paulo, Brazil: Tipografia Brasil, Rothschild Loureiro & Cia, Ltda. 43 p. Secretaria da Agricultura, Industria e Comercio

© Copyright Soyinfo Center 2014

do Estado de Sao Paulo. [20 ref. Por]
• ***Summary:*** Contents: Introduction: Soya. Botanical description. Varieties. Composition of the plant. Culture/ cultivation. Enemies and pests. Improvement of the seeds: Improving the oil (*óleo dos graos de soja*), improving the cake and flour, other improvements. Commerce and trade.

This general book draws heavily on U.S. publications, including Piper and Morse, 1923. The section titled "other improvements" (p. 38-39) briefly mentions many food uses of soybeans, including vegetable-type soybeans (Easycook and Hahto), green vegetable soybeans (*Quando verdes... elas constituem ótimo legume verde = when green... they constitute an excellent green vegetable*), sprouted seeds (*sementes germinadas*), soy flour, soymilk (*leite de soja*), soy casein, soy cheese (*queijos e requeijoes*) [tofu], shoyu, and miso. The Japanese colony in Sao Paulo makes shoyu in commercial quantities.

Note 1. This is the earliest Portuguese-language document seen (June 2009) that mentions green vegetable soybeans, which it describes as shown above.

Note 2. This is the earliest Portuguese-language document seen (Sept. 2006) that uses the term *óleo dos graos de soja* to refer to soybean oil.

Note 3. This is the earliest Portuguese-language document seen (Jan. 2013) that mentions sprouted soybeans, which it calls *sementes germinadas.*

Note 4. This is the earliest Portuguese-language document seen (April 2013) that uses the term *queijos e requeijoes* to refer to tofu. Address: 3a Seccao Tecnica do Departamento do Fomento da Producao Vegetal, Sao Paulo, Brazil.

3613. Saris, John. 1940. The first voiage of the English to the islands of Iapan... Tokyo: Toyo Bunko. [123 p.] 31 cm. Facsimile of the original ms. in the Toyo Bunko, Tokyo.
• ***Summary:*** This is a facsimile reprint of Saris' handwritten log. On 29 Aug. 1613, while in Japan (near Shizuoka), Saris wrote (Toyo Bunko transcription): "Of Henns they haue greate store, as likewise of Deere, both redd and fallowe wilde bores, hares Goates Kyne etc. Of theese they haue plentie, butter they make none, Neither will they eate any Milke, because theie hould it to be as bloode, nor tame beasts."

Note 1. The word transcribed from the original manuscript as "Cheese" by Satow in 1900 is transcribed here by the Japanese as "theese." To us the word looks more like "theese," but we are not sure.

Note 2. John Saris died in 1646.

3614. Soybean collection at the N.I. Vavilov All-Russian Research Institute of Plant Industry (VIR) based on the log book of 1940. 1940.
• ***Summary:*** This list of soybean accessions at the VIR (St. Petersburg, Russia) in 1940 was sent by Irina Seferova, Soybean Collection Curator at the VIR. Based on that year's log book, it shows that the VIR had 4,014 accessions of various types (landrace, breeder resource, primitive line, advanced Cultivar, and a few wild forms) which are not individually designated. These come from 35 different countries, regions, etc. as follows: Africa 1. Africa, Congo 2. Africa, South Africa 6. Austria 1. Canada 14. Caucasus, Abkhazia (USSR) 21. Caucasus, Georgia (USSR) 31. Caucasus, North Caucasus (USSR) 9. Central Asia (USSR) 5. Ceylon (Sri Lanka) 2.

China 2,347.

China, Manchuria, Experimental Station Echo 547. Cuba 1. France 9. Germany 11. Guatemala 2. Hungary 4. India 37. Iran 1. Ireland 1. Italy 7.

Japan 171. Korea 49. Latvia 2. Lithuania 6. Mexico 1. Netherlands 1. Poland 4. Russia, European part (USSR) 29.

Russia, Far Eastern Region (USSR) 421. Russia, Siberia (USSR) 13. Ukraine (USSR) 14.

USA 233. Uzbekistan (USSR) 9. West Asia 3.

Total 4,014.

A separate table sent by Irena on 30 Nov. 2010 shows 13 major collections of soybeans, They are ranked on the table by number of soybean accessions. All of the entries are dated and some have multiple dates. Moreover, it is not clear whether that soybeans were collected during an expedition or whether they were sent to VIR for some reason. We will assume an expedition only when its leader is named.

(1) 1,859 accessions from Experimental Station Echo, Manchuria (China), Donor: A.D. Woeikoff [Aleksandr Dmitrievich Voeikov (1879-1944)- LC transliteration]. Years: 1923, 1929, 1931.

Note: According to a USDA periodical in March 1926, Woeikoff was director, Experimental Station, Echo" at "Tiehlingho, Kirin Province, Manchuria." This "Experimental Station. Echo" in Manchuria was operated by the old Chinese Eastern Railway.

(2) 529 accessions from Echo Experimental Station, Manchuria (China). Years: 1923, 1924, 1927, 1928, 1929, 1932.

(3) 232 accessions. VIR Expedition to Far East Region (USSR), led by Trofim Jakolevich Zarubajlo [Trofim IAkolevich Zarubailo] (born 1906). Year: 1932. Note: A post-graduate student of the VIR in 1932, he then became an employee of the VIR and was the leading expert in the genetics of cereal crops.

(4) 194 accessions. VIR Expedition to USA, led by D.N. Borodin, Head of the Division, Dep. of Applied Botany and Plant Breeding. Accessions from USA, Japan, China, Korea, and Russia. Years: 1921, 1922, 1923, 1924, 1925, 1926, 1928.

(5) 171 accessions. from Manchuria, Agronomical Department of the Chinese Eastern Railway, Vrachinskij [Vrachinskii]. Year: 1929. Vrachinskij is the family name of a person. Nothing more about him is known.

© Copyright Soyinfo Center 2014

(6) 79 accessions. VIR Expedition to Japan led by Evgenija Nikolaevna Sinskaja [Eveniia Nikolaevna Sinskaia–LC transliteration] (Sinskaya). Year: 1928. Note: An employee of the VIR, Sinskaya (a woman) was one of the most talented botanists and plant breeders in Russia. She created her own scientific schools. An exceptional field researcher, experimenter and theorist, botanist, geographer, ethnobotanist, and environmentalist, Evgenia Nikolaevna was not only a good friend and active adherent of N.I. Vavilov, who selflessly helped him in carrying out his scientific and institutional programs, but she was also an outstanding follower, playing a significant role in the development of his ideas and concepts.

(7) 74 accessions from Manchuria Agricultural Society, China. Year: 1925, 1926.

(8) 66 accessions. VIR Expedition to Far East Region (USSR), led by M. Tchenkova. Year: 1929.

(9) 62 accessions from the Moscow Agricultural Exhibition, Russia. These accessions came from Russia, Ukraine, Caucasus, Central Asia. Year: 1923.

(10) 87 accessions. Expeditions to Italy (1927), China, Japan, and Korea (1929) led by N.I. Vavilov (See separate record for 1929).

(11) Other, 661 accessions (1921-1940).

Photos show: (1) E.N. Sinskaja / Sinskaia (1889-1965).

(2) Trofim Jakelovich Zarubajlo / Zarubailo (born 1906).

Note: "Today, the N.I. Vavilov Institute of Plant Industry in St. Petersburg still maintains one of the world's largest collections of plant genetic material. The Institute began as the Bureau of Applied Botany in 1894, and was reorganized in 1924 into the All-Union Research Institute of Applied Botany and New Crops, and in 1930 into the Research Institute of Plant Industry. Vavilov was the head of the institute from 1921 to 1940. In 1968 the institute was renamed after him in time for its 75th anniversary" (Source: Wikipedia, at Nikolai Vavilov, Dec. 2010). The VIR celebrated its 100th anniversary in 1994–www.vir.nw.ru. Address: St. Petersburg, USSR.

3615. Zaibei Nihonjin Kai. 1940. Zaibei Nihonjin shi [History of Japanese in America]. 1619 Laguna St., San Francisco, California. [Jap; eng+]

• ***Summary:*** The section titled *"MUTO Yamaji no Shôyu-gyo"* (Yamaji Mutô's shoyu business) (p. 59) states that in 1887 Yamaji MUTO tried to sell Kikkoman shoyu in San Jose, California in beautiful pottery containers. Initially the venture was a success, but the product was purchased more for the container than for the shoyu. The container was used for a flower vase. Sales dropped rapidly after 1 month, and the venture soon failed. Address: San Francisco, California.

3616. **Product Name:** [Best Canned Maruta Misozuke Daikon (Giant White Japanese Radishes Pickled in Miso)].
Foreign Name: Maruta Misozuke Daikon.
Manufacturer's Name: Kawamura Yoheibei.
Manufacturer's Address: Honzaimoku-cho 3 chôme, Kyôbashi-ku, Tokyo-shi, Japan. Phone: Kyôbashi 1705..
Date of Introduction: 1940?
Ingredients: Daikon, miso.
New Product–Documentation: Photocopy of label (from canned product) sent to Soyfoods Center (in late 1981) by Esta Keirn, formerly of Oriental Show-You Company (Columbia City, Indiana). Undated. Characters are read from right to left. Maruta is a registered trademark. Supplier to the Imperial Army and Navy (*Kunaishô Riku Kaigun Goyôtatsu*). Makers of "Homare zuke" products that help you to live for 10,000 years (*Homare zuke seizô moto*).

3617. Deasy, George F. 1941. Geography of the United States soybean-oil industry. *J. of Geography* 40(1):1-7. Jan. [2 ref]

• ***Summary:*** Contents: Development of the United States soybean industry. Distribution of American soybean mills. Uses of soybean oil. Future of the United States bean soil industry,

Tables show: (1) "United States production of vegetable oils from domestic oil-yielding seeds." Cottonseed oil 1,678 million lb. Soybean oil 323 million lb. Linseed oil 157 million lb. Corn oil 137 million lb. Peanut oil 78 million lb. Olive oil 5 million lb. Tung oil 2 million lb. Thus, soybean oil ranks second only to cottonseed oil–but a distant second. The amount of soybean oil produced is only 19% as much as the amount of cottonseed oil.

(2) United States acreage and production of soybeans, 1924 to 1938. For even-numbered years gives: Total soybean acreage (increased from 1.78 million in 1924 to 7.79 million in 1938). Acreage harvested for soybeans (increased from 0.448 million to 2.898 million). Total production of soybeans (increased from 4.947 million bushels to 57.665 million). Soybeans crushed (increased from 0.307 million bushels to 48.886 million). Percent of total production crushed (increased from 6.2% in 1924 to 84.8% in 1938).

(3) Comparative conditions of the soybean industry in selected regions and states of the U.S., 1937. Defines and gives figures for 2 regions and 2 states: North-central states, southern states, Illinois, Mississippi. Gives for each: Percentage cut for hay, hogged off, and cut for beans. Yield of beans in bushels/acre. Total soybean production.

(4) U.S. factory consumption of soybean oil, 1938 (million pounds): Edible products: Shortening 137.133. Oleomargarine 39.885. Others 11.280. Inedible products: Paint and varnish 15.183. Soap 10.897. Linoleum and oilcloth 3.605. Miscellaneous products: Unclassified 5.399. Loss: (incl. foots) 14.046.

Bar charts show: (1) Estimated soybean production in leading countries, 1938: China, Manchukuo, United States, Chosen [Korea], Japan. (2) Estimated soybean production in leading U.S. states: Illinois, Indiana, Iowa, Ohio, North

© Copyright Soyinfo Center 2014

Carolina, Missouri, Others.

Maps show: (1) Total U.S. soybean acreage, 1934. Each dot represents 1,000 acres (2) Total U.S. soybean production, 1934. Each dot represents 5,000 bushels. (3) Location of soybean mills in the USA, Nov. 1939. Each dot represents a mill which processes soybeans, or is reported to be equipped or will be equipped for soybean crushing. Most of the mills are in the Midwest, or the central Atlantic seaboard. Address: Formerly Univ. of Cincinnati, Ohio.

3618. French Commercial Attache in Tokyo. 1941. L'extraction des derivés du soja [The extraction of soybean derivatives]. *Revue Internationale du Soja* 1(1):33-34. Feb. [Fre]
• ***Summary:*** Discusses the work of the South Manchuria Railway Co. with soybeans, including solvent extraction (especially that done by M. Sato using ethyl alcohol; The resulting meal is sold under the name Soya Rex [Soyalex?] Flakes), The Manchurian Soya Products Society (which is building a plant at Kawasaki, near Tokyo), The Society of Nitrogen Fertilizers, Ajinomoto, the Soya Bean Chemical Engineering Co., Hohnen, Nisshin, and Nikka. Address: Tokyo, Japan.

3619. Prat, D. de. 1941. Le soja: Matière adhésive et matière textile [Soy: Its use in adhesive and textile materials]. *Revue Internationale du Soja* 1(2):49-54. March. [Fre]
• ***Summary:*** Soy flour can be used to make adhesives by mixing it with gelatin, glue, or casein. Details are given on making textile materials, including treatment of soybean stalks to isolate the fibers, treatment of the pods, treatment of the residue of oil extraction (isolation of protein from soybean cake or meal, then spinning it into fibers). In America, the Ford Motor Company makes protein fibers from soy flour; they are condensed with formaldehyde. A process used in Japan by Nihan [sic, Nihon] Kary Kogyo Kabushiki Kaisha is described. The cakes are first washed with a warm dilute (5-10%) alkaline solution at 20-30ºC for 2-5 hours. The proteins extracted (10-20%) are then precipitated by the addition of acids or of metallic salts (acetic, sulphuric, or phosphoric acid) to this alkaline solution. The precipitated material is dissolved in a dilute alkaline solution, with the addition of lecithin. The precipitant is washed in water in order to give it an appropriate water content. The solution is allowed to "ripen" (mûrissement), and is then spun in a in a coagulating bath, to which a coagulant is added. In Japan, Showa-Sangyo makes and sells a product named "Silkool," which is an artificial fiber made from soy protein and which would have characteristics similar to that of Lanital. "Soja Bean Silk" is also made in Japan from soy protein.

3620. Takahashi, R. 1941. Some injurious insects of agricultural plants and forest trees in Siam and Indo-China. I. Aphididae. *Taiwan Government Agricultural Research Institute Report* No. 78. 27 p. March. *

• ***Summary:*** "Polished rice is the principal food,... Shoyu (soy) sauce and the many preparations of the soya bean are used in almost every dish."

"Shoyu sauce" is used to season sukiyaki, tempura, sashimi, and kabayaki (grilled eels; "A thick tasty sauce made from shoyu is poured over them").

3622. Kajita, Toshiji; Inoue, Ryohei. Assignors to Showa Sangyo K.K., Yokohama, Japan. 1941. Process for manufacturing artificial fiber from protein contained in soybean. *U.S. Patent* 2,237,832. April 8. 2 p. Original application filed 8 Sept. 1937, Serial No. 162,954. Divided and this application filed 7 June 1939. Filed in Japan 25 May 1937.
• ***Summary:*** Uses soybean protein and tartaric acid. Address: Tokyo, Japan.

3623. Comin, Donald. 1941. Notes on green vegetable varieties of edible soybeans. *Ohio Agricultural Experiment Station, Department of Horticulture, Publication* No. 58. 6 p. June 17. Mimeographed.
• ***Summary:*** "The Department of Horticulture, Ohio Agricultural Experiment Station, planted green vegetable varieties of edible soybeans for the first time in 1940." However in 1937 and 1938 such edible soybeans were grown by the Ohio State University Department of Agronomy in cooperation with the USDA at Columbus, Ohio. Data concerning these trials is show in table 2. The beans were planted on 9 June 1937 and 1 June 1938.

Table 1 shows "Notes on green vegetable varieties of edible soybeans" that were tested and have names. For each variety is given the F.P.I. number, variety name, seed color, hilum color, and number of days to maturity in Washington, DC. They are listed in ascending order of number of days to maturity as follows: Agate, (90 days to maturity), Bansei, Waseda, Chusei, Goku, Kanro, Fugi [sic, Fuji] (115 days), Willomi, Hokkaido, Sousie [sic, Sousei], Osaya, Shiro, Hakote, Sato, Hiro, Toku, Suru, Kura, Jogun, Chame (125 days), Higan, Rokusun, Aoda, Nanda (145 days).

Table 2 shows data on "green vegetable varieties of edible soybeans" grown by Dep. of Agronomy, Ohio State University, 1937 and 1938. Named varieties: Bansei, Waseda, Hakote, Fugi, Willomi, Hokkaido, Jogun, Imperial, Kura. Tables 3 and 4 show data or the same varieties in 1940. Address: Wooster, Ohio.

3624. Concepcion, Isabelo. 1941. Significance of soy bean in

the dietary of Filipinos. *Acta Medica Philippina* 2(4):479-95. April/June. Read before the Sixth Pacific Science Congress, San Francisco, California, July 24 to Aug. 12, 1939. [28 ref]
• ***Summary:*** Contents: Introduction. Composition and nutritive value. Supplementary value of soy bean (to a rice-based diet). Forms of soy bean used in Philippines: Soy bean curd or "tokua," fermented bean curd or "tahuri," soy bean curd brain or "tojo" (served with a little thick brown sugar syrup), soybean with shaved ice or "mongo con hielo," soy bean flour, soy bean milk. Deficiencies of Filipino diet. Effects of improper food. The need for a campaign to popularize soy bean products. Conclusions.

"Soy bean is grown in many parts of the Philippines where it is known as 'utao' and also as Chinese 'Balatong.' It is grown in large quantities in Batangas Province. The green pods are harvested in October and November and the dried seeds may be had in bulk in December and January. Just when soy bean was first cultivated in the Philippines is not known. For years casual plantings have been made but it is only in comparatively recent years that the cultivation has been seriously considered as an agricultural industry. Statistics indicate that consumption of soy bean in the Philippines has grown faster than production. They also show a growing appreciation of soy bean in the Philippines."

Soy bean with shaved ice "is a very popular soy bean mixture introduced by the Japanese but now sold in nearly all refreshment parlors all over the Philippines. The preparation consists of a mixture of boiled red mongo and soy bean mixed with cream, brown sugar and ice shavings. This form of soy bean mixture is more nourishing than any other preparation just described on account of its cream and sugar content."

The consumption of soy bean products in the Philippines "does not amount to very much. The reason for this apparent neglect is the general lack of sufficient information. It is desirable that the government should initiate the necessary campaign to inform the people regarding the valuable nutritive properties of soy bean. Although the Bureau of Science since 1931 has been carrying a demonstration campaign to teach the public the different methods of cooking soy bean with the aim of popularizing its use among the masses, its efforts so far have not yielded the expected results. Another reason is the lack of a central body in the Philippines that can coordinate all the nutrition work to be carried out in that country. Furthermore, there is lacking a definite long range policy for the betterment of nutrition...

"The popularization among the masses of soy bean and soy bean products like soy bean curd, soy bean flour, and soy bean milk should be undertaken along with a more intensive campaign about its nutritive value carried on in the different schools all over the Philippines."

Note 1. In section titled "Fermented bean curd or 'Tahuri'" (4 paragraphs and 1 table), the text is a combination of that first presented by Gibbs and Agcaoili (1912) and Orosa (1932). Although the word "fermented" is used here to describe *tahuri* for the first time, no information about a fermentation microorganism or process is given.

Note 2. This is one of the earliest English-language documents seen (Sept. 2006) that uses the term "Soy bean" in a new way–as a singular noun, like corn or wheat, not preceded by "the." Examples: "Soy bean is grown in many parts of the Philippines..." "... campaign to teach the public the different methods of cooking soy bean with the aim of popularizing its use among the masses,..." Address: Dep. of Physiology and Biochemistry, College of Medicine, Univ. of the Philippines.

3627. Jackson: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1941. Seed color: Green, with black hilum and green cotyledons.
• ***Summary:*** Sources: Morse, W.J. 1941. "Shanghaied... a super food." *Soybean Digest.* July. p. 4-5, 10. See p. 5. Jackson is a late variety, maturing in 141 or more days.

Morse, W.J. 1948. "Soybean varietal names used to date." Washington, DC: Appendix to the mimeographed report of the Fourth Work Planning Conference of the North Central States Collaborators of the U.S. Regional Soybean Laboratory, Urbana, Illinois. RSLM 148. 9 p. May 26. See p. 4. "Jackson–P.I. 82581."

Talk with Dr. Richard Bernard of Illinois. 1999. Aug. 31. There were two varieties named Jackson. The second, introduced in 1953, was named after Stonewall Jackson. It was one of many varieties named after Southern Confederate generals by southern soybean breeders. After it was released, the former name Jackson was retired and the PI number 82581 was used instead. Address: USA.

3628. Morse, W.J. 1941. Shanghaied... a super food. *Soybean Digest.* July. p. 4-5, 10. [10 ref]
• ***Summary:*** The super food is green vegetable soybeans from edible soybeans. "Attempts to secure seed of these food varieties from oriental countries through correspondence met with little success, due to the fact that the edible types were classified under another name than the soybean. During agricultural exploration work in the Orient from 1929 to 1931, many varieties of soybeans were found in Japan and Chosen [Korea] which were used solely as green vegetables or dry edible beans." These varieties have been under test for the past 8-9 years at various agricultural experiment stations throughout the United States.

A table shows 42 "edible varieties of soybeans classified according to maturity." Very early (100 days or less): Agate, Sioux. Early (101-110 days): Bansei, Chusei, Etum, Giant Green, Goku, Kanro, Kanum, Sac, Tastee, Waseda, Yellow Marvel. Medium Early (111-120 days): Fuji, Hakote, Hiro, Hokkaido, Jogun, Kura, Osaya, Sato, Shiro, Sousei, Suru, Toku, Willomi, Wolverine. Medium (121-130 days): Chame, Emperor, Funk Delicious, Illington, Imperial. Medium late (131-140 days): Aoda, Easycook, Hahto, Higan, Rokusun. Late (141 or more days): Green, and Black, Jackson, Jefferson, Nanda, Seminole.

DR. W. J. MORSE

"Most of these edible types have been found to be much superior to the commercial varieties in flavor, texture, and ease of cooking. Moreover, tests have indicated that the flour made from edible types has a better flavor than that made from commercial varieties. Some of the edible types have also been judged to be superior to commercial types in the manufacture of bean milk, roasted beans and other food products...

"One of the most promising uses of edible varieties of soybeans is as a green shelled bean and for this purpose the pods should be picked when the beans have reached the full size but are still green and succulent. The green beans resemble young, tender Lima beans and have a rich, distinctive and delicious flavor... The usual oriental way of cooking green soybeans is to boil the pods in water flavored with soy sauce or salt and serve them to be eaten from the pod."

In America, "Several commercial concerns have canned large packs of green soybeans, which have become quite popular."

Photos show: 1. Soybeans sprouts pushing up out of spherical earthenware pots at a market in East Asia. 2. A woman selling "soybean curd" ("the 'boneless meat' of millions of Oriental people") in a Korean market. 3. "In place of candy between meals, Japanese children often carry about a small bag of cooked [green] vegetable soybeans, break open the pods and lick the salty beans out with their tongues." 4. Roasted soybeans, which are used extensively in candies in Japan. 5. Portrait of Dr. [sic] William J. Morse. 6. Green vegetable soybeans (in the pods on plants, or shelled) being sold in a Korean farmers market. 7. "This Japanese farm girl has just pulled an armful of green vegetable soybean plants to prepare for market." 8. A Korean peddler with a large pack of green vegetable soybeans on his back.

Note: This is the earliest document seen (Aug. 2013) that mentions the soybean varieties Etum, Green and Black, Jackson, Jefferson, Kanum, Sac, Seminole, Tastee, Wolverine, or Yellow Marvel. Address: USDA Bureau of Plant Industry, Washington, DC.

3633. *New Canadian* (*The*). 1941. Shoyu supplies cut off–Local firm prepared to meet demand. Community consumes fifty thousand gallons annually. Aug. 22. p. 8.

• ***Summary:*** Mr. Teiichi Amano, head of Amano Bros. Ltd. makes Maruten brand shoyu bean-sauce, miso, and vinegar in his plant at 2141, 2135, 2131 Dundas Street, Vancouver, BC, Canada. In January 1941 he started to brew shoyu, which used to be imported from Japan before budget import restrictions took effect. It must age for 7-12 months. His soybeans are imported from California. For 12 years he has made miso and vinegar, and in Japan his father and grandfather made shoyu. Mr. Amano estimates that shoyu consumption in British Columbia exceeds 48,000 gallons/year. A photo shows the inside of the shoyu plant.

A large ad (5 x 4 inches) at lower left of page is titled "Amano Bros. Ltd.: Manufacturers of shoyu bean-sauce, miso, vinegar."

Note: This is the earliest English-language document seen that uses the term "shoyu bean-sauce" to refer to soy sauce or shoyu. Address: British Columbia, Canada.

3634. Ladejinsky, W.I. 1941. Manchurian agriculture under Japanese control. *Foreign Agriculture* 5(8):309-40. Aug. [37 ref]

• ***Summary:*** Japanese control of Manchurian agriculture has assumed two forms. The first, initiated shortly after the "incident" of 1931–the occupation of the country by Japan–is Japanese colonization of Manchuria on a large scale. The second and more recent phase is the establishment of a stringent control over all aspects of Manchurian agricultural economy in order to enable Japan to get a large supply of foodstuffs as soon as possible and at the lowest possible price. So far neither program has achieved the expected results.

Until about the end of the nineteenth century, the country was a primitive, sparsely settled agricultural and cattle-grazing region. Since then, however, the fertile soil, suitable climate, the laying of a network of railways, and the removal of all barriers against Chinese immigration have been responsible for the development of Manchuria into one of Asia's most important agricultural regions. The industrialization of the country during the 1930s, so energetically fostered by Japan, has produced almost no change in its rural character. The recent program of expansion of agricultural production, as compared with the downward revision of the ambitious industrialization plans, serves to emphasize the importance of agriculture.

Agricultural control in Manchuria did not come into

© Copyright Soyinfo Center 2014

its own until the Government monopolized the soybean trade, both domestic and foreign, in the fall of 1939. In order to raise exports to non-yen countries, the reduction of Manchurian prices of soybeans and bean products became a necessity. Accordingly, Manchuria instituted a comprehensive system of control over its most important industry by enacting on October 17, 1939, the Law for Control of Staple Produce. This law aims to control and regulate the price and distribution of staple products (soybeans, seeds, bean cake, and bean oil), and to expand production and exports, as well as to develop industries using such produce as raw material. The Manchuria Staple Products Company was created by a special act of October 17, 1939, to carry out these provisions.

The two acts transformed the country's leading industry into a state monopoly. The farmers must now sell their chief cash crop to the monopoly at officially fixed prices; the monopoly in turn sells to the exporters in accordance with its own regulations. The main reason for the establishment of the monopoly was to supply Japanese farmers and consumers with beans and bean products at the lowest possible price and to get possession of the remainder of the crop for the purpose of securing the much-needed foreign exchange. Address: Agricultural Economist, Office of Foreign Agricultural Relations.

3635. *Washington Post.* 1941. Japan hems in Vladivostok, Soviet 'Doorway to Pacific.' Sept. 5. p. 11.
• ***Summary:*** A bulletin from the National Geographic Society explains that Vladivostok, which 75 years ago [i.e., about 1866] was a boisterous outpost of muddy streets, wooden shacks, saloons and gambling houses, is not a modern, busy city of about 206,000 inhabitants, and a Soviet air and naval base. The picturesque harbor, known as the "Golden Horn," is normally filled with ships. It has always been a link between the vast reaches of Siberia and the outside world, yet only a few miles from the border of Japanese dominated Manchukuo. A bit further south is Chosen [Korea], also dominated by Japan. And Japanese ships dominate the waters around the port.

"Vladivostock's harbor freezes over later in December and the ice lasts until mid-April." Ice-breakers keep the way open for steamers to enter and leave the port during that time.

"Warehouses along the waterfront [in Vladivostok] ordinarily are filled with soy beans and by-products, such as soy bean oil and soy bean cakes." These are the port's main export items, along with Siberian timber and dried fish.

• ***Summary:*** "Julean Arnold of Berkeley, California, who spent more than 35 years in China as Commercial Attache, believes that the name 'soybean' came from the Chinese

© Copyright Soyinfo Center 2014

through the Japanese. He describes its probable origination as follows: The name is really taken from the Chinese 'chiang-yiu' which means soy-sauce, and which in Japanese is pronounced 'shou-yu,' contracted also by the Japanese into 'so-ya' but with the fundamental Chinese character for 'chiang-yiu' pronounced 'gee-ang yu.' The 'yiu' or 'yu' is the Chinese character for oil or sauce. In any event, 'chiang-yiu' means soy-sauce. The Chinese character for 'ya' means sprouts, thus the word 'tou' combined with 'ya' means bean sprouts. The Chinese equivalent for soybean is 'hwang' or 'huang-tou,' the 'huang' meaning yellow. Thus the word 'soy' carries us back to 'chiang-yiu' pronounced by the Japanese 'shou-yiu' and corrupted into 'so-ya' and further corrupted into 'soy-a' or 'soya' but really meaning soy sauce, while in English used for the whole category of legumes known as soybeans." Address: Commercial Attache, China.

3645. Becker, Joseph A.; Froulich, Paul; Jackson, D.; et al. 1941. Agricultural statistics, 1941. Washington, DC: U.S. Government Printing Office. 731 p. For soybeans and soy products see p. 7, 299-305, 490, 494, 496, 519, 523.

• ***Summary:*** "This volume presents information formerly published (until 1935) in the statistical section of the Yearbook of Agriculture" (p. 1). "Export and import statistics of the United States include trade with the Philippine Islands. They also include any trade between foreign countries and Alaska, Hawaii, and Puerto Rico, but do not include shipments between continental United States and these possessions. Prior to January 1, 1935, the Virgin Islands of the United States were treated in the same manner as the Philippine Islands, but since that date the Virgin Islands are treated in the same manner as Alaska, Hawaii, and Puerto Rico." (p. 5). A bushel of soybeans weighs 60 lb and a gallon of soybean oil weighs 7.5 lb (p. 7). Note: No separate statistics are given for soybeans or soybean products grown in or exported to or from Alaska, Hawaii, Puerto Rico, or the Virgin Islands.

Table 392 (p. 299) gives U.S. soybean acreage statistics for the years 1924-1940, including: Acreage grown alone for all purposes, total acreage (incl. half the interplanted acres), acreage harvested for beans, yield per acre, production, price (dollars/bushel), farm value (in 1,000 dollars), foreign trade (imports and exports, year beginning in July). In 1924 for soybeans: Acreage grown alone for all purposes: 1,567,000. Total acreage: 1,782,000. Acreage harvested for beans: 448,000. Yield per acre: 11.0 bushels. Production: 4,947,000 bushels. Average price per bushel received by farmers: $2.46.

The corresponding figures in 1928 were: Acreage grown alone for all purposes: 2,154,000. Total acreage: 2,439,000. Acreage harvested for beans: 579,000. Yield per acre: 13.6 bushels. Production: 7,880,000 bushels. Average price per bushel received by farmers: $1.88.

Table 393 (p. 299) gives U.S. soybean production and farm disposition statistics for the years 1924-1940, including: Total production, used for seed (total, or home grown), fed to livestock, sold.

Table 394 (p. 300) gives U.S. soybean statistics for acreage, yield, production, and season average price received by farmers, by States, average 1929-38, annual 1939 and 1940. The states are: New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, Nebraska, Kansas, Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, Texas, and USA total.

Table 395 (p. 301) gives soybean statistics for acreage and production in specified countries, average 1930-34, and annual 1935 to 1940. The countries are China, Manchuria, United States, Chosen [Korea], Japan, Taiwan, Netherlands Indies, Rumania, Bulgaria, Yugoslavia, Hungary, and estimated world total.

Table 396 (p. 302) gives the average price per bushel of soybeans received by U.S. farmers each month and season average from 1930 to 1940.

Table 397 (p. 302) titled "Soybeans for seed" gives the average wholesale price per bushel at Baltimore and St. Louis, 1931-1941, each month from Jan. to May and average.

Table 398 (p. 302) titled "Soybeans for crushing" gives the average price per bushel, U.S. No. 2 Yellow, bulk, carlots, net track Chicago, 1933-40, each month from Oct. to Sept.

Table 399 (p. 303) gives statistics on amount of soybeans crushed, and production, imports, and exports of soybean oil (crude basis), and soybean cake and meal, USA, 1930-1940.

Table 400 (p. 303) gives the average price per pound of soybean oil (domestic crude) in tank cars, midwestern mills, 1929-1940, each month and yearly average.

© Copyright Soyinfo Center 2014

Table 401 (p. 303) gives the average price per pound of soybean oil (domestic crude) in drums, New York, 1931-1940, each month and yearly average.

Table 402 (p. 304) gives the average price per ton of soybean meal (41% protein), at Chicago, 1930-1940, each month and yearly average.

Table 403 (p. 305) for soybeans and soybean oil, gives international trade (exports and imports), averages 1925-1934, annual 1938, 1939. For soybeans: Principal exporting countries–China, Manchuria, United States, total. Principal importing countries–Germany, Japan, Denmark, United Kingdom, Sweden, Italy, Netherlands, Canada, total. For soybean oil: Principal exporting countries–China, Manchuria, Denmark, Japan, Sweden, total. Principal importing countries–Netherlands, United Kingdom, Italy, Germany, United States, Belgium, Chile, France, Morocco, Norway, Algeria, Austria, Czechoslovakia, Canada, USSR, total.

Table 659 (p. 490) gives U.S. exports (in pounds) of vegetable oils (incl. corn, cottonseed, linseed, cocoa butter, coconut, peanut, and soybean oil) from 1914 to 1939.

Table 617 (p. 455) gives statistics on oleomargarine–materials used in manufacture, USA, 1924-1940. Concerning soybean oil: Less than 500 lb were used in 1924 and 1925, but 33,000 lb were used in 1926. The first significant amount was used in 1930: 2.25 million lb. Note: Additional statistics on oleomargarine production and consumption in the USA are given on p. 454-57.

Table 660 (p. 494) gives U.S. imports (in pounds) of oilseeds (incl. soybeans {but no data given for 1918-1926}, sesame seeds, rapeseed) and vegetable oils (incl. olive oil, palm oil, palm kernel oil, peanut oil, perilla oil, rapeseed oil, soybean oil, and tung oil) from 1914 to 1939.

Table 662 gives imports of principal agricultural products (incl. soybean and soybean oil) into the United States, by countries, each year 1932-1940. The source countries for soybean (p. 519) are: Kwantung, Japan, China, Germany, other countries, total. The source countries for soybean oil (p. 523) are: Kwantung, Japan, China, Netherlands, other countries, total. Address: U.S. Dep. of Agriculture, Yearbook Statistical Committee, Washington, DC.

3646. Blanchard, Marcel. 1941. Le soja en France: Ses possibilités culturales. Ses débouchés industriels. Son intérêt économique [The soybean in France: Its cultural possibilities. Its industrial outlets. Its economic interest]. Paris. Societe d'Editions Geographique, Maritimes et Coloniales, 17 rue Jacob, 6eme. ii + 200 p. Illust. 22 cm. [158 ref. Fre]

• ***Summary:*** Contents: Introduction. Part 1: Cultivation of soya. 1. The soybean. 2. Soybean cultivation worldwide. 3. The varieties of soybeans. 4. The requirements of the soybean crop. 5. Sowing soybeans. 6. The soybean during its vegetative stage. 7. Harvesting soybeans. 8. Mixed cropping and intercropping of soybeans. 9. The enemies and diseases of the soybean.

10. History of soybean cultivation in France (introduction in 1739 at Jardin des Plantes under direction of Buffon, 1850–National Society for Acclimatization, around 1880 MM Vilmorin-Andrieux, M. Pailleux, M.P. Olivier-Lecq, Messrs. Lechartier, Denaiffe, Dr. Le Goff, Boulanger & Dausse, Brioux, Semichon, Carle de Carbonnières, Rouest, de Guerpel).

11. The vegetative cycle of the soybean in France. 12. The soybean at the various French agricultural research centers (*les Centres de Recherches agronomiques français*) including Centre de Versailles, Station de Dijon, de Colmar, de Clermont-Ferrand, d'Antibes. 13. The possibilities of soya in France in terms of its cultivation.

Part 2: The nutritional value of the soybean. 1. The nutritional value of the soybean.

Part 3: Utilization of soya. 1. Soybeans in the farm economy. 3. The soybean in human nutrition and in industry.

Part 4: The soybean from an economic viewpoint. 1. Commerce and trade in soybeans and soybean products up to Sept. 1939. 2. The present economic possibilities of the soybean in France. Conclusion. Bibliography. 16 illustrations. 8 maps.

The introduction begins: "In a letter written on 15 Jan. 1935, on board the *Chenonceaux* which was sailing toward Shanghai, Li Lu-Ying [sic, Li Yu-ying], president of the National Academy of Peiping (l'Académie Nationale de Péping) offered to furnish us with the translation of important documents in the Chinese, Japanese, and Russian languages concerning all aspects of soya. Let him find here the expression of our gratitude, because he introduced us to a plant, in which there is more interest abroad than in the country of its origin."

The publisher was formerly named Maison Challamel, founded in 1839.

Illustrations show: (1) The branch of a soybean plant, with the flowers and young pods, enlarged 3x. (2) The flower of a soybean plant as it is about to open, enlarged 5x. (3) A soybean branch with mature pods and leaves, enlarged 2x. (4) Two views of a soybean seed with parts labeled. C = chalza (*chalze*). H = hilum (*hile*). M = micropyle (*micropyle*). R = radicle (*radicule*). A-H = hypocotyl axis (germ) (*axe hypocotylé*). G = raphe, bud, leaf-bud (*gemmule*). Enlarged 3x. Note: The raphe is a small grove extending to the chalza, where the integuments were attached to the ovule proper.

(5) Microscopic view of a transverse section of the seedcoat: C.P. = palisade layer of cells (*cellules en palisade*). C.S. = hourglass cells (*cellules en sablier*). P.E. = spongy parenchyma (*parenchyme externe*). C.A. = aleurone layer (*cellules à aleurone*). P.I. = remains of parenchyma cells of endosperm or internal parenchyma (*parenchyme*

© Copyright Soyinfo Center 2014

interne). Enlarged 247x. (6) Cells of the epidermis facing the microscope. Enlarged 460x. (7) Microscopic view of a transverse section of a cotyledon, two views, showing starch grains (*grain d'amidon*), oil droplets (*oléolaste*), and aleurone grains (*grain d'aleurone;* high in protein). (7a) Six large maps of soy in Asia and in Oceania, in North America and in South America, in Europe and in Africa in 1939 (p. 12-36). (8) Nodules containing nitrogen-fixing bacteria on the roots of a soybean plant (p. 66). (9) Planting soybeans; a man walks behind a planter pulled by two horses (p. 84). (10) Cultivating soybeans; a man sits on a cultivator pulled by two horses (p. 89). (11) A field of long, straight, weed-free rows of soybeans in the United States. (12) Drying of soybean hay in shocks. (13) Harvesting soybeans; a man sits on a harvester pulled by two horses. (14) Threshing soybeans using a machine (p. 99). (15) Intercropping of soya and maize. (16) The soybean variety Lisbonne growing at the Central Station for Seed Trials (*Station Central d'Essais d Semences*) (p. 122). (17) Map of France with isotherm lines of July and a line showing the northern limit of maize cultivation (p. 134).

Tables: (1) Asiatic varieties: Chinese and Manchurian varieties (6 varieties), varieties from the British Indies (7), from the Dutch Indies (11), Japanese varieties (17).

(2). American varieties: Canadian varieties (7), U.S. varieties (40 varieties) (for each is given: Days to maturity, flower color, seed color, color of the oil, oil content, protein content, weight of 1,000 seeds in grams, seed yield (in kg/ha), yield of hay containing 15% moisture (in kg/ha)). (3) European varieties: German (7), Austrian (3), English (4), Italian (1), Polish (7), Czech (9), Soviet Russian (9).

Mineral needs of the soybean. Yield of two soybean varieties, with and without inoculation. Yield of three soybean varieties with and without inoculation. Germination percentages of 8 French soybean varieties at the Station Centrale d-Essais de Semences in 1938-39 (ranges from 91% to 100%). Variation in the composition of soybean hay at 4 stages of maturity. Weight of seeds vs. straw for 10 U.S. soybean varieties (the straw weighs 1.5 to 2.7 times as much as the seeds). Average yield of soybeans in four countries in 1933 (in kg/ha): Manchuria 1,200. Japan 1,000. Korea 650. China 950. Length of the vegetative cycle at four stations with 10 varieties in France (ranges from 98 to 157 days). Length of the vegetative cycle at four more stations with 16 varieties in France (ranges from 95 to 172 days). 18 varieties that completely matured their seeds at 2 stations in 1921 and in 1922. Oil and protein content of 7 French soybean varieties at Station de Clermont-Ferrand. The seed yield of 10 soybean varieties at the same station. The seed yield of 6 soybean varieties at Station d'Antibes. Six tables (p. 138-42) on the nutritional value of soybeans. Six tables (p. 148-61) on the utilization of soybeans in the farm economy and for feeding animals 2 tables (p. 162-42) on the soybean in the human diet and in industry. 5 tables (p. 175-42) in trade in soybeans and its by-products. 7 tables (p. 181-86) on the present economic possibilities of the soybean in France.

Chinese and Manchurian varieties soybean varieties (p. 48): Chu Yen Tou Erh, Kung-Chu-ling pai Mei, Pai Hoa Tso Tse, Su Li Huang, Ta Li Huang, Tieh Chia, Tou Tse.

Soybean varieties from the British Indies (*des Indes britanniques*) (p. 48): Behrum, Hto-nao, Hto-nang, Mirjanhat, Pekyat-pyin, Pe-Ngypi [pè-ngapi], and Santonauk. Note: According Thompstone & Sawyer (1914), some of the above names are the names of the yellow soybean in different parts of Burma.

Soybean varieties from the Dutch Indies (*des Indes néerlandaises*) (p. 48): Djepoen, Idjo, Ireng, Krawe, Mentik, Poetik, No. 16 sélectionné, No. 17 sélectionné, No. 27 sélectionné, No. 28 sélectionné, No. 29 sélectionné.

One variety from Indochina (p. 48) is Langson.

Soybean varieties from Japan (p. 50): Akasaya, Banseihikarikuro [Bansei hikari kuro], Chinseihikarikuro [Chinsei hikari kuro], Gindaizu [Gin daizu], Ishikarishiro [Ishi kari shiro], Kanro, Kurosaya, Mitsuishidaizu [Mitsuishi daizu], Naktchadaka, Oyachi no. 2, Rankoshi no. 1, Shimoshirazu no. 1 [Shimo shirazu no. 1], Shirokotsubu, Shirotsurunoko, Tsurunoko, Wasehodaka / Waschodaka, Yoshiokatairin [Yoshio katairin].

Soybean varieties from Canada (p. 50): A.K. (Harrow), Brun du Manitoba, Soja jaune de Montréal / Montreal, Soja jaune de Québec / Quebec 92, Manchu (Hudson), Mandarin (Ottawa), O.A.C. No. 211. Address: Directeur interimaire, Station d'Essais de Semences (Ministere de l'Agriculture), France; In 1946 Chef de Travaux at this station.

3647. Fallon, F. (Baron). 1941. Le soja [The soybean]. *Belgique. Ministere des Colonies. Direction Generale de l'Agriculture et de l'Elevage. Propagande et Vulgarisation Agricoles* No. 21. 39 p. Bruxelles: Impr. Industrielle et Financiere. [17 ref. Fre]

• ***Summary:*** Contents: Botanical description: Introduction, the plant's needs, varieties. Soybean cultivation in Europe: Introduction (for some countries preferred early, medium, and late varieties are listed), France, Great Britain, Hungary, Poland (selection has been done at the Wilna experiment station using varieties imported from Hungary and Czechoslovakia), Romania (About 30,000 ha are devoted to soybeans, primarily in Bessarabia [Besarabia], Dobrouja [Dobrudja, Dobrogea], Bukovina [Bucovina], Walachia or Wallachia or Valachia [now called Muntenia, a fertile belt across southern Romania], and Moldavia. Most of these varieties came from Austria), Switzerland, USSR (the main soybean regions are all warm ones–the Caucasus, Ukraine, and Transcaucasia). Soybean cultivation in America. Soybean cultivation in Africa (especially in South Africa, mainly for forage in the Natal and Transvaal). Soybean cultivation in Asia: China and Manchuria, Malaysia, British Indies, Dutch Indies, Indochina, Japan. Soybean cultivation

© Copyright Soyinfo Center 2014

in Oceania (mainly Philippines).

Cultivation: Crop rotation, inoculation, planting and propagation, maintenance and manuring the land, harvest, seed storage, yield, selection of varieties. Soybean utilization: As human food (dry soybeans, soy sauce, soy flour, soymilk, tofu, soy oil), industrial uses (soy oil, refining and use, soymilk casein). Soya as a fertilizer: Green manure, or soybean cakes. Soya as a feed for domestic animals: Green forage, hay, silage, pasture, seeds, cakes. Soybean cultivation in the Belgian Congo. Soybean trade.

In the Congo various soybean trials have been undertaken since 1936 at the stations of the National Institute for Agronomic Study of the Belgian Congo (l'Institut National pour l'Etude agronomique du Congo Belge). Numerous varieties from the USA and Manchuria have been tested. Address: Directeur au Ministere des Colonies, Professeur a l'Institut Agronomique de Gembloux [Belgium].

3648. Japan-Manchoukuo Year Book. 1941. Tokyo, Japan: Japan-Manchoukuo Year Book Co. Index. 26 cm. Eighth annual issue. [Eng]

• ***Summary:*** This is the last issue. Each year book is divided into two main parts: Japan, and Manchoukuo. This book was published in mid-March 1941.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year.

Page 289-90. In the chapter on "Agriculture and stockbreeding" in Japan, Table 19 shows "Production of various grains, potatoes, etc." in koku from 1927 to 1939. 1 koku = 1.803 litre = 5.11902 dry bushels (USA). For soya bean:

2,606 million koku in 1938

1.948 million koku in 1939

Table 19B gives the value of each crops (in yen) from 1927 to 1939. Other crops in this table are oats, millet, barnyard millet, proso millet, maize, buckwheat, red bean, sweet potato, and Irish potato.

Page 391. In the chapter on "Chemical industry" "Imports of commercial fertilizers" from 1931 to 1938 include "Bean-oil cake," the imports of which decreased from 1.032 million metric tons in 1931 to a low of 0.376 million metric tons in 1936, then began to increase to 0.849 million metric tons in 1939.

Page 403. In the same chapter Table 38 shows "Vegetable oil production" with quantity in metric tons and value in yen, from 1930 to 1938. Soya bean oil production increased from 36,977 metric tons (mt) in 1930 to 65,711 metric tons in 1938–making it the leading vegetable oil produced in Japan.

Page 446, in the chapter on "Commerce," Table 13 shows the "Average wholesale price of staple commodities in Tokyo" in yen per koku, average December each year from 1934 to 1939. The brand of soya beans was "Manchu White." The price dropped from a high of 19.37 yen in 1936 to a low of 7.70 yen in 1937, then rose to 13.90 in June 1940.

Page 455, in the chapter on "Foreign Trade," a table shows trade of "Oil cake" from 1927 to 1st half of 1940. The amount decreased from 1927 to 1936 then increased thereafter.

Page 460 in the same chapter contains a very large table titled "Imports by countries of origin" in yen from 1933 to 1938. Categories include "Oil cake," which has increased from 41,181 in 1933 to 104,639 in 1939. Manchoukuo is the main country of origin, followed by Kwantung Province, then China, then British India, then D.E.I. [Dutch East Indies].

Page 684, in the chapter on "Agriculture" in Manchoukuo, a large table shows "Output of principal of crops (metric tons)" from 1924 to 1939. For soya beans: 4.091 million metric tons in 1938. 3.956 million metric tons in 1939.

The other principal crops shown in the tables are other beans, kaoliang, millet, maize, wheat, rice, upland rice, and other cereals.

Page 778, in the chapter on "Commerce," Table 12 shows "Wholesale prices of principal staple commodities in Hsinking [Changchun, in Jilin province] from 1934 to 1940 in M¥ [million? yen]. The price of 1st grade soya beans went from 3.36 per 100 kin in 1934 to 7.69 per 100 kin in Dec. 1940. Wholesale prices for bean cake and bean oil also underwent dramatic inflation.

Page 812-13, in the chapter on "Manufacturing industries," has a long section "IV. Bean oil & cake." The four principal cities of manufacturing in Manchoukuo are Dairen, Yingkow, Antung, and Harbin. Table 20 shows "Output of bean oil at the principal cities" in 1,000 kin [1 kin = 0.6 kg] from 1932 to 1938. The leading city by far was Dairen. The total bean oil produced decreased at the four centers decreased from 221.061 million kin in 1932 to 97.255 million kin in 1938, then rose sharply to 127.850 million kin in 1939.

Pages 813-14, and their tables, are very similar to their counterparts in the 1940 year book.

3649. Photo of John Takeo Tadano, owner of Marusho Shoyu. 1941.

• ***Summary:*** The inscription on the photo reads: "To Nakatsu family. Always, John Tadano. '41." Sent to SoyInfo Center by Barbara Y. Peters, his daughter (Nov. 2008). Barbara writes: "My father was a food broker, I believe, for Japan Foods. He had attended Phoenix College, but when World War II started he was not able to continue. I gather he was also on the football team as quarterback when the war broke out. He was stripped of the title Homecoming King too."

Sakanishi shiryo. Food culture of Japan (drafts). Washington, DC: Library of Congress. 84 sheets. 27 cm. *
• ***Summary:*** Shiho Sakanishi was born in 1896.

3651. Saris, John. 1941. The first voyage of the English to Japan. Transcribed and collated by Takanobu Otsuka. Tokyo: Toyo Bunko. xxxii + 266 p. 26 cm. Supplementary volume. [3 ref]
• ***Summary:*** A transcription of the original manuscript, which was published in a facsimile edition in 1940. The original manuscript has the title: *The first voyage of the English to the islands of Japan.*

On 29 Aug. 1613, while in Japan (near Shizuoka), Saris wrote: "Of Henns they haue greate store, as likewise of Deere, both redd and fallowe wilde bores, hares Goates Kyne etc. Of theese they haue plentie, butter they make none, Neither will they eate any Milke, because theie hould it to be as bloode, nor tame beasts."

Note 1. The word transcribed from the original manuscript as "Cheese" by Satow in 1900 is transcribed here by the Japanese as "theese."

Note 2. John Saris died in 1646.

3652. Thunberg, Karl Peter. 1941. Tsunberugu no nihon kikô [Thunberg's voyages in Japan]. Tokyo: Okugawa Shobo. Translated by Yamada Tamaki from original edition of 1796. [Jap]*

3653. *Miso Shoyu Kogyo* (*The Miso and Shoyu Industries*). 1941--. Serial/periodical. Tokyo: The Soy Society. Monthly. [Jap]*
• ***Summary:*** The book *Japanese Serial Publications in the National Agricultural Library* gives the English title as "The Soy and Miso Sauce Industry." Address: Tokyo, Japan.

3654. Daizu ni kansuru sankô bunken [Bibliography on soybeans]. 1941? Tokyo: Kikakuin Daiyonbu Dainika. 22 p. [Jap]*

3655. **Product Name:** [Silkool (Artificial Silk-like Filament from Soy Protein Fiber)].
Foreign Name: Silkool.
Manufacturer's Name: Showa-Sangyo.
Manufacturer's Address: Japan.
Date of Introduction: 1941?
Ingredients: Soy protein.
New Product–Documentation: Prat. 1941. Revue Internationale du Soja. March. p. 49-54. In Japan, Showa-Sangyo makes and sells a product named "Silkool," which is an artificial fiber made from soy protein and which would have characteristics similar to that of Lanital.

3656. Dei, Kooiti. 1942. Ueber die Inaktivierung der Sojaurease durch Borsaeure [The inactivation of soy urease using boric acid]. *Tohoku J. of Experimental Medicine* 42(1):93-100. Jan. 31. [9 ref. Ger]
Address: Medical-Chemical Institute, Faculty of Medicine, Imperial Tohoku Univ., Sendai [Japan].

3657. Miller, Harry W. 1942. Answering America's protein problem! *Soybean Digest.* Jan. p. 6.
• ***Summary:*** "Editor's Note: Dr. Miller, whom we here introduce to the readers of The Soybean Digest, is a leader of the soybean food industry. President of the International Nutrition Laboratory, Mt. Vernon, Ohio, manufacturers of Miller's Soya Foods, he has had a most interesting career.

"Graduating in medicine in Chicago in 1902, he went to China the next year as a medical missionary under the Seventh-day Adventist board. He spent 8 years in the interior of China, and then was transferred to the superintendency of the Washington Sanitarium and Hospital, Tacoma Park, D.C., where he remained from 1913 to 1925.

"Returning to China in 1925, he established several medical centers in that country and in Japan, Korea, the Philippines and the Malay Peninsula.

"Becoming interested in dietary problems, because his specialty, goiter surgery, was directly concerned with a dietary deficiency condition, and because of the high Oriental mortality rate due to malnutrition, he began studying the food products which might ease the situation.

"This led him to the soybean, because, he observed, malnutrition was not nearly so acute in those sections in which the soybean was an article of diet.

"In 1936 Dr. Miller established a food plant in Shanghai from which he manufactured milk from the soybean. As he puts it: 'This work was nicely underway when the Japanese invasion of Shanghai resulted in the complete destruction of the plant, and after a year of waiting I again returned to America and established in Mt. Vernon the International Nutrition Laboratory where we have specialized on the processing of the soybean, not only studying varieties best suited for human food, but methods of preparing the bean and also developing processing equipment, that will give us a more satisfactory product."

"Dr. Miller has an interesting statement regarding the use of Soya Milk in infant feeding: 'In this country nearly a score of babies that we are in touch with have either been started on Soya Milk or have been transferred to it very shortly after birth, and the number of users of Soya Milk for infants are increasing very rapidly. Our results of feeding large numbers of babies and children are to be found in the National Medical Journal of China.'"

"Soybean foods for human consumption have to date been scarcely available in America, and the question arises: Why bother to supplement a dietary which is already so abundant?

"Still, it would seem strange it the raw material which has been a mainstay in the Oriental diet for so many

© Copyright Soyinfo Center 2014

centuries could not be utilized in the American diet. It can be!

"That part of the American diet most often lacking is protein. Most animal proteins are cumbered with toxins, and most vegetable proteins are inadequate for nutrition.

"Soybeans the Answer: The soybean provides the answer to the protein problem. With a protein content of more than 40 per cent, it is the best source of protein which we have. Its protein is biologically equal to that of meats and animal foods, and it has the advantage of being free from toxins.

"The effectiveness of the soybean is strikingly demonstrated in China. Where vegetable protein is abundantly supplied in the diet as in Manchuria, and in North China, we have a stalwart race of people. However, in South China where the major products are oil and sugar we see dwarfed bodies and it is a rare exception to find in the warm climate among oil and carbohydrate feeders a single well-developed individual." A photo shows "The International Nutrition Laboratories, Mt. Vernon, Ohio, home of 'Miller's Soya Foods.'" The building is large, and appears to be constructed from bricks. Address: M.D., International Nutrition Lab., Mt. Vernon, Ohio.

3658. *Chicago Daily Tribune.* 1942. Java–Its a crowded corner of the rich Indies' storehouse. Feb. 4. p. 6.
• ***Summary:*** Yesterday, Java was subjected to its first Japanese air raid. "It is the heart of the Netherlands East Indies, the most densely populated area in the world, and one of the richest in natural resources." Its population, together with that of Madoera [Madura island, administered as part of East Java], is approximately 42 million.

Roughly 40-50% of the land on Java is cultivated–the remainder being mostly forests or mountains. The main crops are rice, rubber, sugar cane, cassava, millets, sweet potatoes, soy beans, kapok...

Includes a good historical overview of the European powers in Java; the Portuguese were the first to arrive.

3659. Chevalier, Aug. 1942. Production mondiale de graines de Soja [World soybean production]. *Revue de Botanique Appliquee & d'Agriculture Tropicale* 22(245-246):98-99. Jan/Feb. [Fre]
• ***Summary:*** The world's leading soybean producers in the mid- to late 1930s, in terms of million tonnes produced, were: China 5.01, Manchuria 4.32, USA 1.57, Korea 0.507, Japan 0.367, and the Netherlands Indies [Indonesia] 0.288. Address: France.

3662. Dies, Edward J. 1942. Tables (Document part). In: E.J. Dies. 1942. Soybeans: Gold from the Soil. New York, NY: The Macmillan Co. 122 p. April. 21 cm.
• ***Summary:*** Tables show: (1) U.S. soybean acreage, yield, and production, 1924-1941 (p. 5). During this time acreage has increased more than 12-fold from 448,000 to 5,855,000 acres. Yield as increased 88% from 11.0 to 20.7 bushels/acre. Production has increased more than 21-fold from 4.947 million to 106.712 million bushels.

(2) Soybean production in specified countries and estimated world total (p. 10-11). The countries are: China, Manchuria, United States, Chosen [Korea], Japan, Netherlands India [later Indonesia], Kwantung [Leased Territory], Taiwan, U.S.S.R., Rumania, Bulgaria, Yugoslavia, other Europe (incl. Poland, Czechoslovakia, and what was formerly Austria).

(3) Illinois soybean acreage, yield, and production, 1919-1941 (p. 25). Production (in bushels) increased from 30,000 in 1919, to 46,000 in 1920, to 167,000 in 1921, to 812,000 in 1922, to 1,431,000 in 1925, to 6,970,000 in 1930, to 24,012,000 in 1935, to 34,912,000 in 1940, to a peak of 49,128,000 in 1941.

(4) "Soybean varieties–Origin and varietal characteristics" (p. 38-47). For each variety is given: Place of origin, year introduced to USA, days to mature, flower color, pubescence color, seed characters (seed coat color, germ color, hilum color, seeds per pod, seeds per pound, oil percentage, protein percentage), use (de = dry edible beans, f = forage, gra = grain, gv = green vegetable).

Soybean varieties described in the table on p. 38-47 are:

Agate, A.K., Aksarben, Aoda, Arisoy, Arksoy, Avoyelles, Bansei, Barchet, Biloxi, Black Eyebrow, Cayuga, Chame, Charlee, Chief, Chernie, Chestnut, Chiquita, Chusei, Clemson, Columbia, Creole, Delnoshat, Delsta, Dixie, Dunfield, Easycook, Ebony, Elton, Emperor, Etum, Fuji, Funk Delicious, George Washington, Georgian, Green Giant, Goku, Habaro, Haberlandt, Hahto, Hakote, Harbinsoy, Hayseed, Herman, Higan, Hiro, Hokkaido, Hollybrook, Hongkong, Hoosier, Hurrelbrink, Illini, Ilsoy, Imperial, Ito San, Jogun, Kanro, Kanum, Kingwa, Kura, Laredo, Lexington, Macoupin, Magnolia, Mamloxi, Mammoth Brown, Mammoth Yellow, Mamredo, Manchu, Mandarin, Mandell, Mansoy, Medium Green, Midwest, Mingo, Minsoy, Missoy, Monetta, Morse, Mount Carmel, Mukden, Nanda, Nanking, Norredo, Ogemaw, Old Dominion, Oloxi, Ontario, Osaya, Otootan, Ozark, Palmetto, Patoka, Pee Dee, Peking, Pine Dell Perfection, Pinpu, Richland, Rokusun, Sato, Scioto, Seminole, Seneca, Shiro, Sioux, Sooty, Sousei, Southern Green, Southern Prolific, Soysota, Suru, Tarheel Black, Tastee, Toku, Tokyo, Virginia, Waseda, Wea, White Biloxi, Willomi, Wilson, Wilson Five, Wisconsin Black, Wood's Yellow, Yelredo, Yokoten.

(5) U.S. production and crushing of soybeans, and production of soybean oil and meal from 1924 to 1941 (p. 53, based on government reports). Domestic production of soybean oil, only 2.2 million lb in 1924, had increased almost 6-fold by 1929 to 13.424 million lb. Then in June 1930 the protective Smoot-Hawley tariff went into effect. By levying a tariff on imported soybeans and soybean oil, it stimulated domestic soybean crushing and production. Oil production (in million lb) jumped immediately, from 13.424 in 1929 to 34.688 in 1930 (even though the Great Depression had begun), to 208.9 in 1935, to 565.2 in 1940. Note: A semi-log graph of U.S. soy oil production vs. time shows that it increased at the most rapid rate from 1924 to 1935. This rate decreased slightly between 1935 and 1942, then decreased again from 1942 to about 1980.

(6) Soybean oil imported and exported (pounds to and from USA, from 1912 to 1940) (p. 58). The first soybean oil was exported from the USA in the latter half of 1919. At least 1 million pounds/year was exported from that time until 1940. The peak year was 1920, when 46.7 million lb were exported. Source: Department of Commerce, Bureau of the Census.

(7) Factory consumption of soybean oil by classes of products, 1931-1940 (p. 61). The classes are: Compounds and cooking fats [shortening], oleomargarine, other edible products, soap, paint and varnish, linoleum and oilcloth, printing ink, miscellaneous, foots and loss, total. In 1931 and 1932, and in most subsequent years, the leading class was shortening. In 1939 the top four classes were (in million lb): shortening 212.3, oleomargarine 87.1, other edible products 39.9, and paint and varnish 29.8. Source: Bureau of Census reports.

(8) Supplies of feed in 1939 (p. 78). Feed supplies are composed of feed grains (91.73% of the total), cereal by-products (5.16%, including wheat meal products, gluten feed, distillers and brewers dried), and oil and cake meals (3.10%, including cottonseed {1.55%}, soybean {1.04%}, linseed {0.32%}, and other 0.17%). Address: USA.

3663. Ladejinsky, W.; Rossiter, Fred J. 1942. Food situation in far eastern and southeastern Asia. *Foreign Agriculture* 6(4):147-64. April.

• ***Summary:*** Rice is the most important food product in all of the countries except North China and Manchuria. Following the Japanese invasion of 1931, soybean production dropped, declining 38% by 1934. Between 1935 and 1939 agricultural output increased once again, though it did not attain previous levels. Then beginning in 1939, a new decline in agricultural production set in. This coincided with the establishment of a stringent control over all aspects of Manchurian agricultural economy in order to enable Japan to get a large supply of foodstuffs as soon as possible and for as little as possible. Because of the opposition of the Manchurian farmers to this scheme, the shortage of both human and animal labor, and not altogether favorable climatic conditions–the soybean crop was reduced from 157 million bushels in 1938 to 145 million bushels in 1939 and in 1940 and 1941 to an estimated 125 and 115 million bushels, respectively. The net effect of reduced production has been a sharp decline in agricultural exports.

Since soybeans and soybean products constitute Manchuria's leading export crop, the exported volume of these products is especially revealing. In 1939-40 (October-September) Manchuria exported 25 million bushels of soybeans, 775,000 short tons of beans cake, and 150 million pounds of bean oil, as compared with 77 million bushels, 1.1 million short tons, and 220 million pounds of soybeans, cake, and oil, respectively, the previous year.

This decline in Manchurian soybean exports affected Japan's food supplies adversely. Aside from the direct use of soybeans for food, probably the most important soybean product from the viewpoint of diet is bean curd [tofu], one of the main sources of protein for the great majority of the Japanese urban population. In 1939-40 Japan was able to get 41 million bushels of soybeans (including cake and meal), against 58 million the previous year. In 1940-41 Japan increased its soybean takings to 48 million bushels, but it was much below the planned record import volume of 84 million bushels. Address: Office of Foreign Agricultural Relations [USDA].

3667. Burlison, W.L. 1942. Soybeans. Paper presented on Aug. 21. 7 p. 28 cm.
• ***Summary:*** It is not known to what group or where Prof. Burlison presented this paper, which begins: "Almost overnight the midwest has boomed as an 'arsenal' of food and oil for the United Nations, and it has done it with one of Japan's own crops–the soybean.

"Today, less than a year after Pearl Harbor, precious war material is being rolled out in a record crop of more than 14 million acres of soybeans, most of which is concentrated in five or six midwestern states. Out of those beans will come four and a half million tons of oil–oil for explosives, for food, for paint and varnish for U.S. fleets and oil medicines."

"If agriculture has any miracles, this is one of them, and only the midwest could have done it. Science, fertile fields, big farms and power machinery, coupled with the cooperation and pioneering spirit of industry and of organized agriculture, have made a major industrial and wartime crop out of what was once little more than a curiosity and a luxury. Even until just recently it was just 'cattle and hog feed,'"

In 1804 soybeans were first grown in the United States in Pennsylvania. In 1829 Thomas Nuttall tried growing the soybean in a botanical garden in the eastern United States.

"Midwest 'pioneers' mentioned along with Morse as champions and sponsors of this 'wonder' crop are Profs. W.L. Burlison, J.C. Hackleman and C.M. Woodworth, of the University of Illinois; Illinois farmers such as the late Charles L. MeHarry [sic, Meharry], John T. Smith and W.E. Riegel; Profs. W.A. Ostrander and Keller Beeson, of Purdue University; Fouts Brothers, on whose Indiana farm the American Soybean Association was organized; Johnson Brothers, Ohio farmers [Edward Franklin "Soybean" Johnson (1889-1961), and Elmer Solomon Johnson (1879-1920) of Stryker, Ohio], and I.C. Bradley, pioneer processor of soybeans.

"As a result of their pioneering efforts single farmers in Illinois are now growing more soybeans than were grown in the entire United States 40 or 50 years ago. Alfred and Eugene Knight, for instance, have 1,040 acres in soybeans on the 1,800-acre tract they are farming near Fithian, Illinois. They have 700 acres planted in rows for cultivation and weed control, and 480 acres in a single field. At one place on their land there are beans for a solid mile."

J.E. Johnson, manager of the Knight farms, is vice-president of the American Soybean Association, chairman of the Illinois Farm Chemurgic Council, and a member of the board of directors of the Illinois Crop Improvement Association.

"As recently as 1909 only 2,000 acres of soybean were reported in the census figures for the whole of the United States, and most of these were grown for hay and feed." "All this has meant a sweeping diversification of midwest agriculture."

3669. Bunnell, D.J. 1942. Soybean oil in the war time economy. *Soybean Digest.* Oct. p. 4.
• ***Summary:*** Germany has long needed to import large amounts of edible oils. Anticipating war, Germany prepared for the time when she would be cut off from world trade. A program was instituted to build stock-piles and plans were made to increase production within her zone of influence. In 1937 Germany imported 21½ million bushels of soybeans from Manchuria, up from 16 million bushels in 1936.

© Copyright Soyinfo Center 2014

Indications of stock-piling were first apparent in 1937, and increased progressively up until the war started in 1939.

After extensive experiments, Germany found that she was not well suited to large production of oil-bearing seeds. Her best potential source of new supply was from corn-growing countries within her zone of influence in southeastern Europe. Germany's Ministry of Agriculture worked out a plan in which Bulgaria and Romania were guaranteed 10% better return per acre, independent of yield, if they would convert corn acres to growing soybeans. The results were not large, yet several million bushels of soybeans were grown to add to Germany's oil supply. "During the present growing season, soybeans have been planted in the conquered territory of the Ukraine."

In the spring of 1940 when Germany invaded Norway, the 60-70 million pounds/year of mostly fish oil that the USA imported from Norway were cut off. When Germany moved into Spain, southern France, Italy, and Greece, American imports of about 100 million pounds/year of olive oil were cut off. Yet as long as the war was confined to Europe, the USA was not seriously handicapped. Our total imports of edible oil had amounted to 1½ to 2 billion pounds/year before the war; so we had lost only about 10% of our imports.

The picture changed abruptly in Dec. 1941 when Japan invaded the Philippines and the South Pacific. That area had been supplying us with well over one billion pounds/year of edible oils–mainly coconut oil from the Philippines, palm and palm-kernel oil from the Netherlands East Indies and Malaya, tung oil from China, and perilla oil from Japan. The USA now faced severe oil shortage within months.

To aggravate this situation, our domestic consumption had increased in 1941 to almost 11 billion pounds, from 9.7 billion in 1940. In addition, our allies needed oil from us; Russia had lost her main source (the Ukraine) and we were already supplying England and the other United Nations under the Lend-Lease Act. In early 1942, U.S. government officials awoke to the fact that she would have to be the world's largest exporter of edible oils for the duration of the war.

Our domestic production had to be sharply increased if shortages were to be avoided. American farmers were asked to sharply increase their acreages of soybeans, peanuts, and flax. The soybean current soybean harvest is estimated at 211 million bushels, up from 106 million one year ago. Also, peanut acreage doubled. A portrait photo shows D.J. Bunnell. Address: Vice-President, Central Soya Co., Chicago, Illinois.

• ***Summary:*** The entry for "Bean" (*mame*) includes (p. 125-26): "broad bean(s) (*vicia faba*)" = sora mame; ketsu-mame (vulgar). "French bean(s)" = ingen-mame. "Indian bean(s)" = adzusa. "parched bean(s)" = iri-mame. "small red bean(s) (*phaseolus subtrilobatus*)" = adzuki; shôdzu (with 2 Chinese characters = 2 Cc). "soya bean(s)," soy = daidzu (2 Cc). "sugared bean(s) = ama-nattô.

The entry for "Beancurd" (*tôfu*) (2 Cc) states (p. 126): "served in hot water" = yudôfu. "baked" = yaki-dôfu. baked and "smeared with sweetened miso" = dengaku (2 Cc); dengaku-dôfu. (Note: Hachihai-dôfu is–cut small and stewed in a sauce of 4 parts water, 2 parts sake, and 2 parts soy [sauce]). "fried" = abura-age, aburaage.

Beanpaste, n. an.

The entry for "Rice" states (p. 1142-43): (the riceplant) = ine; (raw grain rice) = kome; (cooked rice) = meshi, gohan (2 Cc); gozen (2 Cc); o mamma (child's word)... "glutinous rice" = mochi-gome. "glutinous rice and red beans" = o-sekihan (2 cc); kowa-meshi (given in Japan as a return for wedding); "new rice" = shimmai [shinmai]. "rice and red beans (eaten in Japan on the 1st, 15th and 28th day of each month and on birthdays, and supposed to be productive of good luck)" = aka no meshi; aka no gohan. "rice and tea"... = kigara-cha, or kigara-meshi, is rice boiled with a little soy and now generally given instead if cha-meshi. "uncleaned rice (husked but not polished) = gemmai [genmai]. "Rice-cake" = mochi; o kachin; ammo (child's word).

The entry for "Sauce" states (p. 1176): kake-shiru; (of wheat, beans, salt) miso; shôyu (2 Cc).

The entry for "Sieve" (*furui*) states (p. 1232): "a memory like a sieve" = *misokoshi-mimi.* "a hair sieve" = kinugoshi.

Note: The word "kinugoshi," in this sense, appears to have nothing to do with kinugoshi tofu.

The entry for "Soup" states (p. 1264): soppu; (o) tsuyu; shiru; (flavored with soy) sui-mono;... (made with miso) o tsuke; miso-shiru; o-mi-o-tsuke (used only by women).

The entry for "Soy" (shôyu) (2 Cc) states (p. 1265): "o shitaji" (used by women). "soy pourer" = shôyu-tsugi; shôyu-sashi.

Soy-bean, n. daidzu (2 Cc). black soybean, kuro-mame; kuro-daidzu.

Words *not* listed: kinako, kinugoshi tofu, yuba. Address: 1. Japanese Secretary to H.M. Legation at Yedo; 2. Imperial Japanese Foreign Office.

3679. Takenobu, Yoshitaro. ed. 1942. Kenkyusha's new Japanese-English dictionary. Cambridge, Massachusetts: Harvard University Press. iv + 2280 p. 24 cm. American edition. Reproduced by a photolithographic process from the 82nd printing of 1939." Title also in Japanese: *Shin Wa-Ei Daijiten.* [Eng; jap]
• ***Summary:*** "The present war has necessitated the publication in the United States of a new edition of Kenkyusha's Japanese-English Dictionary because this country is cut off from the former source of supply of the dictionary and because the demand and need for all Japanese dictionaries has greatly increased. To meet this need, the Department of Far Eastern Languages of Harvard University has undertaken the project of publishing in the United States this dictionary as well as other essential Chinese and Japanese dictionaries, and the Rockefeller Foundation has supplied the necessary funds for the enterprise.

"This American edition of the dictionary has been reproduced by a photolithographic process from the eighty-second printing of 1939. No changes have been made in this edition except to increase slightly the size of the print and the book."

The very first page, titled *Kaisetsu* ("explanation"), shows the Japanese syllabary and the romanization of each.

Near the end are two appendixes: (1) Pages 2264-74: *Saishin-go oyobi gairai-go ichiran* [List of most recent words and foreign words]. (2) Pages 2275-80: *Chugai hikaku nenpyo* [List of Japanese emperors and era names, with Japanese years and Western calendar years–starting with the first legendary emperor Jimmu (660-585 BC)].

The content of this pirated American edition is basically the same as that of Kenkyusha's 1931 second edition of this dictionary. Address: General editor, Japan.

3680. Tennessee Non Pop: New U.S. domestic soybean variety. 1942. Seed color: Yellow (straw), hilum light brown.

3681. Borth, Christy L. 1943. Modern chemists and their work: Pioneers of plenty. New enlarged edition. New York, NY: The New Home Library. [12] + 13-410. See p. 200-12, 359-74. Index. 21 cm.

• ***Summary:*** This book was originally published in Sept. 1939 as *Pioneers of Plenty: The Story of Chemurgy.* This is an enlarged version of that book.

Partial contents: Foreword, by the publishers. Introduction: 1. Chemurgy. Book one: Chemurgy's cradle rockers. 2. Chemurgy's crowded stage. 3. Hale–Father of chemurgy [Dr. William J. "Billy" Hale, a great organic chemist]. 4. Hale and Herty hunt. 5. Herty–Pioneer of the pines. 6. The Herty heritage. 7. Garvan–A career of contrasts [Francis Patrick Garvan, a Manhattan {New York} lawyer, who transformed undisciplined ideas into the potent reality of chemurgic action]. 8. Garvan–The chemurgic crusader.

Book two: Pioneers and problems. 9. Baekeland–Plastic pioneer. 10. Ford links farm and factory [mostly about the work of Henry Ford and his researchers with "the soy" / soy bean]. 11. Chemurgic oil fields [about soy oil and other vegetable oils, incl. coconut, palm, flax, cotton, corn, tung, perilla, chia, sesame, pine, peanut]. 11. The first and greatest chemurgist [George Washington Carver]. 12. Too much food! [for the first time in history]...

Book three: Americans discover America... 19. Research pays off [Henry Ford, soy beans, A.E. Staley, Dr. W.L. Burlison of the University of Illinois, Adolf Hitler, American Soybean Association, the four regional laboratories]. 20 The farm grown automobile arrives [Henry Ford's and Bob Boyer's plastic car].

Since Ford began his soy research in 1930, he has spent more than $3 million on this project, upon which more than 20 scientists have been constantly employed (p. 206). Since as early as 1919, Henry Ford's "mind was moving toward chemurgic conclusions." Many of his statements in interviews during the 1920s, although "they must have sounded far-fetched at the time, dovetail nicely into the currently unfolding pattern of chemurgic thinking" (p. 207). For every million Ford automobiles, about 2 million lb of soy-bean oil are used (p. 207-08). Even today about two thirds of the world's annual crop of soybeans (6 million tons) are raised in Japan's "puppet state" of Manchukuo (p. 209).

Address: Botanisches Institut, Naturwissenschaftliche Fakultaet, Kaiserl. Universitaet zu Tokyo [Japan].

3683. Nakajima, K. 1943. Nattôkin no ôyô ni kansuru kenkyû (Jogen oyobi dai 1 pô) [Application of *Bacillus natto* I]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 19(3):155-62. March (Chem. Abst. 46:7703). [6 ref. Jap]

3684. Gamio, Manuel. 1943. Soybeans in the Indian diet. *Soybean Digest.* April. p. 4. Translated from the Spanish by Edna O. Miller.

• ***Summary:*** As early as 1929, when Dr. Gamio or his organization (Inter-American Indian Institute) attended the third conference of the "Institute of Pacific Relations" held in Kyoto, Japan, he became aware of "the high nutritive value of the soybean and we realized that its cultivation and use in Mexico would solve both biologically and economically the difficult problem of food for the people.

"Upon recommendations of the First Inter-American Indian Congress of 1940 and of the Board of Directors of that Institute, there was presented to the Office of the Coordinator of Inter-American Affairs and the Department of State a project that has for its objective bettering the nourishment of the Indians of America by the use of the soy bean and its derivatives. This project is to begin in Mexico," in the Valley of Mezquital, state of Hidalgo. "The project of the Institute is confined to only one section of the valley, where soy beans will be planted and kitchens set up in which the Indians will be taught to season and use the foods which can be derived from soybeans...

"In parts of Mexico, principally in the northern plateau, this legume is already being cultivated on a considerable

© Copyright Soyinfo Center 2014

scale, but we understand that its production will be devoted chiefly to industrial uses and perhaps to exportation." A photo shows Dr. Gamio. Address: Dr., Director of the Inter-American Indian Inst., Editor of the Boletin Indigenista, Mexico City, Mexico.

3685. Hartz, Jacob. 1943. Soybeans in the south. *Chemurgy Digest.* June 30. p. 99-100.
• ***Summary:*** "The history of soybeans in the South has been very brief. Soybeans were first grown for hay and forage purposes approximately twenty years ago in a very small way in the Mississippi Valley...

"When the small harvester-threshers, commonly called combines, were introduced for the harvesting of soybeans, the acreage increased by leaps and bounds. At that time, (1933) the cotton reduction program was staged by the Triple A. This took out of production 13½ million acres of cotton land in the South and Southwest. Therefore, soybeans really made the first big increase in acreage a decade ago.

"However, the big impetus to soybean growing in the South was given when all supplies of vegetable oils and high protein meals were shut off from the Orient and Southwest Pacific. Japanese aggression resulted in freighters being put to uses other than bringing these products to the Pacific coast.

"The writer has been growing and selecting adapted varieties and distributing soybeans as a seedsman in the South for the past eighteen years" [i.e. since 1926].

"Had Southern farmers and seedsmen insisted on their colleges of agriculture and experiment stations doing half as much work in the propagation of new varieties as has been done in Illinois, Indiana and Ohio, our soybean program for the South would be much further advanced than it is today."

"World War II has stopped the flow of vegetable oils and meal from the Orient and South America to our West Coast. The War Production Board, acting last year through the A.A.A., encouraged Southern farmers to triple their soybean acreage by pegging the price at $1.60 per bushel. This resulted in the South's largest production."

"For several years past the United States Regional Soybean Research Laboratory has directed a program in the twelve northcentral soybean growing states. Unfortunately, their funds were not sufficient to permit work in the South. However, funds have been made available since January 1 through the Bankhead-Jones Act to enable this laboratory, working under the direction of the United States Department of Agriculture Bureau of Plant Industry to carry on the same type program in twelve southern states including Oklahoma and Texas. This work is being done with the cooperation of the colleges of agriculture and experiment stations in those states."

"Mr. Jacob Hartz is a member of the Chemurgic Council, and is recognized as one of the leading authorities on soybean growing, being Southern Director of the American Soybean Association. He is owner of the Jacob Hartz Seed Company at Stuttgart, Arkansas, and is a member of the Arkansas State Plant Board, representing the Arkansas Seed Growers' Association. He has been active in various seedsmen's groups including the Southern Seedsmen's Association." Note: This article was adapted from one in *Southern Seedsmen.* Address: Owner, Jacob Hartz Seed Co., Stuttgart, Arkansas.

3686. Brown, Wenzell. 1943. Hong Kong aftermath. New York, NY: Smith & Durrell, Inc. 283 p. See p. 80. June. No index. 21 cm.
• ***Summary:*** The story of the fall of Hong Kong in 1941, and the experiences of the author in the Stanley Prison Camp, established by the Japanese conquerors.

Page 80: "We drew up the package and examined it and found that it contained some bean curd cheese and two pomeloes... Bean curd cheese has much the flavor of a very strong Gorgonzola. We each had a square of about a quarter of an inch which flavored an entire bowl of rice."

3687. Ohwi, Jisaburo. 1943. Symbolae ad Floram Asia Orientalis XIX. [Contribution to the flora of East Asia XIX]. *Acta Phytotaxonomica et Geobotanica* (*Shokubutsu Bunrui Chiri*) 12(2):107-13. June. [14 ref. Lat; Jap]
• ***Summary:*** On p. 110 the author first named *Glycine koidzumii.* In Okinawa it is known as *Miyako-jima tsuru-mame* (Miyako Island vine bean).

3688. *Soybean Digest.* 1943. Japs eat rice and bean curd. June. p. 5.
• ***Summary:*** "The Japanese soldier in the field eats a highly nutritious, scientifically balanced diet particularly well adapted to his special needs and considerably better than the customary diet of the Japanese civilian, according to studies of captured Japanese army rations made at the Board of Economic Warfare. Food items tested include the standard ration biscuit, a health drink called "Mirin" containing lactic acid, a yeast preparation called "Florylin," wheat germ tablets, and a tinned ration labeled 'rice and soybean curd.'

"Rice and bean curd is a mixture of cooked rice and soybean protein flavored with shoyu sauce. Soybeans ground in water yield soluble proteins which form a solution known as 'soybean milk.' When boiled this forms a surface skin [yuba] due to the coagulation of proteins, and the skin when totally or partially dried is highly nutritious, containing valuable proteins which are considered a satisfactory substitute for fish or meat.

Note: The writer is confused about the difference between tofu and yuba. This food has nothing to do with yuba. It is probably vinegared rice in deep-fried tofu pouches (*Inari-zushi*).

"The rice and bean curd ration used by the Japanese thus offers an excellent combination of carbohydrate and protein.

© Copyright Soyinfo Center 2014

It is, in fact, a sort of cooked sandwich, in which boiled rice takes the place of bread and the soybean protein takes the place of meat."

3689. *New Yorker.* 1943. Meat without bones. 19(24):14-15. July 31.
• ***Summary:*** A humorous article. "Governor Dewey's announcement that only the soy bean stands between New Yorkers and starvation made the soy as timely as Badoglio" [Pietro Badoglio, and Italian soldier and politician. As Prime Minister of Italy, replacing fascist dictator Mussolini, he signed an Armistice with the Allies].

"We immediately sent out our man with instructions to get the soy story and spare no expense doing it, and he has submitted the following facts. In the first place, it is true that a diet of soy beans and water will sustain life indefinitely; Governor Dewey could live on soy beans and water until he becomes president." This year the acreage will probably double or triple as "the result of the soy's publicized ability to take the place of meat and other protein foods that are now hard to get. In this country the soy is considered chiefly an article of civilian diet, but it is also included in military rations as an ingredient of such things as soups, gravies, and pie crusts."

"In China as well as Japan, soy bean curds are called 'meat without bones.'"

Soy bean oil can be used for pretty much any purpose, including a butter substitute and artificial rubber (which won't stretch but works fine as a doormat). The beans may be served as a "green vegetable. Put in a warm, steamy place, they shoot out sprouts, which make a nice salad. Soy-bean flour makes good muffins. Mixed with ten parts water, it turns into a palatable milky drink. From this milk several kinds of cheese and something like buttermilk may be produced. The dried bean can be used as a breakfast cereal, or, roasted and ground, as a coffee substitute.

"Soy meal with the oil removed has dozens of uses in industry... Soy-bean glue is now the preferred adhesive for pine and fir plywood, from which the Mosquito bomber is made. Soy beans can also, of course, be put in beanbags."

Note 1. This is the earliest document seen (June 2012) with the phrase "Meat without bones" (or a similar phrase) in the title; it is used to refer to tofu.

Note 2. This is the earliest document seen (Aug. 2013) that uses the term "milky drink" to refer to soymilk.

Note 3. Notice the interesting use of the terms "the soy's publicized ability..." and "the soy is considered..."

3693. Miller, Harry W. 1943. Soybeans and the Orient. *Soybean Digest.* Sept. p. 18, 44.
• ***Summary:*** "It was my privilege during 23 years of residence in the Orient to travel very extensively through the provinces of China, and to acquaint myself with all eastern Asia relative to soybean production. I found that while the central and northern provinces of China including Manchuria are the principal soybean producing areas of the Orient, that soybeans are widely used by all the groups of Orientals, save the Filipinos, and the Malays, and are universally used by the Chinese, and that wherever they emigrate in any part of the world, the one universal food of the Chinese is soybeans, and not rice, as so often claimed.

"There are millions of the Chinese who do not live in the rice producing territories. The Chinese and many of the Oriental people have come to understand by common experience rather than scientific deduction that soy protein is an essential to livelihood and cannot with safety he dispensed with from their diet. Wherever in Chinese occupied territories soil and climatic conditions are at all favorable to the production of soybeans, they will be found as one of the stable crops. However the yield in the tropical portions of China is rather small. They have depended on importing beans from Manchuria and northern China. The same is true of the South Sea Islands.

"Foundation: Much that we have learned concerning handling soybeans and preparing them into food materials we must credit to the knowledge gained through studies made and travels in the Orient, chiefly in China, Korea, and Japan. Like their handling of many other things, they have developed the soybean culture and processing up to a certain point and there they stand. We have built upon their foundation, and have carried research in the agricultural field, as also processing methods several steps farther, and

© Copyright Soyinfo Center 2014

have made soya food products not only better but far more digestible, and therefore nutritionally more available, and found out that the bean can be made tasty as well.

"You may ask how are the Oriental people using the soybean. There are many ways. If you were to visit the Chinese markets during the late summer and early autumn months you would be able to purchase shelled green soybeans. You would also be able to purchase the unshelled beans, that is in the pods just like you buy peas in the pod. Some people prefer to purchase them in the pods, cook them in the pods in salt water, and then squeeze out the beans and eat them from the pod. There have been no canning facilities available to the Chinese for any of their products in years past, and so the use of the green soybean is only seasonable. You might expect that since the Chinese have stone mills everywhere to grind their wheat and their corn into flour and meal that they would be grinding their soybeans into a flour. But soy flour is largely an Occidental product. It would be very difficult for you to pick up in any of the markets of China a pound of soy flour.

"Curd: The Chinese have learned through long experience that the greatest value nutritionally from the soybean is obtained through a water extraction of its protein. This milky liquid after it is strained is coagulated into a cheese [tofu]. Ninety percent and possibly even higher of the nutrition the Oriental obtains from the soybean is taken in the form of this cheese. Of course they have many ways of dealing with this soft gelatinous curd, which has a very high water content. They press it into cakes, about the thickness of a large slice of bread. This then is placed in a brine solution or other flavored liquid, and later sliced up like we at times dice cheese. Again it is pressed into thin sheets that are about a sixteenth of an inch in thickness. These are also diced up and eaten like a relish or a salad.

"Another common product is a thin semi-transparent sheet of protein [yuba] made by a slow heating vat filled with this soya milk. A heavy scum will come to the surface, which they lift off at intervals and suspend to dry. These sheets are later on used as food wrappers. They can use these sheets which are pure protein, like we can use cellophane sheets, but instead of wrapping parcels with them they stuff them with certain vegetables, imitating the body and legs of a fowl, or the form of a fish, or they can represent almost anything in the way of an animal, and by submitting them to a little baking, give the same nice brownish hue by the use of a little oil, so you could hardly tell whether you were eating actual turkey or an artificial one.

"When you go to the market where the soybean producer delivers his finished products, you will see a great variety of foods made from soybeans. As I say, you can buy the bean curd in squares, or you can buy the patties, or you can buy the thin sheets of soya cheese, or you can buy these large semi-transparent sheets of soya protein. These in turn can be incorporated into many tasty and highly nutritious dishes, by the skill and ingenuity of the cook, and has also the likeness of meat in flavor and appearance. Naturally nutritionally we know of the high value of these proteins for a proper substitute for meat, fish, fowl, eggs, and the protein of animal milk.

"Of course the Chinese have as one of their big industries the making of oil from the soybean, and that is true of the Koreans and the Japanese. They heat the bean, grind it, and put it into wooden presses and extract the oil by driving wedges into their oil presses, bringing a tremendous pressure to bear upon the roasted beans. This oil is all used for edible purposes.

"The residue of the bean cake contains about 6 percent of oil, and has been exported in recent years to great extent. But the Chinese have in certain localities ground it up and used the bean cake meal for food, although much has been used in China and exported for fertilizer.

"The soybean is also extensively sprouted, and these sprouts are used in their vegetable food mixtures and eaten as bean sprouts.

"I shall not attempt at all to discuss the varieties of soybeans found in the Orient. I have seen almost every color, every shape and size, running from a small shot sized bean to the large jumbo sizes, such as we have in our edible list. All the beans that I have seen that come from India have been of a very small size. When we buy beans in China we go to the market and ask for soya beans. If we are not satisfied with what they have we go to another shop, and see if we can find a bean of superior size and quality. We never purchase soybeans in China by name of any variety.

"As is well known, China and most parts of the Orient grow from two to three crops per annum on the same ground. In some areas when they harvest a rice crop they plant a soybean crop on the same soil. In other areas when they harvest a wheat crop they put in a crop of soybeans. We believe in many of our central states, and certainly this would be true of the southern portions of our central states, that it would be quite practical to harvest a crop of peas, and disk the land, and plant and harvest a crop of soybeans" (Continued).

3700. Rebelo Hespanha, Jaime. 1943. A soja: Cultura e utilizacao dos seus produtos [The soybean: Cultivation and use of its products]. Lisboa, Portugal: Livraria Rodrigues. 42 p. No index. [Por]
• ***Summary:*** Contents: Part I: Soybean culture. 1. Introduction: History and origin, botanical description, advantages of its cultivation for farmers. 2. Soybean culture: Climate, terrain, types of culture, seed and sowing, varieties and sub-varieties, seed characteristics, time of planting, manuring and fertilizing, precautions during cultivation, harvest. 3. Yields.

Part II: The products of soya and its utilization. 1. As human food: As a green vegetable (*como legume*), flour (*farinha*), milk (*leite*), cheese (*queijo-caseina* [tofu]), oil (*oleo*), the hulls (*bagaço*). 2. Feed for cattle. 3. Industrial products.

In Spanish the soybean is called "Soja, Soya, Haba, or Guisante de Japan."

In the section on soybean culture, pages 10-11 state: "For 20 years [i.e. since 1923], the soybean has been cultivated in Ribatejo, with the only goal of providing feed for cattle. The soybean is now being cultivated technically in Alentejo, in Baixo-Minho, and in parts of Estremadura. [Note 1. Ribatejo, Alentejo, Estremadura, Baixa, and Minho are all provinces of Portugal, according to the U.S. Board of Geographic Names for Portugal, 1961.] The land in these areas is well suited for growing soybeans. The most admirable initiative for the cultivation of soybeans in Portugal was undertaken by the Malange [Malanje] Agricultural Station (in Angola), which obtained a yellow variety that had been given an excellent classification in Germany.

"Soybean cultivation in Angola could be extensively spread, even among European farmers. The growing period does not exceed 145 days, and the yield averages 700 kg of seeds [per hectare], bringing a price of $25 (0.25 angolares) per kilogram. It would be good if the example given by the Malange Agricultural Station would spread to the [area around the] cities."

Note 2 This is the second earliest document seen concerning soybeans in Portugal, or the cultivation of soybeans in Portugal. This document contains the second earliest date seen for soybeans in Portugal, or the cultivation of soybeans in Portugal (1923 in Ribatejo). The source of these soybeans is unknown. The author was born in 1891.

Note 3. This is the earliest Portuguese-language document seen (April 2013) that uses the term *queijo caseina* to refer to tofu. Address: Major do S.A.M., Portugal.

Varieties available from producers or dealers in the Corn Belt ("Leading vegetable varieties adapted to Indiana are listed in order of maturity... Numbers accompanying variety names are U.S.D.A. introduction numbers"): Very early (Giant Green). Early (Bansei, Fuji, Chusei, Kanro). Midseason (Hokkaido, Jogun, Willomi, Kura, Sousie [Sousei], Toku, Emperor, Tastee). Medium late (Rokusun, Funks Delicious [Funk Delicious], Higan, Easy Cook [Easycook]). Late (Aoda). Very late (Nanda). Seed sources ("For names of growers or distributors of vegetable soybean seeds, write to the Agronomy Extension Division, Purdue University"). Culture ("Rabbits like vegetable soys"). Commercial uses ("In Wisconsin, Ohio, and other states companies are canning green vegetable varieties on a commercial scale in much the same manner as garden peas"). Home uses: Green soybeans, canning green soybeans ("vegetable soybeans"), dry soybeans (with 8 recipes, including those for "soybean pulp–made by mashing, grinding, or pressing the cooked dried soybeans through a coarse sieve"). Soybean sprouts (with 4 recipes). Soybean flour, grits and puffs (with 8 recipes). Address: 1&3. Home Economics Extension; 2. Agronomy Extension. All: Lafayette, Indiana.

3709. *Soybean Digest.* 1944. Lack of soy sauce worries Nisei workers. July. p. 11.
• ***Summary:*** In Urbana, Illinois, a shortage of soy sauce at "the chow shack in the work camp manned by Nisei evacuees threatened the morale of these workers in their pea vining operations..." These are "American citizens of Nipponese parentage, who had been evacuated from Pacific Coast areas to avoid trouble there... Barrels or 10 and 15 gallon tins were what they needed. Soy sauce seems as essential to these evacuees as coffee to the average American worker."

and Surgery 1944. Far Eastern nutritional relief (Japanese culture). OPNAV 13-18. Civil affairs guide. Restricted. Washington, DC: Office of the Chief of Naval Operations. vi + 19 p. See p. 4-13, 15-16. Aug. 15. 18 cm.

• ***Summary:*** From the title page: "Prepared by the Naval Medical Research Institute, Bureau of Medicine and Surgery, for Military Government Section, Central Division, Chief of Naval Operations." At the top of every page is written the word "RESTRICTED," which is also underlined for added emphasis.

Note: On 6 Aug. 1945 the U.S. dropped the first atomic bomb on Hiroshima, Japan. This manual was prepared about one year before that event. Therefore it appears that the U.S. believed, a year before the war was over, that it would win the war.

Page 4: Table 3. Proposed basic rations (daily intake per person). In the left column are the basic foodstuffs needed. Across the top are: Weight, calories, calcium, iron, vitamin A, thiamin, riboflavin, niacin. Soy sauce can be used as a source of salt. "Provisional emergency nutritional plan"–when the optimal diet is unavailable but a bare subsistence diet is all that is possible–for 2-3 months.

Page 5: Table 4, "Recommended emergency nutritional plan" includes soybeans and groundnuts as types of "Pulses"–of which 100,000 people will need 9.0 long tons per day.

Page 6: The basic Japanese food habits may be summarized as follows:

"(a) All Japanese, rich and poor, eat fair quantities of three types of food: rice, which provides bulk and carbohydrates; beans, especially the soybean, which provide protein and some fats; and pickled vegetables and fruits, which provide vitamins.

"(b) Fish is eaten by all, but only the more well-to-do eat it in quantity. It never replaces rice.

"(c) Fresh vegetables are common in the diet of all Japanese, although (as in other countries) the farmer probably eats more than the poor city dweller does.

"(d) Meat is not a major article of diet, although its popularity has increased greatly in recent years."

Azuki bean paste is also used as a covering on some rice cakes. As for salads: "A Japanese dressing of vinegar, soy sauce, and sugar on thinly sliced cucumber or cold, boiled spinach would be more in keeping with Japanese food habits."

Page 7: "Fried bean-curd (*age*) is sometimes served with boiled rice (*gohan*)." Discusses various types of sushi.

Page 8: Including inarizushi (with fried bean curds).

Note 1. This is the earliest English-language document seen (April 2013) that contains the word *inarizushi* (one word without hyphenation). "3. Beans (*Mame*). Beans are almost as important as rice in the Japanese diet. The two most important beans are the soybean (*daizu*), and a small red bean (*azuki*)."

Page 9: "The soybean forms the basis of the salty miso paste which in turn is the basis of bean soup or misoshiru. This bean soup, together with rice and pickles, is the standard breakfast throughout the country, and is eaten as part of dinner by millions of Japanese. Added to the thick salty soup are various bits of vegetable and fish which the housewife may have available.

"In cities miso is made by specialists and sold in small food shops, but each summer in the country every housewife makes her own annual supply.

"Soy sauce or shoyu is of vital importance in the Japanese diet. This is used as a sauce for fish, for rice dishes, and for meat dishes. It is to the Japanese what salt is to us, an indispensable adjunct to any meal. Any strange food might be made palatable if there were soy sauce to go with it.

"Tofu is a third important soybean product. This is a bean-curd cake. As a rule it is prepared in square blocks by special tofu makers who peddle it to the neighborhood. It forms a substitute for fish at a modest meal. The flavor and consistency of tofu vary with the region and maker. Tofu makers often raise pigs on the waste products of tofu making.

"The small red azuki beans are made into paste and used as stuffing for rice cakes, and the beans are sometimes mixed with rice on festival occasions. Azuki beans are in the nature of a minor special treat."

"Most farmers grow at least part of the beans they need.

"4. Pickles (Tsukemono or okoko. 'fragrant thing'). Almost nothing is served in Japan without some pickled product to go with it as an appetizer. Thus, pickle is served with all ordinary meals, with boxed lunches (bento), or often together with tea or wine at meals.

"The commonest form of processed pickle purchased in shops is pickled radish or daikon. (The pickle itself is called *takuan*). Another common form is pickled plum or umeboshi."

Page 10: "Fish and shellfish often form a part of sushi, which is plain rice flavored with vinegar, with slices of fish, shellfish, or omelet laid on top or rolled in seaweed or fried bean-curd. Fish are also eaten in soup, especially a clear soup with chunks of the fish in it."

Page 11: Fruits and vegetables include "(f) Konnyaku (paste made from the starch of the plant 'devil's tongue')." "Konnyaku is boiled and processed into squares and sold–then cooked in soy sauce or soup. It is also used in shredded form."

Other vegetables include "(d) Bean sprouts (*moyashi*)."

Page 12: "Most vegetables are boiled and eaten with soy sauce and a little sugar. They are frequently put into soup, cooked into a stew, chopped up and mixed with rice, or pickled."

Page 13: "Salt (brine production) is used generously in making miso and green vegetable pickles. Salt is a government monopoly and is sold at little or no profit."

© Copyright Soyinfo Center 2014

"8. Meat. Such meat dishes as sukiyaki, using either beef or chicken, are common in middle and upper-class urban families. Soy sauce is an important element in cooking sukiyaki. In general, before the war beef and pork were coming to be eaten more and more among the poorer classes, especially in cities."

Page 14: "Major Japanese dislikes" include:

"(a) Entrails and internal organs of cattle or pigs, e.g., livers, tongue, or brain. (b) Lamb (said to smell). (c) Mutton. (d) Cheese (strongly disliked by most Japanese). (e) Milk and butter would be hard to make acceptable. This applies to foods fried in butter..."

Page 15: "11. Field recommendations:

"(a) Basic food habits are ingrained early in childhood. Food is a center of anxiety and fear. In times of war and calamity. Thus, food will be subject to wild rumor and constant criticism.

"(b) The cultivation of gardens should be encouraged.

"(c) So far as Japan is concerned, a general supply of fresh pickled vegetables and shoyu will go a long way toward making even the handouts of a conqueror palatable.

"(d) Because food habits are often difficult to change, it would probably be helpful to enlist local assistance in the preparation and distribution of food supplies. Cooks make excellent anthropologists. Given any food, a Japanese cook would manage to Japanize it. For instance, in cooking vegetables Japanese use soy sauce and sugar, not salt and butter. Similarly, spaghetti in tomato sauce or macaroni in cheese would not be acceptable. Cooked in soy sauce, sugar and dried bonito shavings, however, it would probably be eaten, as in this form it would be similar to Japanese soba or udon."

Table 5, "Composition of Japanese foods per 100 grams (Ready to be eaten)" includes: "Bean-curd omelet. Pea curd. Bean curd (*Tofu*). Bean residue [okara]. Sprouted beans (5% protein)."

Page 16: Table 6 (8 columns), "Production and consumption of foodstuffs in Japan proper–1936" includes rice, wheat, barley, other cereals, soybeans, other beans,... For each food is given: Name of food. Area (1,000 acres). Value of production (million yen). Production (million pounds). Exports (million pounds). Imports (million pounds). Total (million pounds). Consumption per capita (pounds; Rice: 350.9. Wheat 42.2. Barley 36.3. Soybeans 27.2. Fish 67.3. Meat 4.8. Eggs 5.9. Dairy products 0.8, but fresh milk, of which consumption amounted to 1.04 gallons per capita, has not been included). Extensive notes accompany Table 6.

3711. Moyer, Raymond T. 1944. The agricultural potentialities of Manchuria. *Foreign Agriculture* 8(8):171-91. Aug. [12 ref]

• ***Summary:*** The name Manchuria has been used for some centuries by Western peoples as a designation for the territory located outside the Great Wall, northeast of China proper. The Chinese during more recent times have called it the Three Eastern Provinces, meaning Liaoning (Fengtien), Kirin [Jilin], and Heilungkiang Provinces. Under the Japanese after 1931 this territory, together with that of a fourth Province, Jehol, was organized into a political entity to which the name "Manchoukuo" was given. As used in this discussion, Manchuria refers to the territory included in the four Provinces. Together they cover an area estimated at 496,531 square miles, which is greater than the combined areas of Germany, France, Belgium, and the Netherlands. The population in 1940 was stated to be about 43 million, at least 90% of which was Chinese. A distinction is often made between North Manchuria and South Manchuria. No sharp line of demarcation divides these regions. The 44th parallel is sometimes used as a line divided the two.

Slightly more land is devoted to the production of soybeans than to any other crop. The important pre-war crop regions and their principal crops are as follows: Kaoliang-millet-soybean region–grows a tall, grain sorghum called kaoliang, Maize-soybean-kaoliang region, Soybean-millet-kaoliang region, and the soybean-wheat-millet region. The soybean acreage of Manchuria was 8,700,000 acres, Kaoliang covered 7,300,000 acres, millet had 6,300,000, and maize and wheat had 3,300,000 and 2,700,000 acres respectively. The calculated yield of soybeans, over the 5-year period 1934-38, averaged 16.8 bushels per acre as compared with 17.2 for China and 16.1 for the U.S. (1931-39).

Of the total value of all products exported, average 1933-37, approximately 70% was contributed from agricultural and animal products. Soybeans and soybean products alone accounted for 49% of the total. The annual export of soybeans averaged about 2,300,000 short tons. Soybean oil averaged about 88,000 tons which, if converted into its equivalent in soybeans, brings the total, in terms of soybeans, to about 3,200,000 tons. Further amounts of other beans exported raises the total average quantity to about 3,400,000 tons. In addition, about a million tons of soybean cake were exported (see table 6). Of the soybeans exported, about 60% went to Europe and most of the remainder to Japan and to China proper. Of the oil, Japan took a major part, but China also took a large quantity. Of the cake, about 80% went to Japan and most of the remainder to China.

From 1934-38 the average amount of soybeans produced was 4,362,000 short tons. There were 3,157,000 short tons available for export, and they imported none. Thus there were 1,205,000 short tons available for utilization, and 1,024,000 tons available after providing for feed and seed. The number of pounds available, per capita, for human consumption in Manchuria was 57.8 pounds. In China proper, it was only 29.8 pounds. Address: Office of Foreign Agricultural Relations.

3713. Lang, A.L. 1944. Facts on soybean fertilization. *Soybean Digest.* Sept. p. 52, 54, 58.
• ***Summary:*** Piper and Morse state that in China and Manchuria the only fertilizer applied is a compost of stable manure and earth. In some districts in Japan, straw ashes and phosphate of lime are used, while in others wood ashes and phosphate of lime are used. "These treatments would indicate response to organic matter, calcium, phosphorus and potassium."

The first fertilizer studies on soybeans in the USA were by Flagg at Rhode Island and Phelps at Connecticut. Flagg found that applications of 150 to 450 pounds of nitrate of soda were not profitable. Phelps found in studies from 1895 to 1901 that nitrogen fertilization failed to increase the yield or protein content of the beans produced.

In recent years, research on soybean fertilization has been concentrated in the Midwest Cornbelt areas. Researchers include Albrecht and Klemme of Missouri, H.R. Meldrum of Iowa, and R.E. Yoder of Ohio [in the Agronomy Dept., Ohio Agric. Exp. Station]. "At the Illinois Station, soybeans have been grown on the soil fertility plots of the local farm and outlying experiment fields since 1903." Soybeans seem to do better on poor run-down acid soils than almost any other Cornbelt crop. They respond well to phosphate and potash fertilizers. A photo shows A.L. Lang. Address: Assoc. chief of the soil experiment fields, Univ. of Illinois.

3714. Umeda, Isao; Tateno, M.; Matsumoto, M. Assignors to Noda Shoyu K.K. 1944. Chômiryô seizô-hô (shinshiki 1 gô) [Method of preparing a seasoning (semi-fermented soy sauce #1)]. *Japanese Patent* 167,668. Oct. 18. Application filed 12 April 1943. [Jap]*
• ***Summary:*** This Shinshiki #1 patent for making chemical soy sauce was opened by Kikkoman to other shoyu brewers in Japan free of charge (Yokotsuka 1980). In 1948 the same offer was made with the Shinshiki #2 patent for a soy sauce made by a combination of fermentation and chemical processes. Address: Noda Shoyu Co., Noda, Japan; 1. Head of research lab.; 2. Actual discoverer; 3. Asst. researcher.

3715. Asai, Toichi. 1944. Ueber die Mycorrhizenbildung der Leguminosen-Pflanzen [On the building of mycorrhizae in leguminous plants]. *Japanese J. of Botany* 13(3):463-85. Nov. 28. [12 ref. Ger]
• ***Summary:*** Among the important crops plants that have vesicular-arbuscular (VA) mycorrhizae are soybeans. Table 1 (p. 465-66) shows the various leguminous plants (including soybeans) in which the existence of active endotrophic mycorrizae have been confirmed. A table (p. 472) gives details on cultivated soybeans. A detailed summary of the article is given (p. 484-85). Address: Botanical Lab., Fifth Higher School of Kumamoto.

3716. Lee, Hsiang Kai. 1944. Miracle bean for starving millions. *Soybean Digest.* Nov. p. 10.
• ***Summary:*** "Because of the importance of the soybean as human food" the history of China has been "marked with bloody clashes. The invasion of China in 1931 by greedy Japs was caused primarily by the lush prize of the immense soybean crops of China, which in the past decade have averaged more than 250 million bushels a year. China's rich soybean land was seized with two objectives: The first one is the insidious scheme to subjugate China's 450 million people through starvation, the second one is to utilize the immense crops of soybeans to build up Japan's industrial strength for world conquest."

The author "was born and raised on soybeans in Honan, China." Address: Engineer, Ford Motor Co.

3717. Markham (James E.). 1944. Display ad: Notice of sale. Invitation for bids for the purchase of shares of stock of Oriental Show-You Company. *Chicago Daily Tribune.* Dec. 3. p. A6.
• ***Summary:*** World War I is now raging. This company in Indiana was founded and owned by a Japanese man, Mr. Shinzo Ohki. Japanese were not allowed to become American citizens if they had been born outside the USA.

This fairly large, prominent ad begins: "James E. Markham, Alien Property Custodian, invites bids for the purchase as a whole of 132 shares of common stock, of par value $100 each, (constituting approximately 39% of the outstanding common stock) and 20 shares of preferred stock, of the par value of $100 each (constituting approximately 17% of the outstanding preferred stock) of *Oriental Show-You Company,* an Indiana corporation, engaged in the manufacture and sale of Oriental Show-You sauce and food products, with its office and place of business at Columbia City, Indiana..."

"All bids must be presented at the office of the Alien Property Custodian, 123 South LaSalle Street, Chicago, Illinois, on or before 12:00 o'clock noon, Central War Time, on December 20, 1944, at which time and place all Bids will be opened publicly. The stock will be sold only to American citizens." Address: Alien Property Custodian, Chicago.

3718. Bayles, D.P. 1944. Soy oil is pinch hitting. *Soybean Digest.* Dec. p. 8-9.
• ***Summary:*** "Use of soybean oil in protective coatings remained about 2 to 2.5% of total oils employed by that

© Copyright Soyinfo Center 2014

industry from 1930 until the outbreak of the Sino-Japanese war in 1937. Then with the curtailment of tung oil supplies, it rose in importance until in 1941 it represented 4.7% of total oils used for drying purposes." Address: Bureau of Foreign & Domestic Commerce.

3719. Finding aid for the Abiko family papers, ca. 1890-1944 (Archival collection). 1944. University of California, Los Angeles (UCLA), Library, Department of Special Collections. 44 boxes (22 linear feet). 2 oversize boxes, *
• ***Summary:*** Collection No. 1690. "Kyutaro Abiko (1865-1936) was the longtime publisher of the *Nichibei Shinbun* of San Francisco, the leading Japanese daily newspaper published from 1899-1942. He also organized the Central California Land Company. In 1909, he married Yonako Abiko (1880-1944). After the death of Kyutaro in 1936, Yonako Abiko became publisher of the *Nichibei Shinbun.* During World War II, she was briefly interned at the Tanforan Assembly Center in San Bruno, California. The couple had a son, Yasuo Abiko (1910-88). The collection consists of correspondence, diaries, photographs, and memorabilia related to the Abiko family. Most of the material in the collection is in Japanese, but some is in English as well."

Physical location: "Physical location: Stored off-site at SRLF. Advance notice is required for access to the collection. Please contact the UCLA Library, Department of Special Collections Reference Desk for paging information." Address: Los Angeles, California 90095-1575.

3720. International Institute of Agriculture. 1944. Agricultural commodities and raw materials produced and consumed in the different parts of the world 1934-1938. Villa Umberto, Rome, Italy: IIA. 229 p. Index. 24 cm.
• ***Summary:*** Concerning world soya production (worth $184 million gold), Asia [mainly China, Manchuokuo [Manchuria], Chosen [Korea], Netherlands Indies (Java and Madura), Japan, Kwantung, and Taiwan; based on 1939 IIA studies of world market #4] produces 89.6% (393.5 million bu of 60 lb each, worth $165 million), North America 9.4% (41.2 million bu, worth 17 million), USSR 0.6% (2.6 million bu, worth $1 million), and Europe 0.4% (1.8 million bu, worth $1 million).

Concerning world soya consumption (worth $184 million gold), Asia consumes 78.4% (worth $145 million), Europe 11.6% (worth $21 million), North America 9.3% (worth 17 million), USSR 0.7% (worth $1 million).

Between 1934 and 1938 soya production has increased greatly, rising 90% in Asia, 9% in North America, and 1% in the USSR and Europe. The biggest soya exporting continent is Asia, and the biggest importer is Europe. In Europe, Germany (at 24.3 million bushels, each 60 lb) imports more than all other European countries combined, followed by Denmark (8.8 million), the UK (4.8), Sweden (4.4), and Netherlands (3.7). Address: Rome, Italy.

3721. Miller, Harry W. 1944. The story of milk from the soya bean. Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 1-6.
• ***Summary:*** This rare and very interesting booklet was sent to Soyfoods Center by Charles D. Howes of Mt. Vernon, Ohio, in Feb. 1979.

Contents: Full page photo of the "International Nutrition Laboratory established for processing soya bean foods, located at Mt. Vernon, Ohio. Foreword, by J.A. LeClerc, PhD, Formerly Senior Chemist of the USDA (Retired). March 5, 1944. The story of vegetable milk (Soyalac), by Harry W. Miller, M.D. Early trend, observations in China, back in America, the milk question, encouraged to produce a vegetable milk, further studies in China, the role of the International Nutrition Laboratory in America. Other products of the International Nutrition Laboratory.

"Foreword: The preparation of a palatable and appetite-appealing soya milk is proving a great boon to people allergic to cow's milk. It has been estimated that 20 to 25 per cent of our population are allergic to ordinary milk and many thousands of babies suffer from infantile eczema and other violent symptoms, whose condition clears up when transferred to soya milk feeding.

"Soya milk as prepared has approximately the same composition as cow's milk, except when soya milk is especially prepared for infants its formula simulates mother's milk. Soya milk contains more Vitamin B than cow's milk, and an equal quantity of Vitamin B-2. The valuable proteins found in soya milk contain all the Amino-acids known to be essential for growth. Preparations made from the soya bean are relatively rich in iron and copper, so that soya milk compares very favorably with animal milk as to its nutritional and biologic values.

"Soya milk has this further advantage that it does not endanger the user to disease producing germs.

"In view of the fact that there is not enough animal milk available in this country for the optimum nutrition of our population, also that it takes three years of care and feeding before a cow gives milk, that only a small percentage of the food consumed by the cow is returned in the form of milk, and further that the use of only ten million bushels or one twenty-fifth of our annual soy bean crop for conversion into soy bean milk, would supply a pint of milk every day to 8,000,000 people, at a cost less than that for cow's milk, and that soya milk is palatable, and especially acceptable by children, it would seem the sensible thing to encourage the preparation and consumption of soya milk on a large scale.

"The 'Story of Vegetable Milk' is most interesting to read. The successful preparation of an appetite-appealing soya milk, after years of experimentation by Dr. Harry W. Miller, now bids fair to become one of the most practical of modern food discoveries. Its use will not only be the means of saving thousands of children from unnecessary suffering

© Copyright Soyinfo Center 2014

and sickness but soya milk should prove a good substitute for cow's milk for those who are allergic to animal milk.

"It is my sincere wish that all who are fortunate enough to obtain a copy of Dr. Miller's "Story of Vegetable Milk," will study its contents and then pass it on to others, in order that in due time, millions of our people will have recognized the full nutritive value of this most excellent food product."– Signed, Joseph A. LeClerc, PhD.

"Early trend: Being the oldest of a family of five children, it fell to my lot to help Mother about the kitchen. She was well known for her sumptuous meals, and we always had many visitors at our house. Later as a part of the curriculum of the college which I attended was a course in cookery, and this stimulated my interest in knowing how good things were made as well as their food values. Then when I became a student of medicine we were introduced into a study of food preparation which in those days (1898) was rather unusual in the program of a medical school. This course only seemed to further whet up my interest in the study of foods and their preparation.

"Having to earn the resources for pursuing my medical education. I secured the position of guiding visiting groups through a food factory. As I explained the processes of manufacture, many questions were directed to me on all phases of nutrition as it relates to health and disease, and I took great interest as a guide to inform myself in every way available. I hungrily devoured literature on the subject and was fortunate in being under the tutorage [sic, tutelage] of the father of nutrition work in America, namely the late Dr. John Harvey Kellogg, to whom more credit belongs for furthering the selection, processing and sanitary packaging of breakfast foods than any other man. He was forty years ahead of the times in advocating the value of proper diet in relation to the cure of the sick, and so I have been able to grow up with the advance of nutrition work from its beginning and see the birth of the science of dietetics.

"Observations in China: In the autumn of 1903 my wife and I sailed as medical missionaries for interior China. After a stormy voyage, in which seasickness had deprived us of rations that were included in the price of our ticket, as well as several pounds of flesh, we arrived at the port of Kobe, Japan, where our colleagues, Dr. and Mrs. Lockwood, who preceded us one year, had a small sanitarium and had prepared a sumptuous meal for us. Half starved, we ate with great relish. One dish that was new to us especially attracted attention. It was a protein loaf made from the soy bean curd which was marketed under the name 'To Fu.'

"Arriving at the port of Shanghai, China, we went inland and took up our abode in the central part of the province of Honan, where we not only wore the Chinese costumes, including the queue, but our diet was from foods bought from the local markets, and consisted of only those edibles indigenous to China. Here again we were introduced to the soy bean, whose home is China, and which has been the great source of protein of the Chinese people for millenniums.

"The bean was grown abundantly in Honan, and in fact in all parts of North and Central China. Wherever the Chinese emigrate, they utilize this bean in many marvelous and tasty ways, mostly, however, in the form of cheese made by coagulating the milk with calcium sulphate. This curd is eaten in its soft state, or else pressed into little square cakes. The curd may be formed in sheets by pressing cloths. They also gather sheets of almost pure albumen [yuba] from a scum arising to the top of the soy milk on heating same. Accustomed to people chiefly drinking cow's milk, rather than making products from it, I questioned the Chinese why they did not use the soy milk. They said some of the aged with weak digestions do, but that the cheese was more popular, as they could combine it with other cooked foods. Still more did I wonder why, for the much undernourished infants of the Orient, they did not give them soy milk, containing as it does such important food entities as salts, vitamins, protein and oil in richer amounts than the bean curd and without the undesirable gypsum.

"Being engaged in language study and other mission responsibilities for several years I could do but little more than ponder over what I felt were great possibilities in soy milk for the people of China as well as other lands, were it scientifically studied.

"Another observation I made was that the people of North and Central China who were vegetable-protein eaters, getting especially soy bean rations, were a large and muscular people in comparison with those of the South, where rice was the food, and who used more meat in their diet. These results were later confirmed by experiments to show that the protein of the soy bean is one of the greatest body building foods known.

"Back in America: After eight years' service in China, I was compelled to return to America on account of illness contracted in interior China. When sufficiently recuperated, I was called to the position of medical superintendent and surgeon of the Washington Sanitarium and Hospital at the nation's capital. This again brought me in touch with important nutrition studies carried on at the government bureaus in Washington and also the work at Johns Hopkins University. We also had our own laboratory where we prepared several soy products and introduced many original dishes into our hospital dietary. The Washington Sanitarium was an institution whose dietary was of the lacto-vegetarian type" (Continued). Address: M.D., Mt. Vernon, Ohio.

3722. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part V). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 23-30.
• ***Summary:*** Continued. "Unfortunately, the war that broke out in Shanghai on August 13, 1937, put an end to this illustrious beginning of making a soya milk with the

© Copyright Soyinfo Center 2014

vegetable cow. The sales returns were just beginning to equal the cost of operation. As a consequence of the war, the fire and bombing destroyed more than a hundred thousand dollars, national currency, worth of property and equipment. However much valuable experience had been gained during this time through the feeding of infants and children and the dieting of special disease conditions. The results of this experience were published in the *China Medical Journal,* 1937. These results showed that soy bean milk was second only to mothers milk in the feeding of infants and children and has no equal in dieting cases of stomach acidity and other intestinal complaints. The high biologic value of its protein, the ease of its digestion and ready absorption, when combined with dextrose and maltose, yielded a food of tremendous value to the people of the Orient where the soy bean is indigenous. This brief experiment in conducting a soy bean dairy left a contribution far exceeding the losses sustained by fire and the bombs. For two years we had to turn largely aside from food manufacture. We were busy establishing and organizing a sanitarium at Hankow, China, known as the Wuhan Sanitarium and Hospital. This large institution was extensively used for the care of sick refugees and disabled and wounded soldiers up till October 25, 1938, when the Japanese army forces entered the Wuhan area. Three months later I, with a group of four other Americans, being among the first to evacuate from Central China, were granted transportation on a Japanese transport to Shanghai.

"The Role of the International Nutrition Laboratory in America: Back in America, my first thoughts were how most advantageously to follow up our food research work and lay hold upon the wealth of nutritional advance and the knowledge of food processing in the U.S.A. in perfecting processes developed in China. The need of the peoples of the Orient was uppermost in our mind and protein direct from vegetation seemed their only way out for adequate nutrition, the soy bean naturally being that source. We, therefore, secured land and erected a suitable building on a farm at the suburbs of Mt. Vernon, Ohio, as this was in the soy bean growing belt.

"No sooner did we start the foundation of the building than we began also to fabricate the equipment for carrying forward the processes already worked out for the manufacture of soya milk and subsidiary food products from the soy bean according to our more recent research. The farm gave me opportunity to grow several types of the edible soy beans. The edible soy beans differ widely from the field type beans grown so extensively in the United States. The field varieties are raised for hay or for ripened beans to be used by the oil refiners, the residual bean cake is sold for stock feed. A small part of the bean crop is used for flour. The edible beans are those varieties that are better flavored, easier to cook, make better flour and are such as can be shelled in the immature state for green pack tinned beans. There is as much difference in foods made from the edible beans and those made from the field soy beans as in the taste and quality of sweet corn and that of field corn. There are two belts in America for producing soy beans. Some varieties of soy beans mature in from 90 to 120 days and are suitable for planting in the northern belt which includes the states of Ohio, Indiana, Illinois, Michigan, Wisconsin and Iowa, and the beans requiring over 120 days to mature are grown in the southern belt including the states of North and South Carolina, Georgia, Arkansas, Texas and Missouri.

"Out of fourteen varieties of the edible beans planted on our farm, four outstanding varieties were selected, namely, Bansei, Aoda, Funk's Delicious and Hokkaido. These four mentioned in the order of their value were found best for green pack canning, also made the best quality flour and milk, and were found best for processing for other foods. From our southern soy bean station located in North Carolina, there were three varieties, namely, Rokusun, Tokyo and Woods Yellow, named in the order of their value for food processing, A very unique feature of our farm experiment work was the shelling of green soy beans, with the use of a Viner obtained from the Scott Viner Company of Columbus [Ohio]. Some 40,000 cases of these delicious beans were put up this season (1943). A single unit of these Viners is capable of shelling five tons of green beans in one day.

"Because of the limited production in America of these fine vegetable types of soy beans, we readily saw that we would have to run, as an important adjunct of the laboratory, a seed department, and an extensive agricultural program in raising this type of beans, and our methods in these lines have been perfected to overcome shattering, uneven ripening and other heretofore drawbacks to the raising of these splendid beans. We now have under cultivation annually several hundred acres of these large delicious edible soyas for green bean canning and for milk processing.

"Our factory, a newly built brick structure, lined with enameled tile, was completed in the autumn of 1939 and contains laboratory space, test kitchen space where soy milk and soy products are under continual tests for their combining properties in tasty recipes. This modern food factory has three large boilers for supplying steam pressure for processing, and contains specially constructed stainless steel cookers, vacuum pans, spray dryer, iron cow (homogenizer), grinder, centrifuges, sterilizers and other processing machinery. This is our first model plant where we have arranged the machinery in series so that the hydrated beans start at one end of the factory and come out a dehydrated complete milk powder at the other end, all ready for tinning in sanitary cans, and shipping.

"Nothing is perhaps more spectacular than to watch this milky bean juice being converted into a palatable, readily digestible milk, containing all the food essentials, with minerals and vitamins added and flowing from the iron cow in quantities as much as is often secured from the aggregate milkings of several hundreds of cows. It is truly a wonder,

© Copyright Soyinfo Center 2014

a colloid milk, bacteria free, being made in a sanitary laboratory.

"The splendid tasting and readily soluble powdered milk as it is now produced at the International Nutrition Laboratory came about only as a result of much effort and time in making many improvements and alterations of equipment from week to week. Dr. Weisner, of Ohio State University, did much valuable research work on the bacteriology of soy milk, and we are indebted to Dr. W.J. Morse for supplying seeds and much valuable information, and to Dr. LeClerc, senior chemist of the Government Department of Agriculture, for check-ups that assisted us in the standardization of our products.

"We were fortunate in being able to develop this milk in the Orient with a background of the Chinese experience with soy bean foods for ages and also have the benefit of scientific and technical expert help in the United States through the frequent visits I made to this country, and I feel profoundly grateful for the services of many of the leading nutrition experts as also the laboratory and engineer help to be found in Government Bureaus at Washington and at the Ohio State University. For vitamin assays, I am indebted to Dr. Howard J. Cannon, Director of the Laboratory of Vitamin Technology at Chicago. In the Orient we also had able laboratory help, and the feeding work was under our own supervision in Shanghai Sanitarium Clinic, a 200-bed hospital conducting a very large maternity and children's department.

"Soy beans can be grown in almost any country of the world and are capable of many methods of preparation. In Oriental countries we need to improve the preparation of soy bean foods to make them more digestible. In the Occident we have readily at hand the processing vats to thoroughly cook the beans, but to go over big, they must be made readily available and also palatable. The International Nutrition Laboratory, as its name indicates has been established to thoroughly process the bean and at the same time make it palatable so that its use can be universal. In warm climates or frigid areas nothing is more easy of digestion than the colloid liquid, soya milk.

"On several occasions we have gone out to lecture and give demonstration to clubs and to the annual meetings of the American Soy Bean Association. We have observed the textiles, fabrics and plastics made from soy bean protein with great admiration. At one meeting, wool was shown made from the soy bean and at another a cap, necktie, and many other articles we use" (Continued). Address: Mt. Vernon, Ohio.

3723. **Product Name:** Agé.
Manufacturer's Name: Slocan Soya Co.
Manufacturer's Address: Slocan, BC, Canada.
Date of Introduction: 1944?
New Product–Documentation: Note: Slocan is in the southeast part of British Columbia. Letter from Edward and Danette Westlind. 1989. Aug. 14. "My wife and I are purchasing a small tofu and agé business on September 1, 1989. Slocan Soya Co. was started during the second World War when there was a large population of Japanese Canadians interned in the Slocan Valley. For roughly 30 years, agé was the only product made by Slocan Soya. Twelve years ago Slocan Soya Co. was sold to a local Caucasian woman who started producing tofu to supplement her income. From the 1940s until now there has been very little in equipment upgrading and the business has been gradually declining due to lack of interest on the part of its owner. We are confidant that with new energy and enthusiasm on our part the business can be revived."

3724. Greenway, P.J. 1945. Origins of some East African food plants. Part III. *East African Agricultural Journal* 10(3):177-80. Jan.
• ***Summary:*** "The first effort to establish this crop in East Africa appears to have been made at Amani [German East Africa; in today's Tanzania] in 1907 and further introductions were made from the U.S.A. in 1909. These do not appear to have been successful and further trials were made in 1911 with seeds from China, Japan and South Africa. Since about 1920 further trials have been, and are being, made by departments of agriculture in East Africa... It is recorded that occasional plots of soy beans are to be seen cultivated by the natives in Uganda and Kenya, they apparently trade their seeds with Indian traders."

Note: This document contains the earliest date seen for soybeans in Tanzania, or the cultivation of soybeans in Tanzania (1907). The source of these soybeans is unknown. Address: Systematic Botanist, East African Agricultural Research Inst., Amani [German East Africa, later in Tanzania].

3725. Morse, W.J. 1945. Soybeans in the land of our enemies. *Soybean Digest.* Jan. p. 6-7.
• ***Summary:*** Text of a letter to the American Soybean Assoc., Guelph, Canada, written from Tokyo, Japan on 20 July 1929. This is the first ASA meeting Morse has missed. He and Dorsett, comprising the Oriental Agricultural Exploration Expedition, arrived in Japan on March 18 and set up headquarters in Tokyo. "It is amazing, the extent to which the soybean is used for food in Japan." For details, see Morse 1929 ("Letter from Dr. Morse"). Address: USDA Bureau of Plant Industry, Washington, DC.

3726. Schofield, Maurice. 1945. The amazing soya bean. *Contemporary Review* (*London*) 167:48-51. Jan. [4 ref]
• ***Summary:*** Contains a good but brief history of the soybean, including the history of its cultivation in Britain. Samuel Dale, the British botanist, probably thought of soybean cultivation long ago. The "Royal Botanical Gardens at Kew saw some specimens in 1790. But it was

© Copyright Soyinfo Center 2014

the awakening in the West which stirred up the ground at Woburn, where prior to 1914 the Royal Agricultural Society had several years' experimenting with it before concluding that soya needed a warmer climate than ours. In 1916 the Board of Agriculture, though maintaining that the Japanese and Manchurian varieties hitherto tested would not produce seed in economic amounts in Britain, suggested the possibility that varieties more suitable might be bred...

"After Mr. Henry Ford's success with thousands of acres of soya near Detroit [Michigan], it was not surprising in 1933 to hear of part of the Fordson Estate at Boreham, Essex, being turned over to soya cultivation. A six-acre field was prepared, 47 varieties of soya from North America, Manchuria and Japan being sown. Despite very good weather in that year, the initial fast-growing period (experienced in the hot season of Manchuria) was not good enough: our merry month of May was not so merry for soya. By September many plants had very small pods; others had not got beyond the flowering stage; others yet again had not bloomed at all. A year later a twenty-acre field was prepared to utilise what was hoped to be acclimatised seed from the previous year. There was a good race to maturity between 'green Jap,' 'brown C,' and 'black O,' with the 'Jap' variety winning...

"That there is still a case for soya in England is the belief of enthusiasts like J.L. North, of the Royal Botanic Society, Miss Elisabeth Bowbridge, who was connected with the Essex experiments, and Dr. H. Hunter, director of the National Institute of Agricultural Botany at Cambridge. Dr. Hunter, after twelve years' experience, holds that only varieties like 'Jap' and 'brown C' have a tolerable chance of full maturity in this country, yet soya cultivation is still worthy of a place in British agriculture because of its superior qualities." Address: England.

3727. McCay, Jeanette B.; Loosli, J.K.; Adolph, W.H.; Brewer, Lucille; Munn, M.T.; Neidert, Marion; et al. 1945. Soybeans: An old food in a new world. *Cornell University, Extension Bulletin* No. 668. 65 p. Feb. Illust. Index. 28 cm. Produced by the Soybean Committee of the New York State Emergency Food Commission. [38 ref]

• ***Summary:*** Contents: A potential food resource: Introduced into the United States, new American industries. Composition and food value of soybeans: Proteins, fats, carbohydrates, minerals, vitamins, the enzymes of the soybean. How to use soybeans and soy products (contains many recipes): Fresh green soybeans (how to cook, how to can, how to freeze), dry soybeans (how to cook, how to can, how to freeze, 3 recipes, salted soybeans [oil-roasted soynuts], how to prepare bean pulp {by running drained cooked soybeans through a meat chopper}, 4 recipes), sprouted soybeans (vitamin C forms during sprouting, exposure to light does not affect vitamin C, riboflavin and niacin are also increased, how to sprout soybeans at home {9-step process}, store sprouts in refrigerator, how to freeze sprouted soybeans, how to cook sprouted soybeans, illustration of apparatus [equipment] for sprouting soybeans in quantity, 6 sprouted soybean recipes), grits, flakes and flour (protein equivalents {one pound of low fat soy flour is equal in protein value to two pounds of cheese, 2 pounds of navy beans, 2½ pounds of beefsteak or chicken, 3 dozen eggs, 5 pounds of bread, or 12 pints of milk}, a little soy flour with wheat flour improves protein quality, amount of protein, iron, and calcium also increased, 23 soy-grits and flour recipes {divided into 3 main dishes, 3 quick breads, 17 desserts}), a stronger staff of life–bread (rats fed bread containing only 5% soy flour grow much better than those eating white bread, does soy bread taste good?, little change required in baking with soy flour, 6 yeast bread recipes), soybeans in large-quantity cooking (6 recipes), other soybean products (soybean curd, soybean milk, soy sauce). Production, varieties, and culture of soybeans. Soybeans in animal feeding: For cattle, for sheep, horses, swine, and poultry, soybean hay a substitute for alfalfa, for dogs and fur-bearing animals. References. Index.

Contains nine bar charts in the form of illustrations / pictorial drawings / symbolic graphics (which may be by Kenneth Washburn).

How to sprout soybeans at home (p. 26-27):

"1. Select a stock of clean, bright, new-crop soybeans of one of the field varieties. The yellow seeds have less conspicuous skins than do the black beans, although the black beans may be preferred. The garden varieties are not satisfactory because the sprouts break off easily, but the exact variety is unimportant so long as the seed is good.

"2. Handpick the seed thoroughly, and discard everything except clean, whole beans.

"3. Wash the beans and place them in a suitable container for sprouting, such as a one- or a two-quart glass fruit jar. The bean sprouts increase to about six times their original volume.

"4. Cover the seeds with at least four times their volume of lukewarm water and let them stand for a few hours, or at most overnight, until they are swollen.

"5. Pour off this water, and wash or rinse the swollen beans thoroughly, then pour off the last wash water.

"6. Cover the top of the jar with a piece of cheesecloth or other thin cloth, and tie it on securely. Quarter-inch mesh screening also makes a good cover.

"7. Invert the jar and place it in a cupboard or dark place, in a slightly tilted position, so that the excess water can drain away.

"8. At least three times a day, or better every four hours, place the jar under the water tap or pour on plenty of cool water, thus thoroughly and carefully washing the swelling and sprouting seeds, so that bacteria or molds which may have developed are carried away. The better the washing, the better the sprouts. After washing, place the jar back in its

© Copyright Soyinfo Center 2014

slanting position.

"Chlorinated lime water to kill fungus growth is not needed if the seed is well selected. If such a solution is used (1 tablespoon of chlorinated lime in 1 gallon of water), it should not remain on the seeds longer than for ½ hour; the soybeans are injured by a longer exposure.

"9. In from three to four days at room temperature, the sprouts will be from 1 to 2 inches long and ready for use. Then pour the sprouts into clean cold water and shuck off the skins if this is desired. With the yellow-seeded varieties, however, the skins are not conspicuous and need not be removed. If a flower pot or similar receptacle is used for sprouting with a piece of cloth over the bottom hole for drainage, be sure that the surface of the beans is also covered with a piece of moist cloth to prevent drying; otherwise the sprouts will be tough and will not be uniform.

"It is not wise to attempt sprout production in the summer, because good sprouts will not be produced in warm weather unless the place where they are sprouted can be kept at about 70ºF. The sprouting of old, badly cracked, discolored or shriveled soybeans should not be attempted, for this only causes trouble. Soybeans packaged for cooking and baking are not likely to sprout too well. When in doubt, one should make a preliminary trial. If, after the first day, or after soaking, the beans become soft or soggy, they are probably unfit for sprouting.

"The commercial production of soybean sprouts in large quantities proceeds along the same lines as outlined, except that larger sprouting devices or tanks are used and the process is more carefully controlled. An apparatus with an automatic watering device developed at Cornell University to sprout a large quantity of beans is shown in figure 6.

"Store sprouts in refrigerator: Sprouts not used immediately must be stored in a covered container in the refrigerator, as is any fresh, crisp vegetable, for as long as a week. They must be kept moist; otherwise they will wilt or discolor. If kept longer, they must be blanched for 2 minutes, then canned as a green beans, dried, or frozen."

Tables show: 1. Proximate and mineral composition of soybeans and soy flours. Essential amino acids in servings of certain protein-rich foods (lean meat, eggs, cooked soybeans). 3. Calcium, iron, and B vitamins (thiamine, riboflavin, niacin) supplied by common serving portions of certain foods. 4. Vitamin composition of 7 soy products. 5. Food values of sprouted soybeans and of some common vegetables per 100-gram edible portions. 6. Thiamine, riboflavin, and niacin content of soybeans during sprouting, storage, and dehydration. 7. Soybean milk, cow's milk, and human milk (typical nutritional analyses). 8. Composition of some [seven] soybean products used for food in the Far East. 9. Varieties of soybeans most suitable in New York State for animal feed and human food (For green vegetables: "Garden varieties such as Green Giant, Hokkaido, Jogun, Bansei, Fuji, Tortoise Egg, and Willomi").

Concerning "Fresh Green Soybeans: When gathered from the garden while the pods are still greenish and the seeds are still soft but fully developed, the soybean is a new green vegetable that some persons say is more attractive and delicious than the fresh lima bean. Many Victory gardeners have grown them for the first time, and they may be purchased commercially canned as are green peas."

Note: This is the earliest English-language document seen (Aug. 2003) that contains the term "protein quality." Address: New York.

3728. Pohjakallio, Onni. 1945. Soijapavusta (Glycine hispida Max.) [About the soybean]. *Luonnon Ystava* (*Friend of Nature*) 49(1):24-28. Feb. [Fin]

• ***Summary:*** In 1936, from May to September, soybean field plot trials were conducted at the Agricultural Research Centre, Dep. of Plant Breeding, Jokioinen [pronounced yo-ki-OI-nen] in southern Finland [just southwest of Forssa, at about 60.8º north latitude].

Soybean varieties were not able to produce any mature seeds in most of the trial years, except 1937, when the summer was very long and warm. Also in 1938 some varieties produced seed yields with a high germination percentage. Trials were conducted for seed production, but it is not stated which variety gave the best seed yield.

The text states that the earliest varieties in the trials were Manitoba (probably from Canada), Hokkaido (probably from Japan), Soya Vilnensis (from Lithuania), and Aro (from Sweden). A number of other varieties, whose names are not given, were also used in the trials. Table 1 shows varieties used in a 1943 trial: Manitoba, Manchuria, Virginia, and Ön (from Japan). Table 2 shows that the variety Peking was used in another 1943 trial.

Page 24 states: "Soybean is not adapted to growing in Sweden, but because it possesses many promising characteristics it is of interest. So the Swedish government has given money (10,000 SEK) for the breeding of soybean varieties. Also in Finland, in the Department of Plant Breeding, Jokioinen, some preliminary soybean trials were conducted."

Page 25 states: "It has been reported that soybean yield in Germany has been 10,000 to 30,000 kg/ha of fresh seed, 5,000 to 8,000 kg/ha of hay, or 800 to 3,000 kg/ha of dry soybean seeds. Also in Sweden, in trials conducted in 1938, yields of 1,800 kg/ha of seeds were attained, but in 1941 the mean yield was 529 kg/ha and in 1942 only 240 kg/ha. In Finland, the soybean has been cultivated on such small areas that one cannot speak of yields per hectare. In most of the years, the field trials in Finland produced no yield of mature seed. In the trials at Jokioinen in the years 1936-1944, where the earliest varieties (except in 1936) were tested, the pods were able to reach the yellow color only in 1937, when the summer was very warm." A photo (p. 25) shows the soybean variety Hokkaido growing in Jokioinen in 1937.

© Copyright Soyinfo Center 2014

Page 28 notes that it is said that the soybean is a crop for short daylength, but great differences have been found in that character between varieties. "Our plant breeders should try to breed soybean varieties that are adapted to conditions in Finland. Therefore soybean varieties which possess the lowest sensitivity to photoperiodism have been crossed together in Finland." The variety which was least sensitive to photoperiod was Manitoba.

Note 1. This is the earliest document seen (Feb. 2001) concerning soybeans in Finland, or the cultivation of soybeans in Finland. This document contains the earliest date seen for soybeans in Finland, or the cultivation of soybeans in Finland (1936). The source of these soybeans is unknown.

Note 2. This document was discovered and partially translated for Soyfoods Center in Jan. 1995 by Dr. Simo Hovinen a plant breeder at Boreal Plant Breeding in Jokioinen, Finland. He tried unsuccessfully to find the original field reports of the soybean field trials conducted at Jokioinen during the years 1936-1944. He also searched through many research series from Finland but was unable to find any article about the trials mentioned in Onni Pohjakallio's text. Address: Jokioinen, Finland.

3729. Yamazaki, Momiji. 1945. Tôa hakkô kagaku ronkô [East Asian studies/theses on fermentation chemistry]. Tokyo: Daiichi Shuppan K.K. han. 436 p. Published 20 March 1945. [160* ref. Jap]

• ***Summary:*** This remarkable work, published in a limited edition of 1,000 copies, was written by Dr. Yamazaki, a microbiologist, who graduated from the Department of Agricultural Chemistry, Tokyo University, in 1914. The book is a review of existing Asian literature on fermented foods, with a good bibliography. Dr. Yamazaki may have been employed by the laboratories of the Manchurian Railway.

Contents: Introduction: Preface, origin of alcoholic beverages, various alcoholic beverages of the world, summary. • ***Summary:*** Contents: Foreword. Introduction and summary. Description and uses. Production. Imports. Post-war problems.

This "report is one of a number which were prepared during 1944 and 1945 for the Foreign Economic Administration..." Most of the data "were taken from official and semi-official Japanese sources." Errors and inconsistencies in these data have frequently been detected.

"Japan is not important as a world producer of soybeans. It is, however, normally the world's principal soybean importer. Its annual production during 1928-39 was only 10 to 14 million bushels. By comparison, the production in the United States was 90 million bushels in 1939 and more than 190 million bushels in 1943 and 1944; the average annual production of soybean in Manchuria during the thirties was more than 150 million bushels annually.

"Prior to the present war Japan took most of the exportable surplus of Manchuria, the principal world exporter of soybeans, as well as substantial quantities from Korea, a country which produces almost twice as many soybeans as does Japan. During the 10 years 1928-1938, Japanese imports averaged 26 million bushels annually, approximately double its own production."

"If an annual per capita consumption of 0.5 bushels [30 lb] of soybeans were to be maintained in Japan in the post-war period," Japan would require a total supply of about 37 million bushels/year, based on a 1940 population of 73.1 million. An estimated 10-14 million bushels could be produced in Japan in the short term period after the war. The rest must be imported.

Uses of soybeans include miso, soy sauce or shoyu, and tofu. The main center of soybean production in Japan is the island of Hokkaido. The soybean is the principal oilseed imported into Japan.

Tables show: (1) Soybeans: Production, imports, exports, and apparent consumption, Japan Proper and Karafuto, 1928-39. Columns show: Production. Imports from Empire. Other imports. Total imports. Exports. Apparent consumption: Total and per capita. (2) Soybeans: Imports into Japan from principal sources, average 1928-32, annually 1933-39. The graph has two main parts: Quantity (1,000 bushels), and value (1,000 yen). Empire areas: Manchuria (incl. Kwantung), Korea, Formosa, total. Non-Empire areas. Grand total. Source: Monthly and annual returns of foreign trade of Japan, Korea, and Formosa. Address: U.S. Tariff

Commission, Washington, DC.

3732. Thom, Charles; Raper, Kenneth B. 1945. Manual of the Aspergilli. Baltimore, Maryland: The Williams & Wilkins Co. v-ix + 373 p. May. Illust. 7 color plates. Index. 24 cm. [260* ref]

• ***Summary:*** Contents: Preface. Part I: General discussion. 1. Historical introduction. 2. Classification, generic diagnosis, and synonymy. 3. Morphology and description. 4. Cultivation and examination. 5. Preservation of cultures. 6. Variation.

Part II: The manual proper. 7. The use of the manual. 5-21 contain descriptions of 14 Aspergillus groups incl. 18. The *Aspergillus wentii* group. 19. The *Aspergillus tamarii* group. and 20. The *Aspergillus flavus-oryzae* group.

Part III: Reference material. 22. Topical bibliography. 23. General bibliography. 24. Check list of species and genera. 25. Accepted species, varieties, and mutations.

"After the development of the microscope, men began to see structure in molds. In 1729, Micheli distinguished conidiophores and heads. "He noted that the heads were rough, the spore chains or columns producing an uneven surface, hence he gave the name Aspergillus (rough head). He then marked with Latin phrases his sketches of differently colored moldy substances... *Aspergillus capitulo pulla* for a black form, etc."

"After DeBary's group began to study organisms in comparative culture, the number of publications began to increase rapidly... Titles appeared in the 125 years before DeBary's 1854 paper; 73 appeared in the next 18 years preceding Brefeld's 1872 papers; 236 in the next 19 years just preceding Wehmer's oxalic acid reports in 1891. All of this may be called the period of physiological morphology. The remaining two thousand, published between 1891 and 1928, represent the pure culture period. This may equally well be called the biochemical period" (p. 4-5).

"Aspergillus wentii is a cosmopolitan species that is fairly common in soils, upon moist grains and other vegetable matter undergoing slow decomposition... In the Orient, it is often included with *Aspergillus tamarii, A. flavus,* and *A. oryzae,* all under the latter name as a rule, in the 'Koji' preparations used in the manufacture of various soy products."

Aspergillus tamarii is "a cosmopolitan mold upon vegetable material undergoing slow decomposition and can be isolated from almost all soils examined. Like *A. niger* and *A. flavus,* it is more frequently recovered from warm and semi-tropical soils than from cool, temperate soils, although it occurs in the latter. The species commonly appears with *A. flavus* and *A. oryzae* as a constituent part of the 'koji' used in the fermentation industries of the Orient. Certain strains apparently produce appreciable amounts of diastatic and proteolytic enzyme, while other strains are known to produce kojic acid...

"Kita's culture was isolated from a soybean sauce termed 'Tamari', hence the species name. Tamari is made by a shorter fermentation process than soy sauce or shoyu, and differs from it in flavor. Kita believed that where it was made empirically, it owed its individuality to the particular aspergillus which he isolated and described."

"Two species names are widely used for members of this cosmopolitan group. *Aspergillus oryzae* is applied quite generally, without regard to morphology, to the strains used by the Japanese and Chinese in the fermentation of rice and soy products. Although purified cultures are used in many places, the nomenclature is based more upon utilization than upon morphology. There appears, however, in these industries, a series of strains with long conidiophores, radiate heads, mostly greenish-yellow, with the green often fading completely in old cultures. These strains appear to be most commonly used in the production of the diastatic type of ferments and to be distributed in the great culture collections as *Aspergillus oryzae* (Ahlb.) Cohn. Such strains seem to be mostly oriental or tropical in origin." The other species is *Aspergillus flavus.* This chapter (p. 262-65) contains many excellent high-magnification illustrations of *A. oryzae.*

3733. Portères, Roland. 1945. Introduction du Soja dans l'alimentation des populations indigènes de la région forestière de la Guinée française [Introduction of the soybean to the diet of the native people in the forested region of French Guinea]. *Agriculture* (*France*) No. 57. p. 62-63. July. [Fre]

• ***Summary:*** Contents: The need to introduce soya into the indigenous diet. The difficulties of cooking soya. Varieties of soya that are easier to cook: Size and form of the seed, characteristics of the seed coat. Soaking, washing, and cooking. Cooking by the indigenous people. Difficulties of improving the indigenous diet by using soya. Favorable seasons for the entry of soya into the diet.

In the forested region of French Guinea (*Guinée*) (as well as in the western part of the Ivory Coast) the diet is rich in cellulose (from various greens and roots), starch (rice, starchy roots and tubers), and oils (such as palm oil), but is deeply deficient in protein. Protein could be furnished by meat, fish, or the seeds of legumes. As for meat from domesticated animals, we can calculate that in the area in and around Macenta (*Cercle de Macenta*) [a forested area in southeast Guinea] no more than 10 kg are available per person per year. The *Tomas* and the *N'Guerzés* people are not active hunters. They do only a little trapping and from that get only a little game (squirrels, rats, birds). They also fish very little.

In a village of 1,000 inhabitants like that of Seredou [in French Guinea, where there is a French agricultural experiment station], possessed of few flocks or herds, the supply of protein foods is represented annually by 2 kg of domestic meat, 2 kg of meat from wild game, and 1 kg of

© Copyright Soyinfo Center 2014

fish–or only 5 kg per person per year. The production of leguminous seeds (*niébés* [*niebes, Niebe, niebes, cowpeas, Vigna unguiculata*], peanuts {*arachides*}, voandzou [voandzeia, Bambara groundnut], and haricot beans) is estimated at 5-6 tonnes.

Among vegetable proteins, there are great differences. Research on the utilization of plant proteins by human beings shows that the protein of the soybean (*la graine de soja*) is most efficiently used. Moreover, the richness of soya in protein (40%) and oils (18-20%), its good digestibility, and its easy and rapid production, make the popularization of its cultivation a pressing necessity.

However, the indigenous people do not know how to cook soya, and it can be difficult to cook. The author has examined the difficulties encountered and has developed a process of easy cooking applicable to the indigenous people and a classification of the varieties according to the ease with which they can be cooked. Varieties of whole soybeans which are easier to cook have the following characteristics: Form: Round, not ovoid or ellipsoid. Size: Large. Brilliance of the seed coat: Dull, not shiny. Hilum color (*Tégument au polê embryonnaire*)*:* Dark. Volume after soaking in water for 24 hours: Swells to 2-3 times its previous size. Separation of seed coat during cooking: Good and easy. Separation of seed coat after 24 hours of soaking: Good and easy.

The soybean varieties recognized as easy or rather easy to cook at Seredou are: Mammoth Yellow, Manchurian Yellow, Haberlandt, Tokyo black dwarf, Virginia black, Wood's, Manchu, Ile-de-France, Hei-Tan-Black, Mandchourie green, Seredou 265, Seredou 266, Kamianetz I, II, and III, Mandarin, Kurome Osaya, Early Japan (*Hâtif du Japon*), Messine, O Yachi, Washington 36.903, Ota San, Jaune de Cracovie.

After practical trials at Seredou in 1940, the following process was adopted using local water of pH 5.5. 1. Soaking–Wash the soybean seeds quickly then let them soak in water at ambient temperature for 12-24 hours. Pour off the soak water and do a second rapid washing. 2. Cooking–Toss the soybeans into boiling water. Return to a boil, then cook at a light boil. Keep the pot covered during cooking. If you must add water during cooking, add only boiling water. Cooking time should be 2½ hours for large seeds, 3 hours for medium-sized seeds, and 3½ hours for small seeds.

The indigenous people do not cook their beans in this way at all; in fact they believe that the longer you cook beans, the harder they become. But at Seredou several indigenous people have learned the correct method of cooking and they like soya. In other areas (Macenta, Kissidougou, Yombiro), those who have tasted cooked soybeans like them very much, better than haricot beans.

The best time to introduce soya in the local diet is in the months before the rice is harvested especially June and July. Add salt only at the end of cooking and then the beans cook for a few more minutes.

Note: This is the earliest document seen (Aug. 2009) concerning soybeans in French Guinea (renamed Guinea in 1958), or the cultivation of soybeans in French Guinea. Address: Ingénieur Agricole et d'Agronomie coloniale. Licencié ès-sciences.

3734. Miller, Carey D. 1945. Thiamin content of Japanese soybean products. *J. of the American Dietetic Association* 21(7):430-32. Aug. [10 ref]

• ***Summary:*** The approximate amount of thiamin retained in various soybean products is as follows: Raw soybeans, 100%. Soybeans pressure cooked for 60 minutes at 121ºC, 26% (i.e., 74% of the thiamin is lost). Soybean "milk" (*tonyu*), 74%. Soybean curd residue (*kirazu*), 19%. Soybean curd (*tofu*), 18%. Tofu contains 54 mcg. thiamin per 100 gm. About 7% of the thiamin in tofu appears to be destroyed by the cooking process, about 20% remains in the residue (*kirazu*), and the remainder of the thiamin (almost 60%) is lost in the discarded liquid which drains off when the protein in precipitated and pressed.

The author acknowledges the help of the Yokoyama Tofu Factory. *Kirazu* may be used as a human food in combination with vegetables, etc. "However, in Hawaii most of the *kirazu* is fed to pigs. To make tofu, hot soybean milk "was mixed with a liquid containing magnesium and calcium sulfates, a by-product obtained in the manufacture of salt from sea water, which precipitated the tofu as a flocculent curd."

Note: This is the earliest English-language document seen (June 2013) that uses the term "Soybean curd residue" to refer to okara.

Aburage (a fried soybean curd) loses additional thiamin as a result of the cooking process. "Miso, made from cooked soybeans and fermented rice, which is allowed to age in huge wooden vats for 2 months or longer, is a relatively good source of thiamin," containing about 130 mcg. per 100 gm. But since relatively small amounts are used, even by people who favor this food, its contribution to the daily thiamin need is not great. Address: Nutrition Dep., Hawaii Agric. Exp. Station, Univ. of Hawaii, Honolulu.

3735. Surrender of Japan after World War II (Important event). 1945.

• ***Summary:*** The surrender of the Empire of Japan on September 2, 1945, brought the hostilities of World War II to a close. The documents and terms of unconditional surrender were signed on board the battleship USS Missouri in Tokyo Harbor. The United States now stood astride the world as the only remaining Great Power.

The background to the surrender was:

By 1945, the Japanese had suffered an unbroken string of defeats for nearly two years in the South West Pacific, the Marianas campaign, and the Philippines campaign. The Allies captured the nearby islands of Iwo Jima and Okinawa

© Copyright Soyinfo Center 2014

in the first half of 1945. Okinawa was to be a staging area for Operation Downfall, the American invasion of the Japanese Home Islands. Such an invasion was dreaded by both sides; it was widely believed that Japan would fight to the bitter end and never surrender. Thus, the United States would have to fight, in enemy territory, for every inch, from Okinawa, on to Kyûshû, all the way to Tokyo. But the Japanese Imperial High Command was determined not to allow the allies to establish a beachhead on Kyûshû–Japan's southernmost main island. The strategy of making a last stand at Kyûshû was based on the assumption of continued Soviet neutrality.

1945 Aug. 6–The United States dropped an atomic bomb on the city of Hiroshima, hoping that the resulting destruction and devastation would cause Japan to surrender; it did not.

1945 Aug. 8–The United States dropped a second atomic bomb on the city of Nagasaki. Late in the evening of the same day, in accordance with the Yalta agreements, but in violation of the Soviet-Japanese Neutrality Pact, the Soviet Union declared war on Japan, and soon after midnight on August 9, 1945, the Soviet Union invaded the Imperial Japanese puppet state of Manchoukuo.

The combined shock of these events caused Emperor Hirohito to intervene.

1945 Aug. 15–In a recorded address broadcast across the Empire, Emperor Hirohito announced the surrender of Japan to the allies.

3736. Arnold, Julean. 1945. Soy–China's Cinderella. *Soybean Digest.* Sept. p. 36-37, 69.

• ***Summary:*** In the summer of 1937 masses of Chinese refugees poured into Shanghai in frantic efforts to escape Japanese armed forces. The immediate problems were food and shelter. One relief agency, China Child Welfare, Inc., with which the author worked, helped to establish 220 refugee camps to accommodate 250,000 people. Since tofu is too concentrated for infants, the group turned to soybean milk. "Fortunately the Peking Union Medical College of the Rockefeller had several decades earlier carried on extensive research with the soybean under the direction of a Russian scientist Dr. A. A. Horvath. He became a great enthusiast on the nutritive properties of the soybean. He found that by adding a certain amount of calcium lactate, sodium chloride [table salt] and sugar to the soybean milk, it would be possible to produce a substitute for cow's milk, and at a fraction of the cost of cow's milk. Chinese trained under him carried on research experiments.

