955. Zavitz, C.A. 1899. Report of the experimentalist. *Ontario Agricultural College and Experimental Farm* (*Guelph*), *Annual Report* 24:119-83. For the year 1898. See p. 174, 181.

• ***Summary:*** The section titled "Fodder crops" (p. 174) contains a table listing six varieties of fodder crops that have been tested for 4 years in succession on plots of 1/100 acre in size. One of the crops was Yellow Soya Beans. Average height of crop in 1898: 23.0 inches. Average height in four years: 25.5 inches. Average yield per acre in 1898: 8.07 tons.

© Copyright Soyinfo Center 2014

Average yield per acre in four years: 8.52 tons. Egyptian peas gave the largest average yield of green crop per acre in 4 years (9.0 tons), followed by Grass peas (8.88). "The Yellow Soya bean, which has proven to be one of the best soja beans which have been grown at this place, occupies third place in production of green crop per acre" [8.52 tons].

In the section titled "Miscellaneous crops" we read (p. 181): "Soya, Soja, or Japanese beans. Five varieties of Japanese beans have been grown for two years in our experimental grounds. Most of these varieties were brought out from Japan by Prof. Brooks of Amherst University, Massachusetts. Some of them are doing well in the State of Massachusetts. They produce grain which is the richest of any produced on the farm. Our experiments, so far, are not of sufficient extent to justify our saying much in regard to the place these beans are likely to occupy in the future of agriculture in Ontario. It might be stated, however, that in yield of grain per acre, the Yellow Soya beans, the seed of which we originally obtained from the state of Kansas, stands highest, and that the Early White, Medium Black and Medium Green gave yields in the order named. The seed of the last three were secured from Prof. Brooks. In yield of green crop per acre the largest returns were secured from the Yellow and from the Medium Green varieties of Soya beans." Address: B.S.A., Experimentalist, Ontario Agricultural College [Guelph, Ontario, Canada].

956. Suzuki & Iida. 1899. Trade list of Japanese bulbs, seeds and plants: 1899-1900. New York City, New York. 16 p. April. Index. 21 cm. [Eng]

• ***Summary:*** In the section on "Seeds" (p. 13-16) is a subsection (p. 16) titled "Vegetable seed." "Soy bean" sells for $0.15 per lb.

Cable address: Suzuki, New York. Uyekigumi, Yokohama. Note: This company is the U.S. branch of the Yokohama Nursery Co., Ltd. of Yokohama, Japan. Their most popular product appears to be lily bulbs. Address: 11 Broadway, New York City, New York; 3 Nakamura, Yokohama, Japan.

957. Yamamoto, Masami. 1899. Seishu, gyûnyû, shôyu-chû no horumuarudehiido bôfu no kôryoku jikken seiseki [Results of experiments on the antiseptic power of the formaldehyde in sake, milk, and shoyu]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 206. p. 313-25. April. [Jap]

958. *Foreign Seeds and Plants Imported by the Section of Seed and Plant Introduction, USDA, Inventory.* 1899. [Soy bean introductions]. No. 1. S.P.I. Numbers 1-1000. 81 p.

• ***Summary:*** S.P.I. Number 480. "Glycine hispida. Soja bean. From South Ussurie [Ussuri, Usuri], Siberia [Russia]. Received through Prof. N.E. Hansen, March 1898. (1 package)." Note 1. This document contains the earliest clear date seen for soybeans in Russia, or the cultivation of soybeans in Russia (March 1898). The source of these soybeans is unknown, but it seems likely that they came across the Ussuri (*Wusuli*) River from Manchuria.

647-656. "Glycine hispida. Soy bean. From Tokyo, Japan. Received through Hon. A.E. Buck, March 4, 1898.

"647. 'Akasaya.'

"648. 'Nakade.'

"649. 'Deko;' medium early.

"650. 'Sennari;' medium early.

"651. 'Fuknishiro' [maybe 'Fukunishiro']; medium early.

"652. 'Kiyomasa;' late.

"653. 'Mejiro;' late.

"654. 'Aoteppo;' late.

"655. 'Kinoshita;' late.

"656. 'Asahi;' late."

Note 2. This is the earliest document seen (Oct. 2013) concerning introduction of soybeans to the United States by USDA's Section of Foreign Seed and Plant Introduction. These soybeans were all received in March 1898 from both South Ussurie, Siberia, and from Tokyo, Japan.

Note 3. The last named soybean variety above, #656, Asahi, may well be the same variety tested at the Kansas Agric. Exp. Station in 1900 and described in their Bulletin No. 100 in March 1901. Address: Washington, DC.

959. *Foreign Seeds and Plants Imported by the Section of Seed and Plant Introduction, USDA, Inventory.* 1899. [Soy bean introductions]. No. 2. S.P.I. Numbers 1001-1900. 94 p. Transmittal date: 5 July 1899.

• ***Summary:*** 1492-1493. "Glycine hispida. Soy bean. From France. Received through Mr. W.T. Swingle, December 1898.

"1492. (2 packages.) 'An erect annual legume, with hairy stems and leaves, which has been cultivated in China and Japan from remote antiquity. It was long grown in botanic gardens, but when the facts concerning its use as a human food by oriental nations came to light about twenty years ago, it was largely introduced into this country and Europe, where thorough trials of its forage and food value have been made. There are a large number of named varieties, which vary in the color of their seeds and the length of time which the plants require to come to maturity. The seed is planted at the rate of half a bushel to the acre, in drills 2½ to 3 feet apart, and cultivated about the same as Indian corn. In Virginia soy beans are planted between the hills of corn, so that two crops are produced on the same field at the same time. The yields of seed are often enormous. Soy beans are fed to stock green as silage, or as hay. The stems are rather woody and do not make the best quality of hay, but as either ensilage or green forage they are unsurpassed. The hay contains from 14 to 15 per cent crude protein and 3 to 6 per cent of fat. The beans contain from 32 to 42 per cent

© Copyright Soyinfo Center 2014

protein, and from 12 to 21 per cent of fat in fresh material. When fed to milch cows, a ration of soy beans increases the yield of milk, improves the quantity of the butter, and causes the animal to grow rapidly in weight. It is an excellent addition to a ration for feeding cattle. In China and Japan, where the soy bean is an article of diet, substances similar to butter, oil, and cheese, as well as a variety of dishes, are prepared from it. The yield of green forage amounts to from 6 to 8 tons per acre, and the beans from 40 to 100 bushels. The feeding value of the bean has been found to be greater than that of any other known forage plant except the peanut.' (Jared G. Smith.)

"1493. (1 Package.) 'Soja hispida à grain noir' (black-seeded *Soja hispida*)." Address: Washington, DC.

960. *San Francisco Chronicle.* 1899. A San Franciscan's impressions of the Orient. Aug. 20. p. 3.
• ***Summary:*** George A. Newhall, Vice-President of the San Francisco Chamber of Commerce, visited Asia where he was officially commissioned to promote international trade. His first stop was in Yokohama, Japan where "he was received with the greatest cordiality by Kahe Otani, president of the Yokohama Chamber of Commerce, member of the House of Parliament,..." Mr. Otani "has two houses, one of modern European style, the other a typical Japanese dwelling, and it was in the latter that the repast was offered." Mr. Newhall removed has shoes and refused a chair that was offered to him.

"The numerous courses were served by served by dainty little soft-footed Japanese maidens all of the food being in elaborate lacquered bowls and served on lacquered trays richly ornamented with gold. The courses were as follows:

"1. Sweetmeats with rice, molded in different shapes, representing birds, flowers and beasts.

"2. Entree of meat and vegetables, with soye sauce.

"3. Fish-tai, baked and served cold with piquant Japanese sauce."

"The banquet lasted seven hours, from 3 to 10 P.M., and Mr. Newhall heroically sat it out, using chopsticks,..."

961. *Washington Post.* 1899. Food from the Orient: Americans may really become lotus eaters. Some Asiatic food products. Special investigation of the subject being made by the Department of Agriculture. Sept. 3. p. 27.
• ***Summary:*** A commission has been appointed by Secretary of Agriculture James Wilson to look into the subject of useful Asian vegetables. "Now that the Pacific Ocean has become an American lake,... Yankee enterprise is on the alert to gobble up whatever may be available for use on the other side of that large pond..."

The section titled "Better than potatoes" states: "Among other valuable Asiatic food plants are millet and the soy bean. The former is a cereal of the first rank, cultivated on an enormous scale both in India and China. The latter forms an important part of the largely vegetarian diet of the Chinese and Japanese. It has been cultivated for many years in Europe, and is beginning to be extensively grown in the United States, though mainly for forage. It resembles a pea rather than a bean, but is very different from our peas and beans."

962. Omako, M. 1899. "Ramuko" su oyobi shôyu no sekiri, korera oyobi chôchi fusu no sankin ni taisuru sakkin ryoku ni tsuite [The bacteriocide power of soda-water, vinegar, and shoyu against the bacilli of cholera, typhoid fever, and dysentery]. *Tokyo Iji Shinshi* (*Tokyo Medical Journal*) No. 1119. p. 1-6. Sept. 16. [6 ref. Jap]
• ***Summary:*** Nakazawa (1950) translates the title of this article as "The antiseptic power of lemonade vinegar and shoyu on the bacillus of dysentery, cholera, and typhus."

Note: Wine is said to have been first made by the Babylonians about 3,000 B.C. But vinegar existed as much as 5,000 years before that. It is mentioned in the Bible. It is produced naturally after a wine fermentation when bacteria called acetobacters convert the alcohol to acetic acid. The English word "vinegar," first used in the 14th century, is derived from the French *vin aigre,* or sour wine. In German it is *essig,* and in Italian *aceto,* which is where the name acetic acid comes from. Address: Osaka, Japan.

963. Platt, James. 1899. "Soy." *Notes and Queries* (*London*) 4:475. Dec. 9. 9th Series. [2 ref]
• ***Summary:*** "This word has been badly treated by all our dictionaries. The best is the 'Century,' where it is traced to 'Japanese *siyan,* Chinese *shiyu,'* but even that involves two errors. One is a misprint (*'siyan'* should be *siyau*)*;* the other is that it accounts for only half the English word.

"To explain this, I must draw a distinction between three kinds of Japanese. (1) In Japanese as written with the native character *soy* would not be *siyau,* but *siyau-yu.* (2) In the Romanised Japanese this is simplified to *shoyu.* (3) Colloquially this is still further reduced by dropping the final vowel, to *shoy* or *soy* (*sh* in Tokio, *s* in some other dialects). Of this monosyllable only the *so* represents the classical *siyau;* the final consonant (*y*) is a relic of the termination *yu.* Hence my remark that the 'Century' accounts for only half the English word. The English word is derived from the Japanese, the latter from the Chinese. The Chinese form given by the 'Century' is Northern Mandarin. At Shanghai it becomes *sze-yu,* at Amoy, *si-iu,* at Canton *shi-yau* [fermented black soybean sauce]. The first element is defined by Williams, in his 'Dictionary,' p. 764, as 'Salted beans, or other fruits, dried and used as condiments'; the second element merely means 'oil' (Williams, p. 1111)."

© Copyright Soyinfo Center 2014

11. Dec. Series 2. [24 ref. Ger]
• ***Summary:*** Discusses three genera of molds: *Penicillium, Aspergillus,* and *Mucor.* Gives details and a review of the literature on the use of *Aspergillus* species of mold for the production of saké, koji, soy sauce, miso, and various other East-Asian foods. In 1896 a book titled *Les moisissures* (*The molds*), by Calmette was published in Brussels, Belgium; he discussed sake, the chemical composition of koji, and the action of its diastase enzyme. "It was a Japanese named Jokichi Takamine who first had the idea of using koji in place of malt in American and European distilleries. In 1889 in the USA he was issued a patent on the process for using koji (or a mixture of koji and moto) in a fermentation to make of product containing 15-18% alcohol. The process was first tested in practice at Peoria, Illinois, is a distillery of the Distilling and Feeding Co., but not with the results that all the world had expected. Both Delbrueck (1894) and Saare (1895) had the opportunity to the process on the spot in 1894; in the opinion of Delbrueck koji is suited for use in place of malt in the saccharification of starches. For the production of koji, Takamine uses an inexpensive wheat bran instead of the typical rice. The process is then described in detail.

Aspergillus oryzae plays a key role in the production of two East-Asian foods: soy sauce (*Shoyu-Sauce*) and miso. The former is made with wheat, soybeans, salt, and water; miso is made from soybeans, koji, salt, and water. For details see Kellner's publication "On Saké, Shoyu and Miso." In Java, another species of Aspergillus, namely *A. Wentii* is used to make their soy sauce (*Sojasauce*), according to Prinsen-Geerligs.

Also discusses the use of Mucor species, such as *Amylomyces rouxii,* in the production of spirits or brandy from dehulled rice. In 1892 Calmette was head of the Pasteur Institute in Saigon; today he is director of the Pasteur Institute in Lille, France. He has taken considerable interest in Mucor species, and published the results of his research in his 1896 book. Colette has a factory at Seclin near Lille. Colette and Boidin have formed the Amylo Society (*Société d'Amylo*) in Lille. Address: Chemist, Austria.

965. Stoddard, W.H. 1899. Soy, or Soja beans. What they are,.... how to grow them, and what they are good for. Carlinville, Macoupin County, Illinois. Published by the author. Printed by Enquirer Printing Establishment. 6 p.
• ***Summary:*** "This is an extract from a paper read before the Macoupin (pronounced muh-KOO-pun) County Farmers' Institute, Dec. 21, 1898. It was mentioned in letter by Mary H. Stoddard, 25 Nov. 1944. On page 2 is inscribed: Compliments of Mary Hoyt Stoddard Best (Mrs. Earl), daughter of William H. and Mary V. (English) Stoddard. 202 Sue St., Carlinville, Macoupin Co., IL 62626. July 28, 1975.

The publication begins: "To our brother farmers and stock men. In answer to the many inquiries received, asking for information about the soja beans, we have prepared the following circular to answer some of the many questions, giving a few of the facts we have learned about them from the reports of several state experiment stations, and from our own personal experience in growing them for a feed, seed, and fertilizing crop. All intelligent farmers know there is an urgent need for a grain and forage crop other than corn. A crop rich in nitrogen and fat. A crop that can be grown easily, quickly and with little or no extra cost over that of corn. If possible, one that will *not* exhaust the soil like wheat, oats and corn, but rather add to its fertility."

The author discusses clover, alfalfa, and cow peas. He says he has obtained a yield of 10 bushels "with less than half a stand." He accurately reviews the nutritional value of soy beans compared to available supplements. "The last and best of this trio of legumes is the soy bean, or as it is generally but incorrectly called, the 'soja' bean. This plant is a native of South-Eastern Asia, growing wild in Japan, Java and parts of China. In Japan, where the greatest use has been made of it as food for man and beast, there are many varieties, like our corn with us, but only a few have been introduced into this country. Here it is divided into three classes, the Early Dwarf, the Medium Early and the Late Mammoth. Of these three there are white, yellow, green and black seeded varieties, which differ but little in value. They are of an upright, branching growth. None of the varieties ever run or vine like the cow peas.

"The Early Dwarf grows from 16 to 24 inches high, matures seed fit to feed green in 69 to 75 days, and ripens fit to cut for a seed crop in 80 to 90 days.

"The Medium Early varieties grow 3 to 4 feet high and are a few weeks later than the Early Dwarf.

"The Late Mammoth grows 5 to 7 feet high, but seldom forms seed north of the Ohio river, and only ripens in our southern states. It is worthless here except for hay or green forage for pasture, or to plow under for fertilizing. The Early Dwarf has been grown successfully as far north as Wisconsin and Minnesota, where corn is a doubtful crop.

"No soil is too poor for it to thrive and grow. It even yields a fair crop on ground too poor to grow clover. Unlike cow peas, which are a failure as a seed crop on rich land, it stands prosperity, and instead of running to vines, it simply increases alike its yield of forage and seed. So far no insect is known to injure the vines while growing. Chinch bugs never touch it. Drouths that burn up clover and cow peas and fire corn, have little effect on it. Rains that make "little yellow corn" and rot off cow pea vines, do not injure the sojas. If cut for hay or seed and lying on the ground, rains that would utterly ruin clover, corn fodder or cow peas, rarely injures the sojas.

"This fall part of my own crop was cut and lay on the ground all through the two weeks' rain in October, and I never lost a handful of vines or a pint of seeds from that cause. The little, fine, velvety hairs on stalk, leaf and seed-

© Copyright Soyinfo Center 2014

pods, seem to hold the water at a distance till it can dry out. These same little hairs on the green, growing plant attract and hold the dew till the large pulpy leaves can absorb the nitrogen it contains, transferring it through leaf, stalk and the mass of thread-like surface roots to the soil which supports it, thus paying its rent, till the ground is richer after growing the crop than it was before planting."

"Now for the food value of the seeds: Of protein or food nitrogen, which is as necessary to the growth and health of animals as it is to plants, forming blood, bone and muscle, Soja bean seed contain 34 per cent; ground linseed oil-cake contains 32 per cent; cow peas 20 per cent; wheat and oats each 11 per cent; corn 10 per cent; wheat bran and ship stuff 15 per cent; artichokes 2½ per cent; sugar beets 2 per cent. Of fat, which goes to make heat, life and energy in the animal, these same foods contain: Soja beans 17 per cent; linseed oil-cake meal 3 to 7 per cent; corn 5 per cent; oats 5 per cent; wheat 2 per cent; bran and ship stuff each 4 per cent; cow peas 1 4-10 per cent only; artichokes two-tenths of 1 per cent; sugar beets 2 per cent."

"One of our most successful cattle feeders, Mr. J.F. Clark, of this county, reports having pastured the past season his field of sojas when summer feed was short, and says he never had cattle thrive and fatten faster on any kind of feed.

"Mr. E.G. Duckles, of Chesterfield, cut and fed his green sojas to his dairy cows the past summer with a quick and decided gain both in quantity and quality of the milk and butter.

"In my own experience I can say I never tried a better feed for calves or shoats [shotes], or brood sows and pigs, than the sojas either green or dry. They fairly go wild over the mature green beans if offered to them when grass is dry and before corn is ready to feed."

"Prices of seed for 1899: Early Dwarf Sojas, $2.50 per bushel; $1.50 per half bushel; $1.00 per peck. Medium Early Sojas, $2.00 per bushel; $1.35 per half bushel; $0.75 per peck." Note 1. No price is given for Late Mammoth Sojas.

At the end of the booklet is a full-page ad: "Macoupin County Stock and Seed Farms. W.H. & C.L. Stoddard, proprietors, Carlinville, Macoupin County, Illinois. Our specialties: Ohio Improved Chesterwhite Swine, Soja Beans, and 'Big Macoupin' White Seed Corn."

Note 2. This is the earliest document seen (June 2011) concerning soybeans in Minnesota, or the cultivation of soybeans in Minnesota. This document contains the earliest date seen for soybeans in Minnesota, or the cultivation of soybeans in Minnesota (Dec. 1899).

Note 3. This is the earliest English-language booklet seen (Aug. 2001) about soybeans, i.e. with the word "Soy" (or any of its cognates) in the title.

Note 4. This is the earliest English-language document seen (Oct. 2006) that uses the term "the sojas" to refer to soybeans.

Note 5. This is the earliest document seen stating that William H. and C.L. Stoddard of Macoupin County Stock and Seed Farms are selling Soja Beans.

Note 6. This is the earliest document seen (July 2013) that mentions the soybean varieties Early Dwarf or Late Mammoth.

Note 7. *Merriam-Webster's Collegiate Dictionary* (1998) defines shoat (derived from Middle English *shote*), a term first used in the 15th century, as "a young hog usually less than one year old." Address: Farmer, Carlinville, Macoupin County, Illinois.

966. Kano, S.; Iishima, S. 1899. Honpo-san shizenbutsu oyobi shikohin 18 shu no kyûshû ni tsuite [Digestion experiments on 18 Japanese foods]. *Gun-i Gakko Gyofu Koku Nobu* (*Bulletin of the Army Medical College*) No. 3. p. 101-33. [Jap]

• ***Summary:*** These human digestion experiments with single food materials were conducted at the Army Medical College in Tokyo. They are summarized in English by Oshima (1905, p. 168-73). Most of the experiments used shoyu as a seasoning. Experiment #89 used *kingyo fu* (a gluten preparation) and raw red azuki (adzuke) beans. #92 used tofu. #93 use tofu cake or okara. #94 used yuba. #97 used kuzu starch (made from *Pueraria thunbergiana*). Address: Army Medical College, Tokyo.

967. Beresford, Charles William. 1899. The break-up of China, with an account of its present commerce, currency, waterways, armies, railways, politics, and future prospects. New York and London: Harper & Brothers Publishers. xxii + 491 p. See p. 34, 40, 60-61, 63, 70. Index. 23 cm.

• ***Summary:*** Lord Beresford visited many parts of China and Manchuria on a mission given to him by the president of the Associated Chambers of Commerce. "The break-up of an Empire of four hundred millions of people is an even that has no parallel in history." Recently controversy has raged over the "Open Door" and "Sphere of Influence" concepts.

All of the information related to soybeans appears in Chapter IV, titled "Newchwang." The author arrived at that port in Manchuria on 4 Nov. 1898. Two of the largest British trading companies are Butterfield & Swire, and Jardine & Matheson Steamship Co. Each has about 35 steamers which, in 1897 made about 250 trips in and out of Newchwang. Newchwang and Talienwan are the only two ports on the sea that can be used for trading with all of Manchuria. "The backbone of the Chinese coasting trade under the British flag is the Newchwang coasting trade–[soya] beans, bean-cake, pease, and kindred stuffs. If Newchwang is closed the whole coasting trade would be very materially affected." (p. 34).

"The freight carried by boats in the summer is borne in the winter by carts, carrying on an average 22 cwt. [1 cwt = hundredweight = 112 pounds], which would take advantage of the frozen ground to bring down loads of beans, oil, maize, millet, and grain," etc. (p. 40).

© Copyright Soyinfo Center 2014

The staple exports from Newchwang "are beans, bean-cake, and bean oil... Until recent years the bulk of the beans and bean-cake trade was carried on with the south of China; but since the Chino-Japanese war [Sino-Japanese war, 1894-95] an extensive trade has been carried on with Japan; in fact Japan has outstripped China altogether." Exports to Japan increased from 460,000 taels in 1891 to 5,079,000 taels in 1897, from 2,727,000 taels in 1891 to 2,438,000 taels in 1897. Exports to Canton increased from 1,751,000 taels in 1891 to 2,338,000 taels in 1897. "Beans are sent to Hong Kong and Canton for food, and bean-cake is sent to Swatow for manure." (p. 60-61).

"In 1868, a steam bean-mill was started here [in Newchwang]; but, owing to native opposition, it was not allowed to work, and thus the experiment came to an end. In 1896 Messrs. Butterfield & Swire erected a bean-mill, and with satisfactory results, the profit accruing from the making of bean-cake in this way being enormous. The mill is worked by Chinese only, and is practically Chinese-owned. Other mills are shortly to be erected, and their erection will greatly enhance the importance of Newchwang as an open port." (p. 63).

In Newchwang "I also visited a bean-factory for pressing the oil out of the beans; it was the most primitive process conceivable. The beans were placed in receptacles made of grass, which in their turn were put into perforated iron vessels. The pressure was produced by wedges, driven home with slung stones, the bearings being solid trees with the heart cut out to make a guide. The Chinese have generally set their faces against machinery for this industry. Messrs. Jardine & Matheson have imported machinery which would carry out the work far cheaper and better, but I was told the Chinese merchants had boycotted both the bean-cake and the oil, and that the mill had to be closed." (p. 70).

Page 484 shows that of the 730,964 tons of shipping entered and cleared from Newchwang, 363,922 tons (49.8%) were on British ships. China's five largest ports in terms of value of trade in 1897 were Shanghai (101,832,962 Haikwan taels), Tientsin (55,059,017 taels), Canton (49,934,391 taels), Hankow (49,720,630 taels), and Newchwang (26,358,671 taels). China's five largest cities in terms of estimated population were: Canton 1,600,424, Peking 1,300,000, Tientsin 1,000,000, Hankow 800,370, and Foochow 636,351.

On the same page are definitions of the following Chinese weights and measures: 16 taels = 1 catty. 1 catty = 1.33 lb avoirdupois. 100 catties = 1 picul. 1 picul = 133.33 lb weight avoirdupois. 6 mou = 1 acre. 3.3 li = 1 mile. 1 Haikwan (or Customs) tael = $0.72 American or 2*s.* 11.75*d.* English.

A large full-body photo, facing the title page, shows Lord Charles Beresford.

Note: This is the earliest document seen (April 2008) concerning the Sino-Japanese War and soybeans. Address: England.

968. Chamberlain, Basil Hall; Mason, W.B. 1899. A handbook for travellers in Japan: Including the whole empire from Yezo to Formosa. 5th ed., revised and augmented. London: John Murray; Yokohama, Shanghai, Hongkong, Singapore: Kelly & Walsh, Ltd. ix + 577 + 53 p. "With 28 maps and plans and numerous illustrations." Index.

• ***Summary:*** Contents: Introduction. Routes: 1. Eastern Japan. 2. Routes connecting Tokyo and Kyoto. 3. Central Japan. 4. Western Japan and the Inland Sea. 5. The island of Shikoku. 6. The island of Kyushu. 7. Northern Japan. 8. The island of Yezo [Hokkaido]. 9. Luchu and Formosa. Glossary.

Page 10: Provisions: "Curry-powder will often help to make insipid Japanese dishes palatable, and *shôyu* (soy [sauce]) adds a zest to soups." "The following Japanese articles of food are considered palatable by most foreigners: *Kaseteira* [*Kasutera*], sponge cake. *Miso-shiru,* bean-soup [miso soup],... *Sakana no tempura,* fish fritter. *Unagi-mesihi,* layers of rice with eels done in soy. *Yokan,* sweet bean-paste" [azuki].

Gods and Goddesses (p. 56): Toyo-Uke-Bime, also called Uke-Mochi-no-Kami, is "the Shinto Goddess of Food or of the Earth. The *Nihongi,* one of the two principal sources of Japanese mythology and early history..." The Moon God killed the Goddess of Earth. From the body of the murdered Earth sprang cattle and horses, millet, silkworms, rice, barley, and [soy] beans, which the Sun-Goddess decreed should thenceforth be the food of the human race. In the *Kojiki* version of the myth, it is Susa-no-o who slays the Goddess of Food, and there are other differences of detail."

Eastern Japan (p. 225): "Tenjin-yama or Minato (Inn, Suiryo-kwan). This prettily situated place contains a few sake breweries and soy manufactories, the produce of which is shipped in junks to Tokyo;..."

Mountains of central Japan (p. 281): "Narada (accommodation at a Buddhist temple)" consists of but a few households; the people are isolated and poor. "Rice, *sake,* and soy [sauce] are with them luxuries to be indulged in on rare occasions, their ordinary food consisting only of millet and potatoes."

Central Japan (p. 334): "Yuasa (Inn, Edo-ya) is a dull town, noted for its manufacture of soy."

Central Japan (p. 336): "There is a current belief to the effect that Koya-san is so precipitous that such luxuries as bean-curd (*tôfu*) cannot he carried up to it, but that the priests place coppers on the temple balustrade, with which the crows fly off to Kumano and bring back bean-curd in return."

Central Japan (p. 389-90): Kasuga no Miya (a Shinto temple). The oratory "is now used by the townspeople on the evening of the Setsubun (3rd February) for the performance of the ceremony of scattering [roasted soy] beans to expel evil spirits."

Central Japan (p. 403): Matsudô. "Travellers will remark the great industry and economy practised in the agriculture

© Copyright Soyinfo Center 2014

of this district, even the ridges between the rice-fields being sown with beans or barley." Note 1. Soy beans were often planted on such ridges, then harvested as green vegetable soybeans.

Note 2. The last 53 pages of this book are advertisements. Address: 1. F.R.G.S., Emeritus Prof. of Japanese and Philology in the Imperial Univ. of Tokyo, Tokyo; 2. Corresponding member of the Royal Scottish Geographical Society, and late of the Imperial Japanese Dep. of Communications.

969. Fraser, Hugh (Mrs.). 1899. A diplomatist's wife in Japan: Letters from home to home. 2 vols. London: Hutchinson & Co. See vol. 1, p. 231, 233, 238. Chap. XI. With 250 Illust. 24 cm. [Eng]

• ***Summary:*** The author's maiden name is Mary Crawford. These letters, written in a poetic, flowery style during a three years' residence in Tokyo, Japan (April 1889 to April 1892), describe many aspects of Japanese life. Chapter XI, written in Nov. 1889, begins with a description of a Japanese mushroom hunting party in the autumn woods of Kyoto. After the mushrooms (the most prized at *matsu-také*) are gathered, they are cooked over a little fire in the woods. "Then begins the business of roasting the mushrooms, in which everybody helps; and great enthusiasm is shown over the delicious odour they give out. 'Ii nioi! Ii nioi de gozaimasu!' (Good smell! Honourably good odour!) exclaim the ladies, as they deftly peel off the outer skin of the toasted fruit, which is then shred into small pieces, flavoured with *shoyu* (soy) and vinegar, and eaten with *o'hashi,* the honourable chop-sticks."

During his visit to Japan, there was an attempt on the life of the young Russian prince Cesarévitch. There was a great outpouring of sympathy and condolences and love from Japanese people of all ranks "to the boy who lay healing of his wound in Kobe Harbour. The poor sent the most touching gifts–the rice and shoyu, the fish and barley flour, which would have fed the little family for a year;..." Address: Tokyo, Japan.

• ***Summary:*** The soybean is referred to in French as "Dolic du Japon ou soja." An illustration (non-original, p. 175; by Thiebault, from Carrière 1880) shows the soybean plant (titled *Dolic du Japon ou soja*) and a cluster of pods. Its scientific names are Soja japonica, Sav. or Soja hispida, Moench. Synonyms are Dolic soja, and Dolic à café. A botanical description is given. "Varieties which are most widely cultivated are the yellow soybean (le soja jaune; Soja ochroleuca) and the black soybean (le soja noir; Soja hispida). A sub-race named *soja d'Étampes* is the most widely appreciated in France. It is very productive but it needs 4-5 months to ripen its seeds. The soybean is an annual; it was introduced to France from China by de Montigny under the name *pois olèagineux.* It is successfully cultivated in China, Japan, the Indies, the Moluccas, etc. It is rather easily sold in the green state at various markets. Its principal merit is its ability to resist drought. It needs as much heat as haricots...

"The Japanese transform the seeds of this legume into a puree (tofu; *ten-hu*) or a paste (*miso*) with which they make a sauce (soja), which they use to prepare various seasonings named *shoyu* or *sooju* and *tofu* or *daïzu.*

"Soybean seeds germinate very irregularly and very late in Europe, especially in their second year of existence. An analysis of the soybean seed on a moisture-free basis, conducted by Mr. Joulie, is given.

"The soybean is richer than wheat in fatty and proteinaceous materials. When one prepares dry soybeans, it is useful to soak them in water for 8-10 hours before cooking, for they are naturally very hard. They are also eaten in the shelled green state.

"The varieties with branches [les variétés à rames] are not yet cultivated in Europe." Gustave Heuzé lived 1816-1907. Address: Membre de la Société Nationale d'Agriculture. Inspecteur Générale Honoraire de l'Agriculture.

971. Itô, Tokutaro; Matsumura, Jinzô. 1899. Tentamen florae Lutchuensis. Sectio prima. Plantae Dicotyledoneae polypetalae [Essay on the flora of the Ryukyu Islands. Section 1. Dicotyledonous multi-petaled plants]. *J. of the College of Science, Univ. of Tokyo* 12:263-541. See p. 420. [30 ref. Lat; eng]

• ***Summary:*** In the section titled "Leguminosæ," by J. Matsumura, descriptions of the following plants are given in Latin: *Glycine hispida* (p. 420). *Glycine hispida* (p. 420). *Pueraria thunbergiana* (p. 426). *Phaseolus radiatus* L. var. *typica* (p. 427–Azuki is not mentioned).

Note: The Ryukyu Islands were formerly called the Loochoo Islands. This is an unfinished systematic enumeration with citations, notes, and few descriptions, but without keys. Address: 1. Societatis Linnæanæ, Londeniensis Socius; 2. Dr., in Universitate imperiali Tokyoensi botanices Professor [Tokyo, Japan].

972. Killebrew, Joseph B. 1899. Grasses and forage plants. Knoxville, Tennessee: Printed for University of Tennessee by S.B. Newman & Co. 144 p. See p. 108-11.

• ***Summary:*** The title page reads: "Bulletin of the Agricultural Experiment Station of the University of Tennessee. Vol. XI. 1898. Nos. 2, 3 & 4." Charles W. Dabney is president of the station. The author, Col. J.W. Killebrew, A.M., Ph.D., is "probably the greatest authority in the South

© Copyright Soyinfo Center 2014

upon the culture and uses of grasses and forage plants." The section on soy beans (p. 108-11) is titled "Soy bean–coffee bean–soja bean–(*Glycine hispida*)–(Forage, Ensilage and pasture)."

Note: This is the earliest document seen (Jan. 2011) that contains the term "coffee bean" used to refer to the soy bean in connection with soy coffee.

"This plant has recently been introduced into cultivation in the United States, though it has been known in China and Japan from a remote antiquity. It is one of the crops grown for human food in oriental countries. It yields a large amount of seed while the forage, both green and dry, is capable of sustaining and even fattening domestic animals. Experiments that have been tried in Tennessee in its culture have been fairly successful.

"The soy bean is an annual, belongs to the leguminous family, and is grown for the same purposes as cowpeas and clover. As a soil renovator, as a hay and as ensilage it is nearly the equal in every respect of red clover.

"There are many varieties of the soy bean. The early varieties are thought to be the best to cultivate for seed. The medium early green is the best for hay and this with the medium early black is best for soiling and for ensilage... It will bear moisture well and a case is given by Mr. Robert C. Morris, of Illinois, where soy beans stood three weeks in water during the month of July without any permanent injury."

"The yield of the soy bean is very prolific, running from 25 to 40 bushels per acre and even 100 bushels have been reported under very favorable conditions...

"Probably the best use which can be made of the soy bean in the South is for the fattening of hogs. When so used the labor and expense of harvesting is saved..." There follows a long quotation by Prof. Georgeson of the Kansas [Agric. Exp.] Station on the value of soy beans for pork production.

"The farmers of Tennessee would do well to test the value of this bean practically on all different varieties of soils. It would unquestionably be a valuable addition to the crops of the Cumberland table-land. It would be valuable in the sandy soils of West Tennessee but it would grow with the greatest luxuriance upon the valley lands of East Tennessee and upon the limestone soils of the Central Basin and the clayey lands of the Highland Rim."

Note: Limestone is one of the most useful zoogenic deposits. Also used as a common building stone, it is formed chiefly by the accumulation of organic remains such as shells or coral. A photo (p. 109) shows a stand of soy beans growing near some corn plants (courtesy U.S. Dept. Agric–USDA). Address: A.M., Ph. D., Grass expert, Agric. Exp. Station, Knoxville, Tennessee.

• ***Summary:*** "The Soja Bean has been but recently introduced from Japan into our northern states. It is not a success in the South. Like the Cow Pea it will grow on any soil, and is relished by stock both for its seeds and vines. The hay is inferior to that of the Cow Pea on account of its heavy woody stems and because the leaves readily fall off. Like the Cow Pea also, the roots are small and not much of value as a fertilizer." Address: Univ. of Illinois, Class of 1900.

977. Robertson, R. 1899. Experimental farm for the Maritime Provinces. Report of Superintendent. *Annual Report of the Experimental Farms* (*Ottawa, Canada*). p. 241-61. For the year 1898. See p. 255.
• ***Summary:*** The section titled "Experiments with soja beans" (p. 255) states: "The seed used in these experiments was of a very early variety of soja bean from Japan, sent by the Director. The experiments were planned with the object of finding out the best distance apart for growing this variety of bean, and also its value as a forage crop... The seed was sown 5th June." The best yield, 5 tons 600 pounds, was obtained by sowing the beans in drills 2 feet apart. Distances of 2.5 and 3 feet gave lower yields.

Note 1. This is the earliest document seen (Jan. 2010) concerning soybeans in Nova Scotia province, Canada, or the cultivation of soybeans in Nova Scotia province. This document contains the earliest date seen for soybeans in Nova Scotia province, or the cultivation of soybeans in Nova Scotia province (5 June 1898). The source of these soybeans was Japan.

Note 2. Robertson was the first superintendent of the experimental farm for the maritime provinces, at Nappan, Nova Scotia, serving from 1897-1913. Address: Superintendent, Experimental Farm, Nappan, Nova Scotia, Canada.

978. Saito, Akio. 1899. [Chronology of soybeans in Japan, 1868 to 1899, first half of the Meiji period] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Feb. p. 11-12. [Jap]
• ***Summary:*** 1871 July–A brewing tax (*jôzô-zei*) and patent tax are levied on clear sake (*seishu*), unclear sake (*dakushu*), and shoyu. But in 1875 the two taxes on shoyu are discontinued because shoyu is considered one of the necessities of life.

1873–At about this time a sincere farmer, Itoi Mosuke, of Akita prefecture finds a special type of soybean and names it Itoi-mame. Later the name changes to Ani and they are cultivated all over Akita prefecture.

1873 May–The Japanese government exhibits soybeans at the exposition in Vienna, Austria. And the USA becomes interested in soybeans. Also at this expo, Kikkoman uses glass bottles for their shoyu for the first time.

1875–At about this time, shoyu becomes so popular overseas that a German-made fake shoyu appears.

1877–There are now 40-50 miso shops in Tokyo, centered in Hongo (which comprises the areas of Yotsuya, Fukagawa, Shiba, Shinagawa, Ooi, Oshima, etc.).

1877 Feb.–Dried-frozen tofu (*kôri-dôfu*) is purchased as an army supply for the Seinan no Eki war.

1877 Aug.–The first domestic exposition is held in Japan, at Ueno Park, Tokyo. Kikkoman shoyu wins an award.

1878–The quick method of miso fermentation (*miso no sokujo-ho*) is mentioned in a government report.

1878–The first official government statistics on soybean cultivation in Japan start to be compiled. This year the area is 411,200 hectares and production is 211,700 metric tons [tonnes; yield = 514 kg/ha].

1879–The price of high-quality miso in Tokyo is 4 *sen* per kg. In 1980 the price is 303 yen/kg–or about 7,575 times higher. Note: From now on prices from the Meiji era come from a book titled *History of Lifestyle of the Meiji, Taisho, and Showa periods as seen from prices of the day* (*Nedan no Meiji Taishi Showa Fuzoku Shi*). It is published by the Weekly Asahi (*Shukan Asahi*).

1882–Around this time many small shoyu manufacturers appear and quite a few bad quality shoyu products are on the market. Shoyu loses considerable consumer confidence.

1885–The price of 1 keg (*taru,* 16.2 liters or 9 *sho*) of shoyu at this time is as follows: Highest grade (*jo no jo*) (Kikkoman) 1 yen, 40 sen; Middle upper grade (*jo no chu*) (3 makers including Yamasa) 1 yen 38 sen; Lower upper grade (*jo no ge*) (Kamibishi) 1 yen 25 sen; Upper middle grade (*chu no jo*) (Fujita) 1 yen 25 sen; Lower middle grade (*chu no ge*) (Chigusa) 1 yen 17 sen; Lower grade (*ge*) (Kinka) 80 sen. Yamaguchi Yoshibei of Yamasa Shoyu starts to sell Worcestershire Sauce, called "Mikado Sauce."

1885 May–The government reinstates the tax on shoyu to raise money for the army.

1887–Soybean production in Japan tops 400,000 tonnes (419,700 tons) for the first time.

1890–The Tokyo-Area Shoyu Brewers' and Wholesalers' Union (*Ichifu Rokken Shoyu Jozo-ka Tokyo Tonya Kumiai Rengokai*) forms a cartel for the first time because of a 50% increase in the price of their raw materials.

1891–Mogi Kenzaburo of Kikkoman (1st generation) starts to use a special press (*gendo maki assaku-ki*) invented by Yamazaki Izuko to press the shoyu out of the moromi mash more efficiently and quickly.

1893–In recent years the import of soybeans to Japan has increased rapidly, and this year it reaches 96,000 tonnes. These soybeans are grown mainly in Manchuria. The average price of 2 liters of high-quality shoyu in Tokyo is 10 sen. (In 1982 it is 584 yen, or 5,840 times more than in 1893).

1894–Around this time miso soup is recognized for its value as a protein food. Dr. Sito Nesaku, an agricultural specialist, says that miso is a farm household's milk.

1894–Yabe Kikuji (1868-1936) calls natto "Japanese

© Copyright Soyinfo Center 2014

cheese" and presents the first academic paper on natto bacteria in Japan.

1895–Around this time the number of walking vendors of tofu, natto, and boiled whole soybeans (*ni-mame*) increased, as did the production of dried-frozen tofu (*kori-dofu*). The number of small shoyu makers decreased dramatically as Kikkoman, Yamasa, and Higeta increasingly used advanced industrialized methods. Recipes and methods for making miso pickles (*miso-zuke*) using carrots, daikon, udo, and ginger are given in women's magazines such as *Jokan, Katei Zasshi* and *Jogaku Kogi.*

1896–Around this time the importation of salt starts, as shoyu makers in Noda and Chiba buy 15,000 tons of salt from England.

1897–Soybean imports this year increase to about 140,000 tonnes, which is one-fourth of Japanese consumption. Domestic soybean production is 400,000 tonnes.

1899–Mogi Keizaburo of Kikkoman of Kikkoman (1st generation) starts using a boiler for the first time in the shoyu industry. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

979. Tokyo Plant Seed Co. (Konoyen). 1900. Condensed seed & plant list for 1900. Tokyo, Japan. 7 p. Jan. 1. Illust. 21 cm. [Eng]

• ***Summary:*** In the section on "Seeds" (p. 5-6), "Soya beans" sell for $0.06 per lb. (U.S. gold dollars). The seeds of 43 plants are offered. Only two are less expensive than soya bean: upland rice (all varieties) and Japan buckwheat, each $0.05 per lb.

This catalog is a "Supplement to The Farm Annual for 1900 of the Tokyo Plant Seed Co." The cable address is "Konoyen, Tokyo." Address: No. 2-5 Tameike, Akasaka, Tokyo, Japan.

980. Stoddard, W.H. 1900. Soy or soja beans and cow peas for feeding and fertilizing. *Independent Press* (*Griggsville, Illinois*) 21(9):1, 4. Jan. 3. Paper read at the Farmers' Institute.

• ***Summary:*** W.H. Stoddard, a soybean pioneer in Illinois, argues that the three best crops to restore depleted soil on farms are the legumes clover, cow peas, and "soy or soja beans." Moreover, these can combine with a grain crop as fodder for livestock. "I think the best of this trio of leguminous plants is the soy bean or as it is generally but incorrectly called, the soja bean. This plant is a native of Southeastern Asia, growing wild in Japan, Java and parts of China. In Japan, where the greatest use has been made of it as food for man and beast, there are many varieties, like our corn with us, but only a few have been introduced into this country. Here it is divided into three classes, the Early Dwarf, the Medium Early and the Late Mammoth. Of these three there are white, yellow, green and black seeded varieties, which differ but little in value of composition for feeding... I prefer the yellow as they have proven more productive of seed and the seeds are larger than the other varieties...

"The Late Mammoth grows 3 to 7 feet high, but seldom forms seed north of the Ohio river and only ripens in our southern states. It is worthless here except for hay or green forage for pasture or to plow under for fertilizing. The Early Dwarf has been grown successfully as far north as Wisconsin and Minnesota where corn is a doubtful crop.

"No soil is too poor for it to thrive and grow. It even yields a fair crop on ground too poor to grow clover. Unlike cow peas, which are a failure as a seed crop on rich land, it stands prosperity, and instead of running to vines, it simply increases alike its yield of forage and seed. So far no insect is known to injure the vines while growing. Chinch bugs never touch it. Drouths that burn up clover and cow peas and fire corn, have little effect on it. Rains that make 'little yellow corn' and rot off cow pea vines, do not injure the sojas. If cut for hay or seed and lying on the ground, rains that would utterly ruin clover, corn fodder or cow peas, rarely injures the sojas...

"My sojas with less than half a stand, averaged 10 bushels per acre, while crops, of 25 to 60 bushels are common, average crops, according to soils and seasons, and over 100 bushels per acre have been grown at the south. Grown for forage or hay it yields 5 to 15 tons green and 2 to 5 tons dry. As hay the sojas are ¼ richer feed than clover, 3 times richer than field corn cut green purposely for fodder...

"As a dairy feed they are of the greatest value, giving an additional amount of milk and butter and also adding to the quality of the latter...

"In my own experience I can say I never tried a better feed for calves or brood sows and pigs than the sojas, either green or dry. They fairly go wild over the mature green beans if offered to them when grass is dry and before corn is ready to feed.

How to plant, cultivate, harvest, and thresh the sojas: "Plant about a peck per acre in drills with a corn planter in rows 20 to 30 inches apart... To harvest the Early Dwarf is quite a task, as the seed pods set so low on the stalks and they are so tough and hard when ripe it is impossible to cut them with a machine. It has to be done by hand with corn knives or hatchets. Cut as soon as the pods turn yellow. Catch the tops with one hand, cut and throw into small piles to cure. Dry thoroughly and then thresh or store in a barn; or better, in open shed till ready to thresh or feed. If many are grown, they are best threshed with a common grain separator, removing the concave and putting in a board in its place. Don't use a wind-stacker machine if you can get any other, as they have to run too fast to do good work. If ripe, don't cut with a scythe; it shatters the beans and does not cut low enough. Don't use a hoe, the handle strikes the vines, shatters seeds and the blade digs up clods of dirt to get mixed

© Copyright Soyinfo Center 2014

with the seeds."

The author concludes: "Don't feed like it was corn fodder or hay; remember they are very rich, condensed feed. Try them. Write to the secretary of agriculture, Washington DC, for Farmers' Bulletins Nos. 16, 22 and 58. They are sent free of charge to any address. No. 58 is specially valuable as it is devoted entirely to the topic of soy beans as food for man and beast, the different varieties and how to grow them."

Note 1. This is the earliest document seen (Jan. 1998) that uses the word "separator" or the term "common grain separator" in connection with soybean production. Address: Carlinville, Illinois.

981. Aso, K. 1900. The chemical composition of the spores of *Aspergillus oryzae. Bulletin of the College of Agriculture, Tokyo Imperial University* 4(1):81-96. Feb. [5 ref. Eng]
• ***Summary:*** "Our knowledge of the chemical composition of the spores of fungi is still very scanty, and as regards their ash, no analysis whatever has thus far been made." The spores of *Aspergillus oryzae* "can easily be obtained in any quantity in Japan, as the rice grains covered with the mycelium and the spores of this fungus form an article of commerce under the name of *Tane-Koji* or *Koji-dané.* I have preferred however to collect the spores myself, in order to obtain them in a pure state.

"Aspergillus oryzae plays a great part in several industries in Japan, being used not only in the manufacture of Sake or rice wine, but also in that of Shoyu or Soja-sauce, and of Miso."

Note: This is the earliest English-language document seen (April 2012) that uses the term "Soja- sauce" (or "soja-sauce") to refer to soy sauce.

"This fungus contains powerful enzymes, a diastase, a maltase, invertase and a peptase. Oxydases appear to be present only in traces."

In the section titled "Preparation of samples" (p. 82) the author describes how he prepared and collected the spores: "Tane-kôji was prepared roughly milled rice without mixing any ash [in sake factories the ash of oak leaves is typically mixed with the rice substrate]; and when the rice grains became covered with innumerable spores, they were brought out from the cellar and the spores were separated from the rice grains and the mycelium by tapping on the bottom of the culture boxes (*kôji-buta*) inverted on a sheet of paper." These spores "were then sifted with a very fine silk sieve to remove all impurities... This sample was exposed to air in a balance room for two weeks and kept in a bottle."

Two tables (p. 83) show the organic constituents in 100 parts of air-dry spores, and 100 parts of dry matter. The latter contains 5.151% ash, whose composition is discussed in more detail on pages 93-96. A table (p. 95) shows the ash content and composition of winter wheat, paddy rice (not whitened), oats, soy-bean, rice (not whitened), and spores of Aspergillus. The latter is by far the richest in ash, potash, and phosphoric acid. In conclusion, the author expresses "much thanks to Dr. O. Loew, formerly professor in this college..."

Note: This is the earliest English-language document seen (Jan. 2006) that uses the term "Soja-sauce" (regardless of capitalization) to refer to soy sauce. Address: Nôgakushi, Japan.

982. *New York Times.* 1900. A missionary exhibit: Oriental curios to be seen soon at Museum of Natural History. March 4. p. X8.
• ***Summary:*** It is chiefly an exhibit of curios from Asia, collected by various missionaries. The Japanese department is one of the most complete. "There are specimens of Japanese food supplies, beans of different kinds, rice, dried edible mushrooms grown in an oak grove [probably shiitake],... long, transparent strips of a tempting looking stuff which is labeled 'seaweed'; a bottle of [soy] sauce made of fermented wheat and beans; a cake made of wheat flour and looking much like ordinary bread but with odd black lines running through it [*fu,* or dried wheat gluten cake with nori]; a stick for stirring bean curd [tofu];..."

Note: An almost identical article appeared in this newspaper on June 12, p. 2. It describes the exhibit that this article is announcing.

983. Cottrell, H.M.; Otis, D.H.; Haney, J.G. 1900. A new drought-resisting crop–Soy beans. *Kansas Agricultural Experiment Station, Bulletin* No. 92. p. 19-28. March.
• ***Summary:*** Contents: Introduction. Description of the soy bean. Variety to plant. Planting. Cultivating. Harvesting. Yield. Feeding value: Steers, dairy cows, calves, cattle, hogs and pigs, pasture for hogs, hay. Cost of production. Faults of the soy bean. Fertilizing value ("it improves the soil on which it is grown"). Will it pay for the Kansas former to raise soy beans? Obtaining the seed.

"The Kansas Experiment Station began raising soybeans in 1889 and has raised them every year since–in 1889 having 70 acres in this crop. We have found the soy bean to stand the drought as well as Kaffir-corn or sorghum; it is not touched by chinch-bugs; the grain is a richer feed than linseed meal, and the plant enriches the soil on which it is grown. We believe that in 1900 the soy bean should be tried on a small scale by every Kansas farmer...

"The soy bean was brought [to Kansas] from Japan, where it is extensively cultivated for human food, taking the place of beef on account of its richness in protein. Because of its peculiar flavor but few Americans like it.

"Variety to plant: Kansas farmers should plant the Early Yellow soy bean. The Kansas Experiment Station has tried many other varieties, and the Early Yellow is the only sort that we have found that is satisfactory under Kansas conditions. Other kinds either yield too little or the crop does not mature during our season. In the spring of 1899

© Copyright Soyinfo Center 2014

we issued a press bulletin describing the merits of the soy bean and recommending the farmers to give the crop a trial. The College had no seed for sale and farmers ordered from the seed men, simply writing for soy beans. As long as the supply of Early Yellow soy lasted orders were filled with it, and the crops are reported satisfactory. After this supply was exhausted the seed men filled the orders with the Late Yellow soy, a variety that matures in Georgia and Alabama. Kansas farmers who planted the seed of this late variety report that but a small portion of the crop matured, the rest being killed by frost. Early Yellow soy beans planted May 12, 1899, were harvested August 23; planted after wheat, July 14, 1989, were ripe October 9."

"The beans should be planted in rows 30 to 42 inches apart, with the single beans dropped 1 to 2 inches apart in the rows. One-half bushel of seed per acre is required. The ground should be in good tilth, and the weeds thoroughly killed just before the beans are planted... We cultivate the same as corn, using the two-horse cultivator with small shovels and taking great care not to ridge the ground... Where more than 10 acres of soy beans are grown, it will pay to harvest them with a regular bean harvester... As soon as cut, the beans should be raked into windrows and immediately shocked, and left to cure in the cocks. The thrashing may be done with the ordinary grain thrasher, using all blank concaves, and running the machine slow enough to prevent cracking the beans... Farmers with better ground than ours report a yield of 20 bushels per acre, using our seed."

Five experiments were conducted feeding ground soybeans (14.4% fat) to hogs: "These experiments show that when soy beans are fed with corn or Kafir-corn for fattening hogs a saving was made in the amount of feed needed to make 100 pounds of gain of 13, 24, 31, 33, and 37 per cent., the amount varying in different experiments. Can the Kansas farmer afford to go without the soy bean and lose this saving?" (p. 25). Soy beans also make a pasture that is greatly relished by hogs.

Cost of production (p. 26): When grown on a large scale in Kansas, with ordinary prices for farm labor, it costs about 40 cents a bushel to raise soy beans. "This includes all expenses from preparing the ground for planting to storing the thrashed beans in the bin, but does not include rent.

"During the summer of 1899 we kept an account of the cost of raising soy beans on fields containing a total area of sixty acres. Labor cost $1.25 per day for a man and $2.50 per day for a man and team. The cost per acre was: Preparation of land, $1.35; planting, 30 cents; cultivating, $2; hoeing, 70 cents; harvesting, $1.40; thrashing, $2.57; total, $8.32. The yield of the 60 acres was 932 bushels, making the total cost per bushel nearly 54 cents." Kansas dairymen, hog raisers, and stockmen should all raise soy beans.

"Obtaining the seed: Most seed men sell soy beans, listing them as soy beans, soja beans, or coffee beans. The following farmers report having raised soy beans in large quantities in 1899: Hon. Geo. M. Munger, Eureka, Kansas; A.E. Clark, Pleasant Hill, Kansas; M.L. Dickson, Edgerton, Kansas; Wm. C. Lee, Manhattan, Kansas; H.H. Clothier, Vera, Kansas; D.L. Beale, Montana, Kansas; O.E. Simmers, Abilene, Kansas."

Illustrations (by Hench, p. 20, 22-23) show: Two soy bean pods and two soy beans (full size). A soy bean knife on a cultivator beam. A full-page soy bean plant, with many leaves and pods.

Note 1. This is the earliest document seen (Jan. 1998) that uses the word "harvester" harvester ("a regular bean harvester") or the word "horse" (or "horses"; "the two-horse cultivator") in connection with soybean production.

Note 2. This is the earliest document seen (Sept. 2007) that gives an itemized accounting of the cost of producing soybeans.

Note 3. This is the earliest document seen (July 2013) that mentions the soybean variety Early Yellow. There is good reason to believe that this is simply a new name for the Yellow Soy Bean, the name which had been used at Kansas since 1890. Address: 1. M.S., Agriculturist; 2. M.S., Asst. in Dairying; 3. B.S., Asst. in Field and Feeding Experiments. All: Manhattan, Kansas.

984. *Ohio Agricultural Experiment Station, Press Bulletin.* 1900. The soy bean a substitute for clover. No. 206. April 16. Published at the end (p. 270) of Ohio Agric. Exp. Station Bulletin No. 120 (June 1900).

• ***Summary:*** "The Soy or Soja bean is an upright, stiff-stemmed, branching bean, introduced a few years ago from Japan, which is rapidly coming to the front as a most valuable forage plant. It has been grown for several years by the Ohio Experiment Station with very satisfactory results. Planted in some of our poorest soils, it has produced two to three tons of excellent dry forage or hay per acre, which is eaten with relish by all kinds of stock. As a crop to turn under for green manuring, we do not know its equal.

"As the Soy bean is a warm weather plant it should not be planted before the last of May in Northern Ohio, nor before the middle in the southern part of the state... It should be harvested before frost and cured as hay.

"The Soy bean, like clover, adds nitrogen to the soil, and it is therefore a renovating, instead of an exhausting crop. It is especially suited to take the place of clover in a systematic rotation where the clover has been killed out by severe winters, as is the case at present over a large part of Ohio, or where the spring seeding of clover has failed to catch. The Ohio Experiment Station has used it in such cases with such good results that it feels justified in urging the farmers of the state to give it a careful trial.

"There are several varieties of Soy beans, some of which will mature seed in Ohio, while others will not. As a rule, the latter class are more valuable for forage, as they make larger growth. The beans, however, which are produced at the rate

© Copyright Soyinfo Center 2014

of ten to twenty bushels per acre, are a valuable feeding stuff, as they are quite high in protein, and to some extent take the place of such materials as linseed meal in the ration. The Kansas Experiment Station has fed them to fattening hogs with the result of effecting a large saving in the quantity of food required to make a pound of pork, and others report similar results in feeding them to sheep.

"The Experiment Station has no seed of these beans for distribution, but it may be procured of most of the principal seedsmen." Address: Ohio.

985. Nikitin, A.F. 1900. Bobi soi i poluchayemiye iz nikh produkti v khimiko-dieteticheskom otnoshenii [The soybean and its products from a chemical and dietetic viewpoint]. *Viestnik Obschestvenoi Gigieny, Sudebnoi i Prakticheskoi Meditsiny* (*Bulletin of Public Hygiene, Forensic-, and Applied Medicine*) (*St. Petersburg*) 4(2):453-69. April. English-language summary in Experiment Station Record 13(2):166 (1901). German summary in Zeitschrift fuer Untersuchung der Nahrungs- und Genussmittel 4:39-40 (1901). [46 footnotes. Rus]

• ***Summary:*** An excellent summary of the Russian and foreign literature on soybeans. Nikitin published two of his own original analyses of the chemical composition of soybeans, plus six analyses done by Giljaranski and one by Lipskii. These were black, yellow, and greenish soybeans from Russia, China, and Japan. He published numerous investigations on the nutritional value of soybeans. Lipskii found, in his investigations on the digestibility of soybeans, that in a diet consisting exclusively of mashed soybeans, 19.5% of the nitrogen and 19.2% of the fat remained undigested. The nitrogen loss is also somewhat larger than a diet of mashed peas, which Rubner found to be 17.5% undigested.

I.G. Podoba, a researcher, made Zwieback from soybeans. It consisted of 11.4% water, 24.57% nitrogenous substances, 9.16% fat, 47.09% nitrogen-free extract, 5.10% crude fiber and 4.62% minerals. Podoba gave this Zwieback for 4 consecutive days to five children at 9:00 A.M. They felt full until 2:00 P.M., whereas they usually felt hungry by 12:00 noon.

Tables show the nutritional composition of the following based on various investigations: 1. Soja hispida platycarpa var. melanosperma Harz (black, long; 3 investigations {1879} by E. Wein and Kinch, plus average). 2a. Soja hispida tumida var. pallida Harz (yellow; 25 investigations {1861-1881} by Anderson, Senff, Schwackhöfer & Stua., Zulkowski, Mach, Ulbricht, Wildt, Schröder, Blaskowics, E. Wein, Weiske, Kinch, plus average, p. 456). 2b. Soja hispida tumida var. castanea Harz (brown; 13 investigations {1876-1882} by people mentioned above, plus average, p. 457). 2c. Soja hispida tumida var. atrosperma Harz (black, round; 5 investigations {1872-1882} by Senff, Mach, Wein, Kinch, plus average, p. 457). 3. Analysis of soybeans whose botanical origin is unknown (17 investigations {1877-1886} and average, p. 457-58; Planted soybeans and harvested soybeans by Caplan. Tirol "coffee bean" by Mach. Unknown by Wagner. From China, Hungary {Pressburg}, and Étampes by H. Pellet. Unknown by Carriére. From Japan and India by Kinch. From Japan by Meissl. Three from Japan by Kellner. Two from Japan (Dai-dzu) by unknown. From America by Jenkins). 4. Analyses of soybeans derived from other sources and grouped together (13 analyses, p. 458). Address: USSR.

986. *Washington Post.* 1900. Dinner a la Japanese: A repast that is certainly picturesque and may be digestible. May 20. p. 22.

• ***Summary:*** From the Boston Evening Transcript: "In each course there are half a dozen dishes and the host tells what they are. First suimono, a bean soup [sic, clear soup, often with tofu];... sashimi, raw fish cut into thin slices and covered with ice. This is dipped into rich sauce called soy, and is really very good."

Note 1. This is the earliest document seen (Jan. 2014) concerning soy ingredients used in Japanese-style recipes, food products, or dishes outside Japan.

987. Langworthy, C.F. 1900. Vegetable cheese. *Sanitary Home* (*Fargo, North Dakota*) 2(3):55-57. May.

• ***Summary:*** "It is commonly believed that the Japanese, Chinese, and other oriental peoples live almost exclusively on rice, eating little or no meat... In the course of centuries the Japanese and Chinese have evolved the art of preparing substances resembling dairy products from vegetable sources. It is well known that beans, peas, and other legumes contain large amounts of protein... The soy bean, which is perhaps the principal legume grown in Japan and China, is less suited for food in its natural state."

"Though the soy bean is not relished when cooked in the ordinary way, the Chinese and Japanese prepare very satisfactory foods from it in ways which are unknown to western cooks. Bean cheese or bean curd, called by the Japanese tofu and by the Chinese tao hu, is one of the most important of these products and is prepared as follows: The soy beans are soaked in water for about 12 hours and crushed between mill stones until of a uniform consistency. The ground material is then boiled with about three times its bulk of water for an hour or more and filtered through cloth. The filtrate is white in appearance and has somewhat the appearance of milk. It has the taste and smell of malt. Analysis shows that it resembles cow's milk in composition. When heated a film forms on the surface which in appearance suggests cream. This is dried and eaten under the name of yuba. As soon as the soy bean milk becomes cool, some material is added; for instance, crude sea salt, containing magnesium chlorid [chloride], which precipitates the proteid material, the fat being inclosed in the coagulated mass. The coagulated material is pressed and kneaded into

© Copyright Soyinfo Center 2014

small cakes or cheeses. These are sometimes dipped in saline solutions of curcuma to color them. The bean cheese cakes are sometimes eaten fresh or may be cooked in different ways. Often when practicable they are frozen. This removes a considerable part of the water present. As shown by analysis, the fresh bean cheese contains about 5 per cent of protein and 3 of fat. Ordinary cheese made of milk contains about 28 per cent protein and 36 per cent fat.

"Miso resembles tofu to some extent. It is prepared from cooked soy beans, which are rubbed to a thick paste and fermented with rice wine ferment. Shoyu is a thick sauce prepared from a mixture of cooked pulverized soy beans, roasted and pulverized wheat, wheat flour, salt, and water. The mass is fermented with rice wine ferment in casks for from one to five years being frequently stirred. The resulting product is a moderately thick, brown liquid, in odor and taste, not unlike a good quality of meat extract, though perhaps a trifle more pungent. Throughout the East it is eaten in large quantities with rice and other foods and is an important source of protein. Under the name of soy sauce, it has been known to Europeans in India for many years, and is not unknown in the United States. Most of the soy bean products are fermented; that is, they are prepared with the aid of micro-organisms. The micro-organisms break down the cell walls and similar materials and thus the cell contents are rendered more accessible to the digestive juices at the same time peculiar and pleasant flavors are developed. The manufacture of these products is of very ancient origin and affords an interesting, practical illustration of the use of bacteria for economic purposes.

"The Chinese residents of San Francisco and other cities consume large quantities of these soy bean products and it is stated on good authority that soy bean cheese is manufactured in this country, though doubtless it is seldom, if ever, eaten by any except the Chinese."

Note 1. This periodical was later named *North Dakota Farmer.*

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "bean cheese cakes" to refer to tofu.

Note 3. This is the earliest document seen (June 2011) concerning soybeans in connection with (but not yet in) North Dakota.

Note 4. This is the earliest English-language document seen (Aug. 2013) that contains the term "soy bean milk."

Note 5. Dr. E.F. Ladd was a nationally-known pioneer in food safety and sanitation in the United States. He published this periodical, *Sanitary Home,* in Fargo and distributed it free of charge like an extension publication before the extension service was created; North Dakota State Univ. paid the printing and mailing expenses. Interested in home safety, he rewrote technical publications in a language homemakers could understand. He did much work with North Dakota food purity and chemical purity laws. Address: PhD, Office of Experiment Stations, Dep. of Agriculture, Washington [DC, USA].

988. Kozai, Y. 1900. Chemische und biologische Untersuchungen ueber Sake-Bereitung [Chemical and biological investigations on sake production]. *Zentralblatt fuer Bakteriologie. Series 2.* 6(12):385-405. June 8. [42 ref. Ger]

• ***Summary:*** Contents: Techniques of sake production. The molds of the koji grains: Molds (*A. oryzae,* a white mold, other molds), yeasts. The use of pure-culture yeasts in sake production (2 experiments).

The author reviews the literature concerning the early investigations on *Aspergillus oryzae* and its commercial applications. He gives credit to Hoffman and Korschelt as the first writers upon the subject.

Note: An illustration (frontispiece) facing the title page shows many forms of *Mucor rouxii* from C. Wehmer.

989. Abel, Mary Hinman. 1900. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 32 p. See p. 9-11. Illust. Revised Nov. 1904. Corrected March 1906. [1 ref]

• ***Summary:*** A section titled "Soy Bean (*Glycine hispida*)" (p. 9-11) briefly describes the soybean plant and the rich nutritional composition of its seeds. The first paragraph is quoted from USDA Farmers' Bulletin 58.

Starting with paragraph 2: "This leguminous plant, probably native in China, is the most important legume of China and Japan... In the Orient this bean and the various food products made from it are so largely consumed that it is perhaps the most important food plant next to rice. The soy bean is eaten to a small extent boiled like other beans, but in China and Japan it is elaborated into a variety of products, all of which have a high percentage of protein, and when eaten in connection with the staple food, rice, which is so deficient in that constituent [protein], helps to make a well-balanced dietary. Some one of these products is eaten at perhaps every meal and by rich and poor alike, especially in the interior of these countries, where sea food is not obtainable.

"One of the most important of these preparations is shoyu, and it is the only one that has been introduced to any extent into other countries, where it is known as soy sauce...

"There are also several varieties of bean cheese or similar products made from this legume which are very important foods. These are natto, miso, and tofu. Natto is made from soy beans that have been boiled for several hours until very soft, small portions of the still hot mass being then wrapped securely in bundles of straw and placed in a heated, tightly closed cellar for twenty-four hours. Bacteria, probably from the air or the straw, work in the mass, producing an agreeable change in its taste.

"For tofu, the soy bean, after soaking and crushing, is boiled in considerable water and filtered through cloth.

© Copyright Soyinfo Center 2014

To the resulting milky fluid 2 per cent of concentrated sea brine is added, which, probably by virtue of the calcium and magnesium salts present, precipitates the plant casein, which is then pressed into little snow-white tablets. It is made fresh every day. Tofu is sometimes cooked in peanut oil before it is eaten. In natto and miso the action of minute organisms plays an important part. In tofu there is no such action. The composition of a number of these products is as follows:"

A table (p. 11) shows the nutritional composition of food products made from soy beans, including fresh tofu, natto, white miso, red miso, Swiss miso, and shoyu (2 samples).

An illustration (non-original line drawing, p. 10) shows a soy bean plant with a cluster of 7 pods to its upper left (slightly changed from an original in Carrière 1880, p. 154).

This bulletin also discusses (with an illustration of each): The bean–Broad or Windsor bean (*Vicia faba*). Kidney bean (*Phaseolus vulgaris*). Lima bean (*Phaseolus lunatus*). Scarlet runner (*Phaseolus multiflorus*). Frijole (*Phaseolus spp.*). Cowpea (*Vigna catjang*). Lablab bean (*Dolichos lablab*) and other common varieties. Locust bean (*Ceratonia siliqua*).

The pea–Field pea (*Pisum arvense*). Garden pea (*Pisum sativum*). Chick-pea or gram (*Cicer arietinum*).

The lentil (*Lens esculenta*). The peanut (*Arachis hypogæa*).

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the term "milky fluid" to refer to soymilk.

Note 2. Mary Hinman Able was not an employee of the USDA or of the federal government. She was a pioneer in the fields of nutrition, nutrition education, home economics, and popularizing science for the general public. Between 1904 and 1913 she wrote several farmers bulletins for the USDA. From 1909 to 1915 she was editor of the *Journal of Home Economics*.

990. *Times* (*London*). 1900. Japanese commercial interests in Manchuria. Oct. 5. p. 12, col. 2. [1 ref]

• ***Summary:*** "The Commissioner of Chinese Customs at Niu-chwang [pinyin: Yingkou, formerly Newchwang; Niuchwang, Niuzhang] refers, in his report for the past year, to the important part played by Japan in the recent rapid growth in the foreign trade of Manchuria."

"This growth in trade with Japan may be said to have commenced with the war between Japan and China [1894-1895], which probably opened the eyes of the Japanese to the wealth of Manchuria and the peculiar value of its products to themselves. The Soya bean is consumed in enormous quantities in Japan, the better qualities for food and the inferior ones as manure. In former years the supply was obtained from Korea, but the Manchurian bean is cheaper. Beancake is used as a food for cattle and for manure, and its value in both respects is well known. Japanese shipping at Niu-chwang naturally shows a great increase likewise."

991. *North Otago Times* (*New Zealand*). 1900. The industries of Japan. Oct. 13. p. 2 (Supplement).

• ***Summary:*** "Agriculture is the chief pursuit of the people of Japan, and in the greater part of the cultivated area rice and the principal food crops, wheat, barley, and soya beans, are grown."

"The industries of the Japanese empire may be distinguished as 'original' and 'imported.' The original industries which existed from early times are those of... vegetable wax, salt, sugar, sake, soy [sauce], oil, tobacco, indigo, and raw silk."

992. *Chicago Daily Tribune.* 1900. Simple diet of the Japs. Nov. 25. p. 36.

• ***Summary:*** The "Japanese have an advantage because of their simpler and cheaper diet. The Japanese eat thrice a day, but their food is so simple that foreigners find it difficult to satisfy themselves with it until they try it for two or three weeks, by the end of which time they generally concede its merits over the heavier foods of America and England.

"A Japanese breakfast consists of a tiny cup of tea, followed by a soup which may be made of bean curd, fish, or seaweed, a small piece of boiled fish, a small omelette, and a small cup of hot rice."

"The monotony is so great to a European that there is never any temptation to overeat, and the Japs are not gluttons. Yet this is the diet of the Japanese" against whom the Americans "will soon be pitted for commercial supremacy."

993. Sack, J. 1900. Samenstelling van Indische voedingsmiddelen: Tweede serie (LI-C) [Composition of Indonesian foods: Second series (51-100)]. *Bulletin van het Koloniaal Museum te Haarlem* No. 23. p. 85. Nov. Fold-out table bound at the end of No. 23. [3 ref. Dut]

• ***Summary:*** This is the second such table published in this Bulletin. The first table by J. Sack was published in Bulletin No. 22 (March 1900). Dr. M. Greshoff supervised the work. The composition of fifty Indonesian foods is given, with two lines of notes in one wide column after each. Each food is numbered: 51-100. Soy-related foods are: 56. Black soybeans (*Katjang kadelé itam; zwarte soja*). 76. Tempeh (*Tempé*). 81. Japanese shoyu (*Japansche soja*).

Also discusses: 57. *Katjang poetih* (Poetih [putih] means "white." A note says this is a type of soybean but we think it is a species of *Vigna*). 58. Katjang ketjipir (*Psophocarpus tetragonolobus*). 67. Sesame seeds. 82. Agar-agar. Address: Assistent bij het Laboratorium, van het Koloniaal Museum te Haarlem [Netherlands].

994. *Journal of the Oriental Institute* (*Vladivostok*). 1900-1901. Sovremennaia letopsis' Dal'nego Vostoka [Contemporary chronology of the Far East]. p. 157-58. [Rus]*

© Copyright Soyinfo Center 2014

• ***Summary:*** This chronology was published in installments under a specific grant from the Governor-General of the Amur Region. The entry for 1900-1901 titled "Japanese interests in Manchuria" describes increasing Japanese soybean imports from Niuzhuang, Manchuria, since soybeans from Manchuria are found to be less expensive than those imported from Korea.

995. Bailey, Liberty H. 1900-1903. Cyclopedia of American horticulture. 2nd ed. 4 vols. New York, NY: The Macmillan Co.; London: Macmillan & Co., Ltd. See vol. 1, p. 136-37. Vol. 2, p. 653. Vol. 4, p. 1693. Assisted by Wilhelm Miller, Assoc. Editor.

• ***Summary:*** This classic is illustrated with over 2,000 original engravings, including two of the soy bean. Full-sized illustrations (fig. 191; p. 136) in Volume 1, under "Bean," show the seeds of 6 types of beans, including four seeds of *Glycine hispida* (the soy bean).

Another illustration (fig. 195; p. 137) shows the leaves and pods of the Soy Bean–Glycine hispida (one-third size), and the accompanying text states: "Of greater value [than the Cow-pea] for the same purposes, north of New Jersey, seems to be the Japanese Soy Bean, which is early enough to come to maturity almost anywhere in the United States. Its foliage is rather thin or open, however, which impairs its value for green-manuring. The dry Bean constitutes one of the richest vegetable foods known, and its flavor seems unobjectionable to all kinds of stock. Sow 1 bushel to the acre."

Volume 2, p. 653 notes: "Glycine (Greek for Sweet). Leguminosae. Perhaps 15 or 20 species in tropical Asia, Africa, and Australia, mostly twining vines. The Glycines are allied to Dolichos, Vigna and Phaseolus: The cultivated species are distinguished by small and hairy flowers in short axillary racemes... In this country Glycine is known only in the Soy Bean, G. Hispida, Maxim. (fig. 195; p. 137), which is an erect, hairy annual from Japan and China. It is also known as the Soja Bean, Coffee Bean and Coffee Berry... In China and Japan the seeds are much used for human food, but in this country the plant is grown for forage, having begun to attract attention about 25 years ago. The beans may be used as a substitute for coffee; and for this purpose the plant is often sold. The Soy Bean, in the form in which we know it, seems to be unknown in a wild state. It is probably a domesticated form of Glycine Soja, Sieb. & Zucc., which is wild in Japan. These two species are united by some authors and separated by others (see Franch. & Sav. Fl. Jap. 1:108. Maxim. Bull Acad. St. Petersb. 18:398). For purposes of perspicuity and definition, they may well be kept separate in the books... Glycine was once applied to Wistaria. It is sometimes used for that genus at the present day in foreign lists (L.H.B.)"

Vol. 4, p. 1693 states: "Soy Bean (*Glycine hispida,* which see for botanical description) is a legume, and while it has long been a staple crop in Japan it has but somewhat recently been cultivated in the United States. Figs. 191, 195. It grows to perfection only in a tropical or semitropical climate. In its native country, Japan, the seed is an important human food product, but in the United States its principal use at present is as a forage plant for farm live stock and as a soil renovator...

"To the horticulturist the Soy Bean is valuable chiefly as a soil renovator... When the soil is so hard and forbidding that clover will not thrive the Soy Bean may be made to serve as a nitrogen gatherer, and when plowed under it serves to greatly improve the physical condition of the land. See also *Glycine* (L.A. Clinton)." Address: Prof. of Horticulture, Cornell Univ., New York.

Ned.-Indie inheemsche voedingsmiddelen. De sojaboon [Chemical analysis of some indigenous foodstuffs in the Netherlands Indies. The soybean]. *Geneeskundig Tijdschrift voor Nederlandsch-Indie* 40:247-59. [18 ref. Dut]

• ***Summary:*** Contents: Literature review. Introduction (Boorsma is living in Java). Chemical composition of indigenous soybeans: Table giving figures (based on Boorsma's original research) for large black, large yellow, small yellow, unripe or immature black soybeans, soy protein (*eiwit in de soja*) or legumine, the oil (*De vette olie*), analysis of the ash, starch, the black soybean (*zwarte kedeleh*), use of soybeans in Java and Japan. Japanese soy preparations (*Japansche soja preparaten*)*:* Shoyu (soja) made with koji, tofu, yuba, miso and natto. Indigenous (Chinese) preparations: Tempeh (*tempe kedeleh*), Indonesian soy sauce (*Ketjap–Bataviasche soja*), tofu and pressed tofu (*Tao-hoe en Tao-koan*), Indonesian miso and fermented black soybeans (*Tao-tjo en Tao-dji*).

Note 1. This is the earliest document seen (Jan. 2012) in any language that mentions "Tao-dji."

Note 2. This is the earliest Dutch-language document seen (Jan. 2012) that mentions fermented black soybeans, which it calls *Tao-dji.*

Note 3. This is the 2nd earliest document seen (March 2009) that mentions Indonesian-style miso, which it calls "Tao-tjo." This is the earliest Dutch-language document seen (Feb. 2009) that uses the word "Tao-tjo" to refer to Indonesian-style miso.

The section titled "Japanese soy preparations" (p. 251-53) includes descriptions of koji, tofu, dried frozen tofu (*kori-tofu*), yuba, miso and natto, as follows: Tofu is the Japanese name for a yellow-white to gray mass, which is prepared by macerating the finely ground up soybeans with water; an initial [natural] fermentation, which occurs alongside, creates enough acid to precipitate part of the protein. Then a short heating, causes as much fat as possible to bind to the protein, so that the liquid after filtration has a milky appearance. Through the addition of the highly alkaline magnesium concentrate, a by-product of making sea salt, the protein is precipitated, separated out by hand and shaped into cakes–which contain lots of water, protein and fat. As a side dish or in the preparation of soup, tofu is used a lot. To remove most of the water, it is common to freeze and dry the cakes in the sun afterward. Then they are called kori-tofu.

Note. This is the earliest Dutch-language document seen (April 2013) that mentions dried frozen tofu, which it calls kori-dofu.

Yuba is an even fattier product obtained by the evaporation of the cream layer, that aggregates on the surface of the just mentioned bean milk.

In Japan, most soybeans are processed into cheese types, called miso and natto [which the author confuses in the following].

The cooked beans, that have been formed into a firm dough are fermented again with koji, kitchen salt and water. The temperature and the amount of kitchen salt, that one uses, affect the nature of the product [miso] and the speed of fermentation. Finally the mass is cooked for a long time in the brine, separated and shaped into cakes. The resulting vegetable cheese [natto] is then wrapped in bundles, of about 500 grams, of straw, and left to its own for a few days in a heated space; where, according to Loew [sic, Yabe 1895, p. 438-39] the microbes attached to the straw cause an additional post-fermentation.

The reason for the somewhat extensive attention [in this writing] to the latter, is that the native soybean (katjang kedeleh) preparations of the Dutch East Indies are, more or less, patterned after the Japanese.

This excellent article contains a 4½-page description (the best seen to date, p. 253-58) of the traditional process for making soybean tempeh (*Tempe kedeleh*). The soybeans are parboiled, soaked in water for 2-3 days, drained, steamed in a steamer (*koekesan*), spread in a layer several centimeters thick on woven bamboo trays in shelves, and covered completely with banana leaves. They are then inoculated with the *bijang,* which is the "mold containing residues of a previous preparation." This is mixed in here and there, then the trays are covered lightly with banana leaves so as to let in some air. "Rampant growth of the mold soon begins. In the evening the mass is molded a little and after two 24-hour periods one will obtain a coherent cake, which is cut into pieces and taken as is to the market."

The cotyledons are stuck together by a dense mycelium, which has grown into a somewhat white covering. According to Prinsen Geerligs (cited above), the name of the mold is *Chlamydomucor Oryzae.*

During the two days of rampant mold growth, a radical conversion takes place in the components of the seeds; a lot of water, carbonic acid, and heat start to develop... A thermometer inserted into the fermenting mass shows a temperature 10-12ºC above that of the environment.

As the preparation is finished, the banana leaves are taken away; the temperature drops slowly to normal, the rampant mold growth stops, and the mass dries out slightly. In this condition, the tempeh can be kept for several days without spoiling.

When the rampant mold growth is allowed to continue for a third day, simply by leaving the banana leaves in place, the conversion will soon become much stronger as noted by the formation of ammonia. Also poisonous products start to form; a monkey, given a little bit [of overripe tempeh] among his other foods that day was vomiting violently one hour later. Thus we should admit that the stories about poisonings caused by various sorts of tempeh [such bongkrek, made from coconut presscake] probably have some foundation. But there is little fear of this from soybean tempeh.

After microscopic examination, Boorsma concluded that

© Copyright Soyinfo Center 2014

Prinsen Geerligs and others were wrong in stating that (1) the mold hyphae penetrate and dissolve the hard soybean cell walls, and (2) cellulose is decreased during tempeh (*tempe*) fermentation. He studied the chemical and compositional changes at four stages during a 3-day tempeh fermentation; a table shows his findings. He observed that fats and soluble carbohydrates decreased substantially, while nitrogen decreased only slightly. He also discussed the hydrolysis of soybean lipids, and why tempeh is easier to digest than whole soybeans.

Note 4. This is the earliest Dutch-language document seen (Sept. 2011) that uses the term *tempe kedele* or the word *tempe* to refer to tempeh.

Note 5. This is the earliest document seen (Jan. 2012) that describes how to make tempeh on a commercial scale.

On page 258 Boorsma briefly discusses Ketjap (which he called *Bataviasche soja,* or Jakarta soy sauce) and Tao-hoe and Tao-koan (tofu and firm tofu), based on information from Prinsen-Geerlings (for both) and Vorderman (for firm tofu). For each he gives a nutritional composition. On page 259 Boorsma briefly discusses *Tao tjo* and *Tao-dji* (Indonesian-style miso and fermented black soybeans). Note 6. This is the earliest Dutch-language document seen (Dec. 1999) that uses the term *Tao tjo* to refer to Indonesian-style miso or tauco / taucho.

Note 7. This is the earliest document seen (April 2001) that contains the term *Tao-koan.*

Note 8. This is the earliest Dutch-language document seen (Jan. 2012) that contains the word *natto.*

Note 9. This is the earliest Dutch-language document seen (Oct. 2012) that mentions yuba, which it calls *Yuba* and describes as *een nog vetrijker product dat verkregen wordt bij uitdampen van de roomloog, die zich bij de zooeven genoende boonenmelk aan de oppervlatke verzamelt."*

Note 10. Boorsma was a Dutch naturalist who lived in Indonesia in the early 1900s. Address: Netherlands.

researcher, he burrowed into all the records he could find of the early Spanish and French voyages, and laid before Queen Elizabeth a one-man encyclopedia of the wonders of America. It was, he assured everyone, a land "of huge and unknown greatness," though he himself had never been west of Bristol, England. In short, he helped to paint a picture of America as a land veined with gold and blazing with precious stones–the English version of the Spanish El Dorado.

An illustration (frontispiece) facing the title page shows the Shogun Ieyasu, seated in flowing robes. Address: Sir, K.C.M.G. [Knight Commander of (the Order of) St. Michael and St. George, Her Majesty's Envoy Extraordinary and Minister Plenipotentiary to Japan [England].

1002. VanBuskirk, J.D. 1900. Some common Korean foods. *Transactions of the Korea Branch of the Royal Asiatic Society* 14:1-8.

• ***Summary:*** Table 1, "Korean food products," based on statistics published in the 1917 report by the Bureau of Agriculture of the Government General, shows Korean production in millions of bushels: Rice 61. Barley 25. Millet 19. Wheat 8. Beans and peas 18. Since exports and imports of foodstuffs are relatively small compared to the amount produced, and the number of animals fed is not large, "these figures should give us a good idea of the amount of food eaten."

Rice is sometimes cooked with peas or beans (incl. soy beans) mixed in (called *pat-pap* or *kong-pap*). But the cooking takes longer and the beans are often not well cooked, and thus less digestible (p. 3).

The section titled "Bean and pea foods" (p. 4-5) gives the name of each food in Korean characters and discusses: (1) Bean curd (*tu-bu*), equivalent to Japanese tofu, is curded with the "concentrated mother liquid from sea water" [Jap. nigari]. The bean residue [okara] (*pi-ch'i*) left over from making tofu is also sometimes eaten. Bean curd "is not generally eaten without further preparation; it is commonly added to soups and stews and often made into omelets with eggs; another palatable food is made by cooking the bean curd for a short time in bean sauce (*chang*) and serving this with sesame oil, pepper and onions; it is called *to-bu cho-rim.* Bean curd may be eaten without further cooking served in sauce."

Note 1. This is the earliest English-language document seen (April 2013) that uses the term *tu-bu* to refer to Korean tofu.

Pea curd (*mook*) is similar to beancurd in composition but made from peas using a very different process.

"Bean Sauce (*kan-chang*) is somewhat like the Japanese 'sho-yu' but is more salt and not sweetened. Soy beans are thoroughly boiled, mashed, made into cakes and partially dried. These cakes (*me-ju*) are stored for months and allowed to mold and slowly ferment: when ripe they are broken up and soaked in salt water for a long time, then strained, the solid part being dried and used as a condiment (*toin-chang*). The liquid is boiled and the coagulated protein scum frequently removed; when sufficiently concentrated the liquid sauce is cooled and stored. This is the indispensable condiment for Koreans.

Note 2. This is the earliest English-language document seen (April 2012) that uses the term *kan-chang* to refer to Korean soy sauce.

"Another bean sauce (*ko-cho-chang*) is made by taking about equal parts of the fermented bean cakes, rice, and salt, with a large amount of red pepper, the mixture being soaked in a small amount of water till ripe. This too is very important as a condiment."

Note 3. This is the earliest document seen (March 2009) that clearly mentions a Korean-style miso, which it calls "ko-cho-chang,"–today commonly called "red pepper sauce."

"'Kong-cha-ban' is made by boiling beans in the bean sauce; they do not swell but are hard, brittle, and very salty. Sugar and sesame oil may be added when serving them.

"Sprouted beans (*kong-na-mul*) are very common. The beans are soaked in water and allowed to sprout. When the sprouts are quite long both beans and sprouts are boiled and served–sauce is generally added."

Kim-chi, a fermented food made from cabbage or sliced turnips, is sometimes served with added bean sauce.

Among animal foods: "'Mut-chim' is dried fish soaked in water, then shredded; it is then soaked in bean sauce. Sesame oil and pepper are added; it is then allowed to stand for a shot time." Address: M.D.

• ***Summary:*** In the section titled "Some valuable importations" (p. 30) has a subsection on "Grasses and forage plants" which states: "Superior varieties of soy beans have been brought from Japan."

A section titled "Experimental Farm at Arlington" [Virginia] (p. 75) is identical in content to that in the Yearbook of 1900. Address: Secretary of Agriculture, Washington, DC.

1004. Zavitz, C.A. 1900. Report of the experimentalist. *Ontario Agricultural College and Experimental Farm* (*Guelph*), *Annual Report* 25:101-29. For the year 1899. See p. 121-22.

• ***Summary:*** The section titled "Soy, Japanese beans" (p. 121-22) begins: "The Soy beans, which are also called Soja beans, have been grown for a great length of time in Japan and in South-eastern Asia... About eighteen years ago Prof. Georgeson, then connected with the Agricultural College in the State of Kansas, imported from Japan fifteen varieties of the Soy beans, with which he conducted practical

© Copyright Soyinfo Center 2014

experiments on the Experiment Station grounds and found that five of the varieties gave good results. These five varieties were imported from Kansas some seven years ago [i.e. in about 1892] for growing in our experimental plots. The Yellow Soy bean has given decidedly the best results among the five varieties which we obtained from Kansas. A few years ago, the Agricultural College of Massachusetts also imported a number of varieties of the Soy beans from Japan, and three of these have now been tested in our experimental grounds here at the College.

"The *Yellow Soy* bean which was imported from Kansas has given an average of eight tons of green crop per acre, being two and one-quarter tons per acre more than that produced from the common beans, and three and one-quarter tons per acre more than that produced from the horse beans. In each of the past three years the *Medium Green* Soy bean has given the largest yield of green crop per acre among the three varieties imported from Massachusetts, but each of these years the Yellow Soy variety has given better satisfaction than the Medium Green in yield of crop per acre, although the results in 1898 were practically equal. We hope to grow these two varieties in larger lots, in order that we can compare them thoroughly in regard to their qualities for green fodder and for hay.

"In the production of grain the Yellow Soy variety has produced the greatest yield of each of the tests made at the College. Of the different varieties tested during the past three years, the Extra Early Dwarf is the earliest, the Yellow Soy the second earliest, the American Coffee Berry the third earliest, and the Medium Green is the latest to reach maturity. In many of the localities in Ontario the Medium Green variety of Soy beans would be too slow in maturing to produce seed.

"In the spring of 1899 three varieties were sent out over Ontario in connection with the co-operative work, to find out how these varieties would succeed over the Province. The varieties distributed were the Medium Green Soy beans, American Coffee Berry and the Extra Early Dwarf Soy beans. The Medium Green and the American Coffee Berry gave upwards of twenty bushels of seed per acre, and the Extra Early Dwarf an average of about thirteen bushels per acre. The Yellow Soy bean was not included in the experiment, as the seed of that variety was not available at the time. Arrangements have been made, however, to secure seed of this variety from the Kansas Experiment Station, for 1900. We feel justified in making somewhat extensive experiments with the Soy beans on account of the strong claims made for these beans in a few places where they have been grown. The following is taken from the bulletin issued by the United States Department of Agriculture on the Soy bean as a forage crop:"

"The Experiment Station at Kansas is growing the Soy beans very extensively; they had no less than sixty acres in Soy beans this year."

"We understand that at least five complex food products are prepared from the Soy beans in Japan, although the beans are seldom used alone as a vegetable. They are also frequently dried and roasted, and used as a substitute for coffee."

Note 1. This is the earliest document seen (June 2005) concerning co-operative research on soy beans (one of two documents). This research was initiated and organized in 1899 by C.A. Zavitz of Ontario Agricultural College in Canada; he also recorded and compiled the results.

Note 2. This is the earliest English-language document seen (June 2005) that uses the word "co-operative" (or "co-operatives" or "co-op" or "co-ops" spelled with a hyphen) in connection with soy beans. Address: B.S.A., Experimentalist, Ontario Agricultural College [Guelph, Ontario, Canada].

1005. Zavitz, C.A. 1900. Co-operative experiments in agriculture. *Ontario Agricultural and Experimental Union, Annual Report* 21:6-37. For the year 1899. See p. 9, 16, 31-32.

• ***Summary:*** A table (p. 7) shows the number of distinct experiments in agriculture, number of experimenters, and number of satisfactory reports each year for 1886, 1888, and 1891-99. For 1886 these numbers were 1, 12, and 8. For 1888 they were 1, 90, and 40. For 1891 they were 12, 203, and 126. For 1895 they were 15, 1699, and 513. For 1899 they were 23, 3485, and 739. Thus, during these 14 years the Union made remarkable progress.

A table titled "List of experiments for 1899" (p. 9), under "Grain crops" includes "Testing three varieties of Japanese beans–3 plots."

In a long "List of experimenters" we read (p. 16) that the Japanese beans were grown by: (1) F.B. Doud, Branchton, Brant Co. (2) Simon Miller, Unionville, York Co. (3) Jno. D. Neilson, Thedford, Lambton Co. (4) O.A.C., Guelph, Wellington Co.

In the section titled "Conclusions" (p. 31-32), table 15 shows the results (based on 4 tests) of testing three leading varieties of Japan [soy] beans: Medium Green (estimated value 72), yielded 2.6 tons/acre of straw and 22.4 bu/acre of grain. American Coffee Berry (estimated value 100), 1.4 tons/acre of straw and 21.3 bu/acre of grain. Extra Early Dwarf (estimated value 86), 1.1 tons/acre of straw and 12.7 bu/acre of grain.

The text immediately below the table explains: "The Soy beans [sic] (Glycine hispida) is a leguminous plant native of Japan and China, and ranks very high from a chemical point of view. The plant is an annual, erect in growth and branches profusely. There are a large number of varieties, nearly all of which are too late for the conditions of Ontario. The different varieties are distinguished largely by the time required for the plants to mature and by the color of the seed; the yellow, the green, and the black, being the most common. The Soy beans are used for green fodder, silage, hay, pasture, and

© Copyright Soyinfo Center 2014

as a soil renovator, and the grain is used as a feed for live stock. These beans have been used as a food for man from the earliest times in Japan and China, and more recently in the European countries. They are not used as a food by themselves, but are made into different complex forms, of which five are quite common among Japanese, namely: natto, tofu, miso, yuba, shoyu.

"Conclusions.

"1. The Soy beans gave very good results in the Union experiments in 1899.

"2. The medium green Soy beans which gave the largest yield of grain per acre of the three varieties tested over Ontario in 1899, is the latest of the three varieties.

"3. The American Coffee Berry was the most popular variety with the experimenters when yield, time of maturity, etc., were all taken into consideration."

Note 1. This is the earliest report seen (Aug. 2002) in this periodical concerning soy beans. C.A. Zavitz is also secretary of the Ontario Agricultural and Experimental Union, and a member of its Committee on Agriculture (appointed at the last annual meeting).

Note 2. This is the earliest document seen (Jan. 2012) that mentions natto in Canada. Address: B.S.A., Director of Co-operative Experiments in Agriculture, O.A.C. [Ontario Agricultural College], Guelph [Ontario, Canada].

1006. Nikitin, A. 1901. Die Sojabohne und ihre Produkte in chemisch-diaetetischer Beziehung [The soybean and its products from a chemical and dietetic viewpoint (Abstract)]. *Zeitschrift fuer Untersuchung der Nahrungs- und Genussmittel* 4(1):39-40. Jan. 1. [2 ref. Ger]

• ***Summary:*** A German-language summary of the following original Russian-language article: Nikitin, A.F. 1900. "Bobi soi i poluchayemiye iz nikh produkti v khimiko-dieteticheskom otnoshenii [The soybean and its products from a chemical and dietetic viewpoint]." *Vestnik Obschestvennoi Gigieny Sudebnoi i Prakticheskoi Meditsiny* (*Bulletin of Public Hygiene of Forensic and Applied Medicine*) (St. Petersburg) 4(2):453-69. April.

A table shows analyses of different types of soybeans. Two are by the author himself, conducted on black soybeans from southern Russia; six are by Giljaranski on a yellow soybean from Russia, and yellow and black soybeans from China and Japan; and one is by Lipski [Lipskii] on a yellow soybean from Russia. He notes that cultivation of soybeans has lapsed since it was not understood how to use them as food, but only as fodder.

Very few investigations have been conducted on the nutritional value of the soybean. Lipski, in his investigations on the digestibility of soybeans, found in the case of an exclusive diet of soybean paste (*Sojabohnenbreikost;* probably made from cooked, ground soybeans) that 19.5% of the nitrogen and 19.2% of the fat remain undigested. I.G. Podoba, a researcher, made zwieback from soybeans; it contained 11.43% water, 24.57% nitrogenous substances, 9.16% fat, 47.09% nitrogen-free extract, 5.10% crude fiber, and 4.62% minerals. Podoba fed this zwieback to 5 children on 4 days for at morning tea-time. They remained satisfied until 2:00 P.M., whereas they were usually hungry by 12:00 noon. Address: Russia.

1007. Wilson, James. 1901. Report of the Secretary. *Yearbook of the U.S. Department of Agriculture.* p. 9-78. For the year 1900. See p. 32, 72, 77.

• ***Summary:*** The frontispiece is a portrait photo of William Saunders (1822-1900). / In the section titled "Some valuable importations" (p. 32) is a subsection on "Grasses and forage plants" which states: "Superior varieties of soy beans have been brought from Japan."

A section titled "The Library" (p. 72) is quite detailed: "Growth of the library–Additions to the Library during the past year have numbered about 5,000 volumes. A larger proportion of the additions has come by way of exchange than ever before, owing to arrangements for exchange made by the Librarian as a result of a personal visit to various points in Europe. These arrangements have a salutary effect in bringing to the attention of scientific bodies in other countries the numerous valuable, scientific publications of the Department, adding prestige to the Department as a whole and to its scientific workers in particular.

"Card index–Cards have been issued containing entries of all articles in the Yearbooks and Farmers' Bulletins issued by the Department; these have been printed and distributed to nearly 4,000 libraries, thus assisting in the efforts to make these publications more available to readers."

"Card catalogue–The additions to the card catalogue have been so great that it is probable that it will be in shape to be printed within a year or two. Such a catalogue, if printed, would be of the greatest use to workers in agricultural experimentation wherever located."

The section titled "Experimental Farm at Arlington" (p. 77) notes: "Congress at its last session authorized this Department to take charge of part of the Arlington grounds lying east of the Georgetown and Alexandria road. These grounds are susceptible of being made productive and very attractive, but at the present time require grubbing, draining, surfacing, and fertilizing. This work is being vigorously pushed; drain tile will be laid during the coming year; $10,000 should be appropriated to carry on the work." Address: Secretary of Agriculture [USDA], Washington, DC.

1011. Cottrell, H.M.; Otis, D.H.; Haney, J.G. 1901. Soy beans in Kansas in 1900. *Kansas Agricultural Experiment Station, Bulletin* No. 100. p. 55-115. March. (Issued April 1901).
• ***Summary:*** This is an extremely detailed report, remarkable for soy beans in the year 1900. It is composed mainly of county by county reports by farmers of planting tests made during the year, and yields of forage and/or seed. The first general trials of soy beans throughout the state of Kansas were made in the summer of 1900.

One table (p. 58) shows the "Yield per acre on the college farm" of soy beans, corn and kaffir corn from 1889 to 1900, inclusive. The average soybean yield over these 12 years was 12 bushels/acre, the top yield was 17.0 bu/acre in 1889, and the lowest was 2.6 bu/acre in 1894.

A second table, titled "Varieties of soy beans" (p. 59), shows the varieties tested, the source of the seed (many seedsmen), the yield of beans per acre, the yield of hay per acre, and the days from planting to maturity. The varieties with their yields in bushels per acre (sorted in descending order of seed yield) are: Early Yellow, from Kansas State Agricultural College (7.4 bu/acre), Early Soy, from Peter Henderson & Co. (New York) and Johnson & Stokes (Philadelphia, Pennsylvania) (6.5 and 6.2), Dwarf Soy, from George W. Hilliard (Brighton, Illinois) (6.4), American Coffee, from J.J.H. Gregory (Marblehead, Massachusetts) (5.5), Medium Early Black, from J.J.H. Gregory (3.0), Extra Early Dwarf, from J.J.H. Gregory (2.7), Late Soy, from Johnson & Stokes (* = did not mature), Medium Soy, from Hilliard (*), Chastain Soy, from E.N. Chastain (Hume, Missouri) (NS = no stand), Nalrade, from Japan (Days from planting to maturity: 166), Asahi, from Japan (Days to maturity: 166), Tamarat Sukun, from Japan (Days to maturity: 151), Soy bean 4912, from USDA, from Japan (Days to maturity: 128), Best White 4913, from USDA, from Japan (Days to maturity: 128), and Best Green 4914, from USDA, from Japan (Days to maturity: 166). Early Yellow also gave the best yield of hay (1.4 tons/acre).

A map (p. 60) shows where soy beans were grown in Kansas in 1900; they were grown in at least one location in 75 of the of the 105 counties of the state. These locations are concentrated in the eastern one-third of the state, and especially in the northeast.

The report concludes by stating that "a majority of the 292 who reported growing soy beans in 1900 think them a profitable crop, and this with a new crop, in an unfavorable season."

Most farmers who tested soy beans responded to most of the following questions (their letters were condensed to 5-15 lines typeset): Have you grown soybeans before; if so, starting when? Type of soil in which this year's crop of soy beans was planted? Method and date of planting. Spacing between rows, and of plants within each row. Method and frequency of cultivation. Method of harvesting (one of the biggest problems). Pests you noticed (rabbits–often jack-rabbits–and grasshoppers were reported by many; only a few reports mentioned injury from other insects, and none from diseases). Yield of beans (most farmers got less than 15 bushels/acre; the highest yield was 31 bu/acre). Results of feeding beans or plants to livestock (almost every feeding trial was highly favorable; hogs, milch cows, and sheep generally thrived on them). Degree of satisfaction with the crop and its profitability. Do you plan to try soy beans again next year? Many farmers reported that the beans withstood drought very well. No mention was made in the Bulletin of any farmer having tried the soy bean as food.

H.C. Whitford, of Garnett, in Anderson County: "Tried to cut with mower, but this broke the clods and we had to resort to hand pulling. Got badly injured in the shock. [Presumably the soy beans, not Whitford.] I thought them worthless and fed them to hogs; the hogs were very fond of them." William Matthias, of Huron, in Atchison County: "Pigs and poultry got a taste of the ripe beans, and they made desperate raids on the field."

Joseph Shaw, of Strong, in Chase County: "Pigs were crazy for them, and ate stalks and all." John German, of Hiattville, in Bourbon County, said *his* hogs wouldn't touch the beans, although his calves and yearlings would. C.O. McLane, another Bourbon County man, from Uniontown, said concurringly that calves and also colts would climb

© Copyright Soyinfo Center 2014

low fences to get at some sorghum he had liberally laced with soybeans. Many respondents grumpily observed that soybeans were relished by rabbits.

Concerning soybean pioneers: H.J. Gifford of Haviland, in Edwards country: "I have planted the Little Yellow soy bean on a small scale for the past seven years [since about 1894]–principally as a coffee substitute." Gustave Koehler of Troy, Doniphan County: "I have raised the soy bean for years, and find it not a paying crop." Carl L. Howe of Emporia, in Lyon County: "Have raised soy beans for four or five seasons..."

Full-page photos show: 1. Early Yellow soy bean (p. 83). Brooks early soy bean (Henderson; p. 85). Early Yellow soy beans in the field (p. 87). Sixteen acres of Early Yellow soy beans (p. 89).

An excellent summary (p. 111-15) is given of these tests by Kansas farmers. The Early Yellow variety gave the best results. 135 farmers (46%) stated that soy bean is a profitable crop, 68 had a favorable opinion but needed further trial, 33 gave an unfavorable report, and 30 found the crop to be a total failure. The others did not express their opinion. "The season was the most unfavorable for growing soy beans but one that we have had in twelve years." Another major reason for low yields was probably the failure to inoculate the soy beans with nitrogen-forming bacteria before planting. Inoculated soil was first sent to 25 farmers in the spring of 1900; roughly 1,000 to 1,200 lb of inoculated soil are required per acre. "Soy beans have been grown on the College farm for twelve years... On Kansas farms where there is a sufficient supply of alfalfa for all the stock, we do not think it will usually pay to grow soy beans. Alfalfa supplies protein and mineral matter at a less cost than soy beans."

Note 1. This is earliest English-language document seen (June 2004) that uses the term "pest" or "pests" in connection with soybeans.

Note 2. This is the earliest document seen (July 2013) that mentions the soybean varieties Tamarat Sukun, Nalrade, Asahi, or Best Green.

Note 3. This is the earliest document seen (Dec. 2005) that contains a map directly related to soybeans. Address: Manhattan.

1014. Phelps, C.S. 1901. The soy bean as a forage and seed crop. *Connecticut* (*Storrs*) *Agricultural Experiment Station, Bulletin* No. 22. 20 p. April.
• ***Summary:*** Contents: Introduction. Varieties. Uses of the crop. The soy bean as a forage crop: As a soiling crop, as a silage crop, soy bean fodder compared with corn fodder [from "Indian corn"], proportions of nutrients in soy bean fodder, digestibility of the nutrients of soy bean fodder, comparison of the amounts of digestible nutrients in soy bean and corn fodders. The soy bean as a seed crop: Introduction, proportions of total and digestible nutrients in soy bean seed, feeding value of soy bean meal. Culture of the soy bean: Soil and fertilizers, seeding and cultivating, harvesting (use as a soiling crop for milch cows, growing for silage, growing for seed), methods of introducing the nitrogen gathering germs, experiments on inoculating soy beans to produce root nodules. Summary and deductions.

"The soy bean is a legume... It is a native of southern or eastern Asia, and has been cultivated in China and Japan from very early times. In those countries it is cultivated principally for its seed, which is used as food for man... In this country it has been grown for many years, chiefly in the South; but only within fifteen years has it received much attention as a forage or grain crop in other parts of the country... The Storrs Station began studies on the soy bean in 1890, and has cultivated the crop and continued its studies each year since then" (p. 3).

"Several varieties of the soy bean are grown in this country. They are distinguished chiefly by the color of the seeds and the time of reaching maturity. The most valuable varieties grown in recent years were imported from Japan, and were brought to the attention of the farmers in this country by the Hatch Experiment Station of Amherst, Massachusetts. The three leading varieties are the *early white,* the *medium early green* and the *medium black.* The first named produces a small plant and a rather light growth of seed. It is better adapted than the other varieties to rather poor soils, and is valuable mainly for its seed, as it produces a small amount of forage. The medium early green is

© Copyright Soyinfo Center 2014

valuable either as a forage crop or for its seed. It produces a heavy growth of leafy fodder, and will generally mature a large amount of seed before frost. The medium black is a large, leafy plant much like the medium early green, except that it does not produce quite as heavy yields of fodder and requires a little longer season in which to mature its seed" (p. 3-4).

Seed crop: "During the past ten years the soy bean has been quite generally recommended in this country as a valuable crop to grow for seed to be ground into meal... The Hatch Station at Amherst, Massachusetts, reports yields of 25 to 40 bushels per acre..." (p. 12).

Harvesting: "When grown for seed the crop should remain standing until the seeds are well matured. By this time most of the leaves will have dropped. The plant should then be pulled or cut and placed in small stooks [shocks]. As soon as dry the crop should be hauled and stored in a dry place. If left in the field after the pods become dry the seeds are liable to scatter [shatter] badly by the snapping open of the pods and considerable waste will result in case the weather is dry" (p. 15).

"Methods of introducing nitrogen gathering germs" (p. 15-17). It is well known that plants belonging to the legume group "are able to acquire nitrogen from the air. This nitrogen is taken into the plants through the agency of bacteria that live in the little wart-like bunches on the roots, known as root tubercles or nodules. The nodules are the home of the bacteria, and several distinct species or kinds of bacteria are found on the roots of different kinds of plants. It seems to be well proven that where the nodules are not found on the roots the plant does not acquire atmospheric nitrogen, except possibly in very small amounts. The proper species of bacteria for the inoculation of most of our common legumes are found in nearly all soils." "The introduction of the germs may be brought about in any of three ways: first, the spores of the bacteria may be carried to and introduced into the new soil with the seed; second, the spores may be introduced by mixing with the soil of the new field a small amount of soil from a field where the beans have been grown and have produced nodules; third, the spores may be introduced by gathering the dust and dirt that falls from the roots of the soy beans when threshed, and applying it in the soil when the beans are planted."

"Experiments on inoculating soy beans to produce root nodules" (p. 17-19). "The Station began to grow soy beans in 1890 and has grown them each year since; but for the first three years no nodules were found on the roots. During this time the yields were light, unless the crop was heavily fertilized, and the foliage was pale yellow in color. In 1893, seed of the early white variety was obtained form the Hatch Station, of Amherst, Mass., and, at the same time, some soil from a field where soy beans had been grown by that Station and where the nodules were abundant the year before. This soil was obtained for the purpose of introducing nitrogen gathering germs. Six hundred pounds were scattered over about one-tenth of an acre at time of planting." By mid-summer, the soy beans on the larger field, over which the special soil had been scattered, had their roots covered with nodules; no nodules were found on the soy beans in field to which no imported soil had been added. "The plants upon which no nodules were found were pale yellow in color and produced a light growth of seed. The plants [with nodules] on the larger field made a vigorous growth and seeded heavily."