"Thus when we were interested in preparing a scientific, sanitary, and standardized soybean milk we looked for assistance to Doctors Ho and Tso who were trained at the P.U.M.C. but later came to Shanghai to join the Lester Institute where they continued their work on soybean nutritive products. So we impressed them into service. We also secured much aid from Dr. W.S. Fu, who supervised a Chinese children's hospital in Shanghai. He gave us accommodations for setting up a small plant for the manufacture of soybean milk in one of the court-yards of his hospital." A description of the equipment and process used is given. After boiling the soymilk for 20 minutes, calcium lactate, sodium chloride, and sugar were added. The soybean milk was served hot to the children in the camps. The plant was managed by Miss Nellie Lee, a Chinese who graduated from Mt. Holyoke College and had studied dietetics and social science.

After taking the milk from the soybean, there is a residue [okara] very rich in protein. We found by adding 40 percent coarsely ground wheat flour which is also plentiful in China, plus the other ingredients above mentioned, we could make a biscuit which when baked in an oven proved to be very palatable. It represented probably the greatest food value for the cost obtainable. A Chinese department store baked them for us. We distributed millions of them to the refugee camps.

"In order that our committee might take the fullest possible advantage of the very able assistance we received from Chinese scientists, doctors and others we organized the China Nutritional Aid Council with Chinese and American members for the express purpose of popularizing a properly prepared soybean milk and other soybean nutritional products." This council, backed by China Child Welfare, Inc. of New York, launched a campaign to share with people in other parts of China "the advantages of our experiences in providing soybean milk for from 25,000 to 37,000 children daily in the refugee camps in addition to several millions of soybean biscuits furnished the refugees."

"Another American medical missionary, Dr. H.W. Miller, went much further in his experiences with soybean milk products. He became so enthusiastic about their possibilities that he set up a modern plant in Shanghai for their manufacture, with facilities for producing qualities acceptable to those whose palates rebelled against the ordinary types of soybean milk."

After the Japanese bombing of Pearl Harbor, the China Nutritional Aid Council and its soymilk plant moved to Chung-king [or Ch'ung-ch'ing, a city in southern Szechuan province; the Kuomintang made it the political capital of China from Oct. 1938 until the end of World War II]. Nellie Lee has worked for 5 years "spreading the gospel of soybean milk for the great masses in that country."

"When John D. Rockefeller Jr. came to Peking about 25 years ago to dedicate the Peking Union Medical College of the Rockefeller Foundation, he told me that he found it harder to spend money than to make it." A large photo (p. 36) shows a Chinese mother feeding her children "soy milk and soy cakes at a food shop where highly nutritious foods are made and sold at cost prices."

Note 1. This is the earliest document seen (July 2012, one of two) that uses the word "Cinderella" in connection

© Copyright Soyinfo Center 2014

with the soybean. The author, however, does not elaborate on this idea. This is the earliest document seen (July 2012) with "Cinderella" in the title.

Note 2. In the winter of 1937 K.S. Lo of Hong Kong, age 27, happened to be in Shanghai on other business. There he attended a talk by Julean Arnold titled "Soya Bean: The Cow of China." This talk inspired Lo to establish the Hong Kong Soya Bean Products Co., Ltd. in March 1940. This company later made the world-famous Vitasoy soymilk. If the date and title of this talk are correct, this would be the earliest date seen (Aug. 2002) for the use of the term "Cow of China." Address: Berkeley, California.

3737. Ladejinsky, W.I. 1945. Agriculture in Japan: Prewar. *Foreign Agriculture* 9(9):130-42. Sept. [7 ref]
• ***Summary:*** The soybean is a staple food of the Japanese. Soybeans are also in demand for a number of industrial products, chief of which is soybean oil. The 1939 soybeans are estimated to have occupied 795,000 acres. Because of the competition from imported Manchurian soybeans, extension of mulberry-tree plantations prior to the 1930s, and increased acreage under orchards and vegetables, the soybean area declined from an annual average of 1,091,000 acres during the 5-year period 1920-24 to 808,000 acres in 1935-39, or by 26%. Production decreased from 18 to 13.5 million bushels. Despite the declining output, consumption of soybeans during the same period increased from an annual average of 32 million to about 44 million bushels. Production of soybeans in recent years has averaged about 30% of the country's consumption. The shortage of about 30 million bushels was made up by imports from Manchuria (80%) and Korea (20%). Address: Office of Foreign Agricultural Relations.

3738. Weigle, Edith. 1945. Japanese close-ups. *Chicago Daily Tribune.* Oct. 10. p. R6.
• ***Summary:*** Tokyo–In the early morning, at about 5:30 or 6:00 (it's still dark in winter), "there comes the song of the boy selling nato [natto]." He calls out the word three times, with two notes to each word. In the key of C, the notes would be E-G, G-A, E-G. "Nato [sic, Natto], pronounced nah-toe, is a bean [fermented soybeans] used in the morning one-dish meal. When it is mashed, seasoned with raw egg and finely chopped onions, and heated, the Japanese eat it in quantity, washing it down with green tea." They are now ready for the day.

In the early after, the "tofu (bean curd) seller, also rides a bicycle and makes a querulous wailing sound that apparently has the appeal of the Pied Piper, for small children inevitably follow his slow progress down the lanes."

• ***Summary:*** Contains 9 tables and a summary in German. When soybeans are pulverised, proteinase and peptonase activity can be determined; their optima are at 7.0 to 7.5 pH and 37ºC. Address: Medical-Chemical Institute, Faculty of Medicine, Imperial Tohoku Univ., Sendai [Japan].

3740. Holman, Ross L. 1945. A chemurgic fantasy. *Yale Review* 35(2):282-91. Dec. Condensed as "New riches from farm synthetics" in Science Digest. 1945. 17:53-55. March.
• ***Summary:*** The farm chemurgic movement, started in 1934 to find industrial markets for surplus farm crops, has begun to grow. W.J. Hale is the founder of the present chemurgic movement. "There is no farm crop that the test tube has turned into more industrial products than soy beans. It is surprising to see what the soy bean can become in the hands of a chemical juggler. To offset war scarcities it can be processed into many things, from gunstocks for guns to a good substitute for butter; from vitamin K for our blood to a handkerchief for our tears.

"America's industrial pioneer number one with soy beans is Henry Ford. With a staff of chemists, a laboratory, and several thousand acres of soys he is turning these beans not only into a large variety of things to eat but into something to wear and ride, to keep the rain off and to doctor our liver troubles. We may recall how extravagant Ford sounded to us in the Twenties when he said that some day we would be able to dispense with the farm cow and drink synthetic milk [See *New York Tribune,* 9 Feb. 1921]. This fantastic prophecy made rich material for newspaper reporters and cartoonists. There were comic caricatures of a robot cow pouring out synthetic milk to be churned into a synthetic butter. Today reporters and cartoonists know that the joke has backfired. Ford's chemists have been getting milk from soy beans for years. The milk has been shown to have important food values. The list of Ford's soy foods includes meats, cheese, breakfast foods, macaroni, bread, crackers, sweet milk, buttermilk, and coffee."

Reichhold Chemical Corporation and one or two other companies are producing soy-bean rubber at the rate of 25,000 tons a year.

The author also discusses how Henry Ford uses soy beans to make synthetic wool. "Ford himself frequently wears a soy-bean suit, and experiments seem to prove that it can be manufactured at less cost than any other textile fiber. Two Japanese scientists processed a wool from soys before the war and insisted that wool for a whole suit of clothes could be manufactured for less than a dollar."

"The climax of Ford's pre-war chemurgic achievements was the manufacture of a car with a all-plastic body. The body, made largely of soys, was 1,000 pounds lighter than a similar car with a steel body... Just about the time it was ready to go into production Pearl Harbor stalled the manufacture of cars for the duration.

"Madison College near Nashville, Tennessee, is an educational institution that has turned farm chemurgy into a bonanza... The chief crop handled here is the soy bean, which is manufactured into 30 foods ranging from meat to coffee." The students, working their way through college, make the foods and student nurses and boys taking pre-medical courses play a major role at the school's sanitarium, where "patients are nursed back to health on soy foods."

At Taftville, Connecticut, the National Dairy Products Corporation is now manufacturing 10 million pounds a year of Aralac, a wool-like fiber made from the casein in skim milk.

"America's pioneer chemurgist, who performed scientific miracles before chemurgy ever got its name, was the late Dr. George W. Carver, of Tuskegee Institute in Alabama. Dr. Carver's record of processing over 300 industrial products from the peanut and 120 from the sweet potato is too well known to need discussion here."

Note: This is the earliest document seen (April 2002) that mentions vitamin K in connection with soy.

3743. Swingle, Walter T. 1945. Our agricultural debt to Asia. In: Arthur E. Christy, ed. 1945. The Asian Legacy and American Life. New York: The John Day Co. x + 276 p. See p. 84-114. Index. 21 cm. Also published by The Asia Press, 1942. [2 ref]
• ***Summary:*** "The beginning and foundation of the Library of Congress Orientalia Collection was the great Chinese encyclopedia, the *Ssu k'u ch'uan shu,* a gift of the Empress Dowager of China.

"About 1914, Dr. Swingle, then head of the Office of Crop physiology and Breeding, Bureau of Plant Industry, U.S. Dept. of Agriculture, was able to secure the services of a Cornell graduate, Dr. Hing Kwai Fung, to make abstracts and/or translations of information in the *Ssu k'u ch'uan shu* regarding economic plants. Dr. Swingle interested Dr. Herbert Putnam, Librarian of Congress in increasing the holdings of Chinese books, especially gazeteers [sic, gazetteers] which contain local information. When Dr. Fung returned to China, he was given a modest sum for purchasing books. Dr. Fung was able to persuade the Commercial Press (the largest publishing firm in China, located in Shanghai) to act as receiving agent for books for the Library of Congress, and to ship them to Washington [DC]. Soon after, Dr. Swingle was sent to the Orient–in March 1918–by the Dept. of Agriculture." There he made arrangements for collecting books in Tokyo and Shanghai.

"As American merchants and missionaries gradually penetrated into China, they sent home more and more plants and trees. The Arnold Arboretum, organized and directed by the great tree expert, C.S. Sargent, financed extensive trips to the Orient to obtain botanical specimens and seeds of ornamental trees and shrubs as well as photographs of them as they grew in their native habitat. These trees and shrubs revolutionized the garden and park plantings of the northern parts of the United States. The illustrated popular books of E.H. Wilson, who made many trips to the Orient for the Arnold Arboretum, helped to arouse interest in the very rich arboreal flora of China...

"The Plant Introduction Service of the U.S. Department of Agriculture was organized by David Fairchild in 1897; he did very extensive exploring for foreign economic and ornamental plants from 1898 on, and directed the Plant Introduction Service from 1909 to 1928. I was fortunate enough to be one of the first 'agricultural explorers.'" Of these men Frank N. Meyer and P.H. Dorsett were outstanding, not only for the number and value of the plants they secured, but also for the detailed and accurate descriptions of every plant they sent to Washington.

"P.H. Dorsett some years later, during the twenties, traveled widely in North China taking many fine photographs of Chinese crop plants and writing descriptions of the culture, harvesting and curing of each. On these trips he collected many varieties of soy beans largely through the utilization of a new and potent method of securing the willing cooperation of all educated Chinese people. A complete translation, prepared by Michael J. Hagerty under my direction in 1917 of the chapter on soy beans contained in a standard Chinese work on economic plants (the *Chih Wu Ming T'u K'ao* by Wu Ch'i-chun) had been furnished the plant explorers looking for soy bean varieties. This translation, covering eighty-two pages, discussed several hundred varieties, telling where they were largely grown. In all cases the name of the variety and the name of the locality where it was grown were not only spelled out in English but also written carefully in Chinese characters. An index made it easy to turn to any variety under discussion and see what was said about its culture.

"This was a turning point in field explorations in China. Such indexed translations in the hands of foreign plant explorers insured the attention of all educated Chinese, who gladly directed the explorer to the nearest source of the various named varieties. I had learned this at first hand in 1915 when studying varieties of Citrus in southern China. Surprise and skepticism about the foreigners knowledge

© Copyright Soyinfo Center 2014

of Chinese books gave way to astonishment and warm approbation."

"The soy bean is a striking example of the introduction of a new crop... Soy beans were sent from China to France as early as 1740 and from 1779 were grown in the famous Botanic Garden of Paris. Benjamin Franklin, who had been a member of the French Academy of Sciences since 1772, sent seeds back to the United States and urged that they be given a trial. But in spite of his plea, the soy bean remained merely a curiosity in this country for more than a century.

"In the late eighties [sic, 1890] Prof. C.C. Georgeson brought soy bean seeds from Japan, where he had been teaching at the Agricultural College at Komaba, and planted them in a field on the campus of the Kansas State Agricultural College. I could see the stunted soy bean plants from the windows of the botanical laboratory where I was a teen-age research assistant. This variety, adapted to the perpetual spring climate of Komaba near Tokyo, did not do well on the bare Kansas hills, often swept by hot dry winds. And nothing happened. Soy beans did not arouse interest among Kansas farmers until many years after this failure.

"In the third decade of the twentieth century Dorsett sent to Washington more than 800 named soy bean varieties from China, Manchuria and Japan. These together with shipments secured by Dr. David Fairchild from his numerous correspondents in the Old World, especially in Asia, amounted by 1928 to a total of more than 2800 packages of soy beans, almost all named varieties but many of them duplicated, some of them many times. Meantime tests made by W.J. Morse, in charge of soy bean culture for the Bureau of Plant Industry, showed that many varieties had a narrow range of adaptability. Accordingly, from 1929 to 1931, Morse joined Dorsett in the Orient and these two experts, with trained Chinese helpers, brought to this country the largest single collection of soy bean varieties ever assembled. As soon as Morse returned from studying soy beans in Asia and attacked the problem of finding which Asiatic varieties adapted to the different regions and selecting and breeding to make them fit various American soils and climates, a remarkable change occurred in soy bean culture. Yields went up and plantings increased year by year...

"One of the best-known industrial uses for soy bean proteins is for making water-resistant glue. No less than 30,000 tons of soy bean glue were made in 1942 by a single firm and its licenses annually, most of it being used in the rapidly growing plywood industry. Soy bean proteins have been enthusiastically used by Henry Ford in his automobiles, being mixed with the more expensive phenolic resins, thereby reducing costs and also yielding a more plastic, freer-flowing mixture which takes dyes better...

"As long ago as 1917-1918 Dr. Yamei Kin set up under my general supervision for the U.S. Department of Agriculture a soy bean mill in New York City in the hope of supplying tofu to increase the bulk and food value of meat dishes served to soldiers in training at near-by camps. Dr. Kin succeeded in making excellent tofu. She even served to a group of army officers a meal composed entirely of soy bean dishes! However, it proved impossible to test tofu on a large scale at that time, since we could not get priority for transportation of soy beans from North Carolina, then the nearest region where they were grown on any considerable scale.

"A splendid example of a double fermentation is the soy bean cheese called *nam yüe* by the Cantonese and *sufu* in North China. It is preferred even to the best Roquefort as a salad dressing constituent by those who have had the opportunity to try it. It is made by Chinese masters of the cheesemaker's art who believe that its fermentation is an insoluble mystery.

"Shih Chi-yien, then working in the American University of Soochow, published in 1918 the first English account of the most important fermented bean foods. He traced the making of *tofu* from soy beans back to the Han dynasty (A.D. 22). Ten years later Wai Ngan-shou [Nganshou], one of the first scientifically-trained Chinese microbiologists and fermentation experts, was able to isolate and identify as a new species of Mucor the mold that makes possible the *nam yüe* fermentation. It is a curious fungus, *Mucor sufu,* distantly related to the miraculous *Penicillium notatum* whose marvelous curative action has only recently been discovered. A third fermentation expert, Shih You-kuang, studied another soy bean fermentation product, *meitauza,* made by another species of Mucor, and published an illustrated account of it in German in 1937. In his review of the literature of Mucor fermentations, Shih You-kuang cites no fewer than thirty articles by eighteen authors all based on Chinese fermentations...

"Miss Elizabeth Groff, under my direction in 1918, made a thorough study of the fermentation of soy sauce in the famous factories of Canton, China, and published the first detailed account of the process in the *Philippine Journal of Science* for 1919."

"It has been my privilege to assist in building up a great Chinese library in the Library of Congress, under the enlightened policy of Dr. Herbert Putnam, beginning in 1912. The Orientalia Division, headed by Dr. Arthur Hummel, is now the largest Chinese library outside of Asia and is probably larger than all the European libraries of Chinese books combined. It now contains, Dr. Hummel estimates, about 230,000 Chinese volumes (*Chüan*) and some 20,000 more will soon be added in the form of bibliofilm [a type of microfilm] copies of very rare works from the Chinese National Library, sent to Washington for safekeeping."

Note 1. This is the earliest secondary document seen that mentions the early introduction of soybeans to America by Benjamin Franklin.

• ***Summary:*** Contents: The soybean. Recent history. Some antecedents to the present trials conducted in Spain. Agronomic notes (incl. soybean varieties). Preparation of the soil. Utilization of soybeans. Food uses. Other applications of the seed. Industrial uses. Soybean oil. Use of the soybean plant as feed. Forage. Use of soybean in clinical analysis (urease). Appendix: Soybean production worldwide in 1925-1929 and 1933 (from IIA, Rome).

For some years the author has been dedicated to the economic propagation of this legume (*la soja*) in Spain. He has succeeded in calling attention to its merits, both with the first edition of this book (1932) and with subsequent work and demonstrations; a number of farmers have experimented with the crop. He was asked to do a new edition of this booklet by the Ministry of Agriculture's Department of Publications, Press, and Propaganda / Advertising, in order to synthesize some observations of recent years and to give an opinion on the possibilities and economic advantages of 'la soja' in Spain. The author reflects that the days of hunger in the 'red zone' are not far away (p. 5).

The Station of Cereal Culture (*Estación de Cerealicultura*) and the Institute of Agronomic Investigations (*Instituto de Investigaciones Agronómicas*) are already working on soybean cultivation. The author offers to the Superior Council of Scientific Investigations the subject of the use of soy in the diet, and how to perfect the soybean, lower its price, and employ its derivatives in as many technical fields as other countries already do. In effect, not alone did Russia start giving maximum attention to the soybean (p. 7).

In southeast Spain, soybeans have been cultivated on the farms of Jerez de la Frontera by the author's esteemed teacher and the director of the Center D. Eduardo Noriega Abascal (p. 8). A graph on page 10 shows soybean imports and exports for 1934 for various countries.

Some antecedents to the present trials conducted in Spain: In 1917 the Spanish council in Shanghai, don Julio Palencia, sent to the Spanish Department of State a study on the cultivation of soybeans, proposing that trials be made to acclimatize the valuable legume to their country.

In Motril (a city in south central Spain on the Mediterranean) and then in the Southern Agricultural Station at Malaga (a town just to the west of Motril, also on the Mediterranean), soybeans started to be cultivated about 10 years ago (c. 1931). by the agronomic engineer D. Arsenio Rueda, in parcels of 5 ares = 0.5 ha, from which he obtained yields each of 60 litres (.78kg/liter), so 46.8 kg per 5 ares.

Both white and black varieties have given good results, but the white was better, and the seeds obtained have been divided among agriculturists...

In Spain, besides the trials cited above, for more than 25 years (since ca. 1916) the soybean has been cultivated with excitement thanks to the zeal and the interest, realized in patriotic labor on the farm in Jerez (southeast Spain), of the agronomical engineer Eduardo Noriega, and also of Mr. Oritz, comrade of the former. They shared yellow and black varieties with Valencian farmers; Valencia is on the Mediterranean. Cultivation has since been accomplished in the central Spanish region. There is also a record of the cultivation of soybeans in Lerida in the years 1925-26 by the doctor don Jose Abdal, an illustrious pharmacist.

The sowing was done with seeds procured from Japan of the variety soja hispida, yellow seeded, with the object of seeing if it would grow in this province. The seeds were soaked for 10 hours in water, then planted in a garden without more security or care than they would take with any other plant. They were sown at the end of April and most of the seeds germinated, reaching a height of 65 cm. They developed and flowered perfectly, and were completely developed by the end of August. This small trial can only demonstrate that the soybean will grow in irrigated terrain, on a warm site, and without much care (p. 12-14).

The agronomic engineer Jesus Andreu, 20 years ago, did tests on the culture of soy as a forage plant in the province of Pontevedra with good results. There is also news, if incomplete, of other successful tests in the provinces of Madrid and Toledo.

As a consequence of this news–and perhaps of the spreading of these and of the foreign trials, and of the experiences of the National Agronomic Institute–soybeans have been divided among individuals and farms for the last 10 years by the General Direction of Agriculture. And the Institute of Cereal Culture has resumed trials with seeds of Japanese origin. The author's companions, don Felix Sancho Penasco and don Fernando Gaspar are studying a hundred varieties, and will determine the requirements of each variety in order to select the ones appropriate for each region (p. 15). Address: Ingeniero Agronomo, Madrid, Spain.

3745a. United States, Office of Foreign Agricultural Relations. 1945. Civil affairs handbook, Japan. Section 7, Agriculture. Washington, DC: Headquarters, Army Service Forces. xii + 195 p. Maps. 25 cm. Supplement (xiv + 236 p.) issued in 1945. [1 soy ref]

• ***Summary:*** A digital version of this book is available on HathiTrust. This Section 7 is one in a series of 17 sections about Japan, including: 1. Geographical and Social Background. 2. Government and Administration. 3. Legal Affairs. 4. Government Finance. 5. Money and Banking. 6. Natural Resources, etc.

This book offers many deep insights into Japan's agriculture in 1945 and before. For example, we read on page xi that shortly before the war: "Practically all of the sugar had to be imported from Formosa; two-thirds of the soy beans from Manchuria and Korea; and 20% of the rice from Korea and Formosa." Japan's hard-working farmers supplied the rest.

The book contains 57 tables, 14 figures, and one map (4 maps on one page, xiv).

Printed across the top of the title page: "Army Service Forces Manual M 354-7." On the same page below the title: "Headquarters, Army Service Forces, 1 April 1944."

Page 59 states: "The principal soybean foods used daily in Japanese life are soysauce, miso (red, white, black), tofu or bean curd, soybean milk, green vegetable beans, roasted beans, soy flour, natto, yuba (film from soybean milk when heated), and beverages (coffee substitute and tea mixture with roasted beans). Soysauce is extensively manufactured by large concerns throughout the Japanese Empire. It is used at every meal by the Japanese family, taking the place of salt and other condiments. Miso is a fermented product from rice or barley, salt, and soybeans, usually requiring from 6 to 12 months for curing. It is a daily breakfast dish in the form of soup with vegetables and it is also used to preserve vegetables, fish, and meat. Tofu, made in small factories throughout cities and villages, is used extensively in place of meat. It is used in the fresh or dried state in soups with vegetables, mixed with vegetables and fried as squares in deep fat, and also toasted. Soy flour is used with wheat flour in the making of various breads, rolls, buns, crackers, and pastries. The roasted flour mixed with sugar is used in making various forms of confections. The roasted beans are used in much the same manner as salted peanuts, and in the making of numerous candies and cakes. Soybean milk is made in the tofu factories and sold as fresh milk [Interesting!]. Natto is a fermented bean, occurring in the various forms though not used as extensively as miso and tofu.

"Japan imports large quantities of soybeans, bean oil, and bean cake from Manchuria. The beans are used largely in the manufacture of soysauce and miso. Only a small percent of the Manchurian beans is processed for oil and meal as there are but three or four bean oil mills in Japan. The beans imported from Chosen [Korea] are of much higher quality than the Manchurian beans and, therefore, are used entirely in the manufacture of miso, tofu, and other food products. Bean oil is used in the manufacture of shortening, salad oil, cooking oil, and various industrial products such as paints, enamels, varnish, soap, and waterproof goods. Bean cake is used largely (90 percent) as fertilizer though considerable quantities are used as cattle feed and in the manufacture of a cheap soysauce. In recent years bean cake has also been used in the manufacture of a wool-like fiber."

Pages 101 and 104, in the section on "Leguminous crops," state: "The principal legume crops produced are soy beans, other beans, peas and peanuts. The most important is soy beans. Soy beans are a staple food of the Japanese, and are used for soy sauce, bean paste and bean soup. They are also in demand for a number of industrial purposes, chief of which is soy bean oil.

"The total area of all leguminous crops in 1936 was 1,516,000 acres (includes 19,000 acres under peanuts) or 7.6 percent of the total cultivated area. The soy bean crop alone covered 807,000 acres. The 1939 area under all these crops amounted to 1,449,000 acres of which soy beans are estimated at 795,000 acres (Table 41). Because of competition from imported Manchurian soy beans, extension of mulberry tree plantations prior to the 1930's, and increased acreage under orchards and vegetables, the soy bean area declined from an annual average of 1,091,000 acres during the 5-year period 1920-24 to 803,000 acres in the period 1935-39, or by 26 percent. Production followed suit, with a decrease from 18 to 13.5 million bushels. Despite the declining output, consumption of soy beans during the same period has increased from an annual average of 32 million bushels to about 44 million bushels. Production of soy beans in recent years has averaged about 30 percent of the country's consumption.

"The shortage of about 30 million bushels was made up by imports from Manchuria (supplying 80 percent) and Korea (20 percent). Next to rice, soy beans form the largest single imported foodstuff. From the Japanese point of view, the mitigating factor of this situation is that the colonies are the sole source of supply. This fact has led a Japanese to remark that from a practical point of view Japan is self-sufficient in soy beans. With respect to other beans, such as 'azuki' and 'broad' beans [*sora mame*] the ratio of domestic production to total consumption has been estimated at 55 and 85 percent, respectively. The condition that applies to imported soy beans applies to these beans as well, since they, too, originate in Manchuria."

The word "soybeans" appears on 35 pages in this book, "soybean" on 28 pages, "soy" on 15 pages (p. 104, 101, 59, 68, 92, 105, 137, 140, 147, xii, 55, 58, 223, 228, 233), "soysauce" on 6 pages, "bean paste" [miso] on 5 pages, "miso" on 5 pages, "tofu" on 4 pages (p. 59, 100, 58, 233), "soy flour" on 3 pages, "soybean milk" on 3 pages, "green

3746. Iguchi, K.; Kichiga, S.; Serizawa, R. 1946. [Extraction of organic substances]. *Japanese Patent* 172,096. Jan. 9, 1946. [Jap]*
• ***Summary:*** Describes solvent extraction using ethyl alcohol.

3747. Bourne, Geoffrey H. 1946. Nutrition in Japan. *Nature* (*London*) 157(3981):177-78. Feb.
• ***Summary:*** "The Japanese diet is "deficient in fat. In 1928 the daily intake of this nutrient was only about 15-20 gm. a day, which is only about one quarter of the desirable intake. 85 per cent of the fat which was consumed was vegetable fat and therefore contained no fat-soluble vitamins."

Protein was derived principally from fish and soya beans, and a very small quantity from beef and other meats in certain classes. Fish and other marine products are not entirely satisfactory as the sole sources of animal protein because of the variation in the seasons... Soya bean, which contains a high-quality protein, forms the most stable source of protein."

3748. Strayer, George M. 1946. Editor's desk: Back Rivers Bill if amended. *Soybean Digest.* March. p. 5.
• ***Summary:*** "H.R. 579, known as the Rivers Bill, has been in the hands of the committee on agriculture of the House of Representatives for over a year. As written it would repeal the federal taxes on margarine, and the federal taxes on the manufacturers, wholesalers and retailers of margarine.

"Repeatedly the American Soybean Association has adopted resolutions at its annual conventions endorsing the repeal of such taxes on margarine *produced from domestic fats and oils.* The war years, together with the Japanese annexation of Far Eastern supplies of tropical oils, have made it impossible for margarine manufacturers to use anything other than domestic fats in their product. Over 40 percent of the oil used in margarine in 1945 was soybean oil."

The Rivers Bill does not yet limit the repeal of the taxes to margarine produced from oils and fats produced within the continental United States.

The other section, titled "It's full [soybean] production once more in 1946," states: "The uncertainty concerning the 1946 soybean price has at last been ended with Secretary of Agriculture Anderson's announcement February 25 that the present support of $2.04 will be continued.

"The need for continued high production of soybeans is part of the general picture of world food shortages,..."

Note: This is earliest appearance of "Editor's Desk" in *Soybean Digest.* Address: Secretary, American Soybean Assoc., Hudson, Iowa.

3749. Emory, Mayo L. 1946. Soybean milk-substitute as used on Okinawa. *U.S. Naval Medical Bulletin* 46:616-18. April.
• ***Summary:*** Near the end of World War II, after the campaign for Okinawa, "the nutrition of the native children presented a serious problem. Both malnutrition and undernutrition were universal and starvation was common." "Breast-fed children suffered most," followed by orphans under the age of 6.

"Soybean was one of the foods available. It was found that a substance closely resembling milk (table 1) was produced as a intermediate step in the preparation of a native soybean dish *tofu.*

"On 18 July 1945 the formula was made up experimentally in a native kitchen and tried out in General Hospital G6-59 on the pediatric ward. The following day the formula was used in the orphanage of 142 children of Dispensary G10-20. The food was readily accepted by the children... One cupful, approximately 200 cc, was given to each child before the noon meal. Those who wished more were given more." It was found that dehydrated egg powder could be added easily to the soybean formula to make a more valuable food. After only a month, on Aug. 19, the experiments were concluded.

The method of preparation was simple; the formula is given (for 1 lb dry soybeans, 1 lb of dehydrated egg powder and 3/4 lb sugar could be added). "Four natives (one cook and three helpers) could prepare enough milk-substitute to feed a thousand children." The "bean residue" [okara], a by-product of the process, was generally eaten "in soups by both adults and children, but it was not suitable for infants." Address: Surgeon U.S.P.H.S [U.S. Public Health Service].

3750. *Sun* (*Baltimore, Maryland*). 1946. Palace kitchen invaded by Japs: Demonstrators eye menu and demand leftist cabinet. May 14. p. 1.
• ***Summary:*** The end of World War II has left many hungry in Japan. On Sunday, about 100 men and women, some with children strapped to their backs, invaded Emperor Hirohito's Imperial Palace in Tokyo demanding to see the emperor and to ask why rations were two weeks late.

When they were told that the emperor was "out of town," they demanded to see his kitchens, where they found preparations underway for a banquet. The menu included: "Blue cod cooked in soysauce... Vegetables cooked in bean paste" [miso].

The spokesmen for these demonstrations are often said to be members or leaders of the Communist party, and economic complaints are often viewed as tied to political goals. The marchers waived red flags.

3751. Hall, Lloyd A. 1946. Protein hydrolysates–Flavor ingredients for foods. *Food Industries* 18(5):681-84, 808, 810, 812, 814, 816. May.
• ***Summary:*** The subtitle reads: "Acid digestion of casein, corn or wheat gluten yields an amino acid mixture with a meaty or other flavorful taste. The digest is clarified,

© Copyright Soyinfo Center 2014

neutralized and dried for addition to soups, sauces, meat products and spice mixtures."

"To the best of our knowledge, the first commercial use of hydrolysates was in China and Japan about 1908. Several patents pertaining to them were granted to the Japanese scientist, Ikeda, in 1912. The Japanese were the first to make commercial use of mono-sodium glutamate, one of the salts of glutamic acid. It was used to impart or intensify a meat flavor, especially in soups, broths, gravies, and like foods.

"Production of glutamate: Until 1935, most of the mono-sodium glutamate used in this country was purchased from Japan. About 1935, domestic commercial production of mono-sodium glutamate from wheat gluten began. Shortly afterwards commercial production of it from Steffen's waste water, a by-product from beet sugar factories, was started by an Ohio plant.

"The proportion of the various amino acids in the hydrolysates varies with the protein material used. Wheat and corn glutens, yeast, soybean meal and casein are the most commonly used proteins."

"Three basic methods: The three types of hydrolytic methods which may be used are: (1) enzymic hydrolysis; (2) alkaline hydrolysis; and (3) acid hydrolysis.

"Enzymic hydrolysis is usually carried out with pancreatic trypsin and papain." Acid hydrolysis of proteins is often preferred over the other methods because it does not destroy the tryptophane content of the proteins. Alkaline hydrolysis has the advantage that very little humin is formed, but the hydrolysate does not contain all of the amino acids nor does it have the good flavor of the acid hydrolysate.

In its commercial process, Griffith Laboratories uses the acid hydrolysis process with hydrochloric and sulphuric acids. The ten steps in the process are described, as follows: 1. Run water acidified with hydrochloric acid into a steam-jacketed, glass-lined kettle. "2. Heat to 113ºC. 3. Stir in the protein material. 4. Heat at atmospheric pressure for about 9 hours to obtain complete hydrolysis. 5. Filter to remove the humin. 6. Pump filtrate into a glass-lined vacuum kettle. 7. Distil under vacuum to remove about 50% of hydrochloric acid content. 8. Dilute with water to the desired specific gravity and add activated carbon to decolorize. 9. Boil for a few minutes and filter. 10. Pump to another kettle and neutralize with sodium carbonate to pH 5.2-5.4 to obtain best flavor value." The higher the amino nitrogen content of the hydrolysate, the better the taste. The authors believe that higher quality standards should be established for protein hydrolysates to be used in food products; the amino acid content is now rarely shown. "Mono-sodium glutamate and other 'non-essential' amino acids, such as glycine," impart a good taste to food products. There is a prejudice against protein hydrolysate powders because they are hygroscopic; this problem can be overcome by using liquid hydrolysates.

Three photos show the equipment used in the process. Address: Director of Research, Griffith Laboratories, Inc., Chicago, Illinois.

3754. Morse, W.J. 1946. The Pacific story. Radio broadcast. NBC. Hollywood, California. June 2. John Baker OI, Radio Service. 4 p. transcript
• ***Summary:*** The broadcast [written by Morse, apparently to East Asia] begins: "This Pacific program means a great deal to me. It is an impressive justification of the late Dr. Charles V. Piper of the Department of Agriculture who was my boss nearly 40 years ago when I started working on soybeans." It was his vision of the possibilities in the United States of this great crop of the East that started the development that has made it a team mate for our native Indian earn. It was in 1907 that Dr. Piper said to me, "this plant has great possibilities for our agriculture and industry," He soon backed up his faith with action. Not only did we work on collecting new varieties from every possible source but he sent me out to look over cottonseed-oil mills as possible outlets for the flood of soybeans he felt sure would come.

"It has been my wish many times that Dr. Piper could have lived to see these later days, especially the present ones when the United States as a soybean producer has occupied second place, headed only by China. It is pleasing to us now that products of American-grown soybeans are a part of the bread that is returning across the Pacific to those people [in China] who gave us generously of breeding material.

"We began collecting new varieties and strains from the Orient about 1908. A few varieties had been brought over a hundred years before but during that century it was merely a garden oddity. In those years we were living beside an undiscovered gold mine, you might say. But now we know we have something–the most valuable of the many p1ant gifts out China and perhaps the most versatile plant known.

"When I recite what we consider the virtues of the soybean, it may sound to the people on the other side of the

© Copyright Soyinfo Center 2014

Pacific like a school boy at the supper table announcing his discoveries of the day. Nevertheless, this is a good place to say that on both sides of this ocean and in Europe, too, it really deserves its name of "Wonder Bean"–a valuable aid to good farming, a protein feed for livestock, a big-tonnage raw material for industry, and a nutritious human food that is winning a high place in the diet. The war greatly emphasized its usefulness.

"In the United States the acreage of this crop had reached sizeable proportions before the war and it had a place on the grain exchange–along with such mainstays of our life as wheat and corn. But in 1907, when Dr. Piper visioned its future, the total acreage in the United States was only 50,000, Three years ago it reached a peak of nearly 16,000,000 acres. The production of soybeans in 1917 was about 70,000 tons. By 1945 it had increased almost 100 fold.

"We needed the soybean–farmers, manufacturers, and consumers–and, with great merit to start with, it was made to fit more exactly into various uses.

"Testing and selection are going on now at perhaps a greater rate than ever before, using types and strains brought in by thousands from China, Japan, Korea, and Manchuria. More than 15 years ago I spent 2 years in those countries. I have pleasant recollections of the people who proudly brought in their favorite beans from farms and village garden plots. We now have under test more than 2,500 varieties, types, and strains, with about 100 varieties commercially available. Some of them, bred or selected for the north country, mature in 75 days and some, suitable for southern states, take 175 days.

"Until recent years the farmer has looked on the soybean mostly as a forage crop, Of late years it has gained in food and industrial uses. Today more than 100 oil mills are crushing soybeans; 200 concerns are manufacturing soybean food products; and more than 100 manufacturers are turning out various industrial products, including plastics and oils for paint and other uses. Now it is a $500,000,000 industry.

"Not only has Federal and State research widened the fields of usefulness of the soybean, but recently there has been much research by commercial interests.

"The soybean food list includes scores of products but those now getting most attention are soy flour, grits, flakes, and meat substitutes. Soy flour's greatest usefulness is in adding value to other foods.

"In industry the soybean is on a good and broad foundation, with about 70 percent or our production processed by oil mills. Industry uses the oil for the manufacture of cooking fat and many industrial products. The remaining high-protein meal is used for stock feed, flour, plastics and other industrial products.

"Altogether we have learned a lot about the soybean–from its home countries of the Orient and through our own efforts–and it has become so important as to be almost indispensable. Our plant pot is really a melting pot."

Address: USDA.

3755. Marquis, Arnold. 1946. The Pacific story. Radio broadcast. National Broadcasting Company (NBC). Hollywood, California. June 2. 30 minutes. 23 p. transcript.
• ***Summary:*** This radio broadcast is a fascinating story–told by many voices–of how the Japanese scientifically developed soybean production, utilization, and export in their puppet state of Manchukuo, and, how the USA intends to capture the soybean export markets lost by the Japanese when they lost World War II.

The Chinese speak of the soybean this way: "It is the poor man's meat. It is the cow of China. It is meat without bones. The Japanese speak of it this way: If we could have held Manchuria, it would have guaranteed that Japan could never be starved out. American nutritionists speak of it this way: It is high in protein. It is rich in vitamins–in A, B-1, C, G, and E–and also in the bloodclotting vitamin K. Weight for weight it contains several times as much B-1 as beefsteak. And as for minerals: One-half cup of soy flour contains as much calcium as a whole cup of milk... [and] as much phosphorus as two cups of milk. And weight for weight, it contains as much iron as liver, twice as much iron as molasses, and three times as much iron as whole wheat flour. The soybean is a wonder food. One pound of soy beans is almost a complete one-day ration for an adult."

The USA is now developing two famine-relief foods based on soybeans. The first contains 50% soybean, plus split peas, wheat flour, and a little peanut-meal, onion, salt, and fish-oil. Four million pounds of this mixture and twelve million pounds of another soy-based mixture are being sent "to the famine areas of China." In other words, soybean are being sent from the USA to the land of their origin, "where they have been a mainstay for five thousand years."

Discusses: The growing of soybeans in Manchuria. The Japanese takeover and extension of their control via the South Manchuria Railroad, whose terminus is Dairen. The importance of Manchurian soybeans to Japan. The Japanese Central Laboratory at Dairen and its research on soybeans. The two Japanese agricultural experiment stations in Manchukuo. Development of the benzine [benzene] solvent extraction process for soybean oil, "until there were 200 large bean plants in southern Manchuria." Soybeans as a livestock feed in Manchuria. Use of soybeans as food in China: "Tofu is bean-curd... This is fermented tofu. It is very good. Tofu is eaten in several forms. Fresh, fermented, dried or frozen. Just about any way it is prepared, its food value is preserved... We also use the oil of the soy bean. And with the soy bean we make soy sauce." Many Asiatic peoples also use soybeans to "make bean milk and bean flour." "They roast them for confections [kinako]. They eat them green [green vegetable soybeans]. They sprout them [soybean sprouts] and they even make drinks of them.

Note 1. This is the earliest English-language document

© Copyright Soyinfo Center 2014

seen (Oct. 2011) that contains the term "fermented tofu.

Industrial uses of soybeans in America. How Dairen became Japan's great center of the soy bean industry in Manchuria, and the Mixed Storage System. "About 55% of the soybeans grown in Manchuria are used for human food."

"You see, its all tied together. The growing of the bean, the processing, the transportation, and the export. Since 1937, the economy of Manchuria has been developed for the benefit of Japan." The Japanese and the Bank of Manchukuo (which is an instrument of the powerful Mitsui and Mitsubishi financial combines) are "buying up all the soybean business" and trying to eliminate the major European companies that were exporting soybeans before the Japanese moved in, such as Dreyfus Co. (France), and Wassard Co. (Denmark). Although the Japanese claim that Manchukuo is an independent nation, other nations realize it is a puppet state. The Chinese Eastern Railway, which was built by the Russians and has its terminus at Vladivostok, is in competition with the Japanese-controlled South Manchuria Railroad for the soy bean business of Manchuria. The latter uses rebates (kickbacks) to try to eliminate competition.

In 1937, after 6 years of dominating Manchuria, Japan invaded China proper–using Manchuria to supply their troops. "By 1941, Manchuria was yielding some four million tons of soybeans. The Japanese controlled every pound of it. And by 1941 they had fostered the growing of soybeans in Korea, and also in Japan itself. Also, by this time, the Japanese had seized a good part of the soybean country of China proper. But by Pearl Harbor [7 Dec. 1941], the United States was also growing soybeans: Over 3 million tons in 1941. By 1945 it was nearly 6 million tons."

Now that the war is over, the Japanese have lost the entire soybean industry in Manchuria–including the laboratories, bean oil mills, Dairen, the South Manchuria Railroad, and the Bank of Manchukuo which controlled it. China, which now controls Manchuria, "will consume much of the soybeans which, before the war, were exported to European countries, and to Japan." The United States has begun to supply this soybean export demand, and in fact "is already shipping soybean products back to the Far East–to the famine stricken areas of China."

America Doctor: "So far most of our soybeans have gone for feeding livestock. But now we known what they can mean to man. Narrator: Now, in this great crisis, we are learning what the Chinese have known for thousands of years. Chinese: It is the poor man's meat. It is the cow of China. It is meat without bones... Announcer: This is the story of the wonder food and the part it has played in our time."

Next comes a 5-minute segment in which W.J. Morse of the USDA Bureau of Plant Industry (Beltsville, Maryland) talks about the significance of the soybean and its development, and the new Pacific Program. Then the conclusion: "For a reprint of this program, send ten cents in stamps or coin to University of California Press, Berkeley, California. The Pacific Story is written and directed by Arnold Marquis. The original musical score was composed and conducted by Thomas Peluse. Your narrator–Gayne Whitman... This program came to you from Hollywood. This is N.B.C.–The National Broadcasting System." Note 2. A cover letter accompanies this manuscript. It is from Arnold Marquis, Writer-Producer, The Pacific Story, to Mr. John Baker, Department of Radio, USDA, Washington, DC. The letterhead reads: National Broadcasting Company, Inc., A service of Radio Corporation of America, Sunset and Vine, Hollywood 28, California. [Phone]: 6161. Dated May 13, 1946. Address: USDA.

3756. McWethy, John A. 1946. Soybean success: War boom continues as many plants expand, bring out new products. Examples: Meat flavor, wool-like fibre, bottle cap adhesive, soymilk cheese. St. Louis meeting draws 400. *Wall Street Journal.* Aug. 31. p. 1.

• ***Summary:*** This article is about the 3-day meeting of the American Soybean Association in St. Louis, Missouri. The soybean industry thrived during the depression, more than doubled in size during World War II, and is now continuing to grow. The A.E. Staley Manufacturing Co., America's largest soybean processor, has just started construction of a new $1 million plant that will turn soybeans into monosodium glutamate (MSG), making one million pounds a year. MSG has been previously made on a small scale in the USA from wheat, but Staley's plant will be the first to make it on a large scale from soybeans.

The Drackett Co. in Cincinnati is putting the finishing touches on a commercial plant that will make a wool-like fibre from soybeans. Robert A. Boyer, the firm's research director, said the new fibre will be used mostly for blending with rayon. He thinks it may sell for less than wool.

ADM, one of America's four largest soybean processors, earlier this year completed a plant to make a "whipping agent" from the versatile soybean; it can replace egg albumin, which is much more expensive.

Dr. Harry W. Miller, president of the International Nutrition Laboratory (Mt. Vernon, Ohio), "started making soybean products in Shanghai, China, in 1935. Bombed out in 1937 by the Nips [Nipponese = Japanese], he came to this country and began making similar products here in 1939. Now his firm does a $500,000 a year business and could do a lot more if sugar and other ingredients used with soybeans were available." His most popular items are [soy] milk, cutlets, and canned green soybeans. He says the milk tastes "rather like malted milk and is especially good for infants and others allergic to animal milk. His company has also developed a cheese made from soymilk, a prepared mix for ice cream from the soymilk, and "albumen sheets" [yuba], which are very popular in China.

© Copyright Soyinfo Center 2014

These sheets aren't much thicker than a piece of paper and are used in China to make the layers of a loaf filled with mushrooms. The Chinese also use soybeans [yuba] to make products that taste like both fish and chicken. In American kitchens, an excellent substitute for butter can be made "by combining soya oil, soya milk," carotene oil for color, and salt.

One big American breakfast cereal maker is said to be planning to introduce a "soya flake cereal soon, similar in appearance to cornflakes. Another may soon market a puffed soyabean cereal, a third may introduce a cooked cereal made from soybeans, oats and wheat."

General Mills is building a factory for producing a synthetic resin from soybeans–a product developed at the Northern Regional Research Laboratory in Peoria, Illinois. Dr. G.E. Hilbert, NRRL's director, says this new resin shows "considerable promise as a protective coating and as a heat-sealing and moisture-proofing agent.

During the past few years, soybean processors have been switching to the solvent extraction systems, from the expeller system, for obtaining oil from soybeans. Most newer plants use hexane solvent. The advantage of the solvent system is that it removes all but about half of one percent of the oil, compared with 3½% to 5% left in the meal when expellers are used. The meal currently sells for 3 cents/lb compared with 11.75 cents/lb for the oil.

NRRL has recently developed a process that uses alcohol instead of hexane. This yields superior "soyflour." Before the war, production of soyflour was 25 million lb/year; this year it is expected to top 400 million lb. Roth Products Corp. of Chicago has already used 6 million pounds of soyflour this year in its dehydrated soups, baked goods, pancake flour mixes, and sausage filler.

The soybean industry (especially the NRRL) is also working to make soybean oil more stable. It "has a tendency to develop a grassy or painty flavor on standing." A process obtained from Germany "goes a long way toward preventing the development of these objectionable flavors."

The Lincoln soybean variety, developed at the U.S. [Regional] Soybean Laboratory at Urbana, Illinois, and first made available to farmers during the war, is playing a major role in increasing yields. Today farmers in the corn belt are getting 25-30 bushels/acre with Lincoln, compared with only 15-16 bushels/acre in the early 1920s with varieties then available. Moreover, today's soybeans contain 20-21% oil compared with only 15-17% about 20-25 years ago.

• ***Summary:*** Green vegetable soybeans (*edamamé*) contained 280.1 to 403.2 mcg per 100 gm of vitamin B-1 and the pod contained 88.4 to 99.1 mcg/100 gm. When the fresh soybeans were boiled for 1 hour in water, 35% of the vitamin B-1 was lost, but the beans in the pods were somewhat protected from the loss; after boiling for 30 minutes, 10.5% of the vitamin B-1 was protected from loss when in the hulls. Address: Osaka Municipal Inst. of Domestic Science, Japan.

Nov. [Nogent-sur-Marne (Seine), France]. [3 ref. Fre]
• ***Summary:*** Contents: Introduction. Table showing the climate of the Sérédou [Seredou] station. 1. Varieties tried at the Sérédou Station: Introduction of soybean varieties (in 1935 [from Manchuria, and Japan], in 1938 [from Annam, Cochinchine, and Cambodia], in 1939 [from Tonkin, Java, USA, and France], and in 1940 [from French Cameroon, Poland, Argentina, Netherlands, Italy], new acquisitions in 1939 and 1940, multiplicity of varieties), classification of the soybeans at Sérédou, agro-botanical observations on the varieties, attempt at classification (general, botanical classification, classification of seed varieties), principal characters (incl. name and place of origin) of the soybean varieties cultivated at Sérédou in 1940.

2. Ecology: The ecological behavior of some (39) varieties, general ecological behavior (the phases of vegetation and critical periods), soya for forage, soybean seeds and their selection, facilities needed for cultivation and production during the year, inoculation of the seeds, quality

© Copyright Soyinfo Center 2014

of the soil, enemies of the soybean including parasites and diseases.

3. Plan for production of soybeans in a forested tropical zone: Organization of cultivation, map of precipitation in West Africa (Sérédou receives about 2,000 mm/year), exports (3-4 crops a year can be grown), cropping patterns, growing soybeans for use as food.

4. Modifications of indigenous methods: The need to introduce soya as an indigenous food and badly needed source of protein, difficulty of cooking soybeans, selecting varieties best suited to cooking, soaking, washing and cooking, cooking by the local people, times of year favorable for introducing soya into the diet, place of soya in the crop rotation.

5. The nutritional composition of soybeans grown in West Africa (analyses of varieties cultivated at Sérédou were made by M. Nguyen Van Cuc, a chemist at Nogent-sur-Marne), graph showing that oil content and protein content are inversely related. 6. General conclusions based on the first trials: Based on the 1939 and 1940 trials one can conclude that in the forested areas of [southeast] Guinea (Gueckedou, Macenta, N'Zerekore [Nzerekore]), and the sub-forested areas (Kissidougou, Beyla), soybeans can be grown with good results, and every effort must be made in this direction in the years to come. Soybeans can help meet the food shortages that exist in June, July, and part of August.

The preface (p. 3) states: "Sporadic attempts at the introduction of soybean cultivation have been in French West Africa since 1900. They have been conducted on a small scale in the various stations of Dahomey [later Benin], Ivory Coast, Upper Volta, French Guinea, French Sudan (*Soudan français* [Mali]), Upper Senegal-Niger (*Haute-Sénégal-Niger* [Mali]), and at the Office of Niger (Soninkoura [probably Soninnkoura in the Segou region of Mali on the Niger River], using irrigated cultivation). Practical results have been obtained in forested Guinea (at the Sérédou Station) and in the upper Ivory Coast. This study focuses on the results of trials conducted at Sérédou in 1939 and 1940.

The section on "Introduction of soybean varieties at the Sérédou Station" (p. 5) states that in 1935 five varieties were tested at Macenta by M. Barthes. They were Nogent 2856–Black *Wou T'ecu,* from Manchuria. None germinated (*ne germèrent pas*). Nogent 2855–Black *Hoi T'ecu,* from Manchuria. None germinated. Nogent 2852–Yellow *Huen T'ecu,* from Manchuria. 102 plants matured. Nogent 2817–Yellow of Japan. 17 plants matured. Nogent 2853–Green *Tsing T'ecu,* from Manchuria. 1,000 plants matured. Of these five, only No. 2853, the green-seeded soybean from Manchuria did well, and was kept and appreciated, but its cultivation was continued until 1939.

The best The best period for vegetation is from October to March in low irrigated lands, and until June in high lands. The vegetation period varied from 80 to 160 days for the different varieties (in the short cycle varieties branching is very reduced). Soybeans can be cultivated for export or for local consumption, both as forage and as food for the natives. Soybeans for export must be harvested during March-April and exported during the dry season. As a food for the natives it can be a supplement during the food-short months of June and July. Since soybean seeds lose their germination power quickly during the rainy season, it is necessary to have a little cultivation during June, August, and September in order to produce the necessary seeds for export. This cultivation cannot be integrated into the cultivation for food as it produces in a season when rice, which is preferred by the natives, is available.

Note 1. This is the earliest document seen (Aug. 2009) concerning soybeans in Upper Volta (renamed Burkina Faso in 1984), or the cultivation of soybeans in Upper Volta.

Note 2. This is the earliest reliable document seen (Aug. 2009) concerning soybeans in Dahomey (renamed Benin in 1975), or the cultivation of soybeans in Dahomey.

Note 3. This document contains the earliest date seen for soybeans in French Guinea, or the cultivation of soybeans in French Guinea (1935). The source of these soybeans was Manchuria and Japan. Address: Ingénieur d'Agronomie Coloniale, Licencié ès Sciences.

• ***Summary:*** Among the foods consumed in these camps were soybeans (*soojaboonen*), tempeh (*tempe,* see p. 175, 183-84), and ontjom, starting in November 1944. "The food was very insufficient, calorically as well as regards further composition and taste. So numerous cases of nutritional oedema and other deficiency phenomena occurred. The construction of kitchens, bakeries and such was done by the inhabitants of the camps themselves with the most primitive materials. Food yeast, baker's yeast, maize malt, vitamin B extracts and other useful products were also made by the inhabitants themselves mostly out of waste products. For the patients very simple diets were composed." Address: Geneeskundig Laboratorium, Hoogschool, Batavia (Jakarta, Indonesia).

3764. *J. of the American Society of Agronomy.* 1946. Fellows elect: William Morse. 38(12):1116-18. Dec.
• ***Summary:*** "William Joseph Morse was born in New York in 1884. He was granted the B.S. degree by Cornell University [Ithaca, New York] in 1907 and the same year began his studies with the U.S. Dept. of Agriculture where he is, at present, principle agronomist in charge of soybean investigations for the Division of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering. The U.S. Regional Soybean Laboratory, conducting research in twenty-four states is also under his direction.

"Although Mr. Morse has published many papers on his investigations on cowpeas, velvet beans and other miscellaneous legumes, his chief interest and work has been with soybeans. It may be appropriately stated that he is the father of soybean production in American agriculture. His many authoritative publications on varieties, culture and uses of the soybean attest to his outstanding work. From 1929 to 1931, he traveled through China, Japan, Korea and Manchuria collecting new varieties of soybeans and compiling data on cultural methods and uses for them.

"Mr. Morse was three-times president of the American Soybean Association, and has served the American Society of Agronomy for many years on the important committee of Varietal Standardization and Registration." A photo shows William Morse.

Note: This is the earliest document seen (June 2003) that uses the word "father" in connection with William Morse and soybean production in the USA.

3765. Senryôki shuppanbutsu: Ryôri to eiyô. 15 vols. [Publications of the occupation period; Food and nutrition. 15 vols.]. 1946-1951. Japan: 13-26 cm. [Jap]
• ***Summary:*** Chapter (or volume) 8 of this book is *Nattô no gôriteki seizôhô* (Rational natto production), by Yamazaki Momoji and Miura Jirô.

This is a collection of publications mostly from the censorship collection of Allied Forces for occupation (1945-1952); this group contains works on cooking and nutrition.

3766. Meals for Millions Foundation. 1946-1967. Meals for Millions Foundation Records, 1946-1967 (Finding aid for archival collection). Los Angeles, California: University of California at Los Angeles (UCLA). 48 boxes (24 linear feet). 1 oversize box.
• ***Summary:*** Collection No. 1107. Repository: UCLA Library, Dep. of Special Collections, Los Angeles. Physical location: Stored off-site at SRLF (Southern Regional Library Facility). Please contact UCLA for paging information.

"The Meals for Millions Foundation of Los Angeles was a non-profit organization dedicated to the eradication of hunger in the world through 'three-cent meals.' The plan for such a program was formulated by Clifford Clinton (of Clifton cafeterias in Los Angeles, California), who, with the assistance of Dr. Henry Borsook of Caltech organized the foundation in 1946. The basic product of the foundation, known as Multi-purpose Food, was a tasteless additive that could be mixed with virtually anything. Developed by Dr. Borsook, MPF was said to provide one-third of the daily vitamins, minerals, and protein needed by the average adult.

"Shortly after setting up the Foundation, Clinton brought in Florence Rose and Ernest Chamberlain to be co-directors and take over the day-to-day management. This collection or archive consists primarily of the office and personal files of Miss Rose, most of which she rescued from destruction when Meals for Millions began to change course in 1965. Florence Rose left the Foundation at that time and was then associated with Investors Overseas Services until her death in 1969.

"The collection came to UCLA indirectly (via Smith College [although Florence Rose's personal papers are still at Smith College]) from Ernest Chamberlain, close friend and confident of Miss Rose. The files have been alphabetically listed and their arrangement retained as originally filed. Consequently, a great deal of duplication exists throughout and the interrelationships of materials are often cloudy at best" (Quoted from the Biographical narrative on the website, July 2007). Organization: Arranged in the following series: 1. Alphabetical files of the Meals for Millions (MFM) Foundation (boxes 1-21); 2. Miscellaneous unsorted correspondence and ephemera (boxes 22-26); 3. Miscellaneous printed material (boxes 27-30); 4. MFM notebook files of printed material (boxes 31-37); 5. MFM projects in foreign countries (boxes 38-47); 6. Miscellaneous files re soybeans, MFM staff and financial information, newspapers (box 48); 7. Two records by Peggy Lee produced for MFM, photographs, People to people film (oversize box).

Boxes 38 to 47 are MFM projects in foreign countries or regions, listed alphabetically: Africa, Alaska, Argentina, Bolivia, Brazil, Ceylon, Chile, Finland, Germany, Haiti, Honduras, Hong Kong, Hungary, Iceland, India (5), Indonesia, Israel, Japan, Korea, Lebanon, Mexico, Pakistan, Paraguay, Peru, Philippines, South Vietnam, Taiwan, Tanzania, Thailand, Uruguay, Vietnam. Box 48 is oversize materials.

3769. Bascom, William R. 1946. Economic Survey of Micronesia for the U.S. Navy. Vol. 7. Human and economic resources–Ponape, Eastern Carolines. Honolulu, Hawaii: U.S. Commercial Company. 287 p. See p. 126-27. [231* ref]
• ***Summary:*** In Chapter 2, "The people," Section B is titled "Cultural data." From the Introduction (p. 18) we can extract a brief chronology. Before 1826–Native period. 1826. O'Connell is shipwrecked. 1826-1886–Pre-Spanish period. 1899–Germany purchases Ponape, together with the rest of the Carolines and most of the Marianas, after Spain had been defeated in the Spanish-American War. 1914 Oct.–The Japanese Navy takes control of Ponape and rules it with a military government; a civilian administration is added in 1918. 1920–The Carolines become a Japanese mandate under the League of Nations. 1922–A Japanese civilian administration called the South Seas Government (*Nanyo Cho*) is added. The Japanese Period ends in Sept. 1945 near the end of World War II, with a surrender to U.S. forces; the American Period begins.

In Chapter 6, "Resources and production," Section A is titled "Agriculture." The introduction states (p. 171-72): The Japanese established the Tropical Industries Research Station at the site of the Pohnpei Agricultural Station [in 1926]. Agricultural investigations were under the direction of Mr. Moritaro Hoshino; a manuscript written by him, reporting the results of his investigations, was made available to this Survey and translated in part; it is the source of some of the following information: "The Japanese on Ponape grew a variety of foods for their own use. In 1934 small government-subsidized truck gardens were started in Palikir, and during the war this activity expanded until the island was almost entirely self-supporting. Sweet potatoes and cassava seem to have been the most important staples, but many other plants were also grown... the Japanese grew tomatoes, green peppers, okra, *mitsuba,* spinach, kohlrabi, cabbage, lettuce, a kind of parsley, water cress (*mizu napa*), turnips, radishes, carrots, peanuts, soya beans, and rice. Of those in the latter group, at least lettuce, peanuts, and rice had been planted in small quantities by the Germans."

Note 1. This study was republished in 1965 in *Anthropological Records* (University of California Press). 22:1-156. April. 15. See p. 87.

Note 2. This is the earliest document seen (March 2010) concerning soybeans in Micronesia, or the cultivation of soybeans in Micronesia. This document contains the earliest date seen for soybeans in Micronesia, or the cultivation of soybeans in Micronesia (1945 or before). The source of these soybeans was probably Japan.

Note 3. Thanks to Diane Ragone (July 2002) of the National Tropical Botanical Garden (Kauai, Hawaii) for providing the 1965 source. Address: [Univ. of California].

3770. Holmberg, Sven A. 1946. Från sojaväxtförädlingen vid Fiskeby [Soybean breeding at Fiskeby]. *Kunglinga Lantbruksakademiens Tidskrift* (*J. of the Royal Swedish Academy of Agriculture*) 85(4):373-84. [Swe; eng]
• ***Summary:*** "The first aim of soya bean breeding at Fiskeby, Sweden, has been to achieve earlier maturity. Varieties which in America and elsewhere are described as 'extra-early,' do not behave as such when grown in the cool, long-day climate of Sweden. The Canadian variety, Manitoba brown, which ripens in 100 days at Ottawa, Ontario, on the 45th latitude, requires 143 days on the 58th latitude at Fiskeby, Sweden. The Sioux variety ripens in 185 days in Virginia, USA (39º), 114-121 days on southern Sachalin [Sakhalin] (47º), and in 136 days at Fiskeby (58º)."

Note: Sakhalin, belongs to the USSR; belonged to Japan from 1905-1945 as Karafuto, but belonged to Russia before that.

"Out of 6,426 attempted hybridizations, only 872 gave progeny. By crossing the short, extra-early varieties found on the islands of Hokkaido [Japan] and Sachalin with the taller, medium-early varieties from Manchuria and Germany, new hybrids were raised. Some of these are decidedly earlier in maturity than either of their parents and are also medium in height. Many of these new hybrids ripen on our latitudes the first days of September showing an advance in earliness of 2-3 weeks as compared with the 'extra-early' varieties cultivated before. New crosses have been made to increase the yield and improve the quality of these hybrids."

Note: This is the earliest document seen (Jan. 2010) that is by or about Sven A. Holmberg, or his work breeding soybeans for northern latitudes and/or cold climates. Address: Sweden.

3776. Oriental Show-You Company. 1946. Oriental recipes. Columbia City, Indiana: Oriental Show-You Co. 15 p. *
• ***Summary:*** These recipes describe how to use the company's shoyu (naturally fermented, Japanese-style soy sauce). A 24-page edition was published in 1940.

3777. Rombauer, Irma S. 1946. The joy of cooking: A compilation of reliable recipes with an occasional culinary chat. Indianapolis, Indiana, and New York, NY: The Bobbs-Merrill Co. 884 p. Illust. by Marion Rombauer Becker. Index. 22 cm.
• ***Summary:*** This is the earliest known edition of *The Joy of Cooking* since the end of World War II. It was actually printed from the 1943 plates with very few changes. It has the same number of pages as the 1943 edition, but less emphasis on soy. Soy-related recipes: Chicken chop suey (with soy sauce, p. 143-44). Sukiyaki (with soy sauce, but no tofu, p. 163). Chow mein with fried noodles (with soy sauce, p. 164). Dried bean loaf (with dried soybeans, p. 176). Soybeans, green (p. 280). Soybeans (dried; "Boil them in fresh salted water until tender {about 3 hours}," p. 280). Seasonings and ingredients for sauces (incl. soy sauce, p. 379).

Includes a delightful Foreword and "Preface to the 1943 edition." Also well-known recipes for Peanut butter cookies and Peanut brittle. Worcestershire sauce is used to season many sauce or gravy recipes (p. 379-92). Words notably missing from this edition: Blender, milk shake. Address: St. Louis, Missouri.

3778. Walworth, Arthur. 1946. Black ships off Japan: The story of Commodore Perry's expedition. New York, NY: Alfred A. Knopf. xviii + 277 p. + viii. See p. 191, 263-64. Introduction by Sir George Sansom. 22 cm. [83* ref]
• ***Summary:*** On about 13 March 1854, the Japanese permitted the U.S. officers to walk about the towns of Yokohama and Kanagawa. Dr. James Morrow, the expedition's agriculturist, went on land also. The Treaty of Kanagawa was signed by Japanese and American representatives on 13 March 1854 and proclaimed on 22 June 1855. The Japanese celebrated the occasion with a big meal that included fish, shrimp, sea weed jelly, side dishes of confections, soy sauce, condiment, rice, saké, etc.

Appendix L, titled "Presents received by Americans from the Japanese government, March 24, 1854," notes that "1 box, 10 jars of soy" were received from Udono, 4th commissioner. The term "soy" here refers to shoyu (Japanese-style soy sauce); no mention is made of soybeans as such. Arthur Clarence Walworth was born in 1903.

3779. *Soybean Blue Book.* 1947-1966. Serial/periodical. Hudson, Iowa: American Soybean Assoc. Annual. Titled Soybean Blue Book from 1947-1966; Soybean Digest Blue Book from 1967-1979; Soya Bluebook from 1980 to present.
• ***Summary:*** A directory and information book for the soybean production and processing industries–but with much greater emphasis on processing and utilization. One of the most valuable sources of worldwide information on soybeans. During the period from 1947 to the 1960s, the Blue Book was usually published in March or April of each year.

In the 1966 Blue Book (p. 28-29) are two full-page tables titled "World Soybean Production." The first gives acreage in 1,000 acres, yield in bushels per acre, and production in 1,000 bushels. The second gives hectarage, yield in kilograms per hectare, and production in 1,000 metric tons. Figures are given for: 1950-54 (average), 1955-59 (average), 1963, 1964, and 1965. Statistics are given for the following countries: North America: Canada, United States. South America: Argentina, Brazil, Colombia, Paraguay. Europe: Italy, Rumania, Yugoslavia, Other Europe (excluding USSR). USSR (in Europe and Asia). Africa: Nigeria, Rhodesia, Tanzania. Asia: Turkey, China (Mainland), Cambodia, China (Taiwan), Indonesia, Japan, Korea (South), Thailand. Estimated world total. Address: Hudson, Iowa.

3780. *Soybean Digest.* 1947. Sweden hunts for varieties. March. p. 18.
• ***Summary:*** "The first problem of soybean production is Sweden is finding varieties that will mature in that northern latitude.

"Breeding work at Fiskeby in Sweden is covered in the preliminary report of Sven A. Holmberg of Norrkoping in the *Journal of the Royal Swedish Academy of Agriculture.* Middle Sweden is in the same latitude as northern Canada and southern Alaska. Successful soybean growing requires varieties that can be harvested in early September... The Canadian variety, Manitoba Brown, which ripens in 100 days at Ottawa, Ontario on the 45th latitude requires 143 days on the 58th latitude at Fiskeby, Sweden. The Sioux variety ripens in 85 days in Virginia, in 114-121 days on southern Sachalin [Sakhalin] and in 136 days at Fiskeby...

"Mr. Holmberg will be glad to send a copy of his report on the work at Fiskeby, which contains an English summary, to interested readers. Address Sven A. Holmberg, Norrkoping, Sweden."

In: F.A. Brillmayer. 1947. Die Kultur der Soja in Oesterreich. Vienna: Scholle-Verlag. 97 p. See p. 11-14. [Ger]

• ***Summary:*** Starting in 1920 again, for the second time, Austria promoted the production and utilization of soybeans, and with this the impulse for a new "soya wave," which now went all over Europe, was unleashed. Here in Vienna a soya industry also began with the production of Edelsoja. Assistant Professor Kupelwieser used it to demonstrate the outstanding significance of soya as a protein source, going against the then current opinion that soya was primarily an oilseed. From my soybean breeding location at Platt in Lower Austria, Austrian cultivars spread all over Europe and even overseas.

Why should it not be widely known that valuable pioneering work was performed in Austria? The line of soybeans bred in Platt went to Poland, the Balkans, to Hungary, Belgium, Holland, and Greece, to Turkey, to Persia, Canada, England, Germany, Dutch Guiana [later renamed Suriname], the Indian Peninsula [Vorderindien, incl. India, Sri Lanka, and parts of Pakistan and Burma], China, Java, Tanganyika, to French Morocco, and Bessarabia [now part of the Moldavian S.S.R. in the USSR]. It was not only new breeds of soybeans that spread out from Austria but a rekindling of the "soya idea" that had its origin here. This led to a change of opinion and the soybean came to be seen as a world power factor (*Weltmachtfaktor*), as is already well known today.

According to Dr. [E.C.] Winkler's patented process for debittering soya, a very modern factory was erected in Vienna XX. In it, a part of the oil was expressed, leaving a meal with only half its original fat content. Dr. Winkler achieved, through prior debittering of the soybeans, an excellent food and salad oil that did not need to be further refined. Also, the production of unrefined salad oil from Edelsoja originated in Austria.

History of the introduction of soya to Austria (p. 11): On the occasion of the Vienna World Exhibition of 1873, Japan exhibited soybeans and awakened a great interest for this Asian plant throughout Central Europe. This was mainly because of the fact that in the Exhibition attention was called to the value of the soybean. The Viennese university professor Friedrich Haberlandt took the matter into his own hands. Through the agency of the imperial embassy / legation he had the Ministry of Agriculture acquire 20 soybean samples from Japan and China. The tests were done in the warmer provinces of the Monarchy. There were 148 agronomic trials introduced in Hungary, Dalmatia [a former region on the Adriatic coast of what is now Croatia; formerly an Austrian crownland], Kärnten [Carinthia, today a state in southern Austria bordering on Italy and Yugoslavia], Steiermark [Styria, a state in the mountainous part of central and southeast Austria], Istrien [Istria, in Slovenia since June 1991], and Mähren [Moravia, a region in central Czechoslovakia]. In 1877 Haberlandt had already gathered so much experience that exact guidance for cultivating soybeans could be given. At this time the first composition analyses were undertaken, so exact knowledge of the value of soybean seeds was obtained. Likewise, through Steuf and Wolker, experience was gained in pressing oil from the seeds, and selections were undertaken in the Botanical Garden at Vienna. The highest yielding types were called "Haberlandt" and these first appeared in the seed catalog of the great seed company Vilmorin Andrieux & Co. in 1880.

Haberlandt pointed out the value of the soybean as food and recommended a diet of soybeans and potatoes, which contained all nutrients necessary for human life. It was also recommended that the soybean be incorporated into the commissary provisions of the army, and in this process that peas in the popular pea sausage 'Erbswurst' be partially replaced by soybeans.

At that time, the soybean could not stand on its own. It remained strong for a long time in the peasant agriculture of Krain [Carniola; now in Slovenia] and Istrien, and served as a 'coffee bean' (*Kaffeebohne*) in the preparation of a breakfast drink. There were two conditions which stood in the way of the spread of soybeans. First, the soybean is a foreign food to us. When cooked, it remains hard and has an after-taste, an off flavor that is bitter. The very thin layer under the seed coat of the bean is the source of this after-taste. In addition, it was said that Asian soyfoods have no taste. What is more, there was plenty of food in the Monarchy, so there was no need for a new, foreign food.

The soybean completely disappeared from memory in Austria. It was only kept in a few botanical gardens as a curiosity.

In 1920 I began breeding soybean lines with the goal of getting ones that would ripen in our climate and give reasonable yields. Conditions for soybean culture became ripe after World War I due to the general lack of food. My starting material was a matchbox full of soybeans that a prisoner of war had brought with him from Siberia. After a long delay, the solution to the soybean problem was begun in Platt in lower Austria, near Zellerndorf in the district of Hollabrun. Some of the seeds ripened and in the next year those that ripened earliest were selected. In 1924 I was able to announce to Dr. Markus Brandl (the top agricultural official in the area) that I had a field of soybeans that matured in mid-September. Immediately Dr. Fritz Drahorad was sent to Platt to inspect and report on the soybean plant. Drahorad was the current top ranking agronomic official in Vienna in charge of plant cultivation and seed testing (*Oberkommissär der Bundesanstalt für Pflanzenbau und Samenprüfung*) and the assistant to Privy Councillor (*Hofrat*) Professor Dr. Tschermak von Seysenegg, who had been involved with soya at Royal College of Agriculture (*Hochschule für Bodenkultur*) in Vienna. He wrote a confirming report, that a good yielding, early maturing variety was now at hand. This first domestic variety was small seeded and black. It was

© Copyright Soyinfo Center 2014

called Platter SS (Black Seeded) 14.

Using newspaper articles and a small price list, I propagated soybean culture. I pointed out its significance as human and animal food, established connections with central authorities in China, and exchanged experiences and breeding material with research stations in Manchuria. The Chinese Eastern Railway soybean station in Harbin, which then employed a staff of 20 scientists, published annually a hefty volume with research results dealing with all questions of culture, breeding and utilization. In this way, Austria received new breeding material from Manchuria–over 80 soybean varieties. But in Platt they failed to perform up to our expectations because of the longer vegetation period.

Meanwhile, from the small-seeded SS 14 a very large seeded strain was selected. In the price list of 1929, eight lines appeared, with maturity times ranging from 114 to 128 days. One thousand seeds weighed 158 to 170 gm. Yields steadily improved throughout 1929. In the same year, the new varieties of Platt Yellow and Platt Yellow Giant were made available in small quantities for research. A table (p. 14) shows that 100-gm packets of mixed types were sold, including many black types and Professor Früwirth's Black Eyebrow, all prefaced by the word 'Platter.'

Note: This is the 2nd earliest document seen (Oct. 2007) concerning the cultivation of soybeans in Persia [renamed Iran in 1935]. Address: Braunsdorf–Vienna, Austria.

3782. *Soybean Digest.* 1947. To live: Japan must import more soybeans. May. p. 36.
• ***Summary:*** "The Manchurian soybean crop in large part holds the key to the economic health of the Japanese people. This situation is revealed in a special analysis prepared for the Foreign Economic Administration by F.H. Shelledy of the U.S. Tariff Commission... In the past the heavily peopled islands have grown only one-third of their needed soybeans. The rest have come from Manchuria, chief supplier to the world soybean trade, and to a smaller extent, from Korea. The soybean was one reason why the Japs over-ran Manchuria... Now, however, the Manchurians are growing a third fewer soybeans than they were before the war... Before the war Japanese farmers grew from 10 to 14 million bushels of soybeans annually. Most of their crop found its way to the island markets, being superior for food to the beans imported from Manchuria and Korea... But Japanese farmers used a large part of the crop as green manure, since they lacked animal manures. They also depended on the Manchurian soybeans as a source of fertilizer... Before the war the Japanese were importing 26 million bushels of soybeans annually...

"'Actually there appears to be little chance of any substantial increase in soybean production in Japan. If Japan is to have sufficient soybeans to supply its needs, it will have to import most of them,' Shelledy says."

3783. Walsh, Robert M. 1947. Soybean production–Here and abroad: And possible competition from other oilseeds. *Soybean Digest.* May. p. 18-21.
• ***Summary:*** Contents: Introduction: Soybean production concentrated in China, Manchuria, and USA, uses of soybeans oil. War-time role. Short during the war. Early postwar situation. Possible future developments. Long time [term] outlook.

"Before the war, Asia produced 400 million bushels of soybeans a year; the United States 56 million." China was the leading producer, with slightly over 200 million bushels/year–all of which was used domestically. Manchuria produced about 150 million bushels/year and was the world's chief exporter. "The United States, Korea, Japan, and the Netherlands Indies were the only remaining producers of any consequence. Contrary to popular, output in southeastern Europe was extremely small."

In the USA, production grew from 5 million bushels in 1924 (mostly for seed use) to 23 million bushels in 1934, with an increasing percentage "going to oil mills for crushing. The severe drought of 1934 was a notable factor leading to the present day importance of soybeans as a cash crop in the United States. Soybeans proved to be more drought-resistant than corn. In 1935 farmers more than doubled their 1934 production." By 1939 production had reached 90 million bushels.

"Drought related shortages of lard in 1935-37 resulted in a rapid gain in the use of soybean oil in shortening." Between 1935 and 1939, soybean oil went from being used mostly in nonfood industrial products (paint and related products was the biggest use in 1935) to being used mostly in food products (such as shortening and margarine). Cottonseed oil was still the main liquid oil used in processed foods and linseed oil was still the main oil used in "drying-oil products."

"To sum up, soybean oil made notable gains in production and use during the late 1930's. This upward movement was sharply accelerated by the war which followed.

"War-time role: Throughout most of 1940 the United States had large supplies of domestic and imported oils, and prices were low. And our consumption of fats in 1941 was the largest in peace-time history. Real trouble began in 1942. Imports fell abruptly after the Japanese attack on Pearl Harbor. The United States had been dependent on Pacific sources for about half its imports of fats and oils. In the five years 1937-41, imports had averaged 2 billion pounds annually. From 1942 through 1946, yearly imports were less than half that amount. The major loss was in coconut oil," followed by palm oil from the Netherlands Indies, and tung oil from China. In addition, the U.S. had previously lost nearly 100 million pounds of olive oil from the Mediterranean region, and fairly large amounts of fish- and fish-liver oils from the European North Atlantic area.

© Copyright Soyinfo Center 2014

During World War II, the U.S. government acted to increase domestic oil production and to ration supplies. Soybean production increased. "To induce larger output, AAA [Agricultural Adjustment Administration] restrictions on soybean acreage were partially relaxed in June 1941. The government offered to support prices of 1941-crop soybeans at approximately $1 per bushel. These actions, together with rising market prices, brought forth an increase of over 1 million acres in soybeans harvested for beans.

"An all-out war production program for oilseeds was launched in 1942. High production goals were set for soybeans, flaxseed, and peanuts... Large-scale increases in livestock production were fostered."

Production of soybean oil showed steady gains throughout the war, rising from some 500 million pounds in the 1940 season, to 1,200 million pounds in the 1942 season, and reaching a peak of 1,400 million pounds in 1945-46.

A graph shows "Soybeans harvested for beans: Production, crushings, and price, United States, 1924-46." The upper graph shows U.S. soybean production and crushings in millions of bushels. The lower graph shows the price received by farmers in dollars/bushel and the "comparable price (September 15)."

3784. Hedge, Porter M. 1947. Washington Digest: Army buys more [soy] flour. *Soybean Digest.* June. p. 39.

• ***Summary:*** "The Army has ordered 75,000 long tons of soy flour for June, July, and August delivery for civilian feeding in Japan, the Ryukyu Islands [which stretch southward from Kyushu, Japan's southernmost main island], and Korea.

"Of the total 62,600 long tons are for Japan proper and the Ryukyu Islands; the remainder for Korea. The Korean shipment, and 12,500 long tons of the Japan quota are a substitute for pulses."

3785. Caldwell, Joseph S.; Culpepper, C.W.; Hutchins, M.C.; Ezell, B.D.; Wilcox, M.S. 1947. Dehydration of green vegetable soybeans: A comparison of quality in nineteen varieties and strains with that of canned green and mature dry beans. *Canner* (*The*) 105(10):13-16, 24. Aug. 30; 105(11):13-14, 16, 26. Sept. 6; 105(12):15-16, 18. Sept. 13; 105(13):35-36. Sept. 20. Summarized in Soybean Digest. March 1948, p. 20-30. [25 ref]

• ***Summary:*** "Japanese horticulturalists classify vegetable soybeans as garden vegetables and have developed and selected about 125 distinct varieties which they grow especially for food purposes... out of a total of about 125 varieties introduced from Japan [to the USA], approximately 25 are fairly well adapted to conditions in some or most of the important soybean-producing districts and combine satisfactory yields and good to excellent quality as fresh green beans."

"The canning of vegetable soybeans on a commercial scale is assuming some importance. Twenty-three canning companies in 12 states included soybeans in the list of products packed in 1944. The number was reduced to 16 in 10 states in 1946" [according to the National Canners Association, Canners Directory, for 1944 and 1946]... Commercial freezing of soybeans, either alone or in combination with sweet corn as succotash, has very recently begun by a few commercial operators.

For the first varieties to reach usable maturity, the green pods were picked from the plants by hand, spread in the laboratory on wire trays to a depth of about an inch, steamed for a few minutes to soften the pods, then shelled in a power-driven pea huller equipped with special screens having openings of suitable size. "This method proved slow and unsatisfactory, as the pods clung together in masses so that many remained unopened even after two or three passages through the machine, while the empty hulls broke up and tended to clog the screens." A much more satisfactory and efficient method is described, still using the pea huller.

Table 1 shows the 17 varieties of green vegetable soybeans used, date harvested, days from planting screen size, length of blanch, total solids content, ascorbic acid content (hand shelled, or steamed then machine shelled), carotene content, and yield of dry product as a percentage of fresh product. The varieties, listed alphabetically, are: Aoda, Bansei, Emperor, Etum, Giant Green, Hahto, Imperial, Jogun 2, Kanum, Kanro, Rokusun, Sousei, Tastee, Willomi, and Wolverine. The varieties with the best scores after dehydration were Willomi (strain A), and Etum. Address: USDA.

3786. Leonard, Warren H. 1947. Barley culture in Japan. *J. of the American Society of Agronomy* 39(8):643-58. Aug. [2 ref]

• ***Summary:*** Contents: Introduction. Geographical distribution. Regional types and varieties. General cultural practices. Cultural methods on upland fields. Culture on paddy fields. Diseases and insect pests. Utilization. General summary.

Barley, one of the most important crops grown in Japan, is used for both food and forage. Almost all barley grown in Japan is the common six-row barley, *Hordeum vulgare,* as in the United States. In Japan, most of the crop is spring barley, seeded in the fall. The two basic types are covered barley and naked barley; about 60% of the crop is naked barley (which threshes free from the glumes, as does common wheat) and 40% covered. During the period 1936-1940, the cultivated area devoted to barley was about 14% of Japan's arable land area. When the covered and naked types are included together, barley ranks second in acreage among

© Copyright Soyinfo Center 2014

all Japan's cultivated crops, being exceeded only by rice, which occupies 53% of the cultivated area. Barley is grown throughout Japan.

Table 6, titled "Uses of barley in Japan, 1942" gives the number of bushels and percentage for covered barley / naked barley for the following uses: Meal (eating use) 64.42% / 75.88%. Fodder or feed 22.83% / 14.36%. Seed 2.96% / 3.39%. Bean paste [miso] and soysauce 2.99% (1.032 million bu) / 6.03% (1.826 million bu). Beer 5.00% / -. Other uses (candy, medicine, yeast, etc.) 1.80% / 0.34%.

Note that both covered barley and naked barley are used to make miso and soysauce, but about 77% more naked barley is used in terms of bushels per year.

Barley is generally preferred to wheat for cooking with rice; it is pearled when used in this manner. Barley straw is used for straw braids, roof-thatching, litter, and mulches for vegetables.

Covered barley is grown almost exclusively in the United States, primarily for use as livestock feed and for malting. Address: Prof. of Agronomy, Colorado A. and M. College, Ft. Collins, Colorado.

See p. 10-11. [Ger] Address: Studienrat and Dr., Erlangen.

3788. Rodrigo, P.A. 1947. Soybean culture in the Philippines. *Philippine J. of Agriculture* 13(1):1-22 + 5 plates. Third quarter. Summarized in Soybean Digest, May 1948, p. 41. [14 ref. Eng]

• ***Summary:*** Contents: Introduction. Description and history. Climatic and soil requirements. Varieties. Propagation. Preparation of the soil. Fertilizers and lime. Inoculation. Planting. Care of the crop. Harvesting and production: For day, for seed. Cost of production. Uses of soybeans. Diseases. "In the big cities in the Islands, many of the soybean products like soy sauce or toyo, tokua, tajuri [fermented tofu], tojo [soymilk curds], miso, etc. are becoming more popularly used by the Filipinos, and will be more so as their nutritive values become more fully realized. Already, in some sections of the country where soybean is being grown, the seed is used either as a green or as a dry vegetable. The dried bean is roasted and is eaten offhand or is used in adulterating coffee, and the bean in the dough stage is boiled and eaten like peanut" (p. 2).

Note 1. This is the earliest English-language document seen (Oct. 2011) that uses the word *tajuri* to refer to fermented tofu.

Table 1 shows annual imports (in kg) of soybeans and soybean products into the Philippines from 1929 to 1940, including dried beans, soy sauces, soybean meal, tausi (fermented black soybeans, salted), paste (miso), and total. By far the leading import (by weight) from 1929 to 1937 was dried soybeans. In 1929 some 4,574,497 kg were imported. This figure rose gradually (with ups and downs) to a peak of 5,660,575 kg in 1937, then fell sharply to only 237,666 kg in 1940. Soybean sauces were the No. 2 import, starting with 606,231 kg in 1929, rising to a peak of 1,441,563 kg in 1932, then remaining above 1,000,000 for most years thereafter. Imports of soybean meal started in 1935 with 660,699 kg; they reached a peak 1,023,303 in 1936 (the next year), then remained near 1,000,000 thereafter. Tausi was first imported in 1940, the amount being 151,571 kg.

Table 2 shows the value of these items (in pesos). In 1940 the imports of greatest value were soy sauces (120,346 pesos), soybean meal (50,682), and tausi (20,280).

"In the Philippines, while the plant has been under cultivation since the Spanish regime [1571-1898], it has not gained much headway due mainly to the lack of a variety suitable for commercial planting, and perhaps due to want of interest among farmers" (p. 4-5). The Philippine Bureau of Plant Industry has, to date, introduced more than 200 soybean varieties to the Philippines from the USA, China, Japan, Hawaii, Java, and India, but it presently recommends only a few varieties for commercial planting. These include Ami, which has long been cultivated there and is well adapted to the varied soil and climatic conditions.

Based on the results of a number of years' trials in different regions of the Islands, the following varieties have been found to be productive: Yellow Biloxi Hybrid (introduced from Hawaii in 1936), Mis 28 E.B. Str. 3910 (introduced from India in 1937), Mis 33 Dixi (introduced from India in 1937), Head Green (introduced from the USA in 1935), and American Black. All of these varieties are good for May and June planting, and all but Yellow Biloxi Hybrid are good for September to December planting (dry season).

"In the Philippines, the green but fully developed pods are harvested, and the seed is cooked and eaten in practically the same way as lima bean or patani... In Lipa, Batangas, soybean in the dough stage is boiled in the pod and sold and eaten offhand" like peanuts. The more common soy products made in the Philippines are soy sauce or *toyo,* tokua [tofu], tausi [fermented black soybeans], and miso. "Soybean milk is being manufactured by the Bureau of Plant Industry in a limited scale and a big modern firm has started putting soybean milk and other products in the local markets" (p. 15-16).

Note 2. This is the earliest English-language document seen (Nov. 2011) that uses the word *tausi* to refer to fermented black soybeans. Address: Chief, Horticulture Research Section, Bureau of Plant Industry.

3789. *Soybean Digest.* 1947. Export to Japan? Nov. p. 36.

• ***Summary:*** "There is some prospect that a limited volume

© Copyright Soyinfo Center 2014

of whole soybeans may be exported to Japan this year for use in preparation of soya base foods for human consumption. This has been discussed by Army and State Department officials with the Department of Agriculture. Army and State Department are reported to be strongly in favor of some whole soybean exports. Fats and oils officials haven't been too keen on the idea since there is plenty of crushing capacity in this country."

3794. Cole, A.B. ed. 1947. A scientist with Perry in Japan: The Journal of Dr. James Morrow. Chapel Hill, NC: University of North Carolina Press. 307 p.
• ***Summary:*** For background on Commodore Perry and the opening of Japan, see Fairbank, Reischauer, and Craig. 1973. *East Asia: Tradition and Transformation,* p. 327; a summary is given in this bibliography.

In 1854, Dr. James Morrow of South Carolina, agriculturist with the U.S. Perry expedition to Japan, East Asia, spent 18 weeks in Japan. He took seeds, plants, and scientific information from the USA to distribute as gifts for the shogun Tokugawa Iesada, and was instructed to collect the same and make observations, which he recorded in this journal. He explored the Great Liu Ch'iu (Okinawa), and sampled fried bean sprouts (we are not told what type [probably mung bean]) and soy sauce in "a little sauce of bean soy" in Canton (p. 48).

In April 1854 in Kanagawa, Japan, he "put in small papers more than two hundred papers of seed, and sent one of each kind to Mr. Allen, gardener of New York,–to Mr. Landreth, gardener in Philadelphia,*" (p. 155) (Endnote 89, p. 286: *"Probably Richard L. Allen, formerly of A.B. Allen & Co, dealers in agricultural implements in New York, and probably David Landreth of David Landreth & Son {David & Oliver Landreth & Thomas F. O'Neil} in Philadelphia."), "also to Mr. Buist, gardener in Philadelphia,–to Henry Gourdin, Esq., of Charleston,–and to Gen. Wade Hampton, of Columbia, South Carolina [a planter and congressman]. I sent the large Japanese papers to the Department of the Interior at Washington [DC].

Appendix G (p. 228) shows a list of seed bought in Simoda [Shimoda] Bay in large quantities in April 1853 (1854?) [sic, probably 1854]. Included are "Small red Beans (soya) [azuki?]," and "Black beans (another variety)."

Appendix H (p. 228-30) contains a "List of seed presented to me [Morrow] by the Japanese gentleman who was the principal in making the treaty & collected by himself as he said with great pains. These were principally from Yeddo [Edo, today's Tokyo] and Conagowa" [Kanagawa; an important port in 1854, a town north of Yokohama and a prefecture whose capital is Yokohama]. Included in the list of 56 plants are "Dolichos pease (green), Red Beans, Black pease, Red pea–Dolichos, and Small red Bean (soya) [azuki?]."

A photo (frontispiece) facing the title page shows Dr. James Morrow. Note: Morrow's soybean seeds were sent to the Commissioner of Patents, whence they were distributed to farmers, and planted from 1855 on.

3795. Food and Agricultural Organization of the United Nations. 1947. Soybeans: Area, yield, and production. *Yearbook of Food and Agricultural Statistics.* See p. 101-02.
• ***Summary:*** Under soybeans, gives region/continent and country, then statistics for soybean area, yield, and production for each soybean producing country. Statistics show that the following countries produced the following amounts of soybeans (measured in 1,000 metric tons) during the 1934-38 period (the earliest period given).

Europe: Austria 0.2. Bulgaria 11.6. Czechoslovakia 0.9. Hungary 0 (but 6.2 in 1940 and 1.3 in 1945). Italy less than 0.5 (but 0.01 in 1940 and 0.9 in 1945). Poland 0.5. Rumania [Romania] 11.7, Yugoslavia 1.5. Europe total: Former boundaries 550, present boundaries 260. USSR: Former boundaries 68.1, present boundaries 97.1.

America: Canada 5.5. United States 1,164.0. Total 1,170.0

Asia: China: China Proper 6,092.7, Formosa (Taiwan) 4.2, Kwantung 20.2, Manchuria 3,851.0. Indochina: Cambodia 0.4 (in 1937). Japan 325.1. Korea 518.6. Netherlands Indies [Indonesia]: Bali and Lombok 9.0, Java and Madura 236.4. Asia total: 10.60. Africa: Southern Rhodesia less than 0.5 (but 0.3 in 1942 and 0.2 in 1945).

Shurtleff & Aoyagi (1982), statistics for the years 1947 to 1981 are given for soy sauce imports to the USA (in both a full-page graph and a full-page table) from: Japan, China (PRC), Hong Kong, total (1,000 lb), and total ($1,000). The major source of U.S. imports has always been Japan; this figure peaked at 18,672,000 lb in 1972, then fell after Kikkoman's plant opened in the USA. Total imports increased from 220,000 lb in 1947, to a peak of 23,098,000 in 1972 (worth $3,116,000), falling to 8,093,000 in 1974, then rising to 19,613,000 in 1981 (worth $7,044,000).

3797. Berrehsem, Marion. 1948. Cookery from the Orient has many a recipe helpful to Americans learning to save meat. *Christian Science Monitor.* Jan. 8. p. 10.
• ***Summary:*** "Centuries ago the Asiatics learned the value of the soybean, which is not inferior to meat in nutritional value." The widespread acclaim for Asiatic cookery "can be attributed in no small measure to the fact that cooks in these countries have devised many delicious menus which use meat in small quantities, or not at all.

Recipes include: Egg foo yung, with soy sauce as optional but recommended ingredient. Cream soy sauce, with 1 cup rich cream or milk, "1 to 3 tablespoons soy sauce," plus butter and flour.

3798. Okano, K. 1948. Nama daizu no yûdokusei tanpakushitsu ni tsuite. Daizu saponin no yôketsu hanno ni tsuite [The toxic protein in raw soybeans. The hemolytic reaction of soybean saponin]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 22(1):23-24. Jan. (Chem. Abst. 46:5197). [8 ref. Jap]
• ***Summary:*** Heating soybean saponins in the presence of the meal destroys their hemolytic activity, but heating the purified saponins does not.

3799. Caldwell, J.S.; Culpepper, C.W.; Hutchins, M.C.; Ezell, B.D.; Wilcox, M.S. 1948. Dehydrated green vegetable soybeans. *Soybean Digest.* March. p. 20-21, 24-28, 30.
• ***Summary:*** "The authors compared most of the leading vegetable varieties of soys in three forms: canned green, dehydrated green and mature dry beans. Tests were made for flavor and desirability... Approximately 125 varieties of soybeans are classified by Japanese horticulturists as garden vegetables and are grown specifically for use as human food. Thorough tests of these in the United States have shown that some 25 are fairly well adapted to conditions in some or most of the important soybean-producing districts and that they combine satisfactory yields and good to excellent quality as fresh green beans.

"Canning of vegetable soybeans on a commercial scale is assuming some importance. The number of canners reporting soybeans in the list of products packed increased from 7 in 5 states in 1940 to 23 in 12 states in 1944, but was reduced to 16 in 10 states in 1946 (according to the National Canners' Association Canners' Directory), and to 16 in 8 states in 1947. Commercial freezing of soybeans, either alone or in combination with sweet corn as succotash, has very recently been begun by a few operators. The wide adaptation of vegetable soybeans to cultivation, and their acceptability and especially their high nutritive value as fresh vegetables, which exceeds that of any other fresh legume (Chatfield and Adams 1931) seemed to warrant a study of the possibilities of dehydration as a means of preserving them."

Seventeen varieties of "vegetable or 'edible' soybeans were selected for the study by William J. Morse of the Division of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering. All of the varieties were grown together on the Plant Industry Farm at Beltsville, Maryland. The varieties were ready for harvest from 84 days (Sousei) to 111 days (Rokusun 17) after planting. The beans were shelled, blanched in flowing steam for 8 minutes, then dried "in a rapid current of air at 170ºF for the first 4 hours, with reduction to 150º for the remaining 4-5 hours of the drying period. Material was removed from the drier with a moisture content of 5 to 5.5 percent." The two varieties judged best overall were Willomi (strain A) and Etum (authentic strain).

Comparison of dehydrated with canned green soybeans was difficult since the canned and dried products of the same variety were so dissimilar. "The dried product retained much of the characteristic flavor of the fresh beans; in the canned, this was lost and replaced by an altered 'canned' flavor which was much less appealing to all the judges.

Part of the planting of each variety was allowed to mature, then the beans were harvested, dried, and the mature dry soybeans pressure cooked. "Mature dry beans, as a class had a characteristic, mild, nut-like flavor and the rather strong 'beany' taste of some varieties, fresh or dehydrated, was never present. The mature nut-like flavor was somewhat more attractive and pleasing, in the opinion of the judges, than the flavor of the dehydrated green beans, and they considered that most consumers tasting both products for the first time would prefer the mature beans. On the contrary, those who are familiar with the fresh vegetable would prefer the dehydrated product rather than the mature dry bean.

"No comparison between dehydrated and frozen beans were possible in the present study." Address: Div. of Fruit & Vegetable Crops and Diseases, Bureau of Plant Industry, USDA.

• ***Summary:*** These three microorganisms are widely used to culture butter. "Soybean or vegetable milk is used extensively throughout Japan and China for infant feeding as

© Copyright Soyinfo Center 2014

well as for adults." The introduction of soybean milk to the American people has occurred only recently. Soybean milk has been manufactured in the form of a powder. It has been used with good results... especially in those countries that find it cheaper to use a vegetable milk... The development by butter organisms of diacetyl [which is partially responsible for the aroma of butter] and related compounds in vegetable milk and products made from it may be desirable from a commercial standpoint."

The butter cultures were obtained from the Department of Dairy Industry, Iowa State College, Ames. The soybean milk was obtained from Harry Miller, Director of the International Nutrition Laboratory, Mt. Vernon, Ohio. Cow's milk and soybean milk were inoculated and incubated, then measurements of the following were taken at regular intervals up to 216 hours: pH, titratable acidity, volatile acidity, and Mg Ni salt. The production of acetylmethylcarbinol (AMC) and diacetyl in soybean milk by butter culture organisms was not evident until after an incubation period of 48 hours; however, upon incubation of cultured soybean milk for 168 to 216 hours, larger amounts of the flavor and aroma compounds were produced in soybean milk than in cow's milk. "The values obtained for the titratable acidity in cow's milk and cow's milk to which 0.15 per cent citric acid had been added were nearly twice as great as those secured for the soybean milk. Address: Dep. of Bacteriology, The Ohio State Univ., Columbus, Ohio.

3802. Morse, W.J. 1948. Soybeans yesterday and today. *Foreign Agriculture* 12(5):91-95. May. Summarized in Soybean Digest, June 1948, p. 32.
• ***Summary:*** A good overview of soybeans and their history in China, Manchuria, Korea, and Japan (the principal regions of world soybean production), plus thoughts on their relatively recent introduction to the Western world.

"In China, the soybean is one of the leading and most ancient of crops, ranking fifth in extent of culture and occupying about 9% of the total cultivated area. Although grown everywhere in China, about 60% of the soybean acreage and production is confined largely to 3 northern Provinces, Shantung, Kiangsu, and Honan. China consumes practically all its production, estimates indicating 55% for food, 27% for oil extraction and other purposes, 10% for stock feed, and 8% of the total cultivated area of Manchuria and is a dominating factor in the life of that country. As a cash crop, it provides fully half the total volume of freight handled by Manchurian railroads. Estimates have indicated that from one-third to two-thirds of the production of soybeans was exported; 15 to 20% utilized for food, feed, and planting; and the remainder processed for oil and oil meal.

"Korea occupies third place among the soybean-producing countries of Asia. Acreage and production are confined largely to the central and northern areas, because southern Korea, growing chiefly cotton and rice, seems less well adapted to soybean-seed production. The entire seed production is used for food, stock feed, export, and planting, none being used for oil extraction.

"Japan, although a large producer of soybeans, has consumed all its own production and imported large quantities of seed from Manchuria and Korea. Since World War I, production of soybeans in Japan has decreased to some extent, more emphasis being placed on the greater production of rice. The proportion of soybeans used by Japan for various purposes was: Miso (soybean-rice fermented paste), 22%; soy sauce, 22%; oil and oil cake, 21.5%; bean curd, 15.5%; confections, 7.2%; forage, 6.2%; green manure, 2.5%; seed, 1.8%; green vegetable beans, 0.8%; and miscellaneous 0.5%.

"In the Soviet Far East the soybean is said to be one of the chief industrial crops and in some districts to constitute 20% of the cultivated area. Acreage and production have increased markedly since 1926, especially in the Khabarovsk territory.

"Previous to 1935 soybean oil in the United States was utilized chiefly in soap, paint, and varnish. Since that time, however, 70 to 85% of the soybean-oil supply has been used

© Copyright Soyinfo Center 2014

in the food industries... The soybean has become one of the most valuable, if not the most valuable, of China's gifts to the Western World."

Photos show: (1) Manchurian soybean in bags being loaded on a freighter at the Dairen wharves for shipment to European oil mills. (2) Two horses pulling a plow, and a 2nd man planting soybeans on ridged rows in Manchuria. (3) Soybean plants growing along the edges of rice paddies, as is common in oriental countries; the green beans will be used for home consumption. (4) Two Korean men threshing soybean plants in a courtyard with bamboo flails. "In Korea, as well as in many other oriental countries, bamboo flails are used in threshing soybeans." (5) A man with a sickle in a field of dried soybean plants. "Soybeans are harvested by hand in all the soybean-producing countries of the Orient." (6) A combine harvesting soybeans in the USA. It has "been one of the important factors in the economic production of soybeans in the United States." (7) "General view of a Chinese oil-mill yard in Manchuria, showing mill, storage of soybeans in osier bins, and steel tanks." 3803. Miller, H.W. 1948. Survey of soy foods in East Asia. *Soybean Digest.* June. p. 22-23.

• ***Summary:*** The primary objective of Miller's company "was to develop a milk built up to formula for babies, children, and adults that could be utilized by Oriental populations where animal milk is not available, and which for economic reasons can never be a dependable source of food supplies for the masses.

"Before the war the Laboratory had branches both in Manila, Philippine Islands, and Shanghai, China. The war saw the plant in Shanghai completely demolished and the equipment destroyed. In Manila, the building was left, but all the equipment was removed. Therefore we have been busy since the end of hostilities in restoring these plants.

"In 1946 and 1947 and during this last January and February the writer made trips and spent time in connection with these institutions. I am glad to report that on my last visit to the Philippine Islands I was able to see the plant there start its operations. The machinery and equipment are practically restored.

"At the present time there are no soybeans under cultivation in the Philippine Islands... though certain parts are very well adapted to the growth of the southern type of soybeans.

"The Manila plant is interested in marketing bottled 'Soyalac' (soy milk) both in natural and chocolate flavors, and also in entering the production of soy ice cream–we are permitted to call it that in the Philippines.

"From Manila I went to Hongkong where 8 years ago a small company known as the Hongkong Milk Factory made a beginning in homogenizing a constituted soy milk. On this last trip to Hongkong, K.S. Lo, the manager, took me through their plant. He informed me that they are now serving to each of the school children a half-pint bottle of the soy milk, both in the natural and the chocolate flavors, at their noon lunch.

"The Hongkong Milk Factory is in reality a soybean dairy. As you view the equipment including the bottle filling machine and the refrigerating unit, you would not know you were not in an American dairy. Mr. Lo informed me that if they had refrigeration they could be putting this soy milk out in many of the other cities of China on a very large scale.

"The firm obtains it beans from China, mostly from the province of Chang Tung, though some come from Manchuria. The beans are not of a very fine quality."

At Shanghai there were two soybean enterprises that particularly attracted my attention. The one for which we helped secure the machinery and equipment is being run under the name of the International Nutrition Products Co., Ltd. It is to be run very much like the Manila plant in the manufacture of liquid soy milk. The company will develop along with it a soy margarine and soy spread in the form of a mayonnaise dressing.

"The other enterprise is being undertaken by the government. The Chinese Army Quartermaster Department has purchased a property where ice cream, dried eggs and butter, and also candy were made. This large property has a splendid group of buildings with refrigeration." Here the Chinese Army intends to run a "soybean factory and a vegetable dehydration plant.

"The Chinese Army has secured the help of my son, Harry Willis Miller, Jr. He is there at the present time erecting this plant. It is perhaps the largest soy protein processing plant we know of at present. The firm has bought equipment for large-scale production of a spray-dried soy milk powder. This is to be included in other rations of a dehydrated character for use of the Chinese Army."

In Japan, the author found the people to be "greatly undernourished, especially in regard to protein. Soybeans are scarcely to be had... Bean curd plants are all closed down... I know of nothing that the Japanese nation needs worse than soybeans... I found the Japanese people, even to the advisor to the Emperor, whom I met, pleading with us to establish a plant similar to that which we have in China and the Philippines. However we have no financial interest in those plants. They are carried on wholly by local capital. Our part is simply the 'know-how' in setting them up and transmitting the processes to them."

Note: This is the second earliest document seen that uses the term "soy foods" in the title. Address: International Nutrition Lab., Mt. Vernon, Ohio.

3804. *Soybean Digest.* 1948. On tour of Orient [Dr. A.K. Smith]. June. p. 13.

© Copyright Soyinfo Center 2014

• ***Summary:*** "To add to this country's knowledge of processing and preparing soybeans for food, Dr. Allan K. Smith of the oil and protein division, Northern Regional Research Laboratory, Peoria, Illinois, has left the United States for a 3-month investigation that will have covered Japan, Korea, and China before he returns next August. This extension of the Northern Laboratory's soybean research program has been made possible through provisions of the Research and Marketing Act. The information obtained will be the basis for studies on making soy food products more acceptable as a high-protein source in the American diet." A portrait photo shows Dr. A.K. Smith.

3805. Smith, Allan K. 1948. Re: Discovery of a new process for making soy sauce in Peiping, China. Letter to Drs. K.B. Raper and L.B. Lockwood, Northern Regional Research Laboratory, Peoria, Illinois, July 5. 2 p. Typed, without signature (carbon copy). [Eng]
• ***Summary:*** "The so called new process uses a high frequency current to shorten the aging process. The process was developed in Japan and the operators in Peiping are Japanese who have stayed in China after the evacuation of the Japanese... What I know now is rather sketchy. The effect of the high frequency current is not in the immediate acceleration of the action of the organisms in the system, but rather it is supposed to decompose or breakdown the substrate so that it is more readily acted upon by the organisms or enzymes so that the work of the organisms becomes easier. The process is still in the experimental stage in Peiping." A description of the process, which takes two months, is then given. A hand drawn illustration (sketch) shows a wooden tank, an external generator, and two electrodes in the soy mash in the tank–one on the bottom and one floating on top. Address: Shanghai, China.

3806. Smith, A.K. 1948. Re: Using high-frequency current to shorten soy sauce aging process in China and Japan. Letter to Drs. Kenneth Raper and Louis Lockwood, Northern Regional Laboratory, Peoria, Illinois, July 5. 2 p. Typed, without signature (carbon copy).
• ***Summary:*** "In Peiping, I ran into something new and different in making soy sauce. I don't know what it is worth but the operators claim it has value.

"The so called new process uses a high frequency current to shorten the aging; process. This process was developed in Japan and the operators in Peiping are Japanese who have stayed in China after the evacuation of the Japanese. I shall probably find out more about the process when I get into Japan. What I know now is rather sketchy. The effect of the high frequency current is not in the immediate acceleration of the action of the organisms in the system, but rather it is supposed to decompose or break down the substrate so that it is more readily acted upon by the organisms or enzymes so that the work of the organism becomes easier. The process is still in the experimental stage in Peiping, the operator had built his own generator and he did not think that he had reached the best operating conditions. He was using 2 months total time for his process.

"The parched wheat and steamed beans are seeded with the mold in shallow boxes, stacked in a fermentation room at 37º to 42º C. for about 72 hours. The molded material is mixed with a 9% salt solution (10º Bé) ratio of salt solution to material is 110. The material is then placed in the electrolytic treating tank–which is a wooden tank with an electrode in the bottom and one floating on top. The electrolytic treatment lasts for one week's time but the material receives only two treatments a day of about 15 minutes duration, morning and evening. Too much electrolytic treatment kills the organisms, also the frequency and voltage must be regulated for best results. The current in the plant visited was supposed to operate at 30,000 cycles but the operator thought that 50,000 cycles would be better. The wave length was supposed to be 7.5 meters, the generator was a sparking type. The amperage was 200 mm (?) I think.

"After a week of electrolytic treatment, the material was stored in a cement tank at about 40º C and the sauce removed in about 45 days. The factors which the operator thought important and which required definite control for maximum results are: (1) amperage, (2) frequency, (3) length of wave, (4) salt contents, (5) salt solution temperature, and time of applying the electric current.

"Sample #51 and 52 are the molds taken from this plant."

An simple illustration by the writer shows the wooden tank (filled with steamed soy cake and parched wheat) with generator. Address: Traveling in Shanghai, China; Normally at NRRL, Peoria, Illinois.

3807. Murata, Hideko. Assignor to King Shoyu Company (Honolulu, Hawaii). 1948. Sauce preparation. *U.S. Patent* 2,444,577. July 6. 3 p. Application filed 20 Jan. 1947. [3 ref]
• ***Summary:*** "This invention relates to sauce preparation and more particularly to a process for the production of shoyu, a

© Copyright Soyinfo Center 2014

Japanese type soy sauce."

"It is [the] object of this invention to provide a process for the production of a soy sauce which may be carried out in a few days,... [is] inexpensive,... [and] comparable in taste and in composition to that produced by the older methods requiring a considerably longer period to complete."

"I have now discovered that an excellent soy sauce may be prepared from vegetable proteins without utilizing the slow process of enzymatic degradation," by hydrolysis with a strong mineral acid such as hydrochloric acid at elevated temperatures. "This new method requires only 4 to 5 days for completion in contrast to the older fermentation methods which require weeks, months or even years to complete." Address: Honolulu, Hawaii.

3808. Onuki, Motoi. 1948. Shôyu [Shoyu]. Tokyo: Takeuchi Shobo. 414 p. Illust. Index. July. 21 cm. [Jap]
• ***Summary:*** The author, now president of Yamasa Shoyu in Chôshi, Japan, graduated from Tokyo Teikoku Daigaku, Nogeikaku-ka (Tokyo Imperial University, Dept. of Agricultural Chemistry). He lived 1895-1960. Chôshi is a seaport town at the mouth of the Tone River, 60 miles east of Tokyo, on the tip of Cape Inubo (Jap. *Inubô-saki*). Address: Presently: Yamasa Shôyu K.K., Torishimariyaku (President), Nôgaku Hakase. Chôshi-shi, Kitaogawa-machi 2504, Chiba prefecture, Japan.

3809. Lagos U., José Angel. 1948. Cultivo de la soya [Cultivation of the soybean]. *Revista de Agricultura* (*Costa Rica*) 20(9):365-67. Sept. [Spa]
• ***Summary:*** Contents: Introduction. Botanical characteristics. Climate. Soil. Planting. Cultivation. Rotation. Fertilizers (including importance of root nodules with nitrogen fixing bacteria, and use as green manure {*abono verde*}). Harvest. Utilization. Hay (and silage).

The soybean is known by various names: Soya or soja, *frijol chino* (Chinese bean), *frijol japonés* (Japanese bean), and *haba de Manchuria* (Manchurian bean).

Utilization: It has many uses. Its oil has practical application in manufacturing industries. The seeds or beans are used for human food. It can be used to make delicious dishes, salads, etc.

Note 1. No mention is made of soybean cultivation in Costa Rica.

Note 2. This is the earliest Spanish-language document seen (March 2012) that gives the name of the soybean as *frijol chino* or *frijol japonés* or *haba de Manchuria*. Address: Nicoya [Costa Rica].

3810. Douglas, Marjory Stoneman. 1948. The most unforgettable character I've met [Barbour Lathrop]. *Reader's Digest.* Nov. p. 67-71.
• ***Summary:*** Describes the work of Barbour Lathrop and David Fairchild in setting up the Section of Foreign Seed and Plant Introduction within the U.S. Department of Agriculture. Fairchild was one of the earliest importers of soybean varieties into the U.S. Lathrop, born in 1846 in Alexandria, Virginia, was an American traveler extraordinaire. He wanted nothing for himself except to be free and to travel light. He never owned any property and never married. The room he kept at the Bohemian Club in San Francisco was the most permanent home he knew. The income he inherited from after his father's death in 1885 was enough for his constant travels and a few good clothes. He gave away much of his money in research grants to young scientists and students. In 1885 he visited Japan and visited the Hairy Ainus. "To have foreign plants introduced into the United States became the most important purpose of his life. There was at that time no provision for such a project in the Department of Agriculture. Lathrop's first thought was to find a young scientist who could travel with him and look for plant material. On shipboard, during his 18th trip around the world, he met David Fairchild, a young plant pathologist who had resigned from the Department of Agriculture to study entomology at Naples. Two years later Lathrop gave Fairchild the money with which to begin in Java his great studies of the plant treasures of the tropics. Lathrop then took him around the world to study plant life.

"In 1897 Fairchild presented a plan for a bureau of plant introduction to the Secretary of Agriculture, who approved it and appointed Dr. Fairchild to set it up. There was still no appropriation for it, but funds from the Forestry division were used to establish a place where foreign plants and seeds could be received.

"Lathrop descended on Washington and insisted that Dr. Fairchild needed to know much more about exotic plants before the bureau could function effectively. Accordingly, Fairchild was designated a Special Agent of the Department of Agriculture, but Lathrop paid his salary and all expenses of new years of exploring together. After nine years of travel, Dr. Fairchild returned to Washington to become Chief Plant Explorer of the Bureau of Foreign Seed and Plant Introduction.

"Later in Florida, where Dr. Fairchild founded a Tropical Plant Introduction Garden, the first award of the Meyer Medal for Plant Introduction was made to Lathrop." Note: This medal was created memorial for plant explorer Frank N. Meyer, who died in 1918.

An illustration (line drawing) shows a portrait of Lathrop.

3811. Fairchild, David. 1948. Early experiences with the soybean. *Soybean Digest.* Nov. p. 14-15. [2 ref]
• ***Summary:*** "It was not until 1897 that I first saw soybeans growing... I found my friend Merton B. Waite had been trying to grow soybeans on his farm outside Washington [DC, in Maryland; see Fairchild, Oct. 1948], but with little success. They had been sent in by some American consul

© Copyright Soyinfo Center 2014

or missionary, I believe. At about the same time Dr. George T. Moore [who by 1903 was Physiologist in Charge of the Lab. of Plant Physiology, Bureau of Plant Industry, USDA, working on soybean root bacteria] in working on the root nodules of leguminous plants had discovered that the nodules contained bacteria. Waite and I talked over the matter of the failure of his soybeans and wondered if they might require special bacteria, so I wrote out to Japan and imported several pounds of soil from a soybean field.

"We made a little experiment, planting alternate rows of soybeans with and without the addition of this Tokyo soil. The effect of the imported soil was immediately apparent as the plants grown in it made a far better growth and had their roots covered with bacterial nodules, whereas the control were practically without any.

"Photographs had yet to come into any general use as records of agricultural experiments, but Waite had taken up photography as a hobby and made excellent photographs with his stand camera. So at harvest time he pulled up an equal number of soybean plants from the soil-treated rows and from the controls, and the only photographic record in existence of this little experiment (the first of its kind, I suppose, in the world) is this negative taken by Waite in the autumn of 1897.

"Although these experiments did not at the time lead to more extensive trials, they indicate the awakening of our interest in soybeans.

"In that fall of 1897 it was my privilege to organize the office of plant introduction in the Department of Agriculture. We began introducing a great number of different kinds of plants, among them, as I see from our inventories printed at the time, occasional small collections of soybeans from China and Japan. They were obtained mostly through correspondence with missionaries and consuls stationed there.

"At that time the Department had no testing ground near Washington where we could grow miscellaneous vegetables, including these soybean collections. It was not until several years had passed that facilities were provided on the so-called 'Potomac Flats' [in Washington, DC] and James H. Beattie, an enthusiastic young horticulturist, took over the planting of our introduced seeds.

"The soybeans did well and Beattie soon had on his hands a quantity of seeds. But we didn't know just what to do with these strange beans. When cooked in the way other beans were prepared they had a strange flavor that nobody seemed to like...

"It was not, I think, until the office of forage crop investigations was organized and C.V. Piper took charge that the soybean as a forage crop attracted attention and Beattie's experiments came to be looked upon as important. We planted larger patches of soybeans on a tract of land near Bethesda, MD...

"And then we ran into the difficulty of harvesting the soybeans. P.H. Dorsett of the office, one of the most ingenious and most indefatigable workers I have ever known, and his friend Rankin, who was running the little experimental farm, put their heads together and adapted a bean picker then in use–in California I think–and discovered that it was perfectly possible to harvest soybeans mechanically...

"I went out exploring again and my travels with Mr. Lathrop this time took me into the soybean fields of Japan. The tremendous importance of the crop as I saw it there made a great impression on me. Also the almost universal use of soy sauce, which Americans were just beginning to appreciate, fixed my interest...

"Dr. Yamei Kin, an extraordinary Chinese woman whose acquaintance I had made on the boat returning from Japan, made a visit to Washington and captivated us all by her enthusiasm over soybeans. She introduced us to 'tofu,' a delicate cheese which has not even yet attracted the attention it deserves from the American public.

"In 1903 A.J. Pieters came to me one day and told me of an amazing young Hollander who had been a gardener of the great geneticist, Hugo de Vries. He was then on his way back from a trip on foot to Mexico, and I wired him to come to Washington. For 13 years, as agricultural explorer of our office, Frank N. Meyer tramped from village to village over much of China. He gathered soybeans whenever he saw them, for he felt it was important to secure all the local varieties he could for our plant breeders before they should have disappeared as the result of the spread of standard varieties he thought was bound to come.

"The importance of getting as many as possible of these local varieties and these, or selections from them, form, I believe, the basis of the very extensive soybean breeding that has been done by the various plant breeders of America."

Note: According to Vivian Wiser of the USDA and to the Washington D.C. Historical Society (13 Feb. 1991; phone 301-785-2068, Mrs. Offut), in 1897 Merton Waite lived in downtown Washington, D.C. in a built-up area. There is no record of his owning a farm outside Washington D.C., but he may have owned the farm as a sort of summer home or he may possibly have worked with the group at the USDA farm at Somerset, Montgomery County, Maryland. He was a plant pathologist and physiologist, in charge of diseases of orchard fruit trees, especially pears and peaches. There is a collection of David Fairchild's materials at Coconut Grove. His personal residence, The Kampong near Coconut Grove, is still (as of 1998) well preserved and open to the public. Address: "The Kampong," Coconut Grove, Florida.

Address: Japan.

3814. Kurakake, T. 1948. Japan Association [Japan Soybean Association] (Letter to the editor). *Soybean Digest.* Dec. p. 10.
• ***Summary:*** "The Japan Soybean Association was founded on March 4, 1946 for the purpose of increasing production of soybeans, improving varieties and increasing the rational utilization of soybeans.

"As is well known, soybeans are an Asiatic crop which have been utilized as food for centuries. Before the war, Japan relied on importation from Manchuria and Korea for a major part of its supplies, but since the termination of hostilities, these sources have been cut off. Consequently, Japan has to rely on its own production and also on importation from other sources. This other source is the United States, whose soybean history is relatively new but which has expanded so rapidly that it has become the largest producer in the world. Since the end of the war, Japan has imported 42,569 tons as of October 10, 1948, by which she has been able to fill the minimum requirement.

"The Japan Soybean Association is planning to have a Soybean Exhibition on January 20, 1949 at one of the leading department stores in Tokyo and we would like to have if possible, some exhibits or literature from your Association. Expansion of soybeans in the industrial field in the United States is tremendous and we would like to know as much as possible about the production and use of soybeans in the United States.

"We shall appreciate it if you can help us with this exhibition and also keep in close touch with you." Address: Secretary, The Japan Soybean Assoc., Chuo-ku, Tokyo.

3816. Food and Agricultural Organization of the United Nations. 1948. Soybeans: Area, yield, and production. *Yearbook of Food and Agricultural Statistics–Production.* See p. 101-02.
• ***Summary:*** Under soybeans, gives region / continent and country, then statistics for soybean area, yield, and production for each soybean producing country. Statistics show that the following countries produced the following amounts of soybeans (measured in 1,000 metric tons) during the 1934-38 period.

Europe: Austria 0.2. Bulgaria 11.6. Czechoslovakia 0.9. Hungary 0 (but 1.3 in 1945). Italy less than 50 metric tons (but 0.9 in 1945). Poland 0.5. Rumania [Romania] 11.7, Yugoslavia 1.5. Europe total: 27.0.

USSR: (97.1).

North America: Canada 5.5. United States 1,164.0. Total 1,170.0

Asia: China: China Proper 6,092.7, 3,851.0, Taiwan (Formosa) 4.2. Indonesia: Bali and Lombok 9.0, Java and Madura 236.4. Japan 325.1. Korea 518.6. South Korea 0 (but 122.2 in 1945 and 130.6 in 1946). Philippines 0 (but 0.2 in 1946). Siam [later Thailand] 3.6. Turkey (but 0.4 in 1945). Asia total: 11,070.0.

Africa: Nyasaland 0 (but 0.4 in 1946). Ruanda-Urundi 0 (but 0.9 in 1947). Southern Rhodesia less than 50 metric tons (but 0.2 in 1945). Uganda 0 (but 2.6 in 1946). Union of South Africa 0 (but 1.5 in 1945).

World totals (Excluding USSR): 12,300.0.

Note: This is the earliest document seen (Nov. 2007) that gives soybean production or area statistics for Turkey or for the Middle East. This document contains the earliest date seen for soybean production or area statistics for Turkey or for the Middle East (1945).

3819. Japan Year Book 1946-48. 1948. Tokyo: The Foreign Affairs Association of Japan. 614 + 314 p. See p. 291, 367, 376. 22 cm.
• ***Summary:*** The Preface indicates that this book was published in about Dec. 1948. The editor's name is not given.

Page 291. A full-page table shows "Annual yields of cereals and vegetables" (area in *chobu,* yield in *kan,* production in *koku*). For soy beans (dried):

2.299 million koku in 1943
2.072 million koku in 1944
1.321 million koku in 1945
1.565 million koku in 1946.

In 1946 production of azuki beans was 16.7% that of soy beans.

Page 367. "Soy-bean Cake: This is another item of fertilizer which was imported into this country before the war, principally from Manchuria. Of the demand for some 1,000,000 tons, 60 percent was imported in the form of soy-bean cake and 40 percent in the form of soy-bean."

© Copyright Soyinfo Center 2014

Page 376. "Flavors: Oriental flavors are produced in considerable quantities as indispensable for Japanese cooking, of which soy, or Japanese sauce and miso, or soybean paste are important items.

"The domestic production of soybeans being insufficient, Japan imported before the war or in 1941-45 twice as much soybeans as domestic production from Manchuria and Korea to meet the home consumption of soy and miso."

Three tables (p. 376) show (1) Soybean imports [to Japan] during 1940-1944. These imports are from Manchuria,, Korea, Central China, and total. (2) Production of soybeans in Japan 1943-1946, area planted, yield and production of dried soybeans. (3) Soybean allocations by kind [end use] in 1941 and 1944. The end uses are miso, soy sauce, staple food [beans eaten as beans], other food, chemical [industrial], fodder, and others.

• ***Summary:*** Contents: Introduction. Farming conditions. Oilseed production. "On a visit to China, Japan, and Korea during the summer of 1948, the author as a representative of the Northern Regional Research Laboratory, was given the opportunity of studying the methods of Oriental people in using soybeans as food and to collect microorganisms used in fermenting soybeans and other fermentable products."

"In Japan, the natural resources and the food processing sections of the Supreme Command of the Allied Powers furnished guidance and transportation in seeking information."

In China, nearly 90% of the people are farmers. "Agriculture is their most important industry." In north China, the crops (including soybeans) are similar to those in the USA. In "south China there is less diversification and the principal crop is rice."

"The high density of population in China dictates a vegetarian diet for most of the people, especially her peasants. I was informed by the best authorities that customarily the peasants of China eat meat only three times a year, on their three great holidays, the Dragon Festival, the Autumn Festival, and their New Year's celebration." The Chinese diet is very well balanced. Address: Northern Regional Research Lab., Peoria, Illinois.

• ***Summary:*** This pioneering and extremely important article on the early history of the soybean in America contains many pre-1860 citations, cited here for the first time, concerning farmers testing soybeans in Mississippi, Indiana, Ohio, New York, Connecticut, Missouri, New Hampshire, North Carolina, Kentucky, Virginia, Maryland, Delaware, and Pennsylvania. Many of these early citations are from "Letters and Reports of the Agricultural Division of the Patent Office, 1839-60." Address: Dep. of History, Columbia Univ., New York.

3829. Mee, Sanae. 1949. A study of carboxylase in soybean sprouts. *Archives of Biochemistry* 22(1):139-48. May. [8 ref]
• ***Summary:*** The thiamine content of soybean sprouts has been investigated in several forms. The activity of the enzyme carboxylase, which was shown to be present, rises to a maximum shortly after sprouting begins, then falls off. Manganese was shown to be an effective activator of carboxylase. Variations in the carboxylase activity are paralleled by variations in the amount of thiamine in combined form. Address: Lab. of Biochemistry, Osaka Imperial Univ., Osaka, Japan.

3830. Smith, Allan K. 1949. Oriental uses of soybeans as food: With attention to fermented products. Notes on Oriental farming practices. IV. Japan. *Soybean Digest.* May. p. 24-26, 28, 30.
• ***Summary:*** Contents: Introduction. Production of miso. Soy sauce in Japan. Monosodium glutamate. Trends in soy sauce production.

"The Kikkoman Shoyu Co. Ltd. was founded in 1764. This is the largest soy sauce plant in Japan and probably the largest in the world for making a fermented type sauce. The annual shoyu production at Noda has been as much as 23 million gallons, consuming 30,000 tonnes (11 million bushels) of soybeans, 27,000 tonnes of wheat, and 29,000 tonnes of salt. The Noda city factory includes 8 brewing plants, 1 barreling plant, 6 auxiliary plants for the construction of barrels and other materials used in their process, and a research laboratory with a staff of more than 30 workers. The factories of Noda city are spread over 2,333 acres of land... The koji is made in wooden trays about 14 by 24 by 4 inches deep. There are 1,500 cement fermenting tanks in one plant. For a good grade of soy sauce, the mash is fermented for 8-12 months. But owing to the current pressing need for the sauce, the fermenting period is now often shortened to 3 months." Address: Northern Regional Research Lab., Peoria, Illinois.

3831. Smith, Allan K. 1949. Oriental methods of using soybeans as food: With special attention to fermented products. Notes on Oriental farming practices. *USDA Bureau of Agricultural and Industrial Chemistry.* AIC-234. June. 40 p.
• ***Summary:*** Page 1 states: "The text of this bulletin, with slight revisions, is as it appeared serially in *The Soybean Digest,* issues of February through June, 1949, although many additional photos appear herein. It is processed with the publisher's permission." Note: An enlarged 65 page edition was issued in July 1961.

Photos show: (1) Nine people in a field cultivating soybean with hoes near Nanking, China. All of these workers but one are women. July 1948. (2) "The three-man shovel, Korean version of the turning plow. The motive power is supplied by the mean holding the ropes." (3) A man and donkey threshing wheat with a stone roller. (4) A water buffalo and man pumping water from the rice fields. All parts of the pump and elevator are made of wood. Near Nanking, China, July 1948. (5) Windmill used for pumping water. The sails or vanes are mats woven from grass. (6) Children with baskets of soybean sprouts and inflated Chinese national currency in the market place at Canton, China. Aug. 1948. (7) Soybean milk for sale on the streets of Canton, China. Aug. 1948. It is in bottles, carried using a shoulder pole. (8) A wedge press for oilseed operations at Canton, China. Preformed disks of the flaked or ground meal are inserted in the slot and turned clockwise in the hollow log; pressure is applied with wooden wedges. July 1948. (9) Equipment for steaming soybeans preparatory to making soy sauce. Steam is passed upward through the wooden tanks from a boiler beneath. Peiping, China. 1948. (10) Soy sauce preparation.

3833. Boswell, Victor R. 1949. Our vegetable travelers. *National Geographic Magazine* 96(2):145-217. Aug. See p. 145, 216-17. With 32 paintings by Else Bostelmann.
• ***Summary:*** The author tells the story of the origin, nature, behavior, and travels of some of America's most commonly grown vegetables that originated in other countries. We call our vegetables "truck crops." This word "truck" is derived from the French word *troquer* meaning "to barter or exchange." It is applied because of the general practice of bartering or dealing small lots of vegetables in traditional outdoor markets.

The section titled "Vegetable soybeans are new in America" (p. 216-17) notes that "Soybeans (*Soja max*) have been grown in the Orient for more than 5,000 years, but, strangely enough, they appear to have been known in the Western World a scant 250 years [i.e. since 1699]. It is puzzling, indeed, that this plant of Chinese origin should have become established so late in the West (including western Asia, Europe, and the Americas), while many other species from China have been known and valued in the West for thousands of years."

"The first written record about soybean goes back to an old Chinese *Materia Medica* written between 2900 and 2800 B.C. There is, however, no known record of it in a European language older than A.D. 1712, when a German traveler [Englebert Kaempfer] reported finding it in Japan in 1691 and 1692."

"Ship captain brought soybeans to America:... Actually, the first record of it in this country was in an old encyclopedia published in Philadelphia in 1804. That article said it was a plant adapted to Pennsylvania and well worthy of cultivation there. It had been introduced about 1800 by the captain of a clipper ship who bought some of the beans to supplement his ship's stores." A more reliable history follows.

"The vegetable varieties of soybeans are gradually gaining favor in the United States... It was only about a dozen years ago [i.e. 1937] that many Americans began to learn about vegetable varieties of soybean; yet their use as a vegetable is at least 1,500 years old and probably much older." Address: Principal Horticulturist, United States Dep. of Agriculture.

3838. Shimada, I. 1949. Letters: Exchange troubles. *Soybean Digest.* Sept. p. 130.
• ***Summary:*** The author, superintendent of the Tsurumi plant of the Showa Sangyo Co. Ltd. in Yokohama, Japan, writes the editor of *Soybean Digest:* "Since our defeat [the defeat of Japan in World War II] 100,000 to 200,000 tons of U.S. soybeans have been imported here yearly. They give much nutrition to our people for which we cannot express too many thanks. Our Tsurumi plant has a daily capacity of 325 tons of soybeans by solvent extraction. We hope to know more about your crop. Your American Soybean Association is well known also to us as having given great contributions to the industry in your country. The Soybean Digest published monthly would be highly esteemed by us also."

A note by the Editor at the end of this letter states: "Many people in foreign countries are unable to subscribe for the Soybean Digest or Soybean Blue Book due to lack of currency exchange. The Digest is unable to comply with the many requests for free subscriptions that arise due to this condition." Address: Yokohama, Japan.

Address: Agricultural Faculty, Nihon Univ.

3841. Kurakake, T. 1949. Soybeans in Japan. *Soybean Digest.* Oct. p. 18, 20.
• ***Summary:*** "Though soybeans have been grown for centuries in Japan the tendency has been to neglect them due to a lack of ingenuity among farmers in improving varieties, to the fact that government laboratories did not take measures to improve them, and to the fact that growth was rather satisfactory even when they were allowed to grow naturally.

"It is very difficult to find out the number of varieties in Japan, but the Japanese Soybean Association estimates the number at more than 1,000. The reason for this large number is assumed to be that they appeared naturally during the long span of time over which they were grown in the various localities.

"Experiment Stations: In Japan, each prefecture has its own agricultural experiment station, and each experiment station selects varieties that are most suitable for the prefecture and encourages the farmers to grow them. There are about 170 of these recommended varieties. Of the above, about 10 are the result of cross breeding carried out at the experiment stations; about 50 to 60 are by selection and the remainder are produced naturally.

"The characteristics of good varieties in Japan have been: resistance to disease, high yield and a good taste when roasted. However, recently soybeans have been looked on as a source of oil because of the shortage of fats and oils, and soybeans with high oil content are in great demand.

"Japanese soybeans are classed as summer, autumn and intermediate types according to the planting and maturing periods. Summer type varieties are planted in April and May. The flowers bloom with the high temperatures of the early summer, and the beans can be harvested in late July or early

© Copyright Soyinfo Center 2014

August. The period from planting to harvest is from 90 to 100 days.

"It seems that the summer varieties are generally heat-sensitive and have relatively low photo-sensitivity. They are widely grown in the plains of western and eastern Japan and in Hokkaido. Most of the varieties grown in Japan are of this type. Usually they are small-seeded.

"The autumn type soybean in contrast to the summer type is highly photo-sensitive and has almost no heat sensitivity. It is planted from the middle to the latter part of June. Flower bloom is accelerated as day length is shortened after mid-summer. The beans are harvested in November. The time from planting to harvest is more than 130 days. Varieties of this type are usually grown in the western part of Japan where it is relatively warm. But the acreage is comparatively small.

"Varieties of the intermediate type are in between the summer and autumn types. Planting is from May to June. They have photo- and heat-sensitivity to about the same extent, and require from 100 to 130 days to mature. This type is grown widely in northern Japan with the exception of the mountainous districts of eastern Japan and Hokkaido, and the number of varieties is next to the summer type.

"The total soybean acreage and production in Japan has been declining since about 1910, which was the peak. The acreage during the latter part of the 1880's was more than 400,000 chobu [1 chobu = 1 chô = 2.45 acres] with a production of over 300,000 tons. Acreage and production gradually increased to about 460,000 chobu and 500,000 tons. However, with this as the peak, acreage and production have gradually decreased so that since the Pacific War acreage has been 220,000 chobu and production 200,000 tons. With the decrease in acreage and production there was also a decrease in yield per area planted.

"During the same period, from the 1880's to just before the Pacific War, the yield of rice, wheat and barley increased from 180 to 200 percent, but that of soybeans fell from 20 to 30 percent from the peak period. The reduction in yield shows to what extent the farmers neglected improvement of varieties, while the government was inactive and without progressive policies.

"Were unprofitable: Another reason for the decline is that soybeans were an unprofitable crop for farmers. Japan began to import large quantities of cheap Manchurian and Korean soybeans during the 1890's. As a result the farmers in Japan were compelled to sell their soybeans at a cheap price. At about the same time the capitalistic economy began to develop in Japan with the gradual evolution of exchange economics. Japanese farmers quit planting unprofitable crops and changed over to more profitable ones. Soybeans were replaced with mulberries for silk raising, orchards, vegetables and sweet potatoes.

"Soybeans were always sold at about 60 percent of the price of rice and at about the same price as fertilizer. Actually much of the soybean crop in Japan was formerly used as fertilizer.

"However, in spite of the fact that soybeans were an unprofitable crop, they did not disappear entirely from the farms in Japan. Farmers continued to plant them not as a commercial crop but for their own consumption. Only the excess above their own needs was sold on the market.

"The districts where soybeans are grown most widely are areas where agrarian economics is most backward–in the mountainous areas of Tohoku, Hokuriku or Kanto and in the Kyushu area. In the advanced agricultural areas they are limited to the banks of rice paddies, roadsides or plots around the houses. In other words, the existence of soybeans indicates feudalism in Japan. Under such conditions there is no opportunity to improve varieties to fit specific farms. Here lies the answer to the question of why the soybean declined in importance year after year but still continued to exist.

"The rise and fall of soybeans in Japan has a very close relation with the importation of foreign soybeans, which has increased six-fold since 1897.

"The principal exporters of soybeans to Japan were Manchuria and Korea. Quantities imported by Japan gradually increased from about 200,000 tons during the 1910's to 800,000 tons following 1928. As a result of this large quantity of cheap soybeans, domestic soybeans were almost neglected.

"However, defeat in war caused a great change in the soybean picture in Japan. Japan lost Manchuria and Korea and the importation of soybeans from these territories was completely cut off. As a result, Japan faced a grave fats and oils and protein shortage.

"Total imports of soybeans since the war have been less than 10 percent what they were before the war.

"Formerly, the greater part of the soybean meal obtained after the extraction of the oil was used as fertilizer or livestock feeds; but soy bean oil meal and soy flour imported from the United States are now used for making miso and shoyu. This indicates the critical shortage of soybeans."

Note: This is one of the most interesting articles we have ever seen on the history of soybeans in Japan from the late 1800s until 1949. Address: Secretary, The Japanese Soybean Assoc., Tokyo, Japan.

3842. *Vegetarian News Digest* (*Los Angeles*). 1949. Health in the news: The soy bean–wonder food of many uses. 1(9):21. Sept/Oct.

• ***Summary:*** "Allan K. Smith of the Northern Regional Research Laboratory, Peoria, Illinois, recently returned to the United States from the Orient where he learned of countless uses for soy beans. In China, Japan and Korea he found soy beans being fermented, ground, and processed in various ways. In its motherland, Smith discovered, the soybean is a source of flour and cake, oil, bean sprouts, vegetable milk, various sauces and pastes, curd, cheese, and several other

© Copyright Soyinfo Center 2014

foods." Describes how soy milk is made in China. One restaurant that Smith visited prepared more than 25 different dishes from soybeans.

3843. Brant, Burl. 1949. CARE packages use soy products. *Soybean Digest.* Nov. p. 39.
• ***Summary:*** "Since April 1948, when the Japanese Food Package for CARE was developed, two soybean products have been continuously included in those packages. They are soy sauce, known as 'shoyu' and a bean curd [sic] preparation, known as 'miso.'" Both the miso and shoyu shipped to Japan were made in the USA. The annual production of shoyu in America is estimated at about 500,000 gallons. The shoyu sent to Japan is made by blending traditional fermented shoyu with HVP soy sauce. Address: Asst. Executive Director, Cooperative for American Remittances to Europe, Inc. (CARE).

3844. Kagawa, Aya. 1949. Japanese cookbook (100 favorite Japanese recipes for Western cooks). Tokyo: Japan Travel Bureau. 162 p. Illust. (line drawings, and color-, and black and white photos). 19 cm. Series: Tourist Library No. 11.
• ***Summary:*** Contents: Preface. General remarks (The why of Japanese food, its nutritive value, table utensils, an ordinary meal, meals for guests, table etiquette, kitchen utensils, how to cut up fish and vegetables, glossary {incl. aburaage, miso, shoyu, tofu}). Japanese cookery: Table of measures, soups, boiled foods, broiled foods, fried foods, saucepan foods, steamed foods, *hitashimono* (boiled greens in soy [sauce]), aemono (dressed vegetables), vinegared foods, sliced raw fish (sashimi), rice foods, sushi (vinegared rice foods), pickles, seasonal menus, New Year's foods, Girls' Festival foods. How to make Japanese cakes (incl. bean paste from red beans).

Many recipes call for "shoyu" [soy sauce]. Soy related recipes: Scrambled egg soup (with shoyu or Worcester sauce, p. 42). Tofu and Japanese leek soup (p. 49). Miso soups (p. 50-51). Broiled egg-plants (with miso, p. 70). Beef sukiyaki (with tofu, p. 79-80). Fish stew (with tofu, p. 81). Odamaki mushi (with yuba, p. 85). Boiled greens in soy (p. 91-92). Dressed food with white sesame [seeds] and vinegar (and aburaage {fried beancurd}, p. 96). Dressed carrot and kidney beans in pod (with tofu, p. 97).

On p. 14 we read: "Soy beans are used very much in Japanese food; especially in hilly regions where fish is scarce, or in vegetarian menus (in connection with Buddhism). Beans are not only simply boiled but eaten in various ways. They are made into *tôfu* (beancurds), *aburaage* (fried tôfu), *nattô* (steamed and fermented beans), *shôyu, miso,* [azuki] bean-paste used in cakes, etc." Key flavorings are miso, shoyu, sugar, and vinegar. Sake, mirin, dashi and ajinomoto (seasoning powder) are also important. "Seaweeds are usually eaten dry. Nori (seasoned laver), kombu (tangle), wakame (lobe leafed undaria), hijiki (spindle-shaped bladder-leaf), and so on, are rich in iodine,..."

Note: This is the earliest English-language document seen (April 2013) that contains the term "fried tôfu" (with diacritics).

"Of flavorings, *miso, shôyu,* sugar and vinegar are the most important. *Sake* (Japanese wine), *mirin* (a sweet kind of *sake*) and *dashi* are used in this way to give flavor. Properly speaking, *dashi* is formed by boiling shaving [sic, shavings] of *katsuobushi* (dried bonito) or *kombu* (tangle, a kind of kelp), but *ajinomoto* (seasoning powder) may take its place. Usually, however, *dashi* is not made, and instead *niboshi* (a small dried fish) is boiled together with the food to give it flavor. Besides, ground walnuts sesame, peanuts etc., are used to dress vegetables. In addition to these, mustard, red pepper, horse radish [wasabi], the leaves and berries of *shiso* (a kind of highly flavored leaf), the leaves and berries of *sansho* (Japanese pepper), Japanese leeks [negi], *myôga* (myôga ginger [*Zingiber mioga* Roscoe]), ginger [shôga, the root of *Zingiber officinale*], are used as flavorings, being found growing in most kitchen gardens."

"Our special thanks are due to Dr. R.H. [Reginald Horace] Blyth, professor of Gakushin University, who translated the original Japanese manuscript into English." Aya Kagawa was born in 1899. The book was first published in December 1949 but not copyrighted until 1952. The almost identical 9th printing appeared in April 1955. Only the color photos were changed (upgraded) by 1955. The first true revision and 2nd edition was the so-called "Fourteenth & revised edition" of 1962. Address: M.D. and president of Joshi Eiyô Tanki Daigaku (Women's Nutrition College), Tokyo, Japan.

Shôyu kasu ni yoru kôki seibun no bunri, shu toshite teifutten kôki seibun ni tsuite [Studies on flavorous substances in soy [sauce]. I. Isolation of flavorous substances from soy-cake, chiefly the flavors substances of lower boiling point]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 23(5):200-05. Dec. [13 ref. Jap; eng]
Address: Noda Industrial Science Laboratory, Noda, Japan (Kikkoman).

3846. Vavilov, Nikolai Ivanovich. 1949-50. The origin, variation, immunity and breeding of cultivated plants (Translated from the Russian by K. Starr Chester). *Chronica Botanica* 13(1/6):1-366. Original Russian ed. 1935. [4 ref]
• ***Summary:*** N.I. Vavilov was a major contributor to scientific thought in the fields of genetics, plant breeding, and the study of plant variation, systematics, and evolution.

Page 2 notes: "the higher the technical level of a civilization the more highly bred are its crop plants. Thus, Chinese vegetables including different varieties of cabbage, soybeans, rice... are noteworthy for the quality and size

© Copyright Soyinfo Center 2014

of fruit and seed, and altogether bear witness of careful selection during many centuries."

Page 20 introduces a section titled "World centers of origin of the most important cultivated plants. Page 21 lists the major cultivated plants from the Chinese Center of Origin, including the soybean (*Glycine hispida* Maxim.), adzuki bean (*Phaseolus angularis* Wight.), broomcorn millet (*Panicum miliaceum* L.), Italian millet (*Panicum italicum* L.), Japanese barnyard millet (*Panicum frumentaceum* Fr. and Sav.), kaoliang (*Andropogon sorghum* Brot.), buckwheat (*Fagopyrum esculentum* Moench.), and Tartar buckwheat (*Fagopyrum tataricum* Gaertn.).

Page 26 notes: "The most important endemic plants of the temperate zone are three species of millet, buckwheat, soya bean, and a number of legumes... Moreover, the species are usually represented by enormous numbers of botanical varieties and hereditary forms. The varieties of soy bean, adzuki bean, persimmon, and citrus fruits include thousands of easily distinguished hereditary forms.

Page 43 lists the major cultivated plants from the Brazilian-Paraguayan Center of Origin, including manioc, peanut (*Arachis hypogaea,* on light soils), cocoa, and the rubber tree.

Page 46 discusses "Primary and Secondary Crops: Our research has suggested a division of all cultivated herbaceous plants into two groups. The first group consists of plants cultivated from ancient times and known only in cultivation or in wild state. These are called the primary group. To this group belong such plants as wheat, barley, corn, soy bean, flax, and cotton. The second group consists of all plants which have been derived from weeds which grew among the basic primary plants." Cultivated rye arose from the second group.

Four related tables on pages 75-78 show variability in 15 species of the Papilionaceae, including the soybean. The heritable variable characters include: Color of blossom (8 characters), size of blossom (2), structure of pod wall (2), form of pod (7), color of ripe pod (6), size of pod (2), surface of pod (4), seed form (6), seed surface (2), seed color (8), variegation of seed coat (3), color of cotyledons (3), seed size (2; large and small), color of scar (3), leaf structure (2), leaf form (3), size of leaf (4), leaf margin (2, entire or toothed), hairiness of leaves (2), color of stipules (2, green or with anthocyanin; stipules are the pair of appendages borne at the base of the leaf), color of leaves (2), and waxy layer on plant (2 characters), stem structure (2), plant height (3), hairiness of stem (2), form of stem (3), color of shoots (2), color of stem (2), habit (2, erect or decumbent), vegetative period (2, early or late), formations of albinos (2, present or not present). On the basis of the Law of Homologous Series, though soybeans usually consist of forms with hairy pods, we might expect to find forms with smooth pods. Such forms originally came from Japan and Manchuria.

Page 84 discusses parallel variations in distant families. Fasciations–In almost all families there appears to be a tendency to the formation of fasciated or hypertrophied organs of different kinds–including in soybeans.

3847. **Product Name:** [Higashimaru Shoyu].
Manufacturer's Name: Higashimaru Shoyu Co. Ltd.
Manufacturer's Address: 100-3 Tominaga, Tatsuno city 679-41, Japan.
Date of Introduction: 1949.

3853. Blyth, R.H. (Reginald Horace). 1949. Senryu: Japanese satirical verses. Tokyo: The Hokuseido Press. iv + 230 p. Illust. No index. 21 cm. [1 ref]
• ***Summary:*** These verses were chosen, translated and explained by R.H. Byth. Contents: Preface. Introduction. Haiku and senryu (17 chapters, each on a different subject; e.g., Nature and man. All and one. Simple and complex. Sex. Zen. Religion. Is senryu poetry?). The origins and technique of senryu (vocabulary and syntax, poetic brevity, personification, colloquialisms, the composition of senryu, customs and manners, postscripts, anonymity, principle of selection, conclusion). Senryu (14 chapters, each on a different subject; e.g., Women. Children. Mothers. Fathers. Wives. Husbands. Mothers-in-Law. Other relations.

© Copyright Soyinfo Center 2014

Professions. Animals. Things. Historical. Psychology. Pictures of life).

The Preface begins: "Rightly or wrongly, I feel that the appropriate way to appreciate senryu is through the understanding of haiku... haiku preceded senryu by about a hundred years." Haiku and senryu together give "a fairly complete idea of the nature of the Japanese people, their spirituality and idealism on the one hand, and their thorough-going realism on the other... the 'world of calm delight' and the 'strife divine.'" "The average Japanese and especially the so-called intelligentsia, has a low opinion of senryu. This is quite unjustified."

The Introduction begins: "Senryu are expressions of moments of vision into, not the nature of things, but the nature of man."

In the 14 chapters of the section on "Senryu," each entry has four parts: (1) The senryu itself, written in Japanese characters. (2) Romanization of (1). (3) Translation of (1) in the form of 3 lines with 17 or fewer syllables. (4) Blyth's commentary on this senryu. In addition, many senryu are accompanied by an illustration. The great majority of these illustrations are by Mr. Sobun Taniwaki, who died in 1947.

Page 90 (chapter on "Wives"):

"'To the cook she says
"A hundred times,
"Don't forget the bean-curd water.'"

Comment: "The water bean curd is boiled in is supposed to be good for washing clothes in. The mistress keeps telling the maid-servant, ad nauseum, not to throw away the water after the bean curd is cooked. In this repetition, this persistence about a small thing, is seen a whole world of the human mind."

Page 117 (on "Professions"):

"Holding the *dengaku* in his hand
"The pack-horse driver
"Comes out to scold the horse."

Comment: "*Dengaku* is baked bean-curd covered with *miso,* a kind of sauce. The horse gets tired of waiting for his master in the pub, and begins pawing the ground... This is a road-side scene of Old Japan." Address: Author, Tokyo, Japan.

3854. Mogi, Masatoshi. 1949. Shôyu miso [Shoyu and miso]. Tokyo: Daiamondo-sha. viii + 283 p. [4] p. of plates. Illust. 19 cm. [Jap]

• ***Summary:*** The first four pages of this book contain 10 small photos relating to shoyu production and 10 relating to miso production. Contents: I. Shoyu. Commercial products: 1. History of shoyu (p. 3). 2. Varieties of shoyu (p. 8). 3. Supply and demand of shoyu (p. 25). 4. Quality of shoyu (p. 28). 5. Containers used for shoyu (p. 36). Production: 6. Fermented shoyu (*Jôzô shoyu*) production method (p. 40). 7. Amino-san shoyu production method (p. 90). 8. Semi-chemical shoyu production method (p. 108). 9. Methods of preventing formation of undesirable mold on and gas in bottled shoyu (kabi, p. 110). 10. About steaming equipment (jôki kikan) in the shoyu plant (p. 115). Industry: 11. Structure of the shoyu industry (p. 123). 12. The structure of selling and buying of shoyu (p. 141). 13. Supply and demand for shoyu, and the future of the industry (p. 149).

II. Miso. Commercial products: 1. History of miso (p. 173). 2. Supply and demand for miso (p. 175). 3. Varieties of miso (p. 179). 4. Standards for miso (p. 188). 5. Nutritional composition of various types of miso (p. 189). 6. Storing miso (p. 191). Production: 7. Regular miso production methods (p. 193). 8. Methods of making miso using substitute raw materials (p. 223). Industry: Structure of the miso industry (p. 245). 10. Financial condition of the miso industry (p. 254).

The author was born in 1907. Address: Brewing Lab., Noda Shoyu Co. Ltd., Noda-machi, Chiba-ken, Japan.

3855. Saito, Akio. 1949. [Chronology of soybeans in Japan, 1927 to 1949] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Feb. p. 14-15. [Jap]

• ***Summary:*** 1927 Sept. 15–Noda Shoyu [Kikkoman] has the longest strike in pre World War II Japan. The labor system becomes more modern and employer-employee problems start to be handled in new ways.

1928–The production of soy oil reaches 38,000 tons, passing rapeseed oil which is 30,000 tons. Soy oil is now Japan's leading vegetable oil.

1931 Sept.–Japan invades Manchuria, using the Mukden incident as a pretext. 1932–Japan attacks China. By early 1932 Japan had conquered all of Manchuria.

1932 Feb.–The Rikagaku Kenkyujo in Tokyo makes salt-free shoyu for the first time.

1935–At about this time, systematic cultivation of soybean seeds begins.

1938–The average retail price of good quality shoyu is 62 *sen* for 18 liters (10 *sho*).

1938 Sept.–The *Kokusaku Daiyohin Fukyu Kyokai* is founded. This organization encourages the substitution of less expensive or more abundant ingredients in shoyu, such as barley for rice, millet or barn yard millet grass (*hie*) for barley, or the chrysalis of a silkworm for soybeans and wheat in making HVP shoyu (*amino-san shoyu*).

1939–The first soybean is registered in Japan; it is named "Ministry of Agriculture and Forestry, Number 1" (*Norin ichi-go*).

1939 Dec.–The Japanese government puts its energy into controlling the rising prices of rice, miso, shoyu, salt, matches, fresh produce, etc. (i.e. essential foods for daily life).

1940 March–The "Central Price-Fixing Organization" (*Chuo Bukka Iinkai*) sets ceiling prices for the following to control inflation: soy oil, soybean cake, Japanese soybeans mixed with Manchurian soybeans, salted salmon, salted

© Copyright Soyinfo Center 2014

trout, dried nori, and eggs.

1940 April–The "Price Setting Central Committee" (*Kakaku Keisei Chuo Iinkai*) decides to use a ticket (rationing) system for ten items including rice, miso, shoyu, salt, matches, charcoal, and sugar.

1940 June–The Ministry of Agriculture and Forestry (*Norinsho*) and the Ministry of Commerce and Industry (*Shokosho*) proclaim the new revision of the regulation for controlling excessive profits (*Borikoi Nado Torishimari Kisoku Kaisei*), and on responsibility relating to prices.

1940 Sept.–Even though people are under control, summer resorts become crowded and people take home rice and miso and souvenirs. The government asks them not to do this.

1940 Oct.–The Japan Soybean Control Corporation (*Nihon Daizu Tosei K.K.*) and the Cooperative Soybean Products Marketing Corporation (*Daizu Seihin Kyohan K.K.*) are founded.

1941 June–The home use food oil ticket (rationing) system starts.

1941 Dec. 7–Japan attacks Pearl Harbor. War with the USA begins. 1942 Feb.–The ticket rationing system starts for miso and shoyu.

1943 June–The regulations for emergency food production are decided. They start to use unused lands for production of various small grains and legumes (*zakkoku*).

1943 Nov.–A record book rationing system is established for tofu, to ensure fair distribution.

1945 Aug. 14–Japan surrenders to the USA in World War II after atomic bombs are dropped on Hiroshima and Nagasaki (Aug. 6 and 9).

1945–Because of unusually cold weather, Japan's soybean production drops dramatically, resulting in one of the smallest crops since 1878. It is only 170,400 tonnes, 36.3% lower than the previous year.

1947–The production of shoyu this year is only 1,868,500 *koku.* Since there is not enough shoyu, a lot of substitute shoyu and powdered shoyu (*kona shoyu*) appear; neither of these two products are regulated.

1947 May 3–A new constitution is adopted in Japan in which the country renounces the right to wage war, the emperor gives up claims to divinity, and the Diet becomes the sole law-making authority.

1948 Oct.–At about this time, the food situation in Japan starts to improve. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

3856. Sasaki, Kyota. 1949. Amino-san shôyu seizô-hô. Fu gurutamin san sooda [Method of manufacturing HVP or amino-acid soy sauce. With a supplement on monosodium glutamate]. Tokyo: Fuminsha. 181 p. [Jap]
• ***Summary:*** Amino acid. Address: Kôgaku-shi, Japan.

3858. *SoyaScan Notes.* 1949. Chronology of the macrobiotic movement in North America, 1949-1966. 25 Jan. 1995. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1949–Michio Kushi, a student of George Ohsawa, arrives in New York City from Japan, in connection with the World Federalist Movement. He writes letters back to Japan, and Ohsawa reads them to his students at his center (*Maison Ignoramus*) in Yokohama, near Tokyo, Japan.

1951–Aveline Tomoko Yokoyama falls in love with Michio's letters, wins a trip to America by being the best seller of Ohsawa's newspapers, and meets Michio in New York.

1952, early–Herman Aihara, age 31 (born Nobuo Nishiyama on 28 Sept. 1920), arrives in America, and settles in New York City. As early as March 1952 he was selling macrobiotic foods in New York; he imported them from Ohsawa in Japan.

1953–Michio Kushi and Aveline Tomoko Yokoyama are married in New York. They had exchanged letters before she arrived.

1955 Dec.–Herman Aihara and Chiiko (Cornellia) Yokota are married in New York. Cornellia arrived in the United States from Japan in Oct. 1955. They had exchanged many letters before she arrived.

1959 or 1960–Zen Teahouse, the first macrobiotic restaurant in the USA, is started in New York City by Alcan Yamaguchi. It was located at 317 Second Ave. and consisted of a small (4-table) main room containing a kitchen. Miso and shoyu were served regularly. This restaurant was later renamed Paradox.

1959 Nov. or Dec.–George Ohsawa arrives in America for the first time, staying in New York City with Herman Aihara, his closest associate. After a week he flies to California to find a source of short-grain brown rice; he locates Koda Brothers (in Dos Palos), but also gives lectures in San Francisco and Los Angeles. After one week in California, he returns to New York City.

1960 Jan.–Ohsawa presents the first of three series of lectures designed to introduce macrobiotics, and the philosophy and medicine of the Orient, to America; each for ten nights during January, February, and March of 1960 at the Buddhist Academy in New York City. During these lectures his first work in English is published, a mimeographed edition of *Zen Macrobiotics.* He and the Aiharas duplicated and bound these in the Aiharas' apartment, then sold them at the lectures for $0.50. He also lectured at the Universalist Church, The New School for Social Research, Columbia University, and New York City College (See: *Macrobiotics: The Art of Longevity and Rejuvenation,* p. 188-89).

1960 May 10–Herman Aihara starts publishing

© Copyright Soyinfo Center 2014

Macrobiotic News, a magazine consisting mainly of Ohsawa's lectures, plus some current news.

1960 July–Ohsawa returns to America (after a trip to Europe) and lectures daily for two months at the first American macrobiotic summer camp at Southampton, Long Island, New York. Mrs. Lima Ohsawa, aided by Cornellia Aihara, gives macrobiotic cooking classes. Many people attend, especially writers, actors, artists, musicians, and intellectuals.

1960–To serve this growing interest, a tiny restaurant named Musubi is started in Greenwich Village and run by Alcan Yamaguchi, Romain Noboru Sato, Herman Aihara, and Michio Kushi. In late 1961 Musubi was moved to 55th Street.

1960–The first macrobiotic food store (combined with a gift shop), named Ginza, is started by Herman Aihara.

1961 Feb.–At a meeting of the Ohsawa Foundation, Inc. (New York City) Herman Aihara is elected president while he was traveling in Europe. He accepted the position when he returned later that month.

1961 summer–George and Lima Ohsawa come to America again for the second macrobiotic summer camp, this time in the Catskill Mountains at Wurtsboro, New York. Lima and Cornellia Aihara give cooking classes. After the camp, at the time of the Berlin Wall crisis (August 1961, before the Cuban missile crisis of Oct. 1962), Ohsawa feared that a nuclear war might be near. He urged his followers to leave New York and find a place that was safer from radioactive fallout and good for growing rice. After extensive research, they choose Chico, California.

1961 Oct. 1–Thirty four people (11 families) arrive in Chico from New York City in a caravan of vans, buses, and station wagons. Among the active people in the group are Bob Kennedy, Herman Aihara, Teal Ames, Lou Oles, and Dick Smith.

1961 Nov.–The first printed edition of *Zen Macrobiotics,* by G. Ohsawa is printed in Japan (218 pages). It has been edited and the parts rearranged.

1962 March 6–The group in Chico establishes a new food company named Chico-San as a retail store and an import and wholesale business. It was capitalized with $10,000. In addition to a line of whole-grain products, they soon began to import a variety of macrobiotic foods from Ohsawa in Japan. The first store and food plant (they made sesame salt or *gomashio* and repackaged foods) was in the basement of a small hearing aid shop in Chico. It became the first macrobiotic food production company in the USA.

1962 July 7–Third summer camp opens in Wurtsboro, New York, under the direction of Irma Paule and Sam Chapman; it continued until Labor Day.

1962 Christmas–George Ohsawa visits Chico and lectures on macrobiotics.

1963–Ohsawa lectures in Boston, New York City, and at the fourth macrobiotic summer camp (the first on the West Coast) at Chico. Lima Ohsawa and Cornellia Aihara give cooking classes. In Chico, Ohsawa suggests that the group try making rice cakes. He sends them a rice cake machine from Japan and production began in the fall of 1963. Rice cakes soon became Chico-San's first really popular and successful product.

1963 May–Junsei Yamazaki arrives in the USA (in San Francisco) from Japan. He first goes (by bus) to Chico, California, to help with the installation of small rice cake machines. After the July 1963 summer camp in Chico, California, he goes to New York, arriving in August.

1964 summer–Ohsawa lectures in California at the fifth macrobiotic summer camp (2nd on the West Coast) at Big Sur. Lima Ohsawa and Cornellia Aihara give cooking classes.

1964 Sept.–After the macrobiotic summer camp on Martha's Vineyard, the Kushi family moves from the island to Cambridge, Massachusetts (101 Walden St., on the outskirts of Boston to the northwest). Michio stops all his outside business activities and directs his full attention to teaching macrobiotics.

1964 Nov.–The first edition of *Zen Cookery,* edited by Teal Nichols, a book of macrobiotic recipes (83 p.), is published by The Ohsawa Foundation in Chico, California.

1965–The macrobiotic movement in America, though small, is growing rapidly. Ohsawa lectures again in California at Mayoro Lodge, near Pulga.

1965–Michio Kushi organizes the first East West Institute out of his home in Cambridge and begins teaching macrobiotics, cosmology, and cooking to mostly young people.

1965–The second edition of Ohsawa's *Zen Macrobiotics* is prepared and published by Lou Oles of the Ohsawa Foundation in Los Angeles. It contains much more information (including much more about soyfoods) than the original 1960 mimeographed edition.

1965–*You are All Sanpaku* by William Dufty is published.

1965 Nov. 9–Beth Ann Simon, a young heroin addict from New Jersey, dies while following a strict macrobiotic diet. This is the movement's first major setback. Ohsawa and the macrobiotic diet receive much adverse publicity, and the incident brands macrobiotics among many in the medical and health professions as a dangerous and extreme form of food faddism. The image was hard to get rid of. The U.S. Food and Drug Administration closes the New York branch of the Ohsawa Foundation, run by Irma Paule.

1966 April 24–George Ohsawa dies unexpectedly in Tokyo, Japan, at age 72–just as his teaching is beginning to spread rapidly in the West. The cause of his death: a heart attack, perhaps caused by filarial parasites he had picked up at Lambarene, Gabon.

1966 April–Erewhon opens as a tiny (10 by 20 foot) retail store downstairs at 303-B Newbury Street in Boston.

© Copyright Soyinfo Center 2014

1966, summer–Michio Kushi begins to lecture each Monday and Wednesday evening in a back room of the Arlington Street Church in Boston. These talks were supplemented by cooking classes with Aveline Kushi in Brookline.

• ***Summary:*** "'Fuku wa uchi! (Fortune in) Fuku wa uchi (Fortune in) Oni wa soto (Devil out)'

"This is a cry heard from almost every orthodox Japanese home on the evening of the Setsubun (literally season change), which comes on at the end of Kan or coldest season. The Kan season, which lasts for thirty days, inclusive of Daikan (major-cold) and Shokan (minor-cold), ends usually on the 2nd or 3rd of February, when the ceremony of Mame-maki (bean-throwing) or Tsunan (devil-driving) is held in most Japanese houses.

"On the day of Setsubun, a small branch of *Hiiragi-tree* (*Osmanthus aquifolium*), which resembles the holly, and the head of a dried sardine are put at the entrance of each house... In the evening, the ceremony of Mame-maki, or bean-throwing, is held to 'bring fortune in and drive evil out.' The bean-thrower, who is the master or scion of a family (never a woman in olden days), is dressed in Kamishimo-dress and he throws a handful of parched beans from a dry measure, which he carries on a Sambon-tray [sic, sanbo-tray], crying as quoted above. He throws a handful twice in the lucky direction of the year where resides the Year-virtue God, and once in the direction opposite to him. He repeats the same cries in every room and closet that there may be in the house, one of its doors being open while he throws the beans, possibly, as an exit for the Devil. Thus is the fortune invited and evil driven out for the year.

"Some of the beans that are thrown in the room are kept on account of a common belief that, if you eat three of these beans at the time when the first thunder peals in the year, you will escape a thunder bolt during the year. A man or woman in his or her 'unlucky years of age,' i.e. 25 and 42 years for men and 19 and 33 years for women, will wrap in a piece of white paper as many of beans used at Setsubun as his or her years of age, together with some coins, which are thrown away at crossroads so that evil may be done away with for the year.

"Recently the ceremony of bean-throwing is held at every large Shinto shrine and Buddhist temple, when some champion wrestlers or noted actors act as what are called 'Toshi-otoko' (literally year-man) as the bean-thrower is commonly called. Happy are those indeed who succeed in catching a few beans that are thrown by these year-men, for great are crowds who assemble to catch a few of the beans. These beans, which the luckier people of the crowds catch, are kept at home as a luck-bringer for the year.

"Tradition has it that during the reign of the Emperor Uda (59th) a devil of some kind lived in a cave near Lake Misoro in Kumano. It came out in the night to make havoc in the neighbourhood, till, by following the oracle of Vaiscavana, seven wise men were ordered by the Emperor to kill the evil spirit. They threw parched beans into the cave by closing its entrance with the leaves of the Hiiragi-tree and heads of sardines. This is said to be the origin of the practice of throwing parched beans in the evil direction with a few Hiiragi-leaves and the head of a dried sardine outside a door which is open at the time when the beans are thrown out."

An illustration (line drawing) shows a man in traditional Japanese dress (a hakama and kamishimo), standing on the wooden walkway that surrounds a temple, throwing beans at Setsubun out of a small wooden measuring box (*masu*).

Note: In short, Setsubun, the bean-throwing festival, both rids evil from the previous year, and brings prospects of good fortune for the current year. Address: Manager, Fujiya Hotel, Miyanoshita, Japan.

• ***Summary:*** Chicago home economist Dorothy Roost Bates, just back from four years in the Hawaiian paradise, was the teacher in the last of these foreign fare classes.

"The teriyaki is expensive since it requires a tender cut of beef, preferably the rib eye. Mrs. Bates used sirloin...

Teriyaki (A Japanese appetizer): 1 pound tender beef steak, ¼ cup soy sauce, 1 tablespoon sugar, 1 clove garlic, 1 teaspoon ginger (fresh), chopped fine.

"Slice meat in thin strips across grain. Place on bamboo sticks [skewers] (100 for 25 cents in Chinatown)." Mix soy sauce with other sauce ingredients. Soak meat in sauce 30

© Copyright Soyinfo Center 2014

minutes or more, turning to marinate evenly. Broil 5 minutes on each side before serving hot.

"These are usually done over charcoal, but broiling [in an oven under an overhead gas flame] works very well. The skewered beef may be arranged on a cooky [cookie] sheet for broiling." Also contains recipes for Hawaiian curry. Chicken luau.

Note 1. This is the earliest teriyaki recipe seen (Nov. 2006) that uses beef (or any other kind of red meat) and the main ingredient.

Note 2. It is also the earliest teriyaki recipe seen that has a complex sauce, similar to modern teriyaki sauces.

• ***Summary:*** Monosodium glutamate has been garnering a lot of publicity lately. In fact, the name is now so well known that it is popularly known in commercial circles as MSG.

"The virtue of monosodium glutamate is that it intensified flavor. This has been known to the Chinese for generations. The knowledge was passed on to the Japanese," who started manufacturing it and sold it in the United States prior to the start of World War II.

"However, what with the running out of Japanese patents and the disruption of the war, manufacture of MSG was commenced in this country," where annual production is now some 9 million pounds. It is used chiefly in canned soup and soup powders.

MSG is a type of amino acid. It may be extracted [sic, hydrolyzed] from corn gluten, wheat gluten, or soybean gluten [sic]. "Another important source is the molasses from beet sugar which yields a product [substance] known as Steffens waste."

"The Chinese extracted their MSG from soybean gluten [sic] and called it ve-tsin." When the Japanese began to manufacture it commercially, they named it ajinomoto, which means 'element [basis] of taste.'"

You can add a dash of MSG to any dish, just as you would Worcestershire sauce or paprika.

It is claimed that, under certain circumstances, "glutamic acids increase the mental ability of persons with low I.Q.'s."

3872. Nickerson, Jane. 1950. News of food: Higeta shoyu shipped here. *New York Times.* Aug. 29. p. 30.
• ***Summary:*** The first shipment of Higeta soy sauce (shoyu) ever made to the United States has just arrived from Choshi, Japan, imported by George Saiki. It is made by that venerable company, Choshi Shoyu, which has been brewing soy sauce in Japan since 1616. Long located in the village of Choshi, in Chiba prefecture, its factory is now equipped with modern equipment. A 22-oz. bottle of Higeta shoyu retails for $0.74 at Macys.

Saiki says that Higeta shoyu has long been used in Japan's imperial household. It is now fermented for 6-18 months. Mr. Saiki, like most Orientals, recommends its use in a wide range of dishes, from soup and fish, to fowl, meat and vegetables.

3873. Miso Manufacturing Experiment Administration Committee. 1950. Miso jôzô shiken hôkoku [Report of the experiments on miso manufacturing, May 1950]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 4. p. [iii] + 1-84 + 1-90 + 1-32. Sept. English translation (32 p.) is bound at the end of Issue No. 4. [Jap; Eng]

• ***Summary:*** The first three parts of this article (177 p.) are in Japanese and the last part (32 p.) is a detailed English summary.

Contents (English summary): 1. The circumstances which led to make the miso manufacturing experiments: The general aspects of raw materials for miso, the circumstances which led to set about the experiment work.

2. Experiment methods and experimental results: The experiment methods, marking by means of functional testing (frequency curve, analysis of variance and minimum differences required for significance among average marks, discussion), chemical analysis (raw materials, chemical analysis of defatted soy-beans, non-defatted soy-beans, and corn-meal, denaturation of protein in defatted soy-beans, enzymic digestion of defatted soy-beans), finished goods (miso) (general analysis, correlation between the analytical results and the functional testing results, nitrogenous compounds, judgment for finished goods by dividing into 3 grades, analysis made by excluding the disparity among manufacturing plants, judgment for the results of finished goods, by manufacturing plants (minimum significant difference–2.39)).

3. Conclusions: Premises, 50% koji products, 100% koji products, 150% koji products.

4. Discussion. 5. Appendix–Experiments on a laboratory scale: Object of experiments and outline thereof, koji-making experiment, conclusions.

In the years before World War II, annual consumption of soybeans in Japan was not less than 1,000,000 tonnes (metric tons), of which 300,000 tonnes were grown in Japan and the remainder was imported from Manchuria and Korea. Out of this 1,000,000 tonnes, about 700,000 tons are estimated to have been consumed as foods or seasonings; approximately 250,000 tonnes were used as raw materials for miso, which is one of Japan's most important seasonings.

Concerning miso consumption in the years just before World War II, exact figures are not available, but it can be roughly estimated at about 150 million *kan* (1 kan = 8.27 pounds), or a little more than 2 *kan* (ca. 16.5 lb) per person per year.

In those days, miso was made to suit public tastes in the various regions of Japan, and there were various kinds of miso according to the region. Miso can be grouped into three basic types: soy-bean miso (*Mame miso*) salty miso, and sweetish miso. Describes briefly how each of the three types was made. One table (p. 2) shows the ingredients used to make each of these three types: (1) Soy-bean miso: Soy-beans 10 *koku* = 1,800 liters. Salt 110 *kan* = 909.7 lb = 413.5 kg. Ripened miso 1,000 *kan* = 8,270 lb = 3,759.1 kg.

(2) Salty miso: Soy-beans 14.0 *koku* = 2,250 liters. Milled rice or milled barley 7.0 *koku* = 1,260 liters (made into koji). Salt 185 *kan* = 1,530 lb = 695.4 kg. Ripened miso 1,650 *kan* = 8,270 lb = 3,759.1 kg.

(3) Sweetish miso: Soy-beans 12.8.0 *koku* = 2,304 liters. Milled rice or milled barley 15.7 *koku* = 2,826 liters (made into koji). Salt 94 *kan* = 777.4 lb = 353.4 kg. Ripened miso 1,700 *kan* = 14,059 lb = 6,390.5 kg.

As late as 1941, due to food shortages, miso was brought under Japanese government control; from that time until the end of the war, miso production gradually decreased. Starting in about 1944 only one type of miso was made for all the regions of Japan–a type of salty miso. 100 *kan* of miso was made using 34 *kan* of soy-beans, 16 *kan* of milled rice or barley, and 15 *kan* of salt. Efforts were made to shorten the fermentation time by using a quick ripening method [a heated or warm environment].

At the end of World War II, Japan was unable to import soy-beans from Manchuria [and, to a lesser extent, Korea]. This dire soybean shortage led to a sharp decrease in miso production; Japan started to use defatted soybean meal and defatted soy flour (imported from the USA) in place of whole soybeans, and sweet potatoes or imported corn instead of some rice or barley, to make miso. The quality of miso dropped. The experiments described in this report represent an attempt to improve miso quality scientifically, mainly by investigating how to use defatted soybean meal to make better quality miso. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

3874. Obata, Y.; Nukata, K.; Zama, K. 1950. [Studies on the phosphatides. I. Isolation of lecithin]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 24(1):29-32. Nov. [10 ref. Jap; eng]
Address: Dep. of Fisheries, Faculty of Agriculture, Hokkaido Univ.

3875. Obata, Y.; Sasa, S.; Nukata, K. 1950. [Studies on the phosphatides. II. A new method for the isolation of cephalin]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 24(1):33-35. Nov. [4 ref. Jap; eng]

• ***Summary:*** The existing method for the isolation of cephalin from animal material is not readily applicable to the isolation of the same substance from plant material. Soybean cephalin was isolated from "soybean lecithin." Address: Dep. of Fisheries, Faculty of Agriculture, Hokkaido Univ., Sapporo.

3876. *Soybean Digest.* 1950. Japan shifts from whole beans to meal. Nov. p. 24.

• ***Summary:*** Two pie charts show Japanese usage of

© Copyright Soyinfo Center 2014

soybeans in 1940 and 1948. In 1940 the Japanese were consuming about half of their 562,000 tonnes of soybeans as whole soybeans used to make various foods such as shoyu, miso, and tofu. But by 1948 nearly all their soybeans were being used in the form of soybean oil meal, especially to make miso, shoyu, and amino acids. Consumption of miso and shoyu have greatly increased, while other uses (especially tofu) have shrunk.

"During the 10 years preceding the end of World War II, Japan imported an average of about 700,000 tons of soybeans, chiefly from Manchuria. This inflow of soybeans was stopped almost entirely immediately after the war, which resulted in critical protein and oil supplies. But imports since then have increased, overcoming the extreme shortage. About 80 percent of total soybean imports during 1946-48 were from the U.S."

3877. Holmberg, Sven A. 1950. Soybean trials in Sweden. *Soybean Digest.* Dec. p. 13.
• ***Summary:*** Varieties: "Even the earliest of the foreign varieties are too late when grown in Sweden.

"By crossing varieties of northern island origin (Hokkaido [Japan] and Sachalin [Sakhalin]) with northern continental varieties (north Manchuria, North America and central Europe) we have produced some 1,900 hybrids.

"One of these hybrid progenies, 'Fiskeby III' is now being grown commercially on a small scale for human food."

"Growing district: Although we do most of our breeding work at Fiskeby, we have for safety placed some replica plots and most of our contract culture of soybeans somewhat further south near the city of Kalmar between latitude 56º and 57º. We have to reckon with some risk of summer frost until late in June and then again from September on."

Yield: "We have no figures of average crop results. But at this time we consider a yield of 15 bushels an acre as normal and fairly satisfactory.

"Under favorable growing conditions we have not infrequently recorded about 25 bushels an acre in field culture. In yield tests at Fiskeby the 4-year average (1946-1949) was slightly above 26 bushels/acre.

"Usage: The small quantities of soybeans harvested in Sweden beyond those required for seed are consumed as human food. For culture in Sweden we select only strains which in flavor, seed coat color, seed size and cookability answer the requirements for an edible soybean."

A simple map shows the location of Fiskeby [southwest of Stockholm]. Photos show: (1) Soybeans at Fiskeby being harvested with a combine, pulled by a tractor. (2) Jordan Finergaard standing and holding in each hand some harvested soybean hybrid progenies. He has made a large number of such crosses at Fiskeby. (3) A field of ripe soybeans at Fiskeby.

Note: Fiskeby is located next to Norrköping (Norrkoping) in southern Sweden, southwest of Stockholm. Address: Algot Holmberg & Soner A-B, Norrkoping, Sweden.

3878. Tammes, P.M.L. 1950. Bereiding van ketjap [Preparation of soy sauce]. *Landbouw* (*Bogor, Java*) 22(10-12):568-69. Dec. [Dut]
• ***Summary:*** Contains a brief description of how to make Japanese-style soy sauce, and an analysis of its composition in both volume per 100 cubic centimeters, and grams per 100 grams. Address: Makassar (Algemeen Proefstation, Landbouw).

3879. Yuasa shôyu enkaku-shi [Record of Yuasa shoyu]. 1950-1960? Kubo-san no ie, Yuasa-cho, Arita-gun, Wakayama-ken, Japan. 46 p. Unpublished manuscript. Handwritten. 19 x 25 cm. [Jap]
• ***Summary:*** According to Heiji Tamura (*Shoyu no Hon,* 1971, p. 31), there is a lovely poem in this work titled "The Song of Shoyu" (*Shoyu no uta*) that reads as follows:

Smell the aroma from the depths of the brewing keg!
Waves of fragrance, deep purple, tamari;
Flowers of wisteria.
Its origins reaching back to the Antei period,
Its brewing lineage inherited from the great teacher.
Tamari from Yuasa is the first in the Emperor's kingdom.
Its aroma is of the finest quality,
Its flavor most excellent,
Its fame, noblest and purest flower of Arita.

Note: Arita is the early name of the Yuasa region. This poem was translated by Shurtleff and Aoyagi and published in *The Book of Miso* (1976, p. 220). The original Japanese reads like this: *"Nachi no ura. Soko made niou murasaki no namiuchi tsuzuku fuji no hana. Nezashi wa furuku Antei ni. Hoto Kokushi no nagare o kumite kamosu Yuasa no shoyu wa Kokoku ni okeru hajime nari. Kaori wa takaku, aji yoshi to, homare Arita no seika."*

Note: This book is not in the Wakayama Prefectural Library nor in the Yuasa Choritsu Library (8/89).

Talk with Seiichi Ando. 1989. Sept. 12. He saw this book, which he believes was never published, 20-30 years ago at the home of a shoyu maker named Mr. Kubo located at Yuasa-cho in Yuasa, Wakayama prefecture, Japan. The manuscript is a basically a history of this company and household. It was definitely written after the start of the Meiji period in 1868. The first word of the Japanese title is the logo or symbol of this house's brand of shoyu.

Letter from Wakayama Univ. Keizaigaku-bu, Sakaedani 930, Wakayama city 640, Japan. The unnamed writer of this letter was not able to locate this book in his Keizaigaku-bu, the university library, the city library, the prefectural Kyoiku Iinkai, the Yuasa Kyoiku Iinkai, and the prefectural history Hensan-shitsu. Finally he located a shoyu maker in Yuasa who had a copy of the original work but would not lend it to be photocopied for fear it might be damaged. The shoyu

maker's name was Chobei KANO, Yuasa 7, Yuasa-cho, Arita-gun, Wakayama-ken. Phone: 0737-62-2035. His brand is Kakucho (*Tsuno + nagai*). He can also be reached (in Yuasa-cho) at Kokudo-ten (Country + road + shop) Yuasa 147. Phone: 0737-63-5243. Address: Arita-gun, Wakayama-ken, Japan.

3880. Nakazawa, Ryoji. ed. 1950-1964. Hakkô oyobi seibutsu kagaku bunken-shû [Bibliography of fermentation and biological chemistry]. Tokyo: Nihon Gakujitsu Shinkokai/Hirokawa Publishing Co. 11 volumes. In European languages and Romanized Japanese. [500 soy ref. Eng; Jap]

• ***Summary:*** Contains extensive, excellent bibliographies on the following soy-related subjects (listed here alphabetically): Amazake (p. 139, only 2 references). Kôzi (Koji) (p. 398-410). Mirin (p. 464-65). Miso (p. 465-68). Natto (p. 8-9). Natto bacteria (p. 9-10). Penicillium (p. 210-63; see p. 240 for tempeh and ontjom). Rhizopus (p. 81-97). Soybean and soybean cake (p. 271-77). Syôyu [Shoyu] (p. 436-49). Tôhu (p. 498, only 3 references, all for nonfermented tofu).

Each bibliography lists the documents in approximately chronological sequence. An unnumbered page near the beginning titled (in Japanese characters only) *Shuyô Inyo Bunken* [Main Periodicals Cited] lists 51 such periodicals, of which 12 are in Japanese. Of these twelve, all have the title written in Chinese characters, with an English translation, and a Chinese plus a romanized abbreviation of the Japanese title.

Two examples: No. 2. *Nippon Nogei Kagaku Kaishi.* J. Agr. Chem. Soc. Japan [J. of the Agricultural Chemical Society of Japan]. *Nô-ka.* No. 4. *Nihon Jozo Kyokai Zasshi.* J. Fermentation Association Soc. Japan. *Zyô-Kyô.* Note that much of the romanization throughout these 11 volumes is based on a system that is no longer used. Nakazawa was born in 1878. Address: Japan.

3881. **Product Name:** [Mieki Soy Sauce (HVP)].
Manufacturer's Name: Ajinomoto Co. Inc.
Manufacturer's Address: Kyobashi 1-5-8, Chuo-ku, Tokyo 104, Japan.
Date of Introduction: 1950.
New Product–Documentation: Yokotsuka (1980) notes that in 1950 Ajinomoto began to sell Mieki or Ajieki (HVP), a major event in Japanese soy sauce history. Soya Bluebook. 1986. p. 105.

3883. Photograph of the T. Amano Co. in Vancouver, British Columbia, Canada. 1950. Vancouver, British Columbia, Canada.

• ***Summary:*** This black-and-white photo, sent to Soyfoods Center in 1981 by T. Amano Co. of British Columbia, shows the front of a small, modern building. A floor-to-ceiling panel of glass bricks are to the left of the main door near the center. Over the door, in large letters is written: "T. Amano Co." On the right front window, partly covering venetian blinds, in smaller letters, we read on five lines: "T. Amano Co. Manufacturers–Soya sauce & rice paste [miso]. Oriental food products. Importers & exporters." Address: Vancouver, British Columbia, Canada.

3885. Adachi, Isamu; Sakurai, Shigeru. 1950. Nihon shokumotsu-shi [History of Japanese foods]. Tokyo: Yuzankaku. 480 p. [Jap]

• ***Summary:*** Best book seen on the history of Japanese foods. The following appears in chapter 8. Edo Period:

"Amazake and Shirozake (p. 375-76). In ancient times there was Kozake and hitoyo-zake (one-night sake). They became known as amazake at a later date. But kozake was different from subsequent amazake; sometimes it was made using sake instead of water in the fermentation. The term 'amazake' first appeared in the literature of the Keicho period, which started in A.D. 1596. Later, during the Kan-ei period (1624-1630) there was Shirakawa Amazake.

"In Rokujo, in Kyoto, the Yamashiro-zake was very old and famous. Within the city of Edo (today's Tokyo), in the Yokayama-cho section, during the Temmei period (1781-89), Sangoku Ichi Amazake was sold. After taking it home, the consumer would add an equal amount of boiling water to the amazake and stir while simmering. The names Sangoku Ichi (three countries are one) and Shirayuki (white snow) came from the fact that it was sold in a container with a plum flower crest drawn on it (*umebachi*) and also Mt. Fuji was drawn in the shop. This was because the goddess of the Mt. Fuji shrine is named *Konohana Sakuya Hime* ("Tree Flower Blooming Princess"); she got pregnant overnight. Since amazake was known as "one-night sake" in ancient times it was connected with this goddess.

"Amazake used to be sold only in winter. Around the Bunka period (1804-1817) it was sold year-round. There were 5-6 amazake shops in Edo (Tokyo). Among them, the one in front of the Asakusa Honganji temple was famous. Although at that time amazake was sold during the summer, it later returned to being a winter drink."

3886. Brown, Helen Evans. 1950. Chafing dish book. Los Angeles, California: The Ward Ritchie Press. [21] + 141 + 8 p. Index. 16 x 16 cm.

• ***Summary:*** This stylish little cookbook reflects the growing influence of Asian (especially Chinese) culture and cuisine in California–and the author's enthusiasm for it. The recipe for sukiyaki (#93) calls for "a soy bean cake" [a cake of tofu]. A footnote to the recipe for Chinese spinach (#117) states: "The Chinese would add a piece of fermented bean cake to this; a piece of bleu cheese gives much the same effect."

Helen Brown uses "soy sauce" to season all of her Chinese- and Japanese-style recipes: Nos. 32, 60, 64, 73, 77, 87, 89, 91, 93, 117. Address: Pasadena, California.

3887. Burtis, E.L. 1950. World soybean production and trade. In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 61-108. [17 ref]

• ***Summary:*** Contents: 1. Historical summary. 2. The Far East: China, Manchuria, Korea, Japan, Netherland Indies, other countries of Asia, net foreign trade of Asia. 3. Europe: Production, foreign trade. 4. United States: Varietal development, trends in planted acreage, soybeans for seed, acreage and production of soybeans for hay, vegetable-type soybeans, growth of the soybean-processing industry, soybean oil production, trade, and utilization, production and utilization of soybean oil foots (the residue from refining), soybean meal and other soybean protein products (incl. soybean flour, soybean glue, and other industrial soybean products). 5. Minor world areas.

Tables: (2) Soybean production in leading countries and estimated world total, 1922-1948. Statistics are given for China (excluding Manchuria), Manchuria, Korea, Japan, Formosa [Taiwan], Netherlands Indies [Dutch East Indies, later Indonesia], United States, Canada (1936 on), USSR (1928-1938), 5 Danubian countries (Austria, Yugoslavia, Hungary, Rumania, and Bulgaria, 1934 on, partly estimated by author).

(3) Net exports or imports of soybeans (million bushels) by major exporting and importing countries, 1909-1913 and 1922-1948. China and Manchuria (combined) dominate world soybean exports from 1910 to 1940, with the peak year being 1929 (100 million bushels) and with more than 50 million bushels being exported every year from 1926 to 1939. But by 1941 exports as fallen to almost zero. The only other exporter was the USA, which had its first net soybean exports in 1932 (4.2 million bu); this rose to a peak of 10.5 million bu in 1939 then dropped to almost zero during World War II. Europe was the largest a net importer of soybeans from 1910 to 1948; the peak years were 1929 and 1933, when 62.6 million bushels were imported. Japan was the second largest net importer of soybeans from 1910 to 1948; the peak year was 1938, when 29.8 million bushels were imported. The Netherland Indies (today's Indonesia) is the only country from Southeast Asia in this table. The country imported 2.0 million bushels in 1913. Imports steadily decreased from 4.2 million bushels in 1922 to less that 50,000 bushels in 1936. Then the country switched to being an exporter, with 400,000 bushels in 1937, and averaging about 300,000 bushels per year from 1937 to 1941. Trade stopped during World War II (1942-1947) then resumed again in 1948 with 200,000 bushels of exports.

(4) Net exports or imports of soybean oil (million pounds) by major exporting and importing countries, 1909-1913 and 1922-1948. (5) Net exports or imports of soybean cake and meal (thousands of metric tons) by major exporting and importing countries, 1929-1948. (6) Net exports or imports of soybean oil and soybean in terms of oil (million pounds) by major exporting and importing countries, 1909-1913, 1922-1948.

(7) Net exports or imports of soybean cake and meal and soybeans in terms of meal (thousands of metric tons) by major exporting and importing countries, 1929-1948. (8) Apparent consumption of soybean oil and soybean cake and meal by principal European countries, 1929-1938 (based on tables 3-7). (9) Soybean acreage grown in the United States for all purposes (equivalent solid acreage), by states and groups of states, 1924-1948 (1,000 acres).

(10) Soybean acreage harvested for beans in the United States, 1924-1948 (1,000 acres). (11) Soybean production in the United States, by states and groups of states, 1924-1948 (1,000 bushels). (12) Soybean supply and disposition in the United States, 1924-1948 (1,000 bushels).

(13) Acreage and production of soybeans, soybeans processed for oil and meal, and soybean oil produced in the United States, 1924-1948. (14) Soybean oil production, trade, (imports and exports), stocks (crude basis), and domestic disappearance in the United States, 1910-1948 (1,000 pounds; compiled from reports of the Bureau of the Census). (15) Soybean oil utilization by classes of products in the United States, 1931-1948. Food products: Margarine, shortening, other, total. Nonfood products: Soap, paint and varnish, other drying oil products, miscellaneous non-food products, loss, incl. oil in foots, total. Total domestic disappearance. One table is in 1,000 lb.; a 2nd is in per cent of total.

(16) Supply and utilization of soybean protein products (meal basis) in the United States, 1921-1947 (1,000 metric tons). For each year is given: Estimated production, imports or soybean cake and meal, total supply, exports of soybean cake and meal. Domestic utilization in: Full-fat soybean flour, low- and medium-fat soybean flour, soybean glue for softwood plywood, soybean glue for hardwood plywood, other uses (largely feed for livestock).

A map (p. 90) shows soybeans harvested for beans in the USA, 1944. Each dot represents 2,000 acres.

A graph (p. 105) shows tonnage of high-protein feeds fed to livestock, 1926-1947. Within this are four graphs for: Soybean cake and meal, other oilseed cake and meal (mostly cottonseed), tankage and meat scraps, fish meal, dried milk products, gluten feed and meal, and (beginning 1935)

© Copyright Soyinfo Center 2014

brewers' and distillers' dried grains, and total.

A graph (p. 66) shows world soybean production from 1922 to 1949. The data is from Table 2. Within this are graphs for USA and for East Asia (incl. China, Manchuria, Korea, and Japan).

One bar chart (p. 73) shows domestic consumption and net exports of soybeans and soybean oil, in terms of oil (million lb.), by principal consuming countries, annual average, 1929-1938 (Based on tables 2-4. Oil equivalent of soybeans calculated at 8.4 pounds per bushel). By far the biggest consumer is China. By far the biggest exporter is Manchuria. Others: Japan, Germany, United States, Korea, Netherlands Indies, United Kingdom, Netherlands, Denmark, Other Europe (except U.S.S.R.).

Another bar chart (p. 74) shows domestic consumption and net exports of soybeans and soybean meal, in terms of meal (1,000 metric tons), by principal consuming countries, annual average, 1929-1938 (Based on tables 2, 3, 5, and 7. Meal equivalent of soybeans calculated at the rate of 0.02117 metric tons per bushel). The biggest consumer is China, followed by Japan. By far the biggest exporter is Manchuria. Other small exporters: Germany, United States, Korea, Formosa, Netherlands Indies, Denmark, United Kingdom, Other Europe (except U.S.S.R.). Address: Bureau of Agricultural Economics, USDA, Washington, DC.

3888. Burtis, E.L. 1950. World soybean production and trade: Historical summary (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 61-63. [17 ref]

• ***Summary:*** "World soybean production and trade have passed through three major stages of development. In the first phase, extending from prehistoric times to 1908, soybean production and trade were confined almost exclusively to eastern Asia. Uncultivated species of soybeans still grow wild in North China, Manchuria, and Korea. Apparently culture of soybeans as an agricultural crop originated in that area, and spread first to Japan, Formosa, southern China, Indo-China, Siam, the northern border districts of India, and the Netherland Indies.

"In North China, Manchuria, Korea, and Japan, soybeans have long been a major crop. They are mentioned in ancient Chinese writings as one of the five sacred grains. Farther south, soybeans are less important both in agriculture and in the diet.

"A lively coastwise trade in soybeans, soybean cake, and soybean oil was carried on between Manchurian and southern Chinese ports for centuries before Chinese ports were opened to foreign ships in the mid-1800's. Exports of soybeans and soybean products from Manchurian ports to Japan increased rapidly in the late 1800's, especially after China made special trade concessions at the end of the Sino-Japanese war in 1895. Japanese import demand for soybeans and soybean cake was strong, and the population of Manchuria was growing rapidly. Opportunities in Manchuria attracted a steady stream of agricultural workers from northern China after restrictions on immigration to Manchuria were relaxed by the Chinese government in the third quarter of the 19th century.

"The second stage of development in soybean production and trade, extending from 1908 to 1939, was marked by large exports of soybeans and soybean oil from Manchuria to Europe. The beginning of this trade was an indirect result of the Russo-Japanese War in 1904-1905. Food requirements for Japanese troops stationed in Manchuria had led to an increase in production of soybeans. When these troops were withdrawn, a surplus of soybeans developed. At the same time, the Japanese acquired a substantial interest in the Manchurian export trade through their lease of the South Manchurian Railway and development of the port of Dairen at the southern end of the railway.

"Japanese firms in 1908 made several shipments of Manchurian soybeans to England, where the soybeans were found to be a suitable source of oil for soap manufacture and meal for use in mixed feeds for livestock. Nearly all previous shipments of soybeans from the Orient to Europe had arrived in an unsatisfactory condition largely because of poor shipping practices. Exports of Manchurian soybeans to Europe increased rapidly after 1908. At first these shipments went to England, but by 1910 to other European countries also, especially Germany, Denmark, and the Netherlands. After an interruption during World War I, trade with Europe continued to grow, reaching a peak in the late 1920's and early 1930's. Soybeans were one of the leading materials processed by the expanding oilseed-processing industry in Europe.

"Large exports of soybean oil from Manchuria to Europe also developed, beginning about 1910 and reaching a peak in 1926. Soybean-processing capacity in Dairen grew along with this trade; the oil mills in Dairen produced largely for export and by 1924 accounted for about half the total soybean-processing capacity located along Manchurian railroads. Exports of Manchurian soybean cake also were large in the 1920's and 1930's, but the cake was too high in oil and water content to stand the tropical sea voyage to Europe and therefore went mainly to Japan, Formosa, and Korea.

"The growth of imports of Manchurian soybeans and soybean oil into Europe was the natural consequence of an active European import demand for fats and oils and protein concentrates, and a vast immigration from China into the relatively empty but fertile Manchurian farmlands during the 1920's.

"The third and present stage in the world history of soybeans is marked by the pre-eminence of the United States in production and processing of soybeans for oil and meal.

© Copyright Soyinfo Center 2014

This phase began in 1940 when war disrupted the trade between Manchuria and Europe. Exports of soybeans from Manchuria to Europe had not been resumed by 1948, except for small quantities moving through northern China ports.

"Soybeans were very little grown before 1910 as an agricultural crop in the United States. Production first began to assume commercial importance during World War I; it showed a steady upward trend in the 1920's and early 1930's, expanded rapidly after 1936, and in 1942 rose sharply to a new high level in response to strong wartime demand for domestic sources of fats and oils and oilseed meal. Soybean acreage and production were well maintained through 1948. Soybeans are well adapted to the climate and soils of the Corn Belt and to the crop rotations and mechanized farming practiced in the Corn Belt.

"Since the early 1920's the soybean-processing industry in the United States has actively carried on research to improve methods of processing soybeans and soybean products and to develop new uses and markets. Mill capacity has always been ample for the increasingly large output available for processing, except early in World War II, when steel and other materials needed for new additions were reserved for more urgent war uses. The United States soybean-processing industry now stands first in the world in size and in technical knowledge and ability." Address: Bureau of Agricultural Economics, USDA, Washington, DC.

3889. Hartsuch, Bruce Edwin. 1950. Introduction to textile chemistry. New York, NY: John Wiley and Sons, Inc. ix + 413 p. 22 cm. [3 soy ref]
• ***Summary:*** Preface: "During recent years there has been an increasing awareness that something revolutionary has occurred in the field of textiles. New fibers and filaments have made their appearance; the wizardry of the textile chemist and engineer has produced fibers from such raw materials as soybeans, corn, skim milk, chicken feathers and benzene; old fibers have been improved; wool has been torn down and rebuilt so that many of its undesirable properties have been lost; rayons of exceptionally high strength are being manufactured; we now have shrink-resistant wool, mothproof wool, fire-resistant cotton, and cotton cloths that will not shrink."

"This book has been designed and written as a textbook for college students and teachers who have a knowledge of the theoretical and applied chemistry..."

Table 12, "Strength of fibers" (p. 109) gives (for 20 fibers) the tenacity (tensile strength) and wet strength as a percentage of dry strength. Nylon (of the high tenacity type) has the highest tenacity: 6.0 to 7.5 gm per denier; soybean fiber has the lowest 0.6 to 0.8. Of natural fibers, cotton is 4.2 to 6.3, silk (degummed) is 2.8 to 4.9, and wool is 1.0 to 1.7. Concerning wet strength as a percentage of dry strength, cotton is highest (best) at 110-130%, wool is 76-97%, and silk is 75-95%. But soybean fiber is only 30-35%, which means that it has relatively little tensile strength when dry, and only about one-third as much when wet.

Table 13 gives the "Elongation of fibers (percentage of increase in length at the break)." Soybean fiber has a dry elongation of 40, making it more elastic than most other fibers; no wet elongation is given for soybean fiber.

On pages 369-72 is a long section about "Soybean fiber," with emphasis on the way it is made. "The Japanese were among the first to investigate the use of soybean protein in the manufacture of protein fibers, and patents were granted in this country in 1940 and 1941 (U.S. Patents 2,192,194, 2,198,538, and 2,237,832)." Near the end of the book (p. 373-86) is a Glossary, which includes definitions of "spinneret" and "spinning." Address: Assoc. Prof. of Chemistry, Michigan State College.

3890. Holmberg, Sven A. 1950. Sojabönodlingens möjligheter och berättigande i vårt land: Några erfarenheter från förädlingsarbeten och försök vid Fiskeby [The possibilities of soybeans in our land (Sweden): Some experiences of research and breeding at Fiskeby]. *Kungliga Skogs- och Lantbruksakademiens Tidskrift* (*J. of the Royal Swedish Academy of Agriculture and Forestry*) 89(5-6):460-68. English-language summary in Soybean Digest (May 1951, p. 36) as "Native soys in Sweden." [6 ref. Swe; eng]
• ***Summary:*** "Attempts to grow foreign soy bean varieties in Sweden have not been successful. Hybridization and selection for adaptation to Swedish climate have resulted in a large number of strains which ripen as far north as Norrköping," north latitude 58º30'. Day length is no longer an obstacle to soy bean growing in Sweden. "Three soy bean strains of the variety 201-14 (Fiskeby III) show a mean yield during 4 years (1946-1949) at 2 stations in the districts of Östergötland and South Kalmar of about 1,800 kg/ha (27 bushels per acre). A comparison between soy bean test results in Sweden (for group 201-14) and in the U.S.A. (for group 0 and group I) will show little or no difference in bean yield and protein content, but American tests give about 4 per cent more oil. Only edible types of soy beans are of interest for growing in Sweden. The Swedish edible soy bean variety 201-14 (Fiskeby III) has found usage for food principally in the Swedish Army. A suitable growing district for Swedish soy beans and some experience in soy bean culture is to be found in the district of South Kalmar. The chief aim of our soy bean breeding is further increase in bean yield, while retaining present standard of edible quality and early maturity."

Although most attempts to grow foreign soy bean varieties in Sweden have been unsuccessful, a selection of a cross between a north Japanese and a German variety will ripen seed as far north as 50º30' in Sweden. Address: Fiskeby, Sweden.

3892. Japan Rodosho Shokugyo Antei-kyoku. 1950. Miso seizôgyô [Miso manufacturers]. Tokyo: Rodosho Shokugyo Antei-kyoku. 105 p. 21 cm. Shokumu Kaisetsu, No. 61. [Jap]*
• ***Summary:*** This Japanese government publication must be very similar to another published the same year titled *Washi seizogyoku.* Both are No. 61 in the same series and both have the same author, publisher, and number of pages. Address: Japan.

3893. Klose, Nelson. 1950. America's crop heritage: The history of foreign plant introduction by the federal government. Ames, Iowa: Iowa State College Press. x + 156 p. See p. 11-15, 119, 134-36. Illust. Portraits. Maps. 24 cm. [34* ref]
• ***Summary:*** Contents: Foreword, by David G. Fairchild (The Kampong, Sept. 1949). Preface. 1. Early American agriculture: Methods and terminology, colonial introductions, introductions of the eighteenth century, contributions of individuals, public experimentation and exploration (Trustee's Garden of Georgia in Savannah laid out in 1733 by General James Oglethorpe to grow silk, rice, and indigo, contribution of Royal Botanic Gardens at Kew–founded in 1760, Sir Joseph Banks director for 48 years, sends first professional plant hunter, Francis Masson, to Africa in 1772 for 3 successive years, plant explorer David Nelson, Captain William Bligh and the mutiny on the *Bounty* intended to introduce the seedless breadfruit tree into the West Indies as a food for slaves, the work of John Ellis). 2. Search for new crops 1770-1840: Introductions by statesmen (Benjamin Franklin, George Washington, Thomas Jefferson), work of agricultural societies, Dr. Henry Perrine. 3. Federal promotion of crops: The Treasury Circular of 1819, the Treasury Circular of 1827, assistance of the Navy (The Perry Expedition to Japan and James Morrow), Diplomatic assistance. 4. Leadership of the Patent Office 1836-62: First agricultural appropriation (Oliver Ellsworth, head of the Patent Office during this period, was instrumental in securing the appropriation of $1,000 in 1839), work of the Patent Office (and Commissioner Ellsworth), agriculture under the Department of the Interior (Ellsworth, Charles Mason, D.P. Holloway, D.J. Browne, distribution of seeds incl. supply of foreign seeds from the seed firms of Vilmorin-Andrieux in Paris [France], Charlwood and Cummings in London [England], Ernst Von Spreckelsen and Co. in Hamburg [Germany], and William Skirving in Liverpool [England], seed distribution curtailed), separate crop histories (tea and Robert Fortune, sorghums for sugar), miscellaneous introductions. 5. The commissionership 1862-69: Aims and methods of the commissioners (Isaac Newton, Horace Capron, Frederick Watts, William Le Duc, Norman Colman), international exchange of plants. 6. Main importations: Wheat and small grains, oats, fiber crops, grapes, citrus fruits, tea. 7. Lesser importations: Sugar crops, fruits, vegetables, tropical plants, pasture and forage crops, trees. 8. Plant introduction under Rusk and Morton: Distribution of seeds and plants, promotion of special crops, the division of pomology, fiber and forage crops. 9. Bonanza years: Problems facing agriculture, work of plant explorers (Fairchild and Lathrop, Niels Hansen, Mark Carleton, Seaman Knapp). 10. Plant introduction of the twentieth century: Search for new crops, introductions by Meyer, significant introductions 1901-13, the war years [World War II], looking to the future.

Benjamin "Franklin's name is linked with the history of three field crops which achieved economic importance: upland rice, broom corn [broomcorn], and soybeans... He became enthusiastic over the soybean as a result of his membership in the French Academy of Sciences. Soybeans sent from China to France as early as 1740 were grown after 1779 in the famous Botanic Garden of Paris. From France, Franklin sent some of the seeds to the United States, but the soybean did not find a favorable reception until the technology of the twentieth century demanded it" (p. 14).

"O.F. Cook, in 1898, began the 'Inventory of Plants Introduced" in which numbers were assigned to each new item and information given on its origin, nature, value, and cultivation" (p. 110).

Chapter 10–"Introductions of the twentieth century. David G. Fairchild took charge of the Office of Foreign Seed and Plant Introduction in 1897, and held that post, except for tours of exploration, for twenty-seven years. Under his leadership the Office set up an efficient system for disseminating plants, and experts in different parts of the country were employed to locate new plant materials. In 1902 Fairchild's division came under the jurisdiction of the new Bureau of Plant Industry. Three other divisions–the Arlington Experimental Farm, Congressional seed distributions, and tea investigations–were established at the same time. When the Bureau of Plant Industry was organized in 1900, it was the first official agricultural organization of its kind devoted exclusively to plant introduction. In addition to the four branches listed above, there were divisions concerned with physiology and pathology, botany, grass and forage plants, pomology, and the experimental gardens and grounds. Under Beverly T. Galloway, the Department's leading plant pathologist, more than two hundred employees were engaged in plant work... The Arlington Farms and Potomac Flats were located in Washington, DC, and an eighty-acre garden at Chico, California" (p. 120).

One of America's outstanding plant explorers, Frank N. Meyer, made four trips to Asia over a period of 12 years

© Copyright Soyinfo Center 2014

(1905-1918) and sent back more than 2,500 introductions. His four trips and important plant discoveries on each are summarized. "On his last trip to China in 1918, Meyer disappeared from the deck of a steamer plying the Yangtze River. There is some indication that he may have committed suicide, for his letters reveal that the mental and physical hardships of his lonely existence may have broken his will to live" (p. 122-23). An excellent photo (facing p. 124) shows Frank Meyer.

There was a shift in emphasis from introduction to breeding, hybridization, and selection after William A. Taylor succeeded Galloway in 1913 and during the 1920s.

"Soybeans from Asia are probably the most outstanding plant introductions since the Kharkov and durum wheats. Economic products of the soybean plant, now a major field crop, include hay, forage, food and feed products, and oil for many industrial uses. Recent introductions of the soybean have been merged by breeding, into new, superior plants with little resemblance of the original.

"Interest in the soybean as a commercial crop began with the introduction of three varieties from Japan in 1900. Nearly three hundred varieties were obtained in China, Japan, and India in 1909. The Department recommended soybeans as a crop that could be substituted for cotton in the South.

"In 1910, twenty soybeans from a group of 350 under test were selected for wide distribution. Three hundred varieties received from Korea and northern Manchuria in 1914 were expected to extend soybean cultivation northward in America...

"The distribution of soybeans was a prominent feature of crop seed distribution after 1914, Estimated value of the crop of 2,500,000 acres was $23,917,500. Because of its contributions to the new industry, the Bureau of Plant Industry claimed credit for half its value. Ryerson, in 1933, stated that all but three of the twenty varieties of soybeans then in cultivation were found by the Office of Plant Introduction.

"When it became clear that the soybean would be a major crop, the Department decided to send two explorers to search the soybean areas of Japan, Sakhalin, Manchuria, Korea, and China to make sure our farmers would have the best varieties. After two years of work, P.H. Dorsett, of the Division of Plant Exploration and Introduction, and W.J. Morse, of the Division of Forage Crops and Diseases, returned with almost three thousand varieties" (p. 135).

Table 1 (p. 57) shows seed distributed by the federal government 1862-89. The number of packets grew from 306,304 packets in 1862, to 1.2 million in 1863, to 2.22 million in 1975, to 3.62 million in 1884, to a peak of 4.667 million in 1885. The annual appropriation to fund this distribution work, which began with $25,000 in 1870, grew steadily to $100,000 in 1885. Address: Assoc. Prof. of Social Sciences, Central State College, Iowa.

3895. Moncrieff, R.W. 1950. Artificial fibres. New York, NY: John Wiley & Sons, Inc. x + 313 p. Illust. Index. 22 cm. [4 soy ref]

• ***Summary:*** Part III of this book, titled "Regenerated Protein Fibres," contains 4 chapters (13-16), one each on fibers made from casein (Lanital, Aralac, Fibrolane), peanuts (Ardil), soybeans, and corn protein (zein, Vicara). Chapter 13, titled "Casein Fibres–Lanital, Aralac, Fibrolane" notes that the early attempts to make fibres from casein were unsuccessful, and it was not until 1935 that the problem was really solved. An Italian, by name [Antonio] Ferretti, carried out a series of researches in 1924-1935 and succeeded in making pliable fibres with certain wool-like characteristics. The Italian rayon producers, Snia Viscosa, purchased Ferretti's patents and undertook large-scale production of casein fibre from milk. This fiber they called 'Lanital' (*lana* is Latin for wool), and in 1937 some 1,200 tons of this fiber was made. In the U.S.A. the Atlantic Research Associates, Inc., carried out research independently, and in 1939 undertook production of a casein fibre, to which they gave the name 'Aralac'. The company which manufactured this material is named Aralac Inc., and in 1943 the production was about 5,000 tons. However, in 1948, Aralac Inc. sold their entire plant and property [in Taftville, Connecticut] to the Virginia-Carolina Chemical Corporation [of Richmond, Virginia], who are using it to make 'Vicara' fibre from corn protein. 'Aralac' is not at present (1949) being manufactured." Fibrolane is the name of a fibre made from casein in the UK by Courtaulds Ltd.

Chapter 14, titled "Ardil," notes that "'Ardil" is a vegetable protein fibre made from the proteins in ground-nuts or 'monkey nuts'. It is a product of research carried out by I.C.I. Ltd., and was developed at their Ardeer factory in Scotland, from which its name is derived." Research on the product was begun in 1935 by Professors Astbury and Chibnall, and in 1938 the first filaments were spun at Ardeer. Plans were made to construct a pilot plant, but due to the intervention of World War II, the plant was not established until 1946. Its output in 1948 was half a ton per week. Also discusses the development, chemical structure, manufacture, properties, dyeing, and uss of Ardil–with a photo and 3 references.

The contents of chapter 15, titled "Soybean Fibres" is as follows: Introduction. Manufacture. Properties. Dyeing. Uses. The chapter begins: "The Ford Motor Co. carried out research on the separation of proteins from the soy bean and

© Copyright Soyinfo Center 2014

their solution and regeneration as fibres. The fibres, which came into production in 1939, were spun and woven to make upholstery for motor-cars. In 1942 about half a ton a day of fibre was being produced. The process was taken over by the Drackett Products Co. of Cincinnati [Ohio] in 1943. Considerable earlier work had been done in England and Japan, and it is possible that in the latter country production anticipated that of the Ford Motor Co... A new plant for the commercial production of Azlon is now (1949) being built [by Drackett].

Chapter 15, titled "Zein Fibres–'Vicara,'" begins: "The production of a fibre from zein or maizin, the protein of corn, has been developed by the Corn Products Refining Co. of Illinois and by du Pont de Nemours and Co. The former company patented in 1939 a process for the production of zein from corn protein, but afterwards little more was heard of fibre production until 1948. Probably the hiatus was due to the world shortage of corn; but despite the shortage, research was carried on by the Virginia-Carolina Chemical Corporation of Richmond, Virginia, so that production could be started when the supply of corn permitted. In 1948 this organization purchased the fibre plant in Taftville [Connecticut] which had formerly been used [by Aralac Inc. and Atlantic Research Associates] for the production of 'Aralac,' the casein fibre. The factory was re-tooled and re-designed, and the production of 'Vicara,' which is an attractive fibre, is now a commercial undertaking.

Chapter 8 (p. 86-126), titled "Viscose, is about viscose rayon, a regenerated cellulose. "Development of Viscose: The greatest single factor in the development of the viscose process has undoubtedly been the support given to it by Courtaulds, Ltd., although there have naturally there have naturally appeared other viscose producers. The pioneer work was undoubtedly carried out by Courtaulds, who not only founded and developed an important new industry, but also introduced it to America under the name 'The American Viscose Co.' During the 1939-45 War this American company was sold to American interests in order to provide dollars for Britain... The present happy position of the viscose industry not only in this country [England], but throughout the world is undoubtedly due to the industrial genius of the late Mr. Samuel Courtauld." World production increased from 1,000 tons in 1900 to 8,000 tons in 1910, to 15,000 tons in 1920, to 200,000 tons in 1930, to 1,100,000 tons in 1940.

Note: The book is dedicated "To my father, William Moncrieff (1875-1954), a pioneer in the weaving of artificial fibres." A second edition was published in 1954, and a third edition in 1957.

Note: This is the earliest document seen that refers to "regenerated protein fibers." Address: B.Sc., F.R.I.C., F.T.I.

• ***Summary:*** "The production of soybeans, which for many centuries was confined to the countries of Asia, spread rapidly after World War I to the western world, and since World War II practically all leading nations have become more and more interested in the culture and production of the crop. Agricultural experiment stations throughout the world have become engaged in the development of varieties suited to their soil and climatic conditions through introduction, selection, and hybridization. Successful results have been obtained in many countries and, in a few, acreage and production have increased to the extent that the crop has become an important factor in that nation's agriculture. This is especially true of the United States, Netherland Indies, Rumania, U.S.S.R., Austria, Bulgaria, and Poland.

"The principal zones of soybean production in the Orient are China, Manchuria, Korea, and Japan. In Manchuria, the soybean occupies about 25% of the total cultivated area and is a dominating factor in the economic life of the country. As a cash crop it provides fully half the farm income in the north and more than half the total volume of freight handled by the railroads. It is estimated that from one- to two-thirds of the production of soy beans is exported; 15 to 20% is utilized for food, feed, and planting, and the remainder is used for oil extraction.

"In China, the soybean is one of the principal and most ancient of crops, ranking fifth in extent of culture and occupying about 9% of the total cultivated area. Although grown everywhere in China, about 60% of the soybean acreage is confined to three northern provinces, Shantung, Kiangsu, and Honan. China consumes practically all of her production, estimates indicating more than 50% for food, 27% for oil extraction and other purposes, 10% for stock feed, and 8% for planting.

"Korea occupies third place among the soybean-producing countries of Asia. Acreage and production are confined largely to central and northern Korea, as southern Korea, which grows principally cotton and rice, seems to be less suited to the successful production of soybeans. The entire Korean production is used for food, stock feed, planting and export, and none is used for oil extraction.

"Japan, although a large producer of soybeans, has consumed all her production and has imported large quantities from Manchuria and Korea. Acreage and production of soybeans in Japan have decreased since World War I and greater emphasis has been placed on increased production of rice. The proportions of soybeans used by Japan for various purposes are: 'miso' (soybean-rice fermented paste), 22%; soy sauce, 22%; oil and oil cake, 21.5%; soybean curd [tofu], 15.5%; confections, 7.2%; forage, 6.2%; green manure, 2.5%; seed, 1.8%; green vegetable beans, 0.8%; and miscellaneous, 0.5%.

"In the Soviet Far East, the soybean is said to be one of the chief industrial crops and in some districts constitutes 20% of the cultivated area. Acreage and production have increased markedly since 1926, especially in Khabarovsk territory, the largest seed-producing area.

"South of China, the soybean is cultivated to some extent in the Netherland Indies, India, Siam, Cochin China, Philippines, and Australia. Until 1932, the production of soybeans in the Netherland Indies was not sufficient to meet the domestic demand. Since then, acreage and production have gradually increased until soybeans began to be exported to Holland about 1936. The soybean has been widely cultivated for a long time by the natives of the hilly regions from the borders of Afghanistan eastward to Burma, to northern Siam, and French Indo-China. The crop in India has been grown for its forage and food value rather than for commerce. Although successful results have been obtained in some of the provinces with varieties of good oil content, the growing of the crop as an oil seed does not appear to have been popular with the native farmers. In Australia successful results with American varieties have greatly increased acreage and production, especially in the states of Queensland, New South Wales, and Victoria.

"Although attempts to grow soybeans in European countries have extended over many years, it is only within the past few years that there has been any appreciable production. At present, production is confined largely to European U.S.S.R., Bulgaria, Yugoslavia, Austria, Rumania, and Czechoslovakia, production being largest in Rumania, Bulgaria, and Yugoslavia. In the development of adapted varieties, some progress has been made in Sweden, Poland, Netherlands, and Hungary. Because of the economic importance of the soybean, scientists of the U.S.S.R. have carried on extensive experiments with it, especially in the development of adapted varieties and utilization. At present, the principal areas of production are Ukraine, Moldavia, and certain regions in the North Caucasus.

"Experiments have been conducted with the soybean in nearly all regions of Africa but as yet it is an unfamiliar crop to the majority of African farmer. It has been grown successfully in the upland, midlands, and coastal districts of Natal [South Africa] and throughout Gambia, Nigeria, Egypt, the Gold Coast Colony, and also in the corn- and cotton-growing districts of the Belgian Congo.

"Although the soybean has been the subject of considerable experimental work in practically all countries of the Americas, little progress has been made in commercial culture except in the United States and Canada."

Note: This is the earliest document seen (Oct. 2010) that clearly refers to soybeans in Afghanistan, or the cultivation of soybeans in Afghanistan. This document contains the earliest clear date seen for soybeans in Afghanistan, or the cultivation of soybeans in Afghanistan (long before 1950). The source of these soybeans is unknown. Address:

• ***Summary:*** "The origin of soybean culture in Manchuria is not definitely known, but it is supposed to have been brought from central China many centuries ago. At first soybeans were grown only for food but when they became a source of oil, production gradually increased. No mention has been found of soybean oil in ancient Chinese literature, so it is concluded that the crushing of soybeans for oil occurred in comparatively recent times. The production of soybeans, however, was more or less localized until after the Chinese-Japanese War (1894-1895), when Japan began to import the soybean oil cake for fertilizing purposes, resulting in a sudden expansion of demand for this product. Soybean cake became the chief end product of the oil mill industry. The Russo-Japanese War brought about a wider interest in the soybean and its products; shipments were made to Europe about 1908 and the soybean assumed worldwide attention. Acreage and production increased rapidly and the soybean became one of the most staple crops and exports of Manchuria.

"The soybean was first brought to the attention of Europeans in 1712 by Engelbert Kaempfer, a German botanist, who spent two years, 1691-1692, in Japan. Although Kaempfer discussed in detail the various food products prepared from the soybean by the Japanese, little interest was taken in the crop. According to Dale's *Pharmacologiae,* it is evident that European pharmacologists were familiar with the Japanese soybean and its medicinal uses in 1751. Soybean seed sent from China by missionaries was planted as early as 1740 in the Jardin des Plantes, Paris. The plant was experimented with at various times after this date and in 1855 the *Société d'Acclimatation* distributed seed but did not succeed in establishing a permanent culture of the plant. The soybean was grown in 1790 in the Royal Botanical Gardens, Kew, England, but apparently no effort was made toward its culture as a crop. The greatest impetus given soybean cultivation in Europe was the work in 1875 and subsequent years of Friedrich Haberlandt of Vienna, who published the results of his work in much detail. Haberlandt obtained seed of nineteen varieties–Chinese and Japanese–at the Vienna Exposition in 1873. Only four of these varieties matured and in 1877 seed was distributed to various co-operators throughout Europe. Although most of the tests gave fairly promising results, and Haberlandt strongly urged the use of the soybean as a food plant for both man and beast, the soybean failed to obtain any great importance until about 1909. Previous to this time efforts had been made to introduce the soybean and its products–oil and oil meal–from the Far East into European markets in competition with similar products manufactured from other oleaginous seeds, but they were generally unsuccessful, chiefly because of the inferior quality of the meal and oil, and unfavorable shipping conditions for the seed. Although attempts to grow soybeans in European countries have extended over many years, in general, the climatic conditions are not well suited to the successful culture of the crop. At present, production is largely confined to parts of European U.S.S.R., Austria, Bulgaria, Yugoslavia, Czechoslovakia, and Rumania." Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

3899. Morse, W.J. 1950. History of soybean production: 3B. Modern history in the United States (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 6-9.

• ***Summary:*** "The first mention of the soybean in the United States is by Mease in 1804, who stated that 'the soybean bears the climate of Pennsylvania very well and should be cultivated.' In 1829, Thomas Nuttall grew a variety in the botanic gardens at Cambridge, Massachusetts. From observations he wrote, 'Its principal recommendation at present is only a luxury, affording the well-known sauce, soy, which at this time is only prepared in China and Japan.' The Perry expedition to Japan in 1854 brought back two varieties of soybeans which were distributed by the United States Commissioner of Patents. Frequent references to the soybean occurred thereafter in agricultural literature under such names as Japan pea, Japan bean, and Japanese fodder plant. [Note: The last two names do not appear in the SoyaScan database as of Nov. 1991.]

"The Mammoth Yellow variety, cultivated extensively in the southern states for many years, is said to have originated from seed sent from China by missionaries in 1873. In 1878, G.H. Cook of New Brunswick, New Jersey, obtained seed of the soybean from the Bavarian station and James Neilson obtained several varieties from Vienna. Crops of these varieties were harvested in 1879. Undoubtedly these varieties were some of those grown and distributed throughout Europe by Haberlandt. In 1890, C.C. Georgeson of the Kansas Agricultural Experiment Station brought in three varieties from Japan and in 1889 W.P. Brooks of the Massachusetts Agricultural Experiment Station brought back several varieties from the same country.

"Previous to the numerous introductions by the United States Department of Agriculture beginning in 1898, there were not more than eight varieties of soybeans grown in

© Copyright Soyinfo Center 2014

the United States and these with quite limited adaptation to soil and climatic conditions. With the introduction and development of new and improved varieties adapted to a greater range of soil and climatic conditions and uses, acreage and production gradually increased. Until about 20 years ago, most of the soybeans in this country were grown in the southern and eastern states. In 1919, the five leading states in soybean acreage were North Carolina, Virginia, Mississippi, Kentucky, and Alabama. By 1924, the relatively more rapid expansion of the crop in the north central region of the country brought Illinois into the leading position, followed by Indiana, Tennessee, North Carolina, and Missouri. Illinois has held the lead in acreage and production ever since, and the north central region has grown in importance as a region of soybean production and processing.

"Soybeans at first, and for several years, were grown primarily as a forage and pasture crop. Previous to 1930 the acreage harvested for seed was less than one-fourth the total acreage grown for all purposes. With the adaption [adoption] of improved methods of culture, improvement of machinery for planting, cultivating, and harvesting, adapted improved varieties for processing for oil, and with the development of markets for soybeans for crushing purposes, a gradual increase in the proportion of acreage harvested for soybeans took place. In 1939, 40% of the total soybean acreage was harvested for seed. The proportion for this purpose increased rapidly during the war years. In 1944, 72% of the total planted acreage was harvested for seed and in 1947, 84.5%. An important factor in the marked increase in acreage of soybeans in 1934 was the severe drought, which ruined large acreages of corn, small grains, and tame hay in the early season of the year–as a result of which soybeans were planted as an emergency crop. The program of the Agricultural Adjustment Administration, United States Department of Agriculture was a stimulus to the expansion in acreage of soybeans in the last half of the 1930's. Corn acreage limitations and allotments restricted the acreage of corn and so increased the acreage of cropland available to other crops. Soybeans for seed, although classified as a soil-depleting crop in the principal producing regions, competed effectively for part of this acreage. The greatest annual increase in acreage of soybeans harvested for seed occurred in 1942, in response to the urgent appeal by the Government early that year for a large increase in soybean production to meet wartime demands for oil and fats. Programs of production goals and guaranteed support prices have contributed to maintaining production at a high level since 1942. The Government program for soybean processors, which greatly reduced their risks, was also of importance.

"Standards for use in grading and marketing soybeans were set up by the United States Department of Agriculture as early as 1925 and in 1936 a future [futures] market for soybeans was established in Chicago. In 1929, a soybean laboratory was established in Ohio by the United States Department of Agriculture to conduct research toward the development of high-oil and high-protein varieties. In 1936, the United States Regional Soybean Industrial Products Laboratory was located at Urbana, Illinois, and in co-operation with the experiment stations of the 12 north central states began agronomic investigations in the development of new improved varieties for industrial purposes and chemical research on the development of new industrial uses for soybeans. In 1942, the laboratory work devoted to industrial uses was transferred from Urbana to the Northern Regional Research Laboratory at Peoria, Illinois. At this time the agronomic research remaining at Urbana was designated the United States Regional Soybean Laboratory and was expanded to include 12 southern states in addition to the 12 north central states originally served. The Regional Research Laboratory at Peoria conducts research on soybean processing and on processing and utilization of the oil and oil meal for food and industrial purposes.

"Numerous commercial concerns as well as many public research institutions, are conducting research designed to develop more efficient techniques in processing soybeans for food and industrial uses. Much research is also being conducted on methods for improving the quality of oil and flour, and for adapting these products to specific uses." Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

3900. Morse, W.J. 1950. History of soybean production: 9. Varieties and variety improvement (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 17-23.

• ***Summary:*** "Varieties of soybeans are very numerous [especially in East Asia], no doubt because of the fact that the soybean seems to be peculiarly sensitive to changes of soil and climatic conditions." Differences in behavior of the same pure-line variety in different locations are often so striking that it is difficult to believe that the variety is the same.

In China, soybean varieties are quite numerous and "are classified according to color, size, shape, time of planting, method of planting and use. The local names of varieties differ in different localities so that it is very difficult to obtain a variety which is widely known." There has not been much organized research on soybean varietal improvement in China. "The University of Nanking has done more work of this kind than any other organization."

Although many soybean varieties are grown in Manchuria, only three types are distinguished: yellow, green and black. This has apparently been found adequate for commercial purposes. In detail, these three groups are:

© Copyright Soyinfo Center 2014

(1) Hwang Tou–yellow beans. (a) Pei Mei (white eyebrow, pale hilum). (b) Chin Huang (golden yellow or golden round). (c) Hei Chi (black belly), dark hilum. These three varieties are highly prized for the quality of their oil, but Pei Mei and Chin Huang are also valued for the soybean curd [tofu] made from them.

(2) Ching Tou–green beans. (a) Green with yellow germ or cotyledon. (b) Green with green germ or cotyledon. The green bean with the yellow germ yields more soybean curd but of an inferior quality compared to that of the yellow varieties. The green bean with the green germ is preferred for making sprouts.

Hei Tou or Wo Tou–black beans. (a) Ta Un Tou (large, black), green germ. (b) Hsia Un Tou (small, black), yellow germ. (c) Puen Un Tou (flat, black), yellow germ. The Ta Un Tou is used for oil, the Hsia Un Tou for oil and Horse feeds, and the Puen Un Tou for salted fermented soybeans [fermented black soybeans].

"Most of the varieties grown by Manchurian farmers consist of a mixture of varieties of which more than 90% are yellow-seeded types." The distribution throughout Manchuria of the various types is discussed. Native Korean soybean are classified into eight different groups.

Since 1898 the USDA had brought into the United States more than 10,000 introductions from China, Manchuria, Korea, Japan, India, Netherland Indies [Indonesia], South Africa, and several European countries.

Table 1 (two pages) shows the "Characteristics of soybean varieties most generally grown in the United States," arranged into seven groups from very early to very late maturity. For each variety in every group is given: Seed color (black, brown, green, olive or greenish yellow, straw yellow), hilum color (black, brown, dark brown, light brown, pale), seeds per lb., oil %, protein %, iodine value (range: 119 to 140), pubescence color (gray, or tawny), flower color (purple, white, or purple & white), shattering (little, medium, or much), and use (commercial {grain or oil and meal}, forage, or vegetable). The groups are: (1) Very early: Agate, Capital, Cayuga, Flambeau, Goldsoy, Habaro, Kabott, Mandarin, Mandarin 507, Mandarin (Ottawa), Minsoy, Ontario [developed in USA], Pridesoy, Sac.

(2) Early: Adams, Bansei, Earlyana, Hawkeye, Illini, Kanro, Lincoln, Manchu, Manchu 3, Manchu 606, Manchukota, Mendota, Montoe, Richland, Seneca.

(3) Medium Early: Chief, Dunfield, Hokkaido, Hongkong, Jogun, Mandell, Mingo, Mukden, Scioto, Viking.

(4) Medium: Aoda, Boone, Funk Delicious, Gibson, Kingwa, Macoupin, Mount Caramel, Patoka, S100, Virginia, Wabash, Wilson.

(5) Medium late: Arksoy, Arksoy 2913, Haberlandt, Laredo, Ogden, Ralsoy.

(6) Late: CNS, Mamloxi, Mammoth Yellow, Palmetto, Roanoke, Tanner, Tokyo, Volstate, Woods Yellow.

(7) Very late: Acadian, Avoyelles, Gatan, Otootan, Pelican, Seminole, Yelnando.

"Varieties now grown in the United States may be divided into three general groups, namely commercial (grain), vegetable, and forage. Varieties for commercial seed production are preferably yellow-seeded and are used largely for processing for oil, meal, and soybean flour, but these varieties may also be used for forage purposes if heavier rates of seeding are used. The varieties used principally for forage and green manure are the black- and brown-seeded varieties, which for the most part are low in oil but yield a finer and heavier forage than the commercial and vegetable varieties.

"The term 'vegetable varieties' has been applied to varieties introduced from oriental countries where they are used solely as green vegetable or dry, edible soybeans. In extensive tests of the quality of the green and dry beans made by the Bureau of Human Nutrition and Home Economics, Department of Agriculture, and by departments of home economics of various agricultural colleges, the vegetable varieties have proved much superior to the field or commercial varieties in flavor, texture, and ease of cooking. Many of these vegetable types have been found through experiments to be superior to commercial types for soybean milk, soybean flour, soybean curd, salted roasted soybeans, and other food products. (See Chapter XXV). The varieties used for processing and forage purposes usually do not cook easily and have a raw 'beany' flavor. Nearly all vegetable varieties cook easily and have a sweet or bland nutty flavor. The most suitable vegetable varieties are those with straw-yellow, greenish-yellow, or green seed, although a few black, brown, and bicolored varieties do have superior qualities as green shelled beans. Vegetable varieties, ranging in maturity from 75 to 175 days, have been developed for all soybean-producing areas in the United States.

"Several commercial companies have canned large packs of the green shelled beans of the vegetable varieties. Quick-frozen green shelled beans alone and in succotash have been placed on the market by several companies, the frozen product being highly satisfactory in color, texture, and flavor. For canning or quick freezing in the green stage, the yellow- and green-seeded varieties make a more attractive product than the black-, brown-, or bicolor-seeded varieties. Vegetable varieties have also become quite popular with the home gardeners and many seedsmen in various sections handle two or more varieties" (p. 22).

Listed from very early to very late, vegetable varieties include: Agate, Sac, Bansei, Kanro, Mendota, Hokkaido, Jogun, Aoda, Funk Delicious, and Seminole. Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

• ***Summary:*** Pages 174-85 discuss: 1. Roasted soybeans (*irimamé*). 2. Cooked whole soybeans and ground soybeans (*nimamé, udemamé, mamé-zuri*). Soaked soybeans (*hitashi-mamé*). 4. Uncooked ground soaked soybeans (*goto* and *go*). 5. Ground soybean paste molded into shapes (*uchigo, gotsu-dotsu,* and *jinda tofu*). 6. A mixture of soybean paste and rice molded into a stick shape (*mamé-shitogi*). 7. Goto miso and Goto miso soup (*Goto misoshiru*). 8. Various kinds of natto. 9. Miso. 10. Miso soup. 11. Roasted soy flour, and soybean flour (*kinako* and *tofun*). 12. [Soy] bean sprouts (*moyashi*). 13. Soybeans soaked in their pods (*mamé-tsuke*).

Note: This is the earliest document seen (Nov. 2008) that mentions *jinda* or *jinda tofu.*

3903. Yuasa Shoyu Jozo Dogyo Kumiai [Yuasa Shoyu Brewers' Assoc.]. ed. 1950? Yuasa shôyu enkaku taiyô: Nihon shôyu jôzô no biso. Wakayama-ken jûyô bussan [Summary of the history of Yuasa shoyu: The originator of Japanese shoyu brewing. An important product of Wakayama prefecture]. Yuasa-cho, Arita-gun, Wakayama prefecture, Japan. 200 p. [Jap]
• ***Summary:*** Company name with diacritics is: Yuasa Shôyu Jôzô Dogyo Kumiai. The head of the Brewers' Assoc. is Seshichi Kubo. Included in this history of Yuasa shoyu are logos of at least 6 major Yuasa shoyu manufacturers, together with the company name. Histories of individual companies are not included. One of the companies is Kadocho Shoyu; the founder of its parent company (honke) was Kodaya Umataro.

Yuasa shoyu originated in 1230 A.D., the 4th year of the Antei period. It started to be produced and sold during the Bunreki period by Bo Iwasa. It started to be shipped to Osaka in 1535 (the 4th year of the Temmon period) by Akagiri Zenuemon (or Yoshiuemon). The Yuasa shoyu dealer in Osaka (Yuasa Zogyojo) was Ihei Komatsuya. The Osaka shoyu distributor was established in 1782 (the 2nd year of Temmei) by Matsutaro Kochiya. The Yuasa Shoyu Brewers' Assoc. was founded on 21 June 1899 (the 32nd year of Meiji). Production is 52,700 koku (1 koku = 180 liters, so 9,486,000 liters), worth 850,000 yen. Address: Yuasa, Wakayama prefecture, Japan.

3904. Hokubei Mainichi Shinbunsha. comp. 1951. Hokubei Mainichi nenkan [Hokubei Mainichi year book]. San Francisco, California: Hokubei Mainichi Shinbunsha. 772 p. Index (at front). Illust. (in ads). 22 cm. [Eng; Jap]
• ***Summary:*** This 1951 yearbook was printed on 30 Nov. 1950 and published on 5 Dec. 1950. At the beginning of every city with a large number of Japanese residents is an index and a list of phone number abbreviations. A typical entry starts with the company name in Japanese, then the company name, address and phone number in English. Address: 1737 Sutter St., San Francisco, California 94115. Phone: Jordan 7-7323.

3905. Morse, W.J. 1951. What's in a name? *Soybean Digest.* Jan. p. 22-24.
• ***Summary:*** "Ancient Chinese literature recording the advice of agriculturists on the best varieties of soybeans to plant under different soil and climatic conditions and the utilization of certain varieties for specific purposes, indicates that the soybean was perhaps one of the oldest crops grown by man [sic]. Varieties of soybeans are very numerous in oriental countries, especially Korea. There during agricultural explorations by the United States Department of Agriculture in 1929 to 1931 more varieties showing a wider range of color, size, and shape of seed and plant characters were found than in China, Manchuria, and Japan.

"The soybean is peculiarly sensitive to changes of soil and climatic conditions and this explains undoubtedly to a very great extent why practically every locality in the soybean regions of eastern Asia has its own varieties. Explorations in small villages in China and Korea revealed that nearly every family had its own favorite varieties for different uses.

"It is noteworthy that of the large number of varieties introduced into the United States from the Orient the same variety has rarely been secured a second time unless from the same locality. Obviously, centuries of experience aided by natural crossing and selection have brought about the development of the vast number of varieties for special purposes under local conditions in China, Korea, and Japan.

"Prior to the introduction of numerous varieties of soybeans by the Department in 1898, not more than eight varieties had been grown in the United States. The culture of these was limited to a few well-defined areas. During the past 50 years the Department has made several thousand introductions of soybeans from China, Korea, Manchuria, Indonesia (Java), and India, representing many hundreds of distinct types.

"This large collection, ranging in maturity from 75 to 200 or more days, has shown wide differences in color, size, shape, composition and quality of seed, plant characters, utilization, and in adaptation to the various soil and climatic conditions in the United States.

"In a recent review of all introductions received from eastern Asia, it was noted that a large number of those from China, Korea, and Japan were sent in under their native varietal names, the translation of which revealed some very interesting and perplexing names. It was interesting to note among the oriental names three–Chief, Chestnut, and Hawkeye–that breeders in the United States have assigned to varieties developed for their own local conditions.

© Copyright Soyinfo Center 2014

"The many peculiar oriental varietal names of soybeans suggested the title of this article. It was thought that American soybean breeders and growers would be interested in knowing the sort of varietal names soybeans have in other parts of the world.

"It is obvious that the oriental breeder or grower, in naming some of the varieties, must have been in a poetic frame of mind in assigning such names as 'Heaven's Bird,' 'White Spirit of the Wind,' 'Flower Garden,' and 'Clasped Hands.'

"The large number of varietal names is quite understandable as they indicate various seed and plant characters, temples, villages, prefectures, animals, birds, uses, and occasionally a breeder's name. This will be noted in the following lists and selected classification of varieties.

"It is not to be assumed that these lists of names represent all of the varieties grown in these countries. In fact, they are only a selected number from the varieties introduced into the United States during the past 50 years. It was interesting to note that some of the Chinese varietal names were the same as those in Chinese literature dating back 100 years ago."

"Selected classification of Chinese soybean varieties:

"Seed Color: Black Belly, Chicken's Foot Yellow, Crow's Eye Yellow, Crow's Skin Green, Flesh Yellow, Musk Deer's Skin Yellow, Parrot Green, Raven's Eye Yellow, Tiger Skin.

"Seed Size: Great White, Large Black, Large Green, Large White Eyebrow, Small Golden.

"Seed Shape: Flat Black Golden Round, Large Round Black, Pearl Shape, Round Pearl, Small Round Green.

"Hilum (Seed scar): Flowery Eyebrow, Large White Eyebrow.

"Maturity: August Green, Autumn Azure, Burst Pods in Six Months, Eighth Month White, Fifth Month Yellow, Melon Ripe, Midsummer Yellow.

"Pods: Five Month Broad Pod, Four Grain Green, Four Grain Yellow, Iron Pod Green, Three Bean Pod, White Podded Green.

"Leaf: Long Large Green Leaf.

"Pubescence: Hairy Green, Red Hair Green, Sixth Month White Hairy, Yellow Hair Green.

"Utilization: Black Curd, Follow Rice, Round Cattle Feed, Vegetable.

"Odd Names: Entwined Silk, Moon Tooth, Sparrow's Cackling, Unknown Water."

"Selected classification of Korean varieties:

"Seed Color: Barbarian Blue, Black Chestnut, Castor Bean Skin, Golden, Indigo, Lacquer Black, Red Striped, Rich Black, Widower (Black and White), Yellow Dragon's Eye.

"Seed Size: Big Green, Large Black, Small Blackeye, Small Blue.

"Flower: Early White Flower, Large White Flower, White Flower Pure Yellow.

"Hilum: Chotan White Eye, Green Eye, Purple Mouth, Rensen Brown Eye, Small Blackeye, White Eye.

"Maturity: Aid For New Land, Black Sprout, Black Vegetable, Edible, Millet Friend, Plant In Millet, Plant in Wheat, Plant Between Crops, Rainy Season, Roasting, Sprout.

"Habit: Climbing.

"Leaf: Bamboo Leaf.

"Birds: Crow's Early, Domestic Geese, Pigeon, Skylark, Swallow, Water Rail.

"Animals: Deer, Horse, Mouse, Red Rat, White Horse.

"Village: Anpen, Chotan, Tansen.

"Superior Varieties: Great Happiness, Plentiful, Prolific, Rich, Rich and Virtuous.

"Odd Names: Beheaded, Clasped Hands, Cow's Knee, Flying Fish, Flower Garden, Peaceful, South Sea, Spirit of the Wind, Turtle Nest, White Priest's Foot, Wild Boar's Hip."

"Selected classification of Japanese varieties:

"Seed Color: Black Autumn, Black Saddle, Brown Spotted, Green Fool, India Ink, Mink Skin, Pretty Flesh Color, Silver White, Yellow Jewel, Yellowish White Blackeye.

"Seed Size: Large Green, Large Jewel, Large White, Large White Ring, Small Blackeye, Small Bullet, Small White.

"Seed Shape: Gingko Seed Shape, White Ball, Water Caltrop Shape.

"Hilum (seed scar): Blackeye, Green Eye, No Eye, White Eye, White Mouse Eye.

"Pods: Black Eye Long Pod, Black Pod Gold, Four Seeded Yellow, Fox Pod, One Seed, Red Pod, Three Seeded Pod, Two Seeded Pod, Yellow Pod, White Pod.

"Pubescence: Early Smooth, Green Non Hairy, Half Smooth, Middle Season Smooth, Naked Devil, Non Hairy, Smooth White, Smooth Devil, White Hair.

"Stems: Fan Shape Stem, Red Stalk, Single Stalk, White Stem.

"Leaf: Five Leaf Saddle, Monbetsu Long Leaf.

"Habit of Growth: Akita Bunch, Bunching Maiden, Doesn't Touch The Earth, Dwarf, Very Bunched Pods.

"Maturity: August, Black Autumn, Early Gold, Middle Season, October, Very Early Abundant, Yellow Fall, Midseason Fox, Through Frost, White Autumn.

"Utilization: Devil Chaser [for roasted soybeans–irimame], Forage, Miso, Natto, Paddy Field Boundary, Produces in Shady Places, Soy Sauce, White Sprout.

Superior Varieties: Abundance, Abundant Pods, Brings Treasure, Early Increase, Excessive Yield, Fortune, Heavy Yield, One Hundred Percent Good, Small, Fortune, One Thousand Pod.

"Animals: Early Fox, Mink, Mouse, Small Donkey, Tiger.

"Birds: Crane's Friend, Dove, Dove Killer, Sparrow,

© Copyright Soyinfo Center 2014

Wild Duck, Wild Goose, Young Crane.

"Persons: Bingo's White, Chichanari, Hachiya.

"Prefectures (states): Aizu, Chiba, Echigo.

"Shrines: Goshanari, Miyashiro, Zankonji.

"Villages: Chizuka, Hachirihan, Iwakiri.

"Odd. Names: Covered with Frost, Bright Country, Elder Brother, Enter Priesthood, Heaven's Bird, Old Woman's Cane, Pretty Girl, Through the Water, Under The Snow, White Dog's Foot."

Photos show: (1) Bean curd [tofu] cakes being sold by vendors on streets in Peking, China. In the Orient special varieties of soybeans are used in the manufacture of bean curd and many other soy products. (2) Korean farmers' market day held weekly in the small villages. This offers a rich source of soybean varieties. (3) Japanese farm girls planting seed of the Azemame (Paddy Field Boundary Soybean) variety on the land bounding a rice paddy. The beans are used in making miso (salty soy paste), soy sauce, and other foods for human consumption.

Note: This is the earliest English-language document seen (Aug. 2011) that uses the term "salty soy paste" to refer to miso. Address: Retired Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, Agricultural Research Administration, U.S. Dep. of Agriculture, USDA.

Address: Dep. of Agricultural Chemistry, Faculty of Agriculture, Tokyo Univ., Tokyo, Japan.

3907. Bening, W. 1951. First published report on soybeans: It was written in Germany in 1712. *Soybean Digest.* March. p. 20-22.
• ***Summary:*** This book was the *Amoenitatum Exoticarum* ("Exotic Novelties") by Engelbert Kaempfer. The book, itself, is located in a locked glass case at the Engelbert Kaempfer Museum, in the dreamy medieval town of Lemgo, Germany, where Kaempfer was born on 16 Sept. 1651. When he died, he left behind his extensive diaries, drawings, and manuscripts, some of which are still among the rare materials of the British Museum in London. Kaempfer had a lifelong desire to travel abroad and an "unbelievable capacity for learning foreign languages... An amateur in almost all fields of science, with profound knowledge in medicine, botany, and pharmaceuticals, at the age of 32 Engelbert managed in 1713 to be engaged as secretary to the Royal Swedish Ambassador Extraordinary on a special mission to Persia. And some years later, after many story book adventures, he was assigned as surgeon in the colony of the Dutch East India Company in Japan."

The author then gives an English-language translation of what Kaempfer wrote about the soybean. "This [Dutch East India] company operated at that time the only European colony in Japan. It was licensed by the emperor of the country. The colony was hermetically sealed from the country and its inhabitants. Laws were extremely severe on foreigners as well as the natives.

"Kaempfer, whose only wish was to study the country and its population, despaired. Yet under these hard circumstances, he wrought the masterpiece of his life. His open character and untroubled friendliness to all, and his extraordinary gift of learning languages overnight, opened to him the minds and hearts of the Japanese people...

"Engelbert Kaempfer in those prison years on the little island of Deshima, laid the foundation of western science in Japan.

"When Engelbert returned to Lemgo 10 years after he had left home, he wrote his *Amoenitates Exoticae* in the difficult Latin language of those times."

Photos show: (1) Kaempfer's book, opened to the illustration of a soybean plant. (2) Dr. W. Bening, "a German nutritionist and soya expert, who has been connected with the program for improvement of the German diet with soy foods." (3) The outside front of the Engelbert Kaempfer Museum near Lemgo. (4) Page 840 of Kaempfer's book, which contains a brief discussion of Siuku, or Kuro Mame [black soybeans]. Address: PhD, German nutritionist and soya expert.

3919. *Soybean Digest.* 1951. Accept "Soyalac" as infant food. July. p. 22.
• ***Summary:*** "'Soyalac,' a vegetable milk produced by the International Nutritional Laboratory, Mt. Vernon, Ohio, has been accepted as an infant food by the Council on Foods of the American Medical Association, Dr. H.W. Miller, the president announces.

"Miller began development of 'Soyalac' in China over 15 years ago. It is prepared from the valuable protein and oil of the soybean. Its carbohydrates are a combination of sugars and it is reinforced with minerals to build it up into infant food to care for nutrition problems from birth to weaning time.

"'In order to meet the requirements of the American Medical Association, a vast amount of experimental work was necessary, not only to produce feeding results with 'Soyalac' by leading child specialists, but to obtain records of the feeding of large groups of babies over a long period of time,' said Dr. Miller. 'These results were obtained in America, Japan, the Philippine Islands and China. 'Soyalac' was granted acceptance on the basis of its splendid record as a hypoallergic food.'

"International Nutrition Laboratory was recently purchased by Loma Linda food Co., Arlington, Calif., and is now being conducted as the latter firm's eastern division.

© Copyright Soyinfo Center 2014

Products manufactured by the Mt. Vernon plant will be almost exclusively derived from the soybean.

"The firm has set up the International Research Foundation in charge of Dr. Miller. The plan is to continue research into and investigation of soy products."

3920. Mogi, Masatoshi; Nakajima, Shigeji; Iguchi, Nobuyushi; Yoshida, Fumihiko. 1951. Kyôka miso no kenkyû. I. Trial brewing of miso with a riboflavin-producing strain of *Aspergillus oryzae*]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 29(8):302-310. English-language summary on p. 44 of this issue. [11 ref. Jap; eng]

• ***Summary:*** (1) Out of 121 strains of *Aspergillus oryzae* taken from many kinds of miso and koji starter (*Tané-koji*), eleven strains which produced riboflavin comparatively well were selected by means of culturing in Pfeffer's solution. (2) A strain that produces the most riboflavin was selected from these 11 strains by manufacturing soy-bean and rice malts.

(3) A sort of fortified miso was made on trial by using this strain, and it produced 3 times the ordinary amount of riboflavin in "rice Miso" and 2.4 times the amount of riboflavin in wheat Miso. Note: This is the earliest English-language document seen (Feb. 2009) that uses the term "rice miso" to refer to miso having rice and soybeans as its main ingredients. Address: Brewing Lab., Noda Shoyu Co. Ltd., Noda-machi, Chiba-ken, Japan (Noda Sangyo Kagaku Kenkyujo).

3928. Hirano, Mitsuo. 1951. Complaint from Japan [Crushers dissatisfied with quality of U.S. soybeans] (Letter to the editor). *Soybean Digest.* Nov. p. 38.
• ***Summary:*** Notes that in 1951, Japan purchased about 270,000 tons of soybeans from the USA on a commercial basis–in part because it was difficult to import soybeans from China and Manchuria after World War II and because of the "Korean incident." Japanese processors have expressed their dissatisfaction with the quality of these U.S. soybeans. The beans were purchased on the basis of Yellow No. 2, but it is the common opinion in Japan that they are of lower quality, and in fact are "much inferior to Manchurian soybeans." The U.S. soybeans contained a much higher percentage of foreign material (such as corn, cottonseed, broken stems, sand, and splits) and damaged kernels than Manchurian soybeans. American exporters should pay more attention to the quality of the soybeans they export from Japan.

A table shows Japanese imports of soybeans by country of origin from 1946 to 1951. The USA was the main source every year except 1950, when China was. In 1948 Japan imported 6,158 tons from Java, and in 1951 about 100 tons from Siam [Thailand]. Address: President, Assoc. of Fat and Oil Manufacturers, Tokyo, Japan.

3929. *Soybean Digest.* 1951. Grits and flakes... from the world of soy: Leaflet on soybeans in Japan. Nov. p. 42.
• ***Summary:*** "A leaflet with pictographs showing the production of soybeans and their usage in Japan has been issued by the Soya Bean Extraction Oil Mill Association of Japan. The leaflet is printed in both Japanese and English."

[24 ref. Jap; eng]
• ***Summary:*** This classification of Japanese soybeans by two criteria into 9 maturity groups is now the standard. Maturity group Ia (60 days to flowering, less than 60 days from flowering to maturity) corresponds to USA maturity groups I–II; these beans grow in northern Japan (Hokkaido). Maturity group Vc (greater than 100 days to flowering, greater than 80 days from flowering to maturity) corresponds to USA maturity group VII; these beans grow in southern Japan (Kyushu). Address: Norinsho.

• ***Summary:*** One of the best early summaries of industrial uses of soybeans. Contents: 1. Manufacture of soybean protein: Introduction, nature and evaluation of protein modification, choice of raw materials, industrial isolation and modification processes, improvement of color, plant operation and equipment. 2. Industrial utilization of soybean flour and isolated protein: Introduction, control of bacterial and mold growth, plywood glues, soybean flour paper-coating adhesives, Soybean protein [isolate] paper coating adhesives, paper and textile sizes (paper sizes, textile sizes), water-thinned paints, plastics, textile fibers, fire foam stabilizers, tacky and remoistening adhesives, printing inks, miscellaneous uses.

"The first large-scale industrial use of soy flour was the development of plywood glue in the Pacific Northwest about 20 years ago by I.F. Laucks and Glenn Davidson, who imported specially prepared hydraulic pressed soybean meal from Manchuria. The Douglas fir plywood industry needed a cheap, water-resistant adhesive. While casein was suitable for the purpose, it was more costly and subject to wide fluctuations in price and availability. Soybean flour adhesives produced a strong bond which, although not waterproof, is highly water resistant. Because the adhesive mixtures are not tacky, the glued veneer is easy to handle, and therefore the manufacturing process can be speeded up considerably... In 1942, 60 million pounds of soybean glue (dry basis) were used for gluing plywood. This amount, together with a small amount of casein glue, represented 85% of the total plywood glue production. By 1945, the amount had fallen to 70%. In 1947, consumption of soybean glue was 25 million lb. Dike (pers. comm. 1947) estimates that two-thirds of the 1947 production of Douglas fir plywood was glued with soybean adhesive and hence intended for interior use, while one-third (wet basis) was glued with phenolics and intended for exterior use. In the plywood industry as a whole, soybean glues represent, on a dry basis, by far the largest tonnage of any type of adhesive."

"It is noteworthy that the single largest use of casein and [isolated] soybean protein is in paper coatings. The average 1940-46 consumption of casein in the U.S. was about 65 million lb and of soybean protein about 15 million lb, approximately one half of each amount being consumed in paper coatings.

"Production of soybean fiber had reached 900,000–1,200,000 pounds by 1939 in Japan. No production of soybean fiber in Japan during and after the war has been reported. Pilot plant production of soybean fiber by the Ford Motor Company reached 5,000 pounds per day in 1940, but production was subsequently discontinued and the plant and equipment disposed of to The Drackett Company.

"The Federal Trade Commission, recognizing the potential and increasing importance of man-made protein fibers, has adopted for them the general name 'Azlon,' following the same pattern of using 'Rayon' for synthetic

© Copyright Soyinfo Center 2014

cellulose fibers... All protein fibers made on a commercial or pilot plant scale possess low dry and especially low wet strength."

Synthetic protein fibers can be classified and discussed in terms of the "wool model" or the "silk model." The mechanical properties of each of these two fibers is related to its structure. Wool has long-range elasticity but moderately low strength, whereas silk has much greater strength, but a significantly lower range of elasticity. The "full realization of the fact that that textile fibers are, for the most part, made of fibrous molecules has undoubtedly been one of the major factors contributing to the present activity in the field of synthetic fibers."

"During World War II, the greater part of the isolated soybean protein produced was hydrolyzed and used by the U.S. Navy to prepare a foam for fighting oil and gasoline fires on war ships. A soybean protein solution was fed into a water stream and the mixture converted into a foam by means of an aerating nozzle."

3948. Ciancio, Pedro N. 1951. La soja y el problema alimentario del Paraguay [The soybean and Paraguay's nutritional problem]. Asunción, Paraguay: Edit. "El Grafico." 505 p. No index. 25 cm. Contains a 17-page English-language summary. Ciencia de la Nutrition (Metabolismo). [50 ref. Spa; eng]

• ***Summary:*** On cover: *Ciencia de la nutrición* (*metabolismo*)**.** Contents (from English-language summary, p. 477-94): 1. Report on the soybean, presented at the First Interamerican Congress of Medicine (*Primer Congreso Interamericano de Medicina*), sponsored by the National Academy of Rio de Janeiro [Brazil], September 7-16, 1948 (the soybean was the 6th subject on the program; the report by Dr. Pedro Ciancio, which emphasized the nutritional benefits of soya as a protective and basic food, was unanimously approved by the scientific assembly). 2. The "Paraguayan Soybean," a new variety (developed after 20 years of cultivation in Paraguayan soil). 3. The nutritional value of soy in the light of modern science. 4. Deficiencies in the dietetic regimen in Paraguay and how to correct them; particular importance of the soy bean to correct these deficiencies. 5. Peculiarities of the biochemical structure of the soybean and the medical applications deriving therefrom. 6. Soy cultivation ("Paraguayan soil is excellent for the cultivation of soy... The average output ranges from 1,500 to 2,000 kilos per hectare but in some regions of Caazapá (Rosario, Charará, Buena Vista, etc.)... I obtained the enormous output of 4,000 kilos per hectare, and this without any inoculation whatever!"). 7. The place of soy in the diet. 8. World production of soy. 9. Conclusion. More about soy milk (p. 493).

The author emphasizes the many nutritional benefits of using soy flour (he used the term "whole soy flour," p. 493), toasted soy meal, and soy milk in the Paraguayan diet. He believes that soya can be used to improve the diet without increasing its cost. In 1950 the author conducted experiments, in collaboration with the distinguished biochemist Prof. Dr. Ramón Codas of the Faculty of Chemistry and Pharmacy (Asunción), feeding soy milk to undernourished families living in the Department of Caazapá. When 1 liter/day of soymilk was added to the usual diet for 2 months, "most of the groups had increased their weights, and better coloring and greater activity could be noted in all the members of the groups under observation. He recommended using the resulting okara in soups or tortillas.

Chapter 8, "World production of soy," states (p. 490): "Cultivation of soy began in 1921, the year in which I introduced the plant to our country. Although its cultivation is only slowly increasing, at the present time there are already many villages where soy is cultivated, though on a small scale."

In 1950 a group of renowned scientists (Bergmann, Weizmann, and Willstater) at Weizmann's Institute of Science at Rehovoth, Israel, confirmed the importance of soy in banishing world hunger. They developed a soy powder and Bergmann wrote a report about it.

Note 1. This document contains the earliest date seen

for soybeans in Paraguay, or the cultivation of soybeans in Paraguay (1921). In 1989 E.R. Alvarez-Britos wrote: "In 1921, Dr. Pedro N. Ciancio, considered the apostle of soybean cultivation in Paraguay, introduced the varieties Hollybrook, Manouth [Mammoth?], Pekin [Peking], and Shanghai, from Argentina, the USA, and Japan."

Note 2. Much of this book was written between 1940 and 1942. Address: Prof., Dr., Asunción, Paraguay.

3949. Hui Manaolana Foundation (formerly Niji-no-Kai). 1951. Japanese foods (Tested recipes). Honolulu, Oahu, Hawaii: International Institute, Y.W.C.A. 122 p. Illust. (some colored). Index. 24 cm.

• ***Summary:*** The Hui Manaolana was formerly named Niji-no-Kai and is affiliated with the International Institute of the Y.W.C.A. The book was inspired by Mrs. Isaac M. Cox (Catherine E.B. Cox), an educator and volunteer advisor to the Y.M.C.A. Almost all the recipes in this book have been submitted by members of the group, and that woman's name appears next to the recipe title. Shoyu is called for in many recipes.

Following a preface and an introduction, the recipes are organized by type. The many interesting ads related to soyfoods, scattered throughout the book, are cited elsewhere. Helpful hints (p. 12): "To prevent tofu from crumbling, soak in salted water for a while before using." On p. 15 are 4 menus each for breakfast, lunch or supper, and dinner. Soups: Chiri (Fish & tofu soup). Kenchin (Vegetable soup with tofu). Basic miso soup. Satsuma jiru (Miso soup with chicken & vegetables). Oio fish dumplings in miso soup. Miso soup with long rice. Rice: Azuki meshi (Rice with red beans). Sekihan (Steamed azuki rice). Inari zushi (Sushi rice in aburage).

Fish and seafoods: Ebi no teriyaki (Barbecued shrimp. The sauce consists of: 3/4 cup shoyu, 1 teaspoon gourmet powder [Ajinomoto], ½ cup sugar, 1 teaspoon grated ginger, 1 clove garlic [crushed]. Mix well). Katsuo no miso yaki (Tuna broiled with miso sauce). Katsuo teriyaki (Broiled fresh tuna). Meat and chicken: Sukiyaki (with tofu). Pork and tofu. Tofu: Gan modoki [Ganmodoki]. Ankake tofu (Boiled tofu with thick sauce). Tofu with crab meat egg roll. Tofu tempura. Okara (Bean curd residue dish). Iri dofu. Okara nira (with aburage). Yudofu with goma [sesame] miso sauce. Fried tofu cooked in miso. Koya dofu (Frozen soybean curd cooked in shoyu).

Note 1. This is the earliest English-language document seen (April 2013) that uses the term "Koya dofu" (regardless of capitalization) to refer to dried-frozen tofu.

Note 2. This is the earliest English-language document seen (April 2013) that contains the term "Gan modoki" (regardless of hyphenation); it refers to deep-fried tofu burgers.

Vegetables: Kiriboshi and aburage. Nikomi oden with yakidofu. Cabbage with mustard & miso sauce. Shira ae–Watercress (With tofu dressing). Shira ae (Vegetable with tofu sauce). Daikon sumiso ae (Turnips in miso). Nikomi oden (Vegetables with miso). Nishime (with tofu). Nasu no shigiyaki (Fried eggplant with miso sauce). Negi–nuta (Green onions with miso sauce). Green pepper–miso yaki. Kuromame (black soybeans). Noodles: Kitsune udon (With aburage). Relishes: Konbu no tsukudani (Seasoned seaweed). Tekka miso (Fried miso with gobo). Kaibashira no tsukudani (Scallops cooked in shoyu). Shoyu turnips. Desserts: Ohagi (rice cake with bean paste and kinako). Many with kanten, azuki beans, and azuki koshi an (Sweetened bean paste).

Glossary (p. 97-98) includes: Aburage (fried bean curd). An (red bean paste). Azuki (red beans). Edamame (soybeans). Fu (gluten cake). Gourmet powder (mono-sodium glutamate). Kanten (gelatin made from agar-agar). Karashimiso (mustard miso). Kinako (yellow soy bean powder). Kirazu (bean curd residue). Konbu (seaweed). Kuromame (black soy beans). Miso (fermented rice and soy beans). Nori (sea weed). Okara (bean curd residue). Shira-ae (vegetables with mashed tofu). Shoyu (soy sauce). Sumiso (vinegar and miso sauce). Sushi. Tare (thick shoyu sauce). Tempura (fritters). Teriyaki (barbecue). Tofu (bean curd). Ume (pickled plum). Wakame (sea weed). Yakitofu [yakidofu, broiled or grilled tofu].

Note 3. This is the earliest English-language document seen (April 2013) that uses the term "Yakitofu" to refer to grilled tofu.

Note 4. This is the earliest English-language document seen (June 2013) that uses the term "bean curd residue" to refer to okara.

Note 5. This is the earliest English-language document seen (Nov. 2012) that uses the term "yellow soy bean powder" to refer to kinako [roasted whole soy flour]. Address: International Institute Y.W.C.A., Honolulu, Hawaii.

3950. Imai, K. 1951. [Practice and theory in soybean cultivation]. Osaka, Japan: Fuminsha Co. [Jap]*

104 p. 2nd ed., 1954. 125 p. [Jap]*

3953. Smith, Dean A.; Woodruff, M.F.A. 1951. Deficiency diseases in Japanese prison camps. *Medical Research Council* (*London*), *Special Report Series* No. 274. p. 192. (HMSO Privy Council, G.B.).
• ***Summary:*** This comprehensive report discusses the effects of an inadequate, unbalanced, and unaccustomed diet, maintained over a period of years, on thousands of men, women and children, prisoners in the hands of the Japanese in Hong Kong and Singapore.

One section is titled "Preparation of Tempe." British and Dutch prisoners of war in Changi, a Japanese prisoner of war camp in Singapore, survived on tempeh. "Soya beans first appeared in Changi in May, 1943, as a purchase by the Camp Messing Fund; from December of that year onwards, they were occasionally issued to the camp by the Japanese in place of a certain amount of rice... The beans were first simply boiled, but in this form they were rather unpalatable and exceedingly indigestible, and many men passed unaltered beans in their stools. Some Dutch prisoners of war suggested that this difficulty could be overcome by converting the beans into a substance known in the Netherlands East Indies as *tempe,* a product which... occupies a very important place in the diets of those who live in central and east Java." A description of the tempeh-making process is given. "The original culture of fungus was obtained from the withered petals of the *Hibiscus* plant... At Changi, *tempe* was made part of the general issue when available and was used to treat protein and vitamin deficiencies, and was given to diabetics for whom the ordinary rice diet was unsuitable."

Note: According to *The Defining Years of the Dutch East Indies, 1942-1949,* by Jan A. Krancher (McFarland & Co. 1995), upon their invasion of Java in 1942, the Japanese began a process of Japanization of the archipelago. Over the next 3 years, more than 100,000 Dutch citizens were shipped to Japanese internment [prisoner of war] camps, and more than 4 million *romoeshas,* forced Indonesian laborers, were enlisted in the Japanese war effort. The Japanese occupation stimulated the development of Indonesian independence movements. Headed by Sukarno, nationalist forces declared their independence on August 17, 1945. For Dutch citizens, Dutch-Indonesians or "Indos," and pro-Dutch Indonesians, Sukarno's declaration marked the beginning of a new wave of terror.

3954. Stanley, Joseph. 1951. Production and utilization of lecithin. In: K.S. Markley, ed. 1951. Soybeans and Soybean Products. Vol. II. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 593-647. [162 ref]
• ***Summary:*** Contents: 1. Occurrence and composition: Occurrence, structure and composition, nomenclature. 2. Manufacture. 3. Commercial lecithins. 4. Physical properties. 5. Chemical properties. 6. Utilization of lecithin: Margarine, chocolate (measurement of viscosity of chocolate), confectionery and ice cream, baked products (bread, cakes, biscuits, cookies, and crackers), macaroni, edible oils and fats, antioxidants, pharmaceuticals, paints and printing inks, rubber and petroleum, leather and textiles, cosmetics, soaps, and miscellaneous applications. 7. Synthetic substitutes and other lecithins. 8. Analysis of lecithin: Rapid volumetric determination of phosphorus (standardization of 0.1 N uranyl nitrate, determination), determination of small amounts of lecithin. 9. Statistical and market analysis.

Originally soybean lecithin was considered to be an undesirable sludge, because the hydrated form tends to ferment producing bad-smelling substances. Thus, the main problem was to dispose of it without creating a nuisance. In Manchuria and Germany, where expeller and solvent extraction plants were installed, it was decided to dry under vacuum the hydrated substance which had been removed from the oil using a centrifuge. This dried residue was named "soybean lecithin," and initially no uses for it could be found. Researchers began to look for new applications, and initially they thought it could be used in nerve tonics like sodium phosphates and phytin, but such applications would consume very little lecithin. Over the last 20 years, thousands of commercial applications have been discovered, yet these use less than 20% of the lecithin that is potentially available.

The total production of soybean lecithin in the USA was estimated at 8 million lb in 1948, while about 40 million lb which could be produced is not recovered. About 94% of the lecithin recovered in the USA comes from soybeans. Soybean oil yields an average of 2.65% commercial lecithin; other vegetable oils yield on average only about 0.5% lecithin. The large present and potential production of lecithin has caused the price per pound to drop from about 75 cents 20 years ago to about 15 cents in 1950 (p. 593-94).

Historically, the manufacture of soybean lecithin began in the late 1920s in Germany with its recovery from expeller soybean foots, which were composed of phosphatides, phytins, sterols, glycerides, carbohydrates, gums, water and some soybean meal. After dehydrating the sludge at low temperature under vacuum, it was extracted with various solvents such as methanol, ethanol, benzene, etc. The extract was purified by re-extraction with acetone to remove the nonphosphatides. Then the residue was redissolved in an appropriate glyceride carrier to make commercial soybean lecithin. This process made a good, stable lecithin, but the various steps made it expensive.

The installation in Germany of solvent extraction plants for processing soybeans offered a convenient method of separating and purifying the lecithin without the use of solvents. The first good process was developed by Bollmann of the Hanseatische Muehlenwerke, A.G., in Hamburg, and patented in Germany on 8 Oct. 1923 (No. 382,912) and later

© Copyright Soyinfo Center 2014

in the USA on 12 June 1928 (No. 1,673,615). A detailed description of process is given (p. 601).

World soybean lecithin production in 1948 is estimated at 10 million lb. Another 2 million lb of vegetable lecithin was recovered worldwide, including corn lecithin in the USA, peanut lecithin in England, and rapeseed lecithin in Germany and elsewhere in Europe. During the period 1934-1938 soybean lecithin was produced in the USA, Germany, Japan, Denmark, and Norway. "It can safely be said that during 1934-1938 the world utilized only about 4% of its potential production of soybean lecithin, and it is doubtful whether more than 10% was utilized even in 1948."

"The lecithin that is not recovered is left in emulsion form or in the foots, and is either thrown away or at best is mixed with the press cake or sold for soap stock. At least 96% of the potential production of vegetable lecithin of the world suffers this fate." Address: Joseph Stanley Co., Chicago, Illinois.

3961. Morse, W.J.; Cartter, J.L. 1952. Soybeans for feed, food, and industrial products. *Farmers' Bulletin* (*USDA*) No. 2038. 41 p. Feb. Supersedes Farmers' Bulletin No. 1617 (Morse 1930, 1932).
• ***Summary:*** Contents: Importance of the soybean and its byproducts. Direct use of soybeans on the farm: Soybean hay (for dairy cattle, beef cattle, horses and mules, sheep, swine, poultry), soybeans for pasturage (hogging down soybeans, sheep, beef and dairy cattle, poultry on soybean pasturage), soybean for soilage, for silage, for soil improvement, for livestock feed (feed for swine, dairy cattle, beef cattle, horses, sheep, poultry, wild game {quail, pigeons}), soybean straw (feeding value, fertilizing value).

Soybeans processed for meal and oil: Processing methods, meal for livestock (for dairy cattle, beef cattle, poultry, swine, sheep, dogs {in dog-food industry}, rabbits, fur-bearing animals, quail and pheasants), meal as fertilizer, for industrial purposes, in food products, use of oil (in food products, industrial uses such as paints and varnishes). Soybeans and products for human consumption: Vegetable soybeans, dry soybeans ("Other uses of the dry soybean

© Copyright Soyinfo Center 2014

{principally of oriental origin} are in the preparation of soybean milk, soybean curd, soybean sprouts, beverages, salted, roasted soybeans), soy flour, grits, and flakes, Oriental soybean foods, soy milk, soy curd, soy sauce, soy sprouts, soy beverages. Miscellaneous uses of the soybean: Honey production (the soybean as a honey plant, soy flour for honey bees), soy flour and grits in dog food, soy flakes in brewing beer, soy flour for insecticides.

Under "Soybean utilization," page 3 notes: (1) The roots and coarse stems are used as fuel in China, Manchuria, and Korea. (2) In many parts of China the plants, when 3 to 4 inches high, are used as greens. (3) In Manchuria and Korea, the leaves are cured and smoked as tobacco.

Under "Soy milk," page 38 states: "The ground soybean pulp or mash [okara] left after separating the liquid from the solid material is still of good nutritive quality, but it has very little flavor. It can be dried and made into flour for human food, combined with foods of more pronounced taste, or used for animal feed."

Under "Soy curd" [tofu], page 38 states: "Chinese and Japanese markets and restaurants in many cities in the United States sell fresh soy curd. Several firms in the United States can soy curd."

Under "Soy sprouts," page 40 states: "Soybeans and several other species of beans, especially the mung bean, are sprouted and used as a green vegetable in the Far East. Soy sprouts (fig. 18, D) can be produced successfully in the home, and a year-round fresh vegetable that may be used raw or cooked can be obtained by sprouting soybeans in a flower pot, a glass fruit jar, or a strainer.

"In producing sprouts, select a stock of clean, bright beans of the latest crop. Any of the field varieties may be used, but the yellow-seeded varieties have less conspicuous skins, though black-seeded varieties, such as the Cayuga, Peking, Wilson, and Otootan, seem to germinate more quickly and uniformly. Carefully hand-pick the seed, discarding everything except the clean, whole beans. Wash the beans thoroughly, cover with lukewarm water, and allow them to soak for a few hours (or at most overnight) until they are swollen. Place the beans in a container and cover them with dampened cheesecloth. Rustproof wire-mesh screening or cheesecloth can be used to cover the bottom of the container to allow for drainage. In using a glass fruit jar, cover the top with a piece of cheesecloth and tie it on securely. Invert the jar and place it in a dark spot at room temperature.

"Tilt it slightly so that excess water can drain away promptly. Pour plenty of water on the beans 3 to 4 times a day, thereby insuring thorough washing. The beans may be sprinkled each evening with chlorinated lime solution (1 teaspoon of calcium hypochlorite dissolved in 3 gallons of water) to keep down mold growth and spoilage. Chlorinated limewater is not needed to kill fungus growth if the seed is of good quality. In 3 to 4 days the sprouts will be 1 to 2 inches long and ready to use. Bean sprouts increase about six times their original volume. The commercial production of soy sprouts proceeds along the same, lines, except that larger sprouting tanks or trays are used and the process is more carefully controlled.

"Soybean sprouts can be used in many ways and are cooked and served with the bean attached. They are a fair source of thiamine, riboflavin, and ascorbic acid. The sprouts may be served raw in salads, cooked in various ways, and used in such dishes as omelets, stews, fricassees, and chop suey. They are very tender and lose their crispness if put into hot dishes more than a few minutes before serving.

"A few companies have successfully canned soy sprouts [in the USA]. The New York (Cornell) Agricultural Experiment Station found that sprouts lend themselves admirably to quick-freezing." Address: USDA.

3962. Nakano, Masahiro; Matsuura, Shinji. 1952. [Research on koji starter (*tane-kôji*). III. On the rate of germination of the mold spores]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 6. p. 157-60. March. English-language summary bound at the end of No. 6, p. 30. [Jap; eng]

• ***Summary:*** The hourly rate of germination for koji starter mold spores was examined by the direct counting method, as reported in part I, and the so-called "active spore numbers" were calculated. Nine samples of koji starter were examined: For miso (4), shoyu (3), and shochu (3), and each was given a code letter, M, S, and T respectively in the figures 1-9.

Conclusions: (1) Germination starts at about 3 hours and arrives at a stationary phase at about 6 hours in practical koji making; at this stage no control of mycelium growth is required. (2) There are products with rapid or with slow germination according to the blends of the makers. (3) Distinct differences in "active spore numbers" were found. In practice, the greater the "active spore numbers," the smaller the amount of koji starter required for making koji. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

3973. Breirem, Knut. 1952. Oscar Kellner (May 13, 1851–September 22, 1911). *J. of Nutrition* 47(1):3-10. May.
• ***Summary:*** "It is generally accepted that German science in the period 1850 to 1914 was of very high standing... During this period Germany was a Mecca for students seeking advanced training in the physiological and chemical sciences." F. Honcamp has stated that in German agricultural chemistry, there were three great pioneers or pathfinders: Liebig, Hellriegel, and Kellner.

Oscar Keller was born in Tillowitz, Silesia, on 13 May 1851. Note: Today [2001] this small town, called Tulowice, lies in southwestern Poland. He fought in the Franco-German war [Franco-Prussian War] in 1870-71, then finished high school and went to the universities in Breslau and Leipzig to study the basic sciences, especially chemistry. An extremely diligent young man, he got his Ph.D. in the short space of three years from the University of Leipzig. His first scientific paper was published in 1874. As a young doctor Kellner became an assistant in animal chemistry at the Agricultural Academy of Proskau (Silesia).

In 1876 Kellner went to Hohenheim at Stuttgart (Württemberg). Here he became an assistant to Prof. Emil Wolff, who was of Danish origin. Before coming to Hohenheim Wolff had been the first director of the experiment station Möckern (Moeckern), at Leipzig, the first agricultural experiment station in Germany–erected in 1851, the year Kellner was born. Kellner began to study feed evaluation, a field in which he later became the master.

© Copyright Soyinfo Center 2014

In 1880, at age 29, he was invited to the Imperial University of Tokyo as a professor of agricultural chemistry. He stayed in Japan for 12 years and left a strong mark on the foundations of agricultural chemistry in Japan. In Japan, he married a Japanese woman. In 1892 he was called back home to Germany to become director of the agricultural experiment station at Möckern [Moeckern]. In 1905 the first edition of his book, *Ernaehrung der landwirtschaftlichen Nutztiere* (*The Feeding of Livestock*) was published. Many subsequent editions were published, the 10th in 1924. An English translation was published in 1910. He was also the editor of *Biedermann's Centralblatt für Agrikulturchemie* and *Die Landwirtschaftlichen Versuchsstationen.* Endowed with a strong personality and a love of work, he accomplished a great deal. He died in the autumn of 1911 of a heart attack at age 60.

An excellent full-page portrait photo shows Oscar Kellner. Note: While in Japan, he wrote three original and important articles each on miso and koji from 1889 to 1895. Address: Royal Agricultural College of Norway, Div. of Animal Nutrition, Vollebekk, Norway.

Page 414. A large table shows "Production of cereals and vegetables" (area in chobu, yield in koku). For "Dried soy-beans

1.822 million koku in 1941
2.331 million koku in 1942
2.400 million koku in 1943
2.072 million koku in 1944
1.321 million koku in 1945
1.566 million koku in 1946
1.345 million koku in 1947
1.659 million koku in 1948
1.672 million koku in 1949
2.503 million koku in 1950

In 1950 production of red [azuki] beans was 16.5% that of soy beans.

Other crops mentioned in the table are dried maize, foxtail millet, sawa-millet, proso-millet, Indian-millet, buckwheat, and dried peas.

Page 415. This table continues on p. 415 with area in chobu and yield [production] in kan [1 kan = 3.75000 kilograms]. For Green soy-beans [Edamamé]:

11.275 million kan in 1941 on 9,671 million chobu
8.442 million kan in 1942
7.609 million kan in 1943
8.073 million kan in 1944
11.099 million kan in 1945
8.026 million kan in 1946
10.602 million kan in 1947
8.578 million kan in 1948

© Copyright Soyinfo Center 2014

10.362 million kan in 1949
9.890 million kan in 1950 on 6.000 million chobu.

3981. Hirano, Mitsuo. 1952. Using American soybeans in the Japanese economy. *Soybean Digest.* Sept. p. 28-29.
• ***Summary:*** Contents: Introduction. The soybean situation and its supply and demand in Japan. The soybean oil milling industry in Japan. The Japanese soybean industry and American soybeans. Conclusion.

The main purpose of the writer's present trip to the USA is to make a careful study of the American soybean market.

Soybean production in Japan gradually increased from 210,000 metric tons in 1880 to a peak of 540,000 tons in 1921. Thereafter production declined as imports from Manchuria rapidly rose. In 1945, the year that World War II ended, production in Japan was only 180,000 tons, but as a result of government policy aimed at increasing food production, it had risen to 440,000 tons by 1951. However most of this production is transformed into foods, so Japanese oil mills have had to depend almost entirely on exports for their raw material. In 1952 exports are expected to be about 350,000 tons.

The earliest Japanese government records of soybean imports show that in 1897, 131,000 tons were imported from Manchuria. That amount increased each year, reaching a peak in 1944 when approximately 930,000 tons were imported. However since the end of World War II, the pattern of Japanese soybean imports has changed dramatically. The United States and the West replaced Manchuria as the main source of Japanese soybean imports. At first, imports were made by the Japanese government from China and by the Occupation Forces from the USA under the GARIOA program. But imports from China was made increasingly difficult by the expansion of the Communist sphere of influence. Finally, in 1950, with the outbreak of the Korean War, soybean imports from China came to a complete stop. Since then, American soybeans have dominated the Japanese market.

From the late 1800s, the Japanese oil milling industry used mostly Manchurian soybeans. From the end of World War I (in 1918) until about 1925, many large soybean crushing mills were constructed in Japan. Just before World War II, in about 1940, the nine large solvent plants in Japan had a crushing capacity of 970,000 tons/year. World War II reduce this to six mills with a capacity of 490,000 tons. Since 1948, many smaller mills have been constructed; in 1951 there were 38 soybean oil extraction mills with a total capacity of about 1.2 million tons.

"I believe that the phenomenal increase in the production of soybeans in the United States is an accomplishment unequalled by anything in the agricultural history of the world... I firmly believe that it could not have been attained without the untiring efforts of the American farmers, agriculturists, government agents, and the American Soybean Association." With Communist forces entrenched in China, Manchurian soybeans are unavailable to Japan at the present time. So Japan is very grateful for this in U.S. production. However there is one problem–quality. Although Japanese oil millers buy Yellow No. 2 grade, the soybeans that arrive in Japan are of much inferior quality. The main problem is that they contain much more foreign material than is allowed–4 to 6% rather than 3% of pebbles, weeds, pebbles, sand, and dirt.

"American soybeans will continue to play as important role as a source of supply for the Japanese oil industry." However there will soon be growing competition from China. A portrait photo shows Mitsuo Hirano. Address: Managing Director of Hohnen Oil Co., Ltd. and President, Assoc. of Oil and Fat Manufacturers, Japan.

3982. Inamori, Shôjiro; Inamori, Michisaburo. 1952. Karushiumu kyôka miso no kenkyû. I. [Studies on calcium fortified bean-paste (miso). I. Experiment of brewing the bean-paste fortified by adding calcium carbonate]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 30(9):370-74. Sept. English-language summary on p. 39. [9 ref. Jap; eng]
• ***Summary:*** For fortification with a calcium salt, calcium carbonate is the most suited. When added at a level of less than 1%, it exerts no influence on the quality of the finished product. Address: Inamori Laboratory, Inamori & Co., Japan.

3983. Mogi, Masatoshi; Nakajima, S.; Iguchi, N. 1952. Kyôka miso no kenkyû. II. Shigaisen shôsha ni yoru miso kôji-kin no furabin seisan ni tsuite [Studies on fortified bean-paste (miso). II. On the riboflavin production by ultraviolet-induced mutants of *Aspergillus oryzae*]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 30(9):363-69. Sept. English-language summary on p. 39. [10 ref. Jap; eng]
• ***Summary:*** By treating the most excellent strain of *Aspergillus oryzae* (described in a previous report) with ultraviolet rays, 743 mutants were obtained. The authors classified them into 13 types. Of these mutants, 19 strains which produced exceedingly large amounts of riboflavin were selected culturing in Pfeffer's solution. Four strains produced 3 times as much riboflavin as the parent strain in soybean koji and 3 strains twice that of the latter in rice koji. A fortified miso, made by using the most abundant riboflavin producing strain, contained twice as much riboflavin as that made with the parent strain. Address: Noda Industrial Science Lab. Japan (Noda Sangyo Kagaku Kenkyujo).

Enrichment with calcium]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 7. p. 155-62. Sept. English-language summary p. 22-23. [5 ref. Jap; eng]

© Copyright Soyinfo Center 2014

• ***Summary:*** Precipitated light calcium carbonate is suitable both technically and economically as a calcium source. Up to 1% can be added to the miso without a noticeable change in the smell or taste. Details of the procedure for adding the calcium carbonate during the miso-making process are given. It is added after the koji starter to the steamed rice. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

3985. Nakano, Masahiro; Ebine, Hideo. 1952. Eiyô kyôka miso no kenkyû. II. Bitamin kyôka miso [On the manufacture of enriched miso. II. Enrichment with vitamins A, B-1 and B-2]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 7. p. 163-66. Sept. English-language summary p. 23. [6 ref. Jap; eng]
• ***Summary:*** Concentrated cod liver oil was used as the source of vitamin A; it was used as a homogenisate with the gelatin solution. Vitamins B-1 and B-2 were added in crystalline form. These vitamins were dissolved in the "pitching water" and added to the initial stage of ripening. Changes in the content of each vitamin were then examined.

Vitamin A content decreased rapidly. The initial 5,000 I.U. [International Units] had decreased to 1,700 I.U. after 10 days and to only a trace after 30 days. Vitamin B-1 content decreased somewhat, whereas vitamin B-2 content increased, and this showed in vitamin B-2 production in the koji mold. The fates of these vitamins were the same whether they were added alone or in combination. Their addition did not decrease the quality of the miso. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

Shizen heni no genin ni kansuru kenkyû (heterokarioshitsu) [Studies on the natural variation of koji-molds (*Aspergillus oryzae* and *Aspergillus sojae*). III. Studies on the mechanism of natural variation based on heterocaryosis]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 26(6):279-85. Oct. [9 ref. Jap; eng]
• ***Summary:*** Anastomosis occurs between various strains of koji molds. Natural variation in koji molds (*Aspergillus oryzae* and *A. sojae*) is largely caused by heterocaryosis, which generally produces conidia of increased diameter.
Address: Dep. of Agricultural Chemistry, Faculty of Agriculture, Univ. of Tokyo.

3991. Amaha, Mikio. 1952. Saikin hôshi no tainetsu-sei ni kansuru kenkyû. IV. Kanetsu ni yoru hôshi no shimetsu genshô ni tsuite [Studies on the heat resistance of bacterial spores. IV. Kinetics of the death reaction of spores by heat]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 26(7):339-45. Nov. 1. [12 ref. Jap]
Address: Dept. of Agricultural Chemistry, Faculty of Agriculture, Univ. of Tokyo, Japan.

3992. Amaha, Mikio; Sakaguchi, Kinichiro. 1952. Bacillus zoku saikin no hanshoku saibo narabini hôshi no eiyô yôkyû ni tsuite [Nutritional requirements of vegetative cells and spores of aerobic spore-forming bacilli]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 26(7):353-59. Nov. 1. [16 ref. Jap]
• ***Summary:*** The writers studied the nutritional requirements for formation of vegetative cells and spores of six species of *Bacillus* including *Bacillus natto.* On a completely synthetic medium this species required only biotin for growth, as did *B. mycoides.* Omission of DL isoleucine completely inhibited development of spores. When single amino acids were used for growth (e.g., L-glutamic acid, L-arginine, L-asparagine) they supported fair growth of the vegetative cells and spores.

Note: This is the earliest document seen (Jan. 2012) which states that *Bacillus natto* is different from *Bacillus*

subtilis in that the former requires the vitamin biotin for growth, whereas the latter does not. Address: Dept. of Agricultural Chemistry, Faculty of Agriculture, Univ. of Tokyo, Japan.

3993. Morse, W.J. 1952. Some export history (Letter to the editor). *Soybean Digest.* Nov. p. 30, 32.
• ***Summary:*** "I have read with interest your editorials on the export beans." During the 1930s, American soybeans were the cleaner, better color, and better quality than Manchurian soybeans. This was one reason that European mills preferred to buy soybeans from the USA rather than from Manchuria, and "would pay 5 cents more per bushel for American soys."

During the early 1930s: "In Japanese-held Manchurian territory and Korea, the Japanese soybean inspectors did a pretty thorough job of inspection. All of the beans I saw from those places–and I saw plenty–were clean and seemed to be of good quality. Of course these beans were taken largely by the Japanese mills and the Chinese mills in Manchuria. The Korean beans all went to Japan and were mostly used for food products. The Japanese soy sauce factories used the Manchurian beans."

Now Mr. Morse laments: "I just cannot see why with all our good modern machinery we send such trashy beans abroad. Must be a colored gentleman in the woodpile somewhere!" "It is quite obvious that if America wants to hold the European market they must ship something beside trashy beans."

3994. Yoshida, Shizuo. 1952. Yakan hosoku shômei no tsuyosa o kotoni shita chôbi no shita ni okeru daizu no kôshû hannô (yohô) [Photoperiodic responses in soybean plants under long-day conditions with supplemental illumination of different intensities at night (Preliminary report)]. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 21(1&2):127-28. Nov. [1 ref. Jap; eng] Address: Faculty of Agriculture, Naniwa Univ.

3995. Amaha, Mikio. 1952. Saikin hôshi no tainetsu-sei ni kansuru kenkyû. V. Kanetsu-go no baiyô kiso-sei no eikyô. (2) Bitamin oyobi N gen ni tsuite [Studies on the heat resistance of bacterial spores. V. Effect of vitamins and amino acids in the synthetic subculture media on the survival time of *Bacillus natto* spores]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 26(8):420-27. Dec. 1. [17 ref. Jap]
• ***Summary:*** The composition of the cultural media was found to influence the survival time of the spores of *Bacillus natto.* The presence of thiamine, pyridoxin [pyridoxine], and biotin were found to be essential vitamins, and their presence prolonged survival time. Amino acids that were converted directly to glutamic acid gave longer survival times.

Note: This is the 2nd earliest document seen (Jan. 2012) which states that *Bacillus natto* is different from *Bacillus subtilis* in that the former requires the vitamin biotin for growth, whereas the latter does not. Address: Dept. of Agricultural Chemistry, Faculty of Agriculture, Univ. of Tokyo, Japan.

• ***Summary:*** "In my brief paper (Karasawa 1936), I reported that the cultivated soy bean might have been derived from the wild bean through the accumulation of qualitative and quantitative changes due to gene mutation, unaccompanied by any chromosomal change. Since then, I have made two crossing experiments of the soy bean x *G. gracilis* and *G. gracilis* x *G. ussuriensis* in order to ascertain their genom affinities. The latter case, however, was not successful, probably being due to technical failure."

A photo shows the results (pods and seeds) of the first cross. Address: Nasu Cyto-genetic Lab., Tochigi prefecture, Japan.

4017. Manas y Cruz, M.; Rozul, Juan B. 1952. Plant production and exploration. In: 1952. A Half Century of Philippine Agriculture. Manila, Philippines: Liwayway Publishing. xix + 463 p. See p. 154-69, especially p. 157-58. Published for the Bureau of Agriculture Golden Jubilee Committee by Graphic House. [18* ref. Eng]
• ***Summary:*** "Only a few species of our cultivated plants are indigenous to this country... Plant introduction work in the Philippines was started as far back as the Spanish regime... Between 1521 and 1815 approximately 200 species of economic plants of American origin were introduced into the Philippines." Plant introduction became a major project of the Bureau of Agriculture after it was established in 1902. Its first chief, F. Lamson-Scribner, laid the basic foundation for the introduction and exploration work.

Direct introduction of hybrid strains, such as soybeans, has saved much time compared to "the development of native varieties by the processes of selection and hybridization. For instance, it must have taken its American breeders from 7 to 12 crop seasons to produce the hybrid strain of soybean, Mis 28 EB strain 3910. When tested here for 2 or 3 crop seasons, it proved to be a very suitable variety of soybean for commercial growing in the Philippines."

The section titled "Vegetable Crops" notes: "In general, the introduction of vegetable crops has been very successful. Practically all the vegetable crops grown commercially here [including soybeans]... are the products of plant introduction work... Of the soybean, *Glycine max,* we are now commercially growing introduced varieties and strains both suitable for the rainy and dry season culture. Of over a hundred varieties and strains introduced from China, Japan, U.S., Hawaii and India, only few have been selected as the most adapted to certain regions of the islands. The most successful introductions recommended for commercial planting are: Mis 33 Dixi, Head Green and Mis 28 EB Strain 3910, all adapted to rainy and dry season cultures, and Yellow Biloxi hybrid, only adapted to rainy season culture. They gave yields of from 15 to 25 cavans of seeds per hectare" Note: 1 cavan, a unit of weight in the Philippines = 44 kg or 50 kg. Thus, 15 to 25 cavans/ha = 0.66 to 1.25 tonnes/ha.

"Unfortunately, our detailed Plant Introduction records of the past years were practically all destroyed or lost during the last World War operations, so it has been quite difficult to reconstruct them from memory or from whatever literature the authors were able to ransack within the short time available."

On page 398 is an ad for Cenvoco Vegetable Lard, made by the Central Vegetable Oil Manufacturing Co. of Manila. This shortening was probably made from coconut oil rather than soy oil.

Note 1. This is the earliest English-language document seen (Feb. 2008) that uses the term "Vegetable Lard" to refer to vegetable shortening.

Note 2. This book was written by men of the Philippine Bureau of Agriculture and its successors, the Bureau of Plant Industry, the Bureau of Animal Industry, and the Fiber Inspection Service. Address: Bureau of Plant Industry.

4020. Takenobu, Yoshitaro. ed. 1952. Kenkyusha's new Japanese-English dictionary. Tokyo: Kenkyusha. iv + 68 + 2266 + [2] p. 19 cm.
• ***Summary:*** This interim edition, between the 1931 second edition and the 1954 third edition has two dates written in Japanese in the front matter: March 1931 and April 1949. On the last page, the publication date is given in Japanese as 1 Feb. 1951.

This edition has two main parts: (1) "New Words (1949) consisting mostly of mostly English language words that entered the language due to the social and cultural influence of the American occupation of Japan. The words, a mini-dictionary on 68 pages, include words such as aakeedo = arcade (written in both rômaji and katakana). There are also some new Japanese words.

(2) The entire content of the 1931 second edition– exactly the same, page for page.

New words related to soy: daizu [abura]: [soy] bean oil. Address: General editor, Japan.

4021. Burlison, W.L. 1952? Looking ahead with soybeans. Urbana, Illinois. 14 p. Undated. Unpublished manuscript.
• ***Summary:*** Dr. Burlison, who had retired in June 1951, prepared this undated, handwritten manuscript for a talk on soybeans he gave or intended to give in about 1954. Contents: Introduction. 1. The challenge of the past: Publications, research, extension work, early soybean farmers (Stoddard of Carlinville), American Soybean Association, soybean processors in the USA and Illinois, Illinois Farm Advisers Assoc., H.G. Atwood and the Peoria Plan, establishment of Regional Soybean Laboratory 1936 is most significant recent event in soybean history (part is located in Peoria, headquarters in Urbana, Illinois), the challenge, Illinois still leads in soybean production.

2. The facts of the present: Strong interest by the university, researchers, farmers, and processors, average yield has more than doubled.

3. The promise of the future: Industrialists predicted needs for the future (See *Soybean Digest,* Sept. 1952. R.M. Bethke of Ralston Purina Co., H.C. Black of Swift & Co., J.C. Konen of Archer Daniels Midland Co., Ward Calland of National Crop Improvement Council, Mitsuo Hirano, president of Association of Oil and Fats Manufacturers of Japan, J.C.A. Faure of International Association of Seed Crushers, E.M. Learmonth of British Soya Products Ltd. (London), USDA Office of Agricultural Experiment Stations, George Strayer of American Soybean Association).

As early as 1897 in Illinois, "the soybean showed great future promise. To date our College of Agriculture has published 32 bulletins and 42 circulars and many hundreds of journal articles and pamphlets of various kinds. This is truly a fine record."

Today in the United States there are 260 plants which process soybeans; 37 of these are in Illinois.

"It should be noted that the first recorded effort to find an outlet for surplus [soybeans] was in 1921 when the president of the Illinois Farm Advisers Association contacted the industry for the purpose of finding a possible outlet in Illinois to handle our soybeans. Our soybean production was just getting under way which meant some uncertainty in soybean supplies.

"This uncertainty continued until 1928 when, because of heavy abandonment of winter wheat in Illinois, it seemed necessary to turn to soybeans for a part of the acreage if some assurance could be given that a sudden increase in production would not result in ruinous prices. After some negotiations with the late H.G. Atwood a price was set for soybeans as far as his company was concerned. So far as we know, this is the first instance of a case where the price was fixed before that crop was produced. This was a very important move in giving soybeans considerable stability.

"The most significant recent event in soybean history was the establishment in 1936 of the Regional Soybean Laboratory a part of which is now located in Peoria, Illinois, and a section devoted to soybean breeding with headquarters at this university."

"Illinois is still by long odds the leading soybean-producing state. Of the state's 102 counties, 41 produced from 1- to almost 4 million bushels in 1951. Outside of Illinois there are only 21 counties in the nation that produced 1 million bushels of soybeans last year. Four Illinois counties grew between 3 and 4 million bushels in 1951." Champaign County leads the nation with almost 4 million bushels. Address: Univ. of Illinois.

northward from the middle of Hokkaido and in the eastern districts, summer type varieties are mainly grown. In the warmer districts, summer type varieties are also mainly grown.

In the warmer districts southward from the middle of Hokkaido, varieties of all three types are grown.

4023. Bening, W. 1953. Soy flour and milk powder in Europe. II. *Soybean Digest.* March. p. 20-21. See also: Part III. April, p. 20.
• ***Summary:*** Japan exported the first Manchurian soybeans to Europe in 1905. "Two oil mills in Hamburg-Harburg, Hansa-Muhle and Brinckmann & Mergell, had independently–and almost simultaneously–invented the continuous solvent extraction process for oil seeds. After World War I Hansa-Muhle entered into close cooperation with *Geheimrat Rubener,* an outstanding German nutritionist.

"Rubener was among the first to recognize that protein is essential in the diet. He pointed out that different proteins have different values, that grain protein needs fortification with other high-value proteins, that soy flour is one of the cheapest and richest sources of those amino acids in which grain proteins are deficient.

"Hansa-Muhle was the first in Germany to actually promote protein enrichment of bread with soy flour in the meat-and-milk-deficient years following World War I. But the emergency was over sooner than anticipated. The new enriched *Rubener bread* did not have sufficient time to win over consumers."

"In Germany, the industry was just starting to step from promotion and education into actual commercial production when the import and currency policy of the Reich reduced soybean imports so drastically that almost no beans were available for the soy food industry. The production capacity of the country was reserved for war purposes. Allocations of beans could not be obtained except for army orders."

"After World War II... there was a lack of bread grain as well as fat. The food administrations fell back on Rubener's and Hansa-Muhle's procedure of the protein enrichment of bread with defatted soy flour. So defatted soy flour was shipped to Germany from America."

Soy flour was introduced into Greece when it was struggling to prevent extinction by bolshevism. The Italian-German occupation during World War II had reduced the country's food reserves. At first 5% soy flour was added to bread; this amount, combined with the relatively poor gluten content and baking quality of the available wheat, was too much; it "brought about a visible shrinkage in the bread volume. Reduction of the soy flour content to 3% resulted in satisfactory bread.

Photos show: (1) A large Rumanian soybean field in north Bessarabia, 1938, with 4 men standing in the field. (2) A portrait photo of W. Bening.

4024. *Soybean Digest.* 1953. 23 million meals of Multi-purpose food. March. p. 19.
• ***Summary:*** "Nearly 23 million 3-cent meals of the 'Multi-Purpose' food have been distributed on the hunger fronts of the world, according to a report issued by the non-profit Meals for Millions Foundation, Los Angeles...

"More than 1¼ million meals, the report states, have gone to feed Korean refugees (813,000 meals since last June). Shipments to India total 3,880,000 meals of which nearly a million have been shipped since June. Popularity of the food has been enhanced by development of special native recipes printed in the Korean and Tamil languages.

"Significant shipments have gone to the Middle East, Hong Kong, Formosa, Burma, Africa, Arabia, Japan, Philippines, Latin America, Europe, and Caribbean and South Pacific Islands.

"World-wide distribution has been through 133 American relief and religious agencies and health departments of foreign governments...

"For further information or to make contributions contact Meals for Millions Foundation, 648 South Broadway, Los Angeles 14, California."

Note: This is the earliest document seen (Dec. 2007) concerning soybean products (soy flour) in Arabia [this term usually refers to the Arabian Peninsula, but in this case it may well refer to Saudi Arabia]; soybeans as such have not yet been reported. This document contains the earliest date seen for soybean products in Arabia (March 1953); soybeans as such had not yet been reported by that date.

kakô no yobi jikken [Studies on the preparation of bean milk. I. Preliminary experiments on the preparation of bean milk by cultivating Lactobacillus]. *Eiyogaku Zasshi* (*Japanese J. of Nutrition*) 10(6):187-89. April. [3 ref. Jap; eng]
Address: 1-2. Aichi-ken Eisei Kenkyusho (Sanitary Inst. of Achi prefecture); 3. Lab. of Food & Nutrition, Kinjo College.

4029. Watanabe, Tokuji. 1953. Re: Questions about isolated soy protein. Photographs of the process for making Kori-Tofu. Letter to Allan K. Smith, Northern Regional Research Laboratory, Peoria, Illinois, about May 1. 2 p. Handwritten, with signature. [Eng]
• ***Summary:*** Dr. Watanabe received, with many thanks, the sample of isolated soybean protein prepared in the pilot plant at Peoria, Illinois, and sent by Dr. Smith. It will be very useful for his research. He asks Dr. Smith to please tell him the procedure used in preparing the sample and the method for determining the degree of denaturation of the protein.

He sends Dr. Smith seven small black-and-white photos plus two small illustrations (drawn by him) showing the process for preparing "Kori-Tofu, which is consumed in western Japan." Below each is an explanation. "Although the procedure is very primitive as you see," it is an interesting way to make soybeans more digestible and nutritious. If Dr. Smith is interested, Dr. Watanabe will send him more information about foods prepared from soybeans in Japan.

Note 1. This is the earliest English-language document seen (April 2013) that uses the term *Kori-Tofu* (regardless of capitalization) to refer to dried-frozen tofu.

The photos show the interior of a fairly small commercial tofu shop. The captions read: (1) Boiling of aqueous extract of ground soybeans. (2) Precipitation of protein by adding calcium chloride to the boiled extract. (3) Precipitate is poured into the frame [curds into forming box] and pressed. The result is tofu. (4) Tofu is preserved [kept fresh] by dipping in water. (5) The tofu is cut into slabs, and placed on wooden benches or tables outdoors in the winter; here it is exposed to the cold, dry air all night long. The slabs are then kept (aged) in a frozen state for 2 weeks. A freezer can also be used. (6) The pieces of frozen tofu are thawed by immersion in running water in a large sink. (7) The sponge-like tofu is pressed using a screw press to dehydrate it. (8) The dehydrated tofu is dried on racks by heating and ventilation. (9) The final products spread on tables where they are selected and graded.

Note 2. This is the earliest English-language document seen (April 2013) that uses the word "sponge" or the term "sponge-like" to describe the texture of dried-frozen tofu.

Note 3. Allan K. Smith earned his PhD degree in physical chemistry from Columbia University in New York City. Address: National Food Research Inst., Food Agency, Ministry of Agriculture and Forestry, Fukagawa-Hamazonocho 2, Koto-ku, Tokyo, Japan.

4030. Iguchi, Nobuyoshi. 1953. Kôji-kin ni kansuru kenkyû. VII. Nitrogen mustard ni yoru shôyu kôji-kin no heni ni tuite (1) [Studies on *Aspergilli.* VII. Induction of induced mutations in *Aspergillus sojae* by nitrogen mustard (1)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 27(5):229-33. May. [22 ref. Jap; eng]
Address: Noda Sangyo Kagaku Kenkyusho (Noda Industrial and Scientific Research Lab., Noda, Japan).

4031. Yokotsuka, Tamotsu. 1953. Shôyu kôki seibun ni kansuru kenkyû. IX. Kô futten-bu no kôki seibun (4) Phenol-sei kôki seibun no bunri [Studies on flavorous substances in soy [sauce]. IX. June. English-language summary p. 16. [3 ref. Jap; eng]
• ***Summary:*** Molds of the genus *Aspergillus* which produce highly active protease were selected by a simple, suitable method as suitable for making shoyu. The optimal ratio of soy bean cake to wheat bran for the formation of amylase by the Aspergilli appears to be 1-3 to 7, and for the formation of protease it appears to be less.

The optimal ratio of soybean cake to wheat bran differs according to the strains of Aspergilli. Asp. 0-3-6 (*Aspergillus oryzae*) produces more active amylase and protease on the wheat bran. *Aspergillus Okazakii* produces more active protease on the media containing more soy bean cake.
Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

International Dairy Congress, Proceedings 13(4):602-05. June. Proceedings of the 13th International Dairy Congress, held 22-26 June 1953 at The Hague, Netherlands. [2 ref. Eng; fre; ger]
• ***Summary:*** Although there are many ways of using whey, in Japan only a small percentage of it is used as raw material for the manufacture of lactose; most of it is mixed with skim milk [nonfat milk] for the feeding of calves, or is discarded.

The preferred process was: Soak soybeans in water overnight, then grind finely. Add whey to the ground soybeans. Heat the mixture. Remove the insoluble residue [okara] by press filtering. A powder can be prepared from the resulting liquid soy & whey milk.

When lactic acid whey was used the resulting product had a much better flavor than soy-bean milk itself. Address: Faculty of Agriculture, Univ. of Tokyo, Japan.

(5) Precursors of phenolic flavorous substances]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 27(6):334-39. June. [4 ref. Jap; eng]
• ***Summary:*** The flavorous substances in the steam distillate of soy-cake [soy sauce presscake; *shoyu kasu*] (boiling point 185-325º) were investigated by means of hydrolysis and oxidation. Address: Noda Industrial Science Laboratory.

4049. Costello, Michael. 1953. Meals for Millions: This crusading Californian is showing how the problem of world hunger can be licked. *Reader's Digest* 63:126-28. July. Condensed from *The Christian Century,* 70:602-04, May 20,1953.
• ***Summary:*** The colorful story of Clifford Clinton (an illustration shows his portrait), Henry Borsook, Multi-Purpose Food (based on soybean grits), and Meals for Millions Foundation, Inc. To aid the Foundation and its humanitarian work, "Clinton donates office space in one of his Los Angeles cafeteria buildings (located at 648 S. Broadway, Los Angeles 14, California). To reach it one passes through a dim 'landscaped' dining room with pools, grottos, singing birds and organ music, then up innumerable stairs, through a bakery and a carpentershop, and arrives finally in a bustling, crowded office. Here orders come from individuals, churches, social and governmental agencies. The Multi-Purpose Food business is handled by a small staff headed by a bouncy, enthusiastic woman named Florence Rose."

"Four million Multi-Purpose meals have gone to India, three million each to China and Japan, two million each to Germany and Korea, one million to France." Some 333,000 people in Lebanon, 250,000 people in the Philippines, and several hundred thousand in Austria and Greece have been saved from hunger by Multi-Purpose meals. Shipments have gone to the Vatican for distribution to Italian poor, to migrant labor camps in California and Arizona, to the Navajo and Hopi Indian reservations. The largest buyer and distributor is the Roman Catholic Church, followed by the Friends Service Committee.

Note: This is the earliest document seen (Feb. 2001) concerning soybean products (Multi-Purpose Food containing soy grits) in the Vatican; soybeans as such have not yet been reported.

• ***Summary:*** "We have synthesized 16 kinds of mercaptans and 2 kinds of mercaptols. Eight of them are unknown substances. The odors of them are illustrated." Address: Hokkaido Daigaku Nôgaku-bu, Nogei Kagaku Kyoshitsu (Inst. of Agricultural Chemistry, Hokkaido Univ., Sapporo, Japan).

4061. Sneider, Vern. 1953. Below the teahouse. *New York Times.* Oct. 11. p. X1, X3.
• ***Summary:*** People are basically the same in their wants and desires, but that underlying similarity is often confused by externals. For example: "The Japanese might want his miso soup for breakfast; the Korean might want his pickles, called kimchi, and the American might want his ham and eggs. Yet basically they all want the same thing–namely, breakfast."

4062. Lo, K.S. 1953. The story of soybean milk. *Far Eastern*

© Copyright Soyinfo Center 2014

Economic Review. Oct. 29. p. 568-69.
• ***Summary:*** In 1936 the author, a resident of Hong Kong, happened to be in Shanghai, where he read a newspaper article about a talk given by a Dr. Webb [actually by Julean Arnold; see letter from K.S. Lo, 3 Nov. 1989] on the nutritional value of the soybean. He was very impressed. A year later, the invasion of China by Japan brought a steady flow of refugees into Hong Kong, and with them problems of food supply and malnutrition. Lo recalled the article he had read about soybeans and began to think about the idea of making soybean milk to be sold to the working classes at the lowest possible price. He took his idea to Hong Kong's new director of Medical Services, Dr. P.S. Selwyn-Clarke, who was known for his progressive ideas, his untiring energy for work, and his concern for the poor. "He at once offered me his moral support were I to embark on this scheme. It was through his personal encouragement and moral support that eventually I was able to bring it to fruition. He was also later to become my strongest supporter and advocate of soybean milk. A modest factory was built at Causeway Bay and it was opened for business in March, 1949 [actually 7 March 1940]. The equipment used was simple and crude and the method adopted for the making of this milk was modeled after the dairy industry. On the day of its opening, I can still remember that the total business done was 9 bottles sold."

"After two years of hard struggle, we were beginning to make some headway in our sales. At this point the Pacific War intervened and brought our activities to a stop. The factory was occupied by the Japanese, and what little equipment we had in it was lost. After the war was over we tried to restart it, and once again Dr. Selwyn-Clarke came to our rescue."

"Much to our surprise, the post-war public took to soybean milk without being coaxed. All of a sudden it became very popular, especially among the working classes." A larger and more modern factory was built at Aberdeen, and completed in 1950. After this a product that did not require refrigeration was developed; sales increased ten-fold. "Today we are able to produce from 3000-5000 cases (24 bottles each) of soybean milk a day; distributed over the territories of Hongkong, Kowloon, New Territories and Macao with a fleet of 18 trucks."

The company has "succeeded in producing a nutritious and wholesome food and putting it within the reach of the masses." The price has been kept down to 20 cents (H.K.) per bottle. The soybean milk is also extremely high in vitamin B, and because of the large amount consumed by the public daily, this has a beneficial nutritional effect. The company is now also working actively with UNICEF [United Nations International Children's Emergency Fund] in promoting similar projects in Asia. "Already we know for certain that a factory similar to ours has been put up in Djakarta by the Indonesian Government in conjunction with UNICEF."

"We are, however, not resting on our laurels. Our technicians have been busy experimenting on condensed soybean milk, which we hope to put on the market sometime next year. Then we will move onto soybean milk powder, and other forms of soya food products."

Note 1. This is the earliest document seen (April 2004) that describes UNICEF's awareness of the attractions of Vitasoy as a high protein soy beverage for use in developing countries, and joint efforts by UNICEF and Vitasoy to promote similar products in Asia. Note 2. When Vitasoy was launched in March 1940, it was fortified with vitamins, calcium, and cod liver oil. Now, in 1953, it appears not to be fortified at all.

4063. Funahashi, Saburo; Uritani, Izuko; Akazawa, T. 1953. [The metabolism of germinating plants. I. Evidence for the occurrence of coenzyme A in soybean seedlings]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 27(10):684-88. Oct. [23 ref. Jap; eng]
• ***Summary:*** A coenzyme A (CoA) preparation of 2.2 units per mg was isolated from soybean seedlings. Its occurrence in soybean seedlings may be taken as one piece of evidence that the TCA cycle was a major metabolic pathway in this plant tissue.

Note: The TCA (tricarboxylic acid) cycle, is presently (Dec. 2008) best know as the "citric acid cycle," and also as the "Krebs cycle." It is a series of enzyme-catalysed chemical reactions of central importance in all living cells that use oxygen as part of cellular respiration–first established by the seminal work of Albert Szent-Györgyi and Hans Krebs. Address: Dep. of Biological Chemistry, Faculty of Agriculture, Nagoya Univ., Nagoya, Japan.

4068. Loring, Patricia. 1953. Hawaii has varied food for visitors. *Chicago Daily Tribune.* Nov. 29. p. F7.
• ***Summary:*** "Japanese food, for me, was the most difficult to manage. Miso soup (made from soybeans), kidney beans, and cabbage for appetizers were edible. Beef tofu, kamaboko (fish cake), miso yaki [fish coated with miso, then broiled] were all questionable."

4069. Akasawa, Takashi; Funahashi, Saburo; Uritani, Ikuzo. 1953. [The metabolism of germinating plants. III. Coupling of transamination with tricarboxylic acid cycle in soybean seedlings]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 27(12):849-53. Dec. [18 ref. Jap; eng]
• ***Summary:*** Cytoplasmic particles isolated from soybean seedlings were previously shown to be active as an enzyme system in catalyzing the oxidation of acids in TCA cycle.

In this paper we present evidence that respiratory oxidation of an acid of TCA cycle members by the cell fraction in the presence of an alternative amino acid–alanine, aspartate or glutamate–are followed by the formation of remaining amino acids, when supplemented with coenzyme concentrates. Therefore, it seems that the particles are active in catalyzing action for the transamination which is coupled with TCA cycle (from journal@rchive). Address: Lab. of Biochemistry, Faculty of Agriculture, Nagoya Univ., Nagoya, Japan.

4070. Funahashi, Sabura; Akasawa, Takashi; Uritani, Ikuzo. 1953. [The metabolism of germinating plants. II. Pyruvate oxidation by the mitochondrial fraction]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 27(12):842-88. Dec. [29 ref. Jap; eng]
• ***Summary:*** Pyruvate oxidation by the mitochondrial fraction of soybean seedlings, including hypocotyl and cotyledon, was investigated in the light of recent understanding of the role of acyl-transferring coenzyme A. Address: Lab. of Biochemistry, Faculty of Agriculture, Nagoya Univ., Nagoya, Japan.

4071. Gamio, Manuel. 1953. Campaign to introduce soybean in Mexican diets. *Soybean Digest.* Dec. p. 16.
• ***Summary:*** "In 1929 when we attended a Conference of the Institute of Pacific Affairs held in Japan, we had the opportunity of becoming acquainted for the first time with the soybean and some foods that are made from it. Later several states and private organizations succeeded in introducing its cultivation in different regions of the country."

The author found, after complex experiments, that the best way to fortify corn tortas or tortillas is to cook the soybeans together with the corn in lime water. "For some time the Department of Public Education has been trying to increase the consumption of this legume through its rural schools, while the Department of Agriculture is attempting the same thing among the farmers and the farm schools. Finally, the National Corn Commission, which is the agency that has introduced the cultivation of hybrid corn in many regions of Mexico, has begun intensive propaganda for the soybean.

"For its part, the Inter-American Institute is making use of its publications, America Indigena (Indian America) and Boletin Indigenista (Indian Bulletin) has begun a prolonged campaign in Central and South America suggesting the introduction and general use of this grain. Also, it has sent samples of the seed to encourage its planting." Address: Director of the Inter-American Indian Inst., Mexico City, Mexico.

4074. Niwa, Soichi; Katayama, Nobu. 1953. Tônyû no kakô ni kansuru kenkyû. II. Tônyû o genryô to shita nyûyô shokuhin no kakôhin [Studies on the preparation of bean milk. II. Manufacturing methods of milky foodstuffs by using bean milk]. *Eiyogaku Zasshi* (*Japanese J. of Nutrition*) 11(3):68-69. Dec. [1 ref. Jap; eng]
• ***Summary:*** As Japan has little available land for dairy farming, sufficient milk production cannot be expected. Bean milk, which is one of Japan's own soybean products, is rich in nutrients and is sold very cheaply as a by-product of the manufacture of Japanese tofu. For this reason, attempts have been made to use bean milk as a substitute for dairy products.