"The results of this test seem to indicate that the presence of the nitrogen gathering bacteria, as indicated by the abundance of nodules, increased the percentage of nitrogen and of protein in the seed. This experiment would seem to show that the presence of the nodules is not only accompanied by an increase in the amount of the crop, but, in this case at least, by an increase in the proportion of protein as well. The only other experiment similar to this that has come to our attention was made by D.H. Otis, and reported by the Kansas Station in Bulletin 96. In this experiment, however, the ripe seeds were discarded and only the stems and leaves were analyzed."

A table (p. 18) shows that the soybean seeds from plants having abundant nodules on the roots contained about 10% more nitrogen and protein (on a water-free basis) than seeds from the plants with few or no nodules (p. 17-19).

Other tables show: (1) Soy bean fodder: Yields per acre with different types of fertilizers, 1895-1899. (2) Proportions of total and digestible nutrients in the fresh (green) substance of soy bean fodder, corn fodder, and corn silage. (3) Proportions of the total nutrients that are digestible in soy beans compared with those of other feeding stuffs. (4) Experiments with soy bean and corn grown for fodder. Estimated amounts of digestible nutrients per acre. (5) Composition of soy bean seed compared with that of other grain feeds (incl. Chicago Gluten meal). (6) Effect of nitrogen gathering bacteria on the percentage of nitrogen and protein in the seed. Address: Vice-Director of the Station and Agriculturist, Mansfield (P.O. Storrs), Tolland County, Storrs, Connecticut.

1017. Thavis, L. William. 1901. Farm work in Alaska: Progress of agricultural experiments there. A Kansan is in charge. Prof. Georgeson, formerly of the Manhattan Agricultural College, talks of the possibilities of raising things to eat in North. *Kansas Semi-Weekly Capital* (*Topeka*). Dec. 20. p. 6.

• ***Summary:*** This article begins: "Special Correspondence of the Capital. Washington, D.C., Dec. 17.–Prof. C.C. Georgeson of Manhattan, Kansas, is now special agent in charge of the government agricultural experiment stations in Alaska, with headquarters at Sitka. He is today one of the best paid agricultural explorers and experts in the United States..."

"Prof. Georgeson is a Dane by nativity, having come to this country when a youth. He began his work as a gardener and general horticulturist, passing his apprenticeship in this line in his native land. A year after he landed he entered the Michigan Agricultural college, from which he graduated in 1878. He was at once offered the position as assistant editor of the *Rural New Yorker,* published in New York city. That position he held for two years. In the fall of 1880 he was chosen professor of agriculture and horticulture in the Texas Agricultural college. This was followed in 1885 by an offer from the Japanese government to fill a similar chair in the Imperial college of agricultural in Tokio, which he accepted. He remained in Japan nearly four years and returned to the United States in the fall of 1889. Very shortly after his return he was invited to take the position of professor of agriculture in the Kansas Agricultural college at Manhattan. He accepted the offer in January, 1890, and remained in that college nearly eight years till September, 1897, when the final dispersion of the old faculty took place at the hands of the Populist party.

"Prof. Georgeson's work in Kansas is well known to the farmers of the state. The experiment stations maintained by the national government had just been fairly started when he came to Kansas and his work in that line at the Manhattan station may be traced through the thirty bulletins which he wrote while there."

"The Soy bean was introduced into this country for the first time by Mr. Georgeson at the Kansas station in 1890. He sent to Japan for the seeds and grew them that year at the college. The scientist found it to be a valuable drouth resisting plant and grew it extensively and distributed the seed widely gratis to the farmers of Kansas. He introduced the growing of this bean as a second crop after wheat, and plowed it under for green manure if it failed to ripen. Prof. Georgeson proved by his feeding experiments that the meal of the Soybean was more valuable than linseed oil meal for both steers and hogs, and that the farmers could raise them at a fraction of the price per ton that the oilmeal costs.

"In January, 1893, Secretary of Agriculture Rusk sent Prof. Georgeson to Europe to investigate the dairy industry in the Denmark. There was at that time a great revival in the dairy industry in the United States, and Denmark stood at the head of the list of dairy countries."

"The results of the professor's investigations were published by Secretary Morton in a report entitled 'The Dairy Industry of Denmark,' which was well received by the American people." Note: "Report on the dairy industry of Denmark," by Prof. Charles C. Georgeson. Published in 1893 as *U.S. Bureau of Animal Husbandry, Bulletin* No. 5. 133 p.

"When the Populists broke up the Kansas college in 1897 Prof. Georgeson took the civil service examination for an assistantship in the United States Department of Agriculture. His examination proved satisfactory, and he was appointed assistant in the division of agrostology. He was immediately sent by the department to the Panhandle of Texas to investigate the pasture conditions in that locality. In March, 1898, Mr. Georgeson was appointed special agent in charge of the Alaska agricultural investigations, and at once started for the North, where he has since remained.

"Prof. Georgeson arrived in Washington a few days ago from Sitka. He expects to remain several weeks, during which time he will seek desired legislation for the new country. In an interview he said:

"'Three years ago scarcely no one believed that everything could be grown in Alaska outside of a few hardy vegetables. Even the old residents shook their heads and prophesied utter failure when anything more was attempted. We have, in spite of this feeling, however, succeeded in maturing all the leading grains and also flax and buckwheat.'"

If agriculture can be developed in Alaska, then it can become a populous state. "If agriculture is not developed, it must always remain what it is–a distant gold camp in which poor men can live only as servants of the rich, because if their livelihood can not be drawn from the soil, living will be too expensive."

A portrait photo shows Prof. C.G. Georgeson with a large mustache, dressed in a dark suit and bow tie.

Note: The Populists were a political party in Kansas

© Copyright Soyinfo Center 2014

that wanted to protect Kansas farmers from interference by big government and Eastern money, advocated "free silver," and disliked Republicans. In 1896 the Populist party gained control of the Kansas legislature, and the next year they threw out the administration and faculty at Kansas Agricultural College–including Prof. Georgeson and President George T. Fairchild–and installed new people more sympathetic to their views. But several years later, when the Populists lost power to the Republican party, the Republicans did the same thing in reverse.

1018. D.A.R. 1901. Katjang-Kedelihpraeparaten [Soyfoods]. *Orgaan van de Vereeniging van oud Leerlingen der Rijks Landbouwshool* (*see Landbouwkundig Tijdschrift*) 13(161):242-45. Dec. [Dut]

• ***Summary:*** The author wrote an article in the April issue of this magazine about soybean cultivation. Now he will discuss how soybeans are used to make foods. As mentioned in the previous article, soya beans as such are not good to eat, even boiled or roasted; they need to be processed so as to digest the indigestible protein; then this protein can be absorbed by the digestive enzymes of the stomach and intestines.

As Japan is *the* soya country, we will start with the product that is most popular there, soy sauce, which has also earned its place in Europe. It is made from equal parts of roasted soybeans and wheat, 1-3 parts water, and much salt. The koji is fermented for a long time. Prof. Dr. M. Fesco [sic, Fesca], who provided much of this information, said it takes about 20 weeks to 5 years. The longest and slowest fermentation gives the best quality product. In Japan, every housewife makes her own soya sauce and there is competition for the best homemade soy sauce. Late-ripening protein-rich soybeans, called shoyu-mame, are used. In Java, the residue from soy sauce is used a lot, along with peanut presscake, for fertilizing sugar-cane fields.

In the Netherlands Indies, ketjap [Indonesian-style soy sauce] is made solely by the Chinese. Also called Tao-yoe, it is prepared by covering cooked soybeans with hibiscus (*waroe*) leaves. The age and variety of the leaves is very important. The mold that grows produces substances [enzymes] that digest legumin [soy protein]. More of the process is described.

Note 1. This is the earliest document seen (Feb. 2009) that contains the term Tao-yoe. H.T. Huang (e-mail of 25 Feb. 2009) states: "Tao-Yoe sounds like Cantonese for *Douyou* (pinyin) or *tou yu* (W.-G.) which in Mandarin mean soy sauce, and which first appeared in about 1750 in the *Xingyuan Lu* (*Hsing Yüan Lu*). See Huang 2000, p. 371-73.

Star anise (*Hades manies*) is also added to Indonesian soy sauce. Some Chinese have gained a reputation for their knowledge of the different additives (*boemboengs* [*boemboes*]). 61. kg of soybeans (1 gantang or 10 katties) can yield 3 bottles of number 1 ketjap (which retails for 50 Dutch cents per bottle), plus 3 bottles of 2nd extraction ketjap (each 40 cents), plus 3 bottles of ketjap no. 3 (which is little better than salt water with a light brown tint; each 20 cents).

The Japanese also use soybeans to make tofu (*tofoe*). Precipitated with magnesium chloride, it is a greyish-white dough, or sometimes yellow product. Although containing 90% water, it is a concentrated food. A table (based on analyses by E. Kirch [sic, Kinch] of Tokyo) shows the composition of tofu and kori-tofu; the latter is made by freezing tofu then thawing it. Tofu is a good product for vegetarians, but beware than it can act as a laxative because of the magnesium chloride.

Note 2. This is the earliest Dutch-language document seen (Sept. 2011) with the term *Katjang-Kedelihpraeparaten* in the title; it means "Soyfoods."

Note 3. This is the 2nd earliest Dutch-language document seen (April 2013) that mentions dried-frozen tofu, which it calls kori-tofu.

• ***Summary:*** This book is continually paginated with Vol. 1, so the first numbered page is 365. Part 15 (chapters 56-58) is titled "Morphology, physiology, and classification of the technically important higher Ascomycetes and related forms" (p. 627-704). Chapter 56, by Prof. Dr. Carl Wehmer (*Dozent an der Technischen Hochschule zu Hannover* [Germany]), "Morphology and classification of the families of the Aspergilli (*Aspergillaceen*)*"* discusses (p. 627+): Eighteen illustrations of Aspergillus conidiospores (p. 632-33). *Aspergillus Oryzae* (Ahlburg) Cohn (=*Eurotium Oryzae* Ahlburg), which is widely used in Japan to make saké, soy sauce (*Soja-Sauce*), and miso (p. 638-39, with illust.). *Aspergillus Wentii* (Wehmer), which is used in Java to make Tao-Yu (Chinese-style soy sauce) using cooked soybeans covered with *Hibiscus* leaves (p. 640).

Chapter 57, also by Prof. C. Wehmer, titled "Chemical effects of the Aspergilli (*Aspergillaceen*)*,"* discusses (p. 674+): Saccharification of starches, diastase and diastatic enzymes, Takamine's research using Aspergillus to make diastase (Takadiastase) and its efficiency compared with similar enzymes of different origins, koji extract which contains amylase and other enzymes, use of *A. oryzae* to make saké, shoyu, and miso (p. 675-76).

This book also discusses: Zygospore production (p. 379). Sporulation and Aspergillus (p. 387-89, with illust.). Morphology and classification of the Mucorales, zygomycetes, zygospores (p. 420-21). The genus Mucor,

© Copyright Soyinfo Center 2014

sporangia, Rhizopus (p. 424-27, illust.). Mucorales used in the spirits industry, Mucor rouxii, Chinese yeasts (p. 436-37). Ragi/raggi and tapé (*tapej*) (p. 441). Decomposition of proteins and their derivatives, protease (p. 690-91). Film-forming surface yeasts and their accompanying phenomena, *Mycoderma* (p. 732-33). Invertase (p. 828). Other enzymes discussed in this chapter include maltase, melibiase, lactase, trehalase, raffinase, and amylase. Address: Prof. of Fermentation Technology and Bacteriology at the Imperial-Royal Technical College at Vienna [o. ö. {obiger Oesterreichischer} Professor der Gaerungsphysiologie und Bakteriologie an der k.k. {kaiserlich-königliche} Technischen Hochschule zu in Wien].

1020. Dep. of Finance (Okurashô). 1901. Financial Annual of Japan (No. 1). Tokyo, Japan: Government Printing Office. 74 p.

• ***Summary:*** A table titled "Amount of taxation under various heads" (p. 12-13) gives the government revenue (in yen) from various types of taxes from 1867-68 to 1901-02. The soy [sauce] tax began in 1885-86 and was 640,179 yen that year. The rates of taxes on soy and income were raised in 1899. The soy tax jumped from 1,535,648 in 1898-99 to 2,453,392 in 1899-1900. In 1901-02 it was 3,808-730.

Note 1. In 1867-88, Japan's main sources of income were land tax (2.00 million yen), customs duties (0.721 million yen) and other miscellaneous taxes (0.534 million yen) for a total of 3.265 million yen.

In 1901-02, Japan's main sources of income were land tax (46.56 million yen), income tax (5.618 million yen), saké tax (55.280 million yen), various business taxes (6.263 million yen), customs duties (15.77 million yen) and other miscellaneous taxes (2.233 million yen) for a total of 138.741 million yen.

Note 2. In 1894-95 was the First Sino-Japanese War, over domination of Korea; Japan won. In 1904-05 was Russo-Japanese war; Japan won, gaining complete control of Korea. Address: Japan.

1021. Bie, H.C.H. de. 1901. De landbouw der inlandsche bevolking op Java [The agriculture of the indigenous people in Java]. *Mededeelingen uit 's Lands Plantentuin* (*Buitenzorg*) No. 45. 143 p. See p. 97, 99, 138-43. [Dut]

• ***Summary:*** The soybean is discussed in the chapter titled "Cultivation of crops other than paddy rice: Cultivation of secondary crops (*Palawidja*)." Soya bean is one of the secondary foods served with rice, but it is mostly used to make soy sauce and tempeh (*tempe*). One variety of soybean, which originally came from Japan, is widely grown as a second crop on the wet rice fields (*sawahs*), and it is easy to cultivate at altitudes of 1,200 to 1,500 feet above sea level. It is called *katjang kedele* in Central and East Java, but *katjang djepoen* in Sunda or West Java (*de Soendalanden;* [the area around Bandung only]). A description of the plant and the method of cultivation in Java is then given. It is planted much more on wet rice fields than on dry (non-irrigated) fields (*tegalans*) near the rice fields used for vegetables and secondary crops. Usually the soybean seeds are planted right after the paddy stumps have been cut away, but sometimes they are planted just before or during the paddy harvest, and pressed into the earth under the feet of the paddy cutters. They are rarely weeded, excepted when the crop is suffocated by tall weeds. At harvest, the plants are pulled completely out of the ground and bound into bunches. At night they are stored under a specially-constructed roofed shelter in the field, and during the day they are sun-dried on bamboo structures or on the ground. This takes at most 3-4 days, if the plants are really ripe and the weather is good, after which the bunches are put on bamboo mats in heaps and threshed. To protect the seeds from damage, one preferably uses piece of banana tree branches which still have fibrous veins. The fibrous plant stems and branches are removed together with the soybean pods and burned on the sawah fields. Poor people first sort out the pieces good enough for fuel and take these home. Immature green leaves are fed to animals. Sometimes soybeans are planted on the dikes of the paddy fields at the same time as or a few days later than the paddy rice. The fresh seeds from this harvest are then planted in the sawah fields after the paddy is harvested. Soybeans planted in this way are called *katjang apitan.*

There are two varieties of soya: one has an ivory yellow seed coat and the other is black. The latter is used almost exclusively to make soy sauce; the former to make pastry and condiments for rice or as a vegetable (*sayur; sajoer*). Soya is cooked with salt in the green pod and eaten as a snack.

The indigenous people do not occupy themselves with the production of soya (soy sauce) or *ketjap* or other products made from soybeans such as *taoetjo* [*tao tjo, tauco, taucho* = Indonesian style miso], *taoehoe* [*tao hoe, tahu* = tofu], *taoekwa* [*tao koan, taokoan or takoa* = fermented tofu], and *taoetji* [*tao dji, tausi* = fermented black soybeans]. The work is too involved and takes too long before the product is ready to be sold. Most people are too inexperienced and there is not enough of a market for the product.

The only food that most people make out of soybeans is tempeh (*témpé*), which plays the same role in Central and East Java as does ontjom in Sunda or West Java, and is prepared similarly. The tempeh-making process is described. It takes place indoors, out of the light. Tempeh is sometimes cut into smaller pieces. It is usually eaten pan-fried after being soaked in a solution of tamarind and salt. It is also cooked with vegetables.

Most soybean seeds are sold to the Chinese, who export them or process them to make soy sauce and other products. To make soy sauce, the seeds are roasted to aid in removing the hulls. Some people pound the seeds instead. They are cleaned, boiled in water, drained, spread on flat bamboo

© Copyright Soyinfo Center 2014

trays (*tampah* or *njiroe*) and dried daily for a week in the wind. They are washed again then soaked for 30-40 days in salt water which has been boiled then cooled. This mash is mixed thoroughly and strained through a cloth. To the black liquid is added a boiled and cooled mixture of cane sugar and water, then the mixture is boiled until its volume is reduced by 20%. If the solid residue removed by filtering still tastes salty, it is put into water, kneaded and strained again. A sugar solution is added and all is boiled down as before to make second-grade ketjap.

To make *taoetjo* (*tauco, taucho* or Indonesian-style miso), the soybeans are soaked in fresh water, the hulls are removed, the seeds boiled and spread on bamboo trays to cool. Rice or glutinous rice flour is roasted until golden brown, then mixed with the seeds and set aside for 2-3 days to ferment between hibiscus (*waroe*) leaves on flat trays. When the mass has molded, it is sun dried for a few days until very hard. Note: This is the soybean koji used making taucho.

Remove the leaves and put this mass of soybean koji into salt water. On the third or fourth day, add some yeast (*gist*) and some cane sugar syrup. Continue the soaking and fermentation in salt water for 2-3 weeks. Place it [in crocks] daily outside in the dew, taking care that no rain gets on it.

To stimulate the fermentation, take steamed rice or glutinous rice that is only half cooked. Add *ragi* starter and allow it to ferment for 2-3 days until a sweet, alcoholic flavor develops. This kind of fermented rice is called *peujeum* in West Java, or *tapé* in Central or East Java. Now add this fermented rice to the soybeans in salt water to enhance both the fermentation and the product.

After 3-4 weeks the soybeans should be very soft like porridge; then the taucho is ready to be used. It is eaten raw with cooked or raw vegetables, or mixed with meat or rice dishes; other condiments are also made from it.

Another product that the Chinese make out of soybeans is tofu (*tahoe* or *tauwhoe*). Soaked soybeans are ground and the puree is mixed with fresh water. Then a milky liquid (*melkachtige vloeistof*) is filtered off and coagulated. The Chinese use a coagulant called *tjiogo* (gypsum or calcium sulfate), which is specially imported from China and is not always available, even to the Chinese apothecary. It is first burned, then cooled before being added to the milky liquid. The white mass which is precipitated is called tofu. A similar product can be made from mung beans. Address: Batavia (Jakarta), Java.

1022. Chamberlain, Basil Hall; Mason, W.B. 1901. Handbook for travellers in Japan: Including the whole empire from Yezo to Formosa. 6th ed., revised. London: John Murray; Yokohama, Shanghai, Hongkong, Singapore: Kelly & Walsh, Ltd. ix + 577 + 94 p. "With 28 maps and plans and numerous illustrations." Index.

• ***Summary:*** This 6th edition is quite similar to the 1899 5th

edition, but with some important changes, and 41 pages of additional advertisements at the rear. In the concise English-Japanese dictionary (p. 21-22): Beans–mame. Soy–shôyu, shitaji.

Eastern Japan: Chôshi (Inn, Daishin): "Chôshi is noted for its soy, the manufacture of which may be seen at Tanaka Gemba's establishment, the oldest and largest, which supplies the Imperial Household."

In the ads at the back is a full page advertisement (p. 49) for "Higeta Soy, manufactured by G. Tanaka, Chôshi, Shimôsa, Japan." An illustration shows the Higeta trade mark. "Higeta Soy dates from 1615 A. D. (Second year of Genwa).

"Higeta Soy is honoured with the distinguished patronage of the Imperial Household.

"Higeta Soy was awarded the superior medal at the World's Fair at Chicago [Illinois], and gold and other superior medals by the Home Exhibitions.

"Higeta Soy has an excellent flavour and is very nutritious, being made of the best kind of bean, wheat, rice, and table salt." A table gives a nutritional analysis.

"Higeta Soy, not being acrid, is suited for ladies and children.

"Higeta Soy can be preserved even in hot countries, if kept in a dark place. This fact has been proved by many years' experience." Detailed directions for use are given.

Note: This is the earliest document seen (Feb. 2012) that mentions "Higeta" in connection with soy sauce. Address: 1. Emeritus Prof. of Japanese and Philology in the Imperial Univ. of Tokyo, Tokyo; 2. Corresponding member of the Royal Scottish Geographical Society, and late of the Imperial Japanese Dep. of Communications.

1023. Conn, Herbert William. 1901. Agricultural bacteriology: A study of the relation of bacteria to agriculture, with special reference to the bacteria in the soil, in water, in the dairy, in miscellaneous farm products, and in plants and domestic animals (Continued–Part II). • ***Summary:*** Part II of this book is "Bacteria in soil

© Copyright Soyinfo Center 2014

and water" (p. 53-174). In the section on "Bacteria and leguminous plants," the subsection titled "Nitrogen fixation by legumes" (p. 136-37) notes that in 1881 it was shown that peas and other legumes can assimilate atmospheric nitrogen. "This conclusion, so contradictory to the belief accepted at the time, was at first vigorously disputed; but, upon being subjected to further experimentation by many observers, was found to be strictly correct. Many of the plants of the great family of legumes certainly do have the power, under certain circumstances, of fixing atmospheric nitrogen and absorbing it into their tissues." During the next 10 years it was shown that this fixation was dependent on the growth of certain soil bacteria associated with "root tubercles" on the legumes (p. 137). Note 1. This is the earliest English-language document seen (March 2003) that uses the term "nitrogen fixation" in connection with legumes.

"Only such plants as developed tubercles were able to increase the amount of nitrogen in their tissues, and the amount of nitrogen fixation was roughly proportional to the development of tubercles" (p. 139).

In 1866 Woronin found small bodies (whose nature he did not understand) inside the tubercles (p. 140). These small bodies were soon found to be bacteria, and Beyerinck–who first studied them with care–gave them the name *Bacillus radicicola* (p. 142). By 1901 it was known that the bacteria enter by passing through the delicate root hairs (p. 143).

"The tubercle, therefore, may be regarded as a peculiar abnormal growth of the root of the leguminous plant, stimulated by the presence of invading organisms" (p. 144). Whether "it is the legume or the bacterium which fixes the nitrogen, or whether it is a phenomenon occurring only as a result of the two organisms combined together in a united growth, is not so clear" (p. 145).

It is now generally believed that the leguminous plant and the bacteria together, by *symbiosis,* absorb and fix atmospheric nitrogen, "each benefitting by the presence of the other."

The section titled "Different species of the tubercle organism" notes (p. 148-49) that "the soil of Connecticut is not adapted to the legume called the *soy bean.* When this bean is planted in the ordinary Connecticut soil it does not flourish but yields a small crop, unless heavily fertilized, and does not produce tubercles. This species does, however, grow readily in Massachusetts. Some years ago the experiment was tried of importing the Massachusetts soil, upon which this plant had produced abundant tubercles, and mixing it with the Connecticut soil, subsequently planting the soy bean. The result was an excellent growth of the soy bean and the development of tubercles in the Connecticut soil. At the present time these particular plots of land are capable of producing large luxuriant crops of the soy bean, with abundant root tubercles and a large fixation of atmospheric nitrogen. It is interesting to note that the same experiment has been repeated in Germany, where the soy bean does not readily grow. In this case soil was imported from Japan, where the plant flourishes, and was used for supplying the German soil with the proper species of organism. The result was equally successful with those of Connecticut experiments. Evidently Connecticut soil does not contain the species of bacteria adapted for producing the tubercles in the soy bean, although those which produce tubercles on the pea and the clover are abundant enough.

"These experiments indicate that the root-tubercle bacteria are not all alike..."

In the section titled "Importance of the leguminous crops to agriculture," a subsection titled "Selection of a proper legume" (p. 152) notes: "The most vigorously growing legume is best. The plants most commonly found useful are peas, cow peas, beans, soy beans, alfalfa, vetches, seradella [serradella], and some others."

The next subsection titled "Insuring presence of proper bacteria" (p. 152-53) states: "As already mentioned some species of legume find in a certain soil the tubercle organism adapted to them, while other species of legume will not find the proper organism in the same soil. The soy bean is a most excellent crop for this purpose, since it is an extremely luxurious growing legume, producing abundant tubercles and a large fixation of nitrogen when supplied with the organisms which produce tubercles. But in order to make use of this crop it may be necessary to import the proper bacteria from other soils."

During the past few years bacteriologists have attempted to meet these difficulties by "furnishing to the agriculturist a culture of the tubercle bacteria for the purpose of inoculating his soil, and thus providing it with the proper organisms to produce the tubercles. Such a material has now been on the market and under experimental tests for several years under the name of *Nitragin.* This commercial product is found by analysis to consist of a practically pure culture of certain of these tubercle bacteria, which are capable, when inoculated into sterilized soil, of producing the tubercles upon the roots of leguminous plants. Although the method of manufacture is not known, there is little doubt that the material comes directly from the tubercles of certain leguminous plants, and that the bacteria thus obtained have been produced in large amount in the bacteriological laboratory" (p. 154). Note 2. This is the earliest English-language document seen (March 2003) that uses the word "bacteriologists" or "bacteriology" (or "bacteriologist") in connection with nitrogen fixation by legumes.

Experiments with Nitragin have been carried on in large numbers in many localities for some years. "The results of the use of this material have been very irregular." Some experimenters have found no advantage accruing from its use. However quite a number "have found that the inoculation of Nitragin into the soil has increased the yield and produced a larger fixation of nitrogen" (p. 154-55). It works very well in sandy soil. Note: No address for ordering

© Copyright Soyinfo Center 2014

Nitragin is given. Address: Prof. of Biology, Wesleyan Univ., Middletown, Connecticut.

1024. Davis, Nathan Smith, Jr. 1901. Dietotherapy and food in health. Philadelphia, Pennsylvania: P. Blakiston's Son & Co. [ix] + 372 p. Illust. 23 cm. Index. Series: This is Volume VI of A System of Physiologic Therapeutics..., edited by Solomon Solis Cohne, A.M., M.D.

• ***Summary:*** Contents: Part I–General principles of diet and diet in health. Part II–Diet in Disease. In Chapter 3, "The elements of food," the section on "Proteids" states (p. 32): "Meat is not a necessity of life. Nitrogenous food is a necessity, but it can be obtained in sufficient quantities from vegetables. An exclusively vegetable [vegan] diet will enable a person to do as much, at times even more work, as a diet containing an excessively large amount of meat, but it will not fit one to meet sudden demands for great exertion. A mixed diet is undoubtedly the most desirable; one that contains a very moderate amount of meat is best."

In Chapter 4, on the same subject (continued), the section titled "Vegetarianism" states (p. 42): "Those who live chiefly upon cereals, vegetables, fruits, and nuts are called vegetarians. These foods are with rare exceptions supplemented by such animal foods as milk, cheese, and eggs... The nitrogenous matter obtained from vegetables is less easily digested than that which is of animal origin; a much larger percentage passes from the alimentary tract unutilized. Few persons live entirely upon a vegetable diet. Those who attempt it lose vigor and show languor and disinclination for physical and mental work. They become less able to resist disease. Because a vegetable diet is an economical one, it has sometimes been forced upon the bodies of laborers, but uniformly the decrease in the amount of work they are able to perform more than counterbalances the decreased expense of their food." Note: The source of this information is not cited. How about the Chinese laborers who built so much of America's transcontinental railroad? Research by Chittenden at a Yale University [New Haven, Connecticut] soon proved Davis's statements to be incorrect.

In Chapter 6, titled "Animal foods," a table (p. 61) gives the "Comparative composition of various types of milk" (Source: Koenig, *Chemie der menschlingen Nahrungs- und Genussmittel,* 3rd ed. Vol. I, p. 267-362). The sources of milk are: Woman, cow, dog, ewe, buffalo, cat, goat, llama, ass, and mare–all mammals of course. Mare's milk has the lowest total protein (1.3%), followed human milk and ass milk, tied for the 2nd lowest protein content (2.3%). Cow's milk has 3.5% protein (52% more than human milk), and dog's milk has the highest protein content (11.2%).

Chapter 8, titled "Vegetable foods," contains a section on "Peas and beans" (p. 104-05). A table gives the "Composition of fresh and dried legumes..." The dried legumes include navy beans, frijoles, lentils, cowpeas, soy beans, chick-pea, peanuts, and St. John's bread (carob bean).

Taka-diastase is mentioned as a useful aid to digestion (p. 176).

In the section on "Diet in diabetes" (p. 334-44), soya bread, gluten bread, almond cakes, cocoanut, and peanut are listed in a table (p. 340) of important ingredients in diabetic breads. Soya bread is said to contain from 3% to 23% carbohydrate and sugar.

Nathan Smith Davis, Jr. lived 1858-1920. Address: A.M., M.D., Prof. of the Principles and Practice of Medicine, Northwestern Univ. Medical School [Chicago, Illinois].

1025. Hosie, Alexander. 1901. Manchuria: Its people, resources, and recent history. London: Methuen & Co. xii + 293 p. See p. 180-84, 218-24, 240-45, 252-53. Illust. Index. 23 cm.

• ***Summary:*** The Preface states that Hosie was in charge of the British consulate at Newchwang in Manchuria from Nov. 1894 to July 1897 and from April 1899 to April 1900. In 1900 he made the first careful estimate of soybean production in Manchuria, calculating the amount at 600,000 tons. He noted that during that period most of Manchuria's soybean exports went to southern China, through the ports of Swatow, Amoy, and Canton, where mills were erected for extracting the oil; the cake was used for fertilizing sugar plantations there and in Java. Nearly all of the soybean oil exported from Manchuria was consumed in China.

Chapter 2, titled "Recent events in Manchuria" (p. 39-72) begins with the Sino-Japanese war of 1894-95 (it began on 3 Aug. 1894 and concerned a dispute over the kingdom of Corea [Korea]), the Japanese invasion of Corea and Manchuria, Japanese victory and the treaty of Shimonoseki (17 April 1895), the complexities of railway construction and financing in Manchuria (from the start of construction of the Manchurian Railway on 28 Aug. 1897), and the expected effects of the new railroads on Manchurian trade. Manchurian trade currently labors under serious disadvantages due largely to climatic conditions, absence of good roads, and the slow and clumsy methods of transport. "I have said that it is practically impossible to sow, reap, and export [soy] beans, the most valuable trade product of the country, in the same year, and that they have to be carried by cart and stored at depots on the waterways to await shipment when the ice breaks up in the following spring. In this way capital is locked up for months and heavy storage charges are incurred" (p. 67). The Russian Central Manchurian Railway should greatly alleviate these problems. Bubonic plague struck Manchuria in 1899 (p. 69).

Note 1 This is the earliest document seen (Jan. 2008) concerning the transportation of soybeans by railway.

Chapter 7, titled "Agriculture and agricultural products" (p. 172-98) contains extensive information on "Beans" (which are actually soybeans). Beans are often used on large farms in the second year of a 4-year crop rotation consisting of millet, beans, rice (or barley or wheat), and millet. Other

© Copyright Soyinfo Center 2014

important cereal crops are Job's tears (*Coix lachryma,* used medicinally and in making sweetmeats) and tall millet (*Kao-liang*).

"A large variety of beans is grown in Manchuria, and, together with their resultants, bean-cake and bean-oil, they constitute by far the most valuable item in the export trade of the three provinces." In April they are sown by hand in drills, and the crop ripens in September. "The Chinese distinguish the beans of commerce by their colours, and they are known as Yellow (Huang Tou), Green (Ch'ing Tou), Black (Hei, or Wu Tou), White (Pai Tou), Red (Hung Tou) and Small Green (Lü Tou). The yellow, green and black are varieties of the soy bean (*Glycine hispida, Moench.,* or *Dolichos soja,* L.)..." The white and red beans are "the ray-fruited dwarf bean (*Phaseolus radiatus,* L.)" [azuki bean]. The Lü Tou (small green bean, *Phaseolus mungo,* L.) [mung bean], "the smallest but one of the most important of the beans of commerce cultivated in Manchuria," is used to make vermicelli and bean sprouts.

Concerning soy beans: The "yield per acre, which requires from 16 to 18 lb. of seed, is estimated at from 27 to 39 bushels, with a weight of about 40 lb. per bushel." [Note: A U.S. bushel of soy beans weighs 60 lb.]. "Each variety of soy bean has a number of sub-species. The yellow has three, known respectively as (a) Pai-mei (white eyebrow), from the white scar on the saddle or point of attachment to the pod; (b) Chin-huang, or Chin-yüan (golden yellow or golden round), from the golden colour and more rounded shape of the bean; and (c) Hei-chi (black belly), from the dark brown scar on the saddle. All the three sub-species are highly prized for the quantity of oil or fat which they contain, but sub-species (a) and (b) are noted for the quality of the bean-curd (Tou-fu) or legumine obtained from them, as well as for the sprouts which are procured by soaking the beans in water, and which are greatly relished as a vegetable.

"There are two sub-species of the green bean (Ching-Tou)." One has a green epidermis (skin) but is yellow inside, while the other is green on the both the surface and inside.

The black bean (Wu Tou) has three sub-species:–(a) To-wu-tou (large black bean), where the epidermis is black and the inside green. It yields oil or fat, and it is likewise boiled with millet or rice and used for food.

"(b) Hsiao-wu-tou (small black bean), where the bean is somewhat smaller than the sub-species (a), with a black epidermis and yellow inside. It is largely used for horse feed and also yields oil, the refuse being employed for feeding pigs. It is likewise pickled for food.

"(c) Pien-wu-tou (flat black bean), where the epidermis is black and the inside yellow. It is flattened and elliptical in shape, and is mostly used for pickling and for horse feed." (p. 181-82).

A detailed description is then given of Tou-fu, or bean curd, and how it is made (p. 183-84).

"Besides these beans of commerce there are several varieties of garden beans cultivated for food, such as...; the Mao Tou, or hairy bean [probably green vegetable soybeans], with short hairy pods, each containing one to three beans (epidermis white and inside green);... With the exception of the Mao Tou these are usually cooked and eaten with the pods" (p. 186).

"The plants grown in Manchuria whose seeds yield oil are six in number. They are (1) *Dolichos soja,* L., or soy bean," (2) Castor oil plant. (3) *Sesamum orientale,* or sesame. (4) *Perilla ocymoides,* L., or perilla. (5) The cotton plant. (6) *Cannabis sativa,* L., or the true hemp plant. "The names and uses of these [six] oils are the following: (1) *Tou yu* [soy bean oil]–cooking, mixing paints and lighting" [illumination]. All these six "oil-yielding seeds" (with the exception of *sesamum seeds,* which are roasted) are crushed, steamed and subjected to great pressure. A table (p. 188) shows the percentage and value of the oil and cake extracted from these six seeds.

A black-and-white photo shows a Chinese bean mill at Newchwang with a huge granite stone wheel (facing p. 220).

Also discusses: Job's tears or pearl barley (p. 180-81). *Phaseolus radiatus* (the ray-fruited dwarf bean [azuki] which is red or white, p. 182-83). Hemp, a valuable textile plant (p. 186-88, 251). Sesamum seed (p. 188). Ground-nuts [peanuts] (p. 188, 251). The ground nut (*Arachis hypogæa,* L.) is cultivated in Manchuria for food, however not to any great extent. The oil is not extracted from the nuts, as it is in the south of China. Seaweed (p. 258).

A second edition of this work was published in 1904 (London: Methuen & Co., 293 p.; New York: C. Scribner's Sons; see p. 181-87). In the 1910 ed. (published in Boston by J.B. Millet Co.; 320 p.), see p. 75-79. Address: M.A., F.R.G.S., Once Acting British Consul, Tamsui; Now at Aberdeen (Scotland or Hong Kong).

1026. Hosie, Alexander. 1901. Manchuria: Its people, resources, and recent history. Chapter X–The trade of Manchuria (Document part). London: Methuen & Co. xii + 293 p. See p. 236-59.

• ***Summary:*** "There can be no doubt that millet (*Horcus sorghum,* L.) is the principal and most valuable crop of Manchuria; but being the staple food of the people, the common feed of beasts of burden, and the grain used by the distilleries in the manufacture of *samshu,* it is nearly all consumed in the country itself." The rest is exported to other parts of China. Other important related grain crops are Kao-liang (*Holcus sorghum,* L.) and Hsiao-mi (*Setaria italica,* Kth.).

The port of Newchwang is the only Manchurian port still open to foreign trade and the only place at which reliable trade statistics were available. These statistics, collected and published by the Imperial Maritime or Foreign Customs, cover the trade in vessels for foreign type only, and do not include the native junk trade, which is conducted under the

© Copyright Soyinfo Center 2014

supervision of the Native Custom-House. The latter type of trade is considerable, but the statistics are not reliable.

After the Sino-Japanese war of 1894-95, Japan invaded and occupied the southern province of Manchuria. Some expressed gloomy views concerning the commercial future of Manchuria, but Japan has now become the main market for Manchurian agricultural products, and in turn is now trying to sell her manufactured goods to Manchuria. Since the war, the trade of Manchuria has actually trebled. "The chief export from Manchuria is beans and their products, bean-cake and bean-oil..." A table (p. 242) shows "Exports of beans, bean-cake and bean-oil for 1898 and 1899 in foreign-type vessels. For each product is given the quantity (tons) and value (in both Haikwan taels and British pounds). In 1899 the quantities were as follows: [Soy] Beans (yellow 153,745 tons {58.6% of total weight} worth 4,694,750 Haikwan taels; green 95,649 tons {35.3% of weight} worth 3,306,172 taels; black 21,076 tons {7.8%} worth 602,492 taels) totaling 270,470 tons worth 8,603,414 taels. Bean-cake 260,798 tons worth 6,711,364 taels (=£1,010,200). Bean-oil 9,512 tons worth 1,000,193 taels (=£150,550).

An estimated additional 30,000 tons of [soy] beans were exported that year from Newchwang in junks headed for China Proper.

"A few years ago the consumption of pulse and bean-cake was practically confined to the southern provinces of China (through the ports of Swatow, Amoy and Canton), where mills were erected for extracting the oil from beans and the bean-cake was used for fertilising the sugar plantations." Since the Chino-Japanese [Sino-Japanese] was of 1894-95, Japan has occupied the Liao-tung Peninsula and realized the value of Manchurian agricultural products. In 1899 Japan's purchases of these products had surpassed that exported to Southern China. In Japan, "bean-cake is replacing fish manure," which in recent years has become scarce and expensive due to the shortage of herrings along the Japanese coast. From Canton, some bean-meal goes to the sugar fields of Java. Nearly all of the bean-oil exported through Newchwang is consumed in China. Due to the rough roads, bean-oil from the interior of Manchuria is brought in large, strong watertight wooden boxes lined with paper to the port of shipment, where the boxes are broken up and the contents, like the oil extracted in Newchwang itself, poured for export into large brittle jar- or carafe-shaped wicker baskets lined inside and outside with layers of waterproof paper."

Beans and their products "are, in a word, the wealth of Manchuria. They were worth 2.5 million British pounds in 1899 exports alone.

A table titled "Summary of the export trade of Manchuria through Newchwang, 1898-1899" (p. 252) shows that beans, bean-cake, and bean-oil are by far the most valuable export, worth much more than all other exports combined. A second table titled "Distribution of Manchurian exports through the Port of Newchwang, 1898-99" (p. 253) shows that in 1899, the destinations receiving exports of greatest value were (in million British pounds sterling): Japan 1.2, Shanghai 0.95, Swatow 0.505, Canton 0.404, and Amoy 0.272.

A final table (p. 259) shows that in 1899 the tonnage exported from Manchuria by steam ship was more than 38 times as great as the tonnage exported by sailing ship to destinations.

Note: This is the earliest English-language document seen (Dec. 2005) that uses the term "bean-meal" to refer to ground, defatted soybeans. Address: M.A., F.R.G.S., Once Acting British Consul, Tamsui; Now at Aberdeen (Scotland or Hong Kong).

1027. Irish, H.C. 1901. Garden beans cultivated as esculents. *Missouri Botanical Garden, Annual Report* 12:81-165. See p. 147-48. [3 soy ref]

• ***Summary:*** The article begins: "In entering upon a study of garden beans in 1898, all procurable varieties catalogued by leading seed firms of America and Europe were grown at the Missouri Botanical Garden during that and the two succeeding years. Habit of growth and other varietal characters were carefully noted in the field each year. These, together with the seed characters, have been brought together and classified. The varieties studied are here grouped under five genera which are distinguished from each other mostly by technical characters as follows:" Phaseolus, Dolichos, Vigna, Glycine, and Vicia. There follow detailed descriptions, keys, synonymy and figures of all the seeds various esculent [edible] varieties, with notes on diseases, culture, and cooking.

Under *Glycine hispida* Maxim. (p. 147-48) is a list of five previous scientific names for the soybean and the sources in which those names were first cited. A photo (plate 44) shows the front and side views of six soybean varieties.

A full-page original illustration (see next page; line drawing, plate 46) shows the leaves, pods, and flowers of a soybean plant.

Describes five varieties whose seeds can be obtained from seedsmen Haage & Schmidt: Yellow Soy, Black Soy, Green Soy, Brown Soy, and Etampes Soy. The accession numbers for each of these, and their original foreign names and places or countries of origin are given.

A long footnote states that a number of the domestic U.S. seeds came from the Field Columbian Museum or the Philadelphia Commercial Museum [Pennsylvania]. Most of the imported seeds came from Japan, including at least seven soybean ("Daidzu") varieties: (1) Yellow–10757, "Daidzu," Mujage Agric. School, Japan. (2) Yellow–10758, "Daidzu," Iwate Agric. Institute, Japan. (3) Yellow–10760, "Daidzu," Japan. (4) Black–10752, "Kuro mame," Japan. (5) Black–10753, "Daidzu," Osaka Agric. School, Japan. (6) Green–7743, "Awo-daidzu," Yamacata [sic, Yamagata],

© Copyright Soyinfo Center 2014

Japan. (7) Green–10756, "Daidzu," Iwate Agric. Institute, Japan.

But at least one each came from Russia (10470 Kazan), Siam (10574 "Waa Tai"; 10768 "Lau Lao Peas"), Korea (10771 "Pea Bean"), Floyd County, Georgia (USA; 10932), and Polk County, Georgia (USA; 10937 "Weevil Proof Peas" (Beans)).

1028. Jaffa, M.E. 1901. Nutrition investigations among fruitarians and Chinese at the California agricultural experiment station, 1899-1901. *USDA Office of Experiment Stations, Bulletin* No. 107. p. 1-43. [15+* ref]

• ***Summary:*** Contents: I. Nutritive value of fruits. Introduction. Analysis of food materials: Description of samples. The dietary studies: Individual studies of 6 fruitarians, discussion of fruitarian dietaries. Digestion experiment with a girl: Metabolic nitrogen, balance of income and outgo of nitrogen.

II. Dietary studies of Chinese. Introduction. Composition of food materials. Dietary studies and a discussion of the results of each: A dentist's family, a Chinese laundry association, employees on a Chinese truck farm. Summary. Conclusions.

In part I, the author studied a family of 6 healthy fruitarians living in California almost exclusively on fruits and nuts. He found that they were apparently in good health, although underweight. The children were somewhat smaller in stature than average American children of their age and sex. However the youngest child in this family, "and the only one who had lived as a fruitarian [on nuts and fruits] almost from infancy, was certainly undeveloped. Her bones were very small, although she showed no tendency toward rachitis. She looked fully 2 years younger than she was" (p. 20).

In part II, "Dietary Studies of Chinese," the introduction begins: "We often hear those who recommend a vegetarian diet say, 'See how much hard work the Chinamen can do, and they live almost entirely upon rice,' and many believe that the Chinese to a great extent are vegetarians." The author notes that in Japan "bean cheese [tofu], and other foods comparatively rich in protein which are made from soy beans are eaten in large quantities by all classes." Of the 3 groups of Chinese studied, each one ate "bean cheese" [tofu] and 2 of the 3 ate "dried bean cheese" [probably dried-frozen tofu] during the study. The food was inexpensive, costing an average of $0.19 per man per day. Rice was consumed in large amounts, but was far from being the only food eaten. In fact "the diet was about as varied as that in the ordinary American households."

"The Chinese studied, who are believed to be fairly representative of Chinese residents in California in similar employment, did not, as is often supposed, live almost entirely upon a vegetable diet. Indeed, they approached no nearer to such a diet than does the average American, who has no thought of doing without animal food.

"Rice on an average constituted between one-half and one-third of the total food consumed and held much the same relation to the total food of the Chinese as do bread and other cereals, starches, etc., to the total food of the ordinary American family." Address: Asst. Prof. of Agriculture, Univ. of California.

1029. Moore, R.A. 1901. Field experiments with grain and forage plants. *Wisconsin Agricultural Experiment Station, Annual Report* 18:237-54. For the year ending June 30, 1901. See p. 252-53.

• ***Summary:*** In a section titled "Summary" (p. 250-54) we read (p. 252-53): "Soy Beans.–Soy beans were introduced into the United States from Japan and are now quite extensively grown in the south as a forage plant. Several of the western Experiment stations have tested them and found them an excellent soiling crop. If cut at the proper time a fine grade of hay can be procured which is noted for its richness in protein.

"The experiments carried on at the Wisconsin Station

© Copyright Soyinfo Center 2014

last year [1900] seemed to indicate, that while a large amount of green forage or hay could be produced, the plant matured so late that severe frosts prevented the ripening of the beans for seed.

"The seed used this season was northern-grown, having been procured from Michigan; the test made largely to determine if soy beans would ripen in Wisconsin... They were harvested October 2 and threshed, giving a yield of 22 bushels ripe seed beans per acre...

"A portion of one plot was cut and gave a yield of 4 tons of green forage or 2¼ tons of cured hay per acre.

"Stock of all kinds eat soy beans with a relish." A photo (p. 253) shows a man standing in plots of soy beans (probably in Wisconsin).

"Barley: Sixteen varieties of barley were also tested on the experimental plots this year. The Oderbrucker and the Mandscheuri No. 62 have been grown for three successive years and given excellent satisfaction. The Mandscheuri barley was first introduced into Ontario [Canada] by the Agricultural College at Guelph [OAC], from Russia, and the Wisconsin Station received its original supply therefrom." Note 1: From this original Mandscheuri barley, Prof. Charles A. Zavitz of the OAC produced a variety called OAC 21 in 1906; it was soon was adopted as the standard malting variety by Canada's brewing industry.

Note 2. This is the earliest English-language document seen (May 2008) that uses the word "Mandschurei" to refer to Manchuria or to a plant variety. Address: Agriculturist, Madison, Wisconsin.

1030. Rafu Shinposha. comp. 1901. Rafu nenkan [Rafu Shimpô yearbook, No. 1]. Los Angeles, California: Rafu Shinpôsha. [Jap]*
Address: Los Angeles.

1031. Smith, Jared G. 1901. Commercial plant introduction. *Yearbook of the U.S. Department of Agriculture* p. 131-44. For the year 1900. See p. 133, 138-40.
• ***Summary:*** In the section titled "Cooperation with experiment states in plant introduction" (p. 131+) states (p. 133): "But the cultivation of the sunflower may be undertaken, using our improved methods and machinery, as feed for poultry or in combination in feeding rations; also the soy bean for forage and hay to fatten animals. New varieties of sunflower may be obtained from Russia or new soy beans from Japan to satisfy our needs in these particulars,..."

Pages 138-39: At the California station–"At the Amador substation, Prof. C.H. Shinn reports... The common, scarlet, purple, and hedge vetches also made a very fine growth, indicating that they are worthy of more extensive planting in the Sierra foothills. These vetches did even better in northern California. The European lupines and many forms of field peas have also done well, as have the soy beans, cotton, sorghums, and the Russian millets."

Page 140: "Kansas Station–At the Kansas experiment station... Three varieties of soy beans from Japan did finely, and one of them, a late variety, produces pods without any rank or bitter taste, indicating that it might be developed into a good garden vegetable."

"Kentucky Station–At the Kentucky experiment station three varieties of soy beans from Japan did well, and the early maturing ones seemed especially adapted to cultivation in Kentucky." Note: No variety names are listed. Address: Chief of the Section of Seed and Plant Introduction, USDA.

1032. Soybeans are first crushed in Japan for oil and meal by Owada Seisakusho (Early event). 1901.
• ***Summary:*** In 1901 crushing of soybeans starts in Japan. Owada Seisakusho of Tsuruga, Fukui prefecture, Japan, starts making soy oil and soybean cakes using the press method (*assaku-ho*).

The source of this fact is the "Sixty Year History of the Nisshin Oil Mill Co."

Note: In 2013 this fact was confirmed by the former executive director of the Japan Oilseed Processors Association, Mr. Y. Komura.

1033. Wuchino, A.E. 1901. Soia [Soya: As one of the best food and feed products from the plant world]. Tiflis (Tblisi), Republic of Georgia: K.P. Kozlovski (Ave. Golovin, No. 12). 45 p. 26 cm. [Rus]
• ***Summary:*** Page 12 states: The information about growing soybeans in Transcaucasia is very poor, but the first planting was done in the 1870s. G. Sturua obtained some varieties of soybeans from Tokyo, Japan, via his brother. He gave some of these seeds to the Tblisi Botanical Garden [in Georgia]. In 1898 at the agricultural school in Kutaisi, they conducted a good soybean trial.

Note 1. This is the earliest document seen (April 2008) concerning soybeans in the Republic of Georgia, or the cultivation of soybeans in Georgia. This document contains the earliest date seen for soybeans in Georgia, or the cultivation of soybeans in Georgia (1898 in Kutaisi). The source of these soybeans is unknown, but they may have come from Japan. It is not clear whether or not the soybean seeds were cultivated at the Tblisi Botanical Garden. They probably were, but we cannot be certain.

Note 4. This is the 2nd earliest document seen (May 2008) concerning soybeans in Central Asia (Transcaucasia), or the cultivation of soybeans in Transcaucasia. This document contains the 2nd earliest date seen for soybeans in Central Asia or the cultivation of soybeans in Central Asia (1870s). The source of these soybeans is unknown.

Note 4. Kutaisi (or Kutais) is a city in western Georgia on both banks of the Rioni River about 65 miles (105 km) northeast of Batumi.

Note 5. This is the earliest document seen (May 2008) that mentions G. Sturua. How can we learn more about his

© Copyright Soyinfo Center 2014

life and work with soybeans? For more details, see Tupikova 1930. Address: Georgia.

1034. Photograph of Kintaro Oshima with colleagues at Göttingen University, Germany. 1901? Undated.

• ***Summary:*** This undated group photograph was taken at the University of Göttingen (in the town of Göttingen, central Germany) in about 1901, the year Peter A. Yoder graduated with his PhD degree. Kintaro Oshima (relatively short in height) is the 2nd person from the left, standing. The location appears to be a chemistry classroom. The photo was apparently taken by Peter Yoder, who studied at this university from 1899 to 1901, when he received his PhD degree. Back in the United States, Yoder worked for 20 years as an agricultural chemist and technologist for USDA's Bureau of Plant Industry.

On the back of the photo (see next page), each of the 16 persons in it has signed his name and place of origin. For example: "Kintaro Oshima, Sapporo, Japan." Note: He also wrote (vertically) in Japanese: Ooshima Kintaro, Dai Nippon Teikoku [Empire of Japan], Sapporo." "B.B. Ross, Auburn, Alabama. Charles A. Browne, Jr., State College, Pennsylvania. A.J. Gibson, Queensland, Australia." It was a multinational group: Four people were from Russia, two from Holland, two from Göttingen, and one each from Hannover, Germany, Java (Dutch East Indies), France, and Australia.

Note: Oshima's name appears in our SoyaScan database in nine different records from 1909 (USDA Bulletin titled "A digest of Japanese investigations on the nutrition of man", suggesting he was in Japan at the time) to a 1914 article on "The presence of creatinine in beans" published in *Journal of the Tokyo Chemical Society.* The photo was sent to Soyinfo Center in Feb. 2008 by Chris Yoder of Michigan. Dr. Peter A. Yoder (born 21 Aug. 1867 in LaGrange Co., Indiana; died 20 July 1929 in Washington, DC; buried in Ft. Lincoln Cemetery, Washington, DC) was Chris Yoder's grandfather's uncle.

1035. *USDA Bureau of Plant Industry, Inventory.* 1902. Seeds and plants imported through the Section of Seed and Plant Introduction for distribution in cooperation with the agricultural experiment stations. Numbers 4351 to 5500. No. 9. 79 p. Jan. 18. Also titled USDA Bureau of Plant Industry, Bulletin No. 5.

• ***Summary:*** Soy bean introductions: Glycine hispida.

4628. "From Massachusetts. Received March 13, 1900. *Medium green.* Distributed."

4912-4914. "A collection of soy beans from Japan. Received March 23, 1900. They are as follows:

"4912. Common. Distributed.

"4913. Best White. Distributed.

"4914. Best Green. Distributed."

4980. "From Yokohama, Japan. Received March 27, 1900. A collection of vegetable seeds presented by Suzuki & Iida, New York City. *Early soja."*

5039. "From Paris, France. Received March 30, 1900. Presented by Vilmorin-Andrieux et Cie. *Extra early black-seeded.* A very early maturing strain."

Note 1. This is the earliest document seen (Jan. 2005) by or related to the USDA Bureau of Plant Industry. Note 2. This is the document earliest seen in this series with an issue date (Jan. 18, 1902) printed on the cover. Address: Washington, DC.

1036. Makino, T. 1902. Observations on the flora of Japan. *Botanical Magazine* (*Tokyo*) 16(179):34-35. Jan. 20. [42 ref. Eng]

• ***Summary:*** Gives numerous early references concerning Glycine Soja, Dolichos Soja Linn., Soja hispida Moench, Glycine hispida Maxim., Soja japonica, Sooja japonica Sieb., and Daidsu. Habitat: Japan, widely cultivated, having various forms. There are not any wild forms in Japan. "Soja" was derived from "Shoyu" or Soy, a kind of sauce made of boiled seeds of this plant and fermented wheat, commonly used by Japanese.

Glycine (Soja) ussuriensis. Glycine Soja, Soja angustifolia, Johnia javanica, Glycine javanica, Phaseolus lathyroides. This species is never in cultivation and the seed grains are useless hence the specific name "Soja" given to it is very inappropriate. Probably a variety of the preceding species.

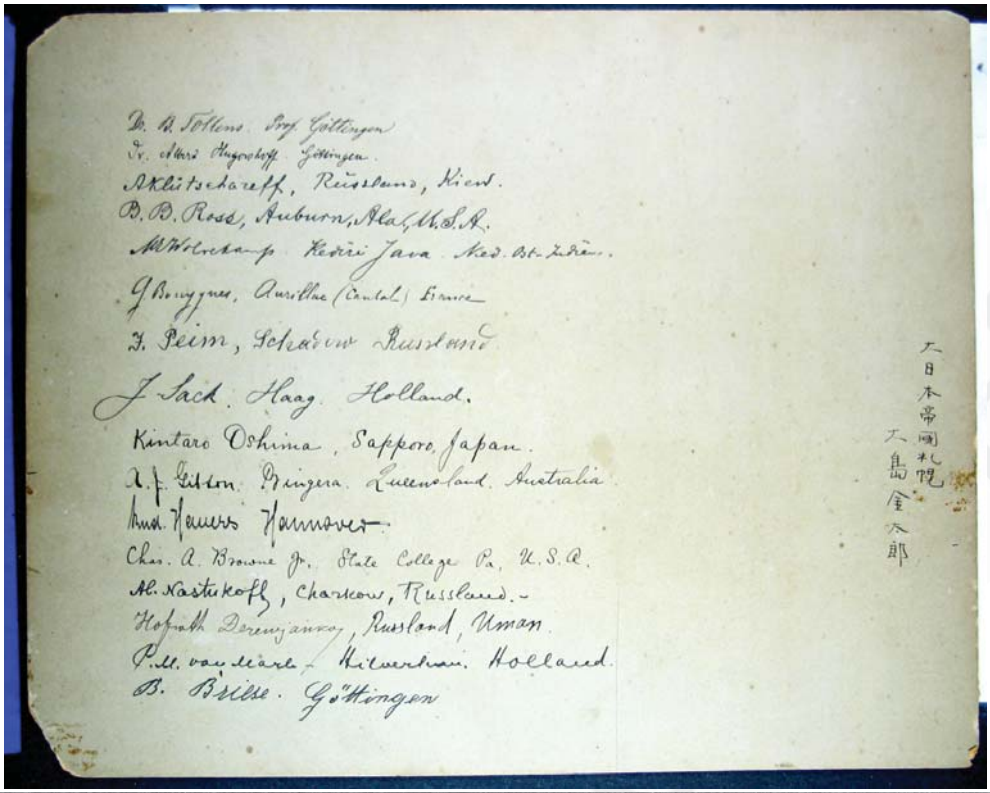
1037. Boehmer (L.) & Co. 1902. Wholesale catalogue: 1902-1903. Yokohama, Japan. 44 p. Illust. 26 cm. [Eng]

• ***Summary:*** The section titled "Plants and seeds of economic value" (p. 30+) gives the first detailed information seen (Dec. 2004) in Japanese seed catalog about the different varieties of soy-beans as follows: In large letters near just below the section title we read: "We are in a position to fill special contracts for the following food-, fodder-, vegetable-, and other plants, which are used in the textile and other industries."

After describing 3 types each of rice and millet the text continues: "Soy-bean. Dolichos soya L. Jap. nom. [Japanese name(s)] Daidzu and O-mame. These Jap. soybeans have been well acclimatized in Central Europe and there yield very fine crops." Three types, based on seed color, are described:

(1) "The white Soy-bean. Jap. nom. Shiro Mame. The following varieties are recommendable: Five-months bean. Goguwatsu Mame. Ripening in July. Summer bean. Wase or Natsu Mame. Small seeded, early. Middle-late bean. Nakate Mame. Larger in seed than the foregoing. Late bean. Okute Mame. Bullet bean. Maru Mame. Very valuable as horse feed. Gun bean. Teppo Mame. This kind is principally used

© Copyright Soyinfo Center 2014



© Copyright Soyinfo Center 2014

to make the famous Soyu-sauce" [shoyu, soy sauce].

Note: This is the earliest document seen (April 2012) that uses the term "Soyu-sauce (regardless of capitalization or hyphenation) to refer to soy sauce.

(2) "The black Soya-beans. Kuro Mame. Round middle-late bean. Kuro-Teppo Mame. Green Mame. Nicuri [Nikuri] Sei. Green throughout. Pale green–Kaje [Kage] Mame. Round seeds."

(3) "Speckled Soya-beans. Jap. nom. Fuiri Mame. Green and black bean. Kuro-Kura Kake-Mame. Green and brown bean. Aka-Kura Kake-Mame. Flat and long bean. Yellow-green bean. Fuiri Mame. Marked with many dark spots."

Other food legumes on this page include: Sword bean–Dolichos incurva, nata mame. Ray-fruited dwarf bean–*Phaseolus radiatus,* adsuki [azuki], small pealike bean of very fine fine flavor and therefore very popular. *Phaseolus typicus*–Oku Adzuki–Very large seeded bean. *Phaseolus pendulus*–Kuro Adsuki–Black fruited. Shiro Adsuki–White fruited. Tsuru Adsuki–Twining bean. *Phaseolus subtrilobatus*–Bundo [Yayenari], bearing each from 4 to 6 hanging pods. Also (p. 31): *Pueraria Thunbergi*–Kudzu.

Note 1. The above information on soybean varieties and other economic plants appears to have been taken in large part from any of three books about Japan by Johann J. Rein published from 1884 to 1889, especially his 1889 book.

Photos show: (1) A characteristic Japanese garden, with many stone lanterns and trees, and people walking along the stone pathways around the central pond. (2) A Japanese woman seated, packing bulbs into baskets. (3) The company's packing department, showing many Japanese and European workers and trays of bulbs. (4) A bamboo-walk in Japan.

Note 3. The title page of this catalog states: "Nurserymen & exporters. The only European nursery firm established in Japan. Established in 1882. Cable address: Boehmer Yokohama." It suggests that the company's main business is in "lily-bulbs, iris, peonies, and other Japanese flower roots." Page 1 states that this is the first Boehmer catalog in which "photo-arto-prints" appear. Page 3 notes: "Prices are quoted and will be charged in Yen and Sen, 1 ¥ = 100 sen. The value of the Yen is subject to slight fluctuations, but about equal to 0.50 Gold $; 2 shillings; 2 Mark; 1 Rubel [sic, Ruble]; 2.50 Frcs. [French francs]; 1.20 Fl. [Florins, probably Austria-Hungary], etc." Address: Nos. 5 and 28 Bluff, Yokohama, Japan.

1038. Yokohama Nursery Co., Ltd. 1902. Descriptive catalogue... for 1902. Yokohama, Japan. 80 p. Illust. Index. 26 cm. [Eng]

• ***Summary:*** On the cover of this English-language catalog is an illustration of a flowering cherry tree (*Prunus Pseudo-cerasus*) blooming. In the section "Price list of seeds" (p. 72+) is a subsection (p. 76) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1901 catalog. Address: P.O. Box No. 72. Nos. 21-35 Nakamura, Yokohama, Japan.

1039. Mammoth: New U.S. domestic soybean variety. Synonyms: Late Yellow, Mammoth Yellow, Southern, Yellow (Ball 1907). Late (Piper & Morse 1923, p. 42). 1902. Seed color: Yellow (straw), hilum tawny.

• ***Summary:*** Sources: E.B.D. [Evan B. Davis, of Hendricks County, Indiana]. 1902. "Soy beans will be valuable this season." *Indiana Farmer.* 62(5):3. Feb. 1. "While it [Early Yellow, or Dwarf] will not produce as much forage or seed as the... Mammoth, it is a sure crop for Indiana and the other varieties are not."

Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No 98. 28 p. May 27. See p. 12, 13, 26-27. "Classification–Key to the varieties (p. 11): VI. Yellow seeded: 1C. Later, 125 to 135 days, taller, 32 to 42 inches = Mammoth." "The Mammoth is the best known and most widely cultivated variety in the Southern States. It has also been sold to a considerable extent in the North, mostly because of the splendid growth it makes, but it has never given satisfaction there because of its lateness. It has been a commercial variety in this country for a great many years, but its origin is not known... The time required to reach maturity varies from 110 to 140 days, the average being 120 and 130 days. The yields of 17 plats at Washington varied between 4 3/5 and 15 bushels to the acre, with an average of 9 1/3 bushels. The name, Mammoth, is very suitable for this variety, and is coming into use for it in agricultural press and by some seedsmen. Numbers and sources of lots grown: Agrost No. 1195, 'Yellow,' S.P.I. No. 4285, Virginia; Agrost. No. 1300, 'Late,' F. Barteldes & Co.; Agrost. No. 1305, T.W. Wood & Sons; Agrost. No. 1307, 'Southern,' T.W. Wood & Sons; Agrost. No. 1308, Iowa Seed Co.; Agrost. No. 1309, Johnson & Stokes; Agrost. No. 1310, Plant Seed Co.; Agrost No. 1311, C.J. McCullough; Agrost. No. 1314, 'Late Yellow,' Peter Henderson & Co.; Agrost No. 1315, Northrup, King & Co.; Agrost No. 1465, 'Yellow,' Breck & Sons; Agrost. No. 1466, 'Yellow,' Texas Seed and Floral Co.; Agrost. No. 1472, 'Southern,' J.M. Thorburn & Co.; Agrost No. 1477, Hammond Seed Co.; Agrost. No. 1976, union of seven of above serial numbers; Agrost No. 1977, union of seven of above serial numbers; S.P.I. No. 4285, 'Yellow,' T.W. Wood & Sons; S.P.I. No. 17280, grown from Agrost. Nos. 1976 and 1977."

Piper, C.V.; Nielsen, H.T. 1909. "Soy beans." *USDA Farmers' Bulletin* No. 372. 26 p. Oct. 7. See p. 8-9. "Mammoth (Yellow)."

Piper, Charles V.; Morse, W.J. 1910. "The soy bean: History, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 187. 84 p. Dec. 31. See p. 29. "The Mammoth is at present the most important soy bean grown in the United States. It has also been known as Late, Yellow, Late Yellow, Southern, and Mammoth Yellow. The

© Copyright Soyinfo Center 2014

date of introduction of this variety is very obscure, and nothing definite is known regarding its origin. None of the numerous recent introductions are identical and but one is closely similar, No. 23328, from Erfurt, Germany, received as 'Yellow Riesen.' It is not probable, though, that this was a German-grown seed, as so late a variety could scarcely mature in Germany. Several varieties from Shanghai, China, and from Japan are closely related. It may possibly be the 'white-seeded' soy bean introduced by the Perry expedition. We have been unable to find any early published records that definitively refer to this variety. It is not improbable that it is this variety that was grown at the North Carolina Agricultural Experiment Station in 1882. There can be but little doubt that it is the "soja" bean from T.W. Wood & Sons, Richmond, Virginia, grown by the Kansas Agricultural Experiment Station in 1889 (see their Annual Report for 1899, p. 43) and in 1890 (see their Bulletin 19, p. 201). Since 1895 Mammoth has been a well-known variety."

Piper, Charles V. 1914. *Forage Plants and Their Culture.* New York, NY: The Macmillan Co. xxi + 618 p. See p. 513-14, 519. The Mammoth variety "was introduced previous to 1882. It is largely due to the introduction of this variety that the soybean has become an important crop in the United States, as a very large percentage of the acreage is still planted to this variety." "This is a tall late variety, under average conditions growing from three to five feet high, and strictly bushy in habit. At the present time probably two-thirds of the acreage of soybeans in the United States is devoted to this variety. On account of its lateness, it will not usually mature seed north of the District of Columbia and Kentucky, This variety was introduced prior to 1882, but there is no record as to its exact source. The seeds are yellow, one pound containing about 2100. The pubescence is gray, and the flowers are white" (p. 519).

Morse, W.J. 1918. "The soy bean: Its culture and uses." *USDA Farmers' Bulletin* No. 973. 32 p. July. See p. 15. "The Mammoth (fig. 10) is the standard commercial late variety, more extensively grown at the present time than any other. It yields well both in grain and forage, but for grain it cannot be expected to mature north of Virginia and Tennessee. As forage, however, it can be utilized much farther north."

Kinney, E.J.; Roberts, George. 1921. "Soybeans." *Kentucky Agric. Exp. Station, Bulletin* No. 232. p. 23-57. May. See p. 33. Concerning the Mammoth variety: "The chief variety of the Cotton Belt and by far the most extensively grown of any variety in the United States. The introduction of this excellent variety in 1882 was largely responsible for the greatly increased interest in the soybean in this country."

Piper, Charles V.; Morse, William J. 1923. *The soybean.* New York, NY: McGraw-Hill Book Co. xv + 329 p. March. See p. 41-43, 166. Page 41 states: "The early introduced varieties.–Previous to the numerous introductions by the United States Department of Agriculture beginning in 1898, there were not more than eight varieties of soybeans grown in the United States." One of these was Mammoth (with yellow seeds). Page 42 states: "Mammoth.–The Mammoth is at present the most important soybean grown in the United States. It has also been known as Late, Yellow, Late Yellow, Southern, and Mammoth Yellow. The date of introduction of this variety is very obscure, and nothing definite is known regarding its origin."

Note: This is the earliest document seen (Dec. 2004) that mentions Northrup, King & Co. in connection with soybeans. Address: USA.

1040. Sawa, S. 1902. Note on Hamananatto, a kind of vegetable cheese. *Bulletin of the College of Agriculture, Tokyo Imperial University* 4(5):419-20. March. [1 ref. Eng]
• ***Summary:*** "This peculiar product is prepared from soy-beans, as are also two other kinds of vegetable cheese manufactured in Japan, the *Miso* and the *Natto;* but it has a different flavour and taste, and lacks the slimy character of the common *Natto.* It is manufactured only in the central provinces of Japan–especially in those of Mikawa and Totomi, from which it finds its way all over the country. It has an agreeable salty taste and a peculiar odor somewhat resembling that of the fresh crust of brown bread. There is not any mycelium discernible with the naked eye. The soy-beans composing it form no compact mass, and are of a brown colour with a thin layer of a salty taste and a somewhat sticky consistency.

"In preparing this product, the soy-beans are well washed, boiled to softness, spread on straw mats, and mixed with wheat flour (6 liters flour to 10 liters soy-beans). Moldfungi will now develop, but soon afterwards this mixture is exposed to the direct sunlight for three days, probably to kill the fungi, and is then put into flat tubs. After 12-13 days some common salt and ginger are added. The entire mass is then kept in tubs under pressure for about thirty days.

"A portion, carefully freed from the pieces of ginger and particles of straw mats used in its manufacture, was dried, pulverized and sifted through a 0.5 mm sieve. I found the chemical composition of the dry matter to be as follows: Albuminoid nitrogen 3.57%. Crude fat 3.44%. Crude fibre 6.87%. Total carbohydrate excluding cellulose 8.40%. Total ash, including salt added 18.54%. The fresh sample contained 44.73% water and 55.23% dry matter.

"There exist at least three different kinds of bacteria in this product. The most numerous colonies on agar are of two kinds." A detailed microbiological description is given.

Note 1. This is the earliest document seen, and also the earliest English-language document seen (Nov. 2011) that contains the word *Hamananatto* (or "Hamanatto").

Note 2. This is the earliest English-language document seen (Jan. 2012) that uses the word "sticky" to describe natto.

© Copyright Soyinfo Center 2014

1041. Orton, W.A. 1902. Some diseases of the cowpea. I. The wilt disease of the cowpea and its control. *USDA Bureau of Plant Industry, Bulletin* No. 17. p. 9-20. April 22. See p. 15-18.

• ***Summary:*** In the section titled "Preventive measures," the subsection on "Substitution of other crops" states (p. 15-16): "The soy bean and Florida beggar weed may be used as hay as a summer crop, or hairy vetch may be sown in the fall. All these crops have in common the disadvantage of being unfamiliar to the average farmer... while the cowpea is cultivated and its use understood everywhere."

The subsection titled "Experiments with cowpeas and other crops" states that on 29 May 1901 1½ acres were planted of land thoroughly infected with cowpea wilt were planted "to a number of varieties of cowpeas, soy bean, velvet bean, and some Japanese forage plants obtained through the section of Seed and Plant Introduction of this Department." "The soy beans were a disappointment, as they made a very small growth, one foot or so high, and produced only a small crop of seed. They were badly attacked by the nematode [*Heterodera radicicola*] and suffered much from dry weather.

"A brief account of these forage plants as grown on land infected with wilt disease and nematode follows:... *Soy bean* (*Glycine hispida*).–Eight varieties were tried on ten plats. All proved to be immune to the wilt disease, but none of them was adapted to the local conditions. The writer planted the soy bean in 1900 on Edisto Island, South Carolina, "where it made a heavy growth, 3 to 4 feet high, and produced a large crop of seed. It was free from wilt disease there and showed great promise as a forage crop." The varieties tested at Monetta [South Carolina, in cooperation with Mr. T.S. Williams of Monetta] were as follows:" Best Green, Early Black, Yoshioka, Rokugatsu, Gosha, Black Round, Green Medium, and Bakaziro [Bakajiro]. All but the first and second originated in Japan. The first, seventh, and eighth were most affected by the root nematode.

Note 1. This is the earliest document seen (July 2013) that mentions the soybean varieties Black Round, Gosha, Rokugatsu, or Yoshioka, and the earliest document seen (one of two documents, July 2013) that mentions the soybean varieties Early Black, Bakaziro, or Green Medium.

Note 2. Some of these named soy bean varieties were later renamed in 1907 as follows: Best Green became Tokio / Tokyo. Early Black became Buckshot. Yoshioka became Yosho. Rokugatsu became Ito San. Gosha became Manhattan. Black Round became Buckshot. Green Medium became Guelph. Bakaziro became Amherst. Address: Asst. Pathologist.

1042. Suda, Katsusaburô; Yoneki, Z. 1902. Nattô no biseibutsu ni tsuite [On the microorganisms of natto]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 242. p. 321-26. April. Special Conference Lecture (Rinji Taikai Enzetsu). [Jap]

• ***Summary:*** The authors believe that the microorganisms contained in natto consist of one sort of motile [mobile] and two sorts of immotile varieties. They predict that the varieties which take part in the fermentation of natto and cause the change in its chemical composition, producing thereby its characteristic smell and stickiness, are probably the motile and one of the immotile varieties. Address: 1. Sendai; 2. Joshu.

1043. Webber, Herbert J.; Orton, W.A. 1902. Some diseases of the cowpea. II. A cowpea resistant to root knot (*Heterodera radicicola*). *USDA Bureau of Plant Industry, Bulletin* No. 17. p. 23-36. April.

• ***Summary:*** "Root-knot or root-gall, as it is ordinarily termed, is one of the most common and destructive plant diseases in the southern United States. The disease is caused by the attacks of a nematode, *Heterodera radicicola* (Greef.), Müll.*, which enters the roots and causes large galls (Footnote: **Heterodera* is referred to in various publications under the generic names *Tylenchus* and *Anguillula*). It is interesting to note that the nematode producing the root-knot of plants is closely related to the trichina of pork, which has become a household word and a universal terror."

Nematodes are popularly called "nematode worms." "The size of the gall is largely determined by the number of nematodes present. As new nematodes are hatched and take up their abode in fresh portions of the tissue the gall increases in size."

"The best descriptions of the development and metamorphosis of the root-knot nematode (*Heterodera radicicola*) known to the writers are those by Professor George F. Atkinson (1889, "Nematode root galls"), then of the Alabama Experiment Station, and by Dr. G.E. Stone and Ralph E. Smith (1898, "Nematode worms"), of the Hatch Experiment Station of Massachusetts." Full citations are given for each of these two papers.

"Extent of the disease: The disease is evidently very common throughout the Gulf States and South Carolina, and may possibly extend farther northward. However, it will probably never become a serious malady north of this general region, except in greenhouses, as the nematode is killed by severe cold."

The section titled "A resistant cowpea" states (p. 35) that four soybean varieties (Best Green, Early Black, Green Medium, and Bakaziro [Bakajiro]) were grown in the same experimental field as the cowpeas, on nematode and wilt infested soil. All four were "badly affected" by the nematodes. One variety of cowpea, the Iron cowpea, showed considerable nematode resistance.

Note 1. This is the earliest document seen (Oct. 1997) stating that nematodes attacked soybeans in the United States.

© Copyright Soyinfo Center 2014

Note 2. This is the earliest document seen (one of three documents, July 22013) that mentions the soybean varieties Early Black or Bakaziro. Note 3. These soybeans were apparently grown on the farm of Mr. T.S. Williams, Monetta, South Carolina. Address: 1. Pathologist; 2. Asst. Pathologist.

1044. Ono, Ryozo. 1902. Shôyu-chû yori sekisetsu kesshôtai ni tsukite no jikken [Investigation of the crystallized substance separated from shoyu]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 245. p. 649-54. July. [Jap; eng]
• ***Summary:*** The author examined the crystals that separate from shoyu during the winter; he reports on the cause and prevention of such separation.

1045. Meyer, Frank Nicholas. 1902. Letters of Frank N. Meyer. 4 vols. Compiled by Bureau of Plant Industry, USDA. 2444 [i.e. 2577] leaves. Unpublished typescript.
• ***Summary:*** Only two copies of these rare, magnificent unpublished documents exist. One is Rolls 28-30, Vols. 105-109, Project Studies, Division of Plant Exploration and Introduction, Record Group 54: Records of the Bureau of Plant Industry, The National Archives. The second is at the University of California at Davis. Most are carbon copies of typewritten letters. Includes some illustrations (pencil sketches) by Meyer.

The first letter in this collection, dated 7th Oct. 1902, is from Meyer in Santa Ana, California, to Mr. Adrian J. Pieters (a fellow Dutchman) at USDA in Washington, DC. Meyer arrived in California on 18 Sept. 1902 and started immediately to work for USDA at the plant introduction garden in Santa Ana; he stayed 7 months. In April 1904 Meyer is in Guadalajara, Mexico. In March 1905, Meyer receives an offer from David Fairchild and Pieters to work for USDA as an agricultural explorer in northern China. In August 1905, he is in Nagasaki, Japan. In Sept., he is in Shanghai, China. In Oct. 1905, he writes a long letter to Fairchild. Meyer made four very fruitful expeditions to Asia, eastern Europe, and the Middle East. His first expedition was to China, Manchuria, and Siberia, 1905-08. His second was to Europe, Russia, Caucasus, Transcaucasia, Turkestan, and Siberia, 1909-12. His third was Russia, Siberia, Manchuria, China, and Japan, 1912-15. And his fourth and final expedition was to Japan and China, 1916-18.

On 23 Dec. 1917, war engulfed Frank Meyer at Ichang (I-ch'ang or Yichang) on the Yangtze River. He was trapped there until 2 May 1918 when he managed to break through lines of soldiers. The last letter in this collection, dated 18 May 1918, is from Meyer to Fairchild written from Hankow, China. He died about 1-2 June 1918, having drowned in the Yangtze River below Anking, and above Wuhu, China.

Meyer did not report any soybeans in Russia or Turkestan.

Note 1. This is the earliest document seen (July 1998) concerning Frank N. Meyer.

Note 2. Ichang, which opened as a treaty port in 1876, was a city of 40,000 people by 1920. It is situated at the head of steam navigation on the Yangtze, at the throat of the main outlet from Szechuan, and at the point where the mountains of Szechuan and western Hupeh meet the central plain of Hupeh.

Note 3. Soyfoods Center owns all pages that mention soy, plus: (1) The full U.C. Davis cataloging record for the archival collection, which is in Special Collections SB108 A7M49 1902 v1-4. (2) A letter from Melissa Tyler of U.C. Davis, dated 22 Sept. 2003, discussing the collection and its lack of front matter. (3) Appendix A: Bureau of Plant Industry, by Knowles Ryerson about a dispute he had with Secretary of Agriculture Henry Wallace involving Nicholas Roerich, Dr. H.G. MacMillan, and James F. Stephens over a plant exploration expedition to Manchuria and the Gobi Desert. In 1934 Ryerson was appointed Chief of the USDA's Bureau of Plant Industry; this dispute led to his removal that same year; he was replaced by Frederick D. Richey. Address: USDA Bureau of Plant Industry.

1046. Morse, Edward S. 1902. Glimpses of China and Chinese homes. Boston, Massachusetts: Little, Brown & Co.; London: Kegan Paul. xv + 216 p. Oct. Illust. Index. 21 cm. Reprinted in 2001 by Kegan Paul.
• ***Summary:*** In Chapter 3, "A Chinese dinner," the author notes (p. 65): "Women are excluded from the table, as in Japan." He gives a list of the foods he was served for dinner, with his comments (p. 67). The last is: "Fermented bean-curd soup. Very poor."

Edward Sylvester Morse (an American, from Hartford, Connecticut) lived 1838-1925. The book is illustrated by sketches from his journal. Prof. Morse, who lived and taught for several years in Japan in the late 1870s and 1880s, and quickly grew to admire and love the Japanese, finds little to like or admire among the Chinese: "In my short experience with the Chinese I do not recall the faintest indications of kindliness, politeness, or urbanity; whether high or low in station, their attitude was always the same." "The reception a foreigner encounters in China is due to an intense dislike of us, coupled with an absolute contempt for all we do and for all we have accomplished" (p. 206-07).

Note: This is the 2nd earliest English-language document seen (Oct. 2011) that clearly mentions fermented tofu, which it calls "Fermented bean-curd" (one of two documents). Address: Former Prof. of Zoology, Imperial Univ., Tokyo.

1047. *Times of India* (*The*) (*Bombay*). 1902. Improving Indian agriculture: Some recent experiments. Dec. 1. p. 6.
• ***Summary:*** "In two previous articles we described the highly interesting experiments, now in progress at the Bombay Government farms established at Poona and Surat,

© Copyright Soyinfo Center 2014

in the improvement of Indian cotton...

These farms are intended to benefit Indian agriculture. "The Bombay government for many years enjoyed the services of Mr. J. Mollison, the present Inspector-General of Agriculture, a most experienced and practical agriculturist. Under his supervision the work of the farms was framed on lines which ensure that any discoveries made shall be of direct value to the ryots" [farmers].

"The seed store is the microcosm of the experimental farm, for there are gathered together specimens of every kind of grain and vegetable which is being tested. A single example will give an idea of the work which is in progress. Here are some half dozen sealed jars containing different varieties of the soy bean. This is largely utilized as human food in Japan, and is much richer in albuminoids than any other pulse. It is grown to a certain extent in Northern India, but the quality is far inferior to that produced in Japan. So Japanese seed has been procured, with a view to its acclimatization and substitution for the inferior Indian variety.

"A curious circumstance transpired in connection with this particular bean. In one small area in the Central Provinces it was found that a kind was growing far superior to any raised elsewhere in India. Traced to its source, it was ascertained that this exception rose from five seeds carried thither by a wandering *fakir"* [Muslim Sufi ascetic].

The groundnut is also discussed.

1048. Matsumura, J. 1902. A conspectus of the leguminosae found growing wild, or cultivated in Japan, Loochoo and Formosa. *Botanical Magazine* (*Tokyo*) 16(181):37-115. See p. 85 (31). [Eng]

• ***Summary:*** "51. Glycine, L. I. Stems erect. Leaflets usually broadly ovate or elliptical. Flowers white or violet. Stamens diadelphous. Fl[owers]. July. Japan; Liukiu [Ryukyu]; Formosa. Cult[ivated]. Daizu. G. hispida, Maxim.

II. Stems twining. Leaflets usually oblong or linear. Flowers violet. Stamens monadelphous or diadelphous. Tokio; Formosa? Fl[owers]. Sept. Tsuru-mame. G. ussuriensis, Regel et Maack.

1049. Becker, Joseph Ernest de. 1902. The sexual life of Japan: being an exhaustive study of the nightless city... or, The "History of Yoshiwara Yûwaku." New York: American Anthropological Society. xvi + 386 p. + 25 unnumbered leaves of plates. See p. 160. Illust. 25 cm. *

• ***Summary:*** By an English student of sociology. On prostitution in Tokyo. J.E. de Becker lived 1863-1929.

1050. Candolle, Alphonse Louis Pierre Pyramus de. 1902. Origin of cultivated plants. New York, NY: D. Appleton and Company. viii + 468 p. See p. 330-32. 20 cm. The international scientific series, vol. XLVIII. [15 ref. Eng]

• ***Summary:*** The section on soy in this edition is identical to (in fact, a facsimile of) that in the 1885 edition by the same publisher in New York. The author, a famous Swiss botanist, whose father was also a famous botanist, lived 1806-1893. Address: France.

1051. Johnson & Stokes. 1902. Garden and farm manual (Mail order). Philadelphia, Pennsylvania. 88 p.

• ***Summary:*** In the section on "Selected Farm Seeds," page 58 states: "Soja Bean (Late Variety)–The demand for the **Soja** or **Japanese Soy Beans** has grown remarkably of late years. Their great value is as a forage crop and for fertilizing the soil and for pasturing or feeding the green fodder much in the same way as the cow pea. A valuable variety south of the Ohio River. Sow broadcast one-half bushel to the acre, or it may be planted in drills three feet apart and one foot between plants. Pkt., 10c.; lb., 25 c.; 3 lbs., 60 c., postpaid; by freight or express, qt., 20 c.; peck, 70 c.; bush., $2.25.

"Soja Bean (Early Variety)–The ordinary or late soja bean, described above, while valuable south of the Potomac and Ohio Rivers, is too late to be of value in the far Northern States. This variety ripens in all of the Northern States, where it has been grown over four feet in height, heavily podded with seed and yielded over ten tons per acre. It is a valuable fodder variety either for feeding green or for the silo. Being a rich nitrogenous feed, it is unsurpassed as a flesh-former, and, like the clovers, is a soil-improver, deriving its nitrogen from the air. Concerning the "New All who are interested in this class of plants should give our New Early Soja or Soy Bean a trial. Choice seed grown for us in Michigan" [by E.E. Evans]. Lb., 25 c.; 3 lbs., 60 c., by mail, postage paid; by express or freight, qt., 25 c.; peck, $1.00; bushel of 60 lbs., $3.50.

A very interesting photo (2.75 by 6.63 inches) shows "A field of our new early Soja Beans growing in northern Michigan." A mother and daughter are standing in the field.

Note: This is the earliest seed catalog seen (June 1999) that contains a photograph of soybean plants or soybeans. If we compare this photo with the photo on the cover of the "1904 Retail Price List" from the Evans Seed Co. of West Branch, Michigan, we can see clearly that the mother and daughter in each photo are the same! Therefore the photo of soybeans in this 1902 Johnson & Stokes catalog shows soybeans growing on the farms of the Evans Seed Co. in northern Michigan. Moreover, Johnson & Stokes almost certainly obtained its "New early variety" from the Evans Seed Co. Thus, the Evans Seed Co. must have been growing soybeans by 1902.

On the cover of this catalog is an illustration of a jovial, elderly man, admiring a giant tomato which he is holding on the five fingers of his right hand. He has a white beard, bald head, and fairly long white hair, and is wearing spectacles and suspenders. This is the first cover of a Johnson & Stokes catalog on which this man appears; he will soon appear on many more.

© Copyright Soyinfo Center 2014

This catalog is owned by the Smithsonian Horticulture Branch Library in Washington, DC. Call number: 11055. Address: 217 and 219 Market St., Philadelphia, Pennsylvania.

1052. Law, James Thomas. comp. 1902. Law's grocer's manual: A practical guide for tea and provision dealers, Italian warehousemen, chandlers, drysalters, bakers, confectioners, fruiterers, and general store-keepers. 2nd ed.: Tofu (Document part). London: Gilbert & Rivington, Ltd. 1185 p. See p. 957. Illust.

• ***Summary:*** "Torfu [sic, tofu] or Bean Curd.–(See also *Soy.*) A Japanese food product which is said to approach more nearly to animal food than any other vegetable. It is made by powdering the yellowish-white beans grown chiefly in the North of China and the Himalayas. The powder, or meal, is impregnated with brine, and undergoes elaborate treatment until coagulated. and preserved in a mass. It contains about 1-5 [one-fifth] its weight of fat and 2-5 [two-fifths] of nitrogenous matter, and when wanted for use is cut up into slabs which may be fried or toasted, and saturated with soy [sauce], so as to taste like a sweet bread, or it may be divided into small squares for soups, sauces, etc."

The first edition was published in 1896. A third edition was published in 1931 in London by W. Clowes & Sons (xiii + 774 p.; edited and revised by C.L.T. Beeching). A fourth edition was published in 1950 in London by William Clowes & Son (xv + 814 p.; edited and revised by W.G. Copsey).

1053. Rorer, Sarah Tyson. 1902. Mrs. Rorer's new cook book: A manual of housekeeping. Philadelphia, Pennsylvania: Arnold and Company. 730 p. Illust. Index. 21 cm.

• ***Summary:*** The soy bean is mentioned in two special sections: Botanical classification of our common vegetables (p. 281): "Leguminosae: Pulse family. Soy bean, peanut, kidney bean, string bean, lima bean, black bean, pea, chick pea, lentil, St. John's bread."

Soy bean (*Glycine hispida,* Maxim.) (p. 334-35): "Soy beans are grown principally in China where they form an important article of food; in fact, they are the richest of all in food constituents. It is also grown to a considerable extent in India [sic], where it is mixed with rice. This bean ranks high in fat and albuminoids and is their only muscle-making food. It has more than meat value. By the Chinese it is made into cheese [tofu], pastes [jiang], and sauces [Soy]. Soy sauce is used by them on all meat and fish dishes. For the English and Americans it forms the foundation for such sauces as club-house and Worcestershire."

Note 1. This is the earliest document seen (Feb. 2012) stating clearly that soy sauce is used as an ingredient in making Worcestershire sauce.

"Soy is an agreeable seasoning to creamed meat dishes and a very pleasant addition to French salad dressing. It can be purchased in jugs at any Chinese shop, or at the American wholesale druggists by measure." A table (based on Church) gives the composition of the soy bean: Albuminoids, etc. 35.3%. Fat 18.9. Starch and dextrin 12.5. Sugar 12.0. Cellulose 4.2. Water 12.5. Mineral matter 4.6.

"Soy" [sauce] is used as an ingredient in 12 recipes: Japanese fish sauce (p. 228). Japanese eggs (p. 253). Sautéd [sic Sautéed] celery ("When ready to serve sprinkle over two tablespoonfuls of soy or mushroom catsup, and send at once to the table," p. 389-90). Ginger chutney (p. 435). Japanese dressing (p. 442). Celery salad ("This is greatly improved by adding a few drops of Worcestershire sauce, soy or mushroom catsup," p. 451). Bobotee salad (p. 457). Philadelphia cream salad (p. 459-60). Shad roe salad ("one tablespoonful of Worcestershire sauce or soy," p. 469). Salad seasoning ("Agreeable seasonings to be kept on hand for salad making: Garlic, mushroom catsup, tomato catsup, Worcestershire sauce, soy, tobasco oil [sic, Tabasco], tarragon vinegar, mint sauce, capers and celery seed," p. 472). "A group of Hawaiian recipes"–To cook beef ("bake until brown. Then pour over it a half pint of sweet cream, to which you have added a tablespoonful of soy. Cook slowly for one hour, basting frequently with the cream," p. 691-92). Cream lettuce sauce to serve with fish ("a half saltspoonful of pepper and a teaspoonful of soy," p. 695).

Worcestershire sauce is used as an ingredient in at least 25 recipes. The first four are: Ox tail soup (p. 62). Cream of cheese soup (p. 74). Mock turtle soup (p. 80). Baked carp (p. 104).

Peanut butter is used as an ingredient in 5 recipes: Cream of peanut soup (p. 75). Lentil pie (p. 337-38). Peanut wafers (p. 535). Nut and fruit crackers (with almond butter or

© Copyright Soyinfo Center 2014

peanut butter, p. 537-38). Marguerites (p. 556).

The earliest recipe seen for homemade peanut butter states (p. 535): "Peanut Butter: Roast the nuts, shell and blow off the brown skins. When making it in large quantities, it will pay to have a bellows for this purpose, or put the peanuts on a coarse towel, cover them with another towel, rub them gently, then blow off the skins. If you use salt dust them lightly with it and grind at once. Pack the butter into glass jars or tumblers, cover them and keep in a cool place. This may be used plain or diluted with water."

Two recipes use almond butter as an ingredient: Almond wafers (p. 525). Nut and fruit crackers (p. 537-38). A recipe for homemade almond butter is given (p. 525).

The word "vegetarian" is mentioned in connection with 7 sections of recipes: Meats (p. 135-36). Vegetables (p. 277-78). Salsify (p. 317-18). Tomatoes and okra with curry (p. 417-18). Nuts (p. 522-23). Nut croquettes (p. 538). Sample menus–Vegetarian (p. 666). The author speaks very favorably of a balanced vegetarian diet. Scientists in general agree, she says, that animal proteids are easier to digest than vegetable proteids. "I must contend, however, that a well selected vegetable diet will give health, bodily vigor and mental strength to those who live rationally." In other countries and cultures, vegetarians are quite equal in strength to those of the same economic class who live largely on meat or on a mixed diet of proper proportions–and are most likely freer from disease. The out-door laborer would probably do better on a vegetarian diet whereas the sluggish digestive apparatus of an indoor is probably better suited to beef (p. 135-36).

"The American people, as a class, in their rushing and bustling life, prefer to take their nitrogen from animal products, which are more easily digested and assimilated than vegetables." "The Japanese, who do in their country the work performed by horses here, are practically vegetarians." The "vegetarian requires but two meals per day," yet they are more nourishing than three meals of meat. They take less time to eat, cost less, and offer more variety. "The amount of cellulose or waste in vegetable foods keeps up the peristaltic motion of the intestines and lower bowels; hence, vegetable eaters are rarely troubled with constipation and torpid livers." America has "grown into a meat-eating nation" in large part because the scullery maids who preside over the kitchen are largely uneducated, do not understand nutrition, and have never learned the subtleties of preparing vegetables (p. 277-78).

"To the vegetarian, they [nuts] are indispensable; they furnish his meat, milk and butter. They are palatable, nutritious, and, if well prepared, easy of digestion. Being of vegetable origin, they are free from the danger of disease germs. Their food value is generally overlooked by Americans as they are generally served as dessert"–on top of a heavy meal. "From the general awakening in regard to healthful diet, societies have sprung up all over the world, recommending the use of vegetable foods, especially fruits and nuts. We have well established, both in New York and London, large vegetarian societies, many with separate branches of 'fruit and nut eaters.' Personally I have tried the experiment, and find it most satisfactory" (p. 522).

The Preface notes that this "new book on Domestic Science... represents on paper The School at its highest period of development..." "A great change in the methods of living has taken place in America during the last few years." Not long ago, schools of cookery taught "fancy cookery"–"to succeed with these elaborate, dyspeptic-producing concoctions as the highest ambition. All this has now changed: the teacher or cook book (an ever present teacher) that does not teach health, body building, and economy in time and money, is short lived. There are still a few women who do elaborate cooking to please the palate and appetite,... They are still at the palate stage of existence. Strive to reach a higher plane of thought–eat to live. Why should any woman be asked to stand for hours over a hot fire mixing compounds to make people ill? Is this cookery? Is the headache that follows a food debauchery more pleasant or pardonable or less injurious than that which follows drink? Results of intemperance are identical. Simple living and high thinking have the approval of learned men and women,..."

Sarah Tyson Heston Rorer (1849-1937) "is one of the great ladies of American culinary history. She was a nationally recognized cookery expert, founded and ran a cooking school in Philadelphia for 18 years, authored over 75 books and pamphlets, edited her own magazine *Table Talk,..* and was domestic editor of the *Ladies Home Journal* for 14 years." With over 1,500 recipes, tips and advice, and more than 125 recipes, this "is one of America's great cookbooks. The *Ladies Home Journal* reprinted it in 1970. It offers an excellent view of American cookery at the turn of the 19th to 20th centuries" (MSU introduction).

Note 2. This is the earliest document seen (Jan. 2001) which states that "body building" is widely considered part of a healthy way of life. Address: Philadelphia.

1054. Yendo, K. 1902. Uses of marine algæ in Japan. *Postelsia: The Year Book of the Minnesota Seaside Station* p. 1-18. For the year 1901.

• ***Summary:*** Page 1: "I propose to mention briefly the more important algae which are generally used by the inhabitants of Japan."

Page 5: *"Phyllitis fascia* (*Haba-nori*)**.** Young plants of this species are collected and laid out in sheets after a method which will be explained more in detail in connection with the uses of Porphyra. The sheets are dried in the sun and afterwards baked, powdered and eaten with soy [sauce]. Haba-nori is used principally by the peasantry of the Province of Awa and Sagami.

"Chordaria abietina (*Matsumo*)**.***"* This is particularly abundant in northern Japan, where it is collected and packed

© Copyright Soyinfo Center 2014

in salt. It is cooked with soy and is a common food of the poorer classes in the north."

Page 6: "*Undaria pinnatifida* (*Wakame*). This species is used in several ways. Dried bales are common articles of merchandise. After washing with fresh water it is used as an ingredient of soup, cooked with soy, or eaten as a salad with vinegar."

Pages 7-9: *Laminaria* (*Kombu*). One form in which *Laminaria* is very much relished by the common people is the so-called Kombu- mati [Kombu-maki] or Laminaria roll. To make this, the dried weed is boiled in fresh water for a while and cut up into pieces of the desired length and width. Portions of dried herring, cod or other fish are wrapped up in the boiled alga and then recooked in dilute soy, soup or milk. *Laminaria* is also used upon New Year's day as a festoon, and for this purpose *L. radicosa* (*Antokume*) is utilized, but not as a food."

Pages 8-9: "*Cystophyllum fusiforme* (*Kijiki* [*Hijiki*]). The young fronds are collected and dried in the sun, in which condition they are a well-known article of merchandise. Cooked in soy it is eaten by the peasantry, but not by the better classes."

Pages 9-12: "*Porphyra* (*Asakusa-nori, amanori* or *nori*). This is one of the most important food plants of Japan. It is used by every class of people in a variety of ways and is cultivated in many districts. The plant is collected, made into sheets, and baked." The method of cultivation is described briefly. The sheets "are washed for a time to remove the mud and sand and are then laid out upon reed mats which are placed in the sun. The layer is made as thin as possible, the plants adhering to each other by their own gelatine. When such a sheet is quite dry it is peeled off from the surface of the mat, folded and ready for market. When baked before a gentle fire, Porphyra acquires a remarkably agreeable flavor; the rule of the cooks is to bake until the purple color changes to green. After cooking, *Porphyra* is eaten with soy, powdered and employed as a condiment or made up into sushi. This occupies somewhat the same place in the Japanese menu as the sandwich does in Europe and America. A sheet of Porphyra is laid out, boiled rice spread upon it, strips of meat or fish laid upon this, and the whole then rolled up. after which it is cut in slices. Everyone eats sushi."

"*Nemalion lubricum* (*Umi-zomen*). In some parts of Japan this plant is dried and bleached. It is then eaten with soy or vinegar, but its use is not common."

Page 14: "*Campylaphora hypnoides* (*Ego*). This is prepared similarly to Gelideum corneum. It makes a stiff jelly, which is used for food with sugar or soy, much as is cornstarch by the Americans."

Page 15: "*Grateloupia affinis* (*Comenori*) and *G. filicina* (*Mukade-nori*). These plants are dried, and after dipping in fresh water are eaten with vinegar or soy. Their use is not very general."

Statistics for exports (chiefly to China; weight in lbs and value in yen) for the years 1890-1894 are given for leaf laminaria, cut laminaria, and agar-agar. Address: [Minnesota and Japan].

1055. Yokohama Nursery Co., Ltd. 1903. Descriptive catalogue... for 1903. Yokohama, Japan. 75 p. Illust. Index. 26 cm. [Eng]

• ***Summary:*** On the cover of this English-language catalog is an illustration of a flowering cherry tree (*Prunus Pseudo-cerasus*) blooming. In the section "Price list of seeds" (p. 67+) is a subsection (p. 70) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1902 (and 1901) catalog. Address: P.O. Box No. 72. Nos. 21-35 Nakamura, Yokohama, Japan.

1056. Pozzi-Escot, Emm. 1903. Chimie de l'industrie du soja [Chemistry of the soy sauce industry]. *Revue Generale de Chimie Pure et Appliquee* 6(3):64-69. Feb. German-language summary in Chemisches Central-Blatt 1903(1):849-50. [3 ref. Fre]

• ***Summary:*** "The manufacture of soja [soy sauce] (which is also called shojou or miso) forms one of the most important industries of Japan. It is obtained by fermentation of the soybean (*du haricot-soja*), wheat and koji, with the aid of certain molds." Soja is widely consumed in Japan and also widely exported. "It is a condiment more than a food, and it serves in place of salt in most culinary preparations. The average Japanese consumes 50-80 cc/day.

The production reached 2,307,844 hectoliters in 1893, and today it surpasses 2.5 million hectoliters, bringing in more than 6 million marks to the government [in taxes]. Today the number of brewers surpasses 11,000; it was nearly 10,000 in 1897 and 10,600 in 1900. One of the factories in Tokyo employs 250 workers and produces 50,000 hectoliters each year. The author has become friends and communicated with two professors in Tokyo, Dr. Oscar Loew (Prof. of Agricultural Chemistry at Tokyo University) and K. Aso.

Three tables (by Murai 1897, by Nagai and Murai, and by Prinsen-Geerligs 1895) give the composition of shoyu (the first two tables are each based on two analyses).

Noting that many erroneous works have been published on the manufacture of soja [soy sauce], the writer proceeds to describe the process as he understands it, based largely on Japanese publications–but also with many mistakes. The process has four main steps: 1. Preparation of the wheat or soybeans. 2. Preparation of the soja koji. 3. The fermentation process. 4. Extraction and sterilization. The total process takes 1-2 years. He concludes with some ideas for improving the process by reducing the fermentation time. He would heat the soy sauce during fermentation and add alcohol. Address: In charge of pure chemical research at the labs., Malzeville, France.

1057. Uyeno, K. 1903. Shinkoku-san kôji (Fonkyo) kenkyû

yohô [Preliminary report on the investigation of Chinese koji (Honkio). Part I.]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 253. p. 225-38. March. [1 ref. Jap] Address: Yakugakushi.

1058. Balland, A. 1903. Sur les principales légumineuses alimentaires des colonies françaises [The principal edible legumes of the French colonies]. *Comptes Rendus des Seances de l'Academie des Sciences* (*Paris*) 136:934-36. Meeting of April 14. [Fre]

• ***Summary:*** This article appears to be a summary of, and contains less details than, one of the same tile by the same author published this year in *Annales d'Hygiene et de Medecine Coloniales.* Eight legumes are described briefly and the maxima and minima of their nutritional compositions given. Included are peanuts (*Arachide or Pistache de terre, Arachis hypogaea*), soybeans (*Soja, Dolichos soja*), and Bambarra groundnuts (*Voandzou, Voandzia* [*Voandzeia*] *subterranea*).

"Soja–The cultivation of the soybean (*Soja, Dolichos soja*) dates back to ancient antiquity in China and Japan. The seeds, which are rich in both nitrogen and oil, enter into culinary preparations which are very popular in these countries. The samples analyzed come from Cambodia, Cochin China [in today's Vietnam], and Tonkin." The protein content of these samples ranges from 34.85% to 38.41%, and the fat content from 12.95% to 14.80%. The mean weight of 100 seeds ranges from 5.00 gm to 11.23 gm.

Note: This is the earliest document seen (Feb. 2012) concerning soybeans in Cambodia (renamed Kampuchea in 1979) (one of two documents). Address: Ancien Pharmacien Principal au Laboratoire des Expertises du Comite de l'Intendance, France.

1059. Hennings, P. 1903. Einige neue japanische Uredineen. IV. [Some new Japanese Uredinales. IV.]. *Hedwigia* 42(3):107-08. In Supplement at back half of Vol. 42. May. [Lat; Ger]

• ***Summary:*** Begins with a 6-line Latin-language description of soybean rust. "Uredo Sojae P. Henn. n. sp." [=Phakopsora pachyrhizi; soybean rust]. He then explains, in German, where, on what part of what host plant, when, and by whom it was collected: "Tosa, Shimoda, on leaves of Glycine Soja S. & Z. September 1902. Yoshinaga. No. 42."

Note 1. This is the earliest document seen (March 2005) that clearly describes soybean rust on the genus *Glycine.* Notice, however, that *Glycine Soja* is the wild annual soybean, not the regular cultivated soybean (*Glycine max*).

Note 2. We learn from later Japanese documents (e.g., Kitani & Inoue 1960) that this rust fungus was collected in 1902 by Torama Yoshinaga. "No. 42" apparently refers to Yoshinaga's sample- or reference number; five other such numbers related to Yoshinaga are cited in this article.

Note 3. Tosa is an old province on southern Shikoku island, now Kôichi prefecture. Shimoda was and is a seaside town in Tosa / Kôichi. Address: Japan (probably).

1060. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*). 1903. Zappo: Tônyû oyobi jinzônyû [Miscellaneous news: Soymilk and other man-made or artificial milks]. No. 256. p. 616, 635. June. [Jap]

• ***Summary:*** Note: This is the earliest Japanese-language document seen (July 2012) that mentions soymilk in the title, or that uses the term *tônyû* (literally "bean milk") to refer to soymilk.

It is also the earliest document seen (Aug. 2013) in any language that mentions *tônyû* or *tonyu.* As of Aug. 2013 *tônyû* is the modern Japanese word for soymilk.

1061. *Chicago Daily Tribune.* 1903. Roosevelt order worries labor. Sept. 21. p. 2.

• ***Summary:*** "The new Japanese salad, 'udo,' and a condiment, 'wasabi,' similar to horseradish, will soon be introduced to the American people. They were found in Japan by Barbour Lathrop of Chicago [Illinois] and Prof. D.G. Fairchild, agricultural explorer for the government [USDA], who brought to this country cuttings of these plants, which are now growing in American soil."

"Prof. Fairchild says that in the tea houses of Japan the crisp blanched stems of udo are eaten with salt, as our native celery is served, or it is boiled and served with soy sauce."

1062. Hitier, H. 1903. Le soja hispida [Soja hispida, the soybean]. *Journal d'Agriculture Pratique* 67(49):746-47. Dec. 3. [Fre]

• ***Summary:*** In the session of 18 Nov. 1903, Mr. Foëx noted that *Soja hispida,* which serves as both an industrial and a forage plant, also furnishes a very favorable food for diabetics. Its seed contain high levels of protein, oils, and phosphates, and very little starch. At the Montpellier School of Agriculture, Mr. Foëx cultivated soya as a forage plant; the animals were very fond of it. But despite very careful cultivation at Montpellier, the soybean never gave yields near those presently obtained in China and Japan. What could be the causes of this inferior production? In examining the roots, the author can find no traces of root nodules (bactéroïdes), which are found on the roots of all other legumes cultivated in France. These soya bacteria apparently do not exist in local soils. In order to inoculate local soils, Mr. Foëx is having some soil containing the debris of soybean roots sent from Japan. He will notify the Society of the results obtained in growing soybeans under these new conditions.

Mr. Schribaux observes that there are many species and races of root nodule bacteria. It is important to find the right type for each host plant. Address: France.

porta In-kou [A trip for the study of the port of Yingkou]. *Izvestiia Vostochnogo Instituta* (*J. of the Oriental Institute, Vladivostok*) 7:21-146; 8:115-270. [Rus]

• ***Summary:*** As the major export port for Manchurian soybeans and soy products prior to the completion of the Chinese Eastern Railway and the consequent rise of Dairen and Vladivostok to preeminence, Yingkou is the appropriate focus for a study of the increasing export trade to Southern China and Japan (especially) in the 1880s. Pages 85-88 list foreign companies and establishments operating in Yingkou in 1902-03.

Of particular interest might be Bandinel and Co. known in Chinese as Jichang (?) which represented such worldwide and regional ocean freighters as Hamburg- American, Lloyds and Mitsui Bussan as well as the oil mill carrying its own name (*Jichangyan*).

Tables (p. 256) give 1901 export statistics for soybeans, cake and oil both by quarters and destinations (Hong Kong, Japan, Chinese ports, Samarang [Semarang, Central Java], and Korea). Address: Manchuria.

1064. Balland, A. 1903. Les principales légumineuses alimentaires des colonies françaises [The principal edible legumes of the French colonies]. *Annales d'Hygiene et de Medecine Coloniales* 50(3):193-206. Third Series. [1 ref. Fre]

• ***Summary:*** Contents: Peanuts (*Arachide* or *pistache de terre, Arachis hypogaea*) in Congo (samples were analyzed from Bahr-el-Ghazal [a former province of southwest Sudan–just east of the Central African Republic] and from Haut-Oubangui [later in the Central African Republic]), Senegal, Guinea, Indochina [in today's Vietnam], Madagascar, New Caledonia.