However, bean milk tastes of what is called "aokusai" (green and unripened). It is also impossible to sterilize it enough without coagulating it with the heat, so it can easily spoil, especially in the summer. Because of these weaknesses, it is hard to supply this bean milk to consumers, especially in summer. If these shortcomings could be eliminated, bean milk would become a very valuable high-protein nutritious food which could serve as a substitute for dairy products. Address: Aichi-ken Eisei Kenkyusho (Sanitary Inst. of Achi prefecture).

The tofu freezing process]. *Osaka Furitsu Kogyo Shoreikan Hokoku* (*Reports of the Industrial Research Institute, Osaka Prefecture*) No. 5-3:10-15. [5 ref. Jap; eng]
• ***Summary:*** Kôri-dôfu (also called Kôya-dôfu) is made by freezing, ageing, thawing, and drying firmly pressed tofu. The resulting product has a dry, sponge-like texture. The freezing process, which plays a very important part in determining the quality (and thus the price) of the final product, was investigated thermometrically and micrographically.

Commercial dried frozen tofu is frozen quickly. This imparts a fine-grained texture to the surface of the tofu, but requires prolonged aging (20-30 days) to restore the lost elasticity. Home-made frozen tofu, freezes more slowly outdoors in cold, snowy weather, which gives it a coarse-grained texture; it requires less aging (5-7 days).

and their relation to Japan's economic future. Chicago, Illinois: University of Chicago Press. xxv + 655 p. Illust. Maps. Index. 26 cm. [3 soy ref]
• ***Summary:*** A revision and expansion of the author's 1948 SCAP report.

Tables 13 and 18 (pages 80 and 90) list production (in both U.S. tons and metric tons) and crop area (in both acres and hectares) of major crops in Japan for 4 time periods. Soybean production during the period 1931-1940 averaged 325,300 tonnes (metric tons) on 326,600 ha; it was 181,000 tonnes on 233,100 ha in 1947, then 224,300 tonnes in 1949, increasing to 330,000 tonnes on 303,400 ha in 1950. Production figures for red beans (azuki beans) are also given for the same periods.

Table 17 (p. 86-88) gives the caloric and protein food value for each of these crops in table 13. For soybeans 6.5% of the crop is used for next year's seed, and in 1947 some 15% was fed to livestock and 47% went to non-food industrial uses.

Commercial fertilizers (p. 404):... "For many years Japan has used organic commercial fertilizers, including soybean meal, other oil cake meals, fertilizer manufactured from fish, bone meal, and many other materials used in small quantities. Before its commerce was disrupted by World War II, Japan imported substantial tonnages of organic materials from other oriental sources."

Page 420: "The most calories per unit area of land generally are produced by sweet potatoes, rice, and white potatoes in that order... The winter grains cannot be replaced by these crops, and certain minor crops such as soybeans, are of such importance for oil or protein, or both, that they are not likely to be replaced." Moreover, increased emphasis on sweet potato production would bring up serious storage problems."

Page 431: The yields of soybeans can be increased "by tip pruning" (see p. 626, no. 63). In Japan the six staples are "rice, barley, naked barley, wheat, sweet potatoes, white potatoes."

Page 524: A plastic board has been made in Britain from sawdust and other wastes, "A similar materials. "Another similar material, 'Excelite,' made from excelsior, silicate of soda, soy protein, and quicklime, is reported from the United States. It is less well adapted to Japan because soy protein is needed for food."

For many years. Japanese farmers used organic commercial fertilizers, including soybean meal. Large amounts were imported from other oriental countries (p. 404). Address: Univ. of Chicago, Illinois.

4087. Fisher, A.W.; Burlew, John S. 1953. Nutritional value of microscopic algae. In: John S. Burlew, ed. 1953. Algal Culture: From Laboratory to Pilot Plant. Washington, DC: Carnegie Institution of Washington. ix + 357 p. See p. 303-10. Chap. 20.
• ***Summary:*** The last section,"Algae as human food" (p. 309-10) states that there has not yet been an opportunity for feeding microscopic algae to human subjects. However: "In recent studies in Japan reported by Dr. Hiroshi Tamiya (private communication, May 1952), dry powdered *Chlorella ellipsoiidea* has been described as tasting like a dried seaweed or powdered green tea, both popular in Japan... Hydrolysates of powdered algae showed promise as a substitute for soy sauce."

Table 1 titled "Protein content of Chlorella compared with that of typical animal feeds" (p. 304) shows: Fish meal 60%, Chlorella 50%, brewer's yeast (USP) 48%, soybean meal (typical) 44%, dried skim milk 36%, brewers' dried grains 25%, wheat 12%. Chlorella has a low methionine content. Address: 1. Arthur D. Little, Inc., Cambridge, Massachusetts; 2. Carnegie Institution of Washington, Washington, DC.

4107. Kirby, Riley H. 1954. The Japanese market for U.S. agricultural products. *Foreign Agriculture* 18(5):79-84. May.
• ***Summary:*** The population of Japan proper, 87,000,000 persons, is confined to an area of about 147,000 square miles. Only 16% of the country is farmed. Large-scale machinery is little used because the nearly 6 million farms are small–they average 2.5 acres–and labor is abundant–43% of Japan's population is employed on farms. The average amount of soybeans produced in Japan from the years 1931-40 was 358,000 short tons. Then, in 1949, Japan produced 247,000 tons; in 1950, 364,000 tons; in 1951, 523,000 tons; in 1952, 575,000 tons; and in 1953, 460,000. Rice alone occupies 40% of the planted areas of Japan.

Japan's imports of soybeans in recent years have approached 300,000 tons. There is some feeling that if Japan could produce margarine from soybean oil at sufficiently low cost, the Japanese people might further increase their consumption of bread, thus expanding the markets for both wheat and soybeans. Address: Regional Economist, Asia and the Middle East branch, Foreign Agricultural Services.

• ***Summary:*** This is an early study on osmophilic yeasts in soy sauce. The following species were tested: *Zygosaccharomyces major, Z. soya, Z. salsus.* Soy sauce mash is different from sake mash because of its high content of sodium chloride (about 18%) and its high nitrogen concentration (total N of 1.0 to 1.5%). It was found that the viable count of yeast cells grown in soy sauce mash experienced a remarkable fall when ordinary media without sodium chloride were used for the plating. Address: Noda Industrial and Scientific Research Laboratory.

4117. Arimune, Katayuki. Assignor to Bureau of Industrial Technics. 1954. [Improvement of drying or semidrying oils]. *Japanese Patent* 5390. Aug. 26. (Chem. Abst. 49:14342g). [Jap]*
• ***Summary:*** Soybean oil used; its water repellency was better than the product which used linseed oil.

4123. *Washington Star Pictorial Magazine.* 1954. Bank of plant treasures. Sept. 26.
• ***Summary:*** Photos show: (1) "Headquarters for plant explorers and site of the bank of plant treasures in the Beltsville Plant Industry Station, located just north of Washington" [DC, in Maryland]. (2) "In Japan, 25 years ago, William J. Morse of Washington was inspecting soybeans. He is known as the father of the American soybean, now the basis of a multi-billion dollar industry."

4124. Shibuya, Yoshikazu. 1954. [Soy sauce from the mother liquor of glutamic acid]. *Japanese Patent* 6198. Sept. 27. (Chem. Abst. 50:2118e). [Jap]*
• ***Summary:*** Soybean cake is heated with 3-10% hydrochloric acid for 60 hours at 85ºC until the production of furfural reaches a maximum. The product is mixed with an equal weight of mother liquor from glutamic acid, heated for 3 hours at 60ºC, neutralized, fermented at 25-30ºC with a mold culture, and filtered. Address: Japan.

4125. *Soybean News.* 1954. 100.9 bushels per acre [in Japan]. 6(1):3-4. Sept.
• ***Summary:*** "That's right, soybeans that produced over 100 bushels per acre, according to a report we have received from F. Uryu, Agricultural Chemist for the Japan Soybean Association.

"Uryu reports that the winner of the 1951 soybean growing contest of Japan won the prize yield using the Akasaya variety with 100.9 bushels per acre.

"Now it is unlikely that the winner of any of our state soybean growing contests will equal this record in the near future. The methods used by this Japanese winner are quite different from our usual cultural practices. Here is how he did it.

"The inoculated seed was planted in a well fertilized seed bed on May 24. The soybean plants were lifted from this bed on June 15, topped back to just below the first compound leaf and planted 20 inches apart in well fertilized, irrigated rows 36 inches wide. They were cultivated and hand, weeded three times in July, sprayed with BHC [benzene hexachloride, an insecticide] chemical dust the 25th of Aug., hand harvested the 2Oth of Oct.

"Topping the plants is practiced in order to increase the number of pods per stalk. The accompanying picture indicates that the method works."

A photo (p. 3, by F. Uryu) shows a harvested Akasaya soybean variety plant densely covered with a huge number of pods.

4126. *Hartford Courant* (*Connecticut*). 1954. Street hawker remains familiar figure in Tokyo. Oct. 24. p. D14.
• ***Summary:*** No longer seen in the USA, street hawkers do a brisk business in Tokyo. The sellers of each product have their unique call. "The juvenile vendor is likely to be repeating 'Natto,' 'Natto' in young and earnest tones. He is selling fermented beans, which are served with soya sauce over warm cooked rice."

"'To-fu ya-san' appears with bean curds'" [tofu].

The 'chin-don-ya-san' is a one man band and children's theater. The ragman, and the peddlers of shell-fish and bamboo poles can also be heard.

4134. Nickerson, Jane. 1954. Japanese culinary art for the New Year. *New York Times.* Dec. 26. p. SM30.
• ***Summary:*** Describes the food that Japanese-Americans prepare in New York City to celebrate the New Year. The first seven days of the New Year, called Matsu-no-Uchi, are a time for fun and feasting. They enjoy traditional foods, such as "rice-cake [mochi] soup (*zoni*), black beans (*kuromame*), sake (warm rice wine),... and *toso,* a sweet sake flavored with spices."

The rice cakes are "formed from a glutinous rice that is pounded into a starchy mass after being boiled..." "Black [soy] beans, sweetened, boiled, and eaten cold, carry with them the idea of a new year devoted to enterprising hard work. That is because the Japanese word for beans" [*mamé*] sounds the same as the word meaning 'industrious.'

4137. Smith, Allan K. 1954. Isolation and utilization of vegetable proteins. *Economic Botany* 8(4):291-315. Dec. [161 ref]
• ***Summary:*** Contents: Introduction. Vegetable protein sources. Raw materials for protein isolation. General procedures for protein isolation. Flax seed (*Linum usitatissimum* L.). Sunflower seed (*Helianthus annuus* L.). Soybean seed (*Glycine max* (L.) Merrill). Castor-beans (*Ricinus communis* L.). Seed of peanuts (*Arachis hypogaea L.*). Seed of cotton (*Gossypium sp.* L.). Corn (*Zea Mays* L.). Literature cited.

© Copyright Soyinfo Center 2014

The lengthy subtitle reads: "Among these proteins, those of soybean are isolated in the United States to the extent of about 30 million pounds annually, more than half of which are used in pigment coating of paper. Others, also discussed in this article, are derived from the seed of flax, sunflower, castor, peanut, cottonseed, and corn."

"Introduction: Vegetable protein isolation on a large scale for use in industrial processing operations is comparatively new, having its beginnings in 1935 in a small plant in Chicago [run by the Glidden Co.]. The development of a process for vegetable protein isolation was preceded by the use of vegetable protein concentrates for plywood glue [by I.F. Laucks Co.], in the form of soybean meal containing 40 to 50 percent protein, by the Douglas fir plywood industry of the Northwest in the early 1920s... Looking backward it is easy to see that the slow development of protein utilization, even in recent history, is attributable to the highly complex structure of the protein molecule... The chemistry of protein lags far behind the chemistry of the other two classes of major agricultural chemicals produced in such abundance by nature, namely, the carbohydrates and fats." The "process of building one pound of animal protein requires six to ten pounds of vegetable protein..." (p. 291).

Worldwide, the soybean is by far the largest oilseed crop, followed by peanuts, then cottonseed. Before the soybean became a major crop in the USA, peanuts led all other oilseeds in world production. (p. 292).

"Soybean protein is the only industrial protein isolated from oilseeds in the U.S." Soy protein has a higher yield and better color.

"The largest potential use of soybean protein is for textile fibers, but this use has not yet been developed. Fibers comparable to the casein fiber, Aralac, which was produced during World War II, have been made experimentally by the Ford Motor Co. (1937), The Drackett Company (1940), and the U.S. Department of Agriculture (1942). The great weakness of Aralac was its wet strength, and commercial production did not prove feasible. The Japanese, who were experimenting with soybean fibers before the war, have resumed their research. The British development of a commercial fiber from peanut protein and the American development of a protein from zein support the belief that a successful fiber can be made from soybean protein. Such a development might very well double the present rate of soybean protein production."

Soybean meal, when dehulled, contains about 50% protein and has several industrial uses including plywood glue, wallpaper coating, and adhesive formulations for the manufacture of paper products. A 1951 survey stated that 51.5 million lb of soybean meal were used in such industrial products. The largest single use, 35 million lb, was for plywood glue in Douglas fir plywood. Recent reports indicate this application has increased to 60 million lb.

Large amounts of wheat gluten and some corn gluten are used to make monosodium glutamate (MSG), which originated in Japan under the name "ajinomoto." The MSG shaker is rapidly finding a place in American homes next to the salt and pepper shakers. Smaller amounts of wheat gluten are used to make a taste product somewhat resembling pork chops.

Table I (p. 293) shows U.S. production of 7 oilseeds (soybeans, cottonseed, flax, peanut, castor bean, safflower, and sunflower) and protein concentrates made from them in 1951-52. Apparently soybean meal is considered a protein concentrate, since 5,704,000 tons were made in 1951-52. By far the largest amount of "protein concentrate" is made from soybeans, followed by cottonseed (2.5 million tons), flax (495,000 tons), peanut (150,000 tons), and safflower (6 tons). Address: Northern Utilization Research Branch, Peoria, Illinois.

4140. **Product Name:** [Handmade Shoyu: Yuasa Tamari].
Foreign Name: Tezukuri Shôyu: Yuasa Tamari.
Manufacturer's Name: Kadocho K.K.
Manufacturer's Address: Yuasa 7, Yuasa-cho, Arita-gun, Wakayama-ken, Japan. Phone: 0737-62-2035.
Date of Introduction: 1954.
Ingredients: Whole soybeans grown in Japan, wheat, unrefined salt, and water.
Wt/Vol., Packaging, Price: 0.72 liters or 1.8 liters.
How Stored: Shelf stable.
New Product–Documentation: Labels. 1989, Oct. received from manufacturer. For the 0.72 liter container, the label is 5.25 by 4.25 inches. Brown on blue. Illustration (with caption) shows Yuasa Tamari shoyu being made by hand in the traditional way during the Tokugawa period (1600-1868), with men emptying wooden buckets into a large vat.

For the 1.8 liter container, the label is 4.25 inches square. Red, yellow, and green on white. The trademark is a thick-walled "O" with a roof over the top. "Yuasa: The homeland of shoyu. Founded 1831 (the 2nd year of Tempo)."

• ***Summary:*** Recently, manufacturers of dried-frozen tofu have been working to improve its color. The color of typical samples, collected at Osaka City central market in the summer of 1953, was measured with a Beckman photometer. It was found that the color of the finished product is influenced by the soy bean oil in the tofu. The higher the percentage of reflectance (and thus the whiter the color of the product), the higher the market price.

• ***Summary:*** Soy related words:

aburaage: see aburage.

aburage: fried beancurd.

age: a piece of fried bean-curd.

ama-miso: slightly salted bean paste.

atsuage: not listed.

Daitokuji natto: not listed.

daizu: a soya (= soy) bean. daizu kasu: a [soy] bean cake [a co-product of soy bean oil]. daizu abura: [soy] bean oil.

dengaku: bean curd baked and daubed with miso. dengaku-zashi ni sareru: to be transfixed; to be pierced through (as with a spear).

edamame: green soybeans.

ganmo: not listed.

ganmodoki: not listed. Hamananatto: not mentioned. Hamanatto: not mentioned.

inarizushi: fried bean-curd stuffed with boiled rice.

kogoridôfu = kôyadôfu.

Note 2. This is the earliest English-language document seen (April 2013) that contains the term *kogoridôfu* (written as one word, with diacritics) which it says is the same as kôyadôfu [dried-frozen tofu].

Note 3. This is also the earliest English-language document seen (April 2013) that uses the term *kôyadôfu* to refer to dried-frozen tofu.

koikuchi: not listed.

koikoku: a carp cooked in bean (= miso) soup.

kôji: malt (mugi); yeast; leaven (kôbo); kôji-ya: a maltster [a maker of kôji]. kôji ni suru: to malt something.

kôridôfu: a frozen bean curd.

kuromame: a black soy bean.

miso (chomiryô = seasoning): bean paste; miso. miso o suru: to mash the miso [as in a suribachi]. miso kakeru: to put miso on something (as food). (2) (tokui to ten) sore ga kare no miso da: that is what he takes pride in [that is what he is good at]. (3) (hikakuteki-ni) miso o kakeru (shuppai suru): to make a mess (=sad work) of something; to make a miserable (=poor) showing. miso o suru (hetsurau): to flatter [someone, as one's superiors]. [Modern is goma suru; kare, shatcho ni goma shitte-iru: he is flattering his boss. A grinding gesture goes with it. goma-suri: a person who flatters]. kuso miso ni iu: to speak meanly of a person; to speak of a person in the most disparaging terms. miso mo kuso mo isshoni suru: to mix up good and bad things. miso no miso kusaki wa, jô miso ni arazu: The secret of art lies in concealing art [Akiko never heard this saying]. soko ga miso darô: perhaps that's the point he takes pride in [=the key point].

misokoshi: a *miso* strainer. [misokoshi de mizu o sukuu]: weave a rope of sand; attempt impossibilities [literally, to try to scoop up water with a miso strainer].

miso-mame: soy (= soya) beans.

misuzu-dofu: not listed.

momen: no meaning related to tofu is listed.

nama-age: fried bean curd.

Note 4. This is the earliest English-language document seen (April 2013) that contains the term *nama-age* which

© Copyright Soyinfo Center 2014

refers "fried bean curd."

nattô: fermented soybeans. nattô uri: a vendor of fermented soybeans. nattô-jiru: miso soup with ground fermented soybeans.

nigari, nigashio: bittern; brine.

nimame: boiled beans [typically boiled soybeans served as part of *osechi* at New Year's].

nori [no tsukudani]: laver boiled down in soy [sauce].

oboro: not listed.

okabe: = tofu.

okara: bean curd refuse.

shimidôfu = kôridôfu [frozen tofu].

Note 5. This is the earliest English-language document seen (April 2013) that contains the term *shimidôfu* (written as one word, with diacritics) which it says is the same as kôridôfu.

shitaji (7): soy [sauce].

shôyu: soy [sauce].

tamari: [a kind of] soy; soy sauce; sauce from refined soy.

tôfu: beans curds (=cheese); tôfu. [tôfu itcho; in characters]: a piece (=cake) of bean-curds. [tôfu-ya]: a bean-curds dealer (=seller). [yaki-dôfu]: roasted bean-curd. kare ni iken shita totte, tôfu ni kasugai da: advice to him is like water sliding off a duck's back = It's a mere waste of words (=It is like pouring water into a sieve) to advise him. [tofu-ya e ni ri, saka-ya e san ri to iu tokoro da]: there is no human habitation within five miles of the place. [It's out in the boondocks].

tônyû: bean soup; soya-bean juice [sic, soymilk].

u-no-hana: (1) flowers of the *Deutzia scabra.* (2) [tôfu no kara] bean-curd refuse.

tsukudani: preserved food boiled down in soy.

yuba: dried bean curds [sic, the film that forms atop soymilk when it is dried]. Address: General editor, Japan.

• ***Summary:*** Shigeo Umeda lived 1903-1965. Address: Japan.

4154. Valignano, Alessandro. 1954. Sumario de las cosas de Japón (1583). Adiciones del Sumario de Japón (1592). Editados por José Luis Alvarez-Taladriz [Summary of the things of Japan (1583). Additions to the Summary of Japan (1592), edited by José Luis Alvarez-Taladriz]. Tokyo, Japan: Sophia University. xix + 205 p. + 346 p. 26 cm. Series: Monumenta Nipponica Monograph No. 9. [230 ref. Spa]
• ***Summary:*** This book consists of two separate books by Valignano bound as one; each is paginated separately. In the 1st book, on page 93, the author mentions that he bought the necessary provisions, rice, miso, dried fish, etc. Footnote 240 gives a long definition of *misso* (sic, miso) in Italian from *Saverio Orientale,* by Bernardino Ginnaro (1641, Naples).

An appendix near the end of the 2nd book (published in 1592; see p. 317-330) begins with a Treatise on how they own land and calculate rents in Japan. It starts (p. 318) with a reference to "Principio [1601-1603], c. 6." In a long footnote on p. 320, he states: "To measure rice, wheat, barley, *Goma* [sesame seeds, used to make oil], *Mame* (see below), *Abura* (vegetable oil), *Saque* [saké], etc. they use certain measures such as the shaku, go, sho, to, koku, etc." Looking in more detail at the entry for *"Mame,"* after the word, we read (in square brackets), the Chinese character for "bean" followed by the Portuguese words 'Feijoes, ou graos de Iapao' ib. [VJP 150],..." This means that the word "Mame" means beans or Japanese beans. They are described in the VJP which, according to the abbreviations section at the front of this book (p. xix) means "Vocabulario de la Lingoa de Iapam. [Nagasaki, 1603-1604]. This is the famous first dictionary of Japanese in a European language, Portuguese, compiled by the Jesuit mission in Japan, and published by the Jesuits in Nagasaki in 1603-04. If we look on page 150 of that dictionary, we do indeed see: "Mame. Feijoes, ou graos de Iapao."

Note 1. Today, the word Japanese "mame" has two meanings: (1) Beans [generically, all types]. (2) A soybean. When the word *mame* is the first part of a compound word, it usually refers specifically to the soybean: *mameabura* is soybean oil–more commonly called *daizu abura; mamekasu* is soybean meal–more widely called *daizu kasu; mamemaki* is the ceremonial scattering of roasted soybeans at Setsubun. Therefore: It cannot be stated clearly that the soybean is mentioned in this book, or that the concept of a soybean, apart from beans in general, was clear to the author. However given this context of how foods are measured, we think it is more likely that he was referring to beans in general than to one particular type of beans. If he wanted to refer specifically to soybeans, they are clearly mentioned as *Daizzu* in the VJP

© Copyright Soyinfo Center 2014

dictionary which he cites! *Daizzu* [Daizu, the Japanese word for soybeans] are defined as: "Mame. Graos, ou feijoes de Iapao."

Note 2. *Principio* is an abbreviation (see p. xvii) that refers to a book titled *Libro Primero del principio y progresso de la Religion christiana en Jappon...* by Padre Alexandro Valignano of the Company of Jesus, 1601. Manuscript in the British Museum.

About the author: On p. 2-3 we read: The padre Alessandro Valignano (ca. 1539-1606) of the Society of Jesus [Jesuit] visited Japan three times, 1579-1582 (during the rule of Oda Nobunaga, who died in 1582), 1590-1592 (during the rule of Toyotomi Hideyoshi, who died in 1598), and 1598-1603 (during the rule of Tokugawa Ieyasu, who died in 1616). The fruit of his first trip was the *Sumario,* published in 1583, of his second trip was the *Adiciones del Sumario,* published in 1592, and of his third trip was the *Apologia de la Compañia de Jesûs de Japón y de la China* (1598) and the *Principio y progreso de la religión cristiana en Japón.*

His three visits correspond to three very important periods in Japanese history, in the transition from decentralized feudalism to centralized feudalism or from feudal anarchy to feudal order: the period of Azuchi (Nobunaga), of Momoyama (Hideyoshi), and of Tokugawa (Ieyasu). His writings capture magnificently the history of these 3 periods.

Because he is a Christian and a Jesuit father (Roman Catholic), his main interest is in religious affairs in Japan.

Brief biography: Valignano was an Italian missionary. 1566–He entered the Society of Jesus. 1574–Traveled to Portuguese India. In Asia, he helped to develop missionary work in Goa, Macau, and especially Japan, where he supported the mission with a share of the silk trade, developed a native clergy, and saw Christianity grow to some 300,000 adherents.

Address: Faculty of Agriculture, Naniwa Univ., Japan.

4161. Takahashi, Jusaku. 1955. 2, 3 no bitamin B-12 no shigen ni tsuite. I. [Studies on several sources of vitamin B-12. I.]. *Eiyo to Shokuryo* (*J. of Japanese Society of Food and Nutrition*) 8(2):25-27. March 11. [Jap]
• ***Summary:*** A significant amount of vitamin B-12 is found in natto and miso, although little is found in the whole soybeans from which these products are made. The amount of B-12 in soybeans and various soyfoods is as follows (measured in nanograms per 100 gm): Fresh whole dry soybeans 8, Tengu natto (sold commercially) 83, Shinshu miso 170, Shinshu miso (boiled for 15 minutes) 170, Shinshu miso (boiled for 30 minutes) 162.

When natto is stored at 30ºC, vitamin B-12 is slowly lost. It drops from 83 nanograms per 100 gm when fresh to 49 nanograms per 100 gm after 3 days.

4166. Nickerson, Jane. 1955. Sukiyaki and tempura. *New York Times.* April 24. p. SM50.
• ***Summary:*** Describes how to prepare each of these famous Japanese recipes. The recipe for sukiyaki is adapted from one used at the Miyako, the oldest Japanese restaurant in New York. Like most such recipes it calls for "soybean curd (tofu)..." "The soy sauce (shoyu) used in the dish should be Japanese; it has a marvelous intensity which makes it different from other such sauces." *Suki* means "plow" and *yaki* means "roasted." The legendary history of the dish is given.

For tempura, the traditional Japanese sauce is composed of soy sauce heated with dashi and other ingredients– including "monosodium glutamate, the vegetable protein seasoning sold here under such trade names as Accent and known in Japan as *aji-no-moto.*" Japanese make tempura from shrimp, seaweeds, string beans, eggplant, mushrooms, and many other kinds of vegetables. Four photos show views of these two dishes.

4173. *Soybean Digest.* 1955. 1954 world [soybean] crop hit new record. April. p. 20. [1 ref]
• ***Summary:*** According to the USDA Foreign Agricultural Service, world soybean production established a new record in 1954; 742.8 million bushels were harvested, up 14% over 1953. Over 80% of the increase was accounted for by the United States. Most of the remaining increase occurred in China-Manchuria. In 1953 China produced 198 million bushels and Manchuria produced 134 million. In 1954 Manchuria's production statistics were included with those of China, the total being 350 million bu. Canada also set a new record with 5.065 million bu harvested. Also mentioned (with production statistics for 1953 in bushels) are Italy (35,000), Yugoslavia (155,000 avg. 1945-49), Other Europe (565,000) USSR (NA), Turkey (125,000), Indonesia (10,839,000), Japan (15,777,000), South Korea (4,995,000), Taiwan (Formosa) (640,000), Thailand (743,000), Brazil (3,242,000), Tanganyika (25,000), Nigeria (the biggest producer in Africa with 140,000 to 150,000 bu for export), and the Union of South Africa (68,000).

In Brazil, soybeans are produced in the states of Rio Grande do Sul and Sao Paulo. Average soybean acreage (harvested acres) in Brazil: 1945-1949: 23,000 acres. 1953: 148,000 acres. 1954 (preliminary): 162,000 acres. Average soybean yield in Brazil: 1945-1949: 19.0 bu/acre. 1953: 21.9 bu/acre. 1954 (preliminary): 22.7 bu/acre. Average soybean production in Brazil: 1945-1949: 446,000 bushels. 1953: 3,242,000 bushels. 1954 (preliminary): 3,674,000 bushels. "Brazil's harvest at 3.5 million bushels was up 13% from the year before. Some 2.6 million bushels were expected to be available for either crushing or export. The much-publicized program to increase soybean planting in Sao Paulo has so far met with discouraging results. This reportedly is due to the farmers' dissatisfaction with the earnings derived from soybeans compared with cotton and some other crops and to a shortage in Sao Paulo of combine harvesters."

Note 1. This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for Brazil.

Note 2. This is the earliest document seen (Jan. 2005) concerning the USDA's Foreign Agricultural Service and soybeans.

4174. Nakajima, Katsuichi. Assignor to Nichiman Food Industries Company. 1955. [Deodorization of soybeans]. *Japanese Patent* 3026. May 4. (Chem. Abst. 51:13264). [Jap]*
• ***Summary:*** Raw soybeans put in a closed vessel were steamed with vapor previously passed through a chamber packed with stems or leaves of the camphor tree and then dried *in vacuo* and pulverized. Address: Japan.

4175. Ikeda, Tetsutaro; Yamamoto, Ryuichi. Assignors to Shionogi Drug Manufacturing Company. 1955. [Water insoluble vitamin B-1 powder]. *Japanese Patent* 3400. May 20. (Chem. Abst. 51:13324c). [Jap]*
• ***Summary:*** A decoction from soybeans can be used instead of gelatin.

4176. Fujisawa, Shinkichi. 1955. Shokuhin moshiku wa shôyu, miso shikomi genryô to shite tekisuru butsuryô no seizô hôhô [Food product for brewing of soy sauce or fermented soybean paste]. *Japanese Patent* 30-4442. June 28. 3 p. (Chem. Abst. 51:13311b). [Jap]
• ***Summary:*** A protein-rich food product is prepared from sweet or white potatoes by addition of organic and inorganic nitrogen sources followed by cultivation with microorganisms. The product contains large amounts of vitamins and proteinaceous components and can be used as a food or as an ingredient in the production of soy sauce (at 60%) or miso (at 30%). Address: Gifu-ken, Inaba-gun, Numa-machi?, Okan 698, Japan.

4177. Fujisawa, Shinkichi. 1955. Shokuhin moshiku wa shôyu, miso shikomi genryô to shite tekisuru butsuryô no seizô hôhô [Food product for brewing of soy sauce or fermented soybean paste]. *Japanese Patent* 30-4443. June 28. 2 p. (Chem. Abst. 51:13311c). [Jap]
• ***Summary:*** Soybeans or defatted soybeans are hydrolyzed with acid or alkali, neutralized, mixed with fish meal or pressed cake of chrysalis and inorganic nitrogen sauces, cultured with slime bacteria, and fermented with yeast. Address: Gifu-ken, Inaba-gun, Numa-machi? Okan 698.

4178. Kawakami, Yasota. Assignor to Keikichi Endo. 1955. [Improvement of the flavor of soy sauce]. *Japanese Patent* 4444. June 28. (Chem. Abst. 51:13311e). [Jap]*
• ***Summary:*** Ethyl esters (100 parts) of fatty acids consisting mainly of linoleic and oleic acids are dissolved in 50-100 parts of ethanol by employing 50-150 parts of poly(oxyethylene sorbitan monooleate or -palmitate) as an emulsifier. Then 0.1-3 parts of the solution is added to 100 parts of a soy sauce of inferior flavor. The ethyl ester of cottonseed oil is also effective.

4179. Mino, Shoichiro; Mino, Yosuke. 1955. [Koji for the brewing of Mieki]. *Japanese Patent* 4445. June 28. (Chem. Abst. 51:13312c). [Jap]*
• ***Summary:*** *Mieki,* an amino acid solution produced as a by-product of sodium glutamate manufacture, has an off-flavor and a disagreeable fluorescence. These disadvantages are not removed by brewing with the usual koji. Vanillin can change the off-flavor to an agreeable soy-sauce flavor, and a red food color can remove the fluorescence and form a good soy-sauce color. These substances and alanine, glycine, and sodium glutamate are added to the usual koji.

© Copyright Soyinfo Center 2014

For example, a mixture of 5 gm alanine, 5 gm glycine, 5 gm sodium glutamate, 0.1 gm vanillin, 0.5 gm red food color, 700 ml Mieki, and 1.3 liter water was sterilized by boiling, and cooled. Cultures of 90 ml each *Zygosaccharomyces major* and *Z. soya* were added and the mixture was mixed with 5 kg roasted and crushed wheat and cultured with *Aspergillus candidus* at 28ºC for about 3 days to give 6.7 kg of a new koji. The koji (3 kg) was used with 10 liters of Mieki containing 2% total nitrogen to produce a soy sauce of superior flavor and color. Address: Japan.

4180. Morizui, Mareyuki. Assignor to Scientific Research Institute, Ltd. 1955. [Synthetic wine (ingredients include defatted soybeans)]. *Japanese Patent* 4438. June 28. (Chem. Abst. 51:17091b). [Jap]*
• ***Summary:*** Defatted soybeans are treated with methanol, rice-malt and saccharifying agent, and fermentation is caused by addition of yeast to make the ethanol content 5-20%. The product is mixed with perfumes or pure wine. Address: Japan.

4181. Takeda, Yojuro; Kagami, Motoo. Assignors to Takeda Foods Company. 1955. [Concentration of soy sauce by use of ion-exchange resins]. *Japanese Patent* 4441. June 28. (Chem. Abst. 51:13311d). [Jap]*
• ***Summary:*** Soy sauce is passed through a column of cation-exchange resin regenerated with hydrochloric acid, sulfuric acid, or sodium chloride, and the filtrate concentrated to ¼ volume. The flavor of the soy sauce, which is adsorbed on the column, is eluted with hydrochloric acid, adjusted to pH 4.4-4.6 with sodium hydroxide, and added to the concentrated filtrate to give a concentrated soy sauce of a superior fresh flavor.

4182. Iguchi, Nobuyoshi; Yamamoto, Kishiro. 1955. Kôji-kin ni kansuru kenkyû. XII. Jinkô heni kabu X-816 to oya kabu no tanpaku bunkai kôso-kei ni tsuite no hikaku (2) [Studies on Aspergilli. XII. The comparison of the proteolytic enzyme system between the induced mutant X-816 and the parent strain (2)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 29(6):394-99. June. [18 ref. Jap; eng]
Address: Noda Industrial and Scientific Research Lab., Noda, Japan (Noda Sangyo Kagaku Kenkyusho).

4183. Hamada, Hideo. 1955. Shôsô-in yakujin-chû no inamomi oyobi daizu no keishitsu ni tsuite [On the characters of paddy and soybeans in drug wastes preserved in the Shosoin Treasury]. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 23(4):276. July. [1 ref. Jap; eng]
• ***Summary:*** The paddy and soybeans in the drug wastes preserved in the Shosoin Treasury were investigated morphologically and microchemically.

"The soybeans of the treasury exhibit the medium size and shape between those of the wild form and the summer varieties. The Shosoin soybeans weigh about 21% lighter than the contrasting soybeans of nearly the same size, and retain the minimum water contents of soybean, viz. 8.9%, while those of the summer varieties hold about 12% in general. Besides it is noteworthy that the cotyledon parenchymatous cells of the Shosoin soybeans are about 37% narrower than those of the contrasts. Despite being under such circumstances, no significant sign of chemical deterioration in soybean protein and fat in the plasm, exclusive of pectin in the middle lamella of the cell wall, is observed under a microscope." Address: Hyogo Agricultural College.

4184. Rao, Rama Kanth; Krishna, M.G.; Zaheer, S.H.; Arnold, L.K. 1955. Alcoholic extraction of vegetable oils. I. Solubilities of cottonseed, peanut, sesame, and soybean oils in aqueous ethanol. *J. of the American Oil Chemists' Society* 32(7):420-23. July. [7 ref]
• ***Summary:*** Describes solvent extraction using ethyl alcohol. Notes that as early as 1937 the Japanese reported the use of ethanol as a solvent for the batch extraction of soybeans in a plant at Dairen, Manchuria. In the USA, the most commonly used solvents for solvent extraction of vegetable oils are low boiling petroleum fractions, such as normal hexane. In European countries benzene, trichloroethylene, and cyclohexane have been used. In America, considerable work has been done on the use of ethanol and isopropyl alcohol as solvents. Address: Iowa Engineering Exp. Station, Iowa State College, Ames, Iowa.

• ***Summary:*** Page 1123: "Oriental Show You Co., 20 Woodbridge E. (Imported Japanese)..." Address: New York 1, New York.

4186. McLaughlin, Kathleen. 1955. Soy milk plant to aid Indonesia: Factory in Jogjakarta may build up nutritional values for all Southeast Asia. *New York Times.* Sept. 18. p. 21.
• ***Summary:*** Harry Miller, Jr., an American technician for the United Nations Food and Agriculture Organization, is supervising construction of a plant to produce soybean milk–in both liquid and powdered form, in Jogjakarta, Indonesia. The plant is expected to be in production by Feb. 1956, and by mid-year the dehydrated form should be available for domestic shipment.

More than 20 years ago, Mr. Miller's father, an American medical missionary in China, developed a good-tasting soybean milk there. By hard work, persistence, and

© Copyright Soyinfo Center 2014

ingenuity, he developed the equipment that is now being instaled in the Jogjakarta plant.

"By 1936, Dr. Miller had returned to Shanghai with his family, erected and equipped a factory, and was turning out 3,000 quarts of bottled soybean milk a day, at 7 cents (U.S.) a quart. Cow's milk cost 30 cents.

"Then the war with Japan erupted. In 1937, Japanese forces completely destroyed his plant and in 1938 the Millers left China for their home in the United States." In 1947 they returned briefly to China, then in 1948 they left again before the Communist advance.

Dr. Miller's patents have long since been relinquished to the public domain, with the exception of an interest retained in one soybean milk plant in California. As an F.A.O. expert, Harry Miller Jr. hopes to make his father's soymilk processing system as widely available as possible, especially in places like Indonesia, where it can offer the greatest benefits.

The United Nations Children's Fund [UNICEF], which has provided $350,000 worth of the Miller type equipment for the Jogjakarta plant, has agreed that half of the annual output of 600 tons of soybean milk, powdered or liquid, from this plant, will be distributed free of charge to Indonesians for the first 3 years.

4189. Strayer, George M. 1955. Need industry council for vast selling job! Sees 100 million bushels annual exports in the not-far-distant future. *Soybean Digest.* Sept. p. 12, 14-15.
• ***Summary:*** At each year's annual convention, the problems are different. "Cottonoil stocks: Last year when we met at Memphis [Tennessee] the federal government owned vast quantities of cottonseed oil. Today those stocks are gone. Large tonnages were placed in the export markets of the world." At the same time, "we have sold about 55 million bushels of 1954-crop soybeans into export markets–about 15 million bushels about the highest previous figure."

"Our association has a vast educational and public relations job to do with foreign buyers"–as in Europe and Japan. It is now a buyer's market and ASA must do everything possible "to assure proper administration of the grades under the new standards."

"For several years I have pointed out at this meeting the desirability of forming an industrywide organization to carry on the promotional and educational work which our industry needs. The soybean industry has now reached a point where we are faced with a vast sales and promotional job... We must begin to do as many other industries have done–we must be prepared to sell and sell and sell. For some months a joint committee from this Association and from the National Soybean Processors Association has been meeting on this subject... Full report will be made today, together with suggested action by this group. It is my personal feeling that we have finally reached agreement on an industrywide Council or Institute, and that we must now move ahead just as rapidly as possible." ASA does not have the income to do this work alone.

Photos show: (1) George Strayer. (2) Chester B. Biddle and family of Remington, Indiana; he was president of the American Soybean Association from 1951 to 1953. (3) Charles P. Taft behind a podium, speaking about world trade. Address: American Soybean Assoc.

• ***Summary:*** The percentage of vitamin B-6 in the form of pyridoxol, pyridoxal, and pyridoxamine in soybeans is 44, 44, and 12 respectively. Address: Biochemical Lab., Kitasato Inst., Minato-ku, Tokyo and Biochemical Inst., Kyoto Prefectural Univ. School of Medicine, Kawara-machi, Nishijin, Kyoto, Japan.

4191. Meade, Mary. 1955. Consul general's wife gives us Japanese recipes. *Chicago Daily Tribune.* Oct. 21. p. B1.
• ***Summary:*** Here is Mrs. Okuma's recipe. "Teriyaki (Six servings): 1 2½ pound frying chicken. ½ cup soy sauce. ½ cup sake. ½ teaspoon sugar. 1 teaspoon ginger juice (or 1 minced clove garlic). ¼ teaspoon aji-no-moto (monosodium glutamate).

Soak pieces of chicken for 1½ hours in a mixture of the other ingredients. Place in a baking pan and bake at 350 degrees [F.] for 45 minutes, Turn pieces several times and baste with sauce in which chicken was soaked. Serve with relishes: pickled horseradish, white onions, and cucumbers.

Note: This is the earliest English-language document seen (Nov. 2006) that uses chicken or poultry as the main ingredient in a teriyaki recipe. It is also the earliest that calls for baking (rather than broiling) the ingredients.

4192. *Soybean Digest.* 1955. Strayer on special mission to Japan. Oct. p. 7.
• ***Summary:*** The USDA has announced "the appointment of Geo. M. Strayer, executive vice president of the American Soybean Association, as a marketing specialist in the fats and oils division on a temporary basis for a special agricultural mission in Asia,..."

"Strayer will leave in mid-October, will spend a minimum of a month in Japan, Hongkong and the Philippines surveying the market potential for American soybeans and soybean products.

"Japan has been the largest single buyer of U.S. soybeans the past two years. Strayer will contact buyers of soybeans and soybean oil meal, since the Japanese are also large buyers of the latter commodity, and will discuss the handling with them of soybean exports and the problems involved.

"He will be accompanied by Mrs. Strayer. They expect to return to the U.S. at the end of November."

4193. Tanabe, Keizo. Assignor to Agency of Industrial Science and Technology. 1955. [Catalysts for isomerization of oils]. *Japanese Patent* 8056. Nov. 7. (Chem. Abst. 51:18645f). [Jap]*
• ***Summary:*** The catalysts are suitable for transferring or conjugating the double bonds in the acid radicals of soybean oil, etc., to make drying oils. 50 parts soybean oil in the presence of 5 parts catalyst gave a 29% yield after 3-6 hours reaction in an inert atmosphere at 180-200ºC.

4194. Holmberg, Sven A. 1955. Problems of soybean adaptation in Sweden: Breeding work is based on Japanese material. *Soybean Digest.* Nov. p. 18, 20.
• ***Summary:*** "In the various European countries more or less serious efforts have been made to introduce the soybean as a crop. The northern extremes where soybeans are grown as a major crop in Asia are the plains of the Amur, the Nonni and the Sungari rivers on the mainland and the Japanese island of Hokkaido...

"Hokkaido is the only country in the world where soybeans are grown as a major crop in a relatively cool and partly marine climate. There is no doubt that soybean breeding material from Hokkaido holds more promise for Sweden, and generally for northern Europe, than material from Manchuria and other regions with a continental climate.

"In accordance with this surmise the author brought home to Sweden in 1940 a collection of soybean strains from Hokkaido and southern Sachalin (Sakhalin, Karafuto).

"This Japanese material was used in some 2,700 hybridizations followed by selection for adaptation. The choice of this breeding material has reduced the adaptation problem for Sweden to practical dimensions...

"Although the Kalmar-Oland region of Sweden, latitude 56º-57º, where the Fiskeby varieties of soybeans are grown commercially, enjoys a longer frost-free season than many soybean growing districts in Hokkaido, northern Manchuria and the northern United States, this relatively long growing season is required to ripen extra early varieties in a cool autumn. Only the breeding of Swedish soybean varieties combining earliness with adaptation to the day length of the latitude has made it possible to grow soybeans regularly in Sweden.

"In 1941 seed of three early foreign soybean varieties was distributed by the Swedish government Food Commission to farmers for practical growing trials. These failed and the experiment of growing foreign soybean varieties was soon abandoned.

"But the breeding of soybeans with a view to adaptation was pursued with the support of the government both by the Swedish Seed Association at Svalof and Algot Holmberg Seeds Ltd. at Fiskeby.

"In 1950 a brown-seeded soybean, Sv. Ugra, was announced at Svalof. It was from a cross of Wisconsin Black with a Polish variety. The yellow-seeded Fiskeby III originating from a cross between a German strain and a Sachalin variety was released by Holmberg in 1949.

"Since Fiskeby III was of the edible type it has been approved for use in army rations, school lunches, etc. It is grown commercially on a small scale in the Kalmar-Oland region. Its mean yield over a 10-year period has been 23.2 bushels per acre...

"In Holland a private breeder, Dr. Louis Koch, has also used northern Japanese material with good results. His successful work has been discontinued but his strains are kept alive."

A photo taken at Fiskeby in 1949 shows (left to right): Pierre Holmberg, George M. Strayer, M.E. Paddock (agricultural representative on an ECA mission), J.L. Cartter (U.S. Regional Soybean Laboratory), and Sven A. Holmberg.

© Copyright Soyinfo Center 2014

stimulates the appetite. The mixed ingredients are fermented at natural temperatures for about a year, then pressed with a hydraulic press. Japan is expected to produce 271,440,000 gallons of soy sauce during the year ending in March 1956. Since Japan's population is about 88 million, per capita consumption is about 3.1 gallons/year. The raw materials needed to produce this say sauce for one year are: Soybeans 30,000 tons. Soybean cake 200,000 tons (made from 250,000 tons of soybeans). Wheat 200,000 tons. Salt 250,000 tons. "This means that Japanese soy sauce makers are annually using 280,000 tons of American soybeans. Japanese soy sauce makers imported all their soybeans from Manchuria before World War II. The situation has since changed entirely."

Photos show: (1) A tank truck used for transporting soy sauce in Japan. (2) A hydraulic press for compressing the mash. Address: Managing Director, Japan Soy Sauce Brewer's Assoc.

4197. Strayer, George M. 1955. Why Japan wants clean soybeans. Blow to U.S. exports to Japan. *Soybean Digest.* Dec. p. 4-5.

• ***Summary:*** "Japan is a country of over 80 million people. Total area is about the same as California. Only a very small part is tillable."

"Last year Japan imported a total of about 750,000 metric tons of soybeans (27.5 million bushels). About 250,000 tons were crushed in oilseed mills. The remainder went directly into foods usage, producing soy sauce, soybean paste [miso], and soybean curd [tofu]. Over 90% of the flakes from the soybean crushing at the oil mills went to these same food plants.

"Soybeans are the life blood of Japan. They are an absolute necessity, for they are the food of the people. They are used directly, not indirectly, as is our soybean meal in the form of livestock products.

"There are over 3,000 vegetable oil mills in Japan, all except about 30 of them small community plants. Only 33 are on the list to receive imported soybeans. There are over 6,000 manufacturers of soy sauce in Japan. There are over 50,000 manufacturers of tofu or soybean curd, and there are several thousand small manufacturers of soybean paste or miso.

"These small plants do not and cannot have cleaning facilities. They must use the soybeans as they come. They prefer domestic beans, second choice is Chinese beans, and next come our beans. Why? Only one answer–foreign material. Their reaction is exactly as would be yours under similar conditions. They merely ask–why can you not sell us clean soybeans?"

The Japanese are importing more and more soybean from Red China. The Ministry of International Trade and Industry (MITI) favors increased trade with China. "Authorized imports of soybeans [to Japan] to 335,000 metric tons. Of these, 203,000 metric tons were allocated directly to oil mills and food manufacturers. They may be purchased on a global basis–wherever the buyer can buy at the lowest price and find acceptable supplies. Oil millers will favor U.S. beans because of higher oil content, while food manufacturers will probably buy Chinese beans when available.

"The remaining 132,000 tons were allocated to import firms. If a firm had a record of U.S. imports during the previous year the quota for that firm is based on 50% of the tonnage handled. But if a firm imported Chinese soybeans during that same period, the firm's quota is based on 100% of that tonnage.

"As soon as I discovered the content of the allocation I called it to the attention of embassy officials here in Tokyo, and a protest was filed with the Japanese government. However, at this writing much more work remains to be done.

"As closely as can be figured about 9 million bushels of soybean business was lost by the U.S. in this one allocation.

A large photo shows George Strayer standing behind a podium, addressing a room full of men seated in chairs. A movie projector is visible in the center aisle. The caption reads: "Strayer addressing meeting of 110 representatives of the soybean industry in Japan at the University Club in Tokyo Nov. 14. Invitations were issued by W.D. Termohlen, Agricultural Attache in the American Embassy, to the leadership of oilseed crushers, miso, soy sauce and soybean curd associations of Japan. At his side is Hiroshi Nakamura of Honen Oil Co., who served as interpreter. Mr. Nakamura was a Fulbright scholar in the United States during the 1954-55 university year."

Note 1. This article was written by Strayer in Tokyo, where he is conducting a marketing study for the U.S. Department of Agriculture.

Note 2. This is the earliest document seen (March 2001) concerning the activities of the American Soybean Association in Asia, in East Asia, or in Japan. This is also George Strayer's first trip to Japan.

Color of Koya-dofu (continued)]. *Osaka Furitsu Kogyo Shoreikan Hokoku* (*Reports of the Industrial Research Institute, Osaka Prefecture*) No. 7-1:31-37. [9 ref. Jap; eng]
• ***Summary:*** The color of Koya-dofu (dried-frozen tofu) turns from white to yellow during the manufacturing process. This change in color is caused mainly by the structural change in the tofu during processing. The faster the product is frozen, the whiter the color of the final product. The yellowish tint comes from the soybean oil which oozes out of the tofu due to internal stress. Auto-oxidation of oil or protein has little to do with the product's color.

The small amounts of genistein were found in the tofu deepen the color while the tofu is being treated with ammonia.

Commercial frozen tofu is frozen quickly which imparts a fine-grained texture to the surface of the tofu, but requires prolonged aging (20-30 days) to restore the lost elasticity. Home-made frozen tofu, freezes more slowly outdoors in cold, snowy weather, which gives it a coarse-grained texture; it requires less aging (5-7 days).

• ***Summary:*** A very interesting study in human geography and culture, and of the details of life in three villages (incl. Hanashiro and Matsuda) on the island of Okinawa starting in 1951. This book is doubly interesting because by the year

© Copyright Soyinfo Center 2014

2000 Okinawans were widely considered to be the longest-lived and healthiest people in the world (Willcox 2001).

The author decided to select a village whose economy was based on agriculture–this meant primarily the cultivation of rice, sugar cane, sweet potatoes, and soybeans (p. vii).

Okinawan villages have a striking "dependence on plants, not only for food but for other uses" (p. 3). Chapter 1 is about the geography and cultural history of Okinawa, which has long been pulled between and paid tribute to China and Japan. Okinawa is the largest and most populous of the Ryukyu islands. These islands are generally divided into four island groups (*gunto*)*;* the Okinawa, Amami, Yaeyama, and Mikado groups. Three maps and a table (p. 8-16) shows these relationships. Naha, the capital of Okinawa island, is in the southwest.

Bean paste [miso] or bean curd [tofu] are used in the cooperative ceremonies of housebuilding (p. 70-71).

The most typical shops in rural Okinawa include import stores, which carry rice, flour, soybean sauce, and wheat (p. 74). Small retail shops sell foods, including soybean oil and Ajinomoto (p. 76).

"In the farming areas, sugar and rice are the only significant sources of cash income. Sweet potatoes, rice, eggs, and soybeans may be sold," but they do not provide much cash. The farmer "can produce much of his food and need spend little money if he is willing to subsist on sweet potatoes, bean curd, and bean-paste soup" (p. 86).

Chapter 7, titled "Agriculture" states: "Soybeans, grown for home consumption, are used for making bean curd (*tôfu*) and bean paste (*miso*)*"* (p. 131, 151). For soybean cultivation and crop rotation, see pages 136, 138, 151. Soybean plants are harvested with a small sickle and threshed by a flail; the residues are used for either fertilizer of fuel. Whereas soybeans are always used to make tofu or miso, soy sauce is always purchased.

Another type of bean is the "red dwarf bean (*adzuki*)*"* (p. 151).

Table 16 (p. 153) shows that soybeans are grown as a dry-land (rainfed) crop; in Hanashiro in 1952 they occupied 19.2% of the total land area; sweet potatoes occupied 50.8% and rice 15.5%.

The term "waste bean curd" (*tofu no kasshu* [*kasu*]) is used to refer to okara (p. 158-59); it is fed to horses and oxen.

When a person dies, if his descendants are devoted, his life will be remembered and celebrated periodically until 33 years after his death (p. 204).

Page 280: "One of the most significant links between family, village, and school is the annual athletic meet (*undôkai*)... There is much bustle, laundering, hair washing and cooking in a village the day before the meet. Special lunches including rice dyed red, bean curd, slices of fish paste, beef or pork are prepared." The infant is with the mother "when she is turning the quern to make bean curd" (p. 204).

The main difference is the basic diet is that the poor eat more sweet potatoes and less rice. For most people, breakfast includes a "soup made of hot water and bean paste, perhaps with bits of other foods. For dinner: "Bean-paste soup, rice or sweet potatoes, bean curd and tea" (p. 223).

"Home-made bean curd (*tôfu*)*"* and bean paste (*miso*) are an important foods, but miso is the more important of the two. in the daily diet. The present diet is better than before the war, when it consisted of mostly of the sweet potato and bean-paste soup. The latter usually has a few shred of shreds of fish or meat in it. "In times of scarcity, or if the family is poor, only the paste is used; when it is dissolved in hot water, it makes a kind of clear bouillon which is jokingly referred to as 'mirror soup' (*kagami miso*) because one can see his face in it; it is also called 'nothing in it soup' (*nnshiru*)*"* (p. 224)

The method of making bean curd is described (in part incorrectly). The remaining whey is used for pig food. "Bean curd, fried, boiled in a soup, in a mixture with vegetables, or as an ingredient in *sukiyaki* is always served at a party."

"Most families serve bean-paste soup (*misoshiru*) every meal every day. It [miso] has four basic ingredients: soybeans, rice or barley–occasionally the cycad, salt, and water. Recipes differ considerably among families... It is put in a large jar (*tsubo*) which is placed in the kitchen or in a storeroom and allowed to stand for at least a year, sometimes for three. With age, the paste becomes sweeter and is considered to be better; when ready for use, it is very soluble in water" (p. 225).

An excellent photo (p. 239) shows a woman making bean curd using a hand mill.

In observances in memory of the dead, when the "tomb is revisited on the seventh day, rice cakes [mochi], bean curd, favorite foods of the deceased, and a little sake may be taken as offerings" (p. 248).

After New Year, the next public holiday is *Jûrokunichi* (literally, sixteenth day), the 16th day of the first lunar month (Feb. 21, 1951); it "is a day of devotion and prayer at the family tomb." In Hanashiru, food is taken in two lacquer boxes (*jûbako*), the second of which includes bean curd (p. 253).

In historical times, Okinawan culture was for centuries exposed to Chinese culture, especially from the 14th to the early 17th centuries, "The most significant borrowings, either directly from China or via Japan," have included "articles of diet, such as bean curd" (p. 298).

Soybean or soybeans are mentioned on pages vii, 74 (soybean sauce), 76-77 (soybean oil), 86, 138 ("The second month (March 8 to April 5, 1951) is devoted to soybean planting which continues until about the middle of the month..." The soybean plots are weeded), 131 ("Four crops are the mainstays of Okinawan agriculture: rice, sweet potatoes, soybeans, and sugar cane"), 135-36 (soybeans in crop rotation), 138-39 (Soybeans are harvested in the fifth

© Copyright Soyinfo Center 2014

month, June 5 to July 3, 1951), 151 (After the soybean, the daikon is the most important of the minor crops grown for home use. Soybeans are planted once a year), 297 (sweet potatoes, soybeans, and sugar cane can be grown freely on land unsuited for rice). Address: Geographer, Berkeley, California.

4208. Griffin, Stuart. 1955. Japanese food and cooking. Rutland, Vermont, and Tokyo, Japan: Charles E. Tuttle Co. 167 p. Illust. No index. 19 cm.
• ***Summary:*** This basic introduction by an American contains about 70 Japanese recipes. The best known of these in the USA is Sukiyaki. The chapter titled "Ingredients" states (p. 3-4) that ingredients available in the USA include *"fu,* or wheat gluten; *tofu,* or bean curd; *yuba* or dried bean curd [sic]; and *udon,* or macaroni... sugared red beans [azuki],... bean paste squares and jellies, seaweed rice-cakes [probably mochi], painted with *shoyu* sauce." Sauces and flavorings are very important to Japanese cookery. "Foremost among these is *shoyu,* or soy sauce, made from wheat or barley, soybeans, salt, and water A dark, inky, thirst-provoking liquid, it is similar to that found in Chinese restaurants. The wheat is grilled in a big iron pan until burnt-brown in hue. It is then crushed. [Soy] Beans are boiled in an adjacent cauldron, with a heavy weight on the lid. Boiling lasts three to five hours, then the fire is put out, and the beans are kept in the kettle overnight. Steaming may be used as a method of bean preparation. This process lasts for five or six hours. The grilled wheat and boiled beans are mixed and placed in a malt-room [sic, koji room] where malt seed [sic, koji starter] are added The mixture turns to malt [koji] in a few days. Salt water is put over the malt and left for a few more days, being stirred occasionally until fermentation takes place. This overall mixture is pressed, and the [soy] sauce obtained is bottled.

"*Miso* is another necessity. This is a mixture of malt [koji], salt, and mashed soybeans, the liquor of which is drained off in tubs and allowed to ferment. *Miso* will be discussed later in the soup chapter" (see p. 64). Soy sauce and Aji-no-Moto are frequently mentioned. Soy-related recipes: Chirashi-zushi (with beancurd, p. 31-34). Sashimi (with shoyu, p. 36-41). Miso soups (p. 49, 64-69). Bean curd soup (p. 52-53). Roasted on a plough (sukiyaki with bean curd, p. 70-81). Vegetables, white sesame & vinegar (salad, with "1 *aburaage,* a kind of fried Japanese bean curd," p. 1124-25). Shoyu spinach (salad, p. 134). Turnips in shoyu (p. 134-35). Sweet soy beans (a festival dish at New Year's, p. 154-55).

Also mentions: Red rice (with azuki beans and glutinous rice, p. 17-18). Norimaki-zushi (sushi wrapped with nori, p. 27-30). Red bean cake (*yokan,* with bean paste, made from red kidney beans, and agar-agar, p. 145-46). Red kidney bean soup cake (*shiruko* [with azuki beans and mochi], p. 148-49). Bean & jam cake (*kuzumanju,* [with azuki bean paste and kuzu], p. 150-51). Address: [Japan].

• ***Summary:*** Much of this information describes the development of Kikkoman and its predecessors during the Edo period. Pages 61-63 give information on early Dutch exports of shoyu from Japan. Bibliographic references are given for shoyu export documents, all written in old Indonesian Dutch (which is quite different from old Dutch of the same period), from 1668 to 1776 (Kanbun 8 to Anei 5) located at the Waran Bunsho-kan (Japanese-Dutch Document House at The Hague, Netherlands).

1. Copy of a letter dated 17 Dec. 1668, written by the governor, Balthasar Bort, and the Council of the Moluccas [Malacca? Malaccas?] near Ceylon to Ryklof van Goens. To: India, Southeast Coromandel area. To Coromandel: Sake 30 kegs (*taru*) and shoyu 12 kegs.

2. Copy of a letter dated 13 Feb. 1670 (Kanbun 10), written by the governor Antehong Pavilioen and the Council of Negapatonam. This is an order form for goods needed by the company, plus some other things. India, East Coast Ceylon island, northwest of opposite shore. Order from Japan: Sake 30 kegs, shoyu 12 kegs, miso 6 kegs.

3. Original general letter dated 13 Feb. 1677 by the Governor General and the Council of the Dutch East Indies from Batavia [today's Jakarta] (Northern part of India, east Coast Madras). To Coromandel: Palliacatta, Various types of Japanese shoyu 17 kegs.

4. Original general letter dated 13 Feb. 1679 (Enhô 7) by the Governor General and the Council of the Dutch East Indies. (India west north corner Surat). To Surat: Shoyu 4 kegs.

5. Original general letter dated 11 Dec. 1679 by the Governor General and the Council of the Dutch East Indies, from Batavia. To Coromandel: Miso 1 keg, shoyu 10 kegs, oil 8 kegs. To Ceylon: Shoyu 20 kegs, sake 2 layered kegs–6 kegs, miso 2 layered kegs = 20 kegs.

6. Original general letter dated 29 April 1681 (Tenwa 1) by the Governor General and the Council of the Dutch East Indies, from Batavia. Coromandel: Shoyu large keg(s) (ôdaru)–half kegs (handaru). Ceylon: Shoyu large keg(s) (ôdaru)–three-quarter kegs.

7. Memorandum, dated 8 Jan. 1681, concerning a list of

© Copyright Soyinfo Center 2014

merchandise imported by ship [from Japan] on Chinese junks and ships from other foreign countries in Tonkin. Offerings to the former king: Sake 5 kegs, shoyu 10 kegs. Offerings to the assistant king (fuku-ô): sake 5 kegs, shoyu 10 kegs.

8. Copy of a letter dated 14 March 1683 (Tenwa 3) from the Governor and Commissioner, Jacob Joris Pitch, and the Council of Palliacatta near Batavia. Sake: large keg(s), half keg(s). Shoyu: large keg(s), half keg(s). Miso: 6 kegs.

9. Copy of a letter dated 20 Jan. 1699 from governor Govert van Hoorn and the Council of Malacca. Ceylon: Sake 2-layer kegs–6 kegs. Shoyu 2-layer kegs–8 kegs. Miso 2-layer kegs–2 kegs. Bengal: Shoyu 5 kegs, miso 5 kegs. Nagapatnam [probably Nagapatinam, a seaport town in southeast Tamil Nadu, in south India, on the Coromandel Coast 160 miles south of Madras]: Sake 2-layer kegs–3 kegs. Shoyu 3 kegs.

10. Thunberg's *Travels in Japan* (*Nihon Kiko*) published in 1796 noted in 1776 (Anei 5) that the Japanese do not export much tea to the surrounding countries since Japanese tea is quite inferior in quality to tea from China. However the Japanese make shoyu that is far better than Chinese shoyu, and many kegs of shoyu have been shipped to Batavia [Jakarta], India, and Europe. The Dutch in Japan discovered how to use heat to prevent over-fermentation of shoyu. They boiled the shoyu in an iron cauldron, then bottled it and sealed the mouth with painting pitch (*rekisei*). Shoyu heat-treated in this way will retain its strength and can then be used in making various sauces.

Note: In various of the above reports, shoyu was written as Zoya or Soya; sake was written as Saky with an umlaut (2 dots) over the "y," and miso was written as Miso. These products were listed along with other Japanese goods. It is clear that these things were exported from Japan ports in India.

Also includes: Regulations of the Tokyo Shoyu Company (1881), p. 89-91. Address: Noda Shoyu, Noda, Japan.

• ***Summary:*** Repeats the information from Morita 1915 about Haruhachi Shimada being the first to brew shoyu in Hawaii.

4213. Lundqvist, Eric. 1955. In eastern forests. Translation of Vildarna finns i väst. London: Hale. 264 p. Illust. 27 cm. *
• ***Summary:*** "Only white crayfish with ketjap sauce and paprika. We went ashore to look for turtles' eggs. The island is high and hilly, and covered with dense jungle."

Note 1. The "eastern forests" refer to those of Indonesia.

Note 2. This is the earliest English-language document seen (April 2012) that uses the term "ketjap sauce" to refer to (probably) ketjap (Indonesian soy sauce).

4214. Noda Shoyu K.K. 1955. Noda Shôyu Kabushiki Kaisha Sanjugonen-shi [Thirty-five-year history of Noda Shoyu, Inc.]. Noda, Japan: Noda Shoyu K.K. 865 p. Illust. No index. 28 cm. [Jap]
• ***Summary:*** This is the second major history of Kikkoman, written largely by Mr. Morio Ichiyama. Concerning the Mogi Saheiji family line (p. 107): The third generation Mogi in this line started a shoyu brewing business in 1782. The trademark, first used in 1784, is identical to the Kikkoman trademark used today; it was designed by Manbei SARANUMA, who was a grain merchant. Earlier in 1784 another trade mark named Kikko-dai was used briefly.

In the section on exports (p. 560), subsection "Development of exports," it is written that shoyu was allowed to be exported during the period of Japanese isolation (*sakoku*) that started in the early 1600s (early Tokugawa period). According to Dr. Iwao, whose source of information was the Hague Library in the Netherlands (*Waran Haagu Bunshokan;* probably Nederlandse Vereiniging van Bibliothecarissen, Documentalisten en Literatuuronderzoekers (NVB)), in 1668 the Japanese sent 12 kegs of shoyu to Coromandel, India (a coast region of southeast India on the Bay of Bengal), in 1670 to the island of Ceylon, in 1677 to Coromandel again, in 1679 and 1681 to Surat in northwest India and to Coromandel, in 1681 to Tonkin (part of French Indochina from 1887, today in North Vietnam) where 10 kegs of shoyu were offered to both the ex-king and the vice-king, and in 1699 shoyu was shipped [by Dutch merchants] (together with sake and miso) to Ceylon, Bengal, and Nagapattinam (a seaport town in southeast Tamil Nadu, south India, on the Coromandel coast, 160 miles south of Madras). Shoyu was written as "Zoya" or "Soya." Sake was written as "Saky" with two dots over the "y." And miso was written as "miso." These exported products were sold at various places in India.

Pages 453-56 discusses the *Mankin Sangyotai* or *Bankin Sugiwai Fukuro* (1731 or 1732), noting that koji starter (*moyashi*) was now being made specifically for shoyu. Sake is made mostly during the cold season (*kanzukuri*). Shoyu should be fermented during the summer (*dôyo shikomu*) and pressed at the end of fall.

Pages 529-30 discuss the size of the wooden kegs *taru* in which shoyu was shipped and retailed. During the Tokugawa or Edo period (1600-1868) the kegs typically had a capacity 8 *sho;* since 1 *sho* = 1.80 liters or 0.476 gallons, a typical shoyu keg had a capacity of 14.40 liters or 8.568 gallons. And they typically contained 7.5 *sho* of high-class shoyu or 7 *sho* or regular/low-class shoyu. Starting in the year Meiji 1 (1868), a keg with 9 *sho* capacity was introduced. Then in Meiji 33 (1900) a larger size keg (called the *ô-dara-zumé*) was introduced; its capacity is not given. A keg of half this

© Copyright Soyinfo Center 2014

capacity (called the *ô-dara no handaru*) was also introduced. Contains many photos and illustrations.

Note 1. *Webster's New Geographical Dictionary* (1988) defines Coromandel Coast as a coast of southeast India from Point Calimere north to the mouths of the Krishna River. It has a low shoreline with no good harbors. The chief ports are Nellore, Madras, Pondicherry, Cuddalore, Tranquebar, and Nagapattinam.

Note 2. This document contains the earliest clear date seen for soybean products (Japanese shoyu) in Ceylon (today's Sri Lanka; 1670), or Tonkin (today's North Vietnam; 1681); soybeans as such had not yet been reported. Address: Noda, Japan.

4215. Rodrigo, P.A. 1955. Brief directions for growing soybeans (Leaflet). Manila: Philippine Dep. of Agriculture and Natural Resources, Office of Agricultural Information. 2 p. Revised ed. July 21. [Eng]
• ***Summary:*** The author concludes: "The soybean crop is ready to be harvested in 120 to 150 days after planting, depending upon the variety and the season when grown. For general purposes, the crop can be harvested when about 90% matured, especially when there is danger of bad weather. If intended for seeds, however, the crop should be thoroughly matured. In the absence of a binder the plants may be pulled off and tied into small bundles. These bundles may be set into stacks and threshed as soon as dry. The Japanese portable rice thresher is also an efficient soybean thresher. When there is danger of continuous rain the crop should be harvested and placed in the shade before it gets wet. At this stage, the soybean is easily spoiled; the beans rot with great rapidity. Soybean for seed purposes should be threshed as soon as practicable and the grains immediately and thoroughly dried. The seeds which should be completely air-dried are then stored in sealed containers. The straw and other by-products of threshing should be spread in the field for manurial purposes." Address: Chief, Horticulture Research Section, Bureau of Plant Industry, Philippines.

4221. Hedge, Porter M. 1956. Washington Digest: Brazil. *Soybean Digest.* Jan. p. 32-33.
• ***Summary:*** "A soybean expansion program is taking place in Brazil, Foreign Agriculture officials report.

"A new large crushing plant capable of producing around 20,000 metric tons of soybean oil a year is being built by an international concern.

"Technicians have been imported to help develop satisfactory varieties and demonstrate best methods of production.

"The expansion is taking place in the southern part of Brazil where most of present production is. The new processing plant is being located in this area.

"The Brazilian government in recent years has encouraged producers in this area to increase production of wheat so wheat imports could be reduced. Soybeans are a good crop to rotate with wheat. The area is one with large operators having ample capital to carry though an expansion program.

"Brazil's annual output of soybeans now is around 3 ½ to 4 million bushels. The new processing plant would be capable of handling an increase in volume equal to the size of the present crop.

"An increase in Brazilian supply would not necessarily mean a new supply for world trade. Most of the present output is grown by Japanese and Chinese immigrant farmers, and is marketed in Japan as soybeans.

"However, Brazil is short of fats. Population is increasing rapidly there, as in other parts of the world. The standard of living is rising. It's felt here that soybean expansion would be almost entirely for home use rather than export."

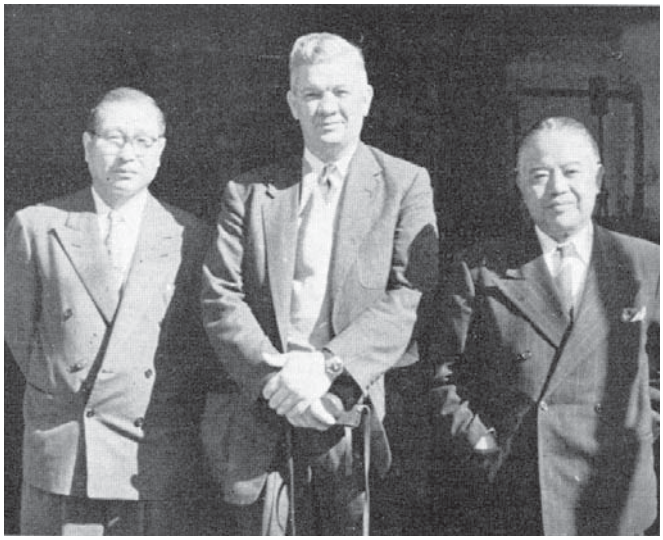
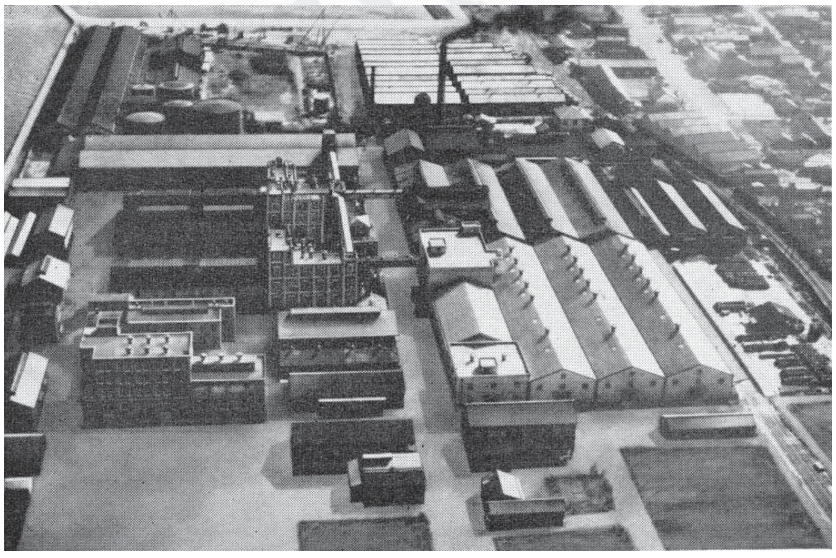
4222. Strayer, George M. 1956. We must remember: U.S. soybeans are food for the Japanese. *Soybean Digest.* Jan. p. 8-10.



• ***Summary:*** This is the first in a series of reports by the editor covering his recent marketing study for the USDA in East Asia. Above all, Japan wants clean soybeans from the U.S., with less foreign material. New U.S. standards allow No. 2 soybeans to contain up to 2% foreign material. U.S. standards classify all particles of soybeans which go through a 8/64-inch round hole screen as foreign material. Manchurian standards classify such broken particles of soybeans as unsound soybeans but not as foreign material. An estimated half of U.S. foreign material is these broken particles–which still end up making adequate soy products. "Because Manchurian [soy] beans have for years arrived with a foreign material content of ½% or less, the approximately 3,000 oil mills, 6,000 soy sauce plants, 5,000 soy paste [miso] plants and the 50,000 tofu or soybean curd plants in most cases do not have cleaning facilities... The role played by milk, meat, and eggs in the diets of America is taken by soybeans in the diets of Japan." The industries that uses soybeans are well organized, and each has its own trade association.

Photos show: (1) Strayer with the heads of the Yokkaichi oil mill and the Japan Oil and Fats Manufacturers Assoc. (2) The plant of the Hohnen Oil Co. at Shimizu which processes only soybeans into edible oil, glue, flour, and flakes for miso and tofu production (capacity 300,000 tons/year). (3) K. Sugiyama, chairman of the board of Hohnen Oil Co. receiving a medal. (4) Three men examining soybeans at the Takeya miso plant. (5) A cover photo shows a shipload of U.S. soybeans under new standards docks at the Ajinomoto plant in Yokohama, Japan.

4223. *New York Times.* 1956. Bean fetes mark 'spring' in Japan: Weather uncooperative as showerings of soy signal 'turning of the season.' Feb. 5. p. 11.



• ***Summary:*** "Tokyo, Feb. 4–Spring came to Japan ceremonially today with a chorus of staccato shouts and a shower of roasted soybeans in almost every household and all the temples of the land."

This ceremony, Setsubun (the "turning of the season"), celebrated on the first day of spring, is said to have originated in Japan's Imperial Court about 500 years ago. It "is supposed to frighten away demons and welcome beneficent spirits." The rite brings large sums of money into Buddhist temples and Shinto shrines throughout Japan.

One good place to see or participate in the Setsubun ceremony is at Tokyo's great temple of Kannon, the Buddhist goddess of mercy, located in the gay Asakusa amusement

© Copyright Soyinfo Center 2014

and shopping district. The ceremony, starting with a solemn procession of priests and about 40 lay notables, is described. "Many of the notables were business men in their forty-second year, a year supposed to be unlucky." They had paid large sums of money to the temple to be chosen to scatter the beans today, thus presumably nullifying the bad influences that are said to follow between one's 42nd and 43rd birthdays. Worshippers tossed 10-yen coins into slotted wooden receptacles. To catch a roasted soybean that has been tossed is supposed to bring exceptional good luck for the rest of the year.

4224. Elson, Katharine. 1956. Two Japanese shops cater to capital: For soya sauce or seaweed. *Washington Post, Times Herald.* Feb. 19. p. F13.
• ***Summary:*** The House of Hanna (1468 T st. nw.) was started in 1948 by Clara Hanaumi, wife of an American ex-GI, Harold Hanaumi, who was born in Hawaii and is of Japanese descent. A photo shows Harold Hanaumi in his shop discussing the "merits of a can of Japanese soy sauce with Mrs. Robert Overhuel."

The 2nd shop, Friends Market (1633 11th st. nw) is run by Harry Asaka. At first, Mr. Asaka featured just three items that are basic to "Japanese cooking–miso, a soybean paste; shoyu, the soya sauce, and rice."

4225. Strayer, George M. 1956. Japan's processors could use far more U.S. soybeans: Second of a series of reports by the editor covering his recent trip to the Far East. *Soybean Digest.* Feb. p. 6-9.
• ***Summary:*** Mr. Sugiyama, age 80, is chairman of the board of the Hohnen Oil Co., Tokyo, and is generally recognized as the dean of the Japanese oil industry. The soybean is today the major oilseed in Japan, but after crushing most of the oil and meal go into food products, rather than into feeds. "The Japanese oilseed crushing industry is an old one as compared with ours. According to information given me by Mr. Akaguchi, vice president of the Oil and Fat Manufacturers Association, the crushing of oilseeds in Japan on a commercial basis was started about 1630. Rapeseed was the first commodity crushed. The oil was the commodity desired. As soybeans came into the crushing picture they, too, were crushed for the oil, and the meal at the outset was of little consequence. Through the years the meal has become of increasing importance in the economy.

"Today there are two types of oilseed mills or plants in Japan. The first, and most numerous, is the small village plant, usually located in the interior villages, and operated by two or three persons. This is many times a strictly family enterprise. There are about 3,000 of these plants in Japan today, and in the trade they are known as 'mountain plants.' These plants operate on indigenous soybeans, garnered from the farms surrounding the village, and the oil and meal are utilized in the same village. Their production never enters normal trade channels...

"The other group of oilseed mills, known as 'sea plants,' are located on or near deep water, are comparatively large in size, and usually operate on imported raw materials, using solvent process equipment."

Before World War II, Japan's oilseed crushers imported about 800,000 tons/year of soybeans and up to 1 million tons/year of soybean oil meal and cake from the Chinese mainland. "Following the Japanese march into Manchuria in the early 1930s, the Japanese assumed ownership of many of the mills at Dairen and other Manchurian ports."

"During the 1955 calendar year total imports of soybeans into Japan were approximately 750,000 metric tons. Roughly half of this tonnage went to the oil mills, the other half to foods plants."

Photos show: (1) Mr. and Mrs. K. Sugiyama in formal Japanese dress. (2) Bags of soybeans being loaded onto trucks to be a warehouse of the Yoshihara Oil Co. near Osaka, Japan. (3) An Allis-Chalmers continuous solvent extraction unit at Yoshihara Oil Co. near Osaka.

4226. Strayer, George M. 1956. Japanese tofu makers don't like green beans or foreign material: Third of a series of reports by the editor covering his trip to the Far East. *Soybean Digest.* March. p. 20, 22.
• ***Summary:*** Contrary to general opinion, the Japanese are relatively well fed. "Theirs is a vegetable diet [largely meatless, near vegetarian, except for fish] out of necessity, for the concentration of nearly 90 million people on a small area of land less than the size of California and only about one-tenth of which is tillable makes a vegetable diet a necessity. They cannot afford the luxuries of an animal diet.

"Soybean protein fills the place in the Japanese diet that milk, meat and eggs occupy in our economy." Describes how tofu is made (8 photos show key steps in the process), and gives information based on an interview with Mr. Yamamoto of the Japan Tofu Association. Tofu originated in China where it has been made for at least 1,300 years. "In Japan the records show the production of tofu for something over 400 years... Today the tofu industry in Japan is using about 300,000 metric tons of soybeans per year, of which about 200,000 are produced in Japan and the remaining 100,000 tons are imported.

"A portion of the imports has been coming from the United States, some of them from Manchuria, and some from Brazil." "There are nearly 50,000 small tofu plants scattered throughout Japan. They buy their soybeans in small lots, and it is utterly impossible for them to provide adequate cleaning facilities in each of those plants. They must use the beans as they come to the plant, although I did see in my visits some efforts to screen the beans by hand and blow the light materials out of some lots. As can be easily imagined, morning glory seeds, foxtail, seed, cockleburs, corn and sticks and stems do not make good tofu. It is easy to

© Copyright Soyinfo Center 2014

understand why the plant operators want clean soybeans, and why over a period of time they are going to insist on having them.

"Managers of the tofu plants quickly point out that they consider the high foreign-material content of No. 2 beans a disadvantage from the standpoint of the quality of their product, and also from the standpoint of transportation on those materials. They would like, they continually point out, to buy clean soybeans, recognizing that they will cost more money.

"The tofu association buys some of the bean supplies coming from imported sources for its members. They want as light a yellow color as possible–in fact a nearly colorless or white bean is their preference. They want light-colored hilums, and greatly disapprove of the black hilum varieties because of the effect upon the color of the tofu. They want yellow interior color and yellow seedcoat, and dislike the green seedcoated beans which they sometimes get from the U.S. as U.S. No. 2 yellow beans."

• ***Summary:*** Soybeans, grown under short-day conditions, were sprayed with TIBA solutions at different growth stages from floral initiation to flowering. Treatments at about 10 days before flowering resulted in marked increases in the number of flower buds. Treatment at earlier stages resulted in greater increases in leaf numbers than bud numbers. Address: Faculty of Agriculture, Tokyo Univ.

4229. McKinney, L.L.; Cowan, J.C. 1956. Need for research on soybean oil meal. *Soybean Digest.* Part I. April. p. 14-16; Part II. May. p. 14-16, 18. [60 ref]
• ***Summary:*** Contents: Part I: Introduction. Vitamins: Known, unknown. Estrogenic activity. Saponins. Part II: Amino acids. Isolated soybean protein in nutrition. Summary.

"Estrogenic Activity: In 1946, reports began to appear in the Australian veterinary journals concerning the decrease in lambs from ewes grazing in subterranean clover [*Trifolium subterraneum*]. In some cases lambing fell below 10% of normal with 30% loss in ewes. During the period since 1950 the Australians have isolated isoflavones from the clover and have shown that these natural yellow dyes, found in most plant materials, are the causative agents. Genistein, an isoflavone also found in soybean oil meal (SOM), was found to be the principal one involved.

"The isoflavones have biological properties identical with those of stilbesterol (diethylstilbesterol) [stilbestrol, diethylstilbestrol]. Both of these compounds are proestrogens and are converted into the true hormones by the body. Stilbesterol is efficiently converted into the true hormone and has about equal activity. The isoflavones are not efficiently converted into the true hormone and have low activity. Genistein and diadzein [sic, daidzein], both of which are present in SOM, have about 1/50,000 of the activity of stilbesterol and the estrogenic activity varies considerably with the different isoflavones...

"According to Markley [1950] the presence of six isoflavones, usually in the form of glucosides, has been reported. These are genistin, diadzin [sic, daidzin], isogenistin, tatoin, methylgenistein, and methylisogenistein. The 'in' suffix denotes glucosides and 'ein' denotes the free isoflavone..."

Saponins: "Japanese workers pioneered the investigations on soy saponins and by 1940 they had shown that on hydrolysis four sapogenins along with glucose, galactose, rhamnose, arabinose, and glucuronic acid were obtained. They designated the sapogenins as soysapogenol A, B, C, and D. In 1950, Meyer, Jeger, and Ruzicka published their work leading to the structure of these four soysapogenols."

A graph shows (p. 14) U.S. high protein feed supply, 1925-1955, soybean oil meal equivalent, or 44% protein basis. In about 1941 soybean meal passed cottonseed meal to become the leading U.S. source of high-protein feed. Address: NRRL, Peoria, Illinois.

4230. *Soybean Digest.* 1956. Proceed on Japan project [Japanese-American Soybean Institute]. April. p. 7.
• ***Summary:*** In early April, 1956, the signing of a market development project for soybeans in Japan was announced jointly by the Foreign Agricultural Service, U.S. Department of Agriculture, and the American Soybean Association [ASA]. Designated as soybean project No. 2, it supplements the general market development agreement (signed previously by the two organizations), which designated the ASA as the official cooperator with USDA in projects involving P.L. 480 funds.

Up to $75,000 in Japanese yen may be used by the project to conduct an extended survey of deliveries of American soybeans, under the new grading standards which went into effect on 1 Sept. 1955. Preliminary details were worked out during October and November 1954 by George M. Strayer, while he was in Japan, with Japanese soybean trade groups.

"Establishment of an office in Tokyo, Japan, by a joint committee of the Japanese interests and the American

© Copyright Soyinfo Center 2014

Soybean Association is contemplated. First step will be the formation and activation of this Japanese-American Soybean Institute, and the employment of a managing director to be in charge of Tokyo operations."

Ersel Walley of the American Soybean Association is now in Japan as an official representative of ASA. The funds for the cooperative project will come from three sources: P.L. 480 sources, Japanese Trade Association sources, and ASA. The basic purpose of the project is to collect the necessary information on the "requirements of the Japanese market for soybeans so that exports of American soybeans may more nearly fill those needs, and thus expand the Japanese market for American soybeans."

Before World War II, Japan, which had a population of about 60 million people, imported as much as 800,000 metric tons of whole soybeans and 1 million tons of soybean cake and meal per year. Today Japan has a population of nearly 90 million people yet imports only 700,000 metric tons of whole soybeans and no soybean meal. Thus, there is demand which needs to be filled.

Japanese buyers have repeatedly objected to the "foreign material content and green-seedcoat color of many shipments of soybeans received" from the USA. This study will try to determine just how American soybean deliveries compare with those from Manchuria and Brazil, and how Japanese buyers who require a special quality or type of soybeans will be able to secure their needs–as through a special contract.

The current project is written to cover a period of one year starting 1 April 1956.

Note 1. This is the earliest document seen (Jan. 2014) concerning the Japanese-American Soybean Institute (JASI).

Note 2. This is the earliest document seen (March 2003) concerning a joint venture between USDA's Foreign Agricultural Service and the American Soybean Association. This soon became a large, thriving project.

4231. *Soybean Digest.* 1956. ASA [American Soybean Assoc.] men on Japan mission. April. p. 27.
• ***Summary:*** Ersel Walley and Marion Hartz will prepare an exhibit of soybeans and soybean products at the Osaka Trade Fair in April. Walley, former president of the American Soybean Association, is presently a member of its board of directors, and is also president of Walley Agricultural Service, Fort Wayne, Indiana.

Walley left the USA for Japan by plane on March 19. "He was in charge of the erection and staffing of the exhibit and is now meeting with Japanese trade groups of the soybean industry pertaining to a program of market development on soybeans under Public Law 480."

"The exhibit, sponsored jointly by the American Soybean Association and Foreign Agricultural Service of the U.S. Department of Agriculture, features the availability of American soybeans, the higher oil content as compared with shipments from other parts of the world, and demonstrates the place of soybean food products in supplementing the high rice diet of the Japanese people.

"'Japan is already our No. 1 customer for American soybeans,' Walley pointed out as he left for Seattle and Tokyo, 'but the potential market in Japan is only partially supplied. There is need for several times the present imports of soybeans as a source of fats and oil and protein.'

"As a purchaser of surplus agricultural commodities under Public Law 480 Japan has brought in wheat, rice, cotton and tobacco. A portion of the Japanese yen is issued in payment for those commodities to be used in further promotion and expansion of markets for agricultural commodities,..."

A photo shows Ersel Walley in 1956 holding two suitcases, standing in front of the ASA office in Hudson, Iowa. The caption states: "Ersel Walley as he left American Soybean Association headquarters to catch the plane for Japan."

4232. *Soybean Digest.* 1956. Mississippi County Farm Bureau made out a check for $300 to help finance the cost of the soybean market development study in Japan (Photo caption). April. p. 7.
• ***Summary:*** This photo shows: "Left to right, Hays Sullivan, Bill Wyatt, Tom Callis and Earl Wildy. Wildy is president, Callis is secretary and Sullivan and Wyatt have been active in the country's soybean program." Wyatt and Callis are holding and looking at the check.

4233. Nakamura, Mitsuo. 1956. [Drying oil from semidrying oil]. *Japanese Patent* 3931. May 28. (Chem. Abst. 51:13419b). [Jap]*
• ***Summary:*** Soybean oil is one of the ingredients. The product is filtered to obtain an isomerized soybean oil containing a conjugated double bond.

4234. Utsumi, Isamu; et al. Assignor to Tanabe Drug Manufacturing Company. 1956. [Amino acids mixture]. *Japanese Patent* 4395. June 11. (Chem. Abst. 51:15074g). [Jap]*
• ***Summary:*** A hydrochloric acid hydrolyzate of fat-extended soybean cake is concentrated *in vacuo,* and the residue is neutralized with sodium hydroxide to pH 7 and dried *in vacuo.* This residue (60 gm) and 7 gm ultrafine silicon dioxide are mixed, the mass is passed through a 20-mesh sieve, and the granules are mixed with 3% talc and molded into tablets. Address: Japan.

4235. Baens-Arcega, Luz; Marañon, Joaquin; Palo, Macario A. 1956. Proteolytic enzyme from a Philippine strain of *Aspergillus oryzae* (Ahlburg) Cohn. *Philippine J. of Science* 85(2):189-201. June. [7 ref. Eng]
• ***Summary:*** Strains of the mold *Aspergillus oryzæ* are used in Japan to make shoyu, miso, mizuame [rice syrup], and

© Copyright Soyinfo Center 2014

sake, and used in the manufacture of commercial enzymes such as Takadiastase, Polyzyme, Digestin, Oryzyme, and Kasiwagidiastase.

The authors isolated several protease-forming yellow-green molds. By repeatedly culturing the isolates in copra meal and rice bran media, one was found to produce protease of excellent digestive potency as evaluated by the Oshima and Church method. Optimum temperatures for protease production was 27ºC in copra meal and 22 to 27ºC in rice bran.

"The potency produced by the Philippine strain of *A. oryzæ* in copra meal is 3 times that of the most efficient *A. oryzæ* and 2 times that of the *Aspergillus effusus* type cultured in wheat bran by Oshima and Church." Address: Inst. of Science & Technol, Manila, Philippines.

4236. Walley, Ersel. 1956. Osaka soybean exhibit a success: Soybean marketing development program project No. 1. *Soybean Digest.* June. p. 6-8.
• ***Summary:*** "Japan was indeed a most logical location for our first truly International Exhibit of soybeans and soybean products." "Our exhibit at the Japan International Trade Fair in Osaka, April 8-22, 1956, was complete in every detail to tell the story of American soybeans from planting to ultimate utilization in the U.S. and Japan. A panorama of large photographs lined the wall of the exhibit telling the entire story through captions printed in Japanese." Two American films telling the entire story of American soybeans, in Japanese, were shown regularly in the small theater in the American pavilion, and proved of great interest. At least 500,000 people streamed through the American pavilion and viewed the exhibit.

Special thanks must be given to Shizuka Hayashi, managing director of the newly formed Japanese-American Soybean Institute, and to Marion Hartz of Stuttgart, Arkansas. Photos show: (1) Marion Hartz, Shizuka Hayashi, and Ersel Walley standing in the U.S. exhibit. (2) Long lines of people waiting to get into the American pavilion at the Osaka Trade Fair. (3) Ersel Walley demonstrating soybean cleaning equipment for many Japanese onlookers. (4) A Japanese trade group inspecting the soybean exhibit. (5) Mr. Hayashi with a group of Japanese tofu makers visiting the Trade Fair.

4237. *Washington Post and Times Herald.* 1956. Anne's trading post: Travelers bring recipes from afar. July 29. p. F14.
• ***Summary:*** Sukiyaki is the most popular of saucepan dishes. This recipe is taken from the *Japanese Cookbook* published by the Japan Travel Bureau. The ingredients include Soy sauce, 3 tablespoons and Tofu, 4 ounces. "Tofu is a bean curd which can be purchased here [in Washington, DC] however I omit it because it doesn't appeal to American palates."

4238. Owen, June. 1956. Food news: Other lands offer menu. *New York Times.* July 31. p. 26.
• ***Summary:*** "Oriental: Oriental Food Shop, 2791 Broadway, offers all the ingredients necessary for Japan's most noted dish, sukiyaki. These include tinned bean curd, bamboo shoots, and Japanese soya sauce."

Katagiri, 223 East 59th Street, is another good source for imported Japanese foods, especially canned, ready-to-eat products, including "scallions in soya sauce."

4239. Sato, Takao; Kamiyama, Keiji. 1956. Daizu no saishu ni kansuru kenkyû: Kotonaru hyôkô de saishu shita daizu sushi no jidai shokubutsu no seiiku shûryô ni oyobosu eikyô ni tsuite [Studies on seed production of soybean: Experimental researches of the effects of differences in the altitudes of producing localities upon the seeds and their progeny plants]. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 24(4):317-18. July. [2 ref. Jap; eng]
• ***Summary:*** The seeds were produced at altitudes from 80 to 1,350 meters. Within a given variety, differences in seed size were due to edaphic (relating to the soil) rather than climatic conditions. The higher the altitude, the earlier was the flowering and seed maturity, and the lower was the fat content.

To produce superior soybean seeds, one should choose localities as free as possible from plant diseases or noxious insects. Of the seeds produced, larger sized ones from within each variety should be selected for planting to give more abundant yields. Address: Kanto-Tosan Agric. Exp. Station.

4240. Walley, Ersel. 1956. The Japanese-American Soybean Institute: Soybean marketing development program project No. 2. *Soybean Digest.* July. p. 12-13.
• ***Summary:*** Under agreement with the USDA's Foreign Agricultural Service, the American Soybean Association is charged with carrying out a year-round soybean marketing development program in Japan. This is the first such project to be conducted by an American commodity group in foreign sales promotion–so there were few guidelines or examples of how to proceed.

Walley went to Japan and initiated the first project, the soybean exhibit at the Osaka Trade Fair. The next project was the formation of this institute [JASI]. Mr. Shizuka Hayashi was hired as managing director. He "enjoys unusual respect and prestige throughout the entire Japanese soybean industry. He speaks and writes English excellently." He has devoted most of his life to oils and fats, and has visited the United States.

The Japanese members are the manufacturers of oil and fat, miso, tofu, and shoyu, plus the fat and oil importers-exporter associations.

Photos show: (1) Walley and Hayashi. (2) Signs above the American soybean exhibit at the Osaka Trade Fair.

4246. Kurtz, Howard D. 1956. Marketing problems of U.S. soybeans in Japan: Change in U.S. grading standards was a big step in the right direction. *Soybean Digest.* Sept. p. 41.
• ***Summary:*** "The purpose of my visit to Japan was to study the Japanese soybean requirements in relation to our U.S. grades and standards; to learn more about the uses they make of our soybeans, and the marketing problems involved.

"The Department had from time to time, as this group knows, received quality complaints on certain deliveries. It was therefore thought a firsthand knowledge stood to aid us in developing standards that might better reflect character and quality from the export standpoint, for we in the Department are just as much interested as you folks in industry, to see that the grades enable buyers, both domestic and foreign, to get the kind and quality of commodities they want and need.

"To sum up briefly, from observations and discussions with Japanese industry people, the major marketing problems insofar as quality is concerned can, I believe, be broadly stated under two primary headings: foreign material and color.

"Foreign material: Comments by the Japanese indicated that we made a big step in the right direction last year when we reduced our foreign material by 1%. It is believed the Japanese interests are now reasonably well satisfied with the overall allowance of total foreign material. The kinds of foreign material contained in some of our deliveries, however, still remain a problem. The food manufacturers in particular object to such material as stems and certain weed seeds as they affect both the palatability and appearance of their products. For food purposes this is readily understandable.

"Due to the nature of my assignment, considerable time was spent observing the unloading of cargoes. The average results between the U.S. inspection and the Japanese inspection checked remarkably close, especially when one considers the handlings that occur between inspections. The Japanese use our standards and apply them in a manner similar to the way they are applied in this country.

"I did find, however, unevenness in foreign material in occasional holds of our ships, even though I am satisfied uniformity existed at the time they were sampled at our ports. As you know, soybeans containing foreign material are difficult to load uniformly in any type of container, because foreign material does not flow freely as do the soybeans. When this condition exists and our cargoes are broken up into many small lots, such as they are in Japan, the party receiving his delivery from an area of high foreign material is not satisfied. In fact, it appeared that many of our past

© Copyright Soyinfo Center 2014

complaints on the foreign material factor have probably stemmed from this distribution problem.

"Color: It was apparent the Japanese do not like any form of green coloring in soybeans. The oil people object to the color the green soybeans give oil, and to the reduced price they take when they market the flakes to the food people. The food manufacturer objects to the color the green soybeans give their product. To illustrate the importance the Japanese place on color, in addition to their inspectors showing the usual quality factors, the trade requires them also to show the percentage of light and dark green kernels. Color is a quality guide in that country. From observations both in Japan and since my return, it does not appear that the present Illinois-Minnesota origin buying arrangement is the solution to this problem. By this I do not wish to imply that it has not accomplished anything, rather it appears to have served its usefulness.

"It would seem the color problem could best be solved by separately classifying the green and yellow seed-coated soybeans under the framework of the standards. Our quality certificate itself could then better relate an accurate picture of the type of soybeans inspected.

"Color again enters into the picture in the form of purple mottling. Due to this not being pronounced in our Midwest and Midsouth crops the past two seasons, emphasis in Japan was not placed on this factor. Should We encounter years again though where they are prevalent, comments indicated there would be serious objections.

"Another indirect color problem in Japan deals with our splits. High percentages of splits are objected to, especially by the miso and tofu industries. They contend that soybeans that have been split for long periods of time fade and lose their natural yellowish color, resulting in a food product that has a dull appearance.

"It is believed if we can iron out most of these quality problems, through the combined efforts of all concerned, it will help put our trade with Japan on a much more solid foundation." Address: Board of Grain Supervisors, Agricultural Marketing Service, USDA, Chicago, Illinois.

4247. Sakaguchi, Yukio. 1956. American soybeans in Japan: Japan will have to import greater quantities of soybeans in the future, and will rely on U.S. soybeans if problems can be solved. *Soybean Digest.* Sept. p. 33.

• ***Summary:*** "On behalf of the Japanese soybean delegation consisting of five representatives, Goro Kawamura, president of Japan Miso Association; Saihei Toriumi, vice president of Japan Shoyu Association; Kumazo Abe, president of the Japan Tofu Association; Keiichi Matsuoka, president of Oil and Fat Importers and Exporters Association, and I, Yukio Sakaguchi, vice president of Oils and Fats Manufacturers' Association, I wish to express our sincere gratitude to the American Soybean Association for having invited us not only to attend this convention but to visit various places of interests and study conditions for the eventual benefits of both you and ourselves.

"In Japan, as you probably know, soy beans are consumed not only for oil extraction but also for various food products such as Shoyu sauce, Miso, Tofu and Natto, etc., also for making Monosodium Glutamate. We need 900,000 to 1 million tons of soybeans for these purposes. Although about 500,000 tons of domestic soybeans are produced a year, most of them are consumed by producers themselves and only about 200,000 tons are sold in the market. The balance, 700,000 to 800,000 tons, therefore, depends on imports.

"Approximately 500,000 tons of soybeans in 1954 and 800,000 tons in 1955 were imported to Japan, out of which 440,000 tons in 1954 and 570,000 tons in 1955 were imported from the U.S.A. I am sure Japan is one of the best customers for your country so far as soybeans are concerned.

"Before World War II, Japan depended solely on Manchurian soybeans but since the end of the war, owing to various difficulties involved in importing from Communist China, U.S. soybeans have taken the place of Chinese beans. However, it is noteworthy that lately due to the difference in freight distance in favour of Chinese beans and the fact that quality of Chinese beans is more suitable for food products than are American beans, import of Chinese beans is gradually increasing. That is to say, imported Chinese beans have been increased to 200,000 tons in 1955 from only 50,000 tons in 1954. Whereas the total imports of U.S. beans have decreased to 71% in 1955 and 95% in 1951, Chinese beans have come up to 25% from 3% in the same years.

"U.S. soybeans are better in oil content but contain more foreign material, damaged beans, broken beans, other seeds and other colored beans than Chinese beans. If improvement can be made in these points I am sure Japan will come to buy more U.S. beans in the future.

"Since Japan's consuming level of oils and fats at present is still very low as compared with other world nations and further in view of the demands for soybeans for various food manufacturers are increasing. I believe considerably greater quantity of soybeans will have to be imported in the future.

"It is therefore desirable that an overall study involving not only in respect to quality but also to other trade conditions and loading be made. Fortunately through the efforts of your Association, your government and your people, the Japanese-American Institute [JASI] has been established having as its members the American Soybean Association and the five Japanese organizations and is carrying out activities since early this spring. The various pending problems mentioned will surely be solved satisfactorily through the efforts of this Institute.

"Taking this opportunity, we wish to assure you that we will cooperate with the Japanese-American Soybean Institute in its activities.

© Copyright Soyinfo Center 2014

"In conclusion I again wish to thank you for having offered us a chance to attend your convention and to see and talk with all those concerned in the soybean industry in the U.S.A. At the same time, we sincerely hope that the friendly relations between the U.S.A. and Japan will be ever strengthened through the trading of soybeans."

A photo shows Y. Sakaguchi standing by a microphone at a podium. Address: Vice President, Oils and Fats Manufacturers' Assoc., Tokyo.

4248. *Soybean Digest.* 1956. European export program the first undertaking of Soybean Council! Sept. p. 26-27.
• ***Summary:*** At the top of the first page are two letters under the heading: "Endorsements for Soybean Council from USDA." These are: "Copies of actual letters [with signature on letterhead] received [in mid-August 1956] from True D. Morse, Acting Secretary of Agriculture, and Marvin L. McLain, Assistant Secretary, by Howard L. Roach, president of the Council."

The article begins: "A huge export market development program in European countries to be implemented with over one-half million dollars in P.L. 480 and soybean industry funds will be the first undertaking of the new Soybean Council of America.

"The Council is an industrywide organization formed this past summer for the purpose of research, education and promotion of the nation's soybean crop.

"An agreement between the U.S. Department of Agriculture's Foreign Agricultural Service and the Council to implement the program was approved by the Council's board of directors and signed by the officers. It was submitted to and signed by FAS Aug. 22. The program will be similar to the soybean market development program already in effect in Japan under the sponsorship of the American Soybean Association and Japanese trade groups.

"The European export program will include Italy, Spain, Germany, Austria, France, Finland and possibly other countries. It will in general follow the recommendations of Geo. M. Strayer, executive director of the Council, to USDA on his recent return from Europe. Strayer, who saw possible unwieldy surpluses developing from the 1956 and 1957 soybean crops, believes there is a potential increase of 60 to 70% in European markets for soybeans and soybean products over a period of years.

"A European office will be set up, and the Soybean Council will carry out projects in research, market analysis, sales promotion and related trading activities for soybeans, soybean oil and other soybean products in the above named European countries.

"The program will be financed by:

"$500,000 in foreign countries made available by FAS.

"$25,000 advanced by the Soybean Council.

"Funds advanced by European trade groups.

"The program is thus a massive attack by the Council on the threat of soybean surpluses during the next 2 crop years.

"The overall program of the Council, of which the European export project is a first step, will be financed by voluntary contributions from soybean producers at the point of sale. The operation will be simple. The collection of 10¢ per 100 bushels ($1.50 per carlot of 1,500 bushels) will be made by the buyer at the time of purchase. And soybean processing plants will deduct $1.50 per carlot on soybeans coming into their plants. The proceeds will be turned over to the Soybean Council of America. That is all there is to it.

"The checkoff will begin with the 1956-crop movement as originally planned.

"First report on the Council was made by its officers during the American Soybean Association convention at Urbana.

"Said President Howard L. Roach: 'The question has been asked, "Why aren't the grain men represented on the Council?"

"'We had to make a start somewhere. For the producer and processor associations to set up the Council seemed to be the most practical method of getting it started. That was what was done. 'Grain handlers will be brought into the Council as soon as they wish, and as soon as they have representation able to speak for them as a group.'"

"On the cover: In the lower left-hand picture on the front cover Treasurer Albert Dimond, Secretary R.G. Houghtlin and President Howard L. Roach give their first report on the Soybean Council of America at the ASA convention."

A photo shows: "Board of Directors of the Soybean Council of America. Left to right, R.G. Houghtlin, secretary, Chicago, Illinois; Geo. M. Strayer, executive director, Hudson, Iowa; Scott Cramer, Chicago; Dwight Dannen, St. Joseph, Missouri; Albert Dimond, treasurer, Lovington, Illinois; Dave Wing, vice president, Mechanicsburg, Ohio; Chester B. Biddle, Remington, Indiana; Howard L. Roach, president, Plainfield, Iowa; Jake Hartz, Jr., Stuttgart, Arkansas; John W. Evans, Montevideo, Minnesota; Wayne Lichty, assistant executive director, Hudson, Iowa; Ralph G. Golseth, Danville, Illinois; and John Sawyer, London, Ohio."

4249. Walley, Ersel. 1956. Japan: Soybean gateway to the Orient. Twin problems of foreign material and green color are still the chief ones facing us in the Japanese markets. Walley says we can develop markets at home and abroad for a billion bushels of soybeans. *Soybean Digest.* Sept. p. 31-32.
• ***Summary:*** This article begins: "Our reference here to Japan as the 'Gateway to the Orient' is not based primarily upon her geological location. It is based on the outstanding intelligence, aggressiveness, and willingness of the Japanese people to work.

"Soybeans were centuries old in Japan before they were even known in the United States. It is well established that tofu and perhaps other soya products have been used for food

© Copyright Soyinfo Center 2014

in Japan for over 400 years. We have before us the record of one soya sauce factory which is over 100 years old, and commercial oil extraction was established in Japan near the beginning of this century.

"The fact that Japan has for centuries supplemented their rice diet, rich in starch, with the essential proteins, fats, and minerals of soybeans may bear causal relation to the unusual energy of the Japanese people."

A photo shows the "Official visitation team of the Japanese-American Soybean Institute and Ersel Walley, who helped set up the Institute. Left to right, Matsuoka, Sakaguchi, Walley, Abe, Kawamura, Toriumi." Address: Past President and Director, American Soybean Association Fort Wayne, Indiana.

4250. Nickerson, Jane. 1956. Japan big contributor to American table: Products sent here to go on exhibition.–Recipes offered. *New York Times.* Oct. 25. p. 38.
• ***Summary:*** Japan exports more than 80 food products to the United States–more than the writer had expected. The variety of Japan's food contributions to America will be the subject of the Japanese Food Show, which opens to the public next Tuesday at the Japan Trade Center, 393 Fifth Ave., Manhattan. About 50 imported foods will be on display, some will be for sale, and the preparation of popular recipes (such as sukiyaki) will be demonstrated.

Imports to be displayed include "shoyu (soy sauce)."

Three Japanese specialty foods shops plan booths at the show: the Oriental Food Shop (2791 Broadway), Katagiri (224 East 59th St.), and Tanaka (144 West 65th St.).

A recipe for "Beef teriyaki" calls for: "½ cup shoyu (Japanese soy sauce)... 1 cake tofu (soy bean curd), cut into cubes..."

4251. Takahashi, Jûsaku. 1956. Bitamin B-12 kyôka shokuhin ni kansuru kenkyû. I. Shokuhin-chû bitamin B-12 no anteido ni tsuite [Studies on the fortification of some foods [incl. miso and soy sauce] with vitamin B-12. I. On the stability of vitamin B-12 in foods]. *Bitamin* (*Vitamins, Kyoto*) 11(4):385-88. Oct. 25. (Chem. Abst. 51:15816i). [11 ref. Jap; eng]
• ***Summary:*** The change of vitamin B-12 content in enriched miso, soy sauce, jam, and cream during storage and heating was tested by a microbiological method using *Euglena gracilis* var. *bacillaris.*

Vitamin B-12 added to miso was relative stable during storage for 30 days; 89% remained at 3-5ºC and 35-59% remained at 30ºC. However vitamin B-12 added to soy sauce was relatively unstable during storage; only 75% remained at 30ºC.

Vitamin B-12 added to miso was relative stable during heating; only 6% was degraded after 30 minutes at 100ºC. However vitamin B-12 added to soy sauce was so unstable on heating that 28-54% was degraded after heating for 12-30 minutes at 100ºC. In short, the enrichment of soy sauce with vitamin B-12 seems unsuitable. Address: Faculty of Agriculture, Utsunomiya Univ., Utsunomiya, Japan.

4252. Ebine, Hideo; Nakajima, Michie; Nakano, Masahiro. 1956. Eiyô kyôka miso no kenkyû. V. Misoshiru kanetsu ni saishite bitamin-rui no sonshitsu ni tsuite [On the manufacture of enriched miso. V. Loss of vitamins during preparation of miso soup]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 11. p. 111-12. Oct. [5 ref. Jap]
Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

4253. *Soybean Digest.* 1956. Japanese saw our industry firsthand. Oct. p. 8.
• ***Summary:*** "Glimpses of the U.S. soybean tour by Japanese industry representatives are shown on this page.

"They came to see the U.S. soybean industry from farm to final usage and returned home to report on what they had seen to their respective industries. The tour started with attendance at the American Soybean Association convention at Urbana, Illinois, in mid-August, and ended with a visit to the U.S. Department of Agriculture in Washington in early September.

"The tour was part of the program of the Japanese-American Soybean Institute. Its purpose was to better relations between Japanese and American soybean trade groups. The Japanese hope to get out of it better soybeans for their food industries–fewer damaged and colored beans, and less foreign material. The Americans hope to get a bigger market for U.S. soybeans from the country that is already our best foreign customer."

Six photos show the Japanese members of the group at various stops along the tour.

4254. *Los Angeles Times.* 1956. Diet clue to cause of heart disease. Nov. 11. p. C2.
• ***Summary:*** In the last 25 years in Hawaii, there has been a large increase in the incidence of fatal heart attacks. After studying the hearts of persons who have come to autopsy, Dr. Nils P. Larsen of Honolulu suspects that this is because Hawaiians, whose income has risen significantly during this time, have been consuming much more "butter, cream, eggs, and milk" than before.

In Japan, the village of Narusawa, at the foot of Mt. Fuji, had the lowest rate of rejection of military conscripts during World War II; the villagers there lived largely on "soybean soup." Note: Probably miso soup.

In Mukojima, another village, the people have the greatest longevity of any village in Japan. About 8.4% of the population are over 70 years of age. The diet of Mukojima, which is described, includes noodles made from sweet potatoes, azuki beans, small fish, seaweed, carrots, and

© Copyright Soyinfo Center 2014

pumpkins.

4255. Kenney, Harry C. 1956. Exquisite Japanese display woos trade on New York's Fifth Avenue: Tokyo bids for global markets. *Christian Science Monitor.* Nov. 17. p. 17.
• ***Summary:*** At the Japanese Trade Center on Fifth Avenue you find an exquisite display of the products of postwar Japan. Japan, whose economy is now making real growth, is working to develop long-term overseas markets. The man the New York office is Masato Yamamoto, an executive in the Japan External Trade Recovery Organization (JETRO). A quiet man, he told the writer the remarkable story of Japan's 10-year recovery since the end of World War II.

Japan is, in many ways, like Britain in that both are islands which must import raw materials and export finished products. The key to survival is trade and exports.

Japan has a population of 90 million on an area about the size of Montana, only about 17% of which is arable.

"As I took leave of Mr. Yamamoto he handed me a bottle of shoyu, or Japanese soy sauce, from a display of about 50 other Japanese food products."

He explained that the Japanese have been making this sauce for about 1,000 years. Address: Staff correspondent.

4256. Hayashi, Shizuka. 1956. The work of the Japanese-American Soybean Institute. *Soybean Digest.* Nov. p. 20.
• ***Summary:*** This Institute was established in May 1956. The initial work has concentrated on a study of the condition of soybean from the USA and other countries when they arrive in Japan. Additional studies have been made of the shoyu and miso industries in Japan.

The Japanese soybean crop this season has been a poor one, estimated now at about 170,000 tons, far below the earlier estimate of 220,000 tons. These domestic soybeans are preferred by makers of miso, shoyu, tofu, glue, and feeds.

To make up the total requirements of 954,130 tons, some 784,130 tons must be imported. This includes 10,000 tons of Brazilian soybeans and at least 86,000 tons of Chinese soybeans–both depending on the price.

New-crop U.S. soybeans purchased by Japan are estimated as follows: 60,000 tons for October shipment, 110,000 tons for November shipment, and 30,000 tons for December shipment. Total: 200,000 tons. The average price is about $112 to $113/ton, C&F Japanese ports. A small photo shows Shizuka Hayashi.

Note: This is the first article seen by Shizuka Hayashi in Soybean Digest. Address: Managing Director, JASI, Tokyo.

4257. Kida, Setsuko; Hashida, Wataru; Teramoto, Shiro. 1956. Nattô oyobi nattô-kin ni kansuru gakuteki kenkyu. I. [Nutritional studies on natto and *Bacillus natto.* I. On the nutritional requirements of natto-bacillus]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 34(11):542-46. Nov. [16 ref. Jap; eng]
• ***Summary:*** Six strains of natto bacillus used in this study were isolated from several samples of natto in the market. These strains very much resembled the typical natto bacteria (*Bacillus natto* Sawamura etc.) and were also related to *Bacillus subtilis* NRRL 558 and to *Bacillus mesentericus.* According to the classification in *Bergey's Manual of Determinative Bacteriology* (6th ed.) the strains studied here may be included in the group *Bacillus subtilis.*

The nutritional requirements of the natto bacillus and *Bacillus subtilis* were compared when growing on a synthetic medium. The strains isolated from natto differed from *B. subtilis* NRRL 558 in that they required biotin in the vitamin-omission test and could not utilize certain amino acids (DL-serine, DL threonine, DL methionine) as a sole nitrogen source.

Note: This is the 3rd earliest (but the clearest) document seen (Jan. 2012) which states that *Bacillus natto* is different from *Bacillus subtilis* in that the former requires the vitamin biotin for growth, whereas the latter does not. Address: Dep. of Fermentation Technology, Faculty of Engineering, Osaka Univ., Japan.

4258. *Chicago Daily Tribune.* 1956. Musical sounds abound when you're in Japan. Dec. 9. p. F18.
• ***Summary:*** In the early morning "the natto seller peddles his fermented beans with a musical call of 'Natto, Natto.'"

Another food vendor "sells tofu (soybean curd). He does his advertising with a horn and his call of 'tofu!'"

4259. Hayashi, Shizuka. 1956. China to grow more soybeans. *Soybean Digest.* Dec. p. 19-20.
• ***Summary:*** The quality of U.S. soybeans arriving in Japan has improved over the past year. This is due to the new U.S. standards (which went into effect on 1 Sept. 1955), the work of the Japanese-American Soybean Inst. in monitoring the quality of soybean shipments, and the work of Mitsuo Hirano, president of the Oil and Fat Manufacturers Association, who visited the U.S. several years ago [in 1952] and strenuously negotiated with the government and trade groups to try to improve the quality of U.S. soybeans shipped to Japan.

Production of soybeans in Communist China in recent years is as follows (in tons): 1949–5,086,000. 1952–9,519,000. 1953–9,931,000. 1954–9,080,000. 1955–9,121,000. 1956–9,550,000 (estimate).

This year China will be a soybean exporter, with more than 50% of total exports going to Soviet Russia and the Eastern satellite countries. The next largest export buyer is Japan, for which approximately 200,000 tons will be available. Address: Japanese-American Soybean Inst., Tokyo.

• ***Summary:*** Sixty soybean varieties of Chinese, Japanese, and U.S. origin were planted on 10 different dates in 1954-55. The yields of most varieties were directly proportional to the length of the growing periods. Most of the varieties fell into distinct groups related to the planting date. Address: Formosa, (Taiwan).

4267. Lu, Y.C. 1956. [Inter-cropping of soybean by the "muddy-in" method with second crop of paddy rice]. *J. of Agriculture and Forestry, Taiwan* (*Nung Lin Hsueh Pao*) 5:39-55. [9 ref. Chi; eng]*
• ***Summary:*** Six varieties of soybeans from Taiwan, Japan, and the USA were planted. Those planted in hills gave a higher average plant-yield, whereas those drilled gave a higher yield per unit area. The varieties Wu-tou and Avoyelles gave high yields but their beans are small and have dark seed coats, which makes them unsuited for processing. The variety Shih-shih gave a good yield, had large beans with a yellow seed-coat, and seemed very promising for cultivation in Taiwan. Ao-biku, Taiwan-ching pe tou, and Fukien-ta-tou [Fujian dadou] are also yellow coated but have small beans and a thick seed coat. Address: Formosa, (Taiwan).

4273. Chen, Philip S.; Chen, Helen D. 1956. The work of Dr. Harry Miller with soy milk (Document part). In: P.S. Chen and H.D. Chen. 1956. Soybeans for Health, Longevity, and Economy. South Lancaster, Massachusetts: The Chemical Elements. 241 p. See p. 14-15. [24 ref]
• ***Summary:*** Chapter 1, "Protein," begins: "The soybean is best known for its high protein content (p. 7). It then discusses the work of Dr. Harry Miller (p. 14-15): "The one who has done more with soy milk than any one else is Dr. Harry W. Miller, Director of Research, International Nutrition Research Foundation. He began his work with soy milk shortly after 1925 when he was in China as a medical missionary and saw the need of making a preparation for the feeding of babies and children. Referring to his work with soy milk, he said,'I regarded that work as of far greater

© Copyright Soyinfo Center 2014

importance than the building up of the sanitarium because it had to do with the preservation of thousands of lives that otherwise would be lost if they did not have a proper substitute for mother's breast milk, because cow's milk is beyond the economic level of the Chinese people and almost all the Oriental races. We used this milk extensively and a long period of experimental work was carried on. Studies were made of the development of babies and children as to their weight gains, their height gains, their disposition, their skin texture, their hair development, their dentition and bone development. We finally published the article in the Chinese Medical Journal in 1937.'

"Dr. Miller was the first to put out a true soy milk, one that is homogenized and built to any formula. Finally he made it into a powdered milk by spray drying. Both 'Soyagen' and 'Soyalac,' which he perfected according to his patented process, are now widely used by infants and children who are allergic to cow's milk, as well as by grown-ups who prefer a vegetarian diet.

"Besides his factory in this country, Dr. Miller has established soy milk plants in Japan and Formosa [Taiwan], and has helped the United Nations build a plant in Indonesia. His formula is used by three large soy milk companies in Hong Kong, one of which puts out 75,000 bottles a day." Address: 1. • ***Summary:*** Contents: The invention of margarine in France. Other countries follow. The coining of a new word. The history of cooking fat [shortening]. Impact of fat hydrogenation. Recent expansion in margarine consumption. Consumption levels of margarine (per capita). Present world trade in margarine. The production of cooking fats (shortenings).

Margarine was invented in France in 1869 by the French chemist-turned-business man, Hippolyte Mège-Mouriés. Production started at Poissy in about 1872-73. In other European countries, margarine production started as follows: Netherlands in 1871, by the Jurgens and Van den Berghs in the little village of Oss; Denmark 1870-71, by Otto Monsted, Denmark soon had the highest per capita margarine consumption; Austria-Hungary 1873-74, in Liesing near Vienna; Germany 1875; United Kingdom 1889–Otto Monsted established England's first margarine plant in an old hat factory in Godley, Manchester. Demand was so great that he had to erect a new factory in Southall near London. Production began in March 1895 at the rate of more than 1,500 tons/week. The word 'margarine' was first used by Mège's teacher, Michel Eugène Chevreul, around 1813. At a meeting of the French Academy on 13 July 1813 Chevreul reported on a fat-like substance that he had prepared and which he named margarine or margaric acid

Page 59 states: "When Napoleon III had offered a prize in 1869 for a butter substitute that would be cheaper and would keep better than cows' butter, Mège was an easy winner, as by then he had produced a satisfactory product. A factory was installed in Poissy, but manufacture did not get under way until after the Franco-Prussian war of 1870-71 [in which France under Napoleon III was defeated by Prussia under Bismark]. The way was not clear, however, until Félix Boudet, a distinguished chemist retained by the French health authorities for the purpose, had reported favourably on the new product. On 12th April, 1872, a regulation was passed permitting the sale of margarine, but it was not to be called butter. Mège promptly formed the 'Société Anonyme d'Alimentation' with a capital of 800,000 francs. Large scale production started in 1873."

The Mège patent in the USA, issued in May 1874, was purchased by the United States Dairy Co., which hired Henry A. Mott to improve on Mège's method. A number of U.S. margarine patents were issued in the following years. Many of these suggested the use of lard or vegetable fats instead of oleo oil. One of the improved methods was used by the Commercial Manufacturing Co. in New York, which soon became America's largest margarine manufacturer.

Margarine was introduced to the USA after the Civil War, when the country was undergoing profound economic changes. Farmers strongly resisted the introduction of margarine, believing that it would compete with the butter made on their farms.

The word "margarine" was coined by Mège's teacher, Michel Eugène Chevreul, in about 1813. At a meeting of the French academy on 13 July 1813 Chevreul reported on a fat-like substance that he had prepared and which he named margarine or margaric acid. The name was derived from the Greek word for pearl (*margarites*) He gave its chemical formula as $C_{17}H_{34}O_2$. What Chevreul thought to be a new substance was, in fact, a mixture of palmitic and stearic acids.

Since Mège's crystalline substance had a pearly luster, he gave the soft portion of the tallow, expressed after digestion, the name oleo-margarine, since he believed it to be a mixture of oleine and margarine.

As in the Greek root the *g* is pronounced hard like the *g* in garlic; it is incorrect to pronounce margarine as marjarine, as if the g were replaced by j.

In England, margarine (imported from Holland) was first sold under the name of Butterine. This name was dropped in 1887 after Parliament passed the first Margarine Act (p. 63).

The histories of margarine and cooking fat [shortening] are closely connected. "Whereas all the important developments in the early history of margarine took place in Europe, the first significant pages in the history of cooking fat were written in America. It is ironical that one of the largest lard-consuming and exporting countries [USA] should have been the first to turn to an alternative. There is here a parallel with Denmark, which as the biggest exporter of butter had the highest *par caput* consumption of margarine. The new lard substitute was called 'compound' lard or 'shortening' in the United States; both were misnomers. There was often very little or no lard present, nor was the new product used only for baking purposes where 'shortness' was required. Compound fat or cooking fat are more correct designations" (p. 63).

"The introduction of hydrogenation into fat technology can be regarded as the re-birth of the margarine and cooking fat industries... No more was it necessary to rely on animal fats which were available only as by-products of the meat-packing and dairy industries." In 1902 Normann announced that he had hardened a liquid fat by hydrogenating it with a catalyst. Early commercial success was expected. Patents were applied for in Germany by a plant engineering firm (Leprince and Sivke; German Patent No. 141,029, of 1902) and by Normann himself in the United Kingdom (No. 1,515, or 1903). Normann's work was based on earlier experiments

© Copyright Soyinfo Center 2014

by Varentrapp (1840), Sabatier, Senderens, and others. The first large-scale hydrogenation plant began operations in 1906 in England, at Crosfield's factory in Warrington. In Germany the Oelwerke Germania, at Emmerich on the Rhine, started a plant for hydrogenating whale and linseed oils. Several years later, Procter & Gamble Co., Cincinnati, Ohio, began commercial hydrogenation in the USA.

Canada: Recent developments with margarine in Canada have followed those in the USA. In 1948 the Supreme Court rules that the provisions of 1935 Dairy Industry Act relating to margarine were invalid; in 1949 margarine was first produced in Canada. By 1952 margarine production had reached 47,000 tons, making Canada the second largest margarine producer in the British Commonwealth, after Great Britain. Address: Highgate, UK.

4283. Schwitzer, M.K. 1956. Margarine and cooking fats: Their history and world trade. II (Document part). In: M.K. Schwitzer. 1956. Margarine and Other Food Fats: Their History, Production and Use. New York, NY: Interscience Publishers, Inc. 385 p. See p. 59-78. Chap. 2. [52 ref]
• ***Summary:*** Tables: Table 8 (p. 67) shows margarine production in major countries worldwide in 1938, and 1946 to 1953. The countries are: United Kingdom, Australia, Canada, South Africa, British Caribbean, Austria, Belgium, Denmark, Finland, France, Germany, Israel, Japan, Netherlands, Norway, Poland, Soviet Union, Sweden United States. Production in these countries totaled 1,350,000 tons in 1938, dropping to 949,000 tons in 1946, then rising steadily to 2,618,000 tons in 1953. In 1938 Germany was by far the leading producer (439,000 tons), followed by United Kingdom (208,000), and USA (172,000). In 1953 the three largest producers were USA (577,000 tons), Germany (573,000), and United Kingdom (406,000). Holland was the world's largest margarine exporter.

Page 69: Graph of per capita consumption of margarine and butter in the UK and USA, 1938-1953. During this time, butter consumption decreased and margarine consumption increased in both countries. In the UK, per capita consumption of both margarine and butter are higher than in the USA, and margarine consumption passed that of butter in the mid-1940s.

Page 70: Estimated per caput consumption margarine in major countries worldwide in 1938, and 1946 to 1953. The countries are: United Kingdom, Australia, New Zealand, Canada, Norway, Netherlands, Sweden, USA, Finland, Denmark, Western Germany, and Belgium. Clearly Europeans, and especially those in Scandinavian or northern European countries, are the leading margarine consumers. In 1938 the leading countries were Denmark (47.4 lb/capita), Norway (141.2), and Sweden (10.5); USA was 2.9. In 1953 the leaders were Norway (51.1), Netherlands (40.8), and Denmark (40.1); USA was 7.9.

Page 71. Fats used in the production of margarine in the United Kingdom (1937-1953; soy oil started in 1951 and is insignificant). In 1938 UK margarines were made from 53% vegetable oils (groundnut was the leader, followed by coconut), 41% marine oils, and 6% animal fats. In 1953 UK margarines were made from 91% vegetable oils (groundnut was still the leader, followed by coconut), 8.8% marine oils, and 0.2% animal fats.

Page 72: Fats used in the production of margarine in the USA (1938-1953; soybean oil passed cottonseed oil in 1951). In 1938 U.S. margarines were made from 93.6% vegetable oils (cottonseed was the leader, followed by coconut then soybean oil), and 6.3% animal fats. In 1953 U.S. margarines were made from 98.9% vegetable oils (soybean oil was now the leader, followed by cottonseed), and 1.1% animal fats.

Page 73: Fats used in the production of margarine in certain countries (1937-1952) In 1951-53 soybean oil comprised the following percentage of all oils used to make margarine is these countries: Australia 0%, Canada 50%, Denmark 5%, Netherlands 5%, Norway 3%, Sweden 0%.

Page 75: Production of cooking fat (shortening), 1938, and 1946-53, in the UK, Canada, Germany, and USA. World production of "lard substitutes" is considerably smaller than that of margarine, and the USA and the UK are the only major manufacturers. Total production in these countries grew from 868,000 tons in 1938 to 1,075,000 tons in 1953. In 1953 the leading producers were USA (748,000 tons), United Kingdom (209,000 tons), and Canada (61,000 tons). In Germany shortening is called *Plattenfett* and *Kunstspeisefett.*

Page 76. Fats used in the production of cooking fat in the UK (1937-1953; soy is not mentioned).

Page 76: Fats used in the production of cooking fat in the United Kingdom (1937-1953; soybean oil is not mentioned).

Page 77: Fats used in the production of cooking fat in the USA (1938 and 1946-1953; soybean oil had passed cottonseed oil by 1946). In 1938 U.S. shortenings were made from 91.7% vegetable oils (cottonseed was by far the leader, followed by soybean then palm oil), 8.2% animal fats, and 0.1% marine oils. In 1953 U.S. shortenings were made from 18.6% vegetable oils (soybean oil was now by far the leader, followed by cottonseed), and 16.2% animal fats (mostly lard). Address: Highgate, UK.

4290. Hayashi, Shizuka. 1957. Soybean "schools" in larger cities. *Soybean Digest.* Feb. p. 25.
• ***Summary:*** "The Japanese-American Soybean Inst. is the operating agency for the market development project in Japan that is being conducted by the American Soybean Association and utilizing P.L. 480 funds."

The Institute has arranged for the production of a movie film about 18,000 to 20,000 feet in length showing the production and consumption of soybeans, with emphasis on the fact that they are the least expensive source of nutrition. Note: This film, titled "The Green Bud," was released by Dec. 1957.

Arrangements have been made with the Food Life Improvement Association (a government agency under the Ministry of Agriculture) and the Japan Nutrition Organization (a government agency under the Ministry of Welfare) for the opening of classes in various cities throughout Japan. More than 800 public health centers are engaged in activities first to educate prefectural leaders as to the value of soybeans and how to use more effectively the various soybean products in daily life, and then gradually to expand such activities throughout the whole population.

Researchers at Kyoto University will investigate why U.S. soybeans are not suitable for making natto and kinako. A study will also be made to find a method to preserve natto in a dried condition.

"Japan purchased approximately 300,000 metric tons of new crop [soy] beans during October-December 1956 and the first half of January 1957. This included 34,040 metric tons from China. The total budget for October 1956 to March 1957 calls for a total of 435,000 tons including 10,000 tons from Brazil." A photo shows Mr. Shizuka Hayashi. Address: Managing Director, Japanese-American Soybean Inst., Tokyo.

4292. Onaga, D.M.; Luh, B.S.; Leonard, S.J. 1957. Quality evaluation and chemical composition of soy sauce. *Food Research* 22(1):83-88. Feb. [18 ref. Eng]
• ***Summary:*** The quality of soy sauce varies greatly with the raw materials used and with the method of manufacture–by fermentation or by acid-hydrolysis. In the fermentation process, cooked soya beans and roasted wheat flour are fermented by the mold *Aspergillus oryzae* and then by yeasts; this is followed by a long digestion in brine.

Soy sauce samples obtained from markets in California showed significant differences in flavor and aroma. The importance of various chemical constituents to flavor is discussed. Address: Dep. of Food Technology, Univ. of California, Davis. 1. Moved to Herschel California Fruit Prods., Woodland, CA.

4293. *Soybean Digest.* 1957. [Soybean] Council leaders to Japan, Europe. Feb. p. 5.
• ***Summary:*** George M. Strayer, the Council's executive director, left Hudson, Iowa, for Japan on Feb. 1 to "review the progress of the soybean market project that has been carried on by the Japanese-American Soybean Institute... over the past year. And he will negotiate with Japanese trade

© Copyright Soyinfo Center 2014

groups and governmental agencies for continuation of the project for another 2 years."

"Howard L. Roach, Council president, will probably leave for Spain and Italy in February to set up central agencies for soybean market development projects in those countries. Roach will complete negotiations with three Spanish oilseed trade groups for their cooperation in the project." He will work with similar groups in Italy. The three purposes of the Spanish market development project are given. "The Soybean Council will supply a trained oil technician to work with Spanish and Italian government officials, trade people and consumer groups in solving problems connected with the use of U.S. soybean oil in Italian and Spanish foods."

4294. Takahashi, Teizo. 1957. [Glutamic acid hydrochloride by fermentation]. *Japanese Patent* 1088. Feb. 15. (Chem. Abst. 52:7614e). [Jap]*
• ***Summary:*** In the preparation of glutamic acid hydrochloride, raw seed proteins are hydrolyzed with a proteolytic enzyme, then treated with hydrochloric acid. An aqueous suspension of soybeans or defatted soybeans is cultured with a microorganism such as *Bacillus pumilus* until the proteins become water soluble. The solution is hydrolyzed with 10% hydrochloric acid, then filtered, etc.

4295. Sokolsky, George. 1957. These days: The China trade. *Washington Post, Times Herald.* March 20. p. A19.
• ***Summary:*** "There use to be a commercial attache in China, Julean Arnold, who tried hard to push American products. He tried to get the Chinese to like raisins."

Today the Chinese market has grown to 600 million people, who have a low standard of living. The Japanese, British and Germans would like to do more business with China. "The Japanese, particularly, are bound to find a way to barter manufactured goods for foodstuffs, especially the soybean, which is a staple of the Japanese cuisine and which grows plentifully in Manchuria and areas of North China."

4299. Nakashima, Kyozo; Tamura, Tsuruo. 1957. Kôri-dôfu seizô kôtei ni kansuru kenkyû. IV. Tônyû no gyôseki ni tsuite [Studies on the production of dried-frozen tofu. IV. Coagulation of the soybean milk]. *Osaka Furitsu Kogyo Shoreikan Hokoku* (*Reports of the Industrial Research Institute, Osaka Prefecture*) 17:78-84. March. [3 ref. Jap; eng]
• ***Summary:*** The effect of temperature, time, and stirring speed on the coagulation of soymilk were studied, and the quantity of calcium chloride required to coagulate the milk was determined. Each of these variables is critical. If the temperature is too high when the coagulant is added, there is danger of having a "crust" due to the rapid coagulation. If too little coagulant is added, some of the soymilk will remain uncoagulated and the whey will be milky in appearance. When just the right amount of coagulant is added, the whey or supernatant will become transparent–but this correct amount may differ from one soybean variety to the next. The required amount of calcium chloride can be determined from the specific gravity of the soymilk. The rate at which the coagulant is added and the rate of stirring while it is added affect the final quality and yield of the tofu–as well as the size of the curds. Thus, for a given soybean variety, both the rate of adding and the speed of stirring should, ideally, be mechanized.

Note: Accompanying this article is a 12-page, double-spaced, typed English-language translation by Henry Sasame. Address: Osaka, Japan.

4304. Nelson, Nancy S. 1957. Tokyo timepiece. *Christian Science Monitor.* May 22. p. 18.
• ***Summary:*** Tokyo–The writer has discovered a delightful way to tell time in Japan, by the sounds and sights of her street. "From one street to the next, as the tofu peddlers pass, the 'shush' sound of the amado (wooden shutters) follow, as they are slid back into the walls to let in the warm light of the [morning] sun." There "is an occasional screech of brakes when a housewife stops a tofu peddler to buy for breakfast.

"When echoes of the [small brass] tofu horns have faded, other merchants, as if this is their cue, make their appearances." There are the sellers of bamboo, goldfish, soba, and fish, the trash / rag man, and the kamishibai (children's theater).

"And with evening the tofu sellers return. Their plaintive horns seem to sound dusk across the city sky. Amado are dragged back across windows, electric lights go on, and a Tokyo day disappears.

"I feel that instead of selling bean curd, the tofu peddlers are really town criers heralding the night with their call meaning 'all's well.'"

Address: Inst. of Polytechnics, Osaka City Univ.

4306. Hayashi, Shizuka. 1957. Soybean market project now in second year. *Soybean Digest.* May. p. 36.
• ***Summary:*** "Continuation of the work of the Japanese-American Soybean Inst. (JASI) for another two years has been formally approved" by USDA's Foreign Agricultural Service.

During the first year, which ended on March 31, the institute concentrated mostly on research. The most important achievement is the improvement in the average quality of the soybeans arriving in Japan, especially in the decreasing percentage of foreign material, which now averages well below 2%. Great efforts must be made to continually reduce this percentage, and a long time will be required to eradicate the deeply rooted impression that U.S. soybeans contain excessive foreign material.

The plans for work in Japan during the next year are described. As of April 15, Japanese importers have purchased 90,000 tons of soybeans from China. By April 20 JASI will move into larger quarters in the Nikkatsu International Building (Room No. 410, No. 1, 1-chome, Yurakucho, Chiyoka-ku, Tokyo) in the center of the city. Address: Japanese-American Soybean Inst., Tokyo.

hydrolysis with hydrochloric acid. II. On the products produced by hydrolysis (1)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 31(5):323-28. May. [1 ref. Jap]
Address: Nagano Junior College, Japan.

4309. Kohzu, Tokuichiro. 1957. [Fundamental studies on manufacturing glutamic acid from soy-bean meal by the hydrolysis with hydrochloric acid. II. On the products by hydrolysis (1)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 31(5):323-328. May. [1 ref. Jap]
Address: Nagano Junior College.

4310. Onishi, Hiroshi. 1957. Studies on osmophilic yeasts. I. Salt-tolerance and sugar-tolerance of osmophilic soy-yeasts. *Bulletin of the Agricultural Chemical Society of Japan* 21(3):137-42. May. [6 ref. Eng]
• ***Summary:*** The first experiment involved the reversibility of salt-tolerance in osmophilic soy yeasts. Three strains of *Zygosaccharomyces major* were cultured successively in NaCl-free and NaCl 18% koji extract media. The growth of osmophilic yeasts in a medium of high sodium chloride concentration involved a process of physiological adaptation.

For growth of the yeast *Zygosaccharomyces major,* the order of the toxicity of salts was as follows: K+ < Na+ < Mg++ < Ca++ < Li+. Address: Noda Inst. for Scientific Research [Noda City, Chiba-ken, Japan].

4311. Onishi, Hiroshi. 1957. Studies on osmophilic yeasts. II. Factors affecting the growth of soy yeasts and others in the environment of a high concentration of sodium chloride (1). *Bulletin of the Agricultural Chemical Society of Japan* 21(3):143-50. May. [14 ref. Eng]
• ***Summary:*** The following named yeasts were grown: *Zygosaccharomyces major, Z. soya, Z. salsus, Z. miso* α*, Saccharomyces miso* α*,* and *Pichia miso.* The following unnamed yeasts were also grown: N 5, N 8, N 24, A 31, A 34.

The pH range for the growth of soy yeasts (such as *Zygosaccharomyces major*) was found to be very wide (pH 3.0–7.0) in a NaCl-free medium, but quite narrow (ph 4-5) in a medium that contained 18% NaCl–as is typical of soy sauce. Address: Noda Inst. for Scientific Research [Noda City, Chiba-ken, Japan].

4312. Onishi, Hiroshi. 1957. Studies on osmophilic yeasts. III. Classification of osmophilic soy and miso yeasts. *Bulletin of the Agricultural Chemical Society of Japan* 21(3):151-56. May. [13 ref. Eng]
• ***Summary:*** Most of the salt-tolerant yeasts isolated from soy sauce and miso belonged to *Saccharomyces rouxii.* Some of them produced luxuriant pellicles (surface films) on culture media containing sodium chloride, but pellicles were not formed on salt-free media. A new variety was isolated from these yeast species: *Saccharomyces rouxii* Boutroux var. halomembranis nov. var. A few strains were identified as *Saccharomyces acidifaciens* (Nickerson) Lodder et Kreger-van Rij. Two new species were also described: *Torulopsis halophilus* nov. sp. and *Torulopsis nodaensis* nov. sp. These two species showed high salt tolerance, especially the former, which was a facultative halophile.

In a 1952 monograph titled *The Yeasts: A Taxonomic Study,* by J. Lodder and N.J.W. Kreger-van Rij, the subgenera *Zygosaccharomyces* is no longer recognized. In this classification almost all of the *Zygosaccharomyces* known as the osmophilic yeasts were included in only two species and one variety, *Saccharomyces rouxii* Boutroux, *Saccharomyces rouxii* Boutroux var. *polymorphus* Lodder and Kreger-van Rij, and *Saccharomyces mellis* (Fabian et Quinet) Lodder and Kreger-van Rij. For example, *Zygosaccharomyces major, Z. soya. Z. salus,* and *Z. japonicus,* known as soy yeasts, were all included in one species, *Saccharomyces rouxii.*

• ***Summary:*** The foods of Japan have changed noticeably since World War II. The islands of Japan, whose combined area is 15% smaller than that of California, are much much too small to grow enough staple food crops (such as rice) to feed the 80 million inhabitants. So Japan, which has been shorn of its overseas empire (Korea, Taiwan, Manchuria, etc.) has now become a major importer of wheat flour, and the number of bread eaters has been rapidly increasing.

Great efforts have also been made to incorporate more protein into the daily diet. "Scientists today have begun to view time-honored seasonings like miso and soy sauce, made largely from soybeans, from a new angle."

The most popular confections are *namagashi* which are traditional Japanese. They include *yokan* (hard red bean paste) [made from azuki beans].

4330. Hayashi, Shizuka. 1957. Tofu takes large volume of soybeans. *Soybean Digest.* Aug. p. 26-27.
• ***Summary:*** "There are approximately 45,000 tofu manufacturers in Japan, of which about 23,000 are members of the Tofu Association. There is one large factory in Osaka, the largest in Japan, which consumes 2 tons of soybeans a day." In 1957 Japan will use 1,070,000 tons of soybeans, including approximately 350,000 tons for shoyu, 230,000 tons for miso, 160,000 tons for tofu, and 120,000 tons for other foods. But the Tofu Association says 308,000 tons will be used for tofu.

Note: This is the earliest English-language document seen that gives the number of tofu manufacturers in Japan, and statistics on the amount of soybeans used for making tofu in Japan. Address: Japanese-American Soybean Inst., Tokyo, Japan.

4331. Komiya, Masashi. 1957. The seven wonders of soy sauce. *Foreign Agriculture* 21(8):4. Aug.
• ***Summary:*** In spite of its salt content of 18%, shoyu does not taste excessively salty. By contrast, when sea water, which contains a mere 3% of salt is swallowed, the salty taste is almost unbearable. It is estimated that the average Japanese obtains one-third of the salt he needs from shoyu. Japan expects to produce 1,527,000 tons of soy sauce in 1957. Address: Managing Director, Japan Shoyu Assoc.

4338. Hayashi, Shizuka. 1957. The Japanese-American Soybean Institute. *Soybean Digest.* Sept. p. 33-34, 36.
• ***Summary:*** Subtitle: "The Japanese know the quality of U.S. soybeans is improving. Mr. Hayashi expects every Japanese family to include soybeans in the daily diet as a result of the Institute campaign."

"Membership in the Japanese-American Soybean Institute [JASI] is made up of the Japanese Oil Processors Association, the Japan Soy Sauce Association. the Japan Miso Industry Association, the Japan Tofu Association, and the Oil and Fat Importers and Exporters Association–in other words all groups connected with the soybean industry in Japan. The American Soybean Association is also a member of the Institute.

The Institute carries out a variety of research and educational programs. Under the initial agreement, JASI was established in April 1956 for a period of 1 year with a total budget of $75,000; it began functioning on 1 May 1956. Each of the Institute's main projects and contracts signed during the first year is described. The production of a movie film, approved by USDA's Foreign Agricultural Service (FAS), is now in progress. "This will be a documentary colored film in three rolls of about 24,000 feet long. The theme of this film involves grammar school children working on a special subject of soybeans in their practical science room."

Before JASI was established, most Japanese did not realize that soybeans were grown in the U.S.–except on a small scale. "Before the war [World War II] we knew that Manchuria, China, was the only major soybean growing country. I was in Manchuria for more than 10 years before the war as an exporter of soybeans to Europe and Japan. We [Japan] imported about 1.5 millions tons of soybeans annually from China. Production in China was then around 6 million tons. In 1948 I visited this country [USA] and was surprised to learn for the first time of America's huge production of soybeans. After the war when Japan was still under the SCAP's [Supreme Commander Allied Powers = General Douglas MacArthur] control, soybeans were not available from China. It was then that Japan received soybeans from America for the first time in history. It is since then that Japan has gradually become familiar with American [U.S.] soybeans.

"However, soybeans coming into Japan right after the war were very bad. They contained enormous amounts of foreign material, worm-eaten damaged beans, broken beans; besides sizes were irregular and color was bad. The quality of American beans was so bad that it gave Japanese users the impression that U.S. soybeans were not comparable with Chinese soybeans. Everywhere we went we received complaints of foreign material." No makers of miso or tofu wanted to buy them.

Now, a year after JASI was established, the situation has improved. Everybody in the soybean industry now knows about U.S. soybeans, and knows their quality is improving. JASI sends these people a newsletter, the *Soybean Digest Late News,* translated into Japanese. A photo shows Shizuka Hayashi. Address: Managing Director, JASI, Tokyo.

4339. Hirano, Mitsuo. 1957. Greetings from the oil and fat manufacturers of Japan: Sees the possibility of greatly increased barter trade by Japan with China with fewer soybeans being bought from the United States. *Soybean Digest.* Sept. p. 37.
• ***Summary:*** "In recent years the American government and trade people concerned have been doing much to increase exports of soybeans from America by improving the quality of American beans and also by meeting other wishes of importing countries, the result of which has been favorable and certainly commands our respect and cooperation. In this connection, I may mention the achievements of the Japanese-American Soybean Institute which was organized in April of last year under the mutual cooperation between the American Soybean Association and our five Japanese soybean trade groups. The activities of the Institute are being carried out smoothly and its programs are being gradually accomplished.

"Now I should like to spend a few moments on the recent soybean situation in Japan. According to the demand-and-supply plan for the 1957 fiscal year of the Ministry of Agriculture and Forestry, the total demand of soybeans in Japan for the year starting on April 1 is estimated at

© Copyright Soyinfo Center 2014

1,070,000 tons, of which 220,000 tons are to be supplied by the domestic soybean production and the rest is to be imported from abroad. In the plan of the Ministry the total production of the 1957 soybean crop in Japan is estimated at 490,000 tons, of which 270,000 tons are considered to be consumed by the growers themselves and the remaining 220,000 tons are expected to be sold on the market.

"Of the 850,000 tons to be supplied from foreign sources, the preponderant portion of 610,000 tons are the raw material for the crushing industry and the rest is for other soybean food industries in the country.

"As you know, Japan's soybean imports are still under the foreign exchange allocation system, and for the first half of the 1957 fiscal year 315,000 tons out of the above-mentioned total of 850,000 tons were allocated to consumers, who are expected to have already imported the respective amounts allocated to them. For the second half of the fiscal year, according to the original plan of the government, about 500,000 tons of soybeans are to be imported from abroad. But in view of the shortage of foreign exchange that Japan has been experiencing in the past few months nobody can deny that the government may be forced to change its original plan and cut the amount of soybean imports for the second half.

"In order to cope with the problem of the dollar shortage, our government, as you may know, is now negotiating with your government to use the loans from the Export-Import Bank of Washington for the importation of about 150,000 tons of soybeans out of the amount to be allocated for the second half of the fiscal year. The negotiations may soon be concluded, I think.

"The amount of Chinese soybeans that were purchased under the allocation for the first half of the fiscal year was estimated at about 70,000 tons. Up to last April the payment was made in cash sterling, but since then the trade has been placed on a barter basis. Importers of Chinese soybeans must export to China within a certain period the equivalent value of the beans in other commodities. This obligation on the part of the importers appears to work as a brake on imports of Chinese beans. However, in view of the fact that the Japanese government has quite recently eased restrictions on a number of commodities to be exported to communist China, the barter trade between the two countries, according to general expectations, will be greatly improved. Furthermore, the Chinese trade being controlled by the state, prices and quantity of exports can be decided from political viewpoints and there is no knowing what policy may be taken by them to increase their exports of soybeans.

"Of course the quality of Chinese soybeans is not perfect in every respect, but still the very small percentage of foreign material and the shorter period of transportation give a favorable impression on the Japanese importers. This is particularly so when Japan is suffering from the shortage of foreign exchange.

"Rapeseed is the most important of all the oilseeds produced in Japan. The preliminary production estimate for 1957 is 270,000 tons, which is about 50,000 tons less than the production of last year. This decrease in production would mean a decrease of 17,000 tons in rapeseed oil, and if this decrease is to be compensated for by soybean oil, 100,000 tons of soybeans would have to be imported in addition to the original amount of 850,000 tons imports.

"But as mentioned before, because of the present foreign exchange situation it is feared that the whole of the original amount will not be allowed to be imported within the present fiscal year. On the other hand it must be remembered that the increase of soybean imports can be attained by increasing our exports of soybean oil to overseas markets, for in case of soybean oil exports we can get an exchange allocation for the equivalent quantity in beans in addition to the normal import allocation.

"I understand that an American soybean delegation will visit Japan this fall as a part of the activities of the Japanese-American Soybean Institute, and I believe that this kind of inspection tour is most appropriate and will certainly contribute much to deepening the mutual understanding."

Photos show: (1) A portrait photo of Mitsuo Hirano, smiling and looking dapper. (2) "Hirano's talk was presented by Ichiro Kashiwagi of New York," who is shown speaking at a podium with microphone. Address: President, Assoc. of Oil and Fat Manufacturers of Japan.

4340. Hougen, Volorous H. 1957. The Argentine soybean venture. *Foreign Agriculture* 21(9):13-14. Sept. Reprinted in Soybean Digest, Nov. 1957. p. 15.

• ***Summary:*** There is new evidence that the soybean may one day join sunflower, cottonseed, and flaxseed as an important oilseed crop in Argentina.

"This is not the first effort Argentina has made to grow soybeans. But it is the first scientifically planned introduction of the crop.

"Past history: Soybeans have a long history of misfortune in Argentina, dating from around 1882. The end of [the 19th] century saw good results from plantings in La Rioja Province; and in the early 1900's the Córdoba [Cordoba] Agricultural College reported successful trials. About this time experiments in using soybeans for fattening steers brought favorable results. In 1915, very large yields were reported in Córdoba Province. Seed was increased, and in 1924 the Ministry of Agriculture distributed it to farmers, on the theory that drought resistance and value as an animal feed would make soybeans a useful crop. This program did not, however, succeed in establishing the crop on a sound footing in any area.

"In the early 1930s a commercial organization imported about 300 tons of soybean seed, and about 14,800 acres were planted. However, unsatisfactory yields led to low returns, which gave little incentive for continued production. In

© Copyright Soyinfo Center 2014

1941 the *Instituto Argentino del Suelo* [*Suelo* = land, soil, or ground] encouraged a commercial firm to make further seed imports. This firm sold the seed and took an option to buy the crops. But again production failed to come up to expectations, apparently because growers did not know how to plant and how to grow the crop. In the crop year 1942-43, about 12,300 acres yielded only about 117,600 bushels of soybeans–10.4 bushels per acre, compared with average U.S. yields of about 20 bushels in 1951-55."

In recent years, Japanese colonists in subtropical Misiones Province (in the far northeast, bordering Paraguay) have brought their own seed and "grown a few thousand tons for their own food." But this area does not have the best kind of climate and soil for soybeans.

"Now, however, Argentine commercial interests have undertaken the introduction of soybeans on a large scale. They believe the crop may be more profitable than cotton, wheat, corn, and sunflower in certain marginal districts.

"The area selected for immediate development–about the size of Kansas–includes all of Santa Fe Province and parts of the adjacent Provinces."

"Production efforts for the 1956-57 crop centered in northwestern Santa Fe and western Chaco Provinces. Last November, although 19,000 acres had been prepared for planting, the season was so dry that only about 3,600 acres were actually planted, and much of the 1,000 tons of seed specially imported from the United States remain unused. But the expected yields of 20 to 21 bushels per acre will provide pure seed for planting this fall, plus some beans for the market.

"It was clear to me that careful planning has gone into this program. Argentine agronomists and soil scientists, trained in the United States, are analyzing soils and climatic conditions in cooperation with the Ministerio de Agricultura y Ganadería. Economic analyses are establishing the level of performance soybeans must reach if they are to displace other crops. At the government research centers and experiment stations, soybean varieties are receiving careful tests. In 1956-57, 74 varieties were on trial in different parts of the country. Those performing satisfactorily will receive a further test in field plantings."

"Like the varieties, the farmers themselves are carefully selected. Each gets not only a contract for the purchase of his crop, but seeds, inoculants, fertilizers, and technical guidance. Five times during the 1956-57 crop year, each grower received instruction and practical demonstration, covering everything from preparing the seedbed, planting, cultivating, and controlling diseases and insects, to harvesting the crop. Successful farmers are expected to help train others in future years."

A map shows Argentine soybean areas, centered on Santa Fe Province. Dark asterisks show permanent research centers. Small circles show experimental fields. The name of each is given.

Note: This document contains the earliest date seen for the cultivation of soybeans in Argentina (1882). Unfortunately, no citation for this date is given, and we are not told the source of these soybeans or where they were grown. Address: Fats and Oils Div., FAS [USDA].

4347. *Soybean Digest.* 1957. Honorary life members [American Soybean Assoc.]: Howard L. Roach, Ersel Walley. Sept. p. 10.
• ***Summary:*** Howard Roach, from Plainfield, Iowa, was vice president of the American Soybean Assoc. in 1943 and 1944, and president in 1945 and 1946. Mr. Roach was active in the formation of the Soybean Council of America, Inc., and was elected its first president in 1956, which position he now holds.

Ersel Walley now lives in Fort Wayne, Indiana. He has had a very large impact on the growth of the soybean crop an on the American Soybean Association. "As a tenant farmer he began growing soybeans in 1922, and as a farm operator and manager [in Ohio], he has grown soybeans continuously since that year."

"For many years he has served as a director of the American Soybean Association, and was president in 1948 and 1949. In 1948, Walley spent 3 months in Europe at his own expense, investigating the possibility of a postwar market for American soybeans.

"In 1956 and 1957, he accepted assignments to arrange soybean exhibits at International Trade Fairs in Osaka and Tokyo. While in Japan in 1956 he was instrumental in establishing the Japanese-American Soybean Institute."

A portrait photo shows each man.

4348. *Soybean Digest.* 1957. [Multi-Purpose Food helps flood victims in Japan]. Sept. p. 31.
• ***Summary:*** A large photo shows the Freedoms Foundation medal and three American children presenting cans of MPF to Fumiko Miyagi. The caption reads: "Fumiko Miyagi of Japan, guest of the American Soybean Association at its Minneapolis [Minnesota] convention, expresses gratitude to Minneapolis children whose penny-wisdom and penny-power sent 3¢ meals of Multi-Purpose Food (MPF) to flood victims in Japan. Also expressing interest in this new role of American soybeans as a liberator of malnourished people is Albert Dimond, president of the American Soybean Association. Displayed at the convention exhibit of the non-profit Meals for Millions Foundation is the Freedoms Foundation medal it was awarded for 'outstanding achievement in bringing about a better understanding of the American way of life' by distribution of MPF free in distressed areas of the world. Miss Miyagi, a Tokyo art teacher and women's club leader, is president of the Japanese Meals for Millions affiliate."

Note: This is the earliest English-language document seen (Nov. 2002) that uses the word "malnourished."

4349. Strayer, George M. 1957. We are on the threshold of big things. *Soybean Digest.* Sept. p. 19, 20, 22, 24.
• ***Summary:*** Contents: Introduction. Went to Japan. Work of the Soybean Council of America. Legislative front. Finances better (American Soybean Assoc. {ASA} is in the black, in part because the Soybean Council of America has assumed some of the financial burden of the development work in Japan that had previously been borne by ASA). Thanks to many who have contributed time, effort, and talent to ASA during the past year (Ersel Walley, Albert Dimond, Kent Pellet, George McCulley, Del Cobie).

USDA statistics project a very large soybean crop in 1957. And U.S. soybean exports, the largest in history, are expected to reach 80 million bushels. Huge quantities of soybean oil have also been exported in 1957. "We have begun to capitalize on the tremendous potential markets for [U.S.] soybeans and soybean products which exist around the world."