Cajan (*Cajanus indicus*) in Guinea, French Guiana, New Caledonia, Réunion, Madagascar. Doliques (*Dolichos lablab, D. sinensis, D. uniflorus*) in French Guiana, Indochina, Cambodia, the Indies, Madagascar, New Caledonia, Réunion, Sudan. The Haricot bean (*Phaseolus vulgaris*) in the Congo, Dahomey, Guinea, French Guiana, Sudan, Madagascar, New Caledonia, and Réunion. Lima bean (*Haricot courbé, Phaseolus lunatus*) in French Guiana, the Indies, Madagascar, Réunion. Mung bean (*Haricot mungo, Haricot trilobé, Phaseolus mungo*) in the Indies, Indochina, Madagascar, Réunion.

Soya (*Soja, Dolichos soja*) (p. 204-05): The cultivation of soya dates back to the ancient past in China and Japan. "According to A. Candolle (1885): 'Known facts and historical and philological probabilities tend to show that the species was wild from Cochin-China to the south of Japan and to Java [Indonesia] when the ancient inhabitants of this region began to cultivate it at a very remote period, to use it for food in various ways, and to obtain from it varieties of which the number is remarkable, especially in Japan.' The seeds, which are rich in both nitrogen and oil, enter into culinary preparations which are very popular in these countries. The samples analyzed come from Cambodia, Cochin China, and Tonkin." The protein content of these samples ranges from 34.85% to 38.41%, and the fat content from 12.95% to 14.80%. The mean weight of 100 seeds (*Poids moyen de 100 grains*) varies by country as follows: Cambodia 11.23 gm, Cochin China 9.10 gm, and Tonkin 5.00 gm.

Note: This is the earliest document seen (Feb. 2012) concerning soybeans in Cambodia (renamed Kampuchea in 1979) (one of two documents).

Bambarra groundnuts (*Voandzou, Voandzia* [*Voandzeia*] *subterranea*) in Congo and Madagascar. This annual legume comes from sub-tropical Africa, where it is widely cultivated. According to Candolle, it is also called "Mandubi d'Angola." Address: Pharmacien principal de l'armée (Main pharmacist for the French Army).

1065. Hiltner, Lorenz; Stoermer, K. 1903. Neue Untersuchungen ueber die Wurzelknoellchen der Leguminosen und deren Erreger [New investigations on the root nodules of legumes and their instigators]. *Arbeiten aus der Biologischen Abteilung fuer Land- und Forstwirtschaft am Kaiserliche Gesundheitsamte* 3:151-307. Sonderabdruck. [72 ref. Ger]

• ***Summary:*** These investigations led the researchers to classify the nodule bacteria into two groups, based mainly on morphology.

Soybeans (Soja, both brown and yellow seeded) are mentioned throughout the report. Pure cultures of the commercial inoculant Nitragin were supplied for the soybean trials at 4 locations, starting in 1900; all four were successful in producing root nodules. Tests were conducted without nitrogen or glucose, with nitrogen, and with nitrogen and glucose. The authors pointed out that direct inoculation of large seeds such as lupin and soybean may not lead to nodule formation due to the excretion of substances from the seed coats during the swelling process. Soybean seeds were covered with distilled water for 5 hours and the water extract was used in studying the growth of the bacteria and their transformation into bacteroids. The authors conclude that a protein is given off from the seed contents [cotyledons] that favors the growth of the nodule bacteria, whereas from the seed coats substances are given off that may help to plasmolyze and destroy the bacteria. They suggest the possibility of antagonism between the substances given off by the seed contents and by the seed coats that reduces the toxic action of the seed coat excretion upon the bacteria.

Contents: Introduction. Field trials with Nitragin from the year 1900. Field trials in 1900 (including both successful and unsuccessful trials with late-ripening soybeans). Field trials in the experimental fields at Dahlem (brown- and yellow-seeded soybeans, with and without oats; soil from a Japanese soybean field was used for inoculation; Prof.

© Copyright Soyinfo Center 2014

Kirchner of Hohenheim had the first success with soybeans on these fields). Characteristics of the soya bacteria (general). Asparagin. Characteristics of the soya bacteria (without nitrogen or glucose, with nitrogen; with nitrogen and glucose). Characteristics of the pea bacteria. Figures. Tables (for soya, see p. 192, 195).

Note: This is the earliest document seen (Oct. 2005) describing successful soybean inoculation experiments using pure cultures. It is also the earliest document seen (April 2000) that mentions successful use of the commercial inoculant Nitragin with soybeans. Address: 1. Privy Councillor; 2. Huelfsarbeiter im Kaiserliche Gesundheitsamte (Helper in the Imperial Public Health Departments) (Dahlem?), Germany.

1066. Kokhanovskii, N. 1903. Ocherk ekonomicheskogo polozheniia Iaponii [An outline of Japan's economy]. *Izvestiia Vostochnogo Instituta* (*J. of the Oriental Institute, Vladivostok*) 5:1-130. [Rus]

• ***Summary:*** Includes a discussion (p. 6-11) of Japanese domestic agriculture. For 1900, soya was the fifth most important culture by area, occupying 6.9% of cultivated area. Rice, wheat, rye and barley were all ahead of soy. Statistics (bottom of p. 7) are shown for 1895-99 and 1900. The discussion of harvests is followed by a table (p. 10) of information on agricultural prices in Japan from 1887-1900, showing a clear rise in bean prices (though soya is not differentiated here from other bean products).

Pages 62-63 contain information on Japan's imports and exports for 1900-1902 taken from the sources listed at the bottom of page 62, footnote 2. Further examination of these would allow the compilation of clear statistics for growing Japanese import of soya and more gradual growth in the export of soya products.

Tripe (p. 461): Tripe a la Creole, with Worcestershire sauce. Address: Chicago, Illinois.

1069. Yule, Henry; Burnell, Arthur Coke. 1903. Hobson-Jobson: A glossary of Anglo-Indian colloquial words and phrases, and of kindred terms, etymological, historical, geographical, and discursive. A new edition edited by William Crooke, B.A. London: J. Murray. New York: Humanities Press. New Delhi: Munshiram Manoharlal. 1021 p. See p. 858-59 ("soy"). Index. 22 cm. [6 ref]

• ***Summary:*** "Soy, s. A kind of condiment once popular. The word is Japanese *si-yau* (A young Japanese fellow-passenger gave the pronunciation clearly as shô-yu), Chinese *shi-yu.* [Mr. Platts (9 ser. N. & Q. iv. 475) points out that in Japanese as written with the native character, *soy* would not be *siyau,* but *siyau-yu;* in the Romanised Japanese this is simplified to *shoyu* (colloquially this is still further reduced by dropping the final vowel, to *shoy* or *soy*) Of this monosyllable only the *so* represents the classical *siyau;* the final consonant (y) is a relic of the termination *yu.* The Japanese word is itself derived from the Chinese, which at Shanghai is *sze-yu,* at Amoy, *si-iu,* at Canton, *shi-yau* [fermented black soybean sauce], of which the first element means 'salted beans,' or other fruits, dried and used as condiments; the second element merely means 'oil.'] It is made from the beans of a plant common in the Himalaya and E. Asia, and much cultivated, viz. *Glycine Soja,* Sieb. and Zucc. (*Soya hispida,* Moench.) boiled down and fermented. [In India the bean is eaten in places where it is cultivated, as in Chutia Nagpur (Watt, Econ. Dict. iii. 510 Seq.)]"

The authors then quote passages relating to soy from Lord King's *Life of John Locke* (1679), Dampier (1688), Ovington (1690), Kaempfer (1712), Thunberg's Travels (1776), and Mrs. Frazer, a Diplomat's Wife in Japan (1900).

Yule lived 1820-1889. Burnell lived 1840-1882. Address: 1. Living in Palermo; 2. Madras Civil Service, one of the most eminent modern Indian scholars. Died 1882.

1070. Societe Nationale d'Agriculture de France. 1904. Séance du 13 Janvier 1904 [Meeting of 13 January 1904]. *Bulletins des Seances de la Societe d'Agriculture de France* p. 25-28. Mr. Tisserand, presiding. [1 ref. Fre]

• ***Summary:*** The perpetual secretary notes that he has received from Dr. Trabut, a correspondent [in Algeria], information about the soybean (*le soja hispida*). There follows a long quotation.

At the meeting of 25 Nov. 1903 Mr. Foëx, in reporting on the soybean culture trials at Montpellier, called attention to the feeble / low seed yields of the soybean in France, and the absence of nodules on the roots. He thinks that in order to expand this crop, under normal conditions, it would be suitable to import from Japan soybean root bacteria.

Since 1892, having cultivated numerous soybean varieties in the botanical garden of the government botanical station, I am able to make some observations about this legume that I consider to be very interesting for southern countries.

In 1898 I published a notice for our colonies on the subject of root nodules, in which I expressed the following:

The next two paragraphs about soybean nodules ad nodulation are quoted from his 1898 publication.

In my annual report of 1898 I explained that since the cultures of this special soybean root bacterium have been propagated, all of the soybean plants cultivated at the station had numerous large nodules on their roots.

In this same report, I insisted on the value of this legume as a forage plant for dairy cows.

A cow which is well nourished, which gives 6 liters of milk every 24 hours, has always given 7½ liters when its ration is composed, instead of the current forage, of 18 kg of soybean plants cut while green at the moment of the formation of their seeds.

Since this time, soybean plants at the station have been cultivated in soil where the nodule bacteria were abundant, and I have never observed any large differences in their yields.

The yields varied, above all, depending on the soybean variety; there certainly existed a large number of varieties with distinct characteristics.

The different varieties can be divided into very early, medium, and late in their general development / maturity. It is the latter varieties which give the largest yields of green forage and which are of greatest interest as southern crops.

In summary, the soybean has not succeeded as a plant for human food; it is a very inferior substitute for the haricot bean. In Algeria, the indigenous people have accepted the soybean as a food rather well; but they prefer the *Dolichos Lubia* [*Vigna unguiculata* subsp. unguiculata; black-eyed pea or cowpea] which is, in effect, superior, but has more agricultural needs. The various soyfoods made in the Orient are very complicated; we must find a simpler way to utilize this seed. I think the flour, made from the defatted seeds, would be a good food.

As a forage plant, the soybean must be studied by the agricultural experiment stations with the goal of acclimatizing the varieties which are suitable for this use.

At Rouiba, I have obtained varieties which grow large and yield from 30 to 35 metric tons of green forage per hectare.

Discussion: Mr. Schribaux.–Mr. Trabut states that soybean plants with nodules did not produce more than soybean plants without them; we are probably looking at indifferent nodules, of the type that Messieurs Dehérain and Demoussy observed on the lupine plant.

I have the feeling that it is in the soils of the countries of origin of the soybean, in China, in Japan, that we would encounter the highest probability of securing active microbes; soils that would be wise to dry at a low

© Copyright Soyinfo Center 2014

temperature, before shipping, so that their useful organisms would not loose some of their vitality during the journey.

Mr. Tisserand.–These experiments would be easy to accomplish as we have Japanese persons, former students of our agricultural schools, that went back to their country and would certainly provide us with their cooperation.

Mr. Prillieux.–I have heard that the soybean bacteria are to be found in certain crops in Germany. Address: France.

1071. *Daily Sun* (*Saint John, New Brunswick, Canada*). 1904. Fighting Jap a worthy foe: Army built on French and German models. Cavalry a weak point–Rapidity and efficiency of the column already proven–Perfection in administration details. Jan. 27. p. 7.
• ***Summary:*** The section titled "Artillery officers" states: "A good soldier is twice as valuable if he has good care, and this, among other things military, the Japanese have learned. Everything which goes to make for the efficiency of the troops is scrupulously attended to. The rations are of the simplest–rice, dried fish, soy, and sometimes meat–but they are always ample and always the best of their kind."

'Japanesy' that we might well import."

Nuta salad: "This is made of clams, rape tops and onion with a sauce of bean paste, rice, mustard and soy [sauce], rubbed into a brown liquid." One large illustration shows a Japanese woman with elaborate dress and hairdo; three others show her working at home.

1079. *San Francisco Chronicle.* 1904. Preparations to quit Newchwang: Civilians fear a raid by Chinese bandits when Russians retire. May 9. p. 1.
• ***Summary:*** The Russians are evacuating Newchwang and the western side of the Liao Tung peninsula. The Japanese captured Dalny yesterday. Last week the Japanese landed 10,000 men at Kinchou bay, 10,000 at Foochou bay and 7,000 at Pitzwo. "The isolation of Port Arthur is complete. Sixteen Japanese war ships protected the landing of troops at Kinchou bay,...

"Food is scarce at Moukden [Mukden, later renamed Shenyang], the troops are eating [soy] bean cakes."

1080. *Boston Daily Globe.* 1904. Typical dishes. Japanese service is dainty in the extreme. May 22. p. 35.
• ***Summary:*** "Meat plays a small part in the Japanese menu,... Fish and rice are the staples... The following is a typical menu for a dinner of ceremony:" Soy-related dishes include: "Suimono–A kind of bean-curd [tofu] soup." "Hachi-zakana–A fine, large fish, either boiled with salt or boiled [broiled?] with shoyu." "Umani–Bits of fish or sometime fowl, boiled with lotus root or potatoes in shoyu and with 'mirin,' a sort of sweet liqueur." "Tsubo–Seaweed..." "Ayemono [Aemono]–A sort of salad made with bean sauce [miso?] or pounded sesamum [sesame] seeds." Raw fish–The favorite for festive occasions is the *tai* [sea bream], "on account of its name, which is the last syllable of the word *me-de-tai,* meaning 'congratulatory.'... Before eating, the slices are dipped lightly in soy [sauce], seasoned with grated horseradish or ginger."

1081. Brunson, John A. 1904. A glimpse of Japanese life. *Good Health* (*Battle Creek, Michigan*) 39(5):237-42. May.
• ***Summary:*** A good photo (p. 239) shows a Japanese vegetable vendor carrying his goods in baskets on a shoulder pole. Page 240 notes: *"Tofu,* or 'bean curd,' as the foreigners call it, is a favorite dish. The beans are first ground fine in hand mills. These mills consist of two stone discs about eighteen inches in diameter, and perhaps six or eight in thickness, one being placed above the other. To the upper stone is attached a handle by which it is turned, and the motor power is supplied by two women. It is a familiar sight in Japan to see 'two women grinding at the mill.' The husks and coarser parts of the bean flour are then carefully removed, and the fine white residuum is mixed with water and pressed into squares which somewhat resemble cottage cheese in appearance. The *tofu* is then boiled, and is both palatable and nutritious, but rather concentrated."

In Japan, fish are served raw, while yet fresh, "with *shoyu,* a kind of Japanese Worcester sauce."

Note 1. This is the earliest article seen (Aug. 1996) with detailed information on soyfoods in Dr. John Harvey Kellogg's periodical *Good Health.*

Note 2. This is also the earliest document seen (Aug. 1996) that compares tofu with cottage cheese.

1082. Bolce, Harold. 1904. First taste of raw fish: Approached with fear and trembling, but followed with ecstasy. *Washington Post.* July 22. p. 11.
• ***Summary:*** From Booklovers Magazine: The writer visited Japan ("this Sunrise Land"), where he met novelist and diplomat Tumio [sic, Tomio] Yano, who invited him to dinner at the Nippon club. "Not so well known among the Occidentals as soy sauce, but of equal merit as an appetizer, is wasabi. Its use is universal in Japan. It serves the same purpose as horseradish does on Occidental tables, but is less acrid." It is almost always eaten with raw fish.

Bolce closes with a song of praise to *Eutrema wasabi.* "All honor to triumphant agricultural Japan, and may this far Eastern member of the mustard family take deep root and spread and flourish in my native land." Address: [Washington, DC].

1083. Smith, Hugh M. 1904. Japan, the paramount fishing nation. *Transactions of the American Fisheries Society* 33:111-38. See p. 116. 33rd annual meeting held 26-28 July 1904 at Atlantic City, New Jersey.
• ***Summary:*** "Raw fish is one of the national foods. I acknowledge that my repugnance to it was great, but it was overcome with the first dish, for as prepared and served by the Japanese the thin, cold, boneless slices of perfectly fresh tai or mackerel, taken with chop sticks and dipped in soy-bean sauce, are delicious."

Note: This is the earliest English-language document seen (April 2012) that uses the term "soy-bean sauce" to refer to soy sauce.

The author traveled to Japan on assignment from U.S. Fish Commissioner Bowers to study the fisheries and related industries; he was the first American to ever do this. He traveled 5,000 miles within the country, always accompanied by helpful government officials, who were well familiar with the different regions and their fisheries, and to act as guides, companions, and interpreters.

"The artificial propagation of food fishes is not as yet important and is practically to salmon on the island of Hokkaido and to carp in all sections."

"A branch of fisheries in which Japan far surpasses all other countries as regards both extent and methods is the sea-weed industry. In the United States, not withstanding our long coast line and sea-weed resources not inferior to Japan's, the annual crop of marine vegetables is worth only

© Copyright Soyinfo Center 2014

$40,000, whereas in Japan these products are worth not less than $2,000,000, and are exceeded in value by only four animal products of the fisheries [herring, sardines, bonito, and tai / red snapper]. Gives detailed information about four of Japan's main "sea-weed resources" (p. 121-27) including *kombu* (*Laminaria,* kelp; and shredded kombu), *kanten* (vegetable isinglass, agar-agar), *nori* (*Porphyra,* laver; "the supply comes almost entirely from planted grounds, and in the cultivation of marine vegetables the Japanese stand alone).

This article contains many photos, including one of "bars of vegetable isinglass" (p. 123). Illustrations (from Japan) show (p. 122-25): (1): Gathering kelp in Hokkaido, showing both above and below water. (2) Planting dry brush on which laver is to grow in shallow water in Tokyo Bay. (3) Spreading and drying laver on mats.

1084. *Times* (*London*)**.** 1904. Summer conditions and food supplies in Manchuria. Aug. 9. p. 2, cols. 5-6.
• ***Summary:*** From a correspondent. There are two harvest seasons in Manchuria. The first is that of wheat and barley; the second is that of yellow millet and red millet, followed by [soya] beans, "which are the product *par excellence* of Manchuria," and finally *kao-liang,* or tall millet.

"The vast quantities of [soya] bean cake, stored in the country from last year's stock, which were not exported as usual to Japan, were enough to support at least 50,000 Russian horses. The beans and cake were stored in towns within easy access of the Russian centres. and have long since been secured."

"As regards food for her [Russia's] army, the natives can furnish a relatively small proportion of coarse flour made from wheat... The small millets can be used as porridge. Natives travel long distances on this alone. For the cold season the bean curd is splendid food for men who live in the open air. The supply of this is practically unlimited.

Note 1. This was written in the midst of the Russo-Japanese war (Feb. 1904–Sept. 1905); Japan beat mighty Russia.

Note: This is the earliest document seen (March 2008) that mentions Russo-Japanese War in connection with soya beans.

1085. *New York Times.* 1904. In the business world: Invoice values advanced. Aug. 26. p. 9.
• ***Summary:*** "Several heavy advances in invoice values were announced yesterday by the Board of United States General Appraisers... and from Many Fook & Co., Yokohama, 160 buckets Japanese shoyu sauce, entered at .80 and advanced to 1.40 yen a bucket. All good will be seized."

1086. Bellows, E.C. 1904. Agriculture in Japan. *Monthly Consular Reports* (*U.S. Department of Commerce and Labor, Bureau of Statistics*) No. 287. Aug. p. 22-25.
• ***Summary:*** In 1901 the artificial fertilizer manufacturing companies of Japan produced 62,400 tons; 151,000 tons of fish fertilizers were produced, and 83,967 tons of Chinese bean cakes were imported for use as fertilizers. Artificial fertilizers are also imported from Great Britain, fish guano from Siberia, animal bone from China, and other fertilizing materials from different countries.

"The principal agricultural products, named in the order of their acreage, are rice, rye, barley, wheat, [soya] beans, mulberries, sweet potatoes, millet, buckwheat, rape, red beans [azuki], Italian millet, tea, indigo leaves, potatoes, sorghum, tobacco leaves, cotton, and hemp. The area devoted to rice cultivation constitutes a little more than two-fifths of the total area of arable land." Address: Consul-General, Yokohama, Japan.

1087. *San Francisco Chronicle.* 1904. Reports defeat of besiegers: Dispatch from Harbin says the Japanese lost 1,300 in the attack on Port Arthur. Sept. 28. p. 2.
• ***Summary:*** Chefoo, Sept. 27. "Chinese say that the battle which began September 19th continued intermittently until September 24th. In defending one fort the Russians rolled bean cakes down on the massed Japanese. These bean cakes are very heavy and are pressed into the shape of circular grindstones."

Note: This article seems to be about the Russo-Japanese War (4 Feb. 1904 to 5 Sept. 1905). It was fought mostly in Manchuria. The Japanese won.

1088. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*)**.** 1904. Shodoshima no shôyu jôzô no jikkyô oyobi kairyôhô [Brewing of shoyu in Shodoshima and improvement]. 7(80):1127-34. Oct. [Jap]
Address: Shodo Island, Japan.

1089. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*)**.** 1904. Japan's fiscal resources. No. 289. Oct. p. 147-48.
• ***Summary:*** "The Commercial Intelligence, of London, England, September 14, 1904, contains an article on the 'Economic War Resources of Japan,' from which the following fiscal data is taken." In normal times, Japan derives her revenue from various taxes and duties, including a "land tax, income tax, business tax, tax on liquors, tax on soy, sugar excise" etc. These together are estimate to produce $69.5 million for the fiscal year 1904-05. Total revenue from all sources is estimated to be $111.8 million. But now the Japanese government needs more money for prosecuting its war with Russia.

A table (p. 148) shows revenues from the "Supplementary budget of Japan, 1904-05." The four biggest sources of revenue (in million dollars) are: Land tax $11.9. Sugar excise tax $4.1. Income tax $2.6. Business tax $2.5. The soy tax [on soy sauce] brings in only $567,208.

© Copyright Soyinfo Center 2014

Note: Pages 146-47 discuss "Japan's tobacco monopoly. The law relating to the monopoly of leaf tobacco was promulgated in March, 1896. This law provided that all leaf tobacco grown was to be bought by the government and in turn sold to the manufacturers by the Government at a fixed rate of profit." Address: Washington, DC.

1090. Abel, Mary Hinman. 1904. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 39 p. See p. 11-13, 18-20. Revised. Illust. [1 ref]*

• ***Summary:*** A revised edition, 3 pages longer than the 1900 original. The information about soy is unchanged, however it is on different pages (see above). The section titled "Nutritive value of the legumes" (p. 18-20) includes a table titled "Composition of fresh and dried legumes compared with that of other foods." Under "Dried legumes," the composition of "Soy beans" (dry, containing 10.8% water) is given.

1091. Evans Seed Co., Inc. 1904. 1904 retail price list: Northern grown legume, forage plant, grain and grass seeds (Mail-order catalog). West Branch, Michigan. 24 p. 23 cm.

• ***Summary:*** A black-and-white photo on the cover shows a man, a woman, and a child (little girl) standing in a "Field of soys and pearl millet at West Branch, Michigan." Below that is written in large letters: "Our northern grown seeds are unequalled for hardiness, earliness, vigor, high germinating power and purity." Printed by Herald-Times Print., West Branch, Mich. At the top of the cover in small letters: "44º12' North Latitude."

Contents: Note to the American Farmer and Stockman. Our terms. Legume seed department. Soy beans. Cow peas. Field peas. Garden peas. Beans (*Phaseolus vulgaris*). Spanish field pea (*Lathyrus sativus*). The vetches (*Vicia villosa* and *V. sativa*). Velvet beans (*Mucuna utilis*). Lupines (Blue and Large White). Faba or Broad Beans (*Vicia faba*). Lentils (*Lens esculenta*). Pea nuts (*Arachis hypogœa*). The clovers. Northern Grown Grain and Forage Plant Department: Field corn, Russian emmer (*Triticum spelta*). Spring wheat. Oats. Barley (*Hordeum vulgare*). Japanese barnyard millet (*P.* [*Panicum*] *Crus Galli*). East India pearl millet (*Pennisetum spicatum*). Teosinte (*Reana luxurians*). New legumes for 1905 (the Japanese Muroran bean is a forage crop that is earlier than the earliest soy or cow pea). Grass seeds: Timothy (*Phleum pratense*) and Orchard grass (*Dactylis glomerata*). Meadow fescue (*Fescuta pratensis*). Awnless brome (*Bromus inermis*). Red top (*Argostis vulgaris*). Kentucky blue grass (*Poa pratensis*). Root seeds. Seed potatoes. Bacteriated soil ("sand containing the bacteria adapted to peas, soys, cow peas, vetches, lentils, broad beans, lupins, etc. Sold in new 16-oz. cotton bags at $1.50 per 100 pounds. Not less than 100 pounds will be sold). A paradise for pork (Also called "hog heaven," it is a "combination crop." "Some plant corn, soys and mangels or sugar beets in alternate rows"). Chemical analysis vs. cow analysis [of feeds] ("All authorities, chemists and cows included, agree that the soy bean is the most digestible of all concentrated foods. And palatability–convince yourself. Plant an acre of soys and when they are ripening turn in your stock, your cows, horses, hogs, sheep, turkeys, ducks and chickens. They will tell you all about the palatability of the soy bean)." Standard of weights in Michigan: Beans, soy: 8-16 quarts of seed required per acre. Weight per bushel: 60 lb.

The note (p. 2) "To the American Farmer and Stockman" begins: "Greeting: It has always been our aim to be something more than seed sellers–or merchants." It states in detail the company's strong commitment to quality seeds. "Our terms are invariably net cash with order." The first section (p. 3+), titled "Legume seed department" begins: "From ancient times down to the present certain plants have been used for the purpose of renovating and maintaining the fertility of soils... It was not until 1888 that a German scientist discovered by which process these plants enrich the soil. Briefly, legumes are plants having the power, by aid of certain bacteria, of converting atmospheric nitrogen into nitrates available for plant food, and of storing it up in root nodules, or tubercles. We do not yet know whether this process is a mechanical or chemical one."

However, we do know that nitrogen, one of the vital elements of plant food, is the most elusive, the most expensive to buy and the most difficult to retain of all the elements that go into the production of any crop. We know that a crop of soys, peas, clover, or vetches enriches the soil by adding to the available nitrogen. It is absolutely true that the nitrogen removed from an acre of land by a crop of oats, corn, wheat or timothy often exceeds in value the entire cost of producing a crop of legumes. There can be no greater folly in farming than the continued production of cereals without a rotation in which legumes form a part, and the shorter the rotation the better for the land and the bank account... The *Leguminosæ* includes beans, peas, vetches, clover, lentils, cow peas, soys, faba, lupins, etc."

The subsection titled "Soy beans (*Glycine hispida*)*"* (p. 4-7) gives the most information about this crop to be found in any American seed catalog up to this time. "German, Soja. Japanese, daidzu [daizu]. Next to wheat this is probably the oldest of cultivated plants. It is mentioned in Chinese writings prior to 500 B.C., and remains to this day one of the staple crops of China and Japan. It was originally introduced into America about 1925-30, but failed to attract attention to its merits. It was not until the researches and experiments of Profs. Brooks [Massachusetts] and Georgeson [Kansas], within the past fifteen years, that the true value of soys became known. Since 1896 they have grown more rapidly in popularity than any crop ever introduced into America. Soys contain a higher percentage of protein in more digestible form, than any other farm product, and at a fraction of the cost of the so-called 'concentrated feeds.'" A table shows

© Copyright Soyinfo Center 2014

a nutritional analysis of five varieties of soys made by the Michigan Experiment Station [published in Bulletin No. 199, April 1902]. Ito San and Medium Early Yellow contain the most crude protein (41.04% and 41.52%). A photo shows two uprooted soybean plants, each covered with pods.

Page 5 continues: "Soya are as easy of culture as common beans, cow peas, or corn. They succeed on any soil that will produce corn. They will withstand drouth and wet weather that would ruin most of our staple crops, and will pass uninjured through frost that kills corn to the ground. This has been demonstrated hundreds of times here in Michigan. Scores of seedsmen catalogue soys with southern seed, generally the Mammoth Yellow. Such seed can be bought for $1.00 to $1.25 a bushel, but is absolutely worthless north of the Ohio river. We are the pioneers of the soy seed business at the north; have grown and sold them for the past 8 years [since about 1896]. We have not a bushel of soys grown outside of Michigan." "Evans' soys are known the world over. We sold them last year in England, Germany, Guiana [incl. British Guiana?], West Indies, Hawaii, Mexico and Canada.

Page 6 continues: "Plant soys in drills 28 to 30 inches apart, using 8 to 16 quarts seed per acre, according to variety and use. For ensilage, they may be planted with corn, but we believe it is more satisfactory to grow the two crops separately and mix them as they go through the cutter." The subsection titled "Varieties" gives details on each of the following: Ito San (named by Mr. Evans in honor of Marquis Ito, the Japanese statesman), Early Black or No. 6 (originated by Mr. Evans), Ogema, or Evans No. 9, Medium Early Green, Olive Medium (created and introduced by Evans), Medium Early Black.

Concerning: "Ogema, or Evans No. 9. Originated by Edw. E. Evans and offered for the first time last season. It is a cross of Dwarf Brown and No. 6 and is unquestionably the earliest of all soys. It can be planted later and farther north than any other variety. Beans dark chocolate color. Season 65 to 75 days. Stock limited." Ogema is the company's most expensive variety, selling for $7.50 per bushel, vs. $3.50 per bushel for most other varieties.

A table titled "Prices of soy beans" (p. 7) gives the prices of 12 varieties. The first seven are sold in quantities of one packet, quart, 4 quarts, peck, ½ bushel, and bushel. Most sell for $3.50/bu, but the price ranges from $3.00/bu for Ito San and Medium Early Yellow to $7.50/bu for Ogema. These seven are: Ito San, Ogema (earliest), Medium Early Green (general favorite), Olive Medium, Medium Early Black, Early Black (Evans No. 6), Medium Early Yellow. The last five varieties sold (all new) are: Dwarf Brown, Gosha, Rokugetsu [Rokugatsu?], Bakaziro [Bakajiro], and Hankow. Each is available only in the packet size at $0.15 per packet. On the last page of the catalog is a full-page order sheet.

Note 1. This is the earliest document seen (Aug. 2002) which mentions that turkeys eat or are fed soybeans.

Note 2. This is the earliest document seen (Aug. 2013) that mentions the following soybean varieties: Dwarf Brown, Hankow, Ogemaw, and Mammoth Yellow (one of three documents).

Note 3. This is the earliest English-language document seen (May 2003) that uses the word "bacteriated" to refer to soil containing nitrogen-fixing bacteria.

This catalog is owned by Special Collections, USDA National Agricultural Library, Beltsville, Maryland. Address: West Branch, Ogemaw Co., Michigan.

1092. Fesca, Max. 1904. Der Pflanzenbau in den Tropen und Subtropen [Plant cultivation in the tropics and subtropics. 2 vols.]. Berlin: Wilhelm Suesserott Verlagsbuchhandlung. Vol. 1: viii + 278 p. See vol. 1 (Erster Band), p. 159-65. 21 cm. Suesserotts Kolonialbibliothek. [2 ref. Ger]

• ***Summary:*** In Volume 1, in the chapter on legumes (*Huelsenfruechte, Leguminosen*), is a long section the soybean (*Die Sojabohne*) (p. 159-63), which focuses on soybean production. Contents: Introduction. Climate. Soil and cultivation of the soil. Fertilizers. Planting / sowing. Harvest. Yields. Composition of the seeds and straw. Soybean oil and cake in China. Food uses of soybeans in China and Japan, especially "Shoyusauce" (shoyu) from which the soybean derives its name. It is used in the preparation of Anglo-American sauces such as Worcestershire sauce, etc. A description of the preparation of shoyu is given, along with its composition based on analyses by O. Kellner and E. Kinch. "The fermentation lasts from at least 20 months up to 5 years; the longer the fermentation the better the sauce. The finest quality is a mixture of 3 and 5 year sauces." An analysis of shoyu presscake (*Shoyurueckstande*) is also given.

Note: This 3-volume work is volumes 1-2 in *Suesserotts Kolonialbibliothek*, vol. 708. Address: Germany.

1093. Hoshi, Hajime. 1904. Handbook of Japan and Japanese exhibits at World's Fair, St. Louis. n.p. 206 p.

• ***Summary:*** The Preface begins: "Since Commodore Perry, of the United States Navy, opened Japan to the world's commerce [in 1854], the foreign trade of the country has developed with wonderful rapidity. This startling rapid development of Japanese trade is due to the readiness and celerity [swiftness] with which the frank and courageous people of the Empire abandoned their old customs and turned their faces toward a new civilization. There was no hesitation, no halting, no looking backward. The entire nation awoke with a start to the realization that it was moving in the wrong direction, and turned about and dropped easily in the march of modern progress. Foreign ideas were adopted, foreign methods were imitated and frequently improved upon, and the closest commercial relations were sought with the United States and the countries of Europe. With this adoption of foreign ideas came a desire for

© Copyright Soyinfo Center 2014

foreign goods. New methods made necessary the use of Western machinery in factories and on farms. Even Western foodstuffs became popular.

"Japan's total foreign commerce was increased from 26.6 million yen in 1868 to 582.6 million yen in 1902 or 2,219 per cent. The total exports were increased from 15.5 million yen in 1865 to 281.7 million yen in 1903 or 1,811 per cent. During the same period the imports increased from 10.7 million yen in 1865 to 300.9 million yen, or 2,790 per cent."

Baron Masanoho Matsudaira is Vice-President of the Imperial Japanese Commission to the Louisiana Purchase Exposition.

Concerning "Shoyu, or soy.–The shoyu manufactories in 1901 numbered 15,993, producing 68,940,680 gallons annually" (p. 28).

In 1902 Japan's principal exports in million yen were (p. 40-41): Copper, crude and refined–10.3. Rice–6.7. Tea, green (pan fire)–6.2. Tea, green (basket fire)–3.6. Camphor–3.4. Cuttle fish–1.8. Fish oil–1.5. Sake–0.83. Sea weed–0.61. Shoyu (soy)–0.39.

Palace of Agriculture (p. 119). "In the Palace of Agriculture the Japanese Exhibit occupies an area of 8,667 square feet." "Tea, one of the leading products of Japan, forms the most important exhibit of the space." "There is a large exhibit of shoyu or soy, a famous Japanese sauce made from beans. This sauce is in as common use in Japan as salt and pepper are in the United States. It is used as a relish on the table, also for cooking and salad dressing. Soy is wholesome and exceedingly cheap, which qualities, combined with its splendid flavor, make it a most desirable article of diet.

"Sake, the national drink, is also well represented in the exhibit."

The names of the members of the Japanese Commission and of the commissioners now in the United States are given on pages 112-13. he names of the members of the Japan Exhibit Association are given on page 113. Note: Nowhere is this long and detailed book is the name of Jokichi Takamine mentioned.

The Japanese Garden: Area, 150,000 square feet is described in detail (p. 114-15), as are each of the buildings in it. These include the Japanese Pavilion (the building materials for it "were brought from Japan. It was built entirely by native carpenters after the style of Daimyo's garden–Goten, of about 400 years ago. The architectural style of the building is Heike. The artistically curved roofs, majestically projecting one upon the other..."). Note: This was the building that was renamed Sho-Foo-Den / Sho-Fu-Den by Jokichi Takamine. Other buildings are the Observation Cottage and (standing by the lake) and a reproduction of the Kinkaku Temple in Kyoto (*Kinkaku-ji,* the Temple of the Golden Pavilion).

"The total space occupied by Japan [p. 115] covers 282,455 square feet. he area is three times as great as that covered by Japan at the Paris Exposition in 1900, and three times as large as Chicago in 1893."

"Soy brewers and trade marks" (p. 161, full page, with the trade mark of each shown large and clear): Kikko Sakai: Brewer K. Toyoda, Sakai, Osaka, Japan. Yamakawa-roku: Brewer R. Wakaye, Osaka, Japan. Kikko Mata: Brewer M. Kawamori, Sakai, Osaka, Japan. Mitsu Uroka: Brewer G. Tagashima, Kaidzuka, Idzumi, Japan. Uyeki: Brewer K. Uyeki, Osaka, Japan. Yama-Ju: Brewer M. Yamamoto, Osaka, Japan. Maruichi Jo: Brewer S. Masuda, Osaka, Japan. Maru Matsu: Brewer Y. Motsutani, Osaka, Japan. Hon Ichi: Brewer K. Yehara, Osaka, Japan. Sun: Brewer K. Shindo, Osaka, Japan.

Across the bottom of this page: "The virtue of the sauce and direction for use. The Japanese Soy with the Trade Marks is brewed from the very best Japanese [soy] bean, wheat and salt. The Soy is of dark brown color and is specially adapted for every kind of boiled, baked and fried fish; for chops, steaks and cutlets and cold meats; also for cooking of vegetables. The article possesses a particular taste and flavor and advances [enhances] the digestion.

"The Japanese Soy with these Trade Marks may be stored for a long period and is guaranteed never to turn bad.

"The article is sold for 6 to 9.60 yen per case of 4 *go* bottles, F.O.B. Osaka. An order to any of the brewers will receive prompt attention."

Page 166: 1/3 page display ad for Ueki Shoyu, Osaka. Page 180: ½ page display ad for "Best shoyu. Ota Shoyu Brewing Company, (912 Minamiota Machi, Yokohama, Japan) was established in 1850..." Its shoyu is known as "Fuji Shoyu." "Second medal in 1859 and first Silver Medal in 1903. Exported to Germany, America, Hawaii, Corea, Shanghai, Hong Kong, England, Canada, Australia, India, Singapore, etc., through G. Brandel & Co., No. 41 Yamashita Cho, Yokohama."

Page 189: Full-page ad for "Shoyu, Japanese sauce. Izumiyama Shoyu Brewing Co., Hachinohe Mutsu, Japan. Its two trade marks are shown.

Page 193: ½ page display ad for "Maru Sen Shoyu. Awarded medals and shohai at the World's Exhibition, Paris, 1903, and others. Marusen Shoyu is brewed by Sutejiro Hosono, Kinatomura, Kitakanbara, Niigata ken, Japan.

Page 197: Full-page ad for Kameya Shoyu & Company, Nakaidzumi cho, Shidzuoka ken [Shizuoka-ken], Japan. A large photo shows Sokichi Tsukichi, proprietor, standing in a Western-style room with one hand on a chair. This shoyu is exported to the United States, Hawaii, Europe, China, and Corea.

1094. Kingsford, Anna Bonus. 1904. The perfect way in diet: A treatise advocating a return to the natural and ancient food of our race. 4th ed. London: Kegan Paul, Trench, Truebner & Co., Ltd. xii + 121 p. 17 cm. [92* footnotes]

• ***Summary:*** The Preface states: "The following treatise is

© Copyright Soyinfo Center 2014

a translation, revised and enlarged, of my 'These pour le Doctorat,' which, under the title 'De l'Alimentation Végétale chez l'Homme,` I presented in the month of July, 1880, at the Faculté de Médecine of Paris on completing my medical studies and taking my degree.

"The original thesis was published in Paris in the French language, and subsequently translated into German and issued with illustrative notes and other additions by Dr. A. Aderholdt. Encouraged by the success obtained by these two editions, and by the favourable notices they elicited from various foreign scientific and popular critics, I offer the present work to English readers, confident of a kindly welcome from the friends of the reform I advocate, and hopeful of a serious and intelligent hearing from those who as yet are strangers to the merits of that reform.

"The French and German editions of this treatise include an Appendix, containing short notices and citations from the works of the chief exponents and exemplars of the Pythagorean system of diet. In the present volume this Appendix is suppressed in favour of a forthcoming `Catena of Authorities Denunciatory or Depreciatory of the Practice of Flesh-Eating,' by a `Graduate of Cambridge'; an excellent and ample compendium to which the reader is referred.

"That I have dwelt chiefly on the aspects, physical and social, of my subject, and touched but lightly on those moral and philosophical, is not, assuredly, because I regard these last as of lesser importance, but because their abstruse and recondite nature renders them unsuitable to a work intended for general reading.

"Finally, if any into whose hands this book may fall, should be inclined to think me over-enthusiastic, or to stigmatise my views as `Utopian,' I would ask him seriously to `consider whether ` Utopia' be not indeed within the realisation of all who can imagine and love it, and whether, without enthusiasm, any great cause was ever yet won for our race. Man is the master of the world, and may make it what he will. Into his hands it is delivered with all its mighty possibilities for good or evil, for happiness or misery. Following the monitions and devices of the sub-human, he may make of it–what indeed for some gentle and tender souls it has already become–a very hell; working with God and Nature, he may reconvert it into Paradise."

Page 26. Japan. "`The Japanese not only abstain from animal food, but even from milk and its productions. One of the laws which they most religiously observe is, not to kill, nor to eat anything that is killed.'"

"'Fish and rice are staples of the Japanese diet... Beans are an important article, and from these is manufactured *tofee* [sic, tofu]–literally bean-cheese, an article largely used by the poorer classes'" (*New York World* 1887).

• ***Summary:*** Prof. Dr. O. Loew discusses the preparation of frozen tofu (*kôri-tofu*), frozen konnyaku (*kôri-konnyaku*), and frozen mochi (*kôri-mochi*). Address: Japan.

1097. Perkins, W.R. 1904. Chemical work. *Mississippi Agricultural Experiment Station / Agricultural and Mechanical College of Mississippi, Annual Report* 17:35-39. For the fiscal year ended June 30, 1904.

• ***Summary:*** In the section on "Field experiments for 1903," the subsection titled "Soja beans" (p. 38) states: "This crop gave yields that indicate the likelihood of its becoming a formidable rival of the cowpea as a producer of forage and as a restorative crop. Seven varieties [whose names are not given] were grown, six of which were Japanese varieties imported and distributed by the Bureau of Plant Industry at Washington, D.C., and the Mammoth Yellow variety procured from seedmen. The latter variety produced 4.5 tons of hay per acre with 40 per cent of moisture present. It kept perfectly in a stack and was entirely consumed by sheep during the winter. 24 bushels of seed per acre were secured on a part of the field."

Note: This is the earliest document seen (one of three documents, Aug. 2004) that mentions the soybean variety Mammoth Yellow. Address: M.S., Assoc. Chemist [Agricultural College, Mississippi].

1098. Smith, Hugh McCormick. 1904. The seaweed industries of Japan. *Bulletin of the Bureau of Fisheries* (*USA*) 24:133-81.

• ***Summary:*** A remarkable article, with reproductions of many old Japanese illustrations, plus many current photos. Contents: Introduction (with 7 early references, 3 in English). Kanten, or seaweed isinglass. Funori, or seaweed glue. Kombu. Amanori or laver. Seaweed iodine. Other Japanese algæ and their uses.

The article begins: "Seaweeds are among the most valuable of the aquatic resources of the Japanese Empire, and conduce largely to the prominent rank attained by the

© Copyright Soyinfo Center 2014

fisheries of that country. While marine plants are extensively utilized in France, Ireland, Scotland, and other European countries, in the East Indies, in China, and elsewhere, in no other country are such products relatively and actually so important or utilized in such a large variety of ways as in Japan." Only one species, laver (*nori; Porphyra lacinda*), is extensively cultivated. "The seaweed preparations to which special attention is given are kombu, amanori [nori], funori, kanten, and iodine."

Under "Food qualities of kombu" (p. 153): "Fronds after being scraped once are cut in 3/4-inch squares and boiled in soy-bean sauce, which treatment preserves them for a long time, and these pieces make an excellent relish, tasting like caviare [caviar] or anchovy sauce. The Japanese name, *tsukudani*, means 'boiled with soy-bean sauce.'" The average wholesale price of "kombu chips in soy sauce, 1.10 yen per kamme" (1 kamme [kan] = 8.28 pounds) (p. 154).

Under "Preparation and utilization of porphyra" [nori] (p. 159): "Recently it has been boiled with Japanese (soy bean) sauce and put up in tins."

The section titled "Other Japanese algæ and their uses" notes (p. 163-65) that many species are seasoned in soy-bean sauce: *Arame* (*Ecklonia bicyclis*) "is chiefly eaten as an ingredient of soups, as a salad, or mixed with soy-bean sauce."

Hijiki (*Cystophyllum fusiforme*) "is sun dried and is ready for use after boiling in fresh water or cooking with soy-bean sauce."

Wakame (*Undaria pinnatifida*)*:* "Before being used it is washed with fresh water, and then eaten as a salad, cooked with soy-bean sauce or put in soups... The thick root of wakame, called *mehibi*, is often dried, shaved, cut into slices, or eaten with sauce (miso)."

Suizenji nori (*Phylloderma sacrum*)*:* "This product is ordinarily eaten with raw fish (*sashimi*)*;* the dry weed is soaked in fresh water, and after it has swelled, boiling water is sprinkled over it and then soy-bean sauce is added. In the time of the feudal system this preparation was regularly presented to the local daimyo."

Miru (*Codium tomentosum, C. mucronatum, C. lindenbergii*)*:* "After drying they are preserved in ask or salt. They are prepared for food by boiling or baking in water, and are put in soups; or, after washing, by mixing with soy-bean sauce and vinegar."

Haba-nori (*Phyllitis fascia*)*:* "This plant is prepared for use after the manner of 'awa-nori' (*Porphyra*), principally by peasants of the provinces of Awa and Sagami. The young fronds are dried in the sun in sheet form and subsequently parched, powdered, and mixed with soy-bean sauce."

Matsuma (*Chordaria abietina*) "abounds in northern Japan and is consumed by the peasantry. It is preserved by packing in salt, and is cooked with soy-bean sauce."

Mozuku (*Mesogloia decipiens*) "is preserved by salting, and is eaten after washing out the salt and immersing in soy-bean sauce or vinegar."

Hondawara (*Sargassum enerve*) "When the plant is young it is eaten in soup or with soy-bean sauce."

Somen-nori (*Nemalion vermiculare*) "is eaten in soup or after mixing with vinegar and soy-bean sauce."

Tosaka nori (*Kallimenia dentata*) "is preserved by drying, and is eaten as a condiment or mixed with soy-bean sauce."

Other Japanese algæ which are eaten are: *Awo-nori* (*Enteromorpha compressa, E. intestinales, E. linza*). *Aosa* (*Ulva lactuca*), "the well-known sea lettuce of the United States." *Tsuno-mata, hosokeno-mimi* (*Chondrus crispus, C. ocellatus, etc.*). "The well-known Irish moss. *Ogo-nori* (*Gracilaria confervoides*).

"Other Japanese algæ which are dried and eaten or utilized in various other ways are: *Cata-nori* (*Gigartina teedii*), *comen-nori* (*Grateloupia affinis*), *mukade-nori* (*Grateloupia filicina*), *makuri* (*Digenea simpler*), *ego* (*Carnpylaephora hypneoides*), *okitsu-nori* (*Gymnogondrus flabelliformis*), *and tosaka* (*Sarcodia species*)*."* Address: Deputy U.S. Fish Commissioner.

1099. *Treasury Decisions under Tariff and Navigation Laws, Etc.* 1904. Bean cake, bean stick, and potato cake (24513–G.A. 5361). 6:542-44. For the year 1903.

• ***Summary:*** Bean cake is koya tofu [dried-frozen tofu]. Bean stick is dried yuba sticks. Potato cake is konnyaku.

"The merchandise in question in these cases was imported from Japan and China into the port of Honolulu, Hawaiian Islands, and consists of so-called bean cake, bean stick, and potato cake. The goods were classified and assessed for duty under the provision for "all vegetables prepared or preserved," in paragraph 241 of the tariff act of 1897 at 40 per cent ad valorem, and are claimed to be dutiable at 20 per cent ad valorem, as nonenumerated manufactured articles, under section 6 of the act.

"The bean cakes are small, approximately rectangular shapes of porous consistency and yellow color, which break into crumbs under pressure. The bean sticks [dried yuba sticks] are lengths of hard, brittle, yellow substance, having a glazed appearance and resembling a piece of molasses candy.

"Kikujiro Shimada, owner of the Tofu Manufactory in Yokohama, who has been engaged in this business over thirty-five years, thus describes the manner in which bean cake is made: To manufacture bean cake, koya tofu, first keep soja beans in water at least twenty-four hours (beans are now mostly imported from China), and when the beans become very soft, grind them under the millstone; mix the ground beans with water and boil the mixture in kettles about half an hour. When cooled, by pouring it into a cloth sack and squeezing it, we get a milk-like juice, which is too rich for tofu manufacturing. What remains in the sack is mixed with water and boiled again and the squeezing repeated. The thin milk-like juice we get is mixed with the rich one

© Copyright Soyinfo Center 2014

obtained by the first squeezing, and while the mixture is yet warm it is poured into the mold and a little quantity of nigari (the brine left by the diliquescence [deliquescence] of a salt) is added to cause the bean juice to coagulate. The mold has several holes lined with fine cloth to allow the water to drop away. In the course of an hour or so we get tofu, white jelly-like food. Slice the tofu carefully and freeze it in cold nights and then dry it in the sun. Repeat this for days and nights until the frozen tofu is perfectly dry, when it is marketable.

Note: This is the earliest English-language document seen (April 2013) that uses the term "koya tofu" to refer to dried-frozen tofu.

"The process of making bean stick is described in a letter dated February 20, 1903, from the commercial museum, department of agriculture and commerce, Tokio, received by the collector from the same source as the manufacturers' affidavits above quoted. It is as follows:

"Yuba (bean stick). Keep the soja beans in water until they are very soft; then rub them fine in "suribachi" (mortar like earthen pot) and then boil these. Thick creamlike matter will collect on the surface. This when dried by fire is yuba" (p. 544).

1100. Lea and Perrins. 1905. Lea & Perrins' Sauce (Ad). *Japan Weekly Mail* (*Yokohama*) 43(11):24. Jan. 7.

• ***Summary:*** This black-and-white ad (5 by 4 inches) states: "The original and genuine Worcestershire. By Royal warrant to His Majesty the King."

Note: This is the earliest document seen (Feb. 2012) that contains the phrase "By Royal warrant to His Majesty the King" in connection with Lea & Perrins' Worcestershire sauce. The phrase was used frequently in ads until about 1916. Address: England.

1101. Saito, Kendo. 1905. Microbiological studies on the brewing of Japanese Soja-Sauce. *Botanical Magazine* (*Tokyo*) 19(216):75-77. Jan. 20. Bound after p. 119 of Japanese text. [1 ref. Eng]

• ***Summary:*** The author has been able to isolate the following microorganisms from koji and moromi: 1. Moulds: *Aspergillus Oryzae, Rhizopus sp., Tieghmella sp.* Others incl. *Penicillium glaucum, Cladosporium herbarum,* etc. 2. Bacteria: *Sarcina Hamaguchiae* and *Bacterium Soja* (both new species). 3. Yeasts: *Saccharomyces Soja* (new species) grows copiously in moromi [the mash]. Film yeasts incl. *Saccharomyces farinosus* Lindner [Pichia farinosa (Lindner)], *Mycoderma sp.,* etc.

Note 1. This is the earliest document seen (Jan. 2009) describing Japanese investigation on the yeasts in shoyu mash (*moromi*).

Note 2. This is the earliest document seen (Jan. 2009) which mentions that *Saccharomyces* yeasts are involved in the shoyu fermentation. Address: Botanical Inst., Imperial Univ., Tokyo, Japan.

1102. Akizuki, Yoshizo; Nakanishi, Yoshitaka. 1905. Shôyu shiken seiseki hôkoku [Analysis of shoyu]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 275. p. 49-51. Jan. [Jap]
Address: Zeimusho-kannai, Matsuyama-shi, Ehime-ken, Japan.

1103. Tokyo Plant, Seed & Implement Co. (Tokyo Konoen). 1905. *Agriculturist* (*The*) No. 125. Jan. 56 p. [Jap]

• ***Summary:*** This illustrated monthly Japanese-language periodical, which began publication in 1894, has two main parts and functions: (1) Articles that promote agricultural theories and techniques to the public in easy-to-understand language. (2) A catalog of the publisher's seeds, plants, bulbs, and implements.

The catalog section titled "Beans" (p. 8+) includes two entries (p. 9) for soybeans (*daizu*)*:* (1) Juninko ("ten people like") variety. 5 sen per *gô* (100 sen = 1 yen; 1 *gô* = 180 cc = 0.763 cups {U.S.}). 40 sen per *shô* (1 *shô* = 1.8 liters = 1.903 quarts {U.S.}). A recently improved variety with medium sized, shiny seeds. They are good for making shoyu, miso, or other foods. (2) Kimusume ("fresh daughter") variety. 5 sen per *gô.* 40 sen per *shô.* Mid-season / medium-maturing, summer varieties that yield a big harvest. Address: Tokyo, Japan. Phone: 2421.

1104. Yokohama Nursery Co., Ltd. 1905. Descriptive catalogue... for 1905. Yokohama, Japan. 94 p. Illust. Index. 26 cm. [Eng]

• ***Summary:*** On the cover of this English-language catalog is an illustration of two different species of wistaria blossoms. In the section "Price list of seeds" (p. 82+) is a subsection (p. 87) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1903 (and 1901) catalog. Address: P.O. Box No. 72. Nos. 21-35

© Copyright Soyinfo Center 2014

Nakamura, Yokohama, Japan.

1105. *USDA Bureau of Plant Industry, Inventory.* 1905. Seeds and plants imported during the period from September, 1900, to December, 1903. Nos. 5501 to 9896. Seed and plant introduction and distribution. No. 10. 333 p. Feb. 8. Also titled USDA Bureau of Plant Industry, Bulletin No. 66.
• ***Summary:*** Soy bean introductions: Glycine hispida.

5764-5766. "From Washington, D.C. Three varieties of soy beans from Japan, grown during the season of 1900 on the Potomac Flats.

"5764. Common. (S.P.I. No. 4912.)

"5765. Best White. (S.P.I. No. 4913.)

"5766. Best Green. (S.P.I. No. 4914.)"

6312/6314/6326/6333 -6336. "From the Tokyo Seed and Plant Company, Tokyo, Japan. Received April 20, 1901.

"6312. *Black Flat.*

"6314. *Yoshioka.*

"6326. *Rokugatsu.*

"6333. *Gosha.*

"6334. *Black Round.*

"6335. *Green Medium.*

"6336. *Bakaziro"* [*Bakajiro*].

6379. "Grown on the Potomac Flats, District of Columbia, under the direction of W.R. Beattie, from No. 3870."

6386/6396/6397/6414/6416. "From Pyeng Yang, Korea. A collection of seeds of economic plants which are cultivated in Korea. Presented by Rev. W.M. Baird. Received May 3. 1901.

"6386. *Black.*

"6396. *White.*

"6397.

"6414. 'Plant in May.' (Baird.)

"6416. *Black.*" Note:

Note 1. This is the earliest document seen (June 2000) concerning soybeans in Korea, or the cultivation of soybeans in Korea.

6556/6558-6561. "From China. Received through Dr. G.D. Brill, May 17, 1901. A collection of seeds and plants made during an extended trip through China in 1900. The notes regarding the various numbers are copied from letters written during this period, no separate descriptive list of the various introductions having been furnished. Doctor Brill's numbers are given.

"6556. (No. 57.) 'Much used for bean curd and oil all over central China. Probably as many of these are grown as all the other varieties together.' (*Brill.*)

"6558. From Hankow. (No. 59.) 'Used for bean curd and oil. Considered better than No. 6556.' (*Brill.*)

"6559. From beyond Chiu Niu. (No. 60.) 'Planted between the rows of rice and ripening late in the fall, after the rice is harvested. Used the same as No. 6556, only quality poorer. Will grow on very wet land.' (*Brill.*)

"6560. From beyond Chiu Niu. (No. 61.) 'Planted and used the same as No. 6559. Planted in July or August.' (*Brill.*)

"6561. From Hankow. (No. 62.) 'A black bean, used for same purposes as Nos. 6559 and 6560, but of better quality. Not planted with other crops.' (*Brill.*)*"*

8422-8424. "From Yokohama, Japan. Received through Dr. S.A. Knapp, February 24, 1902.

"8422. *Ita Name.* Early.

"8423. *Ita Name.* Medium.

"8424. *Ita Name.* Late." Note 2. This is the earliest document seen (Jan. 1999) that contains the words/name "Ita Name," which make no sense in Japanese. Perhaps "Eda Mamé" was intended.

8489-8497. "From Washington, D.C. Received March 10, 1902. A collection of seeds grown on the Potomac Flats by Mr. W.R. Beattie from seeds furnished by the Office of Seed and Plant Introduction.

"8489. Grown from No. 6314.

"8490. Grown from No. 6333.

"8491. Grown from No. 6334.

"8492. Grown from No. 6386.

"8493. Grown from No. 6396.

"8494. Grown from No. 6336.

"8495. Grown from No. 6397.

"8496. Grown from No. 6416.

"8497. Grown from No. 6312."

8584/8586. "From Chin-kiang, China. Received through Dr. S.A. Knapp from Rev. Dr. S.P. Barchet, Shanghai, China, April 15, 1902.

"8584. 'A very prolific, nearly white variety used for making oil and also for food. It is sometimes ground into flour and used for making cakes.' (*Knapp.*)

"8586. 'A very oily variety, used chiefly for fattening purposes. Planted in July or August.' (*Knapp.*)*"*

8900. "From Anjo, Japan. Received through Messrs. Lathrop and Fairchild (No. 963, June 29, 1902), July 24, 1902. 'Twenty-six numbered seeds of a giant soy bean presented to the Department by Mr. K. Obata, director of the Tokai branch agricultural experiment station at Anjo, Japan, on condition that should any of the seeds prove to have inherited the characteristics of its female parent he is to have returned to him a fair quantity of the beans which it produces. All the beans have been numbered, and it is desired especially that a record of each be kept for information. This "most exceptional sport" ["an individual exhibiting a sudden deviation from type beyond the normal limits of individual variation usually as a result of mutation, esp. of somatic tissue"] from which these beans are taken measured 12½ feet in length and had a stem 1 inch in diameter at the base. It yielded about one-fifth of a gallon of beans, while ordinary plants, I am assured by Mr. Obata, give from 50 to 60 seeds only. Its root system is well developed, but whether unusual it is impossible to say,

© Copyright Soyinfo Center 2014

as it was dug before Mr. Obata saw it. The history of this "most remarkable sport" is as follows: Mr. J. Miyazaki, a descendant of a Samurai and now a second-hand clothier in the village of Okasaki [Okazaki?], found in his small back yard a soy bean which neither he nor his wife had planted purposely, but over which they quarreled, the wife wishing to pull it up because it grew to such unusual proportions and spread over the whole yard. Mr. Miyazaki, however, found in this abnormal plant something to interest him, and when the local district fair was held in Mukada in October he dug up the plant and exhibited it there, but he unfortunately and thoughtlessly ate up most of the beans. Mr. Obata, of the experiment station at Anjo, saw the plant at the fair, visited Mr. Miyazaki's place, and rescued the remaining handful of seed. He got samples of the soil where the plant grew and has sown about 20 seeds in this soil at the experiment station. I have seen and photographed this remarkable sport and think it worth of the most careful attention.' (*Fairchild.*)"

9344. "From Chiu-hua, China. Secured by Dr. S.P. Barchet, of the United States consulate, Shanghai, China, at the request of Dr. S.A. Knapp. Received January 22, 1903. *Chiu-hua.* 'In case of future reference to the bean, if you call this the *Chiu-hua* bean I shall know what is meant, in the absence of a botanical name, as I have not seen this bean anywhere else. It is sown broadcast in paddy fields before the rice is harvested. The moist ground favors the sprouting, and the standing grain shields the sprouting plant from the sun. By the time the rice is harvested the beans have taken firm roots and require no further care. Horses and cattle are very fond of them green or in the ripe state. The bean also makes a good food for man. This bean I think well worth a trial in the Southern States.' (*Barchet.*)"

9407-9418. "A collection of soy beans grown by Mr. W.R. Beattie on the experimental grounds on the Potomac Flats, from introduced seed.

"9407. Grown in 1902 from S.P.I. No. 4912.
"9408. Grown in 1902 from S.P.I. No. 4913.
"9409. Grown in 1902 from S.P.I. No. 4914.
"9410. Grown in 1901 and 1902 from S.P.I. No. 6312.
"9411. Grown in 1901 and 1902 from S.P.I. No. 6333.
"9412. Grown in 1901 and 1902 from S.P.I. No. 6334.
"9413. Grown in 1901 and 1902 from S.P.I. No. 6336.
"9414. Grown in 1901 and 1902 from S.P.I. No. 6386.
"9415. Grown in 1901 and 1902 from S.P.I. No. 6396.
"9416. Grown in 1901 and 1902 from S.P.I. No. 6397.
"9417. Grown in 1901 and 1902 from S.P.I. No. 6414.
"9418. Grown in 1901 and 1902 from S.P.I. No. 6416."

Note 3. This is the earliest document seen (June 2007) that clearly refers to the cultivation of soybeans in Washington, DC (on the Potomac Flats). This document contains the earliest clear date seen for the cultivation of soybeans in Washington, DC (1900).

Note 4. This is the earliest document seen (March 2003) that mentions the Potomac Flats, an experimental garden owned and used by the USDA in Washington, DC, before it purchased the Arlington Farm in 1900. Even before that, starting in 1865, there was an experimental garden around the original USDA building on The Mall. The Potomac Flats were acquired by the USDA in 1899. They were located in Washington, DC, on the banks of the Potomac River, probably in what is now Potomac Park.

Note 5. This is the earliest document seen (July 1998) concerning David Fairchild and soybeans. Address: Washington, DC.

1106. Kadono, C. 1905. The diet of the Japanese. *Times* (*London*). Feb. 11. p. 6, cols. 3-4.

• ***Summary:*** This article is actually mostly about soya beans and their products. "It is well known that the Japanese diet consists chiefly of rice, vegetables, and fish, with very small and occasional additions of butchers' meat. The relative quantities of these, and vegetables and products thereof used, would be interesting and in some respects instructive.

"The following bill of fare, which attempts to give the three meals of a day for a family of moderate circumstances, will show how they live. It may also be said that all Japanese live rather simply whether high or low in their station of life, and the menu can be taken as typical of all classes.

"Breakfast (about 7 to 7:30 a.m.).–Miso soup (with vegetables, tofu, &c.), pickles, boiled rice, tea (sometimes raw egg or boiled sweet soya beans, or natto, &c.).

"Lunch (12 noon).–Fish boiled in soya, vegetables stewed in soya, pickles, boiled rice, tea.

"Supper (6 to 6:30 p.m.).–Soya soup (with vegetables, fishes, &c.), raw fish sliced and eaten with soya sauce, broiled fish (or boiled) with vegetables (or butchers' meat or fowl and vegetables stewed), rice, tea...

"From the foregoing it can be seen how cereals and vegetables predominate in Japanese diet. Rice and miso and soya, as will be seen from the menu, form the predominant feature of the food, and it may not be an exaggeration to say that the Japanese physique is mainly built up on the products of soya beans, such as miso, soya sauce, tofu, &c."

There follows a detailed table titled "Analysis of Soya Beans and Their Products. (Extract from a table by Mr. C. Omura.)" Nutritional analyses are given for the following, written exactly as they appear: Soya beans (5 varieties), miso (white, red Osaka, red Tokio, red Sendai), soya sauce (regular or Noda), tofu, dried frozen tofu, fried tofu, mash residue from tofu (Okara), yuba (Dried skim off tofu-mash), natto (Steamed beans with surface fermentation).

Note 1. This is the earliest English-language document seen (April 2013) that contains the term "fried tofu."

"Soya beans are grown all over Japan and in Manchuria, and so far as I know cannot be had here [in England]. They are eaten boiled, either young or ripe." They are manufactured into those articles shown above, of which miso, soya, and tofu are the most important..." The author

© Copyright Soyinfo Center 2014

then gives a 5-10 line description for each of how miso, soya sauce, and tofu are made. Tofu is coagulated with a "strong brine. "The remnant (okara), being a white pulverized mass, called fancifully 'snow balls' by Japanese, is eaten boiled and seasoned with soya sauce.

"I have given Japanese meals to some English friends and most have pronounced the food excellent, and some have even braved the sliced raw fish with soya sauce."

Note 2. Concerning the idea that okara is sometimes fancifully called "snow balls," the term *kirazu* is written with three characters: yuki = snow, hana = flower(s), and sai = vegetable(s). Or the author may be referring to a local term from some part of Japan.

Note 3. This is the earliest English-language document seen (June 2013) that uses the Japanese word *okara* or the term "mash" or "mash residue" or "mash residue from tofu" to refer to okara.

Note 4. This is the earliest English-language document seen (April 2013) that contains the term "dried frozen tofu" (or "dried-frozen tofu"). Address: England.

1107. *Manchester Guardian.* 1905. What the Japanese eat. Feb. 13. p. 12.
• ***Summary:*** This is a summary of: Kadono, C. 1905. "The diet of the Japanese." *Times* (London). Feb. 11. p. 6, cols. 3-4. Mentions soya beans, miso soup, tofu, natto, soya sauce, etc.

1108. *Star* (*Canterbury, New Zealand*). 1905. Fish as war food: The fish eater versus the beef eater. Tabloids of brain and nerve food furnished as emergency rations. Feb. 25. p. 2.
• ***Summary:*** "(By Frank G. Carpenter, in the New Orleans 'Times-Democrat'). Washington [DC], December 29, 1904. I saw this morning a specimen of the emergency rations furnished the Japanese Army. It [katsuobushi] looked like a petrified banana of the largest size,...

There follows a conversation with Dr. Hugh M. Smith about fish in Japan.

"Raw fish. 'How about eating fish raw, doctor, I understand that is common in Japan?'

"'It is, and I assure you that raw fish are not so bad when properly served. Take a fresh tai [sea bream] and slice it thin. Bring it cold to the table and eat it with chop-sticks, dipping each bite in soy or bean sauce, and you will find it delicious. The Japanese, however, usually eat their fish cooked.'"

1109. Uyeno, K. 1905. Shinkoku-san kôji (Fonkyo) no kenkyû. Dai nikkai hôkoku [Examination of Chinese koji (Honkio). Part II.]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 276. p. 93-102. Feb. [Jap; eng]
• ***Summary:*** Examination of the saccharifying power of Chinese koji (Honkio) showed it to be somewhat weaker than that of malt. The by-product of saccharification is not maltose (a for malt and Japanese koji) but dextrose. Address: Yakugakushi, Japan.

1110. *San Francisco Chronicle.* 1905. Heaps of corpses cover wide plain: Inspection of Oku's battle field shows fighting was desperate. March 17. p. 5.
• ***Summary:*** After the Battle of Moukden [Mukden, in Manchuria], the Russians fled, setting "fire to stores and railway stations, but they were only partially destroyed. The Japanese saved large quantities of flour and bean cake and other supplies."

1111. *Chambers's Journal* (*London*). 1905. Japanese diet. Vol. 8. March 25. p. 270. Sixth series. [1 ref]
• ***Summary:*** "The nations of the world have now had the opportunity of learning many a valuable lesson from the general management of the Japanese army... It is interesting to note that the hard work done by the Japanese Tommy is performed on a dietary table which would hardly satisfy the soldiers of any other country. A large quantity of the Japanese soldiers' rations is made up of compressed fish-meal... Another form of food which seems peculiar to the Japanese army is obtained from kelp and other seaweeds, many of which afford very nourishing sustenance...

"At home this is the bill of fare of a Japanese family in moderate circumstances, according to C. Kadono in the *Times.* Breakfast (about 7 to 7.30 A.M.)–miso soup (with vegetables, tofu, &c.), pickles, boiled rice, tea (sometimes raw egg or boiled sweet soya beans, or natto). Lunch (12 noon)–fish boiled in soya, vegetables stewed in soya, pickles, boiled rice, tea. Supper (6 to 6.30 P.M.)–soya soup (with vegetables, fish, &c.), raw fish sliced and eaten with soya sauce, broiled fish (or boiled) with vegetables (or butcher meat or fowl and vegetables stewed), rice, tea. The Japanese physique is thus largely built up on the product of soya beans, which are grown all over Japan and in Manchuria, and from which miso, soya, and tofu are made. Soya beans, which, we believe, are not to be had in this country, are much richer in albumen than either beef or mutton. The Japanese diet, therefore, mainly consists or rice, vegetables, and fish, with very small and occasional additions of butcher meat."

1112. Suzuki, Tozaburo. 1905. Apparatus for making soy extracts. *U.S. Patent* 0,785,776. March 28. 6 p. Application filed 28 July 1904. 6 drawings.
• ***Summary:*** Concerns soy sauce production. Six illustrations (line drawings) show the apparatus consisting of 3 vacuum evaporating pans, in series, working on the multiple effect system. The pans consist of a cylindrical drum containing the extract to be evaporated, surrounded by a steam jacket; a rotary stirring device is provided in each drum for keeping the liquid in motion, and the extremities of the stirring arms are fitted with brushes. The concentrated extract from the last evaporator is discharged into a vacuum finishing receptacle

© Copyright Soyinfo Center 2014

heated by hot water. This receptacle is divided into 2 sections, containing shelves composed of hot-water tubes, upon which trays containing the concentrated extract are placed for final drying; the air can be exhausted from either section independently.

Note: This is the earliest U.S. patent seen related to soy. The five earliest soy-related patents in the United States were all issued to Tozaburo Suzuki. This is the second earliest soy sauce patent seen worldwide, after the British patent of Samuel Bowen of 1767. Address: No. 401 Jibeishinden, Sunamura, Minami Katsushika, Japan.

1113. Lust (Benedict). 1905. Mother's milk (Ad). *Naturopath and Herald of Health* (*The*) (*New York City*) 6(3):Unnumbered page at front. March.

May. [Rus]
• ***Summary:*** During the Russo-Japanese War (1904-05) the authors conducted investigations on soy oil in the chemical-bacteriological laboratory of the Russian military hospital in Harbin. They carried out human feeding studies on all aspects of soy-bean oil, which was consumed with a basal ration of rye bread, cabbage soup, and buckwheat or millet cooked as a porridge. Three soldiers of normal health served as subjects and ate 100 grams of unrefined soy-bean oil daily, in addition to 46 grams of fat supplied by the basal ration. The total fat of the diet was on average 97% digested.

Note 1. This is the earliest document seen (Sept. 2001) concerning the effects of dietary lipids (or soy-bean oil) on blood lipids.

Note 2. This is the earliest document seen (Jan. 2004) that mentions the term "Harbin" in connection with soybeans. Address: 1. Head, Korentschewski Laboratory; 2. Head, Zimmerman Pharmacy. Both: Biochemical Laboratory of Harbin Unified Hospital (Kharbinskago Svodnago No. 1 gospitalya)).

Miso, shôyu-chû ka kuroru tetsu ni yotte sarichiru-san to kokuji no hanno o tei suru seibun ni tsuki, dai ikkai hôkoku [A constituent of miso and shoyu which gives, with ferric chloride, a reaction similar to that of salicylic acid]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 280. p. 483-88. June. [Jap; eng]
• ***Summary:*** This constituent is thought to be tyrosine, which is a decomposition product of albuminous matter contained in the raw material. Authors also give the results of experiments on that constituent and the distinction between it and salicylic acid.

1125. Korentschewski, W.; Zimmermann, A. 1905. Sanitaer-hygienische Untersuchung des chinesischen Bohnenoeles [A sanitary-hygienic investigation of Chinese soybean oil]. *Chemiker-Zeitung* 29(58):777-78. July 22. [Ger]
• ***Summary:*** Some 20 different species of these beans are sold under the name 'doutsa,' some being used as human food, others as fodder for cattle, and others again for the extraction of the oil. A kind of vermicelli is also prepared from certain species. The oil is expressed by means of primitive plant in the Chinese factories and exported in large quantities to Japan and Korea. The method of extraction consists in first crushing the beans into caked masses by means of mill stones, then heating them on stone slabs until the appearance of vapors, and finally expressing them in an iron receptacle. As first obtained the oil is turbid, but after some time becomes clear, the deposit consisting of sand particles and vegetable fibres. Only the clear oil is exported, but the turbid oil is sold locally. It has a faint odor recalling that of Chinese wood (tung) oil, is bland to the taste, and of a dark brown colour. Four commercial samples examined by the authors (one being obtained direct from the factory in Kharbin [Harbin]) gave the following results:–Water, 0.3 to 1.80 per cent.; specific gravity at 15ºC, 0.9264 to 0.9287; solidification point, -14.6º to -15.3ºC; saponification value, 207.9 to 212.6; ester value, 203.9 to 207.7; insoluble fatty acids, 93.6 to 94.28 per cent.; iodine value (Hübl), 114.8 to 137.2; solidification point of fatty acids, 16ºC to 17.3ºC; melting point of fatty acids, 20ºC to 21ºC; Maumené test, 102º to 116ºC; and acid value 1.86 to 15.46. It was concluded that the oil contained a large proportion of oleïn. Practical tests showed that the oil was readily absorbed by the system and possessed a high food value.

Note: This is the earliest document seen (March 2000) that mentions tung oil. Address: 1. Dr.; 2. Mag. pharm.; Both: Aus dem chemisch-bakteriologischen Laboratorium des I. Militaerhospitals in Charbin (Chemical-Bacteriological Lab., I. Military Hospital, Harbin, Manchuria).

1126. *France Militaire* (*La*) (*Paris*). 1905. La Guerre Russo-Japonaise: La cuisson des aliments dans l'armée japonaise [The Russo-Japanese War: The cooking of foods in the Japanese army]. 6(6464):1. July 27. [1 ref. Fre]
• ***Summary:*** We borrow the following interesting details from the *Streffleurs Oesterreichische Militaerische Zeitschrift.* The Japanese soldier does not eat bread, which greatly simplifies supply operations, making it unnecessary to construct of bakeries or to carry fresh bread–which is very cumbersome. Moreover, meat is not as important to the Japanese as it is to European armies. Japanese soldiers can easily do without meat, for they are not accustomed to eat it regularly; they are content with rice and dried fish, provisions which are easily transported and distributed. When they are given meat, it is cut into small morsels and stewed with vegetables. They eat it with a sort of piquant sauce (*sauce piquante*) [i.e., soy sauce].

The Japanese eat their meals cold voluntarily–even canned meat.

1127. Clement, Ernest W. 1905. Mito samurai and British sailors in 1824. *Transactions of the Asiatic Society of Japan* 33:86-123. July. See p. 113, 122. Read May 17, 1905. [5 ref]
• ***Summary:*** In 1638, Tokugawa Iemitsu, the 3rd Tokugawa shogun, issued his famous edict with two parts: First, it prohibited foreigners from landing on the coast of Japan. Second, it prohibited Japanese from leaving Japan. Only a limited amount of trade was permitted at Nagasaki with the Dutch and the Chinese.

Yet no policy, no matter how stringent, could prevent the winds and currents from carrying foreign vessels to the

© Copyright Soyinfo Center 2014

Japanese shores. The seclusion became even more difficult to enforce after about 1750, when whaling and merchant vessels began to frequent the waters of the Pacific Ocean.

Page 88 cites three documents that discuss the attempts made before Commodore Perry's visit to open intercourse with Japan. Mito was a fief (*han*) on the eastern cost of Japan just northeast of today's Tokyo. Before 1824 various western ships were seen off the coast. "In 1823, some fishermen discovered a foreign ship off the coast of Hitachi [a village in Mito] and had an opportunity to go aboard. In the ship they found many swords, guns, etc.; and they saw the crew getting oil from whales." The crew of one stranded ship landed, and attacked and robbed the people, throwing them into confusion.

On about June 24, twelve foreigners [British] landed at the village of Hitachi. They attempted to communicate with a villager, and succeeded at basics; the story is told by Aizawa An, a prominent Mito samurai.

In *The Leading men of Japan,* by Charles Lanman [1883] we read (p. 283): "According to the native annals, the coast of Japan was visited by foreign vessels in 1637, 1673, 1768, 1791, 1793, 1796, 1803, 1808, 1813, and 1829." In 1846 two American ships first arrived at Nagasaki [then Tokyo Bay] under Commander James Biddle, and Commander Matthew C. Perry made his visit in 1853, made memorable by resulting in a treaty with the United States. In 1854, Sir James Stirling, an English admiral, visited Nagasaki, and also concluded a treaty with Japan;... Perry "opened" Japan primarily for the U.S. whaling industry. In 1824 British sailors landed in Japan.

Page 113: "Kuhachiro and Tôzô received the following provisions for three days' use: 3 *shô* of rice, 6 *seki* of *miso,* 6 *seki* of salt.

"The following are the provisions for horses: 2 *shô* 1 *gô* of soja bean, 1 *shô* 2 *gô* of rice-bran, 9 *kwan* of hay and straw. These were to be used for three days..."

Footnotes (p. 110, 113, 122): 1 shô = about 1.5 quarts. 1 *seki* is about 0.03 pint. 1 *gô* is about 0.3 pint. 1 *kwan* is 8.2673 lbs. 1 *hiki* is ¼ *sen* [a small unit of Japanese money].

1131. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1905. China: Fertilizing material wanted. No. 299. Aug. p. 14-15.
• ***Summary:*** In China, there is unlimited opportunity to sell modern fertilizers. Most of the country's land has been under intensive cultivation for some two thousand years. Current medical knowledge is forcing a change from old methods to help prevent typhoid, and the advantage of modern fertilizers is coming to be appreciated. The principal commercial fertilizer in China is presently [soy] bean cake. The port of Niuchwang alone ships bean cake to the value of $5,000,000 gold a year, most of it coming to lower Chinese coast ports. It is one of the chief commodities in the trade of Amoy, Swatow, and similar coast ports. China also typically ships about $3,800,000 worth of bean cake abroad each year, mostly to Japan, but the war interfered considerably with the sale last year. Address: Washington, DC.

1132. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1905. Japan: Principal articles imported. No. 299. Aug. p. 30.
• ***Summary:*** A table shows the value of the principal imports to Japan during the first six months of the calendar years 1904 and 1905. The amount imported is not given. "Oil cake" increased dramatically from $728,000 in 1904 to $3,033,000 in 1905. "Beans, pease and pulse" increased from $1,501,000 in 1904 to $2,479,000 in 1905. The largest imports in 1905 were cotton (raw) $34,221,000 and rice $19,872,000. Address: Washington, DC.

1133. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1905. Manchuria: Average prices for the years 1899, 1901, 1903, and 1905. No. 300. Sept. p. 112.
• ***Summary:*** A table shows the inflationary effect of the war with Japan. The price of [soy] "bean oil" (in gold dollars per

© Copyright Soyinfo Center 2014

pound) rose from $0.033 in 1899 to $0.038 in 1901 to $0.043 in 1903 to $0.05 in 1905.

The price of [soy] "bean cake" (in gold dollars per ton) rose from $15.12 in 1899 to $16.80 in 1901 to $18.48 in 1903 to $20.00 to $30.00 in 1905.

Footnote: "Bean cake is sold in units of ten pieces weighing 52 catties, or 69.33 pounds, each. The price for ten pieces has varied from $15.50 to $22.50, Japanese war notes, during the season of 1905. The rise in the price of bean cake is partially due to the decrease in the value of silver." Address: Washington, DC.

1136. Macmillan, H.F. 1905. The "Soya (or Soy) Bean." (Glycine hispida). A new vegetable, fodder, and green-manure product for Ceylon. *Tropical Agriculturist* (*Ceylon*) 25(5):682-83. Nov. 15.
• ***Summary:*** "It is strange that a product so important, so simple of cultivation and so quick in yielding returns as this has not hitherto attracted attention in Ceylon. Notwithstanding the fact that it has been introduced several years ago by the Royal Botanic Gardens, and successfully grown at Peradeniya year in and year out, both for the instruction of visitors to the Gardens and for distributing seeds; I question whether there are at present half-a-dozen gardens or estates in Ceylon which count this amongst their crops."

"The Soya Bean thrives at Peradeniya, and appears to be well-suited to the climate and soil; whilst it also flourishes in the Mediterranean region and Southern Europe. It would therefore seem reasonable to expect it to thrive at a comparatively wide range of elevations in Ceylon, provided the conditions of soil and rainfall were at all favourable. In China and Japan the Soya Bean forms a standard article of food with all classes of the community, being prepared for use chiefly in the form of a sauce, paste or cheese, the latter two preparations being made by crushing and pressing the seeds. In India the seeds are said to be cooked and used in various ways, often 'roasted and ground as *satu,* or simply eaten in the form of *dal.'* Soy sauce is said to form the basis of many popular sauces made in Europe." A few years ago soy sauce in London was worth 2 shillings and 6 pence per gallon. "Personally I think Soya Bean as a vegetable is very agreeable and forms a good substitute for the Lentils and Broadbeans of Europe if cooked and served similarly. Its chemical composition, according to Professor Church, places it above all other pulses as an albuminous food."

The soya bean is also considered valuable as a fodder plant and for green manuring. A brief description of its cultivation is also given. "Regarding cultivation, probably few crops are less exacting in their requirements than this. Its most striking characteristic, judging by results recorded at Peradeniya, is the remarkably short space of time in which the plants grow and produce a crop. Here the seeds germinate in 3 to 5 days, the plants flower when a month old; a fortnight later the pods are fit for picking [for use as a green vegetable], and the harvesting is complete in about two months from the time of sowing. Thus, granted the seasons were favourable, it should be possible to obtain four crops a year. In making these statements, which may seem unduly optimistic, it is not by any means intended to convey the impression that practically no expenditure of labour is involved in the production of this crop. On the contrary it is pretty certain that to make it a profitable product for whatever purpose, even under the most favourable conditions for its growth, a reasonable amount of cultivation will be required. It has yet to be proved how far it would repay cultivation in Ceylon for fodder and green-manuring, but that it should prove a welcome adjunct to the food products of the natives, if not as a general vegetable, there seems no question."

A footnote states: "* Since writing this Mr. Kelway Bamber has presented a small quantity of Soya Bean seed to the Botanic Gardens, remarking that he intended to recommend it as a green-manure crop." Address: Curator of the Royal Botanic Gardens at Peradeniya.

1137. De Becker, J.E. (Joseph Ernest). 1905. The nightless city: or, the "History of Yoshiwara Yûwaku." 5th ed. revised. Shanghai, Yokohama, Bremen: Max Nössler & Co.; London: Probsthain & Co. xvi + 386 p. + 46 unnumbered leaves of plates. See p. 158-61, 221. Illust. 2 maps. 19 cm. Reprinted in 1971 by Tuttle & Prentice-Hall.
• ***Summary:*** A book about prostitution in Tokyo. Note 1. The approximate date of this 5th edition, Dec. 1905, is given on p. xvi, at the end of the "Preface to the fifth edition." The first edition was published in 1899.

"It was not until after the City of Yedo had become the seat of the Tokugawa government that regular houses of ill-fame were established, and up to the period of Keicho (1596-1614) there were no fixed places set apart for brothels and assignation houses" (p. 1).

The section titled "Dai-ya no koto (Cook-houses of the Yoshiwara)" (p. 158-61) notes that "these cook houses supply every conceivable kind of food be it *sushi* (a fish and rice roll), *kwashi* [*o-kashi*] (cakes)..."

© Copyright Soyinfo Center 2014

"By the way, there is, in the *Shôbai Orai* (Chinese characters) by Ikku, an item which shows a bill of fare in a *dai-ya* a hundred years ago. It is as follows;–The bill of the *Ki-no-ji-ya* consisted of:... *Teri-gomamé*–Dried young sardines roasted and boiled in sugar and soy... *Aburage*–Bean-curd fried in oil [fried tofu]... *Yaki-dôfu*–Roasted bean-curd... *Umani*–Any food cooked in a mixture of soy, *mirin,* sugar, and the shavings of dried bonito... *Ankake*–A kind of soup containing *tôfu* or arrowroot, etc., all of which foods are suitable to those persons who stop in brothels for several consecutive days.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "Yaki-dôfu" or the term "Roasted bean-curd" to refer to grilled tofu.

"Famous things of the Yoshiwara... *Sanya-tôfu*–Bean curd of Sanya... *Kobu-maki*–Rolled seaweed... *Ni-mamé*–Boiled [soy] beans... *Dengaku–Tôfu* baked and covered with sweetened miso... These things were very popular (even outside the Yoshiwara)" from 1772 to 1829.

Page 221: "The *yûjo* (prostitutes) did not all appear in the cages until the 20th of the 1st month, so the night aspect of the Yoshiwara did not resume its normal appearance until this date. The *saruhiki* (One who goes about getting money by leading a monkey who performs tricks) and *dai-kagura* (A kind of dance performed in the streets by boys wearing wooden lion-head masks) began to pour into the Yoshiwara from the 1st day of the 2nd month: on the night of the first 'horse day' the front of every brothel in the first and second wards of Yeido-chô and of Kyô-machi was illuminated by a large lantern on which was written the names of the *yûjo* in the house. Votive offerings of red rice [probably *sekihan,* azuki beans cooked with rice], fried bean-curd, and fruit were made to the family shrines of the god Inari."

J.E. de Becker lived 1863-1929. Address: Kamakura, Twenty years a resident of Japan, an English student of sociology.

1138. *Japan Advertiser* (*The*). 1905-1940. Serial/periodical. Tokyo, Japan. B.W. Fleisher. Frequency: Daily. 30-39 cm. [Eng]*

• ***Summary:*** This newspaper merged with the *Japan Times & Mail* to form *Japan Times and Advertiser* (Morning ed.).

1139. Japan Year Book. 1905-1952. Serial/periodical. Published by The Japan Year Book Office, Tsukiji, Tokyo; and by Foreign Affairs Assoc. of Japan. Annual. Serial/periodical. Published by The Japan Year Book Office, Tsukiji, Tokyo; and by Foreign Affairs Assoc. of Japan. Annual. [Eng]

• ***Summary:*** 27 volumes. Merged with *Japan Times Year Book* (1933) and *Japan-Manchoukuo Year Book* (1934-1941).

In the *Year Book* for 1906, in the chapter on agriculture, page 104 gives statistics from 1895 to 1903 for the production of the following: Miscellaneous grains (millet, buck wheat [buckwheat], Italian millet, Sarva millet), beans (soja beans, red beans [azuki]), sweet potatoes and potatoes.

Production of soja beans increased from 2,943,478 koku in 1895 to 3,647,830 koku in 1903–an increase of 23% in 8 years. The frontispiece, facing the title page, lists "Weights, measures, and moneys." 1 koku (dry) = 4.962 bushels.

1140. The Russo-Japanese War (Feb. 1904-1905), the Treaty of Portsmouth (5 Sept. 1905), and the Japanese move into Korea (Important event). 1905.

• ***Summary:*** "The event that really won for Japan full status as a world power and equality with the nations of the West was its victory over Russia, the biggest, even if not one of the more advanced, of the Western powers. Russia in 1896 had obtained from Peking the right to build the Chinese Eastern Railway across Manchuria to its port of Vladivostok on the Sea of Japan, thus shortening the Trans-Siberian Railway, the rail link it had started in 1891 to construct across Siberia to the Pacific. When Russia obtained the lease of the Kwantung Peninsula in 1898, it also got the right to connect this line by a southward extension, the South Manchurian Railway, to the ports of the peninsula, Port Arthur and Dairen (Dalian in Chinese). These railway concessions gave Russia considerable control over Manchuria, and the Boxer crisis allowed it to overrun the whole area militarily. Its efforts to take Manchuria over completely, however, ended in diplomatic frustration, and it agreed to a phased withdrawal of its forces.

"Mutual suspicion and enmity steadily mounted between Japan and Russia... Japan broke off relations on February 6, 1904, started hostilities on February 8 with a night torpedo-boat attack on the Russian fleet in Port Arthur, and only two days later declared war."

In the 5-month war that followed, the Japanese navy destroyed its Russian counterpart to win the final victory. The mighty Russians were shocked by their overwhelming defeat at the hands of a little-known Madame Butterfly nation. "Both countries were exhausted by war, and the Russians were plagued at home by revolution. They both readily accepted President Theodore Roosevelt's diplomatic initiative and met to discuss peace terms in Portsmouth, New Hampshire.

"The Treaty of Portsmouth, signed on September 5, 1905, recognized Japan's 'paramount interest' in Korea, restored at least in theory China's sovereignty and administration in Manchuria, and gave Japan the Russian lease on the Kwantung Peninsula and the Russian-built South Manchurian Railway as far north as Changchun. The Japanese were eager to extract an indemnity from the Russians, but the latter were adamant on this point, and eventually Japan settled for the southern half of Sakhalin [Island] instead [below the 50th parallel north, which Japan called Karafuto]. It was the failure to win an indemnity that

© Copyright Soyinfo Center 2014

the Japanese public found so disappointing.

"Japan was now free of all foreign competitors in Korea." In Nov. 1905 Japan "secured a convention making Korea a Japanese protectorate and ending its diplomatic contact with other powers." In 1907 Japan extended control over the Korean government and disbanded the Korean army. "In August 1910 Japan quietly annexed Korea." Called Chôsen, "Korea was governed for Japan's strategic and economic purposes by Japanese officials under a military governor-general."

In its victory over Russia, Japan became the first non-white or non-Western nation to defeat a white or Western nation. In a mere 50 years Japan had transformed itself from an isolated underdeveloped country with no industrial base into a modern nation, a major military and industrial power.

Japan was now free of all competitors in Korea, and in November 1905 secured a convention making Korea a Japanese protectorate and ending its diplomatic contact with other powers. In 1907 the Japanese extended control over the Korean government, arranged that Japanese could serve as Korean officials, and disbanded the Korean army. The widespread rioting that greeted these moved was severely suppressed. In Aug. 1910 Japan quietly annexed Korea. "There was no protest from the powers, which generally approved what was judged at the time as an inevitable step in world progress. The Japanese called Korea Chôsen and governed it for their own strategic and military purposes by Japanese officials under a military governor-general.

With the annexation of Korea, Japan also became a major imperialist/colonial power, with important colonies in Korea and Taiwan, and predominant rights in South Manchuria. It entered World War I as Britain's ally and, although playing only a minimal military role, it picked up the German colonial possessions in East Asia and the Pacific, including Kiaochow Bay and the port of Tsingtao on the south coast of Shantung. "Japan sat at the Versailles Peace Conference as one of the victorious Five Great Powers–the only non-Western nation to be accepted as a full equal by the West. Thus the Meiji leaders had succeeded far beyond their fondest dreams."

1141. Bardet, M. 1905. Sur un pain sans matières amylacées à base de soja hispida [A bread without starch based on soja hispida (soybeans)]. *Bulletin General de Therapeutique Medicale, Chirurgicale, Obstetricale et Pharmaceutique* 149:181-84. [Fre]

• ***Summary:*** This is a presentation by Mr. Bardet to the Therapeutic Society (*Société de Thérapeutique*) in France about a new bread for diabetics. Soya, which is widely used in Japan, has met with little success in France. However it is of interest because it contains almost no sugars or starches–less than 5-6%–yet an average of 35% vegetable casein. The Japanese consume enormous quantities of vegetable cheese (*fromage végétal*) [tofu], which is obtained from soya.

"The bread which I have the honor to present has been prepared under the name of Krube bread (*pain Krube*). This is the first soy bread I have found which is truly acceptable. When fresh, it resembles a brioche, being somewhat soft and oily; when stale, it becomes firm but still retains the taste of a brioche. It is obtained by grinding the seeds in a special way to defat them (*dégraisser*) and make them better suited to bread." The man who developed the bread is a diabetic.

A table shows the composition of the soy flour: Nitrogenous materials (proteins) 28.69%. Oils and fats 38.00%. Minerals 4.24%. Inert substances 15.21%. Sugars and starches 5.80%. Moisture 8.06%. Total 100%. The bread contains 508 calories per 100 gm. Thus soy bread supplies 3.5 times the protein and twice the calories as regular bread.

Question from Mr. Berlioz: "What is the digestibility of this bread compared with wheat bread?" Answer: They are different foods and cannot be compared.

Question from Mr. Saint-Yves Mesnard: "These seeds [soybeans] were introduced to France by Montigny in 1855; people have tried unsuccessfully to acclimatize them in various places in France, so at present all our soya is imported from Japan. Thus soya is destined to remain a deluxe and rare food. This is very unfortunate, for it is a legume with nutritive properties which could be used advantageously by both diabetics and healthy individuals. It seems to me that this bread has been prepared extremely well and would almost give the illusion of a brioche, if its odor was not so strong. It represents major progress over the former breads which were more like rubber than bread." Answer: "Yes, soya is presently a deluxe product. I believe that the price of 100 kg of flour is about 150 francs, and that is enormous."

Comment by Mr. Laumonnier: "Soya has been successfully cultivated in and around Marennes (Charente-Inférieure) [Note: A department in western France on the Bay of Biscay by the Gironde River, now called Charente-Maritime]. The climate of this region is both temperate and humid–important factors for the culture of this plant. The Japanese army has tried to use soya in its food rations, but found them difficult to preserve."

[recipes] for cooking unpolished rice, rice flour, rice polish; and testimonials of eminent food reformers. Philadelphia, Pennsylvania: The Vegetarian Society of America. 32 p. 18 x 14 cm. Pages unnumbered.
• ***Summary:*** Rev. Henry Clubb (born 1827) was an early advocate of the use of brown rice in America. He notes that this is the food on which the Japanese Army won its great victories (in the recent Russo-Japanese War), performed its rapid marches, remained comparatively free from camp diseases, and recovered rapidly from battle wounds.

On page 5 he notes: "In China, Japan and Java soy sauce, soy bean cheese [tofu], or a similar product is eaten with rice in considerable amounts, and furnishes a large part of the protein necessary for the daily diet of the laborious people."

On the inside rear cover of the booklet is a list of publications and products sold by the Vegetarian Society, which is located at 1023 Foulkrod St., Philadelphia.

Note 1. This is the earliest document seen (April 2011) concerning unpolished rice (brown rice).

Note 2. This is the earliest English-language document seen (April 2011) that contains the term "unpolished rice." Address: Rev., Philadelphia.

[Vernacuar] *Bhat.* (Soy bean, Japan pea).

"An annual, with stout suberect or climbing stems, densely clothed with fine rusty-coloured hairs. *Leaves* 3-foliolate, long-petioled; *leaflets* 2-4 in. long, ovate, usually acute. *Racemes* sessile, few-flowered. *Calyx* ¼ in., densely hairy; teeth long, setaceous. *Corolla* reddish-purple, not much exserted [sic]. *Pods* 2-3 in the axils of the leaves, 1½-2 in. long, linear-oblong, recurved, densely pubescent, subtorulose, 3-4 seeded.

"Sparingly cultivated within the area, and confined to a few of the Sub-Himalayan districts. It is grown more extensively on the lower slopes of the Himalaya up to 6,000 feet, from the Punjab eastwards; also in Bengal, on the Khasia, Manipur and Naga Hills, and in Burma, but nowhere in India has it been found truly wild. De Candolle considered the plant to be a native of Cochin China, Japan and Java at the time when the ancient inhabitants of that region began to cultivate it, and to use it as food. As grown within the area of this flora, and in other parts of India, it represents a very inferior form of soy bean. It is a rainy-season crop, and is usually sown in very poor land. Under proper cultivation the chemical composition of the bean shows it to be the richest of all the pulses in albuminoids and oil. In China and Japan various preparations are made from it, including soy-sauce, which is largely exported from those countries. The plant affords very excellent fodder for all kinds of stock, if harvested before it is fully matured." Address: B.A., F.L.S., Formerly Director of the Botanical Dep. of Northern India.

1147. Oshima, Kintaro. 1905. A digest of Japanese investigations on the nutrition of man. *USDA Office of Experiment Stations, Bulletin* No. 159. 224 p. See p. 20-33, 40-43, 46-47, 145-53, 168-73. [26 ref. Eng]
• ***Summary:*** One section titled "The Soy bean and its preparations" (p. 23-33) gives detailed discussions of tofu (including yuba, frozen tofu, kara [okara], and fried tofu), miso (incl. white miso, red or Sendai miso), shoyu, and natto. The nutritional composition of each is given, and many early studies by Western and Japanese scientists are cited.

"Next to rice in importance in the Japanese diet are legumes, which are universally used... Of the different legumes used as food in Japan, the soy bean (*Glycine hispida*) is by far the most important. According to agricultural statistics for the years 1879 to 1887, nearly 10 per cent of the cultivated land in Japan was devoted to the growth of this legume, an area somewhat larger than that devoted to wheat growing. In the northern Island [Hokkaido] in 1887 nearly 17 per cent of the total cultivated area was devoted to the soy bean. The average yearly production of soy beans amounts to about 360,000,000 kilograms... A part of the product is of course used for seed, and a not inconsiderable part is used as fertilizer.*" (Footnote: * "In northern China soy beans are used to some extent in the production of oil, which is used for cooking and illumination [in oil lamps]. The residue from this process [the presscake] is imported largely into Japan, where it is used as a fertilizer"). Other legumes widely used in Japan include the mungo bean (*Phaseolus mungo radiatus*) and the adzuki bean (*Phaseolus mungo subtrilobata*) (p. 23-24).

© Copyright Soyinfo Center 2014

"Many varieties of soy beans are known, being designated according to the color, size or shape of the seed, and the time required for maturity. For example, there are black, green, yellow, and white varieties, and these are again designated as early, medium, or late, according to the season of maturity, and small, medium, and large, according to the size of the seed. The black soy beans are used chiefly for cooking, with sugar and shoyu; the green variety is also used in this way, either in the fresh state or after being dried" (p. 24). There follows a long section on tofu (detailed in a separate record).

The "larger part of the leguminous food in the Japanese diet consists of the preparations of soy beans, such as miso, shoyu and tofu,..." (p. 46).

In Japan, legumes about 8% of the protein and 11% of the fat in the diet (p. 137). Many digestion experiments are described (p. 144-87), including those with tofu, shoyu, "tofu cake or kara, the soy-bean residue remaining from the preparation of tofu (see p. 26)," and yuba conducted in Japan by Osawa and Ueda (1887), T. Suchi (1887), Kano and Iishima (1899). Table 91 (p. 191) is a "Summary of results of digestion experiments with legumes and legume preparations." The percentages given are "coefficients of digestibility." Experiments No. 6 and 7–soybeans (average): Protein 65.5%, fat (uncertain), carbohydrates (incl. crude fiber) 85.7%. Experiments No. 8 and 92–tofu (average): Protein 92.7%, fat 96.4%, carbohydrates (incl. crude fiber) 93.3%. Experiment No. 94–"yuba (soy legumin coagulated):" Protein 92.6%, fat 95.7%, carbohydrates (incl. crude fiber) 86.6%, crude fiber 35.5%. Experiment No. 93–"tofu cake (soy-bean residue [okara]):" Protein 78.7%, fat 84.3%, carbohydrates (incl. crude fiber) 82.8%, crude fiber 89.6%.

Note: This is the earliest English-language document seen (June 2013) that uses the Japanese word *kara* to refer to okara.

Other Japanese foods discussed include adzuki or adzuke beans (*Phaseolus mungo subtrilobata*) (p. 24, 170), dried algae (sea vegetables, p. 34), and kuzu (p. 170). Address: Director, Hokkaido Agric. Exp. Station, Sapporo, Japan.

1148. Oshima, Kintaro. 1905. A digest of Japanese investigations on the nutrition of man: Preparations of cereals (Document part). *USDA Office of Experiment Stations, Bulletin* No. 159. 224 p. See p. 20-23. [10 ref. Eng]
• ***Summary:*** The section titled "Preparations from cereals" which gives detailed discussions of bread, *fu* (baked wheat gluten cakes), macaroni and vermicelli, sobakiri or soba (buckwheat noodles), mochi, ame [rice syrup].

"Fu: This is a gluten preparation obtained from wheat flour. The whole is mixed with water and made into a dough which is kneaded, the kneading and addition of water continuing until a large part of the starch is removed. What remains is known as "fu," and us used wither in the fresh state as an ingredient of soup, or is roasted to preserve it for future use."

While mochi is usually made from glutinous rice (*Oryza* [*Oryzae*] *sativa glutinosa*), "it may also be made from glutinous grains like millets. In the latter case some special prefix denoting the kind of grain used is also employed, as, for instance, Kibi-mochi, or Awa-mochi (Kibi is *Panicum miliaceum;* Awa is *Setaria germanica*). The use of mochi made from glutinous millets is usually confined to the rural and laboring classes... Mochi is considered one of the essential articles of food for New Year's feasts. It is generally eaten either roasted or cooked with shoyu sauce."

"Ame: This material is prepared most commonly from glutinous rice or glutinous millet, sometimes from common rice, and rarely from Indian corn or sweet potatoes. The essential feature of the process of ame preparation is the conversion of starch into maltose by diastase. Malt or sprouted barley is generally use to furnish the diastatic ferment. The cleaned rice or millet is soaked in water and then steamed, by which process the starch grains are broken open and made easily accessible to the ferment. The steamed grain is then transferred to a suitable vessel, mixed with certain proportions of powdered malt (added fractionally) and of water at about 60º C., and well stirred. The mixture is kept at a temperature of 50º to 60º C. In the course of 6 to 8 hours the diastatic ferment has acted upon the starch and converted it largely into dextrin and maltose. The liquid mass is then filtered by pressing through a fine linen bag, and the filtrate is condensed in a double boiler to the proper consistency, which varies slightly according to the season."

"The material thus prepared is called midzu-ame, which means liquid or soft ame. It is a dense, clear, light amber-colored liquid, not unlike the best commercial glucose in some of its physical properties. It is used in this form, or is further concentrated into kata-ame, or hard ame, a sort of hard, white, sweet candy. Stick ame is also made from midzu-ame by pulling.

"Ame has been manufactured in Japan for at least two thousand years, and long before sugar was known it was used for flavoring articles of food. Even at the present time it is sometimes used in place of sugar in cooking. Ame is also a favorite food adjunct for invalids.

"An interesting discussion of the relations between midzu-ame as made by the Japanese and malt products of European countries before sugar was so generally known is given by Storer and Rolfe (1904, p. 80), in which the process of ame making is described by Takaki, from information obtained from Japan. In the same publication is given also the translation by Takaki (Loc. cit., p. 95) of a 'Note on ame,' published in Japanese by Furukowa [sic, Furukawa] (1885, p. 355). A description of the manufacture of midzu-ame from glutinous rice has been given by Wiley and McElroy (1982, p. 57).

© Copyright Soyinfo Center 2014

"Whether made from glutinous rice, ordinary rice, millet, or corn, ame consists mainly of maltose and dextrin. Kokashima (1855, p. 233) gives the following as the average of three analyses of samples of ame made from glutinous rice: Water, 15 per cent; protein, 1.1 per cent. These figures are almost identical with those given by Furukowa. The composition of ame from ordinary rice, as given by the latter, is as follows: Water, 17.4 per cent; protein, 0.8 per cent; ether extract, 0.1 per cent; maltose, 58. 1 per cent; dextrin, 23.3 per cent, and ash, 0.3 per cent.

"Furukowa states that 'since the rice ame is rich in maltose and poor in dextrin, it has a sweeter flavor than the glutinous rice ame, the flavor of which is weaker in consonance with a similar quantity of maltose and a larger amount of dextrin in it. Since the proportion of nitrogenous matter in both kinds of ame is minute, this constituent would not readily suffer decomposition even if the ame were to be kept for a long time." Address: Director, Hokkaido Agric. Exp. Station, Sapporo, Japan.

1149. Oshima, Kintaro. 1905. A digest of Japanese investigations on the nutrition of man: Tofu (Document part). *USDA Office of Experiment Stations, Bulletin* No. 159. 224 p. See p. 26-28. [1 ref. Eng]

• ***Summary:*** "Tofu: This term is commonly translated as bean cheese–though sometimes bean curd–in English and *Bohnen-käse* in German. Tofu is not strictly equivalent to cheese, however, as neither bacteria nor ferments are involved in the process of manufacture. It consists chiefly of the albuminoid materials of the soy bean combined with magnesium and calcium salts, as pointed out by Inoue." To make tofu, soaked soybeans are ground between millstones. "The mass is then mixed with about three times its bulk of water and boiled for about an hour, after which it is filtered through a cloth. By this process about 30 per cent of the total protein of the beans is dissolved and contained in the filtrate, ready to be precipitated as tofu. The filtrate is white and opaque, somewhat resembling milk. To this is added, with constant stirring, about 2 per cent of the concentrated mother liquid [nigari] obtained in the manufacture of salt from sea water, whereupon the albuminoid material is precipitated in combination with calcium and magnesium salts." After pressing, the tofu is finally cut into cakes about 10 cm broad, 2 cm thick, and 25 cm long [about 3.9 by 0.79 by 9.8 inches], though the size varies in different localities.

"The residue from the boiled and filtered beans is known as kara [okara], or tofu cake, and contains a large quantity of protein and carbohydrates. It is a good food material, being used considerably by poor people as an ingredient of miso soup.

"If the milky filtrate mentioned above is boiled, a sort of film forms on the surface. This film, which consists mainly of coagulated albuminoids and fat, is sometimes prepared in large quantity, and when dried is used as an article of food, being known as yuba.

"Tofu is generally prepared every day and is eaten in the fresh condition simply with a little shoyu, though it is also frequently cooked in shoyu or in miso soup. Fried tofu, called abura-age, is also a very popular article of food. Rape-seed oil is generally used in frying, though sesame oil is sometimes used. Note 1. This is the earliest English-language document seen (April 2013) with the word "Tofu" in the title in a document published in the United States,

Note 2. This is the earliest English-language document seen (April 2013) that uses the word "abura-age" to refer to deep-fried tofu pouches.

"Tofu may also be prepared for preservation and transportation. For this purpose it is cut into smaller pieces and exposed to severe cold weather, to remove the water by freezing, and then dried in an oven. As thus prepared it can be preserved for several years. When the tofu is frozen the water collects in fine needles of ice distributed throughout the mass. When the ice melts and the water runs out, it leaves the tofu porous and it may be easily dried. If it is not frozen, it is difficult to dry it and the resulting material is dense and horn like."

Table 2 (p. 28) gives the average composition of the above-mentioned tofu preparations: "Fresh tofu, frozen tofu, fried tofu, tofu cake [okara], yuba."

The digestibility of the nutrients in tofu has been found to be high, as will be seen from the results of digestion experiments summarized later (p. 191). As much as 95 per cent of the protein is digested and about the same proportion of fat. The carbohydrates were found to be somewhat less digestible when the tofu was eaten alone, but when it was eaten with rice about 99 per cent of the total carbohydrates of the diet was digested.

"Both the composition and the digestibility of tofu, therefore, prove it to be a very nutritious food material. This is extremely significant, because tofu in its various forms is used very extensively by all classes of Japanese. In the interior of the country, where fish can not be easily obtained, it is a most important source of protein. For Buddhist priests, as well as the strict adherents to Buddhism (who eat no animal food), it forms a very popular and almost indispensable dietary article. Though no authentic record has been found regarding the manufacture of tofu in Japan, it is believed on good authority that the method was first introduced from China by Buddhists for their own use." Address: Director, Hokkaido Agric. Exp. Station, Sapporo, Japan.

1150. Oshima, Kintaro. 1905. A digest of Japanese investigations on the nutrition of man: Miso (Document part). *USDA Office of Experiment Stations, Bulletin* No. 159. 224 p. See p. 28-30. [1 ref. Eng]

• ***Summary:*** "Miso: This material is prepared from a mixture of soy beans, barley [note that he does not say rice], common

© Copyright Soyinfo Center 2014

salt, and water by a slow process of fermentation. Although it is highly probably that the process of preparing miso was first introduced either from China or from Korea, the exact date of the introduction is not known. Mention is made of miso in a Japanese record of the latter part of the ninth century.

"In the extent to which it is used, miso surpasses all other preparations from soy bean. Among the rural population and wage-earners in general it forms an indispensable part of the daily menu; among the people living in cities, however, it is used somewhat less extensively. Its chief use is in making soup and in cooking vegetables. For this latter purpose, however, miso and shoyu are to a certain extent replaceable, and generally when more shoyu is used the amount of miso consumed is smaller.

"Since it is the general custom for the people in rural districts to prepare miso for their own use, no accurate statistics regarding the total quantity manufactured and consumed are available. It has been estimated that the daily consumption of miso per person in the rural districts is about 40 grams. In the statistics of 25 dietary studies described beyond (p. 131), with people living elsewhere than in the country, the average daily amount was 43 grams, but the range was from 13 to 100 grams.

"The production of miso depends primarily on the action of a fermenting agent known as koji. The process of preparing the koji used for miso is similar to that for sake-koji (see p. 36), except that for the latter only rice is used, whereas miso-koji may be made from either rice or barley. The object of preparing miso-koji is to propagate certain forms of fungi, of which *Aspergillus oryzae* is the principal one. The koji also contains diastatic and inverting ferments which change the carbohydrates of the raw materials into maltose, glucose, etc., and a proteolytic ferment which acts upon the nitrogenous bodies, converting them into simpler and more soluble materials. The yeast which causes alcoholic fermentation is also regularly present. Koji is dried and finely powdered before it is used.

"To prepare miso the soy beans must first be steamed, and upon this process depends largely the quality and especially the color of the final product. The steaming is continued usually twenty-five hours, at first with strong heat but later very gently. When the beans are properly steamed and cooked, they are rubbed into a thick, uniform paste, to which are added proper amounts of powdered koji, salt, and water. The whole mass is then well mixed and stored in a special vat. The temperature of the mixture is kept at about 15º to 20º C., though as the fermentation advances it often rises to 25º C.

"Different kinds of miso are distinguished by color, taste, and keeping properties, and are prepared by somewhat different processes, the differences consisting chiefly in the use of rice or barley koji, the amount of common salt added, a longer or shorter fermentation, and the temperature at which it takes place. Two of the most important kinds of miso are the following:

"*White miso.*–This material is white in color, contains a small amount of common salt, is fermented with rice-koji for three to four days, and may be preserved about ten days.

"*Red or sendai miso.*–This material is red in color, contains a relatively large amount of common salt, is fermented usually with barley-koji for one and one-half to two years, and may be preserved for several years."

A table shows the composition of white miso and red miso. Note: The source of this table is cited incorrectly. Address: Director, Hokkaido Agric. Exp. Station, Sapporo, Japan.

1151. Oshima, Kintaro. 1905. A digest of Japanese investigations on the nutrition of man: Shoyu (Document part). *USDA Office of Experiment Stations, Bulletin* No. 159. 224 p. See p. 30-33. [1 ref. Eng]

• ***Summary:*** "Shoyu, or 'soy sauce,' is a dark-brown, moderately thick liquid very popular for use in cooking, and as a relish or condiment to increase the flavor and palatability of the diet. In odor and taste it is not unlike a good quality of beef extract. It is prepared from a mixture of soy beans, wheat (or sometimes barley), salt, and water by long-continued fermentation. For the preparation of shoyu a large and late variety of soy bean, that is rich in protein, is usually recommended. The varieties especially adapted to this purpose are called shoyu beans. The western name 'soy bean' for all varieties of *Glycine hispida* very probably owes its origin to his fact.

Note 1. This is the earliest English-language document seen (April 2012) that uses the term "shoyu beans" to refer to soybeans used to make shoyu (Japanese-style soy sauce). / "As shown by the average for five years (1887-1891), the annual production of shoyu in Japan, so far as statistics could be obtained, amounted to 221,000,000 liters. A small portion of the total product is exported, but this is more than counterbalanced by what is manufactured privately in rural districts and not included in the statistics quoted. It may be inferred from these figures that the yearly consumption per capita amounts to not less than 5 liters. It is generally estimated, however, on good authority, that the annual consumption per adult is 9 to 10 liters. In the average of 28 dietary studies included in the present compilation, 36 grams of shoyu were used per man per day, an amount equivalent to nearly 11 liters per annum, which is in agreement with the higher estimate quoted above.

"The term 'hishiwo' [hishio], which is considered as applying to a crude from of shoyu made without filtering, is found in a Japanese record dating from the early part of the eighth century. The manufacture of shoyu in its present form originated much later, probably in the sixteenth century, and has been gradually brought to the improved form of the present day."

© Copyright Soyinfo Center 2014

A detailed description is then given of the process for making shoyu and "shoyu-koji." "When the saline solution is cooled to the temperature of the air, the koji is added and the mixture well stirred. This material is kept in casks and allowed to ferment. It is stirred from time to time, the stirring being at more frequent intervals as the process of fermentation advances. The fermentation is allowed to continue usually one to two years, though often as long as five years. It is believed that the longer the period of fermentation the better the quality of the product, other things being equal. When the fermentation is completed, the mass is filtered and pressed and the filtrate is allowed to settle two to three days. The clear supernatant liquid is then removed and heated to 70º to 100ºC. in a double boiler 2 to 3 hours, after which it may be kept for a long time. To improve the taste, it is usual to add a certain quantity of sugar or sweet sake during the heating process."

Note 2. This is the earliest English-language document seen (April 2012) that uses the term "shoyu-koji" to refer to koji used to make shoyu (Japanese-style soy sauce).

Also discusses: The chemical composition of 3 samples of shoyu. The effect of fermentation, including "proteolytic ferments," "the diastatic fermentation" (which produces glucose), and the alcoholic fermentation.

"The vegetable diet of the Japanese people at large is more or less monotonous, hence the value of these preparations [miso and shoyu]. Indeed, the variety which they afford as food adjuncts can hardly be overestimated." Address: Director, Hokkaido Agric. Exp. Station, Sapporo, Japan.

1152. Oshima, Kintaro. 1905. A digest of Japanese investigations on the nutrition of man: Natto (Document part). *USDA Office of Experiment Stations, Bulletin* No. 159. 224 p. See p. 33. [2 ref. Eng]

• ***Summary:*** "Natto has long been used by the Buddhists. It is prepared by boiling the soy beans in water for about 5 hours to render them very soft; the hot material is then wrapped in small portions in straw, and the bundles, tied at both ends, are placed in a cellar in which a fire has been kindled. The cellar is then closed for twenty-four hours and the cooked beans allowed to ferment in the warm, moist atmosphere. The fermented product is a thick viscid mass having a peculiar but not offensive odor. Four different micro-organisms* (Footnote: * "Yabe found 1 bacillus and 3 micrococci."), the source of which is supposed to be either the straw or the air of the cellar, participate in the fermentation. The principal chemical change concerned in the ripening of natto taken place in the protein.

"In the water-free substance of natto, Yabe (1894) found the following percentages of nitrogen in different forms: Albuminoid nitrogen 4.03, peptone nitrogen 1.62, and amid nitrogen 1.89 per cent.

"The cleavage products leucin, tyrosin, and xanthin were also identified." Address: Director, Hokkaido Agric. Exp. Station, Sapporo, Japan.

1153. Plaut, Hermann. 1905. Japanese conversation-grammar: With numerous reading lessons and dialogues. Heidelberg, Germany: Julius Groos; New York & Washington, DC: Brentano's. viii + 391 p. See p. 111-13. [Eng; Jap]

• ***Summary:*** Words (p. 111): *"misoshiru*–a soup made with miso, a kind of bean-sauce." *"nimame*–boiled [soy] beans." *"teriyaki*–meat or fish baked with shôyu."

Page 113. "15. Reading Lesson. *Nihon no shokuji."* "teriyaki unagi."

Note: This is the 2nd earliest English-language document seen (Nov. 2009) that contains the word "teriyaki." It does not contains the term "teriyaki sauce." The word and the definition are both in English; the book is in English with Japanese lessons and words. Address: Berlin, Germany.

1154. Takenob, Y. 1905. Japan Year Book. Tokyo: Japan Year Book Office. 430 p. See p. 68, 104, 123, 126, 130, 348, 375, 382. [Eng]

• ***Summary:*** This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa. At the beginning of the book, before the title page, are many pages of large advertisements on unnumbered pages. Likewise at the back of the book. For example, a full-page ad for Mitsui Bussan Kaisha (Mitsui & Co. in Europe & America) states that the company was established in 1876, and that they are "General Commission Merchants" for the import of [soy] beans, bean cakes, cotton,..."

The population of Japan Proper (p. 14) was:
1873–33.3 million.
1883–37.0 million.
1898–43.7 million.
1903–46.7 million.

A table of "Weights, measures and moneys" is on the page after the Table of Contents.

Page 68. In chapter VII on "Finances" is a table titled "Budget for April 1905 to March 1906. Revenue." "Tax on Soy" [sauce] brought in revenue of an estimated 4.541 million yen in 1904 and 5.149 million yen in 1905.

Page 104. In the chapter on "Agriculture," a table shows production of beans, including Soja beans and red [azuki] beans, 1895-1903 (in 1,000 koku). Production of soja beans increased from:

2.94 million *koku* in 1895
3.16 million *koku* in 1896
2.99 million *koku* in 1897
3.10 million *koku* in 1898
3.10 million *koku* in 1899
3.41 million *koku* in 1900
3.10 million *koku* in 1899
3.56 million *koku* in 1899

© Copyright Soyinfo Center 2014

3.10 million *koku* in 1901
3.13 million *koku* in 1902
3.64 million *koku* in 1903.

Page 123. In the chapter on "Forestry and fishery" is a section titled "fish fertilizers" which states: "The demand of fish-fertilizers has lately become quite marked, so active indeed that the supply can hardly keep pace with it. A large quantity of bean-cakes from North-China [Manchuria] is therefore arriving in Japan to make good this deficit. The following table shows the average amount of our fish-fertilizers made at home and of Chinese bean-cakes imported, during the recent ten years. The average for the last 10 years of "Homemade fish fertilizers" is 38.891 million kwan [kan] valued at 7.592 million yen, compared with "Chinese bean-cakes" weighing 20.282 million kwan valued at 2.524 million yen. Note: The soybean cakes are much less expensive per unit weight than the fish fertilizers.

Page 126, 130. The chapter on "Manufacturing industry" states (p. 126) that the manufacture of sake and soy [sauce] were among the principal forms of manufacturing in Japan before the country was opened to foreign commerce. A table titled "Quantity and value of chief manufactured goods" (p. 130) gives the amount of soy [sauce] made each year from 1894 to 1902. The quantity increased from:

1.329 million *koku* in 1894
1.409 million *koku* in 1895
1.505 million *koku* in 1896
1.528 million *koku* in 1897
1.532 million *koku* in 1898
1.838 million *koku* in 1899
1.557 million *koku* in 1900
1.717 million *koku* in 1901
1.762 million *koku* in 1902

Page 348. The chapter on "War finance" explains how Japan is financing its present Russo-Japanese war. One way is through extraordinary special taxes, including an addition 1.13 million yen tax on soy [sauce]. is a "Budget for April 1905 to March 1906." The two main sources of tax revenue are Land tax 63.6 million yen, and Tax on liquors 60.5 million yen. Tax on Soy is only 5.1 million yen.

In the Appendix, page 13 (under Group VII) gives the import tariff list for "Beans, soja" and page 20 (under Group X) gives the import tariff for "Oil, bean." There is both a "General tariff" and a "Extraordinary special tax." Address: Tsukiji, Tokyo, Japan.

1155. Yokohama Nursery Co., Ltd. 1906. Descriptive catalogue... for 1906. Yokohama, Japan. 95 p. Illust. Index. 26 cm. [Eng]
• ***Summary:*** On the cover of this English-language catalog is an illustration of 4 different species of lilies. In the section "Price list of seeds" (p. 78+) is a subsection (p. 84) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1905 (and 1901) catalog, except that an 8th variety of vegetable seeds is offered: Runner bean (new long variety). Also on this page is a photo of a forage plant (*Polygonum Sachalinense*)–the first photo seen in this catalog. On the rear cover is an illustration of a Kaempfer iris (*Iris Kaempferi*) blossom. Address: P.O. Box No. 72. Nos. 21-35 Nakamura, Yokohama, Japan.

1156. Abel, Mary Hinman. 1906. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 38 p. March 25. See p. 11-13, 18-20. Corrected. [1 ref]
• ***Summary:*** A corrected edition, one page shorter than the 1904 revised edition. On the cover, below the title is written "(Corrected March 25, 1906)," yet at the bottom of the same page the publication date is given as 1904.

The section about soy (p. 11-13) is titled "Soy bean (*Glycine hispida*) and its preparations," but the information in that section appears to be the same as in the original 1900 edition, as is the illustration of the soy bean plant (p. 12) and the table on page 19.

March. [Jap]
• ***Summary:*** Discusses *Leguminivora glycinivorella.* Address: Pathologist, Sapporo, Japan.

1158. List or manifest of alien passengers applying for admission to the United States: Heiji Ota. 1906.
• ***Summary:*** Line: Ocean Steam Navigation Line / Co. Sheet 10. No. 287. Name of passenger: Heiji Ota. Age: 32. Sex: Male. Married or single: Single. Occupation: Farmer. Able to–Read: Yes. Write: Yes. Nationality–Country: Japan. Race or people: Japanese. Last residence: Okayama. Destination: Portland, Oregon. 12 (?). By whom on passenger list: Self. Whether in possession of (?) money: Yes, $50. Whether going to a residence and relative: 54 N. 4th Dr., Portland, Oregon. Hashiya (?) 21. Port of Landing: Victoria [B.C.]. Date of Arrival: April 19, 1906. Date of embarcation: April 25, 1906. Head tax paid to: G.N. Ry.

Note 1. Heiji seems to be the only Ota on this ship. The Ota Tofu Co. of Portland, Oregon, had almost surely not yet been established.

Note 2. "Required by the regulations of the Secretary of the Treasury of the United States, under Act of Congress approved March 3, 1903, and Department Circular No. 97, dated Nov. 1, 1901."

1159. Katayama, T. 1906. On the preparation of a vegetable cheese from the protein of the soy bean. *Bulletin of the College of Agriculture, Tokyo Imperial University* 7(1):117-19. April. German summary in Chemisches Central-Blatt

© Copyright Soyinfo Center 2014

1906(2):540. [4 ref. Eng]
• ***Summary:*** Describes experiments to make a cheese similar to Swiss cheese. The soybean contains (according to Osborne and Campbell 1898) as its "chief proteid constituent glycinin, a globulin similar in properties to legumin, but of somewhat different composition, containing nearly twice as much sulphur..." and having the following composition: Carbon, 52.12; hydrogen, 6.93; nitrogen, 17.53; sulphur, 0.79; and oxygen, 22.63 per cent.

This protein can be extracted from [soaked, ground] soybeans by boiling. "The liquid thus obtained resembles cow's milk in appearance," and when treated with calcium and magnesium salts, yields a precipitate which is sold in Japan under the name of Tôfu. The author has attempted the preparation of a cheese from tofu. 450 gm of pressed tofu were mixed with 60 gm of common salt, 50 gm of finely-ground Swiss cheese, and the mixture was wrapped in a linen cloth saturated with brine, and left for five months in a room with an average temperature of 15º C. At the end of this time the mass was of a grey color, and quite compact; it was free from the numerous pores produced by evolution of gas in Swiss cheese. The cheese had an agreeable taste different from that of Swiss cheese, and when extracted with water, yielded a solution in which the presence of albumoses and peptones was detected. Further experiments with mixtures containing larger quantities of milk-sugar, but no casein, gave similar results. Address: Japan.

1160. Katayama, T. 1906. A condensed vegetable milk. *Bulletin of the College of Agriculture, Tokyo Imperial University* 7(1):113-15. April. German summary in Chemisches Central-Blatt 1906(2):540. [1 ref. Eng]
• ***Summary:*** A liquid closely resembling cow's milk is obtained by soaking soy-beans in water, crushing them, and boiling with water. "The composition of this milk prepared in Japan for the purpose of obtaining Tôfu by the precipitation with calcium or magnesium salts, is in average as follows:" A table titled "Soy-bean milk" shows: Water 92.53%. Protein 3.02%. Fat 2.13%. Fibre 0.03%. Non-nitrogenous extract, including carbohydrates (galactan), 1.88%. Ash 0.41%.

"There can be no doubt that this vegetable milk is of a certain value as an easily digestible food, although in regard to the nourishment of children it cannot replace cow's milk or mother's milk, even if the necessary amount of milk sugar be added.

"The idea suggested itself to prepare from that vegetable milk, the soy milk, by addition of sugar and evaporation a durable preparation resembling condensed cow's milk."

"In 4 litres of soy-milk were dissolved 4 g. dipotassium phosphate [to prevent separation of protein] and 600 g. cane sugar and the solution concentrated *in vacuo* to a very thick liquid. This no doubt can replace the much more expensive condensed cow's milk for certain purposes of the cuisine as e.g. for sweetening coffee and tea, and for the preparation of chocolate.

"It has an agreeable taste like cow's milk, but a very feeble odor recalling crude beans and a slightly yellowish color. If this preparation should be manufactured on a large scale, it must be, of course, always sold under its proper name, and adulteration of condensed cow's milk with condensed soy milk, must be strictly prohibited." Chemical investigations "must determine whether such an adulteration can be easily discovered. My experiments in this direction answer this question in the affirmative."

Such adulteration could be detected by addition of sodium carbonate, when a yellow coloration would indicate the presence of the soy milk. Also, if a portion of the suspected milk were mixed with twice its bulk of water, treated with a few drops of dilute sulphuric acid, and one-tenth of the whole distilled off, the distillate would possess the characteristic odor of the raw beans, if soy-milk were present. Adulteration might also be detected by separating the casein from the suspected sample with rennet, and adding calcium nitrate to the filtrate; the formation of a precipitate would indicate the presence of the globulin of soy-milk, the so-called glycinin.

Note 1. This is the earliest English-language document seen (Aug. 2013) that contains the term "soy milk" or the term "soy-milk."

Note 2. This is the earliest English-language document seen (Aug. 2013) that uses the term "vegetable milk" to refer clearly to soy milk.

Note 3. This is the earliest English-language document seen (Dec. 2010) that uses the term "condensed vegetable milk" to refer to condensed soymilk. It is also the earliest document seen (Dec. 2010) that mentions or discusses condensed or concentrated soymilk. Address: Japan.

1161. Suzuki, Tozaburo. 1906. Process of brewing soy. *U.S. Patent* 0,825,500. July 10. 4 p. Application filed 5 July 1904.
• ***Summary:*** "Attempts have been made recently to brew soy [shoyu] in a shorter time and easier way than in the process hitherto in vogue." One approach is to heat the mash. "In my invention I prepare the mass originally with a less amount of salt than heretofore has been the custom and subject it to slow and uninterrupted stirring in tanks or receptacles exposed to moderate external heat." When the fermentation is thoroughly completed, "more salt is added to regulate the quality of the soy."

"The soy-yeast is prepared with about 5.10 bushels of barley and 5.13 bushels of soybeans, to which is added salt water prepared by adding about 2.05 to 3.6 bushels of dissolved salt to about 63.52 imperial gallons of boiling water, the quantity of salt being one-third to one-half less than in mash prepared in the usual way."

Three illustrations (line drawings) show apparatus used in the process of brewing soy sauce. Address: Sunamura, Prefecture of Tokyo, Japan.

1162. Ishizaka, S. 1906. Shôyu jôzô fukusan yubun no shiken [Analysis of the oil obtained as a by-product of shoyu fermentation]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 281. p. 589-99. July. [Jap]

1163. Sawamura, S. 1906. On the micro-organisms of natto. *Bulletin of the College of Agriculture, Tokyo Imperial University* 7(1):107-10. [1 ref. Eng]
• ***Summary:*** *"Natto* is a kind of vegetable cheese prepared in Japan by fermentation of boiled soy-bean wrapped in rice straw and left for one or two days in a warm place. This product contains much mucilage filled with innumerable bacteria and it is the great viscosity that is especially esteemed with this cheese."

"The microorganisms of *natto* consist in the beginning chiefly of bacilli, but on being kept for some time micrococci gain predominance.

The writer isolated various kinds of bacilli and micrococci from *natto* and observed their behavior in cultures on sterilised soy-bean." A detailed description of the characteristics of each of the bacilli is given. To Bacillus No. 1 the author gave the name *Bacillus natto.* He considered it to be a new species.

Note: The author was the first to isolate *Bacillus natto* from natto and to give the microorganism responsible for the natto fermentation that name.

He considered the other to be a variety of *Bacillus mes. vulgatus.* He also believed that both bacilli were required to make good natto. *B. natto* was a motile and facultative aerobe. "Natto produced by this bacillus has a good taste and aroma, but is not of so strong viscosity [stickiness] as that produced by Bacillus No. 2. The colonies of Bacillus No. 1 appear always in large number when plate cultures from natto are made. Hence it become probable that this microbe exerts the chief action in the fermentation of natto."

Soy-beans changed by Bacillus No. 2 "show a stronger viscosity but a less agreeable taste and aroma than those produced by Bac. No. 1."

Bacillus No. 2 also produced a "diastatic enzym which was confirmed by formation of reducing sugar in bouillon containing starch. From these facts we can infer that natto may exert some beneficial action on digestion."

Note 1. This is the earliest document seen that contains the term *Bacillus natto,* which refers to the natto bacterium. It is a milestone publication.

Note 2. This is the earliest English-language document seen (Jan. 2012) that uses the word "mucilage" or the word "viscosity" in connection with Japanese natto. Address: Imperial College, Tokyo, Japan.

1164. Yoshida, Kotaro. 1906. Shôyu no seibun ni tsuite [On the constituents of shoyu]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 294. p. 848-52. Aug. [Jap; ger]
• ***Summary:*** The author considers the art and practice of the so-called *hiire* (treatment with heat below 100ºC) during shoyu production to be the most important problem or challenge as far as shoyu quality is concerned. He proposes a modified method of heat treatment, then analyzes the shoyu before and after this treatment. Address: Kagawa-ken, Japan.

1165. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1906. Japan: America ranks third in sales. No. 312. Sept. p. 60-61.
• ***Summary:*** Consul Charles B. Harris reports from Nagasaki on the trade of that consular district: "The five most important imports into Nagasaki during 1905 were coal, valued at $2,708,305; kerosene, at $1,275,342; iron and steel, $796,833; rice, $664,379, and oil cakes, $549,116. Rice and oil cakes represent inter-Asiatic trade, a commerce which is bound to steadily increase... Imports from Great Britain led in 1905, the amount being $5,394,409, China coming second with $1,339,649, and United States third with $1,026,011."

"It is expected that the importance of Nagasaki will be greatly increased as a transshipping point when the Panama Canal is finished..." Address: Washington, DC.

1166. Hosie, Alexander. 1906. Report for the years 1904-05 on the foreign trade of China. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 3725. 120 p.
• ***Summary:*** This is a very detailed report by a seasoned expert on China. "Net foreign trade [in 1904] amounted in silver to 583,547,291 Haikuan taels" (83,580,992*l.* = pounds sterling).

Table H, titled "Principal articles of export in order of value (p. 32): Shows the three most valuable exports to be silk (£11,208,457 = 78,255,412 Haikuan taels), tea (£4,325,802), and cotton (£3,553,744). No. 6 was "Beans" [soy] (£705,662 = 4,926,805 Haikuan taels), and No. 17 was "Bean cake" [soy] (£337,436). Other exports include: Oils (vegetable), fire-crackers, tobacco, hemp, Chinaware, earthenware and pottery, opium (native; exported to Tonkin, etc.), sesamum seed, joss sticks, groundnuts, aniseed, and rhubarb.

Table L, titled "China's principal exports to Asiatic countries" (India excepted), expressed in units of quantity, 1903, 1904, and 1899-1903 average. The top two articles in terms of the 5-year average are [soy] bean cake (3,464,375 cwt) and [soy] beans (2,650,900 cwt). Note: 1 cwt = hundredweight = 112 pounds.

The section titled "Beans and bean cake" (p. 45) states: "I have already explained that the shortage in the export of beans and bean cake to Japan was due to the war being waged in Manchuria. In the total export from China, beans decreased by 823,412 cwts. as compared with 1903, and bean cake dropped from 4,052,026 to 1,370,178 cwts. In

© Copyright Soyinfo Center 2014

these products the Yangtsze [Yangtze] Valley is beginning to compete with Manchuria: in 1904 Hankow sent away 3,173,224 cwts. of beans of all kinds, and Chinkiang had an export of 580,989 cwts. of bean cake and 355,670 cwts. of beans and peas."

Under the year 1905, soy beans and bean cake are discussed on p. 94 and oils (vegetable) on p. 95. "The oils produced in China are numerous and varied. Rape, sesamum, groundnut, tea, wood (*Aleurites cordata,* M. Arg.), cotton seed, bean, poppy seed, tallow seed (*Sapium sobiferum,* Roxb.), castor, cocoanut, hemp seed, linseed, perilla seed (*P. ocymoides,* L.), as well as lighting oils from *Amoora Rohituka,* W. and A., and *Jatropha curcas,* L., are all well known. In addition to these we have the essential oils–camphor, cassia, aniseed, peppermint, ginger, clove, orange peel and sandalwood (from imported wood). The most important of these oils from a commercial point of view is wood oil." Address: Acting Commercial Attaché to His Majesty's Legation at Peking.

1167. Sydow, Hans; Sydow, Paul; Butler, E.J. 1906. Fungi Indiae orientalis. I. [Fungi of the East Indies. I]. *Annales Mycologici* 4(5):424-45. Oct. See p. 429. [Ger; lat]
• ***Summary:*** In the section on Uredineae, under Uromyces Link., a subsection titled "Uromyces Sojae (P. Henn.) Syd." (p. 429), begins with an 11-line discussion in German: In *Hedwigia* (1903, p. 108), P. Hennings describes as *Uredo Sojae* P. Henn. a Uredoform found in Japan on *Glycine Soja* (=*Glycine hispida* or *Soja hispida*). This fungus is rather widespread in Japan. On this same food plant (*Nährpflanze*) in Poona in the East Indies [today's India] (No. 601) there appears a Uromyces, which no doubt belongs to the same Uredoform. The scanty / sparse Uredospores, which are found on the Indian material, are identical with those of *Uredo Sojae.* There follows, in Latin, a five-line description of the teleuto-stage of *Uredo sojae.*

Note 1. These three authors are the first to identify the teleuto-stage and to name this fungus "Uromyces Sojae (P. Henn.) Syd." By 1917 it was renamed *Phakopsora pachyrhizi,* the present (2005) scientific name of the aggressive form of soybean rust.

Note 2. It is unclear whether these three authors, by their use of the equal sign (=) are mistakenly equating the wild annual soybean (*Glycine soja*) with the cultivated annual soybean (*Glycine hispida* or *Soja hispida*), or are saying that soybean rust grows on both the wild annual soybean (in Japan) and the cultivated annual soybean (in Poona, India). Address: Berlin, Germany.

1168. *Revue de Service de l'Intendance Militaire* (*France*). 1906. La cuisson des aliments dans l'armée japonaise [Cooking of foods in the Japanese army (Abstract)]. 19:202-03. [1 ref. Fre]
• ***Summary:*** A French-language summary of a French-language article with the title shown above, published in: *La France militaire,* 27 July 1905.

1169. Dampier, William. 1906. Dampier's voyages: Consisting of a new voyage round the world, a supplement to the voyage round the world,... Edited by John Masefield. 2 vols. London: E. Grant Richards. Portrait. See vol. I, p. 580.
• ***Summary:*** The following passage appears in the chapter titled "The Voyage to Tonquin from Achin in Sumatra" (p. 557-612). "Year 1688. The Nuke-mum [nuoc-mam, fish sauce] is of a pale brown colour, inclining to grey; and pretty clear. It is also very savory and used as a good Sauce for Fowls, not only by the Natives, but also by many Europeans who esteem it equal with Soy. I have been told that Soy is made partly with a fishy Composition, and it seems most likely by the Taste: tho' a Gentleman of my Acquaintance, who was very intimate with one that sailed often from Tonquin to Japan, from whence the true Soy comes, told me that it was made only with Wheat, and a sort of Beans mixt with Water and Salt."

Captain William Dampier, an Englishman, lived 1652-1715. Address: Capt., London.

1170. Gollan, W. 1906. Some results of acclimatization work at the Saharanpur Botanical Gardens. *Department of Land Records and Agriculture, United Provinces* [*of Agra and Oudh, India*], *Bulletin* No. 21. p. 27-28.
• ***Summary:*** One section (p. 27-28) is titled "Glycine Soja Sieb and Zucc. Natural order, Leguminosæ. Japan pea. Soy bean." It states: This is an erect or trailing herb, a native of and also often cultivated in warmer valleys in the Himalayas. It is also largely cultivated in Japan and China. The Japanese form is an erect plant with white or black seeds, and attains a height of 12 to 15 inches. The Himalayan form is a trailing plant, also with white or black seeds, but the latter are not quite half the size of the former. On this account the Japanese kind is a much superior variety to the one cultivated in this country.

"Seeds of the Japanese variety were received for trial at Sahárpur in 1882 from the Government of India. These were sown at Mussoorie in the spring at an elevation of 6,000 feet and at Chajurie, Mussoorie district, at an elevation of 4,000 feet. Both these sowings ripened a few seeds in the autumn of the same year, but neither were considered a success. In 1883, eight hundred pounds of the seeds were imported direct from Japan and were widely distributed, but the seeds proved faulty, as in most instances they did not germinate. A small sowing of half a pound, made at Sahárpur early in July of the same year but from a distinct importation from Japan, germinated freely and yielded 8½ pounds of seed in the autumn. In 1884, seven and three quarters of a pound of this seed was again sown at Sahárpur early in July, and it gave a return of 12 pounds in the autumn. This crop was far from healthy, and suffered from an excess of moisture during the

© Copyright Soyinfo Center 2014

rains. In 1885, the results were better as it is recorded that the black seeded variety gave a yield at the rate of 1,124 pounds of seed per acre. In 1886, this acclimatised seed was widely distributed. In some cases the crop failed and in others it was fairly successful, but in all cases where seeds were harvested, it was said that the people did not care for the pulse in any form whatsoever. The garden grew the crop for a few years longer, but as there was absolutely no demand for the seeds, it eventually abandoned its cultivation.

"There is no doubt the superior Japanese variety can be grown on the plains in a kind of fashion as a rainy season crop, but the yield is not heavy, while the pulse, although very popular in China and Japan, is not considered of much account by either the native or the European. The Himalaya variety, called "bhat" in the neighbourhood of Mussoorie, is grown there on a very small scale and only for the home consumption of the grower. " Address: Former Superintendent of the Gardens, United Provinces, India.

1171. Hearn, Lafcadio; Bisland, Elizabeth. 1906. The life and letters of Lafcadio Hearn [1890-1904]. 2 vols. Boston and New York: Houghton, Mifflin Co. 560 p. See Vol. 2, p. 28-30. Illust. Index. 23 cm.

• ***Summary:*** In a letter to Basil Hall Chamberlain, from Matsue, dated May 1891, Hearn writes: "Dear Professor Chamberlain,–I have just returned from a pilgrimage to the famous Kwannon temple of Kiyomizu–about 18 miles from Matsue–where it is said that the sacred fire has never been extinguished for a thousand years, to find your postal card."

"The scenery at Kiyomizu is superb. But there is no clear water except the view of Nanji-umi from the pagoda and the hills. The mamori, I regret to say, are uninteresting. There is, however, a curious Inari shrine. Beside it is a sort of huge trough filled with little foxes of all shapes, designs, and material. If you want anything, you pray, and put a fox in your pocket, and take it home. As soon as the prayer is granted you must take the fox back again and put it just where it was before. I should like to have taken one home; but my servants hate foxes and Inari and tofu and azuki-meshi and abura-gi [aburage] and everything related to foxes. So I left it alone."

"Through the goodwill of Basil Hall Chamberlain, Hearn gained a teaching position in the summer of 1890 at the Shimane Prefectural Common Middle School and Normal School in Matsue, a town in western Japan on the coast of the Sea of Japan. Most Japanese identify Hearn with Matsue, as it was here that his image of Japan was molded." In "1896, with some assistance from Chamberlain, he began teaching English literature at Tokyo (Imperial) University, a post he held until 1903" (Source: Wikipedia, at Lafcadio Hearn, Oct. 2008). Address: Matsue, Japan.

1172. Hutchison, Robert. 1906. Food and the principles of dietetics. 2nd rev. ed. New York, NY: William Wood and Co. xx + 582 p. Illust. Index. 22 cm. [100+* ref]

• ***Summary:*** Contains exactly the same information about soy and related products as the 1900 1st edition, in the same chapters, except it is on slightly different pages: See p. 232-35, and the section on diabetes, which has a subsection on "Diabetic breads" (p. 491-92).

"Vegetarian" or "vegetarianism" or "vegetable diet" are discussed on pages 172-73, and 185-86. The section on "The nutritive value of vegetable foods" (p. 171+) states: "But we must by no means suppose, even if the chemical constituents of vegetable food were equal in nutritive value to the corresponding constituents of animal food, that therefore vegetable food as a whole can replace meat, and vice versa. The form in which the nutritive ingredients are presented to the digestive organs materially affects their utility as foods. A glass of whisky is chemically the same whether it be taken 'neat' or diluted with a tumblerful of water, but the effects on the body are radically different.

"The question, therefore, presents itself: Is it better to obtain the nutritive constituents of our food in an animal or a vegetable form? and an attempt to reply to this question raises the whole problem of vegetarianism. With that problem we must now concern ourselves for a short space [see footnote].

"Vegetarianism may be advocated either on physiological or on economic grounds.

"As regards the physiological argument, it may be pointed out–what is apt to be lost sight of–that the vegetarian question is really a question of protein, and of that alone. The carbohydrates of the diet must almost perforce be derived from the vegetable kingdom, for there alone are they to be found in any quantity, and it has already been pointed out that the fat of the diet may be obtained with equal physiological advantage from either an animal or a vegetable source.

"But as regards proteins it is different. Even were a given quantity of pure vegetable protein fully equal in nutritive value to a similar quantity of the protein of flesh, we are still unable to extract the vegetable protein in a state of purity and eat it by itself, but must take it in the form in which it is presented to us by Nature. The real question, therefore, is: Shall we eat our protein in an animal or a vegetable form? Now, in the first place, it will scarcely be denied that vegetable foods are relatively much poorer in protein than animal foods are. Contrast typical examples of both kingdoms after the removal of water, for that is the only fair method of comparison, and one arrives at the following results:" A table shows: Dried lean beef contains 89% protein. Beef with fat contains 51% protein. Pea flour contains 27% protein. Wheat contains 16% protein. Rice contains 7% protein.

"The comparison shows that even the fattest meat is far richer in protein than the most nitrogenous forms of vegetable food.

© Copyright Soyinfo Center 2014

"Not only so: what protein is present in vegetable food has its value still further lowered in many cases by the defective nature of its absorption in the body. The truth of this has been already sufficiently demonstrated.

"It must be obvious from all this that vegetable food, unless eaten in large quantities, will not yield a sufficiency of protein to the body. The important question arises, therefore: How much protein does a healthy man require in his food daily? This question has been discussed in an earlier chapter, and it is only necessary to remind the reader that the amount of protein which is required daily by a healthy man doing a moderate amount of bodily work has been estimated at about 100 grammes (Footnote 1). And what are the consequences of living upon a diet which contains less protein than this? To this question, as we have also seen (p. 23), it is not easy to give an altogether satisfactory reply. In the first place it must be admitted that such a large amount of protein is by no means necessary for making good the mere daily waste of protein in the body. Very much less will suffice for that, and carefully-conducted experiments have shown that no impairment of the stock of protein in the body is incurred even if the amount in the food be cut down to as low a level as 60 grammes daily. Even if it be objected to such experiments that this minimum consumption of protein has only been maintained for very limited periods, yet it may be replied that the minimum reached is not much below that which forms the average daily consumption per individual in a large number of healthy races, such, for example, as the Japanese."

Pages 185-86: A vegetable diet is less expensive than a mixed diet, but it requires considerably more cooking time.

"In conclusion it may be well to summarize the main points in the argument which has been pursued in this chapter:

"1. Vegetable foods are rich in carbohydrates, and, with a few exceptions, comparatively poor in protein and fat. They are also bulky, partly from their richness in starch, but also from the presence of cellulose and a large amount of water. Even if compact in their raw state, they tend to take up much water and to become bulky on cooking.

"2. Animal foods are rich in protein and fat, but, with the exception of milk, poor in carbohydrates. They are compact in form (again with the exception of milk), and tend to become more so on cooking.

"3. Vegetable foods are less digestible in the stomach, and on the whole less completely absorbed than animal foods, partly by reason of their bulk, partly because of the indigestible coating of cellulose which invests their nutritive constituents, and in part also from their tendency to undergo fermentation in the intestine, with the production of acids which hasten on peristalsis. Their protein constituents suffer more from defective absorption than any other ingredient.

"4. Both from chemical composition and from defective absorption a purely vegetable diet is apt to be deficient in protein, and the question of vegetarianism becomes a question of whether it is advisable to live upon a protein-minimum or not.

"5. The consistent vegetarian must either live upon a diet which is relatively poor in protein or else consume an excessive bulk of food.

"6. The adoption of the former of these courses, there is reason to believe, tends to diminish energy and the power of resisting disease; the latter is apt to lead to derangement of the stomach and bowels.

"7. Both of these results may be avoided by supplementing the vegetable part of the diet by animal substances rich in protein, but two-thirds of the total protein can safely be taken in the vegetable form.

"8. Either meat, fish, eggs, milk or cheese may be used as the protein-carrier, but for healthy persons the moderate use of the first two has certain advantages. For the gouty, perhaps milk and cheese are more to be recommended, while skim or butter milk, salt fish, and the cheaper kinds of cheese are undoubtedly the most economical.

"9. Vegetable foods have certainly the advantage of being cheaper, both as sources of building material and energy, than the animal foods are, and vegetarianism may therefore be recommended on grounds of economy, both national and individual. The reasons for the inevitable costliness of foods of animal origin have been pointed out; the cost of cooking, however, must not be lost sight of in this connection, and modifies somewhat the above considerations.

"10. It may finally be added, though these points were not dwell upon, that vegetable foods are less highly flavoured than some animal foods, such as meat, but have the advantage of not being liable to undergo putrefaction, and of rarely producing disease." Address: M.D. Edinburgh, F.R.C.P., Asst. Physician to the London Hospital and to the Hospital for Sick Children, Great Ormond St. [London].

1173. Kaempfer, Engelbert. 1906. The history of Japan, together with a description of the Kingdom of Siam 1690-1692 (translated by J.G. Scheuchzer from the original edition of April 1727. 3 vols.). Glasgow, Scotland: James MacLehose and Sons. Vol. 1, xc + 334 p. Reprinted 1971 New York, NY: AMS Press Inc.

• ***Summary:*** Please see the original 1727 edition of this work for a long quote on soybeans, miso, shoyu, and azuki beans; it appears in this 1906 edition in Vol. 1, p. 187-88. Many of Dr. Kaempfer's botanical specimens may still be seen in the Natural History Museum, South Kensington. The front matter in this book is very interesting: The frontispiece shows a full-page portrait (illustration, painting) of Sir Hans Sloane. List of illustrations. Publisher's note. Biographical note of the Scheucher family, by Sir Archibald Geikie. To the King, by J.G. Scheucher. The names of the subscribers [alphabetical]. The author's preface. The life of the author,

© Copyright Soyinfo Center 2014

by the translator. An introduction, by the translator.

In the author's preface Kaempfer explains (p. xxix-xxxiii) that the Swedish Embassy, where he was secretary, was dismissed by the Persian Court. Since his native country Germany was at war, he decided to travel rather than to return home. He joined the Dutch-East India Company and went to Japan, where most visitors find it very difficult to obtain any information about the country, since all Japanese are obliged by solemn oath not to discourse with foreigners. But Kaempfer developed a rare friendship with his interpreters and the Japanese officers on his island (Deshima in Nagasaki Bay). He assisted them in the fields of medicine, astronomy, and mathematics, and in turn was able to learn about their country. Kaempfer was especially fortunate in gaining "the assistance of a discreet young man, by whose means I was richly supplied with whatever notice I wanted concerning, the affairs of Japan. He was about twenty-four years of age, well vers'd in the Chinese and Japanese languages, and very desirous of improving himself. Upon my arrival, he was appointed to wait on me, as my servant, and at the same time to be by me instructed in Physick and Surgery" (p. xxxii). The chief of the island allowed him "to continue in my service during the whole time of my abode in the Country, which was two years, and to attend me in our two journeys to Court, consequently four times almost from one end of the Empire to the other... As I could not well have obtain'd my end without giving him a competent knowledge of the Dutch language, I instructed him therein with so much success, that in a year's time he could write and read it better than any of our interpreters: I also gave him all the information I could in Anatomy and Physick, and farther allow'd him a handsome yearly salary, to the best of my abilities... There was not a Book I desired to see, on these and other subjects, which he did not bring to me, and explain to me, out of it, whatever I wanted to know."

A very interesting map of Japan shows each of the provinces and off-shore islands.

Note: The long index in volume 3, which makes interesting reading, includes acupuncture, algae (marine, used for food), amasake (amazake, see sake), *Amoenitates Exoticæ,* atheists, Buddhism & pagan worship, cami [kami], Canagawa [Kanagawa], cannnib, hempstuffs, Corea [Korea], Cublai–Tartar monarch, culis (see coolies), Deshima (island of Kaempfer at Nagasaki), Dutch East India Company, Fide Jori [Hideyori], Fide Joshi [Hideyoshi], Gendsii [Genji], gokokf [go-kokufu, chief kinds of peas], herbals, Hirando, Isje [Ise], Jejas [Ieyasu], Kami, Kioto (see Miaco), Koja [Koya], Marco Polo, Mikado, moxa, Nagasaki, oil seeds, opium, paganism, paper made by Japanese, pulse, Pythagoras, Quannon [Kwannon], religion, sago, saki [sake], salt, sasen [zazen], secular monarchs [Shogun], sesamum (plant and oil), Siaka (Buddha), Shimonoseki, submarine plants, Tokaido, Tokio, transmigration of souls, umbrellas, Wilstach (Maria Sophia, wife of Dr. Kaempfer). Address: Physician to the Dutch Embassy to the Emperor's Court, Edo (Tokyo), Japan.

1174. Loew, O. 1906. Ueber einige sonderbare japanische Nahrungsmittel [On some special Japanese foods]. *Mitteilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* 11(1):109-11. [Ger]

• ***Summary:*** Prof. O. Loew includes a discussion of tofu, soymilk, yuba, and shoyu (*shôyû-sauce*). On the coasts of Japan there were fresh seafish, and in the inland regions some salted fish were used. People have learned how to prepare wheat gluten (*Jap: fu; German: Weizenkleber*) in various dried forms, which are very porous and easily digested. The protein of the soybean, under the name of tofu (*Tôfu*), comes in the form of soft white cakes and is prepared daily. It is sold from door to door by salespeople.

The cooking of the softened soybeans, before the precipitation of the tofu, has a very milklike consistency. Without doubt, it is similar in nutritional value to milk but it can be recommended only for adults, and not for sensitive infants. "When this soybean milk (*Soyabohnenmilch*) mixed with some gelatine [sic] is simmered down, and while in a concentrated condition the mixture is poured into flat, level containers, there results from the drying of the gelatinous mass thin skins, which are sold under the name of yuba."

Note 1. This is the earliest German-language document seen (Aug. 2013) that uses the term *Soyabohnenmilch* ("soybean milk") to refer to soymilk.

Note 2. The date on the title page is given as 1907-09. The place of publication has now changed to Tokyo. Address: Prof. of Agricultural Chemistry, Imperial University, Tokyo, Japan.

1175. Okumura, Hanjirô. 1906. Tôfu hyakuchin: eisei ryôri [One hundred and rare and favorite tofu recipes: hygienic cookery]. Tokyo: Hagiwarashin Yôkan. 44 p. 18 cm. [Jap]

• ***Summary:*** This book appears to be a simplified, condensed and (somehow) sanitized version of the 1782 classic *Tôfu Hyakuchin,* by Ka Hitsujin.

1176. Senft, Emanuel. 1906. Ueber einige in Japan verwendete vegetabilische Nahrungsmittel, mit besonderer Beruecksichtigung der japanischen Militaerkonserven [On some vegetable foods used in Japan, with special attention to Japanese military canned foods]. *Pharmazeutische Praxis* 5(12):481-91. [5 ref. Ger]

• ***Summary:*** Working for the German Food Administration, the author examined a number of preserved foods that had played an important role in helping Japan to win the Russo-Japanese war. He drew heavily on Loew (1895). "Widely distributed in Japan is a unique baked good, which is produced primarily from wheat gluten with only a little of wheat flour; it is called *Fu* (wheat gluten bread).

"A very important role is played by the soybean and the

© Copyright Soyinfo Center 2014

many diverse products made from it: Yuba, the vegetable cheeses tofu, natto, and miso, plus shoyu or soy-sauce (*Shoju oder Soy-Sauce*). Like the soybean, tofu and natto are rich in protein. They supply the protein lacking in rice."

Also discusses fresh konnyaku, dried-frozen konnyaku, dried persimmons, sea vegetables (12 types in great detail, with an illustration of the cells of a kombu plant), and warabi (dried ferns). Address: Official of military medicines, Committee of military hygiene.

1177. Soya Gakugawa (Chusuke). comp. 1906. Tôfu sanbyakuchin [Three hundred rare and favorite tofu recipes]. Kyobashi: Shiki Shimaya Shobo. Japanese summary by Kawakami 1978. [Jap]
• ***Summary:*** This work is composed of three earlier books published as one: Tofu Hyakuchin (1782), Tofu Hyakuchin Zokuhen (1783), and Tofu Hyakuchin Yoroku (1788).

1178. Tôfu ryôri: Hôichi Shinbun kenshô tôsen [Tofu cookery: Hoichi Newspaper prize winners]. 1906. Tokyo: Hôichi Shinbunsha. 79 p. 21 cm. [Jap]*

1179. Boehmer (L.) & Co. 1907. Wholesale catalogue: 1907 / 1908. Yokohama, Japan. 38 p. Illust. 27 cm. [Eng]
• ***Summary:*** The section titled "Plants and seeds of economic value" (p. 20) gives detailed information about different varieties of soy-beans quite similar to that found in the 1902 catalog, except that now a fourth type, green, is described; it was formerly accidentally included as part of the black type– no new information is given. Soybeans are again offered for sale under the same terms as before.

The information about azuki beans (p. 21) is identical to that in the 1902-1903 wholesale catalogue. Also: Kudzu. At bottom of p. 20: "Prices and full particulars on application."

Alfred Unger, F.R.H.S. [Fellow, Royal Horticultural Society] is now the proprietor. Since this catalogue marks the company's 25th anniversary, the page following the title page states: "To our friends and customers: In this, the twenty-fifth year of our existence, we should like to review, for our patrons, the history of our firm, the founders of the export trade in Japanese Horticultural, Agricultural, and Forestry products.

"When in 1870 the Japanese government up the island of Yesso [Yeso, now named Hokkaido], a Commission of foreigners was appointed to aid in developing the island. Mr. Louis Boehmer joined this commission as head of the Horticultural Department, having been recommended for this position by Messrs Peter Henderson & Co. of New York. When this commission was dissolved in 1880, Mr. Boehmer, who had already seen the possibilities of a trade in Japanese horticultural products, came to Yokohama, founding in 1882 the firm of Louis Boehmer.

"By 1889 the trade had so increased, that Mr. Boehmer needed assistance and the present proprietor, Mr. Alfred Unger, was sent out by the great horticultural firm of J.C. Schmidt [named Haage & Schmidt by 1900], Erfurt, Germany, principally to look after the export of Cycas stems, which just at that time were in great demand. In October, 1892, he was made a partner and the firm of L. Boehmer & Co. was formed. This partnership lasted until 1896, in which year Mr. Boehmer died in Blankenburg am Harz, Germany, where he had gone to recuperate his health.

"Since that date Mr. Unger has been the sole proprietor..." Address: Nos. 5 and 28 Bluff, Yokohama, Japan.

1180. Yokohama Nursery Co., Ltd. 1907. Catalogue... for 1907. Yokohama, Japan. 90 p. Illust. Index. 26 cm. [Eng]
• ***Summary:*** On the cover of this English-language catalog is an illustration of a Kaempfer iris (*Iris Kaempferi*) blossom. In the section on "Seeds" (p. 73+) is a subsection (p. 80) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1906 catalog, except that the price per pound of soy bean has decreased to $0.10 and a 9th variety of vegetable seeds is offered: Carrot (long Japanese).

This catalog contains many changes compared with its 1906 predecessor. The title has changed and, for the first time, appears on the cover rather than on the Contents page. A page about the company near the front explains that it was incorporated in 1890 and now has a telephone number. It has a new branch office in London at Craven House, Kingsway, W.C. Cable address: Tigrinum, London. The Index, for the first time, is in the back of the catalog, and (again, for the first time) contains an entry for "bean" (p. 80) but not for "soy." All other plants are likewise indexed by their common or scientific / botanical names. Address: P.O. Box No. 72. Nos. 21-35 Nakamura, Yokohama, Japan. Phone: 509.

1181. Moore, R.A. 1907. Division of Farm Crops: Plan of work for the coming year. *Wisconsin Agricultural Experiment Station, Annual Report* 5:145-70. Feb. See p. 165-67.
• ***Summary:*** Experiment No. 8 (p. 165-67) is titled "Soy beans." Some background on the crop is given, along with planting instructions. Then a "Report Blank," containing 22 questions, is provided so that each farmer who plans to participate in the experiment may provide detailed feedback on his results to the station. Questions include: Name of experimenter. County and state. Date of planting soy beans. Character of soil. What crop had been grown the previous year? Yield per acre of marketable beans? Did you use any bacteria-laden soil for inoculation purposes? Were nodules noticeable on the roots of the soy beans at any time during the growing period where such soil was used? Were they noticeable where the soil was not used? Give in general way your opinion of soy beans as a seed and forage plant for Wisconsin.

© Copyright Soyinfo Center 2014

The section on soy beans begins: "The soy bean was probably introduced into the United States from Japan about fifty years ago and has been cultivated with success in the southern states. In Japan it is used extensively as a human food, but in this country it is grown for the seed, as a forage plant, and as a soil renovator. As a forage its use as a soiling crop is becoming recognized, by stockmen and dairymen, as it withstands the drought exceptionally well and will give a good cutting of green forage at the time when other feeds are shriveled and wilted. Soy beans of the late variety gave a cutting of 9.9 tons green forage per acre at the Wisconsin Experiment farm in 1900 and yielded thirty-eight bushels of seed beans per acre in 1902, and forty bushels per acre in 1903." Address: Secretary, Madison, Wisconsin.

1182. *Poverty Bay Herald* (*Gisborne, New Zealand*). 1907. Our mail bag: Japanese vegetable milk. March 16. p. 7.
• ***Summary:*** A condensed vegetable milk has been prepared by Professor Katayama of the Imperial Agricultural College, Tokio, but it is not yet a commercial article.

"It is prepared from soy beans, and the liquid is said to be very similar in appearance to cows milk, having a yellowish color and an agreeable taste which would be quite like the product but for a slight odor of beans."

1183. *Bulletin of the Imperial Institute* (*London*). 1907. Utilisation of the soy bean. 5(1):86-87. [2 ref]
• ***Summary:*** "The plant yielding the "soy bean" (*Glycine soja*) has of late received much attention at the hands of agriculturists in tropical countries on account of its value as a green manure. The bean itself has long been employed in the East as a vegetable and food-stuff, and has been imported in large quantities into European countries, principally for use as a feeding-stuff for animals. It is also an important ingredient in Indian soy, which forms the basis of chutney. More recently the introduction of the extraction of cheaper methods for the extraction of fixed oils by the use of solvents has made it possible to utilise such materials as the soy bean, which contains only 10 per cent. of fixed oil, as a source of oil, and considerable quantities are now used in the United Kingdom in this way." Note: This is the earliest English-language document seen (March 2003) that uses the term "solvents" (or "solvent") in connection with the crushing of soybeans to give oil and meal.

Also discusses briefly the preparation of soymilk and tofu in Japan.

1184. Ballard, Walter J. 1907. Far Eastern progress. *Los Angeles Times*. April 11. p. II4.
• ***Summary:*** "The South Manchuria Railway Company is buying 150 locomotives and other railway equipment and supplies, to the aggregate value of $5,000,000. Apply to the Bureau of Manufactures, Washington, D.C., for the names of Japanese forms holding the specifications."

"Japanese enterprise is establishing [soy] bean-cake factories in Manchuria–the land of beans. The capital of the company is $2,490,000. Most of the cake manufactured will be sent to Japan, and the oil to Germany, to be used in soap manufacture."

1185. Suzuki, Tozaburo. 1907. Apparatus for brewing soy. *British Patent* 9,995. 5 p. Date of application, 30 April 1907. Accepted 3 Oct. 1907. 3 drawings.
• ***Summary:*** "This invention relates to improvements in apparatus for brewing soy... The object of this improvement is to provide auxiliary means for quickly changing the temperature of the tanks, said means being also adapted to act as a substitute for the closed chamber for effecting or giving the contents of the tanks a uniform temperature and also acting if desired in conjunction with said chamber for regulating the temperature of said tanks. In the brewing of soy the question of temperature is very important..."

"The novelty of this invention consists in combining with an apparatus, comprising a brewing tank, means for applying a constant temperature thereto, and means for constantly stirring the contents of the tank, an auxiliary means or arrangement whereby the temperature of the contents of the tank may be quickly changed."

Four illustrations depict the apparatus. Address: No. 401 Jibeishinden, Sunamura, Minami-Katsushika, Tokio [Tokyo], Japan.

1186. Suzuki, Tozaburo. 1907. Appareil pour brasser la sauce dite Soy [Apparatus for brewing soy sauce]. *French Patent* 377,294. April 30. 5 p. Application filed 6 July 1907. 4 drawings. [Fre]
Address: Japan.

1187. Funatsu, T. 1907. On different forms of phosphoric acid in press cakes. *Bulletin of the College of Agriculture, Tokyo Imperial University* 7(3):457-59. April. [Eng]
• ***Summary:*** This article begins: "Since refuse press cakes are frequently used as manure, it is of some importance to determine the amounts of phosphoric acid present in different forms, as the availability for plants differs very much in different compounds." The soybean cake used extensively as manure in Japan is imported from Manchuria. A table (p. 458) gives the percentage of phosphoric acid in three different oilseed cakes: Soybean cake, cotton seed cake, and rape cake, with herring guano used for comparison. In soybean cake: Total phosphoric acid 1.38%. Phosphoric acid as lecithin 0.17%. Phosphoric acid as nuclein 0.23%. Phosphoric acid soluble in dilute (4%) hydrochloric acid 0.98%.

In soybean cake, the relative amounts of phosphoric acid (so that the total = 100%) are: Phosphoric acid as lecithin 12.4%. Phosphoric acid as nuclein 16.5%. Phosphoric acid soluble in dilute (4%) hydrochloric acid 71.0%.

© Copyright Soyinfo Center 2014

Note: This is the earliest English-language document seen (Nov. 2005) that contains the term "cotton seed cake" (spelled exactly like this).

1188. Inomata, Yoshio. 1907. Shôyu ni hitaseru pesto nezumi shikabane chû pesto kin no unmei ni tsuite [On the fate of pest bacillus and pest bacillus in the corpse of a rat (killed by the bacillus) which was soaked in shoyu]. *Saikingaku Zasshi* (*Bacteriology*) No. 142. p. 576-83. April. [Jap]
Address: Wakayama-ken Dai Yon-bu Saikinshitsu.

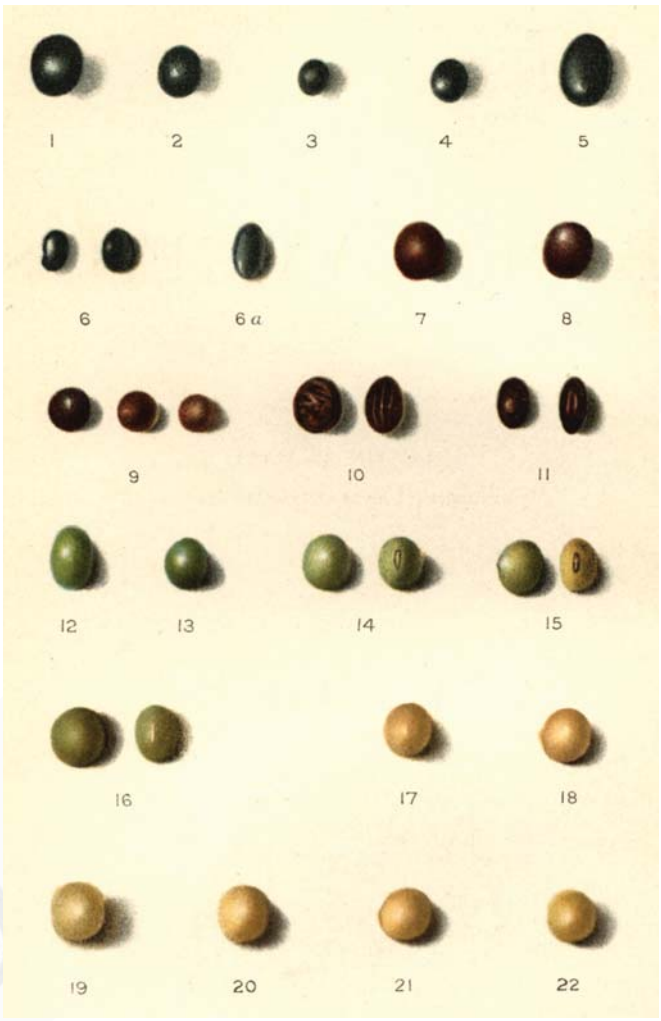
• ***Summary:*** An analysis of the chemical composition of Japanese soy sauce. It is very difficult to isolate the various protein decomposition products and to understand the complex chemical changes that occur during shoyu fermentation. Tables show the composition of both soybeans and wheat. Address: 1-2. Nôgaku-shi, Japan.

1190. Ball, Carleton R. 1907. Soy bean varieties. *USDA Bureau of Plant Industry, Bulletin* No. 98. 30 p. + 5 plates. May 27.
• ***Summary:*** This publication started a new system for naming soybeans, giving them common names such as Buckshot, Ogemaw, and Ito San. Contents: Origin and introduction of the soy bean. Variability. Classification: Key to the varieties. Descriptions of the varieties (23–including the source of the name and the numbers and sources of lots grown, incl. Agrost. No. and S.P.I. No.): Black-seeded group (Buckshot, Nuttall, Kingston, Ebony, Flat King, Riceland), Brown-seeded group (Ogemaw, Eda, Baird, Brownie), Mottled-seeded group (Hankow {with patch or saddle, and usually eccentric lines or stripes outside the patch}, Meyer), Green-seeded group (Samarow, Guelph), Greenish-yellow-seeded group (Yosho, Haberlandt, Tokyo {incl. Best Green}), Yellow-seeded group (Ito San {"It has long and widely sold under the names, 'Yellow,' 'Early Yellow,' 'Early White,' etc."}, Manhattan, Butterball, Amherst, Hollybrook, Mammoth). List of synonyms.

Note 1. This is the earliest document seen (July 2013) containing a list and descriptions of early U.S. soybean varieties. Details on each of the 23 individual varieties discussed by Ball are given in separate records in this database with titles of the format "Buckshot: New U.S. domestic soybean variety" (for Buckshot).

Note 2. This is the earliest document seen (July 2013) which tries to standardize early soybean varietal names / nomenclature to prevent confusion.

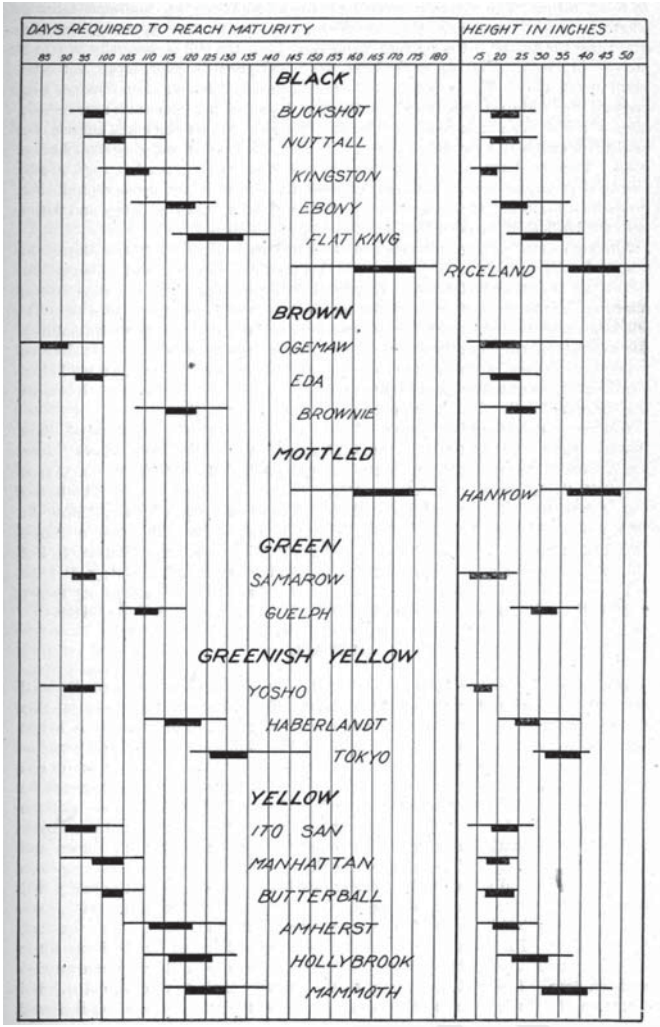
Note 3. This is the earliest English-language document seen (Sept. 2004) that uses the word "mottled" (or "mottling") or the word "stripes" to describe the color of



soybean seeds. Note that both the mottled Hankow and Meyer varieties came from China.

"Classification: The first separation of the numerous forms or agricultural varieties of this species will naturally be through the colors of the seeds. The varieties having seeds of the solid colors black and yellow are by far the most numerous and most striking. The greens and browns are much less common and are also very variable in shade. The browns are of various shades of reddish brown and are also closely related to the mottled group. The yellows vary commonly into greenish shades, and any line drawn between the yellow and greenish yellow is only arbitrary. The yellows also vary into paler shades, and some have even been called 'white' in Japan. This is most noticeable in old seeds, but is never carried farther than pale yellow. It seems likely that none of the legumes commonly cultivated in Japan can have pure white seeds, like our navy beans for example, or the term 'white' would never be applied to a pale-yellow form. All yellow soy beans gradually turn paler with age for at least three to four years, although some varieties are originally paler than others. Although the black group shows more variation in the size of the seeds, the yellow is much

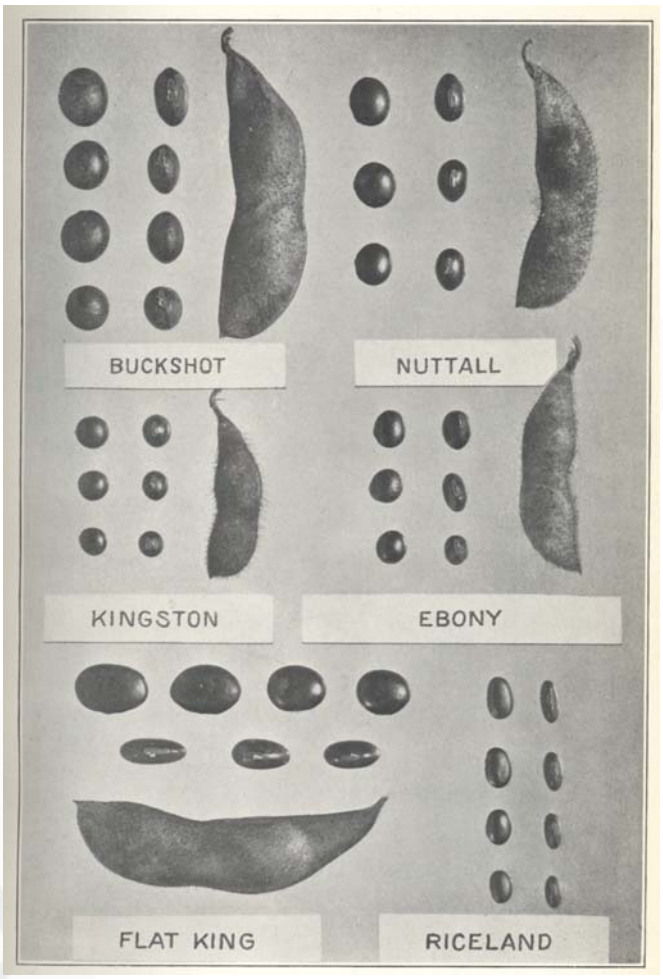
© Copyright Soyinfo Center 2014



more variable in color shades... Figure 1 shows an attempt to represent graphically the relationships and importance of the various color groups." Six color groups are recognized and described herein.

Distribution numbers: Part I is "serial numbers under which soy beans were distributed by the former Division of Agrostology, with the name of the variety to which each has been referred." Part II is a "list of the serial numbers under which soy beans have been distributed by the Office of Seed and Plant Introduction and Distribution, with the name of the variety to which each is referred in this bulletin. Several S.P.I. numbers representing soy beans not studied by the writer are not included in the list. 3870–Hollybrook. 4285–Mammoth. 4912–Hollybrook. 4913–Amherst. 4914–Tokyo. 5764–Hollybrook," etc. up to "17852–Meyer." Note 4. One variety was often introduced several different times under different S.P.I. numbers, and that many varieties have an "Agrostology No." [Number] separate from their S.P.I. number. Description of plates.

"Origin and introduction of the soy bean (p. 7-8): The soy bean (*Glycine hispida* (Moench.) Maxim.) is an annual



leguminous plant from the Orient. Its native home is said to be from southern Japan southward through eastern China and Indo-China to Java. In China and Japan it has been in cultivation for many centuries, certainly since before the beginning of the Christian era. In those countries it is easily the most important legume grown, and in some provinces it is the most important of all crops. Owing, perhaps, to the almost complete isolation of that part of the Orient, its cultivation spread only slowly to other lands. It is now grown to some extent in India, but its introduction there seems to be of recent date. It reached Europe probably in the latter part of the eighteenth century, and its arrival in England is credited to 1790. For several decades it was grown merely as a curiosity in botanic and private gardens. Investigation of the economic value of this plant began more than thirty years ago in Europe, rather earlier than in this country, but the soy bean has not yet attained any great prominence there.

"The soy bean has been known in the United States for more than three-quarters of a century. In the New England Farmer of October 22, 1829, Thomas Nuttall wrote of its possibilities as a crop for this country. For many years it was grown only in gardens as a curious plant from the Far East. The Perry expedition to Japan in 1853 brought back two

© Copyright Soyinfo Center 2014

varieties, a yellow and a red sort [azuki?], which were tested here in a limited way.

"During the last twenty years the soy bean has been the subject of many experiments to determine its agricultural value and adaptations. The agricultural experiment stations of Kansas and Massachusetts were pioneers in these investigations and seed was imported directly from Japan by both stations. Through these efforts considerable interest was aroused, and two or three varieties soon became available commercially. The number of forms and varieties in this country was further increased by additional importations made by enterprising seedsmen. Since 1898 the Office of Seed and Plant Introduction of the United States Department of Agriculture has secured from seven different countries of the old world no less than 65 different lots of soy bean seeds, representing about twenty varieties."

Page 2 lists the 28 people and divisions in the Bureau of Plant Industry. Beverly T. Galloway is chief of the Bureau. Merton B. Waite and Irwin F. Smith are pathologists. Walter T. Swingle is physiologist in charge of plant life history investigations. Mark A. Carleton is cerealist in charge of grain investigations. David Fairchild is in charge of seed and plant introduction. Charles V. Piper is agrostologist in charge of forage crop investigations. Palemon H. Dorsett is pathologist in charge of the plant introduction garden, Chico, California.

Note 4. This is the earliest document seen (Aug. 2011) that mentions Palemon H. Dorsett in connection with plant introduction or with soy beans.

List of synonyms (p. 27): Adzuki = Ito San. Black = Buckshot. Brown Eda Mame = Eda. Crossbred No. 6 = Ogemaw. Early Black = Buckshot. Early Green = Guelph. Early Japan = Butterball. Early White = Ito San. Early Yellow = Ito San. Extra Early Black = Buckshot. Green = Guelph. Green Samarow = Samarow. Hollybrook = Hollybrook [sic]. Ito San = Ito San [sic]. Japanese No. 15 = Kingston. Kaiyuski Daizu = Ito San. Kiyusuki Daidzu = Ito San. Kysuki = Ito San. Large Black = Buckshot. Late Yellow = Mammoth. Mammoth Yellow = Mammoth. Medium Black = Buckshot. Medium Early Black = Buckshot. Medium Early Green = Guelph. Medium Green = Guelph, Ogema = Ogemaw. Southern = Mammoth. Yellow = Mammoth. Yellow Eda Mame = Ito San.

A color illustration (frontispiece, facing the title page) shows one or two views of the seeds of 22 different soy bean varieties, lined-up and numbered. Diagrams show: The probable relationships of the different groups of soy beans (block style; p. 10).

The number of days required to reach maturity and the height of the plant in inches, with averages, for each variety of soy bean (graph plot; p. 13).

The 1st plate, facing the title page, showing the seeds of 22 soybean varieties, is in color. Four full-page photos at the end show the pods (side view) and seeds (side and front views) of (typically) five soybean varieties.

Note 5. This is the earliest document seen (Sept. 2013) that mentions the following soybean varieties: Amherst, Baird, Brown Eda Mame, Brownie, Buckshot, Butterball, Ebony, Eda, Flat King, Guelph, Haberlandt, Kingston, Large Black, Manhattan, Meyer, Nuttall, Riceland, Samarow, Tokyo, Yosho.

Note 6. This is the earliest document seen (July 2013) which states that Black, Early Black, Extra Early Black, Large Black, Medium Black, and Medium Early Black are all the same as Buckshot, or that Early Japan is the same as Butterball, or that Brown Eda Mame is the same as Eda, or that Early Green, Green, Medium Early Green, and Medium Green are all the same as Guelph, or that Yellow is the same as Mammoth. Address: Agronomist, Grain Investigations, USDA Bureau of Plant Industry.

1191. Guelph: New U.S. domestic soybean variety. Synonyms: Early Green, Green, Green Medium, Medium Early Green, Medium Green (Ball 1907). Dwarf Green, Michigan Green, Ohio Medium Green, Wisconsin Early Green (Morse 1948). Large Medium Green. 1907. Seed color: Green (chromium).

• ***Summary:*** Sources: Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No 98. 28 p. May 27. See p. 11, 13, 20-21, 27-28. "Classification–Key to the varieties (p. 11): IV. Green seeded: 1. Medium, 110 days, 30 inches tall, pods broader, seeds round, deep green = Guelph." "Green-seeded group: The Guelph is one of the oldest and best known varieties in cultivation. For many years it has been sold by numerous seed houses as Early Green, Medium Green, and Medium Early Green. It is a rather curious fact that during the eight years in which the United States Department of Agriculture has been actively engaged in the introduction of oriental legumes it has but once secured this variety. This is probably due to the fact stated by writers on Japanese agriculture that the green-seeded and the brown-seeded forms are but sparingly cultivated in the Orient, the blacks and yellows being much preferred. The Guelph soy bean has become quite a favorite in the Northern States of this country, where it is highly esteemed for both seed and forage production. In Kansas, Indiana, Michigan, and in Ontario it has given splendid results in comparative tests extending through several years... At the Ontario Agricultural College and Experiment Farm, located at Guelph, Ontario, a great deal of work has been done with soy beans, and with this variety especially, and the name is given for that reason. Numbers and sources of lots grown: Agrost. No. 912, 'Early Green,' J.M. Thorburn & Co.; Agrost. No. 969, S.P.I. No. 6558; Agrost. No. 1306, 'Medium Early Green,' J.M. Thorburn & Co.; Agrost. No. 1312, 'Medium Green,' Henderson & Co.; Agrost. No. 1464, 'Early Green,' Henderson & Co.; Agrost. No. 1467, 'Medium Early Green,' J.M. Thorburn & Co.; Agrost. No.

© Copyright Soyinfo Center 2014

1469, 'Medium Early Green,' Breck & Sons; Agrost. No. 1473, 'Medium Early Green,' Hammond Seed Co.; Agrost. No. 1476, 'Medium Early Green,' Currie Bros.; Agrost No. 1764, 'Early Green,' Kansas Expt. Station; Agrost. No. 1971, 'Medium Green,' union of Agrost. Nos. 912, 969, 1306, 1312, 1464, 1467, 1469, 1473, and 1476; S.P.I. No. 6558, Hankow, China; S.P.I. No. 13503, Agrost. No. 912; S.P.I. No. 17261, grown from Agrost. Nos. 1764 and 1971." Page 27 states that synonyms for Guelph are Early Green, Green, Medium Early Green, and Medium Green.

Piper, C.V.; Nielsen, H.T. 1909. "Soy beans." *USDA Farmers' Bulletin* No. 372. 26 p. Oct. 7. See p. 10. "Guelph (Green)."

Piper, Charles V.; Morse, W.J. 1910. "The soy bean: History, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 187. 84 p. Dec. 31. See p. 30. "Guelph, or Medium Green, was introduced by Prof. W.P. Brooks, in 1889, from Japan, and is now quite extensively grown in the Northern States [Note: It did NOT originate in Guelph, Ontario, Canada.] The same variety was obtained from Hankow, China, in May, 1901,–S.P.I. No. 6558, according to Ball's identification (1907, p. 21). It has since been received from only one foreign source, namely, S.P.I. No. 22320, from Haage & Schmidt, as 'Green Samarow.' This last might easily be the progeny of the American introduction."

Morse, W.J. 1918. "The soy bean: Its culture and uses." *USDA Farmers' Bulletin* No. 973. 32 p. July. See p. 14. "The Guelph is also known as Medium Green, Early Green, Medium Early Green, and Large Medium. It is esteemed for its forage and as a silage crop in the Northern States. Although a good producer of grain, it is not desirable for this purpose, since the pods shatter badly before all the seeds are mature."

Piper, Charles V.; Morse, William J. 1923. *The soybean.* New York, NY: McGraw-Hill Book Co. xv + 329 p. March. See p. 41, 44, 165, 167. Page 41 states: "The early introduced varieties.–Previous to the numerous introductions by the United States Department of Agriculture beginning in 1898, there were not more than eight varieties of soybeans grown in the United States." One of these was Guelph or Medium Green (with green seeds). "Guelph or Medium Green." "Introduced from Japan, 1889." "Medium Early Green.–The same as Guelph." "Medium Green.–The same as Guelph."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 10-11. Guelph is in the USDA Germplasm Collection. Maturity group: III. Year named or released: 1907. Developer or sponsor: USDA. Literature: 01, 03. Source and other information: From Japan in 1889 by Prof. W.P. Brooks, Massachusetts AES (Agric. Exp. Station). Called 'Medium Green' from 1903 to 1907. Prior designation: None.

Talk with Dr. Richard Bernard, former curator of the USDA Germplasm Collection. 1998. Oct. 15. "Many varieties got named long after they were released, especially in the old days. It took them a while to settle on name. They decided that names like Medium Green, while descriptive, were not valid variety names, so they came up with Guelph." Dr. Bernard further complicated the problem because he had two different strains that were called Medium Green or Guelph, so he let the two names exist together, because the strains are different. These two are still in the soybean germplasm collection. Address: USA.

1192. Kingston: New U.S. domestic soybean variety. Synonym: Japanese No. 15 or #15 (Ball 1907). 1907. Seed color: Black.

• ***Summary:*** Sources: Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No 98. 28 p. May 27. See p. 11, 13, 15. "Classification–Key to the varieties (p. 11): I. Black seeded: 2A. Seeds small, 4 to 6 or 7 mm long, round or broadly elliptical, pods about 1 inch long. Medium [days to mature], 110 to 115 days, low, 15 to 18 inches tall, scarcely branched, seeds spherical or slightly flattened = Kingston." "Black-seeded group: Kingston. This is a small, medium early variety, with rather slender stems... The seeds are the smallest of any black variety, and are equaled in smallness by Brownie only... This variety is too small and unbranched to have much value for forage. It is likely to prove a fairly good yielder of seed, two tests sown thickly for forage having yielded between 8 and 9 bushels of seed per acre... The name, Kingston, is given in honor of the Rhode Island Experiment Station, located at Kingston, Rhode Island. That station has contributed largely to our knowledge of the soy bean as a crop for northern regions, and this variety was received from that source alone. Numbers and sources of lots grown: Agrost. No. 118, 'Japanese No. 15,' Rhode Island Agric. Expt. Station; S.P.I. No. 17255, grown from Agrost. No. 118-1."

Piper, C.V.; Nielsen, H.T. 1909. "Soy beans." *USDA Farmers' Bulletin* No. 372. 26 p. Oct. 7. See p. 23.

Piper, Charles V.; Morse, W.J. 1910. "The soy bean: History, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 187. 84 p. Dec. 31. See p. 31. "Kingston: The Kingston soy bean was received from the Rhode Island Agricultural Experiment Station in 1903 as "Japanese No. 15." It was obtained by them from Prof. W.P. Brooks, of the Massachusetts Agricultural Experiment Station, who brought a number of soy-bean varieties from Japan in 1889, and is probably the variety which he named 'Medium Black.' It has never been secured from any other source. In all probability this is the variety grown at the Rhode Island Agricultural Experiment Station in 1893 (see their Annual Report, 1893, p. 191) as 'Medium Black.'"

Etheridge, W.C. 1912. "Report of Division of Agronomy." *North Carolina Agric. Exp. Station, Annual Report* 34:16-18. For the year ended June 30, 1911. Kingston

© Copyright Soyinfo Center 2014

was one of the earliest maturing varieties grown.

Piper, Charles V.; Morse, William J. 1923. *The soybean.* New York, NY: McGraw-Hill Book Co. xv + 329 p. March. See p. 41, 44. Page 41 states: "The early introduced varieties.–Previous to the numerous introductions by the United States Department of Agriculture beginning in 1898, there were not more than eight varieties of soybeans grown in the United States." One of these was Kingston (with black seeds).

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 12-13. Kingston is in the USDA Germplasm Collection. Maturity group: IV. Year named or released: 1907. Developer or sponsor: Rhode Island AES (Agric. Exp. Station) and USDA. Literature: 01, 03. Source and other information: From Japan in 1889 by Prof. W.P. Brooks, Massachusetts AES (Agric. Exp. Station). Prior designation: PI 17255. Address: USA.

1193. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1907. Asia: Empire of Japan. No. 320. p. 36-39. May.
• ***Summary:*** Japan imported oil cake worth the following amounts: $5,567,500 in 1905 and $7,748,900 in 1906. Japan's biggest trading partners in 1906: Imports (in million dollars): United Kingdom $51.0, United States $33.8, British India $31.4, China $27.7, Germany $21.1. Exports (million dollars): United States $62.3, China $59.9, France $19.5, Hongkong $13.5, Korea $12.3, United Kingdom $10.7. Address: Washington, DC.

1194. Tokyo: New U.S. domestic soybean variety. Dry edible variety. Also spelled Tokio. Synonyms: Austrian Green, Ita Mame, Late Ita Mame, Southern Medium Green (Morse 1948). 1907. Seed color: Yellow (olive), hilum pale.
• ***Summary:*** Sources: Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No 98. 28 p. May 27. See p. 12-13, 22-23. "Classification–Key to the varieties (p. 11): V. Greenish yellow seeded: 3. Late, 130 days or over, 35 inches or over in height, very long branched, pods 1½ inches long, seeds larger, round or elliptical, hilum scarcely tinted = Tokyo." The Tokyo differs from the medium greenish yellow (Haberlandt) variety mostly in a somewhat more vigorous growth and in later ripening... The Tokyo is one of the very best varieties for all-around use. It will give heavy hay and silage crops, is equally good for pasture and cover-crop purposes, and where it matures it gives very good seed yields. Eight plots grown at Washington [DC] in two different years averaged 8 1/3 bushels of seed per acre, in which the lowest yield was 4 bushels and the highest 14½ bushels. The Kentucky Agricultural Experiment Station reports a very much higher seed yield, with the weight of green forage to the acre 11.84 and 14.08 tons from two plots, curing to 5.44 and 6.16 tons, respectively. It is too late for the best results in most Northern States, but it may be replaced there by the Haberlandt variety. This variety was named for the Japanese capital, where some of the importations were secured. Numbers and sources of lots grown: Agrost. No. 468, grown from S.P.I. No. 4914; Agrost. No. 696, grown from Potomac Flats; Agrost. No. 1171, 'Best Green,' S.P.I. No. 9409; Agrost. No. 1198, 'Late Ita Name,' S.P.I. No. 8424, Japan; Agrost. No. 1200, 'Medium Ita Name,' S.P.I. No. 8423, Japan; Agrost. No. 1298, 'Medium Green,' S.P.I. No. 6335, Japan; S.P.I. No. 4914, 'Best Green,' Japan; S.P.I. No. 5766, grown from No. 4914; S.P.I. No. 6335, 'Medium Green,' Japan; S.P.I. No. 8423, 'Medium Ita Name,' Japan; S.P.I. No. 8424, 'Late Ita Name,' Japan; S.P.I. No. 9409, grown from S.P.I. No. 5766; S.P.I. No.17264, grown from Agrost. No. 1198-1; S.P.I. No. 17265, grown from Agrost. No. 1200-1; S.P.I. No.17266. grown from Agrost No. 1171-1; S.P.I. No. 17267, grown from Agrost No. 1298-2." Note: The words/name "Ita Name" make no sense in Japanese. Perhaps "Eda Mamé" was intended.

Piper, Charles V.; Morse, W.J. 1910. "The soy bean: History, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 187. 84 p. Dec. 31. See p. 18, 45, 75. Variety name: Tokyo. Seed color: Olive yellow. S.P.I. No. 17264. "From Tokyo, Japan, 1901... Grown nine seasons. This variety was also obtained from Kobe, Japan, No. 20893." "The best varieties of soy beans (p. 75): Late– Tokyo, 17264."

Tracy, S.M. 1912. "Forage crops for the cotton region." *USDA Farmers' Bulletin* No. 509. 47 p. Oct. 11. See p. 29. The soybean variety Tokyo has recently become popular in the cotton region of the USA (the southern states).

Country Gentleman. 1915. "Soy beans for all climates." May 22. See p. 11. Note: This is the earliest document seen (Dec. 1998) which uses the spelling "Tokio" rather than "Tokyo" for this variety. In about 52% of all documents where this variety is mentioned, its name is spelled "Tokyo," while in the remaining 48% it is spelled "Tokio." The "Tokio" spelling was more common from 1919 to 1925, however it was not used after 1947, when "Tokyo" became the standard spelling.

Morse, W.J. 1918. "The soy bean: Its culture and uses." *USDA Farmers' Bulletin* No. 973. 32 p. July. See p. 16.

per pound: 2,260. Use: Grain, or dry edible beans. Note: This is the first of many documents in which Morse classified the Tokyo as a "dry edible" soybean, one of a limited number of "edible varieties of soybeans."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 18-19. Tokyo is in the USDA Germplasm Collection. Maturity group: VII. Year named or released: 1907. Developer or sponsor: USDA. Literature: 01, 03. Source and other information: 'Ita Name' from Yokohama, Japan, in 1902. Prior designation: PI 8424. Address: USA.

1195. Saito, K. 1907. Mikrobiologische Studien ueber die Sojabereitung [Microbiological studies on the brewing of Japanese shoyu]. *Wochenschrift fuer Brauerei* 24(24):323-24. June 15. [1 ref. Ger]

• ***Summary:*** This is a summary of an article in *Zentralblatt für Bakteriologie* II. 17. p. 20-27, 101-09, 152-61 (1907). Address: Aus dem pflanzenphysiologischen Laboratorium des Botanischen Instituts der Kaiserlichen Universitaet zu Tokio (Tokyo Univ.).

1196. Suzuki, U.; Aso, K.; Mitarai, H. 1907. Ueber die chemische Zusammensetzung der japanischen Soja-Sauce oder "Schoyu." [On the chemical composition of Japanese soy sauce or shoyu]. *Bulletin of the College of Agriculture, Tokyo Imperial University* 7(4):477-94. July. (Exp. Station Record 16:966). [2 ref. Ger]

• ***Summary:*** The koji for shoyu is made with the spores of *Aspergillus oryzae;* it is left in a room at 30-40ºC for 3 days. The shoyu is allowed to ferment for 1-3 years.

From 2 liters of shoyu were isolated: alanine 1.6 gm + 5.0 gm impure alanine. Leucine 6.0. Proline 3.0. Lysine 2.6. New base #1 1.0. New base #2 0.2 Ammonia 4.2. Proteins 5.4 (by calculation). Formic acids (*Ameisensaeure*) 0.1. Acetic acid 0.40. Lactic acid 3.20. Also present were: Tyrosine, asparagin acid, polypeptides, phenylalanine (*Phenylalanin*), cystine. Not found were: Glycocoll, histidine, arginine, serine, *Aminoisovaleriansäure ?,* glutamin acid? (*Glutaminsäure ?*) (p. 493-94).

1197. *New York Times.* 1907. Here is a Japanese bill of fare: Prof. Chittenden shows value of simple diet used in Japan. Aug. 11. p. SM5.

• ***Summary:*** A typical bill of fare of a Japanese family in moderate circumstances includes: "Breakfast (from 7 to 7:30 A.M.)–Miso soup with vegetables. Boiled rice, pickles, and tea. Sometimes raw egg or boiled sweet soya beans or natto.

"Lunch (12 noon)–Fish boiled in soya. Vegetables stewed in soya. Boiled rice, pickles, tea.

"Supper (from 6 to 6:30)–Soya soup. Vegetables. Raw fish sliced, eaten with soya sauce..."

"The miso, soya sauce, and topi [sic, tofu] are all products of the soya bean, on which, with rice, the Japanese physique may be said to be built up." "Rice is the main foodstuff, with the soya bean a close second."

Prof. Chittenden of Yale University notes that Japan's "exploits in war have recently attracted the attention of the civilized world." Yet the great majority of Japanese have "remained untouched by the prodigality of Western civilization." Their "habits and customs still bear the imprint of simplicity and frugality."

Since Japan defeated Russia in war, many observers have noted that "the people of no other nation... have greater powers of physical endurance, or greater bodily strength and agility..."

1198. Brady, Herbert F. 1907. China: Report for the year 1906 on the trade of Chefoo. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 3929. p. 1-24.

• ***Summary:*** Page 13 lists exports, including "bean oil, bean cake," vermicelli and joss sticks. Page 15 states: "Bean cake–It has been a fair year for manufacturers of bean cake. There are some 50 mills in Chefoo using from 2 to 8 stones each, and their estimated output is about 7,500,000 cwts. [1 cwt = hundredweight = 112 pounds] per year. The export amounted to 1,719,328 cwts., valued at 344,850*l."*

Table IV (p. 22), titled "Return of principal articles of export from Chefoo during the year 1906," shows 1,719,328 cwts. of bean cake, worth £344,850, was exported. 39,166 cwts. of beans, worth £13,523, and 34,162 cwts. of bean oil, worth £40,608, were also exported.

The largest item exported was bean cake, followed by vermicelli (worth £226,859). Large amounts of groundnuts (including shelled) were also exported.

Table V (p. 22), titled "Comparative table of principal articles of export from Chefoo during the years 1902-06," shows exports of bean cake rose to a peak of 1,719,328 cwts. in 1906. Exports of beans rose to a peak of 896,426 cwts. in 1905. Exports of bean oil rose to a peak of 34,162 cwts. in 1906.

The main nationalities and types of ships entering the port of Chefoo in 1906 were Japanese steam ships (1,319), followed by British (744, but with the largest total tonnage), Chinese (314), and German (197). Address: Consul.

1199. Hausser, -. 1907. China: Report for the year 1906 on the trade of Swatow. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 3931. 13 p.

• ***Summary:*** "Bean cake was in fair demand during the usual season. The import in 1906 was 3,159,276 cwts. [1 cwt = hundredweight = 112 pounds] as compared with 2,751,110 cwts. in 1905. Bean cake was in former years imported entirely from Newchwang [Manchuria] and Chefoo, but since the Japanese began importing from Newchwang it has been supplied to Swatow also by Chinkiang and Hankow.

© Copyright Soyinfo Center 2014

The trade thus opened is yearly increasing" (p. 6).

Table II, "Return of principal articles of native import during the years 1905 and 1906" (p. 10) includes the quantity (in cwts.) and value (in British pounds sterling) for bean cake, beans, groundnuts, and oil (bean, castor, groundnut, &c). Imports of bean cake in 1906 were 3,159,276 cwts. worth £835,430.

Table III, "Return of principal articles of export of native produce during the years 1905-06" (p. 11) includes the quantity (in cwts.) and value (in British pounds sterling) for groundnuts, and oil (bean, groundnut, &c). Address: British Consul.

1200. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1907. Asia: Chinese empire (Great commercial depression). No. 324. p. 59-72. Sept.

• ***Summary:*** At Newchwang [Manchuria], about "one-half of the Japanese steamers arrived here in ballast only, returning to Japan with cargoes consisting chiefly of beancakes."

The principal exports from Newchwang (as of May 1), which have been fully up to expectations, are as follows (in tons): Beancake [soy] 105,670. Bean oil [soy] 56. Beans [soy] 3,500. Wild silk 55. Silk refuse 333; "also silver coins $506,000, and silver sycee $197,000, both in United States gold values. Of the foregoing cargoes, practically all of the beancake went to Japan; bean oil, beans, silver coins, and silver sycee being shipped to various Chinese ports, and Shanghai taking all of the wild silk and silk refuse."

Note: *Webster's Dictionary* (1985) defines sycee (pronounced SAI-see, and derived from Chinese (Cantonese) *sai sz,* literally fine silk), a word first used in 1711, as "silver money made in the form of ingots and formerly used in China." Address: Washington, DC.

1201. Hosie, Alexander. 1907. Report for the year 1906 on the foreign trade of China. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 3943. 114 p. For the year 1906.

• ***Summary:*** Table N titled "Principal exports from China to Asiatic countries (India excepted)" (p. 66) gives exports of [soy] bean cake and [soy] beans in 1901-05 (average), 1905, and 1906. The section titled "Beans and bean cake" (p. 71) states: "Beans, according to the Chinese returns, show a falling-off in export to foreign countries from 3,173,241 to 1,778,035 cwts. [1 cwt = hundredweight = 112 pounds], but the decrease was not nearly so great, for the Japanese returns give Japan's receipts from Manchuria in 1906 as 972,246 piculs of the value of 3,536,740 yen."

The section titled "Oils, vegetable and essential" (p. 72) states that exports of vegetable oils (by weight) are up 31% over the average of the years 1901-05. "They consist of [soy] bean, groundnut, tea, wood and other oils, and it would be a great convenience if the customs would endeavour to classify these oils and give each class its respective value, for the lump value of different kinds of oils is of no use to anyone who wishes to find the price of, say, bean or wood oil."

Essential oils include star aniseed, cassia-leaf, etc. Address: Acting Commercial Attaché to His Majesty's Legation at Peking.

1202. Suzuki, Tozaburo. 1907. Apparatus for brewing soy. *U.S. Patent* 0,874,041. Dec. 17. 5 p. Application filed 18 July 1907.

• ***Summary:*** In this invention, several tanks were "sunk into a closed chamber wherein means were provided for regulating the temperature. Stirring apparatus was provided for effecting continuous and uniform agitation of he contents of the tanks."

"A further utility of the invention consists in providing means whereby hot water or a like heating medium may be directed through the auxiliary means to facilitate and hasten first maturing by heating the mash and whereby after the first maturing is complete cold water or a like cooling medium may be circulated through the auxiliary means to complete second maturing of the soy."

Four illustrations depict the apparatus. Address: Sunamura, Japan.

1203. Kato, Yogoro. 1907. Tôfu no gyôko ni tsuite [On the coagulation of tofu]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 28:1249-61. Dec. [Jap]

1204. **Product Name:** [Shoyu (Plum Tree Japan, Wisteria Japan, Pinetree Japan, and Water Chestnut Japan)].
Foreign Name: Shôyu.
Manufacturer's Name: Nihon Shoyu Jozo K.K. (Japan Shoyu Brewing Co.).
Manufacturer's Address: Tokyo, and Kyoto-Osaka area, Japan.
Date of Introduction: 1907.
New Product–Documentation: Kenji Kawakoshi, ed. 1972. Shashi-Choshi Shoyu Kabushiki Kaisha. Tokyo: Toppan. p. 72.

Mark Fruin. 1983. Kikkoman: Company, Clan, and Community. p. 69-72. "The Russo-Japanese War... brought on a formidable challenge: the appearance of a maverick entrepreneur named Suzuki who sought to dominate the soy sauce industry in much the same way that he had already prevailed over the world of sugar refining.

"In 1903 the Department of Provisions and Fodder of the Japanese Army had sought to purchase condensed or concentrated shoyu, but discovered that it was generally unavailable and, moreover, that, given the slowly changing technology of the day, it would not quickly become available. Upon learning this, Suzuki Tosaburo, who had already had great success with sugar refining, carefully studied the fermentation process of shoyu and designed

© Copyright Soyinfo Center 2014

a new tank that allowed for the application of heat to fermenting mash to speed fermentation. Thus, Suzuki challenged the traditional world of soy sauce manufacture by introducing high volume, energy- and capital-intensive production methods.

"In April 1904 Suzuki took out a patent on his fermentation tank design, and in 1906 he began sending samples of his new product to Hawaii for field testing. In 1907, after making various adjustments to his process based on the results of the taste sampling in Hawaii, Suzuki formed the Nihon Shoyu Jozo Kabushiki Kaisha (Japan Shoyu Brewing Company) with a capitalization of 10 million yen, and he opened two factories, one in the Tokyo area and one in the Kyoto-Osaka area, to manufacture soy sauce by his new method. Running both factories at full capacity, he produced 300,000 koku (14,280,000 gallons) annually–three times the current capacity of the combined Noda associates! He sold his product under the brand names Plum Tree Japan, Wisteria Japan, Pinetree Japan, and Water Chestnut Japan, at four different prices, thereby blitzing the soy sauce market with his brews."

1205. Okazaki, K. 1907. Eine neue Aspergillus-Art und ihre praktische Anwendung [A new type of Aspergillus and its practical application]. *Zentralblatt fuer Bakteriologie. Series 2.* 19:481-84. [2 ref. Ger]

• ***Summary:*** Of the enzymes that are produced by the lower molds, in recent years the enzyme diastase from *Aspergillus oryzae* has found a new application among physicians.

The writer succeeded in finding, in overripe rice koji, a white type of Aspergillus which he names *Aspergillus Okazakii* n. sp. [new species]. In Part I he gives a morphological description, a physiological description, a description of its close relatives (*Affinität*), and a diagnosis. In Part II he describes how to prepare the enzyme, which he names "Digestin," starting with the preparation of rice koji. Contains two plates with a total of nine figures.

Note: Neither Jokichi Takamine nor taka-diastase is mentioned in this article. Address: Head of the Pharmaceutical Factory of Yenjô, Somei, Sugamo, Tokio (Japan).

1206. Asai, Denzaburo; Saito, Rokuzan. 1907. Miso ryôri nihyakushû: katei jitsuyô [Two hundred miso recipes: For practical use at home]. Tokyo: Yurakusha. 159 p. 23 cm. [Jap]*

• ***Summary:*** Note: This is the 2nd earliest book in WorldCat / OCLC that has miso as a subject or title word. Address: Japan.

1207. Benedict, Francis G.; Osborne, Thomas B. 1907. The heat of combustion of vegetable proteins. *J. of Biological Chemistry* 3:119-34. [7 footnotes]

• ***Summary:*** "Very few determinations of the heat of combustion of vegetable proteins are to be found in the literature. The earliest appear to be those made by Danilewsky (1881), who found for 'Pflanzenfibrin' 6231, for legumin 5573 and gluten 6141 calories per gram."

Values are given for glycinin (a globulin forming the greater part of the protein matter of the soy bean, *Glycine soja*). For yellow soy beans, the values range from 5,147 to 5,255 calories/gram on an "as is" basis. For Japanese soy beans, the values range from 5,016 to 5,056 calories/gram. Calculated to an ash- and water-free basis, the two values are 5,667-5,672 and 5,619-5,665.

Values are also given for amandin (a globulin forming the greater part of the protein matter of the seeds of the almond, *Prunus amygdalus var. dulcis*), edestin (from hemp seeds), phaseolin (from the Japanese adzuki bean, *Phaseolus radiatus*), conglutins α and Beta (from yellow and blue lupins), glutenin (from wheat gluten), and hordein (from barley).

A table (p. 133) summarizes the percentages of carbon, hydrogen, nitrogen, sulfur, and oxygen in each type of protein and the average heat of combustion–which ranges from 5,358 for globulin (wheat) to 5,916 for hordein (barley). "In general the higher heats of combustion are found for those proteins which have a higher carbon content and similarly for those with a lower oxygen content." Address: Chemical Lab. of Wesleyan Univ. [Middletown, Connecticut] and the Lab. of the Connecticut Agric. Exp. Station.

1208. Colby, Frank Moore; Sandeman, George. eds. 1907. Nelson's encyclopædia: Everybody's book of reference. In 12 volumes, profusely illustrated. Vol. III. Ceve to Dende. New York, NY: Thomas Nelson & Sons. 618 p. Illust.

• ***Summary:*** This book, which comes in a 3-ring binder for easy updating, is also called *Nelson's Perpetual Loose-Leaf Encyclopædia.*

Under "Chile," the section titled "Commerce" (p. 85D, dated 1933) lists the principal imports in order of value. These include "bar iron and steel, coffee, soya bean oil,..."

Under "China," the section titled "Agriculture" (p. 93, dated March 1925) states: "In the north, rice is largely replaced by wheat, barley, millet, and maize, and by peas and beans. The soya bean is of special economic importance, ranking high in the list of Chinese imports."

The section titled "Commerce" (p. 93-94) states: "Tea, formerly the main staple of China's export trade, has suffered a decided decline through Indian competition, and is now surpassed by silk which contributes over one-third of the value of the country's exports, and by the soya bean and its products which have risen to a position of importance in the last few years."

The entry for "Dalny" (p. 532, dated Oct. 1919) begins: "Ta-lien-wan, Dairen, or Tairen, seaport town, Kwantung territory, Manchuria, on the south shore of Ta-lien-wan Bay.

© Copyright Soyinfo Center 2014

It is connected by rail with Port Arthur, 20 miles to the north, and with Tientsin and Peking, and by steamer with Hong-Kong and Shanghai. It has a fine ice-free harbor protected by a 1,000-yard breakwater and has a growing trade. Coal and soya bean oil and coke are exported.

"Dalny was founded (1898) on territory granted to Russia by the Chinese government as a terminus for the Chinese Eastern Railway. It was opened as a free port in 1901, and captured on May 30, 1904, by the Japanese, who officially renamed it Dairen, or Tairen, after Kwantung Territory was leased to Japan by the treaty of Portsmouth. Under Japanese control, the city was rebuilt, the harbor works (built in 1903-04) extended, and electric tramways installed. It was opened again as a free port in 1906, and in 1907 a Chinese custom house was established for goods crossing the border of Kwantung." The population in 1910 was 43,576, of whom 24,715 [56.7%] were Japanese and 18,774 [43.1%] were Chinese. Address: 1. M.A., New York; 2. M.A., Edinburgh [Scotland].

1209. Griffis, William Elliot. 1907. Corea: The hermit nation. 8th ed. Revised and enlarged. New York, NY: Charles Scribner's Sons. xxvii + 512 p. See p. 270. Illust. Index. 23 cm. 1st ed. 1882. [99* ref]

• ***Summary:*** This enlarged 8th edition is identical to the original 1882 ed. except that 4 pages of front matter (including a "Preface to the eighth edition") have been added, and the recent history of Korea to 1907 and the index have been updated, adding 50 pages to the end. A color fold-out map has been added, facing p. 506; it shows Korea, Tsushima, Shimonoseki, Karatsu, Hirado, Nagasaki, Goto Islands, northwest Kiushiu [Kyushu]. The information on soy remains unchanged, on p. 270. Address: Ithaca, New York. Formerly of the Imperial Univ. of Tokio, Japan.

1210. Hurrier, Paul. 1907. Matière médicale et pharmacopée Sino-Annamites [Chinese and Annamite (Vietnamese) materia medica and pharmacopoeia]. Paris: Vigot Frères. viii + 292 p. Illust. Index. 25 cm. Preface by Prof. Em. Perrot. [25 ref. Fre]

• ***Summary:*** The book begins with a chapter titled "History of medicine in China," which includes many abbreviated bibliographic references in the text. Pages 21-22 discuss acupuncture and a large fold-out illustration (facing p. 20) shows several views of the meridians on the human body. Part two of the book, titled "Special Chinese and Annamite drugs with therapeutic uses," contains four chapters: 1. Mineral kingdom. 2. Animal kingdom. 3. Vegetable kingdom. 4. Five indexes: Latin names, Chinese names, Annamite names, Japanese names, and Cambodian names.

In chapter 3, "Vegetable kingdom," in the section on Legumes (p. 144) is a subsection titled *Dolichos soja* L. (p. 147). It begins with the three Chinese characters for "Yellow soy bean" = *Teou-Ko* (Mérat); *Mau-tau* (Porter Smith); *Houang-teou* (in Chinese), *Dan-dèn* (in Annamite). The laxative seeds of this variety are used to make a special condiment, soy sauce (*le soy; Tsiang-yu*) composed of soybean flour, tea, and salt. From the cooked seeds, the Annamites make a vegetable cheese (*fromage végétal; Teou-fou*), which resembles goat cheese, and of which they consume very large amounts. Mr. Bloch, in a recent study on tofu (*"Quelques mots sur la fabrication et la composition du Teou-Fou,"* published in *Bulletin des Sciences Pharmacologiques* (Paris), March 1906, p. 138-43), described the process of making tofu, which is coagulated with magnesium chloride. The entire plant is used to make a decoction for treating smallpox and rheumatism.

Glycine javanica (*no-mame* in Japanese is also mentioned on p. 148).

Also discusses: Various sea vegetables (*kombu, kanten, funori, amanori;* p. 71-72). *Cannabis sativa* (hemp; p. 102). *Phaseolus radiatus* = small red bean (azuki in Japanese; p. 150). *Sesamum orientale* (sesame seeds; kuro-goma [black sesame] and shiro-goma [white sesame] in Japanese; p. 178). Address: Pharmacien de 1re class, Docteur de l'Université de Paris, France.

1211. Jumelle, Henri L. 1907. Les resources agricoles et forestiéres des colonies Françaises [The agricultural and forestry resources of the French colonies]. Marseille, France: Barlatier, Imprimeur-Éditeur. viii + 442 p. See p. 333. No index. 28 cm. [2 ref. Fre]

• ***Summary:*** In the chapter on Indo-China (p. 267-363) is a section on coconuts (p. 322+) followed by a section on "Other oil-bearing plants" (*Les autres plantes oléagineuses*), which contains paragraphs (p. 326-27) on the sesame seed (*Le sésame,* cultivated in Cambodia) and the peanut (*L'arachide,* long cultivated in Cochin China and central and south Annam). Some confusion exists concerning the oil of *Aleurites cordata* (Chinese wood oil, *l'huile d'abrasin*) (p. 331-32): "Why is this oil, so well known and widely used in Indo-China, not exported, as is its analogous oil from China? It is not ignored by European and American manufacturers; and in the United States, as in Europe, it is in demand * by the factories that make linoleum or that prepare varnish from copal." (Footnote: *"It seems that the oil imported into Europe and the United States is often adulterated with oil from the seeds of *Soja hispida* [soybeans], which is likewise a very drying oil").

The next section, titled "The indigenous food" (*L'alimentation indigène*) (p. 332-35) includes a discussion of various legumes consumed in Indo-China. "Among the leguminous seeds used as food, there is a large consumption of kidney-beans (*de haricots*), of dolichos beans (*de doliques*), and, even more, of soybeans (*de sojas*)." "The large consumption of the soybean (*du soja*) is due to the fact that its beans, not only are eaten after a long cooking, but, again, serve as the base for various preparations, as in Japan

© Copyright Soyinfo Center 2014

and China (Footnote: It is with these soybeans, mixed with wheat and *koji,* and coarse salt, that the Japanese make their *shoyou* [*shoyu,* soy sauce] and their *miso,* and the Chinese their sauces or analogous dishes, *teou-ju* and *teou-tiung.* In Java, the indigenous people make similar preparations. The fermentations are, in all these cases, caused by various molds.) It is thus that the Annamites [of central Vietnam] make a cheese called *dau-phu,* which is the *teou-fou* of the Chinese, the *tofu* of Japan. They likewise make a sauce named *tuong,* which is almost the same as the *teou-tiung* [*doujiang*] of the Chinese, and two cheeses [tofu], one solid, the other of a softer consistency, called *dau-hu* and *dau-hu-ao* in Cochin China." Address: Prof., Faculte des Sciences de Marseille [Marseilles], France.

1212. Katayama, T. 1907. On the preparation of a vegetable cheese from the protein of the soy-bean. *Zentralblatt fuer Bakteriologie. Series 2.* 19(19/20):601. [1 ref. Ger]
• ***Summary:*** German summary of an article from *Bulletin of the College of Agriculture, Tokyo* 7(1):117. The vegetable cheese is tofu. Address: Japan.