The Japanese-American Soybean Institute (JASI) completed its first full year of operation on 31 March 1957. About $69,000 in Japanese yen were contributed under Public Law 480. Japanese trade groups contributed approximately $15,000 in Japanese yen in services, personnel time, and cash. ASA contributed approximately $25,000 in personnel time. In total, about $109,000 were spent during the first year to "conduct a rather thorough study of the needs of the Japanese markets." JASI has only one objective–to increase the markets for U.S. soybeans in Japan. Strayer spent the month of February in Japan reviewing the work of JASI and meeting with governmental agencies and the five Japanese trade groups which are participating in JASI and wish to continue. Upon returning to the USA Strayer immediately filed a request with USDA's Foreign Agricultural Service for a project which would use $150,000 in FAS funds. This project was approved on April 3 and is now in operation. So the JASI program has doubled in size over the past year. There "is a potential market in Japan for several times the quantity of soybeans now being purchased. The greatest single limiting factor is the allocation of dollars by the Japanese government. Another deterring factor is the 10% import duty which is levied on all soybeans imported into Japan today."

Photos show: (1) George Strayer. (2) Four processors from Halstead Elevator Co (Halstead, Minnesota) and Farmers Cooperative Association (Ralston, Iowa). and Secretary-Treasurer, American Soybean Assoc. [Hudson, Iowa].

4350. Walley, Ersel. 1957. Soybeans around the world. It would take 400 million bushels of soybeans to meet minimum needs of babies and growing children alone in the Orient. *Soybean Digest.* Sept. p. 30-32.
• ***Summary:*** The author made a world tour studying soybeans, including visits to Hawaii, Japan and other parts of Asia, and Italy. He studied production of soy milk in Taiwan, Hong Kong, and Bangkok (Thailand). In Taiwan he visited a soya milk plant which was established "by our good friend and American Soybean Association pioneer, Dr. H.W. Miller. In Hong Kong, the 'peek hole' and gap in the Bamboo Curtain, we found many small soya food producers and no doubt the largest and most successful soya milk plant to be found anywhere [Hong Kong Soya Bean Products Co. Ltd., makers of Vitasoy]." Hong Kong is the place where competition between soybeans from Red China and the USA is said to meet head-on. "May I voice my conclusion that Red China needs in its domestic economy more soybeans than it can possibly produce.

"A trip to southeastern and south Asia included good and sufficient visits to Thailand (Siam), Burma, India, and Pakistan. Of these countries, Pakistan is the only one that has soybean production of mention and here the total production is less than 1 million bushels per year."

A photo shows Walley. Address: Part president and chairman of Market Development Committee, American Soybean Assoc.

Address: Faculty of Agriculture, Univ. of Tohoku.

4355. *Soybean Digest.* 1957. USDA sending soy specialist to Japan. Oct. p. 16-17.
• ***Summary:*** About Dr. Allan K. Smith's upcoming trip to Japan. A portrait photo shows Dr. Smith.

4356. *Soybean Digest.* 1957. Japanese-American Soybean Institute: Good attendance at soy food courses. Oct. p. 16.
• ***Summary:*** "Short courses in food uses of soybeans were sponsored by the Institute for Japanese health center nutritionists in four cities during June, July and August.

"Attendance by the nutritionists ran from 54 to an even 100. The short courses were held in Amori [Aomori] City, Gifu City, Nikko City and Kochi. The nutritionists in turn will discuss the high nutritive value of soybeans and their utilization in the Japanese diet in future courses for consumers to be held by the local health centers and also in talks before local organizations and women's meetings.

"Speakers at the short courses were from the National Nutrition Research Institute, the Welfare Ministry, the Japan Nutrition Association and other organizations. They discussed the usage of soybeans in the diet as a low-cost means of correcting 'low-protein disease' which is prevalent in parts of Southeast Asia and Africa, and demonstrated the cooking of soybean dishes and some uses of soybean oil.

"The health center nutritionists correspond somewhat to the home demonstration agents in the United States.

"By first taking the information to the nutritionists and through them to the Japanese consumers, the Institute hopes to make the great majority of the Japanese people conscious of the part soybeans can play in raising the nutritional level of the diet in Japan.

"Japan exported a total of 12,429 metric tons of soybean oil in the January-July 1957 period, according to a dispatch from Shizuka Hayashi, managing director of the Institute. This compares with 7,951 tons for the full year of 1956.

"Japan exported no soybean oil in August, however. This is due to the great difficulty of obtaining soybeans during the latter half of the year because of Japan's foreign currency situation and the manufacturers' concern that any export of oil would hamper the flow of soybean oil into the domestic market during the period when plants have shut down for periodic repair.

"The Association of Oil and Fat Manufacturers of Japan

© Copyright Soyinfo Center 2014

reports that the target for edible oil and fat consumption in Japan in 1957 is 294,000 metric tons, of which 140,000 tons are to be imported.

"Soybean oil forms about 60% of the oils and fats processed from imported materials, and this percentage is expected to increase.

"Oil and fat consumption per capita is 8.5 grams per day in Japan, about the lowest level in the world. This may be expected to rise with the help of appropriate public relations activities.

"Other oils might be replaced by soybean oil if soybeans were placed on the free import list, and through a public relations program for soybean oil. A 10% customs duty was placed on soybeans last October.

"The Association of Oil and Fat Manufacturers plans to protest the import duty on soybeans during the coming session of the Diet.

"Some Japanese agricultural organizations want to restrict imports of soybeans to protect domestic soybeans and rapeseed. But organizations that use imported soybeans as raw materials and also the consumers of soybean products are opposed to the import duty.

"The Japan Soybean Association plans to send a soybean mission to China to discuss problems affecting Japanese-Chinese trade in soybeans and to study the Chinese crop and industry.

"Total Chinese soybeans contracted for delivery in the August-September-October 1957 period are 22,500 metric tons."

4357. *Soybean Digest.* 1957. First agreement with ARS (Photo caption). Oct. p. 16.

• ***Summary:*** The photo shows four men seated around a table and one man standing. The caption below the photo reads: "First foreign marketing project to be participated in by Agricultural Research Service, USDA, is activated by signing of agreement between ARS, Foreign Agricultural Service, and the American Soybean Association. Left to right: Theodore C. Byerly, deputy administrator, production research, ARS; Gordon Fraser, assistant administrator, FAS, signing the agreement; Geo. M. Strayer, executive vice president, American Soybean Association; Geo. A. Parks, Jr., director fats and oils division, FAS (standing); and Walter M. Scott, assistant to administrator, ARS. Dr. A.K. Smith will go to Japan under this agreement."

4358. Hayashi, Shizuka. 1957. Miso maker switches to U.S. beans. *Soybean Digest.* Nov. p. 24-25.

• ***Summary:*** A week-long soybean promotional program was held in the city of Sendai in September. The Institute participated in the name of the "Food Life Improvement Association." The speaker was J. Sasaki [probably of Sendai Miso Shoyu], vice president of the All Japan Miso Assoc. The biggest miso maker in the district and one of the largest in Japan, he also manufactures shoyu, and he has been using U.S. soybeans only since the early part of this season. Why? More uniform and consistent quality, less purple colored beans, lower price, larger quantities of the same variety available. Address: Managing Director, Japanese-American Soybean Inst., Tokyo, Japan.

4359. Omata, S.; Ueno, T.; Nakagawa, Y. 1957. Shôyu no kappen genshô ni kansuru kenkyû. VIII. Shôyu kôji no kappen genshô (1) [On the browning reaction of soy-sauce. VIII. On the browning reaction of soy-sauce koji (1)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 31(11):822-26. Nov. [12 ref. Jap]

• ***Summary:*** Substances which effect browning are amino acids, reducing sugars, reductones and carbonyl compounds. Address: College of Agriculture, University of Osaka prefecture, Japan.

4360. *Revue Internationale des Produits Tropicaux et du Materiel Tropical.* 1957. L'industrie du soja en Asie [The soybean industry in Asia]. 32(337):202. Nov. [Fre]

• ***Summary:*** Discusses soybean production in Japan, soybean production in China, and soybean production in Formosa.

In Japan, soybean production in 1956 did not pass 438,000 metric tons (tm), which is 70,000 metric tons less than in 1955.

China, which in 1956 disposed of about 200,000 metric tons of soybeans, exported 7.35 million bushels to Japan and has sold more than half of that to Russia and its satellites.

Formosa: Soybean production in Formosa is developing. Address: France.

4361. *Soybean Digest.* 1957. Japan: Soybean imports by source. Nov. p. 24.
• ***Summary:*** This graph, compiled from USDA statistics, shows imports of soybeans to Japan during the period 1925–1956, from the United States, China, and other countries. Prior to 1934, most of the soybeans were imported from China. Imports from the U.S. began in 1934 and have risen steadily, especially since 1952, until in 1956 they account for 75% of the total. In the period since World War II, imports from China have been small but have grown steadily, accounting for about 20% of total imports in 1956. Total imports were about 22,500,000 bushels in 1925-29, falling to a low of about 5,000,000 bu in 1952, then reaching a peak of about 30,000,000 bu in 1955.

4362. USDA Agricultural Marketing Service. 1957. Soybean variety names. Washington, DC. 31 p. Nov. Supplement 1 to Service and Regulatory Announcements No. 156 "Rules and Regulations Under the Federal Seed Act."
• ***Summary:*** The title page states: "Included in Sec. 201.34(e) of the Regulations Under the Federal Seed Act and Descriptions." At the bottom of the "Contents" page is written: Supersedes mimeographed publication "Soybean Varieties" issued by the former Publication and Marketing Administration, U.S. Department of Agriculture, revised July 1953."

Contents: Introduction. Map showing maturity group areas. Description of varieties. Synonyms of variety names. List of obsolete or seldom grown varieties.

Description of varieties: Acadian, *Acme (Canada. * = Also the name of an old variety which is believed to be no longer in existence), Adams, Agate, Aoda, Arisoy, Arkan, Arksoy, Arksoy 2913, Armredo, Avoyelles, Bansei, Barchet, Bavender Special, Biloxi, Blackhawk, Boone, Capital (Canada), Cayuga, Chame, Charlee, Cherokee, Chief, Chippewa, Chusei, Clark, Clemson, CNS, CNS-4, CNS-24, Comet (Canada), Creole, Cypress #1, Delsoy, Delsta, Dorman, Dortchsoy #31, Dortchsoy #67, Dunfield, Earlyana, Easycook, Ebony, Emperor, Etum, Flambeau, Funk Delicious, Gatan, Georgian, Giant Green, Gibson, Goldsoy (Canada), Granger, Grant, Habaro, Haberlandt, Hahto, Hakote, Hardome (Canada), Harly (Canada), Harman (Canada), Harosoy (Canada), Hawkeye, Hayseed, Herman, Hidatsa, Higan, Hokkaido, Hongkong, Illini, Imperial, Improved Pelican, *Jackson, JEW 45, Jogun, Kabott (Canada), Kanrich, Kanro, Kanum, Kim, Kingwa, Korean (Canada), Kura, Laredo, Lee, Lincoln, L.Z., Macoupin, Magnolia, Mamloxi, Mammoth Brown, Mammoth Yellow, Mamotan, Mamredo, Manchu, Manchu No. 3, Manchu No. 606, Manchukota, Mandarin, Mandarin No. 507, Mandarin (Ottawa) (Canada), Mandell, Mendota, Mingo, Minsoy, Missoy, Monetta, Monroe, Montreal Manchu (Canada), Morse, Mount Carmel, Mukden, Nanda, Nanking, Norchief, Norsoy, Ogden, Ontario, Otootan, Pagoda (Canada), Palmetto, Patoka, Peking, Pelican, Pennsoy, Perry, Pridesoy No. 57, Ralsoy, Renville, Richland, Roanoke, Rokusun, Rose Non Pop, S-100, Sac, Sato, Scioto, Seminole, Seneca, Sioux, Smith Super, Sousei, Tanner, Tastee, Tennessee Non Pop, Tokyo, Viking, Virginia, Volstate, Wabash, Willomi, Wilson, Wisconsin Black, Wolverine, Woods Yellow, Yellow Gatan, Yelnando, Yelredo.

Synonyms of variety names (p. 24; Synonym -> Official variety name): Austrian Green -> Tokyo. Bakaziro -> Amherst. Banner -> Midwest. Bell -> Midwest. Best Green -> Hope. Best White -> Amherst. Black -> Buckshot. Black Beauty -> Ebony. Black Champion -> Peking. Black Sable -> Peking. Bopp -> Chernie. Brown -> Mammoth Brown. Brown Biloxi -> Biloxi. Brown Eda Mame -> Eda. Brown Otootan -> Tanner. Buster Brown -> Trenton. Cha Daidzu -> Eda. Clay -> Midwest. Claybank -> Midwest. Clemson Non-shattering -> CNS. Cluster Bean -> Midwest. Coker's 31-15 -> Pee Dee. Columbian -> Columbia. Dortchsoy-2 -> Ogden. Dwarf Brown -> Ogemaw.

Dwarf Early Yellow -> Ito San. Dwarf Green -> Medium Green. Early Black -> Wisconsin Black. Early Green -> Medium Green. Early Indiana Laredo -> Norredo. Early Japan -> Butterball. Early Korean -> Korean. Early Laredo -> Norredo. Early Mammoth Black -> Buckshot. Early Mandarin -> Mandarin. Early Virginia Brown -> Virginia. Early White -> Ito San. Early Wilson -> Wilson. Early Wilson Black -> Wilson. Early Wisconsin Black -> Wisconsin Black. Early Wood's Yellow -> Arksoy. Early Yellow -> Ito San. Eda Mame -> Ito San, Eda. Edsoy -> Delsoy. Essex -> Peking. Etampes -> Ito San. Evan's Crossbred No. 9 -> Ogemaw. Extra Early Black -> Wisconsin Black. Extra Early Black Eyebrow -> Black Eyebrow. Extra Select Sable -> Peking.

Feeser's Prolific -> Midwest. Flat Black -> Flat King. Foster's Prolific -> Midwest. Galloway -> Midwest. German Coffee Berry -> Ito San. Giant Brown -> Mammoth Brown. Giant Yellow -> Butterball. Gosha -> Manhattan. Green -> Medium Green. Green Field -> Illini. Green Samarow -> Samarow. Guelph -> Medium Green. Hale-Ogden 2 -> Ogden. Hollybrook Early -> Midwest. Ignotum -> Ogemaw. Illinois 13-19 -> Ilsoy. Illinois Champion -> Midwest. Indiana Hollybrook -> Midwest. Ita Mame -> Tokyo. Japan No. 15 -> Kingston. Japan Pea -> Ito San. Kiyusuke Daidzu -> Ito San. Kysuki -> Ito San. Large Black -> Buckshot. Large Brown -> Mammoth Brown. Large Yellow -> Mammoth Yellow.

Late -> Mammoth Yellow. Late Ita Mame -> Tokyo. Late Yellow -> Mammoth Yellow. Lima Soy -> Hahto. Mammoth -> Mammoth Yellow. Mammoth Black -> Tarheel Black. Mamotoc -> Tokyo. Manchuria -> Pinpu. Medium Black -> Buckshot. Medium Early Black -> Buckshot. Medium Early Brown -> Early Brown. Medium Early Green -> Medium Green. Medium Early Yellow ->

4376. **Product Name:** [Soymilk].
Foreign Name: Tônyû.
Manufacturer's Name: Ueda Tofu Shop.
Manufacturer's Address: Hachioji, Tokyo, Japan.
Date of Introduction: 1957.
Wt/Vol., Packaging, Price: 180 ml bottles.
How Stored: Refrigerated.
New Product–Documentation: William Shurtleff. 1981. Soyfoods. p. 35. "Dr. Harry Miller: Taking soymilk around the world." "Starting in about 1955 Dr. Miller started to recommend that the Adventist-run Japan San-iku School serve soymilk instead of cow's milk to the students; however the staff hesitated because of its nutritional value and flavor. In 1957 two Japanese Adventists, Mr. Hidekazu Watanabe and Mr. Hanzo Ueda (who ran Ueda Tofu Shop at the time), started making Japan's first soymilk on a small scale in Hachioji, Tokyo, bottling it is 180-ml milk bottles, and selling it locally. Mr. Watanabe later described the great value to them of Dr. Miller's ongoing technical, nutritional, and spiritual guidance. After some time, directors of the San-iku School visited the small soymilk plant, liked the soymilk flavor, and understood its nutritional value. In 1959 they bought similar equipment, set up a small plant in the school, and started to produce soymilk, which was bottled in 180-ml bottles and served to the students at every meal. In 1969 the San-iku School set up an independent food production company called College Health Foods (which later became today's San-iku Foods) and through it, with the help of Loma Linda Foods in America, began to produce Soyalac soymilk infant formula."

Letter (in Japanese) from Hidekazu Watanabe. 1981. July 19. Discusses the early history of this product. "The Ueda Tofu Shop in Hachioji helped with the product development; I was there at the time. In those days our name was *San-iku Gakuin Shokuhin-bu*, not San-iku Foods. The purpose was to provide a place of labor for the students and opportunities to learn food processing. It was not a business. Dr. Perry Webber was the principal of our school at the time. I think that our company did not make commercial soymilk before 1957. The food company is said to have been founded in 1928 in connection with the school, but legally it did not become an independent company until December 1970."

Note 1. This is the earliest known commercial soymilk product made in Japan.

Note 2. This product was the predecessor of Soyalac made by San-iku Foods.

Letter from Mr. Ichiro Tabuchi of San-Iku Foods. 1990. July 4. In 1948 Mr. Tabuchi visited Dr. Harry W. Miller and studied at his soymilk plant in Mt. Vernon, Ohio. During this period, Dr. Miller visited Nihon San-iku Gakuin (located at Chiba prefecture, Sodegaura-cho) almost every year and earnestly advised the people there to make soymilk. In about 1957-58 they started to make soymilk at a tofu plant that was owned by Mr. Ueda. They bottled it in 180 ml dairy milk bottles, which they sold with their tofu. It was a small scale operation and it didn't last long.

4382. Miyamoto, Kazuo. 1957. A nisei discovers Japan. Tokyo: Japan Times. [x] + 282 + [4] p. See p. 181. Illust. Port. No index. 20 cm.
• ***Summary:*** The author, a physician and American citizen, lived with his wife and two children for two years in Japan between 1937 and 1939 "just after the beginning of the China Incident." He spoke and wrote Japanese fluently.

Page 7: On 29 Sept. 1937, after just arriving in Japan, they enter Tokyo. He notes that prices are high, protein consumption is therefore insufficient, and the general population seems undernourished. Beans, including soya beans, ought to be used more extensively. Except for misoshiru [miso soup] and natto, they are apparently not widely used. He suggests that the government welfare department develop and publish soy recipes for the health of the people.

Page 48: On 8 Feb. 1938 on a trip into Yusawa, Niigata, in northeastern Japan, he went skiing. For lunch at a inn he had "natto with lots of onions to erase the odor."

On a train from Ueno station, Tokyo, he has breakfast in the diner of miso-shiru [miso soup], tsukemono [pickled vegetables], and rice for 25 *sen.*

Page 129: In Aomori at the hotel for breakfast they enjoy delicious eggplant fried in butter with shoyu, pepper, and pieces of chiso [beefsteak leaves].

Page 171: At Aoyama hot springs in Hokkaido, caught in a blizzard, he has a bento [Japanese box lunch] from the hotel that includes miso-shiru.

Page 181: On 21 March 1938 they are at the port of Shimonoseki, Japan (in southwestern Honshu, just north of Kyushu, in Yamaguchi prefecture, facing the Tsushima Strait). He notes that many people pass through this port on their way to Chosen [Korea] and Manchukuo [Manchuria].

Shimonoseki is known for its *fugu* or balloonfish (also called globefish or swellfish) for it is here that the largest catch in Japan is taken each year.

They found an eating place, Fujitomo, that served the delicacy. The raw sliced meat was arranged on a huge platter in three rows of semi-circles, so thinly sliced that it was transparent. "The above were dipped in a sauce prepared with murasaki, lime and onions. Tai, considered the king of fishes, must be allotted second place to this delicacy..."

Note 1. The word "murasaki" means purple in Japanese, and is still used in sushi shops and other specialty eating places to refer to soy sauce.

Note 2: This is the earliest English-language document seen (April 2012) that uses the word "murasaki" to refer to soy sauce.

The balloonfish is so poisonous it can kill a person; the toxin is contained in the ovaries. "At Shimonoseki, the season comes to an end at the end of March for then the spawning season begins and the danger of poisoning becomes greater."

Page 201: On a trip to Korea he enjoys *manul zany,* garlic pickled in shoyu.

In April 1955, the family returned to Japan to visit new relatives. Near Furukawa, in northeastern Japan, they inspected a "miso and shoyu factory."

Also discusses: Nori (p. 128). Wakame (seaweed, near Idzu / Izu) (p. 276). Address: Honolulu, Hawaii.

4386. Photograph of a Japanese contingent visiting the Meals for Millions' test kitchen at Clifton's in Los Angeles. 1957.
• ***Summary:*** Ernest Chamberlain is on the far left. Lucille Brown (Food Supervisor) is 3rd from left, in the background. Jean Clinton Davis (daughter of Clifford Clinton) is 6th from left, in the background. They are reviewing Multi-Purpose Food.

This photo was taken in the test kitchen of Clifton's at 648 South Broadway, Los Angeles. The MFM offices were on the top floor of this 5-story building and the test kitchen was on the 4th floor. MFM used this space free of charge for about 10 years (1946-1956), then they moved to Seventh Street for a few years, and then to Santa Monica. The source of the photo is from an internal MFM newsletter.

This photo and date were sent to Soyinfo Center by Donald Clinton, son of Clifford Clinton (Jan. 2011).

4387. Tanizaki, Junichiro. 1957. The Makioka sisters. Translated from the Japanese by Edward G. Seidensticker. New York, NY: Alfred A. Knopf, Inc. 530 p. See p. 293. [1 ref]
• ***Summary:*** Page 293: "He always used white Kobe vinegar, never yellow Tokyo vinegar, and always a thick soy sauce not seen in Tokyo. He offered only fish taken before his very eyes, so to speak, here along the shores of the Inland Sea."

Note: What is the word for "thick soy sauce" in Japanese?

The title of the novel in Japanese is *Sasameyuki,* which means lightly falling snow. The translator, Edward Seidensticker, struggled over the title. Translations like "Fine Snow" and "Snow Flurries" do not convey the elegance or layers of meaning in the Japanese title. The novel follows the lives of the Makiokas, a wealthy Osaka family, from the autumn of 1936 to April, 1941. In Japan, the book has been called by Nakamura "the greatest cosmopolitan novel since the Meiji Restoration."

"In Osaka in the years immediately before World War II, four aristocratic women try to preserve a way of life that is vanishing. As told by Junichiro Tanizaki, the story of the Makioka sisters forms what is arguably the greatest Japanese novel of the twentieth century, a poignant yet unsparing portrait of a family-and an entire society-sliding into the abyss of modernity" (Publisher's description).

4390. Tsukada, Toyoaki; Yamada, Yasuo. 1957? Frozen tofu (dehydrated tofu). Japan. 4 p. Undated. 28 cm. [Eng]
• ***Summary:*** This is a report on the Misuzu plant in Nagano City and the Daiya plant in Suwa City, Nagano prefecture, Japan. "The name 'frozen tofu' is somewhat misleading as the final product is a dried cake with the approximate dimensions of 2½ x 2 x 3/4 inches. The freezing of the tofu is a step in the process which develops certain desirable elastic property to the wet cake. It becomes like a sponge.

"The frozen tofu plants at Nagano and Suwa had essentially the same process but the Suwa plant was the more modern of the two in respect to engineering equipment. The Suwa plant had two completely separate units for making tofu, each one approximately the size of the Nagano plant.

"The Nagano plant reported they had used quite a few American soybeans until two years go when they changed to Chinese soybeans. In his opinion the best frozen tofu is made from Nagano beans but Nagano raises insufficient soybeans to supply the demand. The qualities desired in this product are good color and smoothness (including gloss) and bland flavor. In his process the American soybeans give equal color and smoothness but not flavor to the Chinese beans. American soybeans process as well as other beans. Some soybeans have a soft smooth taste whereas others leave a taste on the tongue. They described Brazilian soybeans as good for making tofu but not for miso. American soybeans give a high yield.

"The owner of the Suwa Plant said they could use up to 20% American soybeans in their process without loss of quality in their product.

"These frozen tofu plants operate on a large scale, of the order of 5-10 tons of beans per day. The frozen tofu process is much more readily adaptable to large scale operation than fresh tofu. All fresh tofu plants are small and usually process in the range of 100 to 200 pounds of beans per day. Because of the wide difference in scale of operation the retail price of frozen tofu is the same or even a little less than

© Copyright Soyinfo Center 2014

fresh tofu. While the frozen tofu plants have adopted more modern equipment than any of the other food processing plants, there is still much room for further modernization and improvement in efficiency of operation.

"The owner of the Suwa Plant recognizes the need for further research and development and made the following suggestions in the order indicated.

"1. Improve the freezing process–to produce an elastic type material in less time.

"2. Use of centrifuges for classification of original extract and also perhaps to concentrate the curd. Dorr thickener should be considered at the stage.

"3. Mechanization of trimming the tofu cakes to size and shape. Common problem to all frozen tofu makers.

"He did not make any suggestions on where research should be done, but mentioned of a certain person in Osaka Prefectural Institute of Industrial Promotion, Dr. K. Nakajima, who specializes in frozen tofu chemistry. Also mentioned Irie Co. of Osaka, which he suggested as a place for developing trimming and packing equipment. Following is a flow diagram of the process for making frozen tofu."

4396. *Soybean Digest.* 1958. Sees clash of U.S. and China in Japan market. Feb. p. 22.
• ***Summary:*** "Interests of the United States and communist China are certain to clash over the Japanese market for soybeans, which is important to both countries, according to a Japanese view.

"Dr. Shigeo Hosono, staff member of the General Agricultural Research Institute of Japan, points out that the United States depends on Japan for about 40% of her export market for soybeans. At the same time China–the world's second largest producer of soybeans–expects to export a substantial part of her surplus beans to Japan.

"Also, China has begun to export rice to Japan and is coming into conflict with U.S. rice exporters.

"The relationship of Chinese soybeans to international trade is discussed by Dr. Hosono in his book, the *Soybean as an International Commodity,* which was published in Japan in 1957.

"China's postwar production of soybeans has fallen well below the average prewar output of 10 to 11 million metric tons annually (in the neighborhood of 400 million bushels). The U.S. Department of Agriculture estimates 1957 soybean production in China-Manchuria at 335 million bushels.

"The sharp postwar decline in soybean production in China may be ascribable to the fact that some provinces, particularly Manchuria, did not recover entirely from war damage. And sudden changes in agriculture caused by land reform measures brought about a general decrease in crop production.

"In Dr. Hosono's view, production may be expected to recover entirely sooner or later since efforts are being made to increase yields of soybeans as well as other food crops in order to boost the supply of edible oils.

"Dr. Hosono sees communist China's potential exports at the present time as about 1 million metric tons (36.6 million bushels) annually, with about 300,000 tons going to Japan.

"Exports of soybean oil meal are restricted since meal is in heavy demand as a fertilizer to boost the output of cotton, according to the author. This is one reason why a larger part of the Chinese soybean crop is not available for export.

© Copyright Soyinfo Center 2014

"Dr. Hosono points out that exports are controlled by the Chinese government's foreign trade policy and are a monopoly of state-operated export-import companies.

"China's trade with countries in the Soviet orbit has rapidly increased since 1951 and reached 81% of total exports in 1954. Under the Soviet-Communist China trade agreement China imports machinery and equipment and exports raw materials including soybeans and vegetable oils.

"The changes in China's trade policy brought about by the communist government has naturally transformed Japan's trade with China. And Japan's peculiar relationship with the United States has brought Japan's trade with China under even more rigorous restriction.

"The U.S. embargo policy toward China hampers the development of Asiatic continental trade not only for Japan but also for West European countries. But Hosono believes there will be no difficulty for Japan to import Chinese soybeans if Japan can export goods demanded by China.

"Japanese tradesmen consider Chinese soybeans of excellent quality. Export standards call for less than 15% moisture, less than 3% foreign material and over 16% oil. And Japan can save considerable on freight charges by buying Chinese soybeans due to her geographical proximity."

4397. *Washington Post, Times Herald.* 1958. Spicy Japanese sauce gives character to meats: Discovered in Hawaii. March 14. p. C9.

• ***Summary:*** The "spicy Japanese sauce" is teriyaki sauce, which is featured in this article. Contains recipes for Teriyaki sauce (with "3 tablespoons brown sugar, ¼ teaspoon ginger, 2 cloves garlic cut, 3/4 cup soy sauce, 1 tablespoon whisky or brandy, optional, and 1¼ cups of water"), Beef teriyaki (with 1 cup soy sauce, 1 clove garlic, 1/3 cup saki [sake] or sherry, 1 inch piece fresh ginger or 1 teaspoon powdered ginger, 4 tablespoons dark brown sugar, 3 tablespoons grated onion; the beef is always cut into very thin strips, and each strip then skewered), and a variation on the latter–Liver or beef teriyaki (with "2 tablespoons shoyu {Japanese soy sauce}").

4398. Dimond, Albert. 1958. Former ASA secretary in Japan mission [American Soybean Assoc. secretary Dr. P.A. Webber]. *Soybean Digest.* March. p. 7.

• ***Summary:*** Albert Dimond, past president of the American Soybean Association (ASA). wrote this account of Dr. P.A. Webber, a former ASA secretary, after visiting him and Mrs. Webber while in Japan recently. The Webbers live and work 10 miles north of Maebashi City, and a third the way up towering Mount Takagi.

"Dr. Webber, who did his graduate work at the University of Michigan, and his wife, also a graduate of the same school, are well on their way toward building and establishing the Mount Akagi Rest Home and Rural School. This is a non-profit Christian, medical and educational center, dedicated to furnishing self-help education and a rehabilitation center for handicapped children. The center is on a mountainside farm of 125 acres.

"Dr. Webber has spent much of his life alternating between Japan and the United States, and has been in Japan since 1948.

"During the early part of his career in Japan he became thoroughly acquainted with the valuable properties of soybeans. On one of his sojourns in the United States he served as secretary of the American Soybean Association, in 1931-32.

"Among his other activities in the United States were serving on the faculties of Berea College in Kentucky and Madison College in Tennessee. He headed the latter for a time. These are both well-known self-help educational institutions. Madison College manufactures and sells soybean foods.

"Dr. Weber also did much of the research and development work on soy milk done in this country [Japan].

During World War II the U.S. government drafted him for "liaison work in Japanese concentration [internment] camps in the western" USA. He "speaks of this interval in his life with sadness. There is no mistaking his love of the Japanese people.

"Asked what was the most pressing need of the Japanese people, Dr. Webber replied, 'Nutrition.' What food? "Soybeans.' Of course it is not as simple as that, but he pointed out that Japan now consumes ½ bushel of soybeans per capita per year. The people need 3 bushels and could use 5 bushels for each person every year. Other forms of protein are beyond their pocketbooks. It is either soybeans or no protein.

"In Japan the government provides 6 years of school. The thirst for knowledge beyond that by these industrious and intense people is impossible to comprehend unless you have seen and talked with them.

"Dr. and Mrs. Webber in offering self-help educational advantages to this agricultural community are doing a wonderful service. It is an example of what can be done by a combination of science and devotion."

4406. Smith, Allan K. 1958. Use of United States soybeans in Japan. *USDA Agricultural Research Service.* ARS-71-12. iii + 36 p. April. April. Illust. 28 cm. Typewritten.
• ***Summary:*** An extremely well researched, interesting document based on a survey conducted in 1957 in Japan. Contents: Definitions of Japanese food products. Introduction. 1. Problems of Japanese food processors in using U.S. soybeans: Food production problems, foreign material, broken and dark-colored soybeans in exports. 2. Analysis of the problems. 3. Research proposals. 4. Miso: Processing, uses, production, composition. 5. Tofu and its modifications: Processing fresh tofu and frozen tofu, aburage. 6. Natto. 7. Hamanatto. 8. Kinako. 9. New products research: Soybean "milk," fermented cheese, soybean flour and isolated protein for foods, isolated soybean protein. Acknowledgments.

A graph on the front cover (and on p. 6) shows soybean production in the USA from 1938 to 1957 (in millions of acres harvested). Photos show: (1) Drying soybeans before threshing in Japan. (2) Manually operated threshing machine. (3) Power operated threshing machine. (4) Modern small-scale equipment for cleaning soybeans and grading for size. (5) Straw weaving equipment. Straw bags are used for soybeans, rice, and other farm products. (6) Cooling roasted soybeans and hand cleaning for making kinako. (7) Soybean varieties: Lincoln, White Hilum Iwate, and Acadian (six photos, showing each variety wet and dry). (8) Wooden vats used for fermenting miso; each stands a little taller than a man, and is bound with 4 bamboo hoops. (9) Miso in wooden tubs [kegs] ready for market. (10) Hand assembly of wooden tubs for shipping miso and shoyu. (11) Stone mill for wet grinding of soybeans to make tofu. (12) A modern tofu shop, with boiler, pressure cooker, filter, and precipitation vat. Photos 11 and 12 courtesy of Sugiyama Chemical Research Inst., Tokyo. (13) Deep fat frying of tofu for making aburage. (14) Wooden kegs used for fermenting hamanatto. Stone weights are used to compact the beans during fermentation.

Other figures: (1) Flow diagram of the miso manufacturing process (incl. koji). (2) Table showing total production of miso in Japan (about 1957) as reported by All Japan Miso Industrial Association. Factory made miso consists of: Rice miso 379,000 tonnes (metric tons), barley miso 146,000 tonnes, soybean miso 58,000 tonnes, total

© Copyright Soyinfo Center 2014

factory made 583,000 tonnes. Homemade miso of all types is 391,000 tonnes (67% of factory made). Total factory and home made: 974,000 tonnes. Ingredients used in this grand total: Soybeans 361,000 tonnes, rice 115,000 tonnes, barley 58,000 tonnes, salt 159,000 tonnes. (3) Table showing nutritional composition of rice miso, barley miso, and soybean miso. (4) Table showing composition of sweet miso, salty miso, and enriched miso. (5) Diagrammatic sketch of equipment used in making fresh tofu. (6) Flow diagram of a frozen tofu factory.

Note: The author was in Japan from Oct. 24 to Dec. 24, 1957. The principal localities visited were: Tokyo, Yokohama, Tochigi City, Nagano, Matsumoto, Suwa, Hamamatsu, Nagoya, Kyoto, Osaka, Fukuoka, Kumamoto, Nagasaki, and Sendai. His trip was sponsored by the Agricultural Research Service and the Foreign Agricultural Service of the USDA, and the American Soybean Association (Hudson, Iowa).

Note: This is the earliest document seen (July 2000) that mentions "barley miso"–a type of miso made with barley koji, soybeans, and salt. Address: Head of Meal Products Investigations, Oilseed Crops Lab., NRRL, Peoria, Illinois.

4407. Smith, Allan K. 1958. Use of United States soybeans in Japan: Hamanatto (Document part). *USDA Agricultural Research Service.* ARS-71-12. iii + 36 p. April. See p. 29-31. April. Illust. 28 cm.

• ***Summary:*** "Hamanatto: Hamanatto, sometimes spelled hamananatto, is made by fermenting whole soybeans. Hamanatto is produced in a limited area in Japan in the vicinity of Hamanatsu [sic, Hamamatsu in Shizuoka Prefecture, central Japan]. Hamanatto should not be confused in any way with natto. The only resemblance between the two products is that both are made by fermenting whole soybeans. Hamanatto has a pleasant flavor resembling miso or shoyu but is sweeter. Factors unfavorable to the popularity of hamanatto seem to be its very dark color (black) and its rather high cost. Hamanatto is said to cost four times as much as miso.

"Hamanatto is reported to have come to Japan by way of Korea about 350 years ago at the time of the Japanese invasion of that country. Natto means 'contributed beans' and hamanatto was contributed to the Japanese warriors. The process is reported to have originated in Buddhist temples where it was developed as a source of protein. The ancestors of the people owning the Yamaya Brewery and the Saito Mido Plant of Hamanatsu [sic] are said to have inherited the process from the Buddhist monks.

"In making hamanatto the beans are soaked in water for 4 hours and steamed without pressure for 10 hours. The cooked beans are spread on the floor for cooling to 30ºC. Koji prepared from roasted wheat or barley is sprinkled over the beans to cover their surface. The Japanese are very particular to cover the entire bean surface. The inoculated beans are placed in trays in a fermenting room for about 20 hours; during the fermentation the beans acquire a good coating of green mold. When taken from the fermenting room they are covered with a sticky material and must be separated and dried in the sun to about 12 percent moisture. This can be accomplished in one day if the weather is warm and sunny. At one factory the beans are carried to the roof for drying.

"The dry beans are placed in wooden buckets [kegs, bound with bamboo hoops] that have a capacity of about 15 gallons. Strips of ginger are placed in the bottom of the buckets before adding the beans and the salt water to cover them. A [wooden] cover that fits inside the bucket is placed over the beans and a very heavy weight placed on the cover. Rough stones estimated to weigh about 100 pounds are used for weights. Figure 18 [a photo] shows the buckets with the stone weights used during fermentation, which requires 6 to 12 months and must include one full summer. During fermentation the beans acquire a dark reddish color that is not unpleasing. After fermentation is completed and the beans are dried in the sun, they turn black. Hamanatto contains about 11 percent salt, said to be the cause of their turning black. Hamanatto will keep at room temperature for 1 year or longer.

"The makers of hamanatto, now using only Japanese soybeans, prefer a very select grade grown only in Hokkaido because they are large, are uniform in size, and are free of foreign matter. They claim to pay ¥4,500 for 60 kg. of specially selected beans; an equal quantity of U.S. [soy] beans would cost them ¥3,000. On this basis the relative cost per 60-pound bushel of Hokkaido and U.S. soybeans is $5.65 and $3.80, respectively.

"An analysis [of Hamanatto] supplied by the Yamaha Brewery is as follows: Water 39 percent, total nitrogen 3.8 percent, water-soluble nitrogen 2.6 percent, reducing sugars 7.0 percent, total sugars 10 percent, crude fiber 12.5 percent, ash (including 11 percent sodium chloride) 12 percent, volatile acids 0.015 percent, total acids 1.2 percent, and pH of water suspension 5.1. The composition of hamanatto probably varies considerably.

"If hamanatto could be produced in dark red rather than black color and the process modernized to bring the cost more in line with other fermented soybean products, it should have much wider acceptance and use."

Note 1. This is the earliest document seen (Nov. 2011) stating that Hamanatto [fermented black soybeans] were made at Yamaya temple in Hamamatsu.

Note 2. This is the earliest document seen (Jan. 2012) that uses the word "sticky" (or "stickiness," etc.) to describe Hamanatto. Address: Head of Meal Products Investigations, Oilseed Crops Lab., NRRL, Peoria, Illinois.

Research Service. ARS-71-12. iii + 36 p. April. See p. 31-32. April. Illust. 28 cm.
• ***Summary:*** "Kinako is a Japanese product that corresponds more nearly to full-fat soy flour of the United States than any other product. Making kinako is a very simple process. Soybeans are roasted for one-half hour or longer in a gas-fired rotating drum to remove the bean flavor; roasting is continued until the characteristic toasted flavor so well known to soybean processors is acquired. The beans are then cooled by spreading on a straw mat in the open as shown in Figure 7 [p. 9]. Foreign matter is removed by hand, the beans are ground to a moderately fine flour, and the kinako is packaged by hand in plastic bags.

"The Kinako Association has l6 members in Tokyo and about 50 in all of Japan. Maximum production capacity of any of these plants is probably not more than 5 tons per day. Production of kinako is seasonal; December is the month of highest production. Production originated in farm homes as a small family industry; later, mechanization of the process was improved, and it became established as a commercial process.

"One of the principal ways of using kinako is to sprinkle it on rice or rice cake [mochi]. Rice cake is made by pounding cooked rice, and the kinako is sprinkled on the macerated product. The poor people of Japan are the principal users of kinako; it should be an excellent protein supplement for their rice. However, it is not known whether the nutritional value of kinako has ever been determined. It could be greatly improved by dehulling the soybeans. Dehulling would increase the protein content about 6 percent and remove undesirable fiber.

"There is not much known about the relative improvement in nutritional value obtained by roasting whole soybeans and steaming the grits. It is possible that if the beans selected for roasting happen to have a low moisture content, they would fail in gaining their best nutritional value. Comparative nutritional values should be made on roasted and properly heated soybeans. If the roasting treatment is inadequate, a conditioning or steam treatment should be installed in the process. The new procedure suggested would be to clean soybeans mechanically, crack the beans into grits, remove the hulls, condition the grits with steam, then roast and grind. Modernizing kinako factories would reduce labor cost, improve quality, nutritional value and color, and further extend its usefulness to other foods as in the fortification of bread, noodles, and other cereals."

• ***Summary:*** The article starts: "After this article went to press, Communist China notified Japan that it was suspending all trade between the two countries."

For many years before World War II, China was one of Japan's major trading partners. "During the early and middle 1930's China accounted for one-eighth of Japan's total imports and one-fourth of its exports." Today about 75% of Japans imports from Mainland China consist of agricultural products. "Rice and soybeans make up about 70% of this amount," with soybeans being Japan's main import from China since 1955. Five graphs (p. 7) show these various import and export relationships between Japan and China. Address: Regional Economist, Asia and the Middle East branch, Foreign Agricultural Services.

ingredients.

4424. *Foreign Agriculture.* 1958. Foreign competition in oils and oilseeds. 22(7):19-21. July.
• ***Summary:*** "The United States is the world's largest producer of oils and oilseeds, and our competitive position in the international market is enhanced by our large exportable supplies of these commodities. We ship about 45 percent of the edible oils and oilseeds that move in world trade and about 50 percent of the flaxseed and linseed oil. Without substantial supplies of our edible oils the importing countries of the world would find it hard to meet their requirements, since the amounts available for export from other countries fall short of what is needed.

"For U.S. growers this trade is essential. Currently, our edible oil exports–mainly soybean and cottonseed oil–total about one third of our production, flaxseed and linseed oil about one-fifth. We have the potential to produce even more, so the question is–can we move it into world trade?"

"Dual market for soybeans: The United States and Communist China produce and export nearly all of the world's soybeans. There is a dual market for them. In the Western world the beans are crushed, the oil is used for both edible and non-edible products, and the meal is fed to animals. In the Orient a large portion is consumed as food.

"Japan is one of the major markets for soybeans and it is a dual market. Here large quantities of beans go directly into food products, and the remainder are crushed. Yet even after the crushing, most of the meal is used for human food and very little for animals. While Japan imports many more soybeans from us than it takes from Communist China, there are signs that we may lose part of this market to China because Japan is short of dollar exchange. Some groups in Japan, mainly the steel industry, would like to expand trade with China as an alternative market for their products, which cannot be absorbed domestically. Two trade agreements between groups in Japan and China were signed earlier this year for just this purpose. Apparently they have fallen through, at least temporarily.

"Where the United States gains most in world markets is through its large exportable supplies of soybeans. Europe has a sizable modern crushing industry which must be kept busy. Since the trend in many of the other oilseed-exporting countries is to crush the seed locally and only export products, Europe has increasingly turned to the United States for raw materials. India and Argentina, for instance, are exporting oilseed products and not the seeds."

A photo shows soybeans being loaded onto a ship in Tientsin Harbor, China.

4425. Hayashi, Shizuka. 1958. Hold 1-day meeting for Tokyo teachers. *Soybean Digest.* July. p. 24.
• ***Summary:*** The Japan Shoyu Association and the Japanese American Soybean Institute jointly sponsored a 1-day meeting to promote shoyu consumption. Attended by approximately 250 high school teachers who specialize in cooking courses, it was held in the Shoyu Association's hall. Mr. Shoda, president of the Shoyu Association, gave the opening speech. He was followed by Mr. Komiya, managing director of the Association, who explained that the Association is always working to improve shoyu quality and to produce shoyu that will be welcomed by housewives. "Mr. Komiya said a poor quality shoyu, which is produced in a few days time by a simple method, is by no means comparable to naturally produced shoyu in quality and flavor. The Association is discouraging the production of such low quality shoyu. He suggested that housewives learn to distinguish good quality from inferior shoyu. Low quality shoyu spoils the appetite while high quality shoyu which has a pleasant flavor and a bright scarlet color, enhances the appetite and gives better taste to food prepared from shoyu." Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome, Yuraku-cho, Chiyoda-ku, Tokyo, Japan.

4430. Hayashi, Shizuka. 1958. Activities of the Japanese American Soybean Institute. *Soybean Digest.* Sept. p. 30, 32.
• ***Summary:*** Contents: Introduction. Chronology of activities carried out by JASI. October, November 1957. December (JASI's new film about soybeans titled "Green Bud" was shown for the first time). January 1958. January. February. March. April. May. June. July. Kitchen car. Results. Chinese soybeans (the most important problem of all).

Japan has a long history of importing soybeans from China. The quality is good and the freight is less than soybeans shipped from the U.S. "Until the trade between Japan and China came to a break," many Japanese food manufacturers preferred Chinese soybeans. In March 1958 a barter contract was signed between Japanese importers and "Red China" involving about 300,000 tons of Chinese soybeans. Most of these were to be bartered for Japanese steel goods to be exported to China. Japan-China trade groups made strenuous efforts to persuade the Japanese government to approve the purchases. JASI, George Strayer (who happened to be in Japan at the time), and top level officials at the U.S. embassy in Japan struggled to stop these soybean imports from China–for they would have replaced U.S. soybean imports to Japan. This strong protest, followed by suspension of trade talks between Japan and Formosa [Taiwan] led to a "final disruption of the overall trade between Japan and Red China. The soybean contracts have been scrapped." JASI won–this time. Address: Managing Director, JASI.

4431. Miller, Harry W. 1958. Soybeans meeting nutritional needs in undeveloped countries. *Soybean Digest.* Sept. p. 68-73.
• ***Summary:*** "It was at the Dearborn, Michigan, meeting of the American Soybean Association held Aug. 18-20, 1940, that I presented a paper on 'Soybeans in Human Nutrition." In this paper I ventured the statement that while soybeans and the interest in them were chiefly valued for their oil content, I foresaw the day would come when soybeans in some form or other would become a regular item in the American diet for humans. The bean flakes and cake were discarded as fertilizer, except to a slight extent they were beginning to be used as stock feed, with a certain amount of credulity.

"At that time we were buying soybeans for a penny a pound, largely as a result of the fact that the value of their high biologic protein was not fully appreciated in animal feeds. Today it is being strongly emphasized and well authenticated that the soybean is one of the world's greatest protein yielders, and protein, as its name indicates, is of prime importance in maintaining the life and nutrition of mankind."

In countries where meat and dairy products as suppliers or protein are unavailable, or form a very small amount of the dietary, there is noted a predominantly high incidence of infections, as also a low life expectancy averaging from 25-30 years. This is directly related to a low intake of high quality protein. In these countries the most noticeable and severely injured classes are those of the newly weaned infant, the growing child, and expectant and nursing mothers. During these ages and conditions the demand for the ratio of protein in the diet is double that of the average adult man and woman. The impact of protein deficiency is more than any other factor the cause of deterioration healthwise in nations where this lack exists."

In the United States: "One-half of the products of cultivated land is fed to animals..."

"E.J. DeCastro, in his book *The Geography of Hunger* comparing animal and vegetable sources of protein states, 'The conversion of vegetable calories into animal tissue has long been known to be inefficient. Only 15% of vegetable calories is recovered in producing milk, 7% in eggs, and only 4% in beef.'"

Three tables (p. 70) show "that the value of food obtained from an acre of soybeans is three times that of wheat and twice that of corn. The reason we do not appreciate these values in this country is that we overproduce corn and wheat for edible purposes, but scarcely use any soybeans for human consumption."

"Up to this time the only agricultural product that has given any promise of being a replacement for animal milk is found in the soybean."

"The Japanese are perhaps the best per capita nourished people of the Asiatic races. Imagine them as maintaining a population that is more than half that of the United States on tillable soil no more than that found in the state of California. Through intensive farming and heavy use of fertilizers to the soil they have raised the yield per acre of land to a production of 13,000 calories per day. And on their land they are able to supply the nutritional requirements for a person on 0.2 acre, as contrasted to 1.8 acres in America. One-half of the calories of farm products in the United States go to animal feed. But in Japan only 5% of their calories come from meat, milk and eggs. Their annual consumption of the soybean as their main protein supplier is 50 pounds per capita,..."

"Milk Plant in Shanghai: After 1945 it looked as though we had a little open time for the development. The Chinese government put in a million-dollar soybean plant in Shanghai. It was completed and ready for operation just prior to the takeover of Shanghai by the Communists in 1949 which ended this.

"But the soy milk business has been spreading to other parts of Asia, first to the Philippines then Hong Kong, and now it has been taken up by the United Nations who are pushing the use of soy milk in Indonesia. The Indonesian people have used Tempe [tempeh], which is a form of boiled soybeans that have been inoculated with the aspergillus [sic,

© Copyright Soyinfo Center 2014

Rhizopus]. In that way they have consumed a considerable amount of soybeans. But here the bean was not in a form Where babies or young children could make use of it."

"Now with the ability to install practical soy milk and soy cheese [tofu] plants in countries, especially the tropics, where soybeans do not grow well and the need of protein is so great, there is opened to the soybean industry a tremendous field of opportunity. This field should also receive a liberal apportionment of funds for research. Some research has been given to this subject, but it's infinitesimal with what is required."

Photos show: (1) Portrait of Dr. Miller. (2) A "factory at Jogjakarta in central Java that produces a ton of soy milk [Saridele] every 7 hours. It is a cooperative venture between FAO, UNICEF, and the Indonesian government. Construction was supervised by H.W. (Bill) [Willis] Miller, son of the author." Water buffaloes are pulling a cart on a street in the foreground. Address: M.D., Director, International Nutrition Research Foundation, Arlington, California.

4432. Nagata, Tadao. 1958. Studies on the flowering and fruiting of summer vs. autumn soybean types. V. Effects of the day length after flower primordia initiation upon the flowering process with reference to the adaptation to planting time in autumn soybean type. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 27(1):87-90. Sept. [11 ref. Eng; jap]

• ***Summary:*** Adaptation of soybean to planting time has been of great interest to human beings since ancient times, when it was discussed in the *Lu-shi chun tsiu* (ca. 250 B.C.).

"In the temperate zone of Asia such as Central and South China and South Japan, the differentiation between summer vs. autumn soybeans–the former is a short season crop planted in April, and the latter a full season crop planted from June to July–is a well known fact as recorded in many old documents in China, such as *Ch'i-min yao-shu,* and *Tien-kung kai-wu,* and in Japan, such as *Nogyo zensho, Seikei zusetsu* and *Honzo zufu."*

The author has already reported the following: (1) For autumn soybean types, the variation of seed yield corresponding to a given planting time depends on the flowering process rather than on the ratio of pods to flowers. (2) Autumn soybean types had more flowers of moderate duration when they were planted in June, but fewer flowers that were too long in duration when they were planted in April.

In this experiment a typical autumn soybean type (also called a "late flowering soybean"), Akazaya-shirodaizu, belonging to class VII, was planted on May 5 in 1954 and April 25 in 1955. Some plants were given short day treatment before and after flowering primordia initiation. The author found an important new relationship between the planting time and the day length after flower primordia initiation. He found that the day length after flowering primordia initiation controls the flowering duration and the number of flowers per day. If the autumn soybean in planted at the proper time, it will bear abundant flowers in a comparatively short duration and have a high seed yield. Thus planting time is the key to high yield and this is primarily a phenological response to the variation in day length. Address: Hyogo Agricultural College, Japan.

4433. Rose, Florence. 1958. Plan international nutrition conference: Propose a working conference of officials from interested countries to tackle world nutrition problems. Soybeans can play a big part. *Soybean Digest.* Sept. p. 74-76.

• ***Summary:*** This is the text of a speech made by Florence Rose of MFM at the American Soybean Association's 38th annual meeting (On Aug. 20). Her actual mimeographed speech was titled "Soybeans Lead Bread–Through the World's Hunger Fronts."

During the past 12 years, the Meals for Millions Foundation, Inc. has sent over 54 million of these "3¢ meals based on soy grits to over 100 countries around the world.

ASA's 38th annual convention in Memphis, Tennessee, was the site of the second stage of the Multi-Purpose Food (MPF) idea "which is to assist other countries to produce their own counterpart Multi-Purpose Food, from their own resources." Today, in India, there is a MPF that utilizes peanuts as the protein source. "The Minister of Agriculture of India became president of our Indian Meals for Millions Association formed in 1955 to make the Indian people aware of this new approach to their age-old problem. Prime Minister Nehru authorized funds for the initial pilot plant now operating at the Central Food Technological Research Institute at Mysore." MFM has aided the take-off of the pilot plant by purchasing over 100,000 pounds of the Indian product–in addition to the 10 million meals of soy-based MPF shipped to India prior to 1956.

"The great United Nations agency, UNICEF, is prepared to assist the government of India in setting up large-scale production, after certain preliminaries are completed." A "grant of $25,000 has been made to our nongovernmental Indian affiliate to help it popularize and publicize the existence of this new food."

There is also a soy-based Multi-Purpose Food in Brazil now. In the Philippines and Japan Meals for Millions is working to develop local production of MPF. In Japan, in "cooperation with Mr. Shizuka Hayashi and your Japanese-American Soybean Institute, we hope there will soon be a Japanese MPF utilizing American soybeans as the protein base."

With its small budget and staff, MFM began looking for a short-cut that might cut the time between a good idea and concrete action.

"Trial balloon: This is the background that led us to send up a trial balloon in the May issue [article, p. 20-22] of

© Copyright Soyinfo Center 2014

the Soybean Digest proposing the idea of an International Conference to which would be invited principally officials on the ministerial levels from interested countries..."

Recently Florence Rose and Ernest Chamberlain (MFM secretary) presented the idea at the recent World Health Organization (WHO) assembly that met in Minneapolis, Minnesota, from May 22 to June 24. They personally discussed the conference with the ministers of health or their deputies from 27 of the 85 countries represented. "All expressed enthusiasm in participating in such a conference if the means could be developed to bring them to the conference location." Such a conference might be sponsored by the California Institute of Technology or one of the United Nations agencies such as WHO, FAO, and/or UNICEF. Best of all would be the American Soybean Association. Specific commitments to initiate MFM programs were given by ministers from Ceylon, Indonesia, and Liberia.

"Yesterday, Dwayne Andreas of Honeymead Products Co. gave us an inspiring example of what interest can mean, by offering Meals for Millions a [rail] carload of soy grits, a gift that will help provide an additional half-million meals of soybased MPF that can tremendously accelerate our programs in Japan and Spain and Italy." Address: Executive Secretary, MFM Foundation, Inc. [Los Angeles, California].

4434. *Soybean Digest.* 1958. Harry Willis Miller honorary life member [of American Soybean Association] 1958. Sept. p. 10-11.

• ***Summary:*** "Dr. Harry Willis Miller, director of the international Nutrition Research Foundation [INRF], Arlington, California, was born 79 years ago in Ludlow Falls, Ohio. Although renowned as one of the world's leading thyroid surgeons, he also has spent many years in soybean research and has done much to perfect and promote soybean food products on the American market.

"As a medical missionary sent to pioneer the work of Seventh-Day Adventists in China from 1903 to 1911, he wondered how he could aid the millions of undernourished Chinese children–hundreds of infants dying daily from malnutrition.

"After years of investigation and practical experimentation with one of the most staple foods in China, he discovered a method of 'milking' soybeans and perfected a palatable formula suitable for both infants and adults.

"The response to the product was spectacular. To meet the immediate demand machinery was shipped to China, and under Dr. Miller's management the first modern vegetable milk plant in the world was put into operation. Until the outbreak of war in Shanghai in 1937, fresh soybean milk was delivered daily to hundreds of homes in Shanghai.

"For the service he rendered to the people of Free China in saving the lives of countless thousands of infants with the use of soybean milk and for his untiring efforts in establishing a dozen or so sanitariums-hospital clinics in the Orient, he has received National China's highest honor. In 1956 Dr. Miller was decorated with the Brilliant Blue Star by Generalissimo Chiang Kai-shek himself.

"Although Dr. Miller has certificates to practice medicine in nine of the 49 states and 11 foreign countries, and even at his age retains a steady hand for surgery cases, he continues to devote much time to the development and perfection of soybean foods.

"Despite his full life as a general medical practitioner, and many years spent superintending numerous Chinese sanitarium-hospitals, serving as president of the Seventh-Day Adventist mission in prewar China, managing and editing the Chinese Signs of the Times, authoring many medical books and articles and lecturing around the world, he has managed to continue his soybean research and experimentation whatever his location.

"From 1939 to 1950, while medical director of the Mount Vernon, Ohio, sanitarium and hospital, he opened a research laboratory where he developed a new improved soy milk, soy-olive sandwich spread, and numerous other nutritious foods made from soybeans and grains, and initiated the International Nutrition Laboratory of America which later became the INRF which he has heavily endowed.

"In 1951 he sold his growing soybean food industry to the Loma Linda Food Co. and came to Arlington, California, where he now makes his home and spends as much time as possible in the new laboratory placed at his disposal by Loma Linda. Two years ago, the World Health Organization became interested in Dr. Miller's progress in developing a superior soy milk and modeled a million-dollar factory in Indonesia after the Loma Linda food factory which he had pioneered in Mount Vernon, Ohio. At the present time WHO is also providing $30,000 for an intensive 2-year infant nutrition research program at a leading U.S. hospital using his soy milk formula.

"Since his appointment as director of the INRF, has laboratory and experimental work have been frequently interrupted to answer please for help from his medical colleagues in foreign lands. From 1954-1956 he went to Penang [Malaysia] and Formosa to serve as medical director and surgeon for the hospitals there, took a similar post for 2 months in Trinidad in 1956, another in Libya in 1957, and he is now filling the post of medical director and surgeon at the Tokyo Sanitarium-Hospital in Japan during a 6-month leave of absence by an SDA medical-missionary.

"Despite his present busy daily routine at the sanitarium he is continuing his work with soybeans and has a nearby tofu shop deliver soy milk daily to the sanitarium in 5-gallon containers. Since his arrival he has introduced soy whipping cream for daily use at the sanitarium and routinely prescribes soy milk to allergic Chinese infants. He writes that he was surprised to find that the soy milk he helped perfect for the Loma Linda Food Co. is now obtainable by military personnel at the U.S. army post exchanges in Japan."

Note 1. This is the earliest published English-language document seen (Oct. 2013) that contains the term "Soy whipping cream."

"While other men have rightly taken up golf, fishing, or other hobbies, Dr. Miller has devoted most of his spare time to research and development of vegetable foods. 'Soybeans have been my lifetime hobby,' he declares. Small wonder he is known from East to West as the man who gets 'milk from an iron cow.'

"Over the years Dr. Miller has been among the most active supporters of the American Soybean Association. He was chosen an honorary life member of the Association at the Des Moines convention. The award was made in his absence in Tokyo during the annual banquet."

Photos show: (1) Dr. and Mrs. Miller with Madam and Generalissimo Chiang Kai-shek. (2) Dr. Miller in Libya in 1957–standing outdoors and dressed in his plain white doctor's outfit. (3) "C.G. Simcox presents honorary life membership award to C.P. Miles, manager Loma Linda Food Co., Mt. Vernon, Ohio, in behalf of Dr. H.W. Miller. Award will be formally presented to Dr. Miller in Tokyo by Shizuko Hayashi, managing director of the Japanese American Soybean Institute."

4435. Sugiyama, Mototaro. 1958. The soybean situation in Japan. *Soybean Digest.* Sept. p. 34.

• ***Summary:*** Mr. Sugiyama is also president of Hohnen Oil Co., which consumes the largest quantity of soybeans imported into Japan.

"As you know, our country is today the No. 1 buyer of American soybeans in the world, and approximately 80% of the total imports are used by our crushing industry.

"First of all, I wish to report to you about the problem of Chinese soybeans in Japan in which, I think, all of you are most interested at the moment.

"The modern Japanese crushing industry started from the processing of Manchurian soybeans about a half century ago, and because of the long experience and familiarity with Manchurian soybeans many processors even today have a feeling of nostalgia for soybeans from the Chinese Mainland. But nostalgia and actual commercial trade are two entirely different things.

"At the beginning of this year, there arose the problem of importing Chinese soybeans on a barter basis in exchange for Japan's exports of steel products to Communist China, and we as buyers of soybeans felt it necessary at that time to state our position clearly as follows:

"1. We will be prepared to buy Chinese soybeans if they are competitive both in quality and in price with American soybeans.

"2. We strongly desire that the trade method employed by the Chinese be improved to one of more reasonable basis, because we are not satisfied with the way in which the Communist government authorities one-sidedly decide quantity, price, and time of shipment, and even designate Japanese importers to handle the transactions.

"3. We ask the Japanese government to maintain in a strict sense the system of Global Budget Allocation under which we can import soybeans from any source of the world according to our own choice.

"In spite of the announcement of our basic attitude as above, the pressure in favor of soybean imports from China was increasing from the so-called 'China trade expanionists' in the government–diet and trade circles as well–and finally toward the end of April we were forced to contract for a certain amount of Chinese soybeans.

"While the situation was such, both the Chinese and Japanese governments were discussing the problem of treatment of the Chinese national flag in Japan and in the midst of the negotiation an unfortunate flag incident occurred in Nagasaki. Following those political developments, the Communist government suddenly announced on May 10, for political reasons still not exactly known to us, to break off all trade relations with Japan, including of course soybean exports to our country. Thus, what we feared most now became a reality.

"As mentioned before, we had a sense of insecurity for our trade with Communist China, and consequently, we were not willing to rely on China for the supply of the important raw material for our industry and the source of fat and protein to our population.

"Then, what will be the future development of this problem? Nobody can answer this question with certainty as it now involves basic differences in the political and economic systems of Communist China and Japan.

"Next, I would like to have a few words on American soybeans in Japan.

"The percentage of American soy- beans in the total amount of our soybean imports was 91% in 1953, 87% in 1954, 71% in 1955, and 75% in 1956 and in 1957, while that of Chinese soybeans was 4%, 6%, 3%, 23%, and 24% respectively. We can tell from these figures that about three-quarters of the total soybean oil and other soybean products consumed by the Japanese people are today made from soybeans grown by the American farmers. It is now 10 years since products from American soybeans were introduced to our Japanese households, and during those years the feeling of nostalgia among the Japanese people for Manchurian soybeans has [sic] been gradually replaced by a new sense of attachment and friendship for American soybeans.

"In recent years competent officials of the U.S. Department of Agriculture and many leaders of your soybean industry have visited our country and established personal contacts, which I am sure have greatly contributed to deepening our sense of attachment for and understanding of your soybeans.

"I think there is a bright future for American soybeans in the Japanese market, but we should not be mere optimists

© Copyright Soyinfo Center 2014

simply watching the situation take its natural course. It is quite possible at any moment that the Chinese will abruptly decide to return to our market to compete with American soybeans, for which we must be well prepared.

"Also, the restrictive measures and boycott of Japanese commodities in America may strengthen the position of the 'China trade expansionists' in various sections of our economy. I am convinced that these and other problems confronting our processing industry will be fully understood by the people who have today assembled here from all segments of the American soybean industry." Address: President, Assoc. of Oil and Fat Manufacturers of Japan, Tokyo.

4436. *Journal Star* (*Peoria, Illinois*). 1958. Two Japanese scientists here to study soybean processing. Oct. 30. p. A-5.
• ***Summary:*** A large photo shows C.W. Hesseltine and A.K. Smith of the USDA Northern Utilization Research and Development Division [NRRL], and visiting Japanese scientists Tokuji Watanabe and Kazuo Shibasaki. The two Japanese scientists have arrived in Peoria to start a year's search for ways to increase the use of U.S. soybeans in Japanese foods–especially tofu and miso. The studies will conducted under an agreement between the Agricultural Research Service (ARS), the USDA's Foreign Agricultural Service, and the American Soybean Association. The research is part of USDA's research and development program to find new outlets for U.S. farm crops.

Dr. A.K. Smith of the Northern Division spent several months in Japan last year studying soybean utilization. He found that Japanese prefer U.S. soybeans for oil-mill processing, which accounts for about half of all Japanese soybeans. The other half is used to make traditional foods, and only a limited quantity of U.S. soybeans are used in this way.

"Dr. Shibasaki is an associate professor in the department of agriculture chemistry at Tohoku University, Sendai, Japan, and an adviser of Miyagi Prefecture Miso and Shoyu Industry Association.

"Mr. Watanabe is chief of the grain processing section of the Food Research Institute, Ministry of Agriculture and Forestry."

Note: Soyfoods Center owns a copy of this black-and-white photo (8½ by 11 inches); it was a gift of the USDA National Center for Agricultural Utilization Research (Peoria, Illinois), which owns the photo.

4437. *Foreign Agriculture.* 1958. Japanese housewives' contest highlights use of soybean oil. 22(10):18. Oct.
• ***Summary:*** Over 200 contestants submitted original recipes. Sponsors and supporters included the Japan Oil and Fat Manufacturers Association, Japanese American Soybean Institute, and Osaka Food-Life Improvement Society. Japan is the world's top importer of soybeans, and the U.S. is its top source, with Communist China second and Brazil third. Japan crushes most U.S. beans for oil, using Chinese beans for food.

of Agriculture and Forestry. They arrive in Peoria Oct. 18.

"They are working under the joint soybean market development project of USDA's Foreign Agricultural Service and Agricultural Research Service, and the American Soybean Association" [ASA]. Their living expenses during their 9 months stay in the USA will be paid by ASA. "And their traveling expenses to the United States and back will be paid by the Japanese American Soybean Institute from funds allocated under the market development project." Address: Japanese-American Soybean Inst., Tokyo.

4443. Inoue, Takashi. 1958. Tamari jôzô-yô kokei kôji ni kansuru kenkyû. II. Miso-dama ni tsuite [Studies on the use of solid koji for making tamari. II. On "Miso-dama" (1)]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 36(11):458-62. Nov. English-language summary at start of issue, p. 42. [4 ref. Jap; eng]
• ***Summary:*** Miso-dama are balls made of cooked soybeans. The size of each ball has a great influence on the fermentation. Address: Nagoya Miso and Tamari Co., Ltd. (Nagoya Miso Tamari K.K.), Japan.

4444. Sakaguchi, Kenji. 1958. Studies on the activities of bacteria in soy sauce brewing. III. Taxonomic studies on *Pediococcus soyae nov. sp.* the soy sauce lactic acid bacteria. *Bulletin of the Agricultural Chemical Society of Japan* 22(6):353-62. Nov. Bound in the back of Nippon Nogei Kagaku Kaishi (J. of the Agricultural Chemical Society of Japan). [21 ref. Eng]
• ***Summary:*** "Thirteen strains of salt-tolerant specific lactic acid bacteria were isolated from soy sauce brewing mashes, and their taxonomical characteristics investigated." Details are given.

"From these facts the author proposed the name *Pediococcus soyae* nov. sp. for this sort of organism."

This bacterium requires two specific nutrients–a peptide-like substance (P-factor) and a dialyzable unknown substance (S-factor). Address: Noda Inst. for Scientific Research, Noda City, Chiba prefecture, Japan.

4445. Sakaguchi, Kenji. 1958. Studies on the activities of bacteria in soy sauce brewing. II. The proteinases and the existence of *Bacilli* spores in the soy mash (moromi). *Bulletin of the Agricultural Chemical Society of Japan* 22(6):345-52. Nov. Bound in the back of Nippon Nogei Kagaku Kaishi (J. of the Agricultural Chemical Society of Japan). [22 ref. Eng]
• ***Summary:*** The activity of proteinases [enzymes that break down / hydrolyze protein] in soy mash [*moromi*] juice was measured. "Compared to proteinases of purely cultured soy koji digest which consisted of only *Aspergillus* proteinases, no difference was observed with the proteinases of usual soy mash through the studies of pH-proteinase activity curves, the inhibition test, and inactivation by acid and alkali treatment. It is supposed, therefore, that the proteinases in soy mash are mostly of *Aspergillus* origin."

Very few *Bacilli* vegetative cells were found in the soy mash. Therefore the researcher "assumed that *Bacilli* mainly grow in the koji and survive in the soy mash mostly in the form of spores. This work also suggested that the so-called '*Aspergillus* alkaline proteinase' consists of two distinct proteinases, and further the existence of an inhibitor which only acts at pH 8." Address: Noda Inst. for Scientific Research, Noda City, Chiba prefecture, Japan.

4446. *Soybean Digest.* 1958. Dr. Miller receives honorary [life] membership [in American Soybean Association] (Photo caption). Nov. p. 23.
• ***Summary:*** This photo shows Dr. Harry W. Miller seated next to Mrs. Miller with 10-15 other people at a long table during a formal luncheon in Tokyo; there he received a gold medallion signifying his election as honorary life member of the American Soybean Association. "The luncheon was arranged by the Japanese American Soybean Institute and Shizuka Hayashi, managing director (standing), presented the award. Dr. Miller, who is on duty in a Tokyo hospital, was elected honorary life member at ASA's convention in Des Moines [Iowa] last August."

A brief review of the researches of Prof. Teizo Takahashi (mainly with saké). A brief review of the researches of Prof. Kin-ichiro Sakaguchi. Prof. Takahashi has 190 references, and Sakaguchi has 394 references. Address: Tokyo, Japan.

4458. Cravens, W.W.; Sipos, Endre. 1958. Soybean oil meal. In: A.M. Altschul, ed. 1958. Processed Plant Protein Foodstuffs. New York: Academic Press. xv + 955 p. See p. 353-97. Chap. 14. [198 ref]
• ***Summary:*** Contents: Introduction. Production and trade: General world situation, United States (production, movement in trade, economic importance of soybean products). Structure and composition of the soybean seed: Gross and microscopic structure, influence of variety, soil, and climate on soybean yield and composition. Methods of processing. Composition of soybean oil meal: Standard specifications in the United States, soybean protein, amino acids, suppressive, toxic, and other factors, enzymes, carbohydrates, vitamins, minerals. Soybean oil meal for feed: General considerations, soybean oil meal for poultry, soybean oil meal for swine, soybean oil meal for ruminants (beef cattle, sheep, dairy cattle, soybean oil meal for dogs). Future trends in soybean oil meal utilization. This chapter is a review of the literature.

"No mention has been found of soybean oil in ancient Chinese literature, so it may be concluded that the crushing of soybeans for oil has occurred in comparatively recent times. The processing of soybeans, however, was more or less localized until after the Chinese-Japanese War (1894-1895), when Japan began to import soybean oil cake for fertilizing purposes, resulting in a sudden expansion of demand for this product. Soybean cake then became the chief

© Copyright Soyinfo Center 2014

end-product of the oil-meal industry. The Russo-Japanese War increased the production of soybeans in Manchuria, and, when this war ended, a surplus of soybeans developed. Japanese firms realized very soon the export potential of this crop, and in 1908 several shipments were made to Europe. After this time the soybean was one of the chief export items of this area...

"After many decades of experience and unsuccessful attempts, the first large-scale continuous solvent-extraction plants in the United States were introduced from Germany in 1934. Both the Hildebrandt 'U'-type and the Hansa-Muehle or Bollman [Bollmann] basket-type extractor were used exclusively until 1937 when the vertical gravity extraction columns built by the Allis-Chalmers Manufacturing Co. and the V.D. Anderson Co. were made available. Modifications of the Hansa-Muehle or Bollman extractor have been built in the United States by the French Oil Mill Machinery Co. and the Blaw-Knox Co. (Langhurst 1951, p. 541-90).

"Considerable research was devoted to find the most efficient and practical solvent for the extraction. Because of its nonflammability, trichloroethylene appeared to be promising at one time. After toxic symptoms were observed in cattle fed trichloroethylene extracted meal, however, it lost its popularity in the soybean processing industry (Picken et al. 1955, p. 420-24; see also the Duren disease in Chapter 6 by Kuiken). Hot alcohol extraction was tried in Manchuria but it is impractical in the United States because of its high cost, the necessity of drying the flakes to 3% moisture in the recovery process, the difficulty in maintaining high purity, and the poor selectivity of alcohol as solvent.

"Prior to 1930 no petroleum company specialized in solvent-extraction naphthas... Finally, commercial hexane filled the requirements better than any other solvent tried, because of its low cost, easy recovery, and selectivity for vegetable oils. Extreme precautions are necessary with flammable hydrocarbon solvents...

"In the United States the bulk of soybeans processed by solvent extraction is handled by the basket and vertical gravity types. Most of the plants operate at or near a solvent-to-soybean ratio or 1:1." Address: McMillen Feed Mills, Decatur, Indiana.

4459. Dean, R.F.A. 1958. Use of processed plant proteins as human food. In: A.M. Altschul, ed. 1958. Processed Plant Protein Foodstuffs. New York: Academic Press. xv + 955 p. See p. 205-47. Chap. 9. [99* ref]

• ***Summary:*** Contents: General considerations: Early sources of protein for human food, competition for food between man and his domestic animals, vegetarianism and vitamin B-12, protein requirements (of children, of adults). Plant proteins now in use: Foods that can be prepared in the home (cereals, legumes {incl. groundnuts, soybean}, sunflower seed, sesame), plant foods used after factory processing (cereals, legumes, sunflower seed meal, cottonseed meal). Other forms of plant food: Plankton, algae, food yeast, leaf proteins (p. 237-38). Future extensions of the use of plant proteins: The theoretical basis of selection, assessment of the value of foods intended for human consumption, practical measures for the future.

In 1957 some 160,000 tons of soybeans were used to make tofu in Japan. "Magnesium or calcium salts are the precipitants of the curd from the soybean milk; the product is eaten by nearly every family in Japan with its breakfast miso-soup."

During World War II, the attempt was made to introduce soya as a food crop to Uganda. But "no instruction was given in the necessary details of preparation, with the result that the crop was very reasonably declared inedible by the Africans. They retain a violent prejudice against it and are suspicious that it has been added to any food, such as yellow corn meal, that they find distasteful.

"One of the most interesting methods for making soya edible has evolved in Indonesia and was described in full by Van Veen and Schaeffer (1950). It takes advantage of the ability of the mold *Rhizopus oryzae* to grow on the bean and alter its constituents... The product made from soya is called *tempeh kedelee* (kedelee = soybean)." Details of the production process are given. A description of natto and its composition is also given (p. 218).

The section on algae gives detailed information on chlorella, a type photosynthetic single-cell protein. As early as 1954, Morimura and Tamiya in Japan were experimenting with the use of powdered *Chlorella ellipsoidea* in foods. Note: This is the earliest document seen (Aug. 1997–one of two documents) that mentions the use of algae or other photosynthetic single-cell protein as food.

The section on leaf proteins (p. 237-39) begins: "Protein synthesis is one of the chief activities of the leaf, and proteins are comparable to animal proteins in their amino acid composition (Lugg 1949). The young leaf is especially rich in protein..." Pirie (1953) has suggested a process for recovering the leaf protein from the fibrous residue left after mechanical separation; the protein is usually very difficult to free. Pirie (1953) has also described the likely structure of an efficient plant. "There are also obvious possibilities in such abundant and little-used material as the leaves of sugarcane, cassava, and bananas" (p. 238-39).

The section titled "Sesame" (p. 219-20) states that the Zande people of southwestern Sudan steep the seeds in water for a few minutes, then pound them lightly to loosen the outer coat. They then dry the seeds and the outer coat is sieved or winnowed away. The seeds are then roasted and ground to a paste, which is sometimes used to make a sauce (Culwick 1950). "The use of sesame as a sweetmeat or condiment is fairly widespread in the Near East. A sweetmeat called *tahinya* or *tahina* is made in the Gezira [Sudan] by cooking the roasted seeds in sugar; sometimes the seeds are crushed before the cooking, and sometimes not" (Culwick

© Copyright Soyinfo Center 2014

1951). Describes how to make the condiment. Address: Medical Research Council, Mulago Hospital, Kampala, Uganda.

4460. Ford, Herbert P. 1958. The life story of Dr. Harry W. Miller. Unpublished manuscript. 169 p. Unpublished manuscript. 28 cm.

• ***Summary:*** This manuscript is the slightly edited second draft of the transcript of a single 7-8 hour interview that Mr. Ford did with Dr. Miller in 1958 in Chicago. According to Mr. Ford, Dr. Miller later gave a copy of the manuscript to Raymond S. Moore PhD, a Seventh-day Adventist educator, with the understanding that Moore would use it as the basis for a book. The book, titled *China Doctor,* was published in 1961. Dr. Miller was not very happy with the way the book turned out.

Pages 122-35 give a much more detailed account and history of Dr. Miller's work with soy milk, tofu, yuba, other soyfoods, meatlike products, and wheat gluten than is found in the finished book, *China Doctor.*

Concerning wheat gluten: Dr. Miller's company in Mt. Vernon, Ohio, International Nutrition Laboratory, "had protein foods in which they used wheat gluten and made meat patties and various kinds of stews, sprouted the green soybeans and made a chili with them and wheat gluten." They also developed a vegetarian wiener [Veja Links] containing raw vital wheat gluten, soy flour, seasonings, and flavors. They stuffed these into wiener casings, submitted them to a smoke house and to cooking, then peeled off the casings/skins and canned the wieners. He developed these at the Mt. Vernon slaughterhouse.

"Soy milk manufacture in the U.S.A. (p. 131). In 1939 Dr. Miller returned to the United States having been so thoroughly convinced that soy milk was destined to have world-wide acceptance... His son, Harry Willis Miller, Jr. had returned preceding his father and had started a small soy milk plant in Utica, New York, where he made and bottled soy milk and also made and canned some of the protein foods out of wheat gluten for which they had developed recipes. This plant was later moved to Mt. Vernon, Ohio, after they started the soybean plant at Mt. Vernon. The plant was rather small at first as their capital was very limited. They had to build up the food plant out of his surgery earnings. As these products were mostly for export, the firm was called the International Nutrition Laboratory. It was called International because they didn't think of having any particular market for soy milk in the United States but anticipated making and packing soy powder which they could ship over to China, Japan, Korea, and other fields. Since the United States is a dairy country, they just thought they would have all kinds of difficulty getting it introduced over in America. They gave their attention largely in the early part of the work to making some products that went over quite well, which could be sold locally such as meat patties–vegaburgers. They would take the wheat flour, wash the starch from it, and make gluten patties. They actually built up a very fine product that was netting them earnings. The earnings of that, together with Dr. Miller's medical and surgery fees, to finally get together a spray dryer which they built with the aid of the know-how assistance of the Rogers Company, who sold these spray dryers... and through this home-made outfit they daily spray dried considerable powdered soy milk and placed it on the market. They made some ice cream mixes and they shipped out in barrels to the Philippines soy milk powder and also shipped consignments of the powder to Shanghai where they had formerly introduced a soy milk to the Shanghai Settlement. Thus they kept soy milk going up until the time of the world war in 1941 which cut them off from shipping to the Orient."

Note: This is the earliest document seen (Jan. 2014) concerning soy milk in international trade (for imported or export).

In the United States they found "an interest on the part of doctors in feeding babies that were covered with various kinds of rashes which they called atopic dermatitis. Many of these babies had asthma, diarrhea, projectal vomiting, nervous irritability and were unhappy babies, all because of the allergy to cow's milk formula." Doctors began to realize that babies with allergies and other sicknesses responded well to soybean milk; the market soon increased. Eggs and milk are the chief causes of allergy, but some vegetable proteins like wheat, corn, and some legumes also cause allergic reactions in some cases. Then doctors began to ask for evidence that the milk was safe. They suggested that it be submitted to the American Medical Association [AMA]. So at once Dr. Miller contacted Dr. Earl Baxter, Professor of Pediatrics at the Ohio State University Medical School, and he agreed to conduct some feeding experiments with soy milk. These studies showed that "babies could be nourished as well on soy milk." In Tokyo, Dr. Choei Ishibashi (later president of the Japan Medical Society) also did meticulous feeding tests with infants, using the powdered soy milk Dr. Miller had sent after World War II. Over a period of many months, he compared the blood, measurement, and growth records of babies fed soy milk with those fed animal milk [cow's milk]. Then Dr. Miller took the results of the studies in Japan and at Ohio State and submitted them to the Council on Food and Nutrition of the American Medical Association. The Council has 15 members, the very best scientists on food and nutrition. "They examined the [soy] milk, examined the claims for it, looked over the research, and then gave the seal of approval which was placed on every can of soymilk thereafter."

"Now that they had this seal of approval, they went to medical conventions and canvassed the doctors; the sale of soy milk grew very rapidly." The plant began to get larger; it made great demands and there were many details to look after. These facts and his lack of capital to carry on this work

© Copyright Soyinfo Center 2014

adequately made Dr. Miller realize that he must do one of two things. He must either organize a corporation, issue stock, and enlarge the company greatly, or he must dispose of the plant and give his time and attention to research.

During this time, Dr. Miller received valuable help from the U.S. Department of Agriculture [USDA]. Dr. J.A. LeClerc (Senior Chemist, Agricultural Chemical Research Division) and Mr. L.H. Bailey, who investigated the use of "soybean milk in making breads" and made the results and analyses available to Dr. Miller. "Thus they got themselves very well established in this country as having a milk for people who did get along with cow's milk."

However the secretary of the AMA told Dr. Miller that he should not claim or advertise that his soy milk was a good alternative to cow's milk for all babies, but only "for those babies who do not do well on cow's milk." However he added: "If you can take care of babies that cow's milk does not take care of, there is no reason why you could not take care of the other babies that cow's milk does agree with too." This was his diplomatic way of counseling them not to make unfriendly comparisons with cow's in a dairy country–even if those claims are valid. By following his advice, Dr. Miller was able to work well with the dairy industry without any conflicts.

The Loma Linda Food Company in California showed an interest in acquiring Dr. Miller's company in Ohio. "They had been making some soy milk in the liquid form, but they were interested in getting an Eastern branch." So in 1950 they purchased the [soy] milk plant in Mt. Vernon and have been operating since that time. This took a great burden off Dr. Miller's shoulders and left him free to do medical and nutritional research work. "It was then decided to start the International Nutrition Research Foundation and Dr. Miller was asked to be the Director of this Foundation. He placed a larger part of the purchase price of the factory into this Foundation, which would be devoted to food research only. From the day this research institution was started it has attracted a great deal of attention from all parts of the world; among those interested parties has been the World Health Organization of the United Nations. They came to the conclusion that soy milk had great possibilities in countries of low economic conditions where they could not afford to buy imported [cow's] milk," and in protein-deficient countries. They came to Mt. Vernon to investigate both the soy milk plant and the experimental research. Dr. Miller educated them on the many benefits of using protein from soybeans instead of from animals. As a result, the United Nations constructed a large soy milk plant in Djojakarta [Jogjakarta / Yogyakarta] Indonesia. It was built with the advice of Dr. S.S. De (who has headquarters in Bangkok, Thailand) and the support of the Government of Indonesia, FAO, UNICEF, and WHO.

4462. Kawamura, Wataru. 1958. Miso enkaku-shi [History of miso]. Tokyo: Zenkoku Miso Kogyo Kumiai. 817 p. Illust. 22 cm. [96 ref. Jap]

• ***Summary:*** The definitive work on the subject. Pages 187-213 list all early Japanese books mentioning miso, with a summary of what each says about it. Contents: Preface. Part 1. Tradition of miso (p. 1-228). Chronological table of miso history. Introduction (p. 1). Outline (p. 9). 1. Transportation in China and Japan in ancient times (p. 19). 2. Jiang in China (p. 29). 3. Jiang in the *Ch'i-min yao-shu* (p. 37). 4. Ancient Japan (p. 50). 5. The *Kojiki,* the *Nihonshoki* and miso (p. 55). 6. The Asuka and Hakuho periods (p. 66). 7. The Nara period (710-784 A.D., p. 72). 8. The Heian period (794-1160, p. 85). 9. The Kamakura period (1185-1333, p. 106). 10. The Muromachi period (1338-1573, p. 125). 11. The Momoyama period (1568-1600, p. 148). 12. The Edo period (1600-1868, p. 158). Appendix 1. Collections of old miso information (p. 187-213). Appendix 2. Old miso cookery (p. 215-228; recipes names and general descriptions of how to prepare them but with no amounts given).

Part 2. Local folk records of miso (miso in various prefectures from Hokkaido to Kagoshima-ken, p. 229-461).

Part 3. History of miso regulation (p. 463-815). 1. Early history of regulation (p. 463). 2. Intensification of regulation during World War II (p. 468). 3. National Miso Industry Association (p. 477). 4. Economic regulations and the new economic systems (p.494). 5. Regulatory activities of the Federation (p. 520). 6. Enforcing the *ichigen-teki* regulation (p. 543). 7. Organizing the system of production and supply (p. 555). 8. Methods of doing business (p. 567). 9. Regulation guidelines for processing miso (p. 582). 10. Consolidation of businesses (p. 622). 11. The Emperor's visit (p. 638). 12. Regulation of the controlled companies (p. 641). 13. Management after the war (p. 665). 14. Pressing conditions of miso and food (p. 694). 15. Discontinuance of *kokka sodo in ho* (national order of total mobilization, p. 723). 16. Start of the public organization for food rationing (p. 729). 17. Effect of food rationing on miso (p. 747). 18. Discontinuance of the public organization ("Kodan," p. 765). 19. National Miso Industry Association (p. 728). 20. Today's miso fermenting technology (p. 798). 21. Conclusion.

Note: A translation of this book into English would yield many heretofore hidden treasures for English speakers. Address: Miso teacher, 2-4-7 Kugenuma, Tachibana, Fujisawa-shi, Kanagawa-ken 251, Japan.

4463. Koyanagi, Tatsuo; Sato, Mitsuko. 1958. Miso no eiyô zôkyô ni kansuru kenkyû. I. Soruburu tenka miso-chû no B-12 oyobi mechionin ganryô [Studies on the enrichment of

"miso". I. Vitamin B-12 and methionine contents of "miso" fortified with viscera solubles]. *Eiyo to Shokuryo* (*J. of Japanese Society of Food and Nutrition*) 10(6):269-71. [4 ref. Jap; eng]
• ***Summary:*** The fish viscera solubles were added before fermentation. If less than 2% by weight, no fishy smell appeared in the final product.

4464. Kuiken, K.A. 1958. Effect of other processing factors on vegetable protein meals. In: A.M. Altschul, ed. 1958. Processed Plant Protein Foodstuffs. New York: Academic Press. xv + 955 p. See p. 131-52. Chap. 6. [141 ref]
• ***Summary:*** Contents: Introduction. Solvent extraction of oilseeds: Introduction, physical properties of solvent-extracted oilseed meals, protein quality and content, solvents for oilseed extraction (hydrocarbons, alcohols, trichloroethylene). Chemical contamination of feed products: Bovine hyperkeratosis (X-disease) (occurrence, causative agent, toxic level, toxicity symptoms), pellets containing stilbesterol [stilbestrol], chemical seed protectants and pesticides. Selection of varieties and strains of seeds: Amino acids in soybean varieties, amino acids in cereal grain varieties, gossypol content of cotton varieties. Storage of raw materials and finished products: Fundamental considerations (feed moisture level and mold growth, airtight storage of wet grain), biological value of stored cereal grains and soybeans, behavior of gossypol in storage of cottonseed, meal, and feed mixtures, use of chemicals for protection of stored grains.

"Conversion of the soybean industry in the United States to solvent processing is far advanced; the volume of solvent-extracted cottonseed and linseed oil meals is increasing rapidly." Three main types of solvents are used for oilseed extraction: Hydrocarbons (typically hexane), alcohols (ethanol or isopropyl alcohol), and trichloroethylene. In 1937 Japanese workers first "reported the use of ethanol for extraction of soybeans in a mill at Dairen, Manchuria. Industrial development of alcohol-extraction systems have not occurred in the United States. The early Japanese interest in alcohol extraction was a result of local availability of solvents; at the present time Japanese processors generally use hexane for extraction of soybean oil." Details are given on the history of trichloroethylene and the undesirable biological effects of feedings trichloroethylene- extracted soybean meal ("trichlor meal") such as the Duren disease of cattle.

"Stilbesterol is of interest as a cattle feed ingredient; it is reported to stimulate rate of weight gain and reduce feed cost (Burroughs, Culbertson, and Kastelic 1955). On the other hand, low-level contamination of feeds with stilbesterol can cause serious reproductive disturbances in some animals."

Note: This is the earliest English-language document seen (June 2006) that uses the word "trichlor" to refer to "trichloroethylene." Address: The Buckeye Cellulose Corp., Memphis, Tennessee.

Several properties of crystalline protease]. *Hyogo Noka Daigaku Kenkyu Hokoku, Nogaku-hen* (*Science Reports of the Hyogo University of Agriculture*) 3(2):97-100. [15 ref. Jap; eng]
• ***Summary:*** "The properties of a crystalline preparation of protease obtained from cultures of *Bacillus natto* were studied. The optimum pH of the enzyme for digestion of casein and gelatin was found to be 8.2 and the optimum temperature was approximately 55ºC." The enzyme was found to be stable after heat treatment for 10 minutes at 45ºC, but it was inactivated above this temperature. Address: Biochemical Lab.

4466. Motoyama, Tekishu. 1958. Inshoku jiten [Encyclopedia of food and drink]. Tokyo: Heibonsha. 604 p. Illust. 27 cm. [Jap]
• ***Summary:*** Includes listings for the following soy-related terms: Aburage (deep-fried tofu pouches), aemono (Japanese-style salads), agedashi-dofu, daizu (soybeans), dengaku, fu (wheat gluten; but the term "seitan" is not listed in this book), ganmodoki (tofu burgers), gisei-dofu, goma-dofu (sesame tofu), goma-miso (sesame miso), inari-zushi, iri-dofu (scrambled tofu), kenchin-jiru, miso, namemiso, natto, oboro-dofu (soymilk curds), oden (stew), okara, shira-ae (tofu salad), shoyu, sukiyaki, tekka, teriyaki, tofu, tonyu (soymilk), tsuto-dofu, unohana (okara), yakimiso (broiled miso), yuba.

Separate entries, with detailed information, are given for some of the above words or terms.

4467. Motoyama, Tekishu. 1958. Inshoku jiten: Shôyu [Encyclopedia of food and drink: Shoyu (Document part)]. Tokyo: Heibonsha. 604 p. See p. 278-80. [Jap]
• ***Summary:*** Contents: Ways of using soy sauce. Brewing soy sauce. Chemical soy sauce.

"Ways of using soy sauce (*shoyu*)*:* It goes without saying that the spread and development of soy sauce is due to its ability to enhance the flavors of foods and create new combinations of flavors. The fact that *namasu,* a dish of raw fish and vegetables seasoned with rice vinegar and soy sauce, is a favorite and representative way of serving sashimi is due largely to the flavor contributed by the soy sauce. On the whole, it cannot be denied that soy sauce tantalizes the palate. The basic significance of soy sauce lies in its ability to supplement the rather simple flavor given food when only salt is used as a seasoning. It is generally thought that the true flavor of soy sauce can best be enjoyed in *kijoyu* or plain, fresh unpasteurized soy sauce. Shoyu surpasses other seasonings in its ability to make each dish unique by evoking

© Copyright Soyinfo Center 2014

complex and delicate flavors inherent in the food itself.

"It is important that its users recognize this point from the beginning. Simply speaking, to experience the quintessence of the flavor of soy sauce, try serving it plain as *kijoyu* over fresh sashimi. In some cases the flavor of fish broiled lightly with salt (*shio-yaki*) or salted pickles can be improved by the addition of a very small amount of soy sauce, however basically these are esteemed for the flavor imparted by the salt. And if high-quality *koikuchi* is heated above a certain temperature–as is the case in broiling–a strong and unpleasant flavor will result. In order to compensate for this, *usukuchi* was created. Although pale in color, it contains a relatively large amount of salt. Able to harmonize well with other seasonings, it has a simple flavor and dissolves easily in water. It is used for soups and *nimono* (dishes simmered in liquids) since there are considered best when their flavors are light and simple. Used by itself it is too salty, and its flavor is inferior to that of regular shoyu. Unless used with liquids in broths, it does not harmonize well with other flavors.

"In broiled eels (*kabayaki*), in the mirin soy sauce (*mirin-joyu*) used with teriyaki, in tsukudani (preserved foods simmered in soy sauce), even in foods simmered in liquids (*nimono*) and especially in cooking where water is not used, *koikuchi* is preferred to *usukuchi* since it was originally developed for its rich, distinct flavor, slightly heavier consistency and darker color. The reason it is heated in *mirin-joyu* is to help unite both ingredients. It is also said that the longer-lasting the seasoning soy sauce (*tare*) used for broiled eels, the better; after several years of use, the oil from the eels and fish becomes mixed with the soy seasoning sauce. Each time the sauce is used afresh in broiling, the heat helps the soy, mirin, and oils to "marry." If the sauce is reheated in a pot, the fire should be turned off just before the liquid comes to a boil. Most fish are first broiled without seasoning sauce, and the sauce then applied later. In the case of tsukudani, it is more important that it last well than that it have a fine flavor so the problem is slightly different.

"Usukuchi is used largely in the Kyoto area and koikuchi in the Tokyo area. However Kyoto cooks use both types of soy sauce in restaurants and at home whereas Tokyo cooks use koikuchi almost exclusively, especially at home. When seasoning foods, if they are too bland or weak, we usually add shoyu, and if they are too salty we usually add sugar. Flavors in which sugar and soy sauce are combined have never been considered high class. Throughout most of Japan's culinary history, seasonings, herbs and spices have been used to a very limited extent. Shoyu and salt have been used to evoke the flavors inherent in foods, and the people have come to a deep appreciation for salt from the point of view of both economy and flavor. If you are well versed in the way of using salt in foods, there is no need to use *usukuchi,* and the efficiency of regular shoyu will rise.

"In recent years, for the sake of portability and preservation, soy sauce has been spray dried to make soy sauce powder and crystals. These of course, have a flavor and fragrance which is inferior to that of regular soy sauce. Since a small amount of mold often forms on the surface of shoyu during the warm summer months, this is often removed by heating the shoyu to 50-60ºC or straining it through cotton cloth. It can also be prevented by adding a small amount of mustard oil to the shoyu.

Note: This is the earliest document seen (April 2012) that mentions spray-dried or dehydrated soy sauce. After instant noodles were first marketed in Japan in Aug. 1958, sales of spray-dried increased as a seasoning for the noodles.

"Brewing soy sauce: Soy sauce is made from a fermented mixture of soybeans and wheat to which water and salt are added. The three basic varieties are *koikuchi* (literally: dark mouth) or regular dark soy sauce, *usukuchi* (literally: light mouth) or the lighter, milder, less common soy sauce used in the Kyoto area and *tamari.* Each of these is made by a somewhat different process. However in the case of the most common soy sauce, it is said that the finest flavor is attained if the koji is prepared from equal quantities of soy and wheat. The amount of salt ranges from 90-110% of the combined amounts of the soybeans and wheat. Thus the amount of water is generally twice the amount of salt. The finest soy sauce contains a relatively small percentage of both salt and water. Inferior grades contain 110% salt or water, as measured above.

"It is not absolutely necessary that soybeans contain all of their natural oils in order to use them in soy sauce. Although a certain percentage of the beans may be defatted soybeans, this percentage is very delicate. When a large percentage of defatted soybean meal is used, it is necessary to use a chemical process for adding amino acids to the soy sauce in order to obtain satisfactory fragrance in the soy sauce.

"Ordinarily, the wheat is roasted until golden brown and cracked into small pieces. The soybeans are rinsed, soaked overnight in water and then either boiled or steamed. After they have cooled somewhat, they are mixed with the cracked roasted wheat, koji spores (*tane koji*) are added and the mixture placed in a warm incubation room (*muro*). By the fourth day the mixture will have turned into *koji* and be covered with a bloom of fragrant white mold. At this time the salt and water solution are added in order to make *moromi,* the mash of soy sauce, wheat and soybeans. This mixture is stirred from time to time and allowed to ferment and age for at least one year.

"It is commonly said that one-year-old moromi has only fragrance, two-year moromi also has flavor and three-year-old moromi has fine color as well. In order to attain the perfect blend of fine qualities, these three different types of moromi are often mixed in the following proportions: 5 parts 1-year moromi, 2 parts 2-year and 1 part 3-year moromi. When the mixture is placed in a cotton sack and pressed,

© Copyright Soyinfo Center 2014

about 70-80% of the weight can be extracted as soy sauce liquid. This is allowed to settle and become clear for 2-3 days. After removing the oil which floats to the surface and the dregs on the bottom, the remainder–called *nama-tamari* (fresh-tamari)–is heated to 60-70ºC to sterilize or pasteurize it. It is then known as *Hi-ire* (put into fire), and is ordinary soy sauce made in Japan" (Continued).

4468. Motoyama, Tekishu. 1958. Inshoku jiten: Shôyu [Encyclopedia of food and drink: Shoyu (Document part II)]. Tokyo: Heibonsha. 604 p. See p. 278-80. [Jap]
• ***Summary:*** Continued: "In recent times, in order to maximize profits and employ capital most efficiently, various methods of high-speed brewing and processing have begun to be used. And due to the relationship between supply and demand, substitute varieties of each of the main types of soy sauce have been developed and are now being produced.

"*Usukuchi* soy sauce is made to have a light color due to the way it is used in cooking. The basic method of manufacture is the same as for regular soy sauce, however to give it a lighter color, the water in which the soybeans are cooked is changed during cooking and then drained off as soon as the beans come to a boil. The wheat is also roasted for a shorter time than for regular soy sauce to give it a lighter color and prevent scorching. The koji is prepared in more or less the same way as for regular soy sauce however the koji is removed from incubation when the mold is in the state called shimofuri or 'salt and pepper' so that there is less (?) mold than for regular soy sauce koji. A larger amount of brine is mixed with the koji and the mixture is allowed to age for 6-12 months. Before pressing, sweet sake (amazake) is added as a natural sweetener. The liquid is heated to a lower temperature (60ºC) for a shorter time (20-30 minutes) during sterilization. Therefore usukuchi cannot be kept as long as regular soy sauce without spoiling.

"In regular soy sauce–which is generally seen as a slightly lower quality product than tamari–salt water is also added to the pressed moromi and the mixture re-pressed to yield a liquid called *bansui.* This is used as one of the raw materials in the even lower quality chemical soy sauce. The main areas which have produced *koikuchi shoyu* since ancient times are Choshi and Noda in Chiba prefecture and Shozushima in Kanagawa prefecture. The main area producing *usukuchi shoyu* is Tatsuno in Hyogo prefecture, however it is also brewed in large quantities in farmhouses for home use. *Kanro shoyu* is a product originally developed in Yanaitsu in Yamaguchi prefecture. Made by reprocessing koikuchi shoyu into a thick, sweet liquid, it is prized in the Kyoto area where it is served with *sashimi* from white fish meat.

"Chemical *shoyu* (*daiyô* {substitute} *shoyu*)*:* Ordinarily, at least one year is required to brew regular soy sauce so that at the large breweries, huge aging cellars or warehouses are necessary. Since this ties up a large amount of capital and reduces profits, studies were first made of ways to speed up the traditional process and then of ways to make soy sauce using chemicals and new raw materials. Soon a large number of varieties of 'amino acid shoyu' appeared on the market. Inexpensive defatted soybean meal began to be used in place of whole, natural soybeans. The meal is first broken down by hydrochloric acid and then neutralized by soda ash to produce crude amino acid. If this product is mixed with brine, the resulting liquid has much the same color and flavor as natural soy sauce. However since the fragrance is poor, ready-made moromi is then added and the mixture reheated. The amino acids in the protein break down in to starches which are also added to produce sugars.

"By the discovery of sugar-containing amino acids, it became possible to devise soy sauce which had both sweetness and viscosity. After experiencing some difficulty with using low-priced defatted soybean meal, research began in the use of fish whose level of freshness had fallen, fish meal, viscera, chrysalis dregs, sesame seed dregs [defatted sesame meal left the oil was removed], and cotton seed dregs. Products were also developed by placing the pressed dregs of regular soy sauce in a liquid made by simmering fish, shell fish and seaweeds in order to impart their flavor to the soy sauce. Another variety of chemical soy sauce was developed for kidney disease patients who are unable to use salt in their food. Malic acid soda made from apples was used to simulate a salty flavor."

4469. Motoyama, Tekishu. 1958. Inshoku jiten: Teriyaki [Encyclopedia of food and drink: Teriyaki (Document part)]. Tokyo: Heibonsha. 604 p. See p. 397. [Jap]
• ***Summary:*** This is a Japanese cooking method used to make grilled dishes (*yakimono ryori*)*.* Fish meat is brushed or dipped in Mirin-shoyu then grilled.

Use the following types of fish: *Tai* (a sea bream, a red snapper, a porgy), *sawara* (a Spanish / spotted mackerel), *buri* (a yellowtail), or fresh salmon (*nama sake*)*.*

Mirin is used as the final touch to give a glossy or shinier appearance. In Japanese, the term *teri o dasu* is used to mean "bring out the gloss / luster" or "to make it shine." Therefore it is called teriyaki (glossy / shiny grill).

Note: The meaning of "Mirin-shoyu" is unclear. Are the only two ingredients mirin (sweetened sake for cooking / seasoning) and shoyu (regular Japanese-style soy sauce)? If yes, in what proportions are they used? If no, what are the other ingredients and the proportions of each?

4470. Motoyama, Tekishu. 1958. Inshoku jiten: Tekka miso [Encyclopedia of food and drink: Tekka miso (Document part)]. Tokyo: Heibonsha. 604 p. See p. 396. [Jap]
• ***Summary:*** Tekka miso is a type of finger-licking-miso (*name miso*)*.* Ingredients (like roasted soybeans, chopped burdock root, etc.) are mixed into a regular red miso, then add to your own taste, gingerroot, sugar, and/or barely malt

© Copyright Soyinfo Center 2014

syrup (*ame*). Finally everything is sautéed / cooked [often for quite a while] in sesame oil.

Some gourmets love to have this special miso made with added minced red chili peppers to make it a little spicy.

4471. Nippon Shokuhin Kyokai. 1958. Tôfu no eisei [Tofu sanitation]. Tokyo: NSK. 97 p. 19 cm. Series: Shokuhin eisei sosho; Tofu no maki. [Jap]*
• ***Summary:*** This is the first book on this subject, indicating that the microbiological safety of tofu was probably a matter of fairly widespread concern at the time.

4472. Richards, Janet; Richards, Charles. 1958. Basic Chinese and Japanese recipes. 3rd ed. rev. and expanded. San Francisco, California: City Lights Books. 75 p. Index of recipes. 17 cm.
• ***Summary:*** Contents: Introduction (General. For epicures, vegetarians, and dieters). Chinese recipes. Japanese recipes. General information: Buffet, party foods & hors d'oeuvres. To brew tea. Special imported ingredients. Where to get ingredients & equipment.

Introduction: "Most of the recipes in this book appear constantly on the menus of the Chinese and Japanese restaurants of San Francisco, New York, and a few other cities that have a population segment with Chinese or Japanese ancestry." Many recipes call for "soy sauce" and up to 1 teaspoon "MSG powder."

The section "For epicures, vegetarians, and dieters" states: "Of the special foods of the Orient, the most versatile is the soy bean. The number of widely differing foods made from soy beans is very large, including bean thread, noodles, soy sauce, soy milk with its derivatives such as dofu, the fermented nam yu and fu yu of China and miso of Japan. Western food technology has also added to the list."

Soy-related recipes–Chinese: Lo han chai (with dofu and seaweed, p. 19-21). Dofu with oyster sauce ("1 block of Japanese tofu, or 2 cakes of Chinese tofu," p. 22). Steamed fish with dofu (p. 29-30). Chicken in soy (with 1 cup soy sauce, p. 31-32). Chinese sauce [commercial]: Foo yü (sharp thick sauce [fermented tofu]). Jeung yow (soy sauce).

Note: This is the earliest English-language document seen (Oct. 2011) that uses the terms "nam yu" or "fermented nam yu" or "Foo yü" to refer to fermented tofu.

Japanese recipes: Miso soup (with tofu. Miso is "fermented soy beans," p. 48). Konbu salad (with soy sauce, p. 49). Egg plant with miso (p. 50). Turnips in soy (soy sauce, p. 50). Misoyaki (p. 54-55). Joints of chicken teriyaki (with Teriyaki sauce, p. 56). Beef sukiyaki (with tofu, p. 59-60). Beef teriyaki (cook on a hibachi, p. 60). Teriyaki sauce (p. 61; Ingredients: ½ cup table syrup {light cane molasses}, 1 quart shoyu {high quality Japanese soy sauce}, 3/4 lb. sugar, 2 pieces dashi konbu {dried kelp} 6 inches long, ½ teaspoon MSG powder, 2 tablespoons sake). Quick teriyaki sauce (p. 61; Ingredients: 3/4 cup soy sauce, 3 tablespoons sake {or sherry}, ¼ cup sugar, 1 teaspoon grated ginger, ½ tsp. MSG powder). Buta dofu (with "soy bean curd," p. 63).

Special imported ingredients (p. 68-71): Japanese–Canned foods: Bean curd, prepared black soy beans. Packaged foods: Miso (the light variety, fermented soy bean paste). Bottled foods: Fuyü (Chinese bean cake; Order top quality such as Quong Hop brand). Shoyu (soy sauce; Order top quality such as Kikkoman, Higeta, or Marukin). Chinese–Bottled foods: Soy sauce. Black beans (Dow Shee; for black bean sauce).

4473. Sekiguchi, R. 1958. [Manufacture of natto]. In: How to Manufacture and Cook Natto. Tokyo: Taibunkan Co., Ltd. See p. 110-63. [Jap]*

4474. Smith, Allan K. 1958. Vegetable protein isolates. In: A.M. Altschul, ed. 1958. Processed Plant Protein Foodstuffs. New York: Academic Press. xv + 955 p. See p. 249-76. Chap. 10. [143 ref]
• ***Summary:*** Contents: Introduction. Source materials for protein isolates: Oilseeds, cereal grains. Processing meal for protein isolation. Preparation and properties of isolated protein: Native proteins, commercial protein isolates, isolated proteins for food uses. The hull problem. Uses of protein isolates: Industrial applications, food uses. Selected oilseed protein isolates: Soybean (properties, soybean whey, commercial isolation, industrial and food uses), peanut (properties, utilization), cottonseed (properties, utilization), flaxseed, sunflower seed (source materials, isolation and properties). Cereal grain proteins: Corn protein (corn fractions, zein isolation, utilization), wheat proteins (gluten isolation, utilization).

The most important uses for wheat gluten "are for manufacture of monosodium glutamate and fortification of weak flours to produce high-protein bread... The monosodium salt of the L-form of glutamic acid has the unique power... of enhancing the flavor of many foods. Also, it is this salt which is largely responsible for the flavoring quality of soy sauce. Monosodium glutamate was developed to a commercial stage in Japan during the 1920's under the name Ajinomoto and was first produced in the United States in 1934." Five companies in the United States are now producing glutamate with an estimated annual capacity of 18 million pounds.

"The raw materials for glutamate in order of their importance are Steffen's waste (Manning 1948), a by-product of beet sugar refining, wheat gluten, and corn gluten; soybean meal has been used extensively in the Orient. The so-called Steffen's waste... is now the cheapest raw-material source for glutamic acid and accounts for an estimated 50% of production." Address: USDA NRRL, Peoria, Illinois.

4476. Tamiya, Hiroshi. 1958. The koji, an important source of enzymes in Japan. In: Proceedings of the International Symposium on Enzyme Chemistry; Tokyo and Kyoto. Tokyo: Maruzen Co. Ltd. 541 p. Held 15-23 Oct. 1957 in Tokyo and Kyoto, Japan. See p. 21-24. [17 ref]
• ***Summary:*** "Etymologically the word Koji is an abbreviation of Kabi-tachi meaning something like 'Bloom of Mold,' and, as a matter of fact, the essential part of Koji is the mold *Aspergillus oryzae,* which is grown on steamed rice or other cereals and sometimes on steamed pulses. In the brewing of the Japanese rice-wine saké, Koji has long been used as the 'malting' agent to convert rice starch into fermentable sugar."

It is "no exaggeration to say that the dietary life of Japan cannot exist without Koji or the mold *A. oryzae.* At present the foods and drinks processed with this agent are being consumed at the rate of about 1,000 million U.S. dollars each year, and the taxes taken from it run up to more than 500 million U.S. dollars each year, which is as much as 20 per cent of the total national budget of our country [Japan; Sakaguchi 1957].

"Historical documents show that Japan learned the use of Koji from China more than 1700 years ago... But the real understanding of the nature and the mode of action of Koji became possible only in the latter half of the 19th century when our country opened her door to Western civilization. It was with the initiation of scientific studies of Koji at this dawn of a new age that enzymology in Japan made its start.

"Soon after the Meiji Restoration in 1868, some governmental colleges were established for conducting higher education of western science and technology. As the teaching staff of these colleges a number of scientists were invited from Western countries. The mold *A. oryzae* was first isolated from Koji in 1878 by a teacher of natural history from Germany, Dr. Ahlburg*, and the fact that the mold has a strong diastatic activity was first made clear in 1881 by a teacher of applied chemistry from England, Dr. Atkinson **. (Footnote: *Ahlburg, H., and Matsubara, S., *Tokyo Iji-Shinshi* 24, 12 [1878].) (Footnote: **Atkinson, R. W., *Tokyo Imp. Univ., Sci. Dept.* 6,1 [1881]; *Proc. Roy. Soc.* (London) 32,299 [1881].)"

The first Japanese scientist to become deeply interested in Koji was Jokichi Takamine. He "eventually succeeded in increasing considerably the diastatic activity of the mold. Having heard that the malting process using mold activity had never been practiced in occidental countries, an ambitious idea occurred to him, the idea of introducing the method into those countries, and with this idea he went to America in 1890. The demonstration he made there was a successful one, but unfortunately his project could not be realized due to the strong opposition of the manufacturers of malt. Undeterred by this failure he soon started an entirely new project, again using Koji-mold, but this time preparing from it a drug having a strong digestive activity*. The procedure he adopted was to grow Koji-mold on [wheat] bran, and to extract the mixture with water, from which the enzymes were precipitated with alcohol. The drug was named Takadiastase after his name Jokichi Takamine, the name which gained world-wide fame not only from this brilliant invention, but also through his later discovery of the adrenal hormone, adrenaline. (Footnote: *Takamine, J., U.S. Patent, 525823, 525825 [1894].)

"As Takadiastase gradually found a larger market, this commercial preparation or its origin *A. oryzae* also became a popular material for the study of enzymes in biochemical laboratories. The more it was investigated, the more varieties of enzymes were found in it. Since the early twentieth century it thus became one of the most popular research objects used in the study of enzymology*. (Footnote: *Tamiya, H., and Morita, S., Bibliographie von *Aspergillus, Botan. Mag.* (Tokyo) 43, No. 506 [1929] to 44, No. 524 [1930].)" Address: The Inst. of Applied Microbiology, Univ. of Tokyo and Tokugawa Inst. for Biological Research, Tokyo, Japan.

© Copyright Soyinfo Center 2014

• ***Summary:*** Under soybeans, gives region/continent and nation, then statistics for soybean area, production, and yield for each soybean producing nation during the following time periods: 1948-1952, 1955, 1956, 1957. Regions and nations listed in the 1958 edition are: Europe: Czechoslovakia, Hungary, Italy, Romania, Yugoslavia.

U.S.S.R.

North and Central America: Canada, United States.

South America: Argentina (in 1948-52 1,000 hectares produced on average 1,000 metric tons of soybeans per year. This remained unchanged in 1955-1957), Brazil (in 1948-52 53,000 hectares produced on average 57,000 metric tons of soybeans per year. Production rose to 115,000 metric tons in 1955, 122,000 in 1956, and 132,000 in 1957).

Asia: Cambodia, China-Mainland, China-Taiwan, Indonesia-total (Java and Madura, Other islands), Japan, Korea-South, Philippines, Ryukyu Islands, Thailand, Turkey.

In 1948-52, Turkey produced 2,000 metric tons of soybeans on 2,000 ha; yield: 860 kg/ha. Production in Turkey increased to 4,000 metric tons in 1955, then 5,000 metric tons in 1956. Note: This is the earliest document seen (Dec. 2007) that gives soybean production or area statistics for Turkey or for the Middle East. This document contains the earliest production or area statistics seen for Turkey or the Middle East.

Africa: Belgian Congo (production in villages), Ethiopia and Eritrea (Fed. of Ethiopia) (starting with 5,000 tonnes {metric tons} in 1948-1952), Nigeria (Fed. of), Rhodesia and Nyasaland (Fed. of Nyasaland), Ruanda-Urundi (production in villages), Tanganyika, Uganda (recorded sales), Union of South Africa (farms and estates).

World total (excluding U.S.S.R.). Regional totals: Europe, North America, Latin America, Near East, Far East, Africa.

Note that statistics for given years (e.g. 1948-52) may change as time passes; apparently this yearbook is periodically updating its statistics.

• ***Summary:*** A poignant photographic essay showing the many activities in the life of a traditional tofu maker. Depicts an era that is rapidly vanishing from Japan.

4483. Fukushima, Danji. 1959. Studies on soybean proteins. I. Water dispersibility of protein of defatted soybean flour as a criterion for degree of denaturation. *Bulletin of the Agricultural Chemical Society of Japan* 23(1):7-14. Jan. [19 ref. Eng]
• ***Summary:*** Denaturation was measured by a change in the susceptibility of the protein (in a water extract of the flour) to the action of protease from *Aspergillus oryzae* before and after heat treatment. "It was found that the decrease of water dispersibility did not always run parallel with denaturation." Address: Noda Inst. for Scientific Research, Noda-Shi, Chiba-Ken, Japan.

4484. Fukushima, Danji. 1959. Studies on soybean proteins. II. A new method for quantitative determination of the degree of denaturation of protein in soybean flour. *Bulletin of the Agricultural Chemical Society of Japan* 23(1):15-21. Jan. [2 ref. Eng]
• ***Summary:*** "Owing to the inadequacy of the water dispersibility method as a criterion for denaturation of the protein in soybean flours, a new method was devised which was quantitative and applicable to soybean flours denatured under various conditions. In this method the native protein in flour is determined by the quantity of protein which is solubilized but remains unhydrolyzed by the protease action of *Aspergillus sojae***.** Conditions for the determination were decided as the result of various experiments.

"It was found that the decrease in the amount of water-extractable protein in heated flour with low water contents was attributable to the prevention of extraction of native protein by partly denatured protein." Address: Noda Inst. for Scientific Research, Noda-Shi, Chiba-Ken, Japan.

4485. Hayashi, Shizuka. 1959. Seek suitable U.S. food varieties [of soybeans]. *Soybean Digest***.** Jan. p. 25-26.
• ***Summary:*** "Nagano prefecture with about 320 miso manufacturers is the largest miso producing area in Japan. Its annual output is approximately 140,000 tons, more than one-fourth of the total Japanese production. Nagano miso is popularly known as 'Shinshu miso.' It is lighter in color than the miso produced in other areas."

Miso made from U.S. soybeans sells for a lower price than that made from Japanese or Chinese soybeans. "The biggest objections to U.S. soybeans were that they contained morning glory seeds, corn and other foreign material not found in beans of other origin. U.S. soybeans take much longer time in cooking to obtain the required softness. Due to the extra time required in steaming the color of the miso produced becomes darker. Further, the irregularity in size of the U.S. soybeans causes unevenness in softness when they are cooked. Broken beans are objectionable for this reason. Above all, the 'taste' of the soybeans after they are cooked is claimed to be unsatisfactory as compared with other beans, and this affects the sweetness or flavor of the miso produced."

Japanese miso makers used to import significant amounts of soybeans from China, but since the breakoff in trade between Japan and China last April, Chinese beans are no longer imported to Japan. So manufacturers of miso and tofu will have to rely more on U.S. soybeans. "Even the largest frozen (dried) tofu makers in the Nagano area are using U.S. soybeans." They met recently in Nagano city to discuss ways of getting better quality soybeans

• ***Summary:*** Figure 2, a graph titled "Change of viable counts of lactic acid bacteria in soy mash," shows the numbers of two bacteria (in counts per ml) during a 12-month fermentation period. The number of salt-sensitive lactic acid bacteria plummets from 150 million on day 1 to zero shortly before 2 months. The number of *Pediococcus soyae* rises rapidly for zero on day 1 to a peak of 150 million after 4 months, then decreases to about 10,000 after 9 months.

The pH decreases steadily from about 6.0 on day 1 to about 5.0 (more acidic) after 6 months. Address: Noda Inst. for Scientific Research [Noda City, Chiba-ken, Japan].

4489. Nakano, Masahiro. 1959. Miso to shôyu [Miso and shoyu]. *Shokuhin Kogyo* (*Food Industry*). Feb. p. 45-57. [19 ref. Jap]
• ***Summary:*** One graph shows miso production in Japanese factories from 1930 to 1955, and total and total supply in Japan from 1950-55. The difference between factory production and total supply would be accounted for by home production or imports. Factory production was about 590,000 tonnes (metric tons) from 1930 to 1940. It dropped during World War II, reaching a low of 200,000 tonnes in 1947. By 1955 it had recovered to about 500,000, but total supply was about 900,000 tonnes.

A second graph shows shoyu production in Japanese factories from 1930 to 1955 and total supply in Japan from 1950 to 1955. Factory production was about 1,040,000 tonnes from 1930 to 1940. It dropped during World War II, hitting a low of about 400,000 tons in 1947. By 1955 it had risen to about 1,180,000, surpassing the pre-war high of about 1,080,000. Total supply in 1955 was about 1,350,000. Thus in 1955 total miso supply was about 180% of factory production, whereas total shoyu supply was about 14% more than factory production. Miso factory production never surpassed its pre-war high. After the war, 35% of the miso and 15% of the shoyu was homemade, but thereafter it has decreased steadily. The rest of this article is mostly about the nutritional benefits of miso and shoyu.

Miso and shoyu were developed because of our need for salt. In the West, salt was also important. The Latin word for salt is salsa [actually, sal], and this word is the origin of the word salary, the payment for workers. The word sauce also stemmed from sal. Address: Shokuryo Kenkyujo Hakko Shokuhin Bucho.

4490. Nakano, Masahiro. 1959. Miso [Miso]. *Shokuhin Kogyo* (*Food Industry*). Feb. p. 5-7. [Jap]
Address: Shokuryo Kenkyujo Hakko Shokuhin Bucho.

4491. Ohsawa, George. 1959. La philosophie de la médecine de l'Extrême-Orient: Le livre de jugement suprême [The philosophy of East Asian medicine: The book of supreme judgment]. Paris: Librairie Philosophique J. Vrin. 207 p. Feb. 16. No index. 20 cm. [Fre]
• ***Summary:*** The author's name on the title page is given as "Nyoiti Sakurazawa (Ohsawa)." Contents: Foreword. Dedication: To my dear Dr. A. Schweitzer. Preface (written by G. Ohsawa on 18 Jan. 1956 at the station of the Protestant Mission at Andéndé, French Equatorial Africa (A.E.F.)). 1. Introduction: Medicine or faith? 2. A practical and dialectical classification. 3. The unique principal of science and the philosophy of East Asia. 4. The origin of man. 5. The medicine of East Asia. 6. The order of the universe and the constitution of man. 7. The supreme faculty of judgment. Appendixes: I and II. Practical guide to East Asian medicine: Gives addresses in France, Germany, Switzerland, Belgium, USA (Michio Kushi, 420 W. 119th St., New York 27, New York), Brazil (Tomio Kikuchi, rua Fugandes, 154, Liberdade Centro, Sao-Paulo), Japan (Nippon C.I., 8 Kasumi-cho, Minato-ku, Tokyo).

On p. 46 Ohsawa mentions miso (*la pâte de soya, de blé ou de riz, pâte tout-à-fait végétale,...*).

Note 1. This is the earliest document seen (May 2009) concerning the soyfoods movement in South America; Tomio Kikuchi was a pioneer in Brazil.

Note 2. This is the 2nd earliest document seen (March 2011) that mentions Michio Kushi.

4492. Walley, Ersel. 1959. India a logical protein market: Soybean Council of America, Inc. *Soybean Digest.* Feb. p.

© Copyright Soyinfo Center 2014

20.
• ***Summary:*** "From an address before the Delhi Rotary Club, New Delhi, India, Jan. 8. Mr. Walley of Fort Wayne, Indiana, chairman of the market development committee of the American Soybean Association, and Howard L. Roach, president of the Soybean Council of America, Inc., were in charge of the soybean exhibit at the U.S. Trade Fair in New Delhi, Dec. 10 to Jan. 10.

"The soybean crop, introduced into the United States from the Orient at the turn of the century, did not assume commercial importance until after World War I. The estimated production for 1958 was 574 million bushels, and increase of 70-fold in 30 years.

"As a pioneer grower it was my privilege to be identified with this very important and significant development in American agriculture."

"In 1935 your own Mr. Gandhi said, 'The soybean stands at the top of all known articles of diet..."

"My personal enthusiasm for the extended use of soybean products for direct human consumption began in Germany in 1948 when I saw the remarkable results secured from adding full fat soy flakes to the diet of emaciated men being returned as released war prisoners from the slave labor camps of Siberia. This interest in promoting the use of soybeans as an economic and valuable source of protein and fat for those whose diets are deficient in these essential elements has continued since that time.

"In the past 3 years it has been our privilege to cooperate with the Japanese soybean industries in promote the use of soybeans as food in Japan through increased use of such foods as tofu, miso, soya sauce and many other soya products more generally known. Hundreds of nutritionists have been trained to carry the story of soy proteins and fats to Japanese households."

In Europe, the Soybean Council of America, Inc. is teaching processors how to blend "soybean oil with olive oil to produce an acceptable and cheaper cooking oil which will be available in larger quantities to more people."

"Another important achievement in Europe is the increased use of soy flour in bread. Adding 5% soy flour greatly increases bread's protein content and value.

"You may ask why we came to India. India is important. Here you have one-seventh of the world's population and one-fifth of the free people of the world. Your future holds great promise. As you industrialize we feel you can and will need to import additional proteins and fats for food." Address: American Soybean Assoc.

4493. Fukui, J.; Ojima, M.; Yarimizu, H. 1959. [The influence of soil heaping at the lower part of stem upon bud-, flower-, and pod-shedding in soybean]. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 27(3):377-78. March. [7 ref. Jap; eng]
• ***Summary:*** The number of pods per plant at ripening time and the seed yield was increased by heaping soil three times. Address: Kanto-Tosan Agric. Exp. Station.

4494. Sakaguchi, Kenji. 1959. Studies on the activities of bacteria in soy sauce brewing. V. The effects of *Aspergillus sojae, Pediococcus soyae, Bacillus subtilis,* and *Saccharomyces rouxii* in purely cultured soy sauce brewing. *Bulletin of the Agricultural Chemical Society of Japan* 23(2):100-106. March. Bound in the back of Nippon Nogei Kagaku Kaishi (J. of the Agricultural Chemical Society of Japan). [20 ref. Eng]
• ***Summary:*** This research found that the "The soy koji mold *Aspergillus oryzae* was undoubtedly the most important organism for soy sauce brewing. By its biochemical actions during the koji making stage, and by its enzymatic actions in soy mash, the mother body of soy sauce was produced." Most of the proteinases in soy mash come from *A. oryzae* (p. 103).

The salt tolerant yeast *Saccharomyces rouxii,* the former name of which was *Zygosaccharomyces major,* grows well in soy mash if it sufficiently aerated. This yeast consumes reducing sugars and produces ethanol (ethyl alcohol). The mixed inoculation of *Pediococcus soyae* (a bacterium) with *Saccharomyces rouxii* (a yeast) gave the best aroma and flavor, most closely approximating those of normal soy sauce.

Note: This is the earliest document seen (June 1999) that mentions the yeast *Saccharomyces rouxii* in connection with soy sauce fermentation. Address: Noda Inst. for Scientific Research, Noda city, Chiba-ken, Japan.

• ***Summary:*** A large amount of soybean cake is mixed with sulphuric acid, and is then processed. The resulting phytosterol consists of campestrol, stigmasterol, Beta-sitosterol, gamma-sitosterol, stigmastanol, and gamma-sitostanol.

4500. Haldeman, Robert C. 1959. Potential effects of St. Lawrence Seaway on costs of transporting grain. *Marketing Research Report* (*USDA Agricultural Marketing Service*) No. 319. 149 p. April. [80 ref]
• ***Summary:*** Contents: Summary. Introduction. Grain production–Great Lakes–St. Lawrence waterway tributary area: Wheat, corn, barley, soybeans (p. 5), other grains. Characteristics of inland grain movements to interior and port destinations. Export grain movements: Wheat, corn, barley, soybeans and soybean oil, other grains. Potential export volume via the St. Lawrence Seaway. The Great Lakes- St. Lawrence waterway. Physical limitations of the waterway: Season of navigation, capacity of the Welland Canal, relationship of estimated traffic volume to capacity, capacity of the St. Lawrence Seaway locks, other physical limitations. Enabling legislation and seaway tolls: The Wiley-Dondero Act of May 13, 1954, The St. Lawrence Seaway Authority Act (of Canada), December 21, 1951. Grain handling expenses. Transportation costs and charges: motortrucks, railroads, inland waterways, Great Lakes, ocean transportation, liberty-type vessel, lake-ocean bulk carrier, comparative costs and charges. Summary of computed costs and charges on grain from interior points to foreign ports. Summary of computed costs and charges on grain to Atlantic Coast ports and tributary areas. Appendix.

Maps show: The Great Lakes and the St. Lawrence River and the Seaway (p. 2). An outline map of the United States with the areas where white wheat, hard red spring wheat, hard red winter wheat, and soft red winter wheat are grown (p. 4).

Illustrations show: A grain elevator truck dump, raised, with a truck in dumping position (p. 27).

Photos show: Grain flowing from the rear of a truck into a hopper-conveyor for movement into a grain elevator (p. 28). Automatic boxcar unloader with a boxcar being unloaded as it is gently oscillated; it can empty 5 cars per hour (p. 29). A Tennessee River tow, which is over 1,300 feet long and includes 21 bargeloads of grain. Pushed by a tugboat, the cargo totals 33,429 tons, or the equivalent of over 500 loaded railroad cars (p. 30). Unloading grain using floating pneumatic grain elevators, widely used at Antwerp and Rotterdam (p. 38).

Tables show: (1) Grain production (incl. soybeans) in selected states, average 1945-1954, 1955 and 1956 (p. 61). (14) Soybeans and soybean oil: U.S. exports by country of destination, averages 1945-49, 1945-54, 1950-54; annual 1955 and 1956. Figures are given for: North America–Canada, Cuba, Other, Total. South America–Chile, Other, Total. Europe–Austria, Belgium-Luxembourg, Denmark, Finland, France, West Germany, Greece, Iceland, Italy, Netherlands, Norway, Spain, Sweden, Switzerland, United Kingdom, Yugoslavia, Other, Total. Asia–Japan, Taiwan (Formosa), Other, Total. Africa. Australia and Oceania. Other. Grand Total. Soybean oil is converted to bushels of soybeans. The exports are on a calendar year basis. The units are 1,000 bushels.

In 1945-49 U.S. exports of soybeans and soybean oil were largest to: West Germany (and Austria) 3,345. France 2,100. Italy 1,745. Japan 1,548. Grand total: 21,219.

In 1956 (preliminary) U.S. exports of soybeans and soybean oil were largest to: Spain 36,630. Japan 19,148. West Germany (and Austria) 12,524. Netherlands 11,311. Grand total: 131,226–a remarkable 6.2-fold increase over 1945-49. Address: Transportation Economist, Marketing Research Div., Agricultural Marketing Service, USDA, Washington, DC.

Address: Nagoya Miso and Tamari Co., Ltd., Japan.

4502. Miller, Harry W. 1959. Why Japan needs soy milk.

© Copyright Soyinfo Center 2014

Soybean Digest. April. p. 16-17.
• ***Summary:*** "It was an opportunity greatly appreciated to study the needs of the Japanese people nutritionally during my 7 months' responsibilities as surgeon and physician at the Tokyo Sanitarium and Hospital... The idea of a soybean beverage and milk from the soybean for soups and cooking was something altogether new... We set us a small pilot plant where we made soy milk, soy cream, soy ice cream, and soy spread... After seeing the ready acceptance by the nursing staff and patients of the Tokyo Sanitarium and Hospital of soy milk and soy cream made daily from a small fabricated plant of equipment procurable in Japan, we conceived the idea of such additions to be made to the tofu plants... We fitted up a small tofu plant out in a rural district with a homogenizer and a few utensils for milk handling. The milk is being bottled and capped there, and the local community is most appreciative. Since it sells at half the cost of fresh dairy milk it leaves a modest profit for the local shop."

4503. Nishimura, Toshihizô; Morinaga, Takamasa; Domoto, Yasuhiko. 1959. Saisei shôyu ni tsuite [Studies on double-brewed shoyu]. *Shoyu to Gijutsu* No. 249. p. 13-15. [Jap]* Address: Hiroshima-ken Shokuhin Kogyo Kenkyujo.

4504. Motosaki, Shinichi; Ogasahara, T.; Ito, K.; Adachi, S. Assignors to Ajinomoto Company. 1959. [Iron-free amino acid solution for flavoring purposes]. *Japanese Patent* 4387. May 9. (Chem. Abst. 53:20618b). [Jap]*
• ***Summary:*** Soybean cake is hydrolyzed with hydrochloric acid. Then to 100 liters of the resulting amino acid solution, 3 kg magnesium chloride is added, brought to pH 12 with sodium hydroxide solution, kept overnight at room temperature, and filtered to give an iron-free product.

4505. Hayashi, Shizuka. 1959. Japanese-American Soybean Institute: Reviews 3-year work of Institute. *Soybean Digest.* May. p. 29-30.
• ***Summary:*** Imports of soybeans to Japan from the USA increased to 777,436 tonnes (metric tons) in 1958, from 536,055 tonnes in 1956, and increase of 45% in just 2 years. This is partly a result of the Institute's 3 years of promotional activities. A list of 12 of the promotional activities is given.

4506. Kalnay, Francis. 1959. Soybean has all the answers (or nearly all). *House Beautiful* 101:174-75, 207-12. May.
• ***Summary:*** The opening 2-page spread contains photos of many commercial soyfood products available in America at the time: Dr. Fearn's Soy-O pancake flour (one with whole wheat and soya, and the other with just wheat and soya), Pure soya bean powder, and Soya bean granules, Wuest's soya-protein bread, Wuest's cookies, Wel-Pac kinako [roasted soy flour], Yamasa shoyu, Kikkoman shoyu, Oliver Tonkatsu Sauce (Tonkatsu are breaded pork cutlets), Hain soy oil (cold pressed), Amoy soy sauce, Prosperity soy sauce, Golden Sang Chan soy sauce, Madison Zoy-Koff, Hime aka-miso (Pacific Trading Co.), Hime yakidofu, Hime frozen bean curds, Delicious Edamame (Packed by Tokai Kanzume Co. Ltd., Nagoya, Japan), Quong Hop & Co. bean cake [tofu], Schiff soy lecithin, Oriental food shop black soybeans, Climax wheat and soy pure egg noodles (The Pfaffman Co., Cleveland, Ohio), and Prince Veta-Roni (Mezzani or Spaghetti; Prince Macaroni Co.).

The subtitle reads: It's a choice gourmet food. It's as nutritious as vitamin pills. It comes in a dozen forms and makes a hundred dishes.

The author uses soy-related words in a very modern way: "Have you ever noticed the way people who know food pronounce the simple word 'soy'? Their facial expression changes instantly, and their tone of voice turns positively lyric. There are two serious reasons for their extraordinary respect for a bean so little and so innocent. The soybean is enormously rich in protein. This wealth of protein is apparent in both quality and quantity... And because soy oil is high in unsaturated fatty acids, it fits well into today's popular low-cholesterol diets.

"In our country soy is relatively new... Soy is the most versatile legume imaginable... The glittering star in soy's troupe of players is soy sauce (also called soya and shoyu)... The soy food industry is still in its infancy in the U.S. Yet the variety of soy products available is impressive."

Note 1. This is the earliest publication seen (April 2001) that mentions Quong Hop & Co. in connection with tofu.

Note 2. This is the earliest English-language document seen (Aug. 2003) that contains the term "soya-protein" (or "soya-proteins").

4507. **Product Name:** [Oliver Breaded Pork Cutlet Sauce].
Foreign Name: Oribaa Tonkatsu Soosu.
Manufacturer's Name: Oliver. Made in Japan.
Manufacturer's Address: Japan.
Date of Introduction: 1959 May.
Wt/Vol., Packaging, Price: Bottle.
How Stored: Shelf stable; refrigerate after opening.
New Product–Documentation: Francis Kalnay. 1959. House Beautiful. May. p. 174-75. "Soybean has all the answers." Photo of the bottle and label. The bottle is wrapped in paper.

4509. Callan, Mary Ann. 1959. Meals–Aid to millions. *Los Angeles Times.* June 7. Part IV. The Family. p. 1, D. Sunday.
• ***Summary:*** A dynamic little woman, Miss Florence Rose,

© Copyright Soyinfo Center 2014

operating with a small work force out of an unpretentious office on 7th street in Los Angeles, is busy making friends overseas for the United States. Miss Rose is the executive secretary of the Meals for Millions Foundation, and she works at their national headquarters. In 12 years the Foundation has shipped more than 56 million 3-cent meals to 100 countries abroad.

Multipurpose Food, developed by Caltech is now produced in the USA in Oxnard, California, primarily from soybean meal. The funds for sending the food abroad now comes from donations. India has produced MPF from peanut meal.

"Overseas women's groups in Brazil, Ethiopia, Greece, India, Japan, Korea, the Philippines, Taiwan, and Viet-Nam have received the friendship food for distribution–in quantities from 500 to 100,000 tons."

Note: This is the earliest article on soy seen (Aug. 2002) in the *Los Angeles Times.* Address: Times staff writer.

4510. Manners, Marian. 1959. What shall I cook? Menu ideas. *Los Angeles Times.* June 11. p. A5.
• ***Summary:*** Wednesday's dinner has a recipe for Mandarin meat balls, that calls for "¼ cup Japanese soy sauce."

Note: Suddenly, starting at about this time, the term "Japanese soy sauce" starts to be used in place of the term "soy sauce"–especially in the *Los Angeles Times.* Is this a coincidence or a commercial "pay for coverage" deal? We suspect the latter–a deal between Kikkoman and the Times. Consider the following chronology:

1957 June–Kikkoman International Inc. (KII) is established in San Francisco, California–Kikkoman's first overseas office in the United States or the Western World.

1958–The first KII branch is established in Los Angeles.

1960–The second KII branch is established in New York.

4511. Manners, Marian. 1959. Guests cook their own fare at Japanese table. *Los Angeles Times.* June 18. p. A8.
• ***Summary:*** A dinner party was given by Mr. and Mrs. George Nakatsuka of Pasadena, California; he is vice-president of the Japan Food Corp. Co-hosts included three West Coast executives with the firm and Kikkoman International, Inc.

"An honored guest was Gunzo Sugihara [age 76], board chairman with the Pacific Trading Co., which he founded in San Francisco in 1906, and a director of the Kikkoman firm." In 1899 he made his first journey to the USA. Each guest cooked his own food using an *okariba yaki.* Imported Japanese soy sauce, made from an ancient formula, requires 18 months to process, age and filter, so as to attain its "smooth flavor, deep, rich color, and freedom from sedimentation." The Kikkoman firm imports soybeans and wheat from the USA for the sauce it makes in Japan, and "only 1% of the 45 million gallons made annually is exported; the major portion is used by the Japanese." A recipe for Barbecue sauce, featuring "1 cup imported Japanese soy sauce" is given. A photo shows Marian Manners and Gunzo Sugihara–both having fun. Address: Times home economics director.

4512. Manners, Marian. 1959. What shall I cook? Menu ideas. *Los Angeles Times.* June 18. p. A9.
• ***Summary:*** Tomorrow's dinner includes "cucumbers in vinegar soy sauce (use Japanese soy sauce)."

4513. Manners, Marian. 1959. What shall I cook? Menu ideas. *Los Angeles Times.* June 25. p. A8.
• ***Summary:*** Tuesday's dinner includes "mixed Chinese vegetables with imported Japanese soy sauce,..."

4514. Hayashi, Shizuka. 1959. Institute makes oil survey in Tokyo: Japanese-American Soybean Institute *Soybean Digest.* June. p. 26.
• ***Summary:*** "A survey on the consumption of soybean oil covering the whole area of the city of Tokyo has been carried out by the staff of the Japanese American Soybean Institute. The metropolis has a population now exceeding 9 million or a total of 1,944,644 households,

"The so-called multistage or cluster sampling method was used in the survey. The whole Tokyo area was first divided into nine blocks. These nine blocks were divided equally into 3,400 parts, out of which 167 were chosen for the survey. The chosen areas included 1,111 households which constituted the secondary sampling unit.

"About 30 school girls of one of the nutrition colleges were employed to visit every family of the 1,111 selected. A number of questions were included in the questionnaires.

"The survey produced the following results:

"1. To a question inquiring whether the family used any edible oil, 93.3% gave an affirmative reply, and 6.7% replied that they do not use edible oil.

"It is amazing in modern civilized life there are still people who do not use edible oil at all. Out of approximately 2 million households there are more than 120,000 families who do not use edible oil, and of the whole Tokyo area approximately 700,000 do not eat oil. This fact alone indicates that more education is needed.

"2. The average daily per capita consumption of oil in Tokyo was shown by our survey to be 6.84 grams. The target set forth by the Japanese government for 1959 was 9.5 grams, which indicates that the quantity of oil consumed by the whole population should be increased.

"3. To a question of whether the oil is purchased by housewives who bring their own bottles or containers to be filled, about 70% replied 'yes.' The remaining 30% purchased in tins or bottles which were the original packages of the manufacturers.

"The survey clearly indicates that there is opportunity

© Copyright Soyinfo Center 2014

for manufacturers to push sales in their own containers under their brand names and thus increase consumption. The purchase of oil in bulk indicates that the housewives are more or less indifferent to specific brands of oil or to the manufacturers.

"4. To a question of where housewives do their buying of oil, approximately 60% indicated that they shop at grocery stores. It is surprising that only about 18% buy at the professional oil stores. This again indicates the possibility of increasing sales through the medium of proper shops.

"5. To a question of how often housewives use soybean oil in their cooking, those who use it less than five times a week constituted approximately 58%, and from six to ten times a week, 33%. This indicates that utilization of oil is still comparatively small.

"6. To a question of whether housewives are satisfied with prices they pay for edible oils, quite a large percentage said that the prices are high and the quality not altogether satisfactory. Increased consumption can be expected if the quality is improved and the price lowered.

"Nearly all the replies to various other questions indicate the importance of further public relations activities.

"The survey proved that the future prospect of soybean oil consumption in Japan definitely is promising if proper promotional activities are undertaken." Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

4515. Hayashi, Shizuka. 1959. Miso makers protest F.M. in U.S. beans. *Soybean Digest.* June. p. 26.
• ***Summary:*** On May 9, all 49 directors of the All Japan Miso Industry Association signed a petition protesting the unacceptably high levels of foreign material [F.M.] is U.S. soybeans exported to Japan. The greatest problems are with corn, morning glory seeds, and split beans. Morning glory seeds must be picked out (usually by hand) and burned in accordance with Japanese food and hygiene laws.

The entire contents of the petition is given. Address: Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

4520. Hayashi, Uichi. 1959. Nattô ni kansuru kenkyû. III. [Studies on natto. III. The quality of natto in its relation to the time of soaking soybeans in water and to the pH value of it]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 37(7):276-80. July. [5 ref. Jap; eng]
• ***Summary:*** One of the most comprehensive studies of natto to date. The addition of H_3PO_4 (phosphoric acid, 0.05 to 0.1%) to the soaking water of dry soybeans to be used in making natto seemed to increase the storage life of the natto yet did not affect its taste or overall quality.

Hayashi's data indicated that there was no change in the fat and fiber contents of soybeans during a 24 hour period of fermentation, but that the carbohydrates [which cause flatulence] almost totally disappeared. A great increase in water-soluble and ammonia nitrogen was reported during fermentation as well as during storage. The amino acid composition was unchanged. Boiling significantly decreased the thiamine content of soybeans; but fermentation by *Bacillus natto* increased the thiamine content of natto to approximately the same level as that of the soybeans before boiling. The riboflavin content of natto was much greater than that in soybeans. Address: Osaka Municipal Hygienic Laboratory, Japan.

• ***Summary:*** "A striking increase in the permeability of cell membranes of *Saccharomyces rouxii,* a typical salt-tolerant yeast, occurred when they were cultivated in the saline medium." Address: Noda Inst. for Scientific Research, Noda City, Chiba-ken, Japan.

4525. Davies, Lawrence E. 1959. Women's world: Hawaii. Mainlander shopping in Honolulu market likely to think she is on the mainland. *New York Times.* Aug. 13. p. 31.
• ***Summary:*** Hawaii's population of 645,000 is composed racially of 32% Japanese (persons of Japanese ancestry), 30% Caucasian, 17% Hawaiian or part Hawaiian, 11% Filipino, 6% Chinese, and 4% other races.

The shelves of Honolulu food markets are stocked with a mixture of mainland, East Asian, and local Hawaiian foods, including (from Japan) seaweed, jars of pickled gingerroot, "prepared seaweed seasoned with soy sauce and sugar," and "broiled eels canned with sugar, soy sauce, and sweet sake."

Note: The term "sweet sake" probably refers to *mirin,* but it might possibly refer to *amazake.*

4526. Hayashi, Shizuka. 1959. Japanese users react to U.S. beans. *Soybean Digest.* Aug. p. 34.
• ***Summary:*** "The fact that soybean in Japan are used 100% as food should by now be well realized by those in the soybean industry as well as by the growers. It has been repeatedly emphasized that soybean trade between the United States and Japan is to be based on the complete understanding of this fact."

One of the first projects of JASI "was to find out the causes of the unpopularity of U.S. soybeans among the Japanese users, especially the manufacturers of soybean products." The major complaints concern excessive "foreign material, broken beans, irregularity of sizes, and mixture of different varieties received. All these problems have been time and again called to the attention of interested parties in the United States." Considerable improvement has been made but there is still work to do. "The writer believes in the very near future specific varieties can be chosen for different food manufacturers and business will be done on the basis of [those] specific varieties."

A list gives the specifications for soybeans desired by Japanese oil processors (6 specs), miso manufacturers (3 specs), shoyu makers (3), tofu makers (2), frozen tofu makers (1), kinako makers (3), and natto makers (3). For example, for miso: (1) Soybeans with white hilum with rich protein content and of big size are preferred. (2) Soybeans should be stored separately by varieties [identity preserved]. (3) Foreign material, especially seeds of other plants, sand and stones should be eliminated.

And for tofu: (1) Soybeans should be rich in protein content with thin seedcoat. (2) Soybeans should be free from foreign material, especially that of poisonous seeds of other plants.

A photo shows Shizuka Hayashi tasting miso made from the U.S. soybean varieties Dorman, Mamloxi, and Jackson at the Inamari miso factory in Shizuoka city. Arthur Rollefson, U.S. assistant agricultural attache, is also shown.

Note: This is the earliest document seen (Feb. 2010) that introduces the concept of "identity preserved" ("Soybeans should be stored separately by varieties"). Address: Japanese-American Soybean Inst., Tokyo.

4530. Ichinohe, Minoru. 1959. Studies on the soybean cyst nematode *Heterodera glycines* and its injury to soybean plants in Japan. *Plant Disease Reporter, Supplement*

© Copyright Soyinfo Center 2014

260:237-48. Sept. 15. Summarized in Soybean Digest, May 1961, p. 28. [14 ref]
• ***Summary:*** 1. Historical review: "The occurrence of the soybean-cyst nematode in Japan was first recorded by S. Hori in 1915. According to his report, Hori discovered the nematode on the roots of a soybean plant which was sent from Shirakawa, Fukushima Prefecture, where the same disease had been observed for many years. He noticed that this nematode was different from the root-knot nematode which had been well known in Japan at that time, and asked S. Uchida to identify it. In accordance with S. Uchida's identification, Hori referred the nematode to 21 species closely related to *Heterodera schachtii* which had been known as the causal nematode of 'Sugar-beet sickness' in Europe. Hori added in his paper that it is necessary to compare this nematode with *Heterodera göttingiana* which attacks pea in Germany."

"Ichinohe (1952) compared the soybean-cyst nematode with specimens of other species of Heterodera, and described it under the name *Heterodera glycines..."* Address: Nematologist, National Inst. of Agricultural Sciences, Tokyo, Japan.

Origin of culture and paths of dissemination of soybeans as considered by the distribution of their summer vs. autumn soybean habit and plant habit. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 28(1):79-82. Sept. Summarized in Soybean Digest, Feb. 1962, p. 26. [24 ref. Eng]
• ***Summary:*** Contents: Introduction. Clines established on combination of the summer vs. autumn soybean habit and plant habit. Ecotypes identified by the habits and their distributions in the world. A consideration on the origin of soybean culture. Some considerations on the paths of dissemination.

To illustrate the soybean's paths of dissemination, the author first establishes a system of four clines, based on the assumption that origin of soybean culture was in north and central China and moved into Manchuria, Japan and Southeast Asia (fig. 1). Each cline is identified by including summer vs. autumn soybean habit and plant habit (vining vs. nonvining). (1) The Manchurian cline (soybeans moved

© Copyright Soyinfo Center 2014

northward from China into Manchuria) is characterized by an increasing occurrence of special nonvining types which have a long relative flowering period and long relative growing period. (2) The Japanese full-season crop cline (soybeans moved from north China into Korea, and from there they were subsequently disseminated to central and northern Japan) is characterized by soybeans of the normal type having a short relative flowering period and a long relative growing period. Called *Aki-daizu* (autumn type), these soybeans are cultivated as a full-season crop in these regions and belong, more or less, to the short-day type. Historically we note that Korea had direct contact with China Proper, and especially with North China, during the Han dynasty (200 B.C. to the 3rd century A.D.). (3) The Japanese short-season crop cline (soybeans moved from central and south China, through Formosa [Taiwan] and Loochoo [Ryukyu Islands, incl. Okinawa]) is characterized by soybeans of the normal type having a short relative flowering period and short relative growing period. These short-season soybeans are designated as *Natsu-daizu* (summer type), since they are sown in the spring, mature early, and occasionally show very high protein content. However another (and more likely) path of introduction of short season crop soybean to Japan would have been directly from central China to south Japan, especially to Kyushu. Historically, we note that Japan had frequent contact with China before and during the Nara period (6th to 8th century A.D.). Recently soybean seeds were found in the *Shôsô-in,* which was established during the Nara period to store important materials (including medicinal herbs introduced from China). Moreover, these soybeans were identified as the short-season summer type akin to those grown in Kyushu and the Ryukyu Islands. (4) The Indo-Chinese cline (soybeans moved from central and south China, down through Southeast Asia [Vietnam, Laos, Thailand, Cambodia, Malaysia] to Indonesia) is characterized by an increasing occurrence of consistent vining types. Address: Hyogo Agricultural College, Japan.

4540. Onishi, Hiroshi. 1959. Studies on osmophilic yeasts. V. Factors affecting growth of soy yeasts and others in the environment of a high concentration of sodium chloride. (II). *Bulletin of the Agricultural Chemical Society of Japan* 23(5):351-58. Sept. [14 ref. Eng]
• ***Summary:*** It was found that many osmophilic yeasts were able to grow in a saline medium at a high temperature such as 40ºC, whereas in a "NaCl-free medium no growth occurred at the same temperature." Address: Noda Inst. for Scientific Research, Noda City, Chiba-ken, Japan.

4541. Onishi, Hiroshi. 1959. Studies on osmophilic yeasts. VI. Glycerol production by the salt-tolerant yeast in the medium with high concentrations of sodium chloride. *Bulletin of the Agricultural Chemical Society of Japan* 23(5):359-63. Sept. [15 ref. Eng]
• ***Summary:*** "*Saccharomyces rouxii,* which is a typical salt-tolerant yeast and plays an important sole in 'soy-brewing' [soy sauce fermentation], was found to ferment glucose giving high yields of glycerol in a high saline medium under aerobic conditions. However, only a small amount of glycerol was produced in the ordinary medium." Address: Noda Inst. for Scientific Research, Noda City, Chiba-ken, Japan.

4542. Smith, Allan K. 1959. Research on the increasing use of U.S. soybeans in Japan. *Soybean Digest.* Sept. p. 62-65.
• ***Summary:*** "In 1956 the American Soybean Association in collaboration with the Foreign Agricultural Service of the U.S. Department of Agriculture started a market development program on soybeans in Japan."

Late in 1957 Dr. Smith "spent 2 months in Japan studying the products and processes where U.S. soybeans are competing with Japanese and communist Chinese beans." He found that the traditional foods of Japan are processed from whole soybeans, whereas in the USA the use of whole soybeans has, until recently, "received no commercial recognition for food, feed, or industrial application. Also the traditional food processors of Japan value the protein more highly than the oil which is the reverse of the emphasis in this country."

The results of Dr. Smith's investigations were published in April 1958 under the title "Use of United States soybeans in Japan." "The problems raised by the Japanese are briefly summarized as follows: 1–Composition: It was generally stated that Japanese soybeans are higher in protein than our soybeans. 2–U.S. soybeans are slower to absorb water than Japanese beans and absorb water unevenly. 3–Our soybeans cook unevenly and consequently they may not support uniform fermentation. 4–Products from U.S. soybeans are darker in color than those made from Japanese soybeans. 5–Food products from U.S. beans do not have as good a flavor as from Japanese soybeans. 6–The Japanese do not like the amount of foreign matter, split and broken beans, and other crop material in U.S. soybeans.

Following Dr. Smith's investigation in Japan, a research project was initiated at the Northern Regional Research Laboratory in Peoria, Illinois. The immediate objectives of the project are: 1–To investigate the reported differences between U.S. and Japanese soybeans and to evaluate their significance. 2–To compare approximately 30 U.S. and 6 Japanese soybean varieties in miso and tofu, two most important Japanese foods, and to determine which U.S. varieties are suitable for making these foods. 3–To study the processing methods used by the Japanese and to modify their processes for better adaption [adaptation] of our soybeans to their use...

"Two Japanese scientists, Tokuji Watanabe and Kazuo Shibasaki, accepted invitations to come to the Northern Laboratory to work on these projects."

© Copyright Soyinfo Center 2014

In the 9 months that Dr. Shibasaki and Mr. Watanabe spent at the NRRL they made progress on all the 6 problems listed, though the project is still underway. They found two U.S. soybean varieties, Jackson and Lee, that make tofu very similar to that made from Japanese soybeans. Other promising varieties are Blackhawk, Comet, Dorman, Ottawa, Mandarin, and Acme.

"Composition: It was reported, and generally assumed to be true, that Japanese soybeans were higher in protein and lower in oil than U.S. soybeans. We have accumulated data (all on a moisture-free basis) to determine whether this report is true. Table 1 shows the protein and oil content of eight Japanese soybean varieties grown in various parts of Japan during 1957 or 1958. The name often indicates the area grown: Aomori, Hokkaido Akita, Kumamoto, Miyagi, Nagano, Hagi-Dani, Hokuho, and White Hilum Iwate. These 8 Japanese varieties contained an average of 40.5% protein and 17.2% oil in 1957 and 42.3% protein and 16.8% oil in 1959.

Table 2 shows the protein and oil content of 15 U.S. [and Canadian] soybean varieties grown in various parts of the USA during 1956, 1957 or 1958: Acme, Adams, Blackhawk, Chippewa, Clark, Comet-1, Comet-2, Dorman, Dortchsoy, Harosoy, Hawkeye, Jackson, Lee, Lincoln, and Norchief. These 15 U.S. varieties contained, on average, 41.8% protein in 1956, 40.1% in 1957, and 40.7% protein and 20.2% oil in 1958. Comparing these two tables, Dr. Smith concludes that U.S. and Japanese soybeans contain about the same amount of protein, but that U.S. field-type soybeans contain about 3.7% more oil than Japanese soybeans.

Table 3 shows the maturity group, protein and oil content, and weight in grams of 100 seeds for 33 recommended U.S. and Canadian varieties. This data is based on Cooperative Uniform Soybean Tests. These 33 varieties are grown in all the major soybean growing areas of the USA; Groups 00 to IV inclusive are grown in the North Central States, approximately north of Cairo, Illinois, to northern Minnesota; groups V to VIII inclusive are grown south of Cairo. The 33 varieties, sorted by ascending maturity group, and within each group alphabetically by varietal name are: Acme (00, Canadian), Crest, Flambeau, Capital (0), Comet, Grant, Mandarin, Norchief, Blackhawk (I), Chippewa, Adams (II), Harosoy, Hawkeye, Lindarin, Ford (III), Lincoln, Shelby, Clark (IV), Perry, Scott, Wabash, Dorman (V), Dortchsoy, S-100, Hood (VI), Ogden, CNS-4 (VII), Jackson, Lee, Bienville (VIII), Improved Pelican, J.E.W. 45 [Wannamaker], and Yelanda. This table shows that the oil content increases slightly as one moves from north to south

Smith then discusses garden- or vegetable-type soybeans. "U.S. vegetable soybeans: There is no clear definition for distinguishing the field-type from the garden-type beans. The distinctive features of the garden beans are in their superiority in flavor, texture, and ease of cooking–properties that make them preferred for food use... Most of our so-called vegetable-type soybeans we are growing in this country are Japanese garden varieties that came directly from that country; the Kim and Kanrich were developed in this country. Serious disadvantages of garden-type beans which restrict production are the tendency to shatter from the pods when ripe and the consequent large loss with mechanical harvesting... the yields of some varieties are also lower than for field beans. It has been stated frequently that the garden-type bean is higher in protein and lower in oil than the field type.

Table 4 shows the protein, oil, weight of 100 seeds in grams and hilum color for 14 "garden-type soybeans" on a dry basis. The source of the data for all the varieties except Kanrich, Kim, and Easycook is the University of Illinois Bulletin 453 by J.W. Lloyd and W.L. Burlison 1939 ["Eighteen varieties of edible soybeans: Their adaptability, acceptability, culture and characteristics"]. "For these data the protein values are no higher than for present-day field types and the oil values are only 0.77% lower" than typical field types soybeans shown in table 3. The weight in grams of 100 seeds, in descending order of seed weight and size, is as follows: Hokkaido 31.9, Funk Delicious 31.7, Willomi 31.1, Jogun 29.9, Emperor 29.7, Giant Green 29.4, Kim 28.7, Imperial 28.4, Kanrich 27.3, Fuji 25.9, Illington 25.9, Higan 23.4, Bansei 21.2, and Easycook 16.2.