1213. Royal Botanic Gardens, Kew [England]. 1907. Official Guide to the Museums of Economic Botany. No. 1. Dicotyledons. Third edition, revised and augmented. London, Printed for H.M. Stationery Off. by Darling... 236 p. See p. 65. 19 cm.
• ***Summary:*** Page 65 states: "No 192. Soy beans (*Glycine hispida,* Maxim.). An annual, cultivated largely in China, Japan, and India. In the two former countries a sauce known as Soy is produced in large quantities and in Japan a kind of cheese or curd cake is prepared known as 'Natto.' The chief products of Manchuria are bean oil and bean cake. The seeds yield 17 per cent. of an edible oil obtained by expression, and the residue is made into large circular cakes, weighing about 60 lbs, similar to that exhibited, used in the East for feeding cattle and also as manure. Soy is imported into Europe in barrels and is said to form the basis of most of the popular sauces."

Also discusses "Ground nuts. Pods and seeds of *Arachis hypogaea,* L." (p. 63, No. 188), and Kuzu (*Pueraria thunbergiana,* p. 66-67, No. 195). Address: Kew, England.

1214. Saito, Kendo. 1907. Microbiologische Studien ueber die Soyabereitung [Microbiological studies on the preparation of soy sauce]. *Zentralblatt fuer Bakteriologie. Series 2.* 17(1/2):20-27; 17(3/4):101-09; 17(5/7):152-61. Plus 5 plates on unnumbered pages near end. [55 ref. Ger]
• ***Summary:*** Contents: Part I (p. 20-27): Introduction. (1) Process for making soy sauce (*Soya,* which can be divided into 3 steps): (a) Preparation of the koji (*Koji* or *Soyakoji*). (b) The main process, making the moromi or mash (*Maische*). (3) Pressing, clarifying, and pasteurizing. (2) Method for isolation of the microorganisms: Molds / fungi, yeasts, bacteria. (3) Special remarks: Molds–(a) *Aspergillus Oryzae* (Ahlbg.) F. Cohn.

Part II (p. 101-09): (b) *Rhizopus japonicus* Vuillemin nov. var. angulosporus (Fig. 1). (c) *Tieghemella hyalospora* nov. spec. (Fig. 5). (d) Other molds. Yeasts–Soya yeast (a) *Saccharomyces Soya* nov. spec. Diagnostic properties, comparison of soya yeast with other types of yeasts. (b) *Saccharomyces farinosus* Lindner (Fig. 2 and 8c). (c) A soya yeast that grows on the surface of liquids (*Soya-Kahmhefe*) (Fig. 3 and 8b).

Part III (p. 152-61): Conclusion of (c). (d) Mycoderma species (Fig. 6 and 8d). (e) Torula species (Fig. 7). Bacteria–(a) *Bacterium Soya* nov. spec. (b) *Sarcina Hamaguchiae* nov. spec. (Table 5, Fig. 10). Conclusion. Appendix: (1) *Rhizopus Tamari* nov. spec. (2) *Aspergillus glaucus* Link. (3) *Aspergillus Rehmii* Zukai (?). (4) *Cirencella mucoroides* nov. spec.

Explanation of five plates of illustrations.

Since ancient times, according to legend, a substance for salting foods has been made by the Japanese. About 300 years ago the process underwent a significant improvement through trade and communication with the Chinese, whose culture then stood on a higher level. For the first time a product named soy sauce (*Soya;* Japanese: *Shôyû*) came to be widely known, and from then on it found extensive use. By the year 1903 nearly 4 million hectoliters [i.e., 400 million liters] of shoyu were being produced in Japan, from which the state took the equivalent of about 7 million German marks in taxes.

Among the yeasts, the author found *Saccharomyces Soya* (a new species of film yeast), *Saccharomyces* (later *Pichia*) *farinosus,* and one species each of *Mycoderma* and *Torula.*

Illustrations show: Plate 1: *Rhizopus japonicus* in seven detailed views.

Plate 2: (2) *Saccharomyces farinosus.* (3) *Saccharomyces Soya,* a soya yeast that grows on the surface of liquids (*Soyakahmhefe*).

Plate 3: (4a-b) The new yeast *Saccharomyces Soya* from soya koji. (6) Mycoderma sp. x 900. (7) Torula sp. x 900.

Plate 4: (5) *Tieghemella hyalospora* (from rice culture) in seven detailed views.

Plate 5: (8) Large colonies (3 weeks old) of *Saccharomyces Soya,* a soya yeast that grows on the surface of liquids (*Soyakahmhefe*), *Saccharomyces farinosus,* and Mycoderma species. (9) *Bacterium Soya.* (10) *Sarcina Hamaguchiae.*

Note: This is the earliest document seen (July 2010) that mentions the species *Saccharomyces Soya.* Later (in 1909) the author gave this film yeast the name *Zygosaccharomyces japonicus.* In the early 1950s this species was renamed *Saccharomyces rouxii.* Address: Plant Physiology Lab., Botanical Inst., Tokyo Imperial Univ., Japan.

1215. Sawamura, Shin. 1907. On the microorganisms of natto. *Zentralblatt fuer Bakteriologie. Series 2.* 19(10/12):335-36. [1 ref. Ger]
• ***Summary:*** German summary of a 1906 article by Sawamura from *Bulletin of the College of Agriculture, Tokyo* 7(1):107. "Natto is a type of vegetable cheese which is made from cooked soybeans by a process of fermentation." Address: Japan.

1216. Senft, Emanuel. 1907. Ueber einige in Japan verwendete vegetabilische Nahrungsmittel, mit besonderer Beruecksichtigung der japanischen Militaerkonserven [On some vegetable foods used in Japan, with special attention to Japanese military canned foods]. *Pharmazeutische Praxis* 6(3):81-89; 6(4):122-24, 131-32; 6(6):211-12, 219. [19 ref. Ger]
• ***Summary:*** These three sections contain a good review of the literature (especially the Japanese literature) in German. Issue No. 3 begins with "Phanerogams. Chapter 5. Legumes. Soybeans and soybean preparations" (p. 81-89). Contents: Introduction. Varieties: Group I. Soja platycarpa-Harz (5 forms–olivacea-Harz and punctata-Harz, melanosperma, platysperma, parvula Martens). Soja tumida-Harz (3 forms–pallida Roseb. [sic, Roxb = Roxburgh], castanea-Harz [brown], atrosperma-Harz). Anatomy and cell structure of different parts of the plant and seeds. A non-original illustration (line drawing; p. 83) shows a soy bean, full-size and at cellular levels. Haberlandt and the Vienna World Exposition of 1873. Foods made from soybeans in China and Japan described by Charles Bryant (1785): Miso, soy sauce (*sooju-sauce* or soy), Roos, Koji. Tofu, sake. Shoju or Soja-Sauce. Miso (vegetable cheese; "Recently the firm Jul. Maggi & Comp. in Kempthal makes a type of miso and sells it commercially").

Issue No. 4 begins with "Natto and tofu" (*Bohnenkäse*) (p. 122-24) and includes fresh tofu and frozen tofu (*gefrorener tofu*). Yuba. A separate section on miso pickles (*Misozuke;* p. 131-32) describes the different types, especially those made with daikon (*Rettiche*).

Issue No. 6 discusses shoyu (called *Extrakt-Sauce Japonica,* or Shoju-Sauce) (p. 211). A table (p. 212) lists the main food plants of Japan, including five different "varieties" (*"var."*) of soybeans: *Kuro-mame, Shiro-mame, Ao-mame, Goishi-mame, Gankui-mame.* A photo (p. 219) shows various Japanese preserved foods, including a metal box containing "Fukujinsuke" [*fukujinzuke*] consisting of sliced vegetables (cucumbers, bamboo shoots, onions) preserved in soy sauce. Address: Military medicine official, Germany.

© Copyright Soyinfo Center 2014

• ***Summary:*** This book, dedicated to Julius Wiesner, "the master of plant physiology," looks at national food supplies from the viewpoint of plant physiology. In the section on "Calculation of assimilative effects," a table (p. 44-45) compares rye, wheat, corn, rice, soybeans, and potatoes in their production per hectare of starch, digestible protein, value of product in German marks, value of nutritive elements consumed, assimilative effect (defined as the ration of the value of the usable substance produced per unit area to the value of the nutritive elements borrowed from the soil by producing this substance), assimilative effect compared with rye, and difference between the production and consumption in German Marks. Soybean produces much more protein per given area of land than the other crops, has the highest assimilative ratio, 6.68 times larger than that of rye. Thus the culture of soybeans should be the most remunerative.

In the same section, a bar chart (p. 48) shows the value (in marks) of physiologically useful substance resulting from withdrawal of one mark worth of soil nutrients. The soybean gives the greatest returns of the 22 plants listed.

In the section on "Consideration of plant production efficiency in crop rotations" (p. 66+), the legumes are praised and soybeans are mentioned on pages 71 (the most productive of all legumes with an enormous number of 668) and 73. In this context, the work of Friedrich Haberlandt with soybeans and his book, *Die Sojabohne* (The Soybean, Vienna, 1878) are described in detail (p. 74-76). Haberlandt died shortly after the publication of this book, and Hecke, his friend, carried on his work.

In the last chapter, "Goals and consequences," a table (p. 102) shows the productivity in the northern U.S. states of nine crops, including wheat, barley, corn, sugar beets, peas, Jerusalem artichokes, and soybeans. In value of crop per hectare, soybeans are third after Jerusalem artichokes (German: Topinambur; French: Topinambour) and sugar beets. Two long footnotes (No. 122 and 123, p. 109-10) discuss the importance in Japan of soybeans and the various foods made from them including shoyu (Shoju, Shoyu), miso, tofu, and yuba. Address: Dr., Wien-Hohenau.

1218. Takenob, Y.; Takeda, G. 1907. Japan Year Book. Tokyo: Japan Year Book Office. 616 p. See p. 327, 467, 584, 602. Third annual issue. [Eng]

• ***Summary:*** Page 327. Chapter 14, "Agriculture" (p. 320-337) has a section that gives production data on "Soja beans" from 1900 to 1905 in *koku.*

3.562 million *koku* in 1900
4.069 million *koku* in 1901
3.136 million *koku* in 1902
3.647 million *koku* in 1903
3.710 million *koku* in 1904
3.261 million *koku* in 1905.

The same table gives production of "Red [azuki] beans which ranged from a high of 924,573 *koku* in 1901 to a low of 708,712 *koku* in 1902. Thus, in 1901 production of azuki beans in Japan was about 23% of that of soja beans [soy beans].

Page 467. In chapter 28, "Foreign trade" (p. 467-95), is a list for the "New import tariff schedule." "Import tariff," with an entry in Group II (Grains and seeds) for "Beans, soja." The tariff is 0.43 yen per 100 kin. On the next line is an entry for "Beans, red or white (small) (*Phaseolus subtrilobata*).

There is no information specifically on soja beans in the chapters titled Formosa, Karafuto [South Sakhalin Island], Korea, or Manchuria. However there are statistics for "Peas & beans" (1901-1905) in tables on pages 584 (Formosa [Taiwan], production in koku) and 602 (Korea, exports, 1902-1906, value in yen). Address: 1. Prof. at Waseda Univ. and Late of the *Japan Times;* 2. Editor of the *Pacific Ocean* and Late of the *Kokumin.* Both: 9, Yariya-cho, Ginza, Tokyo, Japan.

1219. Rafu Shinposha. comp. 1908. Rafu nenkan dai 1 kan [Rafu Shimpô's year book, No. 1]. Los Angeles, California: Rafu Shinpôsha. [14] + 107 + 66 + [38]. Plus 4 unnumbered leaves of plates. Illust. 28 cm. [Jap]

• ***Summary:*** Contents: Title page. Foreword (2 p.). Ad. Table of contents (2 p.). Ad. Map of Southern California. Ads (2 p.). Photos (2 leaves, printed one side only). Ads (2 p.). 1220. Meyer, Frank N. 1908. Re: Soy beans in China. In: Letters of Frank N. Meyer. 4 vols. 1902-1918. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 490-92. Letter of 8 Jan. 1908 from Peking, China, to David Fairchild of USDA.

• ***Summary:*** "Your letter of Nov. 16, 1907, concerning Soy beans. Yes, I think you are quite right in believing that there may be many more varieties still in existence. I personally think that China will afford for many generations yet, a fruitful field for exploration.

"You know that the Chinese have no seed-shops like what we have. Every farmer saves his own seeds of all his crops and as such, there may be countless strains of plants here in existence of which an explorer gets hold only once in a while."

"If it weren't for the missionaries throughout the land, I

© Copyright Soyinfo Center 2014

wouldn't have obtained as many things as I have now."

"I didn't receive as yet the full set of Soy-beans samples, put up by Mr. Piper. I am anxiously awaiting them. Yes, I really got away to China too much in a hurry, I never had even time to cast a glance at the collections of seeds of the Dept., but I hope when back and things go all right, to study these things thoroughly.

"In regard to the Soy beans again, I may say that when I visited the Agricultural Experiment Station of the Japanese in Mukden, I was amazed to find that I, in my half year's stay in Manchuria, had on my own account collected almost twice as many varieties as the Japanese had done under high official auspices. This may give you a small idea how difficult it is here to procure complete collections.

"I see in Mr. C.R. Ball's bulletin on the Soy bean [1907], that under the item of black seeded ones, there is no mentioning made of inside yellow and inside green. I sent some from New-chwang [Newchwang, later Yingkou], and the Chinese made distinction between them. I sent these green inside ones under No. 2550a and 256-a, while a yellow inside was sent in 1905 under No. 6-a. I also think that some more new forms will turn up in the next future, of the Soy beans I sent, as there were some rare local varieties among them, which I sometimes have seen only once."

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer, China.

1221. *Otago Witness* (*New Zealand*). 1908. Science notes. Jan. 22. p. 84.
• ***Summary:*** In a recent number of a Japanese journal, a Mr. T. Katajama [Katayama] described a process for the manufacture of a vegetable milk, the properties of which would render it highly suitable for use in tropical countries. The, preparation is obtained from a well-known member of the leguminous family of plants–namely, the Soja bean–which is a very popular article of food among the Chinese. The beans are, first of all, softened by soaking, and are then pressed and boiled in water. The resultant liquid is exactly similar to cows' milk in appearance, but it is entirely different in its composition.

"This Soja bean-milk contains 92.5 per cent. water, 3.02 per cent. proteine, 2.13 per cent. fat, 0.03 per cent. fibre, 1.88 per cent. non-nitrogenous substances, and 0.41 per cent. ash. Katajama added some sugar and a little phosphate of potassium (in order to prevent the elimination of the albumen), and then boiled the mixture down till a substance like condensed milk as obtained; this 'condensed vegetable milk' is of a yellowish colour, and has a very pleasant taste, hardly to be distinguished from that of real cows' milk. However it still retains the aroma of the Soja bean. It is recommended as a cheap and good substitute for condensed cows' milk."

Note: Summaries of this article appeared several times in New Zealand newspaper articles until 1914.

1222. Yokohama Nursery Co., Ltd. 1908. Catalogue... for 1908. Yokohama, Japan. 92 p. Illust. Index. 26 cm. [Eng]
• ***Summary:*** On the cover of this English-language catalog is photo of huge old flowering cherry tree (*Prunus pseudo-cerasus*) in full bloom in Japan, with people under its outspread branches enjoying the beauty. In the section on "Seeds" (p. 75+) is a subsection (p. 82) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1907 catalog. Address: P.O. Box No. 72. 21-35 Nakamura, Yokohama, Japan. Phone: 509.

1223. Takahashi, Teizô; Shito, Gorô. 1908. Miso no seibun ni tsuite (yohô) [On the composition of miso (prediction)]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 29(2):101-16. Feb. 28. [Jap]
Address: 1. Nôgaku hakase, Japan.

1224. Suzuki, Tozaburo. 1908. Apparatus for brewing soy. *U.S. Patent* 0,888,204. May 19. 4 p. Application filed 5 Dec. 1907.
• ***Summary:*** "This invention relates to improvements in apparatus for brewing soy and has for its object the provision of means for quickly and uniformly controlling the temperature of the soy..."

"It is well known that during the process of making soy it is necessary to artificially change the temperature thereof to obtain fermentation and maturation at the proper time..." Two illustrations depict the apparatus, showing that a coil of pipe surrounds the container in which the soy sauce is fermented. A several paddles in the soy sauce, driven by a bevel gear, enable the soy to be stirred.

"In cold weather hot water or other suitable heating medium is passed through the coil until the first fermentation has been completed and in hot weather cold water or other suitable medium is used during maturing..."

"In order to uniformly and quickly change the temperature of the soy, during the process of brewing, it is desirable to agitate the contents of the receptacle..." Address: Sunamura, Japan.

1225. *Advertiser* (*The*) (*Adelaide, South Australia*). 1908. Correspondence: A curious milk used in Japan is described in a Japanese periodical (Letter to the editor). June 9. p. 11.
• ***Summary:*** "It is made from the Soja bean. The liquid is exactly like cow's milk in appearance, and in taste can hardly be distinguished from it. To make it the beans are first soaked and then boiled in water. Some sugar and phosphate of potassium are added, and it is boiled down till it has the consistency of condensed milk."

1226. Lea and Perrins. 1908. Lea and Perrins' Sauce (Ad).

© Copyright Soyinfo Center 2014

Japan Weekly Mail (*Yokohama*) 50(2):56. July 11.
• ***Summary:*** This black-and-white ad (5 by 6 inches) states: "Assists digestion and gives a delightful piquancy and flavour to all meat dishes, soups, fish, cheese, curries, game, poultry & salads. The original and genuine Worcestershire. By Royal warrant to H.M. the King." A large illustration shows a bottle of Lea & Perrins Worcestershire Sauce. Address: England.

1227. *J. of the American Asiatic Association.* 1908. Railways in China. 8(6):176-78. July. [2 ref]
• ***Summary:*** "South Manchuria: In transmitting a translation of the report of the South Manchuria Railway Company for the six months ended September 30, 1907, presented to the stockholders in Tokyo on December 14, Consul Roger S. Greene, of Dalny, furnishes the following information concerning the restoration of the road to normal conditions: It was decided to rebuild the road on the standard gauge (4 feet 8½ inches), and to equip it with new rolling stock.

"By order of the Japanese Government a double track was to be laid from Dalny to Suchiatun."

"The gross income from the railway and allied enterprises during the six months ended September 30, 1907, was $2,491,224, while the expenses amounted to $2,028,783, leaving a profit of $462,441, of which $122,722 was carried to reserve funds, $29,880 was distributed to the stockholders, with the exception of the Government, as a dividend at the rate of 6 per cent... Of the total income $2,038,525 was from the railway proper, $322,238 from the Fushun coal mines, and the remainder from the wharves, hotels, electric plant, land rentals, etc. Of the total issue of 600,000 shares, at 200 yen ($99.60) per share, 500,000 are held by the Japanese Government, in the name of the Minister of Finance, while the remaining 100,000 are divided among 7,354 persons. Practically all the shareholders are Japanese, there being among them only about twenty-five Chinese, mostly domiciled in Japan, whose combined interests amount to about 500 shares."

During the same period [Oct. to March 10] there arrived at Dalny 104,389 tons of beans and 71,879 tons of bean cake, or 176,268 tons in all, while the total arrivals of beans at other stations, including Newchwang, were only about 20,000 tons, no bean cake being received there, according to the Japanese railway authorities.

"An accumulation of freight similar to that at Changchun has taken place at other stations also. It is stated that the total amount of beans and bean cake awaiting shipment southward at all the stations was, on March 10, 69,127 tons."

"With March 31 the South Manchuria Railway Company completed its first year of actual operation, and the publication of its report for the second six months is awaited with great interest."

Note: According to the title page, the American Asiatic Association was founded in 1898. This periodical, published in at 78 Beekman St., New York City, covers events in Shanghai, Hongkong, Manila, Yokohama, Kobe, and Singapore.

1228. Nishiyama, Y. 1908. Daizu abura ni tsuite. I. [Soybean oil. I]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 11(125):659-71. July. [1 ref. Jap]
• ***Summary:*** A detailed discussion of the physical and chemical characteristics of soy oil, and its composition. Address: Kôgaku-shi.

1229. Wileman, A.E. 1908. Japan: Report for the year 1907 on the trade of the consular district of Tainan (South Formosa). *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4083. 19 p. July.
• ***Summary:*** A table (p. 14) shows returns of imports from Japan from 1902 to 1907. The value of Soy [sauce] imports, which averaged £3,863 for the 5 years 1902-06, was £3,653 in 1906 and £6,764 in 1907. No quantities are given.

Table II (p. 15) shows returns of exports from the open ports of Anping and Takow from 1902 to 1907. [Soybean] "oil cake" was exported to Amoy, where it was used for manure. The value of oil cake exports, which averaged £2,001 for the 5 years 1902-06, was £1,626 for 16,572 cwts. [1 cwt = hundredweight = 112 pounds] in 1906 and £795 for 6,647 cwts. in 1907. Also exported were hemp, lungan (pulp or dried), and sesamum seed. Address: British Consul.

1230. *Chemist and Druggist* (*London*). 1908. Japanese soy. 73(6):223. Aug. 8.
• ***Summary:*** This small "filler" paragraph in the lower right corner of the page states: "Japanese soy [sauce] is an article the exports of which are increasing from Japan, owing to the number of Japanese residents being scattered in many parts of the globe. A new description, which is said to have many advantages and prepared by a new process, was put on the market last year. The exports of soy from Japan amounted in value to 100,500 *l.* [British pounds sterling] as compared with 97,000 *l.* in 1906."

1231. Griffiths, E.A. 1908. Japan: Report for the year 1907 on the trade of the consular district of Shimonoseki. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4106. p. 1-15.
• ***Summary:*** The consular district of Shimonoseki comprises the combined ports of Shimonoseki (at the southern tip of Honshu) and Moji (at the northern tip of Kyushu), plus the two specially opened ports of Wakamatsu and Hakata– in northern Kyushu. A map shows this consular district comprising the prefectures of Yamaguchi, Hiroshima, Fukuoka, and Oita. A table (p. 12-13) titled "Return of Principal Articles of Import into the Ports of Shimonoseki and Moji during the Years 1906-07, and Average for the Five

© Copyright Soyinfo Center 2014

Years 1902-06" shows that "beans, pulse, &c." are imported, with 85.9% of the value coming from Corea [Korea] and 13.1% from China.

Four types of manure are imported: The great majority is "oil cake," followed by fish, phosphates, and other. Imports of oil cake increased from 49,574 tons in 1906 to 70,306 tons in 1907; most of this came from China. Address: Acting British Consul, Shimonoseki, Japan.

1232. Griffiths, E.A. 1908. Japan: Report for the year 1907 on the trade of the consular district of Shimonoseki. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4106. 15 p. Aug.
• ***Summary:*** A map shows the Consular District of Shimonoseki, comprising the prefectures of Yamaguchi, Hiroshima, Fukuoka, and Oita. Shimonoseki is a seaport city located just north of Kyushu, on the Shimonoseki Strait, in Yamaguchi prefecture at the southwest extremity of Honshu. Opposite Shimonoseki, on the northern tip of Kyushu, is the city of Moji. At the center of the map is the Inland Sea, southwest of which is the large island of Shikoku.

In the section titled "Imports" under "Manure" (p. 6) we read that there has been a very large increase in the import of [soybean] "oil cake," amounting to 20,732 tons in quantity and 146,052*l.* (British pounds sterling) in value over the figures for 1906. Other fertilizer imports were fish manure from Corea [Korea] and phosphate rock (phosphorite) from Christmas Island. The latter was used (at Hikoshima, an island at the western entrance to the Straits of Shimonoseki) to make superphosphates for fertilizers, which were exported. Address: British Consul for Shimonoseki, Japan.

1233. Nishiyama, Y. 1908. Daizu abura ni tsuite. II. [Soybean oil. II]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 11(126):747-68. Aug. [Jap]
• ***Summary:*** A detailed discussion of the physical and chemical characteristics of soy oil (*daizu abura*), and its composition. Soy oil can be used to make a substitute for India rubber and a lubricating oil. The author studied the extent to which it can be used as a substitute for linseed oil, and what happens when it is heated and air is blow in.

Note 1. This is the earliest document seen (Oct. 2008) stating that soya bean oil can be used as a lubricant, or as a rubber substitute. Address: Kôgaku-shi, Japan.

1234. Okazaki, Keiichiro. Assigner of one-half to Hanuemon Yenjo of Tokyo, Japan. 1908. Nitrogenous food product. *U.S. Patent* 0,897,392. Sept. 1. 5 p. Application filed 13 March 1907. 3 drawings.
• ***Summary:*** For example: Steam rice hulls until their starch is reduced to a gelatinous state, then cool to a temperature favorable to the growth of Okazaki fungus (about 40º C). "Although both the diastarin fungus and the Okazaki fungus belong to the genus *Aspergillus,* they are easily distinguishable from each other." A table shows 6 differing characteristics. See also Fig. 2. Bring the gelatinous substance into contact with the fungus. *Aspergillus Okazaki* on rice hulls forms a proteolytic enzyme system which prevents coagulation of gelatin, legumen, or casein. A culture of "'Okazaki' fungus... converts the mass [in wooden trays] into perfect 'koji' if properly supplied with air and kept at a temperature of about 30ºC for several days." Then add water to the mass so that its nitrogen content can dissolve. Separate the liquid from the solids and evaporate the liquid to dryness at a temperature of below 100º C. The result is a fine powder which can serve as a digestive agent. Address: Tokyo, Japan.

1235. *Otago Witness* (*New Zealand*). 1908. The journey to Kagoshima. Sept. 9. p. 15.
• ***Summary:*** "There was also a great variety of beans, besides the ever-present soya [bean], from which Japan's national soy sauce is made."

Note: Kagoshima is a city at the southwestern tip of Kyushu, Japan's southernmost large island.

1236. Kametaka, Tokuhei. 1908. Notes on Japanese vegetable oils. *J. of the College of Science, Imperial Univ. of Tokyo* 25:(Article 4):1-7. Sept. See p. 6. [6 ref]
• ***Summary:*** The five oils discussed are: (1) Japanese wood oil (*Kiri-abura*). (2) Camellia oil or Oil of *Thea japonica* (*L.*) *Nois* (*Tsubaki abura*). (3) Oil of *Terreya nucifera S. et Z.* (*Kayano -abura*). (4) Soja bean oil or Oil of *Glycine hispida Maxim.* (*Daidzu-abura*). (5) Oil of Perilla *ocymoides* (*Eno-abura*).

Concerning soja bean oil: "The sample used was pure oil obtained from Tokushima. A bromine addition product of the mixed acids was obtained melting at 110º. This appears to be tetrabromostearic acid $C_{18}H_{32}Br_4O_2$.

"Oxidation of the mixed acids by Hazura's method gave dihydroxystearic acid and sativic acid, the yield being about 27.5 parts of the former and 10 parts of the latter from 100 parts of the oil.

"From these experiments it can be seen that the unsaturated acids in this oil are principally oleic acid and linolic acid, or its isomer." Address: Rigakushi, Japan.

1237. Lipman, Jacob G. 1908. Bacteria in relation to country life. New York, NY: Macmillan Co. xx + 486 p. See p. 231, 245, 258. Sept. Illust. Index. 20 cm.
• ***Summary:*** Chapter 23, titled "Soil-inoculation" (p. 221+) begins with a discussion of the early research of Hellriegel and Wilfarth, tests concerning legume nodules conducted in 1887 at the Moore Experiment Station at Bremen, Germany, and the development in Germany of "pure cultures" and of Nitragin followed by many disappointments from 1896-1898, "which cast discredit on artificial cultures." Yet there is now hope that they will be made to succeed.

The section on "Soil-inoculation in the United States"

© Copyright Soyinfo Center 2014

states (p. 230-31) that at first, crops such as clovers, cow-peas, field-peas, etc. did not appear to require any inoculation. "It was otherwise with at least two leguminous crops, soybeans and alfalfa. Soybeans, originally introduced into the United States from Japan, did not do very well. They frequently failed to develop that healthy, dark green color characteristic of vigorous leguminous plants. Careful examination showed their roots to be devoid of tubercles. Soybean earth, straw and chaff were obtained from Japan and placed in the ground together with the seed. The plants thus inoculated developed normally and produced an abundance of tubercles.

"This experience demonstrated the need of soil-inoculation of soybeans. Many cases are reported in experiment station literature in which these inoculations gave positive results. For instance, in the experiments of the New Jersey Station, on light sandy soils at Hammonton, when cowpeas and soybeans were planted in the same ground, the former grew luxuriantly and gathered nitrogen from the air by means of their numerous nodules, while the soybeans remained small and yellow and produced no tubercles. It was not until the introduction of some soil from a field where these plants had been grown successfully for several years that the soybeans developed properly and grew as luxuriantly as did the cowpeas.

"Similar observations were made time and again in the case of alfalfa." Figure 38 (three photos, p. 224) shows three soybean plants and their roots: (a) the largest, with nodules on the roots, is inoculated with soil; (b) medium size with no root nodules, is untreated; (c) thin and with no root nodules, is "inoculated with soybean chaff."

Note 1. This is the earliest English-language document seen (June 2011) that contains the term "soybean chaff." It refers a by-product that results when soybeans are threshed or the seeds cleaned.

In the Chapter 24, titled "Green-manuring" we read (p. 245): "The cowpea, soybean, and velvet bean as green-manure crops.–On the sandy soils of the East, the cowpea, soybean, sand vetch, crimson clover, and velvet bean have been widely used for improvement of the land. In the cotton-growing states of the South, the cowpea is almost indispensable as an aid in the maintenance of the humus and nitrogen of the soil." Soil bacteria decompose the vines and roots. "The soybean, which is related to the cowpea, has also been used as a green-manure on light soils. It does well, however, also on heavier soils, provided it is properly inoculated, and is not as readily injured by cold weather."

A full-page black-and-white photo (p. 258) shows "A thoroughly inoculated crop of soybeans" growing in a large field.

Chapter 1, titled "The rise of bacteriology" (p. 1-12) gives an interesting, early history. Leeuwenhoek (lived 1632-1723) in Holland first beheld bacteria with his lenses in 1675; he called them "animacules." "He recognized differences in their appearance and size as well as in their mode of motion." These and subsequent observations "gave rise to much speculation and heated discussion concerning the relation of the animacules to animal diseases"–and to the issues of contagion and spontaneous generation. Belief in spontaneous generation had existed since the Middle ages, and the discovery of bacteria seemed to support the ancient theory. But various experiments from 1765 to 1875 gradually disproved the theory.

"The physiology of bacteria.–Pasteur's epoch-making investigations on fermentation shed a broader light on the activities of microörganisms. His work plainly indicated that the various kinds of bacteria possess specific functions and differ in the chemical changes which they produce. This work may, therefore, be regarded as the starting point for much fruitful research... Bacteria were to be distinguished, henceforth, not by their appearance alone, but by the chemical transformations of which they are capable. They were to be regarded as chemical agents of wide significance, builders and destroyers in vegetable and animal substances, in organic and inorganic materials, in the presence or absence of air.

"*Bacteria as a cause of disease*.–The study of bacteria, and of other microorganisms, as agents of decay, putrefaction and fermentation, gained in interest with the recognition that bacteria may also be the specific cause of disease. As far back as 1762, the belief was expressed by Plenciz, a Vienna physician, that disease is the result of infection by animalcules; and, more important still, that every disease has its particular germ. The views of Plenciz met with no acceptance, and were soon forgotten amid the clashing opinions on spontaneous generation" (p. 6).

During the 1800s important advances were made by Bassi, Henle, Pasteur, and Lemaire. Lister developed a method of antiseptic surgery (1868), "through which medical science has achieved splendid results." "The investigations of [the German bacteriologist Edwin] Klebs during the Franco-Prussian War [July 1870–May 1871] traced the entrance and development of bacteria in wounds and their passing into the circulatory system. Klebs and other investigators also noted the constant presence of bacteria in diphtheric infections." "The systematic study of bacteria was furthered by the work of Schroeter, published in 1872." Ferdinand Kohn then articulated the "opinion that, among bacteria, as among more highly organized organisms, there exist definite species fairly constant in their structure and in their physiological activities."

"*Anthrax bacillus*.–In 1876, [the German Robert] Koch [1843-1910] demonstrated clearly and convincingly that anthrax in cattle is due to a specific germ, and thus confirmed a fact already, indicated by the observation of others. He isolated the anthrax bacillus in pure culture, studied it under the microscope, and showed that he could produce anthrax in other animals by inoculation from such cultures" (p. 8).

© Copyright Soyinfo Center 2014

"In agriculture, the development of bacteriology has given un new insight into the nature of soil fertility. We have learned to regard the soil as a culture medium with its almost endless number of species..." We have also "made some progress towards successful systems of soil-inoculation."

Chapter 47, titled "Bacteria in miscellaneous agricultural industries," states (p. 456-57): "The preparation of natto.– Natto is a vegetable cheese made in Japan by fermenting boiled soybeans. The fermenting mass is kept in a warm place for one or two days, at the end of which time it has become filled with vast numbers of bacteria. The material is then found to contain a large proportion of a mucilaginous, viscous substance, which is highly esteemed by the Japanese."

Note 2. This is the earliest English-language document seen (Jan. 2012) that uses the word "mucilaginous" or the word "viscous" to describe Japanese natto.

"The bacterial flora of natto consists at first largely of bacilli, but subsequently spherical forms become prominent.

"Two rod-shaped organisms, isolated by Sawamura, were found to change boiled soybeans into a product similar to natto. One of these produced the characteristics taste and aroma, but did not develop a strong viscosity in the beans. The other organism was found to possess a more pronounced ability to form mucilaginous materials, but did not develop as desirable a taste and aroma. The changes produced by these organisms in the preparation of natto were shown to be due to enzymes secreted by them."

Note 3. Although the date on the title page of some editions is 1911, the copyright page and last page of the Preface indicate that it should be Sept. 1908.

Facing the title page (frontispiece) is a painted portrait of Anton Van Leeuwenhoek (pronounced lay-ven-hook), a Dutch naturalist (1632-1723), who is generally cited as the first to discover bacteria [or microorganisms]. Address: A.M., Ph.D., Soil Chemist and Bacteriologist, New Jersey Agric. Exp. Station, New Brunswick, New Jersey, and Assoc. Prof. of Agriculture at Rutgers College.

1238. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Chinese bean oil. Manufacture into oil and cake in Shantung. No. 336. p. 114-15. Sept.

• ***Summary:*** "Consul Wilbur T. Gracey, of Tsingtau, transmits the following report relative to the production of [soya] beans and bean oil in the Chinese province of Shantung:

"One of the principal exports of Tsingtau is bean oil, produced in the Shantung hinterland, amounting in 1906 to 146,160 hundredweight, in addition to 108,859 hundredweight of peanut oil. In the same year the export from all China of bean oil, peanut oil, tea oil, wood oil, etc., was 430,866 hundredweight, valued at $8,504,440 United States currency. The export of the oils alone from Tsingtau during the year 1906 was valued at $952,428. The refuse from the beans was pressed into bean cakes and exported from China to the amount of 2,423,834 hundredweight, valued at $10,136,611, the shipments from Tsingtau being 57,457 hundredweight. The method of producing the oil cakes may be of interest.

In Shantung province only one crop of beans is grown annually, a Chinese mau (4,200 square feet) of land producing about 300 pounds of beans, 10 per cent of which is saved for planting and the remainder sold or made into bean oil and bean cakes. It is estimated that 10O pounds of beans will-produce approximately 10 pounds of oil.

"The vines are grown on a wooden framework. Small pine poles or stout bamboos form the upright stanchions, with crosspieces of smaller bamboos, and a series of even smaller poles covering the whole roof of the structure and supporting the weight of the vines. The cost of the large stanchions is from $1 to $2 gold each, large bamboos being about 25 cents to 50 cents each, and the smaller ones from 5 to 10 cents.

"Harvesting and pressing: The bean vines are cut entirely by hand with a primitive hook-shaped knife manufactured from iron and sold at a small price... They are dried on the hillsides or on the thrashing floor of the village and the pods removed by a small stone roller pulled by an ass or, occasionally, by the farmer's wife or by the use of a flail. Each village farmhouse has its thrashing floor, a patch of smooth ground about 50 feet square. The beans are separated by winnowing, a small wooden fork or shovel being used to throw pods in the air on a windy day, the chaff being carried away by the wind. No modern machinery is used for any of these processes.

"The oil is extracted and bean cakes manufactured in one process. A rough press is constructed of wood and iron, a sketch of which is forwarded [and filed at the Bureau of Manufactures]. A cylinder of iron has a solid wooden top, upon which a crossbeam is supported which runs through a long slit in two heavy poles on either side of the cylinder. These stout wooden stanchions are from solid pieces of wood, planted solidly in the ground.

The beans are boiled for some time to soften them, then measured off into rough cloth bags. Four of these bags are placed in the iron cylinder, separated by round slabs of wood. A heavy cover is placed on top, the strong pole placed across this and through the slits in the upright stanchions, small wedges driven in between the cross pole and the stanchions, and with continual driving of more and more wedges the oil is extracted from the beans, running off into a trench which surrounds the cylinder, the beans in their bags being pressed into cakes about 18 inches in diameter and about 3 inches thick. The cloth bags are then removed and preserved for future use, the resulting hard cake being the well-known bean cake of China.

"In Shantung Province bean cakes are manufactured

© Copyright Soyinfo Center 2014

principally in and near the towns of Kiaochow and Kaumi, though bean-cake presses can be found in use outside most of the big cities to the north of Tsingtau.

"Shipping and prices: The average price of bean oil is from 4½ to 6 cents per pound. Most of the shipping of these products is carried on by natives almost entirely by Chinese vessels, each carrying 300 to 400 'baskets' of oil. These baskets are really large jars–a basket contains about 200 pounds of oil–with earthenware covers, which are sealed by paper seals, the entire jar being covered with a willow basket work for protection, and it is from this covering that they derive their name.

Bean cakes are not packed, being easily transported as though they were solid pieces of wood. The average price is about 1½ cents gold for 1.33 pounds, and a whole cake sells at 60 cents to 70 cents. They are sent in large quantities to other parts of China and to Japan, where they are used for feeding cattle and fertilizer. The oil is exported principally to South China.

"A peculiar fact which has recently been communicated to me is that cattle fed with a certain amount of bean cake in their food produce milk which contains from 7 to 8 per cent butter fat, while the ordinary cow's milk contains only about 3 to 4 per cent of fat." Address: Washington, DC.

1239. Nishimura, Torazô. 1908. Shôyu kôbo Saccharomyces soya Saito ni tsuite. I. [On the shoyu yeasts, Saccharomyces soya Saito. I.]. *Nogakkai Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 83. p. 11-52. Sept. [Jap]
• ***Summary:*** Three varieties of yeast which sporulated were isolated from the shoyu mash: *Torula shoyu, Torula shoyu var. minuta,* and *Torula turbinata.* These three species seem to play an important role in the brewing of shoyu. he also found several kinds of film-forming yeasts, two of which belong to the genus *Pichia* and others to *Mycoderma* and *Torula.* Address: Nôgaku-shi, Japan.

1240. *Agricultural Gazette of New South Wales.* 1908. Soy or soja bean. 19(10):811. Oct. 2.
• ***Summary:*** The Soy or soja bean "comes from Japan, and of late years has attracted attention as an annual leguminous plant which produces the richest of all beans in protein and fat. It closely resembles the cowpea... They give a greater yield of beans than cowpeas. They are not trailing in habit, hence are more easily harvested."

"As a food for pigs, either as beans, green forage, or hay, it has a high reputation. The animals fatten quickly, are always thrifty, with strong appetites; the hair and skin acquire a glossy look, and the skin feels as if they were fed on oil meals."

Yields as high as 10 bushels/acre were obtained. Address: Australia.

1241. Hall, J.C. 1908. Japan. Bean oil industry: Sample of oil on view. *Board of Trade Journal* (*London*) 63:184-85. Oct. 22.
• ***Summary:*** Reports that "bean oil in Japan... is very simply manufactured from the soy or soja bean (*soja hispida*), grown there and also largely imported from China and Corea. The beans are thoroughly steamed and immediately pressed by machinery, the resultant oil being run into tanks. There it is allowed to settle and purify, the product being a light yellow oil, suitable as material for food and for industrial purposes. The residue is used as manure and as food for cattle. The total production of oil is about 700 tons per annum, the price averaging about 20 *l.* 4*s.* [£20 4 shillings] per ton. So far this oil has been consumed principally in Japan; recently, however, it has been exported successfully.

"A sample of the oil may be seen on application at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C." Address: I.S.O., British Consul-General, Yokohama, Japan.

1242. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Direct Manchurian-American trade. No. 3312. p. 6-7. Oct. 23.
• ***Summary:*** See Monthly Consular and Trade Reports. 1908. "Direct Manchurian-American trade." No. 339. p. 218-20. Dec. Address: Washington, DC.

1243. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Manchurian conditions. No. 3318. p. 11-13. Oct. 30.
• ***Summary:*** See Monthly Consular and Trade Reports. 1908. "Manchurian conditions." No. 339. p. 12-13. Dec. Address: Washington, DC.

1244. *Chemist and Druggist* (*London*). 1908. Japanese bean oil. 73(18):699. Oct. 31. [1 ref]
• ***Summary:*** In the section titled "Trade report," this article begins: "The manufacture of bean oil in Japan from the soy or soja bean (*Soja hispida*) is the subject of note in the *Board of Trade Journal* (Vol. 63, No. 621, p. 184-85). The beans are thoroughly steamed and immediately pressed by machinery, the oil after purification being of light yellow colour, suitable for various industrial purposes. The total annual production is about 700 tons, the price averaging about 20 *l.* 4*s.* [£20 4 shillings] per ton. So far the oil has been consumed principally in Japan, but recently it has been exported with success."

1245. Hausser, -. 1908. China: Report for the year 1907 on the trade of Swatow. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4125. p. 1-14.
• ***Summary:*** A map shows the area around Swatow. "Native imports. Bean cake–Owing to the diminution in the

© Copyright Soyinfo Center 2014

production of sugar in this district the importation of bean cake has fallen off by 30 to 40 per cent. Some 20 years ago, when the sugar growing industry here was at the height of its prosperity, the import of bean cake was from 3,500,000 to 4,000,000 pieces per annum, of which 3,000,000 to 3,500,000 pieces came from Newchwang [Manchuria] and the balance from Chefoo. The Newchwang market was then controlled entirely by the Swatow buyers, the Japanese taking only about 500,000 pieces each year. At present it is they who rule the northern market for bean cake, the fish which they formerly used as fertiliser, in the form of fish guano, being now dried and salted and sent to China for sale as food."

Table II (p. 12), titled "Return of principle articles of native import (net) during the Years 1906 and 1907", shows imports to Swatow of bean cake decreased from 3,159,276 cwts. in 1906 to 2,199,443 cwts. in 1907 [1 cwt = hundredweight = 112 pounds]. Imports of beans decreased from 1,070,357 cwts. in 1906 to 774,414 cwts. in 1907. Imports of oil (bean, castor, groundnut, &c.) decreased from 16,050 cwts. in 1906 to 12,348 cwts. in 1907. Table III (p. 12-13), titled "Return of principal articles of export of native produce from Swatow during the years 1906-07", shows an increase in the export of oil (bean, castor, groundnut, &c.) from 24,527 in 1906 to 29,498 in 1907. A table (IV; p. 13), titled "Return comparing values of 1907 with average values from 1902-06 for the principal articles of import and export", shows that native imports of beans and bean cake decreased from 1,022,189 on average from 1902-06 to 817,243 in 1907. Address: Consul.

1246. Hosie, Alexander. 1908. China: Report for the year 1907 on the foreign trade of China. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4152. p. 1-99.

• ***Summary:*** A list (p. 52) shows that China's leading articles of export, in descending order of value (million Haikuan [Haikwan] taels), are silk (89.1), tea (31.7), cotton, raw (16.9), skins and hides, undressed (12.4), bean cake (9.1)... vegetable oils (4.2), fire-crackers (4.2)... sesamum seed (3.6)... groundnuts (0.4).

A table (p. 62) shows exports of these items from China to Europe and America in 1902-06 (average), 1906, and 1907. Exports of oil (bean, tea, groundnut, wood, etc.) dropped 2.5% in 1907 compared with 1906. A table (p. 64) shows exports from China to Asiatic countries (India excepted) in 1902-06 (average), 1906, and 1907. Exports of bean cake rose from 4,661,956 cwts. [1 cwt = hundredweight = 112 pounds] in 1906 to 4,978,588 cwts. in 1907. Exports of "beans" dropped from 1,778,037 cwts. in 1906 to 1,591,508 cwts. in 1907.

A section titled "Beans, bean cake and bean curd" (p. 68) discusses soybeans, soybean cake, and tofu. "Within the knowledge of the Chinese Imperial Maritime Customs the export of beans from China to foreign countries amounted in 1907 to 1,591,508 cwts. [1 cwt = hundredweight = 112 pounds] of the value of 526,735*l.*; but the total export was much greater, for Japan alone claims to have taken 2,003,840 cwts., of which Manchuria contributed 1,266,775 cwts." There are also discrepancies in the figures for bean cake, accounted for in part by the fact that there was no Chinese custom-house at Dairen until July 1, 1907, and that during the whole of the year beans and bean cake, especially the latter, found their way from Northern Manchuria by the Chinese Eastern Railway to Vladivostock [Vladivostok], and thence by steamer to Japan without coming under the cognisance of the Chinese customs."

"The export of the bean product known as bean curd [fermented tofu], which is packed in earthenware jars and shipped for consumption by Chinese emigrants in the East, was larger in quantity but fell in value."

A section titled "Oils, vegetable and essential" (p. 69-70) begins: "The quantity of oil (bean, groundnut, tea, wood, &c.) shipped to foreign countries in 1907 was 541,999 cwts, or 120,193 cwts. short of the export of 1906. The value of the shipment was 687,714*l.* [pounds sterling]. It is unfortunate that the Chinese customs authorities continue to group these oils under one heading. A detailed classification would be of considerable value in view of the important position which wood-oil has recently established in foreign markets... The same recommendation is applicable to essential oils which are grouped together as aniseed, cassia-leaf, &c." [incl. camphor oil].

A section titled "seeds and seed cake" (p. 70-71) notes: "The most important of all the seeds exported from China is sesamum, which has sprung into prominence within the last few years." Also discusses exports of rape seed, cotton seed; soy is not mentioned in this section.

Note: This is the earliest document seen (May 2005) that mentions the Russian port of Vladivostok in connection with soybeans. Address: Sir, Acting Commercial Attaché to His Majesty's Legation at Peking.

1247. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Agriculture. Farm crops and methods. Japan. No. 337. p. 95-99. Oct.

• ***Summary:*** "Consul Hunter Sharp, of Kobe, transmits the following review of agricultural conditions in Japan,..." According to the 1906 census, Japan has a population of 48,304,397. "Sixty per cent of the people are agriculturists, and yet on account of the mountainous nature of the country, only about one-sixth of the total area is under cultivation."

"On the land known as rice fields, wheat, barley, or rape seed are sown about November, the crop being gathered the following June. Immediately afterwards the rice is planted, and is harvested in October. On the upland fields either wheat, barley, or rape seed is sown and harvested at the same

© Copyright Soyinfo Center 2014

season as above mentioned; after which corn, cotton, beans, panicum miliacum [millet], and various vegetables are sown, maturing at different times."

"Fertilizers freely used:... In 1906 the importation into Japan of oil cake alone amounted to $7,793,766, of which China supplied $7,436,958; ammonium sulphate, $2,637,751, to which Great, Britain contributed $2,543,264, while the United States sent nitrate of soda to the value of $34,236; oil cake, $3,823; and phosphorites, $74,211, aggregating $112,270." Note: We are not told what kind of oil cake the USA exported to Japan, but it was not soya bean cake.

"One year's crop: According to the statistics of 1906 the agricultural products of Japan are given as follows: Rice, the chief crop, has an acreage of 7,104,072, with a production of 229,794,826 bushels; barley comes next, with 3,359,238 acres and a production of 81,407,291 bushels; wheat, the principal crop in other grain-producing countries, occupies only 1,086,118 acres, with a yield of 19,664,325. An average crop for these three is about 30 bushels per acre. Other agricultural products are:" The first two crops shown in this large table are: Soy beans 17,655,973 bushels. Small red [azuki] beans 4,449,408 bushels.

A table titled "Exports of agricultural products" in U.S. dollars for 1902-1906 lumps together "Beans, pease, and pulse," which grew from $45,903 in 1902 to $76,051 in 1906. Exports of peanuts decreased from $175,585 in 1902 to $150,102 in 1906. Japan's largest agricultural export, tea, accounted for about 90% of total exports (worth $5+ million) during this period.

A table titled "Imports of agricultural products" in U.S. dollars for 1902-1906 lumps together "Beans, pease, and pulse," the second largest import category, which grew from $2,881,780 in 1902 to $4,839,708 in 1906. Most of these beans are supplied in about equal proportions by China and Korea. Japan's largest agricultural import, rice, accounted for about 70% of total imports (worth $13 to $39 million) during this period.

"Agriculture in Formosa and Sakhalin:... Japanese Sakhalin has a total area of 12,582 square miles, of which 89,296 acres can be cultivated, and in 1906 the population was 8,569. The agricultural products are barley, wheat, rye, oats, potatoes, peas, kidney beans, soja beans, red beans, hemp, flax, and vegetables. Of these the most successful are potatoes, barley, rye, oats, and wheat, and in a lesser degree peas, hemp, and flax." Soy beans are not mentioned under Formosa. Address: Washington, DC.

1248. Mortimore, -. 1908. China: Report for the year 1907 on the trade of Chefoo. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4129. p. 1-15.

• ***Summary:*** Page 8 discusses "Bean cake.–The trade shows a falling off in 1907, due to the fact that many claims were made from Japan for short weight, which the Chinese refused to meet and the export to that country consequently fell off. Many merchants also now purchase bean cake in Dalny and Antung, from which places direct steamers are run to Amoy and Swatow, with a considerable saving of freight compared with that charged from Dalny to Chefoo and transshipment thence to the south." Table IV (p. 13), titled "Return of principal articles of export from Chefoo during the year 1907," shows 1,190,000 cwts. [1 cwt = hundredweight = 112 pounds] of bean cake, worth £330,017, was exported. 46,400 cwts. of beans, worth £17,924, and 11,533 cwts. of bean oil, worth £13,649, were also exported.

The largest export was fresh eggs, followed by bean cake. Large amounts of groundnuts (including shelled) were also exported.

Table V (p. 14), titled "Comparative table of principal articles of export from Chefoo during the years 1903-07," shows exports of bean cake rose to a peak of 1,719,328 cwts. in 1906. Exports of beans rose to a peak of 896,426 cwts. in 1905. Exports of bean oil rose to a peak of 34,162 cwts. in 1906.

The main nationalities and types of ships entering the port of Chefoo in 1907 were Japanese steam ships (1,281), followed by British (711, but with the largest total tonnage), Chinese (388), and German (181). Address: Consul.

1249. Playfair, F.W.W. 1908. Japan: Report for the year 1907 on the trade of Nagasaki. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4151. p. 1-18. Oct.

• ***Summary:*** A map shows the Island of Kyushu, with railroads and the Nagasaki Consular District. Just southwest of the sea port of Nagasaki is the small island of Takashima. From Nagasaki by sea it is 700 miles to Vladivostock [Vladivostok], 150 miles to Fusan, 460 miles to Shanghai, and 1,100 miles to Hongkong.

Table 1 (p. 10-11) titled "Comparative Table of Articles of Import into Nagasaki during the Years 1906-07" show imports of "bean cake" + rape seed cake were 27,047 tons in 1906. In 1907 statistics were separated: 17,152 tons of bean cake and 10,968 tons of rape seed cake were imported. An aggregate figure is given for imports of "Beans, peas and pulse" (6,590 tons in 1906 rising to 8,536 tons in 1907). Sesame was also imported. Address: British Consul, Nagasaki.

Africa.

1251. Harrington, -. 1908. Japan: Report for the year 1907 on the trade of the consular district of Yokohama. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4165. p. 1-47.
• ***Summary:*** Yokohama is Japan's leading port, accounting in 1907 for about 40% of all imports. Germany exported £13,000 in oil and bean cake to Japan (perhaps transshipped from China; p. 13). Japan's main imports from China via Yokohama included raw cotton £362,000, oil and bean cake £296,000, and soja beans £73,000 (p. 14). There was a small increase in the export of soy [sauce] to Canada (p. 16; no amounts are given).

A ten-page table (p. 22-32) titled "Imports into the Port of Yokohama during the Years 1905-07" shows the import of "oil cake" used as manure rose from 61,830 tons worth £281,870 in 1905 to 88,520 tons worth £461,460 in 1907 (p. 32).

A table (p. 34) titled "Exports from the Port of Yokohama during the Years 1905-07" shows the value of the export of "soy" [sauce] (mostly to the United States and Hawaii) rose from £42,007 in 1905 to £59,900 in 1907; no quantities are given. Groundnuts, rice, seaweed, and Bêche-de-mer (sea slug, trepang) were also exported from Yokohama. Address: Acting British Vice Consul, Yokohama.

1252. Ito, Teiji. 1908. Shôyu narabini tamari (kibiki-damari, sobiki-damari, niira tamari) naka no ekisubun gaitei ippô [A method of obtaining approximate measurements of extracts from shoyu and 3 types of tamari (*kibiki, sobiki,* and *niira* tamari)]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 321. p. 1200-07. Nov. [Jap]

1253. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Milling in China. Prominent industry at large commercial city. No. 338. p. 100-01. Nov.
• ***Summary:*** "Vice-Consul-General Albert W. Pontius, writing from Hankow, supplies the following information of the progress at that Chinese business center in milling both wheat and beans:"

"There were five mills in Hankow in 1907, turning out [soya] bean cake and [soya] bean oil, with a daily capacity varying from 300 to 3,000 cakes. Three of these mills worked at a profit, one has only recently been started, and one lost money and has closed. According to information received, from five cakes 26.67 pounds of oil are derived. Each cake weighs 61.33 pounds. The price of beans averages $1.80 per 133.33 pounds, and the cakes sell for 60 cents each, and the oil at about $5.50 per picul of 133.33 pounds. There is a growing demand in Japan for Hankow-made cakes, which also supply the Swatow market."

"An opening for American machinery in its manufacture: Vice-Consul C.L.L. Williams, of Chefoo, furnishes the following; report, prepared by Marshal Edgar Kopp, of that consulate, concerning the export and manufacture of Chinese bean cake: The export of bean cake from North China is almost monopolized by Chefoo, Newchwang, and Dalny [Dairen]. Newchwang, being nearest to the bean fields of Manchuria, leads at present, but Dalny threatens to become a serious competitor, having excellent harbor and railway facilities. During the first quarter of 1908 the total exports of bean cake from all Chinese ports amounted to 321,910,497 pounds, of which 132,235,649 pounds were exported from Dalny, 51,059,099 pounds from Chefoo, 59,079,765 pounds from Hankow, 35,064,652 pounds from Chinkiang, 23,156,231 pounds from Shanghai, and only 17,675.853 pounds from Newchwang, although 50 per cent of the total exports from all ports during the year 1907 were from Newchwang.

"The exports of bean cake from Chefoo go to southern Chinese ports, while those from Newchwang go chiefly to Japan, where it is used, with great success, as a fertilizer on the rice and sugar-cane fields; it is also extensively used for cattle and hog feed.

"The manufacture of bean cake is conducted in a very primitive way. The work is done by hand, no steam or machinery being used, and there should be an opportunity to introduce some American machinery to replace the antiquated manner of forming and pressing.

"The by-product, bean oil, is of very good quality, and, if the beans are good, about 45 pounds of oil is got out of 5 bean cakes, each cake weighing over 100 pounds. It is extensively used for cooking purposes, and sells for $4.50 per 135 pounds. Chefoo has about 70 bean-cake factories, each of the largest employing 12 men, whose wages are about 6 cents gold per day, including board and lodging. The daily output of each factory is 120 cakes, which sell for 81 cents gold per cake. [Full descriptive information, by the consul, concerning the manufacture of bean cake, is filed in the Bureau of Manufactures.]" Address: Washington, DC.

1254. *USDA Bureau of Plant Industry, Inventory.* 1908. Seeds and plants imported during the period from July, 1906 to December 31, 1907. Nos. 19058 to 21730. No. 13. 192 p. Dec. 4. Also titled USDA Bureau of Plant Industry, Bulletin No. 132.
• ***Summary:*** Soy bean introductions: Glycine hispida.

19183/19184/19186. "From Manchuria. Received through Mr. F.N. Meyer, agricultural explorer, August 28, 1906. A collection of seeds as follows:

"19183. From Newchwang. '(No. 255a.) A small variety of the black soy bean. Used to make bean oil from, the remaining expressed material, known as bean cake, being exported to Japan and southern China as a very valuable fertilizer.' (*Meyer.*)

"19184. From Newchwang. '(No. 256a.) A large variety

of the black soy bean. This is a very rare variety and is used for food: also for making a superior oil.' (*Meyer.*)

"19186. From Newchwang. '(No. 258a.) A medium-sized, greenish soy bean. This variety is the one most commonly used to extract bean oil from, the remaining yellow material, in the form of large, flat cheeses [actually cakes], being exported to different parts of Japan and especially to southern China as a very valuable fertilizer.' (*Meyer.*)" [Note: Piper and Morse (1910, p. 52) state that this variety was later named "Morse." They list no variety named "Virginia." But I. Cunningham (1984) states that this variety was later named "Virginia."]

19980-19987. "From Yokohama, Japan. Received through L. Boehmer & Co. [seedsmen], March 19, 1907.

"19980. Received under the name of *'Fuiri Mame,* the speckled soja bean.' [The scientific name is listed as Phaseolus vulgaris; the common name as bean. Clearly this is not a soy bean.]

"19981. Received under the name of *'Shiro Mame,* the white soja bean.'

"19982. Received under the name of *'Kuro Mame,* the black soja bean.'

"19983. Received under the name of *'Daizu* or *O-mane, Dolichos soja.'*

"19984. Received under the name of *Wase* or *Natsu Mame,* early summer bean.'

"19985. Received under the name of *'Nagate Mame,* middle late bean.' Note: Later referred to as Haberlandt.

"19986. Received under the name of *Okute Mame,* 'late bean.'

"19987. Received under the name of *Kuro-Teppo Mame,* round, middle-late bean.'

20011. "From Ko-bau, northern Korea. Received through Mr. Frank N. Meyer, agricultural explorer, February 20, 1907. '(No. 318a, Aug. 12, 1906.) A green variety of soy bean growing at high elevations. This variety is eaten as a food and is mostly grown in broad strips between buckwheat; a very late ripener. Seems to be the most northerly variety of soy bean seen yet and will do well in cool climes.' (*Meyer.*)"

20405-20412/20414. "From Siberia. Received through Mr. Frank N. Meyer, agricultural explorer, February 28, 1907. A collection of seeds, as follows:

"20405. From Khabarovsk. '(No. 643a, Nov. 15, 1906.) Round, yellow soy beans purchased in the market at Khabarovsk. The Chinese let these beans sprout and use the sprouts all winter as a vegetable. Oil is also extracted from this variety, and the cakes thus formed make a very nutritious food for horses.' (*Meyer.*)

"20406. From Khabarovsk. '(No. 644a, Nov. 15, 1906.) A yellow soy bean purchased in the market at Khabarovsk.' (*Meyer.*)

"20407. From Merkoechofka. '(No. 645a, Oct. 25, 1906.) A brown-black variety grown in eastern Siberia; does not scatter [its seeds] when ripe and is very late in ripening, as it is harvested in the last half of October. Is used for food, being boiled with millet. This variety seems to have come originally from more southern regions, as the season here is somewhat short for it.' (*Meyer.*)

"40408. From Khabarovsk. '(No. 647a, Nov. 8, 1906.) Black soy beans obtained from Mr. V.T. Kovaleff, in charge of the experiment station at Khabarovsk. These seeds came originally from Manchuria in 1899 and are ripening here to perfection, while the light and dark yellow varieties do not ripen well at all. Are used for food for domestic animals when boiled, and are also sometimes fed in the green state.' (*Meyer.*)

"20409. From Merkoechofka. '(No. 648a, Oct. 25, 1906.) Very small, brownish beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)

"20410. From Merkoechofka. '(No. 649a, Oct. 25, 1906.) Very small, black beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)

"20411. From Merkoechofka. '(No. 650a, Oct. 25, 1906.) Very small, dull-black beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)

"20412. From Merkoechofka. '(No. 651a, Oct. 25, 1906.) Brown soy beans found mixed with No. 645a (S.P.I. No. 20406).' (*Meyer.*)

"20414. From Merkoechofka. '(No. 653a, Oct. 25, 1906.) Small, black soy beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)"

20629/20699.

"From northern Europe, Siberia, and eastern Asia. Seeds collected by Prof. N.E. Hansen, of the agricultural experiment station, Brookings, South Dakota, in 1906 while traveling as an agricultural explorer for the Department of Agriculture on an extended trip through Scandinavia, Russia, Siberia and returning through China and Japan. Received March 1907.

"20629. From Manchuria. '(No. 109.) Variety *Hoo-an-dooh.* Used for human food and for fodder in Manchuria and brought from that country by a Russian student-soldier after the Russo-Japanese war.' (*Hansen.*)

"20699. From Ussurie [Ussuri] province, Pacific coast section, Siberia. '(No. 179.) From the farm of Mr. Fick, near Nicolsk.' (*Hansen.*)"

20797/20798. "Received through Mr. Frank N. Meyer, agricultural explorer, April 3. 1907.

"20797. From Shanghai, China. '(No. 722a.) *Black* soy beans obtained through Dr. S.P. Barchet, of the U.S. consulate at Shanghai. These beans come from Chin-hua-fu, Chekiang province, and are used apparently as a second crop on low-lying rice fields, and may as such be very valuable for the Southern States. They are mainly used as a food for

© Copyright Soyinfo Center 2014

domestic animals. It seems that they are sown broadcast after the sowing of the rice crop; specific details are not obtainable just now.' (*Meyer.*)

"20798. From Shanghai, China. '(No. 723a.) *Brown* soy beans obtained through Dr. S.P. Barchet, of the U.S. consulate at Shanghai. These beans come from Chin-hua-fu, Chekiang province, and are used apparently as a second crop on low-lying rice fields, and may as such be very valuable for the Southern States. They are mainly used as a food for domestic animals.' (*Meyer.*)"

20854. "From Harbin, Manchuria. Received through Mr. F.N. Meyer, agricultural explorer, April 11, 1907. '(No. 675a, Dec. 15, 1906.) Green soy beans; Chinese name *Ta shing toa.* These are boiled and used as food, and the sprouts of the germinated beans are also used as a vegetable throughout the winter months.' (*Meyer.*)"

20892/20893. "From Kobe, Japan. Presented by Hon. Hunter Sharp, American consul, who purchased them from J. Ikeda & Co., Tokyo, Japan. Received March 25, 1907.

"20892. White.

"20893. Green."

21079/21080. "Received through Mr. Frank N. Meyer, agricultural explorer, June 21, 1907.

"21079. From Tiëling, Manchuria. '(No. 693a, Jan. 18, 1907.) A light green soy bean; Chinese name *Shing toa.* This bean is used to produce bean oil and bean cake. The variety is very rarely seen.' (*Meyer.*)

"21080. From Tiëling, Manchuria. '(No. 694a, Jan. 18, 1907.) A dark green soy bean; Chinese name *Li dau shing.* This bean is used as a vegetable throughout the winter months, being eaten boiled after it has sprouted slightly. This variety is the most expensive of all the soy beans and is eaten by the better classes of Chinese; sent also from Harbin under No. 675a (S.P.I. No. 20854.)' (*Meyer.*)" Note: This is the earliest English-language document seen (Oct. 2004) that uses the term "dark green" to describe the color of a soybean.

[Notice the large number of seeds introduced by Frank Meyer during this period.]. Address: Washington, DC.

1255. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Direct Manchurian-American trade. No. 339. p. 218-20. Dec.
• ***Summary:*** "Based on the desirable purchase of this wild silk for American manufacture, Mr. Arnell then draws attention to the large possibilities of supplying American manufactured goods through mercantile houses that would handle both ends of the trade:" The U.S. continues to import tussah and pongees [both silk fabrics] from Manchuria.

"At present the trade of the United States with this territory [Manchuria] is entirely one-sided. It sells but does not buy, and this fact constitutes one of the principal causes which are destined to handicap American sellers in competition with Japan, which purchases practically the entire output of beancake, Manchuria's most important export."

The Japanese "sell their piece goods and miscellaneous articles largely to the same Chinese merchants from whom they buy the bean cake." Americans should consider doing likewise with silk fabrics. Address: Washington, DC.

1256. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Manchurian conditions. No. 339. p. 12-13. Dec.
• ***Summary:*** "Consul Thomas E. Heenan furnishes the following information."

"Extent of exports: The principal exports from Newchwang during the six months ended June 30, 1908, were beans, bean cake, and bean oil, of which bean cake and bean oil show an increase, while beans are slightly less. The figures given, as a whole, show an increase in the total export. It has been proposed to tax all bean cake brought to Newchwang for shipment abroad, as the local millers declare that the price of labor and other expenses in the interior is much cheaper than at Newchwang. It is feared that this project, if it succeed, will inflict serious injury to the real interests of Newchwang. All the bean cake exported goes to Japan, and this is one of the principal articles of export from Manchuria. During the present year the price paid has been higher than in other years, due probably to the low price of silver and silver coins. The beans were brought to Newchwang by carts during the winter months, and there was a constant stream of mules and carts during this period. It is said that as many as 1,000 carts came in daily loaded with beans and other articles for export when the river opened. It is seldom that a poor or a crippled mule or horse is seen among those which enter and pass out of the town from one year's end to the other. They are all in splendid condition, and look as if they were well cared for." Address: Washington, DC.

1257. Mooers, Charles A. 1908. The soy bean: A comparison with the cowpea. *Tennessee Agricultural Experiment Station, Bulletin* No. 82. p. 73-104. Dec.
• ***Summary:*** One of the earliest and best publications on soybean management. Presents information on varietal interaction to date of planting and row width, and gives directions for planting, cultivating, and harvesting the crop, as well as data on chemical composition of the seed.

The Introduction begins: "To the farmers of Tennessee the soy bean is a forage and grain plant of special promise. In grain production, as a supplement to corn for fattening stock, no crop tested at this Station has proved its equal... The data presented in the pages which follow indicate that under Tennessee conditions each crop has a place which the other can not take. The worth of the cowpea, however, is known everywhere, while the true value of the soy bean lacks much of being generally recognized."

Varieties: About 24 soybean varieties are reported in

© Copyright Soyinfo Center 2014

this bulletin. "Promising early varieties, such as Ito San and Early Brown, require 90 to 100 days to reach maturity from the time of planting. Under the same conditions the Mammoth Yellow will require 125 to 160 days. The following varieties are known to have been grown by farmers in this state: Mammoth Yellow, Hollybrook, Guelph (medium green), 'Common,' and Buckshot (early black). Other named varieties: Haberlandt, Kingston, Medium Green, Medium Yellow, Samarow, and Tokyo. Table X (p. 97) shows analyses of many of these varieties from the crops of 1906 and 1907.

In a series of time of planting tests, the extreme dates of successful planting in Tennessee were found to be April 3 and Aug. 6. June proved to be the most favorable month in which to plant any variety. In short, Mooers reported striking agreement in the length of season required by any given variety to reach maturity in different years when planted on a given date. He also noted a steady shortening of the growing season as planting was delayed, and that this shortening was much more marked in some varieties than in others.

"Harvesting: The harvesting of soy beans is in some respects more difficult than that of cowpeas... Trials have been made with both corn and wheat harvesters, but the bundles when tied are apt to mold... The mower has given at least fair results." Placing the mowed plants on a curing frame "gives reasonable assurance of success in the saving of both the hay and the grain."

"Threshing: In threshing, a common wheat thresher may be used, but the speed of the cylinder must be reduced, and other adjustments may be necessary in order to get satisfactory results. The Koger pea and bean thresher, which the Station has found to do splendid work, may be used to advantage. The soy beans were not found to thresh clean, however, when the air was very damp and the pods were tough.

"Storing: The seed should not be stored in bins, but in loosely woven sacks, which should be disposed so that air will circulate freely among them."

Photos show: (1) Four varieties (Mammoth Yellow, Ito San, Guelph, and Buckshot) of soy bean plants side by side (title page). (2) A field of cowpeas versus Ito San soy beans–early planted, 80 days after planting on 2 April 1908 (p. 76). (3) A field of cowpeas versus Ito San soy beans–late planted, 43 days after planting on 15 June 1908 (p. 77). (4) A field of Mammoth Yellow and "Japanese" soy beans, and Whippoorwill cowpeas; the photo was taken after a light frost, which killed the tops of the pea vines [cowpea vines] but did not injure the soy beans (p. 78). (5) A field of soy beans cured on frames at the Experiment Station (p. 92). (6) Curing soy bean hay in shocks (p. 92). (7) A man holding a curing frame taken apart (p. 95). (8) A man standing by a curing frame set up (p. 96).

1258. Takenob, Y.; Takeda, G. 1908-1909. Japan Year Book. Tokyo: Japan Year Book Office. See p. 391. Fourth annual issue. [Eng]

• ***Summary:*** This section on "Japanese wine and soy" is in Chapter 18, titled "Industry." The second part of this section, titled "Soy" (and meaning soy sauce or shoyu) states (p. 391): "For soy the prefecture of Chiba, which is contiguous to Tokyo municipality, heads all other places on the list. Parched wheat mixed with salt and beans is a principal ingredient. The process is still far from scientific, and several patented processes, notably that by Mr. Suzuki, do not seem to have attained ideal perfection. The production in recent years is as below:"

Note: According to the table of weights and measures at the front of this Year Book, one *koku* (liquid) = 100 *sho* = 39.703 gallons or 150.275 liters:

1902-03–1,767,366 *koku.* 1903-04–1,763,710 *koku.* 1904-05–1,859,165 *koku.* 1905-06–1,765,973 *koku.* 1906-07–1,932,492 *koku.* This latter figure is equal to 76,725,729 gallons.

The part on *"Saké"* above this notes: "For *sake,* the national liquor brewed from rice, the 'Five villages of Nada,' situated about midway between Osaka and Kobe, are the most noted center of production in Japan. What is interesting is that the fame of 'Nada sake' is generally attributed not so much to the long experience of the brewers at Nada as to the peculiar quality of water in certain wells existing in the five villages. The general opinion is that certain bacilli found in the water possess the virtue of imparting peculiar agreeable flavor to the liquor." Address: Japan.

1259. Takenob, Y.; Takeda, G. 1908-1909. Japan Year Book. Tokyo: Japan Year Book Office. See p. 334, 336.. Fourth annual issue. [Eng]

• ***Summary:*** In chapter 18, "Agriculture," the section titled "Manure. Consumption." states that the value of the top seven sources (in million *yen*) in 1905 were: Night soil (53), stable manure (47), bean cakes [soybean] (13), fish guano (10), artificial fertilizers (8), rice bran (4.3), and bones (0.9). Total 136.2.

In the section on "Staple farm products" is a subsection titled "Beans, sweet potatoes, and potatoes," which includes production figures for Soja Beans and Red Beans [Azuki] from 1902 to 1906. Note: According to the table of weights and measures at the front of this Year Book, one *koku* dry = 4.962 bushels.

For Soja beans: 1902–3,130,000 *koku* [= 15,531,060 bushels]. 1903–3,647,000 *koku.* 1904–3,710,000 *koku* [= 18,409,020 bushels]. 1905–3,261,000 *koku.* 1906–3,557,000 *koku.*

For azuki beans, production ranged from a low of 708,000 *koku* in 1902 [23% as much by volume as soja beans that year] to a high of 918,000 *koku* in 1903 [25% as much as soja beans that year].

By contrast in 1903, production of rice was 46,473,000

© Copyright Soyinfo Center 2014

koku (12.7 times as much as soja beans), and production of barley was 7,462,000 *koku* (twice as much as soja beans). Address: Japan.

1260. Agricultural Bureau, Department of Agriculture and Commerce. 1908. Agriculture in Japan. Tokyo: Agricultural Bureau, Department of Agriculture and Commerce. x + 455 p. See p. 225-29, 434, 439, 448, 453-54. No index. 23 cm. [Eng]

• ***Summary:*** A table of moneys, weights and measures (p. x) includes British equivalents of the following Japanese units: Money–*yen, sen, rin.* Length: *ri, chô, ken, shaku, sun.* Area: *cho, tan, sé, bu* or *tsubo, kô* (*9.724 tan*). Capacity / volume: *koku, tô, sho, go.* Weights: *kwan or kwamme, kin, momme.*

In Chapter 6 titled "Agricultural products," in section 2 on "staple food stuffs" is a subsection titled "Soja beans" (p. 225-29) which begins: "In point of production and use, soja beans occupy an important position among the various beans, they are extensively cultivated from the Hokkaido in the north to Formosa in the south. They find a congenial soil to prosper, the acreage for 1906 was 460,895 *cho* (1 cho = 2.45 acres) which with the exception of the acreage of barley (503,498 *chô*) is equalled by no other products from the upland fields. Their use is quite extensive. They are eaten boiled, baked and powdered while *soy, miso* and *tofu* (bean curd) made out of beans, are found even in the remotest villages. They are found on the table both of high and low. In making *soy* [*sauce*], a by-product in a shape of soy-cakes is obtained and may be used as excellent manure, while in making *tofu,* the remaining ingredients [okara] may be used as a subsidiary diet and as food for cattle. Soja beans may also be pressed, and its oil used for the purpose of diet and for various technical uses, while the residue forms excellent manure. The fresh stalks of soja beans may be used as forage or as effective green manure. In short, soja beans, either as an article of Japanese diet, or as agricultural manure or as food for cattle are indispensable.

"The cultivation of beans under the circumstances was developed from ancient times, and numerous varieties are most extensively cultivated while by its peculiar nature of root, it absolves nitrogen from air so that high priced nitrogenous manure may be dispensed with, and therefore the cultivation of beans like other agricultural products do not exhaust the productive power of the soil, but on the contrary, it operates favourably to improve the soil. As for rotation of crops of wheat, millets, corns and potatoes, beans are indispensable. Seeds are sown early in the beginning of May."

Tables show: (1) Output of soja beans in Japan, 1897-1906." For each year is given the area (in *chô*), the production (in *koku*) and the yield (in *koku* per *tan*) (1 *koku* = 4.962 bushels; 1 *tan* = 0.245 acres). The area increased from 435,605 *chô* in 1897 to a peak of 482,044 *chô* in 1898, then slowly fell to a low of 446,844 *chô* in 1904, then rose to 460,895 *chô* in 1906. Production increased from 3,100,973 *koku* in 1897 to a peak of 4,069,619 *koku* in 1901, then slowly dropped to 3,557,592 in 1906. The yield in 1897 was 0.712 *koku* per *tan,* rising to a peak of 0.830 in 1904. Hokkaido has the largest area (43,924 *chô*) and production (392,140 *koku*). The principal soja bean producing districts are Ibaraki (33,000 *chô*), Saitama (29,000 *chô*), Iwate (26,000 *chô*), Nagasaki (26,000 *chô*), Kumamoto (26,000 *chô*), Niigata (22,000 *chô*). There is no prefecture where the production does not exceed 10,000 *koku.*

(2) "As mentioned above, soja beans are used either boiled, baked or powdered or as material for *tofu* (bean curd), frozen *tofu, soy* and *miso* (bean-cheese), and particularly the latter two products besides meeting with domestic demands, are exported abroad in large quantities, as may be seen in the following table." This table shows amount and value (in *yen*) of miso and soy [sauce] exported from Japan each year from 1903 to 1907, inclusive. Miso exports increased from 1,670,092 *kin* (1 *kin* = 1.322 lb) in 1903 to a peak of 5,199,957 *kin* in 1907 (a 3.1 fold increase in 4 years), while soy [sauce] exports increased from 1,974,119 *shô* (1 *shô* = 1.9 quarts) in 1903 to 4,403,851 *shô* in 1907 (a 2.2 fold increase). The total yen value of these two exports rose from 489,213 *yen* in 1903 to 1,354,517 *yen* in 1907 (a 2.8 fold increase). In American units: Miso exports increased from 2.20 million lb (worth $347,647) in 1903 to a peak of 7.50 million lb (worth $132,652) in 1905, dropping to 6.86 million lb (worth $135,833) in 1907.

Shoyu exports increased from 5.92 million lb (worth $204,959) in 1903 to 13.21 million lb (worth $541,425) in 1907. Note that in 1907 shoyu exports are worth about 4 times as much as miso exports.

(3) Because of increasing exports, Japan now needs to import soja beans from abroad. This table (p. 227) shows the amount and value of soybeans imported by Japan for the years 1903-1907, inclusive. They rose from 146,971 tons (worth $3.18 million) in 1903 to a peak of 193,479 tons (worth $4.92 million) in 1905, dropping to 177,365 tons (worth $4.79 million) in 1907. They are mostly imported from Manchuria and Korea. "While a greater portion of these imports is used as material for *soy and miso,* it is also used in making bean-cakes and is sown for obtaining green manure, or used as manure or for feeding cattle."

(4) This table (p. 228) shows the quantity and value of [soy] bean-cakes imported into Japan for the years 1903-1907, inclusive. The cake was used mostly for fertilizer. Cake imports rose from 216,198 tons (worth $3.81 million and representing 57.8% of all fertilizers) in 1903 to 367,210 tons (worth $8.71 million and representing 44.8% of all fertilizers) in 1907. (5) This table (p. 229) shows acreage and production (output) of [soy] beans in Formosa [today's Taiwan]. Acreage doubled in 3 years from 11,226 *kô* in 1901 to a peak of 22,641 *kô* [53,886 acres] in 1904, then decreased slightly to 21,220 *kô* in 1906. Note 1. 1 *kô* = 9.724 *tan,* and 1

© Copyright Soyinfo Center 2014

tan = 0.245 acres. Therefore 1 *kô* = 2.38 acres.

Production in Taiwan increased more than 3-fold from 44,661 *koku* in 1901 to 135,271 *koku* in 1904, then decreased slightly to 100,803 *koku* in 1906. Note 2. Production of soja beans in Formosa in 1904 was only 3.6% as much as production of soja beans in Japan in 1904.

The next section, titled "Red-beans" (p. 229-30) gives similar detailed statistics on acreage, production, and yield for azuki beans in Japan. *Sarashi-an* (the powdered red bean) is made in Osaka, Tokyo, Niigata, and Aomori. A second table gives annual imports of red [azuki] beans to Japan from 1903 to 1907. They are imported mainly from China, Korea, and British India.

In Chapter 9, titled "Agricultural products in commerce," section 2 is on imports to Japan. A table (p. 433-34) gives imports of the following grains and seeds (in quantity / piculs and value / yen) from 1903 to 1907: Italian millet, soja beans, red beans [azuki] (small white), and sesame seeds. Another table (p. 438) titled "Miscellaneous" includes imports of "bean's oil cake" for the same period. An explanation titled "Soja-beans" (p. 439) states: "Not only as foodstuffs, but also as a manure a large quantity of beans are consumed each year, as that from China and Korea a considerable amount is imported. Besides beans, bean-cakes are imported from China in large quantity." Imports of sesame seeds, rice, wheat and rape-seed are also discussed on the same page. In this same chapter, section 3 is on Exports and imports in Formosa. Soy is mentioned on pages 434, 439, 442, 448, 453-54. "Beans, Soja: The demand for soja beans in Formosa is enormous and as the Formosan product was not sufficient to meet the demand, a large amount is imported from abroad. Soja beans produced in Manchuria, and Chin-kiang [Chinkiang, Zhenjiang] are imported from China and Hongkong." "Oil, Beans [soybean oil]: This is principally produced in Manchuria and is brought here through China and Hongkong. Originally it was used as an illumination, but the demand has greatly increased as it is used in making cut tobacco" [to keep it moist]. Ground-nut oil is used for the same purpose (p. 453-54).

Note 3. This is the earliest document seen (Oct. 2003) concerning miso in international trade–exported from Japan; export statistics are also given. Note 4. The preface, by Chuzi [Chuji] Shimooka, explains that this book was compiled for the International Agricultural Association meeting to be held in Italy in the autumn. The compiler did not have time to explain all the terms [and units] adequately. Address: Tokyo, Japan.

1261. Allen, Horace Newton. 1908. Things Korean: A collection of sketches and anecdotes, missionary and diplomatic. New York, Chicago, Toronto, London, Edinburgh: F.H. Revell Co. 256 p. See p. 74. Illust. (black and white photos). No index. 19 cm.

• ***Summary:*** Page 74: "Products.–The great product of Korea is rice, which is the staple of diet. Next come [soy] beans, which are largely used as a food for man and beast, being mixed with rice in the human dietary or used in the form of curd or cake [tofu], while they are indispensable for making the sauce so highly prized in Asia, and which is shipped abroad in vast quantities for the preparation of a celebrated English sauce as well as others, since it is the foundation for most of our sauces. Any one who patronizes a Chinese restaurant will be familiar with this bean sauce. Millet, rye, barley, oats, wheat and some poor corn, together with cotton and vegetables, form the chief farm crops raised in Korea after rice and beans."

Note 1. By "bean sauce" the author probably means "soy sauce," but he might also mean soybean jang (Korean-style soybean miso).

Note 2. The term "celebrated English sauce" clearly refers to Worcestershire sauce.

Preface: The author lived for 22 years "in China and Korea, including practically the whole period of the latter's diplomatic intercourse with the outside world,..." He spent 3 years in Korea as a medical missionary, 3 years in the Korean service, and 15 years in the diplomatic service of the United States government, "beginning as secretary of legation and ending as minister plenipotentiary." The poor Koreans are in desperate straits but opposition by them to their situation "seems at present to be unavailing if not suicidal." Sadly, the United States "deserted them in their time of need and ignored the solemn agreement we had entered into with them as an inducement for their abandoning the centuries-old position of exclusion and non-intercourse and emerging into the dazzling glare of treaty relations. Our treaty with Korea of May 22, 1882, in its first article, makes the following promise: 'If other Powers deal unjustly or oppressively with either government, the other will exert their good offices on being informed of the case, to bring about an amicable arrangement, thus showing their friendly feeling."

The U.S. disregarded this solemn pledge at the time of the Portsmouth convention; we violated our sacred covenant.

Chapter 16, "Political changes and probabilities."

1884–The "haughty Chinese drove the then inconspicuous Japanese so precipitately from the land that they left their dead in the streets to be devoured by the dogs" (p. 243); the Chinese continued their traditional domination of Korea.

1894-1895–First Sino-Japanese War, over domination of Korea; the Japanese won and in Oct. 1895 the treaty of Shimonoseki was signed. During this war the world got its first intimation of the excellence of Japanese military organization and power. But diplomatic mistakes in Korea by Japan, after her victory, enabled Russia to gain the upper hand. Yet Russia too made diplomatic blunders while for 10 years Japan prepared for another war over Korea.

1904-1905–Russo-Japanese war; Japan won, gained control of Korea, and drove Russia from the entire area

© Copyright Soyinfo Center 2014

except in the vicinity of Vladivostok. During the 20 previous years when Korea could have fortified the country, it "played at all manner of silly pastimes." Now Korea is Japan's to exploit for herself. The U.S. position in the area has been weakened. Japan's next great objective will surely be China; it is only a matter of time. Address: Toledo, Ohio; M.D., Late Envoy Extraordinary and Minister Plenipotentiary of the United States.

1262. Colby, Frank Moore. ed. 1908. The new international year book: A compendium of the world's progress for the year 1907. New York, NY: Dodd, Mead and Company. [6] + 860 p.

• ***Summary:*** The section titled "Manchuria" (p. 475-76) states: "By the treaty of Portsmouth (September 1905) Manchuria was practically divided into a northern or Russian sphere of influence, and a southern or Japanese sphere of influence. The Russian section is crossed by the Trans-Siberian Railway, which runs from east to west for a length of 960 miles over Manchurian soil until it reaches Vladivostok; and by the Central Manchurian Railway, which runs southward from Harbin, on the Trans-Siberian, to Changchun, with a branch line of 70 miles from Changchun to Kirin. The Japanese section is crossed by the continuation of the Central Manchurian line from Changchun to Port Arthur and Dalny, now known as the South Manchurian Railway [sic], which was surrendered by Russia to Japan; by the new Japanese line from Antung to Mukden, 187 miles long... Extensions of the Chinese Northern Railways are permitted by Japan only on condition that the capital, if not Chinese, be borrowed from the South Manchuria Railway Company."

"The leading exports are [soya] beans, bean cake, and bean oil, raw wild silk, maize, and millet. Newchwang and Dalny are the principal ports (p. 476).

"History–Reorganization of the Province: On April 20, 1907, an Imperial Chinese edict reconstituted the government of Manchuria. Instead of three provinces governed by three separate Tatar rulers, the whole country was placed under one viceroy, with a governor in each province."

The long and interesting section on Japan (p. 420-30) contains a map of the country. The section on agriculture states: The percentage of land owned by the tillers of the soil is 50.21 in rice field and 60.93 in upland. The rest is rented by tenants. In 1905 the production of soya beans was 3,261,881 koku and of red beans [azuki] was 804,485 koku (1 koku = 4.66 bushels). There is also detailed information on: Population (47 million in 1903) and immigration, fisheries, religion, education, mining, forestry, number of establishments [businesses] and employees, manufactures (incl. vegetable oils; "The Japanese Government is the greatest employer of labor in the country"). foreign commerce, shipping, railways, post and telegraph, banks and money, government (a constitutional monarchy; the Imperial Diet consists of a House of Peers and a House of Representatives; in 1904, 1.67% of the population could vote), finance (in 1907-08 projected internal revenue taxes on alcoholic beverages, soy [sauce] etc. totaled 96,331,881 yen), army, navy. History: Political parties, relations with the United States (incl. persecution of Japanese in San Francisco, California), relations with Great Britain, with France, with Russia, navy and military development, territorial expansion (retention of some troops in Manchuria as "railway guards," gradual absorption of Korea, and conquest of interior portions of Formosa, expansion of lumbering along the Yalu river, opening of 16 cities and towns in Manchuria as 'places of international residence and trade').

1263. Crowe, E.F. 1908. Japan: Report for the year 1907 on the trade of Japan. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4026. p. 1-86.

• ***Summary:*** "Export of soy (p. 35): This sauce was again sent in large quantities to those countries where the number of Japanese residents is on the increase. A new kind, said to have many advantages, and prepared by a lately-invented process, was put on the market during the year."

Annex I (p. 64-65) shows imports of "Beans, peas and pulse" to Japan (mainly from China and Corea) from 1902 to 1907.

Annex II (p. 76-77) shows "Return of principle articles of export from Japan during the years 1907 and 1906." Exports of soy [sauce] were worth £97,000 in 1906, increasing to £110,500 in 1907. The average value for the 5 years 1902-06 was £65,300; no quantities are given. Other leading exports were tea, cotton undershirts and drawers, saké, and fish. Address: Commercial Attaché to His Majesty's Embassy, Tokyo.

1264. Kato, Yogoro. 1908. Physico-chemical studies on tofu. *Memoirs of the College of Science and Engineering, Kyoto Imperial University* 1:325-31. (Chem. Abst. 3:2182). [2 ref. Eng]

• ***Summary:*** Tofu is a foodstuff made by grinding the soy bean with water, filtering to obtain a milky liquid, and coagulating the suspended matter by the addition of a bitter salt solution (bittern). This bitter salt solution is obtained as the residue in making common salt from sea-water by evaporation. The author concludes that the tofu solution contains a negative colloid and belongs to the class of solutions which might be called colloidal suspension. "It seems quite probable that the manufacture of tofu is based upon the coagulation of the colloid by electrolytes: consequently, several electrolytes containing cation [cations] of high valency, besides calcium and magnesium, may be employed for the coagulation."

Note: This is the earliest English-language document seen (Aug. 2010) that contains the term "physico-chemical"

or with the term "physico-chemical" in the title. Address: Chemical Lab., Higher Technological School of Tokyo.

1265. Morse, Hosea Ballou. 1908. The trade and administration of the Chinese empire. London, New York, Bombay, and Calcutta: Longmans, Green and Co. xv + 451 p. See p. 206, 296, 318. Illust. Index. 22 cm.
• ***Summary:*** An important early book on this subject. A second edition was published in 1913, and a third edition in 1921. The dedication states: "Thirty-three years ago [from 1907, i.e. in about 1874] four young men came to China direct from the halls of Harvard. To the other three, the fourth dedicates this work." The Preface begins: "This book is intended to portray the present state of the Chinese Empire, with such record of the past as will show by what process the evolution of the existing state has been reached." It continues: "The first two chapters on Chinese History have been written by the Rev. F.L. Hawks Pott, D.D., President of St. John's College at Shanghai, and author of the useful *Sketch of Chinese History.* His task of condensing the history of forty centuries into as many pages has been performed in a very judicious way."

A color map (facing p. 8) shows "The gradual extension of the Chinese empire." China originated in the northeast part of today's China, in the area around Shansi, Chihli, and northern Shantung provinces, southeast of Peking. The main river was the Yellow River, and the key cities were Lo-yang / Luoyang (the capital of several early dynasties) and Ch'ang-an / Changan or Hsi-an / Xi'an (the capital of 11 dynasties, beginning with Chou–founded 1111 B.C.). The empire gradually spread southward.

In Chapter 7, titled "The provinces and treaty ports," under Manchuria (p. 205-09) we read (p. 206): "The western part of this province is made up of the plain of the Liao and the valleys of its tributaries, and grows wheat and durra for food, and beans from which are made an esculent and illuminating oil, and bean-cake shipped to restore exhausted fertility to the fields of Japan and of Kwangtung." These beans are soy beans.

Chapter 9, titled "Foreign trade" notes that "silks of China reached the Roman Empire, following presumably the Central Asian caravan routes which were later followed by the Polo brothers and their nephew, Marco Polo" [lived 1254-1324; arrived in China 1375].

"The Portuguese were the discoverers of the East, as the Spanish were of the West, and the first recorded arrival of a European ship in China was that of Raphael Presetrello, who sailed from Malacca [a city in 21st century Malaysia on the Strait of Malacca] about 1511. Six years later, in 1517, Fernando Perez de Andrade entered Canton waters and was well received by the local officials, then as ever quite ready to encourage trade, and was allowed to proceed in person to Peking." The Spanish first arrived in China in 1575, when they were well received at Canton.

In this chapter, in the section on Exports, is a subsection on [soy] beans which states (p. 296-97): "Beans are used to make an oil for cooking and, prior to the introduction of kerosene, for illuminating purposes; the bye-product of this process, bean-cake, is used to fertilise the fields chiefly of Kwangtung and Japan. The foreign export of beans is first recorded in 1870 with shipment of 578,209 piculs, and of bean-cake in 1890 with 96,297 piculs; in 1905 the export of beans was 2,665,523 piculs, of which 80 per cent. went to Japan, and of bean-cake 2,897,948, entirely for Japan; in addition, over two million piculs of beans and two and a half million piculs of bean-cake were imported into Kwangtung ports. The chief source of production is Manchuria, next to that Shangtung, Hupeh, and the lower Yangtze."

The section titled "Oil seeds" (p. 298) discusses only cotton, rape, and sesamum seeds; these have only recently entered into foreign trade. In 1888 the export of rape-seed was 873 piculs, and of sesamum-seed 3,027 piculs. The sesamum seed goes chiefly to Germany and Japan.

In Chapter 10, titled "Internal Trade" (p. 302-22), the subsection on "Beans" states (p. 318): "Beans were shipped in 1903 (much of the trade was diverted from Manchuria during the Russo-Japanese War) to the extent of 3,423,766 piculs from Newchwang, 1,928,543 piculs from Hankow, 404,063 piculs from Chinkiang, and enough from other ports to make a total of 6,327,080 piculs; of this quantity 1,836,707 piculs were shipped to Japan, some 72,000 piculs to other foreign destinations, and the balance, except 590,000 piculs for Amoy, went to the Kwangtung ports, Canton and Swatow. In the same year *Bean-cake* was shipped, 4,553,367 piculs from Newchwang, 1,192,948 piculs from Chefoo, 583,095 piculs from Hankow, 423,447 piculs from Chinkiang, with total shipments of 7,030,325 piculs; of this quantity 3,400,444 piculs went to Japan, and the balance, except 731,161 piculs for Amoy, went to Kwangtung."

Also discusses internal trade of ground-nuts, hemp, jute, and ramie (p. 319). "Oil-seeds" (cotton-seed, rape-seed, and sesamum-seed) and "Vegetable tallow" (expressed from the seeds of *Stillingia sebifera*) are discussed on p. 320. A table (p. 321) gives details on railways in for each province of China (incl. Manchuria), including the points served and length in miles (completed, and under construction in late 1906). Address: A.B. (Harvard), Shanghai, China.

1266. Nihon hyakka daijiten: Daizu [Encyclopedia Japonica: Soybeans]. 1908. Tokyo: Sanseido. See vol. 6, p. 630-62. [Jap]
• ***Summary:*** The entries on soybeans are in volume 6 of this 10-volume work. Soybeans (*daizu*)*:* p. 630-31. A small illustration (line drawing) shows the upper part of a soybean plant, with leaves and pods. Soja-bean oil (*daizu abura*)*:* p. 632. Soybean cake (*daizu kasu*)*:* p. 632. 1267. Photograph of the soybean mill owned by Nisshin Oil Mills Co. in Dairen, Manchuria. 1908.
• ***Summary:*** This digital photo was sent to Soyinfo Center by Mr. Y. Komura of the Japan Oilseed Processors Association (Aug. 2013).

Note. This is the earliest document seen (Jan. 2014) related to Nisshin Oil Mills.

1268. Shimooka, C. 1908. Agricultural products: Products for food stuffs and special use. In: 1908. Agriculture in Japan. Tokyo: Govt. of Japan. x + 455 p. See p. 157-61, Chap. 6. [Eng]
• ***Summary:*** A table (p. 157-58), titled "Comparative Table of Yearly Acreage of Staple Food Stuffs," shows the area planted every 5 years from 1877 to 1906 to major crops. The area planted to soja beans grew from 188,233.1 *chô* in 1877, to a local peak 466,315.2 *chô* in 1887, decreasing slightly to 460,895.1 *chô* in 1906. 1 *chô* = 2.45 acres. Area statistics for the following crops for the same years is also given: Ordinary rice, glutinous rice, upland rice (non-irrigated), total rice, barley, wheat, naked barley, total wheat and barley, red beans [azuki], foxtail millet, proso millet, barnyard millet, buckwheat, sweet potatoes, potatoes (regular), cotton, hemp, indigo-leaves, tobacco leaves, rape-seed.

A ranking of Japan's major crops in 1906 shows ordinary (irrigated) rice to be far the largest with 2,557,958 *chô,* followed by naked barley (*hadaka mugi*) 700,887, wheat 669,838, soja beans 460,895, and barley 443,187 *chô.*

A table (p. 158-59), titled "Comparative Yield of Staple Food Stuffs," shows that production of soja beans on this land increased from 1,882,331 *koku* in 1877 to 3,557,592 *koku* in 1906. 1 *koku* = 47.6 gallons or 180 liters. Production statistics for the other crops mentioned above are also given, along with the output of sugar from 1878 to 1906.

Finally, a table (p. 161), titled "Comparative Table of the Output per *Tan* of the Food-Stuffs," shows the yield of each crop in *koku* per tan. A *tan* is about 0.245 acres. The yield of soybean has risen from 0.698 in 1887 to 0.772 in 1906. The 1906 yield is equivalent to about 18.7 bushels/acre.

Note: This is the earliest document seen (Jan. 2005) that gives historical statistics for soybean production and area in Japan.

1269. Tebbitt, -. 1908. China: Report for the year 1907 on the trade of Newchwang. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*)**.** No. 4000. p. 1-14.
• ***Summary:*** A map shows South Manchuria, Corea [Korea], the Yellow Sea, and the Gulf of Pe-Chi-Li, with major rivers (Liao, Yalu), railroads, ports (Newchwang, Tiaren [Dairen]) and cities (Mukden, Antung, Kuan Cheng Tzu [K'uan Ch'eng Tzu], Seoul).

Table C shows the quantity and value of the principal exports from Newchwang during the years 1906-07. In order of export value in 1907, the leading exports are: Bean cake (£1,434,233 for 4,453,380 cwts.) [1 cwt = hundredweight = 112 pounds], beans, all kinds (£484,225 for 1,408,778 cwts.), [soy] bean oil (£236,481 for 287,402 cwts.), millet, tall and small (£229,967), silk, raw, wild (£193,787), ginseng (£45,279). The leading export, [soy] bean cake, is used for manure and sold mostly to Japan (78% of the total) and South China. Because of the increasing shallowness of the Liao River, especially in its upper reaches, the percentage of beans carried in junks is decreasing, while that carried by railways is increasing. Address: Acting Consul.

1270. Visser, M.W. de. 1908. The fox and the badger in Japanese folklore. *Transactions of the Asiatic Society of Japan* 36(1):1-159. See p. 126. [100+* ref]
• ***Summary:*** "The words and deeds of the persons so possessed are very strange. They ask, for example, for azuki-meshi (rice and red pea-beans mixed), tôfu-juice (bean curd) and tai fish laid in miso (sauce made of wheat, beans and salt), and after having eaten very greedily the possessing fox

© Copyright Soyinfo Center 2014

demands through the mouth of the patient a piece of ground belonging to the family of the latter (in behalf of the fox keeper), menacing the life of the patient if it is refused."

Contains a long discussion about "Inari, the fox-shaped spirit of rice" (p. 129+), but does not mention Inari-zushi. Address: PhD, Japan.

1271. Watt, George. 1908. Commercial products of India. Being an abridgment of "The Dictionary of the Economic Products of India." London: John Murray. viii + 1189 p. See p. 564-65. [15 soy ref]

• ***Summary:*** Since Watt's *Dictionary of the Economic Products of India* has been out of print for some time, the Government of India asked him to write an updated 1-volume abridgement. He said that soybeans in India were first introduced from Indonesia. "The Soy Bean; in Indian vernaculars, *bhat, ram, gari-kulay, hendedisom horec, pond disom, an-ing-kiyo, tzu-dza, bhatnas, seta, musa, khajuwa,* etc.

"A sub-erect or creeping annual native of China, Cochin-China, Japan and Java, comparatively recently introduced into India, though recorded as acclimatised and even seen as an escape from cultivation. It might, in fact, be described as extensively cultivated, though more as a garden than a field crop; is especially prevalent in Eastern Bengal, Assam (Barpeta Sub-division), the Khasia hills, Manipur, the Naga hills and Burma. It is not infrequent in the plains of India proper, especially in Busti, Gorakhpur, Patna and Purnea, etc. In Bombay and Madras, however, the Soy Bean has apparently hardly passed the experimental stage.

"Cultivation.–Two chief varieties occur, one called white, the other black. On the plains it is generally grown by itself as a *kharif* (autumn) crop. The seeds are sown from June to September, and harvested from November to December... In Assam it is sown with*áhu* (autumn rice) in April and May. The*áhu* crop is removed in July and August, and its stubble acts as a support for the bean plants, which are ready for harvest in December and January."

"It is eaten in India in the localities where it is cultivated, chiefly in the form of *dál* or *satú.* In Japan it is largely used as a sauce, cheese (*natto*) or paste, and in China an edible oil is obtained from the seed. If cut when the pods are fully formed it makes a most nutritious fodder, and the seed-cake, as already stated, is an extremely rich cattle food."

Also discusses: Alfalfa (p. 778). Almonds (*Prunus amygdalus,* p. 905). Broad bean or Windsor bean (*Vicia faba,* p. 1106-07. "There are two distinct forms, the long-podded and the broad-podded, the latter originating the name 'Broad' or 'Windsor bean'"). Chufa (*Cyperus esculentus,* p. 465; also called Rush-nut, earth-almond, or tiger-nut). Coffee (p. 363-68, with an excellent history). Cowpeas (p. 1107-08). Lucerne or alfalfa (*Medicago sativa,* p. 778-79).

Mung bean, *udid,* and *urud / urd* (*Phaseolus mungo* or *P. radiatus,* p. 880-82). "There has been some confusion regarding the nomenclature of *Phaseolus Mungo* and the species which follows–*P. radiatus,*–due chiefly to Roxburgh having transposed the original Linnean names. *P. Mungo, Linn.,* is the present plant, udid or urd; while *P. radiatus,* Linn., is the plant known in the vernacular as mung. There are two varieties of udid, one with large black seeds, the other with smaller greenish seeds, and these correspond very possibly with *P. Mungo* proper and the variety *Roxburghii.*

Sea-weeds (Kelp, p. 50). Address: Kew Gardens, England; Formerly, Prof. of Botany, Calcutta Univ., Superintendent Indian Museum (Industrial Section) and reporter on economic products to the Government of India.

1272. *Christian Science Monitor.* 1909. Want favorite food duty free. Jan. 1. p. 3.

• ***Summary:*** "Washington–Greeks, Japanese and Chinese now want to take a hand in framing the new tariff bill. The San Francisco Chinese chamber of commerce,... has submitted to the ways and means committee a brief asking that the duties be reduced on Chinese soy [sauce], rice, fish, meat, type and fire crackers.

"The Japanese association of America, with headquarters in San Francisco [California], makes a plea that mizo [sic, miso], a food, shoyu, a sauce, and greenhouse stock be placed on the free list, and that the tariff be reduced on rice, vegetables, and earthenware."

1273. Brown, J. Macmillan. 1909. Pacific problems: Chinese and Japanese in Manchuria. XII–The moulding of the Chinese race. *Evening Post* (*Wellington, New Zealand*). Jan. 4. p. 3.

• ***Summary:*** "(Specially written for The Post)." This long, scholarly article includes a description of the people, land, and agriculture of Manchuria. "The farmhouses are few and far between, though the millet fields are continuous from mountain-top to plain. In other words, the farms are large; there is none of the small intensive culture of China and Japan. A single patch of millet or maize or soybean covers many acres." Address: Prof.

1274. *Chemist and Druggist* (*London*). 1909. Trade report. 74(1511):61-63. Jan. 9. See p. 63.

• ***Summary:*** Page 63: "Soy.–The new method in regard to the calculation of freight on soy has now been established. To arrive 1*s.* 2½*d.* [1 shilling 2 pence] c.i.f. is quoted, or 1*s.* 3½*d.* to 1*s.* 4*d.* per gal. [gallon] spot for good thick."

A subsequent entry [13 Feb. 1909, p. 270-74] reads: "Soy–Small spot sales of good thick have been made at 1*s.* 3½*d.* per gallon, but for shipment higher prices are asked."

Note: Soy sauce now seems to be categorized as thick and not thick (perhaps thin).

21754-21757. "From Paris, France. Purchased from Vilmorin-Andrieux & Co. Received January 3, 1908.

"21754. Yellow seeded.

"21755. *Ogemaw.* Extra early, brown seeded.

"21756. Black seeded.

"21757. Extra early, black seeded."

21818. "From Paris, France. Purchased from Vilmorin-Andrieux & Co. Received January 17, 1908. *Ito San.* Called by the French, *Yellow Etampes.*

21825. "From Hokkaido, Japan. Presented by Mr. K. Hashimoto, Kuchchau Agricultural Society, Abutagun. Received January 14, 1908. *Amherst* (?). 'Used in the manufacture of "soy," "miso," "tifu" [tofu], etc.' (*Hashimoto.*)"

21830/21831. "From Hokkaido, Japan. Presented by the Yokohama Nursery Company, Yokohama, Japan. Received January 24, 1908.

"21830. *Butterball.* Japanese name *Akita.*

"21831. Japanese name *Rumoi.*"

21946. "From Buitenzorg, Java. Presented by Dr. M. Treub, director of the Department of Agriculture. Received February 11, 1908. *'Zwarte kadelee'"* [black soybeans].

21999. "Received through Mr. F.N. Meyer, agricultural explorer for this Department at the Plant Introduction Garden, Chico, Cal., February 12, 1908. From Boshan, Shantung, China. '(No. 799a, Sept. 18, 1907.) A rare variety of soy bean, sparsely grown near Boshan. Chinese name *Ta ha tau.* Used by the higher classes as a vegetable in soups.' (*Meyer.*)"

22311/22312. "From Shanghai, Kiangsu, China. Presented by Rev. J.M.W. Farnham, Chinese Tract Society. Received March 11, 1908.

"22311. Black. 'Similar to *Nuttall* but larger.' (*Nielsen.*)

"22312. Yellow."

22317-22322. "From Erfurt, Germany. Purchased from Haage & Schmidt [seedsmen]. Received March 16, 1908.

"22317. Probably *Butterball.*

"22318. *'Giant Yellow.'* Probably *Amherst.*

"22319. Brown.

"22320. *Samarow.* Like No. 17260.

"22321. Probably *Cloud.*

"22322. *'Early Black* from Podolia [Ukraine].' Probably *Buckshot.*"

22333-22337. "Grown at Arlington Experimental Farm, Virginia, season of 1907. Received March 19, 1908.

"22333. *Baird.* 'This variety was mixed with *Brownie* when received from Pingyang [Pyongyang / P'yongyang], Korea. This mixture was given S.P.I. No. 6414. The two varieties were grown together under these numbers, 9417, 17256, and Agrost. No. 1542, respectively. The two varieties were separated in the 1907 seed from Arlington Farm, and *Baird* given the above new number, *Brownie* remaining as No. 17256.' (*Nielsen*).

"22334. Flat black. 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois. The original source of the seed is not known. It is quite similar in growth to *Nuttall,* but the seed is not the same shape, being flatter and larger.' (*Nielsen.*)

"22335. Yellow. 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois, where it was grown as *Illinois Medium Yellow.* It is very similar to *Hollybrook,* and perhaps is the same, but appears different on account of having been grown farther north.' (*Nielsen.*)

"22336. *Guelph.* 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois. Original seed was procured from the Agricultural Experiment Station, Wooster, Ohio.' (*Nielsen.*)

"22337. *Guelph.* 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois. Original seed was procured from the Agricultural Experiment Station, Fayetteville, Arkansas' (*Nielsen.*)."

22379-22381. "From Canton, Kwangtung [province], China. Presented by Dr. J.M. Swan, Cooks Hospital. Received March 20, 1908.

"22379. Yellow.

"22380. Black.

"22381. Green mixed with yellow and a few brown."

22406/22407. "From Hongkong, China. Presented by Mr. S.T. Dunn, Botanical and Forestry Department. Received March 26, 1908. [Note: It is not clear whether or not they were ever cultivated in Hongkong. These two soybeans (#22406 and #22407, both black seeded) were later given the names "Hongkong" and "Nigra" respectively, and introduced to the USA in about 1910].

"22406. Yellow.

"22407. Black."

22411-22415. "From Naples, Italy. Purchased from Dammann & Co. Received March 25, 1908.

"22885. *Amherst.* Apparently identical with Nos. 19983 and 17275."

22886. "From Swatow [Shantou], Kwangtung [province], China. Presented by Mr. William Ashmore, Jr., through Rev. J.M.W. Farnham, Chinese Tract Society, Shanghai, China. Received May 14, 1908. Black."

22897-22901. "From Paotingfu, Chihli [later Baoding, Hebei], China. Presented by Rev. J.W. Lowrie, D.D., through Rev. J.M.W. Farnham, Chinese Tract Society, Shanghai, China. Received April 22, 1908. The following seeds. Chinese names in italic as given by Mr. Lowrie. Descriptions of varieties by Mr. H.T. Nielsen.

"22897. *Da ching don.* Green. Similar to No. 17857.

"22898. *Hwang don.* Yellow.

"22899. *'Hei don.* Boiled as a fodder for mules and horses. Oil expressed from it, and refuse used as manure.' (*Lowrie.*)

"22900. *'Da wu don.* Tends to vary after successive plantings.' (*Lowrie.*) Black. Similar in appearance to *Nuttall,* Nos. 17253 and 19183, but has green cotyledons.

"22901. *Hsiao bai hei don.* Smoky yellow."

22919-22922. "From Ingchung, via Fuchau, China. Presented by Mr. J. Willis Hawley. Received May 22, 1908. The following seeds. Varietal descriptions by Mr. H.T. Nielsen:

"22919. Black. Very similar to No. 22886.

"22920. Yellowish green.

"22921. Yellow. Very similar to No. 22714.

"22922. Yellow. Seed resembles *Mammoth* very closely, but slightly smaller."

22927. "From Shanghai, Kiangsu, China. Presented by Rev. J.M.W. Farnham, Chinese Tract Society. Received May 27, 1908. Black. 'Identical with *Shanghai,* No. 14592; cotyledons are green.' (*Nielsen.*)"

23205. "From Shanghai, Kiangsu, China. Presented by Dr. S.P. Barchet, interpreter, American consulate. Received June 30, 1908. 'Similar in appearance to *Ebony,* No. 17254.' (*Nielsen.*) An important bean for dry rice land. Chinese name *Pu chi.'* (*Barchet.*)"

23207-23209/23211-23213/23229/23232. "From China. Received through Mr. Frank N. Meyer, agricultural explorer, and brought by him to the Plant Introduction Garden, Chico, Cal., June, 1908. Forwarded to Washington, D.C., and received July 6, 1908. The following seeds:

"23207. From Soochow, Kiangsu, China. '(No. 960a, April 27, 1907.) A large, greenish soy bean, grown around Soochow on the rather low-lying lands. Used when slightly sprouted as a vegetable. Chinese name *Tsin tou.'* (*Meyer.*)

"23208. From Tangsi, Chehkiang, China. '(No. 961a, April 20, 1908.) A large, yellow soy bean, often purplish colored on one side. Considered locally a very good variety. Chinese name *Sian chu tou.* Grows on the ridges around inundated rice fields.' (Meyer.)

"23209. From Tangsi, Chehkiang, China. '(No. 962a, April 20, 1908.) The ordinary variety of yellow soy bean as grown around Tangsi on the ridges and strips of land around and between inundated rice fields. Chinese name *Huang tou.'* (*Meyer.*)

"23211. From Tangsi, Chehkiang, China. '(No. 964a, April 20, 1908.) A very dark brown colored soy bean, grown near Tangsi; said to be very productive. Chinese name *Tsze pi tou.'* (*Meyer.*)

"23212. From Hangchow, Chehkiang, China. '(No. 965a, April 24, 1908.) An early-ripening, yellow soy bean, called the sixth month's bean, meaning ripening in the Chinese sixth month (our July). Chinese name *Lu ya pai mou tou.'* (*Meyer.*)

"23213. From Hangchow, Chehkiang, China. '(No. 966a, April 24, 1908.) A yellow soy bean called the seventh month's bean, meaning ripening in the Chinese seventh month (our August). Called in Chinese *Chi ya pai mou tou.'* (*Meyer.*)

"23229. From Tientsin, Chihli, China. '(No. 982a, April 4, 1908.) A dark brown colored soy bean; rare. Said to grow near Tientsin. Used for human food; boiled in soups or as a vegetable when slightly sprouted. Chinese name *Tse doh.'* (*Meyer.*)

"23232. From Shanghai, Kiangsu, China. '(No. 985a, May 11, 1908.) The *Barchet* soy bean, growing on wet rice lands. Chinese name *Ma liao tou.* Obtained through Dr. S.P. Barchet, of Shanghai, who procured these soy beans from Chinhuafu, in the Chehkiang Province, central China.' (Meyer.)"

23291/23292/23296/23297/23299/ 23303/23305/23306/23311/23312. "From China. Received through Mr. Frank N. Meyer, agricultural explorer, and brought by him to the Plant Introduction Garden, Chico, Cal., June, 1908; forwarded to Washington, D.C., and received July 6, 1908. The following seeds:

"23291. From Wutaishan, Shansi, China. '(No. 922a, Feb. 26, 1908.) Black soy bean, growing at 5,000 to 6,000 feet elevation. Are considered by the Chinese the best food for their hard-working mules and horses; they must always be boiled before being fed to the animals; otherwise they may cause colic; the Chinese also mix a liberal quantity of sorghum seed and chopped straw with these beans. Chinese name *Ghae doh.'* (*Meyer.*)

"23292. From Wutaishan, Shansi, China. '(No. 923a, Feb. 26, 1908.) Yellow soy bean. Growing at 5,000 to 6,000 feet elevation. They are used all through northern China for making bean curd and bean vermicelli. Chinese name *Huang doh.'* (*Meyer.*)

"23296. From Taichou, Shansi, China. '(No. 929a, March 2, 1908.) Yellow soy beans, found growing on

© Copyright Soyinfo Center 2014

strongly alkaline lands. Chinese name *Huang doh.'* For further remarks see No. 923a (S.P.I. No. 23292).' (Meyer.)

"23297. From Taichou, Shansi, China. '(No. 930a, March 2, 1908.) Black soy bean. Grows on strongly alkaline lands. Chinese name *Ghae doh.'* For further remarks concerning their uses see No. 922a (S.P.I. No. 23291).' (Meyer.)

23299. "From Tsintse, Shansi, south of Taiyuanfu, China. '(No. 933a, March 12, 1908.) Black and yellow. A rare local variety of a strange soy bean used as a vegetable when slightly sprouted, and after having been scalded for a few minutes in boiling water is eaten with a salt sauce; the skin must be removed before scalding. Chinese name *Yang yen doh,* meaning sheep's eye bean.' (Meyer.)

"23303. From Shiling, Chihli, China. '(No. 949a, Jan. 25, 1908.) Yellow soy bean. Chinese name *Ta huang doh.* For further remarks see No. 923a (S.P.I. No. 23292).' (Meyer.)

"23305. From Peking, Chihli, China. '(No. 951a, Feb.8, 1908.) Large, light yellow soy bean. Used mostly as a vegetable when slightly germinated, and eaten with a salt sauce. Chinese name *Ta huang doh.'* (*Meyer.*)

"23306. From Peking, Chihli, China. '(No. 952a, Feb. 8, 1908.) Large, black soy bean, green inside. Comes from Manchuria and is used mostly like the preceding number (S.P.I. No. 23305.) Chinese name *Ta ghae doh.'* (*Meyer.*)

"23311. From Shiling, Chihli, China. '(No. 957a, Jan. 25, 1908.) Large, green soy bean. Used as a vegetable when slightly sprouted, after having been scalded in boiling water. Chinese name *Ta ching doh.'* (*Meyer.*)

"23312. From Pautingfu, Chihli, China. '(No. 958a, Jan. 28, 1908.) A rare, local variety of soy bean, being small and of greenish yellow color. Chinese name *Shau ching doh.'* (*Meyer.*)*"*

Note: This is the earliest English-language document seen (Oct. 2004) that uses the term "dark brown" to describe the color of soybean seeds. Address: Washington, DC.

1279. Boehmer (L.) & Co. 1909. Wholesale catalogue: 1909. Yokohama, Japan. 40 p. Illust. 25 cm. [Eng]

• ***Summary:*** The section titled "Plants and seeds of economic value" (p. 32) gives detailed information about different varieties of soy-beans that can be ordered, quite similar to that found in the 1907 catalog. Address: Nos. 5 and 28 Bluff, Yokohama, Japan.

1280. Nishimura, Torazô. 1909. Shôyu kôbo Saccharomyces soya Saitô ni tsuite. II. [On the shoyu yeasts, Saccharomyces soya Saito. II.]. *Nogakkai Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 85. p. 3-44. Feb. [Jap] Address: Nôgaku-shi, Japan.

1281. *Scotsman* (*The*) (*Edinburgh, Scotland*). 1909. New oilcake industry. March 5. p. 10.

• ***Summary:*** "The following, which appeared in a recent issue of the *Eastern Morning News,* is referred to to-day by our agricultural contributor:–The arrival of the Javorina, s. [steamer], at Hull with the first cargo of Soya beans marks the beginning of what promises to be an important new industry in this country. Considerable interest is manifested in this new development as it will have an important bearing upon the future prosperity of the oilcake industry.

"The Javorina, s., is the first of a fleet of steamers bringing Soya beans to Hull. The beans are in good condition and this is due to the excellent arrangements made for ventilation in the holds. It is a long voyage from Vladivostok, the vessel leaving the Russian port on Boxing Day [probably Dec. 26]. The total quantity for Hull is about 4,700 tons, and the remainder will be transshipped to London.

"The Soya bean grown is immense quantities in Manchuria and China. The Japanese have adopted the bean to commercial uses, not for the food of animals, but for that of man. It is not an unpopular article of diet in many parts of the Far East, and during the campaign conducted in Manchuria by the troops of the Rising Sun the men were fed very often on little else. It possesses sustaining qualities, and is the basis of a Japanese sauce [shoyu, or soy sauce]. Its chief value to this country, lies in the fact, however, that it will be an excellent animal food because of its richness in albuminous compounds and nitrogen, which are very good feeding qualities."

"Several forms of cake manufacturers have conducted... tests and these have proved eminently satisfactory. The experimental Soya cakes which have been made in Hull have been tested by a practical and scientific dairyman in the East Riding, who has reported that one cow set aside for this test and fed with half a cake a day, in addition to other food, yielded a considerable extra quantity of milk daily, and was much improved in general condition. The large proportion of oil in the cake makes sparing use of it advisable.

"Up to the present soya beans have been imported to England only in small quantities, but the development of Manchuria promises to revolutionise what is an important industry in Hull."

"What it will mean to Hull alone is that this new source of supply will be available in the seed crushing trade when other classes of seed are scarce and the mills will, therefore, be able to continue running uninterruptedly.

"A combination of circumstances are said to be responsible for the development under such favourable conditions at the present time–the low price of silver, which is what everything is bought with in Japan and China, and low freights. The Javorina, s. [steamer], is the first of a fleet of nineteen vessels which are now on the way from Dalny or Vladivostock with large cargoes of the bean. Several of these vessels are definitely fixed for Hull, two for Liverpool, and the remaining eleven for other ports in the United Kingdom."

1282. *Times of India* (*The*) (*Bombay*). 1909. Prospectus. March 15. p. 14.
• ***Summary:*** "This company has been formed for the purpose of erecting and working oil mills at some suitable place in British India or any of the native states in India and for the general purpose of carrying on the business of seed crushers and nut crushers and manufacturers of linseed, cotton, and other cakes, oil extractors and manufacturers, and makers and manufacturers of cattle food and of artificial manures and fertilizers of every description.

"The promoters think that there is a bright future for this industry in India.

"The mills will be equipped with the most modern machinery and will be the largest and first of their kind in India, and their capacity will enable the company to deal with about a minimum of 120 tons of seeds per day. The product of the mill will be such as can compete with the best known brands in the British, French and German markets.

"In recognition of the great importance of securing capable management to ensure the success of the undertaking, the promoters have secured the services of Mr. Louis Hoffman a specialist in refining oils, of great experience, who has been manager in complete charge of large oil works in Germany, Austria and China for over 15 years."

"This gentleman was the first to manufacture cocoanut-butter in 1896. He discovered the process of refining rapeseed oil without the help of acids. We have before us his essais, published in the German 'Revue der Harz, Oel- und Fettindustrie' 1908: 'About the manufacture of oils in China,' 'Chinese Woodoil,' 'Vegetable tallow (stillingia sebifera),' and on 'Soja beans (Soja Hispida Moench).' Mr. Hoffmann has been the means of improving oil milling machinery.

Note 1. This ad is strange. It is not part of the newspaper of that date, but it may have been inserted. No company name, address, or other contact information is given! We do not know whether or not this mill was ever constructed or operated.

Note 2. In OCLC / Worldcat, the largest database of publications in the world, no periodical with the title of that shown above (Revue der Harz...) is listed. The closest one published in 1908 is *Seifensiederzeitung und Revue über die Harz-, Fett- und Ölindustrie*–which seems fairly close. Eight libraries worldwide own this periodical, but none are in the USA.

Note 3. As of Aug. 2010, no record mentioning "Louis Hoffmann" or "L. Hoffmann" exists in the SoyaScan database of 85,700 records from 1100 B.C. to the present.

1283. Russell, W.P.M. 1909. China. Report for the year 1908 on the trade of Antung. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4185. 18 p. March.
• ***Summary:*** The section titled "Exports for 1908" (p. 7-8) discusses the amount and value of Beans [soybeans], bean cake, and bean oil exported from this port. An excellent full-page map shows the Eastern Manchuria and Shenking Province, including all the major ports, rivers (Antung is a port on the Yalu River), railroads, and bodies of water.

"Products of Eastern Manchuria.–The following are some of the principal agricultural products of Eastern Manchuria: -

"Beans.–Many varieties are produced, of which the chief are: -

"1. Huangtou, yellow [soy] beans.–These are most extensively grown and are used for making bean cake and bean oil. The average bean cake weighs 50 catties and is worth 1 dol. 20 c to 75 c. small money at the place of production. The oil sells for about 15 c. a catty. The beans themselves fetch 10 dol. a picul on an average. [Note: 1 picul = 133.3 pounds weight.] They are also used for making bean curd, which is one of the chief foods of the people. It has the appearance of curds of milk and is made by a somewhat similar process. The beans are also used for feeding cattle.

"2. Hsiaotou, small beans [azuki].–These are used as a vegetable and also for feeding cattle. They are also used for making vermicelli. Note: This is the earliest English-language document seen (March 2006) that uses the term "small bean" to refer to the azuki bean.

"3. Lutou, green beans [mung beans].–The young sprouts of these are used as a vegetable. The bean is principally used for making vermicelli.

"4. Hetou [Heitou], black [soy] beans, are much grown and much used for feeding cattle and also for making oil and bean cake."

The section on "Exports for 1908" under "Beans" states that "owing to an exceptionally heavy supply coupled with a weak demand from the consuming quarters in Japan and South China, there was speedily a very heavy fall in price and 5 taels 50 c. was quoted [down from 7 to 8 taels last year]... It is stated that the restriction of the opium crop has caused an expansion of the area of the bean crop. The returns show an export of bean cake more than doubling that of the year 1907. Beans largely figure in the money market as a standard for deferred payments." Address: Acting Vice-Consul.

1284. Foster, Walter L. 1909. Visit to Shikoku, Japan. *Advent Review and Sabbath Herald* 86(16):13-14. April 22.
• ***Summary:*** "That night was spent at a very simple hotel by the roadside... For supper I had a few dried minnows, *tofu* (bean curd), and a bowl of rice."

1287. Tebbitt, -. 1909. China. Report for the year 1908 on the trade of Newchwang. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4191. 12 p. April.
• ***Summary:*** The section titled "Exports" (p. 5-6) discusses the amount and value of Beans [soybeans], bean cake, and bean oil exported from this port. An excellent full-page map shows the south of Manchuria including all the major ports, rivers, railroads, and bodies of water.

"Bean cake.–Beans and their products–bean cake and bean oil–were very plentiful and the export brisk. The quantities of bean cake exported rose from 4,453,380 cwts. [1 cwt = hundredweight = 112 pounds] in 1907 to 5,594,678 cwts. in 1908." Each year from 1906 to 1908 Japan has taken about 78% of this bean cake–in spite of the increasing export from Tairen [Dairen] to Japan.

"Beans.–A new venture has been the export of beans during the winter of 1908-09 from Tairen to the United Kingdom, presumably to be used as food for cattle. Hitherto experimental shipments of beans from here have failed, as the beans fermented on the way. This might have been due to the beans having got wet coming down the river, either accidentally or on purpose so as to increase the weight. The beans at Tairen [Dairen], on the other hand, as they come down by rail, arrive dry and are shipped dry, and the success of the venture may be due to this fact."

Summarized in *J. of the Board of Agriculture* (*London*), June 1909, p. 229-30. Address: Acting Consul.

1288. Yokohama Nursery Co., Ltd. 1909. Descriptive catalogue... Bulbs, plants seeds. 1909-10. Yokohama, Japan. 98 p. April. Illust. Index. 26 cm. [Eng]
• ***Summary:*** On the cover of this English-language catalog is an illustration (line drawing) of two cranes and two tortoises. In the section on "Seeds" (p. 80+) is a subsection (p. 87) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1908 catalog, except that the price per 100 lbs. of soy beans has dropped dramatically to $3.50, and there is a new entry: Shogoin mammoth turnip. A photo shows two of these turnips next to a hen's egg for size comparison. Other photos in the catalog include two large (4-7 feet tall) bronze lanterns (p. 98). This is the first Yokohama Nursery Co. catalogue in which we have found a copyright notice or a date of printing (p. 98). Address: P.O. No. Box 72. 21-35 Nakamura, Yokohama, Japan. Phone: 509.

1289. Okazaki, Keiichiro. 1909. Process of manufacturing soy or sauce substitute. *U.S. Patent* 0,923,070. May 25. 4 p. Application filed 2 May 1907.
• ***Summary:*** Okazaki and diastarin fungi are cultivated upon a mixture of bean-cake and wheat bran, water added to the mass and the resultant liquid separated and mixed with a liquid containing brewers' yeast. Illustrations (line drawings) show: (1) "A perspective view of a box containing sawdust and bran used in the cultivation of the okazaki and diastarin fungi; (2) A perspective view of the okazaki fungus [a whitish mold of the genus *Aspergillus*] and conidia thereof; (3) A perspective view of the diastarin fungus and conidia thereof." Address: Tokyo, Japan.

1290. *J. of the Board of Agriculture* (*London*). 1909. Soy beans. 16(2):128-29. May. [1 ref]
• ***Summary:*** An introduction to the soy bean. "There are many varieties known in Japan, China, Tibet, and the temperate portions of the Himalayas." "The soy bean requires about the same temperature as maize, and it may therefore be capable of growth in some of the southern and eastern parts of England. The Board have arranged for some experiments to be conducted with beans obtained from Japan."

Note: This is the 2nd earliest document seen (June 2010) concerning soybeans in Tibet, or the cultivation of soybeans in Tibet. Address: England.

1291. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1909. Oleaginous products: Oil cake and seed. No. 344. p. 153-55. May.
• ***Summary:*** Exports of [soy] beans and [soy] bean-cake from Newchwang, China, are increasing rapidly. The United States Consul at Newchwang, "Thomas E. Heenan, calls attention to the exports of Chinese beans to the United Kingdom as the beginning of what is expected to develop into considerable proportions.

"Since the closing of the river to navigation, large numbers of carts have been entering the town with inland produce, and great quantities of beans have been stored for export in the spring. It is difficult to obtain reliable figures concerning the quantity brought by rail, but up to date 64,000 tons have been brought by carts, and it is estimated that the total quantity brought in by rail and carts during the four Months December-March will reach 88,000 tons, against 30,000 tons for the same period last winter. This quantity, however, is small compared with the stocks shipped to Dalny by rail from the north, and when the thaw sets in, putting a stop to cart traffic, unless there are early spring rains, there is very little prospect of large supplies coming down by river boats, as the snow thus far has been insufficient to give the

© Copyright Soyinfo Center 2014

requisite draft of water in the up-river reaches.

"Countries to which shipments are made: Beans, bean cake, and bean oil are the principal products of Manchuria. The prices of these during the past season have been higher than ever before, but how much of this is due to the ability of Japan, a gold-standard country, to pay more in silver, because silver has been cheap, can not be positively stated. The bean cake and bean oil go chiefly to Japan, but shipments have gone to England, France, and the United States during the past year. The American shipment was a small quantity sent from Newchwang merely as a sample... During the year the exports to England amounted to about 70,000 bags. This is a new development, said to have been brought about by English experts who have made a study of the beans. They have discovered, it is said, a means of extracting an oil therefrom, for culinary use as well as for lubricating purposes., the residue being converted into cattle feed. The exports of bean cake from Newchwang to foreign countries in 1908 amounted to 246,608 tons, valued at $5,518,508.

"The exports of beans from Newchwang to foreign countries and other Chinese ports during 1908 were as follows, in tons:" Yellow [soy] beans 75,996. Green beans 31,873. Black [soy] beans 16,489. White beans 4,315. Red [azuki] and small green [mung] beans 3,634.

"United Kingdom: An experiment with the soya bean in Manchuria." U.S. Consul Walter C. Hamm of Hull [England] writes, under date of January 20,..." The soya bean "has been exported to some extent to the United States, and a few samples have been brought to England, but the present shipments to Hull are the first on a large scale. Three steamers, the Maroa, the Javorina, and the Matoppo, are now on their way from Dalny or Vladivostok with about 10,000 tons each, and the Claverdon and the Bannockburn are loading similar quantities at Dalny, making 50,000 tons in all."

A long quotation from an article in the *Eastern Morning News* describes the arrival at Hull, England, from China, of the first cargo of soya beans on board the Javorina. "The beans arrived in good condition, and this is due to the excellent arrangements made for ventilation in the hold." Experimental "soya cakes have been made in Hull and have been tested by a practical and scientific dairyman in the East Riding, who has reported that one cow set aside for this test and fed with half a cake a day, in addition to other food, yielded a considerable extra quantity of milk daily and was much improved in general condition. The large proportion of oil in the cake makes sparing use of it advisable... The Japanese have adapted the bean to commercial uses, not for the food of animals, but for that of man. It is not an unpopular article of diet in many parts of the Far East. It possesses sustaining qualities, and is the basis of a Japanese sauce [shoyu].

"Chinese beans in Scotland: Tests in crushing mills for oil and stock meal." U.S. Consul Rufus Fleming reports on Feb. 12 from Edinburgh: "In the production of oil cake and seed oil the crushing mills in this district have long used only Bombay and Egyptian cotton seed. Recently some of the mills have experimented with small quantities of 'soya beans' from Manchuria. The Chinese bean, which is about the size of a pea, has been found to contain from 15 to 16 per cent of oil suitable for soap making. The usefulness of the oil for other industrial purposes has not yet been demonstrated. The cake produced, containing about 6 per cent of oil, is said to be good feed for stock... The mills in this part of Scotland have undertaken to carry out thorough tests, and a shipment of 1,700 tons is expected to soon arrive at Leith for this purpose."

Note 1. This is the earliest document seen (Feb. 2003) concerning soybeans in Scotland. They were imported from Manchuria. Rufus Fleming filed his report on 12 Feb. 1909.

Note 2. This is the earliest English-language document seen (Feb. 2000) that uses the term "soya cake" or "soya cakes" to refer to ground, defatted soybeans.

Note 3. This is the earliest English-language document seen (Sept. 2006) that uses the term "Chinese beans" (or "Chinese-beans") to refer to soybeans.

Note 4. This is the earliest document seen (Oct. 2005) concerning soya beans imported to or processed in Hull, England. Address: Washington, DC.

1292. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1909. Agriculture: Foreign crop conditions–China. No. 344. p. 131-38. May. See p. 131-33.

• ***Summary:*** This section begins with a report from Vice-Consul General Frederick D. Cloud, of Mukden, on the products and population of the province of Shengking (Fengtien [Liaoning]). The total population of this Manchurian province is 10,312,241, of which 2,520,145 are engaged in agriculture. The province's largest crop is kaoliang (*Sorghum vulgare,* Barbados millet); 2,166,666 acres yield 76,526,643 bushels worth $26,019,059. "Kaoliang is the food staple of Manchuria, and bears the same relative value in the food economy of Manchurians that rice does with the southern Chinese, or wheat in the United States. Besides furnishing the greater portion of the Manchurian's daily food, it supplies an alcoholic drink, thatching for houses and barns, matting for summer sheds and winter floors, windbreaks to shield the farmer's household from the ice blasts of winter, and fuel to cook his food and warm his house. No part of the kaoliang plant is allowed to go to waste. Even the stubble and roots are carefully pulled up, dried, and put away for fuel."

The kaoliang plant "requires much from the soil, but gives nothing back in return. The soy bean, on the other hand, is a good soil fertilizer, and is extensively grown throughout the province, especially in the rich valley of the Liao River. The bean is the greatest of all export crops

© Copyright Soyinfo Center 2014

from Manchuria, and can always be relied upon to afford the farmer ready cash. Bean oil is used throughout China for culinary purposes, being employed as lard is used in American households, while the residue, after the oil has been expressed, bean cake, is exported mostly to Japan, where it is used for fertilizer." The total value of China's bean crop exports for the year 1907 was $9,860,790, the greater part of which was produced in southern Manchuria. Manchuria has a great advantage over most other agricultural regions, in that the soy bean can be grown most successfully throughout the entire region, from Dalny in the south to Harbin in the north."

The crop that ranks third in importance in Shengking province is millet is millet, of which there are several varieties. The best of these is known as Japanese millet, and is grown mostly for human food. The fourth most important crop is wheat–though it is still a relatively minor crop.

The second largest crop is soy beans; 1,300,00 acres yield 4,716,000 bushels worth $22,393,800. Tables (p. 132) show: The principal varieties of grain produced, and the value and production per acre of the different crops. The approximate acreage devoted to each crop, and the total amount produced and approximate value of each. Address: Washington, DC.

1293. Saito, Kendo. 1909. Preliminary notes on some fermentation organisms of Corea. *Botanical Magazine* (*Tokyo*) 23(268):97-98. May. Summarized in Zentralblatt fuer Bakteriologie. II. 26:92. [Eng; ger]

• ***Summary:*** Discusses the moulds in Corean [Korean] koji (mostly *Aspergillus oryzae, Rhizopus tritici,* and *Rhizopus tamari?*), and yeasts in the mash of Corean alcoholic beverages. The koji moulds or fungi possess, "as regards starch, strong saccharifying power, so that the saccharification of starch contained in the raw material can be accomplished by them." For one of the yeasts he proposes the name *Saccharomyces coreanus.* Address: Botanical Inst., Tokyo Univ., Japan.

1294. *Mark Lane Express Agricultural Journal and Live Stock Record* (*Farmer's Express, London*). 1909. Soya beans and soya cakes. 100(4054):667. June 7. See also Experiment Station Record 21:474 (1909). [1 ref]

• ***Summary:*** This is a detailed summary of a "communication which Professor Gilchrist, of Armstrong College, has sent to the press." "Trials to test the comparative feeding value of soya and decorticated cotton cakes have been carried out at Newton Rigg, the Cumberland, and Westmorland Farm School, under the supervision of the manager, Mr. W.T. Lawrence.

"Soya cake is produced from soy or soya (soja) beans (from which some of the oil is extracted), which are now being extensively imported from Manchuria to this country." "Soya cake" was found to be slightly superior to "decorticated cotton cake" for milk production. Six cows were fed for 6 weeks on each protein supplement. The basal ration consisted of hay, oatstraw, crushed oats, and roots. Concerning milk production, there was a slight advantage in favor of the soya cake but it was too small to be considered significant. Both feeds also gave similar results in terms of the fat content of the milk. The cows, however, gained somewhat more weight while they were being fed the soya cake than they did on the decorticated cotton cake.

"Soy, soja, or soya beans have been known in China and Japan for a considerable time. Soy (shoyu), the universal condiment in Japan, is prepared from soy beans, mixed in equal quantities with either wheat or barley. The British Oil and Cake Mills, Ltd., Hull, inform me that about 400,000 tons of these have been sold to this country within the past few months for delivery till the end of the year, of which 50,000 tons have now arrived, and a steady supply is anticipated in the future. Three qualities of these are now imported:–The Sakura, which are said to be the best, being shipped from Dalny [Manchuria], the Harbin from Vladivostock [Vladivostok], and the Hankow from Shanghai."

"Soya or soja meal is being sold in this country, which is soya beans from which the greater part of the oil has been extracted. This may contain as little as 1.5 per cent of oil, while the albuminoids and other constituents are consequently increased.

"Soya cake is now sold in the Newcastle district at about £6 15*s.* to £7 a ton."

Note 1. This is the earliest English-language document seen (Dec. 2005) that uses the term "soja meal" to refer to ground, defatted soybeans.

Note 2. This is the earliest document seen about feeding "soya cake" to dairy animals.

Note 3. This is the earliest document seen (Sept. 2004) that mentions "Sakura," which appears to a grade or quality of soybeans, rather than a soybean variety name. "Sakura" is not used as either a grade or soybean variety name in the USA. Address: Armstrong College, England.

1295. Mitsuda, Ryuichi. 1909. On the carbohydrates of shoyu. *J. of the College of Agriculture, Tokyo Imperial University* 1(1):97-101. June 16. [Eng]

• ***Summary:*** Contents: Isolation of sugars from shoyu. About furfurol [an aldehyde of furfuran; also called furfural]. About total pentosane. "Although the existence of sugars in shôyu is easily shown by the reduction of Fehling solution, it is comparatively difficult to isolate them in a pure state. At first I have tried to isolate them as the lead compounds... Afterwards I found that such a long operation is unnecessary." He used recrystallization of crude osazones.

He gives technical details of how each carbohydrate was isolated from shoyu or tamari. Furfurol, which is formed from pentose or pentosane, was found to increase with the

© Copyright Soyinfo Center 2014

age of the moromi. Address: Japan.

1296. Takahashi, Teizô. 1909. A preliminary note on the varieties of Aspergillus oryzae. *J. of the College of Agriculture, Tokyo Imperial University* 1(1):137-40. June 16. [Eng]

• ***Summary:*** Describes the first isolation of many different molds from koji. The author isolated 3 varieties of molds from 3 kinds of koji starter (*tane koji*) from 3 sources (saké, miso, and shoyu). A description of each variety is given.

Note: Murakami (1971) says of this article: Although *Aspergillus oryzae* was described in detail by Wehmer in 1895, it was not until the beginning of the 20th century that the koji mold was found to contain multiple kinds of microbes [microorganisms], when Takahashi in 1909 isolated many different molds from koji used in the manufacture of *Saké, Miso,* and *Shoyu* and found that all were varieties of *Aspergillus oryzae.* Address: Tokyo Imperial Univ.

1297. Takeuchi, T. 1909. On the occurrence of urease in higher plants. *J. of the College of Agriculture, Tokyo Imperial University* 1(1):1-14. June 16. (Chem. Abst. 2:213). Also in Tokyo Kagaku Kaishi (J. of the Chemical Soc. of Japan) 30:343 (1909). [5 ref. Eng]

• ***Summary:*** This classic article, which is about the soy-bean, begins: "Although much has been written about urease no mention is made of its occurrence in higher plants. Its presence has been proved only in Urobacteria and certain fungi. In the course of my investigations on a desamidizing enzyme [one which hydrolyzes amino compounds with the removal of the amino group] in higher plants, I have discovered a very powerful urease in both the resting seeds and seedlings of soy-bean (*Glycine hispida*)."

He then describes in detail how he isolated urease from the cotyledons of 30 seedlings (each about 3 cm high), and from air dry seeds. He found that this enzyme, urease, is capable of hydrolyzing urea into ammonia and carbon dioxide. The urease liberates ammonia from urea at ordinary temperatures, but does not act on other nitrogenous compounds. It is readily soluble in water, so that an infusion of soy beans may be employed to detect traces of urea in a mixture of organic matter, the ammonia liberated by the action of the urease being indicated by means of phenolphthalein. The author suggests the use of the seeds for the conversion of the nitrogen of urine into ammonium sulphate for manurial purposes.

Page 7 states that the urease from soy beans was tested but did not act on the following compounds: "Guanidine (carbonate), arginine (both nitrate and methylester hydrochloride), benzamide, allantoin, leucine, alanine, tyrosine, kreatine, histidine (hydrochloride), guanine (hydrochloride), glycocoll (ethylester hydrochloride), uric acid, hippuric acid."

Seven types of seeds were tested (p. 8, incl. Phaseolus radiatus = azuki bean) but the urease from the soy-bean liberated much more ammonia than that from any of the other seeds.

Takeuchi concludes: "It is strange that the urease acts exclusively on urea and not on allied substances. Its natural function in the plant body has still to be made out.

"There is no doubt that the enzyme is important, and its urea-splitting property can be turned to account for determining the presence of urea even in minute quantities in various organs and juices.

"Another application of the enzyme consists in its strong ammonifying action on fresh urine, and its application for the recovery of the chief nitrogen of fresh urine is undoubtedly a step in advance in the economy of manures.

Note 1. This is the earliest document seen (July 2003) that mentions urease in connection with soybeans. An enzyme which can hydrolyze urea into ammonia and carbon dioxide, urease was first discovered by Musculus in urine in 1874.

Note 2. This is the earliest English-language document seen (July 2003) with the word "urease" in the title (or in the article), or that contains the word "urea"–in connection with soybeans.

1298. Yoshimura, Kiyohisa. 1909. Ueber die chemische Zusammensetzung der Tamari-Schoyu [On the chemical composition of tamari shoyu]. *J. of the College of Agriculture, Tokyo Imperial University* 1(1):89-96. June 16. [3 ref. Ger]

• ***Summary:*** So-called Tamari-shoyu (*Tamari-Schoyu*) is a variety of shoyu (liquid soy sauce) which is mainly used and made in the middle and western part of Japan. The chief difference between this variety and the most common soy is the absence of wheat in the raw materials used in its preparation. The author isolated from 1 liter of "tamari-shoyu" 0.3 gm of putrescine, 0.7 gm of ornithine, 0.7 gm of a base $C_6H_9N_3$, and 4.5 gm of ammonium. Address: Japan.

1299. *Oil, Paint and Drug Reporter.* 1909. The soya bean and its probable effect on the markets. 75(25):7-8. June 21.

• ***Summary:*** "Once in a long while an event occurs in the industrial world to change, and sometimes even to revolutionize the set order of things... The latest event to attract prominent attention has been the introduction in an extensive way has been the introduction of the soya bean to the markets of Europe."

Within the last 6 months "there have been shipped to the United Kingdom, to Scandinavia, and to Germany upwards of 400,000 tons of the soya bean, which have been converted into oil, and from oil into soap, and the cake has found a useful place in the fodder markets of these countries. It is seldom indeed that in the course of one short season an unknown or rather an untried substance has ever forced its way into a market so cautious and conservative as that of

© Copyright Soyinfo Center 2014

Great Britain, where the manufacturer and consumer alike are so wedded to established formulas and customs."

"Soya bean oil is described in botanical works as 'obtained from the seeds of soja hispida, a plant indigenous in China, Manchuria and Japan, where the oil is used for edible purposes. The seeds contains 18 per cent of oil.' The manufacture of soya bean oil, says the same authority, forms one of the staple industries of Manchuria."

"The soya bean has occupied quite a foremost place among the agricultural products of South Manchuria for many years, and now seems likely to command still greater prominence. There are quite a number of oil mills in Manchuria, the principal plants being located at Yngkau [Yingkou?] and at Hsiackang, the Chinese quarter of Dalny. In these two centers there were all told in 1908 some thirty-six mills, but of these only five were equipped with modern machinery, the others comprise old stone rollers and presses worked by mules and horses. A mill with a daily capacity of ten piculs will keep six of these animals busy. The modern mill will average an outturn of 40 piculs per diem."

"Before last December there were no soya beans in England; by February there had been imported 120,000 tons, and by the close of the season another 120,000 tons had been added to this, making a total for the United Kingdom of 240,000 tons. The rest of Europe, comprising chiefly Norway, Sweden, Denmark, and Germany, consumed 160,000 tons, bringing the grand total up to 400,000 tons. The yield of oil by the naphtha process of extraction is about 18 per cent. This would make an outturn of 72,000 tons of oil, or, figuring five and one-half barrels to the ton, there would have been marketed in Europe 396,000 barrels of soya bean oil. The shippers, however, had oversold themselves and were obliged to buy back 75,000 tons of seed to fill obligations in Japan."

Concerning the oil: "Its cheapness commended it at a time when corn oil was very high priced, so it replaced corn oil in soaps. For edible purposes, it has not as yet found favor, and it is likely to remain restricted to its industrial uses, for the reason that the use of naphtha in the extraction renders it non-edible, and if pressed the yield would be but 10 per cent or less, which would make it too expensive."

A table gives the quantity of exports (in piculs) from Niutschwang [Newchwang = Ying-K'ou, Yingkou, or Yingkow] for six varieties of beans, beancake, and beanoil for the years 1906-08.

Note 1. This is the earliest English-language document seen (Sept. 2006) that contains the term "Soya bean oil" or that uses the word "beanoil" to refer to this oil.

Note 2. This is the earliest document seen (Sept. 2006) that mentions the use of soya bean oil in soaps. A number of other documents published in 1909 also mention this new use. Apparently soya bean oil was first used in soaps in Europe (Sweden or England), but by Sept. 1909 the manufacture of soap from this oil had been tried with good results in Asia, at a laboratory (probably British-owned).

Note 3. This may be the earliest document seen (May 2008) concerning soya beans in Denmark–although a strict interpretation of the sentence that mentions Denmark leaves open the possibility that soybeans were not specifically imported to Denmark. Later documents (Nov. 1910) appear to show that Denmark first imported significant quantities of soya beans in 1911; before that, Denmark imported soya bean cake, largely from England.

Note 5. This is the earliest document seen (Jan. 2010) that mentions naphtha (or naphthas) used for solvent extraction of soya beans.

Note 6. *Webster's New Geographical Dictionary* (1988) defines Scandinavia as 1. The ancient name of the country of the Norsemen. 2. The name of the region encompassing Denmark, Norway, and Sweden; sometimes expanded to include Finland and Iceland.

1300. LeMaire, M.E. 1909. Nouvelles du Japan savant et industriel [New from scientific and industrial Japan]. *Bulletin de la Societe Franco-Japonaise de Paris* No. 15. p. 43-48. June. See p. 45-46.

• ***Summary:*** In the section titled Scientific publications from the University of Tokyo is a summary (p. 45-46) of an article titled "Notes on Japanese vegetable oils," by Tokuhei Kametaka, Article 4, Vol. 25 (Sept. 1908) of the *Journal of the College of Science, Imperial University of Tokyo.* One of the articles discussed is: "3º L'huile de soja, *Glycine hispida Maxim.* Known as "soja bean oil" in English and *daizu-abura* in Japanese. We know that the soja bean is used to prepare miso, a sauce [sic, paste] that is used to make miso soup (*misoshiru*), a main dish for the Japanese. This oil, of a light yellow color, which has found numerous industrial uses locally, is beginning to be used by the Europeans. In 1907, Japan exported 700 tons of it, worth 20.4 pounds sterling per ton.

Note: This society was founded in 1909 by the government of Japan. Address: Ingenieur des arts et manufactures.

1301. Oshima, Kintaro. 1909. Daizu no tansui kabutsu ni tsuite [On the carbohydrates in soy beans]. *Sapporo Norin Gakkaiho* (*J. of the Society of Agriculture and Forestry, Sapporo*) No. 4. p. 1-8. June. [4 ref. Jap]
Address: Sapporo, Japan.

1302. Tsuda, S. 1909. On the different forms of phosphoric acid in organic manures. *J. of the College of Agriculture, Tokyo Imperial University* 1(2):167-70. June.

• ***Summary:*** "It is a well known fact that phosphoric acid (P_2O_5) is one of the essential manurial elements... The object of the present paper is the quantitative determination of different forms of phosphoric acid in several organic manures of vegetable as well as animal origin."

© Copyright Soyinfo Center 2014

The total phosphoric acid in 100 parts of dry "Soybean cake" was found to be 1.311. The phosphoric acid soluble in ether and alcohol (as lecithin) was 0.114. The phosphoric acid soluble in 0.2% hydrochloric acid was: 0.050 inorganic and 0.640 organic (as phytin). The phosphoric acid soluble in 5% hydrochloric acid was: 0.040 inorganic and 0.120 organic. The phosphoric acid in the last residue (as nuclein) was 0.236. Analyses of "Rape seeds cake" and Red clover hay (before flowering) are also given.

Animal manures (such as herring guano, steamed bone dust [rich in tricalcium phosphate], pressed cake of pupa of silk worms, or crab shells) contain much more phosphoric acid and it is mostly in the form of organic compounds, whereas in vegetable manures it is mostly inorganic, mainly in the form of phytin, with only small amounts of nuclein.

Note: This is the earliest English-language document seen that uses the term "soybean cake" to refer to ground, defatted soybeans. Address: Japan.

1303. *Indian Trade Journal* (*The*) (*Calcutta*). 1909. Soy bean trade in China. 14(170):17. July 1.

• ***Summary:*** "Attention is called by the United States Consul at Newchwang to the exports of Chinese beans to the United Kingdom, which are expected to develop into a considerable trade and which are competing seriously with Indian linseed and cotton seed in home markets...

"The bean cake and bean oil go chiefly to Japan, but shipments have gone to England, France, and the United States during the past year. The American shipment was a small quantity sent from Newchwang merely as a sample... The exports of bean cake from Newchwang to foreign countries in 1908 amounted to 246,608 tons. The exports of beans from Newchwang to foreign countries and other Chinese ports during 1908 were as follows, in tons: Black [soy] beans, 16,498; green beans, 31,873; white beans, 4,315; yellow [soy] beans, 75,996; red and small green beans, 3,634; total, 132,316 tons.

"Mr. Consul F.W. Playfair, in his Report on the Trade of Nagasaki for the year 1908, gives the following details about soy beans and their products: The largest increase under any heading is that of the import of oil cakes for manure, which is £83,485, an advance over 1907 of more than 60 per cent. The reasons for this increase are (1) the extremely low price of bean cake in China and (2) the increase in the area under cultivation. The bean cakes come from Newchwang and Dalny...

"In a report to his Government the Japanese Consul-General in Mukden says: 'The season for the export of beans and oil cake, the principal staples of Manchuria, opens in November and closes in March or April, and the destinations are chiefly Japan and other parts of China (Central and South). Lately beans have begun to be exported to Europe...'

"Mr. Consul Pitzipios, in his Report on the Trade of Chinkiang for the year 1908, states that the exports of bean cake in that year amounted to 588,123 cwts. [1 cwt = hundredweight = 112 pounds]. He adds that this cake is produced very cheaply and goes principally to Japan." Address: India.

1304. Mitsui & Co., Limited. 1909. Soya bean oil. China wood oil (Ad). *Oil, Paint and Drug Reporter* 76(1):20. July 5.

• ***Summary:*** "English soya bean oil–Prompt shipment from Hull. We are largest supplier of soya bean from Manchuria, and have special connections with crushers. Manchurian soya bean oil. Shipment from our Eastern Oil Plant. Fall delivery at New York." Other offices: "Kobe, Yokohama, Hankow, Shanghai, London, Hamburg [Germany], Antwerp. Also branches in all the principal cities of the world." Address: Head office: Tokio, Japan. New York: Silk Exchange Bldg. San Francisco: Merchant Exchange Bldg.

1305. Gordon, E.L.S. 1909. Manchuria. Export trade of North Manchuria in wheat and beans. *Board of Trade Journal* (*London*) 66:180. July 22. [1 ref]

• ***Summary:*** "The following information regarding the trade in agricultural produce of North Manchuria is extracted from an article which appeared in the 'Hoku Manshu,' a Japanese weekly paper published at Harbin, a translation of which article has been forwarded by the Acting British Vice-Consul at Dairen (Mr. E.L.S. Gordon): -

"During the occupation of North Manchuria by Russian troops, agriculture there underwent a great development, owing to the large demand for provisions. At the end of the Russo-Japanese war, however, the home demand suffered a collapse, and it became necessary to find an outlet in foreign markets. From 1906 to 1908 the staple produce of North Manchuria was exported to Japan through Vladivostok. During 1908 this trade suffered owing to the depression in Japan; however, towards the end of the year, North Manchurian beans and wheat began to be exported on a large scale to Europe.

"Up to the autumn of 1908, the export trade from districts north of Changchun [probably Ch'ang-ch'un, capital of Kirin province] had been carried on *viâ* the Chinese Eastern Railway and Vladivostok. Since last winter, however, the increase in the transporting capacity of the South Manchuria Railway, the better equipment and financial organisation of the Japanese merchants, and the higher freight rates that came into operation on the Chinese Eastern Railway in November last, have occasioned a diversion of the traffic to the South Manchurian Railway; large quantities of agricultural produce from districts to the north of Changchun [see Ch'ang-ch'un above] have been carried to that place by Chinese carts, and thence sent by rail to Dairen.

"Formerly the trade in wheat and beans was entirely carried on by Russian merchants, but since 1907 the trade through both Dairen and Vladivostok has fallen into the

© Copyright Soyinfo Center 2014

hands of Japanese, and, to some extent, of European merchants.

"Mr. Gordon further reports that the cereal crops in South Manchuria this year promise to be good. In some places beans have been sown instead of wheat, and it is stated that the bean crop will be greater this year than last by 30 per cent.

"In connection with the foregoing, it may be of interest to note that, according to H.M. Commercial Attaché at Paris, 89,000 tons of oil seeds ('fèves oléagineuses' [probably soybeans]) for cattle food, from Manchuria and Eastern Siberia, passed through the Suez Canal during the five months January–May of this year, destined chiefly, it is believed, for the United Kingdom." Address: Acting British Vice-Consul, Dairen.

1306. *Indian Trade Journal* (*The*) (*Calcutta*)**.** 1909. Soy bean. Memorandum by reporter on economic products. 14(174):136-38. July 29. [14 ref]

• ***Summary:*** This is an excellent review of the literature summary by Mr. Burhill (see this journal, 22 July 1909, p. 113), from original observations and many early Indian sources, of soybeans in India and the results of early soybean cultivation experiments in India. The introduction of the cultivated soy bean "into India is comparatively recent; and, except among those tribes or peoples who are mostly Mongolian, it has obtained little hold. I will state in what parts of India it may be found.

"The Burmese grow it under the names of Pe-ngapi and Pe-kyat-pyin, sowing it, never in great quantity, along with other beans on the mud banks as the falling rivers leave them bare in October, or more sparingly still away from the rivers. The Kachins and other hill-tribes grow a little of it on their hill-clearings, the Kachins calling it Lasi. The Khasis, the Nagas and other tribes between the Brahmaputra and Upper Assam cultivate it similarly. The Khasi name seems to be U-rymbai-ktung and the Naga name An-ing-kiyo or Tzu-dza; but these three names should be subjected to scrutiny as they may be wrong. In the Brahmaputra valley it is grown, so far as known, only towards Barpeta. Whether grown or not in the hills north of the Brahmaputra I cannot prove, but the probability is strong that it is. It is grown by the Lepchas in Sikkim, and is called by them Salyang or Selliangdun, or by the Bhutias [the Bhutia people constitute a majority of the population of Bhutan and form minorities in Nepal and India, particularly in the Indian state of Sikkim] Botumash Bhatwas or Bhatmars."

Note: This is the earliest document seen (Oct. 2010) concerning soybeans in connection with Bhutan. They may well be used or cultivated in Bhutan but we cannot be sure.

"It is apparently grown in the Kingdom of Nepal, for it is found just under the mountains in the north of Oudh and again in the valleys of the north-western Himalayas right to the extreme end, and sparingly up to an altitude of 6,000 feet. In western Bengal and through the submontane districts of the United Provinces it is rare, passing chiefly under the name of Ram Kurthi, or in Bengal also as Gari Kalai. Right upon the Nepal boundary it is known by the hill names, *e.g.,* Bhatnas or Bhatwas, as well as Kajuwa. The Santals grow it and call it Disom Horec. I saw it in 1902 sparingly grown towards Belgaum.

"There are several races in India differing in small points; the seeds may be black or whitish, the leaves may be larger or smaller, etc. The black-seeded races occur in the hills, the other colours of seed both in the hills and the plains. The Khasi hills contain both larger-leaved and smaller-leaved plants...

"We seem to have no green [soy] beans in India and nothing approaching the yellow Manchurian beans [described by Hosie in 1904] in shape nor the larger black."

Many analyses of the percentage, on a dry weight basis, of the oils in soy beans from various countries have been made. "The average of eight analyses of soybeans from China is 19.89. The average of six analyses from Japan is 20.01. The average of six analyses from Java is 21.62. The average of forty-two analyses from Europe is 18.98, being from Germany fourteen analyses with an average of 19.74, from Austria eleven, average 19.44, from Hungary six, average 19.16, from Russia nine, average 17.93, from France two, average 15.40...

Concerning the composition of Indian soy beans, Church, in his *Food Grains of India* (p. 141) stated that they contained: Water 11%, albuminoids [protein] 35.3%, fat 18.9%, starch and sugar 26.0%, fibre 4.2%, and ash 4.6%. "I Presume he had Indian seed but it is not possible to say what race he examined.

"Dr. Leather in 1903 analysed the seeds of seven samples of soy from Japanese seeds cultivated at Manjri, near Poona. The amount of oil in them varied from 14.92 to 23.05 per cent, being on the dry weight 15.97 to 24.41 per cent with an average of 19.99.

"My office is now studying the composition of the seeds of established races in order to see how they compare in oil content with such material as Manchuria exports, or such as Manchurian seed might give in India. At the present time India has not the supply of these beans for an export trade; but possibilities of a certain extent are evident."

"One of the first considerations must be the yield that soy will give per acre in various parts of the country. In British India, in Burma, since the soybean is rarely cultivated alone, no statistics on yields are available. "When the bean in 1885 was grown experimentally at Nagpur from Japanese seed, it yielded at the rate of 180 lbs. per acre [202 kg/ha] (see Report Experimental Farms for that year, p. 5), but later (*vide* Nagpur Experimental Farm Report for 1889-90, p. 5) it yielded but an average of 88 lbs. per acre [98.8 kg/ha] over five years. In Lahore in 1894-95 (*vide* Report on the Government Agri-Horticultural Garden, p. 2) it yielded

© Copyright Soyinfo Center 2014

at an estimated rate of 349 lbs. of seed per acre [391.9 kg/ha] and 349 lbs. of fodder, but on a very small area. Its yield was very poor in the next year. The estimated yield in 1898 in an experiment done in Madras was 468 lbs. per acre [525.6 kg/ha]. It has been grown sparingly at Nadiad in Gujarat, and elsewhere in the Bombay Presidency. In the Experimental Far Report, Bombay, for 1901 a big yield was chronicled, but in the next year the crops at Poona and Surat failed. In 1903 the seeds analysed by Dr. Leather, as already reported, were grown near Poona: the yield is not recorded. In 1904 a yield of about 300 lbs. per acre [337 kg/ha] was obtained (Experimental Farms Report, Bombay, p. 70) on light land. One year later nineteen plots were under trial but with unpromising results, for only five yielded seed enough to repay for the cost of cultivation. The yield varied from 50 to 293 lbs. per acre [56.2 to 329 kg/ha], the five promising to be remunerative yielding over 200 lbs. per acre [224.6 kg/ha]. The Manjri (Poona) farm grew 19 plots in 1905-06 with better results, probably as a consequence of better land. Plot No. 3 yielded at the rate of 700 lbs. per acre [786 kg/ha], No. 13 at the rate of 690 lbs. per acre [774 kg/ha], No. 4. at the rate of 650 lbs. per acre [730 kg/ha] and so on. Nearly all the plots gave returns likely to be remunerative. [Note that the size of the plots is unfortunately not indicated.] One year later it was reported by Mr. Fletcher, Deputy Director of Agriculture, Bombay (Annual Report of the Agricultural and Botanic Stations for 1906-07, pages 15-16) that plot No. 5 had yielded on the edge of black soil at the rate of 1,166 lbs. per acre [1,309 kg/ha], while plots numbered 6, 7, 12 and 13 gave, respectively, 513, 650, 575 and 395 lbs. per acre.

"Earlier than this in the United Provinces, many experiments had been done at the Sahranpur Botanic Gardens (*vide* Gollan in Bulletin of the Department of Land Records and Agriculture, No. 21, 1906, pages 27-28). He obtained yields at the rate of 1,124 lbs. per acre and 561 lbs. per acre.

"These experiments have not yet affected the ryots [peasants, tenant farmers]; the crop must be demonstrated very clearly as a paying one before it will do that."

Note 1. This is the earliest document seen (Sept. 2010) concerning soybeans in Lahore. It is not clear whether the Lahore referred to was in today's Pakistan or India. In 1846 Lahore was conquered by British troops and in 1849 placed under British sovereignty. Before 1947 Lahore was a division of the Punjab in British India. In 1947 it was divided, with the Gujranwala, Sheikhupura, and Sialkot, and parts of Gurdaspur and Lahore districts assigned to Pakistan. Ambala and Jullundur districts and the remainders of Gurdaspur and Lahore districts were assigned to India. In 1970 Lahore became the capital of the reconstituted Punjab province.

Note 2. This is the earliest document seen for seen (Sept. 2010) concerning the cultivation of soybeans in Sikkim.

Note 3. This is the earliest document seen for seen (Sept. 2010) that mentions the soybean in connection with the Lepchas of Sikkim, or the Bhutias of Bhutan and Sikkim.

1307. Crowe, E.F. 1909. Japan. Report for the year 1908 on the trade of Japan. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*) No. 4290. 85 p. July.
• ***Summary:*** The section titled "Import of manures" (p. 18) notes that most importers and dealers in manures lost money last year. "The gains were made entirely in ammonium sulphate and bean and cotton-seed cake, all the other lines showing a decrease. Bean cake in particular recorded an enormous advance, from over 5,500,000 piculs [1 picul = 100 kin = 132.27 lb weight] worth 1,780,000*l.* [pounds sterling], to 7,750,000 piculs, worth 2,220,000*l.*

"The fall in the value of silver of course made bean cake look very cheap as compared with other fertilizers, but it will be interesting to see whether the price will not rise considerably in the future as a result of the new development in the recent large shipments of beans from Dairen to Europe.

"As regards oil cake China and Kwantung province supplied nearly the whole quantity, while with sulphate of ammonia the United Kingdom still provided the greater share..."

A table in the section titled "Total volume of trade" shows imports, exports, totals, and differences between imports and exports for the years 1904-1908. It also shows net increases or decreases for various two year comparisons. Address: Commercial Attaché to His Britannic Majesty's Embassy, Tokio [Tokyo].

1308. Hodgson, R.M. 1909. Bean crop of Manchuria: Hints to shipowners as to charterparties for Vladivostok. *Board of Trade Journal* (*London*) 66:423-24. Aug. 26.
• ***Summary:*** The soybean crop in Manchuria is expected to be 20-50% larger than last year's crop. This would mean a total crop of 1,000,000 to 1,400,000 tons. It is being offered at 32 copecks per pood (about 2s. 1d. per cwt). Note: 1 cwt = hundredweight = 112 pounds.

"The export through Vladivostok of the 1908 crop is not yet entirely finished, some 20,000 tons still being stored there for shipment. The amount sent to Europe through Vladivostok so far has been 180,000 tons, and the greater part of this has been for the English market, although one full cargo went to Hamburg [Germany], and various small consignments to Scandinavian ports. The price, at the time of writing, was 72 copecks per pood (4s. 8d. per cwt.) [4 shillings 8 pence per hundredweight] f.o.b. Vladivostok...

"There is every prospect of the bean trade in North Manchuria developing into a complicated and highly speculative business. The industry has created interest in many quarters, with the result that the number of buyers is increasing. American firms have recently entered the market. German firms, in view of the repeal of the duty on beans in Germany, will undoubtedly buy largely; while a well

© Copyright Soyinfo Center 2014

known Japanese firm, by far the largest operators till now, are believed to be preparing for export on an even greater scale than hitherto. The tendency promises to be for Chinese merchants to get the business into their own hands, buying from the local producers and selling again to the European firms. At present the practice is for the agents of these last to go into the country and buy with Chinese measurements and money. The business is a very difficult one, and several firms engaging in the business for the first time have bought their experience dearly." Address: British Vice-Consul, Vladivostok [Russia].

1309. *Milling* (*Liverpool*)**.** 1909. A new British industry. Soya beans. Their cultivation and manufacture. Their wonderful food value. Great possibilities. 33(9):290, 292. Aug. 28. Also printed in 1910 as *Soya Beans,* a 27-page booklet by Northern Publishing Co. in Liverpool., Liverpool. Extensively quoted by Sawer 1910 (p. 27) and 1911 (p. 212). [1 ref]

• ***Summary:*** "The firms which first entered the export trade in Soya beans in quantity were Messrs. Nathanson (Russia) and Messrs. Mitsui and Co. (Japan). Several English firms have also entered the trade, and among these must be mentioned Messrs. S. Macgregor and Co., and Messrs. Jardine, Mathieson [Matheson] and Co. We believe that Messrs. [John] Bibby, of Liverpool, were one of the first British importers of Soya beans, that firm having received a considerable quantity last year. It was not until last Spring, however, that consignments arrived in this country in large cargoes. Up the present time the imports in 1909 have been estimated at about 300,000 tons. This is a large total for the first year of general crushing, and shows that the trade is certainly to be largely increased, providing that Manchurian exporters can secure the beans, and of this there does not appear to be any doubt."

The yellow Sakura soybean variety shipped from Dalny appears to be the best quality and commands a price of about 2/6 per ton more than small yellow varieties such as the Harbin variety shipped from Vladivostok or the Hankow variety shipped from Shanghai. "The black Soya bean appears to be the richest in oil, while analysis proves it to contain a large percentage of albuminoids and phosphates.

"The analysis of the ordinary yellow Soya bean, made by Mr. Alfred Smetham, F.I.C., F.C.S., of Brunswick Street, Liverpool, shows an average of about the following constituents:–Water 12 per cent., oil 17 per cent., albuminoids (protein) 38 per cent., carbohydrates 22 per cent., fibre 5 per cent., ash 5 per cent., and sand 1 per cent...

"Mr. Smethan, in a pamphlet he has prepared for the *Annual Journal of the Royal Lancashire Agricultural Society* for 1909, gives a number of analyses of Soya beans, besides the products of oil and flour millers generally. Some of our readers will be interested to learn that the Chinese in Liverpool have regularly imported various kinds of Soya beans, which are sold in the Chinese shops for human food. We understand that the method of cooking them is very similar to the British plan of steeping and boiling dried peas. In China the beans, after having had the oil extracted from them, are used for feeding pigs and cattle, as well as for manuring the land. The beans have long been known in Japan, where they are made into a favourite condiment known by the name of Shoyu, the meal from the beans being mixed with meal from either wheat or barley."

The oil is of a superior kind and finds a ready sale at high prices for a great variety of purposes, including the manufacture of margarine and other edible goods, the manufacture of fine toilet soaps and paint oils. Note 1. This is the earliest document seen (Oct. 2007) concerning the use of soybean oil in margarine.

"We hear that the Japanese are extracting the caseine [casein] from Soya beans, using it as a substitute for milk. It is said that this vegetable milk is produced by extracting the juice. The preparation, according to the *Java Times,* is a very popular drink among the poorer classes of China and Japan. In making the milk the beans are first softened by being soaked and then boiled in water. The liquor is secured by straining and is similar to cow's milk in appearance, but has a different composition, which renders it highly suitable for use in tropical countries...

"The most interesting use to which the bean can be put, from a corn miller's point of view, is the production of flour for bread-making purposes. This has been done by a Hull firm who recommend that the Soya flour be mixed with wheat flour in the proportion of one of the former and four or five of the latter. We have obtained a sample of Soya flour and blended it with white flour. After baking a loaf it was seen that the top broke but the crumb was all that could be desired. The flavour of the loaf was superior to that of average brown bread. The Soya flour cannot be bleached; therefore, it would not be suitable for white bread making. We think that a proportion of Soya flour might be blended into the millers' brown meal with advantage, because of its great food value and its flavour. Further mention is made of Soya beans and flour in our editorial notes.

"Just as we go to press a gentleman called at this office and showed us a Soya bean pod which had been plucked from plants raised in South-West Lancashire [England]. It was fully ripe and contained four beans... Soya beans, he informs us, have been grown before in this country as an experiment though without much success."

Note 2. This is the earliest document seen (Sept. 1999) that mentions Mitsui & Co. (a major Japanese trading company) in connection with soybeans.

heads: Soya beans. A new trade. Empire production. Buyers of soya beans. Food purposes. Brown bread. Wheat gluten. "There is a probability of the import of Soya beans becoming a trade of great importance in this country. For some years a cake, made from the residue left by crushing them for the sake of the oil they contain, has been imported into this country. The first really commercial import of these beans was, we believe, made by a Liverpool firm last year. Their great value, both for oil production and for other purposes, has been known for many years, but it was not until after the Russo-Japanese War that the development of the crops in Manchuria was commenced with a view to an export trade... Since the Spring of this year the import [of Soya beans to England] has been several hundred thousand tons."

Sir Alfred Jones is seeing if soybeans can be grown on the west coast of Africa. An influential commission appointed by the Canadian government visited England and other European countries to find out why Canada had lost a portion of her trade in bacon. It is thought that if farmers in Canada had soya bean meal they would be able to produce a much larger quantity of bacon.

"We mentioned in a recent issue of *Milling* how the beans were being finely desiccated and sold for admixture with wheaten flour. Since that time we have obtained baking samples of the flour which is far superior to that first seen. A loaf of bread was made from four parts of English patent [flour] and one part of Soya flour. The loaf produced was of a very pleasant flavour. It cut quite clean and there was an absence of crumbs... The colour of the loaf was a rich brown and the flavour was very good." The quality of brown bread could probably be greatly improved by the addition of soya flour.

"The albuminoids of wheat are of a very different order from those of most other cereals. They provide the baker with a substance which holds in the gas produced by the yeast and so cause the light loaf of bread in which bakers delight in producing... If we could make the albuminoids of other cereals as elastic and tough as those of wheat, light bread could be made from such as barley, maize, oats and Soya flours."

Note: This is the earliest English-language document seen (Nov. 2013) that uses the term "soya bean meal" to refer to ground, defatted soybeans. Address: England.

1311. *Tropenpflanzer* (*Der*) (*Berlin*)**.** 1909. Die Soja-Bohne [The soybean]. 13(8):388-90. Aug. [2 ref. Ger]

1312. *Manchester Guardian* (*England*)**.** 1909. The Manchurian soya bean: New industries projected. Sept. 10. p. 10.

• ***Summary:*** "Considerable interest has been awakened in commercial quarters by the statements recently published as to the immense possibilities of the Manchurian Soya bean and there is a probability that at Liverpool, if not also on the banks of the Ship Canal, an important new industry will spring up."

Note: The Manchester Ship Canal, opened in May 1894, transformed Manchester from a landlocked city into a major sea port, known as the Port of Manchester.

"The value of the bean has already been recognised in various parts of the world, but it was only in the recent opening of the Manchurian Railway for other than military purposes that revealed the immense trade possibilities connected with it."

"The uses of the bean are manifold. It is said to be excellent in bread; it yields a rich oil, is a capital food for cattle and pigs; and in Japan even milk has been derived from it, and from that milk cheese of various sorts has been made. It forms such a rich food for pigs that it requires to be mixed with plainer fare before being offered to them. Its advantages in this direction were quickly grasped by the enterprising Danish pig-breeders; they bought heavily on the Hamburg market, and the subsequent decline in the imports of Canadian hog products into this country has been attributed, in part at any rate, to the advantages gained by the Danish breeders as a result of the extensive use of the bean.

"The first cargo of the beans to reach this country came in the Myrtledene to Bristol and was consigned to a well-known Liverpool firm of cattle food manufacturers. The bean is now used also for soap-making at Port Sunlight. The Myrtledene's cargo arrived in February last, and since then 200,000 tons have been imported.

"Although firms at Hull and Newcastle-on-Tyne are also moving, a serious attempt is to be made to centre the imports of the bean at Liverpool, with the intention not merely of increasing the shipping trade of the port, but also with a view to establishing a new local industry. The exportable surplus of this year's crop will, it is said, probably exceed a million tons, so that the magnitude and value of the trade is readily appreciated. Several of the most prominent commercial men of Liverpool are interested in the scheme, amongst them Sir Alfred Jones, who contemplates attempting its cultivation in West Africa. He is also interested in the question of its shipment from Vladivostok, and particularly in the erection of special mills at Liverpool to deal with the bean. Efforts are now being made to promote a company to take the matter up, and in a few weeks it will be seen whether these efforts have been successful.

"In the meantime the British Vice Consul at Vladivostok reports that the condition of the coming crop is very favourable,..."

1313. *Toronto Daily Star* (*Canada*)**.** 1909. Beef-eating in Japan: Is on the increase–abandoning rice which is cause of beri-beri. Sept. 10. p. 7.

• ***Summary:*** London, Sept. 11. "The Japanese peasant does not eat much rice; it is too dear. Barley, vegetables, and fish are his staple foods. The upper and middle classes, however,

© Copyright Soyinfo Center 2014

who have hitherto eaten large quantities of rice, are now slowly beginning to add meat to their dietary. Beef is the favourite dish. It is cut up small, boiled with a native bean sauce [soy sauce] and vegetables, and eaten with the hashi or chopsticks."

1314. Gordon, E.L.S. 1909. Manchuria. Bean industry: Manufacture of bean cake, oil and soap. *Board of Trade Journal* (*London*) 66:645. Sept. 23. [1 ref]

• ***Summary:*** "It may be well to give a word of advice to those who may be desirous of engaging in the bean trade at Dairen. Most of the beans sent down to Dairen come from the districts north of Mukden, Changchun [probably Ch'ang-ch'un, capital of Kirin province] being the principal market. People will only incur losses if they merely have an office in this port and buy beans in the local market; it will be essential for them to travel in the interior and visit the country markets to make economical purchases."

Bean cake and bean oil: A chemical analysis of bean cake as it is presently prepared shows that it contains 16.9–19.19% water, 9.18–9.76% oily substances, and 40.98–45.00% albuminous substances. "By the present method, using hand presses, the amount of oil extracted from the beans is about 8 per cent. At one mill in Dairen, which is fitted with hydraulic presses, nearly 10 per cent. can be obtained. The quantity of oil in the soya bean is from 16 to 17 per cent., and by improved processes it should be possible to extract practically the whole of this, and still make from the fragments as good a quality of bean cake for fertilising purposes as is made now.

"In 1907 there were at Dairen two large Japanese mills for the manufacture of bean cake, in one of which steam is used as the motive power, while in the other electricity has been adopted, and a few Chinese mills where the old native method has been retained. During 1908 some 17 Chinese factories have been added, and more are in contemplation. The increase is likely to continue, though possibly not to the same extent, for economic reasons...

"The manufacture of soap from bean oil has been tried with good results. The soap is easily soluble in hard water. A cake made in the laboratory at Dairen weighs nearly 2½ ozs. troy, and the cost of manufacture, including wrapping and scenting, is said to be not more than ½*d.* per cake, or 2½*d.* per lb."

Note: This is the earliest document seen (Sept. 2003) which states that hydraulic presses are now being used in Manchuria or China–by one mill at Dairen.

Summarized in the *Indian Trade Journal.* 1909. Oct. 14. p. 45, and in *Tropical Agriculturist.* 1909. Sept. 15. p. 212. Address: Acting British Vice-Consul, Dairen.

1315. *Bulletin of the Imperial Institute* (*London*)*.* 1909. Cultivation and utilisation of the soy bean. 7(3):308-14. Reprinted in the Tropical Agriculturist, Supplement (Jan. 1910, p. 78-79). Summarized in Far Eastern Review, March 1910, p. 489. [3 ref]

• ***Summary:*** Contents: Introduction. Cultivation. Composition of the seeds. Utilisation of the seeds. Considerable expansion was stimulated by the large demand for provisions created by the occupation of North Manchuria by Russian troops during the Russo-Japanese war. After the end of the war and the withdrawal of the troops, the local demand declined and it became necessary to find an outlet for the crops in foreign markets. Much of the staple produce of North Manchuria was exported to Japan through Vladivostok from 1906 to 1908. In 1908 the trade suffered as a result of the depression in Japan. Towards the end of that year, beans and wheat began to be exported to Europe on a large scale. Large quantities of soy beans were imported into the United Kingdom and the Continent.

"The first large cargo of soy beans consigned to the United Kingdom arrived in Hull on the 2nd of March, 1909, and amounted to 5,200 tons. It is stated that before June contracts had been made for the delivery of no less than 200,000 tons. The beans are said to arrive at their destination in perfect condition in spite of the great distance they have to be carried.

"They are classified into three grades: No. 1, shipped at Dalny; No 2, shipped at Vladivostok; and No. 3, shipped at Hankow. The value of grade No. 1 is about £6 8*s.* per ton gross, c.i.f. European port direct, whilst the values of Nos. 2 and 3 are equal and about £6 6*s.* per ton gross, these prices being, of course, subject to the fluctuations of the market." Note 1. This is the earliest record seen (Feb. 2003) concerning soybean grades. Note that the highest grade has the highest value. However, the grade is based on the port from which the soybeans are shipped rather than standards by which the beans from each port can be graded. It is not clear whether the concept of grades originated with the buyers (European oilseed crushers), the shippers (Japanese, probably Mitsubishi), or the sellers (Manchurian merchants).

Most, if not all of the soy beans imported into England are "purchased by the proprietors of oil-mills, who crush the product and thus obtain a quantity of oil, amounting to about 10 per cent. by weight of the seed, and a residual oil-cake proved to be a valuable cattle-food" (p. 309).

The oil was chiefly used in England "for the manufacture of soap and is very well suited for this purpose" (p. 312).

The "oil-cake" that remains after expressing the oil is hard and heavy. Feeding trials comparing this cake with decorticated cotton cake have been conducted at the Cumberland and Westmoreland Farm School at Newton Rigg, and also at the Royal Agricultural College, Cirencester. At Cumberland it was found that cows, when fed the "soy-bean cake," gave more milk than when fed with cotton cake, but the difference was considered insignificant. The proportion of fat in the milk was the same in each case.

© Copyright Soyinfo Center 2014

At Cirencester, the experiment showed that the yield of milk was but little affected by the type of cake used. The percentage of fat in the milk was slightly higher from the cows consuming soy-bean cake.

"In view of the importance of the trade in soy beans, it has been considered desirable that attempts should be made to grow the product in other countries than China. The Imperial Institute has already brought the matter to the notice of the Governments of several British Dependencies, and experiments are now in progress in the Cape of Good Hope, Natal [South Africa], the East Africa Protectorate [Kenya] and the Gambia. An effort is also being made to stimulate the cultivation of the soy bean in India" (p. 313-14).

Note 2. This is the earliest document seen (Aug. 2009) concerning soybeans in Gambia or Kenya, or the cultivation of soybeans in Gambia or Kenya. This document contains the earliest date seen for soybeans in Gambia or Kenya, or the cultivation of soybeans in Gambia or Kenya (1909; one of three documents for Gambia).

Tables show: (1) The composition of soybeans grown in India, in China (deduced by Dr. Forbes Watson; with hulls, or dehulled), and in the United States. (2) Four chemical constants for soybean oil and cotton-seed oil: Specific gravity at 15ºC, saponification value, iodine value, and Hehner value.

Note 3. This is also the earliest document seen (May 2001) concerning the use of soy bean oil in soaps. Vladivostok is a seaport city, the capital of Primorski Krai, in the far Eastern Russian Soviet Federated Socialist Republic [i.e. Russian Far East]. It became part of the USSR at the time of the Russian Revolution in about 1917.

1316. Hausser, P.F. 1909. China. Report for the year 1908 on the trade of Swatow. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*) No. 4332. 14 p. Sept.

• ***Summary:*** The section titled "Bean-cakes" (p. 6-7) states: The total importation during 1908 was 3,036,906 cwts. [1 cwt = hundredweight = 112 pounds], valued at 714,200*l.* [Note: 1 *l.* = 1 £]., as compared with 2,199,443 cwts., value 600,415*l.,* in 1907. Owing to exceptionally large purchases made in the spring of 1908 by Japanese merchants in Newchwang and Dalny [Manchuria], prices went up from 1.40 to 1.80 taels per picul, but notwithstanding this advance, importers in Swatow could not get a corresponding increase for their goods. Prices here dropped from 3.30 taels at the beginning of the year to 2.60 taels per picul, and importers suffered heavy loss. Encouraged by the inflated price of sugar obtained at the end of 1908, the planters will probably invest more money in bean-cake for their sugar-cane plantations this year and the consumption will be correspondingly increased."

A table titled "Return of principal articles of native import (net) during the years 1907-08" (p. 12) shows that imports of "Bean cake" were as follows for each year: 1907–2,199,443 cwts / £600,415. 1908–3,036,906 cwts. £714,200. Imports of "Beans" [probably soy] were as follows for each year: 1907–774,414 cwts / £216,828. 1908–1,057,775 cwts. £249,187. Imports of bean cake in 1908 were second largest in value after rice (£753,300). Also gives figures for groundnuts, "oil–bean, castor, ground nut, etc. (lumped together), and three types of opium.

A table of exports (p. 13) shows that sugar (brown and white) was the most valuable export; the imported bean cake was probably used as fertilizer on the sugar cane fields.

Below the table of contents is a table of currency equivalents. Facing that page is a large map of Swatow [pinyin: Shantou; Wade-Giles: Shan-t'ou], including surrounding Canton [pinyin: Guangdong] province, plus neighboring Fokien [Fukien, Fujian] province to the north, and Kiang-Si [pinyin: Jiangxi] province to the northwest. Address: Consul [British].

1317. *Otago Witness* (*New Zealand*)**.** 1909. New Zealand products: Markets in the East. Oct. 6. p. 21.

• ***Summary:*** "(From our own correspondent). London, Aug. 20. Another hint has been received this week of the genesis of a large market for New Zealand products in the East"–where 400 million people are gradually beginning to adopt European practices.

"The head of the cattle-breeding department of the Japanese Government (Mr. Hashimoto) is at present visiting this country [Great Britain] to make purchases of stock.

"'Meat-eating,' said Mr. Hashimoto, is on the increase in Japan. Its popularity is increased by the recently advanced theory that an over-consumption of rice is a source of beri-beri. The Japanese peasant does not eat much rice; it is too dear. Barley, vegetables, and fish are his staple foods. The upper and middle classes, however, who have hitherto eaten large quantities of rice, are now slowly beginning to add meat to their dietary. Beef is the favourite dish. It is cut up small, boiled with a native bean sauce [soy sauce] and vegetables, and eaten with the hashi or chopsticks."

About 10-12 years ago Japan began to import European cattle into Japan to improve their native breeds. "'For ploughing purposes, Japanese farmers invariably use cattle. For this purpose the native breeds are good, but for milk and beef they are poor.'"

1318. Piper, Charles V.; Nielsen, H.T. 1909. Soy beans. *Farmers' Bulletin* (*USDA*) No. 372. 26 p. Oct. 7. Revised in 1916. [10 ref]

• ***Summary:*** Contents: Introduction. Climatic and soil requirements of soy beans. Varieties of soy beans (12): Mammoth (yellow); Hollybrook (yellow); Ito San (yellow); Guelph (green); Buckshot (black); Ogemaw (brown); Wisconsin Black; Wilson (black); Meyer (mottled black and brown); Austin (greenish yellow); Haberlandt (yellow);

Riceland (black). The culture and planting of soy beans. The inoculation of soy beans. Soy beans for hay: Curing the hay. Soy beans for pasturage. Soy beans in mixture: Soy beans and cowpeas, soy beans and sorgo, soy beans and millet, soy beans and corn. Soy beans for ensilage. Soy beans for grain. Soy beans in rotations. Feeding value of soy beans: Feeding value for sheep, feeding value for dairy cows, feeding value for hogs. Storing soy-bean seed. Comparison of soy-bean grain and cotton-seed meal. Comparison of soy beans and cowpeas. Summary.

The bulletin begins: "The soy bean, also called the 'soja bean' (fig. 1), is a native of southeastern Asia, and has been extensively cultivated in Japan, China, and India since ancient times. Upward of two hundred varieties are grown in these countries, practically every district of which has its own distinct varieties. The beans are there grown almost entirely for human food, being prepared for consumption in many different ways. Their flavor, however, does not commend them to Caucasian appetites and thus far they have found but small favor as human food in either Europe or America.

"As a forage crop, however, soy beans have become of increasing importance in parts of the United States, especially southward. They have been tested at most of the State agricultural experiment stations, and it is clear that their region of maximum importance will be south of the red clover area and in sections where alfalfa can not be grown successfully. They thus compete principally with cowpeas, but as cultivation is usually required they fill a somewhat different agricultural need. Their culture has greatly increased in recent years, especially in Tennessee, North Carolina, Virginia, Maryland, Kentucky, and the southern parts of Illinois and Indiana [though no statistics are given]. It seems certain that the crop will become one of great importance in the regions mentioned and probably over a much wider area. The earlier varieties mature even in Minnesota, Ontario [Canada], and Massachusetts."

"Soy beans are also decidedly drought resistant, much more so than cowpeas, and but for the depredations of rabbits would be a valuable crop for the semiarid West. Rabbits are exceedingly fond of the foliage, and where they are numerous it is nearly useless to plant soy beans unless the field can be inclosed with rabbit-proof fencing."

At the present time seven varieties of soy beans are

© Copyright Soyinfo Center 2014

handled by American seedsmen: Mammoth (yellow seeds), Hollybrook (yellow), Ito San (yellow), Guelph (also called Medium Green, Medium Early Green, Large Medium Green), Buckshot (black; a very early variety handled by northern seedsmen), Ogemaw (brown), and Wisconsin Black. A detailed description, with a photo showing the seeds and pods, is given of each. The best of the new varieties, most of which will be available in 1910, are: Wilson (black), Meyer (mottled black and brown), Austin (yellowish green), Haberlandt (yellow; the seed is considerably larger than that of any of the other yellow-seeded varieties), and Riceland (black).

"During the past three years more than two hundred additional varieties have been introduced from China, Japan, and India, most of which have already been sufficiently tested to give some idea of their value. Many of the new varieties are so superior in various respects that they are certain to replace all of the above-named varieties except Mammoth and, perhaps, Ito San."

A table (p. 23) gives a nutritional analysis of seven varieties of soy beans: Austin, Ito San, Kingston, Mammoth, Guelph, Medium Yellow, Samarow.

Illustrations (line drawings) show: (1) A typical soybean plant with leaves, pods, roots and nodules (p. 5, by Boetcher).

(2) A bunching attachment on an ordinary mower for bean harvesting (p. 19). Photos show: (1) A plant of the Mammoth variety of soy bean (p. 6). (2) Seeds and pods of seven varieties of soy beans (full size; p. 8). (3) A man standing in a field of the Mammoth variety of soy bean in North Carolina (p. 9).

(4) Roots of a Mammoth variety of soy bean with characteristic nodules (p. 13).

Note: This is the earliest document seen (Oct. 2013) stating that USDA has tested nearly 200 soy bean varieties during the past three years. Address: 1. Agrostologist in Charge; 2. Scientific Asst. Both: Forage Crop Investigations, USDA Bureau of Plant Industry, Washington, DC.

1319. Edie, E.S. 1909. Cultivation and uses of soya beans. *Liverpool University, Institute of Commercial Research in the Tropics, Bulletin* 1(1):1-7. Oct. 8. [1 ref]

• ***Summary:*** An excellent article. Contents: Introduction. Uses of the soya bean: Forage, hay, ensilage, soya oil, soya milk, a type of cheese made from soymilk [tofu], soya meal [flour]; use of soya bean oil for soap, illumination, paints and other industrial products, soya bean meal used as a fertilizer on Chinese sugar plantations, soya beans as a legume for enriching the soil with nitrogen, planting between rows of maize. Cultivation of soya beans. Varieties of soya beans.

"The Soya bean (*Glycine hispida*) is a native of South-eastern Asia, where it has been cultivated for centuries in China and Japan. It was introduced at a later period into India, and arrived in England towards the end of the eighteenth century. A considerable number of experiments were carried out with the plant were carried out in Austria about thirty years ago, but it is only quite recently that it has become an article of commercial importance in Europe."

After discussing uses as hay and silage: "It is in the bean itself, however, that the chief value of the Soya plant lies. As food for man and domestic animals it is used to a very large extent in the East. In some parts of China the bean forms one of the staple articles of food, and it is cooked much as beans and marrowfat peas are, and also in soups and other forms. The oil is used largely for making salads and sauces, and is also mixed with flour in the manufacture of cakes. Mr. Turner tells me that the Chinese extract casein from the bean, and I have also seen this stated elsewhere.

"A liquid closely resembling cow's milk is prepared from Soya beans in Japan." The process is described. "This condensed product is of considerable value as a food, but it is unsuitable for the use of infants. This "Soya Milk" is also used in the preparation of a kind of cheese" [tofu]. Note: This is the earliest English-language document seen (Aug. 2013) that contains the term "Soya milk."

"Soya bean meal is now use in the manufacture of biscuits, and for mixing with flour for making brown bread in this country. In some parts of the Continent Soya meal is now being used in preference to rye meal for making bread."

"One of the most valuable products of the Soya plant is the oil. As mentioned before, it is used largely for eating purposes in the East, and Mr. Turner tells me that on the Continent a greater percentage of Soya oil than of Copra oil is allowed in the manufacture of margarine.

"Soya oil is largely used for soap making in the East, and I understand that it has recently been tried with very good results in this country also.

"As a considerable proportion of oil is left behind in the cake after expression of the oil, it may be more profitable to extract the oil by solvents such as naphtha and use it all for manufacturing purposes, as extraction by means of naphtha renders the oil unsuitable for edible purposes.

"In the East Soya bean oil is used as an illuminant and also in the manufacture of paints. The oil has a comparatively high iodine value, which is an index of the drying quality of an oil of that class." Note: This is the earliest English-language document seen (March 2008) which states that soy oil can be used in paints (or other coatings) in connection with its iodine number.

Cultivation: "Recently the question of raising this crop in various British colonies has been discussed. In most of the African colonies, including West Africa, the Soya bean would probably be successfully grown, and in rotation with, or along with maize and other crops, its cultivation would be a very profitable investment. I have seen samples of Soya beans at least three years old, which showed no signs of weevilling or deterioration in any way. Cargoes of the beans shipped from Vladivostock [Vladivostok] and Dalny

© Copyright Soyinfo Center 2014

to Hull and Liverpool are stated to have arrived in perfect condition."

Varieties: A table (p. 6) gives a nutritional analysis by S.H. Collins of "a sample of Chinese yellow Soya beans." Moisture: 10.23%. Oil 15.62%. Albuminoids 37.54%. Carbohydrates 27.27%. Woody fibre 5.02%. Ash 4.32%.

"I have analysed samples of five distinct varieties of Soya beans, some of which were obtained from the shop of a Chinaman who sells them to the Chinese in Liverpool for food. I do not, of course, know the age of the samples, nor their source..." After describing the shape and color (2 green, 2 brown, 1 black) of each, and noting that No. 4 came from Hong-Kong, he gives a nutritional analysis of each in tabular form, and the weight of 20 seeds of each in grams.

"In conclusion I have to thank Mr. A. Grenville Turner, Grain and Seed Broker, member of the Liverpool Corn Trade Association, for much valuable information regarding the Soya beans and for his kindness in obtaining samples for me. I am also largely indebted to an excellent article on Soya beans in the *Natal Agricultural Journal,* November, 1908.

"Since the above was written I have been enabled, through the kindness of Sir Alfred Jones, to analyse a sample of yellow Soya beans grown in West Africa from seed sent out by him early this summer." A table shows the analysis. Moisture: 10.52%. Oil 17.26%. Albuminoids 36.05%. Carbohydrates 26.16%. Woody fibre 5.39%. Ash 4.62%.

"The results show that in the first season at least the Soya bean underwent no deterioration in West Africa, and the plants also came rapidly to maturity."

Also published in 1909 as a 7-page booklet by C. Tinling & Co., Liverpool. Also published in 1911 Spanish by: Mexico. *Ministerio de Fomento, Colonización e Industria* under the title "Explotación de la soya," by E.S. Edic [sic, Edie]. The last line of the article seems to say that the author is at the central agricultural station (*Estación Agrícola Central*).–San Jacinto [probably in or near Mexico City], January 1911. Address: M.A., B.Sc, Liverpool Univ.

1320. *Economist* (*London*)**.** 1909. Trade and smuggling in Manchuria. Oct. 9. p. 691-92.

• ***Summary:*** "One of the most interesting features of the past year has been the development of Manchuria as an exporting country. An almost negligible quantity prior to the war, Manchuria has thrown some 300,000 to 400,000 tons of field produce into the United Kingdom during the last eight months, representing one and a half to two millions' sterling value.

"The principal article of export is the Soya oil bean. In appearance something like a pea, the Soya bean contains between 16 per cent. and 19 per cent. of oil, and has at once jumped into prominence as a food for cattle. The first steamer cargo left Vladivostock in January last [Jan. 1909], and numbers of large steamers were chartered to load at that port and at Dalny, cheap freights materially helping the business in the early stages. Supplies have continued regular during the season, and even now a large fleet is under charter for the United Kingdom, Liverpool and Hull being the principal consuming centres.

"The Manchurian Railway has benefited considerably by this additional trade activity, and though at intervals during the spring months the resources of the line were severely taxed to deliver the large quantities contracted for to the steamers in port at Dalny and Vladivostock, the authorities have been able to cope with the requirements of the trade with less confusion than might have been expected from such a sudden demand upon their carrying powers. The growing area is not confined to special localities, but may be said to extend to the whole of Manchuria. Harbin is one of the principal concentrating points, and from this town the railway runs south *via* Kirin to Vladivostock, and *via* Mukden to Dalny, both ports having ample accommodation for steamers of 6,000 to 10,000 tons capacity.

"The crop is harvested in November and December, and shipments begin towards the end of the latter month. The old crop continues to come down to port in October, and there is a gap of about two months between the old and the new crops. In the United Kingdom the bean is treated chiefly as an oilseed, being crushed in the crushing mills, the oil extracted, and the residue used as a cattle-feeding cake or in the form of meal, while the farmers also employ the bean, of course without crushing, in various forms for stock feeding. The oil is edible, and has already a large and regular sale at high prices.

"It may be safely anticipated, from the results of the present year, which was really only an experimental one as far as the United Kingdom was concerned, that we shall see increased activity during 1910. Owing to the successful trading of the past year, the area under bean cultivation has been increased by over 20 per cent. The total crop is between 800,000 and 1,000,000 tons, of which China and Japan consume about one-half, while the United Kingdom can now be reckoned upon to take the remainder. The success obtained by the oil crushers and farmers in England during the present season makes it certain that increased quantities will be imported into this country in the future if no large Continental competitors come into the field, and prices remain within the reach of consumers. Heavy import duties on foreign oilseeds both in France and Germany have kept these countries out of the market up to the present, to the advantage of the English manufacturers, who have thus been able to find an outlet for large quantities of the manufactured product, in the shape of beancake and oil, in the North of Europe.

"Nor is the future of Manchuria limited to the cultivation of the Soya bean. Several thousand tons of millet seed have been shipped this year to England for the first time, and in spite of the long voyage–six to eight weeks *via* the Canal and a fortnight more *via* the Cape of Good Hope..."

© Copyright Soyinfo Center 2014

"Much harm has been done by the Russian ordinance which lately closed Vladivostock and other Russian ports to the East and along the Amur River, where trade had hitherto been free and unrestricted. Lawful trade is now yielding to illicit trade. Along the frontier marked by the Amur and the Arguna the Chinese have opened up trading stations, selecting sites for them on their own side far from the Russian Customs and Excise posts, which, owing to their small number and to the enormous extent of the border-line between Siberia and China, are quite incapable of exercising any influence over the ever-increasing relations between the Russian and Chinese sides of the boundary. The commodities chiefly traded in by the Chinese are alcohol, vodka, tea, and sugar..." The "smuggling trade has assumed throughout the Amur the character of an organised industry in the hands of the Chinese."

1321. *Indian Trade Journal* (*The*) (*Calcutta*). 1909. The soy bean industry. 15(185):45. Oct. 14. Summarized in Tropical Agriculture (Sept. 1910, p. 212). [2 ref]
• ***Summary:*** This is a reprint of: Gordon, E.L.S. 1909. "Manchuria. Bean industry: Manufacture of bean cake, oil and soap." *Board of Trade Journal* (London) 66:645. Sept. 23.

Note: This is the earliest document seen (Dec. 2005) with the term "soy bean industry" (or "soy-bean industry" or "soya bean industry") in the title.

1322. *Chamber of Commerce Journal* (*London*). 1909. Foreign trade of China in 1908. Special Supplement. Vol. 28. Oct. p. 16-17.
• ***Summary:*** Contents: Introduction. General. Imports: Cotton goods, metals, foodstuffs, etc. (mainly wheat flour, rice, and sugar), other imports. A table shows the value (in Hk tls [Hong Kong taels]) of gross imports into China from the principal foreign countries and British possessions for the years 1907 and 1908. The biggest supplier by far was Hong Kong, however the "imports from Hong Kong came originally from Great Britain, the Continent of Europe, America, Japan, Australasia, India, the Straits, etc., and coast ports of China.

Exports: Total value increased by 12¼ million taels, tea, silk, beans and beancake, firewood, flour, sesamum, tin, provisions, sundry exports (mainly raw cotton).

The subsection titled "Beans and beancake" states: "The trade in beans and beancake attained to figures hitherto undreamt of. Beans were exported abroad to the amount of 4,770,000 piculs, and while they went chiefly to Japan, there were also shipments from Hankow and Dairen, totalling some 500,000 piculs, to England, where it is stated that they were in demand for the manufacture of oil. It seems probable, however, that the English demand for Chinese beans owed much to the combination of bumper crops and low sterling exchange, a combination which does not often occur in the same degree. The largest quantity of beans was shipped from Dairen–1,581,788 piculs–and Suifenho comes next with 1,110,339 piculs. Of beancake, the shipments amounted to 7,380,129 piculs, as compared with 4,182,009 piculs in 1907, Newchwang retaining the first place as a port of shipment, while Dairen takes the second and Suifenho the third."

1323. Gordon, E.L.S. 1909. Report for the year 1908 on the trade and navigation of the port of Dairen (Dalny). *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4372. 18 p. For the year 1908.
• ***Summary:*** The 1st map shows the "Kwantung Leased Territory" (Dairen consular district), a long peninsula including Dairen and Port Arthur, which are connected by the South Manchuria Railway. A 2nd map, "Sketch map of part of Manchuria," shows the four three railways, plus major cities and towns, crops, and rivers: (1) South Manchuria Railway; (2) Chinese Eastern Railway; and (3) Chinese Imperial Railway.

Currency (p. 3): In ports other than Dairen, dealings with the Chinese are based on taels and copper cash, the amount of cash taken for each tael differing at each port. But "at Dairen, there are no taels or cash. The Chinese Imperial Maritime Customs of course make up their statistics in Haikwan taels, but the business here is all done in Yokohama Specie Bank Newchwang notes known as silver yen..." A table shows the value of Haikwan tael, gold yen, and silver yen in shillings and pence for 1907 and 1908.

Pages 3-4 state that "soya beans which come down from the north are made up in bags, each of which weighs from 185 to 200 lbs. avoirdupois. Bean cakes are reckoned by pieces, weighing nearly 60 lbs. apiece." A table defines the following weights and measures: Chinese: *catty, picul, li, mow.* Japanese: *kin, ken* (*6 shaku*), *ri, tsubo, koku* (liquid and dry), 1 S.M.R. ton (2,000 lb).

The section titled "Possible industries" contains subsection III on "Bean cake and bean oil" (p. 6). A table gives the chemical composition of 3 samples of bean cake. "By the present method, using hand presses, the amount of oil extracted from the beans is about 8 per cent. At one mill in Dairen, which is fitted with hydraulic presses, nearly 10 per cent. can be obtained. The quantity of oil in the soya bean is from 16 to 17 per cent., and by improved processes it should be possible to extract practically the whole of this, and still make from the fragments as good a quality of bean cake for fertilising purposes as is made now."

The section titled "The South Manchuria Railway" states (p. 6-7): The work of broadening the main line of the South Manchuria Railway and its Fushun and Newchwang branches from the 3 feet 6 inches gauge to the standard gauge of 4 feet 8½ inches was completed by the end of April, 1908. A new and improved system of trains was introduced, and a revision of fares and traffic rates, in most

© Copyright Soyinfo Center 2014

cases involving a reduction, has been effected. As a result the complaints that were so rife during 1907 are no longer heard, and both traders and passengers seem generally satisfied with the treatment accorded to them. In October express trains composed of Pullman dining and sleeping cars commenced to run between Dairen and Changchun, the northern terminus, twice a week, covering the distance of 437½ miles in 21 hours. This time is to be shortened during 1909 to 18 hours, and no doubt further accelerations will follow and the express run oftener.

"With the completion of the reconstruction of the main line, the work of doubling the tracks between Dairen and Suchiatun, a distance of 238 miles, was commenced, and is to be finished in the autumn of 1909."

The section titled "Exports" contains long subsections on [Soya] "Beans" and Bean cake" (p. 10-13). In the first subsection we read: "Towards the end of 1908 was commenced a trade in beans with the United Kingdom and Europe, which promises to have a great effect on this part of China, and, in view of the great possibilities of this trade, the following, taken from a report which appeared in the local newspapers some little time ago, may prove of interest."

There follows the full-text of a 3-page article on production and exports of soya beans in 1907 and 1908.

The subsection on "Bean cake" states: "In 1907 there were at Dairen two large Japanese mills, in one of which steam is used as the motive power while in the other electricity has been adopted, and a few Chinese mills where the old native method has been retained. During 1908 some 17 Chinese factories have been added, and more are in contemplation. This increase is likely to be sustained, though possibly not in the same proportion. A better price can be obtained for bean cakes made here than for those brought down from the interior, as the latter are apt to get damaged in the course of transportation, and the demand for bean cake as manure in other countries is steadily increasing."

Annex 1 (p. 14) gives the value of imports to Dairen during 1907 and 1908. In 1908 the value of soy [sauce] was £27,431 and of miso was £5,422.

Annex 2 (p. 16) gives the value (in British pounds sterling) of exports from Dairen during 1907 and 1908. [Soy] Beans: £658,135 / 1,000,948. Bean cake: £488,997 / 865,480. Bean oil:–/ £27,284. Address: Mr., Acting Vice-Consul [for Great Britain to Japan].

1324. *Revue Indochinoise.* 1909. Fabrication de l'huile et du tourteau de fève Soja [Production of soy oil and soybean cake]. 11:1046-47. Oct. [Fre]

• ***Summary:*** The extraction of oil from the soybean–*Soja hispida*–which is found in Japan and which is imported to Japan in large quantities from China and Korea, is a very simple operation. The beans are steamed then crushed in mechanical presses; the oil flows out and is collected in reservoirs. It is allowed to stand for a while and is then refined. The result is an oil with a clear yellow color which can be used for the table or for industry. The remaining cake can be used as fertilizer or as a feed for animals.

Total production of the oil is about 700 tonnes per year and the average price is about 20 pounds sterling and 4 shillings per tonne. Up to the present, this oil has been consumed mainly in Japan, however recently it has been exported with success.

Note: This is the earliest French-language document seen (Sept. 2003) with the word *tourteau* or the term *tourteau de fève Soja* in the title, used to refer to soybean cake.

1325. Meyer, Frank N. 1909. Re: Resumé of work as a USDA agricultural explorer. In: Letters of Frank N. Meyer. 4 vols. 1902-1918. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 811-13. Letter of 2 Nov. 1909 from Berlin, Germany.

• ***Summary:*** Meyer filled out this form for USDA as he was passing through Berlin on the way to his second expedition, which started in Russia. "Salary: $1,600 per annum. 1. Education: An ordinary school education up to 14 years of age. After that much private tuition in Foreign languages, in Botany, Drawing (mechanical and landscape), Arithmetic and Measuring, Principles of plant propagation, etc.

"2. Experience: From 14th to 16th years as a pupil in the Botanic Gardens of Amsterdam, from 16th to 23rd year as an gardener and assistant to Prof. Hugo de Vries in his special experimental garden. From 23rd to 25th year as a gardner in commercial nurseries in England, especially having learned the culture of fruits and vegetables under glass and the culture of fruit trees against walls and fences as is practiced in the countries of Northern Europe.

"3. Departmental Service: From October 23, 1901 to August 31, 1902, as a gardener in the Department greenhouses at Washington D.C. Resigned September 1, 1902. September 15, 1902, re-entered Departmental service again in the Plant Improvement Garden at Santa Ana, California. Worked there as a propagator and all-around gardener. Resigned on account of very unsatisfactory conditions at the garden and improper treatment by Mr. P. Pierce, in charge, on April 1, 1903. Worked as head gardener in a carnation and palm nursery in Montecito, California, from April 1903 until March 15, 1904. Made journeys of study in California, Mexico, and Cuba from March 16, 1904, until August 1, 1904. Worked in the St. Louis Botanical Gardens from August 1, 1904 until July 1, 1905, as a propagator of mainly herbaceous plants. Was also member of the Jury on Forestry at the World's Fair in St. Louis during September 1904. Re-entered Department service for the third time on July 10, 1905, as an agricultural explorer. Left Washington, D.C. on July 27, 1905, and returned to the same city July 7, 1908, having visited in these three years parts of Japan, Korea, Eastern and Northern China, Manchuria and

© Copyright Soyinfo Center 2014

Eastern Siberia and collected nearly 2000 numbers of various plans and seeds.

"4. Results accomplished: Valuable varieties of Chinese fruits, vegetables, cover crops and ornamental plants introduced. From February 1909 until July 1909 having written his observations on Chinese agri- and horti-culture in a series of four bulletins which are in course of publication.

"5. Special qualifications. These questions can hardly be answered by the undersigned himself."

"8. Value. To be answered by those in charge."

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

1326. *Chemical Trade Journal* (*Manchester, England*). 1909. Consular notes: Dairen [Manchuria] (Japan). Bean cake and bean oil. 45(1170):429-30. Nov. 6.

• ***Summary:*** A table gives the composition of three samples of [soy] bean cake made using hand presses. "The quantity of oil in the soya bean is from 16 to 17 per cent." The constituents are: Water. Oily substances (range: 9.18 to 9.76%). Albuminous substances. Carbohydrate. Fibre, vegetable. Ash.

"Soap: The manufacture of soap from [soy] bean oil has been tried with good results. Its chief characteristic is that it is easily soluble in hard water. A cake of the soap made in the laboratory here weighs only 2½ ozs. troy, and the cost of manufacture is said to be not more than ½*d.*, including wrapping and scenting, or at the rate of 2½*d.* per lb."

1327. *Indian Trade Journal* (*The*) (*Calcutta*). 1909. Indian soy beans. 15(189):145-46. Nov. 11. Summarized in Agricultural Journal of India (Calcutta) 5:375 (1910).

• ***Summary:*** "As long ago as 1885 the seed was tentatively grown as a possible food crop by the Agricultural Department at Nagpore; and the annual report of the agricultural stations in the Central Provinces, which has just issued, contains a reference to the cultivation of a small plot and to the absence of a local demand. Other provinces also made some experiments. In those days, the merits of the soy bean as a source of oil were scarcely recognised, and no demand for it on this account existed in western countries. Consequently the cultivator found small profit and the agricultural authorities as little encouragement in their attempts. But the crop was never quite lost sight of..."

Tables show: (1) Analyses of the moisture and oil content of 14 soybean samples grown from seed of Japanese origin at the Manjri Experimental Farm showed that the products are of good quality, with 6 samples containing more than 20% oil. "The crusher to whom the samples were submitted" commented that 11 of the 14 were distinctly good, and those containing more than 20% oil better in this respect than the best Sakura Manchurian beans.

(2) The range of oil content of soy beans grown in five countries or continents, as quoted by the Reporter on Economic Products: China 17.60 to 26.18. Japan 13.36 to 25.55. Java 18.37 to 26.18. Europe 15.16 to 21.89. North America 18.42 to 19.52.

(3) The yields per acre obtained in 1906-07 on various plots at the Manjri Farm averaged 660 lb, with a high of 1,166 lb. Address: India.

1328. *Colonist* (*Nelson, New Zealand*). 1909. News of the day. Nov. 13. p. 2.

• ***Summary:*** "The Japanese have discovered a cheap and good substitute for the milch cow in the form of a tiny bean. The juice, which is extracted by a special process from the bean, is said to be an excellent vegetable milk, the properties of which render it highly suitable for use in tropical countries. The preparation, according to the "Java Times," is obtained from the soya bean, a member of the leguminous family of plants, and a very popular article of food among the poorer classes [sic] of Chinese and Japanese."

1329. *Star* (*Canterbury, New Zealand*). 1909. Brief mention. Nov. 20. p. 4.

• ***Summary:*** "A new industry [sic] has sprung up in Japan in the cultivation of a plant known as the Soja bean, which is indigenous to Central Japan [sic] and Lower Manchuria. About three years ago a trial shipment of this bean was made to England, amounting in all to about 200 tons. Last year the export totalled 80,000 tons, and this year it is expected, 250,000 tons will be shipped.

"The value of this bean lies not only in the quantity of oil of high grade for lighting and lubricating purposes contained, but in the residue after the oil is expressed. This is of a highly nutritious nature, possessing a big percentage of nitrogen, and it is employed in the manufacture of biscuits, I as well as having great value as a fodder for stock."

Note: This article is filled with errors. For example: (1) The soja bean has been cultivated in Japan for at least 1,000 years. (2) It is a native of northeastern China, not of Japan. (3) The nitrogen-rich portion is used almost entirely for livestock feed, and only in tiny amounts for making biscuits.

• ***Summary:*** This is the story of how Mitsui & Co. gained control of the [soya] bean trade in Manchuria and exported the first [soya] beans to England and thus to Europe. "Everybody knows that the 'Ubiquitous Beans,' the 'wealth of Manchuria,' are booming up South and North Manchuria as nothing else has ever even come near to, or is ever likely to do. The credit for ushering this new era into the history of Manchurian trade goes without question to Messrs. Mitsui & Co. How this came about will be a matter of interest to many.

"This firm had, before the War, a branch at Newchwang and engaged in the export of Beans to Japan. They thought of shipping Beans, during the winter season when the northern port is closed by ice, to Port Arthur by the Chinese Eastern Railway and induced the latter to publish the freight tariff in the summer of 1903. This led the Mitsuis to consider it worth while to send Beans from Tiehling then taken by them as the buying centre, to Yingkou by junk down the Liao, and then to Port Arthur by rail. In October they made the first purchase of Beans ever undertaken by Japanese in the interior and in this example were followed by the now bankrupt Tungshengho, the then prosperous Newchwang merchants. Hardly had the Mitsui's two Bean steamers sailed out of Port Arthur with the total cargoes of 45,000 piculs when the first guns of the late War were fired. [Note: 1 picul = 132.27 pounds weight.] During the War, Russia saw fit to include Beans in the contraband list, and this effectually blocked all their outlets to Japan. It happened that neither could herrings enter into Japan from Saghalien way. These circumstances quite upset the fertilizer market in Japan. In the mean time, the far-seeing management of the Mitsuis started a painstaking study concerning the Bean producing centres of the world and were quite satisfied, as the result, of there being no others than Manchuria and Japan save for Asia Minor and Cochin China, which produced something like Beans. This discovery set them thinking more seriously than ever and was directly responsible for their undertaking the pioneer shipment of Beans to Europe.

"About the time the Battle of Liaoyang was being fought the Mitsuis bought up all the Beans to be had about Yingkou and dumped them at a fabulous profit on the short stocked market of Japan. They followed up the track of the victorious Army and also their advantage far into the inland and at once began enquiry into the producing capacity of those regions for Beans. It did not take long before they found out to their satisfaction that the output of Beans in South Manchuria has been ludicrously underestimated and then they immediately cast about for the best market in which to offer them, hitting, with a happy stroke of business foresight, upon Europe as such. No sooner was peace restored in October, 1906, than this firm opened its agencies at Tiehling, Mukden, Changchun, Hsinmintun and Kirin and during the winter of '05-'06, sent out their first trial shipment of Beans and Bean Cake to London. This venture proved a miserable failure because, owing to imperfect packaging, the cargoes deteriorated so badly on the way that all were thrown overboard. A second consignment to Europe of 500 piculs reached there in good condition in the spring last year and met such a favourable reception there that an order for 3,000 tons directly followed and then a string of larger ones in quick succession. The Mitsuis were allowed to reap all by themselves the golden harvest of their own sowing till the end of February this year (1909), when a number of strong foreign firms began to appear on the scene to help foster the Bean trade to what it is to-day."

Note 1. The words "Bean" and "Beans" are used to refer to "Soya Bean" and "Soya Beans" throughout this article. The latter two terms are never used.

Note 2. This periodical began in Oct. 1908 as the English-language column in the *Manshu Nichinichi Shinbun* ("Manchurian Daily Newspaper"). Address: Dairen, Manchuria.

1333. *Economist* (*London*). 1909. Oil and cake manufacture–The Soya oil bean. Dec. 4. p. 1144-45. [1 ref]
• ***Summary:*** "From a correspondent. In a recent issue of the *Economist* attention was drawn to the Soya bean trade in Manchuria, and to the rapid rise of the country as an exporter... During the past season the English oilseed crushers settled down to a highly lucrative trade, and for some months past many of the large mills have set their entire plant running on the crushing of Soya beans, to the exclusion of cottonseed, linseed, and other oleaginous seeds. The supposed shortage of the cotton and flax crops in the United States, and the anticipated shortage of linseed in the Argentine, with the resultant scarcity of cottonseed and linseed products has found the English market comparatively unperturbed, for the reason that Soya oil and cake can supply most of the requirements as well, if not better, while

© Copyright Soyinfo Center 2014

the foreigner is debarred from its use by the presence of high tariffs. This new industry supplies a good example of the value to this country of free imports of raw material compared with the protective duties in other countries. The removal or reduction of the duty on the Soya bean on the Continent and in America would be a great blow to our manufacturers,...".

"Large quantities of Soya oil are being shipped from English ports to the American seaboard, and the demand is likely to continue: but the trade has already been so large that it is difficult to buy oil for near delivery. The same oil is also being shipped from Japan and China to the United States, as well as to the North of Europe, and here we have–for the moment at least–the only serious competitors of English crushers. These two Eastern countries, in which the enhanced value of bean products is leading to the introduction of improved European manufacturing systems, are making great strides in the oil crushing industry, and will naturally import increased quantities of beans from Manchuria in proportion to the success which they achieve in the export of the oil.