Conclusion: It "appears that claims for high protein values for garden type soybeans may be exaggerated." A portrait photo shows A.K. Smith.

Note 1. This is the earliest document seen (Dec. 1998) concerning the breeding or selection of soybean varieties for food use–in this case tofu for Japan.

Note 2. This is the earliest English-language document seen (June 2009) that contains the term "garden-type soybeans" or "vegetable-type soybeans." The two terms as synonyms. Address: NRRL, Peoria, Illinois.

4543. *Soybean Digest.* 1959. Father of U.S. soy crop passes. W.J. Morse. Sept. p. 75.

• ***Summary:*** "William J. Morse, age 75, who had better claim than any other man to the title of founder of the soybean crop industry, died of a cerebral hemorrhage early in the morning of July 30 [1959] at his home in Eastchester, N.Y.

"Mr. Morse was known throughout the world an particularly in the United States and the Far East for his work in soybean development in the U.S. Department of Agriculture.

"He was one of the founders of the American Soybean Association and three times president. He was one of the first men to be elected an honorary life member of the Association.

"He was born in Lowville, N.Y., and attended Lowville Academy, then received his BSA from Cornell University [Ithaca, New York].

© Copyright Soyinfo Center 2014

"Mr. Morse went to USDA in 1907 just at the time the Bureau of Plant Industry was making plans to carry on research in the growing of soybeans.

"The plant, introduced from time to time from China, Manchuria, Korea, Japan, and other parts of Asia, had been known here for a century, but had increased to only a few thousand bushels a year. Now, after the long period of search and research, it is one of the nation's leading crops, totaling over half a billion bushels a year.

"Thirty years ago, after having put in 22 years of research in the Department, Mr. Morse spent 2 years exploring for soybeans and other crop plants in China, Japan, Korea, and Manchuria. He returned with hundreds of varieties, many of which contributed to the improvement of strains already here.

"By his development work he supplied the country with varieties suitable for various localities, increased the oil content of some–a big factor in the industrial use of this crop–and made other varieties better for food use. He stimulated the development of the vegetable soybean in this country. The soybean had been little more than a curiosity until research in USDA, largely by Mr. Morse, led the way to making it the important food, feed, and industrial crop of today.

"In 1947 USDA gave him a Superior Service Award.

"He published more than 75 bulletins and articles on soybeans and was co-author of The Soybean, published in 1923 and in print until very recently.

"Burial was at Mt. Hope Cemetery, Hastings-on-Hudson, N.Y. He is survived by a sister, Gladys H. Morse, Lowville, N.Y.; a daughter, Mrs. Walter A. Thalman, Eastchester, N.Y., and three grandchildren.

"Mrs. Morse died last Dec. 23."

A large, excellent portrait photo (taken in the 1940s) shows William Morse in his later years.

4544. Strayer, George M. 1959. Marketing opportunities lie before us. *Soybean Digest.* Sept. p. 18-21.
• ***Summary:*** Last year U.S. soybean production topped the 500 million bushel mark for the first time in history. "For the first time in history we will export over 100 million bushels of soybeans as beans during the present crop year ending Sept. 30. That means that 1 bushel out of every 5 produced on the farms of American finds its way to plants in Japan, Germany, England, Israel and the other countries of the world. This year again we will export about one-fifth of our [soybean] oil production... The soybeans have all been sold for dollars, while some portions of the oil have been sold for dollars and the remainder for foreign currencies under Public Law 480.

"The U.S. soybean crop has truly become an international commodity"–thanks in large part to ASA [American Soybean Assoc.] market development programs in Japan, Spain, Italy, Israel, and Germany. The Japanese program is the biggest and most successful; a long description of its activities is given. In India, the Soybean Council exhibited at a trade fair in Madras. Also discusses problems with grading standards (broken soybean particles are now classified as foreign material) and ASA's need for more members (it now has only 7,000).

The entire soybean industry has been saddened by the death of W.J. Morse on July 30. "More than any other man in the United States he was responsible for soybeans as we know them today. He made the plant exploration trips that uncovered the thousands of varieties and strains of soybeans that were brought to the United States for trial purposes, and which supplied the germ plasm for all [sic, many] of today's varieties of soybeans. One of the first two honorary life members chosen by this Association, Bill Morse retired from his work in the U.S. Department of Agriculture just 10 years ago. His contributions to the present billion-dollar soybean industry can never be adequately appraised."

Thanks to the nine men (serving without pay) who have represented ASA on the board of directors of the Soybean Council of America.

• ***Summary:*** UNICEF stands for the United Nations International Children's Emergency Fund. Appendix 3 (p. 48-51) titled "Data on some nutritious food products that have been developed in Asia and the Far East," discusses Saridele, groundnut extract curd [tofu made from peanut milk], Indian Multipurpose Food (MPF, developed by CFTRI), miso, natto, and tempeh.

"'Saridele' is the name that has been given to a spray-dried soybean extract combined with an extract of sesame, or peanut, with or without the addition of malt. Vitamins and calcium are added to saridele in order to make its nutritive value similar to that of cow's milk or to enhance its nutritive value. Flavorings such as vanilla or chocolate are also used, which make the product highly acceptable.

"A plant having a capacity of about 800 kg./day has been erected in Indonesia with the financial assistance of UNICEF and the technical assistance of FAO. Saridele is manufactured from a mixture of soybeans and decorticated sesame in the proportion of 4:1. Malt extract from maize may be used to replace 50% of the cane sugar used. Soybean and sesame are soaked for about six hours and then disintegrated finely, together with 7 volumes of hot water. The slurry is stirred vigorously and then filtered. The filtered liquid is heated under pressure for 10 minutes at 120ºC., then flashcooled and formulated with Vitamin A, in oil solution, and malt, if desired. The formulated liquid is homogenized, concentrated in a vacuum evaporator to about 22% solids, then spray-dried. The powder finally is sifted and blended with finely ground cane sugar, and calcium carbonate, riboflavin, ascorbic acid and Vitamin B_{12} added; the mixture may be flavored with vanilla or chocolate." A table compares the nutritional composition of whole dried cow's milk and Saridele (based on a leaflet from Saridele Ltd., Indonesia).

4577. Obata, Yataro. 1959. Mieki [Mieki (Leaflet)]. Tokyo: Aji-no-moto Co. Ltd. 1 p. [Jap; eng+]
• ***Summary:*** "It was no other than shoyu which was shipped exclusively by Dutch merchants from Japan to Europe, where it was called the essence or flower of the cuisine at the palace of Louis XIV [in France]. These Dutchmen exported the shoyu in bottles or earthen jars, sealed with pine resin and sterilized [pasteurized] by boiling in hot water. From Japan, they sailed southwards into the Indian Ocean, then northwards into the Atlantic Ocean, finally arriving in Europe with the shoyu. It as very expensive but the quality was good. At parties held by the Bourbon kings of France [incl. Louis XIV and Louis XV], shoyu was loved. Shoyu was praised by Thunberg, who came to Japan in 1774 and later became head of Uppsala University in Sweden. The reason that this well-like shoyu was not served in the first-class dining rooms of European boats later in the Meiji period (1868-1912) was that the flavor was no longer as good, primarily because the moromi mash was no longer fermented for three years, but also because the second pressing (*niban shibori*) with water.

Note 1. This is the earliest document seen (April 2012) that mentions the use of shoyu by Louis XIV [who reigned from 1643 to 1715]. But the author is wrong! In a June 1983 discussion with William Shurtleff in Japan, Obata admitted that this is his speculation with no documentary evidence whatsoever to support it.

Note 2. Mieki is a type of HVP made by the Ajinomoto Co. Address: Ajinomoto Co., Ltd.

4578. Ogata, Sohaku. 1959. Zen for the West. London: Ryder, for the Buddhist Society. 182 p. Illust. Index. 22 cm. [2 ref]
• ***Summary:*** In the chapter titled "Life in a Zen monastery, the section on "Food" states that the meals are very simple. Breakfast consists of gruel and pickles. Lunch is rice mixed with barley, miso soup, and pickles. The evening meal is the same as breakfast. On special occasions, an extra dish will be added. Note: The monastery diet is free of animal products (vegan).

Sôhaku Ogata lived 1901-1973. In Japan, he was professor of Zen Buddhism at Hanazono University. During 1956-57 (during President Dwight Eisenhower's second term) he was invited by the U.S. government to be a Fulbright exchange professor and to deliver lectures on Zen Buddhism at Washington University (St. Louis, Missouri) and at the University of Michigan (Ann Arbor). Before returning to Japan, he visited England, The Netherlands, Belgium, Switzerland, France, Germany, Italy, and Monaco; he gave lectures on Zen and Japanese culture in many cities and towns. Address: Shokokuji Zen Monastery, Kyoto, Japan.

4579. Prescott, Samuel Cate; Dunn, Cecil Gordon. ed. 1959. Industrial microbiology. 3rd ed. Revised by Cecil Gordon Dunn. New York, NY: McGraw-Hill Book Co., Inc. 942 p. Illust. Index. 23 cm.
• ***Summary:*** Chap. 41, titled "Mold enzyme preparations: Uses and products" (p. 666-83) discusses: Mold enzymes: Submerged culture method, continuous tray method for producing mold enzymes, rotating drum method for producing mold enzymes (described by Underkofler et al. 1947), glucose oxidase, uses of mold enzymes (proteases, fungal enzymes). Some mold products: Use in Japan and China, soy sauce (koji from *Aspergillus flavus-oryzae,* Chinese soy sauce, preparation of the "kojies," chemical soy sauce), soy sauce yeasts, tamari, miso, koji. The section on patents (p. 682) cites 15 patents by J. Takamine yet (amazingly) Takamine's name does not appear in the extensive index at the end of the book–though he is considered by some to be the father of industrial microbiology.

The amylo process and a modified amylo process are discussed on pages 864-66. The amylo process is used primarily for converting starch to sugar by the use of selected molds (*Mucor, Rhizopus*), some of which have the ability to produce small quantities of alcohol from sugar.

Soy is also discussed on the following pages: Soybean oil and meal are used in the production of vitamin B-12 by *Streptomyces olivaceus* (p. 485-86). In the production of pentonic acids, several drops of soybean oil were used as an antifoam agent (p. 508). In the production of sodium gluconate, small amounts of soybean oil could be used as an antifoam agent, though they decreased the sugar utilization to an impractical value. (p. 594). L-Glutamic acid can be produced in a number of ways. One is by the hydrolysis of wheat gluten, soybean cake, or other protein-rich food material (p. 713-16). The commercial process now being used in Japan employs sweet potatoes as the chief raw material in a one-stage fermentation process with a strain of *Micrococcus* (p. 712-13).

In the chapter on Saccharifying Agents, Takamine is discussed in the section on "Mold bran" (p. 844). "Takamine, in 1914, advocated the use of mold enzymes (from *A. oryzae*) in the distilling industry. Studies were carried out in distilleries in Canada using his mold-bran preparation (*Taka-koji*) in place of malt to saccharify grains. Although the

© Copyright Soyinfo Center 2014

yields of alcohol obtained through the use of mold bran were reported to be higher than those obtained through the use of malt, the process was not adopted."

A table (p. 857) lists 19 sources of microbial amylase, including Taka-Diastase, made by Parke, Davis & Co., and Alase, made by Takamine Lab. Also in this chapter, in the section on submerged culture of mold amylases, a table (p. 859) shows that soybean meal is used as a protein source in the production of dextrinizing enzyme by *Aspergillus niger* NRRL 337. Address: 1. Sc.D., Prof. of Industrial Biology (Emeritus), Former Head of the Dep. of Biology and Public Health and Dean of the School of Science, MIT; 2. Assoc. Prof. of Industrial Microbiology in the Dep. of Food Technology, MIT (Massachusetts).

4591. *Soybean Digest.* 1960. USDA research may put more U.S. soybeans in Japanese foods. Feb. p. 20-21.
• ***Summary:*** Photos show: (1) A.K. Smith, NRRL chemist, and Tokuji Watanabe, visiting Japanese scientist, examining a cake of tofu. (2) Watanabe wet-grinding soybeans to be used in making tofu.

In 1959 Japan imported an estimated 35 million bushels of U.S. soybeans, almost 10 times the quantity imported in 1950. "About half the soybeans used in Japan are eaten as traditional foods, most of which are made in processes that begin with whole soybeans... Recognizing that Japanese whole-bean processors use limited amounts of our soybeans, Dr. Smith recommended studies of U.S. beans in Japanese food processes. The work began at the Northern Utilization Research and Development Division [NRRL] in Peoria, Illinois Research on miso was performed by Dr. Hesseltine, NRRL microbiologist, working with Kazuo Shibasaki, on leave from Tohoku University, Sendai, Japan. Research on tofu was conducted by Dr. Smith and A.M. Nash of Peoria, working with Tokuji Watanabe, on leave from the Japanese Ministry of Agriculture and Forestry.

"Japanese processors say our beans absorb water, cook, and ferment more unevenly than their own. They also object to foreign matter, split and broken beans, and other crop material in our beans and to the color and 'beany' flavor of products made from them... U.S. soybeans, introduced from the Orient, have for 25 years been bred for yield, oil content, pest resistance, and similar characteristics but not for food processes that begin with whole beans–about half the total use in Japan."

• ***Summary:*** A recipe for Mizudaki [Mizutaki] beef calls for: "½ cup light colored soy sauce. 1½ tablespoons dark soy sauce."

Note: This is the earliest document seen (Sept. 2008) in all major U.S. newspapers digitized by ProQuest that uses the term "dark soy sauce" to refer to dark colored soy sauce. The new term appears in 444 documents between 1960 and the present, including three in the 1960s, etc.

4594. Inagaki, Choten; Fukuba, H.; Miyakawa, T.; Iwata, S. 1960. On the combination of protein and thiamine [in frozen tofu]. *J. of Vitaminology* (*Kyoto, Japan*) 6(1):43-51. March 10. [1 ref. Eng]
• ***Summary:*** On the disappearance of thiamine when soybean curd is frozen and thawed. Address: Lab. of Nutrition Chemistry, Ochanomizu Univ., Bunkyo-ku, Otsuka, Tokyo.

4595. *Cotton Gin and Oil Mill Press.* 1960. USDA research with Japanese foods shows promise for U.S. soybeans: May mean greater exports. 61(6):65. March 19.
• ***Summary:*** U.S. soybeans are not widely used in Japanese food processes that start with whole beans–even though total Japanese imports of U.S. soybeans in 1959 were estimated at 35 million bushels–almost ten times as many as imported in 1950. Recognizing this, Dr. A.K. Smith of the Agricultural Research Service, recommended studies of U.S. soybeans in Japanese food processes at the Northern Utilization Research and Development Division, Peoria, Illinois. About half of the soybean used in Japan are eaten as traditional foods, and the other half are crushed to make oil and meal. Most U.S. soybeans are crushed. About 20% of the soybeans are used to make miso.

Dr. Clifford Hesseltine and Dr. Kazuo Shibasaki developed a new miso process in which the soybeans are cracked into grits. A photo shows Dr. Tokuji Watanabe (on leave from Japan's Ministry of Agriculture) and A.M. Nash of the Northern Division as they work with typical Japanese equipment and study the process of making tofu from U.S. soybeans.

4596. *Sun* (*Baltimore, Maryland*). 1960. Chopsticks, chicken help spur U.S.-Japan goodwill. March 29. p. 36, 24.
• ***Summary:*** Have you ever tried to eat Maryland fried chicken with chopsticks? Between courses of *misoshiru* (soy bean [miso] soup), *oshinko* (Japanese pickles), *sunomono* (fish salad), *asashimi* (fillet of raw fish), *nori* (toasted seaweed), *gohan* (steamed rice), *yokan* (jellied confection containing azuki bean paste), and *ocha* (tea), several dozen individuals, representing both Japan tourists and Baltimore hosts, did just that yesterday. It created good will and plenty of laughs.

Baltimore's only Japanese restaurant is a little place on Jefferson street.

• ***Summary:*** Soybean oil and lecithin may be used as ingredients.

4600. Hayashi, Shizuka. 1960. Public relations seminar by JASI. *Soybean Digest.* March. p. 20.

• ***Summary:*** At this seminar JASI taught Japanese manufacturers of soybean [food] products how sales of these products can be much increased through the use of public relations, including marketing research. "This is particularly true of marketing new products." Previously, these very manufacturers have lacked interest in public relations because they "have been enjoying a reasonably profitable business under the funds allocation system, which has afforded them a sort of protection."

At JASI's first seminar on PR [public relations] and marketing, held recently in Tokyo, about 40 companies and organizations from various parts of Japan participated. "There were two lectures. The first was by Professor Naoyoshi Horikawa on public relations and top management. The other, by T. Shimizu, was on sales promotion. Never in the history of the soybean industry [in Japan] has there been a gathering like this where the so-called 'big shots' of leading organizations sat side by side at the table."

A table shows estimated consumption of soybeans (S) and soybean meal (SM) during 1961 as planned by the Japanese government (tonnes = metric tons). The totals are 1.467 million tonnes of soybeans and 707,000 tonnes of soybean meal. Details: Oil processing: 928,000 S. Livestock feed: 303,000 SM. Tofu and fried tofu: 280,000 S + 20,000 SM. Shoyu: 29,000 S + 200,000 SM. Miso: 130,000 S + 50,000 SM. MSG: 73,000 SM. Other miscellaneous foods: 20,000 S + 40,000 SM. Frozen tofu: 40,000 S. Natto: 30,000 S. Other uses: 21,000 SM. Kinako: 10,000 S.

Note 1. This is the earliest document seen (Nov. 2012) that contains industry or market statistics for kinako or roasted whole soy flour by geographical region.

Note 2. This is the 2nd earliest document seen (Jan.

© Copyright Soyinfo Center 2014

2012) that contains industry or market statistics for natto by geographical region.

A large photo shows about 13 Japanese men seated at a long table at JASI's recent public relations seminar. The name and position of each man is given. They represented the following organizations: Miso Association. Tatsuno Shoyu. Shoyu Association. Frozen Tofu Association. Masuko Miso. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1-Chome Yurakucho Chiyoda-Ku, Tokyo, Japan.

4602. Nagata, Tadao. 1960. Studies on the differentiation of soybeans in Japan and the world. *Memoirs of the Hyogo University of Agriculture* (*Agronomy Series 4*) 3(2):63-102. March. Agronomy Series No. 4. [101 ref. Eng]

• ***Summary:*** In these pioneering, innovative, and fascinating studies, the author uses mainly physiological and morphological data to point out the paths of dissemination of the soybean from China to the rest of the world. He has been studying the subject since 1944 and this is his most definitive publication to date.

Nagata shows that two morphologically different ecological clines can be distinguished in the population of cultivated Japanese soybean varieties: a full-season crop cline and a short-season crop cline.

Note: Clines consist of ecotypes or forms of species that exhibit gradual phenotypic and/or genetic differences over a geographical area.

He also shows that these two clines were introduced separately into Japan from different geographical regions. The full-season cline from north-central China through Korea and the short-season cline from central-south China through Taiwan, the Ryukyu Islands, and into southern Japan.

Contents: Introduction. 1. Classification of soybeans by their degree of summer vs. autumn habit: Reduced rate of period of flowering by delay of time of planting, relative flowering and relative growing period in comparison to the period of flowering. 2. Classification of soybeans by their plant habit [e.g. vining and twining, transmitted from the wild form; determinate vs. indeterminate]: Vining habit affected by the time of planting, determinate vs. indeterminate growth habit and the relation to the vining habit. 3. Interrelation among the summer vs. autumn soybean habit, plant habit and other characters: Interrelation between the summer vs. autumn soybean habit and the plant habit, interrelation of the relative flowering period and relative growing period to the determinate vs. indeterminate growth habit and seed size. 4. Geographical distribution of soybeans in Japan: Distribution of summer vs. autumn soybean habit, distribution of relative growing period of summer soybean and intermediate types, distribution of plant habit.

5. Geographical distribution of soybeans in the world: Distribution of summer vs. autumn soybean habit, distribution of the relative flowering period and relative growing period of summer soybean and intermediate types, distribution of plant habit. 6. The clinal tendencies of soybean distributions and genecological differentiation occurring along with the spreading: Clines established with summer vs. autumn soybean habit, clines established with plant habit, clines established on combination of the habits and their ecotypic significance. 7. Some considerations on the origin and dissemination of cultivated soybeans: Origin of culture, paths of dissemination. General conclusions: Origin of soybean culture, dissemination of soybean, ecological differentiation of soybeans.

The distinction between summer and autumn soybeans is an old one in Japan, dating back to the Edo period (1600 to 1868); it seems to have originated from analogous terms used in old China. The summer soybean is planted early, in April, and harvested in July to August, as a short-season crop in southwestern Japan, including the islands of Kyushu and Shikoku, and in the Kinki district [around Kyoto, Osaka, Nara, and Wakayama]. By contrast, the autumn soybean type is planted later, in June or July, and harvested in November to December in southwestern Japan. However a reliable criterion for distinguishing summer and autumn types has not been established to date (p. 65). The author believes one criterion is the rate of reduction of the number of days to flowering by the delay of planting time. This is shown clearly by the graph in figure 1. When autumn, intermediate, and summer soybeans are planted on April 5, they take about 102, 68, and 43 days to flower respectively. However when they are planted on Aug. 13, they take about 32, 22, and 25 days to flowering. Thus the change in the number of days to flowering is largest in the autumn soybean and smallest in the summer soybean.

Although maturity is the most important character dividing soybeans into maturity groups in the USA, this system is not used much in Japan since it is difficult to distinguish there between the many varieties of soybeans differing from one another in earliness or lateness.

The author divides all Japanese soybeans into four main types and ten sub-types: Summer soybean type (with 3 sub-types), intermediate type (with 2 sub-types), autumn soybean type (with 3 sub-types), and tropical soybean type (vining).

"Relative flowering period" and "relative growing period" are two key concepts that are hard to understand. Each can be calculated by dividing (1) the number days from the beginning to the end of flowering, or (2) the number of days from emergence to maturity, by (3) the number of days from emergence to flowering. Summer soybeans have

© Copyright Soyinfo Center 2014

relatively long lengths of both periods and autumn soybeans have relatively short lengths.

Concerning vining habit, soybeans may be divided into 3 types: Consistent vining, variable vining, and nonvining. The earlier the first two types are planted, the greater the degree of vining they show. Plants with a consistent vining habit are always indeterminate, whereas those with a variable vining habit are always indeterminate. Those with a non-vining habit are usually determinate, but about 10% may be indeterminate. Summer soybean rarely show vining. Indeterminate growth habit is accompanied by stem elongation after the beginning of flowering.

Table 9 shows that summer soybeans have a longer relative flowering period and longer relative growing period than autumn soybeans. Yet (contrary to the text) table 10 seems to indicate that summer soybeans have smaller (lighter weight) seeds than intermediate or autumn soybeans. Thus large-seeded soybeans are most likely to be of the autumn type.

Table 11 shows that the soybeans grown in Hokkaido (Japan's northernmost main island) are mostly summer soybeans; they are planted in early May and harvested in October. No autumn type soybeans are grown in Hokkaido. In the nearby northeast prefectures (Tohoku) intermediate type soybeans predominate. Autumn type soybeans are most widely grown in the Kinki and Chûgoku regions of central and south Japan. In the far south of Japan, summer- and intermediate type soybeans predominate.

Table 13 shows regional distribution of soybeans with respect to their seed sizes. The largest soybean came from Kantô; 60 gm per 100 seeds. The next two largest came from Tohoku and Kinki; 35 gm per 100 seeds.

Figure 9 (p. 82) shows that worldwide (especially in the USA, Europe, and East Asia), the soybeans grown at far northern latitudes (above 40º north latitude) tend to be summer soybeans (short season crop) with a long relative flowering period, a long relative growing period, and a special non-vining habit or normal habit. Autumn soybeans tend to be grown at more southerly latitudes. Most soybeans grown between the equator and 20º north latitude are tropical or autumn type soybeans with a vining habit.

Note: The author makes no attempt to correlate edamame (green vegetable soybeans) with a certain type, habit, or seed size. Address: Sasayama, Hyogo-ken.

4603. Ohsawa, George S. 1960. Zen macrobiotics. New York, NY: Ohsawa Foundation. 103 p. Undated. 28 cm.
• ***Summary:*** This bound, hardcover book was owned by Herman Aihara, and is now (April 2011) in the library of the George Ohsawa Macrobiotic Foundation in Chico, California (President: Carl Ferre). The size is 8½ by 11 inches. The cloth cover is pea green and on it, near the top, is written (on two lines): "Zen macrobiotics" with the word "Zen" in large bold capital letters. In the middle: "George S. Ohsawa," the author. And near the bottom (on two lines): "Ohsawa Foundation: New York–Paris–Brussels–Tokyo."

The book consists of leaves and the text is typewritten. All of the leaves in this edition are edited, some heavily, in two colors of ink: red edits by George Ohsawa, and blue by Lou Oles (According to Herman Aihara). There is no table of contents or copyright page. On the first leaf, near the top, the title is typewritten again on two lines: "Zen Macrobiotics." Then the book begins: "Two ways to happiness through health. Happiness is the goal of everyone in the world. But what is happiness?... In the Orient happiness was defined by sages some thousands of years ago as consisting of five factors, as follows: 1. The first fundamental factor of happiness is joyfulness, an amusing, interesting, brilliant and healthy longevity. 2. The second, not to be worried about money. 3. The third, instinctive capacity to avoid accidents and difficulties that would cause premature death. 4. A loving realization of the order of the infinite universe at all levels. 5. Not to become the first as you will become the last. But try to become the last so that you will become the first forever.

"... School education is completely unnecessary, and even detested. All great men are autonomous and self-made..."

Note 1. This section (two leaves) becomes the Forward in the next edition, which was printed in Japan.

The third leaf is a title page: Like the cover, it has text on 3 levels, but is typewritten. Title: "Macrobiotics: The Biological and Physiological Foundation of Zen Buddhism." Author: George Ohsawa. Publisher: Ohsawa Foundation: New York–Paris–Brussels–Tokyo.

Note 2. The relationship between this title page, the title page of the mimeographed edition, and the cover is unknown.

The next two leaves, are titled "Health to Peace" and numbered "i" and "ii." Note 3. They become the Preface in the next edition, which was printed in Japan.

Next is "iii" which is the Foreword in this mimeograph edition but becomes Chapter 1 in the next edition, printed in Japan.

Next are leaves "iv" through "xxii" which are the Introduction in this edition, but become Chapter 1-3 in the next edition printed in Japan. After leave xxii, the leaves are numbered "8" through "86," and after that is the back cover. The last section of the book is titled "The Case of Mr. E" (leaves 77-86). Note 4. It becomes the first appendix in next edition printed in Japan, which also contains a second appendix titled "The Pro-Forma Death Certificate..."

The mimeograph edition is thus missing pages 3-7. Moreover, all the pages are renumbered by Ohsawa by hand in the upper right corner. In Ohsawa's numbering there are no pages numbered 1, 2, 5, 6, 7, 8, 10, 33 and 34 (a total of 9) and thus his page is numbered 112.

Because the mimeograph edition is bound, it appears that the pages were rearranged after typing but before

© Copyright Soyinfo Center 2014

publication and distribution.

Page 19: "With the conception of Principal Food and that of secondary food clearly distinguished, people of the Orient could live a happy, free and peaceful life from the beginning up to the importation of the brilliant Occidental civilization, more or less violent, with its industrial and scientific instruments... The Principal Food should occupy at least 60% of your eating."

This bound, mimeograph book contains many recipes, all of which are numbered. Soy-related recipes include the following: In the section titled "Beans": 117. Boiled soy beans with miso (the soy beans are first roasted until they pop). 118. Boiled beans ("Boil soy beans until tender. Seasoned with soy sauce and salt. Boil until liquid is gone. Prepare black [soy] beans in the same way)."

Note 5. Later writings by Ohsawa show that by "black beans" he meant black soy beans, *Kuro mame* in Japanese. This is the earliest macrobiotic document seen (April 2013) that gives a recipe for whole soybeans.

119. Gomoku beans (boiled soy beans with vegetables). 120. Goziru soup (Gôjiru; ground soaked soybeans with vegetables). 121 and 122. "Aduki" [azuki, adzuki] beans. 159. Hiziji [Hijiki] with age (seasoned with "soyu" [sic, shoyu]). 160. Hiziki and soyabean (seasoned with syoyu [shoyu]).

In the section titled "Miso and syoyu preparation": "Both miso and syoyu should be of traditional make." 201. Sauce miso (miso-tahini sauce). 202. Miso cream. 203. "Muso" (miso and tahini with minced orange peel). 204. "Miso" soup (5 persons). 205. Carrot and onion au "miso" (15 persons). 206. Vegetable au miso. 207. "Oden" au miso. 208. Buckwheat "dango" au "miso." 209. "Miso-ae." 210. "Tekka" no. 1 (miso with minced yang vegetables–lotus root, burdock root, ginger–fried in sesame oil until very dry. Good for all yin diseases).

In the section titled "Syoyu": Recipes 212-221 are seasoned with "syoyu" (shoyu, traditional fermented soy sauce). "Use the traditional syoyu in all cooking (vegetables and fish). Syoyu diluted with a little water is very good for 'Sasimi' [sashimi] and fried oyster, 'Tempura', fish 'Sukiyaki', 'Tohu' ([tofu] vegetable cheese of soya beans), etc."

803. "'Tohu' plaster. Squeeze 'tohu' (white soya bean cheese) add 10% of flour; stretch this directly on the front or any part painful with inflammation. All pain or inflammation will go away soon." Note 6. This book does not use tofu in any recipes, probably because Ohsawa considered it too yin. However Ohsawa was the one person most responsible for introducing the word "tofu" to popular American culture; his later writings and especially his students and admirers spread the word to the four corners of the United States.

Note 7. This is the earliest macrobiotic document seen (April 2013) that mentions tofu.

Note 8. This is the earliest English-language document seen (July 2000) that mentions "Tekka" (spelled that way, which is now the proper romanization) or that gives a recipe for making it.

Note 9. This is the earliest English-language document seen (March 2006) that uses the word "aduki" beans to refer to azuki beans. This spelling was subsequently widely used, but only in macrobiotic publications.

Note 10. This is the earliest macrobiotic cookbook seen (Jan. 2012).

Also discusses: In the section on "Egyptian beans" (p. 30): Pois "chiche" (chickpeas, basic preparation by boiling). "Beignet" pois chiche (deep-fried balls of mashed chickpeas mixed with flour). Pois chiche croquette (chickpea croquettes).

Publication: "Published by Ohsawa Foundation, 331 Riverside Drive, New York City, U.S.A. (Secretary Aihara, 44 W. 96th St., New York City, U.S.A.)." Underneath this is "Printed in Japan."

Note 11: Concerning the date of publication, we read: "My first two books in English will arrive beginning of November: *Zen Macrobiotics* and *The Philosophy of Oriental Medicine."* (Source: G.O. [George Ohsawa]. 1960/09. "Letter from the editor." *Macrobiotic News* (New York, NY). No. 6. Sept. p. [7]). Address: New York, USA.

4604. Ohsawa, George. 1960. Zen macrobiotics [Continued, Part II]. New York, NY: Ohsawa Foundation. 103 p. Undated. 28 cm.

• ***Summary:*** This mimeograph bound book with the pea green cover, the only known copy of which is owned by the George Ohsawa Macrobiotic Foundation in Chico, California, raises many interesting questions about the publication history of this and closely related titles.

Carl Ferré, an expert on this subject, believes: (1) That there were several "printings" of mimeographed edition and that "printings" may vary. (2) There is a strong possibility that the first editions were sold in Jan., Feb., and March of 1960, before there was any editing on them. (3) It is unlikely that any books were sold with only Ohsawa's red edits on them. (4) It is probable that no books were sold with both Lou Oles' blue editing and George Ohsawa's red editing on them.

Was there a printed edition prior to and different from this edition?

Does anyone own such a copy?

How many pages did it contain and how were the pages arranged? For example, did the original book start with the title page, followed by ages i, ii, iii, etc?

Were the original pages reshuffled to create this bound edition? In this edition, why are there xxi pages of front matter numbered in roman numerals followed by pages 8 through 86 in Arabic numerals.

Why do some pages seem to be missing from this edition. Carl Ferre believes that someone typed the entire

© Copyright Soyinfo Center 2014

book, then Ohsawa decided to move some of the pages around, which they did before they bound and sold the books (for $0.50 each) at Ohsawa's lectures.

How did they bind the books? Did they bind the books by themselves or send them out to a professional bookbinder? Or did a person (who attended the lectures) who was in the bookbinding business offer to bind the books free of charge so they could be sold for only $0.50 each. Was it originally hardcover or paperback? Is the pea green book in Chico simply an example of all the books sold in 1960 at Ohsawa's lectures? Or is it unique–one of a kind? When and where did Ohsawa make all this handwritten changes in red? Was someone suggesting the changes to him? If yes, who?

Why is the title on the cover different from the title on the title page.

Why was the original title page numbered "9" in Ohsawa's handwriting.

What do the Japanese characters under the handwritten "9" mean?

Why is there content before the title page?

We are told the original mimeograph edition was duplicated and bound in the Aihara's apartment in New York City; how was it bound?

Carl Ferre reminds us (e-mail of 2 May 2011): Lou Oles took the recipes out of *Zen Macrobiotics* to create a separate book, *Zen Cookery.* "The problem that has always existed is that *Zen Macrobiotics* has numbers in it that refer to numbers in *Zen Cookery* and they have never corresponded. For example *Zen Macrobiotics* says "See *Zen Cookery* No. 103" and you go to *Zen Cookery,* find that number, and its something totally different–or even nonexistent." Address: New York, USA.

Address: Osaka Municipal Hygienic Laboratory, Japan.

4615. Onishi, Hiroshi. 1960. Studies on osmophilic yeasts. VIII. Isolation of a new obligate halophilic yeast and some considerations on halophilism. *Bulletin of the Agricultural Chemical Society of Japan* 24(3):226-30. May. [10 ref. Eng]
• ***Summary:*** The writer has isolated this yeast from year-old "soy mash and named it *Torulopsis halonitratophila nov. sp."* Although it is an obligate halophile at 30ºC, "it exhibits facultative halophilism when tested at a lower temperature such as 20ºC. This observation suggests that cultural temperature is one of the most important factors for halophilism." Address: Noda Inst. for Scientific Research, Noda City, Chiba-ken, Japan.

4616. Tiner, Hugh M. 1960. Meals for Millions: A 3-cent 'lunch' fights hunger and malnutrition. *Rotarian* (*The*) 96(5):51. May.
• ***Summary:*** Tells the story of Clifford Clinton, Meals for Millions, and MPF (Multi-Purpose Food). Describes how many different Rotary Clubs in the USA have sent MPF overseas for use in relief and rehabilitation projects in Costa Rica, Portugal, Greece, Korea, Mexico, Ceylon, Hong Kong, and India. "Last year $247,000 poured into the Foundation's headquarters on Seventh Street in Los Angeles and sent 'meals' on their way to the hungry.

"But the chief aim of the Foundation is to aid Governments in developing their own versions of MPF, using food products of their regions. An Indian version, based on peanuts, is already in production, and the building of nine plants has been authorized for this purpose. A soy-based MPF is being produced in Brazil. Research is going ahead in the Philippines to develop MPF-type food with fish and coconut meal, in Mexico with soy, in Iraq with sesame and dates, and in the South Pacific with coconuts. Independent, self-supporting Meals for Millions affiliates are active in Brazil, Burma, Ceylon, Formosa, Hawaii, India, Israel, Japan, Mexico, Pakistan, the Philippines, and Thailand, studying, interpreting, and expanding the program." Address: Former president, George Pepperdine College; Past Distirct Governor, Rotary International; Rotarian, San Diego, California.

• ***Summary:*** "Soy-mash" means "soy sauce mash" or moromi. Address: Noda Inst. for Scientific Research, Noda City, Chiba-ken, Japan.

4621. Hayashi, Shizuka. 1960. Discuss problems of soybean usage. *Soybean Digest.* July. p. 26.
• ***Summary:*** Japanese "soy food manufacturers" were addressed by Charles Elkinton, U.S. agricultural attache. During fiscal year 1959 the total quantity of soybeans used by Japanese crushers and food manufacturers amounted to 1.2 million metric tons or 46.7 million bushels, up 12% over the previous year. Japan's total imports during fiscal 1959 were 1,073,477 metric tons of which 1,010,444 metric tons came from the USA.

The total amount of soybeans used by Japanese food manufacturers is as follows, in metric tons. Makers of tofu

© Copyright Soyinfo Center 2014

and frozen tofu used 340,000 tons in 1959/60 rising to 370,000 tons in 1960/61. Shoyu makers used 218,400 tons in 1959/60 rising to 220,537 tons in 1960/61. Miso makers used 186,400 tons in 1959/60 rising to 177,180 tons in 1960/61.

Oil processors crushed 768,870 metric tons or 28,218,000 bushels in 1958/59. A photo shows "Japanese soy food manufacturers," seated on cushions on tatami mats at two long tables, as they are addressed by Charles Elkinton. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building No. 1, 1-Chome Yurakucho, Chiyoda-ku, Tokyo, Japan.

4622. Smith, Allan K.; Watanabe, Tokuji; Nash, Arlo M. 1960. Tofu from Japanese and United States soybeans. *Food Technology* 14(7):332-36. July. [8 ref]
• ***Summary:*** Most of the U.S. soybeans exported to Japan are processed for oil and meal that are used for making food products. A survey conducted in 1957 in Japan by A.K. Smith ("Use of U.S. soybeans in Japan," published April 1958) indicated that at least 25 million bushels of whole soybeans were used in making traditional Japanese foods such as miso, tofu, and natto, and that the Japanese wished to use more.

This paper describes pilot plant investigations comparing U.S. and Japanese soybean varieties to determine which U.S. varieties make the best tofu. Lee and Jackson varieties appeared to make tofu equal in yield, flavor, texture, and color to Japanese soybeans. "When such varieties are known to U.S. exporters and Japanese importers, more soybeans may be exported to Japan 'identity preserved' at some increase in cost over the U.S. No. 2 yellow beans" (p. 332-33).

Note: This is the earliest document seen (Feb. 2010) that uses the term "identity preserved" to refer to soybeans. Address: 1. NRRL, Peoria, Illinois; 2. Food Research Inst., Ministry of Agriculture and Forestry, Tokyo, Japan.

• ***Summary:*** A fatty acid obtained by saponification of soybean oil was used as the main ingredient in making a sheet of poly(vinyl chloride) resin.

4626. Hayashi, Shizuka. 1960. Soy flour in Tokyo school test. *Soybean Digest.* Aug. p. 30.
• ***Summary:*** "Rice has been the main staple food in Japan for centuries, the number of which cannot be definitely counted. Production has been steadily increasing with an average annual crop of about 13 million metric tons in recent years–somewhere near the production of soybeans in the United States.

"Because of the traditional rice diet the protein intake of the Japanese has been small compared with western countries, not to mention the extremely poor intake of fat." Note: Rice contains less than half as much protein as wheat. So rice-eating populations tend to be smaller in stature than wheat eaters.

"The fact that protein is indispensable to the human body has been seriously considered in Japan only since the last World War, along with the question of shifting from rice eating to wheat flour foods. The small income of the Japanese population does not permit them to obtain their protein from animal foods which are mostly very costly in Japan [sic, major oversimplification].

"It is now realized that soybeans are the most economic and ideal source of protein. As a result, the consumption of soybeans and soybean products is increasing.

"The writer believes that the aim of increasing protein intake in the diet can be easily attained if soy flour can be included in wheat flour products such as bread and noodles as well as confectioneries. Various promotional activities with this as the goal will be included in the program of the Japanese American Soybean Institute in the coming fiscal year.

"The total consumption of wheat flour for the 1959-60 fiscal year has been set at 2.4 million metric tons by the Japanese government. This requires an import of 2.1 million metric tons of wheat.

"Wheat flour is low in lysine, one of the eight amino acids, but it can be fortified or enriched by blending with soy flour which contains an adequate amount of lysine. If 10% soy flour is blended with wheat flour this could mean an additional market for a little over 9 million bushels of soybeans.

"The nutritional value of soy flour is well known, and the value of the wheat-soy flour mixture can easily be taught to the public. But whether the flavor of the mixture will be acceptable is a question that needs study.

"To study the question an experiment has just been carried out with 1,600 pupils in one of the Tokyo grammar schools. These children are each given a 100-gram piece of bread with their school lunches every day. At the request of the Japanese American Soybean Institute, the principal of the school agreed to try serving the children with bread made with wheat with defatted soy flour added. The test

© Copyright Soyinfo Center 2014

was carried out continuously for 5 days, the first 2 days with 5% soy flour added, and the following 3 days with 10% soy flour.

"Bread with the 5% quantity of de- fatted soy flour added came out in a slightly larger sized loaf than the loaf containing 10% soy flour. The bread was given to the children without disclosing the fact that it contained soy flour.

"In general, the result has been very satisfactory. No difference was observed between the way the children ate wheat flour bread and bread made with wheat flour and soy flour blended.

"There are 900,000 school children in Tokyo now on the school lunch program, and 10 million children in Japan. On the basis of 10 grams of soy flour per child per day, it would require approximately 30,000 metric tons a year to supplement the school lunches." Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

4627. *House Beautiful.* 1960. Japan. Aug. Entire issue. *
• ***Summary:*** This entire issue of *House Beautiful* was devoted to Japan. The editors found Japanese cuisine to be the best of the 29 countries they had visited. Concerning miso they write: "Some ingredients basic to their cuisine we literally have no counterpart for: such a one is miso, a paste made from soy beans that may be sweet or salty or red or white, and can make a dressing for green vegetables, a marinade for meats, or the filling body of a soup. All delicious!"

4628. Kawashima, Robert. 1960. Here's the way to prepare sukiyaki, the hottest item in the trade. *Los Angeles Times.* Sept. 18. p. K18.
• ***Summary:*** "The trade" refers to Japanese restaurant food in the USA. "The three big dishes, both in Japan and in the United States, are sukiyaki, tempura, and beef or chicken teriyaki." Each requires the use of soy sauce.

A recipe for Sukiyaki cooking sauce calls for "½ cup Japanese soy sauce."

A recipe for Teriyaki sauce calls for "1 cup Japanese soy sauce."

4629. Farlow, David R. 1960. The Japanese American Soybean Institute. When Automatic Allocation goes into effect you will see the full impact of JASI's promotion work. *Soybean Digest.* Sept. p. 35-36.
• ***Summary:*** JASI is starting to get involved with soy milk in Japan. There are about 60,000 tofu makers in Japan and they can readily make both tofu and soy milk. Dr. Harry W. Miller "has long been a strong advocate of the utilization of soy milk to aid in the increased consumption of protein and fat by the Japanese people... K.S. Lo of the Hong Kong Soybean Co. showed me his plant last fall, and I saw huge amounts of soy milk being manufactured and bottled for the Hong Kong area alone. Pepsi Cola is bottled in the same plant and Mr. Lo informed me that soy milk was outselling Pepsi Cola by about two to one in the Hong Kong area. I drank a bottle and I have to admit that much to my surprise it was delicious."

The increase in exports of U.S. soybeans to Japan has been accomplished under a "controlled allocation system"–controlled by the Japanese government. "When the Automatic Allocation system goes into effect, and the consumer alone decides the amount of soybeans and soybean products that are consumed, you will see the full effect that the promotion work that we have done has had." A small portrait photo shows David Farlow. Address: Asst. to the Executive Vice President, American Soybean Assoc.

4636. Hayashi, Shizuka. 1960. The Japanese American Soybean Institute: We can supply the Japanese market with another 26 million bushels of soybeans if we seriously desire it. *Soybean Digest.* Sept. p. 31-32, 34.
• ***Summary:*** Contents: Introduction. Severe criticism (of U.S. soybeans by soybean users in Japan, and work to overcome this bad impression). Next on the consumption and import of soybeans. Now about the future outlook. Possibility of cutting down cost of oil prices. Price of soybean oil can be reduced. Soybean meal as a mixed feed has a big potential market. Soy flour expected to increase.

Before World War II "the soybean requirements of Japan were taken care of mostly by soybeans from Manchuria and China. Soybean oil and low-quality soybean meal were imported into Japan from Manchuria for use mostly as fertilizer." Whole soybeans were used for make shoyu and miso, and for crushing.

"The Japanese soybean industry has stepped into a new era since the war. The crushing industry has been shifted from Manchuria to Japan and it has developed quickly to the present important and prosperous stage. With expanded crushing capacity, the need for soybeans has increased and the major part of the requirements has been supplied by soybeans from the United States, with only a limited quantity from China."

"The break in trade between China and Japan since 1957 has given a chance for U.S. soybeans" to overcome their bad image in Japan.

"Consumption of various soy foods has shown substantial increase" and so have total soybeans imposts into Japan, and the U.S. percentage share of total imports. Table show: (1) Consumption of soybeans and oils in Japan (metric tons), annually from 1955-56 to 1960-61, for tofu and frozen tofu (increased from 319,000 to 370,000), miscellaneous (increased from 167,000 to 214,000), shoyu (increased from 248,000 to 272,000), oil mills (increased from 505,000 to 760,000), and per capita daily (increased from 7.52 gm to 10.80 gm). (2) Imports of soybeans to Japan (metric tons) annually from 1955-56 to 1959-60. In 1955-56: Total 767,099. From USA 571,612. U.S. share of total 74.5%. In 1959-60: Total 1,073,477. From USA 1,010,444. U.S. share of total 94.1%.

"Soybeans have now become the largest item volumewise of all U.S. agricultural products imported into Japan." They now top cotton, which had been the largest. Of all U.S. imports to Japan, soybeans are the second largest after scrap iron. This shows that the market development for U.S. soybeans in Japan has been successful–even under the present controlled currency allocation system which limits imports.

Four years ago the expression "P.R." [public relations] was known by very few people and there was little investment in P.R. in Japan. Today almost everyone in Japan knows what P.R. means. As an example of this change among soybean groups, the Miso Association had no budget for P.R. activities 3 years ago. Today its budget for fiscal year 1960 contains approximately 32 million yen or $90,000 for this purpose. "The same can be said of shoyu, tofu, and other groups." The "Shoyu Association has decided to send a team of 7 top executives of the leading shoyu makes to the United States in October 1960 to study the soybean industry. They are doing this at their own expense but with the cooperation of American Soybean Association.

The total investment in the soybean market development program in Japan over the past 4 years by Foreign Agricultural Service has been $425,000 and the contribution by various Japanese groups has been about $257,000 in cash and services combined.

A 1958 survey showed that the 1,368 oil mills in Japan were operating at 36.8% of capacity. This low percentage is due to the fact that 1,210 oil mills (about 90% of the total)

© Copyright Soyinfo Center 2014

are small factories with a daily processing capacity averaging 10 metric tons; they produce oil mainly from domestic rapeseed at low efficiency.

"If the import of soybean becomes free under the "Automatic Allocation system it is obvious that soybean oil production will be concentrated in the larger oil mills (61 crushers) occupying 85% of the nation's total daily extraction capacity of 8,289 tons. This will bring down the price of edible oil for Japanese consumers. A table shows that 159,000 tons of oil are made in Japan from domestic materials as follows: Rapeseed oil 65%. Fish and whale oil 25%. Rice bran oil 6%. Hog grease 4%. Since Japan has little possibility of increasing oil production from domestic raw materials, it must rely on imports. The price of domestic rapeseed is supported by Japan's government.

Another table shows the rapid growth in production of "concentrated feed" in response to the government's policy to encourage livestock production and the dairy industry. In 1955 it was 509,279 metric tons, rising to 1,310,098 tons in 1958, with 2,000,000 projected for 1960. The percentage of soybean meal used in mixed feeds has been about 4.5% because of the priority given to miso, shoyu and other food industries. However the Livestock Bureau has been requesting an increase in the import of soybeans for feed. Hayashi ends by estimating potential import growth of 700,000 metric tons or 26 million bushels, and by urging U.S. soybean growers to seize the opportunity. "If more funds for market development become available, first preference should be given to soybeans to meet the need for more oil, for more soy flour in bread, and for soybean meal as animal feed."

4642. Strayer, George M. 1960. Commodity organizations that sell can find dollar markets overseas. *Chemurgic Digest.* Sept. p. 7-11.
• ***Summary:*** Today in the USA we have large surpluses of wheat, corn, cotton, rice and grain sorghums. "They are, in part, a result of the three great revolutions that have taken place in American agriculture in the 1900s: 1. Mechanization. 2. Hybridization. 3. Feeding efficiency." "Our single greatest problem today is wheat."

In 1946, just after World War II, the USA produced 180 million bushels of soybeans. "Many people thought we would drop back to 100 million bushels annual production." But instead production has increased, until today it is now nearly 600 million bushels. "Almost 25 million acres have been removed from corn, oats, wheat, cotton and hay acreages and transferred to the soybean crop. Today the U.S. is the worlds largest net exporter of fats and oils and oilseeds.

© Copyright Soyinfo Center 2014

In 1940 we were the world's largest importers. Where have the soybeans gone? Last year we exported 110 million bushels of soybeans–1 bushel out of every 5 produced." The soybeans were "sold into markets which did not exist for use 12 years ago! Japan bought almost 50 million bushels. The European countries bought 45 million bushels. And every bushel was sold for *dollars and only dollars."*

"Part of our increase is due to the breaking off of political relations between Japan and Red China, the traditional source of soybeans for Japan."

Discusses how these large soybean exports were developed. Recently Spain imported 300,000 tons of U.S. soybean oil. Last year Italy purchased 80,000 tons of soybean oil meal.

"Last winter the Soybean Council of America signed a 'global development agreement' with the Foreign Agricultural Service [FAS]..." Representatives of the fats and oils division of the FAS work together with representatives of the Soybean Council to sell soybean oil overseas. But the real work, Strayer emphasizes, must be done by "the commodity organizations representing the individual commodities... My point is this. No one else is personally interested in your markets except you!"

4652. Hayashi, Shizuka. 1960. Japanese soy sauce team in United States. *Soybean Digest.* Oct. p. 22.
• ***Summary:*** "A group of top executives of the Japan Soy Sauce Brewers Association is making a 36-day tour of the U.S. soybean industry as guests of the American Soybean Association. The trip was arranged by the Japanese American Soybean Institute. The soy sauce manufacturers are traveling at their own expense, however."

They arrived in Waterloo, Iowa, Sept. 25. They plan to "visit farms where soybeans are grown and harvested, U.S. elevators, and soybean processing [crushing] plants; the Northern Regional Research Laboratory at Peoria, Illinois; grain grading and export facilities; and the U.S. Department of Agriculture in Washington, D.C.

The team from Japan includes Keizaburo Mogi, managing director, Noda Shoyu Co., Ltd.; Yoshiro Hamaguchi, managing director, Yamasa Shoyu Co., Ltd.; Kichiemon Hamaguchi, president, Choshi Shoyu Co., Ltd., and Mrs. Michiko Hamaguchi; Motoyashi Kinoshita, president, Marukin Shoyu Co., Ltd.; Heibei Yamashita, president, Kinoeno Shoyu Co., Ltd.; Chujiro Yamanouchi, vice president, Japan Shoyu Association, and president, Kyushu Shoyu Association; and Akira Komiya, managing director, Japan Shoyu Association.

"The team will be accompanied on their tour by David R. Farlow, assistant to the executive vice president of the American Soybean Association." Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

4653. Miller, Harry W. 1960. The package soy milk shop. *Soybean Digest.* Oct. p. 14-15.
• ***Summary:*** Soy milk is now widely marketed in the United States in both powdered and evaporated forms.

© Copyright Soyinfo Center 2014

"The demand for the product has been mostly from those allergic to animal milk and through prescription to those who cannot tolerate dairy products. Its manufacture, however, has been by large factory establishments. This is the case with Loma Linda's Soyalac, Borden's Mull-Soy, and Mead Johnson's Sobee. The latest soy milk is being put out by the Indonesian soy milk plant located at Djorgakarta [Yogyakarta, Jogjakarta] which began soy milk powder production in 1957. These plants have contributed much to the knowledge of soy milk, and emphasized its value as a dietary article."

A package soy milk plant can be installed for less than $2,000. It can start as a tofu shop to which is added a steam boiler or steam generator of 5 to 10 horsepower capacity, either a hand-operated stone mill, or better a small mill run by an electric motor with steel or carborundum buhr, and a 50-gallon pressure cooker. The soymilk is formulated by adding sugar, oil, salt, calcium, and vitamins. "These are placed in about one-fifth the desired quantity of extracted milk and run through a small homogenizer especially made for the package plant. When it is homogenized it is added to the other four-fifths of the milk, and we have it as a constituted milk of a nice color and good flavor.

"In most places this soy milk is used hot and marketed at once as hot milk. However, where it is bottled (as is customary with animal milk) it is run over a cooler and bottled which adds a little expense. The package soy milk plant has a capacity for 150 pounds of cheese curd, and 200 gallons of milk per day of operation, using three trained workers, also at a very minimum of cost.

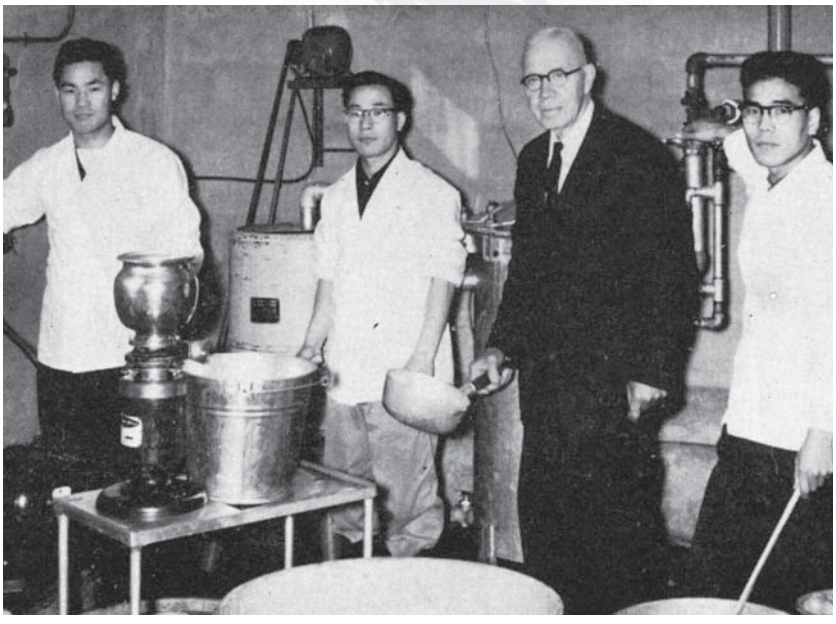
"Plant 30 Years Ago: The practicability of such package soy milk and cheese plants has been amply demonstrated. In fact, my first beginning with soy milk was made in a rather crude package plant at the Shanghai Sanitarium some 30 years ago. This grew into the large soy milk factory later in Shanghai. The next one, which was more streamlined, was put in a school at Taipei, Taiwan, supplying the school, the Taiwan Hospital and community with soy milk daily.

"One year ago the writer had the satisfaction of arranging a flow line of the above described equipment in a village in the northern suburbs of Tokyo, where soy milk is made in a soy cheese [tofu] factory so both bottled soy milk and tofu are supplied to the community and also to a state institution. There are an estimated 3,000 soy curd plants in Japan. At little additional cost each of these can be transformed into soy milk producing shops.

"A soy milk package unit has been assembled at Mountain View College, located in central Mindanao, Philippine Islands. Here the college farm raises a good type of edible soybean. There 700 students get soy milk for breakfast every morning and at noon have soy cheese. In these rice eating and corn producing areas the soybean thus prepared has made a great contribution to the health and welfare of the student body and faculty members.

"A similar package soy milk shop is now being installed at a school in Hong Kong, another at a college and hospital at Bandung, Indonesia, and another at a college in Japan.

"Thus a partial solution of the all-important protein in the nutrition of the Orientals, within their economic reach, is now a possibility. No greater benefit can be visualized than nutrition adequate for infants and the growing school child."



Photos show: (1) Three Japanese workers standing behind a table on which are glasses of soy milk. The caption reads: "Soy milk, ready for customers, is made fresh every day." (2) Dr. Harry Miller and three Japanese workers in a "soy milk package plant," or compact soy milk shop, with several pieces of equipment. Address: M.D., Director Emeritus International Nutrition Research Foundation.

4660. Hayashi, Shizuka. 1960. Soft tofu offers U.S. market. *Soybean Digest.* Nov. p. 24.
• ***Summary:*** Mr. Hayashi has recently learned that American soybeans are the best for making "soft tofu," which is rapidly becoming popular in Japan. The characteristic of soft tofu is that during coagulation there is very little loss of water soluble protein compared with ordinary tofu. Therefore the yield of soft tofu is much higher. After this discovery, the American Soybean Institute began to sponsor tofu making contests to encourage tofu makers to gradually shift to soft tofu. The first such contest was held in April 1959 in Osaka, jointly sponsored by the All Japan Tofu Press Co. The All Japan Tofu Association has over 40,000 manufacturers as members. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building No. 1, 1-Chome Yurakucho, Chiyoda-ku, Tokyo, Japan.

Ten photos of the group and of individual members are shown; each has a detailed caption. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

4662. Ohsawa, George. 1960. The philosophy of Oriental medicine (The book of judgment). New York, NY: Ohsawa Foundation. 171 p. 19 cm. [7 ref]
• ***Summary:*** Ohsawa is trying to express a nondualistic worldview, its many forms of practice or application, and its manifestation in the field of time as pairs of opposites.

The Preface begins: "I wrote this book from the beginning of November until the end of November, 1955, in French Equatorial Africa in Dr. Schweitzer's hospital at Lambarene [Gabon], and from January 1 to January 13, 1956, at the Protestant Mission Station at Andende, in that old house where Dr. Schweitzer began his work in the year 1913,..."

"The aims of this book: 1. To point out the dialectical, universal, simple and useful Unique Principle of science and philosophy, of all the great religions and of all Far-Eastern civilization. 2. To show the biological, physiological, medical, educational, sociological and logical application of the Unique Principle. 3. To present especially Far-Eastern medicine in the light of the Unique Principle. 4. To reveal the Unique Principle in all its glory as the principle of infinite freedom and eternal peace.

© Copyright Soyinfo Center 2014

"The Unique Principle of the Far-East is exceedingly simple and extraordinarily practical... It is the 'conception-constitution' of Life and the Universe" (p. 3). It "is a manifestation of universal love, or the supreme judgment, embracing all the antagonisms and transforming them into oneness, and distributing the eternal joy of life to all, forever" (p. 4).

"Since the publication of my first book in French, *Le Principe Unique de la Science et de la Philosophie l'Extrême-Orient* (at Vrin's, Paris, 26 years ago [1931]), I have always worked in the same direction–for universal understanding. I left Japan forever about the end of my sixtieth year (October, 1953) to see my friends and the great man of the world, whom I believed would understand the Unique Principle, and the practical dialectics thereof. Note: The order of words in the title of Ohsawa's first book in French was actually *Principe Unique de la Philosophie et de la Science d'Extrême-Orient.*

"I hope the Unique Principle will become as well known as the art of flower arrangement, Chinese medicine, 'Acupuncture,' Bonsai, Bobkei, Zen Buddhism, and the theory of Judo-Aiki" [Aikido] (p. 4).

"Until the end of my life I shall always be traveling with my wife, showing how to master this practical dialectics, universal logic, and order of the universe; the very key to the Kingdom of Heaven that will establish infinite freedom, eternal happiness, and absolute justice everywhere." "I live in Europe, chiefly in France, six months of each year, and the rest of the time I shall visit other countries on this planet" (p. 5).

Contents: Preface. Introduction: The physics and metaphysics of yin and yang. 1. Medicine or faith? 2. The Unique Principle–a practical and dialectical classification: Yin (centrifugal) and Yang (centripetal) are always relative, the form, the weight, the color, about water, the chemical composition, the geographical point of view, the taste, conclusion, Dentie, Yin and Yang classification.

3. The Unique Principle of the science and philosophy of the Far East. 4. Man's origin. 5. Far Eastern medicine. 6. Order of the Universe and man's constitution. 7. Supreme judging ability. Appendixes.

"In the Far East, thousands of years ago, medicine evolved from perfect symptomatic medicine to prophylactic [preventive] medicine; then from prophylactic to the yogic (or religious) art of health,..." (p. 13). Western medicine is analytical, empirical medicine; it is a modern superstition (p. 19). "I am going to show you the identity of faith (realization of the order of the universe, or Oneness, the absolute–infinite–eternal) and the highest medicine" (p. 20).

Soy paste [miso] is a very Yang "vegetable paste, prepared with a 20 to 30% volume of salt, which will keep for at least three years" (p. 35).

"How can one, having two new-born twin dogs, make one become very vicious, restless, aggressive, and the other easy, friendly, quiet and patient? Answer: I will feed one with a diet including 20 to 30% of meat or fish, and the other a vegetarian diet with 60% or more cereals... If racing together, the non-vegetarian would lead for the first mile or so, but afterwards, the vegetarian would forge ahead" (p. 36).

"Vegetarian peoples are rather of philosophical and religious mind, inclined to meditation, aesthetics, literature and poetry. The non-vegetarian ones, on the contrary, are strongly inclined to so-called mechanical and industrial progress, and to colonization too. There have been no vegetarian people in world history who colonized other people by force (militarily or economically). From the beginning, the Japanese people were vegetarian until the introduction of Occidental civilization fifty years ago at the time of the Russian-Japanese war" [1904-05]. After that they "became utterly uprooted. The Japanese spirit was lost, as well as the whole of its tradition. To some degree they have allowed themselves to be colonized, spiritually and physiologically" (p. 37).

There are 7 stages of Yin-Yang classification of food. The 7th or highest is "all-embracing supreme judgment. All food products must be free of chemical fertilizer and insecticides (both very Yin), since they destroy not only the natural quality of the food, but also, sooner or later, those who eat it." The key complementary antagonism between Na [sodium] and K [potassium] was discovered by a Japanese doctor, Sagen Isiduka [Ishizuka], 70 years ago." He cured hundreds of thousands of incurable people. "When he died his funeral escort was over two miles long" (p. 38-39).

The greatest master of the Unique Principle was Lao-Tse [Laozi]. It is a polarizable monism (p. 41). "Everything is composed of two fundamental forces, Yin and Yang. They are seemingly antagonistic, but actually they are complementary" (p. 43).

"Every year about July or August, for almost twenty years, I have organized a 'New School' where the students learn the theory and practice of the method to establish good health following the tenets of the Unique Principle" (p. 44).

"But what is education? Present-day education, so-called, is nothing but phonographic remembrances of the mass production of professionals, technicians, engineers or teachers. In short it is a preparation for slavery" (p. 47). It is really indoctrination. There are two important types of education: pre-natal and post-natal. But a real teacher is able to make men free and happy forever (p. 48-50). Knowledge of the Unique Principle is called *Do* in Japan and *Tao* in China; it is the Great Way, and following it is called *gyo* [spiritual practice] (p. 50-52).

All food is of vegetal origin; it ultimately comes from plants (p 62). "Cow's milk is intended for the nourishment of calves... There is no reason for man to live upon the milk of the animal, which is biologically and intellectually inferior to him" (p. 67).

Illness is an alarm, sent by the Infinite to tell us that we

© Copyright Soyinfo Center 2014

are violating the Order of the Universe (p. 77). "The world is dialectical. Quality is influenced by quantity. The world of materiality and relativity is very complex in its expression and phenomena. It appears like an anarchic chaos, but a dialectical law rules it: the 'Unique Principle' or Yin-Yang law.'" Man is the masterpiece of creation. He is happy who has made up his mind to live in accordance with the Unique Principle (p. 82).

"About thirty years ago, I brought acupuncture to Europe and was the first practitioner of it there." "I was at the same time, the first importer of the art of flower arrangement and of the theory (or spirit) of Judo (Juzutsu [Jujutsu])." Both have become popular in today's Europe. "But few people are interested in the *Do* [*Tao*] of Judo and Kado, which is their philosophy" or "Unique Principle." The *Do* of Judo has also been forgotten in Japan (p. 88-89).

"The individual soul and the universal soul are one and the same thing, the infinite" (p. 156). On the last 2 pages of the book are important addresses in New York City (Ginza, Azuma) and Japan (Nippon C.I. in Tokyo), and Centers in Europe (France, Belgium).

Note 1. This is the 2nd earliest English-language document seen (May 2011) written by Ohsawa, who lived 1893-1966.

Note 2. Carl Ferré states (e-mail of 30 April 2011): It was first announced in the Nov. 1960 issue of *Macrobiotic News* and therefore may well have been first published in English in late 1960. The original French edition was published by Vrin in 1956. There were at least two printings of hardcover editions: (1) blue cover with gold lettering; it probably appeared first; (2) brown cover with thicker paper. Address: 1. Lambarene, French Equatorial Africa [Gabon]; 2. Ohsawa Foundation, 331 Riverside Dr., New York City, New York (Secretary Aihara, 44, W. 96th St., New York City, USA).

4663. Ohsawa, G. 1960 Zen macrobiotics: The art of longevity and rejuvenation. New York, NY: Ohsawa Foundation. Printed in Japan. 218 p. Undated. Index. 17 cm.
• ***Summary:*** This is the earliest known printed edition of Zen Macrobiotics. The cover is gray. The author is George Ohsawa. The content is basically the same as the original mimeograph edition, however it has been edited and several of the parts have been rearranged and renamed to create a Forward [sic] (p. 3-5), a Preface (p. 6-8), and Chapters 1-3 (p. 15-43). At the end are two appendixes: One, which was titled "The Case of Mr. E," appeared at the end of the mimeograph edition. The second, which has been added is titled "The Pro-Forma Death Certificate of the American World Empire and its Gold Dynasty."

Concerning the date of publication: Although the date is not given in or on the book, the periodical *Macrobiotic News* announced it as being available in November 1960.

Distinguishing marks of this printing: Page 3: "Forward" is misspelled. Page 7: "... hundreds of ways of cookin [sic] and eating. They are all aim [sic] to create..." Page 62: "The yellow part is most yound [sic, yang],..."

These four errors were corrected in the next printing.

Both printings have 218 pages. However, pages 217 and 218 are different in the two books.

At least two printings were done in Japan. As of April 2011, Carl Ferré, President, George Ohsawa Macrobiotic Foundation (Chico, California) has one original of each.

Carl adds (e-mail of 30 April 2011): "Page 218 of the book you have (*Macrobiotics: The Art of Longevity and Rejuvenation,* by G. Ohsawa) appears to be exactly the same as the second Japan printing. It seems to confirm my hypothesis of a first printing in Japan in 1960, a second printing in Japan around 1962, and a third printing of the same edition in the U.S. after the 1962 Japan printing (and might even be the 1964 book referred to in Yin Yang). I believe the first reference in Macrobiotic News to a printed book is November 1960. Because editions of *Zen Macrobiotics* may have been printed at the same time as *Philosophy of Oriental Medicine,* we may need to look into that title as well in order to determine the full story." Address: Ohsawa Foundation: 331 Riverside Dr., New York City. Secretary Aihara, 44 W. 96th St., New York City, U.S.A.

4664. *Soybean Digest.* 1960. The cover picture: Mrs. Michiko Hamaguchi. Nov. p. 23.
• ***Summary:*** Mrs. Hamaguchi was the guest of Mrs. George Strayer in Hudson, Iowa. She is a member of the Japan Soy Sauce Brewers Association visiting team which toured the USA in September and October.

"Mrs. Hamaguchi is not only the wife of K. Hamaguchi, a director of the Soy Sauce Association and president of the Choshi Soysauce Co., but she is also a well-known soprano singer in Japan."

4665. Kikkoman International Inc. 1960. Kikkoman all-purpose soy sauce: Recipe of the week (Ad). *Los Angeles Times.* Dec. 1. p. 21.
• ***Summary:*** The recipe, Easy does it steak superb, calls for ½ cup Kikkoman soy sauce.

4666. USDA ARS Northern Utilization Research and Development Division, Peoria, Illinois. 1960. Definitions of foreign foods of current interest (Brochure). Peoria, Illinois. 4 p. Dec. 13. 28 cm.
• ***Summary:*** The first section, titled "Japanese foods from soybeans" (p. 1-2) includes: Aburage, frozen tofu, Hamanatto (Hamananatto), kinako (A form of full-fat soy flour made by grinding roasted soybeans), koji (A culture prepared by growing *Aspergillus oryzae* on cooked rice, wheat or other cereal for a few days. Serves as a source of enzymes for making miso, soy sauce, saki [saké, sake]

© Copyright Soyinfo Center 2014

and other fermented foods), kori tofu, miso, monosodium glutamate (a seasoning compound first isolated from soy sauce), nama-age, natto, satsumage [satsuma age], soybean milk or tonyu, soy sauce or shoyu, tofu, yaki-dofu, yuba.

The second section, titled "Indonesian fermented foods" (p. 3-4) includes: Arak, ketjap (soy sauce made with black soybeans), ontjom, ragi, sajur asin, tapé ketan (fermented glutinous rice), tapé katella (fermented arrowroot), tempeh (or témpé or témpé kedelé), tuwak. Address: Peoria, Illinois.

4667. Jones, Stacy V. 1960. Variety of ideas in new patents: Japanese trade-mark. *New York Times.* Dec. 24. p. 19, 25.
• ***Summary:*** Yamasa Shoyu Company of Japan wishes to register with the "Patent Office an arrangement of Japanese characters, as a trade mark for soy sauces." On top of the Yamasa logo is an inverted "v," meaning "high mountain." Underneath it is a "character designating Kihei Hiroya, the founder of the business."

4668. Arnould, Francis. 1960. La vie et l'oeuvre du Dr. Berczeller et le soja alimentaire [The life and works of Dr. Berczeller and soyfoods (Continued–Document part II)]. *Revue d'Histoire de la Medecine Hebraique* 13(4):153-68. Dec. [Fre]
• ***Summary:*** Continued from page 159. Soy flour has numerous practical advantages. Its adds stability and shelf life to breads. Containing very little water, it is lightweight and easy to transport. It is extremely versatile, for use in many foods and dishes. It also has special uses, in war provisions and relief foods for refugees. Because of its light weight and nutritional density, it was used as a foodstuff by German skydivers / parachutists.

III. The big questions and projects: Berczeller was interested in the problem of world protein shortages. Germany had long had a serious deficiency of protein and fat, which could be corrected by soy. Germany imported about 1 million tons of soybeans before the war, and these soybeans were largely treated by the Berczeller process–which was a triumph. Russia experienced grave famines in about 1926, as well as at other times. So Russia turned to the soybean and cultivated it on large expanses of land. Dr. Berczeller traveled to Russia in about 1927 to create a modern soya industry there. North Africa and black Africa suffer from undernutrition and protein malnutrition. Soybean cultivation and a soyfoods industry would offer a solution to the problems of the entire continent.

In 1936 the Maharaja of Baroda [Maharaja Sayajirao Gaekwad III] well understood India's protein problem and had a book published on soya by Indian physicians. But they ignored the decisive progress made by Berczeller, so they were not able to develop utilization of soya that was properly treated. Berczeller was thinking as early as 1932 that introducing the food use of soya to India would be the main human goal of his life.

Even before 1932 Dr. Berczeller saw–at an early date–the great question of world protein supply and undernutrition. He studied the problem of the balance of nutrition and food in Germany scientifically. In 1932, Dr. Berczeller met F. Arnould because he took interest in the general econometric studies done by F. Arnould; this became the basis of their relationship [thus F. Arnould seems to have been an economist]. Thus Dr. Berczeller was a pioneer or precursor of in the field of agricultural and food econometrics.

He was very interested in various international organizations. He foresaw the need for an organization or international laboratory for the study of nutrition and food. From 1932 he told us that he would like to donate his fortune–which was very large–to such an organization.

His ideas and goals were a perfect match with those of existing organizations, the International Institute of Agriculture (Rome) before 1939, and the Food and Agriculture Organization [FAO] after World War II. Particular circumstances–and perhaps even occult occurrences–impeded the development of his works under this normal framework. He was interested in new protein sources, such as yeasts, and in the synthesis of amino acids and even poly-peptides.

IV. The life of Dr. Berczeller. We knew only a part of Dr. Berczeller's life and work. We would like to gather documents, testimonies, opinions, even criticisms from the many people who knew him. Dr. Berczeller explained to us that the idea of studying soya came to him in 1912 after attending a soyfoods dinner at the Japanese embassy in Berlin. He had been indisposed with a headache. So the slight toxicity of seemed to him to be a question of great importance. Already specializing in food questions, he had been an expert in the Austro-Hungarian government in this field during World War I (1914-1918). In about 1918-1920 he worked in the laboratory of Dr. Wasserman studying the proteins in blood. In 1921-22 he invented his process for treating soya. He was aided by the laboratories of the Skoda Foundation in Czechoslovakia.

In about 1924 Winston Churchill wrote a favorable article about food uses of soya in the London *Times.* A soyfoods dinner was given by the British Empire League in London; Winston Churchill attended.

In 1926 Dr. Berczeller went to Russia to organize a soya industry. He was considered to be named "Honorary General of the Red Army." He returned in 1930. In Germany his patents were used or exploited by Hansa Muehle of Hamburg, a huge milling enterprise. His products based on soya flour were sold by the Edel Soja Society in Berlin.

In England his soy flour was produced by the company named Soyolk in Rickmansworth near London. But a lawsuit (*procès*) opposed Soyolk to Dr. Berczeller. He later lost this lawsuit in about 1930.

A factory for making soy flour was also started in the

© Copyright Soyinfo Center 2014

Netherlands.

As early as 1929 Dr. Berczeller presented to the French government a proposal to introduce soy flour into human feeding. When we went to Quai d'Orsay [headquarters of the French government] in the company of Dr. Berczeller in 1932, we reminded our audience of our earlier proposal.

To discuss the introduction of soy flour in the food of large organizations, and of armies / militaries in particular, he went to see many important persons–Joseph Stalin, B. Mussolini, Miss Dorothy Thompson, secretary to President Franklin D. Roosevelt, etc. From 1929 to 1939 Dr. Berczeller travelled extensively in Europe to study on location the food of various countries: Romania, Bulgaria, Yugoslavia, Italy, Portugal, etc. He often traveled to Great Britain, where he studied the countries of the British Empire.

Dr. Berczeller in France: In 1932, when Dr. Berczeller asked us to present his work on soy in France, the agricultural situation in France was not favorable to the use of this progressive item, agriculture being then in the mist of a crisis of overproduction, with too much wheat, too much meat, too much milk, etc.

Those in charge were told to keep his ideas on file and reopen them when the next war broke out. This actually happened. In Oct. 1939 we asked CNRS, the National Center for Scientific Research, to invite Dr. Berczeller to come to France. He arrived in Paris via Geneva with an introduction from the secretary general of the League of Nations. We worked at Toulouse in 1939-40 on a program of soybean cultivation in southern France. During that time he stayed in Paris, at CNRS, working on introduction of soya into the army's food. But in June 1940 the defeat of France by Germany interrupted our work. Dr. Berczeller retreated to Toulouse.

After the armistice, soy flour could have been able to render a great service to France for feeding children. Some of it could have been imported from the United States, but human and political considerations impeded the realization of this.

Dr. Berczeller departed for Marseilles. We lost track of him, but we re-established contact after the Liberation (spring 1945). We tried to import some soy flour from the USA to feed undernourished people returning from the German camps. But incredible blunders on the part of the State's relevant departments caused our efforts to run aground. Several 'Liberty Ships' loaded with soja beans arrived in France but the knowledge as to what to do with these products was not on hand. Finally, they were given to... hogs.

Dr. Berczeller encountered difficulties of all types in France after the Liberation. Ruined, unknown, poorly received, old and sick, he finally lost his equilibrium and was no longer able to conduct his complex affairs and delicate studies. He was hospitalized at the hospital Lariboisière, then sent to various psychiatric hospitals. In this unfortunate evolution, CNRS has taken a very heavy responsibility by its incomprehension and by the false information that it gave. One could write an entire book recounting these misadventures of Dr. Berczeller in the French scientific milieux.

In 1940 Dr. Berczeller, working with a Quaker group near Toulouse, studied the importation of a soy-based infant formula made in the USA. The Quakers later helped him greatly in trying to rectify injustices, but without success. In 1952 Prof. Veznar of Zurich, Switzerland, helped arrange for Dr. Berczeller to be placed in the *Maison de Santé Nationale de Saint-Maurice.* The chief medical officer of this establishment, Prof. H. Baruk, cared for him with the greatest devotion. But he was not able to stop the development of an old heart malady. Dr. Berczeller died at Saint-Maurice on 14 Nov. 1955.

4669. Hayashi, Shizuka. 1960. Promotional work started for soy flour. *Soybean Digest.* Dec. p. 15.

• ***Summary:*** "Parallel with the promotional activities which the Japanese American Soybean Institute has been concentrating on to increase consumption of various soybean products such as soybean oil, miso, shoyu, tofu, frozen tofu and other soy foods, the Institute has now started developing new markets for soy flour for various purposes, and soybean meal for animal feeds.

"As a first step, plans have been made to promote the blending of soy flour with wheat flour for baking bread and other baked goods.

"Experimental investigations have shown that up to 10% of a good quality of soy flour can be blended with wheat flour and that this can be done effectively on a commercial basis.

"This requires educational work as well as promotion. It is, however, encouraging to know that some of the large bakeries are already using a certain percentage of soy flour with wheat flour and selling their breads to the public without disclosing to the public the fact that the breads contain soy flour. Unless there were some advantage or profit to be gained they would not voluntarily use soy flour.

"A series of experiments are being carried out at the experimental institute of the Ministry of Agriculture, for the purpose of encouraging use of soy flour with wheat flour, particularly among the rural housewives through the network of home economic extension workers.

All kinds of breads, cookies, doughnuts, cakes, noodles, etc., have been made. Special attention should be called to the success in making noodles with the addition of 30% soy flour. Noodles with 10% to 20% soy flour have been demonstrated as being perfect in their appearance, color, taste and quality. In fact, noodles with soy flour blended with the wheat are more palatable and acceptable than the ordinary 100% wheat flour noodles.

"Under the joint sponsorship of some of the school

© Copyright Soyinfo Center 2014

lunch newspapers and JASI, a meeting was held in the latter part of October. Representatives of grammar schools in the different wards of the city of Tokyo were present, also officials in charge of school lunch programs from the Ministries of Education, Agriculture, Welfare, and the Tokyo metropolitan government. About 30 nutritionists from the different wards of the metropolis were on hand; also, representatives of manufacturers of soy flour. Altogether, about 130 were present.

"The aim of the meeting was to educate the school teachers and officials of the different government departments regarding the excellent nutritional value of soy flour and to persuade them to start on a program using soy flour blended with wheat flour in making bread for the school lunch.

"Most teachers have very little knowledge of the values of soy flour and its nutritious ingredients such as fats, proteins, and vitamins. Some of the teachers had the idea that the soy flour now being used for baking and confectionery purposes is like the soybean cake and meal that Japan used to import from Manchuria before the war for fertilizer.

"This suggests that extensive promotional activities will have to be undertaken before the public will become familiar with the value of soy flour.

"An hour lecture was given by the writer explaining the nutritional values of soybeans and soy flour. I emphasized the advantage of using soy flour blended with wheat flour both from economical and nutritional points of view.

"The Japanese school lunch gives 100 grams of bread every day to each child. I explained that by adding 12.5% soy flour, this could reduce the quantity from 100 grams to 40 grams and still give the same nutritional values. Cost for each child could be cut from 5.5 yen to 3.27 yen.

"Since there are a little over 10 million school children in the school lunch program, the savings through the use of soy flour could come to 8 billion yen a year on the basis of 250 school lunch days. If the school lunch were given to the approximately 20 million school children who need it, the amazing amount of 16 billion yen, over $44 million, could be saved!

"After the lecture we served samples of 40-gram loaf [loaves] of soy-wheat flour bread baked under the direction of Dr. M. Akutsu, also various foods made with a blend of soy flour with a pottage soup which also contained soy flour.

"All the people in attendance seemed surprised at the excellent quality of the foods produced with soy flour.

"This was the first attempt to promote soy flour. Of course repeated publicity of this nature is needed to develop this new market." Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

[10 ref. Eng; jap]
• ***Summary:*** "As emphasized in the former report (Nagata 1950), soybeans vary in the relative flowering period and the relative growing period compared with the period from emergence to flowering, and the said properties have intimate relation to the distribution of soybeans in Japan and the world (Nagata 1959, 1960). Nevertheless, the factors giving rise to these varietal differences have not been clarified to date. Parker and Borthwick (1951) and Fukui and Yarimizu (1951, 1952) dealt with the problem of the effects of daylength and temperature on the growths of pod and seed, and maturity. They observed that the daylength was a more marked factor affecting those growing processes than the temperature. Other researchers have also observed the effect of temperature at night on the seed formation or fructification (Furutani 1950, Takeshima 1952, Tanda 1952). Above all, Fukui and Yarimizu (1951, 1952) suggested that the long seed forming period of soybeans belonging to the summer soybean type or the intermediate type was attributable to their high sensitivity to photoperiod during the seed forming period.

"The author carried out several experiments on the relative periods of soybeans mentioned above, and found some correspondence of the determinate vs. indeterminate growth habit, seed size, and photoperiodic perception to the relative periods. The results obtained from the experiments are reported in this paper."

"Summary: In order to make it clearer to understand the varietal difference of the relative flowering period and the relative growing period, and the interrelations to other characters, the effects of daylength on the flowering period and the seed forming period were studied in the experiments of 1953 to 1954.

"1. The daylengths from 10 to 18 hours appeared to have greater effect on both of the said periods than on the period to flowering at hours of threshold shorter than the critical daylength. Such an effect differed between the varieties in parallel with the lengths of the periods under short daylength, that is, great on the flowering and the seed forming periods of indeterminate soybeans and the seed forming periods of determinate large seeded soybeans, while less on both of the periods of determinate and small seeded soybeans.

"2. The difference in the effect of daylength mentioned above was clear between the soybeans of summer soybean type and intermediate type due to the sudden leap of the period at the threshold daylength.

"3. Such results seem to make it easy to consider the varietal difference in the relative periods and the interrelations to determinate vs. indeterminate growth habit and seed size under natural daylength in fields, as shown schematically in Fig. 3." Address: Hyogo Agricultural College, Sasayama, Hyogo-ken, Japan.

• ***Summary:*** In Chapter 7, titled "Food, 'Sake' and Tobacco" (p. 275-331) the following may be of interest: Asakusa-nori (includes shoyu), azuki (incl. soybeans, tofu, miso, shoyu, natto), bento and kashi, cattle, chameshi, chawan-mushi ("somewhat similar to Western custards." Make katsuobushi {shaved dried bonito} soup stock, cool, pour into individual *chawan-mushi* bowls {each has a cover}. Mix in an equal quantity of beaten eggs. Add additional flavoring ingredients, cover, and steam until set. "One of the few Japanese dishes that resemble Western dishes in taste").

Chazuke, cooking (incl. sukiyaki and tempura), daikon (incl. miso), drinking cups and customs, eel-eating day (eels are broiled, steamed, then put in a specially prepared shoyu and broiled again), ginnan (ginkgo nuts), gobo (burdock, incl. miso soup and shoyu), gohan (boiled rice), kabayaki (eel), kamaboko, kashi (confections and sugar), katsuo-bushi (incl. shoyu), kawara-senbei (incl. miso), konnyaku (its shredded form, called shirataki, is used in sukiyaki), manju, matsutake mushrooms (widely used in sukiyaki in the fall), menrui (noodles, incl. soba, udon, shoyu), mikan (mandarin oranges), misoshiru (miso soup, incl. tofu, shoyu, tekka-miso, tai-miso, yuzu-miso, wakame), mochi, mochi-tsuki (pounding), myoga (*Zingiber mioga*), oden (with tofu, miso, and shoyu), one-sided fish, red rice (*sekihan,* made with azuki = red beans), ringo (apples), sakana (fish, incl. shoyu and tofu), sake drinking, sake eating, sashimi (incl. shoyu and mirin), satsuma-imo, seaweeds (sea vegetables), shincha (new tea), shoyu (Japanese-style soy sauce; per capita consumption is nearly 4 gallons a year), snake eaters, soba (incl. shoyu), souvenir cakes, sugar, suimono (clear soup, incl. miso and shoyu), sukiyaki (incl. tofu and shoyu), sushi (incl. Inari-zushi made with fried tofu), sweets in season, tea varieties, tea water, tempura (incl. sesame oil and shoyu), tobacco tradition, tofu (incl. bittern/nigari, yaki-dofu, aburage, ganmodoki, Koya-dofu, fried tofu, hiyayakko, sukiyaki, dengaku, miso, miso-shiru, shoyu), tokoroten (kanten, tengusa), tsukemono (pickles, incl. miso), umeboshi, wasabi (incl. shoyu), yasai (vegetables), yokan, and yonaki-soba. Note: Different types of yokan (yôkan, a paste made of azuki beans and sugar) include: mizu-yokan (soft azuki-bean jelly) and mushi-yokan (steamed yokan). Yokan-iro is a liver or rusty color.

Other subjects related to soy: Home cures (p. 66-67, for burns, apply the white of an egg or shoyu). Setsubun (p. 119, incl. mame-maki or throwing roasted soybeans). Brother mountains (p. 192, the most loved one, Fudo-iwa, was fed azuki or red beans but the unloved Gongen-yama was fed soya beans). Fox messengers (p. 207-08, aburage or fried tofu). Kuyo (p. 373-74, incl. hari-kuyo or mass for broken needles–but tofu is not mentioned). Azuki (p. 276-77). Red rice (sekihan, p. 303). Lunar calendar (p. 400, setsubun and bean throwing). Bamboo (p. 410, incl. bamboo shoots served with shoyu). Hi-no-kami (p. 474, incl. amazake). Sacred rice (p. 504, incl. setsubun and throwing roasted soybeans). Shoulder-chipped Jizo (p. 517, concerns the stone statue of Jozo at the Kiunji Temple, Tozaki-machi, Bunkyo-ku, Tokyo, and foxes and a tofu shop). Inari-san (p. 616-17, Inari-sushi and aburage). Address: Japan.

4689. Joya, Mock. 1960. Sukiyaki (Document part). In: Mock Joya. 1960. Things Japanese. Tokyo: Tokyo News Service, Ltd. [vi] + 782 + xliv p. See p. 316-17.

• ***Summary:*** Sukiyaki is mentioned throughout this book, on pages 281 (Cooking, Japanese), p. 293-94 (Konnyaku, incl. shirataki), p. 295-96 (Matsutake, a mushroom used in sukiyaki in the fall), and p. 325-26 (Tofu, a typical ingredient in sukiyaki).

The main entry for sukiyaki (p. 316) states: "Sukiyaki is a modern addition to the Japanese menu, and although it is only about 80 years old, it has become one of the most popular dishes of the people. Furthermore, sukiyaki has now become famous all over the world. Sukiyaki and tempura are pointed out by foreign visitors as the two outstanding dishes of Japan.

"There are a few controversies over the origin of the name, and the most commonly accepted theory is that

© Copyright Soyinfo Center 2014

formerly it was cooked on blades of plows, and therefore this way of cooking was called sukiyaki or plows, roasting. However, there is no proof that this story is authentic.

"Sukiyaki is the cooking of sliced beef, pork, chicken or duck meats over thick iron pans. Beef is the most common meat used for sukiyaki, but chicken and pork are equally good.

"In making sukiyaki, the first requirement is the flat thick iron pan, as when the pan is thin, it is impossible to make good sukiyaki. In the Imperial duck hunting party, small individual thick iron pans are used in cooking the duck meat. This pan is oblong in shape and extremely thick, and its top is almost level with only a slight depression to hold the meat. This pan reminds one of the shape of the Japanese plow, and there might be some relation between sukiyaki and plow (*suki*) as generally believed.

"There are different ways of cooking sukiyaki. The method used in cooking duck meat at the Imperial hunting parties may be the original one. Slices of duck meat are put into a mixture of *shoyu* and *mirin* (sweet sake), and then put on the heavy iron pan placed over a charcoal fire, when the pan becomes hot. The meat is almost instantly cooked, and it is turned over swiftly and eaten. It is extremely delicious. This method is believed to be the original way of cooking sukiyaki. The same method can be used in cooking the ordinary sukiyaki at home in the common sukiyaki pan with beef or pork.

"Then, the next method is to melt the fat of meat or butter on the hot pan, and then cook the meat on the pan. The cooked slices of meat are eaten with *shoyu* or salt. This method is quite new, but yet it is liked by many persons. This method, however, enables the people to eat enormous quantities of meat, as the thin slices will just melt in their mouths.

"The third method is the most common one. In the sukiyaki pan is first put a specially prepared sauce made with *shoyu, mirin, kombu* or *katsuo-bushi.* Then sliced Japanese onions, *tofu, shirataki* (kneaded devil's tongue and root), other vegetables, and sliced beef are added to be cooked. When they are cooked, the people sitting around eat from the pan. In autumn, *matsutake* and other mushrooms are also cooked together with meats. Beef, pork, duck meat, and other kinds of meat are cooked in the same manner.

"The last-mentioned is the most popular way of cooking sukiyaki, but originally perhaps, slices of meat were merely cooked on heated iron pans.

"There is no other new dish that has become so popular throughout the country within such a short period. At present, sukiyaki is a national dish, and particularly preferred by foreigners to other dishes of the country." Address: Japan.

4690. Joya, Mock. 1960. Inari-san (Document part). In: Mock Joya. 1960. Things Japanese. Tokyo: Tokyo News Service, Ltd. [vi] + 782 + xliv p. See p. 616-17.

• ***Summary:*** "Japan is a land of shrines, which are not only extremely numerous, but also play a big role in the people's life. Inari shrines, are, however, the most popular and numerous." Throughout Japan, in rural villages and in big cities, you can find Inari shrines, noted for the bright vermilion color in which their *torii* (gates) and buildings are painted. Inari was originally the guardian shrine of farmers. "But city dwellers too are all worshipers of Inari. They entertain such respect for Inari that they never call it plainly Inari, but always say *O-inari-san,* with the double honorifics."

"A *kitsune* or fox sculpted in stone or wood is always placed in front of them."

"To Inari shrines the people still bring various foods as offerings. Particularly *aburage* or fried tofu is believed to be the most favorite food of foxes of Inari shrines... Because of the reputed fondness of foxes for *aburage,* a kind of sushi wrapped up in *aburage* is commonly called *O-Inarisan.*

Note: This is the earliest English-language document seen (April 2013) that contains the words *Inari-san* or *O-Inarisan* in connection with *Inari-zushi.* Address: Japan.

4691. Joya, Mock. 1960. Setsubun (Document part). In: Mock Joya. 1960. Things Japanese. Tokyo: Tokyo News Service, Ltd. [vi] + 782 + xliv p. See p. 119-20.

• ***Summary:*** *Fuku wa uchi, Oni wa soto* (In with good luck, out with the demon) is loudly heard in all households throughout the country in the evening of *setsubun* (change of season) which falls in the first part of February. In shouting those words, the heads of households scatter roasted [soy] beans, to drive out the demon and all evil fortune. Setsubun is a time-honored festivity that is popularly observed by the people for insuring good luck for the year,

"Setsubun, as its name indicates, marks the end of the winter season under the old [lunar] calendar, and the season of spring begins on the following day, which is called risshun (birth of spring). So ordinarily it has no relation with the calendar year, but due to the popular idea that a new year begins with spring, setsubun gradually came to possess the same significance to the people as New Year's Eve. It is from this conception that the occasion came to be observed for wishing a good and happy new year.

"With this observance of setsubun it may be said that the people of Japan have three New Year's Eves–one under the solar calendar, another under the lunar calendar, and setsubun. The New Year's Eve under the lunar calendar is not observed now, although in rural districts New Year is still widely observed according to the lunar calendar. The setsubun is more popular and more widely observed than the New Year's Eve under the solar calendar. It is also more picturesque and interesting with the *mame-maki* or [soy] bean-throwing custom.

"This *setsubun* is also called *mame-maki* (bean throwing), *oni-harai* (devil chasing) and *tsuina* (evil

© Copyright Soyinfo Center 2014

dispersing). It is said to have developed from the old custom held on New Year's Eve, in which men dressed as devils were chased out to bring in a happy New Year.

"The custom of *oniharai* is at least more than 1,000 years old, as it is mentioned in *Tosa Nikki.* At first it was a court function, and later adopted by the common people. In the old days, *daizu* or soya beans were put in a wooden cereal measure [*masu*] and offered to Toshitoku-jin, a deity who is believed to have taught the people rice cultivation. Then they loudly called out, *'Oniwa soto fukuwa uchi'* (out with the devils, in with good luck) as it is still done today.

"It was during the Tokugawa [1600-1867] regime that *setsubun* particularly developed into a very elaborate and picturesque custom. Since olden days each household has held quite a merry party on the occasion. Moreover big temples hold public *setsubun* festivities on a considerably extensive scale.

"To draw the public to such festivities, they select *toshi-otoko* (the year's man) for throwing roasted beans for expelling the demon and inviting good luck for all present. For this honored duty, generally persons of reputation or local popularity are selected. Noted actors, wrestlers and other such public figures are given the honor. It is thought that the appointment as *toshi-otoko* will insure the person's good fortune during the year. Of late, actresses and other women are sometimes selected for throwing beans at such temple affairs. Over the heads of the crowding people gathered at such temples, the *toshi-otoko* scatter roasted beans with the merry shout of *fuku-wa-uchi, oni-wa-soto.* It is considered lucky to catch those thrown beans.

"In all households, it is customary not only to throw beans at the demon, but also to eat them. Each person has to eat as many beans as his or her age totals, and then one more. The extra bean stands for the New Year. The eating of the beans insures their good health and brings good fortune.

"Then again, those beans, as many as one's age and one more, are wrapped up in paper, and placed at some crossroad at night. If other persons step on those beans, all evils that accompanied the person during the past year would be driven off, it is believed.

"On *setsubun* many rites are still observed to dispel evil spirits and prevent calamities. First, as the most common feature of the day, a dried sardine head and a small branch of *hiiragi* (holly tree) are placed at the house entrance. The evil smell of the dried fish head is believed to drive away devils, and the thorny leaves of the *hiiragi* will stop any evil insect from entering the house.

"In many districts, tree branches are burned in the yard, as the crackling noise of the fire will drive away snakes and insects. The important feature of throwing roasted beans to drive away evils and devils and inviting good luck is said to have originated in cities, and later followed in rural districts." Address: Japan.

4692. Kajitani, Toshihiko. 1960. With friends, sukiyaki. Berkeley, California: [s.n]. 25 leaves. 31 cm. *

4693. Kihara, Yoshijiro; Takeuchi, Etsuko. 1960. [Organic acids in food products. I. Estimation of organic acids in food products by column chromatography]. *Eiyo to Shokuryo* (*J. of Japanese Society of Food and Nutrition*) 13(4):253-57. (Chem. Abst. 59:12077). [3 ref. Jap]*

• ***Summary:*** The organic acids in the food products such as soy sauce, soybean paste (miso), natto, pickle, vinegar, tea, coffee, bread etc. were estimated by the silica gel column chromatography. The kinds of the raw materials and the processing methods gave remarkable effects on the distribution of organic acids in each food product.

Soy sauces which were suspected to contain the acid-hydrolysate of soybean showed the presence of levulinic acid.

The miso varieties, fermented for a longer time, contained valeric [pentanoic], butyric and propionic acid, while only acetic acid was detected in the other products as volatile acid. (From journal@rchive).

4694. Leach, Bernard. 1960. A potter in Japan, 1952-1954. London: Faber and Faber Ltd. 246 p. Portrait. Illust. Index. 22 cm.

• ***Summary:*** The author is as fine a writer as he is a potter and artist. June 15, 1953 (p. 98). Near the great extinct volcano of Daisen on the borders of Tottori Province, the author and friends climbed up the old rough stone-paved pilgrims' way to the Kongoin temple. "There we were served the best meal I have eaten in Japan, vegetarian priests' food, over which infinite pains had been taken... mountain potatoes, crisp fried bean curd and some soft curd mixed into a paste with crushed sesame seed."

July 1, 1953 (p. 105): "A great feed of Continental sausages and Chinese riceballs stuffed with mincemeat and 'Funiu.' The last is a strange and fascinating decoction of fermented bean curd something like a smoky Camembert in taste and texture."

August 19, 1953 (p. 132). In Nagano, Japan, the author and friends visited the very large and famous temple of Zenkoji. They noted "all the commercialized signs of Buddhist decadence, as far from Sakya Muni [Shakyamuni, the Buddha] as Rome from Christ... the vulgarized business of popular religion is equally sickening, East or West.

After that they made their way to a soba shop and the author ordered Soba Gaki which was not on the menu. "This was a kind of porridge no longer in fashion... We ate it first with shoyu sauce and then with sweet adzuki beans."

Oct. 22, 1953 (p. 166). In Toyama the author and his friends had "lunch at a Buddhist vegetarian restaurant [probably serving *shojin ryôri*] which made me wish once again that I could share the meal and its setting with artist and craftsman friends in the West. The manner of serving

© Copyright Soyinfo Center 2014

surpassed all, it was the service of the heart. There is a saying that the Chinese eat with their stomachs and the Japanese with their eyes. The sheer beauty of each tray or dish of food, the quiet discretion. This represents a peak of culture and its home is in Japan."

Facing the title page is a photo of Bernard Leach. Address: Japan.

4695. Meals for Millions Foundation. 1960. Friendship Food for a Hungry World: Distribution summary. Los Angeles, California. 29 p. Undated. 28 cm.

• ***Summary:*** "The world-wide travels of the '3 cent meal' of Multi-Purpose Food, September 1946 to June, 1960 [13 years and 9 months]: 62 million meals [distributed] including 3,429 relief shipments to 127 countries through 210 cooperating agencies."

This 29 page typewritten booklet contains a complete listing of all the shipments of MPF over 14 years, from September 1946 through June 1960. However no dates are given for shipments to individual countries.

Contents: What is the Meals for Millions Foundation? Multi-Purpose Food (MPF): What it is, what it does. Index of countries. Distribution totals (Sept. 1946–June 1960). Acknowledgment.

The index of countries lists the "Country," the "American Agencies or Denominations Cooperating and/or Served," the "Number of Lbs." and the "Distributing and Recipient Agencies." Under each country is the number of shipments and the number of pounds shipped.

In the Index, the countries are listed alphabetically by region and within each region alphabetically by country, as follows (however in the body of the booklet they are listed alphabetically by country name). Countries receiving more than 50,000 lbs. (25 tons) will be noted: Africa: Angola, Belgian Congo (52,657 lb), Camerouns [Cameroon], Egypt, Eritrea, French Equatorial Africa, Ghana, Kenya, Liberia, Libya, Mauritius Is., Morocco, Mozambique, Nigeria, Republique du Congo [Congo-Brazzaville], Rhodesia, Sierra Leone, South Africa, Tanganyika, Tunisia, Uganda.

Asia–Near East: Iran, Iraq, Israel, Jordan, Lebanon (56,910 lb), Oman, Persian Gulf, Turkey.

Asia–Far East: Afghanistan, Borneo, Burma, Cambodia, Ceylon, China (358,957 lb; 1946-1951), Goa, Hong Kong (238,760 lb), India (1,394,707 lb; 742 shipments. Note: Indian MPF became available in 1956, and shipments from the USA were discontinued; 558,072 lb of Indian MPF were made; 410 shipments), Indonesia, Japan (535,250 lb), Korea (1,254,225 lb; 489 shipments), Laos, Macao, Malaya, Nepal, Okinawa (20,616 lb), Pakistan (83,292 lb), Philippines (122,103 lb), Taiwan (46,089), Thailand, Vietnam.

Asia–Pacific Islands: American Samoa, Caroline Islands, Fiji Islands, Guadalcanal, Hawaii, Marshall Islands, New Hebrides.

Europe: Austria (82,159 lb), Belgium, Czechoslovakia, England, Finland, France (124,996 lb), Germany (206,185 lb), Greece, Hungary, Italy, Luxemburg [Luxembourg], Netherlands, Poland, Rumania, Spain, Switzerland, Trieste, Yugoslavia.

Europe–North Atlantic Islands: Cape Verde Islands, Madeira Island.

Latin and Central America: British Honduras, Canal Zone, Costa Rica, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama.

South America: Bolivia, Brazil (198,581 lb), Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, Venezuela.

Caribbean Area: Cuba, French West Indies, Haiti (110,231 lb), Jamaica, Puerto Rico, St. Lucia, Virgin Islands.

North America: Alaska and Aleutian Islands, Canada (51,836 lb), United States (146,635 lb; American Indian relief, Migrant relief, School lunch and institutional projects {Clifton's Golden Rule Cafeteria donated 12,500 lbs}, Miscellaneous).

Additional countries reached through overseas parcels only: Argentina, Cyprus, Denmark, Malta, New Zealand, Norway, Nyasaland, Pitcairn Island, Saudi Arabia, Scotland, Sudan, Sweden, Trinidad.

At the end of all the countries (p. 28) is a box titled "Total Relief Distribution": 3,249 shipments [or perhaps 3,429], 6,412,256 pounds [3,206 tons, or 229 tons a year average for 14 years], 51,298,048 "meals" of MPF. On the next page are the details of the "Distribution totals."

There is also a special acknowledgment at the back to the U.S. Navy and the U.S. Naval Air Reserves "for their cooperation in transporting approximately 200,000 lbs. of M.P.F. during 1959-1960. Operation Handclasp, a people-to-people project of the U.S. Navy, originating in San Diego, has carried shipments to the Far East and to South America. Planes of the U.S. Naval Air Reserves have carried emergency supplies of MPF to disaster areas, such as flood victims in Nagoya, Japan, and to earthquake victims in Agadir, Morocco."

Note: The countries receiving the most MPF by weight are (in descending order of amount) are: India, Korea, Japan, China, Germany, France, Philippines, and Haiti.

A photo shows the cover of the 29-page summary document. This photo and photocopy of the document were sent to Soyinfo Center by Chris Dodson of Freedom from Hunger Foundation, Davis, California (Nov. 2010). Address: Los Angeles, California.

• ***Summary:*** Contains many recipes plus black-and-white photos, plus 4 color photos.

4702. Tatsuno Shoyu Kyodo Kumiai. 1960. Tatsuno shôyu no ayumi [Progress / history of Tatsuno Shoyu]. Tatsuno city. 8 p. 11 x 18 cm. [Jap; eng+]
• ***Summary:*** Name of company with diacritics is: Tatsuno Shôyu Kyôdo Kumiai. It is written that in 1587 shoyu making started in Tatsuno. They made a little bit of sake and shoyu there and in 1590 the number of manufacturers increased. In 1595 among sake and shoyu makers, sake production became very strong and popular. Around 1666 one shoyu maker invented a unique light-color shoyu and began selling it. They received an unexpected positive response from the people who used it, so they were encouraged, improved the product, and established the base of today's Tatsuno Usukuchi Shoyu.

During the period 1714-1740, with the rising popularity of sake production, many new sake makers opened new shops. Some 100 shops made sake on a scale of 20 to 300

© Copyright Soyinfo Center 2014

koku (1 koku = 180 liters or 47.6 gallons) per year. But for some reason, later, sake gradually lost its popularity and the shoyu industry became more popular. The climate of this place was suited for making shoyu. They had the advantages of easy access to good quality wheat, soybeans, and salt. Also there was a river for transportation of their products to Kyoto and Osaka. These were the reasons that Tatsuno was started.

In 1672 Wakizaka Yasumasa-ko of Shinshu Iida became Lord of that place and grew interested in making shoyu. He thought it was a promising industry and encouraged it. It is told in 1741, that as a result of that, exports of shoyu to Kyoto and Osaka grew to over several thousand kegs (*taru*) per year.

In 1809 the idea of adding amazake to shoyu (*Tatsuno usukuchi shoyu*) was invented. The new product became popular among a wide range of people. At about this same time they invented the idea of using the liquid from cooking soybeans when they age (*shikomu*) shoyu.

In 1830 records show that there were 35 shoyu producers in Tatsuno; they made about 20,000 *koku* (1 koku = 47.6 gallons or 180 liters; so 952,000 gallons or 3,600,000 liters) a year. Of this they exported 49,400 *taru* (kegs) to the Kyoto and Osaka areas. Note: 1 taru = 3 *to* and 6 sho = 3.6 *to* = 17.1 gallons or 64.8 liters. So 49,400 kegs would be 844,740 gallons or 3,201,120 liters, i.e. they exported about 88.7% of their shoyu to Osaka and Kyoto.

In 1848 Lord Wakizaka became a very important position of the *Kyoto Shoshi Dai* and further encouraged shoyu production. He gave low-interest loans, helped expand the market, and gave the name *oshiire-dokoro* to shoyu manufacturers. Therefore the name of Tatsuno usukuchi shoyu became more widely known.

During 1869-70 the number of companies making Tatsuno shoyu grew very rapidly, and with the intensive competition, the quality of the product fell drastically as output increased. Many companies went bankrupt. In June 1871 (Meiji 4) the Tatsuno Han Seisankyoku (Tatsuno feudal domain production office) was established to try to sell Tatsuno shoyu nationwide and treat sale of this shoyu as the work of the Han. But the next year the Han system was changed, largely ended–unfortunately for Tatsuno. At this difficult time, one shoyu maker named Shôzo Yokoyama (he was the first head of the Tatsuno shoyu union) became worried about the future of their industry, and met with other local shoyu makers to discuss this problem. In May 1897 (Meiji 9) they established regulations and worked hard to improve their business. As a result they laid the groundwork for today's Tatsuno usukuchi shoyu, which has become the most famous type of usukuchi shoyu. By 1882-83 the Tatsuno Shoyu Association had 65 members who produced over 200,000 koku/year (9,520,000 gallons or 36 million liters/year). Tatsuno proudly became one of Japan's top 3 shoyu manufacturing places.

All went well until 1937, when a war unexpectedly broke out between Japan and China. Things got worse during World War II, and from 1945 the lack of raw materials and workers caused major declines in both quality and quantity. Production dropped to 50,000 koku/year of regular shoyu; a decade of government economic controls (from late 1941 until March 1950) prohibited the production of usukuchi shoyu.

In Dec. 1949 the Tatsuno Shoyu Association was re-established with about 40 members, and in July 1950 the regulations concerning production and distribution of miso and shoyu were cancelled. The members had a lot of ideas and energy to rebuild their industry making Tatsuno usukuchi (light-colored) shoyu. Production and quality increased steadily, soon reaching 250,000 koku/year. In April 1952 the trade Association established the Tatsuno Shoyu Technical Training Center, where people can learn how to make better shoyu. In 1953 they cooperatively built a place to burn amino acid presscake. They found a way to reuse the salt with good results, so the government supported the project with one million yen.

Since there are few documents available to study the history of Tatsuno shoyu, in 1959 the members worked to collect this information and published it in October 1959. Since then, more interesting materials have been found, and the union is planning to publish a second volume. Address: Tatsuno city, Japan.

• ***Summary:*** "A non-exclusive, irrevocable, royalty-free license in the invention herein described, for all governmental purposes, throughout the world, with the power to grant sublicenses for such purposes, is hereby granted to the Government of the United States of America."

The main innovations in this patent are: (1) the use of dehulled soybean grits (from the soybean variety Hawkeye) instead of whole soybeans. (2) The optional addition of pure-culture *Saccharomyces rouxii* (NRRL Y-2547 and Y-2548). Address: NRRL, Peoria, Illinois.

4708. Hayashi, Shizuka. 1961. A visit to two Choshi shoyu plants. *Soybean Digest.* Jan. p. 18.
• ***Summary:*** Each year Japan produces about 1,200,000 metric tons (tonnes) of shoyu (soy sauce), using approximately 150,000 tonnes of soybean meal and 23,900 tonnes of whole soybeans, or the equivalent of 195,000 tonnes of whole soybeans.

Before World War II, shoyu manufacturers in Japan used only whole soybeans, and no soybean meal. The use of meal has been encouraged by the Japanese government under the allocation system. Japan's shoyu industry is the largest consumer of soybean meal for edible purposes, taking about 35% of the meal produced by the processing mills.

There are seven large manufacturers among some 5,000 shoyu makers in Japan. The shoyu production of these larger factories constitutes about 30% of Japan's total shoyu production. The author recently visited the two largest plants in Choshi City: "the Yamasa Shoyu Co., and the Choshi Shoyu Factory." The Choshi factory is the only shoyu company in Japan with oil processing equipment. This equipment is used to crush approximately 15,000 tons of soybeans annually. The meal is used exclusively for making shoyu but is insufficient to take care of the company's needs.

"According to the report of the six-member Japanese shoyu team that recently visited the United States the amino acid soy sauce made in the United States is altogether different from the shoyu produced in Japan."

"With a little promotion it will not take long before a bottle of naturally brewed shoyu will be found on the table of every family on the globe."

A photo shows David Harlow of the American Soybean Assoc. in the factory of the Yamasa Shoyu Co. with the two Hamaguchi brothers who own the plant. Y. Hamaguchi was a member of the Japanese shoyu team that recently visited the USA. • ***Summary:*** *Pichia miso* is a highly osmophilic yeast (one that thrives in high osmotic pressure); it is not a type of miso, although it was isolated from miso (soybean paste). A polyalcohol (also known as a polyol, sugar alcohol, or polyhydric alcohol) is a hydrogenated form of carbohydrate, whose carbonyl group (aldehyde or ketone, reducing sugar) has been reduced to a primary or secondary hydroxyl group (hence the alcohol). Address: Noda Inst. for Scientific Research, Noda City, Chiba-ken, Japan.

4727. *SoyaScan Notes.* 1961. Official figures for per capita annual consumption of shoyu in Japan (1952-1961) (Overview). Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1952–12.9 kg/year = 35.3 gm/day = 5.934 sho/year.
1953–13.1 kg/year = 35.8 gm/day = 6.026 sho/year.
1954–14.1 kg/year = 38.5 gm/day = 6.486 sho/year.
1955–14.3 kg/year = 39.1 gm/day = 6.578 sho/year.
1956–14.6 kg/year = 39.9 gm/day = 6.716 sho/year.
1957–13.7 kg/year = 37.5 gm/day = 6.302 sho/year.
1958–13.4 kg/year = 36.8 gm/day = 6.164 sho/year.
1959–13.7 kg/year = 37.4 gm/day = 6.302 sho/year.
1960–13.6 kg/year = 37.3 gm/day = 6.256 sho/year.
1961–13.0 kg/year = 35.6 gm/day = 5.980 sho/year.
Note: The peak year during this early postwar period was 1956. A *sho* is the traditional unit for measuring capacity / volume. 1 *sho* = 1.800 liters = 1.903 quarts = 0.476 gallons.

• ***Summary:*** "Soybeans have become known as the 'miracle' crop of American agriculture. The record seems to support

© Copyright Soyinfo Center 2014

the title.

In the past 20 years the U.S. soybean crop has grown from 77 million bushels to over 500 million bushels today, and the farm value has increased from less than $70 million to around $1 billion today.

But anyone "who looks for a 'miracle' to explain the fantastic story of the soybean industry is in for a disappointment. Rather behind the success story in the 'work' story..."

For example, at USDA's Northern Regional Laboratory in Peoria, Illinois, "a new process has been developed for preparing two of Japan's most important foods–miso and tofu. Both use soybeans."

Congressmen "ought to support substantial increases in spending for utilization research." Address: President, Chemurgic Council.

4732. Saito, Masataka. 1961. Studies on the influence of low-temperature on soybean plants. I. Effects of day or night temperature on the growth and ripening of plants. *Hokkaido Nogyo Shikenjo Iho* (*Hokkaido National Agricultural Experiment Station, Research Bulletin*) No. 76. p. 9-14. March. [15 ref. Jap; eng]

• ***Summary:*** Two late and one early soybean varieties were used, grown in soil by pot culture. Two temperature treatments were made, viz. at day time (8:00 a.m. to 5:00 p.m.) and at night time (5:00 p.m. to 8:00 a.m.) respectively.

"High temperature treatment was administered in the green house and low temperature treatment was done under natural air conditions. No photoperiodical treatment was conducted.

"The results of this experiment were as follows: (1) The growth of soybean plants differed with varieties used in this experiment. Namely, in the early variety the growth was more accelerated by high day-temperature than by high night-temperature.

"But in the late varieties, plant growth was hastened by high night-temperature.

"The plants grown under these conditions seemed to show a poor growth, specifically, development of branches, number of flowers and total plant weight decreased.

"It seemed that the difference between early and late varieties were due to physiological mechanism of response to temperature.

"(2) High night-temperature increased mean ovule number of pods in 3-4 seeded pod varieties.

"(3) The oil content of seeds seemed to increase under high day-temperature. On the other hand protein content of seeds increased under high night-temperature conditions."

4733. Smith, Allan K.; Nash, A.; Wilson, L.I. 1961. Water absorption of soybeans. *J. of the American Oil Chemists' Society* 38(3):120-23. March. [7 ref]

• ***Summary:*** This study compares the rate of water absorption of U.S. and Japanese soybeans at 10º and 25ºC and at initial moisture levels ranging from 7.5 to 14%. The rate that soybeans absorb water is controlled by their seed coat; a pinhole or a crack in this coat greatly increases the absorption rate. A low initial moisture and the presence of hard beans reduces the rate of water absorption. U.S. soybeans usually have lower moisture and contain more hard beans than do Japanese soybeans.

Hard beans are defined as those that do not absorb enough water in 16 hours to soften normally when cooked in steam. They also observed that small beans are smaller and drier than soybeans that absorb water normally. The development of hardness is partly the result of hot dry weather during ripening. Address: NRRL, Peoria, Illinois.

4734. Hayashi, Shizuka. 1961. Favor U.S. soybeans for shoyu. *Soybean Digest.* April. p. 22.

• ***Summary:*** Gives the results of laboratory tests, conducted by the Soy Sauce Research Institute, comparing Japanese-grown soybeans (No. 2 grade Hokkaido Takachi small size variety) with U.S. soybeans (Illinois No. 2 yellow). The U.S. soybeans scored higher in the amount of soy sauce produced, and the taste and nitrogen content of that soy sauce.

An analysis of a sample of U.S. soybeans shows: Perfect beans 85.88%. Broken beans 11.81%. Damaged beans 0.84%. Foreign material 0.69%. Soybean hulls 0.61%. Morning glory seeds 0.15%.

The lab tests must be confirmed by large-scale experiments on a commercial basis before final conclusions can be made. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

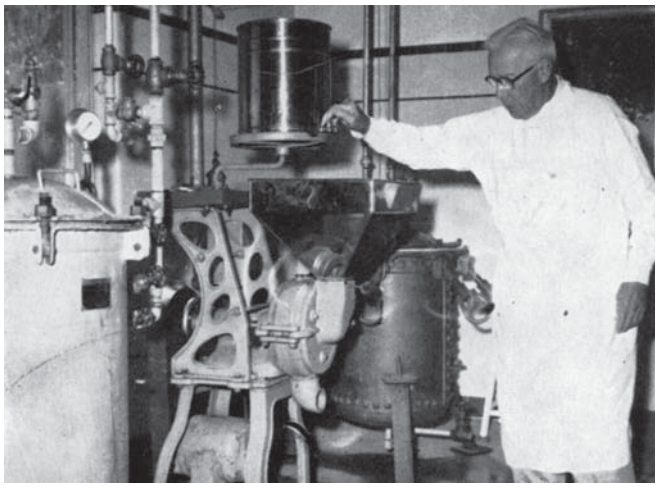
Address: Aichi-ken Shokuhin Kogyo Shikenjo.

4736. Moore, Raymond S. 1961. China Doctor: The life story of Harry Willis Miller. New York, NY: Harper & Brothers. xiv + 215 p. Illust. (8 pages of photos). Index. 21 cm. 2nd edition, 1969. Pacific Press, Mountain View, California.

• ***Summary:*** A key but sometimes inaccurate source of biographical information about this truly Great Man. Contains many excellent photos of Dr. Miller, including an especially good portrait facing page 80.

Contents: Foreword by Hollington K. Tong. Preface. Map: The Far East. The opium cure. Hallway to service. The medical buff. Young surgeon at work. Slow boat to China.

© Copyright Soyinfo Center 2014



From mufti to mao tze and queue. The penniless VIP. Strange horizons. Pigtail honeymoon. Wife hunt. Picture section. Some close calls. A key decision. Operating on the Siamese elephant. Conquering new fields. Return to the Orient. No recipes in China. High finance. Facing the medical boards. A doctor's choice. Travel by presumption. To bow or not to bow. Kidnapping the generalissimo. "Mayor" Miller. An ounce of prevention. Shanghai again. China's greatest honor. Benghazi brink.

The rear cover of the book describes it as follows: "What happens when a man gives himself and his talents to the service of God? Here are a few of the things that Dr. Harry Willis Miller has done and is still doing! At 23 gave up a promising medical career and quarter-million dollar inheritance in America. Went to China as a medical missionary and lived among the poor and sick. Immediately began building the first of 15 hospitals throughout China. With inventive genius performed daring operations and made new discoveries in preventive medicine. Was responsible for many cures of the dread opium 'sickness,' including the cure of the famed 'Young Marshal' Chang. Became perhaps the most widely practiced surgeon in the world. Invented and developed soybean milk, which is responsible today for saving thousands of lives in undernourished areas of the world. Had many dramatic encounters with bandits, wars, famines. Was so well-known and respected that during World War II the Japanese invaders permitted Dr. Miller to give sanctuary to Chinese soldiers in the hospital compound. Returned to the U.S. for a time. Was consulting physician to 3 U.S. presidents and personal physician to national figures, senators, ambassadors, etc. Was awarded the coveted Blue Star of China by Generalissimo Chiang Kai-shek. At 81 is still healing and caring for the people of the Far East."

An ad for the book in *Soybean Digest* (Nov. 1935, p. 35) begins: "The incredible biography of the 'Schweitzer' of the Orient."

Pages 180-89 describe Dr. Miller's work with soy milk, Soyalac and Soyagen, and other soy foods. In the Shanghai Sanitarium kitchen he learned how to improve the flavor and digestibility of soy milk by running steam directly into the milk. From the Philippine Refining Co., which transformed bad-smelling copra into good-smelling coconut oil, he learned that steam distillation was the key to the transformation. From a Filipino company that refined stale and rancid butter into a product that tasted as fresh as new, he learned the secret of flash pasteurization–which effectively killed bacteria. Back in China, Dr. Miller, with his older son, Harry Willis Miller, Jr., worked to apply these new discoveries to soy milk. They worked! He expanded his experiments with infants and children, and in 1936 his results were published in the *Chinese Medical Journal.*

Photos (p. 81-89, unnumbered) show: (1) An excellent full-page portrait of Dr. Miller at age 81. (2) Harry and Maude Miller in China, wearing the Chinese dress they adopted after their arrival in 1903. Maude's tragic death two years later–caused by sprue, a vitamin deficiency disease–gave added personal meaning to Dr. Miller's nutritional research. (3) A group portrait showing a meeting of Adventist Missionaries at Shanghai, China, in 1907.

(4) Harry and Marie Iverson Miller at the time of their marriage in 1908. A trained nurse, she served with him through 42 years of missionary activity, and helped rear their 4 children. (5) Shanghai Sanitarium, opened 1 Jan. 1928, the first of 15 hospitals to be established in China under the leadership of Dr. Miller, who also founded numerous smaller clinics. (6) Members of the Shanghai Sanitarium staff in the mid-1930s, standing in front of a one-engine plane, as they see him off for a visit to outlying places.

(7) Dr. Miller and Marshall Chang Hsüeh-liang at Hankow airport in 1935, two years after Dr. Miller had cured the young Marshall's opium addiction. (8) Dr. Miller carried out more than 18,000 operations. Here he performs a thyroidectomy at one of his frequent visits to hospitals in Manila, Philippines. (9) Wuhan Sanitarium and Hospital at Wuchang, one of the medical units established through the generosity of the Young Marshal. Twenty thousand refugees moved into the Sanitarium compound when Hankow capitulated to the Japanese in 1938.

(10) The ruins of the Wuchang city dispensary, destroyed by Japanese bombs in 1938. (11) Dr. Miller examines a soybean plant grown on his farm at Mt. Vernon, Ohio. (12) Dr. Miller demonstrates his small-scale soymilk processing machine, which can be operated by one person. "The goal of Japan's Ministry of Health is to install one of these in each of the thirty thousand village tofu (soy cheese) factories in Japan."

(13) A baby and nurse with a large can of Soyalac in Japan. (14) A soymilk booth in Hong Kong, where more soymilk is sold than any kind of soft drink. The bottles in wooden cases are stacked four high. (15) A baby, little Mohammed Ali, a Bedouin child suffering from malnutrition bordering on starvation, at the Benghazi, Libya, hospital. In

1956 Dr. Miller nursed him back to health. He soon grew strong and healthy and began to take a lively interest in the world around him.

(16) "Generalissimo Chiang Kai-shek greets Mrs. Mary Greer Miller while Madame Chiang congratulates Dr. Miller following the ceremonies held March 26, 1956, in which Miller received the Blue Star of China, that country's highest award, similar to the Congressional Medal of Honor in the United States." Address: Vice President, College of Medical Evangelists, Loma Linda, California.

4737. Park, Roy H. 1961. Food–Key to a travel kingdom. *Rotarian* (*The*) 97:31-33. April. *
• ***Summary:*** In Japan, teriyaki sauce contains soy sauce as the marinade's major ingredient. Sashimi, raw fillet of fish (such as tuna, sea bass), is dipped in hot mustard and soy sauce. The ingredients in the *bento* (Japanese box lunch) are also seasoned with soy sauce and sugar.

A photo shows people seated around a low table at a *ryokan* (traditional inn) in Japan as a "maid prepares tempting sukiyaki" right in their room. Address: Editor-in-Chief, Duncan Hines Inst., Inc. Rotarian, Ithaca, New York.

4738. Yoshii, Hisao; Kawakishi, Shunro; Hirano, Susumu. 1961. Mamemiso, tamari jôzô ni okeru yûki-san. II. Mamemiso jôzô-chû no yûki-san no ugoki [Organic acids formed in the process of brewing soybean miso and tamari. II. Changes in amounts of organic acids during miso brewing]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 35(4):351-54. April. [5 ref. Jap] Address: Aichi-ken Shokuhin Kogyo Shikenjo (Aichi Inst. of Food Technology).

4739. Onishi, Hiroshi. 1961. Studies on osmophilic yeasts. XII. Characteristic aspects on the assimilation and fermentation of sugars by osmophilic yeasts in the environment of a high concentration of sodium chloride. *Agricultural and Biological Chemistry* 25(5):341-49. May. [14 ref. Eng]
• ***Summary:*** "Sugar assimilability and fermentability are the most important criteria in the taxonomy of yeasts." The researchers found that "these properties of the salt-tolerant [halophilic] yeasts can be drastically altered by changing the concentration of NaCl [common salt] in the medium,..."

Assimilation of galactose and maltose by *Saccharomyces rouxii,* a typical salt tolerant yeast that plays an "important role in soy-brewing" [soy sauce fermentation], was negligible or extremely poor in a medium containing 18% NaCl, even though the assimilation was vigorous in the ordinary (NaCl-free) medium. Address: Noda Inst. for Scientific Research, Noda City, Chiba-ken, Japan.

4740. Report on the progress of studies on "the manufacture of tofu from U.S. soybeans." 1961. Food Research Institute, Japan. 3 p. May 17. Typed, without signature (carbon copy). [2 ref]
• ***Summary:*** Stamped at the top right corner: "Japanese American Soybean Institute." Typed on the line below that: "R-568. June 7, 1961. Under Contract (1960–4)." Contents: 1. Choice of U.S. soybean varieties which are suited for production of tofu (Hawkeye and Lee are suitable; Harosoy and Jackson are not). 2. Effects of the changes supposed to take place during transit and storage of soybeans on their quality as a raw material for tofu (considerable variation in the pH of the milk was noticed, depending on the soybean variety and whey the beans were old crop or new crop). 3. Suitability of high-protein, high-fat soybeans as a raw material for tofu (study is ongoing). 4. Improvement of tofu production method for U.S. soybeans (a special coagulant was used; dehulled beans gave whiter tofu). 5. Popularization of the method for making Soft Tofu. Address: Japan.

4741. Strayer, George M. 1961. Editor's desk: Japan will grow more livestock. *Soybean Digest.* May. p. 4. Written in Tokyo, Japan, April 24.
• ***Summary:*** "Written in Tokyo, Japan, April 24." Address: Tokyo, Japan.

4742. Hardin, Lowell S.; Hesser, Leon F. 1961. Soybean market development activities in Japan. *Soybean Digest.* June. p. 28, 30.
• ***Summary:*** Contents: Introduction. Program started in 1956. Favorable forces. U.S. producers in favorable position. Program is effective. Government policy important.

Note: "This is abstracted from a more complete evaluation of market development activities in Japan, a joint Purdue University-FAS study to be published in June as Purdue Experiment Station Bulletin 719. This was based on studies made in Japan in the summer of 1960 and reflects conditions which existed then."

On page 30 is this sidebar:

"Several developments have taken place which alter the outlook in Japan since Drs. Hardin and Hesser made their study there last summer. Among them are the impending end of automatic allocation in Japan, the higher U.S. market and support prices for soybeans, and the resumption of trading between China and Japan.–Editor."

Tables show: (1) Domestic production and imports of soybeans and soybean meal, Japan, 1934-36 average and 1953-59. In 1934-36, average domestic production of soybeans in Japan was 303,000 metric tons (tonnes) per year. Imports of soybeans was 700,000 metric tons. Imports of soybean meal is not listed. Domestic production of soybeans rose from 429,000 tonnes in 1953 to a peak of 507,000 metric tons in 1955, falling to 426,000 tonnes in 1959. Imports of soybeans rose steadily from 541,000 tonnes in 1953 to 1,073,000 tonnes in 1959. Imports of soybean meal fluctuated greatly from year to year from a high of 42,500

tonnes in 1953 to a low of 500 tonnes in 1956. Source: Food Agency Statistics, Ministry of Agriculture and Forestry.

(2) Soybean imports by country of origin, Japan, 1953-59. Total soybean imports grew from 541,000 tonnes in 1953 to 1,100,000 tonnes in 1959. Imports from the USA grew from 494,000 tonnes in 1953 to 1,000 tonnes in 1959. Imports from the Mainland China grew from 22,000 tonnes in 1953 to a local peak of 205,000 tonnes in 1957, then fell to 0 tonnes in 1959. Imports from the Brazil grew from 24,000 tonnes in 1953 to 35,000 tonnes in 1959. Imports from other countries were negligible in all years except for 30,000 tonnes in 1959. Source: Finance Ministry's Monthly Trade Report.

(3) Soybean consumption and imports, Japan, 1953-59. consumption as whole soybeans increased from 568,000 tonnes to 735 tonnes. Crushed for extraction grew from 380,000 tonnes to 775,000 tonnes. Total consumption of soybeans grew from 948,000 tonnes in 1953 to 1,510,000 tonnes in 1959. Total per capita consumption of soybeans in Japan grew from 23.8 lb in 1953 to 35.8 lb in 1959. Imports from the USA fell from 91% in 1953 to a local low of 72% in 1956, then rose to 94% in 1959.

A photo shows Hardin and Hesser working on this study at desks in their office in Tokyo. Address: Agricultural Economists, Purdue Univ., Lafayette, Indiana.

4743. Hayashi, Shizuka. 1961. Soybeans in the nutrition of Japan. *Soybean Digest.* June. p. 31.

• ***Summary:*** "Japan, with a population of 95 million people on a land area smaller than that of the state of California, is confronted with the problem of how best to feed its population. With the population increasing at a rate of 1 million annually, the problem perhaps will become permanent. According to 1959 government statistics, the following amounts of soybeans (in tonnes or metric tons) were used to produce oil and soyfoods in Japan: Crushed for oil 840,583, tofu 318,150, shoyu (soysauce) 217,686, miso 173,933, frozen tofu 40,000, natto 35,000, kinako [roasted soy flour] 13,000.

Japan uses 420,000 tonnes of soybeans that are grown domestically and 1 million tonnes imported from the U.S. Of the 26.7 gm of fats and oils available to each Japanese daily, 7.6 gm (28%) is supplied by soybeans. Of the 67.7 gm of protein available to each Japanese daily, soybeans provide 10.6 gm (15.7%).

"Meat is not only scarce but the price is too high to meet the daily needs of average people. Annual per capita meat consumption in the United States is 237 pounds while in Japan it is only 2.3 pounds." "The Japanese intake of fats and oils is less than 10 pounds per capita in comparison with about 50 pounds in western countries."

"The Japanese live too much on carbohydrate foods. Rice eating must be minimized and more protein foods eaten. The obvious conclusion is the increased consumption of soybeans."

Note: This is the 2nd earliest document seen (Jan. 2012) that contains industry or market statistics for natto by geographical region. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building., No. 1-chome Yurakucho, Chiyoda-ku, Tokyo, Japan.

4744. Lu, Ying-Chuan. 1961. [The correlations between the agronomic characters and the ecotypes of soybean varieties]. *Chung-hua Nung Hsueh Hui Pao* (*J. of the Agricultural Association of China, Taipei*) No. 34. p. 23-37. June. New Series. [20 ref. Chi; eng]

• ***Summary:*** "About 150 soybean varieties collected from China, USA, Japan, and Ryukyus (Okinawa) were tested in the planting season experiments, from July 1955 to December 1956 at one month interval.

"According to the average days from sowing to flowering and that from flowering to maturity, the tested varieties were classified into eight ecotypes." Address: Professor, Dep. of Agronomy, Taiwan Provincial College of Agriculture, Formosa.

4745. Meals for Millions. 1961. How you can help expand soybean markets: As protein food for people (Ad). *Soybean Digest.* June. p. 59.

• ***Summary:*** A half-page vertical ad. "1. Take out an annual membership in non-profit Meals for Millions Foundation ($10–$25–$100).

© Copyright Soyinfo Center 2014

"2. Make a personal or group contribution (in any amount) through your church, club, community group to provide '3¢ meals' of soy-based Multi-Purpose Food (MPF) to missions, hospitals, schools, orphanages.

"In the past 15 years Meals for Millions has introduced 63 million '3¢ meals' of MPF into 127 countries through more than 200 voluntary agencies for use under observation of medical, health and welfare authorities.

"Meals for Millions is unendowed, unsubsidized–maintained by voluntary contributions–by 'penny power and penny wisdom.'

"The Example of MPM has stimulated its Production in India, Japan, Brazil, Mexico in an international do-it-yourself program whereby developing countries are shown how to convert their own oilseed meals into domestic versions of MPF.

"Meals for Millions has received 5 Freedoms Foundation awards 'for outstanding achievement in bringing about a better understanding of the American way of life.'"

Note: Founded in 1949, the Freedoms Foundation is a national, non-profit, non-partisan, non-sectarian educational organization. The Foundation is located on an 85-acre campus adjacent to the Valley Forge National Historical Park in Pennsylvania and sits on ground that was once part of General Washington's encampment.

"An Eating-Is-Believing Program. A People-to-People Program. Malnutrition is preventable. Help prevent it with '20th Century Loaves and Fishes.' Soy-based MPF.

"MPF was developed at the California Institute of Technology. A 2-oz '3¢ meal' provides protein, vitamins, minerals in amounts approximately equal to those in ¼-pound beef; a glass of milk; a dish of peas and a potato."

"(Contributions deductible for income tax purposes)." Address: 215 West 7th St., Los Angeles 14, California.

1958	391,000	951,000	769,000	571,000	91
1959	426,000	1,073,000	775,000	735,000	94

[a] Computed as residual from total supply minus crushings minus carryover.
[b] Estimates.
Source: Finance Ministry's Monthly Trade Report; Domestic Production, by Japanese Ministry of Agriculture Statistics.

1951, 95% of imports were coming from the USA.

Table 2 shows total and per capita consumption (in kg and lb) of miso, shoyu, and edible oils (all types) in Japan, 1934-1936 average and 1950-1959. In 1957, compared with the 1934-36 average, per capita consumption of miso is 19.62 lb (down 14.4%), shoyu is 30.20 lb (down 0.8%), and edible oils is 7.05 lb (up 350% from 1.98 lb).

"In Japan, soybeans are considered a food grain like rice and wheat and, in fact, serve as an important source of protein supply in the Japanese diet. Total annual consumption exceeds 1,500,000 metric tons; but as production in Japan is only 400,000 tons, more than a million tons of soybeans are imported each year, mostly from the United States. Of all the agricultural exports of the United States to Japan, soybeans today occupy the most important position, amounting to nearly 100 million dollars per year."

Part III: Japan. Introduction. Production of miso in Japan. Soy sauce in Japan. Trends in soy sauce production. Part IV: With Raymond E. Culbertson. Korea. Introduction. Breeding work. Soybean varieties. Climatic relations. Soils of Korea. Topography. Land use. Cultural practices. Marketing. Soybeans as foodstuff. Soy sauce. Acknowledgment.

Page 19 states: "The China National Government has taken an active interest in soybean milk for use by its army. Mr. Willis Miller, with offices and business connections with the Henningsen Produce Company in the Dollar Building (7th Floor) at 51 Canton Road, Shanghai, had just completed, at the time of my visit, the building of a soybean milk plant for the Chinese Government. The process is patterned after that of the International Nutritional Laboratories at Mt. Vernon, Ohio, for making a powdered or spray-dried milk. Mr. Miller also was supervising the installation of a vegetable canning plant for the same purpose."

The text of this bulletin was previously published, serially, with slight revisions, in *Soybean Digest,* from Feb. to June 1949. Address: Northern Utilization Research and Development Div., Peoria, Illinois.

4754. *Soybean Digest.* 1961. Soybeans go on free list in Japan. July. p. 25.
• ***Summary:*** "Japan: Imported soybeans went on the free list (automatic allocation) in Japan July 1 as originally planned, The dropping of import restrictions on soybeans was confirmed by the Japanese cabinet in extraordinary session June 8.

© Copyright Soyinfo Center 2014

"Trading in U.S. soybeans on all Japanese grain exchanges will follow, with trading to be initiated Sept. 1. Detailed rules for trading in U.S. beans have been adopted by all Japanese grain exchanges, which up to now have traded only in domestic soybeans.

"The tariff on imported soybeans will remain at the current 10% rate until an extraordinary meeting of the Diet in early August, when a 13% tariff is expected to be approved.

"In the meantime, the Japanese Agriculture-Forestry Ministry is taking steps to protect Japanese soybean growers following the freeing of imports through increasing the subsidy and the price support program. Japan produced only 14.5 million bushels of soybeans in 1960 as compared to 41 million bushels imported. Observers have been predicting a rapid expansion in imports following automatic allocation. According to the Japanese economic planning board, Japan will need to import 75 million bushels by 1965 and 98 million bushels by 1970."

"Mainland China: In view of the export importance of soybeans and the unsatisfactory internal supply of cooking oils and protein foods, Communist China probably will strive to maintain soybean acreage at around the 4-million-acre level this year, according to Foreign Agricultural Service, USDA.

"Over the long run, and in the circumstances in which Mainland China finds itself, pressures for the expansion of grain acreage will impose relatively inflexible limits on the possibilities for expansion of oilseed acreage, including soybeans.

"Exports of soybeans from Communist China, which reached a postwar high of about 59 million bushels in 1959, declined sharply in 1960, reflecting reduced movement to the Soviet Bloc. In view of the serious food shortage in China the total level of foodstuff exports in 1961 undoubtedly will be cut back and soybeans likely will share in this downward trend."

4755. Yamamoto, Kishiro. 1961. Studies on the mechanism of mold protease production. III. Activating factors of inactive protease in cell-free extracts of *Aspergillus sojae* KS. *Agricultural and Biological Chemistry* 25(7):519-26. July. [16 ref. Eng]
• ***Summary:*** Several kinds of metals were found to be involved in activation. "The velocity of the activation was maximal around pH 10 as well as around pH 5. It was proved that a kinase (enzyme) capable of activating the inactive protease in alkaline solutions does exist in the cell-free extract." Address: Noda Inst. for Scientific Research, Noda, Japan.

4756. Strayer, George M. 1961. Re: Research on tofu being conducted in Japan by Mr. Tokuji Watanabe. Letter to Dr. A.K. Smith, Northern Utilization Research and Development Division, Agricultural Research Service, USDA, Peoria 5, Illinois, Aug. 3. 1 p. Typed, with signature on letterhead.
• ***Summary:*** "Dear Allan: I am enclosing with this letter a copy of Mr. Hayashi's R-578, which is an intermediate report on the work being done by Mr. Tokuji Watanabe of the Food Research Institute [Japan]... you are at liberty to photocopy or otherwise reproduce any parts of it which you may want to retain. As soon as you have finished with this will you please return it to me so that we can dispatch it to FAS [Foreign Agricultural Service, Washington, DC].

Note: This American Soybean Assoc. letterhead is very interesting. Along the top is written: "An organization of those interested in the production and utilization of the soybean." In the center is the logo, consisting of the western hemisphere on the globe of a soybean. Around the bottom: "Founded 1920–Organized 1925." At the left top is the name and title (plus city and state) of each of 3 officers and 5 directors. At the right top are the names of ten more directors. Address: Executive Vice President and Secretary Treasurer, American Soybean Assoc., Hudson, Iowa.

Address: Noda Soy Sauce Co., Ltd., Noda, Japan.

4759. Hayashi, Shizuka. 1961. Report on the Japanese American Soybean Institute. *Soybean Digest.* Sept. p. 37-38.
• ***Summary:*** This talk was presented at ASA's 41st annual meeting at Indianapolis, Indiana.

The goal of the American Soybean Institute, as provided by the contract between the American Soybean Association and the Foreign Agricultural Service, is to develop the Japanese market for U.S. soybeans. Therefore the institute directs its activities toward promotion of the various soybean products made and sold in Japan, and encouraging consumers to take more fat and protein in their daily diet by consuming more traditional soybean products such as miso, tofu, shoyu, and natto, as well as more of the relatively new foods such as soy flour and soybean oil.

1. Government agency: The Ministry of Agriculture and Forestry has under its control approximately 2,000 home advisors, 40 to 50 on the average stationed in each of the 46

© Copyright Soyinfo Center 2014

prefectures. Each home advisor covers an area that has about 4,000 families or approximately 20,000 population.

"The relation between the home advisors and the rural housewives is close and intimate. By virtue of training and education the home advisors have won the position where they are now regarded by the housewives as consultants to all rural families. Suggestions and opinions of the home advisors are unconditionally accepted by the housewives. We are using this network, under contract with the Ministry of Agriculture, to educate the housewives on the nutritional values of soybean products and the advantages of consuming more soybean products in their diets.

"This contract provides for 3-day exhibitions with cooking demonstrations, lectures and display of various panels to be held in three places in each prefecture. So far about 24 prefectures have been covered out of 46. Approximately 400,000 people have attended.

"2. Private Professional Organizations: We have a contract with one of the most influential and popular organizations which has groups of women all over Japan as its members. The leaders of these groups have had actual dietetic experience and education. This organization pushes its educational program under such slogans as, "Let Us Eat Oil Once a Day," or, "Use in Frying Pan Once a Day."

"3. Trade Press: Contracts are being entered into with the trade press to carry out jointly with them events to promote soybean products. By utilizing the press we get the advantage of wide dissemination of the news to the public at relatively low cost.

"4. Industrial Groups: We have contracts with the different soybean groups to promote products such as miso, shoyu, tofu, soybean oil, etc. Each of these groups has its own methods of promotion. For example, a contract with the Soy Sauce Association involves lectures, cooking demonstrations, and exchange of views with the high school home economics teachers. This aims at the large number of students each teacher has in her class.

"A contract with the Oil Processors Association involves soybean oil cooking contests arranged through the network of health centers where a great number of housewives are reached. Under contract with the Tofu Association, meetings are held with not only the manufacturers but also people in general. This is to demonstrate the advantage of producing the so-called 'soft tofu' which can be produced with very little loss of water soluble protein. Actually the aim is to encourage using U.S. soybeans because soft tofu can best be made with U.S. soybeans.

"A contract entered into with the miso groups calls for promotion largely through advertisements in magazines, daily newspapers, television, radios, and even by utilizing the theaters. This type of promotion is expensive but the major cost is borne by the miso groups themselves. JASI shares only a small portion."

Also discusses expired contracts with the Welfare Ministry, seminars with top executives in working with soybeans to explain the power of public relations, and future plans. Since July 1, U.S. soybeans can be freely imported into Japan–with no restrictions. Address: Managing Director, Japanese-American Soybean Inst., Tokyo.

4760. *Soybean Digest.* 1961. Honorary life members [American Soybean Assoc.]: Shizuka Hayashi and Albert Henry Probst. Sept. p. 12.

• ***Summary:*** "Shizuka Hayashi was born in Hawaii. He graduated from Japan Business College and Heald's Business College, San Francisco [California].

"Mr. Hayashi has devoted most of his life to the fats and oils business. From 1923 to 1940 he was manager of the import and export division of Nisshin Oil Mills, Limited, of Tokyo, Japan, and Dairen, Manchuria, one of the largest processors of soybeans and other oil-bearing seeds. When in 1940 the trade division of Nisshin was absorbed by Okura Trading Company, Mr. Hayashi was appointed manager of Okura's Dairen office.

"In 1942, Mr. Hayashi went to Singapore and Penang [Malaysia], representing both Okura and Dunlop Rubber Company. After the fall of Singapore he was adviser to the Manchurian government until the end of World War II. In 1948 he made a trip to the United States to study postwar conditions and renew business acquaintances. On his return home he started his own import and export business.

"When the Japanese American Soybean Institute was formed in 1956 as the operating agency for the soybean export program of the American Soybean Association and the U.S. Department of Agriculture, Mr. Hayashi became its managing director. Through the Institute the soybean industries of Japan and the United States and the

© Copyright Soyinfo Center 2014

governments of the two countries have learned to cooperate in using U.S. soybeans to provide a better diet for the Japanese people."

Albert H. Probst received his B.S., his M.S., and his Ph.D. degrees from Purdue University in 1936, 1938, and 1948. He was appointed agent on soybean investigations for the U.S. Department of Agriculture in May 1936. As research agronomist for the USDA and associate professor at Purdue University, he is in charge of soybean breeding in Indiana. He has assisted in the development of almost 20 new varieties of soybeans. He is author or co-author of over 70 technical and popular publications on soybean research and production.

Photos show Shizuka Hayashi and Albert Henry Probst.

4764. Spilsbury, Calvin A. 1961. Japan's oilseed and fats and oils industry. *USDA Foreign Agricultural Service.* FAS M-120. iv + 52 p. Oct. Illust. 28 cm. [9 ref]
• ***Summary:*** Contents: Introduction. Summary. The fats and oils industry: Total supply of fats and oils, edible fats and oils industries (oilseed crushing and refining industry, rice bran processing, margarine and shortening, oilseed food industries), industrial fats and oils (the soap industry, paint and protective coating industry). Domestic production of oilseeds and oil-bearing materials: Soybeans (farm income and management, research), rapeseed, other oilseeds, rice bran, marine oils, including whale, animal fats. Foreign trade: Soybeans, other oilseeds, marine oils, animal fats, oilcake and meal, trade controls. Demand and price: Price supports. Consumption. Marketing and market development: Marketing vegetable oils, marketing oilseeds (storage, inspection, soybeans, rapeseed), market development. Bibliography. No names of Asian crushers are given.

Japan's margarine and shortening production in 1960 was 88,600 metric tons, nearly 4½ times that of 1950... Margarine production in 1960 was 43,000 tons. Shortening production was only 41,600 tons in 1960. The margarine and shortening industry in Japan consists of 26 manufacturers, but a large percent of plant capacity is found in only a few plants: 4 plants have one-third of the industry capacity, which is around 400 metric tons per 8-hour day... 67% of the oils used to make margarine and shortening in Japan are animal and marine oils, with whale oil being the most widely used (26% of the total) followed by tallow and lard (21%), then fish oil (20.0%). Palm oils comprise 19.0% of the total and vegetable oils 14.0%.

Concerning oilseed food industries (p. 17-20), in 1960 some 532,218 tonnes (metric tons) of soybeans were used directly as foods or manufactured into foods in Japan. Substantial amounts of peanuts and sesame seeds were also so used. "The Japanese American Soybean Institute in Tokyo is actively promoting U.S. soybeans for food uses and has promoted soybeans as the meat of the field because of the excellence of their amino acids."

Note: This is the earliest document seen (Jan. 2005) containing the phrase "the meat of the field." Notice that it refers to soybeans and was apparently coined by an American organization in Japan.

"More soybeans are used directly for food than are grown in Japan, and the cake and meal from an additional 420,000 tons of soybeans are now used each year. The main soybean foods are: Miso, shoyu, tofu, aburaage (fried tofu), frozen tofu, natto, kinako, monosodium glutamate (extract of fermented soybeans and rice used as a seasoning compound; a low-grade shoyu is a by-product), tonyu (soybean milk, cooked water-extract of soybeans, not widely produced in Japan at the present time).

Miso: There are about 3,200 to 3,800 miso plants in Japan, and a large amount of home-made miso is also produced. "About 117,600 tons of soybeans and 52,300 tons of defatted soybean meal (expeller cake is thought to be the best) are required by this industry. Miso consumption is estimated at 28.9 grams per capita per day." Domestic

© Copyright Soyinfo Center 2014

Japanese soybeans, such as white hilum soybeans from Aomori are preferred to U.S. beans, which cook unevenly because of their hard seed coats.

Shoyu: There are about 5,000 producers; some have very large plants but many are small. Per capita consumption is about 3 gallons per year. This requires about 18,500 tonnes of soybeans and 155,000 tonnes of defatted soybean meal per year. A small amount of soybean oil (about 1,000 tonnes/year) is skimmed off the top of shoyu and used for a cutting oil. The cake that remains after pressing out the shoyu contains 4% salt, but it is an ideal hog feed as well as a fertilizer. Around 80,000 to 100,000 tonnes a year are produced. A taru (4½ gallons) of shoyu wholesales for about $3.60. A large volume of soy sauce is now being exported to the USA.

Tofu: There are around 50,000 small tofu plants in Japan. Their demand for soybeans is large and increasing. In 1960 production of tofu and aburaage required 254,800 tonnes of soybeans and 20,000 tonnes of defatted soybean meal. More soybeans and meal are used to make tofu than any other food in Japan, followed by shoyu, then miso. About three-fifths of the soybeans used are imported. In 1960 production of frozen tofu required 27,100 tonnes of soybeans.

In 1960 about 22,800 tonnes of soybeans were required to make natto, 6,200 tonnes to make kinako, 64,800 tones of defatted soybean meal were required to make monosodium glutamate, and 10,000 tonnes of soybeans plus 30,000 tonnes of defatted meal were required to make other soybean food products [such as whole soybeans, soybean milk, etc.].

trade associations to encourage the use of U.S. soybeans in Japanese foods.

Research is needed in six areas: Use of soy flour to supplement bread and cereal products. Manufacture of soybean protein. Use of tempeh. Production and nutritional value of soy milk. Production of low-salt miso for feeding babies. Comparison of U.S. soybean varieties in commercial production of tofu. A portrait photo shows Smith.

4772. *Soybean Digest.* 1961. Look for lower soy production in Japan. Nov. p. 23-24.

• ***Summary:*** It is very likely that Japanese soybean production will decrease rapidly following the freeing of soybean imports which took place on July 1, according to Hiroshi Nakamura, a former employee of the Hohnen Oil Co. who is now a graduate assistant working toward a Ph.D. degree at the University of Illinois.

The Japanese consume more than 1.5 million metric tons [tonnes] of soybeans per year, but only about 400,000 tons are grown in Japan. The rest is imported, mostly from the USA.

Also on July 1, the Japanese government raised the import duty on soybeans, an offsetting factor which may lower potential imports. Resumption of trade with Mainland China could also hurt U.S. soybean exports to Japan.

4773. Shumway, De Van L. 1961. 'Refugees' from N.Y. happy in N. California. *Deseret News* (*Salt Lake City, Utah*). Dec. 8. p. 8A.

• ***Summary:*** A group of New Yorkers, seeking refuge from nuclear war, have found a welcoming home in Chico, northern California. Alvin Baumann, a concert pianist-composer, led the group from Smithtown, New York, across the USA, arriving in Chico in October 2. The 13 families, totaling 34 men, women and children, quickly settled into this city of 16,000. And they say they feel more welcome every day. Painter Joan Andrews is impressed that service station attendants wash the windows of her small foreign car each time she stops for gasoline.

Many in the group are members of the Ohsawa Foundation; they "follow the teaching of a 68-year old Japanese philosopher, George Ohsawa, who teaches an orderly life based on natural foods."

Baumann said the group's own business is taking shape. Believers in eating "natural" foods, they have started the "Chico-San" Bakery and plan to share the profits. They will bake breads with no sugar and little yeast.

They also plan to start a restaurant where the menu will show the exact number of calories per serving, and where live music will be provided by group members. Once a week there will be a discussion on controversial or popular current events.

Note 1. This is the earliest document seen (May 2011) which states that Chico-San has started a bakery.

Note 3. There seems to be little chance of an atomic bomb being dropped on or near Chico. The nearest major city is San Francisco. Address: United Press International (UPI).

4774. Hayashi, Shizuka. 1961. Meal use expands in Japan. *Soybean Digest.* Dec. p. 23. [14 ref]

• ***Summary:*** "Paralleling the growth of the Japanese livestock industry the demand for livestock feed has increased sharply during recent years. As shown in table No. 1, production of livestock feeds during 1960 was more than 2.5 million tons or nearly 50% more than the previous year and three and one-half times that of 1956. Livestock production is shown in table No. 2.

"Approximately 80% of the annual feed production is used by the poultry industry. The other 20% goes for swine and cattle.

"The ingredients used in the production of mixed feeds vary somewhat from time to time depending on the supply situation and price fluctuation of the different ingredients. See table No. 3.

"The percentage of soybean meal used in livestock feeds is about 5%, as indicated by the table. The reason for this small percentage is due largely to the higher price of soybean meal as compared to prices of other ingredients.

"The many years of government control which restricted free imports of many commodities including soybeans created an abnormal state of the economy. The price level of soybean meal in Japan has been far above what it normally should be. This has become chronic and has robbed consumers of the desire for lower and more competitive prices. Table No. 4 shows the prices of various feed ingredients.

"The return of imports to unrestricted free trade on July 1 has changed the picture. Soybeans are now freely imported. The artificial high price of soybean meal will have to be corrected to be in line with the world market or be competitive with imported meal which is expected to be liberalized in the near future. The time will come, perhaps soon, when soybean meal will be used in a much larger quantity for poultry feed.

"Mixed poultry feeds in the United States now include nearly 30% soybean meal. The same formulas could be used by the Japanese poultry industry. Plans are now being worked out by the Japanese American Soybean Institute for promotion toward this end.

Tables show: (1) Production of mixed feeds 1956/1960 in Japan classified by use (metric tons). The uses are dairy cattle, draft cattle, poultry, others, and total. The greatest use (by far) is for poultry, which increased from 439,848 in 1956 to 2,061,564 in 1960. The total increased from 737,427 in 1956 to 2,521,489 in 1960.

(2) Number of poultry and livestock reared, 1957 to 1961. As of Feb. 1 each year. Numbers include chickens,

© Copyright Soyinfo Center 2014

dairy cattle, draft cattle, horses, and hogs. Chickens increased from 45.341 million in 1957 to 71.806 million in 1961. Hogs increased from 1.546 million in 1957 to 2.604 million in 1961.

(3) Consumption of ingredients for production of mixed feeds in 1960 (Jan. to Dec.). The top 4 ingredients were: Corn 1,212,826 metric tons (48.0% of total). Wheat bran 263,202 metric tons (10.4%). Soybean meal 133,805 metric tons (5.3%). Rice bran, rice oil meal 123,187 metric tons (4.9%).

(4) Tokyo wholesale prices of feeds (average Sept. 1961). Soybean meal is relatively expensive. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome Yurakucho, Chiyoda-Ku, Tokyo, Japan.

• ***Summary:*** In soybean variety trials, Palmetto (from the USA) and Sankuo (from Japan) gave the highest yields. In the spacing trial the highest yields were obtained at 40 x 20 cm (1 plant per hill). Phosphate and calcium fertilizers significantly increased soybean yields. Eight varieties were planted monthly from Aug. to Dec. 1960. The growth period was shortened and plant height and yield were decreased by delayed planting. The largest seeds were produced from plants sown in September.

• ***Summary:*** Powdered natto (made by the method of Sakurai and Nakano 1961) can be added to biscuits, crackers, or soup. The addition of 15% powdered natto in biscuits, 20% in crackers, and 5% in curry soup was acceptable to school children. Address: Director, National Inst. of Nutrition, Toyama-cho, Shinjuku-ku, Tokyo.

4790. Department of Trade and Commerce, Canada. 1961. Oilseeds from Canada. Ottawa, Ontario, Canada. 24 p. 28 cm.
• ***Summary:*** "Oilseeds have been grown commercially in Canada since 1720 when the pioneers of New France grew flax for fibre and later for oil." Canada has gradually changed from a net importer of fats and oils to a net exporter. "Last year there were more than 4 million acres in Canada planted to various types of oilseeds, and the bulk of the oilseed production was exported to more than 25 countries of the world. Flaxseed, rapeseed, soybeans and mustardseed are the principal oil-bearing seeds exported from Canada."