"The new season has now commenced in earnest, and from December to April and May as many as fifty steamers have been chartered to load beans at Dalny and Vladivostock for English ports, representing something like 300,000 tons of raw material, or about £2,000,000 sterling value. During the whole of last season the sales to Great Britain amounted to 400,000 tons, so that in the month of December, with twelve months to run, we have contracted for a quantity only 100,000 tons short of the total English trade during 1909. While it is being estimated that Great Britain will require in 1910 double the quantity imported in 1909, the news comes that Japan and China will also want increased quantities next year. The crop barely covered the demands of East and West during the past season, so there is probably some justification for the fear that during the coming season there may be difficulty in supplying the extra demands which already appear certain to be made upon a comparatively limited crop.

"In America, although the beans have not yet been imported for the reason given, the Government has been at considerable pains to collect all available information regarding this product, with the object–should negotiations for the removal or reduction of the tariff fail–of planting the seed in those parts of the country which would be suitable for its cultivation. In Wisconsin, Massachusetts, and Tennessee, agricultural experiment stations have taken up the Soya bean, and issued extensive reports to the Department of Agriculture, all highly laudatory of the bean as compared with other animal feeding stuffs, such as cottonseed cake and meal, linseed cake, and maize, which are the principal feeding stuffs of the United States.

"In England, the bean cake is of even greater importance than the oil, representing as it does about 90 per cent. of the raw material. The cake is the residue after crushing, and the analysis compares favourably in oil and albuminous substances with the best decorticated cottonseed cake and meal, large quantities of which have been imported into this country for many years for cattle feeding.

"Owing to the low prices of imported beans, bean cake can be bought to-day at £6 12*s* 6*d* per ton in London, while cottonseed cake imported from America is as dear as £7 10*s* to £7 12*s* 6*d*. In Denmark, a great butter-producing country, some hesitation was shown in regard to the introduction` of the Soya bean, as it was feared lest the taste of the butter might be affected by feeding cows with Soya cake, but experiments have proved the reverse, and Denmark has secured 25,000 to 30,000 tons of beans for shipment from Manchuria during the next few months for crushing and cake-making. In France and Germany the tariffs are sufficiently high to shut out the article. Powerful interests are nevertheless at work in both countries to have the duty removed or reduced, but the removal of a duty is an object the accomplishment of which is invariably difficult, and it is to be hoped, for the sake of the English manufacturers, that some time will elapse before the large European countries are enabled to receive direct shipments from Manchuria free of duty, which would only increase competition for supplies of raw material and result in a limitation of our export of bean products, both cake and oil.

"The bean industry, though old to the East, is new to us, so much so that little is known as yet about the Eastern trade, which is responsible for the consumption of the greater part of the Manchurian crop. Reliable information on this head is eminently useful, not to say indispensable, to the English importer, as without knowledge of the local industry it is impossible to follow intelligently the trend of values, which are chiefly dependent upon the demand from China and Japan. In Manchuria the trade is mainly in the hands of the Chinese and Japanese."

The traditional method of crushing Soya beans to make oil and meal is described.

"This cake is used chiefly as a fertiliser in Japan and Southern China. During the present season these two countries imported about 600,000 tons of beancake from Manchuria for fertilising. -In this connection the following questions have been asked, the answers to which are of importance to the English importer:–(1) In the event of bean prices in the United Kingdom reaching high levels, will Japan and China be able to pay enhanced values, and continue to import beancake as a fertiliser? (2) For the same reason will Japan eventually come to rely on phosphates or other artificial manures? (3) If prices continue high in the United Kingdom, will a large quantity of the beans which at present go to the East in the form of beancake tend to come to Europe, thus increasing the available surplus for Europe? In the first place, the beancake as a fertiliser takes precedence of phosphates in Japan, which raises a valuable rice crop. In that country the beancake is considered an indispensable import. We are indebted to Messrs Mitsui and

© Copyright Soyinfo Center 2014

Co., of London, one of the largest shippers of Soya beans to England, for some interesting figures dealing with the import of beancake into Japan over a period of seven years. These figures are of considerable importance, as showing that, on the present level of prices, which is a high one for England, there is no likelihood of the East abstaining from competition with Great Britain for supplies of beans."

"Conditions are rapidly becoming more satisfactory to the native, and fresh producing centres are being opened to trade by the construction of lines connecting with the main routes to Dalny and Vladivostock. On the whole, it maybe confidently anticipated that the cultivation of beans in Manchuria will go on increasing in proportion to the impetus given to trade by broader markets and the provision of adequate railway communication in the interior."

A table (p. 1145) shows the steady growth of imports of beancake into Japan during the last 5 years: 1905–182,000 tons. 1906–258,000 tons. 1907–320,000 tons. 1908–400,000 tons. 1909–600,000 tons.

Note: This is the earliest English-language document seen (Sept. 2006) that contains the term "oleaginous seeds" in connection with the soya bean. Address: From a correspondent.

1334. *London and China Telegraph* (*London*). 1909. The soya bean. 51(2,415):1086. Dec. 6. [1 ref]

• ***Summary:*** "An exhibition of Soya beans and by-products from North China, together with photographs of the Soya bean industry, was held recently at the boardroom of the Manchester Chamber of Commerce. Explanations and full particulars of the industry were given by Mr. Cavendish Evelyn Liardet, lately returned form China.

"At a recent meeting of the committee of the African Trade Section of the Incorporated Chamber of Commerce of Liverpool Mr. A. Grenville Turner delivered an interesting address on the cultivation and uses of the Soya Bean.

"In the course of his address Mr. Turner said that it was estimated that this year's crop of Soya beans is likely to exceed 1,000,000 tons. There were about 20 to 25 varieties of the beans, different in colours, size, and shape. The beans contained about 18 per cent of oil, and it was stated that refined Soya oil fetches to-day a higher price even than refined cottonseed oil. The soya bean, which is an edible bean and can be used in the same manner as marrowfat peas, can be utilised for a number of purposes."

"In America an attempt has recently been made there by certain dealers to place the Soya beans on the market as a new substitute for coffee, and sell it under other names at fancy prices. A sample of coffee specially ground from the Soya bean, at the suggestion of Sir Alfred Jones, was submitted, and created much interest. Mr. Turner stated that according to a recent report issued by the Department of Agriculture of the U.S.A., as Soya beans contain no starch, they have been recommended for food for people suffering from diabetes. Soya bean cake is used as manure on the sugar plantations of Southern China, and on the rush beds, from which Chinese matting is made. Mr. Turner also stated that the Japanese extract casein from the bean from which they make a milk, which is condensed. Cheese is also made from this milk."

Also contains a long summary of information on the uses of soya bean oil and cake published recently: "Cultivation and utilisation of the soy bean." 1909. *Bulletin of the Imperial Institute* (London) 7(3):308-14.

1335. *USDA Bureau of Plant Industry, Inventory.* 1909. Seeds and plants imported during the period from January 1 to March 31, 1909. Nos. 24430 to 25191. No. 18. 73 p. Dec. 24.

• ***Summary:*** Soy bean introductions: *Glycine hispida* (Moench) Maxim.

"24610. From Trenton, Kentucky. Purchased from Mr. S.J. Leavell. Received January 6, 1909. *Trenton.* 'A brown-seeded variety picked out of *Mammoth* by Mr. Leavell in 1904, and in that year 12 plants produced 7 pounds of seed; in 1905 these 7 pounds produced 10 bushels; in 1906 Mr. Leavell reports that with exactly the same treatment it out-yielded *Mammoth* by 50 percent. Seems like a promising variety.'" (H.T. Nielsen).

24641-43. "From Taihoku, Formosa. Presented by Mr. I. Kawakami. Received January 21, 1909. The following seeds:

"24641. Cream-yellow.

"24642. Black, small.

"24643. Black, very small."

24672/24711. "From India. Presented by J. Mollison, esq., M.R.A.C., Inspector-General of Agriculture in India, Nagpur, C.P. Received February 10, 1909. The following seeds (quoted notes by Mr. Mollison; descriptions of varieties by Mr. H.T. Nielsen):

24672-2490.

"24672. *'Rymbai-ktung.* From Khasi Hills, Assam.' Similar to no. 18258a.

"24673. *'Bhatumsh* (red). From Darjeeling, Assam.' Light chocolate color, looks like no. 17852.

"24674. *'Bhatumsh* (yellow). From Darjeeling, Assam.' Straw-yellow with brown hilum.

"24675. *'Bhatwas.* From Safipur, Unao, U.P. [Uttar Pradesh].' Black, small seed about the same size as *Cloud,* but rather more dull in color.

"24676. *'Bhatwas.* From Hasangani, Unao, U.P.' Black, looks like no. 24675, only seeds are shiny like *Cloud.*

"24677. *'Bhatwas.* From Ranjitpurwa, Unao, U.P.' Black, just like no. 24676, only seeds are a trifle smaller.

"24678. *'Chabeni khurti* (spotted variety). From Hardupurwa, Teh Bidhanna, Etawah, U.P.'

"24679. *'Chabeni khurti* (black variety). From Bant, Teh, Sadar, Etawah, U.P.'

"24680. *'Chabeni khurti* (black variety). From Atsu,

Teh, Auraya, Etawah, U.P.'

"24681. *'Bhatwas* (mixture of spotted and black). From Mainpuri, U.P.'

"24682. *'Kali khurti, Chabeni khurti, Khajwa.* From Mainpuri, U.P.'

"24683. *'Chabeni khurti* (black variety). From Kilerman, Teh, Sadar, Etawah, U.P.'

"24684. *'Chabeni khurti* (black variety). From Amapur, Teh, Kasaganj, Etawah, U.P.'

"24685. *'Chabeni khurti* (black variety). From Aliganj, Etawah, U.P.'

"24686. *'Chabeni khurti Bhundadar* (spotted variety). From Jalesar, Etawah, U.P.'

"24687. *Khajwa or kulti.* From United Provinces.'

"24688. *'Bhatwas.* From Cawnpore [Kanpur], U.P.'

"24689. *Bhatwas.* From Nanbasta, Cawnpore, U.P.'

"The preceding S.P.I. Nos. 24678 to 24679 are black, with small seed, about the size and shape of S.P.I. No. 20410. There is some slight variation in the size of the seed, but the entire lot might easily be taken for the same variety if judged by the seed only.

"24690. *'Bharat Safed.* From Dehra Dun, U.P.' Similar to S.P.I. No. 22901."

24693-24711. Japanese varieties of soy beans grown on Poona Farm, Bombay Presidency.

"24693. Straw-yellow, with rather an indistinct hilum, quite similar to *Manhattan,* S.P.I. No. 17277.

"24694. Straw-yellow, very similar to S.P.I. No. 24693; seeds may be a trifle larger.

"24695. Straw-yellow, seed very similar to *Ito San,* but the brown speck at end of hilum is very faint.

"24696. Just like above, S.P.I. No. 24695.

"24697. Similar to S.P.I. No. 20405.

"24698. Olive-yellow, very similar to No. 20893a.

"24699. Straw-yellow, seed about the size of S.P.I. No. 17269.

"24700. Pale straw-yellow, with a black hilum; seed about the size of *Acme,* S.P.I. No. 14954.

"24701. Dirty olive-yellow, with slate-colored hilum; seed about the size of *Ito San,* but more globular.

"24702. Straw-yellow, with very faint hilum; similar to *Butterball,* S.P.I. No. 17273, but seed rather smaller and not so bright in color.

"24703. *'Oylan Dai Dizen.'* Straw-yellow, very similar to *Okute,* S.P.I. No. 19986.

"24704. *'Gosha Dai Dizen.'* Very similar to S.P.I. No. 24700.

"24705. Light shade of chromium-green, similar in appearance to S.P.I. No. 17857, but the color is not quite the same. Note 1. This is the earliest English-language document seen (Oct. 2004) that uses the term "chromium-green" to describe the color of a soybean.

"24706. Black. Apparently just like our *Buckshot,* S.P.I. No. 17251.

"24707. *'Kuru Maru.'* Apparently just like *Nuttall,* S.P.I. No. 17253.

"24708. *'Sirohaha'* [Shiro-haha = white mother]. Apparently just like *Butterball,* S.P.I. No. 17273. "24709. *'Teppo.'* Citron-yellow, seeds about the size of *Butterball.*

"24710. *'Motonari.'* Seed very similar to S.P.I. Nos. 24700 and 24704, but the hilum is russet in this case.

"24711. *'Rokugatsu.'* Citron-yellow, with very faint hilum, seed about the size and shape of *Mammoth."* 24839-40 Grown at the Arlington Experimental Farm, Virginia, from seed obtained from Dr. S.P. Barchet, Shanghai, China, in 1906. Seed of the following:

"24839. Greenish. Grown in 1908 under temporary numbers 0578 and 0579, which proved to be identical.

"24840. Yellow. Grown in 1908 under temporary number 0580."

25116-25118. "From Pithoragarh, Kumaun District, India. Presented by Miss L.W. Sullivan. Received March 26, 1909.

"25118. *'Bhat dal.'* A small black variety of soybean."

25130-31. "From Knoxville, Tennessee. Grown at the Agricultural Experiment Station. Received through Prof. H.A. Morgan, March 29, 1909. Seeds of each of the following.

"25130. Early brown.

"25131. Medium yellow."

25132/25149. "From Soochow, Kiangsu, China. Presented by Rev. R.A. Haden, B.D. Received March 19, 1909. The following seeds:

25133-25137

"25133. Small yellow. 'Tom Thumb soy. The smallest variety; used only for bean sprouts.' Note 2. This observation, that Chinese prefer very small soybeans for sprouting, is very important.

"25134. Large yellow. 'Mammoth yellow soy. This is the very largest of the yellow soys. Used especially for oil and bean curds.'

"25135. Large green. 'Tea green soy. Sutt variety. May be put to all the uses of soy, but in practice they are only used to make parched Sutt beans eaten as a relish.'

"25136. Large reddish brown. 'Mammoth red soy. Used only for eating in the green state, but may be used for all the soy purposes. This is the largest of all the soys.'

"25137. Looks like *Meyer.* 'Mammoth mottled soy. Used especially for bean curd; said to give a special flavor to this; has also abundant oil qualities."

"25161. Grown at the Arlington Experimental Farm, Virginia, season of 1908, under Agros. No. 0824. Numbered for convenience in recording distribution, March 31, 1909. *Eda.* (?) Original seed from the Indiana Agricultural Experiment Station, where it was grown as *Early Brown.* 'This turned out to be identical with *Ito San* in every particular except color of seed. It is a uniform light brown, while *Ito San* is yellow. Neither superior or inferior to *Ito*

© Copyright Soyinfo Center 2014

San.' (H.T. Nielsen.)"

"25138. *Glycine soja:* 'Horse-feed peas, a literal translation of the Chinese. It grows wild over a very large portion of China. In the north peas by the same name, but a different variety, are extensively cultivated. Long vines, climbing on anything in reach; fruited from bottom to top. I think this should receive special attention, for the following reasons: It will be a good nitrogen producer. It is extensively used in Chinese medicine, entering largely into prescriptions taken internally for eye trouble. It will make a better drink than anything except good coffee. Parch until brown the whole pea, grind, and treat as boiled coffee. This I have tried and am very fond of it as a drink.' *Distribution.*- An annual vine, native and cultivated in the eastern part of Asia, extending from Amur and Manchuria through China and eastern India; also in Japan." Address: Washington, DC.

1336. Wildeman, É. de. 1909. Le soja [The soybean]. *Agronomie Tropicale; Organe Mensuel de la Societe d'Etudes d'Agriculture Tropicale* 1(12):195-200. Dec. 25; 2(1&2):5-8. Jan/Feb. 1910. [10 ref. Fre]

• ***Summary:*** An overview of the subject, including a brief history, based largely on a summary of about ten documents. It begins: "For some years now, attention has been drawn to the soybean (*Soja hispida* (Mönch) or *Glycine hispida* (Max.)), which comes from Manchuria; its products are now used in various ways in our daily lives."

"It is not a question of exhausting the question, but as the *Bulletin of the Imperial Institute* of London has already devoted several articles to this plant this year and that the first part of vol. I of the *Liverpool University, Institute of Commercial Research in the Tropics, Bulletin* [Edie, 8 Oct. 1909] is entirely devoted to it, it appeared useful to us to insist here on the soybean which would also have a certain importance for our colonies."

This legume originated in Southeast Asia, and has been cultivated for centuries in China and Japan. It is now abundant throughout Manchuria, where the seeds are widely appreciated for their nutritive value. It was later introduced into the Indies (*l'Inde*) and arrived in England at the end of the 18th century. About 30 years, it was the subject of numerous trials [by Haberlandt and co-workers] in Austria, but is only recently that it has become an article of commercial importance in Europe.

"The occupation of Northern Manchuria by Russian troops, during the Russo-Japanese War, gave rise to numerous demands for this bean, which stimulated the extension of [its] agriculture. After the departure of the troops, the local demand fell naturally, and it was necessary to find an outlet in foreign markets. From 1906 to 1908, a large part of the products of N. Manchuria were exported to Japan via Vladivostok, but in 1908 the economic crisis of Japan diverted a part of these products to Europe, which actually received large quantities of soybeans, especially in England. The first large shipment of soybeans contained 5,200 tonnes (metric tons) and arrived at Hull on 2 March 1909. The beans arrived at the destination in perfect condition despite the distance. They were classed in three categories: 1. Shipped from Dalny; 2. Shipped from Vladivostock; and 3. Shipped from Hankow. The value of those in category No. 1 is about £6 8*s.*/tonne [metric ton]; those in No. 2 and No. 3 is about £6 6*s.*/tonne, these prices being, naturally, subject to the fluctuations of the market. Most imported beans are monopolized by the manufacturers of oil who obtain 10-18% of the weight of the beans in oil. [The remaining] oilcake can be used in the feed of livestock."

There follows a long discussion of soybean cultivation and production, including soils, fertilizers, nitrogen fixation by root nodules, planting, intercropping, yields of forage and seed, use as silage, soil restoration, soybean varieties, tables showing the chemical composition of the plant and seeds showing their excellent nutritional value.

"Until recently, soybean cultivation has been confined to Asia and some states of the USA. Recently, the question of cultivating this plant in the various British colonies has been raised. In most of the colonies of West Africa, the soybean could probably be cultivated with success in rotation or mixed with maize or other crops, and give significant yields."

"In China, Japan, and Indo-China the seeds are used to prepare a sort of milky liquid (*liquide lactescent*) [soymilk] and a sort of cheese" [tofu]. A brief description of each process is given. The milk has considerable nutritional value "but is not suited for infants."

"The flour of soybeans (*La farine de fèves de soja*) is used to make biscuits, and, mixed with wheat flour, is used to make a brown bread; it is sometimes even preferred in this application to rye flour. Since it contains neither sugar nor starch, the soybean has been recommended as the basis of diabetic diets." Address: Prof., School of Horticulture, Vilvoorde, Belgium (Professeur au Cors colonial de l'École d'Horticulture de Vilvorde).

1337. Ker, W.P. 1909. China. Report for the year 1909 on the trade of China. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*) No. 4386. 76 p. Dec. See p. 57-58.

• ***Summary:*** A table (p. 5-6) lists 36 major Chinese [and Manchurian] port cities and 15 provinces in China, and the estimated populations of each. Cities with population of 600,000 or greater are: Canton 900,000, Hankow 820,000, Tientsin 800,000, Shanghai 651,000, Foochow 624,000, Chunking 610,000.

A table (p. 6) lists the estimated foreign population of China during the year 1908: Japanese 44,143, Russian 9,520, British 9,043, German 3,637, American 3,545... Total 77,960.

"Beans. Although Japan is the destination of most of the

© Copyright Soyinfo Center 2014

beans and bean cake exported from China, one of the most interesting features of the trade of China in 1908 was the commencement of the export on a large scale of the 'soya' bean of Manchuria direct to Europe. The first season of this trade only began in November, so that the full effect of the new development is not apparent in the customs figures. The port of Dalny, or Dairen as it is now called, is the chief seat of the export for Europe. It is estimated that during the season which began in November, 1908, and closed in June, 1909, over 152,000 tons of beans were shipped from Dairen to Europe, declared mostly for Liverpool, Hull and Bremen. The number of vessels employed for this purpose was 25. During the same period the export of beans from Vladivostock [Vladivostok] is stated to have been over 143,000 tons, of which 65,000 tons were shipped in June. More than half the quantity shipped from Vladivostock went to the United Kingdom. A well-known Japanese firm [Mitsui & Co.] was the first in the field for the export from Dairen, and is said to have made enormous profits, but three or four British firms soon followed and took a considerable share of the business, dispatching perhaps nearly 40 per cent. of the whole quantity. There is great demand in the United Kingdom for seed oil for machinery, soap-making, cooking and other purposes, and I understand that the demand for beans in the United Kingdom was stimulated by a shortage in the supply of cotton seeds from India and Egypt. The efficacy of beans for cattle food has also been proved in the United Kingdom. Excellent crops in Manchuria, low prices in gold for the produce and cheap freights made a combination of circumstances favourable for the trade, such as cannot reasonably be expected to occur frequently, and the purchase of beans in the interior is, I am told, an operation involving no small difficulty and financial risk. However, the prospects for next season's bean trade are, on the whole, bright.

"Hankow [in Hupeh province, on the Yangtze River, 585 miles upstream from Shanghai] also is the outlet of a great bean-producing district, but in its competition for direct export to Europe it is handicapped by a much heavier freight, 1*l.* 15*s.* [*l.* = £] per ton against 19*s.* per ton (rising afterwards to 1*l.* 6*s.*) from Dairen. Moreover, I am informed that some experimental shipments of Yangtse [Yangtze River] beans made in the autumn of 1908 turned out unsuccessful, the beans from the damper climate of Central China, although looking just as good when shipped as Manchurian beans, becoming mouldy on the voyage. An increase in the export of beans is noted also at Chinkiang [Chen-Chiang, in Kiangsu province, on the Yangtze River 43 miles downstream from Nanking].

"Bean cake is exported chiefly from Newchwang. The export there increased from some 4,300,000 cwts. [1 cwt = hundredweight = 112 pounds] in 1907 to some 5,400,000 cwts. in 1908, and in spite of an increasing export from Dairen, Japan took 78 per cent. of this amount, the same as in the two previous years." A table (p. 56-57), titled "Principal Exports from China, chiefly to Asiatic Countries (India excepted)," shows the articles exported (incl. bean cake and beans), averages for the years 1903-07, 1907, 1908, and increases or decreases in 1908 compared with 1907 and the average of 1903-07. For bean cake: Average 1903-07: 3,702,537 cwts. 1907: 4,978,588 cwts. 1909: 9,321,582 cwts. Address: Commercial Attaché to His Majesty's [British] Legation at Peking.

1338. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1909. Soya bean traffic. No. 351. p. 65-67. Dec.

• ***Summary:*** In the section titled "China: Large profits to several concerns handling them," Vice-Consul Gordon Paddock of Harbin, Manchuria, states: "The exports of these beans in the raw state to England was initiated in this district by the Mitsui Company, one of the most important Japanese mercantile concerns, which is said to have made over 1,000,000 yen ($498,000) in this business alone within the last year. More recently, since the beginning of 1909, several British concerns engaged in business in China, have become interested in the export of these beans to England." These include such important concerns as Jardine, Matheson & Co. (Limited), and Samuel Samuel & Co. (Limited) of London. "No large Chinese concern has thus far been interested in the export of these beans from this district."

The section titled "United Kingdom" states: "There is every prospect of the bean trade in North Manchuria developing into a complicated and highly speculative business... American firms have recently entered the market. German firms, in view of the repeal of the duty on beans in Germany, will undoubtedly buy largely; while a well-known Japanese firm, by far the largest operators till now, were believed to be preparing for export on an even larger scale than hitherto. The tendency promises to be for Chinese merchants to get the business into their own hands, buying from the local producers and selling again to the European firms."

The section titled "Liverpool: Experiments in Europe of mixing with flour, etc." states: "Oil millers of Liverpool are disposed to regard the products of the soya bean as additional articles of trade and not as competing to replace the manufactures of cotton seed... The first complete cargo of soya beans that arrived in the United Kingdom reached Liverpool February 14, 1909, and the interest in this new industry has grown apace since then." An expert Liverpool baker, as an experiment, has made a blend of soya flour and wheat flour for use as a "soya dog biscuit... A few German millers are reported to have mixed soya and rye flour in experiments in the making of the blackbread of that country, and local experimenters her [in Liverpool] are experimenting with a blend to improve their own brown bread.

"A vegetable cheese [tofu] is known to be produced

© Copyright Soyinfo Center 2014

from the caseine [casein] that the bean contains, but this has not advanced from the experimental to the commercial stage."

It is "stated that one of the large shipowners of Liverpool contemplates the introduction of the soya bean into West Africa, where soil and labor conditions are thought to be particularly favorable to the growth of good crops. This enterprise is cited as a parallel to the British cotton growing movement at its inception, and some measure of the same success is confidently predicted for it.

"Soya Bean Growing for Africa." Consul Horace Lee Washington of Liverpool "reports that several British firms displayed in the Liverpool office of a large shipping concern samples of soya-bean products. These samples are to be sent to the Calabar and Lagos [Nigeria] agricultural exhibitions, in order to encourage the cultivation of these beans in West Africa for transport to Liverpool. The samples consist of edible and crude oil, flour (for bread making), meal, biscuits, oil cake, soap, and a substitute for coffee.

"Russia: High Cost of Transportation Restricts Their Use." Consul Hernando de Sota, of Riga [as of 1994, the capital of Latvia] "writes that high freight rates on shipments from Manchuria to that district will probably prevent it use to any large extent. He says: 'The Manchurian soya bean has until the present date neither been imported into nor exported from the ports of this consular district. Some time ago one of the largest mills in this city purchased from Manchuria a few carloads of the bean for the purpose of making experiments in converting the bean into cake." However "on account of the high cost of transportation over the Siberia road, by which the bean could not be delivered at Riga for less than 1.20 rubles (62 cents) per pood (36 pounds), the business would not be profitable."

Note 1. This is the 2nd earliest document seen (Feb. 2005) concerning soybeans in Latvia. This document contains the earliest date seen for soybeans in Latvia (1909) (one of two documents).

Note 2. This is the earliest document seen (Aug. 2009) concerning soybeans/soya in connection with (but not yet in) Nigeria. Address: Washington, DC.

1344. Carson, John M. 1909. Soya bean and products. *Special Consular Report* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 41. Part 5. 35 p. Erroneously numbered Special Consular Reports, Vol. XL.
• ***Summary:*** Contents: Introduction. I. Countries of production. China: Newchang (Varieties of beans and amount produced {in centals [hundredweights; 1 cental = 112 pounds]}, methods of cultivating and harvesting, prices and exports, shipments to Europe–use by natives), Dalny (Manufacture of bean cake and oil, preparing the cake, expressing the oil and wages paid, freight charges to Dalny, exports, stock on hand, and prices), Chefoo (Beans imported for cake manufacture, quantity and value of output, bean vermicelli made by a peculiar process [from the small green bean lü tou {mung bean}], preparation of beans, drying of product and prices [for vermicelli]), Shanghai (Extent of export trade in beans), Shantung (manufacture of bean oil and cake, harvesting and pressing, shipping and prices), Swatow, Tientsin (Exports of raw beans, shipments of bean cake, extent of trade at Tientsin). Tables (p. 5) show prices and exports of soya beans, bean cake and bean oil at Newchang for the years 1905-1908. Japan: Cost of production and prices (of soya beans, quite detailed), imports of beans and cakes, use of the bean as food (shoyu, miso, tofu, koya-tofu, natto, flour), Kobe (Beans as human food {eaten boiled with a little soy [sauce], "made into bean curd, and a kind of sauce made of wheat, beans, and salt"}–small exports {"The total exports of beans, pease, and pulse [incl. soy] in 1908 were valued at $25,971, of which about $24,000 worth went to Hawaii, the United States, and Canada for use by the Japanese residents in those countries as an article of food"}, manufacture of cake), Nagasaki (Production of beans, imports of beans–market prices). Shipments from Vladivostok * [Russia, of soybeans probably grown in Manchuria] (Fluctuations in prices, shipments during present season, immense shipments planned next season (by Mitsui)).

"It is the intention of Mitsui Bussan Kaisha, the largest exporter from this port, to ship about 200,000 tons of beans via Vladivostok during 1909 and about double that quantity via Dalny. Many large contracts have been made for next season, and from present indications a strong effort will be made against the control of Mitsui Bussan Kaisha as the Chinese are making arrangements to deal direct with the European market without the aid of the Japanese" (p. 18).

Tables show: The quantities and value of soya beans, soya-bean cake, and bean oil imported into Japan during the year 1908 (p. 15). The soya bean harvests (in bushels) reported in various Japanese districts (p. 16).

II. Markets. Denmark: Experimental imports made, views of an importer. France: High duties prevent importation of soya beans, soya-bean flour bread used by diabetics, unknown in Calais district. Germany: Danger of feeding cattle on soya-bean products, oil value–prices at Hamburg, comparative food value of the bean. Italy: Beans imported and cultivated in limited quantities, prices of soya products–American cotton-seed oil, not imported into Catania, home products supply Piedmont district. Netherlands: A great future for the soya-bean trade predicted, prices of the bean and bean cake, soya cake as cattle feed, manufacture of soya-bean products begun, English soya-bean cake defective. Norway: Imports of soya-bean meal and cotton-seed meal. Russia: Beans and products unsatisfactory as feeding stuffs. Spain: Soya bean unknown in Valencia district [They are neither cultivated nor imported in this district]. Straits Settlements [Singapore and Malaya]. Sweden: Soya-bean products introduced through England. Comparative value of cattle feed [work by Nils Hansson of Sweden], comparative prices of feed stuffs. Turkey. England: Liverpool (Conversion of the soya bean into cake and meal), Plymouth (Soya cake and meal extensively consumed), Southampton (The bean appreciated as a fattener and as a dairy ration, the soya bean as human food [for use in diabetic diets]). Ireland: Chinese bean products are favorably received, soya bean introduced in Belfast, small imports at Cork. Scotland: Statistics as to use in Dunfermline not available, test of feeding value of soya cake [by Prof. Douglas A. Gilchrist], Edinburgh mills making experiments (based on 1909 report 1909 of U.S. Consul Rufus Fleming from Edinburgh).

III. Competitive American exports. Tables (p. 35) show exports for 1907, 1908, and 1909 of cotton-seed meal, cotton-seed oil, and cottolene, lardine [not defined: presumably shortening made from cottonseed oil], etc. to major countries, especially in Europe.

The Introduction notes: "In compliance with requests from manufacturers of cotton-seed products in the United States, who desired that an investigation be made of the production and use of the soya bean and its manufacturers in the Far East and of the extent to which they compete with American cotton-seed products in the European markets, the reports following have been submitted by consular officers in the various countries concerned...

"The reports of the consular officers have been placed in two groups, the first having to do with the countries that produce the soya bean and the second with the countries that are sought as markets. Statistics as to the imports of soya-bean products in many European countries were

© Copyright Soyinfo Center 2014

not available at the time the reports were submitted, but inasmuch as the prices quoted were generally lower than for other seed products, emphasis has been laid on the relative merits of the two classes of goods as shown by experiments and analyses in these countries. These manufacturers will have to work in meeting this new competition."

Note 1. This is the earliest document seen (Dec. 2007) concerning soybean products (oil or meal) in Turkey, Denmark, Ireland, the Middle East, or Sweden (one of two documents); soybeans as such have not yet been reported in any of these countries. This document contains the earliest date seen for soybean products in the Middle East or Turkey (1909).

Note 2. This is the earliest English-language document seen (Nov. 2013) that uses the term "soya-bean flour." Address: Chief of Dep.

1345. Carson, John M. 1909. Soya bean and products: Straits Settlements (Document part). *Special Consular Report* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 41. Part 5. p. 26. Erroneously numbered Special Consular Reports, Vol. XL.

• ***Summary:*** "Vice-Consul-General George E. Chamberlin, of Singapore, reports that the soya bean is not cultivated in that district. As to the imports and the uses to which the beans are put, he writes:

"The beans are imported into Singapore and other ports of this district from China, Japan, and India, principally from the former country, in considerable quantities, and are used for making soya [soy sauce] and bean cheese [tofu], or bean cake–popular articles of food among the natives and Chinese. Practically no beans are exported and no bean cake, all being consumed locally.

"Soya beans in this locality are not made into meal, nor are they used for the same purpose as cotton-seed meal and cake. The present market price is about $2 per picul (133 1/3 pounds) for the white soya bean and $1.75 for the black."

Note 1. The Straits Settlements is a former British Colony on the south and west coast of the Malay Peninsula, including adjacent islands, comprising Singapore, Penang, and Malacca settlements.

Note 2. This is the earliest document seen (May 2010) concerning soybeans in Singapore. This document contains the earliest date seen for soybeans in Singapore (1909). Address: Chief of Dep.

1346. Carson, John M. 1909. Soya bean and products: Japan (Document part). *Special Consular Report* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 41. Part 5. p. 13-16. Erroneously numbered Special Consular Reports, Vol. XL.

• ***Summary:*** Vice-Consul-General E.G. Babbitt of Yokohama writes: "The soya bean, or soja bean, as it is known here (Common Japanese name 'daidzu' [daizu]), is cultivated throughout the Empire of Japan. The total area of cultivation is in the neighborhood of 1,200,000 acres, or about 3.8 per cent of the total area devoted to the cultivation of rice and other cereals and grains. The soya bean is often cultivated, not in fields by itself, but in rows along the edges of rice or wheat fields. These edges are, as a rule, very soft, for they have been previously plowed, and little labor is required in planting... In harvesting the plants are uprooted, and, after being dried in the sun for several days, flails are used to separate the beans from the pods. The flails are of a very primitive type, with bamboo handle and of light weight. Female and child labor is invariably employed in flailing.

"The kinds of fertilizers used differ by districts. In the prefecture of Miyagi, for example, straw ashes and superphosphate of lime are commonly employed, while in the prefecture of Akita wood ashes, superphosphate of lime, and horse dung are used."

The average yield of soybeans in Japan over the past 10 years is 15.30 bushels per acre. For the year 1907 the highest yield is from Ishikawa prefecture, 21.62 bushels/acre, whereas the lowest yield is from Okinawa prefecture (Loochoo Islands, south of Kiushu [Kyushu]), 8.48 bushels/acre. During 1908 huge amounts of soya beans (3.3 million piculs; 1 picul = 132.277 pounds weight) were imported to Japan from China, Kwantung, and Korea, with small amounts coming from Asiatic Russia. Large amounts of soya-bean cake (7.760 million piculs) were imported from China and Kwantung, with small amounts coming from Asiatic Russia and none from Korea. "The total imports of bean oil in 1908 amounted to only 49,993 pounds, valued at $1,325."

"The soya bean is one of the most important articles of food in Japan. The beans are cooked in various ways, while in brewing soy (shoyu), in the manufacture of miso (pea or bean cheese), tofu (bean curd), koya-tofu (frozen bean curd), and natto (steamed beans) they are the chief ingredient. They are also manufactured into flour and make up the principal part of many Japanese sweetmeats. All these foodstuffs are daily used in Japanese homes.

"To a limited extent soya beans are used as horse or cattle food, being sometimes boiled and mixed with straw, barley, bran, etc."

The vice consul of Kobe states that in 1908 Japan produced 18,812,228 bushels of soya beans. Small amounts are exported "to Hawaii, the United States and Canada for use by the Japanese resident in those countries as an article of food." Three factories in the Kobe district make bean cake, largely from imported, lower-cost soya beans. "The beans are first crushed flat, then put into a big container and steamed, after which they are put into a steam press to extract the oil and to be made into cakes. The cakes come in circular pieces, a yard in diameter and an inch thick, each weighing about 50 pounds. The oil is used for lubricating machinery. The cake is used only as a fertilizer and is not fed

© Copyright Soyinfo Center 2014

to animals as it causes their hair to fall off."

Note 1. This is the earliest document seen (Feb. 2004) stating that soya bean oil can be used as a lubricant.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "koya-tofu" to refer to dried-frozen tofu.

Note 3. This is the earliest document seen (Aug. 2011) in *Chemist and Druggist* in which the toxicity of a soy product is discussed or alleged, namely soya cake "is not fed to animals as it causes their hair to fall off." Address: Chief of Dep.

1347. Carson, John M. 1909. Soya bean and products: Shipments from Vladivostok (Document part). *Special Consular Report* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 41. Part 5. p. 17-18. Erroneously numbered Special Consular Reports, Vol. XL.

• ***Summary:*** "Consul Lester Maynard, of Vladivostok, reports that the first important shipments of soya beans to Europe through the port took place about a year ago. The beans are not grown in Siberia, coming to Vladivostok from Manchuria over the Chinese Eastern Railway. The principal distributing centers for beans are Harbin and Kuanchentsi (Japanese name: Changchun) and the area under cultivation is along the South Manchurian Railway and the Chinese Eastern Railway."

Most of the shipping from Vladivostok has been in British bottoms. "Almost two-thirds of the entire crop is shipped through Dalny, a small proportion going through Newchwang and about one-fifth of the crop through Vladivostok. Dalny is the popular port of shipment, due to the fact that it is to 2 days shorter, and there are not the formalities to be gone through that are necessary here."

"The shipments of [soya] beans through this port during the present season, it is estimated, will aggregate 175,932 tons, or about 19½ per cent of the total crop... Nearly all of these shipments have been taken by England."

"Immense shipments planned next season: It is the intention of the Mitsui Bussan Kaisha, the largest exporter from this port, to ship about 200,000 tons of [soya] beans via Vladivostok during 1909 and about double that quantity via Dalny. Many large contracts have been made for next season, and from present indications a strong effort will be made against the control of the Mitsui Bussan Kaisha, as the Chinese are making arrangements to deal direct with the European market without the aid of the Japanese."

Note: This is the earliest document seen (June 2007) that mentions the South Manchuria Railway in connection with soybeans (one of two documents). Address: Chief of Dep.

1348. Carson, John M. 1909. Soya bean and products: Dalny (Document part). *Special Consular Report* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 41. Part 5. p. 6-8. Erroneously numbered Special Consular Reports, Vol. XL.

• ***Summary:*** Contents: Manufacture of bean cake and oil. Preparing the cake. Expressing the oil and wages paid. Freight charges to Dalny. Exports, stock on hand, and price.

"The manufacture of soya-bean products in Dalny is described in the following report by Vice-Consul A.A. Williamson, who also submits a statement of exports from that port and prevailing prices:

"The most up-to-date mill in Dalny at present is the Nisshin Bean Oil Mill of the Okura Gumi. It is the only one using presses run by steam; all the others apply pressure to the cake by hand screws or by driving wedges with heavy stone mallets suspended from the roof of the mill. A sketch of this bean-oil mill is submitted herewith. [On file in the Bureau of Manufactures.]"

There follows a long and detailed description of the process used at the Nisshin mill. "The first step in the process is to clean the beans of dust and dirt by an ordinary fanning system." Note 1. This is the earliest English-language document seen (Nov. 2006) that uses the word "fanning" or the term "fanning system" in connection with cleaning soybeans.

Warm the beans in the cleaning rooms, especially in winter, to increase their oil-giving properties. Run the beans along wooden troughs into roller machines, where they are crushed between an upper and lower roller, until each bean is the shape of a dime. Transport the crushed beans in an iron-lined trough using an Archimedian screw to an inclosed endless chain and bucket system. Scoop them into baskets, weigh them, and take them to a steamer, "which is a square, box-like arrangement of brick, whose wooden top has a circular opening some 4 feet in diameter, the sides being closed in with brick. A workman takes a heavy, loosely woven cloth, like ordinary gunny sacking, and spreads it over the circular opening. Another workman dumps the mashed and weighed beans onto this cloth. The first worker spreads them evenly, at the same time opening the steam-valve lever with his foot. The steam, which enters the box with 30 pounds pressure, penetrates the mass, softening and cooking the beans for about 1 minute."

Preparing the cake: Dump the steamed beans "into the waiting form, which is made of two iron hoops, 1¼ inches wide and forming a 23-inch diameter circle, laid one on the other. Above these a wider wooden hoop is laid. Across all three two bundles of grass (*Carex dispalatha,* Boott), which comes from China, are spread, fan shape." After spreading the coarse grass, thus forming the bottom of the form, set a thin wooden hoop about 15 to 18 inches wide, down inside the iron hoops on top of the spread grass. Dump the steaming hot beans into this receptacle. "A workman jumps in, his feet encased in large leather brogans, and tramps down the mass. Then he raises the iron hoops, the lower one about 1 inch, the upper one an inch or so higher. He then swiftly withdraws the retaining wooden hoop and casts it aside. The beans are

© Copyright Soyinfo Center 2014

now held in form by the grass bottom and grass sides, bound by two iron hoops." Two iron rods are laid across to keep the free ends of the grass in place.

"Expressing the oil and wages paid: All this has been done on an iron plate laid on the floor. This plate is carried to a small press, where it is tilted and the grass-bound cake slides into the bed of the hand press. A few turns of the screw causes a pressure of about 5 tons, under which the cake remains only long enough for another to be made ready. Then it is carried to the steam power press, which works simultaneously up stairs and down, and holds altogether about 100 cakes. As soon as it is full, pressure is applied, and gradually the bottom of the press rises until a pressure of 50 tons is reached. The oil now begins to flow, coming out in streams and falling into troughs at the base of the press. After 10 minutes the pressure is increased to 130 tons and the beans are allowed to stand for 2 hours.

"Meanwhile the oil runs into a small receiving tank, from which it is pumped into the large tanks of a special building. After 2 hours have elapsed the beans cease to emit oil, the pressure is removed, and the bean cakes thrown onto the floor. They are then stripped of the grass covering, the retaining iron hoops first being loosened with a peavy-like tool [resembling a lumberman's lever that has a pivoting hooked arm and metal spike at one end], and the edges trimmed with drawknives. They are now ready for weighing and storing. Those under proper weight (46 kin = 61.33 pounds) are sold at a reduced weight; excessive weight brings no increase in price. The oil is sold after being refined.

"This mill has four presses, each of which works independent of the others. With three crews of men, the work is kept up for 24 continuous hours, and the daily output is 4,000 cakes. Sixty-four pounds of beans give 5.33 pounds of oil and 61.33 pounds of cake. The laborers are all Chinese, only one or two overseers being Japanese. The ordinary coolie receives 30 cents per day, the scale rising according to the steps above the coolie. In this mill the hands share in excess of profits on an increase over a stated output per day, hence they work almost frantically [incentive system]. The finished bean cake measures a trifle less than 23 inches in diameter, 3.625 inches thick, and weighs 61.33 pounds."

Freight charges are given from several stations to Dalny on beans and bean cake per ton, by the carload. The stations are Mukden ($1.85), Hsinchengtzu, Shuangmiaotzu, Hsingtaitzu, Tieling, Kaiyuan, Chengtu, Fushun. Loading charges into ships per ton: Beans 12 cents; bean cake 13 cents; extra stevedore 7½ cents. Other small charges include storage and wharfage after 10 days, transfer charges on the wharf, export duty, rebagging if necessary, etc. "The silver yen at present rate of exchange is about 44 cents American currency."

Note 2. This is the earliest published document seen (Jan. 2014) that mentions Nisshin (a major Japanese soybean crusher), in connection with soybeans. Address: Chief of Dep.

1350. Lewkowitsch, Julius. 1909. Chemical technology and analysis of oils, fats, and waxes. 4th ed. Entirely rewritten and enlarged. 3 vols. London: Macmillan and Co., Ltd. See vol. II, p. 122-24. [7 ref]

• ***Summary:*** The section titled "Soja bean oil (Soy-bean oil, Bean oil, Chinese bean oil)" (Vol. II, p. 122-24) gives details about the soja bean, which is indigenous to China, Manchuria, Korea, Japan, Formosa, and Indo-China. The soja bean industry is one of the most important in Manchuria and Japan. In Manchuria, the expressed meal is made into bean cakes (*Téou-fou-tcha*) which are exported in large numbers. The Japanese make shoyu and miso from soja beans. "Efforts have been made to ship soja beans to Europe, but on account of the deterioration which they undergo on the long voyage, as also on account of the difficulty of disposing of the cakes, attempts in this direction have been abandoned." Two tables give physical and chemical characteristics based on the investigations of: (1) Morawski and Stingl; (2) De Negri and Fabris; (3) Shukoff (from seed grown in an experimental station in South Russia); (4) Lane (who found 80.26% of liquid fatty acids).

Vol. II also discusses many other major and minor oils including: Linseed oil (p. 39-60), hemp seed oil (p. 76-77), sesamé oil (beniseed oil, gingelli oil, teel oil, p. 167-79), almond oil (p. 233-40), and arachis oil (peanut oil, earthnut oil, ground nut oil, p. 244).

Julius Lewkowitsch lived 1857-1913. Address: Ph.D., M.A., F.I.C., Consulting and analytical chemist, and chemical engineer, examiner in "soap manufacture" and in "fats and oils" to the City and Guilds of London Inst.

• ***Summary:*** On the title page: "Written after twenty-five years' residence and work in Japan."

Chapter 22, "Life in a tea, silk, saké or shoyu district," states (p. 121): "As a striking contrast to the general poverty of appearance of districts purely agricultural–i.e. devoted to the cultivation of rice and other cereals–we have the general aspect of those districts in which tea is the principal product, where silkworms are cultivated, or saké and soy

© Copyright Soyinfo Center 2014

manufactured. In these districts–known as "Shoyu" districts–there is a far larger amount of wealth, and the general standard of comfort in all classes is much higher."

Continuing on p. 124: "Saké and soy [sauce] (the latter the foundation of our Worcestershire sauce) are old-established industries which have generally been carried on by the same families for generations." Soy is mentioned briefly on p. 128.

Chapter 35, "Sights and cries in Tokyo streets," states (p. 188-89): The first sounds he hears in the morning are those from a Buddhist temple. "Domestic life begins at a somewhat later hour, but in the streets I can already hear the cry of "Natto, na–tto–!" which tells me that the poor are beginning to bestir themselves. Natto is a concoction of beans which have been kept until they are beginning to go bad. It is said to have a rich tasty flavour, and to be very popular with some sections of the community. It is essentially a poor man's dish. By the time the natto sellers have done their business, other itinerant vendors have begun their rounds." Address: M.A., Lecturer in the Imperial Univ., Higher Naval College and Higher Commercial School, Tokyo. Formerly Fellow of Peterhouse [UK].

• ***Summary:*** The last entry in the section on "Legumes," titled "Soy peas or beans" (*Pois ou fèves de Soja / Soya*), states: In order to be complete, to the preceding dried legumes I add the soybean, used here only as a therapeutic agent, but whose consumption in China and especially in Japan is considerable.

Its use in food is, moreover, completely justified by its great nutritive value. Here are some analyses of its nutritional composition: A table (p. 495) gives 6 analyses by three authors (each of whom cites other researchers) as follows: Balland (Gautier): maximum, minimum, mean. König (Siderski): black or yellow soybeans. König (Siderski): soy flour.

As you see, despite their great nutritive value, all the other legumes remain below that of the soybean. It contains more than 30% protein and 400 calories per 100 gm. It must be added that no other legume is as rich in minerals, for soy always contains at least 4%.

This legume, known in Japan by the name of *daidzou* [*daizu*], can be made into a cheese, tofu (*tôfou,*) and above all the national sauce, shoyu (*shôyou*) and miso. These three substances result from fermentation, but under different conditions.

Japanese miso is a venerable food; it's the *tao-tzung* of the Chinese. It is made of crushed soybeans, boiled and mixed with rice or wheat koji, then submitted to fermentation. Miso consumption in Japan is 30 million kg.

Tofu is also used frequently but less than the preceding [miso], and much less than soy sauce which constitutes the universal seasoning. The consumption of this last would be, in fact, 5.5 liters per inhabitant.

Discussed in this section are: Dry beans (*haricots secs;* [*Phaseolus vulgaris*]), lentils, peas or round peas (*pois ronds* [Pisum sativum]), square peas (*pois carrés;* probably winged beans {*Psophocarpus tetragonolobus*}, or flat pea / Lathyrus pea / chickly vetch {*Lathyrus sativus*}, or *Pisum sativum medullare*), chickpeas (*pois chiches*), and dry [broad] beans (*fèves sèches;* [probably *Vicia faba*], broad beans). Address: M.D., principal physician for the Naval Reserves, Prof. at the Faculty of Medicine, Toulouse (Médecin principal de réserve de la Marine).

• ***Summary:*** The section titled "Soy beans" (p. 257) states: "Recent explorations in China and extensive correspondence with missionaries and others have yielded during the past few years a very large number of varieties of soy beans. Fully 200 distinct varieties have now been obtained, showing a diversity of growth and of possible value wholly unsuspected. Previous to these investigations only 5 or 6 varieties were known to American agriculture. The rapidly increasing prominence of the soy bean, especially in the Southern States, makes it important to secure the very best varieties. It is a curious fact that the variety most widely grown in the United States, the Mammoth, which was introduced at least thirty years ago, has never again been obtained. It is equally strange that of the other numerous new varieties obtained, nearly all of them, except certain Japanese varieties, have been secured in only a single locality. The truth is that throughout most of the Chinese Empire every variety is grown locally. Mr. F.N. Meyer, who has traveled widely in China, states that this extreme localization of these varieties is a very striking fact in Chinese agriculture, due, as he thinks, to the fact that for ages every Chinese farmer has grown his own seed, and there has been little or no exchange of seeds from province to province. It would therefore appear likely that numerous other varieties yet remain to be obtained."

"Among the new varieties of soy beans are some from far north in Manchuria and Siberia, which mature in seventy to eighty days, and others from southern China that are so late that they scarcely mature in our warmest States. Several of these new varieties in the trials thus far conducted promise to be decidedly superior to the Mammoth variety.

"Especially valuable are the Riceland soy beans, grown by the Chinese in rotation with rice. These varieties are very distinct from others and on account of their numerous slender stems, large size, and leafiness make hay of unusually fine

© Copyright Soyinfo Center 2014

quality.

"While at the present time soy beans are most important in the Southern and Middle Southern States, they will doubtless in time become of great value in the arid regions on account of their marked drought resistance. Unfortunately, rabbits are extremely fond of soy beans, causing so much destruction that it is practically impossible to grow this crop where these animals abound, as is still the case throughout our semiarid regions."

Soy beans are also mentioned briefly on p. 248. There are long sections on the "Florida velvet bean" (p. 247-49), "Kudzu" (p. 249-51, with a photo facing p. 48 of "A patch of kudzu (*Pueraria thunbergiana*) growing at Washington, DC"), "Adzuki bean" (p. 253-54, with two photos, plate xi, of a "Field of adzuki beans (*Phaseolus angularis*) grown at Arlington Farm, Virginia, in 1908)," "Cowpea" (p. 254-56), "Bonavist bean or hyacinth bean (*Dolichos lablab*)" (plate XII, p. 258), "Bur clovers" (p. 259-60) and "Vetches" (p. 260; many species of *Vicia;* common vetch, hairy vetch, scarlet vetch, black-purple vetch, woolly pod vetch).

Note: This is the earliest English-language document seen (June 2008) that uses the term "bonavist bean" to refer to *Dolichos lablab.* Address: Agrostologist in Charge of Forage Crop Investigations, Bureau of Plant Industry [USDA].

• ***Summary:*** The section titled "Soya Beans or China Oil Beans" (p. 29-32) begins: "Most notable, perhaps, of the new foods is the Soya Bean, which has come meteor-like into this country in large quantities during the last year or so."

"What circumstances or combination of events have made it possible at this particular period for merchants to ship the vast quantities of the Beans which have recently reached these shores I have not been able to discover, but it seems to me that the chief factor is to be found in the development of Manchuria by the Japanese as the result of the Russo-Japanese war. It is said that during the campaign Soya Beans entered largely into the dietary of the Japanese army, and, doubtless, during the progress of the war the Japanese became familiarised with the Bean-producing districts, and the exportation of the surplus supplies is the result. Be that as it may, the fact remains that up to the end of next August, so I am informed on very good authority, the estimated sales in the United Kingdom of the Soya Oil Beans may be roughly estimated at 250,000 tons. What the future is likely to be is uncertain, but from conversations I have had with those who have studied the subject, the general impression seems to be that they 'have come to stay,' and that in the near future at all events the Beans, either whole or crushed into cake, will have to be reckoned with as a serious competitor of the better known and more generally used feeding stuffs."

"The direct shipments of Soya Bean Cake–or, as it has been hitherto more commonly called, China Bean Cake–from the East, have so far been spasmodic and small in extent, and owing to the 'heated' condition in which they have arrived, have not been, I should say, a commercial success, on account of the relatively low price realized."

A table titled "Composition of soya bean cake and meal" (p. 32) includes the composition of "China bean cake (imported), Soya bean meal, Soya bean cake, Chinese bean cake (rolled or crushed), and Manchurian bean cake."

Soy is also mentioned in the "Appendix" (p. 39-45), a long table that gives the composition of many feeds: Soya beans, Soya bean cake, Soya bean meal (p. 41). Also includes (p. 44-45): Sesame cake, Benniseed (sesame) cake, Til seed (sesame) cake, Ground nut cake (earth nut), Gingelly and Niger seed cake, Pea nut cake (American), Sago flour, Hemp seed cake. Address: The Society's consulting agricultural chemist.

Page 319: In Kowloon, "across the bay from Hong-Kong, is situated a village of soy-makers." "Behind the bamboo fences you will notice the bean poles, and the great earthenware pots, where the bean liquor is fermented, and stirred for two months in the blazing sun until it is black. The beans are skinned and made into a flour, into which gypsum is mixed. Salt and secret things are added to make this appetizing soy, which those who have learned the taste prefer to the flavored Worcestershire, of which it is the base. The soy costs only a trifle, and the workman who earns only ten cents a day will have it at his meal. The wealthy are equally proud of their national 'abettor of appetite.'" Note: Gypsum is used in making tofu, not soy sauce.

Page 408: "On the railway which the war gave her in Southern Manchuria, Japan is seeking a loan of $150,000,000, which will be reloaned to finance these Government-Baronial Development Companies. The railway is to be broad-gaged so as to exchange traffic with the Chinese railways coming from the south and west, rather than to look for trade with the broader gaged Siberian Railway at Kwang Chau Fu. Exclusive of the revenue from military transport the South Manchuria Railway is already earning $3,000,000 gold a year, or nineteen dollars gold a mile per day. The operating expenses are forty-five per cent. China is fighting Japan bitterly to parallel with the Fakumen Railway the Japanese South Manchurian Railway from the Russian railways down past Mukden to tidewater in Liaotung Gulf."

"Another knotty problem for the future in Manchuria is the question of taxation in the railroad zone. The Russians control the largest part of the Chinese Eastern Railway. The Japanese own as a war legacy the South Manchurian Railway. Now, if the Americans, British and French have a right to levy taxes in the settlements of Shanghai, Tientsin, etc., why have not the Russians and Japanese the same right in the railroad zones in Manchuria?"

Page 411: "On exports to Manchuria, the subsidized steamship lines, which so far are in private control, have been compelled by the [Japanese] government to reduce rates fifty per cent. During the first year after the war the government charged on its Manchurian Railway half rates on Japanese goods, which alone came duty and likin free through Tairen (Dalny), on the flimsy pretext that Russia, which is not a manufacturing nation at all, had no custom-houses on the Manchurian border."

Note: A "likin" is a former Chinese provincial tax at inland stations on imports or articles in transit.

1358. Walters, J.D. 1909. Prof. C.C. Georgeson (Document part). In: J.D. Walters. History of the Kansas State Agricultural College. 1909. Manhattan, Kansas: Printed by Printing Dep. of the Kansas State Agricultural College. 226 p. See p. 98-99. Illust. 25 cm.

• ***Summary:*** "Prof. Chas. C. Georgeson, M.Sc., chair of agriculture, came to this country from Denmark when a youth. He began his work as a gardener and general horticulturist, passing his apprenticeship in this line in his native land. A year after he landed he entered the Michigan Agricultural College, from which he graduated in 1878. He was at once offered the position as assistant editor of the *Rural New Yorker,* published in New York City. That position he held for two years. In the Fall of 1880 he was chosen professor of agriculture in Tokio, which he accepted. He remained in Japan nearly four years and returned to the United States in the Fall of 1889. Shortly after his return he was invited to take the position of professor of agriculture in the Kansas State Agricultural College. Shortly after his return he was invited to take the position of professor of agriculture in the Kansas State Agricultural College. He accepted the offer in January, 1890, and remained here nearly eight years, till September, 1897.

"Professor Georgeson's work in Kansas is well known to the farmers of the State. The experiment stations maintained by the national government had just been fairly started when he came to Kansas and his work in that line at Manhattan may be traced through the thirty bulletins which he wrote while here. Experiments in cropping, especially methods of culture best adapted to Kansas conditions, and experiments in steer feeding, were the main features of his work. The soy-bean was introduced into this country for the first time by Mr. Georgeson at the Kansas station in 1890 (Note: Georgeson first introduced soy-beans to the USA in 1890, but soy-beans were first introduced to North America (Province / Colony of Georgia) by Samuel Bowen in 1765, and by many other people before 1890). He sent to Japan for the seeds and grew them that year at the College. The scientist found it to be a valuable drouth-resisting plant and grew it extensively and distributed the seed widely gratis to the farmers of Kansas. He also introduced the growing of this bean as a second crop after wheat, and plowed it under for green manure if it failed to ripen. Professor Georgeson proved by his feeding experiments that the meal of the soy-bean was more valuable than linseed oil-meal for both steers and hogs, and that the farmers could raise them at a fraction of the price per ton that the oil-meal costs.

"In January, 1893, Secretary of Agriculture Rusk sent Professor Georgeson to Europe to investigate the dairy industry in Denmark. There was at that time a great revival in the dairy industry in the United States, and Denmark stood at the head of the list of dairy countries. He considered it important to obtain authentic detailed data in regard to the methods practiced by the Danes, and especially the reasons for the superiority of their butter, which always sold several points higher in the English markets than butter from other countries. The results of the professor's investigations were published by Secretary Morton in a report entitled 'The Dairy Industry of Denmark.'

"When the Populists assumed control of the College

© Copyright Soyinfo Center 2014

in 1897 Professor Georgeson resigned and took the civil service examination for an assistantship in the United States Department of Agriculture. He was first appointed assistant in the division of agrostology and was sent by the department to the Panhandle of Texas to investigate the pasture conditions in that locality. In March, 1898, Mr. Georgeson was appointed special agent in charge of the Alaska agricultural investigations, and started for the North, where he has since remained. During a whole decade he has worked in that semi-arctic region, testing its possibilities for raising grasses, vegetables, and grains. He has also made extensive experiments with the islandic reindeer, the northern sheep, and milch cows. His reports form one of the most interesting parts of the annual literature of the U.S. Agricultural Department." Address: Prof. of Architecture and Drawing, Kansas State Agricultural College, Manhattan, Kansas.

1359. Wilcox, E.V. 1909. Summary of investigations: Miscellaneous crops. *Hawaii Agricultural Experiment Station, Annual Report.* p. 9-16. For the year 1908. See p. 16.
• ***Summary:*** "Several varieties of soy beans have been grown for use as fodder, green manuring, and human food, particularly in the Japanese product, Miso. The yields have been very encouraging. About 500 tons of soy beans are annually imported from Japan, and the demand is increasing. The beans are sold in Honolulu for $3 per 100 pounds. The market can easily be supplied by home production.

"Peanuts have yielded gratifying results in various localities. On the trial grounds of the station a number of varieties have been grown, including Spanish, Bunch Jumbo, Running Jumbo, and Virginia Running."

Note: In 1898 Hawaii was annexed as a U.S. Territory. Address: Special agent in charge.

1360. Yukawa, Genyô. 1909. Ueber die absolut vegetarische Ernaehrung japanischer Bonzen [The strict vegetarian (vegan) diet of Japanese Buddhist monks]. *Archiv fuer Verdauungs-Krankheiten* 15:471-524. [5 ref. Ger]
• ***Summary:*** The author studied a group of 12 strict vegetarian [vegan] Buddhist monks in Japan and found them to be in good health. He estimated that their daily diets, if evaluated for a 150-pound male, supplied 3,575 calories and 113 gm of protein. The older men ate somewhat less. The diet consisted chiefly of rice and barley, with soy products, vegetables, and rape seed oil.

A table (p. 478-79) summarizes the author's research on the protein content of vegetarian meals by previous Japanese researchers. These meals contained various soy products: Miso (*Soybohnenmus*), soy sauce (*Soy*), and tofu. On pages 489-91 are definitions of miso soup, miso, soy sauce (*Soy*) koji, grilled tofu (*Yakidofu*), cooked soybeans (without the hulls removed), azuki bean paste, and mochi, which are served at Nanshuji temple. A table (p. 497-98) gives the nutritional composition of these and other foods. Amounts served at each meal are shown on p. 501, 514, 522, including daikon pickled in miso. The terms "Makrobiotik" and "Makrobier" are used. Address: Aus der Privatklinik fuer Magen- und Darmkrankheiten von Dr. Yukawa in Osaka, Japan.

1361. Jones, W.J. 1910. Manchurian development: The railways and the beans. *Grey River Argus* (*West Coast, New Zealand*). Jan. 3. p. 4.
• ***Summary:*** Contents: Introduction. A progressive company. The possibilities of the line. Refreshing solicitude. The ubiquitous [soja] bean. The processes of distribution. What the bean produces. The future of the beans.

Introduction: "Were any justification required for Dairen's existence as a city of importance it would be found in the fact that the splendid town which Russia established and Japan has improved is the headquarters of the South Manchurian Railway and the outlet for practically all the beans exported from the districts south of the Sungari river. The railway carries the beans, and the beans in return provide the Company with a material portion of its revenue. It is a fair exchange and as a result of the processes Dairen benefits. The South Manchurian Railway Company has been in existence for three years, being organised in 1906, with an authorised capital of £20,000,000 to operate the railway between Dairen and Kwancheng-tzu [Kuancheng district in the city of Changchun in Jilin Province; Kuanchengtze or Kuancheng-tze] transferred from Russia to Japan under the Treaty of Portsmouth. The enterprise was not thrust into the world fully matured; it passed through all the infantile ailments.

"During the progress of the war the gauge of the railway had been altered from 5 ft to 3 ft 6 inches that it might be adapted to the rolling stock bought from Japan to carry troops and supplies. For considerably over a year only a small number of second and third class cars were available and the complaints of the traveller–some reasonable, others gratuitous–were loud and frequent. With the conversion of the line to its present gauge of 4 ft 8½ inches and the arrival of the new equipment of engines and carriages from America the enterprise began to rise superior to serious criticism. Figuratively speaking, it took wings and began to soar out of the labyrinth of difficulties which beset it in its initial stage;..."

"A progressive company: There are indeed few more enterprising concerns than the South Manchurian Railway Company, and it is obvious that they have at heart the development of a country which has hitherto persistently ignored its natural resources." The main line runs from Dairen to Kwancheng-tzu, a distance of 483 miles, at 27½ miles per hour. The attention paid to the needs and comfort of the traveler is "unremitting almost to the point of embarrassment." The dining cars and sleeping cars are commodious and excellent. "When the farmers have been

© Copyright Soyinfo Center 2014

convinced that they are at present merely tinkering with the soil, and direct their attention to serious husbandry, the South Manchurian Railway Company must be one of the most important carrying agents in any part of the globe. Up till now perhaps even the name is unknown in Europe outside Hazell's or Whittaker's."

"The possibilities of the line: The railway is the prime factor in the development of trade in South and Central Manchuria. Its ramifications afford the farmer who has hitherto been merely a local producer an opportunity of coming into the market and securing the best ruling prices. The advantages are mutual... Tourists can now travel from London to Dairen by train in 14 days. From "June to December it is necessary to book weeks ahead to ensure a passage. Tsuruga to Vladivostock [Vladivostok] is still the route for the bulk of the tourists, but this is due to the almost incomprehensible lack of knowledge possessed by the travelling public, not to any superior advantages offered by the Russian port. The day of Dairen and Antung [as a route for tourists] is coming, and is within the sphere of next year's possibilities.

"Refreshing solicitude: The enthusiasm evinced by the public in the Company's operations augurs well for future success." "One cannot help being impressed with the pride of possession evinced, and the train boy who chases the flies off the windows is as important and as proud of the railway as the entire Board of Directors... Every manifestation of progress in South Manchuria contributes towards the success of the line, and manifestations of progress are so consistent and so numerous as to carry conviction to the heart of the most hopeless pessimist.

"The ubiquitous bean: The interests of the railway and the bean trade are inseparable. They are the blood and bone of Manchuria and provide occupation for practically all the merchants at present doing business in the country and at least three parts of the entire population. The bean industry is not a new one, but until recently the volume of business was reckoned by the peck; now it fills the bushel measure. Twenty years ago crops were grown, small areas being laid down calmly and deliberately in monotonous routine. The increase up till 1906 was almost imperceptible, cultivation of beans being confined almost entirely to the Liaoyang districts, while the markets were Japan, and in less degree Shanghai, Swatow, Amoy, and Chefoo. The approach of harvest brought with it no feverish expectancy either on the part of the farmers or merchants. The output never exceeded 200,000 tons, and in most instances it was a great deal less than this. The Chinaman seemed incapable of realising the great possibilities of the industry and was content to adjust his supply to the restricted demand. But in 1906 the 'awakening' came and since that time the bean has been almost an obsession throughout the country. It was an epoch-making discovery, and everything now dates from the beginning of the bean era. Crops are grown everywhere, supplies are stored everywhere, and nothing else is talked about anywhere. Dairen wharf during the season is a scene [?] of indescribable activity. Changchun becomes the focus for converging strings of Chinese carts, and the railway has to work day and night to keep pace with the requirements of shippers. The bean trade has become a real industry and for the stimulus given to it the Shanghai merchants are to thank, as they resolutely laid siege to a somewhat unwilling Government until the latter agreed to open up the country for more extensive cultivation. As a result the crop for 1906 had increased to 400,000 tons, double the best previous yield [crop]. Since then a gradual development has taken place and the returns for 1908 show 1,200,000 tons, or an increase of 70 per cent on the yield for the year previous. It is estimated that the crop now coming to maturity will amount to 1,500,000 or 1,600,000 tons, an increase of 30 per cent on that for 1908. The markets have already extended to London and several places on the Continent, small trial shipments being sent a year ago, with such satisfactory results that up till the end of June 160,000 tons of last year's crop have been shipped to Europe from Dairen and 180,000 tons from Vladivostock. In England the bean cake is largely use as a fodder for cattle, and according to reliable reports it has proved a splendid fattening and milk-producing agent." Continued.

1362. Jones, W.J. 1910. Manchurian development: The railways and the beans (Continued–Document part II). *Grey River Argus* (*West Coast, New Zealand*). Jan. 3. p. 4.
• ***Summary:*** Continued: "The process of distribution. The bean, which is commonly known as the Sakura oil bean in South Manchuria, and the Soja bean in Vladivostock [Vladivostok], has the appearance of the wild pea. It is now principally grown in the districts from Ta-shih-chao to the immediate south of Harbin for practically the whole breadth of the country, along the Antung route, and in many parts of Korea. The Kwancheng-tzu district has the distinction of being the greatest bean-producing centre and Chang-chun exists entirely for and upon beans. The processes through which the crop goes after leaving the hands of the producer are particularly interesting. The beans are taken by the farmers in Chinese carts to the nearest villages and are there exchanged with the innkeepers, who are also the storekeepers, for cloth and the ordinary requirements of housekeeping, a certain percentage of the purchase-money being received in cash. The innkeepers take the beans to the larger towns, and there effect a bargain with the merchants, receiving in return supplies to replenish their stock. The merchants in their turn convey the produce to the principal distributing centres, such as Tiehling, Changchun, and there sell it to the innkeepers, who own large yards where, the beans are stored. The proportions of the business may be gauged from the fact that these yards are 20 or 30 acres in extent. The receptacles are curious bins called tuns,

© Copyright Soyinfo Center 2014

constructed of straw, each 120 ft high and capable holding 150 tons. The last pre-export stage of all is reached when they are sold to the local merchants in Dairen or Newchwang at so much per *dan* (480 1b). The currency in which the farmer deals is the *tiao* (equal to from 5*d.* to 6*d.*). The dealers in the ports pack their produce into gunny bags holding 187 1b, and the consignment is then ready for steamer.

"What the bean produces: The first process in the treatment of the bean is the extraction of the oil. The Chinese, with their loyalty to primitive methods, use a hand press which is not so satisfactory as the efficient machinery of the European merchants, and the latter obtain not only 6 per cent more oil, but from 3 to 4 per cent of butter-fat, which is used in the manufacture of confectionery. From 9 to 10 per cent of oil is extracted by the hand-press and 15 to 16 by machinery. The oil is of various samples, the refined article almost equalling in quality fine olive oil, while the crude article is used by the Chinese for food and lighting. From about forty-eight pounds of beans forty pounds of bean cake and between four and five pounds of oil are obtained, the extra weight being released during the steaming process in manufacture. The beans cost in Manchuria about 5*s* per picul (133 1/3 pounds). The oil is sold at 17*s* per picul and the bean cake at 2*s* 3*d* to 2*s* 6*d* per picul.

"The future of the beans: Towards the end of last season the railway carried 6,000 tons per day to the ports, and it is estimated that this year the amount will be increased by 1,000 tons daily. This looks like business and the merchants would tell you that the prospects are promising. The bean cake is an excellent fertilizer, and an inexpensive one, and might find its way in increasing thousands of tons into countries to which it has not hitherto been exported. But there are difficulties to contend with and possibilities to consider which make trading in beans somewhat of a gamble. The fluctuations in the price of silver may cause a difference in values of as much as 40 per cent in the short period elapsing between sale and delivery. There is also a lack of confidence, consequent upon there being so many rivals on the market as oil-producing seeds. These are problems which may be solved to the satisfaction of bean merchants, and if so, there is a great future for beans and their by-products in Europe and other parts of the world. So far as China and Japan are concerned it is certain that their demand will increase annually by material quantities, at any rate this would appear to be the belief of those interested in the business, judging from the extension of the area placed under cultivation."

1363. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Soya-bean crushing: Factories planned in both Europe and American Pacific Coast. No. 3681. p. 5. Jan. 10.
• ***Summary:*** "Consul Walter C. Hamm, at Hull, England, writes that it is reported that there are projects on foot in connection with the soyabean industry which may have far-reaching effects both on the industry in Hull and on the Pacific coast of America.

"As stated, one scheme is to erect large seed-crushing mills at Vancouver, British Columbia, and Seattle, State of Washington, where the bean can be crushed and the oil extracted. The Canadian Pacific and lines of steamers running from Vancouver and Seattle to Japan and China are said to be aiding this scheme.

"Another project proposed is to erect large factories in Copenhagen for the production of soya-bean oil and cake. It is hoped that the annual turnover of the new company will at first be not less than $1,100,000 and that 30,000 tons of soya beans will be shipped each year by the East Asiatic Company from Manchuria to Denmark. At present oil cake of various kinds to the value of $7,000,000 is consumed annually in Denmark, of which a large proportion is shipped from Hull. The Manchurian beans are the subject of comment in the report of the P. and O. Company, which speaks of the absorption of a very large amount of tonnage for their export. The report adds:

"'This is a new business in Europe, and whether it may prove a permanent factor in the commerce of this country it is at present impossible to say. Meanwhile the result is that Eastern freights have risen to a moderate extent for the first time for two or three years.'"

Note: This is the earliest document seen (Aug. 2001) that uses the word "crushing" or any of its cognates ("crushers," "crushed," etc.) in the title in connection with soybeans. Address: Washington, DC.

1364. *Advertiser* (*The*) (*Adelaide, South Australia*). 1910. Milk from the soya bean. Jan. 11. p. 7.
• ***Summary:*** "The Japanese make a milk, said to be very nourishing, from the soya bean. The process is as follows:- The beans are first of all softened by soaking, and are then pressed and boiled in water. The resultant liquid is exactly similar to cow's milk in appearance, but is entirely different in composition. The soya bean milk contains 2.5 per cent. of water, 3.02 per cent. albuminoid, 2.13 per cent. fat, 0.03 per cent. fibre, 1.18 per cent. non-nitrogenous substances, and 0.41 per cent. ash. Some sugar and a little phosphate of potassium are added in order to prevent the elimination of albumen, and then the moisture is boiled down till a substance like condensed milk is obtained. This condensed vegetable milk is of a yellowish color, and has a very pleasant taste hardly to be distinguished from real cow's milk."

1365. *Bulletin de l'Association Amicale Franco-Chinoise.* 1910. Le soja [Soya]. 2(1):62-64. Jan. [Fre]
• ***Summary:*** This periodical was established to promote understanding and friendship among the people of France and China.

© Copyright Soyinfo Center 2014

The name *Soja* or *Soya* comes from the name that the Japanese give to the sauce made from soybeans. In Chinese it is called *tsiang-yeou* (Cc = Chinese characters given [soy sauce]) and it is made from *houang-teou* (Cc [yellow soybeans]). This sauce, which is used in the well-known *Worcester sauce,* is widely used in China and Japan. Some Chinese residing in Paris [incl. Li Yu-ying] recently took the initiative to introduce into France this sauce, as well as several other products derived from these same 'yellow peas' (*pois jaunes*).

They have just built a factory near Paris in a town named Les Vallées (rue Denis-Papin), on the train line going to Saint-Germaine-en-Laye. There, perfected machines / equipment and the resources of western science allows them to obtain from the raw materials a much better yield than could be obtained using the rudimentary Chinese process. These things made it possible, at the same time, to develop many new soy products suited to European tastes.

A retail store named the Golden Jar in Paris (La Jarre d'Or, 4, rue du Renard) received the right to sell these products from *Caséo-Sojaïne.* And an exposition [of the soy products] was organized at the Grand Palace, at the time of the opening, last Nov. 20, of the Food Fair / Expo (*Salon de l'Alimentation*). There various products were offered.

A summary of the contents of an interesting brochure from that exposition is reprinted. Contents of the brochure: Introduction to the soybean. Products based on soymilk (*Le lait de soja, Le lait végétal*)*:* Liquid, powdered, or fermented soymilk, soy cheese (*Le fromage de soja, Le fromage végétal* [tofu]) (fresh, hard, and fermented). Soy sauce. Soy oil. Sweet soya preserves (*Confiture de Soja;* this soy cream {*crème de soja*} resembles chestnut cream {*crème de marron*}). Soybeans used as a vegetable (dehulled dry soybeans, and soy sprouts {*les germes de soja*}). Other soy products (including soy flour, bread for diabetics, whole-meal bread, and soybean cakes–used as feed for animals).

Note 1. It is unclear whether the Chinese-run factory, *Caséo-Sojaïne,* has started to make and sell commercial soy products, or whether they are just about to. They may have started on Nov. 20 of the previous year, however there is no description of soyfood products now being sold in Paris.

Note 2. This is the earliest document seen (April 2013) that contains the term *Caséo-Sojaïne,* which appears to be the name of a business, not of a product. This term would soon be used to also refer to "tofu." Li Yu-ying's name is not mentioned.

Note 3. This is the earliest document seen (Aug. 2013) that mentions soy cream (*crème de soja*).

Note 4. This is the earliest French-language document seen (Aug. 2013) that mentions powdered soymilk (*Le Lait de Soja, en poudre*).

Note 5. This is the earliest document seen (Sept. 2002) that mentions fermented soymilk (*Le Lait de Soja Fermenté*).

Note 6. This is the earliest French-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *les germes de soja.*

1366. Itie, G. 1910. Le soja: Sa culture, son avenir [Soya: Its cultivation, its future]. *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) 10(82):37-49. Jan. See also: 10(83):137-44. Feb.; 10(84):231-46. March; 10(85):305-07. April; 10(93):485-93. Dec.; 11(94):55-61. 28 cm. [34 ref. Fre]

• ***Summary:*** A superb series of articles by G. Itié reviewing research and current developments with soybeans, and especially with soybean production / culture, worldwide. The extensive bibliography cites many early and rare works for the first time. Interestingly, the series started one year before Li Yu-ying wrote his equally excellent series in the same journal. The author introduced lots of U.S. soybean research to France, citing many U.S. Agricultural Experiment Station publications and early work with growing soybeans in the tropics.

Contents: Introduction. The soybean (Glycine hispida Maxim.). Vernacular names: In China, Tonkin, Cambodia (*Sân dêk*), India, Burma, Nepal, Ceylon (*Bhatwan*), Indo-Malaysia (*Katyang-kadeleh*), England, USA, Germany, Holland, France, Italy. Scientific names and synonyms. Description of the plant. Varieties, general, and in China, India, Hawaii, Japan, USA, Europe (varieties from Hungary, Podolia, Etampes-France, Italy). Origin. History. Climate and geographical area.

Concerning the early history in France: "In France it is very certain that in 1739 missionary fathers sent the soybean to the Jardin des Plantes, along with other plants from China. There exists, in any case, in the Museum, a sachet having contained seeds from the harvest of 1779, and the soybean has been cultivated here in an almost uninterrupted fashion since 1834.

"In France, large scale production of soybeans began in 1821 at Champ-Rond, near Etampes, where large yields were obtained. But above all, starting in 1855, the Society for Acclimatization made great efforts to introduce it. They distributed seeds and conducted tests in various regions, but the methods of culture were not progressive (advanced), and the soybean did not take the place in France that was hoped for."

A table (p. 490) shows the name, yield (in hectograms/hectare; 1 hectogram = 100 gm), and source (a U.S. agricultural experiment station) for the following soybean varieties: Medium Black (12.1, Massachusetts Hatch), Very Dwarf Brown (8.4, Indiana), Early Brown (10.54 to 13.58, Indiana), Early Green (7.80 to 14.00, Delaware & Virginia), Medium Green (12.10 to 36.30, Massachusetts Hatch & Illinois), Hollybrook (8.7 to 10.0, Indiana), Guelph (5.70 to 7, Indiana), Ito San (11.4 to 28.70, Indiana & Wisconsin), Japanese Pea (13.20, Virginia), Mammoth Yellow (7.5 to 18.20, Mississippi), Michigan Green (19.10 to 34.80,

© Copyright Soyinfo Center 2014

Wisconsin), Green Samarow (11.00+, Kansas), Tokyo (7+, Kansas), Early White (15.90 to 33.00, Massachusetts & Illinois), Dwarf Early Yellow (11.00+, Kansas), Early Yellow (13.10 to 22.00, Ontario, Canada), Medium Early Yellow (8.70 to 33.00, Indiana), Yellow (11.00+, Kansas), No. 9407 (43.5, Wisconsin), No. 19.186 (28.0, Delaware).

Other tables show: (1) The chemical composition of the stem, leaves, and pods (p. 138-39, 243). (2) Yields with different fertilizing methods (p. 139). (3) Number of pods and seeds in different varieties of soybeans (p. 236). (4) Spacing at different experiment stations for 3 years that gave the best yield (p. 239). (5) Number of plants and seeds, and yield for 3 different brown or yellow varieties of soybeans from China and Manchuria (p. 491). An illustration (p. 40, line drawing by A. Berteau) shows a cultivated soybean plant and its different parts, including leaves, pods, and flowers. The leaves of the wild soybean, *Glycine angustifolia* (Miq.), are also shown.

Note: The *Jardin Colonial* (Colonial Garden) is located in Paris, France. Address: Ingenieur d'Agriculture coloniale.

1367. Saito, Kendo. 1910. Notizen ueber einige koreanische Gaerungsorganismen [Notes on some Korean fermentation organisms]. *Zentralblatt fuer Bakteriologie. Series 2.* 26(13/15):369-74. Feb. 23. [4 ref. Ger]
• ***Summary:*** Mentions the molds *Aspergillus oryzae* and *Rhizopus Tamari.* Address: Botanical Institute, Tokyo.

1368. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Oil-seed products. No. 353. p. 68-79. Feb. See p. 68-70, 76-79.
• ***Summary:*** In the section on "Germany" the following subsections discuss soya-bean meal: (1) "Hamburg market for oil-cake meal and vegetable oils." "The Germans are not taking very kindly to the soya-bean meal. It is thought that possibly 25,000 tons of the meal have been bought, but most of it will go to the extreme northern section around the port of Esbjerg" which is near England. "The English mills are sending out bullish letters concerning this product, stating they are sold far ahead, but all seem to be willing to sell small quantities of a hundred tons or so for prompt shipment."

(2) "Prices and qualities of soya bean and peanut meal." "Present prices of the soya bean meal are from $32.40 to $33.40 per long ton c.i.f. Hamburg." Peanut meal is popular in Germany with many of the farmers, and is used in rations for dairy cows. Large peanut crops are expected from the Coromandel (India) and the Gambia (West Africa). The peanut oil and cake is made from Rufisque peanuts; the price of this cake is now $38.40 per ton, but lower grades can be bought for $33.50 per ton.

(3) "Various seed cakes compared." "Soya bean meal, it is thought, will not influence the feedstuff situation to any great extent in Germany, and unless the peanut meal comes on the market in great quantities high prices of oil meals will continue to rule throughout the season."

Under "Cocoanut Products," page 76 notes: "A cotton seed oil crushing mill, the largest in the world, has recently been built in Harburg, which is across the river from Hamburg, by F. Thoerls Vereinigte Harburger Oelfabriken, A.G."

In the section titled "Sweden: The fodder value of soya meal and cake," is a lengthy English-language translation of an article on this subject prepared by Nils Hansson, of the Central Institute of Agricultural Experiments.

In the section on the United Kingdom, U.S. Consul Rufus Fleming of Edinburgh [Scotland] gives information already presented in the 21 Dec. 1909 issue of *Daily Consular and Trade Reports* (U.S. Dept. of Commerce, No. 3666, p. 9).

"Hull [England]: Factories planned in both Europe and America Pacific Coast." It is stated that one scheme is to erect large seed-crushing mills at Vancouver, British Columbia [Canada], and Seattle, State of Washington, where soya beans can be crushed and the oil extracted. The Canadian Pacific and lines of steamers running from Vancouver and Seattle to Japan and China are said to be aiding this scheme. Another project proposed is to erect large mills in Copenhagen [Denmark] for the production of soya-bean oil and cake. An estimated 30,000 tons of soya beans will be shipped each year by the East Asiatic Company from Manchuria to Denmark. Address: Washington, DC.

1369. Sagnier, Henry. 1910. Le soja et ses produits [The soybean and its products]. *Journal d'Agriculture Pratique* 74(1):307-10. March 10. [4 ref. Fre]
• ***Summary:*** The soybean was a curiosity in Europe until 2-3 years ago, when large amounts started to be imported. The prince A. d'Arenberg, president of the Suez Canal Society, told the National Society of Agriculture, that prior to 1908 no soybeans had passed through the Suez Canal, yet in that year 35,000 tons passed through it. It seems that the new commerce has been stimulated by the expansion of the crop in Manchuria and Korea, under Japanese influence. Most of the imports have gone to England and northern Europe. In England, the oil is used to make soaps and the cakes are fed to livestock.

Recently it was announced that the Chinese government, preoccupied with the expansion of exports, would have manifested the intention to prohibit these exports in view of preventing a shortage of soybeans in the interior of the country.

"The Chinese are now greatly expanding their efforts to make known in Europe the advantages to be gained from soya and from the products that can be extracted from its seeds. I recently had the occasion to present to the National Agricultural Society of France a study written by

© Copyright Soyinfo Center 2014

Mr. Liyuying [Li Yu-ying], delegate of the government of China for several missions. It was titled *Le soja, utilisation alimentaire, thérapeutique, agricoles et industrielle.* This study was accompanied by samples of yellow and black soybean seeds, and by the principal products which can be extracted from this plant: flour, bread for diabetics, cake (*gâteau*), seasoning sauce (*sauce condimentaire*), confections (*confitures*), raw milk (*lait cru*), cooked and sweetened milk (*lait cuit et sucré*), cake for livestock feed, (*tourteau pour l'alimentation du bétail*), fresh cheese (*fromage frais* [tofu]), and smoked cheese (*fromage fumé* [smoked tofu]).

"These products originated from processing imported soybeans. They have been prepared at a test factory (a photo, p. 309, shows the interior) set up just outside of Paris, at Vallées, near Asnières. Li Yu-ying's study gives complete details on these products" which are made from imported soybeans. This factory, named *Caséo-Sojaine,* "has been established by the agents of a civil society constituted in China under the name of *Société biologique de l'Extrême-Orient* (Far Eastern Biological Society). Made up of physicians, scholars (men of letters), and businesspeople, this society would seem to have as its principal goal/object to make known and have used in Europe the pharmaceutical and agricultural products of the Far East [East Asia]."

Note: This is the earliest document seen (May 2011) that mentions the Far Eastern Biological Society (*Société biologique de l'Extrême-Orient*)

The author concludes by discussing soymilk (*lait de soja ou lait végétal*), soybean cakes (*les tourteaux d'huilerie*), and a brief history of the soybean in France.

Illustrations (p. 308) show: Mature soy bean plant with pods. Close-up of soy bean pods and seeds. Soy milk and soy flour viewed under a microscope (p. 309).

1370. *Weekly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Oil trade. 1(3):114-16. March 19.

• ***Summary:*** The first section, written by the U.S. Consul in Bradford, England, describes the "unexpected decrease in the output of cotton-seed oil [worldwide] and the increase in the use of soya bean and other oils and fats" [in England]. Soya beans are discussed in detail in three other sections: (1) Soya bean and other oils (p. 114-15). "The Liverpool firm also makes the following report on Chinese and Eastern oils and fats which are becoming important in Europe. "Shipments of soya beans from Manchuria during 1909 amounted to about 350,000 tons, and also a large quantity of soya oil from China and Japan. European markets welcomed this new supply, which has prevented a further rise in lower grades of vegetable oils. The greatest interest is shown as to the supplies of soya beans during 1910, but owing to the undeveloped state of the (Chinese) interior, reliable figures of stocks and available supplies can not be obtained."

(2) Soya bean transportation: Freight rates from Newchwang to the United States [San Francisco, California; and Seattle, Washington] (p. 115). (3) Dalny: Prices and cost of shipment.

A table (p. 115) shows exports of [soy] beans, bean cake, and bean oil, during the first three-quarters of 1909, from Newchwang to: Hongkong, Great Britain, Samarang [Semarang, Central Java], Germany, Japan, Chinese ports, and total.

1371. Cowie, W.B. 1910. Soya seeds and oil. *Chemist and Druggist* (*London*) 76(13):66. March 26. [1 ref]

• ***Summary:*** Overview of a paper presented by Cowie on 16 March 1910 in Edinburgh at an evening meeting of the North British Branch of the Pharmaceutical Society of Great Britain.

People have become suspicious of "soya-bean meal" because it has been sold mixed with Java beans which contain a significant amount of cyanogenetic glucoside. A table shows six constants for "soya-bean oil" based on studies by Cowie, E.S.L. & W, and Lewkowitsch. The iodine value was found to be 120, 130.4, and 122 respectively. When soya-bean oil is substituted for olive oil in B.P. liniments of ammonia, lime, camphor, or nitrate of mercury ointment, the ointment is a complete failure.

In Japan there are some 11,000 firms in which 2.5 million hectoliters of soya beans are expressed each year and fermented with *"Aspergillus oryzae* for the preparation of the liquid soy" [sauce].

Also gives an overview of the discussion that followed. Mr. Wilson noted that the use of soya oil in the manufacture of linoleum depends on its relatively high iodine value. He added that for feeding purposes, soya-bean is never used alone; a maximum of 25% is mixed with linseed or other feeding stuffs.

Note: This is the earliest document seen (March 2001) that mentions the term "Java beans." Address: Ph.C., F.C.S., Edinburgh.

1372. Cowie, W.B. 1910. Note on soya seeds and oil. *Pharmaceutical J. and Pharmacist* (*London*) 30:403-04. March 26. [3 ref]

• ***Summary:*** At yesterday's evening meeting of the Pharmaceutical Society of Great Britain, held in Edinburgh, Scotland, three varieties of soya beans and a sample of soya bean oil were exhibited. Seeds received from Mr. J. Rutherford Hill, of the yellow variety, yielded 18% of oil and 38.2% of proteins. They were found to contain no cyanogenetic glucoside. "All the suspicion attached to the soya bean meal seemed to have been caused by admixture with Java beans which contain an appreciable amount of cyanogenetic glucoside."

An analysis of the oil is given; it agrees quite closely with that given by Lewkowitsch and those given in Evans' *Analytical Notes* for 1909. A long passage quoted from the

© Copyright Soyinfo Center 2014

Scotsman of 4 March 1910 concerns the present great interest in soya bean trade. If the Manchurian supply should be cut off, the remainder might be supplied by Japan, where each year 11,000 installations transform 2.5 million hectoliters of soybeans, using fermentation and *Aspergillus oryzae,* into "soy [sauce], a liquid condiment used extensively by the population."

There follows a long discussion, with many questions and answers. Dr. Watt asks about the difference in price between soya bean oil, arachis oil, and cotton-seed oil–which are sometimes used as a substitute for olive oil. Mr. Giles asks if soya bean oil is less expensive than arachis oil. Mr. Cowie notes that it could be detected as an adulterant in olive oil, and that it could possibly be substituted for olive oil in the following official preparations: Liniments of ammonia, lime, and camphor, and nitrate of mercury ointment.

Mr. Wilson described the case in which soya bean oil had been supplied to a fried fish restaurant. When used in cooking, it seemed to decompose like crude linseed oil, creating an offensive smell.

Mr. McEwan recalled that about 15 years ago a baker in Edinburgh had tried to use soya bean oil in bread and biscuits, but had found it impossible to work with, and had long since abandoned it.

Mr. Hill recalled that a gentleman who had a garden a few miles from Edinburgh, Scotland, cultivated the soya bean for three years. Although they grew readily and flowered, he was never able to obtain seeds from them.

Note 1. Unfortunately, neither the name of the gentleman who cultivated the soya bean nor the date that be began cultivation are given. However, if he planted the seeds in May, he could have started no later than May 1906. Note 2. This document contains the earliest date seen for soybeans in Scotland, or the cultivation of soybeans in Scotland (by May 1906, near Edinburgh). The source of these soybeans is unknown. Address: Ph.C., F.C.S.

1373. Cloud, Frederick D. 1910. Why America is so interested in Manchuria. *New York Times.* March 27. p. SM5.
• ***Summary:*** Manchuria represents a huge potential market for American goods (especially those related to Manchurian railways, such as the East Manchuria Railway Co.) and is capable of becoming one of the world's greatest agricultural regions.

The Manchurian railways are presently controlled by Russia and Japan; the U.S. government is determined to ensure their neutrality.

"There is contained within the boundaries of the Three Eastern Provinces which together constitute Manchuria, an area of about 390,000 square miles in extent. A large portion of this vast area is arable land, which is scarcely excelled in productiveness by any territory in the world. At present, owing to the smallness of its population–18,000,000 people in the whole of Manchuria–there is but a fraction of the tillable land under cultivation.

"Yet the value of one crop alone, that of the soy bean, during the present season will amount to something like $25,000,000."

The soil and climate throughout are adapted to the growing of beans, wheat, oats, millet, tobacco, and barley, and in Southern Manchuria corn is a valuable crop. Address: Former American Consul at Mukden, Manchuria.

1374. *Far Eastern Review* (*Shanghai*). 1910. Oil and cake manufacture: The soya oil bean. 6(10):487-89. March. Reprinted from the *London and China Express,* Nov. 1909. [2 ref. Eng]
• ***Summary:*** This article begins: "In a recent issue of the 'Economist' attention was drawn to the Soya bean trade in Manchuria, and to the rapid rise of the country as an exporter... America and the Continent are casting envious eyes upon what almost amounts to a monopoly of the trade held by Great Britain at this moment as a consequence of the existing prohibitive import duties on oilseeds in the protected countries. During the past season the English oilseed crushers settled down to a highly lucrative trade and for some months past many of the large mills have set their entire plant running on the crushing of Soya beans, to the exclusion of cottonseed, linseed, and other oleaginous seeds. The supposed shortage of the cotton and flax crops in the United States, and the anticipated shortage of linseed in the Argentine, with the resultant scarcity of cottonseed and linseed products, has found the English market comparatively unperturbed, for the reason that Soya oil and cake can supply most of the requirements as well, if not better, whilst the foreigner is debarred from its use by the presence of high import tariffs. This new industry supplied a good example of the value to the United Kingdom of free imports of raw material compared with the protective duties in other countries... Soya oil manufactured in England continues to rise, in sympathy with the scarcity and dearness of linseed and cottonseed oils, and it is interesting to note that one of the main factors in the advance has been the demand from the United States, which is being supplied by the English crushers. Large quantities of Soya oil are being shipped form British ports to the American seaboard, and the demand is likely to continue; but the trade has already been so large that it is difficult to buy oil for near delivery. The same oil is also being shipped from Japan and China to the Untied States, as well as to the North of Europe, and here we have–for the moment at least–the only serious competitors of English crushers."

"In England, the bean cake is of even greater importance than the oil, representing as it does about 90 per cent. of the raw material. The cake is the residue after crushing, and the analysis compares favourably in oil and albuminous substances with the best decorticated cotton-seed cake and meal, large quantities of which have been imported into this

© Copyright Soyinfo Center 2014

country for many years for cattle feeding... In Denmark, a great butter-producing country, some hesitation was shown in regard to the introduction of the Soya bean, as it was feared that the taste of the butter might be affected by feeding cows with Soya cake, but experiments have proved the reverse, and Denmark has secured 25,000 to 30,000 tons of beans for shipment from Manchuria during the next few months for crushing and cake-making."

The bean cake made in Asia by primitive methods "contains a great deal of moisture, and is unsuitable for a long voyage, owing to its liability to become heated and unsound. This cake is used chiefly as a fertilizer in Japan and Southern China. During the present season these two countries imported about 600,000 tons of beancake from Manchuria for fertilizing." If the price of the beans rise, "will Japan eventually come to rely on phosphates or other artificial manures?"

A small table shows the imports of beancake into Japan during the last five years: 1905–182,000 tons. 1906–258,000 tons. 1907–320,000 tons. 1908–460,000 tons. 1909–600,000 tons.

"An exhibition of Soya beans and by-products from North China, together with photographs of the Soya bean industry, was held at the boardroom of the Manchester Chamber of Commerce on 17th and 18th inst. Explanations and full particulars of the industry were given by Mr. Cavendish Evelyn Liardet, lately returned form China.

"At a recent meeting of the committee of the African Trade Section of the Incorporated Chamber of Commerce of Liverpool, Mr. A. Grenville Turner delivered an interesting address on the cultivation and uses of the Soya Bean."

"In America an attempt has recently been made there by certain dealers to place the Soya beans on the market as a new substitute for coffee, and sell it under other names at fancy prices. A sample of coffee specially ground from the Soya bean, at the suggestion of Sir Alfred Jones, was submitted, and created much interest."

The oil-cake left after the expression of the oil has a nutritive value that "is approximately equal to that of decorticated cotton-seed cake. Feeding trial with this cake in comparison with decorticated cotton cake have been carried out at the Cumberland and Westmoreland Farm School at Newton Rigg, and also at the Royal Agricultural College, Cirencester. At the former institution it was found that the cows, when fed with Soya bean cake, gave rather more milk than when fed with cotton cake; but the difference was so small that it may be considered that the two cakes are equal in this respect. The proportion of fat in the milk was the same in each case... In view of the importance of the trade in Soya beans, it has been considered desirable that attempts should be made to row the product in other countries than China. The Imperial Institute has already brought the matter to the notice of the Governments of several British Dependencies, and experiments are now in progress in the Cape of Good Hope, Natal, the East Africa Protectorate [later Kenya], and the Gambia. An effort is also being made to stimulate the cultivation of the Soya bean in India. It is stated that considerable additional areas are available for cultivation in Manchuria.

"The annual report of the Hull Chamber of Commerce and Shipping states that the Seed Crushers' Committee report that 'the mills have been fairly well employed, and for the first time in the history of the trade soya beans have been crushed in quantity.' The Hull Seed, Oil, and Cake Association report that 'the outstanding feature of the year has been the advent of the soya bean from Manchuria, which marks an epoch in the crushing trade of the United Kingdom. About 400,000 tons have been shipped to the United Kingdom in 1909, of which 153,000 tons have arrived in Hull since March last. There is reason to hope that the soya bean will be a regular article of import.'"

1375. Ishii, T.; Okamoto, H. 1910. Daizu [Soy bean: Its culture and uses]. *Hokkaido Nogyo Shikenjo Iho* (*Hokkaido Agricultural Experiment Station, Bulletin*) No. 10. 33 p. March. [Jap]

• ***Summary:*** Contents: Preface. The position of soybeans in Hokkaido agriculture. Suitable climate and preparation of the soil for farming. Crop rotation. Varieties of soybeans. Compost. Seeds. Sowing seeds. Care after germination. Harvest. Utilization of soybeans: Green manure, as feed, soybean cake as fertilizer. Soybean diseases. Soybean insects.

An illustration (non-original) on the title page shows the roots of a soybean plant with a few nodules. Address: 1. Agronomist; 2. Entomologist. Both: Sapporo, Japan.

1376. Japan, Bureau of Agriculture (Norinsho, Nomukyoku), Dep. of Agriculture and Commerce. 1910. Outlines of agriculture in Japan. Tokyo: Agricultural Bureau, Department of Agriculture and Commerce. 132 p. March. Illust. No index. 23 cm. [Eng]

• ***Summary:*** This book was compiled to acquaint foreigners with agriculture in Japan. Company name with diacritics is: Nôrinshô, Nômukyoku. A map near the front shows Japan and its empire (incl. Korea, Formosa, Kwantung, Karafuto, and the Kurile Islands, with an inset pie chart showing the value of Japan's agricultural products). Oval photos show Japan's six top agricultural officials. A full-page table shows the moneys, measures and weights of Japan with English equivalents. Contents of the first part of the book: Introduction: Geographical location, area, population, topographical position, climate. 1. General remarks. 2. Condition of farmers. 3. Condition of agricultural land.

The section titled "Upland fields" (p. 18) states: "Upland fields are those portions of land being located in high and dry places which by wanting means of irrigation could not be converted into paddy fields. The utilization of these fields

© Copyright Soyinfo Center 2014

is commonly made by the rotation system and crops are raised twice a year. The commonest instance is that barely, naked barely, and wheat are raised as the first crop in winter whereas soja beans, sweet potatoes and millets are raised during the summer as the second crop." The profits from upland fields are generally smaller than from lowland / paddy fields. The average yield of soja beans over the past 10 years is given in Japanese units (p. 19).

In Japan only cows and horses are kept as work animals. In 1907 Japan had 1,008,922 cows and 2,204,031 horses. But they were used more for their manure than for plowing.

A table (p. 28) shows the value (in yen) of the principal commercial fertilizers in Japan from 1905 to 1907. "Soja bean cakes" (a key source of nitrogen) is by far the largest, averaging 12.9 million yen for these three years, followed by superphosphate of lime, mixed manure, rape-seed oil cakes, herring cakes, bone dust, and cotton-seed oil cakes. Note 1. This is the earliest English-language document seen (Nov. 2005) that uses the term "cotton-seed oil cakes" (plural or singular) to refer to cotton-seed cakes.

A table (p. 37) gives the cultivated area (in 1,000 *cho*) of major Japanese crops in 1887, 1892, 1897, 1902, and 1907. In 1907 rice had by far the largest area (2,906), followed by naked barley (694), barley (658), soja bean (471), wheat (444), mulberry tree (390), sweet potato (288), Indian millet (202), rape seed (143), small red bean ([azuki], 135). Soja bean area remained almost unchanged between 1887 (466) and 1907 (471).

A table (p. 39) gives average yield (in *koku/tan*) of the same major Japanese crops for the same years shown in the previous table. Yield of soja beans rose from 0.698 in 1887 to 0.777 in 1907. Since 1 *koku* = 4.963 bushels and 1 *tan* = 0.245 acres, the 1907 yield is 15.74 bushels/acre.

A table (p. 40) gives the production (in 10,000 koku) of the same major Japanese crops for the same years shown in the previous table. Production of soja beans rose from 325 in 1887 to 366 in 1907. Since 1 *koku* = 4.963 bushels, and 10,000 *koku* = 49,630 bushels, then 366 *koku* is 18.164 million bushels. The next table (p. 42) shows the value (in yen) of each of these agricultural products in 1905-07, and a table (p. 46) compares the cultivated area of each of these crops with rice; soja beans are 16.2% of rice.

In the section on "Food crops" (p. 47+) is a detailed discussion of each. Concerning "Soja bean" (p. 50-51) we read: "The use of this bean is extremely extensive since they are used for the purpose of supplying to the people low priced starchy food by being made into *miso* (pea cheese), soy, *tofu* (bean curd), and other food-stuffs required by the Japanese. The residue obtained from making these food-stuffs from the bean is used for the purpose of feeding cattle or of pressing oil while as manure it is highly valued. Soja bean is easily cultivated requiring less amount of manure and labour. It is therefore cultivated all over the country and occupies the principal position among summer crops of upland fields. Within recent years the demand for it has considerably increased at home and also the export of various food-stuffs prepared out of bean has shown some increase so that no small amount of bean is imported either from China [Manchuria] or Korea. The amount imported actually reaches 10,000,000 *yen.* Over and above these, the import of bean cakes is approximately figured at 20,000,000 *yen* so that the domestic output has somewhat been affected."

Also discusses: Barley and naked barley. Indian millet, Barnyard millet and sorghum. Small red bean [azuki] ("A large amount of small red bean is used as a material for cakes [confections], Hokkaido being the principal producing district." p. 51). Flax and hemp. Green manure crops, incl. *genge* (*Astragalus sinicus, umagoyashi* (*Medicago denticula*)), soja beans, etc.

Note 2. This is the earliest English-language document seen (March 2006) that uses the term "small red bean" to refer to the azuki bean.

Chapter 4, titled "Animal industry and poultry" (p. 69+) contains many statistics which may be of interest to vegetarians. Japanese traditionally ate fish rather than meat. "Even at present, the amount of meat consumed per capita a year does not exceed 1.7 pounds while that consumed in America is 150 pounds and in England 118 pounds per capita." etc.

A table (p. 85) shows imports of principal agricultural products (quantity and value) each year from 1906 to 1908. Imports of soja beans increased from 286 to 352 (x 10,000 piculs) during this period, while imports of [soja] bean cake increased from 433 to 776. Both were imported mainly from China. However "the output of *soy* [sauce] and *miso* made of soja bean is exported to the amount of 1,200,000 yen, while bean cake forms the principal fertilizer in Japan" (p. 86).

ha; 1 tsubo = 35.586 square feet = 3.954 square yards] of the best nursery land...” Address: P.O. Box 1, Ikeda. Kawanishi-mura, Ikeda, Settsu, Osaka prefecture, Japan.

1379. Rea, George Bronson. 1910. Beans: The solution of the commercial situation in Manchuria. *Far Eastern Review* (*Shanghai*) 6(10):453-61, 486-87. March. [Eng]

• ***Summary:*** The article begins: “Shanghai, March 1, 1910.–Neutralization of the Manchurian Railways and the construction of the Chinchow-Tsitsihar-Aigun Line are the latest moves in the prolonged diplomatic campaign to nullify Russian and Japanese preponderance in the Three Eastern Provinces. Since the termination of the late war foreign opinion has accepted the theory that unfair tactics and discrimination are the foundation of Japan’s commercial success in Manchuria. The average European has refused to believe Japan could secure control of the Manchurian trade, unless underhanded methods were employed... At the root of the trouble was the South Manchuria Railway, and on its operation and administration fell the burden of censure.”

Gives a detailed account of the first shipment of soybeans from Manchuria to Europe by Mitsui Bussan and alleged unfair commercial practices used by Japan in Manchuria, especially concerning the South Manchuria Railway. “For years Japan has been the largest consumer of Manchuria’s principal export of beans and bean-cake. The bean-cake was an absolute necessity to the Japanese farmer to fertilize his worn out fields... Before the Manchurian railways were constructed and Newchwang was the only treaty port, the larger British firms established there controlled the trade of the province. The beans or bean-cakes were carted or shipped by river junk to Newchwang to be stored in the godowns of the leading merchants, who also controlled the ocean shipping. At the time when the Japanese farmer required the bean-cake for fertilizing the ground for spring planting, the port was closed by ice, and very often the delay in shipping the cake to Japan entailed considerable loss and damage to the crops. The Japanese purchased their supplies of bean products from the foreign hongs who controlled this trade...

“But the war came and changed all this. Japanese merchants entered the field, and, with the ice free port of Dairen as a base, commenced an aggressive campaign to gain control of this important trade. The end was inevitable. As Japan consumed the bulk of the bean-cake, and controlled the railway transportation to a port where storage and lighterage could be eliminated, loading charges reduced to a minimum and their own steamers employed to freight the product to Japan at all seasons, it was natural that her merchants would underbid the foreigner and take away his monopoly. Despite the discriminating railway rate, giving Dairen the same tariff as Newchwang, the foreigner never had a ghost of chance after the appearance of Japan on the scene. The storage, handling, and lighterage charges at Newchwang were in themselves sufficient to offset any difference in the railway freight. Against such a condition of affairs it was useless for the foreigner to struggle. If he attempted to purchase beans or bean-cake, he would have to sell eventually to the larger Japanese firms controlling the exports to Japan at their price and most likely at a loss.

“So, with the export trade of Manchuria in their hands, it was an easy step to monopolize the imports for such Japanese goods suitable to the demand. At a time when Manchuria was impoverished as a result of a devastating war, and the purchasing power of the inhabitants reduced to a minimum owing to a shortage of currency, commerce was reduced to its original character of simple barter. The farmer, hauling his crop many miles to the nearest market town, exchanged his products for cotton goods and other necessities...

“As a result of the war, many new inland treaty ports were thrown open to trade, and where previously the foreigner was confined to the one port of Newchwang, and forced to deal with the inferior through native agents, he could now branch out and establish himself in many large centers of trade throughout the province...

“It is a far cry from high diplomacy to the humble Soya Bean, yet we hold to the belief that the past and present commercial situation and ultimate solution of the vexatious Manchurian problem is bound up in the control of this one product.”

Eighteen black-and-white photos (each about 3 by 6 inches) show: Upper end of wharf at Dairen. Dairen, the “white city” or amusement park. Loading steamer with [soy] beans at Dairen. Loading beans at Dairen wharves. Loading beans on vessels at Dairen wharf. Another loading scene at Dairen wharves. [Soy] bean oil awaiting shipment at Dairen. Storing beans at Manchuria.–Oil cake company’s warehouse. Loading beans into switch cars on Dairen wharves. View of piles of beans in sacks on Dairen wharves. Piles of beans (in sacks) and round bean cakes awaiting shipment on Dairen wharves. Scenes on Dairen wharves–storing beans into round osier bins. Panoramic view of Dairen, looking across the Nippon Bridge to the Old Russian administration town. Panoramic view of Dairen, from the hills looking towards the harbor. Delivering beans in carts. Open storing grounds at Dairen with piles of beans in sacks. Cleaning and re-sacking beans at Dairen for shipment to Europe. Sansing [a large gate], in North Eastern Manchuria. The new edifice of the Yokohama Specie Bank. The Civil Administration Building, Dairen. Kirin: The governor’s summer yamen [headquarters or residence]. Main street of Tiehling, a great bean and grain center. The streets of Newchwang.