A table (p. 3) shows acreage and production of Canada's 4 major oilseeds from 1948-52 to 1960. Throughout this period, flaxseed was the leading oilseed, with production growing from 230,000 tonnes to 638,000. Rapeseed grew from a minor crop to the second largest one, 9,000 tonnes in 1948-52 increasing to 250,000 tonnes in 1960. Soybeans are third, having grown from 86,000 tonnes to 154,000. In 1960 rapeseed first surpassed soybeans in production. Most of Canada's rapeseed is grown in the three prairie provinces of Alberta, Saskatchewan, and Manitoba. Virtually all soybeans are gown in southern Ontario. Canada is the world's leading exporter of rapeseed. The leading importers of this rapeseed are Japan (40,128 tonnes in 1960), followed by Italy (37,138 tonnes).

The section titled "Soybeans in Canada" (p. 16) gives statistics (tons exported and dollar value) on acreage and production, and on yearly exports from 1956 to 1960 of soybeans, soybean oil, soybean meal, and total. In 1960, Canada exported $20,939,000 worth of soybeans and soybean products, down from $26,988,000 in 1956. The main trend has been toward increased exports of soybeans and decreased exports of oil and meal [value-added products]. Address: Ottawa, Ontario, Canada.

4792. György, Paul. 1961. The nutritive value of tempeh. *National Academy of Sciences, National Research Council, Publication* No. 843. p. 281-89. [3 ref]
• ***Summary:*** "The first tempeh preparations and control soybeans used in this study were obtained from Indonesia * (Footnote: *Through the courtesy of Dr. Poorwo Soedarmo, Institute of Nutrition, University of Djakarta, Indonesia) (1954, 1955) and Southern Rhodesia ** (Footnote: **Through the courtesy of the Executive Officer, Nutrition Council, Federal Ministry of Health, Salisbury, S. Rhodesia) (1955). In the following years attempts, largely futile, were made to produce tempeh in our own laboratory. In 1959 a cooperative arrangement has made it possible to produce tempeh and control soybeans on a larger scale in the Department of Food Science and Technology, New York State Agricultural Station, Cornell University, Geneva, N.Y. under the supervision of Drs. D.B. Hand and K.H. Steinkraus. Under this arrangement, animal studies are carried out independently in our laboratory and in the laboratory of the School of Nutrition (Dr. R.H. Barnes), Cornell University, Ithaca, N.Y."

Various rat feeding experiments are described. Hemolysis tests were carried out by Dr. Kiku Murata (Osaka, Japan) in György's laboratory. It was found that "tempeh is stabilized by virtue of an 'antioxidant' produced during the course of the fermentation process. Unfermented soy flour had a high peroxide content and was rancid.

Note: Dr. Paul György was born in Nagyvarad, Hungary, on 7 April 1893. He received his M.D. degree in Budapest in 1915 and later studied at Heidelberg, Germany, where he became a professor of pediatrics. He has made many contributions to the field of nutrition with his studies of vitamin B-6, pellagra, biotin and vitamin H. Since 1944 he has been associated with the Philadelphia General Hospital as a pediatrician and as Professor of Pediatrics at the University of Pennsylvania, a post from which he "retired" in 1960. Address: Chairman, Dep. of Pediatrics, Philadelphia General Hospital, Philadelphia 4, Pennsylvania.

Progress in meeting protein needs of infants and preschool children: Proceedings of an international conference held in Washington, D.C., August 21-24, 1960 under the auspices of The Committee on Protein Malnutrition, Food and Nutrition Board, and The Nutrition Study Section, National Institutes of Health. No. 843. 570 p. Reviewed by Soybean Digest, Nov. 1961, p. 23.
• ***Summary:*** The National Academy of Sciences was established in 1863, the National Research Council in 1916, and the Food and Nutrition Board in 1940.

In Aug. 1960, 33 researchers from 18 foreign countries joined with 42 researchers from the USA in a 4-day conference to review the results of a worldwide research program for the development of protein products suitable for infants and children from indigenous resources such as soybeans, cottonseed, peanuts, and similar products in countries where protein deficiency is most prevalent. This research program has been conducted by the Committee on Protein Malnutrition with funds provided by the Rockefeller Foundation in cooperation with UNICEF, FAO, and WHO. The researchers also met to survey the areas of greatest need for further research, and to evaluate the status of knowledge in protein nutrition.

The 45 research reports in this volume constitute a comprehensive summary of the status of protein nutrition around the world and the technological problems involved in the development of economical protein foods. The papers are divided into the following groups: Central and South America (7 papers). Africa and the Middle East (10). India and the Far East (10). Relevant research in the United States (6). Experimental protein malnutrition in animals (4). Basic principles of protein and amino acid evaluation and potential protein resources (10). Protein problems around the world (3). Summary of the conference. Nomenclature guide to plant products cited.

Autret (p. 537) stated "the No. 1 problem for F.A.O. and for national agricultural departments is the production of protein foods of good quality." Address: Washington, DC.

• ***Summary:*** A summary of a detailed report prepared for UNICEF. To improve the keeping properties of natto and broaden its potential uses, dry powdered natto was developed. The fermentation time was reduced to 6-8 hours so that the product would be more suitable for general consumption as a food. After fermentation the beans are spread out on metal trays for drying at low temperatures. either in vacuum or aeration, until the moisture content is less that 5%; then the beans are milled. Address: 1. Director, Food Research Inst., Ministry of Agriculture & Forestry, 2 Hamazono-cho, Kotoku, Tokyo, Japan; 2. Head, Fermentation Div., Food Research Inst., Fukagawa P.O., Tokyo.

4800. Sano, Tamotsu. 1961. Feeding studies with fermented soy products (natto and miso). *National Academy of Sciences, National Research Council, Publication* No. 843. p. 257-68. Progress in Meeting Protein Needs of Infants and Preschool Children. [31 ref]
• ***Summary:*** The author developed a natto powder, low-salt miso powder, and an autoclaved soybean powder for use in combating infant malnutrition in underdeveloped countries. Since 1957 Dr György has been studying these soybean foods in collaboration with the author in hopes of increasing their use in infant diets. The natto powder had a higher content of essential amino acids than the soybean powder. Natto powder gave the best results in growth studies on rats, but the increase in body weight was not as great as when the rats were fed skim milk at the same protein level. The miso powder decomposed into a rancid state and thus was unsuccessful.

© Copyright Soyinfo Center 2014

The vitamin B-12 content of natto was found to be higher than that of dry soybeans. Address: President, Tohoku Kosai Hospital, 10 Motoyagura-cho, Sendai, Japan.

4804. *SoyaScan Notes.* 1961. Overview of total miso production in Japan (1934-36, 1952-61). Source: *Shokuhin Kanri Tôkei Nenpo* (Food Industry Statistics Annual Report). [1 ref]
• ***Summary:*** These statistics are from a bundle of documents found in the Kikkoman *kura* in Noda, Japan. Mark Fruin donated a photocopy of all the documents to Soyfoods Center. Statistics are given each year for miso, vinegar, sauce, tomato ketchup, monosodium glutamate, and mayonnaise (from 1952 -1961).

Miso production grew from 596,996 tonnes (metric tons) in 1934 to a peak of 600,750 tons in both 1935 and 1936. No statistics are given from 1937 to 1951, years of disaster for Japan, ending with defeat in World War II.

Starting again, production grew from 381,713 tonnes in 1952, to a peak of 530,078 in 1956, then decreased slowly to 482,357 tonnes in 1961.

4805. *SoyaScan Notes.* 1961. Overview of factory production of miso in Japan (1930-1961). [1 ref]
• ***Summary:*** These statistics are from a bundle of documents found in the Kikkoman *kura* in Noda, Japan. Mark Fruin donated a photocopy of all the documents to Soyfoods Center. Statistics are given each year for miso in 1,000 *kan*, where 1,000 *kan* = 3,750 kg. Farmhouse and home production are not included. Miso production grew from 157,196 in 1930 to a peak of 160,200 in both 1935 and 1936, then fell gradually to 150,221 in 1940, 128,60 in 1942, 140,226 in 1943, and 129,679 in 1944. Then, as Japan was clearly losing the war, it plunged to 77,495 in 1945, 69,887 in 1946, and a low of 50,264 in 1947. In the postwar years, as Japan began to recover, it increased to 94,468 in 1948, dropped to 66,510 in 1950, then began steady growth–101,790 in 1952, rising to a peak of 198,779 in 1956. Then it began to decrease slowly to 180,884 in 1961.

4806. *SoyaScan Notes.* 1961. Chronology of Chico-San, Inc. (Chico, California). 24 March 2011. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1955 Dec.–Herman Aihara and Chiiko (Cornellia) Yokota are married in New York. Cornellia arrived in the United States from Japan in Oct. 1955.

1961 summer–George Ohsawa, fearing that a nuclear war might be near, urges his followers to leave New York and find a place that was safer from radioactive fallout and good for growing rice. After extensive research, they chose Chico, California.

1961 Oct. 1–Thirty two people (11 families) arrive in Chico (in the Sacramento Valley of northern California) from New York City in a caravan of vans, buses, and station wagons. It is an area of fertile farmland where rice is already being grown. Among the people in the group who remained active in work with macrobiotic foods were Bob Kennedy, Herman and Cornellia Aihara, Teal Ames, and Dick Smith.

1961 Dec. 8–The group in Chico has started a bakery named "Chico-San" (Shumway 1961).

1962 March 6–The group in Chico incorporates a new food company named Chico-San, Inc.; it consists of a retail store and an import and wholesale business. It is capitalized with $10,000. In addition to a line of whole-grain products, they soon began to import a variety of macrobiotic foods from Ohsawa in Japan. The first store and food plant (they made sesame salt or *gomashio* and repackaged foods) was in the basement of a small hearing aid shop in Chico. The address was apparently 64, 5th Ave., Chico, California. It became the first macrobiotic food manufacturing company in the USA. Note: Infinity Foods in New York City was apparently the first macrobiotic import and wholesale company.

1962 Christmas–George Ohsawa visits Chico and lectures on macrobiotics.

1963–Ohsawa lectures in Boston (Massachusetts), New York City, and at the fourth macrobiotic summer camp in Chico. Lima Ohsawa and Cornellia Aihara give cooking classes. In Chico, Ohsawa suggests that the group try making rice cakes. He sends them a rice cake machine from Japan and production began in the fall of 1963. Rice cakes soon became Chico-San's first really popular and successful product.

1963–Junsei Yamazaki emigrates to Chico, California, from Japan.

1964–Yamazaki starts to make miso and shoyu for Chico-San.

© Copyright Soyinfo Center 2014

1966 April 24–George Ohsawa dies. The Ohsawa Foundation now has offices in Los Angeles, New York, Paris and Tokyo.

1968 fall–Bob Kennedy of Chico-San signs a contract with the Lundberg brothers of Wehah Farm (Richvale, California) to grow short-grain brown rice organically, exclusively for Chico-San. Chico-San agrees to buy all brown rice planted in 1969.

1969–Lundberg brothers plant 78 acres of brown rice, which is harvested in the fall. Because of Chico-San's successful advertising campaign, one third of this crop as sold in advance and all was sold before the next year's crop was available. The rice

1969 fall–Wendell Lundberg visits Erewhon.

1970–Chico-San contracts for 200 acres of brown rice this year with Lundberg.

1970–Spiral Foods is organized by Chico-San and Peter Milbury to distribute Chico-San products directly to retail stores in the greater San Francisco Bay Area.

1970–Herman Aihara and Bob Kennedy establish the George Ohsawa Macrobiotic Foundation (GOMF). Junsei Yamazaki makes his first big batch of miso. First summer camp at French Meadows. Herman and Cornellia make their first nationwide teaching tour.

1971–Noboru [not Naboru] Muramoto sensei arrives.

1972–The book *Miso and Tamari,* by Herman Aihara published.

1972 Sept. 14.–Fire destroys the Chico-San plant. It started as a short in a rice-cake machine. Chico-San is out of business for several months. The company resumed business at another location across town. But Chico-San lost its exclusive right to distribute Lundberg organically grown brown rice as the company had been unable to package and ship rice and rice products for several key months during the peak sales season.

1973–Herman Aihara establishes the Vega Institute in San Francisco. Noboru Muramoto lectures and his first book, *Healing Ourselves,* is published.

1974–Herman Aihara moves GOMF to Oroville from San Francisco. *Soybean Diet,* by Herman published.

1976. Muramoto moves to Glen Ellen.

1984 Nov. 19–Heinz U.S.A. acquires Chico-San Inc. a manufacturer and marketer of rice cakes and related products. Privately held Chico-San (headquartered in Chico, California) operates rice-cake production facilities in California, Mississippi, and New Jersey. Founded in 1962, the company has about 340 employees.

1985 Jan.–The Quaker Oats Company acquires the Arden Rice Cakes business. The natural foods portion of the business is incorporated under the Mother's brand. Chico-San is based in Chico, California; Arden in North Carolina.

Experiments on the digestion and absorption of powdered natto in the human body]. *Kokuritsu Eiyo Kenkyusho, Kenkyu Hokoku* (*Research Report of the National Institute of Nutrition*). p. 46-48. Jan. 10. [Jap]
• ***Summary:*** Natto was ground into a flour for use as a food or food supplement.

4812. Japan Oilseed Processors Association (JOPA) is founded in Tokyo (Early event). 1962.
• ***Summary:*** The following are answers to questions about the origin of JOPA submitted by Soyinfo Center to Yoshinori Komura who was executive director of JOPA for 16 years from May 1997 until 2013.

JOPA was founded on 25 Jan. 1962 when members held the inaugural assembly. The government authorized its foundation on 25 Feb. the same year.

31 companies and 1 cooperative union of small oil millers initially participated in JOPA. The members included not only seed crushers but also refiners and oil processors.

In Japan the fiscal year begins in April and ends in March. The number of members were 34 at the end of March 1963. 2 companies joined JOPA after its foundation.

Mr. Yukio SAKAGUCHI, the president of Nisshin Oil Milling Co., was the first president of JOPA; he was also one of the core members who founded JOPA. JOPA also elected 2 vice presidents; they were Kyoji SUZUKI, the president of Ajinomoto Co., and Junnosuke HAYASHI, the president of Kumazawa Oil Milling Co.

The first address of JOPA's office was 2-9, Kayabacho, Nihonbashi, Chuo-ku, Tokyo. Later JOPA moved to its present address, Yushi-Kogyo kaikan, 3-13-11, Nihonbashi, Chuo-ku, Tokyo.

What were the main reasons for founding JOPA? Before the foundation of JOPA, there used be an association named "Japan Oil Manufacturing Association" (*Nihon Yushi Seizo Gyokai*). It was founded on October 1940 and dissolved in 1964. In its history, the biggest member company suddenly withdrew from JOMA in May 1961. I do not know why and the persons concerned with the company have gone to paradise without ever explaining their reason. It was actually a mystery. Therefore JOMA really lost its functions. The Minister of Agriculture & Forestry was anxious about this trouble and asked the other main crushers to re-organize the association. And main members at JOMA began to discuss the foundation of the new association and reached the conclusion to settle a new association by the end of 1961.

In Japan, the main role of the industrial association is lobbying to the government. On the other hand, the main function of industrial association used to be recognized as being the end unit of administration of the government. The important information of policy making was distributed just to the industrial association and therefore a company not joining to its association could never get any kind of information from the government.

The initial Japanese name of JOPA was *Nihon Yushi Kyokai.* In May 1991 the name was changed to *Nihon Shokubutsu-yu Kyokai*–which is still JOPA's name at present. "Nihon" means "Japan" or "Japanese." "Yushi" refers to any kind of oils and fats. *Kyokai* means "association." *Shokubutsu* means plants or vegetables, and *yu* means oil, so *Shokubutsu-yu* means vegetable oil. Members of JOPA have always processed only vegetable oils.

Note: JOPA's website (entirely in Japanese) is at www.oil.or.jp. On it is a history and a chronology of JOPA.

Pharmacy; 2. Shizuoka Factory of Yakult Co. Both: Shizuoka city, Shizuoka prefecture, Japan.

4816. Strayer, George M. 1962. The place of certification in the future soybean industry. *Soybean Digest.* Jan. p. 16-17. [14 ref]
• ***Summary:*** The author suggests that soybeans be certified as to variety for export commercially to meet the needs of a large and growing market for food abroad. This applies especially to Japan, for which examples are given.

4817. Paddleford, Clementine. 1962. Japanese dishes making hit in U.S. *Los Angeles Times.* Feb. 8. p. C12.
• ***Summary:*** New York–Japanese foods are everywhere in neighborhood and specialty shops throughout America." This week the writer sampled 50 Oriental delicacies. "The basic Japanese food exports remain with us as always the king crab meat, the Mandarin orange, the white tuna fish. Old friends are also the seasonings, Japanese Shoyu sauce, rice wine vinegar, the ajinomoto which is the monosodium glutamate to enhance the natural food flavors of meat, poultry, fish and vegetables." Also mirin, instant rice with seaweed, and *yuechizuke* which is "egg plant in soya bean paste" [miso].

Note: This is the earliest English-language document seen (March 2009) that uses the term "soya bean paste" to refer to miso.

"The Japanese soy sauce called shoyu is claimed more delicate than the Chinese version. Delicious for gravies and barbecue sauces." Address: Herald Tribune News Service.

4818. *New York Times.* 1962. A choice of new books for the younger reader's library. Feb. 25. p. BR19.
• ***Summary:*** Contains a book review of *Taro and the Tofu,* by Masako Matsuno [a woman]. Elizabeth Hodges wrote the review for children ages 6 to 8. It begins: "One cold night in Japan when the peddler from whom Taro's mother always bought the tofu (bean curd) for the family supper did not appear, Taro went to the old man's shop." A large illustration from the book shows Taro.

4819. Fukamachi, Chiharu; Suruga, Sachiko. 1962. [Qualification of coagulating reagent for tofu manufacture. I. Method of qualification of coagulating reagent (Abstract)]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 16. p. 112. Feb. [1 ref. Jap; eng]
• ***Summary:*** Calcium sulfate is the main coagulant used in making tofu from soybean milk, but calcium chloride and magnesium chloride are also used, alone or with calcium sulfate.

Besides these salts, some other chemicals are also available for this purpose, but there are technical difficulties in applying them to the coagulation of soybean milk.

This paper reports on the establishment of a standard method for evaluating the suitability of soybean milk coagulants on a laboratory scale. By this method, calcium gluconate, as an examined, and was found to be unsuitable as a coagulant.

Reprinted from *Nosan Kako Gijutsu Kenkyu Kaishi* (*J. for the Utilization of Agricultural Products*) 8(3):129+ (1961). Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

4820. Fukamachi, Chiharu; Suruga, Sachiko. 1962. [Qualification of coagulating reagent for tofu manufacture. II. Comparison of commercial coagulating reagents (Abstract)]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 16. p. 113. Feb. [1 ref. Jap; eng]
• ***Summary:*** In a previous paper, it was shown that coagulants with a fine crystalline structure were not suitable for making tofu, because they coagulated soymilk so quickly that control of the process was very difficult.

In this report, the pH of eleven tofu coagulants were observed in water. Coagulants with a low pH (such as 5.1) in suspension had limited latitude in the amount used and also gave low yields of tofu. It was concluded that such chemicals were not for making tofu.

Reprinted from *Nosan Kako Gijutsu Kenkyu Kaishi* (*J. for the Utilization of Agricultural Products*) 8(3):129+ (1961). Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

4822. Kamada, Hidemoto; Nakano, Masahiro; Higurashi, Yasuo. 1962. Daizu seihin no chakushoku ni kansuru kenkyû. IX. [Browning reaction of soybean products. IX. Color formation of shoyu during brewing (Abstract)]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 16. p. 114. Feb. [1 ref. Jap; eng]
• ***Summary:*** Color formation of shôyu (soy sauce) and of an amino acid-sugar system during browning were investigated.

Color formation in shoyu was caused by the reaction between amino acids and sugar, especially pentose (a monosaccharide sugar with five carbon atoms). It was found to be unlikely that the reaction between amino acids and reductone or active carbonyl compound would be significant in color formation of shoyu during brewing (fermentation).

Color formation during fermentation of the mash

© Copyright Soyinfo Center 2014

(*moromi*) and pasteurization (at 82ºC for 30 minutes) of shoyu obtained from the mash were accompanied by a decrease in the pentose content.

Concentration of pentose had a significant effect on the rate and extent of browning of an amino acid-sugar system.

The presence of oxygen had a marked effect on color formation in the mash, but no effect on color formation during pasteurization of shoyu.

Reprinted from *Nosan Kako Gijutsu Kenkyu Kaishi* (*J. for the Utilization of Agricultural Products*) 8(1):6+ (1961).
Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

4823. Kamada, Hidemoto; Nakano, Masahiro. 1962. Daizu seihin no chakushoku ni kansuru kenkyû. X. [Browning reaction of soybean products. X. Characteristics of color of mieki [HVP soy sauce] (Abstract)]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 16. p. 115. Feb. [1 ref. Jap; eng]
• ***Summary:*** The majority of color constituents of Mieki (HVP soy sauce launched by Ajinomoto in 1950) was precipitated by mixing with an equal volume of ethanol (ethyl alcohol).

The color intensity of Mieki stored at 38ºC for 30 days developed slightly, but never developed in the absence of oxygen.

The addition of amino acids had no effect on the color intensity of Mieki stored at 38ºC for 30 days.

Addition of the sugars xylose, galactose, and glucose caused significant browning in Mieki stored at 38ºC, however sodium bisulfite, sodium sulfite, and sodium cyanide inhibited browning.

Sunlight caused browning of Mieki, but not in the absence of oxygen.

4825. Matsuno, Masako. 1962. Taro and the tôfu. Cleveland, Ohio, and New York, NY: The World Publishing Company. 32 p. Feb. Illust. by Kazue Mizumura. 26 cm.
• ***Summary:*** This story, set in Japan, is for children aged 6 to 8. Taro goes to market to buy tofu from a store. He discovers that he has been given too much change. A little voice inside his head tempts him not to return it, to buy some more candy; No one will ever know. But he resists temptation and does what is right, even though it is cold and windy outside, and promptly returns the extra money to the peddler. “He was so happy he wanted to run all the way home.”

The dedication page states: “For my first son.” Each right-hand page contains a large color illustration, including: (1) The old tofu peddler lifting a cake of tofu out of his box, about to put it into Taro’s pail. (2) The tofu seller blowing his trumpet / horn as he carries his tofu in boxes using a shoulder pole. (3) The tofu man deep-frying his tofu.

4830a. Product Name: [Seitan].
Foreign Name: Seitan.
Manufacturer's Name: Marushima Shoyu K.K.
Manufacturer's Address: Kamigata-dori Ko 881, Uchiumi-cho, Shodo-gun, Kagawa-ken, Japan.
Date of Introduction: 1962.
Wt/Vol., Packaging, Price: 3.5 oz jar.
How Stored: Shelf stable.
New Product–Documentation: Note: This is the world's earliest known commercial seitan product. It was first imported to the USA by Erewhon Trading Co. in 1969.

Talk with Aveline Kushi. 1992. April 9. The first seitan imported to America was made by Marushima Shoyu Co. on Shodoshima in Japan. George Ohsawa went to visit the company, talked with Mr. Mokutani (who is still the chairman, and a close friend of the Kushis, and a great admirer of Ohsawa), and showed him how to make it. Marushima began to make seitan commercially in the late 1960s. It was imported to America by Muso Shokuhin at about the same time the first miso and shoyu were imported. She thinks it came in small jars, and was so salty that she used it as a seasoning in place of soy sauce in stews (such as soybean stews) or cooked it with vegetables; this cooking made it softer. This seitan probably started to be imported to America in about 1969.

Letter (fax) from Yuko Okada of Muso Co. Ltd., Japan. 1992. July 2. "I remember the term 'seitan' since I was a kid; it was probably coined by George Ohsawa. Sei means 'is' and tan is the first character in the Japanese term tanpaku, which means 'protein.' So seitan means something like 'right protein substitute.' Marushima Shoyu Co. developed seitan commercially in Japan and Muso has carried their seitan since Feb. 1966 when we started. We shipped seitan to Erewhon on a regular basis from 1968. [Note: Kotzsch. 1984, Dec. East West Journal p. 14-21 states that Muso began to export foods in 1969.] We also exported it to Chico-San [in the USA]. In Europe, we exported seitan to Paris, France." This seitan went to Institut Tenryu, which had a little macrobiotic food shop in Paris run by Madame Francoise Riviere. The first seitan Muso exported to Australia went to Spiral Foods.

Muso Shokuhin. Pure Heart–Muso general catalogue. 1990 July. p. 41. A color photo shows a 180-gm jar of Seitan. The product name is written in English (i.e., in roman letters). Under that, it is written smaller in katakana. Above the company name and address is written: "Sakurazawa Nyoichi shido" which means, "Made under the guidance of George Ohsawa."

Talk with Mr. Kiyoshi Mokutani, president of Marushima Shoyu K.K. in Japan. 1992. July 12. "The invention and development of seitan in Japan." He invented seitan in 1961-62 and took a sample to George Ohsawa, who coined the term "seitan" upon seeing it. Commercial production began in 1962. For details, see interview.

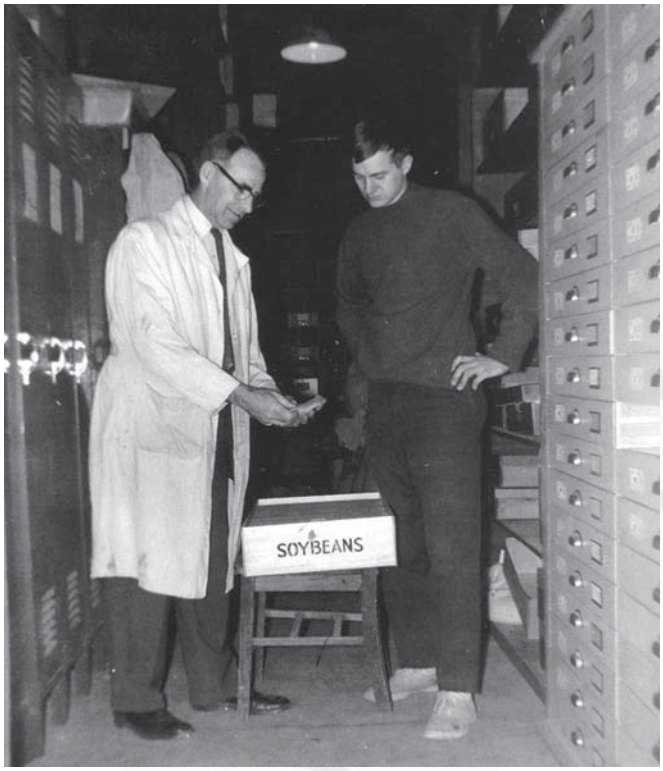
4833. Photographs of William Brandemuhl studying soyfoods in the USA and Japan. 1962. Japan.



• ***Summary:*** William Brandemuhl was a pioneer in studying and writing about soyfoods in Japan after World War II. According to Tomoko Brandemuhl these black-and-white photographs (each 4½ by 6½ inches) were taken by a Japanese newspaper or magazine photographer. All but the first two were taken in Japan in 1963.

(a) The first time he saw soybeans, at the University of Wisconsin (April 1962). (b-d) Studying how tamari is made in Japan. (e) Checking and smelling koji made in small, traditional wooden koji trays. (f) Tasting shoyu or tamari. (g) Examining koji. (h) Cutting fresh tofu. (i) Unwrapping the cloth from freshly pressed tofu. (j) For transportation in Kyoto he used this scooter to visit various places that made or did research on soyfoods.

These photos were sent to Soyinfo Center in Aug. 2012 by Tomoko Brandemuhl (Stratford, Connecticut), his wife.

• ***Summary:*** East meets West on supermarket shelves in Hawaii. "More than half the population of the island of Oahu is of Japanese or Chinese origin..." The "endless kinds of exotic foods in plastic containers" include "tofu or bean curd, [mung] bean sprouts and poi, the poi made of arrow root..."

4838. Claiborne, Craig. 1962. Food news from Tokyo: Cuisines of virtually every country offered at all prices in restaurants. *New York Times.* May 30. p. 7.
• ***Summary:*** The article begins: "There is probably no city in the world today with a more fascinating and varied cuisine than Tokyo." The Imperial, perhaps the city's most famous hotel, offers a wide selection, including sukiyaki.

In Tokyo, the typical Japanese restaurant is small and does not offer a menu. It will often specialize on one or two full-course "dinners built around one particular food. That food may be game, for example, or raw fish, or tofu, which is soy bean curd, or beef."

Tofu is typically found in sukiyaki. For "batayaki, slices of matsuzaka beef, spectacularly marbled," are served with a dipping sauce, which includes "grated long radish [*daikon*] in shoyu (soy sauce), mustard and seven spices, including Japanese pepper, ground poppy seed, cayenne pepper, sesame seeds, seaweed, dried orange peel and hemp seed."

In recent years, "beer seems to have replaced sake as Japan's national drink." Address: Special to the New York Times.

4839. Hayashi, Shizuka. 1962. Opportunity grows for expanding outlook for [soybean] meal: Japanese American Soybean Institute. *Soybean Digest.* May. p. 50-51.
• ***Summary:*** "Meat and daily products are well known as good sources of protein and fat. But their cost is much too high in Japan, as compared with soybean foods, to be included in the daily diet. Also, production is limited, especially in the case of meat.

"If we were to take soybeans out of the food supply one can easily guess what might happen. The intake of oil and fat, although it has been steadily increasing in recent years, is still exceedingly poor. With an annual intake of less than 10 pounds per capita, Japan ranks among the nations of the lowest level in this regard. The import of soybeans and other oilseeds is shown in table 2.

"Based on the above analysis, the market development program for soybeans in Japan has largely emphasized promotion to increase the consumption of soybean oil. Of course, equal efforts are being exerted in encouraging more consumption of other soy products.

"Our promotional and educational activities extend to all the housewives in urban and rural areas, encouraging increased consumption and creating more interest, through the nationwide network of home economists and extension Workers of the Ministry of Agriculture and Forestry, of nutritionists of 800 health centers under the Welfare Ministry, numerous Women's associations and school teachers throughout Japan, as well as television and radio, newspapers and magazines.

"One hundred million people cannot be reached in a short time. To persuade them is even more difficult. Any public relations program is better than none, but to achieve results requires patience and repetition. Never before has the average Japanese person been as conscious of the soybean and its nutritional values, comparing favorably with meat and fish, as he is today.

"Soy flour is a relatively new product which is becoming popular. JASI has made an arrangement with the Japan School Lunch Association of the Ministry of Education to promote the use of 5% to 10% soy flour in school lunch bread, and also its utilization in school lunch dishes. Children registered in the school lunch program number about 10 million and the number is increasing. Beside utilization in school lunches, soy flour is now used in making ice cream, spaghetti and macaroni, hot cakes, biscuits and cookies, sausage curry, and many other items.

" Soybean meal could be used in a much larger percentage in livestock feeds in Japan than it is now. At present, only 5% of the total production of over 3.5 million tons of mixed feeds is soybean meal. JASI is on the job to raise this level to 20% or 30%.

"Because the import of soybeans for many years after the war was allocated with the quantity limited to take care of minimum requirements, the price of soybean meal remained too high, compared with the world market, to be liberally consumed in livestock feeds. This restriction was lifted on July 1, 1961, allowing soybeans to be freely imported into Japan. The price of soybean meal will naturally be lowered to compare favorably with other protein meals. At least it should become competitive with meal produced in other countries–especially when its import into Japan becomes free. This is expected next October.

"From now on soybean meal will have a chance in livestock feeds perhaps equal to that of other meals. However, to break into the field where fish and other meals have been strongly established for many years, soybean meal needs to be promoted vigorously. Mixed feed manufacturers as well as the end users of feeds need to be informed of the new situation. Many even need to be educated to the value and efficiency of using soybean meal in much larger quantities than at present.

"To encourage adoption of feed formulas used in the United States and other countries, which include soybean meal up to 30% or more, could be an effective means of achieving results. Livestock farmers as well as manufacturers seem generally to know the value of soybean meal. But

© Copyright Soyinfo Center 2014

before they will use a larger percentage of it they need to be persuaded by authentic experimental data. JASI recently arranged with one of the prefectural governments to carry out tests at the experiment stations, the data to be used for that purpose. Government reports are influential and help to guide the industry.

"Exports from Japan: There is no country in the world today where soybeans are utilized as food in such versatile ways as they are in Japan as miso in wet and instant powdered form, soy sauce, tofu, natto, kinako, aburaage (fried tofu), yuba and so forth. These could be just as good foods in all other countries as they are in Japan. For example, there is nothing better than the naturally brewed soy sauce for cooking, especially in sukiyaki or barbeque.

"Importers and dealers abroad should not overlook exploring possible markets for these foods. Some are already in world markets, but only a bit of the surface is being scratched."

Tables show: (1) Japan's food supply (1961) (including imports). The four columns are: (a) Name of food. (b) Value (in US$1,000). (c) Protein grams (per day). (d) Fat (grams per day). The four main sources of protein are rice (20.1 gm), fish (11.7 gm), soybeans and soybean products (10.4 gm), wheat (10.2 gm).

(2) Japan's imports of soybeans (1957-1961), all countries vs. USA alone, amount and value.

(3) Imports of other oil-bearing seeds (1957-1961). In 1961 the leaders, after soybeans, were linseed, cottonseed, copra, safflower seeds.

• ***Summary:*** Gives a summary of progress on grants approved prior to Sept. 1971 in Finland, France, Israel, Italy, Japan, Poland, Spain, and the United Kingdom. There are now additional proposals under consideration in France, Indonesia, Israel, Italy, Japan, and Spain. For each project, the size of the grant in that country's currency is given.

In Finland, for example, a grant has been approved for an "Investigation of continuous multistage countercurrent crystallization of linseed and soybean fatty acids as a practical method of producing pure unsaturated fatty acids," by the University of Helsinki, Viik, Malmi. Amount: $70,500. Approved Feb. 1960. Address: Asst. Director, Foreign Research and Technical Programs Div., ARS, USDA.

4843. Claiborne, Craig. 1962. Food news from Noda: Soy sauces. *New York Times.* June 4. p. 24.
• ***Summary:*** The writer, on a trip to Japan, is now visiting Noda and Kikkoman, maker of one of Japan's finest soy sauces, "which, within recent months, has become widely distributed in the United States.

There are two Kikkoman soy sauce plants in Noda. One, which covers several acres, is equipped with the most modern processing and bottling equipment. The other is a picturesque, ancient building at the edge of a lake encircled by iris. Here, "soy sauce for the imperial household is made almost entirely by hand." The soy sauce is fermented in wooden vats, whose outside is painted vivid tangerine red and bamboo green.

Behind the soy sauce made in Noda stands a wealth of tradition, for here (as family records show) the Mogi family has supervised the production of soy sauce for three centuries. The current president of the company is Keizaburo Mogi, a tall gentleman, who takes pride in showing the writer around the premises. Yuzaburo Mogi, his son, age 27, also a company officer, earned his master's degree last June in business administration at Columbia University (New York City).

The company now makes 55 million gallons per year of soy sauce, of which about 3% is shipped to the USA, and much of that to Texas, where it is popular at barbecues.

The process for making soy sauce is described. The moromi mash is fermented for 12-18 months, until it has fully matured.

Soy sauce is believed to have originated in China and to have been introduced into Japan in 552 A.D. together with Buddhism. At that time, the seasoning was named *hishio,* "and like salt in ancient Rome, was supplied to civil and military officials of the Imperial Court as part of their salary."

It was not until about 1532 that the word shoyu, the present name for soy sauce in Japan, came to be used. The soy sauce plant at Noda was started about 100 years later.

Formerly, China was the chief supplier of soy beans to

© Copyright Soyinfo Center 2014

Japan. Today the great majority of soy beans used at Noda are imported from Illinois and Iowa. Address: Special to the Times.

4844. Fukushima, D. Assignor to Noda Industrial Science Research Institute. 1962. [Modification of alcohol treatment of soybeans for fermented products]. *Japanese Patent* 6313. June 28. [Jap]*
• ***Summary:*** Describes solvent extraction using ethyl alcohol. Address: Kikkoman.

4845. Tokunaga, T.; Yoshitomi, K.; Akioka, A.; Yamamoto, S. Assignors to Nisshin Oil Mills. 1962. [Deodorization and improvement of digestibility of defatted soybean flour]. *Japanese Patent* 6315. June 28. [Jap]*

4846. Schroeder, Peter B. comp. 1962. Japanese serial publications in the National Agricultural Library. *USDA Library List* No. 72. iii + 172 p. June. No index. 28 cm. [1100* ref]
• ***Summary:*** Names of Japanese serials and publishers are written in both Romaji (English transliteration) and Kanji (Chinese characters). Part I: Publications dealing with multiple agricultural subjects (p. 1-39). Part II: Publications dealing with specific subjects (p. 41-124). Part III: Alphabetic list of publications (p. 125-48). Part IV. List of publishers (p. 149-72).

"For nearly a century the National Agricultural Library has continuously received Japanese publications. It maintains a Japanese collection of more than 1,100 serials and 5,000 monographs in biological and agricultural fields, which is believed to be one of the largest collections of its kind in the world... The present bibliography contains serials that are currently received or have been received at the National Agricultural Library." Address: National Agricultural Library (NAL), Beltsville, Maryland.

4847. Shibasaki, K.; Hesseltine, C.W. 1962. Miso fermentation. *Economic Botany* 16(2):180-95. June. [32 ref]
• ***Summary:*** The role of miso in the Japanese diet is reported. The *Aspergillus oryzae* strain used for miso and sake has high amylolytic as well as proteolytic action. (That used for soy sauce has high proteolytic action). In miso fermentation, the koji starter is prepared by inoculating trays of cooked rice and vegetable ash. After good growth, the fungus is dried without killing its spores. Cooked soybeans are mixed with rice, salt and the koji starter. Chemical changes during fermentation are reported. Many microorganisms are present in miso. Address: 1. College of Agriculture, Tohoku Univ., Japan; 2. NRRL, Peoria, Illinois.

4848. Taylor, Clifford C.; Singh, Bhagwant. 1962. The competitive position of Maryland soybeans. *Maryland Agricultural Experiment Station, Bulletin* No. 473. 73 p. June. [14 ref]
• ***Summary:*** Contents: Summary. 1. Competition in price: Production expansion at lower prices, substitution and prices. 2. Competitive position in total consumption: Consumption of soybean meal. 3. Competitive position of oil in end products: Margarine, shortening, drying oil products, soap. 4. Competitive position of meal in feeding. 5. Competitive position in export markets: Potentialities of Africa as a competitor of United States soybean oil in Europe, competitive position of United States soybean oil in Asia, competitive position of United States soybean oil in Latin America, competitive position of United States soybean oil in Oceania, recapitulation. Appendix. Contains 39 tables and 6 figures.

"The soybean market has become of prime importance to growers on the Eastern Shore of Maryland. Here, as in nearby areas of Delaware and Virginia, soybean production has multiplied very rapidly within recent years." Address: Dep. of Agricultural Economics.

4849. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1962. U.S. exports of soybeans, edible oils and meal rose in April. 85(2):20-21. July 9.
• ***Summary:*** Major markets for U.S. soybeans in April, with their percentages of total exports were: Japan 28, Canada 24, the Netherlands 17, and West Germany 14.

4850. Arai, Michio; Taga, Takashi. Assignors to Seiichi Ogura. 1962. [Coating leather exposed to solvent vapor]. *Japanese Patent* 8059. July 12. Application filed 18 April 1959. 2 p. (Chem. Abst. 59:7764d). [Jap]*
• ***Summary:*** Soybean oil is the main ingredient used to make a product for coating leather. This product is more insoluble in common solvents than ordinary mixed oils of animal and vegetable origin.

4851. Aruyama, K. 1962. [Yogurt from soybean]. *Japanese Patent* 9262. July 25. [Jap]*

4852. Fujiwara, Kozo; Tokuda, M.; Nanba, A. 1962. Shôyu chû no amino-san ni kansuru kenkyû. II. Tennen jôzô moromi ni okeru shuyô amino-san no shôchô [Studies on amino acids in Japanese soy sauce. II. Changes in the amounts of the main amino acids during the ordinary moromi (mash) process]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 40(7):327-32. July. [6 ref. Jap; eng]
• ***Summary:*** The term "ordinary moromi (mash) process" refers to the natural fermentation process. Changes in free amino acids were studied by microbioassay. Considerable amounts of free arginine disappeared during maturation of the mash. The amounts of free isoleucine, leucine, methionine and phenylalanine steadily increased in the course of maturation from the beginning of the mash process to the 396th day, while free glutamic acid, glycine, lysine and

The contents of amino acids in soy sauces of various types]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 40(7):321-27. July. [13 ref. Jap; eng]
• ***Summary:*** "The contents of 10 amino acids (arginine, glutamic acid, glycine, isoleucine, leucine, lysine, methionine, phenylalanine, threonine, valine) in soy sauces of various types were determined by microbiological assay methods. Each amino acid content was expressed in mg/ml of soy sauce whose total nitrogen content was converted into 1%. Arginine contents in fermented soy sauces and 'aminosan-eki' (chemical hydrolyzate of protein-containing materials) were 0.7 mg/ml and 3 mg/ml, respectively. Glutamic acid contents in 'kiage' (fermented soy sauce), 'tamari' (ditto) and 'sokujo' (quickly fermented soy sauce) were about 8.5 mg/ml, 6.5 mg/ml and about 4.7 mg/ml, respectively. 'Aminosan-eki' contained 8.5 mg/ml or more of glutamic acid, while 'II go aminosan-eki' about 5 mg/ml." Address: 1-2. Osaka Univ., Japan; 3. Osaka Joshigakuen Junior College.

4859. Grow, Howard E. 1962. Market development activities in Japan: Progress report. *Soybean Digest.* Sept. p. 36-37.
• ***Summary:*** Contents: Introduction. Low sales cost. New Oil Organization. Quality as improved.

Of the cost of selling soybeans to Japan, 78.2% is borne by the USDA Foreign Agricultural Service; the remaining 21.8% is borne by the American Soybean Association. The sales cost is less that 1 cent (0.898 cents) per bushel.

"The oil industry in Japan formed a new organization known as the Fats and Oils Association in January. All of the members of the former Fats and Oils Manufacturing Association and all other crushers are members of the new association. The consumption of edible oil in Japan is only about 12 pounds per capita in comparison with 64 pounds in the United States. This level of consumption is low, but has risen considerably since the initiation of the market development program."

"The quality of soybeans received in Japan from U.S. shippers has improved. This is particularly true in respect to lower content of foreign material. More improvement is needed. A considerable volume of the imports of U.S. soybeans now is on a varietal basis. There is room for more imports on the basis of variety.

"Two research projects on soybeans, in cooperation with industry groups in Japan and under contract with Agricultural Research Service, are now under way in Japan. These two projects are with shoyu and miso, and will continue for several years." Address: Asst. to Executive Vice President, American Soybean Assoc.

Summarized as "Chinese soybeans static" in Soybean Digest, June 1963, p. 24. [11 ref]
• ***Summary:*** Since its founding on 1 Oct. 1949, the PRC has sought rapid industrialization and development of heavy industry. Most modern machinery and technology must be imported from advanced countries, using income from farm exports.

Table 12, titled "Export summary: Communist China's principal agricultural exports, 1955-1960" (p. 26), gives statistics (by weight only) for soybeans, peanuts, other oilseeds (sunflower seed, rapeseed, sesame seed, castor beans, cottonseed), tung oil, other vegetable oils (peanut oil, soybean oil, cottonseed oil, rapeseed oil, castor oil), rice, fresh fruit (apples, oranges, bananas, grapes), tea, and tobacco. The two largest exports by weight in 1960 were rice and soybeans. Soybean exports (in 1,000 metric tons) were: 1955–950.1. 1956–970.4. 1957–972.1. 1958–944.0. 1959–1,279.9. 1960–1,011.6.

The United States and Communist China do not trade with each other, but they compete in world export markets. "Sino-U.S. competition is sharper for soybeans than for any other product."

Table 13, "Soybeans: Communist China's exports, as recorded in available data of importing countries, 1955-60, in 1,000 metric tons." The importing countries are divided into two groups: "Free world" and "Soviet bloc." In 1955 the three leading importers were: Soviet Union (483.6), Japan (203.5), and West Germany (90.4). In 1960 the four leading importers were: Soviet Union (351.0), West Germany (212.0), Denmark (126.0), and Italy (110.0). Address: Regional Analysis Div., ERS, USDA.

4864. Wanamaker, George E. 1962. Marketing soybean oil, soybeans, and soybean meal in Cyprus, Lebanon, and Malta. *USDA Foreign Agricultural Service.* FAS-M-141. 43 p. Sept.
• ***Summary:*** Discusses U.S. foreign trade with these three countries. Contains an appendix on Jordan–but soy is not mentioned in it. Malta, an area within the British Commonwealth, has a general economy that is closely tied to military and naval expenditures of the United Kingdom. Malta's excellent deep seaport of Valletta has port-handling and bulk facilities for grains and vegetable oils. Malta imports each year with free currency over 3,000 tons of crude degummed soybean oil in bulk, and about 2,000 tons of margarine and shortening. From its excellent, relatively new refinery, Malta re-exports fully refined soybean oil to neighboring countries. "U.S. crude soybean oil was exported directly to Malta for the first time in 1960... Following a gradual introduction of 500 to 1,000 tons of soybean meal, import requirements for this high-amino-acid meal could average 5,000 tons a year by 1965, especially if the planned 30,000-unit poultry farms are set up. The United States, which is currently delivering bagged soybean meal to Greece, can export soybean meal to Malta at a per-protein-unit price that is competitive with other proteins now being imported.

"Imports of crude soybean oil, begun in 1958, have now all but replaced other seed oil imports. Refined soybean oil has been supplied primarily by Denmark, the United Kingdom, Japan, and the Netherlands. Crude degummed soybean oil is currently being imported from Denmark and the United States, but in earlier years it had originated from Israel and Japan.

Table 10 (p. 33) shows Malta's imports of selected animal fats and vegetable oils, 1957-1961. In 1957 Malta imported 1,228 tonnes (metric tons) of refined soybean oil and no crude soybean oil. In 1958 the country imported 1,440 tonnes of refined soybean oil and 1,446 tonnes of crude soybean oil. In 1961 (preliminary figures) Malta imported 43 tonnes of refined soybean oil and 3,186 tonnes of crude soybean oil.

Page 35 states: "The vegetable oil industry of Malta is represented by The Edible Oil Refining Company, Ltd., with its plant at [72 Merchants Street] Marsa, a suburb of Valletta. The refinery has always concentrated on the refining of crude degummed soybean oil, imported primarily in bulk from Western Europe." Photos show the refinery. Soybean cultivation in Malta is not mentioned.

Note: This is the earliest document seen (Feb. 2001) concerning soybean products (soy oil) in Malta. This document contains the earliest date seen for soybean

© Copyright Soyinfo Center 2014

products in Malta (refined soybean oil in 1957); soybeans as such had not yet been reported by that date. Address: Fats and Oils Div.

• ***Summary:*** The main sugar was glucose and it constituted about 70% of the total sugar. Address: Dep. of Agricultural Chemistry, Faculty of Agriculture, Tohoku Univ., Sendai, Japan.

4866. *Yin Yang: The Unifying Principle* (*Chico, California*). 1962. Useful addresses. p. 38. Sept.
• ***Summary:*** Chico-San's address is given as "1364 Mangrove Ave., Chico, California."

Other organizations whose addresses are given: Japan: Nippon (C.I.). Shinsei-Kai (C.I.). Anbara (C.I.). U.S.A.: Ohsawa Foundation (Chico, Calif.). Mr. Michio Kushi (562 Fifth Ave., New York 36, N.Y.). Azuma Inc. Mr. Tommy Nakayama (2486 Silverlake Blvd., Los Angeles, Calif.). Musubi Restaurant (61 W. 56th St., N.Y.). South America: Casa Longavida (Liberdada, Sao Paulo, Brazil). India: Mr. R.T. Saklath (9 Grant Lane, Calcutta 12, India). France: "Sesam" (Paris). "Longue Vie" (Paris).

Note: This is the earliest document seen (May 2011) that shows Chico-San as having an address on Mangrove Ave. in Chico, California.

4867. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1962. Japan may postpone liberalization of soybean oil and meal. 85(14):22-23. Oct. 1.
• ***Summary:*** "The Japanese Government may postpone action on the liberalization of imports of soybean oil and soybean meal from the scheduled date of October 1 to at least April 1, 1963, (*Foreign Crops and Markets,* July 16, 1962.)

"Domestic oil manufacturers maintain that the 13 percent levy on soybeans, which were liberalized July 1, 1961, is too high. Domestic oil, manufactured from imported soybeans, will hardly compete with imported soybean oil at current prices, even though the import tariff on oil may be raised to a specific duty of 28 yen per kilogram (3.5 cents per pound) from the current temporary *ad valorem* of 20 percent.

"The soybean crushers have been appealing to the government for some time to reduce, or preferably eliminate, the 13 percent import duty on soybeans. The government is considering the recommendation of the Food Agency, which reportedly is in favor of a reduction. The tariff rate will be studied and a decision is expected to be made by April 1, 1963."

4868. Sakakibara, Shigeru; Yamanishi, Nobuo. Assignors to Japan Reichhold Chemicals, Inc. 1962. [Modified xylene-formaldehyde resin]. *Japanese Patent* 16,196. Oct. 10. Application filed 28 April 1961. 3 p. (Chem. Abst. 59:6589g). [Jap]*
• ***Summary:*** Soybean oil fatty acids are used to make the resin.

4869. Nakamura, Hiroshi. 1962. Problems of Japanese processors. *Soybean Digest.* Oct. p. 12-15.
• ***Summary:*** Per capita consumption of edible oils plus shortening and margarine has increased from 2.5 pounds in 1936-39 (average), to 13.2 lb in 1961. A photo shows the Hohnen Oil Mill plant at Shimizu, Japan.

4870. *Soybean Digest.* 1962. Japan is best U.S. market. Oct. p. 26.
• ***Summary:*** This is the summary of a report titled "Japan, the American Farmer's Best Export Market," published by the United States-Japan Trade Council, 1000 Connecticut Ave., Washington 6, DC. The report's date of publication is not given. "Japan is the best U.S. customer for soybeans, purchasing $100 million worth in 1961." Sales have doubled since 1956, the year the Japanese American Soybean Institute was established. Japan presently imports more than 75% of the soybeans it consumes.

A graph shows U.S. exports to Japan (in million bushels) from 1952 to 1961, with two lines projecting future growth. These imports have grown from 10 million in 1952, to 20 million in 1956, to 40 million in 1960, with a possibility of 65 to 80 million by 1968.

4871. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1962. Japan buys soybeans from mainland China. 85(21):20. Nov. 19.
• ***Summary:*** "Japan's purchases of soybeans at the Canton trade fair this fall were unofficially reported as of November 1, 1962, at 60,000–70,000 metric tons. However, as of the date reported, the fair was only half over and further sales were expected.

"It is also reported that Hong Kong is now buying Chinese beans at the rate of 1,00–1,500 tons per month. Prices at which these transactions are being made are not readily verifiable."

4872. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1962. Mainland China sells more soybeans. 85(22):14. Nov. 26.
• ***Summary:*** "On November 15, trade sources reported the sale by Mainland China of 32,000 tons (1.2 million bushels) of soybeans, of which 22,000 tons (0.8 million bushels) were sold to Europe. The destination of the remainder was undisclosed.

"This is in addition to the 60,000–70,000 metric tons

© Copyright Soyinfo Center 2014

(2.2–2.6 million bushels) which Mainland China reportedly sold to Japan at the Canton Fair."

"Current official trade reports indicate that Mainland China will have about 220,000 tons (8.1 million bushels) of soybeans available for export to Japan during the current year. This indicates a sharp decline from the 390,000 tons (14.3 million bushels) estimated earlier by unofficial sources. according to a trade publication China exported about 6 million bushels of soybeans to Japan from the 1961 crop."

4873. Morimoto, Saichi; Ishihara, M.; Yamamoto, A.; Hamada, K.; Imai, K.; Otsuka, M.; Murakami, H. Assignors to Toyo Spinning Company, Ltd. 1962. [Graft copolymerization of proteins with acrylonitrile]. *Japanese Patent* 18,387. Nov. 28. 2 p. Application filed 3 Feb. 1961. (Chem. Abst. 59:7721a). [Jap]*
• ***Summary:*** Soy protein is dissolved in dilute alkali, then processed to make a polymer, in the form of a light yellow powder with excellent dyeability.

4874. Grow, Howard E. 1962. Japanese American Soybean Institute: JASI expands scope of operations. *Soybean Digest.* Nov. p. 22.
• ***Summary:*** This fall, for the first time in 4 years, representatives of ASA, FAS, JASI and the agricultural attache have been able to sit down together and review the accomplishments of the JASI program.

"The program has expanded in its scope of operation with new organizations cooperating in the activities. The National Oil and Fat Dealers Federation has started an educational program to create use of more oil, through the wholesale and retail sellers of oil. The noodle industry has asked to cooperate in the program and are planning the use of soy flour in noodles. The Nutrition Improvement Popularization Institute has initiated a program to promote the use of soy flour in various institutions for children."

Also discusses: The operation of kitchen buses. The Tofu Association is using one bus to give 40 demonstrations per month. Some prefectural governments have purchased buses to operate on a full-time basis.

The School Lunch Association and the education department have tested the use of soy flour in rolls served to several thousand elementary and junior high school students. Questionnaires indicate that the rolls have been very well accepted.

Factory feeding: Nutritionists are promoting the use of soy oil and protein in the lunches of factory workers.

"The feeding tests using soybean meal as a supplement for fish meal in poultry rations are being continued."

Soybeans are now imported by importers without prior approval of the government. There is a 13% duty on all soybeans imported which protects domestic soybean farmers. Address: Assistant to the Executive Vice President, American Soybean Assoc.

4875. Watanabe, Tokuji; Nakayama, Osamu. 1962. Daizu no sui-chûshutsu tanpakushitsu ni kansuru kenkyû [Study of water-extracted protein of soybean]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 36(11):890-95. Nov. [19 ref. Jap]
Address: Food Research Inst., Ministry of Agriculture & Forestry, Japan.

4876. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1962. Japan-Communist China conclude 5-year trade agreement. 85(25):15-16. Dec. 17.
• ***Summary:*** "A Japanese economic mission to Communist China has concluded a trade agreement whereby Japan will import 700,000 metric tons (25.7 million bushels) of soybeans from China over a 5-year period."

"The quantity covered in this agreement is said to be in addition to the 71,500 tons (2.6 million bushels) bought by Japanese firms at the Canton Trade Fair (*Foreign Crops and Markets,* November 26, 1962)."

4877. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1962. Japan to implement soybean agreement. 85(26):18. Dec. 24.
• ***Summary:*** "Japanese importers are preparing to implement the agreement to buy 150,000 metric tons (5.5 million bushels) of soybeans from Communist China for 1963 delivery (*Foreign Crops and Markets,* December 17, 1962). Procurement of the first half of the quantity, or 75,000 tons, was to be committed by December 15, and the other half by January 15.

"The Japan-Communist China Trade Council had sent notices to all principal soybean users asking each to specify the quantity of beans each firm would guarantee to buy. If the total exceeded 75,000 tons for the first portion, there would be pro-rata sharing."

"It was expected that the miso (soybean paste) manufacturers would take as much as they could use, since Chinese beans have traditionally been favored for miso making. However, their annual capacity is only about 100,000 tons (3.7 million bushels). The oil crushers, on the other hand, are reluctant to buy the Chinese beans... As the oil content of the Chinese beans is lower than that of U.S. beans, the crushers do not want to pay an equal price. The Chinese had refused, at least until recently, to concede (about $7 per ton differential was requested) on this point. Whether the crushers will 'cooperate' despite this disadvantage is unknown."

4878. *Foreign Agriculture.* 1962. Japan expects to import more soybeans in 1962-63. 26(12):23. Dec.
• ***Summary:*** Japan, the single largest outlet for U.S. soybeans, buys 83% of its needs from the USA. A 13% duty on imported soybeans is now in effect, but Japanese soybean

• ***Summary:*** n-Butyl p-hydroxy benzoate is widely used as a preservative for soy sauce, but this material is enzymatically decomposed in raw soy sauce. This enzyme is produced by Asp. sojae and has the following characteristics: It is a kind of esterase and its optimal pH is 6.0. It is almost inactivated after heating at 50ºC for 10 minutes, but in the presence of sodium chloride this enzyme inactivation is altered. The longer the period of aging of soy sauce mash, the more the enzyme activity is depressed. Address: Central Research Inst. of Noda Shoyu Co., Ltd., Noda, Japan.

4881. Olson, Harvey Stuart. 1962. Olson's Orient guide [1st ed.]. Philadelphia, Pennsylvania and New York: J.B. Lippincott Co. 1008 p. Illust. (by Cy Ferring). Maps. Index. 20 cm. 1st ed., 1962 [1963].
• ***Summary:*** In Chapter 5, "On dining out in the Orient," we read (p. 229): In Japan, much loved and widely consumed items include "bean sprouts and pastes [miso] and sauces made from soy beans." The Japanese, like many "foreign visitors are fond of sukiyaki made of thin beef strips simmered in a tasty soy sauce garnished with fresh vegetables, served with a raw egg, and accompanied by rice. They enjoy tempura, too,..." The dip is made of finely grated radish [daikon] "and spicy soy sauce."

The section on "Chinese cuisine" states (p. 236): "Cantonese which is the blandest, most subtle, and least greasy of the varieties of Chinese cooking..." Features "bean curd and minced pork."

The section titled "Japanese specialties" (p. 245+) starts with Sukiyaki (One "bowl contains small pieces of lotus root, scallions, bamboo shoots, bean curds, mushrooms, and other greens," p. 246). Also (p. 249) "Batayaki is the first cousin to sukiyaki," but with the difference that "batayaki is prepared with a sauce less pungent than that used for sukiyaki." This sauce has "a soybean base, but mixed liberally with butter" [*bata*].

The entry for "Soy sauce" (p. 252) taken from the Random House *American College Dictionary* "defines soy sauce as 'a salty fermented sauce much used on fish and other dishes in the Orient, prepared from soy beans.' I cannot emphasize too strongly how important a part this sauce plays in the Japanese cuisine. It is not only used in connection with fish but as a sauce for sukiyaki. It is also used generously in preparing chicken and steak and is utilized as a garnish as well as an ingredient.

"As a matter of fact I can think of no place where this tasty bit is not likely to appear. I. for one, like soy sauce." However. if you wish, you can ask your waiter to omit it.

The section on Thailand (p. 278-79) notes: *"Haw Mok,* a flaming hot Thai specialty, is made by pounding dry chili peppers, shrimp paste, lemon grass, onions, garlic and salt, and blending them with steamed coconut milk and soy sauce decorated with egg and slices of raw fish. It is served in a large banana leaf."

The section on night clubs in Osaka, Japan says of Yen Kyo (p. 312). "Another quality Chinese restaurant... Taste the spring rolls, the chicken in papers, and the vegetable bean curd dishes."

In Chapter 12, "Japan," the section on Tokyo states (p. 692): "One can eat squid, lotus roots, roasted sparrows (head, claws and all), raw lobster, embryonic eggs on a stick, cuttlefish painted with soy sauce, blowfish, mud eel, mock turtle, fermented bean curd, bamboo shoots, and quail's eggs,..."

• ***Summary:*** The section titled "Japan: Manufacture of milk from soybeans" (p. 643) states: A former major in the Imperial army, Mr. Fujita, has found a way to furnish the Japanese population with an economical milk without increasing the importance of dairy animals. The milk which Fujita calls "Milkis" has a major advantage–its price is only one-third as much as that of cow's milk and the Department of Defense has created a pilot plant for the monthly production of 20,000 bottles (*flacons*) of this milk.

The milk is made from soybeans by a process which takes only 30 minutes. The national organizations which are working to develop the consumption of milk in this population are very interested in this new process. Address: Ingénieur E.P.C.I.

• ***Summary:*** Includes crucial work on topics like the development of the plough, irrigated rice cultivation, cotton growing, etc. Very reliable on sources, but factual rather than interpretative.

4898. Anson, M.L. 1962. Oilseed proteins in foods. *Archives of Biochemistry and Biophysics.* Supplement 1. p. 68-77. [23 ref]
• ***Summary:*** "A major occupation of man is to feed plant materials to animals and to use the animals as a source of animal protein foods. It is now possible, by applications of modern biochemistry and technology, to feed oilseed materials into a factory and to come out with protein foods similar to animal protein foods in nutritional value, taste and texture.

"Protein technologies were developed in the Orient thousands of years ago to produce products such as soybean curd and fermentation foods which still play a big role in the protein economies of hundreds of millions of people. The modern oilseed meals now produced at very low price give promise of being very useful in the fight against protein malnutrition in poor countries."

"During World War II, Henry Ford, who had the soybean religion, made large amounts of good 'ice cream' entirely from soy protein and fat, until he was stopped. The Chinese have a variety of cheese made from soybeans."

In the section titled "Ancient foods based on oilseeds," the author discusses soy milk and bean curd (tofu) in detail. He notes that traditional fermented foods serve primarily as a source of flavor, and perhaps of vitamins. "In Japan today scores of thousands of factories, big and little, make the traditional soy foods. These factories use up not only local soybeans but almost 10% of the huge American crop. The Japanese eat much more soy protein than meat protein."
Address: 100 Eaton Square, London, S.W.1, England.

• ***Summary:*** Contents: I. Introduction: World production (958,275,000 bushels in 1960), United States production trends, utilization (processing to obtain oil and meal, hay and green manure). II. Soil and climatic adaptation: Areas of production in the United States, soil requirements, climatic adaptation (effect of temperature on plant growth, effect of temperature on composition of seed, effect of light on plant growth, effect of photoperiod on flowering and maturity, effect of soil moisture on growth). III. Time of planting and varietal adaptation: Effect on plant characters (maturity, plant height, lodging, seed quality, size of seed, seed yield), effect on composition of the seed. IV. Planting methods and equipment: Seedbed preparation (conventional, minimum tillage, deep tillage), row width and planting rate (row width, planting rate), double cropping (after fall-sown grain crops, after peas), special methods of planting, types of equipment. V. Rotation practices and erosion control: Effect on soybean yields, effect on the following crop, effect on weed population, soil residues from herbicides, erosion control. VI. Weed control: Effect of planting time on plant growth and weed competition, methods of cultivation, chemical weed control (pre-emergence herbicides, post-emergence herbicides). VII. Seed quality and seed treatment: Factors affecting seed quality and germination, seed treatment. VIII. Nutrient requirements: Nitrogen requirements and nodulation (effectiveness of nodulation as a source of nitrogen, methods of inoculation, survival of bacteria in the soil, effect of seed treatment on inoculation, effect of nitrogen applications), liming and pH levels (pH and plant development, calcium and magnesium requirements), phosphorus, potassium,

© Copyright Soyinfo Center 2014

trace elements, fertilizer practices and recommendations. IX. Water requirements and utilization: Water needs in relation to plant growth and development, irrigation and soil management. X. Growth-regulating chemicals. XI. Harvesting: When to harvest, harvesting methods. XII. Seed storage. XIII. Discussion. The USA now produces about 57% of the world's soybeans, followed by China (PRC; about 33%), Indonesia, Japan, Korea, USSR, Brazil, and Canada, in that order. By 1920, U.S. production was 3,000,000 bushels and the leading states were North Carolina, Virginia, Alabama, Missouri, and Kentucky–North Carolina producing 55% of the total. By 1931, the center of production had shifted to the North Central States, where it is at present. Address: 1. United States Regional Soybean Lab., Urbana, Illinois; 2. Stoneville, Mississippi.

• ***Summary:*** Contents: Price. Quality. Margarine and shortening. Mayonnaise. Miso, shoyu, tofu. Soybean meal. Soy flour. Soy milk. Frozen tofu. Food sources of Japan.

The 400,000 tons of soybeans produced in Japan are used for foods. From approximately 1 million tons of imported soybeans, Japan produces 150,000 tons of oil and 700,000 tons of meal. "Japanese oil consumption is the

© Copyright Soyinfo Center 2014

poorest [i.e. lowest = best] among the world nations. We need to consume oil at more than 5 times the present quantity to reach the level of the western countries." In 1952 Japanese consumption of edible oils was 7.52 gm per person per day, increasing to 11.52 gm in 1960. Soybean oil supplies about 30% of Japan's total oil supply. The main obstacles to greater consumption are price and quality (due to flavor reversion). The leading oil is rapeseed oil. The main oils used in margarine and shortening are fish oil (35.8% of total), beef tallow (25.4%), whale oil (10.0%), and coconut oil (8.0%).

New developments with traditional Japanese soy foods include: Dried, powdered miso in instant form is now available. Soybean meal is now the main ingredient in shoyu, rather than whole soybeans. A few soy milk plants have been erected and bottled soy milk is now sold in the market in limited areas. A certain culture is used to eliminate the beany flavor. Today, soybeans and soybean products provide the average Japanese with 10.6 gm/day of protein (16% of total protein consumption of 67.7 gm), and 7.6 gm/day of fat (28% of total fat consumption of 26.7 gm). During the period 1934-38, average Japanese protein consumption was 54.9 gm per person per day and fat consumption was 13.2 gm (less than half what it is today). Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, Room 410, No. 1, 1-Chomo Yurakucho, Chiyoda-Ku, Tokyo, Japan.

Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 93-98.

• ***Summary:*** "For many years, the Department was financing with dollars a farm research program abroad."

"A considerable expansion of our foreign research program was effected a few years ago under Public Law 480. This program of research is financed with foreign currency accruing to the United States from the sale of surplus agricultural commodities, and, in a sense, trades surpluses for research results. Research in the field of economics, forestry, farm, marketing and utilization is carried out under this program. Projects are selected for financing which are of direct interest to the United States and also of interest to the foreign country.

"At the present time, 195 grants or research agreements have been executed in 20 countries in Europe, Asia, and Latin America. Funds are available to initiate programs in an additional 6 countries. Proposals from most of these countries are being processed at the present time. The annual cost of the grants already executed amounts to about the equivalent of $2-2½ million in foreign currency annually. Substantial funds are available for the expansion of this program.

"The Public Law 480 foreign research program is being administered by the Foreign Research and Technical Programs Division, Agricultural Research Service, U.S. Department of Agriculture, in Washington. A regional office has been established in Rome, Italy, to negotiate the costs of grants and administratively supervise the program in Europe and the Near East. A regional office has been established in New Delhi, India, also, to carry out the same functions in the Far East.

"The technical phases of the program–that is, the approval of projects on which grants are executed and the review of progress reports–are handled by the various research divisions in the Department. For example, all projects on the utilization of soybeans fall under our Northern Utilization Research and Development Division. All those dealing with the nutritional aspects of soybeans as a food are under the jurisdiction of the Institute of Home Economics.

"Ideas for new research projects may come from within the Department, from research organizations abroad, from our Research and Marketing Advisory Committees, from national commodity organizations, or from the processing industry. We are indebted to The Soybean Council of America for the interest it has taken in developing our research program on soybeans abroad. The Council has stimulated many foreign research groups to submit projects on improving uses for soybeans. It has brought to our attention, also, important problems on soybeans that need attention.

"In developing a program on soybeans we have been faced with the problem that most countries in which we have funds have had practically no knowledge or experience on the uses of soybeans, and have conducted very little research on their utilization. The opportunity has been very limited for financing research on the utilization of soybeans in laboratories with background experience on its products.

"Fortunately, the activities of UNICEF and FAO, on increasing the protein level of the diet in the developing areas of the world, and the powerful market development program of The Soybean Council of America, have stimulated great interest in many countries on the usage of soy products in the diet. These efforts have facilitated the development of our research program on soy products.

"As the primary emphasis of this conference is on soybean products for protein in human foods, the research work we are financing on soybean oil and fatty acids will not be discussed here. My talk will cover only those projects dealing with soybean proteinaceous foods, and with minor components in soy flour or soybean products which may affect their food value. A dozen or more projects of this kind, in half a dozen countries, are underway or will be shortly.

"At the National Institute of Nutrition in Rome, Italy, we have executed a grant with Professor Visco to finance research on the use of soybean protein products as

© Copyright Soyinfo Center 2014

supplements to wheat flour production of pasta, such as spaghetti and macaroni. The southern part of Italy depends to a large extent upon cereal grains as the main staple of the diet. Raising the protein level and quality of the diet in Italy could be done readily by increasing the protein content of pasta with soy protein products. Professor Visco has set as his objective an increase of 10 percent in the soy protein content of pasta. He believes this amount of soy protein in pasta would provide all the essential amino acids necessary for good nutrition. The Institute has produced pasta containing 10 percent by weight of soy protein. Pasta containing the type of commercial soy protein used was unaltered in cooking quality, but had a slight gray cast and slight change in flavor. The effect of lowering the content of soy protein on color and flavor of pasta is now being investigated. The effect of other sources of commercial soy protein on color and flavor will be studied, also. Professor Visco is interested in following up these studies by conducting nutritional investigations on groups of school children, using pasta fortified with soy protein.

"In Japan, we are negotiating a grant with the Food Research Institute, in Tokyo, for research on dried tofu. Fresh tofu is the most important soybean food in Japan. On a dry basis, its protein content ranges from 50 to 60 percent, and fat content from 21 to 50 percent. It has a bland flavor. It is eaten as such usually with soy sauce. Slabs are deep-fat fried [tofu], also, forming an envelope which is stuffed with hot rice. Fresh tofu is made in thousands of small plants, many of them family-run operations. Fresh tofu has a relatively short storage life comparable to that of fresh milk. Dried tofu, which is a spongelike product, has come into production in recent years. It has a shelf life of 6 months or longer. However, the product is inferior to the fresh product in overall eating quality.

"Under the grant to be carried out at the Food Research Institute there will be studied the varietal effect of soybeans, and variation of processing conditions on the physical characteristics and flavor of dried tofu. Fresh and dried tofu have promise in supplementing the diet in the protein deficient areas of the world.

Miso is another important soybean food used in Japan. It is produced by the fermentation of soybeans with *Aspergillus oryzae*. The most popular use of miso in Japan is in soup. Miso soup plays an important part in the standard Japanese breakfast. Because of uneven uptake of water, not all varieties of soybeans can be used, or only with difficulty, in the traditional Japanese process for making miso. Most Japanese and Chinese varieties of soybeans are better than most American varieties. In preliminary experiments conducted at the Northern Utilization Research and Development Division, in cooperation with two Japanese miso experts, it was found that dehulled soybeans or soybean grits absorbed water uniformly and yielded excellent miso. Now we are interested in following up these studies on a pilot-plant scale using different varieties of soybeans, and carrying out the fermentation under various Japanese environmental conditions. A grant on this project is being negotiated with the Central Miso Institute.

"As it is produced at the present time, miso has a relatively high salt content. Salt is used in the process to control the microbiological population. Dr. Gyorgy informs me that miso with a greatly reduced salt content might make it more suitable for feeding infants and young children. The development of procedures for producing miso containing very little salt might broaden its usefulness." Continued. Address: Director, Foreign Research and Technical Programs Div., USDA, Agricultural Research Service, Washington 25, DC.

4906. Hilbert, G.E. 1962. Foreign research program of U.S. Department of Agriculture on soybean protein products under Public Law 480 (Continued–Document part II). In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 93-98.

• ***Summary:*** Continued: A related project on miso is under consideration in Israel. This is based upon producing a miso-type product from controlled amounts of oil ranging from none to that originally present in the bean. Japanese miso contains all the oil present in the bean.

"We are negotiating one other project with the Food Research Institute in Tokyo. This project deals with the development of procedures for producing a yogurt-type product from soy milk, and obtaining information on the changes that occur in the soybean components in the transformation. It is planned to have cooperative investigations on the nutritional value of the fermented soy milk conducted at the Institute of Nutrition Research under Dr. Arimoto. Although soy milk has been used for many years in the Orient as an infant food, the expansion of its use has been very slow, particularly in the underdeveloped areas of the world. At times, difficulties have been encountered in its large-scale production due either to lack of technical knowledge or to inadequate control methods. Soy milk may cause diarrhea or flatulence in some infants.

"It is possible that fermented soy milk may have advantages over soy milk. One potential advantage of fermented soy milk is that the acid may destroy undesirable microorganisms that too often occur under unsanitary conditions in underdeveloped areas of the world. The widespread use of yogurt in the original primitive areas of Northeastern Europe and Northern Asia may well have resulted from the comparatively greater safeness and stability of this product over milk. At the present time, 45 percent of all milk consumed in the USSR is in the form of yogurt, attesting its popularity and the fact that a taste for it can be acquired. Nutritional studies conducted in Europe have

© Copyright Soyinfo Center 2014

shown that yogurt is a highly nutritious product, and that digestibility is increased during the fermentation. Likewise, the fermentation of soy milk may lead to an improvement in its food value. At any rate, our hopes are high on this project.

"Fermented proteinaceous foods are produced and used in Indonesia. Three types are tempeh, ontjom, and ragi. Tempeh was just discussed by Dr. Steinkraus. Onjom is made by fermentation of peanut press cake with molds, probably the genus *Neurospora.* It is a popular food in West Java. Ragi is produced by a yeast-mold fermentation of rice flour and sugar. Little is known about the micro organisms effecting this fermentation. Ragi is not served as food. It is used in recipes for the preparation of other foods.

"More information on the microorganisms used in the fermentations to produce ontjom and ragi, and on the composition of these products, is needed. Similar types of products might be produced using other raw materials abundant in other underdeveloped countries. Knowledge on the quality of protein produced would be helpful in determining the usefulness of such products in upgrading the protein level of the diet.

"A grant is being negotiated with the Bandung Institute of Technology, Indonesia, on the isolation of pure cultures of microorganisms present in tempeh, ontjom, ragi, and other Indonesian fermented foods produced by different manufacturers in different parts of Java, as well as other islands of Indonesia. Variations of species used by different manufacturers and in different regions for the same type of food fermentation will be investigated under this grant also.

"Studies will be made of the chemical changes and physical transformations brought about by the pure cultures. This will involve an investigation of the products produced in the fermentations including the proteins elaborated in all except the tempeh fermentation which already is receiving a great deal of attention. Pure cultures of the isolated microorganisms will be studied further and characterized at the Northern Utilization Research and Development Division.

"A number of grants on soybean protein have been executed or are being negotiated with research institutes in Israel.

"One of these deals with the effect of processing conditions on the yield and quality of isolated protein. This grant is being negotiated with Professor Zimmerman, of the Israel Institute of Technology. A great deal of work has been done in the United States and Japan on the commercialization of soy products. Large quantities are being produced, and some are being used for food purposes. However, there is need for more information on processing and drying of soy proteins, and the effect of processing conditions on flavor and nutritive value. This is the kind of research to be carried out in Dr. Zimmerman's laboratory. Also, he will study the flavor and acceptability of isolated soy protein when used in various Israeli-type foods. The effect of processing on the nutritive value of isolated soy protein will be determined by animal feeding tests.

"Although much information has been obtained by Dr. Allan K. Smith and others in the United States on the physical and chemical properties of soy protein, little is known about the complexes of protein in the bean or in the meal. There has been neglected the problem of protein complexes in the native state or formed in soybean oil meal processing operations. Whether protein-phytate complexes exist in the bean or result from interaction during processing operations is unknown. No information is available as to whether nucleoproteins, lipoproteins, and mucoproteins exist in soybeans. we have no knowledge, either, as to the interaction with protein of pigments, metal ions, and carbohydrates during processing of the beans.

"However, these changes affect the color, flavor, and (in view of the sensitivity of lysine) the nutritive value of the protein. This problem on the chemical, physical, and biochemical properties of protein complexes in soybeans will be studied under a grant which is being negotiated with Dr. Katchalski at the Weizmann Institute of Science. Dr. Katchalski's team has a worldwide reputation for the fine work they have done on the structure and modification of proteins. It is an ideal group to investigate this difficult and very important problem, the solution of which may lead to the enhancement of the food value of soy flour and soy protein.

"A grant is being negotiated with Dr. Guggenheim, at Hebrew University, on the development and biological evaluation of protein-rich foods from vegetable sources. Various mixtures of cereals with combinations of soya, sesame, sunflower, and chick peas will be studied. The nutritive value of different combinations of proteins will be assessed on growing rats. In vitro methods of measuring the essential amino acids will be made, also, and compared with levels of amino acids present in the blood of the portal veins of rats following a protein meal. Nutritional evaluation of the protein mixtures on humans will be carried out at a later stage.

"There has been a real need for the development of a rapid chemical method for measuring the biological value of proteins. Such a test would be very helpful in measuring change in nutritive value of proteins, including soy protein or flour, during processing and on storage. we are financing two studies on the development of such a method. One line of work is being carried out at the Israel Institute of Technology under Dr. Zimmerman, and the other at the University of Cambridge, England, under Dr. K.J. Carpenter.

"We are financing three basic investigations on certain minor components of soybeans which may affect the nutritive value of soy products. One of these is a comprehensive study of the simple sugar and oligosaccharides in soybeans. This work is being done at the University of Caen, France. Another investigation deals

© Copyright Soyinfo Center 2014

with a detailed study of the polysaccharides of soybeans, and is being carried out at the University of Edinburgh, Scotland, under Professor Hirst. The third deals with the isolation and characterization of saponins in soybeans and various processed soy products. This study also will include the exploration of methods for inactivating saponins in the processing of soybeans. This work is being done by Professor Bondi, Hebrew University, Israel.

"In this discussion I have summarized, briefly, the various lines of activity we are sponsoring abroad under Public Law 480 on soy protein and proteinaceous soy foods, and related investigations affecting the food value of soy products. It is hoped these investigations in countries where no work on soybeans has been done previously will stimulate additional research on soybeans, and lead to an increased recognition of the importance of soy products in the diet. It is believed these investigations will provide information that should be helpful in guiding efforts to upgrade the diet in protein deficient areas of the world." Address: Director, Foreign Research and Technical Programs Div., USDA, Agricultural Research Service, Washington 25, DC.

• ***Summary:*** "It is a new day when so many important sponsoring organizations join in evaluating the suitability of the protein of the humble soybean to meet the nutritional needs of the human subject, and to study practical ways of extending its benefits in protein deficient diets.

"In August l940, I presented a paper entitled 'The Role of the Soybean in Human Nutrition' before the American Soybean Association at Dearborn, Michigan, and predicted that the day would come when we would find an awakened interest in this country in utilizing soy products as a part of the American menu. I believe we are rapidly approaching that goal, There is now an awakening in many lands to the needs of better nutrition, and it is timely that study and research be given to how we can utilize the values of the soy protein for universal race betterment.

"Soybeans have for centuries been the chief protein supplier in the heavily populated areas of Southeast Asia. It is well to examine methods of processing and utilization as practiced in the Orient. However, the per capita utilization of soybeans has been far below their needs, ranging from 15 to 50 pounds per annum in countries like China, Japan, and Korea, largely due to the inability of agriculture to keep pace with population.

"It was in these soy-producing and-utilizing countries that I had the opportunity over more than half a century to observe their methods of preparation, and to check the results in the feeding of soy products. Considerable leafy vegetables, stems and 'roots' have to a certain extent supplemented the diet with protein, so that adults of mature age probably get adequate protein. However, the appalling infant mortality and adolescent protein deficiency diseases have stressed the need for increased rations such as may be supplied by the soybean.

"Protein has its greatest contribution during the growing years of life. Three times the amount of protein per unit of body weight is needed the first year of life compared with the adult. During adolescence and the teenage years twice the amount of protein is required till they attain their normal body weight as in after life. If individuals are well grown with ample biologic protein their chances for long life expectancy are enhanced.

"With the infant's short intestinal tract and its immature digestive juices, foods have to be reduced to liquids to be usable. Consequently, a liquid food beverage, if supplied in sufficient quantity and quality, enables normal growth to proceed rapidly. Without it, growth is stunted; anemia, infection follows and many do not survive these years of inadequate food intake. Those that survive childhood often die early in life of degenerative diseases.

"The need of liquid nourishment following birth is evident from the fact that all mammals, including the human, have no provision for taking solid food, so as a starter food a lacteal secretion is by nature supplied, and to meet the need of the growing years of the human, various animal milks have been used. However, the supply is meager in the Afro-Asiatic countries.

"My attention was called to soybeans as a dietary food upon reaching China and living on Chinese cuisine. It was some 20 years later, in 1925, that I embarked on the development of a liquid beverage from the soybean. Considerable progress has since been made in improvement of such a food beverage and its use. However, it is only a few areas where nutritional use is made of soy milk, and much remains to be done in its improvement and distribution to combat malnutrition.

"The Oriental approach to processing the soybean is entirely opposite to that of the west. Western countries process the soybean by grinding it into fine flour after dehulling, and screening through very fine 200- or 500-mesh screens, or shall we call it, the milling operation. While in lands where soybeans have been used for centuries, they first hydrate the beans, or as we call it, use the wet-milling operation.

"In Eastern countries interest in soybeans has been primarily in its protein content, while the West has vied for

© Copyright Soyinfo Center 2014

its oil. It was my good fortune that I began my study of the soybean in the Orient where soybeans were used for human food, rather than for animal rations. Soaking the hard, dry bean was the first procedure, and it then is ground into a milklike slurry. The whole soybean is given a water soak for 8 hours, or after dehulling a water bath for 2 hours. In either case the bean doubles its original weight by water intake. It is then ready for the milling operations. This is accomplished with stone buhr mills, or disintegrators, that break up the continuity of the fiber, and expose its nutrient particles of protein, oil, carbohydrate, vitamins, and minerals to a water wash. The water-soluble nutrients are separated from the fiber portion by filtration. The amount of water used in the slurry mix, its temperature, whether hot or cold, and also the quality of beans, determines the ratio of soluble nutrients to those still clinging to the fiber.

"In fact, there are numerous techniques to be observed to get the dispersible protein and other nutrients in the highest soluble amounts. Beans differ, as also the aging of beans. The nutrient yield is greatest immediately after harvest time. Long heat exposure in warm climates, makes for less solubility. A proper soak is of great importance; then next the grinding of the beans. A small stream of water to give a tearing, rubbing action so as to thoroughly expose all soluble ingredients is preferred to a mill with a cutting action to mince into fine particles. Before filtration this slurry should be agitated and heated, which will yield an additional 10 percent to the soluble ingredients. Several methods of filtration, such as a shaking screen, a plate and frame pres, vacuum drum filters, or centrifuges of various types can be used. A re-grind of the fiber cake and a second extraction makes possible an extra 5 to 8 percent recovery of the solubles. A possible 92 percent of protein with other nutrients in proportion has been attained by grinding and filtration methods. In practical plant operations we expect 60 to 80 percent protein recovery of the original bean. This leaves considerable nutrients in the fiber or pulp, which is then used for stock feed.

"The milky solution thus extracted is used either for cheese curds of various types, or is formulated and processed into a beverage milk–liquid or powdered. Soybeans are used in different countries in making a savory sauce, called Soy Sauce; a soup base as in Miso, or as a fermented bean as Japanese Natto. They are eaten as immature green beans in pod or shelled and are very delicious.

"Soy Milk: Trials have been made in the past to utilize soy milk by the Asiatics but for lack of proper processing methods such milk, as filtered and not formulated, was neither tasty nor nutritionally acceptable, giving rise to very unpleasant digestive responses. I have repeatedly asked in parts of China, Japan, and Korea why it was not used as a beverage, always with the same answer, that it gave rise to intestinal disturbances. So a cheese curd is used instead of milk. Curdling it into a cheese, through the use of calcium salts, vinegar or other coagulative agencies, has resulted in many savory food products. Heating this milk extract causes a scum film [yuba] to form, also very tasty, and the remaining portion is curdled and made into cheese [tofu] cakes of varying dimensions and density. All such sheets and blocks of curd receive a second cook, or are fermented, which seems to render them more digestible.

"Soy cheese or curd is easy to market and very popular, being tastily flavored and combined in the Chinese cuisine as a meat, fowl, and fish replacer. The Japanese report 70 different forms or dishes utilizing soybeans, and the Chinese even more. Out of 1 pound of soybeans they make 4 pounds of curd called Tofu.

"While we have spent some time in Indonesia we have had little experience with Tempe–a fermented soybean food product.

"My contributions had to do with developing an easily digested and highly nutritious soy milk, and processing it sufficiently to render it acceptable to both infants and adults. The extract from the bean which is rich in protein can be formulated as desired with added fat, carbohydrate, minerals, and vitamins. These properties can be varied or formulated to that of human milk, or any other type of animal milk. The final product can be made in a single strength, or condensed to double strength and canned, or spray-dried as a powder.

"Our first work in developing a formulated soy milk dates back 56 years ago when we secured a Disper mill [Dispermill], or homogenizer, to constitute a formulated liquid. This soy milk was first used in the Shanghai Sanitarium and Hospital as a table beverage for nurses, helpers, staff, and patients of the institution, and later to the baby and children's ward of the Shanghai Clinic and Hospital. Here we had baby boarders, infants kept under observation on soy milk feeding for up to 2 years. The results of this feeding was reported in the China Medical Journal of 1957. Many other farmed out research studies were made, such as at the indigent hospital in the Philippines; at the Tokyo University, and the Ohio State University in America.

"Results on the Ohio State study are shown in Figure 1.

"The first commercial development was a soy milk dairy established in Shanghai in 1935, the process used was in-bottle sterilized milk, formulated to the standard of cow's milk; also a chocolate milk; and a soy-acidophilus milk, which was extensively marketed all over the city of Shanghai up until the plant was destroyed in 1937 by the bombing of Shanghai.

"A soy milk powder plant was also fabricated there, using a local made Grey Jensen spray dryer, which also came to an end in the same way at the same time.

"There are many technical problems involved in producing a satisfactory nutritional beverage from the soybean to simulate milk, which in the few moments we have would be impossible to enter into. These are gradually being solved, such as improved color, taste,

stability, condensing as a double strength canned milk, and as an instant soluble powdered soy milk. On vacuum pan evaporation, due to the viscosity of soy milk, concentrating to more than 30 percent solids is the limit, as compared with animal milk at 45 percent solids. However, generally speaking, once a water extraction soy milk is obtained the same methods and equipment used by the dairy industry are applicable to produce it in various forms for marketing" (Continued). Address: M.D., Director Emeritus, International Nutrition Research Foundation, 11503 Pierce Blvd., Arlington, California.

4909. Miyashita, Akira. 1962. Kôri-dôfu no rekishi [History of dried-frozen tofu]. Tokyo: Japanese National Frozen Tofu Association (Zenkoku Kori-dofu Kogyo Kyodo Kumiai Rengokai). 591 p. Illust. No index. 28 cm. [Jap]
• ***Summary:*** This is the most comprehensive work ever published on the subject. Unfortunately there are few references to sources. However on page 48 is a list of early documents (mostly scrolls and books) in which Kori-dofu is mentioned, as follows: 1624-1643 *Ryôri Monogatari,* and *Kebukiso.* 1648-1651 *Teitoku Bunshu.* 1688-1703 *Wakan Shojin Ryôri-sho,* and *Honcho Shokukan.* 1711-1715 *Toryu Setsuryo Ryôri Taizen.* 1716-1735 *Ryôri Komoku Chomi-sho.* 1748-1750 *Ryôri Sankai-kyo.* 1772-1780 *Shinsen Ryôri Kondate Burui-shu.* 1781-1788 *Tofu Hyakuchi,* and *Tofu Hyakuchin Zokuhen.* 1801 *Ryôri Shinan Taizen,* and *Honso Komoku Keimo.* 1804-1817 *Nihon Ryôri-ho Taizen.* 1818-1829 *Shojin Ryôri-tsu, Ryôri-tsu,* and *Shojin Ryôri Kondate-shu.* 1830-1843 *Toyo Kondate Ryôri Hayashikumi,* and *Ryôri Dokukeiko.* 1848-1853 Morisada Manko (essays).

Concerning the origin of Shimi-dofu (p. 38-39), there is a legend that Takeda Shingen taught how to make Shimi-dofu as well as miso. The areas where Takeda Shingen lived and where Shimi-dofu is sold are about the same, so it seems likely that there is some connection. In the early Edo period (p. 41), when a money economy became more common among the people, Shimi-dofu became a side business for many farm households in the area. In 1638 in Kefukiso? (Haikai-shu), there was a mention of *Matsumaekoku Kan-dofu,* which is Shimi-dofu.

Contents: 1. Origin of kori-dofu. 2. Production of kori-dofu in the Edo period. 3. The group of kori-dofu makers in Kuzushiro of Kishu and the monopoly of selling kori-dofu in Hasa Yama-han and Ishikawa-han. 4. The leaping progress of production of kori-dofu during the Meiji period. 5. The great European war [World War I] and the natural koya-dofu industry. 6. Shinshu Koya style kori-dofu marching out to Kansai. 7. The invention of kori-dofu which expands and softens. 8. The height of prosperity of the artificial freezing method and the downfall of natural kori-dofu. 9. Kori-dofu after the Pacific Ocean war [World War II]. 10. The group of kori-dofu production workers from Tajima who work away from home. 11. Present-day kori-dofu production business. Appendix. Postscript.

Note: The history of kori-dofu as told in this book is summarized in *The Book of Tofu,* by Shurtleff and Aoyagi (see p. 226-29). Kori-dofu was highly valued as a way of preserving tofu, and as a source of work in cold, mountainous regions during the lean winter months.

• ***Summary:*** "Soybean milk is prepared in the laboratory under various conditions to discuss the effects of the amount of water added, heating temperature and heating time on its chemical composition and physical properties. When the amount of water is less than 5 times [the amount] of soybean, a part of its protein becomes insoluble and the viscosity of the milk is unusually high. The viscosity of the milk after dilution is higher than that of the milk which is diluted before heating. The chemical composition and physical properties of the milks prepared by heating before and after filtration are compared. Although the chemical composition of both milks are not so different, the viscosity of the latter milk is lower than that of the former.

"When 1.0% NaCl or 10% glucose or sucrose are added to the milk, they increase somewhat the viscosity. By adding 0.15% NaCl before heating, the viscosity of the milk becomes fairly higher than by adding after heating.

"The characteristic odor of soybean milk can be removed by soaking soybeans in 0.01-0.1% hydrogen peroxide solution and putting hot steam into the milk for 10 minutes." Address: National Food Research Inst., Tokyo.

have not been solved." Address: Head, Meal Products Investigations, Oilseed Crops Lab., Northern Utilization R&D Div., Peoria, Illinois.

4914. Steenis-Kruseman, M.J. van. 1962. Contributions to the history of botany and exploration in Malaysia: 8. Heinrich Bürger (? 1806–1858), explorer in Japan and Sumatra. *Blumea* 11(2):495-508. [35 ref]
• ***Summary:*** A good biography of Heinrich Bürger. Of Jewish ancestry, he was probably born on 20 Jan. 1806 at Hameln (near Hannover, Germany), the seventh of ten children of Samuel Bürger and Eva Meyer. his father died when he was young. In 1823 he secretly left his parental home to go to Holland. In Sept. 1823 he sailed from Amsterdam to Java. A major reason that he entered the Dutch East India Co. was to help his mother and sisters financially. He was officially appointed apprentice pharmacist in the hospital at Weltevreden (=Batavia, Jakarta) and in 1825 was promoted to 3rd class pharmacist. Later in 1825 he was, at his own request, put at the disposal of the surgeon-general Ph. F. von Siebold at Deshima, a small islet in Nagasaki Bay–the place of Dutch settlement in Japan.

In 1826 Von Siebold made a journey to Edo and, under the guise of being his secretary, Bürger was allowed to accompany him.

In 1828 he was commissioned to take over the position of von Siebold, but due to problems with Siebold's illegal maps of Japan, the latter was not allowed to leave before Dec. 1829. For the preceding 13 months he was kept in the smallest house at Deshima, not by the Japanese but by the Dutch officials who feared that their commercial relations with Japan might be jeopardized. Yet even during this unpleasant period of isolation, Siebold managed to add to his nature specimens.

Between 1830 and 1835 Bürger sent large Japanese botanical and zoological collections to Leyden. Address: Oegstgeest.

• ***Summary:*** "Among producers of major agricultural products in the U.S. producers of soybeans are in a unique position. Despite increases in production which are out of all proportion to normal expectations the markets for the crop have grown in approximate proportion to the production and there have never yet been surpluses of a proportion to justify classing the crop in the same surplus category with wheat, corn, cotton, tobacco, and other major U.S. crops."

As the production of soybeans in the United States continued to grow during the postwar years it became evident that we could produce in this country more soybeans than we could consume advantageously. At the same time it began to appear that other countries in the world might adopt U.S. soybeans into their economies, and that we had something which might offer potential export markets, either in the form of bean or as oil, meal, flour, or other end products.

"In 1949, I made my first trip overseas to explore market possibilities. J.L. Cartter of the U.S. Regional Laboratory at Urbana and I went into several of the northern European countries to determine what the soybean production potentials might be–and what our market possibilities looked like. In 1952, I went back again and at that time made a careful study of potentials in 10 European countries. In 1954, I went back as a member of a Foreign Trade Team sent by USDA to determine why we were losing our foreign markets for U.S. farm products.

"During 1954, Public Law 480 was passed by Congress, providing for the sale of U.S. surplus farm commodities for foreign currencies, with a portion of the proceeds to be made available to trade groups to enlarge and expand the markets for U.S. agricultural commodities. Soybeans were not in surplus, and were not made available for sale for foreign currencies. However, this did not preclude use of money accumulated from the sale of wheat, cotton, tobacco, butter, lard, and other commodities from being used to sell soybeans and/or soybean products.

"By the time P.L. 480 became operative a sizable group of people in the soybean industry had become aware of overseas market potentials for our products. We knew that potential markets existed, and that it was our responsibility to go after them. We decided to do just that.

"By 1955 Japan had become our largest single customer for U.S. soybeans. We were hearing complaints on quality, especially on foreign material content. Our varieties were strange to them, our methods of mechanical handling not understood and our grades and grading standards were confusing. Japan appeared to be an even bigger potential customer if we could help them solve some of the problems of using our product.

"Recognizing the situation, the Agricultural Attaché in Tokyo requested that the American Soybean Association, representing the soybean producers, send someone to Japan to work with the trade in that country. The Fats and Oils Division of Foreign Agricultural Service concurred, and it was my personal pleasure to spend 6½ weeks in Japan in late 1955. Out of that visit came the organization of a joint operational agency, called the Japanese-American Soybean Institute. Mr. Shizuka Hayashi was employed as managing director in early 1956, and since he will appear on this program later I will not describe in detail that organization or its operations.

"Since early 1956 the American Soybean Association, in conjunction with Foreign Agricultural Service and five Japanese trade groups has been operating this market

development project on soybeans in Japan. The major activities have been in the field of education of the housewife on the place of protein and edible oil in the diet of the members of her family. Soybeans have been grown and used in that country for centuries, but the intake of both protein and oil were far below minimum standards, especially in the rural areas. Animal products were not available, and would not become available in quantity in the foreseeable future. Increased intake of protein and oil had to come from vegetable sources. The Japanese consumer was familiar with miso, tofu, shoyu, natto, kinako, and a long list of soybean protein products, and also with soybean oil for a cooking and salad oil. The services of trade organizations, governmental and quasi-governmental agencies, prefectural governments, and many other groups were enlisted. Throughout Japan the story of soy products and their value to health were repeated in a myriad of ways. Demonstrations, movies, training schools, extension workers, nutritionists, mobile demonstration buses, and a host of other avenues of approach have been used. Millions of housewives have been told the story in many ways and in many places.

"Results are the only true measurement of success or failure in an endeavor of this type. In the 1955 crop year U.S. exports of soybeans to Japan were 20,402,000 bushels. In the 1959 crop year, the last on which export figures are available, Japan's imports of U.S. soybeans had increased to 40.8 million bushels–every bushel sold for dollars. And this increase came under very strict governmental currency controls which greatly limited soybean imports into Japan. At least partially as a result of the buildup of demand for U.S. soybeans by foods manufacturers in Japan, created by demand for soybean oil and soy protein products, the Japanese government on July 1, 1961, for the first time since World War II, placed soybeans on the Automatic Allocation basis. It is our expectation that imports of U.S. soybeans into Japan will increase materially above present levels as a result of this action. In fact, at our recent American Soybean Association convention Mr. Hayashi predicted a virtual doubling of Japanese imports of U.S. soybeans in the next decade.

"Our experiences in Japan demonstrated to us early in the game that soybean markets could be expanded by expanding consumption of products. Our Japanese experience suggested that in many areas of the world the job was an industry-wide job, rather than a job for producers alone. We visualized that soybean handlers, soybean processors, exporters of soybeans, exporters of soybean oil and exporters of soybean meal all had a stake in expanding our overseas markets. In 1956, I made an intensive study of the potential markets for U. S. soybean products in 10 European countries. As a result of this study a series of committee sessions and industry conferences were held, resulting in the formation of an industry-wide nonprofit promotional organization, the Soybean Council of America. Financed by a voluntary check-off on the basis of bushelage or tonnage of soybeans crushed, handled or exported, the Soybean Council of America, Inc. now has active promotional programs launched in over 20 countries, and has 15 overseas offices scattered from India to Denmark to Peru, where staff members are stationed to do educational and promotional work designed to increase the markets for U.S. soybean products and soybeans. We recognize that in those countries where processing facilities are located they will buy soybeans and produce their own end products. We also know that many countries have need for oil and not for protein, and that other countries have adequate supplies of oil but are badly in need of protein supplies. As representatives of the U.S. soybean industry we consider it our function to sell the products the buyer wants in the form in which he desires them. Cooperation among producers and processors of soybeans in the financing of the Soybean Council program has been gratifying. The dollar expenses of the promotional programs are borne by the U.S. soybean industry, and through the cooperative program with Foreign Agricultural Service of the U.S. Department of Agriculture, as will be explained by Mr. Hougen, your next speaker, foreign currency funds are made available in certain countries for payment of market promotional and development expenses within those countries..."

This talk continues for 2 more pages and contains 3 tables: (1) U.S. soybean production and usage by crop years (Oct. 1 through Sept. 20) from 1924-25 to 1961-62. (2) U.S. soybean oil exports 1951-52 to 1959-60. (3) U.S. soybean meal exports 1950-51 to 1959-60. Address: Executive Vice President and Secretary-Treasurer, American Soybean Assoc., Hudson, Iowa.

4922. Ohsawa, G. 1962? Zen macrobiotics: The art of longevity and rejuvenation. New York, NY: Ohsawa Foundation. Printed in Japan. 218 p. Undated. Index. 17 cm.
• ***Summary:*** This is the second printed edition of Zen Macrobiotics. The cover is gray. The author is George Ohsawa. The content is basically the same as the first printed edition, except that (1) Typographical errors on pages 3, 7, and 62 have been corrected; (2) A folded, undated insert, titled "Dictionary of Macrobiotic Terms" was found in this printing between pages 216 and 217 (for details, see below). The insert is 17.0 cm / 6.69 inches high by 30.0 cm / 11.81 inches wide. Folded crosswise into thirds, it fits perfectly into these books; (3) The information on pages 217 and 218 is different and updated. The following appears on page 218: Brazil (Casa Longavida, Sao Paulo), Sweden (Miss Ilse Clausnitzer, Stockholm), U.S.A. (Ohsawa Foundation, 61, W. 56th St., New York; Ohsawa Foundation, P.O. Box 238, Chico, California; Chico-San, Inc., 64, 5th Ave., Chico, California; Musubi, 61, W. 56th St., New York–Macrobiotic Restaurant).

Concerning the date of publication: Although the date is not given in or on the book, Carl Ferré (who owns an original of this 2nd Japan printing) notes (8 May 2011): "Chico-San is listed. This means it was after Nov. 1961 at the earliest and most likely very early in 1962. I say this because the address given is not the Mangrove Ave. one." "There is no 'Printed in Japan' in this book either but it is so similar to the earlier one that it has to be printed in Japan. It is also undated. It is not 'revised'..."

In the 3-column "Dictionary of Macrobiotic Terms" (insert), for each entry there is the word or term, its definition, and one page number on which that word appears. Because the page numbers refer to pages in this edition, the dictionary was probably published at about the same time as this book–or at the time of the previous edition in 1960. The following is a selection from the Dictionary, with pages given for soy-related words: Aduki: Japanese red bean. Ae: Dressing (vegetables) with soy bean paste [miso], orange juice, etc. (p. 96). Aemono: Japanese salad (p. 88). Age: Fried bean curd. An: Red [aduki] bean jam. Ankake: Pouring [aduki] jam. Bancha: Coarse green roasted a few minutes. Bansho: Bancha with soy sauce (p. 152). Daikon: Long, white Japanese radish. Dango: A dumpling. Dentie: Head of eggplant salted, kept, dried and then burned into a powder. Egoma: A type of sesame seed–most yang. Gobo: Burdock. Gomashio: Sesame salt. Goma Tofu: Sesame curds (p. 87). Goziru [gôjiru, gojiru]: Soup made of grated soy beans and vegetables ("Ziru" means soup in Japanese) (p. 84). Gyoza: A Chinese food–vegetable mixture wrapped in pieces of thin dough. Hako: A mold or box in Japanese. Haru Tea: A very yang herb beverage. Hiziki [Hijiki]: Spindle-shaped, small, black seaweed. Jinenjo: A wild potato or a Japanese yam. Karinto: A kind of deep-fried cookie. Kasha: Russian buckwheat grain preparation. Kayu: Thin rice preparation [porridge]. Kinpira: Burdock and carrots preparation. Kitune [Kitsune]: Boiled rice or noodles cooked with thin fried bean curds [*agé*] (p. 68). Kobu (or Konbu): A (sea) tangle coming from deep ocean waters. Kobu Maki: Kobu stuffed with vegetables. Koi-Koku: A special carp and miso soup (p. 109). Kokkoh: A creamed blended cereal. Konnyaku: A paste made from flour of this Japanese tuberose [tuber]. Kuzu: Powdered plant-gelatine obtained from kuzu plant. M.U. tea: A tea made of 15 blended herb's roots. Matuba [Matsuba]: Pine leaves. Miso: Soy bean paste (p. 65). Miso Ae: Boiled vegetables served with miso cream (p. 96). Misoni: Carrots and onions cooked with miso (p. 129). Mochigome: Glutinous rice. Moti [Mochi]: Rice cake. Musubi: A knot. Nisime [Nishime]: Same as Nituke. Nituke [Nitsuke]: Vegetables sauteed. Nori: Laver or sloke–a kind of seaweed. Ogura: Aduki (red bean) preparation. Omedato: Dessert made of roasted rice and red beans. Originally Japanese word for congratulation. Oshitashi: Boiled vegetables, served with Tamari (p. 97). Ransho: Egg–Tamari preparation. Renkon: Lotus root. Sashimi: Sliced raw fish. Sarashina: A kind of buckwheat dish. Originally it means the name of a place famous for producing good buckwheat. Siitake [Shiitake]: A kind of Japanese mushroom. Sio [Shio]: Salt. Sio Kobu [Shio Kombu]: A kobu (seaweed) preparation. Soba: Buckwheat. Sukiyaki: Fish (or beef) and vegetables cooked a la japonaise. Sushi: A rice preparation. Syo-ban [Sho-ban]: Coarse green tea with soy sauce (p. 101). Tahini: Sesame butter. Tai: A red snapper [fish]. Tamari: Traditional soy sauce (p. 62). Tekka: A preparation of minced lotus root, burdock root, carrot, ginger, and miso (p. 96). Tempura: Japanese process of deep-frying in oil. Tofu: White soya bean cheese (p. 134). Tororo: Wild potato [wild yam]. Udon: Wheat vermicelli or noodle or macaroni.

© Copyright Soyinfo Center 2014

Umeboshi: Japanese plum salted and conserved for years. Ume-sho-ban: Medicinal beverage [containing umeboshi and shoyu] (p. 156). Yannoh (Ohsawa coffee): A cereal coffee made of roasted rice, wheat, aduki, chick peas and chicory. Yomogi: Mugwort (or wormwood). Yuba: Soybean protein prepared into transparent paper-like sheets (p. 77). Zosui: A rice preparation. Zaru: A bamboo basket. Address: Ohsawa Foundation: 331 Riverside Dr., New York City. Secretary Aihara, 44 W. 96th St., New York City, U.S.A.

4923. Ishiguro, Kôzô. 1963. Studies on pantothenic acid intake. I. Pantothenic acid content in Japanese foods. *Tohoku J. of Experimental Medicine* 78:375-80. Jan. 25 (Chem. Abst. 59:2095). [8 ref]

• ***Summary:*** Tables show: (1) Pantothenic and 4'-phosphopantothenic acid content in foods (Pantothenic acid {Pa A}) is highest in slimy agaric 0.80 mg/100 gm, moderate in stone leek {white part}, stone leek {green part}, and Japanese radish ("Daikon"). 4'-phosphopantothenic acid is very low in the 10 foods listed.

Note: The "slimy agaric" is probably *Stropharia aeruginosa,* commonly known as the verdigris agaric, a medium-sized green, slimy woodland mushroom.

(2) Free pantothenic acid and total panthetine [pantethine] content in foods. The section of the table titled "Pulses" includes the following two values:

Soybeans, dried 0.86 / 0.08.
Azuki beans, dried 1.35 / 0.03.
Black soy beans, dried 0.76 / 0.24.
Soy bean curd ("Tohu") 0.10 / 0.02.
"Abura-age" 0.12 / 0.04
"Miso" 0.37 / 0.17.
Fermented soy beans ("Natto") 1.60 / 0.60.
Peanut 1.80 / 0.20.
Congealed "Tohu" [perhaps dried frozen tofu] 0.12 / 0.02.

The foods with the highest content of free pantothenic acid in this table are: (1) Rice bran 6.50. (2) Pine agaric, fresh 2.00. (3) Peanut 1.80. (4) Natto 1.60.

The foods with the highest content of total panthetine in this table are: (1) Rice bran 2.20. (2) Fresh kantake mushroom 1.20. (3) Natto 0.60.

Note: Pulses generally contain a substantial amount of free Pa A, but are rather poor in total panthetine; however natto is rich in the latter. Address: Dep. of Hygiene, Tohoku Univ. School of Medicine, Sendai [Japan].

4924. Brandemuhl, William. 1963. Soybean history: Aspects of Buddhist influence. Anthropology Dept., University of Wisconsin, Madison. 15 p. Jan. Unpublished manuscript. 28 cm. Summarized as "Early Soybeans Were Spread by Buddhists" in Soybean Digest, July 1963, p. 21. [52 ref]

• ***Summary:*** This research paper (which is not a thesis) was prepared for Anthropology 150a, taught by Dr. R.J. (Robert) Miller. Contents: Purpose of study. Method of study. Botanical history: Naming the soybean, the *Glycine ussuriensis* case, other genetic evidence, claim on the origin of the soybean. Initial utilization. Botanical dissemination. Soybean history–non-botanical: Legend, recorded Chinese soybean history, concluding notes on soybean origin and cultivation history. Buddhist influence on the development of the soybean: Soysauce or shôyu, miso, tofu, natto, ancient soybean food products, the soybean grows.

"Another principal concern of this paper is the Buddhist connection to soybean development. The introduction of soybeans, although an approximation at the very best, coincides quite closely with the spread of Buddhism in Japan. As shown later, Buddhism has a very close connection with soybean history and in many product sectors of soybean development, may have created or at least popularized them" (p. 1).

"Contrary to the above statement I submit the following data which I believe can easily be documented: 1. Emperor Sheng-nung is a mythical character (letter from Herbert W. Johnson, Research Agronomist, USDA / ARS Crops Research Div., Beltsville, Maryland, 30 Aug. 1962). 2. Emperor Shen-nung was a legendary character who cannot be pinpointed to a date of 2838 B.C. (letter from Jung-pang Lo, Research Asst. Prof., Far Eastern and Russian Inst., Univ. of Washington, 6 Sept. 1962). 3. Shen-nung is a mythical ruler, never living at the date attributed to him or at any other date (letter from Edward H. Schaefer, Professor of Oriental Languages, Univ. of California, Berkeley, 6 Sept. 1962). 4. A work attributed to Shen-nung is called *Shen nung pen Ts'ao Ching* but since it contains many Han Period facts (around the beginning of the Christian era) it is believed to be a Post-Han work. This work is first mentioned by T'ao Hung-ching (who edited it) early in the 6th century A.D. (Jung-pang Lo). 5-6. The *Pen Ts'ao Kang Mu* was written by L. Shih-chen (1518-1593) in A.D. 1596 or 1597 (Jung-pang Lo, Schaefer)... 9. The word 'Shiyu' cannot be found in Chinese dictionaries. The name for the soybean in China being 'Ta-tou,' meaning big bean (Jung-pang Lo)."

"Concluding notes on soybean origin and cultivation history: *The Book of Poetry* (Shih-ching) mentions boiling shu (pulse) and the *Erh-ya* (a Chou period lexicon, authorship attributed to Confucius or his disciples) mentions Jung-shu. Kao yu, the commentator, remarked that the Jung-shu (pulse of the Hu people) which was also known as Ta-tou (the soybean). Jung was a term used by the Chinese in the Chou period for the non-Chinese people of the North and Ju was a term used by the Chinese people of the North and West. This would seem to indicate that the soybean was introduced to China from the non-Chinese people of the North. Also supporting this is the *Chou-shu* by Hsi meng, in which there is a reference to Shan-jung shu (pulse of the Jung people of the mountains). A commentator explains that the Shan-jung were tribes in the Northeast (Manchuria).

© Copyright Soyinfo Center 2014

"The Kuang-Tzu contains a passage saying that after Duke Huan of Chi (7 B.C.) defeated the Shan-jung the Jung-shu came to be known throughout China. Chia su-hsieh (5 A.D.) in his book *Ch'i-min Yao-shu* (Ts'tung-shu Chi-ch'eng, editor) quoted the *Shen-nung pen Ts'ao* as saying that Ta-tou (the big bean) was the Hu-Tou (Hu peoples' bean) which Chang Ch'ien brought back from his exploration of central Asia in the first century B.C., there being two varieties. In the Han period both Ts'ui shih and Fansheng in their books on farming techniques mention cultivation of the Ta-tou and its use in famine relief. The *Pen Ts'ao Kang Mu* (1596), mentioned earlier, has a long discourse on the medical properties of the Ta-tou (Jung-pang Lo)."

"Buddhist influence on the development of the soybean: Although references to the Buddhist influence on soybean development are particularly sparse I believe Buddhism deserves credit for initiating the spectacular expansion of soybean utilization in Japan which triggered utilization in the rest of the world. The Buddhist connection is certainly true if oil utilization is excluded. Below lie the reasons for my belief.

"Buddhism was introduced into Japan around 500-600 A.D. (Bush 1959, p. 28-29). Among the priests the traditional hate of flesh was present and agriculture of the field type was encouraged by the government (Tezuka 1936, p. 13). The introduction of soybeans fits well into this historical development. The recent finding of soybean seed in *Shôso In* (Japan) which was established in the Nara era for the storing of legumes of that era that were introduced from China (Nagata 1960, p. 97) proves as does the record of ceremony and taxation system of the Nara era (Nagata, p. 75) that soybeans did exist in Japan at that time.

"Soysauce or more properly shôyu, the now renowned Japanese flavoring, is said to have originated during the Chou dynasty (1134-246 B.C.) (Komiya 1955, p. 14) and was introduced into Japan when Buddhism was being established although not becoming popular until 1300 (Joya 1951, p. 31-33).

"Miso, soybean paste, is a much used breakfast and soup dish in Japan that was introduced to Japan from China or Korea (Horvath 1927, p. 83). It was definitely used by the priests when they first entered Japan, in fact they popularized it among their new vegetarian converts (Joya, p. 21-23).

"An ancient Chinese book states that the Philosopher Hamintze, a prince of the Han dynasty, was the inventor of Tofu or soybean curd (Horvath, p. 6) while another source attributes the tofu innovation to the Chinese Philosopher Whai Nain Tze (Piper & Morse 1923, p. 234). The manufacture of soybean curd (tofu) was started in China in 164 B.C. during Emperor Hwai Wen's reign by Liu An, duke of Hwai Nan. Liu An was a great friend of the Buddhist monks and it seems quite likely that he made this bean curd to provide a change or delicacy to break the monotony of the monastic ration." Note: Whai Nain = Huainan. Liu An was the duke (*tze*) of Huainan. So all of these people are one and the same person.

"Tofu was introduced into Japan from Korea for the first time during the Toyotomi government (Horvath, p. 73) and was undoubtedly introduced into Japan from China by the Buddhists (Piper & Morse, p. 234) being used for their daily food before it was generally used (Horvath, p. 73).

"The true Buddhist monk was carried through the period of childhood growth on a rather heavy diet of bean curd (Horvath, p. 17). Even the naming of soybean curd has its esoteric connotations as the Classical Chinese name for tofu is Li chi which probably means morning prayer (Horvath, p. 72).

"Natto, a sort of vegetable cheese prepared from soybeans has long been used by the Buddhists and is now used extensively by the Japanese (Piper & Morse, p. 224).

"Buddhism seems to have been a major reason for the development of Japan for main soybean products. With the existence of these products Japan opened the world to soybeans." Address: Univ. of Wisconsin, Madison, Wisconsin.

4925. Grow, Howard E. 1963. Feed industry is growing [in Japan]. *Soybean Digest.* Jan. p. 26.

• ***Summary:*** "Livestock production in Japan is developing at a rapid rate. This applies mainly to poultry, but also to swine and dairy at a slower rate. Over 170 million chicks were hatched in Japan this last year. Statistics do not show the percentages for broilers or layers, but many broilers are produced and laying flocks range from a few birds to over 50,000.

"A mixed feed industry is developing in Japan. More farmers are increasingly depending on mixed feed for their herds and flocks. This is a relatively new industry and as a result it has many problems. It appears that feed ingredients used are the ones that are traditionally available. During the past year or two Japan has been importing large amounts of feed grains from the United States and other countries. Protein supplements used are mostly fish meal, wheat and rice bran as well as other minor items. Generally the protein content of their rations is lower than commonly used in the United States. A very limited amount of soybean meal is used. It appears that considerably more fiber is used in the rations for broilers and baby chicks than we have found most desirable in this country.

"We believe that much more soybean meal could and should be used in the mixed feeds in Japan. Soybean meal available is not toasted as we know it in the United States. Projects to acquaint the feed industry with the nutritional value and economies that can be gained by using more soybean meal are now receiving our attention. In cooperation with the U.S. Feed Grains Council tentative employment of a trained nutritionist will permit active work with the feed industry, encouraging them to use more soybean meal. Some

© Copyright Soyinfo Center 2014

progress was made to employ a soybean meal promotion supervisor as an addition to the staff of JASI.

"Some previous tests indicate that research and testing of Japanese produced soybean meal is needed. Plans were completed for starting a feeding test comparing U.S. and Japanese produced meal as soon as some U.S. meal is available for that purpose. Tests will be conducted at three experiment stations under the direct supervision of Dr. Morimoto, chief of the Japan Animal Nutritional Institute. These tests will use 600 broilers and will run for approximately 70 days.

"The U.S. government has established a permanent trade center in Tokyo. Agriculture will be featured during the period from May 20 to June 15, 1963. The theme of this show will be feed and will be sponsored jointly by ASA, JASI and the U.S. Feed Grains Council. There will be exhibits of various sorts emphasizing U.S. feed ingredients and how they are used in efficient livestock and poultry production in the U.S. Seminars are planned for various segments of the livestock and feeding industries. Specialists from the United States will be used to report how research, production and management have combined to develop the livestock and feed industries in this country.

"All of the planning and supervision of the agricultural show in Tokyo is directed by Russell Strobel, assistant Agricultural Attache in Tokyo. The show and symposiums will follow much the same pattern that was used in the successful feed show in London during March and April of 1962. Some adjustments will be necessary because of local situations. Shizuka Hayashi and William Hattori, representing the U.S. Feed Grains Council in Japan, will work closely with Mr. Strobel." Address: Asst. to the Executive Vice President, American Soybean Assoc.

4929. *Soybean Digest.* 1963. Two-year Japan food study. Feb. p. 20.
• ***Summary:*** William Brandemuhl, who earned a B.S. degree in economics at the University of Wisconsin in January, will begin a 2-year study of Japanese food at Kyoto University, starting Feb. 1. He plans to study "soybean products that are little known outside the Orient as well the more conventional soybean products" in hopes that they can be adapted for use elsewhere, especially in nutritionally deficient countries. He notes that Japan uses soybeans for food more than perhaps any other country.

A photo shows William Brandemuhl and Prof. J.H. Torrie of the University of Wisconsin, both looking at a bag of soybeans.

4930. O'Neal, Mary Lee S. 1963. Living in Japan an adventure: Youth section. *Christian Science Monitor.* March 8. p. 17.
• ***Summary:*** The writer's husband and family were sent to Japan by the U.S. Air Force. After several months they found themselves oriented to their new way of living–along with the inconveniences involved. They have become adept at eating sukiyaki with chopsticks at Japanese restaurants. "We have learned to recognize the tofu man piping a little horn as he goes to Japanese doors selling bean curd."

4931. *Foreign Agriculture.* 1963. Japan soybean imports may equal 1962. 1(10):14. March 11.
• ***Summary:*** Japan's imports of soybean meal in 1963 are expected to equal the approximately 16,000 tons believed to have been imported from the USA in 1962.

However in 1961, Japan imported 56,355 metric tons of soybean meal–the largest amount since 1951. Soybean imports were liberalized on 1 July 1961.

Sogo seiseki to butsuri kagaku bunseki kekka no kentô [Results of the third annual inspection of miso (1960). I. Relation of organoleptic test and chemical or physical analysis]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 17. p. 179-201. March. [4 ref. Jap; eng]
• ***Summary:*** Samples of 226 miso varieties, collected from throughout Japan, were subjected to organoleptic tests, and both physical and chemical analysis. Organoleptic tests revealed that miso made from whole soybeans was superior to that made from soybean flakes or from a mixture of whole soybeans and flakes. Miso made from Japanese soybeans was superior to that made from soybeans imported from the USA or China.

Most miso graded as excellent or good conformed to the following formula: N = 0.1 (5S-R) where N is the weight of ordinary salt (NaCl), R is the weight of rice or barley, and S is the weight of soybeans. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

March. [6 ref. Jap; eng]
• ***Summary:*** 257 miso samples, collected from throughout Japan, were subjected to organoleptic tests, chemical analysis (including moisture, sodium chloride, acidity I, acidity II, and glutamic acid), physical analysis (pH and color), and microbiological counts. Seven conclusions are given.

(1) As observed in the 3rd annual inspection, Japanese soybeans showed general superiority to imported soybeans as a raw material for making miso. Note, however, that samples of miso made from U.S. soybeans and graded as excellent or good, increased in number during the past year. Imported soybeans can even be used successfully to make bright colored miso. However, soybean flakes are not yet considered a suitable raw material for making miso of good quality.

(3) Miso of high moisture content was graded as poor in consistency.

• ***Summary:*** Tofu was coagulated with calcium sulfate calcium chloride, and sulfuric acid to compare their hardness and volume. The quality of the curd made with the acid was similar to that made with calcium chloride. Although the curd made with calcium sulfate was very soft and voluminous, it became smaller and harder and smaller in volume when

© Copyright Soyinfo Center 2014

a small amount of acid was added. Various kinds of agents were added to the soymilk before precipitation by calcium chloride to try to get a soft curd. Among these agents, sodium citrate and sodium polyphosphate seemed to be effective in making tofu softer and more voluminous, probably because of their high pH and their ability to increase the water-holding capacity of soy protein. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

4955. *Times* (*London*). 1963. Japan seeks expansion of trade with China: Five-year programme in full-swing. May 17. p. 20, cols. 4-5.
• ***Summary:*** From a correspondent in Tokyo. "With extreme caution, the Japanese Government has begun to tiptoe through the door that leads to expansion of trade with Communist China... with many anxious backward glances toward Washington" [DC]. Last year Japan concluded a £36 million trade agreement with China, and the programme is now in full swing.

But there is not much that the Japanese want to buy. "American soya beans are of better quality than China's, and the demand for Chinese soya beans is not likely to go beyond what is needed for purely culinary purposes."

4956. Akabori, Shiro; Kawakami, Y.; Izumi, Y.; Komatsu, S. Assignors to Ajimomoto Company, Inc. 1963. [Surfactant agents from soybean or wheat protein]. *Japanese Patent* 6455. May 20. 2 p. Application filed 13 March 1961. (Chem. Abst. 59:7758f). [Jap]*
• ***Summary:*** Soybean protein (containing 65% pure protein) is used to make a surfactant (a surface-active substance, such as a detergent).

4957. McEachern, Margaret. 1963. Symphony of sounds tells time in Tokyo: Centuries-old street calls. *Christian Science Monitor.* May 25. p. 15.
• ***Summary:*** Tokyo–The Japanese housewife doesn't need a clock to tell the time of day. She only needs to listen to the distinctive calls from her street.

"The day begins with the call, 'Natto... natto...' in a high youthful voice." That is the sound of a teen-age boy making his rounds as he sells his fermented [soy] beans–a little delicacy that is tasty and nourishing. Japanese housewives use natto in soup, seasoned with soy sauce, served over rice.

The Japanese may be the only people who enjoy soup in the morning. This soup, called *misoshiru,* "consists of 'miso,' or fermented bean soup [sic, fermented soybean paste] with vegetables and fish."

In the late afternoon one hears the eerie sound of the [soy] bean-curd seller. He carries his produce in wooden buckets attached to both ends of a long bamboo pole.

Note: The writer is apparently unaware that natto, miso, and tofu are each made of soybeans–for that word does not appear in the article. A photo shows a housewife shopping in Tokyo.

4958. Clagg, Elizabeth. 1963. Soy products in foods around

© Copyright Soyinfo Center 2014

the world. *Soybean Digest.* May. p. 42.
• ***Summary:*** Miss Clagg undertook a special tour for the Soybean Council last October. This article begins: "Soya from America is blending in foods all over the world to open a whole new world of eating enjoyment."

She found soy flour used by cooks in England, Brussels, and the Netherlands. Soy oil was also widely used. "Americans have adopted so many international recipes in recent years–but as yet we haven't tasted Japanese miso, tofu, natto, kinako, aburaage, German doughnuts, Spanish noodles. The many soybean recipes we tasted in 10,000 miles of tasting are unknown here at home."

A small portrait photo shows Elizabeth Clagg. Address: Member, American Home Economics Assoc. and the American Dietetics Assoc.

4959. Hayashi, Shizuka. 1963. The future of the crushing industry in Japan. *Soybean Digest.* May. p. 26-27.
• ***Summary:*** "The soybean crushing industry in Japan was for many years after the war a profitable enterprise with a margin of profit always assured under the government controlled trade policy. However, since the restrictions on imports of soybeans under the funds allocation system were withdrawn in July 1961 and the duty increased to 13% the picture has changed. The crushing industry has lost this assurance of easy profit making.

"What will be the future? It is government policy to liberalize the import of both soybean oil and meal in the near future. Let us analyze the problem under the assumption that this will take place.

"Of the annual production of 200,000 metric tons of vegetable oils made from imported materials in Japan; 65% is soybean oil. Soybean oil constitutes 40% of the total national production of 330,000 tons of vegetable oils. This shows how important a role soybeans play in the crushing industry. The change of picture could therefore be very serious.

"I will now proceed with analysis of the following points:

"1. Costs of oil and meal produced from imported soybeans compared with costs of imported oil and meal. Cost figures over the past 6 years reveal that without exception, the total cost of imported oil and meal is lower than the processors' cost from imported soybeans. Every month or year shows a loss for the crushers.

"2. Prices of imported soybean oil and meal compared with domestic prices.

"Here again domestic prices, based on Bank of Japan figures, compare unfavorably with prices of imports. A comparison of the actual prices of both domestic and imported meals points up the unfavorable position of domestic meal.

"3. Comparison of prices of soybean oil with prices of other oils produced from various imported materials. Soybean oil has always been priced higher than other oils. Other oils are being supported by the higher prices of soybean oil. Some oils are sold to be blended with soybean oil. If lower priced soybean oil is imported sales of these miscellaneous oils will be adversely affected, thus jeopardizing crushing of other oilseeds.

"4. Effect on domestic rapeseed. Lower import prices of soybean oil will render sales of rapeseed oil difficult. This will create problems in the production and government support of domestic rapeseed. The price of domestic rapeseed oil has always been lower than soybean oil.

"From the above analyses it can be concluded that the crushing business, in the event that oil and meal are liberalized, will not maintain its status as a profitable enterprise. However, this conclusion is based on statistical data and on an 'as is' situation with no consideration of the possibilities of creating additional business. Such items as cutting crushing costs through obtaining better yields, buying materials advantageously, selling products at higher prices or other successfully planned operations are not taken into consideration. There is a positive side which could contribute to profitable business.

"Since the unfavorable elements are primarily caused by the high rate of import duty on soybeans the elimination of the 13% duty is definitely the first remedy at hand. Processors are now petitioning for removal of the duty on beans which they import for crushing. But I think it would be more effective if they would combine their efforts with other soybean food processors to eliminate completely the duty on all beans imported for all purposes.

"Curtailed production: Processors have voluntarily agreed to cut their production as a means of overcoming the depressed market. Business enterprises are free to resort to this means when supply exceeds demand. Whether the present situation justifies this is a question. To force prices up at the expense of consumers is in a sense an industrial strike which will disrupt the economy. Perhaps industry people generally have the tendency to view the situation one-sidedly.

"Where should Japan market her oil and meal?

"The diet-deficient countries are mostly in the Far East. Countries like India, Pakistan, and Communist China are in need of oil and meal. However, the possibilities for Japan to sell her products to these countries are small primarily because of the insufficient dollar funds which these countries have. Unless Japan is willing to provide credit accommodations similar to that given by the United States under P.L. 480 or to agree to barter trade such markets are not within the reach of Japanese sellers even if prices are competitive.

"The only country where Japan can sell her soybean products is in Japan itself. With a population of 94 million and a growing economy (per capita income was $372 in 1961) Japan surpasses all other diet-deficient countries as

© Copyright Soyinfo Center 2014

being the best-qualified country to pay for her products and is perhaps the only one that can do so.

"The potential yearly demand in addition to present requirements for oils and fats and soybean meal in Japan can be estimated as:

"1. 340,000 metric tons of vegetable oil. In terms of soybeans this is 1,900,000 metric tons. Average daily per capita deficiency of fat in the Japanese diet is 10 grams. Based on 94 million people this amounts to 340,000 tons yearly.

"2. 300,000 tons of soy flour for edible purposes. This would be used for blending with wheat flour in such foods as bread, cakes, spaghetti, noodles and macaroni, and also directly in the diet.

"3. 500,000 tons in livestock feeds. Total production of feeds in Japan in 1961 was 3,900,000 tons. At least 15% soybean meal can be used in this volume of feeds.

"Processors are too worried about their present output to think of the potential demands. Rather than to curtail production, efforts should be made to create new demand.

"Promotional programs of JASI: Here are the various media through which the Japanese American Soybean Institute is conducting promotional activities:

"1. Through the network of the home economics extension workers of the Ministry of Agriculture and Forestry.

"2. Through the network of health centers throughout Japan.

"3. Through the high school economics teachers.

"4. Through the school lunch program, jointly with the Ministry of Education.

"5. Through local women's groups.

"The government agency networks are not available to private commercial firms. Processors have no access to such facilities if they want to promote their own brands. They concentrate mainly on advertisements by television, radio, magazines, etc., but because they are doing this individually it is limited in area and is less effective than a combined overall public relations program in which all would pool their funds.

"I strongly suggest that the Japanese processors participate jointly with JASI in the promotion of programs through the above agencies by shifting, say, one-half of their present advertising expenditures to the joint program. They will surely get much greater results."

Tables show: (1) 1962 prices of imported meal. (2) Prices of vegetable oils (1952-1961). The five oils (with their April 1962 prices in yen per 16.6 kg can) are: Soybean oil (2,500), rapeseed oil (2,413), cottonseed oil (2,150), kapok oil (2,241), safflower oil (2,423), and rice bran oil (2,150). Address: Managing Director, Japanese-American Soybean Inst., Tokyo.

4960. Machida, Yoshiro. 1963. Seisei daizu tanpaku no yotô [Utilization of refined soy protein]. *Shokuhin to Kagaku* (*Food and Science*) No. 38. May. p. 42-47. [Jap]

4961. Meals for Millions. 1963. Friendship food for a hungry world. Distribution of relief shipments, September 1946–May 15, 1963. 215 West 7th Street, Los Angeles 14, California. 4 p. Undated. [2 ref]

• ***Summary:*** Total distribution of MPF (Multi-Purpose Food) up to 15 May 1963 was 12,830,416 pounds, comprising 102.6 million meals. Countries receiving over 20,000 pounds, in descending order of amount received, were: India (1,979,748 lb), Korea (1,356,110), Japan (541,102), Hong Kong (394,259), China (358,957, stopped in 1951), Brazil (312,244), Germany (206,185), United States (183,366), Philippines (146,943), Haiti (139,823), France (126,022), Pakistan (101,041), Congo (86,101), Austria (82,159), Tanganyika (77,997) Mexico (65,722) Burma (63,554), Taiwan (58,639), Lebanon (56,910), Canada (51,836), Ceylon (38,428), Israel (38,280), Jamaica (38,171), Greece (38,133), Vietnam (37,524), Italy (36,768), Indonesia (35,873), Jordan (33,375), Hungary (33,165), New Guinea (31,535), Gabon (27,704), Liberia (27,187), Okinawa (23,640), Malaya (23,454), Morocco (22,736), Chile (22,721), Iran (21,482), Peru (21,374), Honduras (21,168), Bolivia (20,860), Nepal (20,626), Borneo (20,053).

The following countries (listed alphabetically) were early recipients of soy-based Multi-Purpose Food from Meals for Millions, and were late in introducing soybeans to the country: Bahamas (received 6 shipments totaling 2,079 lb between 1 July 1960 and 31 Dec. 1962). Basutoland [Lesotho] (received 2 shipments totaling 1,539 lb between 1 July 1960 and 31 Dec. 1962). Bolivia (received 2 shipments totaling 1,634 lb between Sept. 1946 and 30 June 1960). British Honduras (received 5 shipments totaling 11,319 lb between Sept. 1946 and 30 June 1960; renamed Belize in about 1975). Cape Verde Islands (received 1 shipment of 2,007 lb between Sept. 1946 and 30 June 1960; independent since 1975). Caroline Islands (received 2 shipments totaling 2,008 lb between Sept. 1946 and 30 June 1960; renamed Federated States of Micronesia in 1986). Central African Republic (received 1 shipment of 2,025 lb between 1 July 1960 and 31 Dec. 1962). Eritrea (received 1 shipment totaling 2,025 lb between Sept. 1946 and 30 June 1969). Fiji Islands (received 2 shipments totaling 2,052 lb between Sept. 1946 and 30 June 1969). Finland (received 1 shipment of 2,040 lb between Sept. 1946 and 30 June 1960). Gabon (received 3 shipments totaling 17,660 lb between Sept. 1946 and 30 June 1960). Guam (received 3 shipments totaling 4,995 lb between 1 July 1960 and 31 Dec. 1962). Guadalcanal ([later part of the Solomon Islands] received 1 shipment of 513 lb between Sept. 1946 and 30 June 1960). Iraq (received 3 shipments totaling 8,122 lb between Sept. 1946 and 30 June 1960). Jordan (received 9 shipments totaling 28,839 lb between Sept. 1946 and 30 June 1960).

© Copyright Soyinfo Center 2014

Liberia (received 10 shipments totaling 21,949 lb between Sept. 1946 and 30 June 1960). Luxemburg [Luxembourg] (received 1 shipment of 5,130 lb between Sept. 1946 and 30 June 1960). Marshall Islands (received 1 shipment of 739 lb between Sept. 1946 and 30 June 1960). Mozambique (received 3 shipments totaling 7,641 lb between Sept. 1946 and 30 June 1960). New Hebrides [later Vanuatu] (received 1 shipment of 513 lb between Sept. 1946 and 30 June 1960). Oman (received 4 shipments totaling 10,659 lb between Sept. 1946 and 30 June 1960). Panama (received 1 shipment of 96 lb between Sept. 1946 and 30 June 1960). Samoa (American) (received 6 shipments totaling 6,480 lb between Sept. 1946 and 30 June 1960). Somali (received 1 shipment of 270 lb between 1 July 1960 and 31 Dec. 1962). Swaziland (received 1 shipment of 621 lb between 1 July 1960 and 31 Dec. 1962). Tonga Islands [Kingdom of Tonga, independent since 1970] (received 5 shipments totaling 6,723 lb between 1 July 1960 and 31 Dec. 1962). Virgin Islands [USA] (received 2 shipments totaling 2,113 lb between Sept. 1946 and 30 June 1960). Western Samoa [independent since 1962] (received 1 shipment of 1,026 lb between 1 Jan. 1963 and 15 May 1963).

Other countries which received MFM shipments by 15 May 1963 are: Afghanistan, Algeria, Angola, Argentina, Basseterre [Probably refers to the island, Basse-Terre (or Guadeloupe proper) which is the western half of Guadeloupe, separated from the other half, Grand-Terre, by a narrow channel. As of 1994 Guadeloupe is a French Overseas Department. Probably not the seaport on St. Christopher Island, capital of St. Christopher-Nevis–since that is not a country], Belgium, Cambodia, Republic of Cameroun [Cameroon], Canal Zone, Colombia, Costa Rica, Cuba, Czechoslovakia, Dominica, Dominican Republic, Ecuador, Egypt, El Salvador, England, Eritrea, Ethiopia, French West Indies, Gambia, Ghana, Goa [former Portuguese possession; annexed by India in 1962; became a state of India in 1987], Grenada, Guatemala, Haute Volta [Upper Volta, later Burkina Faso], Iraq, Kenya, Laos, Libya, Macao, Madeira Islands [autonomous region of Portugal in east Atlantic Ocean, 600 miles due west of Casablanca, off the coast of Morocco], Mauritius Islands, Montserrat [island in the West Indies], Netherlands, Nicaragua, Nigeria, Northern Rhodesia [later Zambia], Nyasaland [later Malawi], Oman, Paraguay, Persian Gulf, Poland, Puerto Rico, Ruanda Urundi, Rumania [Romania], Ryukyu Islands, American Samoa, Santa Lucia [probably Saint Lucia island in the Caribbean], Sicily, Sierra Leone, South Africa, Southern Rhodesia [later Zimbabwe], Spain, Surinam [Suriname], Switzerland, Thailand, Trieste [Italy], Tunisia, Turkey, Uganda, Uruguay, Venezuela, Yugoslavia.

Note: This is the earliest document seen (March 2010) concerning soybean products (soy flour in MPF) in British Honduras [Belize], Cape Verde, Caroline Islands, Eritrea, Iraq, Lesotho, Liberia, Luxembourg, Marshall Islands, New Hebrides [Vanuatu], Oman, Samoa (American), Tonga, or Western Samoa. Soybeans as such have not yet been reported in these countries.

This document contains the earliest date seen for soybean products (soy flour in MPF) in Bolivia (June 1960), British Honduras (June 1960), Cape Verde (June 1960), Central African Republic (Dec. 1962), Eritrea (June 1960), Iraq (June 1960), Lesotho (Dec. 1962), Liberia (June 1960), Luxembourg (June 1960), Marshall Islands (June 1960), New Hebrides (June 1960; Vanuatu), Oman (June 1960), Samoa (American) (June 1960), Tonga (Dec. 1962), or Western Samoa (May 1963). Soybeans as such had not yet been reported by that date in these various countries. Address: Los Angeles, California.

4962. Senti, Frederic R. 1963. Current status of soybean utilization research under P.L. 480. *Soybean Digest.* May. p. 28, 30-34.

• ***Summary:*** This is the third in a series of USDA research reports under the P.L. 480 program. Discusses progress on active projects: Soybean oil in Seville, Spain; Chemical changes in sterols during refining of soy oil by Prof. H. Niewiadomski in Gdansk, Poland; Flavor stability of soy oil in by Prof. Y. Toyama at Toyo Univ. in Japan; Improving the frying quality of soybean oil by Prof. G. Varela at Univ. of Granada, Spain; Meal constituents.

Oriental foods: Production of shoyu (soy sauce) using U.S. vs. Japanese soybeans, use of dehulled soybean grits for making miso, miso-type food in Israel, use of U.S. soybeans in making tofu, or soybean curd, by the Japan Tofu Association, Tokyo.

Industrial applications: Polymerization studied in Milan, Italy. Soybean constituents. Oriental foods #2: Dried tofu in Japan, *Saccharomyces rouxii* yeast in shoyu and miso, development of fermented products from soybean milk in Japan, fermented soybean cheese in Taiwan, fermented soyfoods (tempeh, ontjom, ragi) in Indonesia.

Domestic research for increasing imports: Work with soy oil, UNICEF trainees from Brazil studying tempeh, projects saponins, protein complexes, and isolated protein quality in Israel.

A small portrait photo shows F.R. Senti. Address: Director, Northern Utilization Research and Development Div. (also known as the Northern Regional Research Lab.), Agricultural Research Service, USDA, Peoria, Illinois.

4963. Strayer, George M. 1963. Development of the Japanese market for soybeans: The first and largest U.S. market development project for soybeans and soybean products. *Soybean Digest.* May. p. 13, 16.

• ***Summary:*** A good historical overview of the American Soybean Assoc. soybean program in Japan, from Strayer's speech presented at the Agricultural Trade with Japan conference in Chicago.

© Copyright Soyinfo Center 2014

"For a long period of years Japan has produced a sizable tonnage of soybeans, a part of them in the northern island of Hokkaido, and a part of them grown on the other islands largely on the dikes or dividers around the rice paddies. But these supplies were not adequate to fill their needs, so considerable tonnage was imported from China and Manchuria each year.

Note: By 1886 Japan was producing 11.5 million bushels of soybeans a year; most were consumed as food (Tamari 1886).

The conquest of the Red Force [Red Army] in China, followed by the Korean episode [Korean war], cut off these Chinese supplies. The American military government shipped supplies of U.S. soybeans to Japan in the years immediately following World War II, as a source of protein for the Japanese people. The Japanese were also importing soybeans from Manchuria during these years, and at the same time Japanese interests owned processing facilities in Korea and in Dairen and Port Arthur of Manchuria. The Korean episode ended all that, and Japan found herself badly in need of a source of supply for her protein.

"During this same period things had been happening on American farms. At the start of World War II we were the world's largest net importer of fats and oils. The sea lanes were cut off, and we doubled and redoubled our soybean production as a means of supplying our requirements of fats and oils. We increased soybean production from 60 million bushels to over 180 million bushels during the war years. We learned what soybean oil could do in human foods and in industry, and what soy protein could do in contributing to economic livestock production. So, in the years since the war ended we have continued to increase soybean production from 180 million bushels per year to a predicted 725 million bushels in 1963. Today we are the world's largest net exporter of fats and oils and oil bearing materials.

"Early export troubles: As this process was going on Japan was restoring her economy, putting her people to work, increasing their incomes and their demand for food. Soybeans were being purchased from the United States but they were produced and handled mechanically, delivered in bulk, and the Japanese buyers were not accustomed to this type of handling and production nor happy with our beans. When I first went to Japan in 1955 we had a market for about 250,000 metric tons of soybeans but we were in trouble. I spent 6 weeks contacting the trades people, seeing for myself just what problems confronted us. A gentleman from the grain grading branch of the U.S. Department of Agriculture joined me, so that agency might understand our soybean sales problems. When we came home we agreed to try to do something about the situation.

"Exporters were appraised of the situation in meetings at export ports. Growers were told what the Japanese market demanded. Sampling and grading was tightened up. Japanese buyers were taught how to buy on our federal grade basis to get the desired quality. A Japanese firm was employed to make impartial samplings and grade determinations on the basis of our U.S. federal grades on cargoes as they arrived in Japan. By focusing much attention on our problems and their solutions we solved them–today U.S. soybeans are not only accepted but preferred in the Japanese market by most buyers, especially the oilseed crushers. Our quality is better, the oil content higher, our supply more dependable.

"In 1955 Japan was buying about 250,000 tons of soybeans per year from us. This seemed to be only a small portion of the potential, for per capita consumption of both oil and protein was far below levels necessary for proper nutrition. In early 1956 the American Soybean Association signed a contract with Foreign Agricultural Service to use some Japanese yen accrued under Public Law 480. A contractual working arrangement was worked out with the five trade groups in Japan representing the major users of soybeans plus the importers, and an office was established in Tokyo in April 1956. A campaign to increase per capita consumption of soybean food products was launched, using a variety of approaches.

"Working closely with the Ministry of Health, the Ministry of Agriculture, with private promotional organizations and with the miso, tofu, shoyu and oil trade groups a concerted campaign was carried on the educate the Japanese housewife on the functions of protein and oil in the human diet, and with the necessity of providing proper

© Copyright Soyinfo Center 2014

amounts of both in the meals prepared for her family. Very naturally, the Japanese, who had used soybeans for centuries, turned to soybean food products because of availability, price, and knowledge of how to use them."

Today Japan buys 1.2 million tons–42 million bushels–of U.S. soybeans a year, "and we visualize further increases to nearly double those figures by 1970."

"Last year Japan paid U.S. farmers about $100 million for soybeans."

4964. Talese, Gay. 1963. One year later, still no bomb. *Esquire.* May. p. 76-77.
• ***Summary:*** The story of the Exodus from Long Island to Chico, California in the fall of 1961–prompted by the teachings of "Zen Buddhist philosopher" [sic] George Ohsawa. Full of interesting details. The Berlin Crisis has worsened and many believed that New York City was the world's leading target for an atomic bomb.

They chose Chico based on their interpretation of Atomic Energy Commission reports and data.

It was Mr. Alvin Baumann who gathered friends at his home one evening when they decided to leave the New York City area. These were not aging beatniks (as the press has implied) but a group of largely successful, professional people. Their names and professions are given. But they had had enough of the big city "rat race"–they were fed up and ready for a simpler life. A study of AEC reports showed Chico as a possible place to go. A few days after the meeting at his home, Bauman and two others flew to California to look at small towns north of San Francisco. The found Chico and liked it. It had a population of less than 37,000, an average temperature of 63 degrees, its own university (Chico State College) to give an intellectual flavor, and it was only 3 hours by car from San Francisco.

"The possibility of great doses of nuclear fallout being carried by rain into Chico is slight because the area has a light rainy season, and the surrounding mountain formation keeps away east-to-west winds that might be transporting atomic dust from other contaminated cities."

They were given a big welcome, but some people in Chico were suspicious–and rumors began to fly when it was learned that the first baby born to Mr. and Mrs. Aihara in Chico had died. An inquest–rare in Chico–stated that the death was attributed to "abdominal abscesses." But then the rumors stopped.

Note: Herman and Cornellia Aihara had two children born in New York–Mari / Marie and Jiro–who were part of the caravan trip to Chico.

The newcomers soon got jobs and also opened a "large health-food shop" named Chico-San. The business averaged sales of $2,000 a month. Irv Hirsh [also spelled Hirsch] worked as a baker–of unleavened bread. Lou Oles, a former trumpeter with Benny Goodman, enrolled as a student of mathematics and physics at Chico State College. At a tavern frequented by college students, Teal Ames was introduced one evening by a friend to a California bachelor named Bill Nichols, who now also lived in Chico. Six weeks after he met Teal he converted to a macrobiotic diet; then they were married.

4970. Bowser, Hallowell. 1963. The rusty bells of hope. *Saturday Review* 46:24. June 22.
• ***Summary:*** "With the single exception of death, mankind's classic enemy is hunger. All through the historical period, right up to the present moment, our best thinkers have stood paralyzed before the problem of how to grow enough food to keep expanding populations well fed."

However in recent years a unique new approach to the problem has emerged from a modest Los Angeles organization known as Meals for Millions. Caltech biochemist Dr. Henry Borsook, who is research director of Meals for Millions, says "It is easier, cheaper, and often more convenient to get vitamins and minerals from sources other than food." He is proposing an agricultural revolution "that involves no added agricultural production. Instead, it makes use of foodstuffs not previously utilized as human fare."

"Though it is plagued by a chronic shortage of funds, more than 73,000,000 meals have been sent to starving people in 143 counties, territories, and island dependencies, and the files in MFM headquarters at 215 West 7th Street, in Los Angeles, overflow with letters of thanks for 'The Friendship Food.'

"The head nurse of the Schweitzer clinic at Lambaréné [Lambarene] wrote, 'It is wonderful food. The patients like it and it does them great good... They love the flavour of MPF in crocodile soup... We have used MPF sparingly because we do not know when we might be so fortunate as to receive more.'"

"The MFM self-help program has been especially successful in India, Japan, Mexico, and Brazil, which have taken over production of MPF themselves, adapting the formula to local conditions. India, for instance, uses a base of peanut meal and Bengal gram [chickpea, garbanzo bean] instead of soy meal. Many other nations are preparing to produce MPF independently."

4971. *Foreign Agriculture.* 1963. Japan revises U.S. soybean standards. 1(24):14. June.
• ***Summary:*** The Osaka Grain Exchange has announced revised standards for the sales of U.S. soybeans. There must now be over 87.0% perfect beans, below 8.0% split beans, and less than 0.5% foreign material in shipments. The old specifications only required that there be over 76.9% perfect beans, less than 15.0% split, and less than 2.4% foreign material in a shipment. The primary purpose of these new standards is to increase the transactions and deliveries on the Osaka Grain Exchange.

• ***Summary:*** Purified soybean oil is used to make a hardened resin with a tensile strength of 470 gm per square centimeter.

4986. Mitani, Kazuma. 1963. Edo shôbai zu-e [Illustrations of merchants, artisans and peddlers during the Edo period in Japan]. Tokyo: Seiabo. 271 p. Illust. No index. 20 x 27 cm. [Jap]
• ***Summary:*** A stunning book, filled with large, lovely illustrations (mostly wood-block prints or line drawings) from the Edo period (1600-1867) in Japan. Soy-related illustrations:

(1) A tofu shop (p. 18), showing a man sitting on a wooden lever-press pressing the soymilk out of cloth straining bag while his wife, with a baby on her back, turns a hand-turned stone mill that grinds soaked soybeans into a smooth puree, which falls into a wooden tub. Large blocks of tofu are shown immersed in cold water in a sort of wooden sink, with a tofu knife on top. In the background, up a step inside the house, an elderly person is deep-frying tofu.

(2) A tofu seller (p. 19), walking in the street with two wooden tubs of tofu at both ends of a shoulder pole. He is wearing getas on his feet and a large round straw hat.

(3) A shoyu seller (p. 23), walking in the street from door to door with several layers of wooden tubs at both ends of a shoulder pole and a kerchief over the head.

(4) A man in a shop with Kinzanji hishio in wooden vats

of various sizes, each bound by braided bamboo hoops (p. 26).

(5) A woman in a kimono (p. 26), serving two cups of amazake.

(6) A man selling dengaku (p. 28), skewered tofu above hot coals in a brazier. He is fanning the coals and hunkering behind the brazier.

(7) A seller of oden (p. 29). He is standing, resting on the shoulder pole, which rests atop two tall boxes.

(8) A man making Inari-zushi (p. 49) at a street stall. An illustration below the roof shows a fox running.

(9) A man selling woven bamboo baskets and miso strainers (*zaru* ya *miso-koshi*) (p. 210).

(10) A woman (*edamamé uri*) with a child on her back as she walks (p. 239), selling edamamé (green vegetable soybeans) in a basket under her right arm.

The author collected these illustrations from many sources; the source of each is given in an "accompanying source book"–which we have been unable to locate. He re-drew each of the old originals, but tried to be true to the original. He eliminated a few things that he felt were not needed in some illustrations and added a few more things to others to make them clearer for today's readers. There are no illustrations that he created. Most of the originals are from the mid-Edo period, especially the Kansei, Bunka, and Bunsei eras (1789-1830), with 2-3 things from the Kyoho period (1716-1735).

To make this book he went to many libraries, archives, and other places where historical documents are kept; he was helped by many other people. He was born on 15 March 1912 (Meiji 45). He graduated from Tokyo Bijutsu Daigaku. Nihon ga-ka (Tokyo Fine-Arts Univ., Japanese Art Dept.). He is a member of the Bijutsu Shuppan Renmei (Art Related Publishing Bureau). He presently lives at Setagaya-ku, Tokyo. The book has a detailed table of contents, but no index. Address: Japan.

4991. *Foreign Agriculture.* 1963. Japanese to negotiate for Chinese soybeans. 1(35):13. Sept. 16. [1 ref]
• ***Summary:*** "Some groups forecast that Japan will take about 250,000 metric tons (9.2 million bu.), either under the agreement alone or with outside purchases included.

"Japanese and Chinese groups agreed in November 1962 on a 5-year program for the exportation of 700,000 tons (25.7 million bu.) of soybeans from Communist China to Japan. For 1963, the first year of the agreement, 150,000 tons (5.5 million bu.) were programmed. However, actual imports probably will exceed 200,000 tons (7.3 million bu.), for some soybeans have been bought outside of the agreed quantity. Communist China is pricing its soybeans below those of the United States, as an inducement to Japanese buyers."

• ***Summary:*** Seven strains of *Bacillus natto* were all found to be vulnerable to phage S-1, while five among them were able to transfer their genetic traits to *Bacillus subtilis* by the phage. Address: Inst. of Applied Microbiology, Univ. of Tokyo, Bunkyo-ku, Tokyo, Japan.

4994. *Foreign Agriculture.* 1963. Japan's soybean imports and consumption up. 1(39):14. Sept.
• ***Summary:*** Japan's imports of soybeans in the Japanese fiscal year, beginning April 1963, are estimated at about

© Copyright Soyinfo Center 2014

1,360,000 tonnes (50 million bushels). The U.S. supplied 86% of the January-July imports, and Communist China supplied 14%. Area planted to soybeans in 1963 declined by 10% to 593,000 acres. Liberalization of imported soybean oil and soybean meal is expected to be postponed until sometime in 1964.

4995. Grow, H.E. 1963. Selling U.S. soybeans in Japan. *Soybean Digest.* Sept. p. 57-60, 62.
• ***Summary:*** "This country [Japan] continues to develop at an unbelievable rate. More good highways are being constructed every year and in spite of the mountainous terrain in many areas, superhighways are being built and used. Tokyo is preparing for the 1964 Olympics with the construction of more subways and superhighways leading to the Olympic area. A new superrailroad will be completed next year which runs from Tokyo to Osaka, a distance of about 300 miles, and with only one intermediate stop will have a running time of approximately 3 hours.

"Another area of expansion, in which we are particularly interested, is in animal agriculture. As you have heard many times, there has been very little livestock and poultry in Japan. That situation is changing rapidly, particularly in the field of poultry and swine. A preliminary report of a projection study indicates that by 1975 poultry numbers will nearly double from about 80 million to 140 million birds, of which a large percentage will be broilers. Swine will increase from 3½ million to 10 million head and dairy cows will increase from a little over 1 million to over 3 million animals. This projection in the field of animal agriculture should be considered as quite reliable, since the information comes from several separate sources which more or less agree.

"This rapid increase in livestock and poultry numbers will increase the feed requirements far beyond the present usage and will require large amounts of feedstuffs. As Japan is limited in ability to produce feeds, a large amount of these requirements will need to be imported. I know that you are particularly interested in What the future market for U.S. soybeans in Japan will be and I can tell you that it is very encouraging.

"As you know, up to this time our American Soybean Association activities have been mostly in the field of human foods and nutrition. Considerable progress has been made in this area and perhaps as a nation Japan is more nutrition conscious than any other country. There are several reasons for this. The per capita income in Japan in 1956, at the time that our program started, was equivalent of $228 per person. In 1961 per capita income was $403 and has continued to rise in 1962 to an estimated $468. As incomes have increased, some of the increased per capita income has been spent for food.

"Japanese Branch: The American Soybean Association, as many of you know, maintains in Japan a market development branch that is known as the Japanese American Soybean Institute, or JASI, as it is commonly called. JASI is directed by Shizuka Hayashi and maintains a staff of 10 people. JASI is directly responsible for the detailed planning and supervising of the programs and activities that are carried out to stimulate greater use of U.S. soybeans and soybean products in Japan. JASI is financed cooperatively by ASA, Foreign Agricultural Service of USDA and the various industry groups in Japan.

Note: This paper continues for 4 more pages. A small portrait photo shows Howard Grow. Address: Assistant to Executive Vice President, American Soybean Assoc.

4996. *Foreign Agriculture.* 1963. Chinese soybeans reportedly of better quality. 1(40):11. Oct. 7.
• ***Summary:*** Importers and crushers indicate that on the basis of present quality Chinese soybeans can be used for crushing on a $3/tonne differential below U.S. soybeans. Formerly $5 to $7 was considered necessary. In 1962 China supplied 13% of Japan's total soybean imports and the U.S. supplied virtually all of the remainder.

4997. *Foreign Agriculture.* 1963. U.S. soybean exports, biggest cash earner. 1(41):11. Oct. 14.
• ***Summary:*** Soybeans and soybean products were the leading "cash on the barrelhead" dollar earner of all U.S. agricultural exports during the 1962-63 marketing year, according to preliminary comparisons of leading U.S. farm products exported for dollars. Major customers have been fast-growing commercial feed industries–first in Western Europe and later in Japan–particularly feed for poultry and hogs and to some extent for beef cattle.

4998. Nelson, Kay Shaw. 1963. Humble vegetable with a glorious past: In praise of the lowly pumpkin. *Christian Science Monitor.* Oct. 25. p. 17.
• ***Summary:*** In the USA we think of pumpkins in connection with Halloween jack-o'-lanterns, pumpkin pie, and Cinderella. "In Japan the whole pumpkin, scooped out and filled with a mixture of minced chicken, sliced carrot, mushrooms, soy sauce, sugar, tofu, green peas, and eggs, is steamed." Address: Washington, DC.

Address: Faculty of Home Life Science, Fukuoka Women's Univ., Fukuoka, Japan.

5001. *Foreign Agriculture.* 1963. Japan to import more Chinese soybeans. 1(44):13-14. Nov. 4.
• ***Summary:*** This is part of the 5-year agreement negotiated in Peking in November 1962 to import 700,000 tonnes (25.7 million bushels) of soybeans from Mainland China. (See Foreign Crops and Markets, Dec. 17, 1962).

5002. *Foreign Agriculture.* 1963. Japanese marketing toasted soybean meal. 1(47):13. Nov. 25.
• ***Summary:*** A large oilseed processor in Japan is scheduled to start marketing toasted soybean meal this month. This will be the first time that roasted soybean meal has been placed on the domestic market. It is expected that toasting will be widely adopted, because of the additional nutritive value of meal so treated. Each of the plants will continue to produce some untoasted meal for soy-sauce production.

5003. Hayashi, Shizuka. 1963. Meal market grows in Japan. *Soybean Digest.* Nov. p. 20.
• ***Summary:*** "Japan produced 14,500 million eggs during 1962. This pushes up Japan to the second largest producing country in the world, the first being the United States, with 64,000 million. The third is England With 11,500 million. The livestock industry in Japan, especially the poultry industry, is rapidly expanding in these last few years as indicated below (a table shows the number of chickens and livestock produced in Japan each year from 1958 to 1962).

"In parallel with the expansion of the livestock industry, the demand for feeds is increasing. As statistics indicate, total mixed feed production came up to nearly 5 million metric tons in 1962..."

A photo shows the inside of the JASI office in Chiyoda-ku, Tokyo. Address: Managing Director, Japanese American Soybean Inst., 410 Nikkatsu International Bldg., No. 1, 1-chome Yurakucho, Chiyoda-ku, Tokyo, Japan.

5004. Muto, Shizuko; Takahashi, E.; Hara, M.; Konuma, Y. 1963. Soybean products as protein sources for weanling infants. *J. of the American Dietetic Association* 43(5):451-56. Nov. [12 ref]
• ***Summary:*** In Japan, the main protein sources for the weanling infant, in the form of solid food, "are *tofu* (soybean curd), *natto* (fermented soybean), and *kinako* (toasted soybean flour)."

Describes briefly how each is made commercially. For example, for kinako, the soybeans are dry heated in an oven for about 25 minutes. The temperature inside the beans at the time they are removed from the oven is about 105ºC. They are then milled into flour [probably after being allowed to cool to room temperature] and sieved through a 70-mesh screen. "The product has a pleasant odor, similar to fresh-toasted bread, and is brownish yellow in color. It is mixed with sugar and is used as a coating for rice cakes."

Nitrogen balance studies on infants fed these foods showed that they "can be substituted at least in part for animal foods in the solid diet of weanling infants with no appreciable drawbacks on growth, digestibility, and nitrogen retention."

Note: The researchers seem to assume that animal-based protein sources are nutritionally superior to plant-based sources. Address: Aiiku Research Inst. of the Mother and Child, Tokyo.

5005. *Soybean Digest.* 1963. Japan miso team visits U.S. Nov. p. 22.
• ***Summary:*** "A team of nine representatives of the Japanese miso industry and their interpreter from Japan were guests recently of the American Soybean Association at Hudson, Iowa. They were under the leadership of Tabukei Tanaka, president of the Japan Miso Industrial Cooperative Association.

"The group visited several farms in the area, and the farmers' elevator and processing plant of the Farmers Cooperative Co. at Dike, Iowa, in addition to the American Soybean Association headquarters.

"The miso manufacturers traveled widely visiting the U.S. soybean industry, with stops in New Orleans [Louisiana], Chicago [Illinois], Minneapolis [Minnesota], Peoria [Illinois], and Washington [DC], before making a tour of Europe on their way home.

Miso is a fermented product made from soybeans and is used mainly as a soup, but also for preserving fish, meat and vegetables, and for various kinds of Japanese cooking. Japanese miso manufacturers have become much interested in purchase of U.S. soybeans for the making of miso in recent years.

"Talk by Mr. Tanaka: Said Mr. Tanaka, in a talk at the Waterloo, Iowa, Elks Club, where he and other members of the team were guests of ASA: 'Ninety percent of miso is cooked into miso soup and is served at the tables of all Japanese families every morning without missing a single day. Over a period of a year you will be surprised to learn of the wide variety of the items served in miso, and how fresh they are. There is no country in the world that has so many common vegetables, fish and shellfish in the rivers and ocean, and seaweed. The U.S. adults would not know the names of the fish and shellfish though even the children of Japan know them well. "'Miso makes rare delicacies of all kinds easily available as regular food every morning. I

© Copyright Soyinfo Center 2014

believe that to know the taste of miso soup is to know the people of Japan, as it expresses the arts and culture of Japan. Mt. Fujiyama is well known as a symbol of the landscape of Japan. Please recognize miso as a symbol of the common food and delicacies of Japan.

"'Soybeans are not only judged by their elements but as an ingredient of miso, of which Japan is proud. Special care should be exercised in selecting soybeans for miso. So please understand the reason why we are as careful to obtain a white germ, lustrous hull, and even the same sized bean as the pearls we select for a necklace. The members of this tour are the representatives of miso industrial and manufacturing enterprises, so they may tell you of their various requirements for soybeans.

"'Please obtain a good understanding of this unique food of the Japanese people. We beg you to supply us with good soybeans.'"

Photos show: (1) "Japan miso team at home of Mr. and Mrs. Geo. M. Strayer in Hudson, Iowa. Front row, left to right: Zensuke Aoki, vice president, Aoki Miso Shoyu Co.; Mr. Strayer; Ukitsu Matsubayashi, president, Shoman Sangyo Co.; Saburo Watanabe, president, Otomo Food Industry Co.; and Howard E. Grow, assistant to the ASA executive vice president. Back row, l to r: Sadao Nakagaki, president, Yamajirushi Miso Co.; Goro Komatsu, president, Yamaman Kashimaya Shoten; Tokubei Tanaka, president, Japan Miso Industrial Cooperative Association, the tour leader; Matauemon Iida, president, Abumata Shoten; Ken Sasaki, managing director, Sendai Miso Shoyu Co.; Sakubei Takekuchi, president, Chikuma-Miso Co.; and Hiroshi Ushiyama, Yusen Air & Sea Service Co., the interpreter.

(2) Miso team in field of Kim soybeans on the Strayer Seed Farms near Hudson. ASA's executive vice president, Geo. M. Strayer; is second from right, and Howard E. Grow, assistant, is at right. Second from left is Tokubei Tanaka, president of the Miso Association.

5006. U.S. Department of Agriculture. 1963. U.S. soybean exports biggest cash earner. *Soybean Digest.* Nov. Front cover.
• ***Summary:*** "Soybeans and soybean products were the leading 'cash on the barrelhead' dollar earner of all U.S. agricultural exports during the 1962-63 marketing year, according to preliminary comparisons of leading U.S. farm products exported for dollars.

"U.S. soybeans and soybean meal, exported at competitive U.S. market prices, are in active demand on the world market. This export dollar demand takes up all the soybeans not being purchased by the U.S. crushing industry. It also takes up all the soybean meal that is not consumed domestically.

"Major customers have been fast-growing commercial feed industries–first in Western Europe and later in Japan–particularly feed for poultry and hogs and to some extent for beef cattle, all of which have been finding ready markets as meat consumption has risen along with per capita incomes."

5007. *Foreign Agriculture.* 1963. Japan, Communist China agree on soybean prices. 1(48):15. Dec. 2.
• ***Summary:*** "The price agreed on by the Japan-Communist China Trade Mission for the 30,000 metric tons (1.1 million bushels) of soybeans scheduled for shipment to Japan in November and December was $103.74 per [metric] ton ($2.82 per bushel), f.o.b. Addition of the freight rate expected to be $5.60 per ton, makes the c.i.f. price $109.34 per ton, or $2.98 per bushel. This price was reported at the end of October to be about $6 per ton lower than that of U.S. soybeans."

Japan is to take 150,000 tons of soybeans from Communist China in 1963, the first year of its 5-year agreement to import 700,000 tons (25.7 million bu) of Chinese soybeans. An additional 70,000 tons (2.6 million bu) was purchased outside the agreed contract, bringing Japan's total 1963 purchases to 220,000 (8.1 million bu). Increased purchases from China this year have been brought about mainly by increased U.S. domestic prices. The quality of Chinese soybeans that Japan has imported this year is reported to be better than that of previous imports, and the oil content has been higher.

5008. *Foreign Agriculture.* 1963. Japanese raise support price for soybean crop. 1(49):10. Dec. 9.
• ***Summary:*** Japan's 1963 soybean crop will be supported at 3,310 yen per 60 kilograms ($4.17 per bu). This increased price is designed to boost production in Japan, where acreage in soybeans has declined every year since 1954. The Japanese farmer may sell his soybeans either to the National Marketing Federation of Agricultural Cooperatives (ZENKOREN) or on the local market.

5009. Loring, Kay. 1963. Front views and profiles: Japanese dinner. *Chicago Tribune.* Dec. 13. p. B14.
• ***Summary:*** Naka-no-Ya Tea House (2100 Lincoln Park West) will prepare a Japanese dinner at your table. First they brink a large copper cauldron, called a mizu taki, to the table, together with a large platter of artistically arranged vegetables, beef, and chicken.

"Chicken brother was kept simmering in the mizu taki. Dexterously using chopsticks, one young woman placed small portions of pea pods, giant black mushrooms, bamboo shoots, spinach, soy bean cakes [tofu]. Japanese cabbage, and the meats into the liquid." After simmering for only a few minutes, they were served steaming hot.

5010. *Foreign Agriculture.* 1963. Japan probably to import U.S. soybean meal. 1(50):10. Dec. 16.
• ***Summary:*** An apparent soybean meal shortage in Japan has prompted the Livestock Bureau of the Ministry of

© Copyright Soyinfo Center 2014

Agriculture and Forestry (MAF) to request permission to import 50,000 tonnes of soybean meal. In all of 1962, Japan imported 15,821 tons of soybean meal (5,945 from the United States and 9,627 from the USSR). Japan's production of mixed formula feed continues to grow at a rapid rate and soybean crushings have not increased rapidly enough to meet the growing demand for soybean meal by the mixed feed industry.

5011. Nishimura, Sachio; Hata, Naoaki. Assignors to Asahi Electric Industry Company. 1963. [Thermosetting epoxy resin]. *Japanese Patent* 26,572. Dec. 20. 3 p. Application filed 13 June 1961. (Chem. Abst. 60:8200g). [Jap]*
• ***Summary:*** Epoxidized linseed oil or soybean oil may be used.

5012. *Foreign Agriculture.* 1963. Japanese buy soybeans at Canton trade fair. 1(51):13. Dec. 23.
• ***Summary:*** Japanese purchases from China in 1964 are expected to total 300,000 tonnes (11.0 million bu). The Japanese trading firms have become very active in purchasing Chinese beans recently owing mainly to an increased oil content this year, less cleanout, and lower prices than U.S. beans.

5013. Keaton, Clyde. 1963. Japan: An expanding market for soybeans. *Foreign Agriculture* 1(51):9. Dec. 23.
• ***Summary:*** A good overview. "Of total commercial utilization of soybeans in Japan, about 19 percent goes into the manufacture of tofu (bean curd) and 8 percent into miso (soy paste). Largest user, however, is the soybean crushing industry, which takes about 67 percent of the total–and most of the American beans–for the production of oil and meal."

"Price is a major factor in soybean sales to Japan. The Communist Chinese Government has been pricing Chinese beans below those of the United States as an inducement to Japanese buyers; it can set prices at any level to move the desired quantity of beans into the Japanese market. This puts U.S. exporters at a disadvantage." Address: Asst. Agricultural Attaché, Tokyo, Japan.

5014. Hasegawa, Kiyozo; Kusano, T.; Mitsuda, H. 1963. Fractionation of soybean proteins by gel filtration. *Agricultural and Biological Chemistry* 27(12):878-80. Dec. [9 ref]
• ***Summary:*** Ultracentrifugal studies (Naismith 1955; Wolf and Briggs 1956) have shown that soybean proteins consist of four major components having sedimentation constants of approximately 2, 7, 11 and 15 S at ph 7.6 to 7.8 and 0.5 ionic strength. The 11S and 7S globulins account for about 70% of total soybean protein. This communication deals with fractionation of soybean proteins by gel filtration with Sephadex G-200. Address: Dep. of Agricultural Chemistry, Kyoto Univ., Kyoto, Japan.

5015. Hayashi, Shizuka. 1963. Japan's food supply: What is wrong with it? *Soybean Digest.* Dec. p. 26. [4 ref]
• ***Summary:*** This article begins with a long table showing the "Total food supply of Japan." It is divided into carbohydrate foods, protein foods, oils and fats, and others.

The average Japanese presently gets 80% of total daily calories from carbohydrates (mainly rice), and 12% from fat (31 gm). Of this, soybean products supply 13.1 gm of protein per day and 5.0 gm of fat per day.

"From all studies we seem to come to the conclusion that diets should contain enough fat to supply 40% to 50% of the calories. As for Japan this level is definitely too high at present. Let us take the figure of 30% of the calories as the minimum fat requirement for the Japanese people. This requires 76 grams per capita per day intake of fat. The Japanese people, therefore, need now to increase their intake of fats by 45 grams a day. This is a must from the nutritional standpoint. If balancing of diets is to be emphasized the food policy of Japan must be revised on this basis. An increase of 45 grams of fat a day means an increase in supply of 1,600,000 metric tons a year in terms of soybean oil or 335 million bushels of soybeans.

"Fat intake in the United States was 149 grams per person per day in 1958. Nearly all countries in Western Europe consumed 109 to 131 grams per capita per day in 1958.

"JASI is continuing its activities in behalf of greater fat consumption. Every opportunity is being grasped and efforts are being made to create the opportunity to promote more and more consumption of soybean oil. In subsequent issues of the *Soybean Digest* I will include reports on some of the oil promotional activities carried out by JASI." Address: Managing Director, Japanese-American Soybean Inst., Tokyo.

sub-chapters on company divisions. 9. Related companies and organizations (p. 217): Appendix. Pages 255-72 contain a detailed chronology of this major Japanese company, which crushes soybeans, and makes soy oil and soy protein products. My personal history, by Kintaro Sugiyama (p. 273). Closing remarks. Address: Japan.

5017. Uesugi, Yoshio. 1963. Brief history of the solvent extraction plant at Dairen, Manchuria, owned by Suzuki Shoten, then Hohnen Oil Co. Ltd. (Document part). In: Y. Uesugi. 1963. Hohnen Seiyu K.K. 40 nen-shi [40 year history of Hohnen Oil Co.]. Tokyo: Hohnen Seiyu K.K. 307 p. See p. 60-63.
• ***Summary:*** In July 1913 the South Manchuria Railway Co. (Manshu Tetsudo) started to build this plant. In March 1914 they started to operate the plant. In the spring of 1915 Suzuki Shoten of Kobe, Japan, bought the plant from the Manchuria Railway Co. for the amount of money the railway company had spent on the plant, and with some conditions. The name was changed to Suzuki Yubô, and they started to use the benzene method of solvent extraction. In Sept. 1915 Fusanobu Isobe became the first plant manager, and in July 1916 Nobuaki Oda became the second.

During World War I, Suzuki Shoten was the largest producer of vegetable oil in Japan. But in Nov. 1917 the company was forced by the postwar economic crisis to give up their plant at Dairen as well as their plants in Japan at Shimizu (Shizuoka prefecture), Naruo, and Yokohama. In 1922 Hohnen Oil Co. Ltd. (Hohnen Seiyu K.K.) was formed to take over these plants. On 20 April 1922 Hohnen obtained all rights to these four plants formerly owned by Suzuki. At this time the total area of the Dairen plant and company housing was about 20,000 tsubo (16.4 acres). Roughly 100,000 tonnes of soybeans were crushed each year, and a maximum of 12,000 tonnes of soybeans were crushed per month. Address: Japan.

5018. Uesugi, Yoshio. 1963. Brief history of the solvent extraction plants at Shimizu, Yokohama, and Nishinomiya (later Naruo) Japan, built by Suzuki Shoten, then obtained by Hohnen Oil Co. Ltd. (Document part). In: Y. Uesugi. 1963. Hohnen Seiyu K.K. 40 nen-shi [40 year history of Hohnen Oil Co.]. Tokyo: Hohnen Seiyu K.K. 307 p. See p. 4, 202-03.
• ***Summary:*** On 19 June 1916 Suzuki Shoten started to build a benzene solvent extraction plant at Shimizu, Shizuoka prefecture, Japan. That June Fusanobu Isobe became the first plant manager and in May 1917 Shinsuke (or Kiyosuke) Imô became the second plant manager. On 30 Jan. 1917 they finished building this plant.

In Aug. 1917 Suzuki Shoten started to build a benzene solvent extraction plant at Nishinomiya (Hyogo prefecture). The first plant manager from Aug. 1917 was Yahachiro Obata. On 30 March 1918 they finished building this plant. The second plant manager was Doyozo Kikuchi from Oct. 1921 to Sept. 1925. The soybean processing capacity was 250 tonnes/day. During World War I, Suzuki Shoten was the largest producer of vegetable oil in Japan. But in Nov. 1917 the company was forced by the postwar economic crisis to give up these plants. In 1922 Hohnen Oil Co. Ltd. (Hohnen Seiyu K.K.) was formed to take over the Suzuki plants. On 20 April 1922 Hohnen obtained all rights to these plants. The types of products produced at the Shimizu plant were: unrefined soybean oil (daizu genyu), Shirasame oil, special grade oil (tokusei-yu), salad oil, defatted soybean meal, Sakuramame, Chitose-mame, Yutaka-mame, Top Run, Hohnen Glue, Merashet Keshôban, Pearl Beans for fermentation (Jôzôyô), and S.M. Soyalet. At the Nishinomiya / Naruo plant the company produced soybean oils, rapeseed oil, Kinshô oil (Gold medal), Ginshô oil (Silver medal), cottonseed oil, defatted soybean meal, lecithin, etc.

In Aug. 1923 Suzuki Shoten built an oil mill in Yokohama (Kanagawa prefecture) to expand their oil production. The capacity of the benzene plant at Shimizu was 500 tonnes of soybeans per day, and that of the benzene plant at Yokohama was 250 tonnes of soybeans per day. Address: Japan.

5019. Uesugi, Yoshio. 1963. Brief history of Japanese solvent extraction plants in Manchuria, Suzuki Shoten, and Hohnen Oil Co. (Document part). In: Y. Uesugi. 1963. Hohnen Seiyu K.K. 40 nen-shi [40 year history of Hohnen Oil Co.]. Tokyo: Hohnen Seiyu K.K. 307 p. See p. 7-10.
• ***Summary:*** In 1905, after the Japanese victory in the Russo-Japanese War (*Nichiro Senso*), Japan obtained special rights in Manchuria. The treaty of Portsmouth, signed on 5 Sept. 1905, gave Japan the Russian lease on the Kwantung Peninsula in southern Manchuria and the Russian-built South Manchurian Railway as far north as Changchun. The Japanese called this railway company the *Minami Manshu Tetsudo K.K.* In 1898 Russia had obtained the lease of the Kwantung Peninsula and the right to connect its Chinese Eastern Railway by a southward extension, the South Manchurian Railway, to the ports of the peninsula, Port Arthur and Dairen (Ta-lien in Chinese).

In 1905 Manchuria was basically an agricultural country and one of its main crops was soybeans. The country's best known industry was the soybean crushing industry, but the methods, equipment, management, and sales were very primitive and the mills very small and scattered. So at that time the South Manchuria Railway Co. (SMRC) recognized the value of soybeans and decided to greatly improve the oil industry in Manchuria. The began by sending some engineers to Europe to study European processing methods. At that time, all major companies in Germany foresaw a great future in the benzene solvent extraction method, so SMRC bought a patent for the process from Germany. Shortly thereafter, in July 1913, they began to build a benzene solvent extraction plant at Dairen, Manchuria. By 1915, after conducting

© Copyright Soyinfo Center 2014

extensive research using this plant, they were convinced that this process had great potential worldwide. So in 1916 they sold the rights to the plant to a private company, Suzuki Shoten of Kobe, with some conditions. This came to be the beginning of Hohnen Oil. Co. in Japan.

At that time the cost of fertilizer to Japan was 115 million yen/year, of which 32.3 million yen was spent on imported soybean cake. Japan wanted to cut import expenses and improve the quality of the product to help Japanese agriculture. The main food oil in Japan was rapeseed oil (*natane abura*). Some vegetable oil was burned in lamps and a little found non-food industrial applications. Europe was much more advanced in oilseed crushing than Japan. The soy oil industry in Japan was very small and it lacked experience with large-scale extraction methods. But Suzuki Shoten of Kobe decided to take a large risk to enter an area that seemed to have a bright future. This took great courage.

In 1914, as World War I began in Europe, the world economy was greatly changed. The Japanese oil industry received a large shock. At that time many of the world's countries experienced a shortage of oils, so the Manchurian oil industry became very active. The oil department of Suzuki Shoten, with what appeared to be the luck of good timing, expanded the capacity of their plant at Dairen, and in 1917 and 1918 built plants at Shimizu (500 tonnes/day capacity), Naruo (250 tonnes/day), and Yokohama (250 tonnes/day), thereby becoming the largest oil company in Japan, with the three largest oil mills in Japan. But unfortunately after World War I, in 1917, many Japanese companies went bankrupt when the good economic times ended. Suzuki's huge program of building oil mills in Japan in 1917 and 1918 left the company short of funds. [As did its unsuccessful attempt to corner the soybean cake/meal market in 1917.] In 1918 Suzuki, too, had to reorganize, so they made each of their divisions into independent companies. On 20 April 1922 the former oil division of Suzuki officially became Hohnen Seiyu K.K. They took over the 4 large oil mills at Dairen, Shimizu, Naruo, and Yokohama. Thus they took a step toward competition of large national companies. Address: Japan.

• ***Summary:*** Contents: 1. Introduction: World production, United States production trends, utilization (processing to obtain oil and meal, hay and green manure). 2. Soil and climatic adaptation: Areas of production in the United States, soil requirements, climatic adaptation (effect of temperature on plant growth, effect of temperature on composition of seed, effect of light on plant growth, effect of photoperiod on flowering and maturity, effect of soil moisture on growth). 3. Time of planting and varietal adaptation: Effect on plant characters (maturity, plant height, lodging, seed quality, size of seed, seed yield), effect on composition of the seed. 4. Planting methods and equipment: Seedbed preparation (conventional, minimum tillage, deep tillage), row width and planting rate (row width, planting rate), double cropping (after fall-sown grain crops, after peas), special methods of planting, types of equipment. 5. Rotation practices and erosion control: Effect on soybean yields, effect on the following crop, effect on weed population, soil residues from herbicides, erosion control. 6. Weed control: Effect of planting time on plant growth and weed competition, methods of cultivation, chemical weed control (pre-emergence herbicides, post-emergence herbicides). 7. Seed quality and seed treatment: Factors affecting seed quality and germination, seed treatment. 8. Nutrient requirements: Nitrogen requirements and nodulation (effectiveness of nodulation as a source of nitrogen, methods of inoculation, survival of bacteria in the soil, effect of seed treatment on inoculation, effect of nitrogen applications), liming and pH levels (pH and plant development, calcium and magnesium requirements), phosphorus, potassium, trace elements, fertilizer practices and recommendations. 9. Water requirements and utilization: Water needs in relation to plant growth and development, irrigation and soil management. 10. Growth-regulating chemicals. 11. Diseases: Foliar, root and stem, seed. 12. Insects and spider mites: Leaf feeders, above-ground stem feeders, pod feeders, root feeders. 13. Nematodes: Root knot, cyst, others. 14. Harvesting: When to harvest (moisture content of seed, chemical defoliation, losses from respiration after maturity), harvesting methods (historical, combine harvesting). 15. Seed storage. 16. Discussion. The USA now produces about 57% of the world's soybeans, followed by China (PRC; about 33%), Indonesia, Japan, Korea, USSR, Brazil, and Canada, in that order. By 1920, U.S. production was 3,000,000 bushels and the leading states were North Carolina, Virginia, Alabama, Missouri, and Kentucky–North Carolina producing 55% of the total. By 1931, the center of production had shifted to the North Central States, where it is at present.

The subsection titled "Seed treatment" (p. 193) states: "Seed treatment with a fungicide is not recommended as a general practice when seed with high germination is planted. Stands may be increased by seed treatment when seed having a germination of 85 per cent is planted. Although seed treatment seldom results in increased seed yields,... the improved stands resulting from seed treatment aid in giving soybeans a competitive advantage with weeds. Studies by Howard W. Johnson *et al.* (1954) show that seed may be treated at any time between harvest and planting with equal effectiveness. The most satisfactory time for treating seed would be as it is cleaned. The materials Arasan, Captan, and Spergon have proved to be most satisfactory for treatment of soybean seed. Before any lot of seed is treated, it may be a good practice to check the germination with and without the fungicide to determine the beneficial effect of seed treatment on each seed lot."

The section titled "Harvesting methods: Historical" (p. 219) states: "The earliest harvester designed specifically for soybeans was a two-wheeled, horse-drawn machine which straddled the bean row (Piper & Morse, 1923, p. 94). This special harvester was common in Virginia and North Carolina, but was never commonly used in the North Central States. Harvesting losses ranged from 20 per cent under favorable conditions to as high as 60 per cent under unfavorable (Sjogren, 1939). In small-grain growing areas, the binder and thresher were adapted for soybean harvest. Harvest losses for using the binder or mower for cutting and then threshing ranged from 16 to 35 per cent of the total yield, with an average loss of 24 per cent (Sjogren, 1939).

"The combine harvester was first used for soybeans in the mid-twenties. The combine harvester has been a major factor in the expansion of soybean production. This machine required less labor than earlier methods and was more efficient." Address: 1. Agronomist-in-charge, U.S. Regional Soybean Lab., Crops Research Div., ARS USDA, Urbana, Illinois; 2. • ***Summary:*** The first edition was published in 1949. This is actually the 2nd ed., which is 36 pages longer. Most of the information about soyfoods in the 1st edition is also in this 2nd edition, but often on different pages: Several examples: Long passage about soybeans and soyfoods (p. 16). Glossary (soy entries, p. 40-42). Nameko miso soup (p. 81). Miso-shiru (introduction, p. 82). Tofu and Japanese leek soup (p. 89). Four kinds of miso soup (p. 90-92).

The last two pages in the 1963 printing are devoted to full-page ads: (1) "Zest that's best with Kikkoman." "Brewed by Noda Shoyu Co., Ltd., Tokyo, Japan. Sole agent in U.S.A.: Kikkoman International Inc., 900 Marin St., San Francisco 24, California. 930 San Mateo St., Los Angeles, Calif. 11-31 31st. Ave., Long Island City 2, New York." Photos show a can and a bottle of Kikkoman All-Purpose Soy Sauce.

(2) "Try Aji-no-Moto: The super seasoning." "Just add a pinch of Aji-no-Moto before, during, or after cooking and see how it unlocks those hidden flavors in all foods–raw, cooked, dried, canned, or frozen." An illustration show an Italian chef with a white chef's hat (*toque blanche*), moustache, kerchief, and upward pointing right index finger. Illustrations show a small glass shaker and a metal can of Aji-no-Moto.

Aya Kagawa was born in 1899. Address: M.D. and president of Joshi Eiyô Tanki Daigaku (Women's Nutrition College), Tokyo, Japan.

5031. Kan, Johnny; Leong, Charles L. 1963. Eight immortal flavors. Berkeley, California: Howell-North Books. 246 p. Illust. (by Jake Lee). Index. 24 cm. 2nd edition 1980.

• ***Summary:*** An interesting book, by a master cook and an excellent researcher and writer. Full of new and useful information.

From the publisher's description: "This is the first cookbook–written by a Chinese-American to emanate from San Francisco's Chinatown–the mecca for both Oriental and Occidental gourmets. It is the only cookbook dealing strictly with Cantonese cookery." The Foreword, written by the famous food writer James Beard (of New York City) in Oct. 1963. notes that he grew up in Portland, Oregon, and was a close childhood friend of the Kan family and of their cousin Johnny Kan, who came to visit from San Francisco's Chinatown [in California]–a "city within a city." Kan's mother was an excellent and ingenious cook. Beard considers Kan's Restaurant "the outstanding Chinese restaurant today."

The "Eight Immortal Flavors" of Chinese cookery are *Hom*–salty. *Tom*–bland (like rice). *Teem*–sweet. *Seen*–sour. *Foo*–bitter. *Lot*–hot (as in chili peppers). *Heong*–fragrant (smell more than taste). *Gum*–golden (as in citrus peel or kumquat). They are always referred to in this order. Note 1. In Western cookery there are only four traditional flavors–sweet, sour, salty, and bitter. The Japanese add a 5th, "umami."

The chefs and cuisine of Kwangchow (the ancient name for Canton, now spelled Guangzhou) are considered the finest in all of China (p. 28).

The chapter titled "Native condiments, sauces, and ingredients" (p. 43-55) includes: Bean curd (*Dow Fu*)*:* "One of the most useful of Chinese ingredients," it is usually pressed into ½-inch by 3-inch squares. Bland in flavor, it is a great mixer for highly flavored foods. "It is even delicious in its fresh state with spicy condiments and is known as 'the meat without bones."

Note 2. This is the earliest English-language document seen (April 2013) that uses the term *Dow Fu* (regardless of capitalization or hyphenation) to refer to Chinese-style tofu.

Black [soy] bean, Dried (*Woo Dow*)*.*

"Soybean skin (*Foo Jook*)*:* Dried skin of soybean milk. Sold in packages, it is flat and thin, with a creamy-glaze appearance. Soak it before using in soups, or in smother-cooking recipes." It has an enjoyable chewy texture and slightly nut-like flavor.

"Soybean skin, sweet (*Teem Jook*)*:* Similar but thicker than *Foo Jook,* its taste is slightly sweeter."

Illustrations (p. 46-47) show: Soy bean skin (foo jook). Bean curd (dow foo).

Condiments (p. 51-54)–"Black beans, salted (*Dow see*)*:* Cured, fermented small black beans... Should be soaked briefly and washed before use. A common use is to mash beans with garlic, creating a seasoning popular for both seafood and meats."

Monosodium glutamate (*Mei Jing*)*:* This flavor accent powder had its origin centuries ago in old China. "A charming story, which we like to believe, involved a contest in which several monks with gourmet tastes competed with each other to produce the most delicious batch of *Loh Han Jai,* the standard monks' food consisting of a variety of various vegetarian ingredients... The winner had added one precious secret ingredient the others did not have–a powdered dried seaweed [*konbu, Laminaria japonica*] which was later discovered to be the first crude source of monosodium glutamate. It was not until 1908 that Dr. Kikunae Ikeda, the great Japanese scientist successfully extracted Glutamic Acid from edible seaweed and from it crystallized monosodium glutamate and marketed it under the name of *Aji-no-Moto.* Then in 1921 Chinese scientist Poo-Nien Wu of Shanghai developed a process for extracting monosodium glutamate from wheat protein and was marketing his discovery, Ve-Tsin, in China, Singapore, Malaya, and the Philippines to the amount of 350,000 pounds a year. Other raw material sources are corn, soybean protein, and desugared beet molasses.

© Copyright Soyinfo Center 2014

Sauces (p. 54-55)–Bean sauce (*Min See Jeung*)*:* A brown salty bean paste. Oyster sauce (*Ho Yow*)*.* Red seasoning sauce (*Hoy Sin Jeung* [*Hoisin Sauce*])*:* A thick red sauce that contains soybeans as an ingredient. "A table condiment for Peking duck."

Spiced red bean curd (*Nom Yee*)*:* "A variation of bean cake fermented." It has a slightly harder consistency, a brick-red color, and a pungent, aromatic flavor.

Soy sauce (*See Yow*)*:* "For Chinese cooking, soy sauce is the great all-purpose and most indispensable of all sauce." There are many grades and types. "For the 'red cooking' method, ingredients are incarnadined by the dark sauce. It may be used as a table dip, by itself, or mixed with mustard." Unlike salt, it has "the taste of a beef essence." It is made by the fermentation of cooked soybeans, roasted wheat, a yeast mold and salt. The best grades of Chinese soy sauce are still made by the old-fashioned, aged, natural fermentation process, rather than by the quickly made chemical hydrolysis method [HVP soy sauce]. The type know as *Sang Chau,* light and color and density, is the premier kind for flavoring and dipping." But unless you ask for it by name, "you will get the darker soy sauce or *See Yow.* There is no definitive record of the origin of soy sauce. "Reference to the sauce has been made as early as the Chou Dynasty [1045-256 BC], some 200 years before Christ!... Undoubtedly since its very origin soy sauce has been made in the home or as a village industry. As a manufactured product it started in 1688. With its long condimentary life, no wonder that, to the Chinese, soy sauce is the Sauce of Life."

Note 3. This is the earliest English-language document seen (April 2012) that uses the term "Sang Chau" to refer to light Cantonese soy sauce."

Vegetables (p. 81-87): Bean sprouts (*Ngah Choy*)*:* This common and inexpensive little vegetable is overused in some Chinese restaurants as a "filler." The name "literally means 'vegetable for the teeth,' implying a crunchy sensation. Bean sprouts are tiny shoots which grow from the soy bean. They are one of the trio of basic Chinese foodstuffs–bean sprouts, bean curd and soy sauce–derived from the wonder bean. The sprouts average two inches long, are opaque white and the bean head is yellow... Another variety of bean sprouts, germinated from a larger type of bean, is the Dow Ngah, or Big Bean Sprout. This variety grows a little longer, with a larger golden head, and the sprout is crunchier, but has a more raw 'beany' flavor. This variety is not used in Chinese restaurants."

Soy-related recipes: Spinach with foo yee sauce (Baw choy foo yee, with "2 preserved bean cakes (*Foo Yee*) mashed with 2 teaspoons juice from jar," p. 89). Shows how "any commonplace vegetable can be turned into an epicurean dish by simply adding preserved bean cake" [fermented tofu] and a touch of garlic. Try it "and you will discover why Foo Yee is often referred to as the miracle ingredient among Chinese condiments."

Bean cake sauteed with meat (Dow foo yuke, with "8 bean cakes (*Dow foo*)*.* Slice each bean cake into 6 pieces," p. 99). Fresh asparagus chicken with black bean sauce (Lei soon gai kow, with "1 full tablespoon mashed fermented black beans (*Dow see*)*,* combined with 1 clove mashed garlic and 1 tablespoon soy sauce, with a dash of monosodium glutamate," p. 100).

Note 4. This is the earliest document seen (Nov. 2011) that uses the term "black bean sauce" and clearly shows how to make it in the kitchen as part of preparing the dish.

Chinese cabbage with foo yee sauce (Siew choy foo yee, with "2 fermented bean cakes (*Foo Yee*) with 2 teaspoons juice from the jar," p. 107). Mustard greens with foo yee sauce (Gai choy chow foo yee, with "2 fermented bean cakes (*Foo Yee*) mashed with 2 teaspoons juice from the jar," and 1 teaspoon soy sauce, p. 109).

Steamed salmon with black bean sauce (Dow see jing sah-mon yee, with "2 tablespoons fermented Black Beans (*Dow See*)*,* crushed to paste," p. 131). Prawns with black bean sauce (See jup hah kow, with "2 tablespoons Black Bean Paste (*Dow see*)*,* p. 133). Steamed fish with black bean sauce (Dow see seen gee jing yee, with "2 tablespoons fermented Black Beans (*Dow see*)*,* crushed to a paste," p. 141).

Dried oysters with bean curd skim (Ho see munn foo jook, with "6 sheets Bean Curd Skim (*Foo jook*) pre-soaked in cold water for 2 hours. Drain thoroughly. Cut in 2 to 3-inch pieces." p. 143).

Note 5. This is the earliest document seen (Dec. 2010) that uses the term "Bean Curd Skim" to refer to dried yuba sticks. Continued. Address: 1. Chef, Chinatown; 2. Historian of Chinese life in America.

5032. Moncrieff, R.W. 1963. Man-made fibres. 4th ed. London: Heywood & Co. Ltd. x + 742 p. See p. 287-95.
• ***Summary:*** Part II of this book is titled "Fibres made from natural polymers." Within Part II, chapter 18, titled "Ardil, Vicara, Soybean," notes that Ardil fiber, made from peanut (groundnut) protein, was first spun at Ardeer [Scotland] in 1938 and after World War II was manufactured at Dumfries [Scotland] until 1957, when it was discontinued. Vicara was made from corn (maize) protein, named zein, by the Virginia Carolina Chemical Corporation from 1948 until 1957.

The contents of the section titled "Soybean" is as follows: Introduction. Manufacture. Properties. Protein fibres and body comfort: Low stiffness for small stretches or bends, compliance, frictional coefficient of the fibre, resilience, loftiness, moisture absorption, heat of wetting (protein fibres generally give out heat when they are wetted), thermal conductivity, static, filament cross section.

"For short periods several manufacturers have made fibre from soybean protein. At one time the Ford Motor Co. made it and used it for car upholstery; it was once made in Japan under the name Silkool. The attraction of soybean as

© Copyright Soyinfo Center 2014

raw material for a fibre lies in its high protein content (35 per cent) compared with groundnuts (25 per cent) and maize (10 per cent). Furthermore the beans which look like light brown peas grow prolifically in the East and in America." The manufacturing process and properties are then discussed briefly. The main disadvantage of soy protein fiber is that it loses strength when it gets wet. Its main attraction lies in the abundance and low cost of soybeans.

Note: The first edition of this book, published in 1950, was titled *Artificial Fibres.* Address: BSc, F.R.I.C., United Kingdom.

5035. Onishi, Hiroshi. 1963. Osmophilic yeasts. *Advances in Food Research* 12:53-94. [150+* ref]

• ***Summary:*** Since the word "osmophilic" was first used by von Richter (1912) for the group of yeasts that can grow well in an environment of high osmotic pressures, a large number of yeasts showing sugar- and salt-tolerant properties have been described.

Soy sauce mashes differ significantly from other brew mashes in their high content of sodium chloride (about 18%) and nitrogen (1.0 to 1.5% as total nitrogen). Thus, in Japan, osmophilic yeasts have been investigated mainly for "effective utilization in the soy sauce and miso paste industry."

Soy [sauce] yeasts and miso yeasts: The first report on soy [sauce] yeasts appeared in 1906, when Saito isolated 5 strains of salt-tolerant yeasts from soy sauce mashes in the Choshi district and classified them into *Saccharomyces soya, Zygosaccharomyces japonicus, Pichia farinosa, Mycoderma* sp., and *Torula* sp. Subsequently, many taxonomic studies were carried out on soy yeasts (Mitsuda, 1910; Nishimura, 1910; Kita, 1911; Ishimaru, 1935). However, none of these observations explained which yeast played an important role in the ripening of soy mashes. Takahashi and Yukawa (1911) showed that *Zygosaccharomyces major* and *Zygosaccharomyces soja* were useful in ripening soy mashes, giving the characteristic taste and flavor through their fermentation. *Zygosaccharomyces japonicus* and *Zygosaccharomyces salsus* were shown to be harmful because they were the main cause of the formation of pellicles leading to deterioration of the commercial quality. This work has been believed to give the most reliable information on both microbiological and applied aspects of soy yeasts.

"As for miso yeasts, extensive and detailed studies were conducted by Mogi (1938-1942). Unlike soy sauce, miso pastes were commercially produced in great variety with different raw materials and various contents of NaCl. Mogi described many new species of miso yeasts belonging to *Saccharomyces, Zygosaccharomyces, Debaryomyces, Hanseluna, Pseudohanseluna, Pseudohanseluna, Pichia, Zygopichia, Torulopsis, Pseudomycoderma,* and *Pseudomonilia.* Among them, the dominants were *Saccharomyces, Torulopsis, Zygosaccharomyces,* and *Zygopichia,* and the last two were found chiefly in miso paste of relatively high salt content."

Salt tolerant yeasts, especially *Saccharomyces rouxii,* play an important role in soy sauce and miso fermentation in Japan. They play a key role in creating the characteristic flavor and taste, and when added, can shorten the ripening period of the mash while improving its quality. Especially with semichemical soy sauce, involving acid hydrolysis of the soybeans, it is very important to add yeasts that cause vigorous fermentation of the mash, which improves the flavor and taste.

But osmophilic yeasts can also cause food spoilage– especially the dry white pellicles or films that form on the surface of (usually raw) soy sauce, and may cause gaseous fermentation. These pellicles are caused by the growth of film-forming yeasts such as *Saccharomyces rouxii* var. *halomembranis* and *Pichia;* the result is deterioration of soy sauce quality. "This spoilage cannot be seen in well-matured soy sauce of good quality, because it contains yeast-static compounds."

Note: This is the earliest document seen (June 1999) that mentions the yeast *Zygosaccharomyces rouxii* in connection with soy sauce or miso. Address: Noda Inst. for Scientific Research, Noda-shi, Chiba-ken, Japan.

5038. Tanaka, Heihachi; Nicholas, Betty. 1963. The pleasures of Japanese cooking. Englewood Cliffs, New Jersey: Prentice Hall, Inc. viii + 247 p. Illust. Index. 22 cm.
• ***Summary:*** Contents: Introduction. 1. A chat about Japanese food: Seasonings and flavorings, table settings and utensils, kitchen utensils, etiquette, cooking and serving a Japanese meal. 2. Appetizers. 3. Soups. 4. Broiled dishes. 5. Steamed dishes. 6. Saucepan foods. 7. Fried foods. 8. Salads. 9. Vegetables. 10. Rice and noodle dishes. 11. Thirst-quenchers. 12. Desserts. 13, Festival foods. Glossary [of Japanese foods and utensils]. List of retail outlets for Japanese food products (national chains and alphabetically by state in the USA).

The book begins (p. 1): "To many Westerners, the cuisine of Japan consists almost entirely of *sukiyaki, tempura,* rice and soy sauce. Nothing could be further from the truth."

Vegetables "are harvested at the height of their season," when tender and full of flavor, then cooked lightly and used (for example) "as an ingredient in *misoshiru* (thick soup [miso soup]) or pickled" (p. 3).

"If one were to single out the most important vegetable cultivated in Japan it would be the soybean. For this legume,... is such a versatile food that it is served in some manner at practically every Japanese meal.

"In the hilly interior of the country where fish is scarce, or in the vegetarian menus of the Buddhists, soybeans are called the 'fish of the field' and relied upon as a valuable source of protein. A favored way of preparing the green soybean is simply to boil and hull it. Dried soybeans are ground [sic, soaked before grinding], soaked in water, cooked and mashed, sieved through silk, and finally cooked again to produce bean curd or *tofu.*

"Steamed and fermented beans become *natto. Miso,* a bean paste made by boiling soybeans, mashing them, adding wheat ferment [sic] and salt and allowing this mixture to ferment for several months, lends itself to use in countless dishes. *Moyashi,* the tender young sprouts of the soybean, are cultivated on indoor racks to conserve precious space in the fields." In a few days, a single cup of soybeans will produce 3-4 pounds of succulent sprouts (p. 3-4).

"Queen of Japanese seasonings is *shoyu* or soy sauce, a dark, red-brown. thirst-provoking liquid made from wheat or barley, soybeans, salt and water. *Shoyu* is loved by the Japanese for its piquant flavor and its use is so extensive that almost no dish is conceivable without it." A brief history of shoyu and its forerunner, *hishio,* and the process for making shoyu are given. Shoyu "mash is allowed to ferment and mature naturally for a full eighteen months when it is pressed and the sauce obtained pasteurized to become refined *shoyu.*

"Another multi-purpose seasoning and foodstuff is *miso,* a paste made from fermented rice and soybeans." Most miso "lasts for years without spoiling or deteriorating. There are two types of *miso*–red and white. Both are widely used in Japan but western palates seem to prefer the white type. Both are highly nutritious and are used in literally hundreds of ways: as a seasoning, a main dish and the basis of many hearty, potage-type soups" (p. 5-6).

"For centuries [sic] Japanese cooks have used a dashi of *aji-no-moto,* a seaweed or vegetable protein derivative, to intensify the natural flavors of the foods they cooked. Translated, *aji-no-moto* means 'essence of taste' (it is often referred to as taste powder) because the minute white crystals heighten the inherent flavors of foods,... but lending no flavor of their own" (p. 6).

Yakimono are broiled foods. "Flavor broiling includes *yakitori* (broiled chicken), *teriyaki* (fish marinated in a sauce containing shoyu and then broiled),... Miso-broiling is used for such vegetables as eggplant as well as for fish or meat" (p. 13).

"Inasmuch as *shoyu,* or soy sauce, is such an all-important seasoning and is called for in almost every Japanese recipe, it should be noted that the use of genuine *shoyu* is quite essential. Most other soy sauces, while excellent for other types of cuisine, really don't do justice to Japanese cooking" (p. 19). Also discusses wasabi, sesame seeds, sesame oil, katsuobushi, konbu, sake, and various mushrooms (p. 20-22).

"*Tofu,* or soybean curd, is such a versatile foodstuff–it may be boiled, fried, steamed, sautéed or marinated–that it is included as an ingredient in many recipes in this cookbook. Fresh *tofu* is sold in cakes; refrigerated, it will keep about one week. It is also available in cans and, while the processed product is not quite as tender as the fresh, it does make a satisfactory substitute. The consistence of *tofu* resembles thick custard and it should be handled carefully to avoid breaking and crumbling. Western taste buds seem to find *tofu* bland and a bit flavorless, but when deftly sauced it is very delicious–and also nutritious. Note: *tofu* must not be overcooked or it will toughen and develop a rubbery texture" (p. 24).

Recipes include: Norimaki-Sushi (with nori, shoyu, and sashimi). Tiny teriyaki (ingredients: 2 pounds beef tenderloin, 1 cup shoyu, 3/4 cup water, ½ cup mirin, 3/4 cup honey, 1 clove garlic, crushed, and 1 one-inch piece fresh gingerroot, grated; p. 46). Liver tsukudani (with shoyu; p. 55). Fish and tofu stew (p. 69). Oyster miso (p. 71). Vegetable and noodle miso (p. 72). Shrimp or prawn miso (p. 73).

Chapter 4 is titled "Broiled foods." "... almost all cooking in Japan is done over a charcoal fire,..." "Without a doubt, the most popular of all broiled dishes with the Japanese people is *yakitori,* or broiled chicken... Almost as popular as *yakitori* is *teriyaki,* usually fish marinated in

© Copyright Soyinfo Center 2014

a *shoyu* sauce, arranged on long skewers, and then broiled over charcoal. *Teriyaki* means 'glaze broiled'–*teri* meaning 'shiny' and *yaki* 'broiled' or 'roasted.' Actually any meat may be *teriyaki,"* but all have in common "the marinade of shoyu, sake, and sugar" (p. 75-76). Recipes include: Salmon teriyaki. Shrimp teriyaki. Stuffed beef teriyaki (p. 88-90). Shoyu marinade basting sauce (p. 93). Sukiyaki (with tofu and shoyu; p. 110). Tempura sauce (with shoyu, p. 121). Fried tofu with sauce (p. 127). Pickled seaweed (with konbu and shoyu, p. 140). Sesame-shoyu dressing (p. 151). Vegetables with tofu sauce (p. 154). Cabbage with mustard-miso sauce (p. 157). Eggplant with miso sauce (p. 164). Azuki meshi (red beans and rice; p. 181). Domburi soboro (with tofu; p. 182-83). "Red bean paste (sweetened)." Ingredients: "2 cups red beans (azuki). 2 cups sugar. 2 teaspoons salt." (p. 203.) Also called "sweetened red bean paste" (p. 200; Jap. *azuki an;* p. 200-203). Yokan (with "1½ cups strained red bean paste"–*koshi-an;* p. 204). Hikishamanju (Bean jam buns with strained red bean paste; p. 207). Shiruko (Red bean soup [azuki] with rice cakes {mochi}; p. 209). Zoni (Rice cake soup, with mochi; p. 215-16). Sweetened soybeans (for New Year's, p. 217-18).

The glossary includes abura-age, azuki ("red beans"), azuki-an ("red bean paste"), daizu (soybean), ganmodoki, kanten, konbu, konnyaku, miso (aka miso, shiro miso), misoshiru, mochi, mochigome, mochiko, nori, shiru-miso, shoyu, teriyaki, tofu, wakame, yakidofu.

Note: This is the earliest English-language document seen (March 2006) that uses the term "sweetened red bean paste" to refer to sweet azuki bean paste [*azuki-an*] or that uses the term "strained red bean paste" to refer to strained azuki bean paste [*koshi-an*]. Address: 1. Head Chef, Japanese Cuisine, Japan Airlines.

• ***Summary:*** Page 1 states: Soybeans were cultivated in Armenia in 1930, and in Azerbaidjan in 1931.

Page 6 states: In 1882 G. Sturua (a Georgian statesman) gave some soybean varieties to the Caucasus Agricultural Society; he obtained these from his brother in Japan.

Page 7 states: In 1898, Georgia has many landraces and varieties of soybeans. Professor L. Dekabrelevich wrote that the soybean was introduced to Georgia during the 1860s or 1870s.

Note 1. This document contains the earliest date seen for soybeans in Armenia, or the cultivation of soybeans in Armenia (1930). The source of these soybeans is unknown.

Note 2. This document contains the earliest date seen for soybeans in Azerbaijan, or the cultivation of soybeans in Azerbaijan (1931). The source of these soybeans is unknown. Address: Georgia.

5040. Teriyaki and sushi: Selected 72 recipes. 1963. Elmsford, New York: Japan Publications Trading Co. 58 p. Illust. Index. 21 cm.

• ***Summary:*** On title page: "Compiled by the Japanese cooking companions." The 12th printing was Jan. 1976. Contents: Rice dishes (incl. How to cook delicious sushi rice, oshi zushi, norimaki). Vermicelli dishes (incl. tsukejiru, kakejiru, somen, soba, udon). Soups. Broiled dishes (inc. teriyaki). Marinated dishes. Boiled dishes. Steamed dishes. Fried dishes. Casseroles. Tart dishes. Pickles. Confectionery. Glossary. Note: Brands promoted in the recipes throughout this book, by appearing in large boldface type, are: Kikkoman soy sauce. Aji-no-Moto, Manjo mirin (sweet rice wine).

Soy-related recipes include: Kenchin-jiru (with "½ tofu (bean curd) (1/3 lb)," p. 17). Miso soup (with 4 tbsp. bean paste (miso)" and "2 aburage," p. 19). Konnyaku (devil's tongue) and carrots with white bean curd paste dressing (with tofu, p. 29-30). Bean curd with liquid starch (with tofu, p. 32). Meat and vegetables in aburage-bags (with "2 large aburage, p. 34). Bonito cooked with bean paste (with miso, p. 35). Steamed squid ("stuffed with tofu and vegetables," with "1 tofu (bean curd)," p. 38-39). Sukiyaki (with "2/3 lb. broiled bean curd," p. 46). Yudofu (with "1 lb. bean curd," p. 47). Yosenabe (with "1/3 lb bean curd," p. 47).

Note 1: This is the earliest document seen (April 2013) that calls for the use of grilled tofu ("broiled bean curd") in sukiyaki. That is the standard way of making sukiyaki in Japan.

The recipe titled simply "Teriyaki" (p. 22) states: "Teriyaki is fish or meat marinated in a mixture of mirin and saké, sugar and soy sauce and roasted directly over fire. This method of roasting is most suited for oily fish, fish with thick meat, chicken and beef." The sauce contains: "2 tbsp. Kikkoman soy sauce, 2 tbsp. Manjo mirin, 1 oz. ginger, and sweetened vinegar (mixture of 1 tsp. vinegar, 1 tsp. sugar, and a few shakes of salt)" (p. 22-23).

The Glossary (p. 47) includes: "Aburage–fried soy bean curd. An–[azuki] bean jam [also called 'red bean jam' in index]. Miso–bean paste. Misozuke–pickles in bean paste. Tofu–bean curd. Yudofu–boiled soy bean curd."

5046. Hayashi, Shizuka. 1964. Contests stress importance of fats in diet. *Soybean Digest.* Jan. p. 29-30.
• ***Summary:*** Wicked! The American Soybean Association now has a major campaign to to try to persuade Japanese, especially children, to eat more fat "for the growth and health of our bodies." "The younger generation especially, because of the ignorance or perhaps indifference of their parents, has not been taught the importance of oil in the diet. This is perhaps the greatest reason why Japan is among the poorest of fat-eating nations. The correction of this situation must start with educating the youngsters. There are over 10 million children in grammar school, 11 million in high school in Japan."

A photo shows two girls, members of a home economics club, pinning up a slogan they have selected on the wall. Written in Japanese characters, it reads: "Take more oil." Address: Managing Director, Japanese-American Soybean Inst., Tokyo.

5047. Hayashi, Shizuka. 1964. Japan team would like to see annual U.S. tour. *Soybean Digest.* Jan. p. 30.
• ***Summary:*** A nine-man Japanese miso team toured the USA early in the fall of 1963 at the invitation of the American Soybean Association. They hope such U.S. tours can take place each year. This first overseas mission of the Japan Miso Industrial Cooperative left Tokyo on Sept. 7 and returned Oct. 17 after a round-the-world trip. Tokubei Tanaka, president of the Association, headed the mission. Address: Managing Director, Japanese American Soybean Inst.

5048. Lambert, J.W. 1964. A plant breeder's look at Japan's soybean needs. *Soybean Digest.* Jan. p. 9-10.
• ***Summary:*** "During a 5-week tour of Japan the writer had opportunity to meet with several representatives of each of the major soybean food industries and with soybean research scientists at several agricultural and industrial research stations."

"The Japanese market is not only large–it is complex. Whereas many of the market countries process soybeans in much the same manner as is done in the United States, Japan uses an important part of her available supply of soybeans directly in the manufacture of traditional food items such as tofu, miso, natto and kinako. Of the 1,443,500 metric tons of soybeans consumed in Japan between April 1, 1962, and March 31, 1963, 65% to be sure was processed in the conventional manner, i.e. for oil and meal; but 20% was used for tofu; 9% for miso; about 2% each for frozen tofu," natto, shoyu, kinako, and other miscellaneous soybean foods.

"In general Japanese soybean industries like the availability of American soybeans in large relatively uniform lots. They acknowledge the marked improvement of American beans in recent years with respect to splits and to dirt and other foreign material." Some like specific varieties such as Hawkeye, Illinois, Ohio, Indiana, and Harosoy. "In most cases the No. 2 Ordinary was indeed 'ordinary,' being a wide mixture of varieties and having a rather high percentage of splits, foreign material and damage. The No. 2 Select had much of the objectionable material removed. 'Hawkeye' was often true to label and was favored by makers of conventional tofu. 'Harosoy,' usually rather pure varietywise and low in foreign material, was favored by frozen tofu and miso makers.

"The additional price on these pure varieties was a deterrent, however..."

"Many of the makers of the conventional tofu and aburaage are using a high proportion of U.S. soybeans,

© Copyright Soyinfo Center 2014

especially in the Tokyo area. On Kyushu, on the other hand, there is a preference for Japanese beans. But even here the lower price of American or Chinese beans was attractive to the tofu makers.

"Miso makers expressed a definite preference for Japanese soybeans but more often because of price were using Chinese beans. Only occasionally were they using U.S. soybeans. The Japanese varieties are preferred because they soften and absorb water more rapidly and uniformly in cooking and reputedly have the most desirable flavor and taste. They are usually large-seeded, and the most highly regarded varieties have colorless hila, which is important in making the popular pale yellow miso. They are relatively free of foreign material and split beans.

"The Chinese soybeans are usually relatively free of foreign material and splits, have a high proportion of colorless hila and are lowest in price. They are relatively small and are no better in taste than U.S. beans. American soybeans, unless identity preserved Harosoys, tend to have a high proportion of dark-colored hila and are high in splits and foreign material.

"Want Less Hull: Natto making requires a very high percentage of whole, unsplit beans and freedom from foreign matter. For this reason a very high proportion of the requirements of this industry are drawn from the domestic supply.

"The representatives of the principal industries were asked what they would like most in soybeans for their respective operations; their replies can be summarized as follows: (1) The crushing industry would like beans with a high oil content and a somewhat higher protein than they are presently getting; they would also like a lower hull percentage. (2) The tofu makers would like beans having a high percentage of soluble protein and protein that coagulates over a fairly wide range of coagulant concentrations. (3) Miso makers would like large seeded beans which have colorless hila and which absorb water rapidly and uniformly during the cooking process; they also often mentioned 'good taste after cooking.' All of these manufacturers would like to have beans low in foreign material and in split beans. The reasons for the former are obvious. The preference for low split bean content is based primarily on the fact that split and whole beans absorb water at different rates.

"Inasmuch as the soybean food manufacturers often expressed a preference for Japanese soybeans providing they could be obtained in large enough quantities and at reasonable prices, it seemed desirable to observe production of soybeans on Japanese farms and to discuss varieties and variety improvement with Japanese experiment station workers. Soybean fields in Japan are exceedingly small by U.S. standards and are located mainly in the hilly or mountainous sections where rice is not grown. A very large portion of the best land in Japan is devoted to rice. Some beans are, to be sure, produced on the banks of the rice paddies, but these beans seldom find their way into the market place. Most of them are used by the farm families who produce them."

"The Japanese varieties are of considerable interest. Virtually all of them have what physiologists call a 'determinate' type of growth. That is, they grow vegetatively until they reach about maximum height before they start to flower, and then the seeds set at all of the nodes within a short period of time. This is in contrast to most of the varieties grown in the Cornbelt [Corn Belt] which are of the 'indeterminate type' that begins to flower when it has three to five true leaves, and continues to flower and set seed for 2 or 3 weeks or until it reaches maximum height.

"The Japanese varieties are relatively short and branch rather profusely under the conventional way of planting, that is in rows about 20 to 24 inches apart and in two plant hills about 6 or 7 inches apart in the rows. The seeds are usually very large, often averaging 35 or more grams per 100 seeds, in contrast to American varieties with 16 to 20 grams per 100. Hilum colors vary, colorless ones are most popular with processors. Oil content is usually much lower than in U.S. beans and protein content higher. As marketed the moisture content is usually higher than that of U.S. beans."

"Japanese varieties of several maturities are being accumulated by the Japanese American Soybean Institute and will be sent to the United States for study and comparison with U.S. varieties under our conditions. The Japanese varieties will be made available to U.S. soybean workers in the regions where they are best adapted. It is hoped that as a result of the present study American soybean breeders may have a better understanding of the needs of the Japanese soybean food industries. It seems likely that the scientists who provide the varieties for American farm production may find it worthwhile to devote a part of their energies and resources to developing sorts that will find an enthusiastic reception by these industries." Address: Prof., Univ. of Minnesota.

5051. *Soybean Digest.* 1964. Nisshin builds soybean plant on deep harbor. Feb. p. 16.
• ***Summary:*** Nisshin Oil Mills, Ltd., of Tokyo, a major soybean processor, is building a soybean processing plant at Isoko in the coastal industrial zone of Yokohama. It is the first soybean processing plant to be built on a deep water harbor in Japan.

"The first stage of the plant, which has a processing capacity of 180,000 tons yearly and a storage capacity of 33,000 tons, was completed in November. Cost of the plant to date has been close to $1 million.

"The firm states that the Isoko plant is very convenient for the landing of cargo, since a 25,000-ton ocean going freighter can be unloaded from its berth. The plant is also advantageous for land transportation, being connected with the National Railways.

"Both extracting and refining equipment of the latest type is being installed including a Rotocel extractor and De Laval deoxidation equipment."

5052. *Guardian* (*England*). 1964. Company affairs: Hohnen-Lever. March 5. p. 14.
• ***Summary:*** "Negotiations for Unilever's joint project with the Hohnen Oil Co. of Japan, to manufacture and sell margarine and other edible fats, have been completed, and the inaugural meeting of Hohnen-Lever, in which the United Kingdom concern will have a 45 per cent stake, is expected to take place on March 26."

A factory with a capacity of 26,000 tons per year will be built at Shimizu, southwest of Tokyo; it is expected to start operating in Aug. 1965.

5053. Kawai, Kazuyuki; Nakamura, H.; Shigano, Y. Assignors to Dainippon Ink & Chemicals Inc. 1964. [Plasticizers]. *Japanese Patent* 2605. March 13. 4 p. Application filed 18 Dec. 1961. (Chem. Abst. 61:3265h). [Jap]*

5054. Akiya, Toshimi. 1964. [Studies on the characteristic and nutritive changes in oils during heating. IV. Decay of linoleic acid contents of soybean oils during heating]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 18. p. 84-87. March. [18 ref. Jap; eng]
• ***Summary:*** It was found that the linoleic acid content of soybean oil had fallen to only 40% of its original value after the oil had been heated at 30ºC for 6 hours, whereas the content was essentially the same as in the original soybean oil when the oil was heated at 200ºC for 6 hours. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

• ***Summary:*** "The cheese called *Teou-fou* in China is somewhat consumed in Paris and the region surrounding it, where the number of Chinese restaurants is greater than one could believe." Of the total restaurants in this area, about 35 are Chinese restaurants, 10 at Vietnamese, and only 5 are Japanese. They are visited both by people of those countries and by western consumers who are curious to taste exotic foods. "There were, and still are, two or three shops in and around Paris, where tofu (fromage de soja) is prepared daily and delivered to the restaurateurs who have ordered it. Mr. Kia-Wo Hou had friendly relations with one of the two established at Colombes and was able to easily procure the materials he needed."

Note: In about 1910 Li Yu-ying, a Chinese soyfoods pioneer, established a soyfoods manufacturing company named Usine de la Caséo-Sojaïne, at Vallées, near Colombes, outside of Paris. It is not clear how the current companies at Colombes are related to the earlier company. Address: 1. Conseil scientifique a l'R.H.O.; 2. Docteur es-Sciences de l'Universite de Paris.

5056. *Foreign Agriculture.* 1964. Big year for U.S. soybean promotion in Japan ends in record sales of U.S. soybeans in 1963. 2(12):9. March.
• ***Summary:*** The Japanese-American Soybean Institute (JASI), in 1963, pushed closer to its 20-pound goal for per capita consumption of edible oils in Japan. Consumption–now at 13 pounds per capita (of which about a third is soybeans oil)–has nearly doubled since 1956.

5057. Hutchison, George S. 1964. The soybean industry fifty years ago. *Soybean Digest.* March. p. 24-25.
• ***Summary:*** In 1915, while on a business trip to the Orient for his employer (Albert Dickinson Co., seed merchants), the author had an opportunity to observe the soybean crushing industry in Manchuria. "By the courtesy of Mr. Hatsumi Okura, Okura & Co., Tokyo, whom I met on the train traveling from Japan and up through Korea to Manchuria, I was permitted to go through the modern experimental extraction mill built by the South Manchurian Railroad at a cost of about $200,000, which had been put into operation about one year earlier. This mill used a Benzine extraction process developed in Germany and had a daily capacity of about 17 tons of oil and 100 tons of soybean meal. It was rated the fourth largest oil extraction plant in the world at that time. This was the first attempt to use the extraction method of processing soybeans in the Orient. Prior to that,

© Copyright Soyinfo Center 2014

practically all the processing was done by screw press.

"There were perhaps a dozen or more smaller soybean mills at Dairen. The Nisshin mill, operated by Okura & Co., used hydraulic presses but most of the others, operated by native Chinese, were of small capacity and used screw presses operated by manpower with capstan bars to rotate the screw."

He closes with a prediction of a bright future for "the Golden Bean." Photos show: (1) Mr. Hutchison riding in a rickshaw during his trip to Manchuria in 1915. (2) A portrait photo of George S. Hutchison. Address: Former director and treasurer, Albert Dickinson Co.

5069. Ohta, Teruo; Ebine, H.; Nakano, M. 1964. Tenpe (tempeh) ni kansuru kenkyû. I. Indonesia-san tenpe funmatsu no hinshitsu to seijô ni tsuite [Study on tempeh. I. On the property of tempeh powder made in Indonesia]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 18. p. 67-69. March. [4 ref. Jap; eng]
• ***Summary:*** Soybeans were fermented with *Rhizopus oryzae* for 60 hours at 30ºC, then vacuum dried and ground to a powder. The solubility of protein and the rate of amino-nitrogen to total-nitrogen were 20% and 2% respectively, indicating that protein hydrolysis slightly exceeded that of koji-beans, but was far less than that of natto.

Peroxide value of fat and oil in tempeh stored for 3 months at room temperature was only 1.3 M.E./kg, whereas that of cooked and dried soybean powder and that of natto powder stored under the same conditions were 71 M.E./kg and 38 M.E./kg respectively. This fact shows that tempeh has antioxidative property comparable to that of miso. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5072. *Foreign Agriculture.* 1964. U.S. soybean industry is invited to participate in Tokyo trade center soybean show in August. 2(14):10. April 6.
• ***Summary:*** "The U.S. Department of Agriculture has invited industry participation in a soybean exhibit to be held at the U.S. Trade Center in Tokyo, Japan, Aug. 24 to Sept. 11 under the foreign market development program.

"The American Soybean Association will cooperate with USDA's Foreign Agricultural Service in sponsoring the exhibit, which will include a seminar covering all aspects of soybean usage in Japan, with papers to be presented by U.S. soybean industry representatives. The Association with FAS carries on market development work in Japan through the Japanese-American Soybean Institute.

"Exhibit space at the Center during the show will be available without charge to U.S. firms interested in the Japanese market for soybeans and soybean products. The exhibitor will provide all materials and personnel for its booth and will make customs arrangements for shipping samples of its product and other exhibit materials into Japan."

5074. Hayashi, Shizuka. 1964. Tests favor U.S. soy meal. *Soybean Digest.* April. p. 30.
• ***Summary:*** "Production of mixed feeds in Japan has shown a rapid increase during recent years. In 1959 production was 1,853,000 metric tons, which increased to 5,700,000 metric tons in 1963. The growth of the livestock industry, especially that of poultry, has of course contributed to this increased consumption of feeds.

A wide table shows growth in livestock numbers in Japan from 1958 to 1963. Chickens grew from 50.2 million to 92 million. Dairy cattle increased 654,000 to 1.14 million. Draft cattle decreased from 2.46 million to 2.33 million (as they were replaced by machines). Horses likewise decreased 762,000 to 471,000. Hogs increased 1.65 million to 3.27 million.

Tests in Japan showed that soybean meal was the best protein source to use in mixed feed raise livestock profitably. Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome, Yuraku-cho, Chiyoda-ku, Tokyo, Japan.

5075. *Foreign Agriculture.* 1964. Speakers announced for upcoming U.S. soybean seminar in Tokyo. 2(21):10. May 25.

© Copyright Soyinfo Center 2014

• ***Summary:*** "Five leading U.S. specialists in livestock and human nutrition will be the keynote speakers at the U.S. soybean seminar to be held at the Tokyo Trade Center, August 24 to September 4. The seminar will run concurrently with a 19-day soybean exhibit to open August 24, both of which will be sponsored by the American Soybean Association in cooperation with the Foreign Agricultural Service."

The five U.S. speakers, their affiliations, and their topics to be presented at the seminar are listed. "A special attraction will be demonstrations on the uses of soy products in human foods, to be presented September 7-11 by Mrs. Dorothea Van Gundy Jones, nutritionist of Loma Linda Foods, Riverside, California."

5076. Abe, Kumazo. 1964. Outlook for fewer tofu producers, more production. *Soybean Digest.* May. p. 48.
• ***Summary:*** "It is commonly believed that about 300,000 tons of soybeans are consumed yearly by the tofu industry in Japan. This consumption may be analyzed as follows according to the statistics announced by the Food Agency: In 1961 actual consumption of soybeans and soybean meal for production of tofu was recorded respectively at 271,100 tons and 30,000 tons, and consumption during 1962 was recorded respectively at 269,700 tons and 30,000 tons, or a slight decrease. But consumption in 1963 was estimated to total 285,100 tons of soybeans and 65,000 tons of soybean meal, indicating a considerable increase. Consumption in 1964 is expected to increase to 287,700 tons of soybeans and 70,000 tons of soybean meal.

"In terms of purely soybeans, the share of tofu in the consumption for food uses, which includes miso and shoyu, is about 60%. Of this consumption, about 10% is said to be Japanese soybeans and the remainder consists of imported soybeans, chiefly from the United States.

"Soybeans are mostly purchased by tofu producers from local grain dealers, but there are many cases of joint purchase by the Japan Tofu Association through trading firms on port of landing basis. There are also cases where the Prefectural Tofu Association makes purchase of about one-third of its yearly requirement on a long-term contract with the importing firm.

"It is commonly believed that there are about 50,000 tofu producers in the country, but their number changes from year to year according to the annual license statistics announced by the Welfare Ministry. They totaled 51,600 in 1960, but they were below 50,000 as of the end of June 1963.

"In Tokyo, tofu producers have increased by more than 200 as compared with 1959 due to population growth. But in Kagoshima there are 450 producers less than in 1959.

"Tofu producers are of such small scale that they have been considered as representative of small enterprises since olden times. A producer having four or five employees may be in the best class. But the scale of business has a tendency to become larger gradually as is shown from the decrease in the number of producers and the increase in consumption of tofu. Amalgamation has been taking place in various areas. Equipment is being mechanized and factories are adopting automation.

"On the other hand, production of bagged tofu increases year by year. Influential tofu producers in many areas have started its production, and enterprises in the other fields have also fixed eyes on its production and started." Address: President, Japan Tofu and Arburaage Assoc.

• ***Summary:*** "Increase of soybeans into Japan have increased steadily since the U.S. market development program was started with the opening of the Japanese American Soybean Institute's office in Tokyo in 1956."

A table shows imports of soybeans into Japan from 1956 (Jan. to Dec) to 1963. Imports of U.S. soybeans in 1956 were 536,055 metric tons (tonnes), worth $61,955,000. By 1963 they had increased to 1,314,303 tonnes worth $143,748,369.

During this same time period imports of soybeans from China had decreased from 165,859 tonnes in 1956 to zero tonnes in 1959, then increasing to 226,644 tonnes in 1963.

"Of all commodities Japan imported from the USA, the soybean ranked No. 1 in 1963. It topped scrap iron and cotton. The total net increase since 1956 up to 1963 amounts to $286 million.

"Let us first study how soybeans are utilized in Japan. By now it has become well known, I am sure, that there is no country in the world where the soybean is utilized in as many diferent styles of foods as it is in Japan. The most popularly known and manufactured in commercial quantity are tofu, miso, soy sauce, frozen tofu, natto, kinako, and soybean oil. The production and the quantity of soybeans used in each of

© Copyright Soyinfo Center 2014

these foods are as shown at top page 43.

"These soybean foods supply the two major nutrients protein and oil in the amount of 9.2 grams and 7.5 grams respectively per capita a day, which constituted 11% and 24% respectively of the total daily intake in 1962.

"What would happen to the Japanese diets if there were no supply of soybeans? The present per capita consumption of fats and oils and protein of 31 grams and 70 grams respectively would be considerably reduced to a level that would seriously cripple the food structure (*Soybean Digest* January 1963).

"The largest percentage of imported soybeans is consumed for oil crushing which takes approximately 65%. There are about 1,030 crushers in Japan but those which crush soybeans are limited to only about 25 including eight larger companies which process about 80% of the total crushed.

"The oil is used almost 100% for edible purposes. The meal is used for production of soy sauce, which takes the largest percentage; and for miso and tofu which use a smaller quantity. About 60% of the meal produced goes to the feed industry.

"In addition to the above traditional soybean foods, a more recent product is soy flour which is fast gaining popularity for various uses such as in bread, noodles, confections, ice cream, sausage, curry sauce and even in preparation of daily meals. It is well worth emphasizing that the noodle manufacturers association, comprising more than 8,000 members throughout Japan, has started a nationwide program with JASI's support to recommend that all its members use 5% to 10% soy flour to enrich wheat noodles which consume approximately 1 million tons of wheat flour annually. From both the nutritional and money-making standpoints many manufacturers have determined to use soy flour because they have discovered it offers definite advantages. The long traditional habit of a 100%-white-wheat-flour noodle has thus been broken under the pressure of the necessity to catch up with the changing world. All soybean products so far cited are for human foods."

5082. Komiya, Akira. 1964. The shoyu industry in Japan. *Soybean Digest.* May. p. 43-44.
• ***Summary:*** Table 1 (which does not include data from farm villages) shows the average yearly expenses for seasonings per household in Japan: 1. Refined sugar 19.7% of total expenses. 2. Shoyu 18.3%. 3. Miso 14.3%. 4. Luxury items 13.1%. 5. Edible oils 9.4%. 10. Margarine 2.3%. 11. Salt 2.0%.

Table 2 shows the quantity and value of shoyu produced in Japan from 1958 to 1962 (according to 3 different sets of data). According to the Japan Shoyu Association, the amount has increased from 1,117,800 kl in 1958 to 1,160,750 kl in 1962, an increase of 4%.

Shoyu has been used daily as a seasoning in Japanese for 800 years [i.e. since about 1164]. Five reasons are given to explain why it is "now becoming a daily necessity." Foreigners like to use shoyu for barbecue and Sukiyaki.
Address: Managing Director, Japan Shoyu Assoc.

5083. Lo, K.S. 1964. Pioneering soy milk in Southeast Asia. *Soybean Digest.* May. p. 18, 20.
• ***Summary:*** "In 1962 we sold 2,500,000 cases of Vitasoy... Vitasoy has become the largest single seller in the local soft drink market. And this is no small achievement, when we are competing with such internationally known brands as Coca Cola, Pepsi Cola and Seven Up. We have certainly come a long way since we first got started in 1940 with a small setup to make 'milk' out of the soybean. How I came about it was quite an accident. I happened to be in Shanghai in 1937 and attended a talk given by the late Julian Arnold who was then commercial attache to the American Embassy in Nanking. He called soybean the 'Cow of China' and practically attributed to it the preservation of the Chinese race... I was very impressed by his talk and came away with soybean stuck in my mind. I soon returned to Hong Kong and decided to do some experiments in making a formulated soybean milk which could serve as a milk substitute. A few friends took an interest in my work, and a private limited company with a paidup capital of HK$15,000 was formed to put the product on the market. The small factory with its crude equipment was formally opened in March 1940 by the then director of medical services, Dr. Selwyn-Clarke. In my opening speech, I said that the aim and object of this new venture was to bring better nutrition to the masses of people at the price they could afford to pay. This has ever since remained the policy of our company. To this day the retail

© Copyright Soyinfo Center 2014

price of our Vitasoy is less than one-third the price of cow's milk.

"The first couple of years were extremely difficult. We soon found that, even among us Chinese to whom the soybean was by no means new, there was a strong prejudice against soy milk. They not only did not believe its nutritional values, but thought it could cause diarrhea, indigestion and stomach ache. At that stage the taste of our product, too, left much to be desired. Many consumers found it hard to take, because of the strong beany flavor and the slightly bitter taste. Another problem we had to face was the keeping quality of the soy milk. We followed the dairy industry by packing it in standard half-pint milk bottles and sealed them with paper cap and hood. They spoiled even quicker than milk unless they were kept under refrigeration all the time."

"Hurt by public prejudice and lack of marketing know-how, the business soon became a failure. When the Pacific War broke out in December 1942, the company had not only lost all its money, but also owed a large sum to me personally because I had to put up the money in order to keep it going. After the Japanese took over Hong Kong, they also took over our small factory and everything inside it. I left the Colony for Free China and remained there until the war was over.

"I returned to Hong Kong after the war was over, and my first task was to get Vitasoy back on the market. I was happy to find most of the equipment was left intact in the factory and by November 1945 Vitasoy [which was named Sunspot Soya Milk at the time] was on sale again. This time I decided to push my product to the small people in the street and to market it as a beverage rather than a milk substitute."

In 1953 the original milk bottle with a paper cap and hood was changed to a soft drink bottle with a metal crown cap. After sterilization by heat, it could be kept for months without refrigeration. "This technical breakthrough gave the biggest impetus to the increase in sales volume."

"Soft drink sales in Hong Kong are very seasonal, with 80% of the volume during the 6 summer months and the remaining 20% spread out from November to April. So we set to work on a heater which will keep Vitasoy hot during the cold weather. Its function will be just the opposite of an electric beverage cooler. After some initial failures we finally came out with a heater which has a capacity of heating up to 4 cases of Vitasoy at a time and always maintains a temperature of 145ºF. So at any time during the winter a customer can walk up to a store and ask for a bottle of hot Vitasoy which will take away the chill, and yet not hot enough to burn his lips... With the help of the heaters, we are able to maintain 50% of our peak summer sales through the winter months. Hot Vitasoy stands out uniquely among the soft drinks, because there is no other soft drink which one can drink hot!"

In 1963 the company built a new plant in Kowloon with twice the production capacity of the old original plant in Hong Kong. Today, Vitasoy is consumed by 250,000 people daily.

"The influence of our work does not stop within the bounds of this little island. We helped UNICEF train technicians to operate a soybean milk powder plant in Indonesia. In Singapore, Malaya and Thailand, private enterprise started soybean milk plants after having seen our success in Hong Kong."

5084. *Soybean Digest.* 1964. Nisshin plant is one of world's most modern. May. p. 10.

• ***Summary:*** "With the completion of its soybean processing and oil refining plant at Isoko in November, Nisshin Oil Mills now claims the largest processing capacity in Japan, and one of the most modern plants.

"The Isoko plant is also the first in Japan equipped to produce toasted soybean meal, and 80% of its production is now toasted.

"Nisshin's total processing capacity is about 320,000 metric tons a year. In addition to the Isoko plant with a capacity of about 11,000 tons monthly, Nisshin has a plant at Kanagawa with a similar capacity, one at Kobe with 5,000 tons capacity, and one at Osaka with 2,500 tons capacity.

"Construction was begun on the Isoko plant in April 1962 and completed last November. Nisshin is now processing about 6,000 tons of soybeans and 5,000 tons of cottonseed monthly.

"The extraction plant is a Blaw-Knox Rotocel continuous extraction unit with desolventizing toaster. Refining equipment is De Laval with continuous decoloring and deodorizing equipment. Nisshin has storage capacity for 33,000 metric tons of soybeans at Isoko. The firm also has its own wharf which will accommodate 25,000-ton ocean-going freighters.

"Nisshin produces untoasted meal for miso and soy sauce in addition to the toasted meal.

"The firm also produces quality salad oil at Isoko. Its automatic filling and packing equipment has a capacity of 1,800 400-gram bottles and 7,200 cans an hour.

Photos show: (1) At Isoko plant of Nisshin Oil Mills (left to right): Howard E. Grow, assistant to the executive vice president, American Soybean Association, Hudson, Iowa; Joseph C. industry. *Soybean Digest.* May. p. 45.

• ***Summary:*** "1. Past Development. In Japan the processing of oilseeds has been going on since very olden times. In about the 10th century extraction of oil chiefly from perilla and sesame was started and in the 17th century extraction from rapeseed and cottonseed was started full scale. It was, however, in the beginning of the 20th century that the Japanese oil industry was firmly established as a modern industry.

"When Japan founded the South Manchurian Railway Co. in Dairen, Manchuria, in 1907, a laboratory devoted to the study of utilization of Manchurian soybeans, an internationally known specialty crop, was established within the Central Research Institute attached to the company. The laboratory adopted the benzine extraction method developed in Germany, and a pilot plant was set up for the first time in Dairen in 1910.

"In the 1920's oil mills, each with an annual processing capacity at the 100,000-ton level, were established in rapid succession for production of soybean oil. These mills exported vegetable oils in considerable quantities in the first third of the 20th century. Their exports totaled 82,883 tons in 1935, 83,407 tons in 1936, and 58,953 tons in 1937. It is especially noteworthy that in those days the United States purchased vegetable oils from Japan. About 59,000 tons were exported to that country in 1935, as many as about 70,000 tons exported in 1936 and about 40,000 tons shipped in 1937, though the United States is at present the world's largest exporting country of vegetable oils and oil-bearing materials.

2. Present Condition. As Japan has a land which is climatically unsuitable for growth of some kinds of oil-bearing crops, sufficient yields cannot be obtained except for rapeseed. Most of the required oil-bearing materials must be imported from abroad. Moreover, Japanese oil mills which were mostly ruined in World War II had to pass about 10 years of difficulties due to the work of restoration and an insufficient supply of raw materials. However, in proportion to the steady increase in the supply of raw materials, improvement of equipment and production techniques has progressed rapidly in such a way that crushing of oilseeds totaled 2,280,604 metric tons in 1963. This shows an increase of 18% over 1962 which recorded 1,930,617 metric tons and reached about double prewar crushing. Of the oilseeds crushed during 1963, domestic crops totaled 355,665 tons and the remaining 1,924,939 tons were imports, which included 1,185,410 tons of soybeans.

"Japan's imports of soybeans totaling 1,185,410 tons during 1963 included Chinese soybeans for food uses (chiefly for production of miso and tofu). At present soybeans for oil extraction are almost entirely imported from the United States. About 200,000 tons of domestic soybeans are in the market, but they cannot be used for oil extraction because of their low oil content.

"3. Problems in the Japanese Crushing Industry. One of the biggest problems confronting the developing Japanese oil industry is the complete liberalization of manufactured oils and fats imports. In preparation for Japan's transition on April 1, 1964, as an Article 8 nation in IMF [International Monetary Fund], the Japanese government has so far gradually expanded the list of liberalized goods, also liberalizing a few manufactured oils and fats several times. The government is now studying liberalization of soybean oil and about 10 other commodities which are still remaining. As stated before, Japanese oil mills cover about 80% of their raw materials by imports.

"For protection of domestic soybeans an import duty of 13% or 4,800 yen per ton is imposed on imported soybeans which are large in quantity and occupy the biggest share in the raw materials of oil mills. It is very unreasonable to liberalize manufactured oils and fats when a high duty is imposed on raw oilstuffs in addition to the disadvantageous situation of Japan as an importing country. So Japanese processors have given detailed explanations to the government clarifying their situation, and the government understanding this point is now taking a policy to liberalize soybean oil and other soybean products after abolishing the duty on soybeans.

"4. Outlook for the Future. We desire that the crushing industries in all countries of the world will develop by refining their techniques and rationalizing their management. We should try to develop our industry on a fair-play basis by repealing the government's unreasonable tariff policy, by overcoming any disadvantage which may be imposed on Japan as an importing country by countries producing the raw material.

"Oil intake by the Japanese people has been very low since olden times because of their diets based on rice. In spite of its remarkable increase in recent years, oil intake is still at a lower level than the American and European diets, but it is expected to increase hereafter little by little as diets improve. Future demands for oils and fats in Japan are expected to maintain a fairly high rate of expansion in parallel with the increased demand for protein meals resulting from development of the livestock industry.

"In order to meet such increased demands, equipment of Japanese post-war oil mills has been all modernized attaining a processing potential to more than satisfy domestic requirements. Therefore, imports of raw materials will increase year by year. There is absolutely no need for Japan to import end products such as oils and meals. We would like to make clear that the half-century-old Japanese oil industry will more and more need increased imports of various oil-bearing materials but no imports of processed goods."

Note. This is the earliest English-language document seen (Jan. 2014) that mentions the Japan Oilseed Processors Association. Address: President, Japan Oilseed Processors Assoc.

5086. Yokotsuka, Tamotsu. 1964. Shoyu. Paper presented at International Symposium on Oilseed Protein Foods, Institute of Food Technologists, USA. See p. 31-48. Held 11-15 May 1964 at Lake Yamanaka, Japan.

• ***Summary:*** Contents: General situation of shoyu in the Orient with emphasis on Japan: The 3 types of shoyu now available in Japan (*koikuchi, usukuchi, and tamari;* about 90% of Japanese shoyu is of the koikuchi type, whose color is between that usukuchi [light] and tamari [dark]).

Note: This is the earliest English-language document seen (April 2012) that contains the word *koikuchi* (it refers to the type of shoyu / soy sauce most widely used in Japan) or the word *usukuchi* (it refers to light-colored shoyu made and used mostly in the Kyoto-Osaka area).

Government regulation of the quality of shoyu in Japan. History of shoyu in the Orient. Development of technology and research in recent years, and problems for the future: Utilization ratio of the total nitrogen, use of defatted soybeans instead of whole ones, reduction of fermentation period, technical aspects (growing koji 50 cm deep without the use of small wooden trays, reducing the two major production costs of growing koji and pressing the mash, pressing once with great pressure for a long time to avoid water washing which causes oxidation), three keys to shoyu production (culturing the mold, stirring the mash, and pasteurization), academic research on microbes in and flavorous compounds of shoyu problems for the future.

The total production of shoyu in Japan is about one million kiloliters, and per capita consumption is about 10 liters/year; this has been decreasing. Japanese get about 50% of their daily salt intake from shoyu, plus about 2 grams of protein. There are more than 5,000 commercial shoyu manufacturers in Japan. They produce about 95% of all Japanese shoyu; the remaining 5% is produced by farmers in the countryside. The biggest manufacturer's market share [Kikkoman's] is about 20%. About 50% of the total output is produced by 35 factories. As is the case with many industries, there has been a growing concentration of shoyu production among the larger companies.

It takes one year or more to finish shoyu fermentation at the natural (ambient) temperature. One-year mash [moromi] has the best flavor, two-year mash has the best taste, and three-year mash has the best color. Up until World War II, these three kinds of mash were blended to produce the highest grade shoyu.

The by-products of the shoyu industry are soy cake and soy oil [shoyu cake and shoyu oil]. Soy cake usually contains about 3.5% of total nitrogen and about 10% of carbohydrate; it is used chiefly for animal feeds. The oil layer, which rises to the top of shoyu, is ethylesters of higher fatty acids, including 30 to 40 free fatty acids. It is removed before pasteurization and utilized for cutting oil, as a raw material in lower grades of soap, as a source of linoleic acid, etc.

The glycerol content of shoyu produced from whole soybeans and wheat is about 1.0 to 1.2%, while that of shoyu produced from defatted soybeans and wheat is about 0.3 to 0.5%.

In Japan, shoyu is sold in two types and sizes of containers: wooden kegs (72 liters and 18 liters), and glass bottles (2 liters, 1.8 liters, and 1 liter). The most popular of these in Japan is the 2 liter glass bottle, which presently costs 100 to 250 yen.

All shoyu exported from Japan has been regulated by government law since 1950. The inspection consists of both organoleptic and analytical tests involving baumé, sodium chloride content, extract, and total nitrogen. Wartime circumstances gave rise to very diluted shoyu which still contained 18% salt, but got its dark brown color from caramel and had a nitrogen content of only 0.1 to 0.2%. These circumstances also led to the chemical hydrolysis of oilseed protein such as defatted soybean meal, copra meal, peanut meal, and sometimes cottonseed meal in order to get shoyu-like substances. MSG manufacturers were chemically hydrolyzing soybean and wheat protein. They succeeded in refining and processing the mother liquor of glutamic acid [HVP] to be used as a very inexpensive way of increasing the quantity of shoyu. Even today this accounts for about 30% of Japanese shoyu.

All of these circumstances delayed the restoration of the quality of Japanese shoyu for a long time after World War II. In 1963 new quality standards were implemented by the Japanese government, supported by the Japanese Shoyu Association and many technicians. The law of the Netherlands forbids the use of the name "soy sauce" for all products except those made from soybeans by fermentation, and with a nitrogen content more than a certain amount. This law excludes most Japanese soy sauce, and Japanese shoyu makers would like to see the law changed.

History: The word shoyu first appeared in Japan in 1596, and in China in 1618, as far as is known in Japan. "Years ago several kinds of beans and corn were used as raw materials; nowadays, however, only soybeans and wheat are used in Japan." Soybeans were first introduced into Europe in 1723 by Thunberg, later president of Upsalla University. In 1723, the population of Tokyo was one million and there were nine associations of shoyu makers in Japan, including the Noda association, which consisted of 19 manufacturers.

Export history: "Japanese shoyu was exported to European countries by the Dutch about 300 years ago. According to old records shoyu was presented to Louis XIV, and it was kept as a secret ingredient by the cooks of the court; the same period when coffee from Ethiopia was first brought to him." For 200 years after that time, export of shoyu was not widely permitted by the Japanese government. Meanwhile Chinese soy sauce became popular all over the world. Though the export of Japanese shoyu was reopened in the Meiji period (1868-1912), the market share of Japanese

© Copyright Soyinfo Center 2014

shoyu worldwide is still very small. Only about 0.2% of the shoyu made in Japan is presently exported, but the amount is increasing year after year. Note: This is the second earliest document seen stating that Louis XIV used shoyu; the first was by Obata (1959). However Obata admitted in 1983 that his statement was pure speculation, with no document to support it.

Defatted soybeans: "The advantages of the use of defatted soybeans are lower cost per unit weight of nitrogen and the reduction of fermentation period. The period to get the highest content of glutamic acid in mash is 10 to 12 months for defatted soybean mash, while it is 18 months for whole-soybean mash at one natural temperature. The disadvantages of defatted soybeans are inferior stability of the final product with respect to oxidation and heating, lower glycerol content and higher acidity, and a little difficulty in alcoholic fermentation. This higher acidity is caused by higher lactic acid content.

To reduce the fermentation period: Use defatted soybeans, treat the soybeans adequately, make koji with high enzymatic activity, and warm the mash. Several years ago a warming temperature of 40ºC (104ºF) was used, but nowadays there is a trend toward the use of lower warming temperatures (30-35ºC maximum) in order to avoid inferior odor and a decrease in the amino acid content. A lower temperature during the beginning stage of fermentation is widely believed to be preferable to promote high nitrogen yield, especially higher content of glutamic acid, and to promote alcoholic fermentation.

Since ancient times the 3 most difficult processes have been culturing the mold, stirring the mash, and pasteurization. The various functions of pasteurization are examined. During and after World War II, when the quality of shoyu declined sharply, and it was easily damaged by filmforming surface yeasts, the pasteurization temperature was raised to more than 80ºC and butyl-para-hydroxybenzoate, an artificial preservative approved by the government, was added. Nowadays, however, since the quality has been restored, this pasteurization temperature cannot be lowered, because consumers are accustomed to the flavor from the higher temperature.

Future problems: Concentration and dehydration of shoyu, more economical containers, new methods of pressing the mash for higher efficiency, further reduction of the fermentation period, export of shoyu, development of highly processed secondary products, etc. Address: Noda Shoyu Co., Ltd.

5090. *Soybean Digest.* 1964. China promotes soybean trade in Japan. July. p. 29.
• ***Summary:*** "For the first time since 1955, Mainland China is holding trade fairs in Japan to promote soybeans and other farm products." Chinese soybeans have a lower oil content than American soybeans, and sell for about $10/ton less. Through this year in Japan, they have been used mostly in the production of miso.

5091. *Soybean Digest.* 1964. Dr. [Hiroshi] Nakamura joins Hohnen Oil Co., Ltd, in Tokyo. July. p. 26.
• ***Summary:*** Hiroshi Nakamura, who received his Ph.D. in the department of agricultural economics at the University of Illinois, Urbana, Illinois, in 1963, was made manager of the Hohnen Oil Co., Ltd., Tokyo, effective April 1. Dr. Nakamura is a former Hohnen employee.

"His thesis at the University of Illinois was entitled, 'Structure of the Soybean Processing Industry in the United States.' It is expected that a bulletin reporting the results of his thesis Work will be published by the Illinois Agricultural Experiment Station.

After receipt of his doctorate, Dr. Nakamura completed a research study at the University of Illinois in the department of agricultural economics with Professors T.A. Hieronymus

© Copyright Soyinfo Center 2014

and C.G. Judge, and published the results of the research in AERR-67, 'Inter- regional Analyses of the Soybean Sector.'

"During the early months of this year Dr. Nakamura was engaged in University of Illinois research in Japan studying the economic development of that country with Professors T.A. Hieronymus and G.K. Brinegar.

"Dr. Nakamura's responsibilities with Hohnen will include handling foreign aspects of the company's business, and organizing research pertaining to marketing activities of the company.

"Hohnen has soybean processing plants at Shimizu, Nishinomiya, and Sakaide, and an edible fats and oils plant jointly with Unilever in Shimizu."

A small photo shows Dr. Nakamura (left) standing with M. Sugiyama Hohnen managing director.

• ***Summary:*** The isoflavone 6,7,4'-trihydroxyisoflavone was found in tempeh and the authors believe this highly active substance is probably a normal constituent of soybeans. [Note: This isoflavone was later shown to be a product of the fermentation process]. This may be an example of isoflavone modification that may occur during the fermentation or processing of soybeans. "Daidzein and genistein are the aglucones of the known glucosides, daidzin and genistin. Enzymatic hydrolysis of the glucosides through the action of *Rhizopus oryzae* has been proved... The antioxidants liberated in tempeh act probably through their protection and preservation of the biologically eminently effective vitamin E in soybeans and not by direct biological action. When larger amounts of 6,7,4'-trihydroxyisoflavone become available, its antioxidant effect in vitamin E-deficient animals should be investigated." Address: 1. Univ. of Pennsylvania; 2-3. Osaka City Univ., Osaka, Japan.

5094. Polansky, Marilyn M.; Murphy, E.W.; Toepfer, E.W. 1964. Components of vitamin B-6 in grains and cereal products. *J. of the Association of Official Agricultural Chemists* 47(4):750-53. Aug. [6 ref]

• ***Summary:*** The percentage of vitamin B-6 in the form of pyridoxol, pyridoxal, and pyridoxamine in soy flour is 63, 25, and 12 respectively. Address: Human Nutrition Research Div., ARS, USDA, Beltsville, Maryland.

5095. Smith, A.K. 1964. The Mount Fuji meeting. An international symposium on oilseed protein foods. *Soybean Digest.* Aug. p. 18-20.

• ***Summary:*** The symposium, sponsored by the International Institute of Food Technology, was held on May 11-15 at the Mt. Fuji Hotel, Lake Yamanaka, Japan. "The 85 technologists participating in the program represented 20 countries and included 30 from Japan and 20 from the United States. An additional 26 technical observers represented the Japanese food industry." "The Mount Fuji symposium was a historic occasion for the advancement of oilseed protein foods, being the first time an international conference was devoted solely to this subject."

"Dr. Y. Sakurai of Tokyo University and George F. Stewart of the University of California, Davis, were co-chairman for the meeting. Dr. T.M. Anson, assisted by others, developed the program. Dr. Masahiro Nakano was chairman of a committee to collect and display oilseed protein foods."

"Soybeans, peanuts, cottonseed, sesame, and coconut were the five oilseeds included in the program as sources of food proteins. Because of their long history and extensive use for food, soybeans were the topics of a major part of the papers and discussion."

"Among the newer developments in the Orient, K.S. Lo of Hong Kong reported on his successful commercial operation in the daily production of 24,000 cases of soybean milk in his two plants. His milk is made from well-washed and dehulled soybeans. It contains about 3% protein, 2-3% fat, and 5-7% carbohydrates, with added vitamins and calcium. Mr. Lo's methods for marketing soymilk are unique; he is also a large dealer in bottled soft drinks, and he markets soy milk as a soft drink. His milk competes with soft drinks rather than with other forms of milk or other health foods. Regardless of his method of marketing, he feels that the product is serving an important nutritional function in the Hong Kong area." Note: Vitasoy is once again being fortified with vitamins and calcium.

Dr. Tokuji Watanabe of the Food Research Institute reported on new ways of making tofu, such as "packed or bagged tofu" which is increasing in popularity. The soymilk is coagulated with calcium sulfate inside a polyethylene or vinylidene chloride plastic bag followed by heating in a water bath. This new process saves time and labor. Several plants are now producing 20,000 bags per day. Tofu is now also being freshly prepared in the home from spray-dried soy milk, coagulated with calcium. "More than 285,000 metric tons of soybeans and 65,000 metric tons of soybean meal are consumed annually for making fresh tofu in Japan, and because of low cost and high food quality, its consumption is said to be increasing.

Concerning miso, koji is now being made by a continuous method in 20-inch deep metal trays. Miso soup is now sold in a dried form. Shoyu production consumes 250,000 metric tons of soybeans of the equivalent as meal.

"The use of soy flour and grits in the United States for

© Copyright Soyinfo Center 2014

edible purposes was estimated at 200 million pounds and in England at 40 million pounds. The largest use of soy flour in the United States was estimated at 50 million pounds for bread and other baked products. In England, most soy flour is the full fat, enzymatic active type and is used at about 0.75% for improving color and flavor of baked goods."

"While isolated soybean protein for industrial uses has been produced since 1937, the production for food protein dates only from 1959. The production of industrial protein is carried on by two U.S. producers and annual production was estimated to be in the range of 40-50 million pounds. Four U.S. companies were reported to be producing or engaged in extensive research on isolated protein for food uses. The newest to be manufactured is referred to as a protein concentrate. It is prepared by washing soy flakes either with 80% alcohol or with water at the isoelectric point of the protein (pH 4.5). The concentrates must contain 70% protein whereas the isolate is 95% or more. The largest use of the isolate and concentrate is in comminuted or ground meat products, also referred to as sausage-type meats. Soy protein concentrate can be legally used in sausage-type meats up to 3.5% of the finished product." Address: NRRL, Peoria, Illinois.

5096. Chapin, W.P.G. 1964. Small sounds of Shimouma. *Christian Science Monitor.* Sept. 15. p. 8.
• ***Summary:*** The writer lives with his wife and children in Tokyo, in a part called Shimouma, in Setagaya-ku. "There are many peddlers. Some pull two-wheeled carts filled with their wares and all announce their presence by blowing a horn or by wailing."

"The men who sell *tofu* (bean curd) use horns with a reedy tone like that of a snake charmer. *Tofu* is popular, so the *tofu* man's progress is slow, and the thin, penetrating whine of his horn can be heard for hours through the day."

5097. Jayasena, H. 1964. Ceylon Meals for Millions Program. Report of proceedings of the inaugural meeting of the Meals for Millions Council of Ceylon, held 22 Sept. 1964 (Leaflet). Ceylon: Mimeograph leaflet published by the author. 2 p. 36 cm.
• ***Summary:*** "The Junior Chamber of Colombo, on the suggestion of Miss Florence Rose, Executive Director of the Meals for Millions Foundation, U.S.A. who while on a brief visit to Ceylon since 1955 when she last came and founded the original Meals for Millions Committee, organised the re-activation of this programme by convening a meeting of voluntary social service and welfare organisations and interested persons to form the Meals for Millions Council of Ceylon. This meeting was held at the Jubilee Room of the Galle Face Hotel at 6.30 P.M. on 22.9.1964.

"The proceedings of the meeting commenced by a discussion in which Miss Florence Rose expressed her deep debt to Mr. K. Somasundaram, former Director of the Ceylon Red Cross Society and to Dr. J.H.F. Jayasuriya who organised the meeting of the original Ceylon Meals for Millions Committee at his residence and to all those who helped to get the programme moving and thereby making the present developments possible.

"In the course of her talk Miss Florence Rose reviewed the programme of the Meals for Millions Foundation all over the world and drew special attention to the developments that have taken place in India, Brazil, Philippines and Japan where the example of the American MPF had stimulated the development of local variations using indigenous raw materials hitherto unused as human food. She explained that in the course of the years since 1955 when she came to this beautiful Island, the Meals for Millions Foundation, U.S.A. had gifted to Ceylon approximately 40,000 lbs. of American MPF which utilises soyabean meal as its protein base to the Government of Ceylon, the Ceylon Red Cross Meals for Millions Committee and other voluntary agencies here. She also explained that in the course of the 18 years in which she has been directing this 'People to People' programme, 13 million pounds of this 'Friendship Food' (MPF) had been introduced to 129 countries." "She pointed out that the Indian version of this food–'Indian multi-purpose Food' is now used in the State of Madras to provide essential protein, vitamins and minerals for over one million children in the Madras State school feeding programme. She also emphasised the developments now taking place in the Philippines, which have been stimulated greatly by the work of the Philippines Meals for Millions Affiliate and the scientific collaboration of Universities, Research Foundations and their leaders.

"After this introductory address, the colour film 'People to People' was screened which showed examples of the work of the Meals for Millions programme in various countries, with special emphasis on the Indian programme and the great interest displayed in this connection by the late Mr. Nehru, former Prime Minister of India who states in this film: 'This India needs, this is what India wants; but we must do it in our own way.'"

"The name of Prof. C.C. de Silva was unanimously adopted as the Chairman of the Ceylon Meals for Millions Council. This was proposed by Mr. Upatissa Hulugalla and seconded by Mr. H. Jayasena.

"Mr. Upatissa Hulugalla proposed that Mr. H. Jayasena be elected the Convenor and Secretary of the Ceylon Meals for Millions Council. The notion was seconded by Mr. N.D. Wijayanayaka and was unanimously adopted by the House."

A list of the 14 people present at the inaugural meeting includes Mr. H. Stanley Fernando (Chamber of Commerce), Dr. (Mrs.) B.V. De Mel, Mr. I. Paiva, Dr. M.J. Carrol, Director U.S. Information Services and Mr. H. Jayasena.

Miss Florence Rose expressed her appreciation to various people including to "Mr. H. Jayasena, whose personal interest and educational efforts on behalf of the programme began five years ago when as Secretary of the

© Copyright Soyinfo Center 2014

National Development Inquiry of the All Ceylon Buddhist Congress he first wrote to her Headquarters for information regarding the programme." Address: Ceylon Meals for Millions Council.

5098. Friendly, Bob. 1964. Japanese lady pushes soy in man's world [Yoshiko Kojima]. *Soybean Digest.* Sept. p. 77. From the New Orleans Times-Picayune.
• ***Summary:*** Pretty brunette Yoshiko Kojima, who is 5 feet tall when standing on her briefcase, is food promotion director for the Japanese American Soybean Institute in Tokyo. This institute is a venture of the USDA with the American Soybean Association. On a business tour of the USA, she says that Japan imports 1.2 million tons of soybeans a year, 70% through the Port of New Orleans, Louisiana. A photo shows Miss Kojima.

5099. Grow, Howard E. 1964. Japanese American Soybean Institute market development activities. *Soybean Digest.* Sept. p. 45-47.
• ***Summary:*** Contents: Introduction. Increased soybean exports to Japan. China has been supplying an increasing amount of Japan's soybean imports during the past 2 years. New approach to promotion of soy oil. Modern processing plant now making properly "toasted" soybean meal in Japan. Study Japan soybean varieties for making foods. Nine U.S. firms will exhibit on the first floor of the Trade Center.

"As you perhaps know, soybeans took over first place as the largest dollar earner of all agricultural commodities in the export market during last year. Soybeans were also in first place in dollar sales of all exports to Japan this year. Cotton and scrap iron have been in first place in exports to Japan for many years, but are falling behind soybeans this year. Japan imported nearly 49 million bushels of soybeans from the United States during the 1962-63 marketing year. This 49 million bushels is 27% of the total soybean exports as beans for 1962-63. Our exports of soybeans to Japan during the previous year were approximately 40 million bushels."

"Soybean meal has been a minor source of protein for livestock feed in Japan. The percentage of soybean meal was only 4.4% of total feed ingredients in 1960 and amounted to only 133,000 metric tons. There has been a steady increase in the percentage of soybean meal used in feed, along with increased tonnage. During 1963 soybean meal supplied 6.6% of the total feed ingredients. This amounted to nearly 400,000 metric tons. The estimated volume for 1964 is 470,000 tons of soybean meal in feed, while the projected requirement for 1965 is 560,000 tons." Address: Assistant to Executive Vice President, American Soybean Assoc.

5100. Kobatake, Yoshiki; Matsuno, N.; Tamura, E. 1964. Daizu kakô shokuhin no tanpakushitsu no eiyô-ka [Nutritional value of protein in Japanese soybean products]. *Eiyogaku Zasshi* (*Japanese J. of Nutrition*) 22(5):173-77. Sept. [7 ref. Jap]
• ***Summary:*** The Biological Value of tofu was 68.5, and dried-frozen tofu (kori-dofu) was 69.1. Both values indicate high nutritional quality. Even higher protein quality was observed in okara, a by-product of tofu. Its Biological Value was 84.9, though its absorption rate was 78.4%. The value for casein was 80.1, for salt-free miso 73.2, for low-salt miso 70.7, and for freeze-dried low-salt miso 60.5. Address: Division of Biochemistry of Nutrition, National Institute of Nutrition.

5101. Mizukami, Masanao. 1964. The Oil and Fat Importers and Exporters Association [of Japan]. *Soybean Digest.* Sept. p. 43-44.
• ***Summary:*** Provides statistics about soybeans in Japan but relatively little new information. Address: President, OFIEA, Tokyo, Japan.

5102. Sugiyama, Mototaro. 1964. Potential of the Japanese soybean market. *Soybean Digest.* Sept. p. 40, 42.
• ***Summary:*** Examines the current situation of and prospects for the Japanese soybean market in future years, in a speech at ASA's 44th annual convention. The United States is the leading supplier of soybeans to Japan.

"The demand for soybeans in Japan, as in other countries processing soybeans, is a derived demand from uses of soybean oil and soybean meal. In addition, we have demand for soybeans to be used in making the traditional soybean foods. In order to discuss the potential of the Japanese soybean market, therefore, we must look into the demand structure for soybean products in Japan.

Demand for Soybean Oil: Let us first examine the consumption of soybean oil. In Japan practically all the soybean oil produced is used for edible purposes, mostly as cooking oil for frying and salad dressing. In terms of the Japanese fiscal year starting April 1, the per capita consumption of vegetable oils in liquid form and pure lard for cooking uses, excluding consumption figures for margarine and shortening, increased from 3.3 pounds in 1952 to 8.4 pounds in 1962, the average annual rate of increase being 10.6%."

"Thus, on the average the increase of the per capita consumption of vegetable oils and pure lard for cooking was 1.4 times greater than the rate of increase of the per capita real income in 1952-62. This is a fortunate situation for processors of oilseeds because of the implication that so long as the real income keeps rising at the rate of 7% per annum we can expect a 10% increase in the annual consumption of vegetable oils for cooking, provided of course that the relationship between income and consumption of edible oils does not change materially at a higher level of income for some years to come.

"The per capita consumption of soybean oil for edible uses increased from 1.1 pounds in 1952 to 3.8 pounds in

© Copyright Soyinfo Center 2014

1962 or at an average rate of 13% per year, as compared with 10.6% annual increase of the per capita aggregate consumption of vegetable oils and pure lard for cooking. As a result, the proportion of soybean oil in the aggregate consumption of vegetable oils and pure lard increased from 32% in 1952 to 45% in 1962.

Demand for Soybean Flakes and Meal: "There have been two major uses of soybean meal in Japan. The so-called food utilization includes uses of extracted soybean flakes or meal in manufacturing soy sauce, monosodium glutamate, miso, tofu and other miscellaneous food items [listed above] in the order of consumption. The quantity used in these food products has remained at about the same level of 300,000 metric tons per annum in the past several years. While use for soy sauce and tofu tends to increase slightly, monosodium glutamate is no longer made from soybean flakes due to the development of a new and better manufacturing technology."

"In sharp contrast to the increasing consumption of edible oils, the per capita consumption of the traditional soybean foods in Japan has continued to decrease in recent years. For instance, the per capita consumption of miso was 21.4 pounds per year in 1952 but it declined to 17 pounds in 1962 or nearly 21% decrease in the 10-year period. During the same period the per capita consumption of soy sauce declined by 14% from 28.4 pounds to 24.5 pounds. The consumption of tofu remained at about the same level in the 1952-62 period [from 20.0 to 20.5 pieces per capita per year] but has tended to decline in the last few years. The per capita consumption of fried tofu or aburaage declined by 16% between 1952 and 1962."

"The other major use of soybean meal is for manufacturing mixed feeds for livestock and poultry. Use of soybean meal in feed has been increasing very rapidly in line with the growing livestock industry in Japan. Starting from a low level in the early 1950's the quantity of soybean meal used in mixed feeds amounted to about 400,000 metric tons in 1962 and 600,000 tons in 1963, thus occupying approximately 60% of the total disappearance of soybean flakes and meal in Japan." "The average annual rate of increase of soybean meal consumption in mixed feeds in the 1958-1963 period is 22%."

A large and very interesting table (p. 42) shows annual per capita "Consumption trends of cooking oils and protein foods in Japan" from 1952 to 1962. Meat and meat products increased from 5.1 pounds in 1952 to 16.3 pounds in 1962 for an average annual increase of 14.4%.

"The per capita consumption of eggs reached a level of 14.8 pounds in 1962 and continues to increase rapidly."

Import of soybeans from all countries increased from 167,032 metric tons in 1952 to 1,293,111 metric tons in 1962 for an average annual increase of 11.7%.

"Use of Whole Soybeans for Foods: On the other hand, the per capita consumption of whole soybeans in the form of the traditional soybean products such as tofu, miso, natto, etc. has declined by about 10% in the past few years from the peak of 12.1 pounds in 1959 to 11.0 pounds in 1962 in line with the declining per capita consumption of these soybean products. In view of the strong consumer preference for livestock products, particularly among the younger generation, it is expected that the per capita consumption of traditional soybean foods will continue to decline in the future."

The rest of the paper deals with predictions / projections for future Japanese demand for soybeans. Address: President, Japan Oilseed Processors Assoc., Tokyo, Japan.

5109. Jones, Dorothea Van Gundy. 1964. Soybean magic. *Today's Food* (*Loma Linda Foods, Riverside, California*) 9(3):4-6. Autumn.

• ***Summary:*** The author is on her way to Tokyo, Japan, where the American Soybean Association has asked her to participate in a soybean seminar and fair; she will lecture and demonstrate the use of soybeans in human nutrition.

"My interest in soybeans goes back many years when our family came in contact with them at the world's fair in San Francisco. They were featured in one of the Oriental displays. My father became so enthusiastic, he promptly bought a hundred pound sack of soybeans and we began experimenting. We discovered they were hard to cook and had a peculiar flavor. It was some time before we found a way to mask their beany taste and prepare them properly... My father [T.A. Van Gundy] became a real pioneer in introducing this king of the legume family and often was referred to as 'Soybean Van Gundy.'

"Many years ago, Loma Linda Foods became aware of the nutritional value of soybeans and began manufacturing a few products. Today there are twenty-five soybean foods under the famous Loma Linda label–some made entirely from soybeans and others incorporating them in some form. One of the latest additions to the Loma Linda line is Boston Style Baked Soybeans.

A photo shows Dorothea Van Gundy Jones with Miss Kojima, assistant manager of the Japanese Soybean Association [sic, Japanese American Soybean Institute], who is visiting the USA as part of her world tour to study uses of the soy bean.

Page 5 shows that the following Loma Linda brand soy products are now available: Soy Flour, Soyagen (All Purpose or Malt), Sandwich Spread, VegeChee, Smokene, Boston Baked Soybeans, and Soy Sauce. A photo on the cover of this issue of Loma Linda's quarterly magazine shows a can of Loma Linda VegeBits. Address: Nutritionist, Loma Linda Foods, 11503 Pierce Place, Riverside, California.

5110. Nichols, Teal. ed. 1964. Zen cookery. Chico, California: The Ohsawa Foundation. 83 p. Index. 22 cm. A second edition appeared in 1965.
• ***Summary:*** This is the earliest known macrobiotic cookbook written by an American, and its influence was profound.

Note 1. The Nov. 1964 edition of *Yin Yang* magazine, published in Chico, California, announced that the book had been published that month (Nov.).

"Acknowledgements: Our heartfelt gratitude goes to Lima Ohsawa, the foremost authority on Macrobiotic Cookery, without whose patient assistance and teaching this book would not have been possible. Many of the recipes appearing in Zen Cookery are from her collection in an earlier edition of Zen Macrobiotics. The Editor wishes further to thank the following people for recipes, suggestions, and invaluable comments: Joanne Hirsh, Dorothy Salant, Nina Bauman, Cornellia Aihara, Penny Smith, Shayne Oles, Betty Kennedy, and Jane Andrews."

"Zen Cookery is a collection of recipes gleaned from the files of many people, all of whom have adjusted their salt intake to suit their own needs. Their recipes reflect this."

Contents: 1. Grains. 2. Noodles. 3. Vegetables. 4. Soups. 5. Sauces. 6. Salads. 7. Inspirations from around the world. 8. Special dishes. 9. Miso soy bean paste. 10. Tamari soy sauce. 11. Breads. 12. Pancakes and crepes. 13. Pie doughs. 14. Desserts. 15. Beverages.

Note 2. This is the earliest English-language document seen (March 2012) that contains the term "tamari soy sauce." It is also the earliest English-language cook book seen that contains the word "tamari" or the term "tamari soy sauce."

© Copyright Soyinfo Center 2014

Each recipe is numbered. Recipes mentioning soy in recipe name (and a few other recipes introducing foods new to the USA): 2. Rice with tamari soy sauce. 3. Rice with aduki beans. 4. Rice & aduki pudding. 7. Sesame rice. 9. Rice with chick peas (garbanzo). 21-28. Buckwheat recipes. 34. Bulghur. 48. Buckwheat noodles in soup (Soba with kombu). 50. Buckwheat noodles with fried bean curds [tofu]. 54. Buckwheat noodles with miso sauce. 55-56. Buckwheat noodles in kuzu sauce. 61. Udon with aduki. 62. Carrot sesame nituke [nitsuke]. 75. Scallion nituke with miso (soybean paste). 76. Carrot and onion nituke with miso. 77. Onion nituke with miso. 78. Vegetable miso stew. 79. Boiled pumpkin with miso. 80. Vegetable sauces with kuzu arrowroot (and tamari soy sauce).

81. Vegetables with tamari soy sauce and tahini. 98. Jinenjo (5 recipes). 101. Miso-vegetable relish. 102. Aduki beans, black [soy] beans, chick peas. 105. Baked chick peas. 106. Buckwheat-aduki pancakes. 107. Udon with aduki beans. 108. Chestnut-aduki gelatine. 109. Chick pea party dip (with tahini and tamari). 110-118. Sea vegetables (kombu, nori, hiziki, wakame, most with tamari). 119. Clear broth (with tamari). 122. Tamari-vegetable broth. or stock. 123. Miso soup (2 types). 124. Creamed miso soup. 125. Root vegetable soup with miso. 131. Soybean soup. 134. Wakame soup (with miso). 149. Sesame sauce. 150. Miso sauce. 151. Miso salad dressing. 152. Thick tamari soy sauce. 153. Tahini tamari soy sauce. 154. Onion tahini sauce (with tamari). 172. Wakame salad.

189. Clam miso. 190. Scallop miso-lemon. 203 Miso spread [with tahini]. 204. Miso sauce [with tahini and orange rind]. 205. Sauce for vegetables [with black sesame and miso]. 206. Scallion miso. 207. Miso salad dressing. 208. Miso-vegetable relish. 209. Miso soup. 210. Udon with miso sauce. 211. Rice porridge with miso. 212. Deep fried miso balls. 213. Carrots and onions miso. 214. Vegetables miso. 215. Tekka (2 types). 216. Tea with tamari soy sauce. 217. Tamari broth. 218. Stringbeans. 219. Dried radish (daikon). 220. Shredded sea vegetables (hiziki). 221. Thick tamari soy sauce. 222. Tahini-tamari sauce. 223. Vegetables with tahini-tamari soy sauce. 234. Aduki muffins. 238. Miso spread (for sandwiches). 239. Tahini-tamari spread. 246. Buckwheat aduki pancakes. 272. Aduki pudding. 273. Chestnut-aduki gelatine. 274. Kanten jello (with agar).

291. Grain Milk (Kokkoh [Kokoh]; a finely ground combination of roasted rice, glutinous rice, oatmeal, soybeans, and sesame seeds). 294. Tea with tamari soy sauce (syo-ban).

Note 3. This is the earliest document seen (Feb. 2005) that mentions Kokkoh (or Kokoh), a grain milk introduced by macrobiotics.

Note 4. Tofu, amazake, and seitan are not mentioned in this book. 287 is Ohsawa Coffee (Yannoh) and 288 is Dandelion Coffee.

Note 5. This is the earliest document seen (June 2000) that mentions the use of miso in a salad dressing (Nos. 151 and 207).

Note 6. In 1985, when writing a revised edition of this book titled *The First Macrobiotic Cookbook,* Herman Aihara wrote (p. v) that this 1964 edition, published by the Ohsawa Foundation of Chico, California, was first the edition of the various subsequent and very influential books with this title.

Note 7. This is the earliest document seen (March 2011) concerning Herman or Cornellia Aihara and macrobiotics (or soyfoods).

Note 8. Along with soyfoods, this cookbook (and its many successors) also introduced numerous other basic Japanese foods such as aduki [azuki] beans (3-4, 102, 106-08, 234, 272-73), sea vegetables of all types, and soba. Address: Chico, California.

5115. **Product Name:** Affair (Non-Dairy Soy Ice Cream).
Manufacturer's Name: Presto Food Products.
Manufacturer's Address: Kansas City, Missouri.
Date of Introduction: 1964.
New Product–Documentation: Shurtleff & Aoyagi. 1985. Tofutti & Other Soy Ice Creams. p. 29-30. "The world's second soy-based commercial non-dairy frozen dessert having a registered trademark." In 1964, after 9 years of R&D by RGB Laboratories, Presto Foods launched America's second commercial soy ice cream. Called Affair, it was a delicious product made for Presto by Swift & Co. at their kosher supervised ice cream plant, using soy protein from Central Soya and coconut fat. Targeted primarily to the kosher Jewish market in New York, it was kosher pareve and came in chocolate, vanilla, and strawberry

© Copyright Soyinfo Center 2014

flavors. The demand for the product was there but Presto had great difficulty getting it distributed. The ice cream distributors wouldn't touch it and Presto did not have their own distribution. So it failed and was withdrawn after about a year. In l965 Presto licensed Nissei Co. in Osaka, Japan to make their soy ice cream, which Nissei was still doing in 1985, although at some point they changed the protein source from isolated soy proteins to casein. It was not until 1981 that Presto Foods tried to introduce a frozen dessert again, this time with Mocha Mix Non-Dairy Frozen Dessert (Borne l985, personal communication).

5120. Akizuki, Tatsuichiro. 1964. Taishitsu to shokumotsu: Kenkô e no michi [Physical constitution and food: The path to health]. Nagasaki: Published by the author. 40 p. 22 cm. [Jap]
• ***Summary:*** Contents: Introduction. The medical science of one's physical constitution. One's physical constitution. Foods. Nutrition. Food products. Miso. Components of miso. Protein. Fat. Minerals. Bacteria. Medical considerations. Conclusion.

Dr. Akizuki, director of the Saint Francis Hospital in Nagasaki, was born with a congenitally weak constitution, and has devoted his career to researching the use of food as preventive medicine. He has placed special emphasis on a holistic (rather than symptomatic) approach to healing, and on traditional natural foods native to Japan. "I feel that miso soup is the most essential part of a person's diet... I have found that, with very few exceptions, families which make a practice of serving miso soup daily are almost never sick... By enjoying miso soup each day, your constitution will gradually improve and you will develop resistance to disease. I believe that miso belongs to the highest class of medicines, those which help prevent disease and strengthen the body through continued usage... Some people speak of miso as a condiment, but miso brings out the flavor and nutritional value in all foods and helps the body to digest and assimilate whatever we eat... I use and have deep respect for modern medicines such as antibiotics and modern surgical techniques, yet they must only be employed when absolutely necessary. Of prime importance is the development of a strong constitution through proper eating. The basic condition of a person's constitution determines whether or not he will be only mildly and temporarily affected by diseases, or be seriously and chronically affected."

In 1945, when the atomic bomb fell on Nagasaki, Dr. Akizuki's hospital–located only one mile from the epicenter of the blast–was left in ruins. Fortunately, he and his nurses and co-workers were not in the building and were uninjured. Throughout the following 2 years, though, Dr. Akizuki and his staff worked daily in prolonged close contact with fallout victims in areas of Nagasaki which were heavily damaged and highly radioactive. Nevertheless, neither he nor his associates suffered from the usual and expected effects of radiation. Dr. Akizuki was extremely interested in this phenomenon, which he hypothesized may well have been due to the fact that he and his staff had been drinking miso soup regularly. But he felt that only a thorough scientific study of the phenomenon could provide the full answer.

One might ask, "Why did Dr. Akizuki wait 17 years to write this book?" Dr. Hideo Ebine (10/89) says, "I think he was very busy even after the war, taking care of many atomic bomb survivors and ordinary patients as a clinician, reconstructing the destroyed hospital, and writing the book *Nagasaki Genbakuki* (Diary of the Nagasaki Atomic Explosion), and so on. Dr. Akizuki is not a typical western type physician. His philosophy somewhat resembles that of macrobiotics, based on the use of food and diet to overcome disease. He examined the results of his treatment for 30 working staff of his hospital affected by radiation, and many patients who suffered directly from the atomic explosion before his confidence in the results of his treatment was obtained." Note: An abridged, undated edition, edited by Kawamura Wataru and titled *Taishitsu wa Shokumotsu de* [Your physical constitution depends on what you eat] was published by the Japanese National Miso Association.
Address: Saint Francis Hospital, Nagasaki.

5121. Arima, K. 1964. Microbial enzyme production. In: M.P. Starr, ed. 1964. Global Impacts of Applied Microbiology. New York: Wiley. 572 p. See p. 277-94. Held 29 July to 3 Aug. 1963 at Stockholm, Sweden.
• ***Summary:*** Table 1 (p. 278-79) shows industrially produced enzymes and their applications. Among the 34 enzymes are diastase (from malt), Takadiastase (from *Aspergillus oryzae*), amylase (from *B. subtilis,* [the natto bacterium]), rennet (from calf stomach), papain (from papaya), Takamine Pectinase Clarase (made by Takamine Lab.), penicillinase (from *B. subtilis,* made by Takamine Lab.), glucose oxidase (from *Aspergillus niger,* made by Takamine Lab.), adenylic

© Copyright Soyinfo Center 2014

acid (in Takadiastase).

Page 280 discusses "Takadiastase–This enzyme is produced by *Aspergillus oryzae* and is sold as a digestive aid. It is the oldest enzymatic product in use, but is still sold throughout the world. It is manufactured by the conventional tray culture method."

Page 282 discusses microbial rennet: "Rennet is the enzyme which develops in the fourth stomach of young calves while they are milk-fed. Later, when they are switched to other feed, the enzyme disappears." In recent years a shortage of animal rennet for cheesemaking has developed, so many investigators have searched for substitutes among vegetable and microbial enzymes. Arima and Iwasaki began this line of research several years ago and succeeded in isolating soil microorganisms that produced rennet. Their microbial rennet enzyme has been tested for making cheese, both in the USA and in Japan, and has proven satisfactory with respect to coagulation activity, flavor, and texture of the cheese.

Pages 283-89 discuss commercial enzyme production. The two basic methods are liquid culture (surface, or submerged) and solid culture (five types of Koji methods: Conventional koji tray culture, mechanized koji tray culture, rotary drum culture (not very successful), koji tray culture with aeration of controlled temperature and humidity, and thick layer koji culture). Address: Dep. of Agricultural Chemistry, Univ. of Tokyo, Bunkyo-Ku, Japan.

5122. Carletti, Francesco. 1964. My voyage around the world. Translation from the Italian [of Ragionamenti, 1594-1606] by Herbert Weinstock. New York, NY: Pantheon Books. Div. of Random House. xv + 270 p. See p. 110. [1 ref]

• ***Summary:*** This is the English-language translation of the 16th century Florentine merchant Carletti (lived 1573?-1636). In the section titled "Second Account: The East Indies" (p. 93+), in the chapter titled "First chronicle of the East Indies" he states (p. 99) that he arrived in Japan in June 1597 at Nagasaki. On page 110 he discusses rice miso, which he calls *"misol."* For details see the 1606 entry for Francesco Carletti. Address: Florence, Italy.

• ***Summary:*** Note: The Kojiki first appeared in Japan in 712 A.D.

5124. Choy, Jung Suck (Mrs.). 1964. The art of Oriental cooking. Los Angeles, California: The Ward Ritchie Press. xi + 156 p. Introduction by Dr. Lee Wok Chang. Illust. Index. 18 x 18 cm.

• ***Summary:*** Contents: Introduction. Korean food. Chinese food. Japanese food. Shopping guide for Oriental ingredients (1 p., with emphasis on the names and address of stores selling Oriental foods). For each category of food (such as Soup) and for each recipe, the name in English is given first, followed by the Asian name in parentheses. ½ to 1 teaspoon "monosodium glutamate" is called for in many recipes. Likewise "soy sauce" is used in many recipes.

Note 1. The index to this book is not a typical index. For example, although "bean curd" is called for in many recipes, it does not appear in the index. So one must read the entire book and all the ingredients in each recipe to find which recipes call for bean curd.

Note 2. The book has an unusually heavy emphasis on animal foods–meat, chicken, fish, shellfish, and eggs. Did people in Korea, China, and Japan really eat like this in 1964?

In Korean, bean curd is called dubu or do-bu (p. 13); bean curd is also called for on pages 45, 50, 54, 125, 136, 137, 138 Other ingredients used: Miso, p. 125. Red beans [azuki], p. 63.

Recipes include: Fish teriyaki, p. 134. Sukiyaki, p. 136. Mizu-taki, p. 137-38. Beef teriyaki, p. 140-41. Pork teriyaki, p. 141.

The shopping guide mentions: Bean curds. Chinese black beans [fermented black soybeans]. Miso. Monosodium glutamate. Sesame seeds. Sesame oil. Soy sauce.

Note: The author was born and raised in Korea. She and her husband joined the faculty of Seoul National University in 1947; she taught home economics. Since 1950 in the United States, she has been giving courses on Oriental cooking to various social and church groups. Address: Berkeley, California.

5125. Japan Dietetic Assoc. Corp. (JDAC). 1964. [Standard composition of Japanese foods]. Tokyo: Daiichi Shuppan K.K. 124 p. [Jap; Eng]

• ***Summary:*** The basic source of information on the nutritional composition of all Japanese foods.

5126. Jayasena, H. 1964. Meals for Millions and multi-purpose food (Leaflet). Ceylon: All Ceylon Buddhist Congress. 2 p. 36 cm.

• ***Summary:*** Contents of this mimeographed leaflet: Introduction. World-wide programme against hunger. India's example. An old dictum challenged. Food tradition and coconuts. W.H.O. [World Health Organization of the United Nations] recommends. A step forward.

"Multi-purpose food consists of a scientific blend of vegetable proteins, vitamins and minerals to provide maximum nutrition in palatable protein form at minimum cost. Besides, it has been designed to provide an adequate supplement to inadequate diets without affecting the taste and texture of the food usually consumed.

"This food was first developed by Professor Dr. Henry Borsook at the California Institute of Technology, U.S.A.

© Copyright Soyinfo Center 2014

in 1945 from a moderate research grant provided by Mr. Clifford Clinton, a civic leader and restaurant operator of Los Angeles.

"Multi-purpose Food called MPF for short was first produced out of soyabean press-cake and enriched with vitamins and minerals to provide in a two ounce quantity one-third of the minimum daily requirements of the essential protein, vitamins and minerals for an adult man established by regulation by the U.S. Food and Drug Administration."

"In 1946, the non-profit-making Meals for Millions Foundation was established in the USA to introduce this new concept for the prevention of malnutrition. By this programme, the Meals for Millions Foundation proposed:

"(1) To introduce to under-developed countries, the soy-based multi-purpose food (MPF) as an example of the type of low-cost food concentrate that could convert poor deficient diets into good nutritious diets.

"(2) To stimulate self-help programmes in the developing countries for them to produce from their own resources MPF type foods to prevent malnutrition among the vulnerable groups in their countries.

"India's example: Although till 1956, the American Meals for Millions Foundation was the only source of multi-purpose food, the stimulus provided by the popularisation of the MPF idea in India led to research being carried out at the Central Food Technological Research Institute, Mysore which resulted in an indigenous MPF being produced in India in 1954. It was made out of local raw material consisting principally of peanut and Bengal gram. This programme received the enthusiastic support of the Indian Prime Minister and the members of his cabinet.

"The Government of Madras after appropriate feeding trials decided to use Indian MPF for its school feeding programme involving about one million children. The MPF required for this feeding programme is produced by a private manufacturer. This idea is catching up in other States of the Indian Union. Indian MPF, a minimum of 1 to 2 ounces costing 3 to 6 N.P. per day is considered sufficient to meet a substantial part of the protein and vitamin deficiencies in the Indian diet. Besides India, Brazil, Mexico, and Japan are also producing MPFs, making use of indigenous raw material.

"An old dictum challenged: MPF whether of the soy-based or other varieties have been formulated on the principle which Dr. Henry Borsook once explained in the following words:

"'We recognized in 1946 that the outstanding world nutrition problem was protein deficiency. The means for coping with vitamin and mineral deficiencies was worked out. The obstacle to coping with the problem of protein deficiency was the wrong teaching which prevailed... that without animal protein there would always be protein malnutrition. There is no scientific justification for this dictum.'

"'It was motivated' he said 'by antiquated ideas, by wrong economics...'

"Dr. Henry Borsook, stressing this point further explained:

"'We know from proved scientific evidence that certain mixtures of vegetable proteins can do just as well nutritionally as animal proteins and we know the reason why. Animal protein is too expensive. A cow or a hog converts only about three percent of its feed into human food...'"

"'Vegetable proteins' Dr. Borsook emphasised 'are the cheapest in land, human labour and materials. There are vast unused reserves of human food in vegetable proteins, especially those in industrial by-products.'"

Incidentally, Dr. Henry Borsook is not alone in this view. This same view is shared by Dr. Moises Behar, Director of the Institute of Nutrition, Central America and Panama, among others. The thesis that animal protein is not essential for human nutrition because by the scientific mixing of various foods it is possible to produce a kind of vegetable "meat" is indeed heartening news for Buddhists especially who by reasons of religious persuasion are enjoined to abstain from killing animals for food or other purposes."

"It is noteworthy that while soyabean meal has been in use as a human food for quite some time, in regard to peanut press-cake, the W.H.O. Protein Advisory Group has recently concluded that solvent extracted groundnut flour can be safely used in feeding children, provided that solvents of known characteristics are utilized and controlled. We would like to make the observation that we should not stop with growing peanut and *gingelly* [sesame] alone. It will be well to consider growing soybean in Ceylon which has experimentally proved feasible in certain parts of the country. In terms of vegetable protein it gives the highest yield. It is also worth reflecting that it is a crop that has retained its place in the food economy of China for nearly 6,000 years.

"A step forward:

"In conclusion it may be pointed out that multi-purpose food is a product that has been universally used. From 1946 till to-date, approximately 13 million pounds of this "wonder food" have been introduced through voluntary agencies to medical, health, and welfare authorities in 129 countries and territories.

"All the conditions requiring the production of MPF in Ceylon are now present. We have malnutrition and under-nutrition of a considerable scale. We have a fair supply of one product, namely, coconut, that can form the base of such a product. The know-how and the technology also can be had, if needed. NPF has experimentally proved as a mean of reducing rice-intake, not only without ill-effects, but with nutritional benefits. The sooner MPF is popularised in Ceylon, the better it will be for the people's welfare." Address: Honorary Secretary, National Development Enquiry, All Ceylon Buddhist Congress.

© Copyright Soyinfo Center 2014

grains in the insular areas of Eastern and Southeastern Asia. *Asian Folklore Studies* (*Nagoya, Japan*) 23(1):1-92. See p. 3. [80+* ref. Eng]*
• ***Summary:*** Page 3 tells a story from the *Kojiki*, which first appeared in Japan in 712 A.D.: "A heavenly god asked an earthly goddess for a meal. Having seen her cooking various kinds of food taken out of her mouth, nose and anus, the heavenly god killed her in anger. Shortly afterward there appeared seeds of various crops from her corpse; from her eyes rice, from her ears the 'millet', from her nose the red bean [probably azuki], from her anus the soya bean, from her vagina barley, while the silk worm came out of her head."

Harlan (1975, p. 45) notes: "The source of the soybean suggests flatulence,..."

Note: This paper was first presented on 20 June 1962 at Indiana University.

5128. Murata, Kiku; Ikehata, H.; György, P. 1964. Detection and isolation of the antioxidants from fermented soya beans, tempeh. In: Proceedings of the Sixth International Congress of Nutrition. Edinburgh and London: E. & S. Livingstone Ltd. xv + 683 p. See p. 601. Held 9-15 Aug. 1963 at Edinburgh, Scotland.
• ***Summary:*** The authors detected an antioxidant in the alcohol extract of tempeh which is similar to that of vitamin E; it prevents haemolysis of red blood cells to dialuric acid. They attempted to isolate the active antioxidants from tempeh and succeeded in obtaining two isoflavons and one unknown "Factor 2" in crystalline forms. Two of the crystals were identified as daidzein and geninstein. Compared with vitamin E, they have only 1% and 5% respectively of the activity to prevent the haemolysis of red blood cells. However "Factor 2" has twice the activity of vitamin E.

5134. Watanabe, Minoru. 1964. Nihon shokuseikatsu-shi [History of Japanese food culture]. Tokyo: Kichikawa Kobunkan. 330 p. Illust. Index. 21 cm. [Jap]
• ***Summary:*** Amazake (p. 43), tofu (p. 3, 129), natto (p. 147), miso (p. 3, 88, 102, 130, 149, 203-05, 241, 288, 301, 314), shoyu (3, 149, 202, 241, 301).

Amazake: There were two types of fermented foods in Japan prior to the 8th century A.D.: The sake line and the hishio (*chiang*) line. The sake line used mainly rice as an ingredient but barley (*mugi*), broomcorn millet (*kibi*), glutinous mountain yam (*yama imo*), and fruits were also used. The hishio line led to miso and soy sauce. Both the early Japanese classics Kojiki (A.D. 712) and the Nihon Shoki (A.D. 720) mention sake. From burial mound tombs created during the period A.D. 300 to 600 have been excavated groups of stone burial objects which are thought to be sake making implements. The earliest sake was made from glutinous rice (*mochi-gome*); it was quite sweet, thick, and glutinous/sticky, and was called "one night sake" (*hitoyo-zake*). It was thick like today's amazake base before it has been diluted, and was probably served on tree leaves and eaten, rather than being drunk as a beverage. After the arrival of foreigners in Japan bringing brewing methods, regular rice started to be used to make drinks with a high alcohol content. Salty and/or pungent condiments (*karami*) were also added. Japanese cedar or cryptomeria (*sugi*) or bamboo leaves may have been used as preservatives. All of these beverages were thick grogs, not clarified sake. Moreover, unlike in later eras, they were not used to add color/pleasure to people's daily life. Rather they were used mainly at religious festivals and ceremonies.

Edinburgh and London: E. & S. Livingstone Ltd. xv + 683 p. See p. 477. Held 9-15 Aug. 1963 at Edinburgh, Scotland. Address: Dep. of Biochemistry, School of Medicine, Nagasaki Univ., Japan.

5136. *Daizu ni Kansuru Shiryo* (*Statistics on Soybeans and Soyfoods in Japan*). 1964--. Serial/periodical. Tokyo: Norin-sho, Engei Kyoku, Tokusan-ka (Japan Dep. of Agriculture, Forestry, and Fisheries). Annual. 26 cm. [30 ref. Jap]
• ***Summary:*** This annual publication of the Ministry of Agriculture, all in Japanese, is the single best unified source of statistical information on soybeans and soyfoods in Japan. By the 1970s the name of the publishing organization had changed to Norin Suisan-sho, Nosan Engei Kyoku, Hatasaku Shinkoka. The average length of a volume was 146 pages in the 1960s, increasing to 170 pages in the 1980s.

Table of Contents for the 1984 Edition reads: I. Finding where soybeans fit (in Japanese agriculture) (p. 1). 1. Changes in the size of area of the cultivated fields (p. 1). 2. Changes in usage of land (p. 2). 3. Changes in the rate of usage of cultivated fields (p. 6). 4. Converting rice fields to other crops (p. 7).

II. Production trends (p. 14). 1. Results of production (p. 14). 2. Present status of management (p. 28).

III. Grant money system (p. 56). 1. Outline of grant money system for soybeans and rapeseeds (p. 56). 2. Changes in the standard price of soybeans and the amount of soybeans subject to the grant money (p. 58). 3. Results of the regulated sales of soybeans (p. 59). 4. Monthly changes in the price of soybeans (p. 60). 5. Standards of inspection of soybeans (p. 62). 6. The present status of inspecting and ranking soybeans (p. 66).

IV. Outlines of the budget of the countermeasure of promoting the production of soybeans (p. 70). 1. Changes in the budget (p. 70). 2. Outline of budget of soy-related items in 1984 (p. 72). 3. The present status of enforcement of the enterprises (p. 82).

V. Varieties of soybeans (p. 86). 1. Table of the soybean varieties which were registered as Norin Bango (agriculture & forestry number) (p. 86). 2. Table listing the main existing varieties (p. 96). 3. Table of the varieties which each prefecture recommends (p. 102). 4. The status of planting different varieties of soybeans (p. 104).

VI. The present status of management techniques of cultivation (p. 109). 1. The season of soybeans in the main producing prefectures (p. 109). 2. Outline of the national association of promoting the improvement of management of beans in 1983 (p. 112).

VII. Trend of demand for soybeans (p. 132). 1. Changes in the demand for and the rate of self supply of soybeans (p. 132). 2. The status of demand for soybeans by year (p. 133). 3. Changes in the amount of soybeans imported for food use and the amount of soybeans used in various items (p. 133). 4. The results of production, shipping, and the usage of raw materials of miso and shoyu (p. 136). 5. The status of consumption of processed soybean products (p. 140). 6. Nutrients of soybeans and soybean products (= soyfoods) (p. 144). 7. Long term view (p. 150). 8. Changes in the rate of making soybeans as merchandise (p. 150). 9. The status of the production of soybeans in main producing countries (p. 151). 10. Changes in the amount of soybean production in the USA (p. 152). 11. The amount and the price of exported soybeans of main exporting countries, by countries (p. 153). 12. The amount and the price of imported soybeans of the main importing countries, by countries (p. 154). 13. The Japanese import situation for soybeans, by years and countries (p. 156). 14. The imported amounts, exported amounts, and the domestic prices by years (p. 162). 15. Changes in the soybean tax (p. 164).

5137. Ohsawa, G. 1964? Macrobiotics: The art of longevity and rejuvenation. New York, Paris, Brussel [sic], Tokyo: Ohsawa Foundation. Printed in the U.S.A. by Eastern Technical Publications (Boston & New York). 218 p. Undated. Index. 17 cm.
• ***Summary:*** This is the earliest known American printing of "Zen Macrobiotics." The word "Zen" was removed from the title at Michio Kushi's suggestion. The cover is yellowish tan. The author is George Ohsawa.

Contents: Foreword: Two ways to happiness through health. Preface: Health to peace. Books by the same author (7 in French, 9 in Japanese, one in English, plus 4 periodicals). Table of contents. 1. Macrobiotics and Oriental medicine. Why I have written this book. What is the philosophy of the Far East? 2. What is my therapy? Unhappiness, illness, crime. Incurable disease. Three categories of cure. What we must not cure. Satori. Courage, honesty justice. Tolerance. 3. The six main conditions of health and happiness. 4. Nothing shall be impossible to you. You should have infinite freedom. You must be your own doctor. 5. Ohsawa's macrobiotic cuisine. 6. Principal foods: Rice, buckwheat, udon etc., millet, raw rice etc. (p. 62-71, with recipes). 7. Secondary foods (p. 72-103, with recipes): Nituke, soup (lotus root ankake, kuzu gruel, cracknel yuba), pie, gyoza (piroshiki), chapati, jinenjo (wild potato, tororo). Egyptian beans (chick peas, *pois chiche*), beans (boiled soy beans with miso, gomoku beans, goziru [gojiru] soup, aduki beans), corn, aduki (ogura vermicelli), goma-tohu [sesame tofu], aemono (salads), varieties (chou farci, buckwheat crepe), wild vegetables, seaweeds (shi kobu [shio kombu], kobu maki, fried kobu, musubi kobu, kobu soup, matsuba kobu, salmon head kobu-maki, hiziki with lotus root, hiziki nitsuke, hiziki with "age," hiziki and soyabean, gomoku hiziki, hiziki rice), wild plants (dandelion leaves or root, aozu {wild

spinach}, fuki), miso and tamari preparation (sauce miso, miso cream, muso [miso with tahini and orange peel], miso soup, carrot and onion au miso, vegetable au miso, oden au miso, buckwheat dango au miso, miso ae, tekka no. 1 and 2), syoyu [shoyu] (sakura rice, sauce au shoyu, sauce au sesame, bouillon au shoyu, ositasi [ohitashi], oatmeal cream, potage oatmeal, sauce bechamel a la sauce shoyu, mayonnaise a la sauce shoyu, sauce Lyonnaise; "Shoyu diluted with a little water is very good for Sasimi [Sashimi = raw fish] and fried oyster, tempura, fish Sukiyaki, tofu {vegetable cheese of soya beans}, etc."), beverages (rice tea, wheat tea, dandelion coffee, Ohsawa Coffee {Yannoh; incl. roasted and ground rice, wheat, aduki, chick peas, and chicory}, Kokkoh {incl. roasted rice, glutinous rice, oatmeal, soya beans, and sesame seeds}, Mu tea, syo-ban {coarse green tea with soy sauce}, kuzu [cream, with shoyu] {"A good drink for everyone"}, aduki juice, radish [daikon] drink no. 1 and 2, ransyo {one beaten egg + 50% of traditional Ohsawa shoyu}, soba tea, umeboshi juice, ume-syo-kuzu, special rice cream).

8. Special dishes. Desserts. 9. Yin and Yang. 10. Macrobiotic suggestions for various symptoms of disease (p. 131-36, with recipes): General suggestions (by disease), macrobiotic external treatment (tofu plaster, soya bean plaster, Dentie). 11. Specific curative dietary suggestions: Examples of diseases and their macrobiotic treatments. 12. Kokkoh: Macrobiotic food for baby. 13. On cooking. Salt. Folk medicine. Your history. Appendix: The case of Mr. E. (Cure in 10 hours). "Pro-forma death certificate of the American World Empire and its Gold Dynasty."

Ohsawa centers and friends (p. 217-18): England (Trustin Foods, London; Mrs. R. Takagi, London), France (Centre Ignoramus, Longue Vie, Guenmai [Genmai = brown rice], Yamato, Ohsawa-France; all in Paris). Germany (Miss M. Arnoldi, Heidelberg; Dr. P. Martin, Munich; Dr. Henning, Hamburg), Italy (Miss H. Onoda, Rome; Mrs. Baccolis, Rome), Japan (Nippon Centre Ignoramus, 8 Kasumi-cho, Minato-ku, Tokyo; Shinsekai, Osaka), Brazil (Casa Longavida, Sao Paulo), Sweden (Miss Ilse Clausnitzer, Stockholm), U.S.A. (Ohsawa Foundation, 61, W. 56th St., New York; Ohsawa Foundation, P.O. Box 238, Chico, California; Chico-San, Inc., 64, 5th Ave., Chico, California; Musubi, 61, W. 56th St., New York–Macrobiotic Restaurant).

This book is undated, but it contains clues as to when it was published. On page 190 is reference to an article in *Time* magazine dated 7 March 1960 about the sad state of health in the United States. Then on page 189, Ohsawa states: "Upon my arrival in the United States last November, I began my lectures on the philosophy and medicine of the Orient. I gave some in Los Angeles and San Francisco [California], but mostly in New York institutes and schools such as the Universalist Church, The New School for Social Research, Columbia University, New York City College, and the American Buddhist Academy. I have postponed my departure twice. But I am very happy as I have confirmed my assumption: marriage between paradoxical philosophy of the Orient and the materialistic techniques of precision of American science, which must be realized for the infinite freedom of Man and for world peace" (p. 189).

Concerning the date of publication, which is not given in or on the book. One guess is about 1964, because when you do a printing of a book, you want to print enough to last for at least two years. This 1962 + 2 = 1964. A pretty weak reason! Carl Ferré (6 and 8 May 2011) states: I've done enough printing to know that the book printed in the USA uses the same plates as the second printing in Japan except for two changes. They added "Printed in the USA by..." (in a different type face) to the back side of the first page, which is blank; and, they whited out "Zen" and the smaller "Macrobiotics" on the cover and title page and replaced both with one word: "Macrobiotics" (again, in a different type face). The rest of the book appears to be exactly the same as the second printing from Japan."

"My thinking is that 1964 is a pretty good guess because I believe it may have been arranged by the East Coast Group–thus, the word 'Zen' was off the title and it was printed by a printer in Boston and New York. This would be about the time Michio Kushi was getting settled in Massachusetts."

Note 1. These lines almost certainly describe Ohsawa's first visit to the United States. He arrived in November 1959 and stayed well into 1960.

Note 2. All recipes in this book are numbered, from No. 1 (Unpolished rice, p. 162) to No. 816 (Rice plaster, p. 136). The recipe numbers are identical to those published in the mimeograph edition of *Zen Macrobiotics* (also titled *Macrobiotics–The Biological and Physiological Foundation of Zen Buddhism*), published in early 1960.

Note 3. The contents of this book is very similar to that of the earliest published edition of *Zen Macrobiotics*, which was printed in Japan and was 218 pages long.

• ***Summary:*** Table 1 lists annual consumption (in metric tons) of oilseed protein foods in some main consuming areas. Column 1: Miso, tofu, tempeh and other fermented or cooked soybean products: Mainland China 3,736,000. Japan 2,536,000. Indonesia 200,000. South Korea 160,000. Taiwan 153,000. Hong Kong 15,000. Malaya 15,000. Singapore 15,000.

Column 2: Soy milks: Singapore and Malaya 1,300 metric tons, Hong Kong 1,000.

Note: This is the earliest document seen (Aug. 2013) that contains industry or market statistics for soymilk by geographical region. Address: Chief, Marketing Branch, FAO Headquarters, Rome, Italy.

5164. Hayashi, Shizuka. 1965. How JASI promotes soybeans. *Soybean Digest.* May. p. 64.

• ***Summary:*** "As our various promotional activities have progressed since 1956 we have become aware of the fact that Japan urgently needs oils and fats–more than double the quantity we now consume–and that this need can be ideally met by soybean oil. In the present-day dietetics where balanced nutrition is called for, what is required in Japan is balancing the diet by increasing the level of fats and oils.

"The development of the soybean market in Japan can be most efficiently achieved by increasing the intake of oil by the Japanese people. I believe that JASI has not made a mistake in concentrating its activities largely in programs promoting soybean oil. I have repeatedly pointed out that if the Japanese people consume 1 gram of oil more per capita per day this means 35,000 tons of soybean oil or 200,000 tons of soybeans yearly. Based on 76 grams, which from the nutritional standpoint is the minimum amount of fats Japanese people should take per day, they are now short at least 40 grams of oil a day. In terms of soybean oil, this means 1,400,000 tons or the oil from 290 million bushels of soybeans yearly. This quantity must be imported if not produced in Japan." Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, No. 1, 1-Chome, Yuraku-cho, Chiyoda-ku, Tokyo, Japan.

5165. Jones, Dorothea Van Gundy. 1965. Nutritionist Jones praises low-fat foods of Japan: To Tokyo for tofu. *Today's Food* (*Loma Linda Foods, Riverside, California*) 10(1):4-6. Spring.

• ***Summary:*** In the fall of 1964 Dorothea was invited by the American Soybean Association to travel to Tokyo, Japan, to participate in a soybean seminar and fair. It was held in August and sponsored jointly by the U.S. Government and the American Soybean Association. She also lectured and demonstrated the use of soybeans in human nutrition. This article describes the trip. Part of her time was taken up with television, radio, and newspaper interviews. Miss Kojima went along to interpret. On a side trip to rural Japan, they had the privilege to stay in a Japanese Inn. Photos show: (1) Nutritionist Dorothea Van Gundy Jones demonstrates Western cookery at a stove while Soybean Institute Vice-President Miss Kojima translates for the audience. (2) Ingredients for making sukiyaki (incl. Loma Linda Tender-Bits and Loma Linda Soy Sauce). (3) Dorothea Jones and her husband standing behind ace carvings at a banquet.

5166. Kitamura, Osamu. 1965. Soybean meal as feed in Japan. *Soybean Digest.* May. p. 46-47.

• ***Summary:*** As the use of soybean meal in feeding livestock and poultry is aimed at the utilization of its protein, there is naturally no need to use oilseed meals when protein sources of animal origin such as fish meal and meat scraps are low priced.

"However, in-shore fishing in Japan has decreased its catches gradually year by year, and many of the fish caught are now marketed as higher priced chilled and frozen fish without being processed into fish meal. This is a result of the rapid development of the cold storage and refrigerating industries at the fishing bases. Consequently, production of fish meal has declined year by year, and Japan now has to import fish meal, contrary to the former situation when it was exported.

"It was in about 1925 that the use of soybean meal began as a protein source in addition to fish meal. At that time Manchurian soybean meal was being imported and it was publicized that soybean meal was equally valuable as fish meal as a protein source. Use of soybean meal began gradually with the establishment of a special livestock experiment station to use it and the announcement of experimental data in newspapers and magazines.

"However, there were some commercial formula feeds which did not use soybean meal due to the defective amino acid composition of its protein or its lack of [sic] unidentifiable growth factors.

"Present soybean meal use: The feed industry in Japan has advanced rapidly along with the steady progress of dietetics. Studies in the physiological effects of amino acids and in the application of the energy theory have been conducted, accompanied by announcement of the experimental data. Thus notions about feeds have changed remarkably during the past 14 to 15 years. Exchange of scientific information with the countries of the world has also been carried out, bringing the Japanese nutritional studies with livestock and poultry up to the international level.

"Consequently, in the Japanese feed industry 20-odd major manufacturers are engaged in studies to develop efficient and economical feeds by establishing their own experiment stations, perfecting their laboratories, and increasing the number of first-rate scientists on their staff.

© Copyright Soyinfo Center 2014

These efforts are now bringing about significant results.

"The merits and demerits of soybean meal have been completely recognized due to various types of experiments conducted so far. Supplementation of methionine and lysine has already reached the practical stage, increasing the utility of soybean meal year after year. But it is a fact that there has been a recent tendency for its use to decrease sharply because of the price factor.

"The comparison of recent prices between soybean meal and fish meal on the basis of their protein content is as follows:" A small table shows that fish meal (from Peru) contains 65% protein and costs ¥57,000 per ton, or ¥877 per 1% protein. Soybean meal (Japanese 45% protein and costs ¥45,000 per ton, or ¥1000 per 1% protein).

"Thus, we must consider that soybean meal is higher priced on the basis of the unit of protein, and its amino acid composition is inferior. And in addition to the price factor, use of fish meal is more advantageous with respect to vitamin B-12, which the latter is said to contain. These factors seem to be responsible for the declining use of soybean meal by livestock feeders as well as feed manufacturers. When soybean meal was priced at the level of 30,000 yen a ton, there was a trend toward mixing a high level (around 15%) of soybean meal by sharply reducing the use of fish meal in formula feed. At present the level of soybean meal mixed is probably below 5% to 6%.

"When soybean meal was used in large quantities, the market price of methionine was brought into question. Accelerating domestic production of methionine and importation of low-priced methionine have been discussed, but these possibilities seem to have been forgotten since the price hike in soybean meal.

"Possibilities of soybean meal: Most domestically produced soybean meal is still untoasted. This is the major cause hampering the use of soybean meal. Therefore, if the Japanese crushers really want to expand the outlets for their soybean meal, they should install perfect toasting equipment and make an effort to lower its protein-unit price below the level of fish meal. Japanese feed manufacturers are now in a critical condition because of the sharp price hike of grains, bran, oilseed meals, animal protein sources and many other items. And Japanese poultry farmers, who are major consumers of feed, are also desperate because of the low price of eggs and the high feed price. It is the view of many people that if this situation continues for a half-year, it will ruin Japanese poultry farming–which has a total production of 166 billion yen, next largest to rice production–with the possibility of halving the consumption of feed. It should be recognized that the future of both feed uses of soybean meal and imports of feedstuffs looks quite dark. If the egg price this spring, when production increases, can maintain its present level without going down below 165 yen per Kg (net received by farmers), the poultry business is expected to be stabilized again.

"Japanese poultry industry: Until 2 or 3 years ago poultry raising was stabilized next to rice production in Japan and was entered into by farmers without hesitation. Japanese poultry farming has rapidly expanded into a large enterprise, turning from small flock feeding to large flock feeding. The nation's poultry production, which totaled 70 million birds until 6 or 7 years ago, sharply increased to 120 million birds in 1964. The egg price per Kg averaged 196 yen in 1958, 189 yen in 1961, and 204 yen in 1963, which was a paying basis. But the price entered a nationwide slump beginning with the sharp drop to the level of 130 yen per Kg registered in Kita-Kyushu City, July 1964. After a moderate pickup in early fall, the price again dropped to around 150 yen in October and November. It was feared that the price would go down below production costs this spring, but it suddenly took an upturn in early March to the delight of poultry farmers.

"Analysis indicates that the cost of feed is more than 66% of the production cost of eggs. Thus, if an egg is sold at 10 yen (180 yen per Kg), feed cost would be 6 yen to 7 yen per egg. Since last fall, manufacturers of formula feeds have been compelled to refrain from raising their sales prices despite the sharp rise of feedstuff prices due to the depression of poultry enterprises. The feed manufacturers continued this attitude for about a half year at the risk of red ink, but in January they were finally compelled to announce a price hike of 800 yen to 1,000 yen per ton because there was no prospect of price reduction either in grains or soybean meal and other oilseed meals.

"During 1964 poultry farmers were distressed by the low price of eggs on one hand, and on the other by the high price of feed, inevitably going into the red. Many poultry farmers went bankrupt, and closed their businesses. This reduced flocks drastically. Under present circumstances, many observers say that the number of chickens fed in 1965 will be reduced to 70 to 80 million birds, the scale of 2 or 3 years ago.

"When the number of chickens has been sharply reduced, sacrificing small growers as at present, it can be anticipated that the relation between egg production and its demand will again be unbalanced, incurring a marked rise in egg prices. Japanese farmers who have once experienced such a confused state will naturally deepen their impression that poultry farming is an extremely unstable enterprise. So it is considered hopeless for the time being that there will be another poultry boom.

"Though poultry farmers who have survived will have a time of prosperity, big blows will hit the new feed manufacturers who have started operations stimulated by the recent poultry boom and also old feed manufacturers who have expanded their facilities. It is feared that selling competition will become even more severe, eventually causing marketing of inferior products, and this will result in the loss of credit.

"This is a serious problem concerning not only soybean