Note 1. This is the earliest English-language document seen (Feb. 2004) that uses the term “bean-cakes” to refer to ground, defatted soybeans.

Note 2. This is the earliest document seen (Oct. 2001) concerning allegations of unfair trade practices.

1380. Yokohama Nursery Co., Ltd. 1910. Descriptive catalogue... Bulbs, plants seeds. 1910-11. Yokohama, Japan. 100 p. March. Illust. Index. 26 cm. [Eng]
• ***Summary:*** On the cover of this English-language catalog is an illustration of various gorgeous Japanese flowers. In the section on "Seeds" (p. 82+) is a subsection (p. 89) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1909 catalog, except that the price per 100 lbs. of soy beans has dropped again to $2.50. Address: P.O. No. Box 72. 21-35 Nakamura, Yokohama, Japan. Phone: 509.

1381. *J. of the Royal Society of Arts* (*London*)*.* 1910. Soy beans. 58:519. April 8.
• ***Summary:*** "At a recent meeting of the Linnaean Society, Mr. J.H. Holland, on behalf of the director of Kew, showed samples of Soy bean, *Glycine Soja,* Sieb. and Zucc (*G. hispida,* Maxim.), with herbarium specimens of the plant producing this seed... This plant is variously known as 'Soy,' 'Soja,' 'Soya,' 'White Gram,' 'American Coffee Berry,' and 'China Bean.'

The "Soy [Sauce] of Commerce" is made from the seeds of this bean, plus salt, flour, and fresh water. "Wenchow is an important centre of the manufacture, and here the bean used for the purpose is said to be chiefly the white form from Chinkiang."

"The principal use of the beans in this country is for the extraction of the oil, of which they contain about 18 per cent. suitable for soap-making, and in general as a substitute for cotton-seed oil... The beans can be bought in London at about £5 to £6 per ton; the oil realises about £21 to £22 per ton, and the cake about £6 to £7 per ton.

"Beans and bean-cake exported from China have gone chiefly to Japan, and certain parts of Asia, but recently, beginning about November 1908, an important trade has been developed in them, more especially with the beans, between Manchuria and Europe, Dairen (Dalny) being the chief place of export."

"The amount of the 1908 crop sent to Europe through Vladivostok up to July, 1909, was 180,000 tons, the greater part destined for the English market (Hull and Liverpool), and the remainder going to German (Hamburg) and Scandinavian ports.

"Up to 1907 the export of Soy beans from Manchuria did not exceed 120,000 tons annually. During 1908 the export rose to 330,000 tons (one half shipped from Dairen; 100,000 tons from Newchang, and 65,000 tons by rail *via* Suifenho [Suifenhe] to Vladivostok), the increase it is said being due entirely to the demand from Europe."

Note: This is the earliest document seen that mentions Suifenho [Suifenhe] (spelled Suifenhe in 1999), a border town on the railroad that joins eastern Manchuria with Vladivostok. It is located between the cities of Suiyang (in Manchuria) and Pogranichnyy (in Primorskiy Kray in the Russian Far East). Address: Kew Gardens.

1382. *New York Times.* 1910. Latest customs rulings. Japanese "miso" for use in preserving soups is dutiable at 20 per cent. April 22. p. 14.
• ***Summary:*** "The United States Circuit Court for the Territory of Hawaii has handed down a decision favorable to importing interests regarding the classification under the tariff of so-called 'miso,' a preparation used for the most part in making soup.

"The article in controversy is a Japanese preparation, and is used by both the Japanese and Americans. The question at issue was whether the commodity is subject to duty at 20 per cent., as claimed by S.B. Fujiyama, the importer making the test case, or at double that rate under the tariff provision for 'preserved vegetables' or as 'a sauce.' The Board of General Appraisers found in favor of the Government's contention at the higher rate. The importer than appealed to the Circuit Court, which finds for the protestant..."

"This Japanese product is made from [soy] beans and rice by process of cooking and fermentation, which have the effect of changing its taste and flavor, though not entirely destroying its form. The chief use of miso is in preserving soup with which it is used."

1383. Holland, J.H. 1910. Linnean Society of London: Soy bean. *Pharmaceutical J. and Pharmacist* (*London*) 30:515-16. April 23. Series 4.
• ***Summary:*** Reprinted from the *Proceedings of the Linnean Society of London.* Session of March 17, 1910. Address: F.L.S., London.

1384. Brenier, Henri. 1910. La question du soja [The soya question]. *Bulletin Economique de l'Indochine* (*Hanoi*) 13(83):105-28. March/April. Series 2. [22 ref. Fre]
• ***Summary:*** This is an in-depth look at the relevance of the soybean to France, both now and in the future. It is prompted by the rapid growth of soybean imports to Europe from Manchuria. The author has a good knowledge of the literature on soybeans and a familiarity with the crop in the field in French Indochina and China.

Contents: 1. Soybean cultivation: Species and varieties, major soybean producing countries (China, Japan, Korea, Indochina), other countries (Java and the Dutch East Indies, France, USA. The Imperial Institute of London is conducting trials in the Cape of Good Hope and Natal [South Africa], in British West Africa, and in Gambia), methods of cultivation and yield. 2. Commerce: Exports of soybeans and soybean cake (beancake, *tourteaux de soja*) from China and especially Manchuria (Newchwang, Dairen/Dalny, Antung, Ta tung kow, Suifenho [Suifenhe] / Sui-fen-ho), importing countries in 1908 in descending order of amount

© Copyright Soyinfo Center 2014

imported (Russian ports on the Pacific [Vladivostok, for re-export to Europe], Great Britain, France, Holland, Italy, Belgium, Germany), prices. 3. Soybean utilization: Chemical composition, use as a forage plant and for improving the soil, use in human foods (tofu, shoyu, Worcestershire sauce, tuong [Annamite soy sauce], miso, natto, soymilk), the soybean as an oilseed (yield of oil from various oilseeds), soybean cakes. Conclusions.

Page 109 discusses soybeans in Indochina, according to information received from M. Crevost, Curator of the Agricultural and Commercial Museum of Hanoi, and from the article by Bui-quang-Chiêu (Dec. 1905). The names of the soybean are different in the various parts of Indochina. In Cochin China (especially in the provinces of Chaudoc and Baria), in Annam (sporadically), and in Tonkin it is called *dau-nanh* or *dau-tuong* (*Tuong* is a sauce made with soybeans, described later under "Uses"). In Cambodia (*Cambodge*) it is called *sandek sieng.* The variety most widely cultivated in Indochina seems to be one with a yellowish-white color, more oblong than round, a little flattened (*soja platycarpa* of Harz [1880, 1885] (?)), different therefore from the fine (*belle*) varieties of Manchuria and Japan that are well rounded and pure yellow.

A table (p. 112) shows soy bean grain exports (in 1,000 metric tons) from different Manchurian ports for the years 1905-1908. The author notes that Indochina could be exporting soybeans to France. One factor that stimulated the large exports of soybeans from Manchuria in 1908 (besides an excellent harvest in 1907) was a program to suppress the cultivation of opium by expansion of soybean acreage (p. 113). The author uses the scientific name *Phaseolus radiatus* to refer to the *petit haricot vert* (probably mung bean). He observed soybeans planted in mixed culture in Szechuan.

Page 116 notes that the rise of soybeans in Manchuria is due in part to the power of the Japanese commercial house Mitsui Bussan Kaisha and the large English oil mills, which joined to develop an industry that had not previously existed. At the end of 1906, Mitsui, which had a dominant commercial role in Southern Manchuria, sent one or two trial shipments of soybeans to England. Mitsui was followed mainly by the British trading houses (Samuel & Samuel, Jardine, Matheson), then by the Germans (Otto Reimers, Arnhold Karberg), and the Russians. Continued suppression of opium growing led to further expansion of soybean cultivation.

A table (p. 117) gives the price of soybeans (per picul of 300 catties = 180 kg), soybean cake (per 10 cakes of 53 catties each or 318 kg for the 10), and soybean oil (per picul of 100 catties = 60 kg) in New chwang [Newchwang] taels and in French francs in the average year from 1882-1891, and in the year 1897. Prices were up in 1897.

Page 124 states: "A factory was recently founded near Paris (at Saint Germain en Laye), with Chinese capital, for the preparation of a series of products derived from soya: milk, *"caséo-sojaïne,"* cheese [tofu], sauce, and sweet soya preserves (*confiture* (*?*) *de soja*)*."* A footnote states: "I owe this curious piece of information to the amicability of the secretary of *Ecole française d'Extrême-Orient,* Mr. Ch. Maybon, who pointed it out in the January 1910 issue of the *Bulletin de l'Association amicale franco-chinoise.*

A table (p. 125) shows that the soybean gives the lowest yield of oil of all major oilseeds: copra (from coconut) yields 67-70% oil, sesame seeds 50-56%, poppy seed (*pavot*) 43-50%, castor oil plant 42-50%, rapeseed (colza) 42-45%, linseed 43%, peanuts 35-47%, cottonseed 21-26%, soybeans from Manchuria 16-18%.

Note: This is the earliest document seen (March 2000) that describes *caséo-sojaïne* as a product. Yet this may well be a mistake since its source of information is given as *Bulletin de l'Association Amicale Franco-Chinoise* (Jan. 1910)–which uses the term to refer to a business name. Address: Inspecteur-Conseil des Services Agricoles et Commerciaux de l'Indochine.

1385. Nishimura, Torazô; Inoue, T. 1910. Shôyu ni kansuru kagakuteki kenkyû. I. [Chemical investigation of shoyu. I.]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 13(146):378-85. April. [Jap; ger] Address: Nôgaku-shi, Japan.

• ***Summary:*** This article is mainly about soybeans, their chemical composition, and the various foods that can be made from them. "By coincidence, the soybean (*Soja hispida*), of Japanese origin, fell into our hands. The first experiments on this plant were conducted many years ago, initially in our private clinic in Frankfurt, then later by another one of us in Frankfurt and the other in Vienna.

"Soja hispida, a legume, produces a seed that lies somewhere between peas and beans in appearance. There are numerous varieties of soybeans and each has different qualities. Only certain varieties are useful in the kitchen. In Japan it is used to make the Japanese "bean sauce [*Bohnensauce*], called shoyu; it is also found in fine European kitchens. Moreover, in Japan, a peculiar dish called tofu (*Tofou*) is prepared from soybeans. It is rich in protein; almost all other nutrients of the beans are removed during its preparation. In its simple boiled state, the soybean is used as a vegetable or salad in Japan by the poor. Also in southeast Europe, people have been planting soybeans for three decades, but they don't have the same value here as in Japan.

"The high concentration of protein in soybeans (30-35%), the low concentration of starch and of digestible carbohydrates (ca. 6%) leads us to want to try soybeans in

© Copyright Soyinfo Center 2014

diabetic diets. But the plain, unprocessed bean, regardless of what we add to it, does not suit European palates..."

"Finally a method was found that removes almost all of the carbohydrates from soybean meal (*Sojabohnenmehl*), and also gets rid of the unpleasant tasting materials. Because this process is much too complicated to be carried out in one's household, Bayer & Co., a paint factory in Elberfeld, took over the production on a large scale. The preparation was next produced in the form of a thick puree, put into sterilized tin cans (about 18-19% solids, of which 8-9% was protein). Meanwhile they succeeded in making a dry powder, and the firm even told us that they would probably prefer to sell the preparation in a powdered form.

This soybean puree, given the name Sarton by the factory, contains no starches or red dextrins (*Erytrodextrins*) as indicated by a test with Lugol's solution. If properly prepared, the taste is excellent. All patients, and even healthy workers, accepted it very well. Like pea soup and lentil soup, the Soybean soup invites the use of plenty of butter or other fats, and thereby enables the incorporation of a high level of total nutrients–with little resulting sugar in the urine.

"More detailed communications about the soybean, about the chemistry of this and other preparations, about its digestibility, etc. will soon be published by Dr. E. Jürgensen from the Vienna Medical Clinic (*Wiener I. medizinischen Klinik*).

Note: This product, which originated in Japan, was made in its own factory in Potsdam. Address: 1. Vienna, Austria; 2. Frankfurt am Main, Germany.

1389. Wilkinson, F.E. 1910. Bean industry of Manchuria. *Board of Trade Journal* (*London*) 69:282-84. May 12. [1 ref]
• ***Summary:*** This article is based on Diplomatic and Consular Reports, Annual Series (Foreign Office, Great Britain), No. 4440 (May 1910). "In 1909, 178,000 tons of beans and 318,000 tons of bean cake were exported from Newchwang and 438,000 tons of beans and 276,000 tons of bean cake from Dairen, making a total of 616,000 tons of beans and 594,000 tons of bean cake. Now, as 100 tons of beans are required to produce 9 tons of oil, it may be estimated that, to produce 594,000 tons of bean cake, 653,400 tons of beans must have been treated, so that the total quantity of beans represented by the combined exports of bean produce from the two ports was 1,269,400 tons. Exports from other places on the coast would bring the total exports from South Manchuria to about 1,300,000 tons...

"At the time of the first shipments to Europe the price of beans laid down at Dairen was about 3*l.* 10*s.* [£3 10 shillings] per ton. By the spring of 1909 the value of the soya bean as an article of commerce had become generally known, and, a large number of British and other firms entering the field as prospective buyers, competition gradually drove the price up. The new crop, though well up to the average, proved not to be equal either in quality or quantity to that of 1908. The price of beans consequently rose still further, and in February 1910, it reached £6 5*s.* per ton, the highest point it has touched as yet.

"At the price mentioned, China and Japan are practically out of the market as buyers, and about 80 per cent. of the purchases of beans made since December last have been for the European market." Address: British Consul, Newchwang.

1390. *Economiste Francais* (*L'*). 1910. Lettre d'Angleterre [Letter from England]. 38(21):761-63. May 21. [Fre]
• ***Summary:*** This unsigned letter from London is dated 18 May 1910. It gives a lengthy summary in French of a report from the British Consul at Newchwang (Ying-K'ou), Manchuria, concerning trade in soy beans and soy bean products (fèves de soya) between Manchuria, Japan, and England. Address: France.

• ***Summary:*** This is a Spanish-language translation of USDA Farmers' Bulletin No. 58 (1897, Revised 1899). The soybean is referred to throughout as "La haba soya." It describes and gives the nutritional composition of various Japanese soyfoods, including natto, miso (3 types; *miso blanco, colorado, Suiza* [*Swiss*]), tofu (*Tofu o queso de haba; Tofu fresco*), soymilk (*leche de la haba soya*), frozen tofu (*Tofu helado*), yuba, soy sauce (*salsa de la haba soya*).

Note 1. This is the earliest Spanish-language document seen (Oct. 2012) that mentions yuba, which it calls *yuba.*

Under the name of coffee beans (*habas de café*), soybeans (*las habas soya*) are sometimes consumed in Switzerland as legumes (*como legumbres*)*;* when they are dry and toasted, they are used as a substitute for coffee (*sustituir al café*). No mention is made of soybeans or soyfoods in Mexico.

Note 2. This is the earliest Spanish-language document seen (April 2013) that uses the term *Tofu* or the term *queso de haba* or the term *Tofu fresco* to refer to tofu

Note 3. This is the earliest Spanish-language document

seen (Jan. 2012) that mentions natto, which it calls *natto.*

Note 4. This is the earliest Spanish-language document seen (March 2009) that mentions miso, which it calls *miso.*

Note 5. This is the earliest Spanish-language document seen (Nov. 2012) that mentions soy coffee or soy as a substitute for coffee, which it calls *sustituir al café.*

Note 6. This is the earliest Spanish-language document seen (Aug. 2013) that uses the term *leche de la haba soya* to refer to soymilk.

Note 7. This is the earliest Spanish-language document seen (April 2013) that mentions frozen tofu, which it calls "Tofu helado."

Note 8. This is the earliest Spanish-language document seen (April 2012) that mentions soy sauce, which it calls "salsa de la haba soya." Address: PhD, Office of Experiment Stations, USDA, USA.

1392. Sewaki, Hisao. 1910. On the preparation of a simple culture medium. *Sei-i-kwai Medical Journal* 39(5):515-16. May 31. Whole No. 339. [Eng]
• ***Summary:*** To replace the ordinary bouillon and agar culture media, most frequently used for the cultivation of bacteria, the writer describes five less expensive alternatives: (1) Shôyu-Bouillon–15 parts shoyu, 18 parts pepton, and 1000 parts water. (2) Simple shoyu culture medium. (3) Shoyu-agar medium. (4) Shoyu medium after Endo's method. (4) Shoyu medium after Conradi-Drigalsky's method.

Characteristics of these shoyu media: 1. The shoyu medium does not contain meat in any form. 2. Shoyu is employed in place of meat. 3. As shoyu contains sodium chloride, the latter is not used. 4. It takes only 2 hours to make an ordinary shoyu culture medium. 5. The above mentioned conditions make the expense very small and economise on time.

Note: This journal, later titled *Seiikai Geppo,* is published by the Society for the Advancement of Medical Science in Japan. Address: M.R.C.S., L.R.C.P.

1393. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Soya Beans. China. No. 356. p. 92-93. May.
• ***Summary:*** Having received several inquiries from interested firms, Vice Consul C.C.L. Williams secured freight quotations on the shipment of Manchurian soya beans and bean cake from Newchwang to San Francisco, California, and Seattle, Washington.

Writing from Dalny at the end of January 1910, regarding soya beans, Vice-Consul A.A. Williamson states that "the whole market has been in an unprecedented state of upheaval this season." "Beans are now at prohibitive prices, higher than ever before–$1.66 gold per 133.3 pounds. Absolutely no guarantees as to oil contents or moisture can be given."

"On account of the high duty on beans–45 cents per bushel of 60 pounds–very few have gone to the United States. The chief product which Americans buy is oil." A table (p. 93) shows exports (in tons) of beans, bean cake and bean oil from Newchwang to Hongkong, Great Britain, Samarang [Semarang, Central Java], Germany, Japan, and Chinese ports during the first 3 quarters of 1909. Address: Washington, DC.

1394. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Oil-seed products. No. 356. p. 83-93. May. See p. 91-93.
• ***Summary:*** In the section titled "Cotton-seed oil and meal," under "England" there is a long subsection on "Soya Bean and Other Oils." In the section titled "Soya Beans" are the following subsections: (1) "China: Freight rates from Newchwang to the United States." A Japanese shipping company, Nippon Yusen Kaisha, has quoted a rate from Kobe to Seattle, Washington, and a French company has quoted rates from Chingwantao* to San Francisco, California, by direct steamer. Exports of "beans, bean cake, and bean oil" from Newchwang to the following ports are given for the first 3 quarters of 1909: Hongkong, Great Britain, Samarang [Semarang, Central Java], Germany, Japan, Chinese ports, and total. The leading buyer is Japan, and the leading export product is bean cake.

(2) "Dalny: Prices and cost of shipment." "Beans are now at prohibitive prices, higher than ever before–$1.66 gold per 133.33 pounds." A table (p. 93) shows the exports during the first 3 quarters of 1909 from this port to Hongkong, Great Britain, Samarang, Germany, Japan, and Chinese ports for beans, bean cake, and bean oil.

* Note: Chingwantao, also spelled Chinwangtao or Ch'in-huang-tao, is seaport town on the Gulf of Chihli, in northeast Hopeh province, northeast China (former Manchuria); a former treaty port. Address: Washington, DC.

1395. Nippon Shubyo Kabushiki Kaisha (Japan Seed & Plant Co., Ltd.). 1910. Eigyô annai [Sales information]. Tokyo, Japan. Spring. 26 cm. [Jap]
• ***Summary:*** On the cover of this Japanese-language catalog we read (in characters from right to left): Number one seed store in the Orient (*tôyô*). Capitalization: 700,000 yen. 43rd year [of Meiji], spring. Sales information.

Page 3 is devoted entirely to beans (*mamé rui*). Shipping and tax free. Each small bag costs about 2 *sen.* The first section described 7 varieties of soybeans: (1) Large white soybeans (*Ooshiro daizu*). 5 sen per *gô* (100 sen = 1 yen; 1 *gô* = 180 cc = 0.763 cups {U.S.}). 32 sen per *shô* (1 *shô* = 1.8 liters = 1.903 quarts {U.S.}). Large, shiny beans. Good tasting. Good for making *nimame* (boiled, seasoned whole soybeans) or kinako (roasted soy flour) (2) Black soybeans (*Kuro daizu*). 5 sen per *gô.* 32 sen per *shô.* Black beans, large beans, extremely productive. (3) Large green soybeans (*Ao*

© Copyright Soyinfo Center 2014

ômamé). 5 sen per *gô*. 23 sen per *shô*. The seed coat is green. Good for making kinako and roasted soybeans (*irimamé*). (4) Black soybeans for rice fields (*Ta no kuromamé*). 5 sen per *gô*. 32 sen per *shô*. Planted on the sides of the foot paths between rice fields (*azé*), these will produce a big crop. Good for making a type of boiled (?) soybeans and miso. (5) Branch and pod *Sangorô* soybeans (*Eda saya sangorô daizu*). 7 sen per *gô*. 60 sen per *shô*. Pull up the whole plant, boil the beans in the pods, and enjoy. Satisfies large demands. (6) "Little bells" soybeans (*Suzunari daizu*). 5 sen per *gô*. 40 sen per *shô*. Although the beans are small, they grow in many clusters, so you get a big crop and a big profit. (7) "Goose eating" soybeans (*Gan-kui mamé*). 5 sen per *gô*. 40 sen per *shô*. Black, large-seeded soybeans. Good for making *nimame* (boiled, seasoned whole soybeans).

Next come 5 varieties of azuki beans: (1) Summer azuki (*Natsu shôzu*). 5 sen per *gô*. 35 sen per *shô*. Early type, therefore if you grow them, they could be profitable. (2) White azuki (*Shiro shôzu*). 6 sen per *gô*. 40 sen per *shô*. Small and white, they are used to make high quality sweet azuki bean paste (*an*). (3) Dainagon shôzu. 5 sen per *gô*. 35 sen per *shô*. Large and high quality, they are the best to make sweet azuki bean paste (*an*). You can get a large crop on any type of land. (4) "Thin seed coat" azuki (*Usu kawa shôzu*). 5 sen per *gô*. 35 sen per *shô*. Although small seeded, they have thin seed coats and are good quality. (5) Mottled azuki (*Kasuri azuki*) 5 sen per *gô*. 40 sen per *shô*. White beans with white kasuri pattern. Tasty. Note: Kasuri is a famous type of Japanese dyed cloth with a splashed or mottled pattern, usually white on blue. (6) Green beans (*Yainari*. [Also written "yaenari"]). 7 sen per *gô*. 60 sen per *shô*. The very small green seeds can be used [ground] to make green kinako (*ao kinako*) or sweet azuki bean paste (*an*). Note: Yainari / yaenari is the most expensive variety of azuki. Address: Near Shinjuku Station, Tokyo, Japan.

• ***Summary:*** The German title is "Ueber das Mandschurische Soyabohnenoel." The author has made a detailed study of soap made from soybean oil. Address: Rigakushi, Japan.

1398. Wilkinson, F.E. 1910. China. Report for the year 1909 on the trade of Newchwang. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*) No. 4440. 23 p. May.

• ***Summary:*** The section titled "Exports" (p. 9) gives a detailed discussion of the amount and value of Beans [soybeans], bean cake, and bean oil exported from this port. An excellent full-page map shows the south of Manchuria and Corea including all the major ports (Newchwang, Port Arthur, Tairen [Dairen], Antung), cities, rivers, railways (existing and proposed), and bodies of water. Export of [soy] beans from Newchwang reached 4,242,943 cwt [1 cwt = hundredweight = 112 pounds], which has only once been exceeded, in 1899, before the port of Dairen came into existence. Export of bean cake has broken all previous records. Some 86% of the 6,365,654 cwts were sold to Japan, "where, owing to the dearth of fish manure, bean cake has become indispensable as a fertiliser in the rice fields... Experimental shipments of bean cake for cattle consumption were made during the year under review both to the United Kingdom and Germany. The shipment to the United Kingdom proved a failure, the cake arriving in a mildewed condition. The result of the shipment to Germany, which as a comparatively large one of about 500 tons, has for some reason or other been kept a secret. Special precautions were taken in this case to keep the consignment in good condition."

The great market for bean oil "is South China, where it is mainly used for cooking purposes as a substitute for lard, which is a more expensive commodity. In spite of its unpleasant odour, the poor consume the oil, as a rule, in its crude state without any attempt at refining it, but amongst the better classes it is boiled before being used and allowed to settle in jars for a couple of months. This process is said to do away to a great extent with the objectionable smell and to improve the flavour. There is also amongst the poorer classes a fairly brisk demand for bean oil for lighting purposes. They find it more economical than kerosene, besides saving them the cost of a lamp, for all they need to do is pour a little into a cup or bottle and drop a proper wick into it... A small quantity of bean oil was shipped to the United Kingdom, where their appears to be a demand for it for soap making... The shipments in 1909 were made in kerosene oil tins, but they have not been a success, as in every case there was a heavy loss by leakage."

"Total production of [soy] beans in South Manchuria." The author will now attempt to estimate this total based on the exports of beans and bean cake from Newchwang and Dairen in 1909. The "consumption by Manchuria of these special products is very limited, and the two ports between them almost monopolise the export. Beans, except to a limited extent, in the form of bean curd [tofu] or vermicelli, which is made of the green variety, do not enter into the diet of the population, nor is any use made by farmers of bean cake either in manuring their fields or feeding their cattle. The staple food of both man and beast in this country is millet, and, for the rich soil in the interior, the ordinary farm manure is the only fertiliser needed. It is probable, therefore,

© Copyright Soyinfo Center 2014

that at least 90 per cent. of the total crop is available for export. In 1909 212,000 tons of beans and 318,000 tons of bean cake were exported from Newchwang, and 438,000 tons of beans and 276,000 tons of bean cake from Dairen, or from the two ports together 650,000 tons of beans and 594,000 tons of bean cake. It is computed that it would require about 653,000 tons of beans to produce 594,000 tons of bean cake, so that the total quantity of beans represented by the combined exports of bean produce from the two ports was 1,303,000 tons. Exports from other places on the coast may account perhaps for another 30,000 tons, which brings the total exports from South Manchuria to 1,333,000 tons. The production therefore, under favorable conditions, may be safely estimated at not far short of 1,480,000 tons."

Tables show: Value of the total trade of Newchwang during 1905-09. Value of trade for beans, bean cake, and bean oil from 1908-09. Distribution of bean, bean cake, and bean oil export from Newchwang. Address: British Consul, Newchwang.

1400. *Weekly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Japan's purchases of fertilizers. 1(15):713. June 11.
• ***Summary:*** "Vice-Consul-General E.G. Babbitt, of Yokohama, reports that the imports of fertilizers into Japan in 1909 were valued at $17,899,322..." They weighed 1,347,541,898 *kin* (1 kin = 1.333 pounds). "The value of the chief fertilizers imported in 1909 was as follows [no amounts are given]: Bean cake, $11,140,407; sulphate of ammonia, $2,949,409; phosphate rock, $1,105,640; rape-seed cake, $588,523; animal bones, $503,578; cotton-seed cake, $400,853; nitrate of soda, $347,814; superphosphate, $218,333; dried fish, $182,334; bone dust, $128,572. The share of the United States in this business amounts to less than 1 per cent of the total."

1401. *Times of India* (*The*) (*Bombay*). 1910. Trade prospects in Manchuria. June 24. p. 6.
• ***Summary:*** "Discussions of the future of the Bombay mill industry are largely governed by the prospects of the China trade. And of the China trade by far the most promising branch is that with the fertile and growing province of Manchuria. We commend therefore to Bombay millowners interested in the China trade a valuable and suggestive report upon the commercial condition of the province in general and of Newchwang in particular, which has been written by Mr. Consul Wilkinson. The staple products of Manchuria are millet and beans. Millet takes the place of the Indian kharif as supplying the food of the people, and beans are the money-bringing produce. It is estimated that the total production of beans [soya beans] in Manchuria is not less than a million and a half tons,... Since 1909 the character of the trade has entirely changed."

"But in 1909 some European millers discovered the merits of the soya bean, and this discovery, synchronising with a demand for oil seeds at a high price, stimulated an enormous export to Europe. The result has been that Europe snaps up the Manchurian beans at prices which China and Japan cannot afford to pay, The cultivators dependent upon the bean cake for manure are hit hard, and the oil mills at Newchwang are standing idle."

1407. Reuter. 1910. The Far East. Russo-Japanese agreement. The situation in Manchuria. *Scotsman* (*Edinburgh*). July 8. p. 7.

• ***Summary:*** "Paris–The Russo-Japanese agreement consists firstly of a brief general statement of the determination of the two Governments to maintain jointly the *status quo* in Manchuria, territorially, administratively, and in other respects, and to co-ordinate railway interests there.

"Secondly, it consists of a detailed technical agreement between the eastern Chinese Railway Corporation and the South Manchuria Railway Corporation, regulating the direction and division of the traffic between Vladivostok and Dalny, establishing advantageous through rates with the railways in Russia and Japan, and adjusting several pending matters.

"The traffic agreement is designed to enable the railways to exploit the territory more profitably, subordinating local developments to a general plan. Vladivostok thereby gains a share in the export of grain and [soy] bean crops to Japan. It is intended to work the lines to be constructed in future as feeders to the existing trunk lines."

1408. Asakawa, K. 1910. Russo-Japanese treaty: Prof. Asakawa defends Japan's position on Chinese railways (Letter to the editor). *New York Times.* July 16. p. 6.

• ***Summary:*** "I venture to call your attention to the following points regarding the editorial entitled 'The Russo-Japanese Treaty, published in to-day's *Times.*

"The protocol that China will not, before the expiration of the terms of the South Manchuria Railway, construct a competing line in its neighborhood, which you describe as a 'secret agreement,' was not 'disclosed as a consequence of Mr. Knox's proposal.' It was signed at Peking in December, 1905, and the European and American Governments were notified of its conclusion early in 1906."

"In the meantime, the increasing exportation of Manchurian [soy] beans and [soy] bean products not only to Japan, but now also to Europe, is rapidly changing the commercial situation in Southern Manchuria, to the great advantage of foreign merchants competing with the Japanese in the import trade." Address: Prof., New Haven, Connecticut.

1409. *Times* (*London*). 1910. The soya bean: Its importance in Manchuria. July 19. p. 63, col. 4.

• ***Summary:*** This is part of a 96-page Times Supplement on "The Empire of Japan." Contents: Introduction–The bean trade in Manchuria. Its introduction to European markets. The growth of exports. The home consumption remains large. Efforts to secure foreign markets. A word of caution. The trade in England (Total: 2,500 words).

"The history of the growth of the bean trade in Manchuria is as captivating as the story of the rise of Jack's famous beanstalk of our nursery days. It reads more like a fairy tale than a page from the Board of Trade Returns." "More than the ordinary amount of imagination is required to grasp the fact that the first commercial consignment of this crop was sent to Europe in 1906, and that the requirements for the coming season are estimated at a million tons."

"The credit for the introduction of this useful article of commerce is undoubtedly due to Messrs. Mitsui and Co., the well-known Japanese financial and industrial firm, who sent their first trial shipment of beans to England in the winter of 1905-6. This consignment was not successful owing to imperfect packing. A second shipment met with better results and led to a succession of large orders. The beans were found to be valuable both for the extraction of oil... and also in the shape of cake for feeding cattle.

"Excellent biscuits have also been made out of one variety of these beans. The United Kingdom was at once able to take advantage of this newly-found import because of its admission free of duty, the high tariff on such produce precluding the Soya beans from access to Germany, France, and other Continental countries. So great was the demand that by the end of the season of 1908, the Mitsui Company had exported to Europe 200,000 tons of these beans... In the season of 1909 the sales to Great Britain alone are stated to have reached 400,000 tons, and several other important firms have entered the field, including the well-known firm of Samuel Samuel and Co."

"The growth of exports:... Figures supplied me by Messrs. Mitsui give the total exports for the season of 1908-9 (from the three ports of Dairen, Newchwang, and Vladivostok) at 788,916 tons and of bean cake (94 per cent.

© Copyright Soyinfo Center 2014

of which went to Japan) at 681,446 tons. Of the beans, 397,156 tons, or 51 per cent., went to Europe, 30 per cent. to China, and 19 per cent. to Japan."

"The home consumption remains large:... In Manchuria the Soya bean is primarily used for the extraction of oil and for the manufacture of cake; it is also made into vermicelli and similar articles of food. Manchuria seems to have a natural monopoly in the growing of this bean for export. The other producing countries, Japan and Korea, require all they are able to raise for domestic consumption, whilst the production of the French possessions in Asia, of Asia Minor, and of West Africa is said to be neither large nor promising enough to be of much account for export. Down to the present time, the Soya bean has not been successfully produced elsewhere, though experimental efforts to grow this particular bean in other parts of the world are in progress." Note 1. This is the earliest document seen (Dec. 2007) suggesting that soybeans may be growing or have been grown in Asia Minor [which is today the large eastern part of Turkey], or the Middle East. A similar and earlier, but weaker, suggestion appears in an article titled "The Ubiquitous Bean," in the *Manshu Nichi Nichi Shinbun* (Dairen) of 25 Nov. 1909. That article states that "Asia Minor... produced something like Beans" [Soya Beans].

"Efforts to secure foreign markets: The Treaty Port of Manchuria half a century ago began the exports of beans, bean oil, and bean cake. It is strange that the potency of the little green bean–it looks more like a dried pea than the bean grown in England–which is furnishing three railway systems with freight, hundreds of vessels with cargoes, three ports with business, and starting up new industries in the North of England should have remained so long undiscovered by Europeans. Even now its advantages appear to have been forced upon the attention of England by a Japanese merchant who, failing his first efforts, made a second attempt to introduce the Soya bean into Europe.

"These beans raised by industrious Chinamen toiling incessantly for a few pence a day are generally brought to the river in carts and shipped in junks in the summer time, while in the winter they are often brought for miles along very bad roads by cart to Newchwang.

"After the building of the railways it was natural that these exports should gravitate more and more to the maritime outlets of these lines at Dairen, Vladivostok, and, to a lesser extent, to Newchwang, which last port, as will be seen in an article elsewhere in this issue, is still receiving the bulk of its consignments by means of junks and by carts. The Newchwang exports consisted of oil and cakes which were manufactured by the aid of numerous crude Chinese oil presses worked with mule power–the oil going to China and the cakes to Japan.

"As soon as the bean assumed an international importance, Newchwang lost its monopoly of the trade. As recently as 1907 almost all the beans available for export–namely, 120,000 tons–were exported *via* Newchwang. Of the 800,000 tons exported last year half went by way of Dairen, and the remainder from Vladivostok and from Newchwang. In the export of bean cake Newchwang still holds the first position because of her numerous Chinese oil presses, together with one modern factory."

"A word of caution:" British merchants lured by the story of the rise of the Soya bean industry are warned that "it would be quite useless to start an office at some point like Dairen or Changchun in order to buy beans in the local market. The only way is to travel into the interior, to visit the country markets and to buy in small quantities for silver coins of low value, that is, 20 or ten cent pieces. The Chinese silver dollar is only worth 85 *sen* Japanese money, or 1s. 9d. [1 shilling, 9 pence], and 5 of the 20 cent silver pieces are worth about 2½d. less than the Mexican or Chinese dollar. The Japanese by purchasing the beans with the little silver coins obtain them cheaper than would be possible for an English firm which was paying for them in silver dollars. For some unaccountable reason, the Chinese producer prefers the small coin though its value is 10 per cent. less."

"The trade in England: The soya bean now constitutes an important part in the Hull import trade... The imports into Hull last year were about 200,000 tons." These large imports are likely to lead to a major decline in cottonseed imports. "The bulk of the soya beans imported into Hull are the yellow beans, and those engaged in the seed trade in the Hull district have a good opinion of the new bean. It is to the cattle grower, rather than to the oil trade, that the advent of the soya bean into this country is of importance, for the cake is cheaper than cottonseed cake and is at the same time richer in those constituents for which cake is used. The value of soya oil is also being widely recognized by soap manufacturers, and there is a notable tendency to employ it in preference to cotton oil.

"The beginnings of an export trade from Hull with the Continent are now in evidence. A considerable quantity of soya cake has already been exported from Hull... Continental dairy farmers are now employing soya meal, with which, apparently, experience has been quite satisfactory."

"With the breaking down of the prejudice of British farmers, which is gradually coming about, a real boom in the soya bean trade would appear to be imminent.

Note 2. This is the earliest document seen (June 2007) stating that Mitsui and Co. sent soybeans to Europe in 1906.

1410. *Christian Science Monitor.* 1910. Rapid development of the soy bean trade in China. July 21. p. 2.
• ***Summary:*** London. From the black variety of soy bean "is manufactured soy (so called from the Japanese equivalent So Yu [sic, Shoyu]), a sauce used by the Japanese as well as the Chinese in astonishing quantities with all kinds of cooked food. It is manufactured by boiling the beans and by allowing them to ferment with yeast [sic] after mixing thoroughly with

© Copyright Soyinfo Center 2014

water, flour, and salt, and is sold in glazed earthenware jars.

"The variety of yellow beans is used for making another product of general use, a clear [sic] jelly like substance known as bean curd. It is to be seen on sale in large slabs on every wayside food stall. The cheerful looking coolies in the accompanying photograph are pausing a moment in their work of grinding beans for the purpose under a revolving stone mill. The pulp [okara] so produced will be filtered, [the soy milk cooked], the casein coagulated by the addition of gypsum and the jelly-like coagulated mass pressed into shape for market.

"But it is the cultivation of a third variety, the white bean, which has developed during the last few years from a mere local crop, to supply far eastern demands, into an industry of world-wide importance. At a recent meeting of the Linnaean Society of London Mr. Holland, on behalf of the director of the royal botanic gardens, Kew, gave some statistics of the remarkable innovation for which Manchuria is apparently responsible. The output of soybeans from that country prior to 1907 did not exceed 120,000 tons annually, nearly all being taken by neighboring ports in China and Japan; but during 1908, owing to the demands from Europe, the export rose to 330,000 tons, while the 1909 crop has been estimated at 700,000 to 800,000 tons. The principal use of the beans in Europe is for the extraction of oil, of which they contain some 18 per cent, which is suitable for soap making, while the cake left after crushing is said to be a valuable cattle food likely to prove a serious competitor to cotton seed and linseed cake, at present in use for this purpose. The beans fetch $20 to $21 a ton in London, the oil from $84 to $88 per ton, and the cake about $26 per ton.

"The sudden influx upon the markets of the world of this extremely useful product is, strange as it may seem, undoubtedly due to the Russo-Japanese war, for the cultivation of the crop was extended in Manchuria in direct consequence of the large demand for the bean for food for the Russian army. When the troops were withdrawn other markets had to be sought for the products, the supply of which was at once greatly in excess of demand."

The photo caption reads: The grinding process. Soy beans being prepared for market in a Kwangtung [Guangdong] village. Note: Guangdong is a province in southeast China; its capital is Canton (Guangzhou).

1411. *Agricultural J. of India* (*Calcutta*). 1910. Cultivation of soy-beans in India. 5(3):277-78. Reprinted in Quarterly Journal of the Department of Agriculture, Bengal. 4:17 (1910). For the year 1910-11.
• ***Summary:*** "Soy-bean should be grown as a *kharif* (rainy season) crop. The seed should be sown in June-July. The cultivation is similar to that of other pulses grown in India, *e.g.*, gram, which however, is grown in the cold weather. The crop is ripe in October-November." Detailed instructions for cultivation are given.

"In a good year, the crop yields from 500 to 1,000 lb of grain per acre. In an experiment at the Poona farm in 1906-07 the average yield of different varieties introduced from Japan was 660 lbs. of grain per acre. The straw affords a very valuable fodder for all kinds of stock, who eat it most readily–(Editor)."

1412. Burtt-Davy, Joseph. 1910. The soy-bean (Glycine hispida). *Transvaal Agricultural Journal* 8(32):620-26. July.
• ***Summary:*** Contents: Introduction. Description. Climatic requirements. Varieties. Planting and cultivation. Harvesting the seed. Returns of seed. Use of the seed for stock feed. Use of the seed for human food. Commerce in the seed. Soy-bean oil. As green forage. For ensilage. For hay. As a rotation crop for green manuring. Some co-operative experiment reports (from South Africa).

"We have grown soy-beans successfully at Skinners Court and on the Springbok Flats since 1903. We have also tested them successfully in other parts of the country, but as there was no market for the beans, and farmers had not learned to use them for their own stock, they were not taken up as a regular crop. Another reason for this was that some varieties gave a uniformly poor germination, while on some soils, or under some conditions, none of the varieties did well.

"We have continued our experiments and have now established a strain of seed which gives very satisfactory results. But owing to the variations in soil and the apparent necessity for inoculation (natural or artificial) in some cases, I cannot recommend farmers to plant largely until they have given the crop a trial on a small scale...

"A variety brought by me from the United States in 1903, known as the 'Southern,' has given the best results of any tried by us, both at Skinners Court and on the Springbok Flats. The seed harvested in 1904 we distributed extensively in different parts of the Transvaal, and have had favourable reports of it, both from the high veld and the bush-veld. The original stock was obtained through [seedsmen] J.M. Thorburn & Co., New York.

"Writing from London, Messrs. Mitchell, Cotts & Co. state that only two varieties have been imported into England in any quantity, viz., the north Manchurian or 'Harbin' quality, exported from Vladivostok, and the south Manchurian or 'Sakura' quality, shipped from Dalny, both of which are described as very similar in appearance and composition; the 'Sakura' realizes about 2*s.* 6*d.* per ton more than the others. These are the classes which are most acceptable to the English market. Seed has been received through the courtesy of Messrs. Mitchell, Cotts & Co., and will be tried the coming season."

"Of the varieties grown in Europe we have tried Vilmorin's 'Extra-Early,' 'Extra-Early Black,' and 'Yellow Etampes' at Skinners Court, but they did not thrive at all, even though grown alongside the 'Southern' which did

© Copyright Soyinfo Center 2014

excellently" (p. 621).

A list of the names of soybeans grown in Japan, grouped according to seed color, is given. Among the six white seeded beans (*Shiro Mame*), Teppo Mame or 'Gun Bean' is "the sort principally used to make the famous Soy Sauce." Maru Mame or 'Bullet Bean' is recommended as very valuable for horse food. The names of three black seeded soybeans (*Kuro Mame*) and three speckled seeded soybeans (*Fuiri Mame*) are also given. "These have not yet been tested by the Department, but seed is on order for trial next season. In the meantime I recommend farmers to restrict themselves mainly to the 'Southern' variety." Note 1. In calculating yields, 1 muid = 3.33 bushels.

"In China and Japan the soy-bean is an article of human diet. In Japan it constitutes a large proportion of the food of the people, a variety of dishes being prepared from it as well as foodstuffs similar to butter, oil, and cheese. A condiment famous among the Chinese under the name of 'soy', is made from this bean. The beans are of a pleasant taste when boiled, either in a green state or when ripe; in the latter state they need considerable soaking before use...

"The Japanese are reported to extract the casein from soy-beans, using it as a substitute for milk. This vegetable drink is said to be a very popular drink among the poorer classes of China and Japan. The beans are first softened by being soaked and then boiled in water.

"Experiments are being made in Europe in the use of soy-bean flour as an admixture with wheat flour for bread. A biscuit is made and sold in Paris, containing soy-bean flour, which has no starch, and is recommended for persons suffering from diabetes.

"Biscuits seem to be the most likely form in which this flour can be used, and two or three large English firms are now making them... A coffee substitute is made in America and on the Continent of Europe, out of soy-beans."

Note 2. This is the earliest English-language document seen (Nov. 2013) that uses the term "soy-bean flour." Address: F.L.S., etc., Governnment botanist and agrostologist.

1413. Crowe, E.F. 1910. Japan. Report for the year 1909 on the trade of Japan. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*) No. 4511. 86 p. July.
• ***Summary:*** "Imports of manures.–The question of manures forms one of the most interesting items of 1909. A detailed table showing the quantities and values imported during the past three years will be found in Table 1 (B), page 61. Bean cake, of course, heads the list as regards value. The total amount imported in 1909 was 575,180 tons, worth £2,283,700, or £3 19*s.* 4*d.* a ton, as compared with 461,950 tons, worth £2,220,000 in 1908, or an average of £4 16*s.* 1*d.* a ton.

"Next comes the sulphate of ammonia, but in this item there was a big drop from 66,445 tons, valued at £898,000, to 45,835 tons, worth 604,700, while in the case of both phosphate rock and fish guano there was a decrease of about £100,000. Nitrate of soda made a small gain.

"It is a well-known fact that bean cake has for years occupied the position of the most popular imported fertiliser in Japan. Now, however, that the United Kingdom, and the Continent of Europe and America to a lesser extent, have become purchasers of Manchurian beans the questions arises as to whether Japan will be able to continue to buy bean cake in huge quantities if the price rises appreciably. In studying this question two factors should not be lost sight of; one is that Japan is herself a large grower of soya beans, having, according to the latest available returns (1908) over 1,200,000 acres under cultivation, producing annually some 19,000,000 bushels of beans, while the other is that Japan imports very large quantities of soya beans from China and Corea.

"The greater part of these beans is used for the purposes of human food, *i.e.,* the making of "soy," "miso," and bean curd, but a portion, by no means small, is used also as a fertiliser.

"The Russo-Japanese war had such an effect in curtailing the supplies of beans and cake that to arrive at a just appreciation of the position it is necessary to go back a good many years." A table (p. 18) shows imports of [soy] beans and bean cake (in piculs; 1 picul = 132.27 lb), the value of each, and the average price of silver each year from 1900 to 1909. Imports of [soy] beans increased from 1,575,022 piculs in 1900 to a record 3,623,377 piculs in 1909. Imports of bean cake increased from 2,280,687 piculs in 1900 to a record 9,663,036 piculs in 1909. The average price of silver fell by about 16% during this period. "Should the price in future be forced up very high in consequence of British and other demand, the presumption is that Japan would turn to sulphate of ammonia if the cost per unit of nitrogen therein were to be less than in the bean cake. On the other hand it must be remembered that the removal of duty on sulphate of ammonia in the United States of America means that that country will probably absorb large quantities of the British output and that Japan will have to pay a bigger price if she wants a share of this fertiliser.

"Thus the outlook for nitrate of soda becomes a good deal brighter and now that, owing to the subsidised Japanese line which runs to South America, it is possible to get cheap direct rates of freight, it looks as though the nitrate of soda will be a serious competitor to the other nitrogenous fertilisers, except in the matter of wet rice cultivation."

Page 31 shows the shares of principal countries in the import and export trade of Japan during the years 1908 and 1909. Japan's biggest imports came from the United Kingdom, followed by the USA, then China. The biggest customer of Japan's exports was the United States, followed by China then France (p. 31). Japan's biggest port (in terms of value of imports and exports) was Yokohama, followed

© Copyright Soyinfo Center 2014

by Kobe than Osaka (p. 37). Japan's population at the end of 1909 was estimated at 49,769,704 (not including Formosa or Karafuto [Japanese Sagalien]). Japan's most valuable exports in 1909 were tea, followed by rice then fish. Exports of "Soy" [sauce] rose from £110,500 in 1907 to £111,100 in 1909.

Summarized in *J. of the Board of Agriculture* (*London*), Aug. 1910, p. 410.

Note: This is the earliest document seen (Sept. 2001) that gives statistics concerning industrial utilization of soybeans–in this case soybean meal used as a fertilizer in Japan. Address: Attaché, British Embassy, Tokio [Tokyo].

1414. Paton, G.P. 1910. Japan. Report for the year 1909 on the trade and navigation of the port of Dairen. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*) No. 4504. 22 p. July.

• ***Summary:*** On pages 3-4 key weights and measures are defined: Chinese: catty = 1.333 lb, picul = 133.33 lb, *li* = 1/3 miles, *mow* = 736½ square yards; Japanese: 1 *koku* [liquid] = 39.703 gallons, 1 *koku* [dry] = 4.963 bushels. The Japanese, Chinese, and total populations are given for Dairen, Shaokangtzu [Shao-kuan, in Kwantung Leased Territory], Port Arthur, Chinchou [Chin-chou] and Pitsewo [Pikou, in Kwantung Leased Territory]. One map (p. 5) shows part of Manchuria, with the main towns, railroads, and where major commodities are produced. Next comes a large fold-out map of the Kwantung Leased Territory [and peninsula] (Dairen Consular District).

Dairen may now be considered the principal outlet for the produce of South Manchuria. The Central Laboratory is doing good work in the manufacture of bean cake and bean oil, and soap from bean oil. "The manufacture of soap from bean oil has been commenced on a very small scale by three different firms in Dairen, but the excessive price of bean oil since the end of 1909 is proving a great handicap." The South Manchuria Railway Company takes a major share in the development of South Manchuria as well as the Kwantung Peninsula. Its work during the past year is discussed. An ice-breaker has been added to facilitate the berthing of ships during the winter months.

"Export trade.–Thanks to the very large increase in the export of beans, the export trade is in a very thriving condition... Beans and bean products.–The most striking feature in the exports is the enormous increase in the shipments of beans and bean products, viz., oil and cake" which accounted for nearly 70% of all exports from Dairen. Export of [soy] beans rose from 206,653 tons in 1908 to 462,423 tons in 1909. In 1909, some 56% of these beans went to Europe, 29% to Japan, 12% to north China, and 21.4% to south China. "Of the amount sent to Japan, probably some was re-shipped to Europe; while of the quantity sent to Europe about 90 per cent. went to the United Kingdom." There follows a long discussion of economic factors causing the prices of soybean and bean cake to be currently high in Manchuria. If, as seems probable, the French, German, and U.S. governments remove the import duty on [soy] beans, then a great impetus will be given to the export... The farmer in Japan has learned the value of bean cake as a fertiliser for the paddy field and the mulberry plantation, and immense quantities are exported to that country. In 1909, indeed, Japan took over 99 per cent. of the bean cake exported from Dairen... A small quantity is exported to South China where it is used both as a fertiliser and as a food for pigs. A shipment was also made last year to Formosa [today's Taiwan] for trial in the sugar plantations and, as the result was successful, the experiment will probably be repeated this year."

"Bean oil.–In Manchuria the primary object of the bean mills is the manufacture of bean cake, and the oil is only of secondary importance. The mills are worked on the press system and only extract 7 or 8 per cent. of the 17 or 18 per cent. of the oil contained in the bean... The largest purchaser of bean oil is South China, which takes about one-half of the output. Of the remainder, the bulk goes to Japan, where it is mostly transhipped [transshipped] to Europe and America." The value of "Soy" (soy sauce) imports to Dairen increased from £22,367 in 1907, to £27,431 in 1908, falling to £21,551 (3,307 tons) in 1909. The value of miso imports to Dairen increased from £2,128 in 1907, to £5,422 in 1908, falling to £2,815 (656 tons) in 1909. Tables (p. 19-21) show returns of: (1) Import trade of Dairen during 1907-09 (2) Export trade of Dairen during 1907-09 (3) Shipping entered at the Port of Dairen during 1908-09. Note: In some parts of this report, the £ sign is written as "*l.*

• ***Summary:*** The elder readers of this garden magazine will know well this plant, which is so useful and versatile. But that we will take advantage of the resurgence of interest in the soybean to give our young readers a summary of what

© Copyright Soyinfo Center 2014

various people appreciate this useful plant. It can be used as food, forage, in industrial products, and as a medicine. Those who have written about it include Blavet, D. Bois, A. de Candolle, Chevallier, Cusin, Foëx, Fruewirth, Grandeau, Guichard, Haberlandt, Lachaume, Ladureau, de Lunaret, Michelin, de Mortillet, Paillieux, Trabut, Vavin, Vianne, Vilmorin, and many more. We also want to encourage our young readers to at least try cultivating the soybean, since this is not difficult.

Contains a brief botanical description of the soybean, a list of the Asian countries where it is grown and its vernacular names in some of these countries, a long quotation from Kaempfer (1712) describing the soybean, and a history of the soybean in France from about 1740 when it was sent to the *Jardin du Roi* (today called the Museum) by missionaries in China–although the first records date from 1779. In 1821 it was tested by Mr. C. Brun of Beaumes on his land at Champ-Soue, near Etampes (Seine-et-Oise). At the end of 1855 the Society for Acclimatization distributed it to some farmers for trial.

Then in 1880, thanks to the introduction in the catalog of the house of Vilmorin-Andrieux & Co. of a variety cultivated in Austria-Hungary which could be propagated very easily, serious trials were conducted in different parts of France. From these, we can conclude that the early yellow soybean (*Soja jaune hâtif*) or oil-pea of China (*Pois oléagineux de la Chine*) (*Houang-teou* or *Houang-ta-teou,* whether referred to as the dwarf or as the tall variety) could be usefully cultivated (p. 233).

Being better advised than we are, the Austro-Hungarians, after the first trial they conducted in 1850, acquired incontestable proof of the value of Soya in the feeding of cattle / livestock (*du bétail*). So they developed this crop more and more; it took off strongly, especially after the Vienna World Exposition of 1873.

In the climate of Paris, only the yellow Chinese and the Mongolian varieties can be cultivated successfully, since their vegetative cycle is 3-4 months. South of the Loire River, one can add the brownish-red variety of China. Finally, even further south, in Languedoc, Provence [regions in south central France], and Algeria, all the late varieties can be cultivated, especially the ones with black seeds and those from Japan. A large number of these varieties are found in commerce, especially the early ones designed by names such as Early of Podolie and Early of Etampes (see fig. 140).

Gives details on how to sow, cultivate, and harvest the soybean for garden use. Its needs are quite similar to those of the Haricot. Unlike Haricot beans, which can only be eaten as green beans (pods and all), soybean seeds (*Pois oléagineux de la Chine*) can be consumed either fresh or dry. Moreover, soybeans are easily digested and do not cause the all-too-well-known inconvenience of Haricot beans. To eat them in the fresh green stage, they should be prepared/cooked like small green kidney beans (*flageolets*), which they resemble in taste. For the dry beans, soak them overnight in twice their volume of either rain- or river-water in which you have dissolved (per liter) 3 gm of baking soda or 50 gm of sugar. The next day, drain them then put them like any dry legume in cold water, bring to a boil, and simmer for 2½ hours. Half way through the simmering process, add salt and a walnut-sized piece of butter. After they are cooked, you can serve them either with or without fat [butter or lard] or meatless seasonings (*au gras ou au maigre*). The cooked dry soybeans are also excellent pureed (p. 234).

A table (p. 234) compiled by Prof. Haberlandt of Vienna compares the composition of seeds of soybeans, haricot, peas, lentils, feves, and yellow lupins. It shows that soybeans are the most nutritive, because they contain the most protein and fat.

A second table (p. 235) shows that this plant, cultivated in the garden solely for its seeds, removes from the soil the following amounts of minerals per 100 kg of seeds: Phosphoric acid 0.729 kg, lime 3.146 kg, magnesia 1.106 kg, and potash 0.811 kg.

A third table shows the amount of these four substances removed when the soybean is grown for forage; the yield is 20,000 to 30,000 kg/ha.

The Asiatics and particularly the Chinese and Japanese greatly value the seeds of the soybean (*du Soja*), which are both nutritive and rich in fat; they form the basis of their diet, replacing butter, oil, and milk. They are used in culinary preparations greatly appreciated in these regions.

The seeds are the richest of all legumes in the protein legumine, which is actually "solid milk." The Orientals soak the beans in water, then grind them, add extra water, then filter the mixture in order to obtain an artificial milk (*un lait factice*) which can be used like that of the cow, the goat, or the ewe (female sheep). Much of the vegetable casein in this milk is coagulated to make a cheese, similar to our *fromage à la pie* (quark), which is called *Teou-fou* in China and *To-fu* in Japan, and which they consume in large quantities, fresh or dry, uncooked or cooked.

"This cheese, when well prepared, is very tasty, and it forms a very exquisite dish when it is deep fried like potatoes.

When the seeds are roasted with an equal quantity of wheat or barley, then mixed with water and allowed to ferment, they become the appetizing condiment sauce of great renown, known as Tsiang-yeou or Shoyu; at this time it is greatly in vogue in England and America under the name of "Indian Soy." This sauce is greatly appreciated with roasted meat or fish; added to beef or beef bouillon, it communicates a color and savor that are very agreeable."

Aside from these food uses, the soybean is also used in Asia for forage and to make oil and meal. "Finally, the soybean can be used as a coffee substitute–as it has long been in the regions of Languedoc and Tyrol [Tirol]." Also

discusses soy flour and its high nutritional value.

A non-original illustration (p. 235) shows a soy bean plant with pods and a close-up of the pods on stem (from an original in Carrière 1880).

1417. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Japanese trade notes. 13(36):499. Aug. 15.
• ***Summary:*** "Consul-General Thomas Sammons, of Yokohama, furnishes the following notes concerning Japanese trade... Japanese 'soy' [sauce] is exported chiefly to the United States, Hawaii, Port Arthur and Dalny [Manchuria], and Korea, each taking approximately 400,000 gallons annually."

"Of Japan's total exports of peanuts the United States takes two-thirds."

"Korea leads in the consumption of Japan's national beverage, sake, taking 1,400,000 gallons a year; the United States consumes about 250,000 gallons annually." Address: Washington, DC.

1418. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1910. Soya-bean oil shipped from Dalny, Manchuria. 13(39):533. Aug. 18.
• ***Summary:*** "Soya-bean oil, worth $122,630, was shipped from Dalny, Manchuria, to the United States during the year ended June 30, 1910. This product enters free of duty and is largely used by soap works." Address: Washington, DC.

1419. *Oil, Paint and Drug Reporter.* 1910. Proposed soya bean exchange at Dairen. 78(9):40. Aug. 29.
• ***Summary:*** London, August 12, 1910: "The Reporters' London correspondent is advised through official channels that his Majesty's Consul at Dairen has intimated to the home authorities that the Mitsui Bussan Kwaisha [Kaisha], the Okura Gumi and other Japanese firms are considering the feasibility of establishing a bean exchange at Dairen, with a view to putting the trade on a sound basis."

1420. Lemarié, Charles. 1910. Les sojas du Japon [The soybeans of Japan]. *Bulletin Economique de l'Indochine* (*Hanoi*) 13(85):493-98. July/Aug. [4 ref. Fre]
• ***Summary:*** "As a contribution to the study of the question of soybeans, so clearly revealed by the Inspector-Consul Mr. Brenier in a recent edition of this Bulletin, he judged it useful to ask me for the notes hereafter collected as much over the course of my lectures as upon the occasion of my voyage to Japan in 1903.

"I borrow much from Rein (*The industries of Japan*) and from Messrs. Paillieux and Bois (*Le Potager d'un Curieux* or *The Kitchen-garden of a Curious One*) who summarized all that we know about soybeans (*soja*) in Europe up until recently" (p. 493).

Describes and gives the names of more than twenty cultivated varieties, using the classification system of Rein and the Japanese based on seed coat color.

"I have already said that it [the soybean] needs heat and frequent watering. These considerations explain, in part, the failures encountered up to now in the attempts to introduce this crop into Europe. I fear the same obstacles for Mr. Li-yu-Ying, of Chinese nationality, formerly a student at the school of practical agriculture at Chesnoy, near Montargis (Loiret).

Note: Loiret is a department of France just south of Paris. Montargis is a commune in the Loiret department; the ancient town is located about 110 km (68 mi) south of Paris.

According to a lecture he gave last year to his former classmates, Li set himself the task of taking up these trials on the outskirts of Paris: or was it on the manure fields / sewage farms (*champs d'épandage*) of Gennevilliers or Achères.

"But even if the cultivation of soybeans in France is not profitable, nevertheless the popularization of the diverse products that come from them is no less useful; Indochina, if the need be, could provide for new industrial ventures. With Mr. Albert Demolon, a scientifically educated agriculturist (*ingénieur-agronome*), then professor at Chesnoy, and today director of the Agricultural Station of Aisne [northeast of Paris] and of the Laboratory of Bacteriology at Laon, Mr. Li-yu-Ying again took up his previous studies related to these various products. In particular, he compared soymilk, which he calls *Caséosojaïne*, with animal milk, and he believed [it] possible, employing the highly developed procedures of handling and fermentation used [in France] with cow's milk, to obtain forms of tofu (*Téou-fou*) acceptable for our Western palates. That is to say: first, before any fermentation, a liquid [form of tofu] lends itself to the same uses as milk, especially useful for artificial feeding of livestock; then, after coagulation: 1. a hard cheese, corresponding to cheese of the firm sort (*fromage à pàte ferme*), cooked egg, or cooked meat in richness of protein; 2. a soft cheese, corresponding to fresh cheese (*fromage frais*) and able to be consumed as a legume; 3. a fermented cheese, after sterilization then inoculation with microorganisms of certain special cheeses, corresponding to these diverse fermented animal cheeses" (p. 497-98).

Also discusses: Azuki (p. 497). Address: Directeur des Services agricoles et commerciaux du Tonkin.

1426. *Chemist and Druggist* (*London*). 1910. Soya-oil trade. 77(12):458. Sept. 17.
• ***Summary:*** This ¼-page article, which appears in the section titled "Trade report and market review," states: "In view of the abnormal conditions of the linseed and cottonseed oil markets, in which there is but little prospect of relief for consumers from the extraordinarily high prices ruling until better seed-crops are secured, the remarkable expansion which has taken place this year in the soya-oil trade deserves attention. But for the developments in this comparatively new article in the European crushing industry, the difficult position of consumers in certain directions, where the use of soya oil has become more popular, would probably be still more serious, although the latter product has also advanced considerably. The 'famine' conditions across the Atlantic as regards linseed and cottonseed oils have resulted for some time past in a persistent drain of supplies from this side to American ports, which also applies to soya oil. Considerable quantities of all these products have, indeed, again been just lately purchased by American interests for prompt shipment. An idea may be gathered of the extension of trading in the soya-bean oil from the Hull exports this year, which, so far, are already well over 12,000 tons, or about 10,000 tons in excess of those of the previous year. The almost prohibitive prices at which to increase their operations in soya beans, although they find considerable difficulty in getting rid of their soya cake on the Continent just at present. The price of soya oil in London is now about 30*l.* per ton, or 6*l.* over the lowest seen early in the year. According to reports from Manchuria, the new crop should yield 20 per cent more than last year, and allow of an export surplus for Europe of half a million tons. The shipments of old crop to Europe, which are now coming to an end, amount to about 420,000 tons. A fact worth mentioning is that Japan and China are consuming less owing to the high price. Japanese requirements heretofore took about 70 per cent of the crop chiefly for fertilising purposes. In 1909, 1,073,000 tons of soya beans and cake were taken by China and Japan combined, whereas the total quantity absorbed by these two countries in the first half of this year was only about 270,000 tons. While there are indications of a further contraction in the outlet in the Far East, there is thus a possibility that the article may enter into more active competition in the European oil markets, and this at a time when such competition should be welcome among manufacturers handicapped by the fabulous prices paid for kindred products."

Flowering branch with close-ups on flower, leaves and pods (p. 285; from an original in Lamson-Scribner 1899). Frame for curing soy bean hay (p. 291; reproduced from Messrs. Lever Bros. pamphlet on Soy Bean Cultivation). Roots of soy bean plant with nodules (p. 301).

Note: This is the earliest document seen (May 2005) concerning Lever Brothers in connection with soybeans.

1428. Higeta Shoyu Jozosho (The "Higeta" brand soy brewery.) Main office: Choshi, Chiba Prefecture (Document part). 1910. In: Japan's Industries: And Who's Who in Japan. 1910. Osaka, Japan: Industrial Japan. vi, iii, 687 p., iv p. See p. 152-53. Undated. Translated from unpublished Japanese manuscripts. 29 cm. [Eng]

• ***Summary:*** History: The 'Higeta' is one of the brands of soy made in Choshi. The concentrated kind of soy from which it is derived was first brewed in the second year of Genna (1616) by a brewer named Gemba Tanaka. After the quality had been greatly improved, a new variety of the brand was made in the second year of Bunsei (1819), known as 'Horai.' When the metropolis was moved from Kyoto to Tokyo in 1868, the firm was honoured by being appointed supplier of soy to the Imperial Household. Since then the business has greatly increased. In 1898 the firm, in conjunction with the Iwasaki and Hamaguchi concerns, started an experimental laboratory, under superintendence of Dr. Ryojun Tawara, and a staff of experts, in which a study was made of soy fermentation. As a result of the investigations, much improvement was effected in the quality of soy generally. In that year, 1898, the Imperial Household ordered a special supply of the 'Higeta' brand, and this fact, coupled with the improved methods of salt refining, greatly extended its sale. When the grand military manoeuvres were held in the vicinity of Kumamoto in 1902, attended by His Majesty the Emperor, an order was placed with the firm to supply the army with bottled soy; to commemorate this honour the brewer has sold bottled soy ever since.

"During the Russo-Japanese war, 'Higeta' soy was used by the Army Department for seasoning canned foods sent to the front. In 1905 a new kind of soy bottle, with a screw stopper, was made for the troops. Soy was afterwards sold to the public in this form. Since then the firm has gone on flourishing, nothing being left undone to maintain the quality of the brand, and improve it if possible.

"The firm possesses two breweries, fitted up with steam engines, and employing altogether 320 workmen. The 'Higeta' brand soy is used all over the country, especially at Tokyo and Yokohama. It goes also to the United States, Canada, Siberia, China, Korea, Hawaii, the Philippine Islands and the Straits Settlements [later Singapore], being much appreciated in all these markets.

"In addition to being suppliers to the Imperial Household, the brewer has been honoured in other ways. At the Milan Exhibition of 1906, the 'Higeta' brand, which was selected by the Japanese Department of Agriculture and Commerce as a typical soy, was awarded the highest order of the Grand Prix; besides this, the soy was presented to Their Italian Majesties by the Japanese Commissioner for the Exhibition, and they are reported to have expressed to him their high appreciation of its flavour. The following are the principal honours conferred upon the firm by various exhibitions:

"A First Prize at each of the five National Exhibitions.

"The Grand Prize at the Chicago [Illinois] Exhibition, 1890.

"A Gold Medal at the Asian Exhibition (Hanoi, French Indo-China), 1903.

"The highest Grand Prize at the St. Louis [Missouri] Exposition, 1904.

"The Grand Prize of Honour at the Seattle Exposition, 1909.

"Mr. Gemba Tanaka, the proprietor, who was born in 1871, studied political economy at Keio University. On succeeding to the business of his ancestors, he entered into his work with enthusiasm, and by his strenuous exertions did much to extend the sale of the 'Higeta' brand. Owing to the esteem in which he is held in the district, Mr. Tanaka has been elected to represent the highest taxpayers of his prefecture in the House of Peers."

A large photo shows "the interior of a Choshi soy brewery."

Note: This is the earliest document seen (April 2001) concerning Higeta Shoyu. Address: Japan.

1429. Japan's industries: And who's who in Japan. 1910. Osaka, Japan: Industrial Japan. vi, iii, 687 p., iv p. 4 p. of plates. Undated. Translated from unpublished Japanese manuscripts. Colophon title in Japanese: Sangyô no Nihon. 29 cm. [Eng]

• ***Summary:*** On the title page, below the subtitle, is written:

"An Exponent Encyclopedia of the Present Industries of Japan has never been yet Published." Black-and-white photos (unnumbered front pages) show each of the major contributors. A photo shows "Dr. Teizo Takahashi (*Kogakuhakushi*), Professor of the Tokyo Imperial University." He contributed an article titled "The Outline of the Brewing Industry." Photos throughout the book show many companies and their owners. The book was apparently never published in Japanese.

This book was published under the support of Count Okuma, whose photo is shown, and who wrote the excellent first part (p. 1-22) titled "The Industries of Japan." Its contents is: 1. The industrial condition of Japan before the restoration: The great landmark in history (in 1858 Japan was forced to end nearly 300 years of seclusion), industries under the Tokugawa shogunate, industries in the Genroku era (1688-1704). 2. Japanese industries after the opening of the country: The industrial revolution, demand for things European, table of exports and imports (1868-1908; p. 5-6), general dissemination of education, progress of natural resources. 3. Industries before and after the Sino-Japanese War (1894-1895): The growth of foreign commerce, the improvement of the currency system and foreign commerce, entry into the comity of financial nations, manufacturing industries on a large scale (there was a major National Industrial Exhibition as early as 1877). 4. The state of Japanese industries before and after the Russo-Japanese War (1904-1905): The blow dealt by the war, abnormal trade and consequent reaction, the increase of population in Japan and Formosa, progress in the means of transport and communication (especially railways), the money market and industry, free trade and protection, protection in the United States, Japan need not imitate the USA, Great Britain's free trade policy. 5. The future of Japanese industries: Bright future for Japanese industries, silk yarn and silk production, cotton yarn and cotton manufacture, forestry, minerals, the trade in marine products, capital.

The book is composed of lengthy chapters on Japan's major industries, each preceded by a general overview and outline, and containing a detailed description of the largest 10-20 firms. These industries are cotton and silk spinning, Portland cement, sugar, brewing sake and soy [sauce], woollen textiles, hemp, electricity, engineering, mining, transportation, silk textiles, shipbuilding, ceramics, an appendix (p. 485-572) with representative firms from other industries (incl. Mitsui & Co. [p. 493-95], Osaka Gas Co. [p. 520]), and a Who's Who in Japan (p. 573-687; brief biographical sketches with photos of "over 700 names of representative captains of our business world," incl. Keizaburo Mogi [p. 632, soy brewer], Teizo Takahashi [p. 664, microbiologist]).

The chapter titled "The Brewing Industry" starts with a general outline by Dr. Teizo Takahashi on the brewing of sake, "shoyu or soya," beer, shochu, awamori, and mirin (p. 121-27). Representative soy breweries are discussed in detail, with photos, a brief company history, present conditions, awards of merit (in Japan and overseas), and a biographical sketch of the owner, proprietor, and or managing staff.

Part I: The soy industry of Choshi, Chiba prefecture (A photo shows the interior of a Choshi Soy Brewery). The four principal Choshi Soy Brewers are: (1) Higeta Shoyu Jozosho [Brewery] (The concentrated forerunner of this brand was first brewed in 1616. Proprietor: Mr. Gemba Tanaka. A photo shows interior of a Choshi Soy Brewery); (2) Jigamisa Shoyu Jozosho (brand first brewed ca. 1645. Proprietor: Mr. Kichibei Hamaguchi. A photo shows the Jigamisa brand soy brewery with hundreds of shoyu kegs); (3) Yamaju Shoyu Jozosho (brand first brewed ca. 1630. Proprietor: Mr. Jujiro Iwasaki. A photo shows a motor for brewing); (4) Yamasa Shoyu Jozosho (see separate record).

Part II: The soy industry of Noda, Chiba prefecture (p. 158): Joju Shoyu Jozosho (brand first brewed before 1710. Proprietor: Mr. Hyoyemon Takanashi. A photo shows the interior of the Joju brand soy brewery with several kegs of shoyu), Kihaku Shoyu Jozosho (brand first brewed in about 1750. Proprietor: Mr. Hichiroyemon [Shichirouemon] Mogi. A photo shows the Kihaku brand soy brewery and its proprietor), Kikkoman Shoyu Jozosho (see separate record), Kushigata Shoyu Jozosho (See separate record. It was 290 years ago [i.e. in 1620] the founder of the firm, the ancestor of the present proprietor, settled in Noda as a shoyu brewer. Proprietor: Hichizaemon [Shichizaemon] Mogi), Minakami Shoyu Jozosho (Brand first brewed in about 1710. Proprietor: Mr. Fusagoro Mogi. A photo shows machinery for pumping soy [sauce]).

The book begins (p. 1): "The year 1858 forms one of the greatest landmarks in Japanese history, for it was then that, after nearly three hundred years of seclusion, the country was definitely thrown open to foreign trade and intercourse. In that year, also, the Tokugawa Shogunate, (1591-1858) signed the first treaty of commerce and amity with the United States, Great Britain, France and Holland. By this treaty Old Japan ceased to be and the New Japan entered upon her career among the comity of nations."

Page 3 continues: "In 1868 [the first year of Meiji] the feudalism that had lasted for centuries, was abolished at a single stroke, and the reins of government restored to the Imperial Throne. Despotism was done away with, and an Imperial Edict announced that the prefectural system of administrature [administration] then inaugurated was to be the foretaste of constitutional government on Western lines twenty years later. Not only was this a political revolution, but a social and industrial revolution. One remarkable feature of this revolution, so complex in its effects, was that the new order of things inaugurated by it became at once stable and permanent, while the nation was infused with a new life and vitality. In this respect, there has never been a revolution in

© Copyright Soyinfo Center 2014

any country to compare with it. It is hardly necessary to say that the industrial side of a revolution is as important and as interesting as its political side, if not more so." Also in 1868 Yedo [Edo], the administrative headquarters of the Tokugawa Government, was renamed Tokyo.

A table of imports and exports (p. 5-6) shows that exports rose from 15.5 million yen in 1868 to 432.4 million yen in 1907, while imaports rose from 10.6 million yen in 1868 to 494.5 million yen in 1907. In a majority of these years, imports exceeded exports.

The improvement of the currency system and foreign commerce (p. 8-10). During the last 10 years of the Tokugawa Shogunate, about 60 varieties of coins were in circulation. In 1871 (Meiji 4) the new Meiji government adopted a gold standard. As foreign Powers were using the Mexican silver dollar as the basis of their exchange in the Far East, the Japanese Government issued silver coin of similar quality and weight (known as silver *yen*) for circulation in Treaty Ports. In 1877, to pay for the Satsuma Rebellion, the government was forced to issue inconvertible paper money. This led to chaos and undermined the gold standard. In 1873 Germany adopted the gold standard; this led to a depreciation of silver. Though Japan remained among the silver standard countries of East Asia, she found it necessary to issue silver trade dollars. In March 1897 the Diet passed an Act that again established a gold standard in Japan. This had a most salutary effect on Japanese finance. "On looking back on the history of foreign commerce in Japan from the time the country was opened in the mid-1800s, we find that it attained its full growth on adoption of the gold standard."

Note: How do we know when this undated document was published? The latest year published in the document is 1909 (see p. 12). But the National Union Catalog record gives the year as 1910. Address: Japan.

1430. Mitsui Bussan Kabushiki Kaisha (The Mitsui & Co., Ltd.) Head office: Suru-ga-cho, Tokyo (Document part). 1910. In: Japan's Industries: And Who's Who in Japan. 1910. Osaka, Japan: Industrial Japan. vi, iii, 687 p., iv p. See p. 493-96. Undated. Translated from unpublished Japanese manuscripts. 29 cm. [Eng]

• ***Summary:*** "History: The House of Mitsui is well known in British business circles, as well as on the Continents of Europe and America. Through the branch office of the latter company in London, they are one of the largest importers to the United Kingdom of silk goods, camphor, [soya] beans and bean cakes, lumber and rice, &c., while they are one of the largest exporters to Japan from the United Kingdom of all kinds of cotton & woolen goods, coal, manures, &c. The Mitsuis have the famous Mitsui Building in Tokyo for the head quarter of all the Mitsui Corporations,–The Mitsui Bussan Kaisha, Ltd. (Mitsui & Co., Ltd., in Europe and America), the Mitsui Bank, Ltd., the Mining Department, &c. The building is a large office building, built of steel frame with a handsome facade of stones and brick located in the centre of the city of Tokyo, and furnished with elevators and other modern appliances in the Occidental style.

"Although the Mitsuis have made it a point to adopt up-to-date European and American business methods, the history of their business undertakings is very old. The Mitsui family can be traced from Takayasu Mitsui, who lived as a feudal lord in the latter part of the 16th century. During the continuous civil wars at that time, he fought several battles, but, these having ended decidedly against him, he retired and spent his remaining years as a private citizen. His grand-son, Taketoshi Mitsui, started the business in Kyoto and also established a dry goods store in Yedo (now Tokyo). It was he who invented and introduced the system of cash retailing, and further, organized the system for collection and remittance of money throughout the country and this was done, be it remembered, when the knowledge of bills of exchange was almost lacking and monetary transactions were almost unknown in this country. In 1687, Takahira Mitsui, the eldest son of Takatoshi, was appointed by the Tokugawa Government as one of its purveyors, and, in 1691, was entrusted with its remittance business. It was in 1707, that the Mitsuis appointed an agent an agent at Nagasaki and became interested in foreign trade. With the restoration of the Meiji Era, the Mitsuis applied themselves with new energy and vigor to the reform and amelioration of their business undertaking on the model of Western procedure. Thus, in 1876, the old exchange house was transformed into the Mitsui Bank, the first and by far the largest private bank established in the country, while, in the same year, the Mitsui Bussan Kaisha, or Mitsui & Co., was organized for the purpose of general trading, but more particularly, for that of foreign trade.

A photo shows the huge and ornate Mitsui Building in Tokyo. Company president: Hachirojiro Mitsui, Esq. Nine Managing Directors are listed, starting with Giichi Iida, Esq. Address: Japan.

1431. Nagai, Shôzô. Japanese Consulate. 1910. Shôyu ni kansuru hôkoku teishutsu no ken [The Japanese shoyu market in San Francisco, California]. San Francisco, California. 7 p. Sept. Handwritten unpublished manuscript. [Jap; eng]

• ***Summary:*** This is a market report from Mr. Nagai at the Japanese consulate in San Francisco, to Mr. Yoshitaro Komura at the Japanese Ministry of Foreign Affairs.

About 50,000 Japanese live in San Francisco. About 6,000 large and small kegs (*taru*) of shoyu a month are imported, equaling about 97,200 liters. Address: Japanese Consulate, San Francisco, California.

1432. Takahashi, Teizô. 1910. The brewing industry: Chapter II. Shoyu or soya brewing (Document part). In: Japan's Industries: And Who's Who in Japan. 1910. Osaka, Japan:

Industrial Japan. vi, iii, 687 p., iv p. See p. 125. Undated. Translated from unpublished Japanese manuscripts. 29 cm. [Eng]

• ***Summary:*** "Development of the industry: *Shoyu,* also called *soya* and more generally known in English as 'soy,' is a food adjunct or condiment especially used in Japan. Its origin is not known, but it is highly probable that the brewing of *shoyu,* like *sakê,* is of Chinese origin. The first description about *shoyu* appears at the beginning of the 16th century during the reign of the Emperor Go-Kashiwabara, and the demand for it appears to have somewhat increased at the end of the century, but the method of its preparation was artless and the product must have been a crude one. Certain improvements in brewing were made at the end of the 17th century, but *shoyu* of the kind at present in use was first prepared at the beginning of the 18th century.

"In 1751 a *shoyu* factory was established in the town of Noda in the Prefecture of Chiba. Other similar factories were opened there and they increased in number annually, and that city now stands in the first rank for this particular commodity. The annual production for the 5 years from 1904 to 1908 may be seen from the following table." Production grew from 74,367,040 gallons in 1904 to 84,952,440 gallons in 1908.

"In olden times *shoyu* brewing was somewhat different from the present method. The steamed *soya* beans were covered with layers of rice straw for 5 or 6 days until the surface of the beans appeared yellow by the growth of the fungus. After that the beans were dried in the sun and steamed again; then, after mixing with moderate quantities of common salt, ginger and orange peel, allowed to ferment in sealed tubs for 1 to 2 months. An improvement was made, probably by the introduction of Chinese methods of preparation, at the end of the 17th century; but the products of those days were very inferior compared with the *shoyu* as a present in use.

"*Shoyu* or Soy sauce is prepared from wheat (sometimes also from barley), the *soya* bean, and a salt solution by a slow fermentation, which requires from one to two years and sometimes longer.

"The process of brewing is divided into four stages: (1) Preparation of the wheat and *soya* bean; (2) Preparation of the soy *koji;* (3) The fermentation, of *moromi* process; and (4) Pressing and boiling." Address: PhD, Prof. at Tokyo Imperial Univ., Japan.

• ***Summary:*** "Outline: Soy is brewed in almost all parts of Japan, but the chief centres for its production are Chôshi and Noda in the Prefecture of Chiba; Sakai and Amagasaki, seaport towns in the vicinity of Osaka; and Tatsuno, Yuasa, and Shôdoshima in the prefectures of Hyogo, Wakayama, and Kagawa respectively. The soy of Chiba Prefecture is generally recognised as the best, and by far the largest quantity is made there. The soy brewers have derived great advantage from the river Tone which flows through the district; indeed the towns of Chôshi and Noda on its banks have flourished from early times in consequence, and have become famous throughout Japan as centres for the brewing of soy.

"Chôshi is right at the mouth of the river, on the Pacific Ocean, and is a few hours' railway journey from Tokyo, which is 73 miles distant. Only a small proportion of the soy, however, is carried by rail, the greater part of it being sent by sea, as the marine service is a good and safe one. Tokyo is the distributing centre for the sauce, both for home consumption and the foreign market. A good telegraph and telephone service facilitates the dispatch of business.

"Soy has been brewed in Chôshi for the past three hundred years. The first to brew the thick concentrated variety of soy was a man named Gemba Tanaka, an ancestor of the present Mr. Gemba Tanaka, who makes the 'Higeta' brand. From that time onward different varieties of soy came to be brewed, such as the 'Yamaju,' 'Yamasa,' and other such brands. In the year 1825, when there was much distress throughout the country owing to a famine, and the Tokugawa Shogunate issued an edict to regulate the prices, and thus allay the suffering as far as possible, four brands of soy made in Chôshi, and three in Noda, were specially exempt from the operation of this law on account of their excellent quality, and were moreover granted the rare privilege of being called the 'Best Soy.' Henceforth Chôshi's four first-class brands became famous throughout Japan, and the industry has grown more and more prosperous.

"The Chôshi brewers are very careful in the selection of their ingredients. The beans and wheat used are the best that Hidachi Province can supply; salt is brought all the way from Hyogo Prefecture, the centre of Japan's salt industry; all the water used is very carefully filtered through layers of sand, and in fact everything possible is done to ensure purity and good quality. Whenever possible, the soy factories are situated in shady, secluded spots, as the sunlight prevents proper fermentation. The machinery and apparatus used is constantly improved.

"It may be mentioned that the relations which subsist between masters and workmen are of a very cordial nature. For the most part, the labour is hereditary, the sons carrying on the vocation of their fathers. The workmen put heart and soul into their labour, rivalling each other in diligence and perseverance, and the employers, on their part, treat their servants with much liberality, and neglect no means to protect and guide them. A complete system of life insurance and old age pensions enables the men to carry on their work

© Copyright Soyinfo Center 2014

without anxiety as to their future. Their children, too, are not left uncared for, and special schools have been erected for their benefit. Indeed, it is to the complete harmony which exists between capital and labour that the great prosperity of Chôshi's soy industry is attributed.

"As already stated, it was the excellent quality of Chôshi soy which won for it such a wide reputation, even at a time when facilities for its transportation were not very good. The climate and the pure water in the vicinity have proved of tremendous advantage in the industry, while the improved means of communication and transport have also done much for its development in later years. And above all, the brewers have paid great attention to their apparatus and methods, so that not only is the industry in a flourishing state, but the prospects for its future development are of the brightest."

"The following articles give some account of the four principal Chôshi Soy Brewers." 1. Higeta Shoyu Jozosho. 2. Jigamisa Shoyu Jozosho. 3. Yamaju Shoyu Jozosho. 4. Yamasa Shoyu Jozosho.

1434. Takahashi, Teizô. 1910. The brewing industry: Chapter III. Soy breweries. (2) The soy industry of Noda (Document part). In: Japan's Industries: And Who's Who in Japan. 1910. Osaka, Japan: Industrial Japan. vi, iii, 687 p., iv p. See p. 158-60. Undated. Translated from unpublished Japanese manuscripts. 29 cm. [Eng]

• ***Summary:*** "History: Noda is a small town of some 12,000 houses situated about 20 miles north-east of Tokyo, and is 8 or 9 miles from the nearest railway station, but the River Yedo, one of the tributaries of the River Tone, affords excellent means of direct communication with the Capital, and light railways traverse the town, these being used for the conveyance of the soy casks from the various factories to the wharves on the river bank, whence they are shipped to Tokyo. Noda is also well provided with an excellent telegraph and telephone service which facilitates business with various parts of the country.

"The major portion of the population is engaged in the industry of soy brewing, for which the place has been famous for very many years. It was back 350 years ago [i.e. 1560] that the first soy factory was established at Noda, the proprietor being a man named Ichirobei Iida. The success of his business proved the suitability of the place for the brewing of *shoyu* or soy, and subsequently Hyoyemon Takanashi, brewer of the 'Jôjû' brand soy, entered into partnership with the idea of doing business on a larger scale than had hitherto been attempted. That partnership was eventually dissolved, each partner starting business on his own account, and subsequently many other firms of soy brewers were established, such as Saheiji Mogi ('Kikkoman' brand soy), Fusagoro Mogi ('Minakami' brand soy), Heibei Yamashita ('Kinoyene' brand soy), and Okuyemon Mogi ('Ichiyama' brand soy), and great prosperity has attended the industry as a whole. In 1825 when, as a result of a famine, the price of commodities rose very high and great distress prevailed amongst the masses, the Government of the Tokugawa Shogunate issued an edict ordering that as a means of alleviating the distress lower prices should be charged for commodities. It is noteworthy that the 'Kikkoman', 'Jôjû' and 'Kihaku' brands of soy (together with the four best brands of soy made in Choshi) were granted the special privilege of being permitted to retain their former prices, on account of their superior quality. Moreover, they were allowed to use the distinguishing mark 'Best Soy' which was the highest testimonial to their general excellence.

"Mr. Keizaburo Mogi, a leading authority on matters relating to the soy industry, began experiments in 1879 at Noda with the object of applying scientific and mechanical methods to the fermentation of the sauce. In 1882 his experiments had progressed to such an extent that steam was successfully applied to the brewing of soy, while at the present time further advance is in contemplation by the utilisation of electricity, the necessary plans for this having already been completed. Mr. Mogi also made a close study of the question of the improvement of the *kôji* (yeast), the most important ingredient of soy, and in 1899 he completed a perfect method for its preparation. For this discovery he obtained a patent from the Government, but in order that the industry as a whole might benefit from his investigations, he made the process public and available to all the brewers. He has also made important investigations in regard to a more rapid process of brewing and has thus rendered very valuable services to the soy industry in general, and to that of the Noda district in particular.

"There are many reasons for the unrivalled position which Noda Soy holds, but the chief cause of its success lies in the extreme care bestowed upon the selection of the necessary ingredients in order that only the very best may be used. The wheat, beans, and salt required for the brewing of soy are not produced in the neighborhood of Noda, but are purchased from distant localities specially noted for those products. Salt, for instance, is brought from Nagasaki, about ten hundred miles distant, and this alone is sufficient proof of the care best owed by the Noda soy brewers upon their product. As in other brewing operations, one of the main factors is the water supply, and Noda is exceptionally well provided in this respect, having been noted from ancient times for the abundance and purity of its water supply, which has its source in a natural well 3,000 feet deep."

"There are over 5,000 labourers employed in the various soy breweries and the fact that there has never been a strike or unpleasantness to any extent is very good evidence that the work-people are satisfied with their lot and that employers are treating them fairly and with proper consideration."

1435. Gilbert, A.W. 1910. Soy beans and fertilizer question. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 13(79):55. Oct. 5. [1 ref]
• ***Summary:*** The following is an extract from the *National Review,* of Shanghai, China: "It is well known that soy-bean cake has for years been the most popular fertilizer in Japan. Now, however, that the United Kingdom, and the Continent of Europe and America to a less extent, have become purchasers of Manchurian beans, the question arises whether Japan will to be able to buy bean cake in huge quantities if the price rises appreciably. In studying this question two factors should not be lost sight of: One is that Japan is herself a large grower of soy beans, having according to the latest available returns (1908) over 1,200,000 acres under cultivation, producing annually some 19,000,000 bushels of beans, while the other is that Japan imports very large quantities of soy beans from China and Korea. The greater part of these beans is used for the purpose of human food–i.e., in making of 'soy,' 'miso,' and bean curd–but a portion by no means small is used also as a fertilizer.

"The Russo-Japanese war had such an effect in curtailing the supplies of beans and cake that to arrive at a just appreciation of the position it is necessary to go back a good many years. In making such a review it will be noted that, both in the case of beans and of cake, the amounts imported in 1909 were record importations, but that the average price was the lowest since 1903. Should the price in the future be forced up very high in consequence of British and other demands, the presumption is that Japan would turn to sulphate of ammonia, if the cost per unit of nitrogen therein were less than the cost of bean cake. On the other hand, it must be remembered that the removal of the import duty on sulphate of ammonia in the United States of America means that the United States will probably absorb large quantities of the British output, and that Japan will have to pay a higher price if she wants a share of this fertilizer. Thus the outlook for nitrate of soda becomes a good deal brighter, and now that, owing to the subsidized Japanese line to (South) America, it is possible to get cheap freight rates, it looks as though (Chilean) nitrate of soda will be a serious competitor to the other nitrogenous fertilizers, except in the matter of wet rice cultivation.

"There is a point which, though obvious enough to those intimately connected with the trade, is sometimes overlooked in general discussions on the subject of bean cake, viz, that the British farmer can afford to pay a proportionately higher price for cake than the Japanese farmer, the reason being that in the United Kingdom the cake, after serving for provender, turns into a fertilizer, whereas in Japan it is employed as a fertilizer directly, without any intermediate use.

"As regards rock phosphate, most of the supplies have hitherto come from Ocean and other islands. Owing, however, to the new fertilizer law which prohibits any admixture in Japan of earth and sand with rock, it will probably be found that the phosphate from the above-mentioned islands, being pure and expensive, will be displaced by the cheaper varieties of rock from Tennessee and Algiers, which are naturally mixed with impurities." Address: Vice-Consul, Nanking.

1436. *Los Angeles Times.* 1910. Fertilizers for Japan. A scarcity of soy beans makes a market for Tennessee rock phosphate. Oct. 13. p. I13.
• ***Summary:*** "It is well known that soy-bean cake has for years been the most popular fertilizer in Japan. Now, however, that the United Kingdom, and the Continent of Europe and America to a less extent have become purchasers of Manchurian [soy] beans, the question arises whether Japan will continue to be able to buy bean cake in huge quantities if the price rises appreciably.

"In studying the question, two factors should not be lost sight of: One is that Japan is herself a large grower of soy beans, having according to the latest available returns (1908) over 1,200,000 acres under cultivation, producing annually some 19,000,000 bushels of beans, while the other is that Japan imports very large quantities of soy beans from China [Manchuria] and Korea. The greater part of these beans is used for the purpose of human food–i.e., in making of 'soy' [sauce], 'miso,' and bean curd [tofu]–but a portion by no means small is used also as a fertilizer.

"The Russo-Japanese war had such an effect in curtailing the supplies of beans and cake that to arrive at a just appreciation of the position it is necessary to go back a good many years." In 1909 Japan imported record amounts of beans and cake, but "the average price was the lowest since 1903. Should the price in the future be forced up very high in consequence of British and other demands, the presumption is that Japan would turn to sulphate of ammonia, if the cost per unit of nitrogen therein were less than the cost of bean cake."

The "British farmer can afford to pay a proportionally higher price for cake than the Japanese farmer," since in the UK the cake, "after serving for provender [feed], turns into a fertilizer [manure], whereas in Japan it is employed as a fertilizer directly, without any intermediate use. "

1437. Williams, C.L.L. 1910. Trade of Newchwang and Manchuria. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 13(86):161-64. Oct. 13.
• ***Summary:*** Imports of gunny bags (p. 161-62): "Owing to the excellent harvest and large export of [soya] beans both last year and this, gunny bags are imported in large

© Copyright Soyinfo Center 2014

quantities. The sacking used is made from jute, principally in Rangoon [Burma]. The bags are in appearance similar to the potato sacks in use in the United States, but are somewhat larger and much firmer and heavier in texture."

The section titled "Exports of beans and coal" states (p. 162): "Among the articles exported [soya] beans and bean products are predominant. The falling off in the exports of these from Newchwang may be largely attributed to the fact that ocean steamships find great difficulty loading here and have, consequently, made Dalny their headquarters. Newchwang retains her command of the China coast trade, but the supply available for this market has fallen short of the 1909 figures. Prices, too, have ruled very high.

"According to press reports Dalny has shipped some 239,494 tons during the season (November to May, 1910), as against 207,452 tons for the same period in 1909. From the same source it is learned that the imports of beans into Japan for the season amounted to only 54,282 tons, a decrease of over 93,000 tons, and that as regards bean cake the falling off was even larger. This is attributed to industrial conditions in Japan and the high prices ruling for beans and bean cake.

"Various receptacle for shipping bean oil have been tried in an effort to secure some form of packing which will protect the contents from leakage or deterioration in the Tropics. Kerosene oil tins have not been found satisfactory nor have the wicker baskets used since time immemorial by the Chinese. The latest experiment is a steel drum.

"All authorities unite in estimating a large bean crop for the coming season. The acreage under cultivation is said to have been greatly increased, and the weather, despite partial local droughts in one or two localities, has been favorable." Address: Vice-Consul, Newchwang.

1438. *Board of Trade Journal* (*London*). 1910. Foreign trade of China in 1909. 71:20-25. Oct. 16. See p. 23-24. [1 ref]
• ***Summary:*** "The following article on the foreign trade of China in 1909 is based on the 'Abstract of Statistics and Report on the Foreign Trade of China' for 1909, recently published by order of the Inspector-General of the Chinese Imperial Customs...

"Apart from tea, silk, and two or three other articles, a marked general increase occurred in the leading exports to foreign countries; but the rise of a great export trade in beans is the fact which overshadows all others. From the earliest days of the Foreign Customs beans and beancake have been the principal exports from Newchwang, but for many years the trade was exclusively domestic. About the year 1890 a beginning was made with shipments to Japan, and the traffic soon rose into importance, Japan being practically the only foreign buyer of these products until 1908. During the eight years 1900-7 the average annual value of the beans exported abroad was 4.37 million taels [a unit of currency. The average value of the Haikwan tael is 2*s.* 7.19*d.* in 1909, 100 Haikwan taels = 111.40 Shanghai taels, for which exchange quotations are made]. In 1908 the total export of beans abroad rose to 4,770,000 piculs [1 picul weighs 133.33 lb], valued at 9 million taels, and in 1909 to no less than 14,438,000 piculs, valued at 32.78 million taels. The soya bean thus took at a bound a position equal to that of tea in the list of exports, and if to the shipments of beans be added those of beancake, giving a combined value of 52 million taels, even the position of silk at the top of the list is challenged. Of the beancake exported (10,088,359 piculs), all but an inappreciable quantity was of Manchurian origin; and of the beans, 10,915,000 piculs were sent out from Manchurian ports, 1,173,000 piculs from Hankow, 1,737,000 piculs from Chinkiang and Shanghai, and 600,000 piculs from Amoy [Xiamen] and Kwangtung [province in southeast China] ports. The ultimate destinations of the consignments of beans are less easy to determine with accuracy. There went directly to Japan 4,945,000 piculs; to Great Britain, 1,158,600 piculs; to Hongkong, 2,010,800 piculs; to Port Said ('for orders'), 2,021,600 piculs; and to Vladivostock [Vladivostok] through Suifenho [Suifenhe], 3,842,000 piculs. The statement, on good authority, that 400,000 tons of beans were shipped to the United Kingdom in 1909 may be accepted as not far from the mark, and would account for 6,800,000 piculs. Add the shipments to Japan and 460,000 piculs declared as for the Straits, Dutch Indies, and European countries, and there still remains a balance of over 2,000,000 piculs of which the destination is uncertain."

Tables show the net imports of foreign and native goods, and exports for the years 1907-09 of: Manchuria (p. 21). China (p. 22).

Note: This is the earliest document seen (March 2010) that gives soybean trade statistics for Southeast Asia (imports to Dutch Indies).

1439. *Oil, Paint and Drug Reporter.* 1910. The soya bean and the fertilizer question. 78(17):41. Oct. 24. [1 ref]
• ***Summary:*** "An extract from the *National Review of Shanghai*, regarding the relation of the soya bean to the fertilizer question, has been sent to the Department of Commerce and Labor by Vice-Consul A.W. Gilbert from Nanking. The discussion of the subject by the Review is as follows:" There follows a long excerpt.

1440. Grossmann, H. 1910. Ein neuer Welthandelsartikel [A new article of world trade]. *Berliner Tageblatt* 39(548):2. Oct. 28. Handels-Zeitung section. Evening edition. Friday. [Ger]
• ***Summary:*** The article begins: "In the history of modern world trade there has been nothing like it. A plant which has been known for many years in its native land, Chinese Manchuria, has enjoyed a significant culture, and the countless products that can be made from it include the indispensable foods for an entire people. In 1908, for the first time large amounts of its products were suddenly imported

© Copyright Soyinfo Center 2014

into Europe, and all at once there was great interest in this plant from the Far East. There followed many publications about the great economic importance of the soybean (*Sojabohne*)."

The soybean first became known in Europe in 1873 at the Vienna World Exposition (*Wiener Weltausstellung*). In 1909 not less than 400,000 tons of soybeans were imported to England. According to information from the British trade attaché, P. Ker, in Peking, the total shipments of soybean seeds (*Sojasaat*) to Europe from Manchuria, including Vladivostok, amount to about 518,000 tonnes. Almost 300,000 more tonnes are shipped to Japan from China. The main ports of exit are Dalny, Vladivostok, and Hankow. Address: PhD, unestablished university lecturer (*Privatdozent*).

• ***Summary:*** Tokyo, Oct. 2.–"The University of Chicago baseball team has been entertained royally since its arrival in Japan. Wednesday night Waseda university tendered the maroons an elaborate banquet at Seiyoken, Uyema, and welcomed us formally."

"Move number two found them [the Japanese baseball players] squatted around on mats with their individual charcoal stove [sic, stoves] before them... The [Japanese] athletes relished most the item entitled 'niku nabe,' cooked in 'shoyu,' a bean sauce,..."

1442. *Proceedings of the Linnean Society of London.* 1910. Soy beans. Oct. (122nd Session). p. 53-55. Meeting of March 17, 1910.

• ***Summary:*** "Mr. J.H. Holland, F.L.S., also on behalf of the Director of Kew, showed samples of the Soy Bean, *Glycine Soja,* Sieb. & Zucc. (*G. hispida,* Maxim.), with herbarium specimens of the plant producing this seed.

"He stated that the seeds of 'Soy,' of which there are many varieties, may be black, brown, green or greenish-yellow, yellow, or mottled; sometimes seeds are described as white, but there appears to be no Soy bean true white in color.

"The plant is variously known as 'Soy,' 'Soja,' 'Soya,' 'White Gram,' 'American Coffee Berry,' and 'China Bean.'

"In China and Japan, where the plant has been cultivated for many years–perhaps centuries–the beans are an important food, and they are also said to be used as a substitute for coffee.

"Bean cake and the sauce known commercially as 'Soy' is also made from them. It is stated that in the manufacture of the soy of commerce, in addition to the beans, the requirements are simply a large amount of salt and flour and an unlimited supply of fresh water. Wenchow is an important centre of the manufacture, and here the bean used for the purpose is said to be chiefly the white form from Chinkiang. The cultivation has been extended to India, Africa, and other warm countries...

"The principal use of the beans in this country is for the extraction of the oil, of which they contain about 18 per cent. suitable for soap-making, and in general as a substitute for cotton-seed oil. The residue, after the extraction of oil, is suitable for feeding cattle, and for this purpose appears likely to become a serious competitor of cotton-seed cakes, sunflower-seed cakes, linseed cakes, &c."

"Beans and bean-cake exported from China have gone chiefly to Japan and certain parts of Asia, but recently, beginning about November, 1908, an important trade has been developed in them more especially with the beans, between Manchuria and Europe, Dairen (Dalny) being the chief place of export.

"The cause of this sudden development may, perhaps, be attributed to the facts that a great increase in the cultivation took place in Manchuria during the Russo-Japanese war to meet the demands for food of the Russian Army; then, when the troops were withdrawn, the production being found, profitable, and the home demand reduced, other markets were sought. The trade extended to Japan, and afterwards, assisted perhaps by a period of depression in that country, it extended to Europe, where the industry has created interest in many quarters.

"The amount of the 1908 crop sent to Europe through Vladivostok up to July, 1909, was 180,000 tons, the greater part destined for the English market (Hull and Liverpool), and the remainder going to German (Hamburg) and Scandinavian ports.

"Up to 1907 the export of soy beans from Manchuria did not exceed 120,000 tons annually. During 1908 the export rose to 330,000 tons (one half shipped from Dairen; 100,000 tons from Newchang, and 65,000 tons by rail *via* Suifenho [Suifenhe] to Vladivostok), the increase, it is said, being due entirely to the demand from Europe."

Summarized in *Tropical Agriculture.* 1910. July 15. p. 28. Address: England.

1443. Sammons, Thomas. 1910. Soya bean trade on the Pacific. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 13(110):545. Nov. 10.

• ***Summary:*** "The shipment of [soya] beans and bean cake from the Orient to the North Pacific coast of America is receiving the serious attention of Americans interested in this subject, some of whom are making extended personal investigations in Japan and other parts of the Far East (the Pacific Oil Mills, of Seattle, Washington, being most active.) Note: This is the earliest document seen (June 2003) that mentions Pacific Oil Mills of Seattle, Washington, or the crushing of soybeans in the United States. Pacific Oil Mills

© Copyright Soyinfo Center 2014

began actual crushing of soybeans in 1911.

"It is roughly estimated that bean cake when prepared, through sterilization and other treatment, is worth $32 to $35 per ton in the North Pacific market, and that the cost in the Far Eastern markets, also roughly estimated, is placed in the neighborhood of $20 per ton. Therefore it is believed that there are possibilities of building up a fairly profitable business in this commodity.

"Heretofore the cost of transportation and the inability to scientifically treat bean cake in America in preparing it for the market have prevented any extensive shipments from the Far East to the Pacific coast. Those who are now giving the matter serious attention, however, find that for cattle feed bean cake, when ground and sterilized, is highly satisfactory. It is also believed that bean cake for fertilizing purposes may ultimately be introduced into the Hawaiian Islands. This can only be done in connection with satisfactory transportation arrangements. In 1906 samples of Manchurian bean cake as forwarded (by the writer) to the Honolulu Chamber of Commerce were pronounced entirely satisfactory and desirable for use on the sugar plantations." Address: Consul-General, Yokohama [Japan].

1444. *San Francisco Chronicle.* 1910. Fertilizer in Japan. Nov. 13. p. 57.

• ***Summary:*** "It is well known that soy bean cake has for years been the most popular fertilizer in Japan. Now, however, that the United Kingdom and the continent of Europe and America to a less extent have become purchasers of Manchurian beans, the question arises whether Japan will continue to be able to buy bean cake in huge quantities if the price rises appreciably."

1445. Lewkowitsch, Julius. 1910. Die Industrie des Soyabohnenoeles [The soya-bean oil industry]. *Chemische Industrie* (*Berlin*) 33(22):705-08. Nov. 15. Whole number 670. (Chem. Abst. 5:597). [3 ref. Ger]

• ***Summary:*** This is a major report on the world soybean oil industry. "In an astonishingly short period of time, the almost unknown soybean has become a major oilseed in Europe." The method of separating the oil from the soya bean in Manchuria is to soak the seeds in water overnight, to crush them, and, after boiling the mass with a little water, to express the oil in a primitive form of press. Owing to the length of time during which the pressure is continued, the yield of oil is as high, if not higher, than is given by the modern hydraulic presses [used in Europe]. The expressed oil is mainly used for food, while any that is unfit for that purpose is burned in lamps. The residual cakes in the press, which are about 3 inches thick and 2 to 3 feet in diameter, form a staple food product. The bean cakes in China are called *teou-fou-tcha* [sic, actually this term refers to okara].

Some idea of the trade done in these soya bean cakes may be formed from the fact that during the year 1904 no less than 160,000 tons of soya bean cake (not including the beans themselves or the oil) were exported to Japan alone, although that country itself produced about 2,500,000 hl. (1 hectoliter = 100 liters, so 6,875,000 bushels) of beans, which were utilised in 11,000 factories that manufacture soy sauce. In the year 1909 the quantity of beans exported from Manchuria to Japan reached 600,000 tons.

Until two years ago considerable difficulties stood in the way of the trade with Europe, for the long sea-voyage through the tropics and especially through the Red Sea, had such a deteriorating effect upon the beans, that, after removal of about 10 per cent of oil, the residual oil cake was quite unsuitable as a feeding stuff. Only a small amount arrived in Liverpool, where the resident Chinese created an insignificant demand for their favorite dishes. Nevertheless, small amounts of soybean cake (*Soyakuchen*) were imported to England for use in mixed feeds, although this branch of trade had but a paltry existence. Therefore the confluence of a number of particularly favourable conditions were required to introduce the beans into the world and European markets. During the Russo-Japanese War, soybeans served as a staple food for the Japanese, and later the Russian soldiers. After the war, Manchuria was thrown open to the commerce of the world. Thanks to the industrial activity of the Japanese and the decline in the shipping rates, a favorable opportunity arose, after the soldiers left, for exporting large quantities of the beans to England.

The first large consignment reached Liverpool towards the end of 1908, and its arrival coincided with a period of great scarcity of other oils and fats, due to various causes, and, in particular, to the increased consumption of edible fats, and the growing demand for dynamite glycerin for the Transvaal mines and the construction of the Panama canal. In addition to this, the cotton-seed harvest in the United States had been poor, and this had caused a considerable increase in the price of Egyptian cotton-seed, so that many oil-mills in England had been forced temporarily to suspend work. Hence attention was at once directed to the new raw material, large quantities of which were available at favourable prices.

The imported beans had the following average composition: Water 10%, oil 18%, proteins 40%, carbohydrates 22%, fibre 5%, and ash, 5%. It was not possible to reckon upon a higher yield of oil than 10 per cent. from the beans, but feeding experiments with the oil-cake showed that while it produced as much flesh as cotton-seed oil-cake, it caused the cows to yield a milk richer in cream. Thus for some time past soya cake has fetched higher prices in the market than cotton-seed cake.

Had it not been for the timely appearance of soy-bean oil the already high price of cotton-seed oil would have been at least 25 per cent. higher, and there would have been a corresponding increase in price of all the fats used in the soap industry. Immense quantities of the new oil were employed in the manufacture of soap, and during the year

© Copyright Soyinfo Center 2014

1909 more than 400,000 tons of the beans were imported into England. Only small quantities were sent to America, and, relatively, very little to the continent of Europe.

The high tariff on raw materials in Germany and in France prevented the importation of the seed, and at first the English oil manufacturers took advantage of this, and exported large quantities of soya oil and soya cake both to America and the Continent. Only within the last few months have the German oil manufacturers succeeded in obtaining the concession that soya beans may be imported into Germany free of duty, but in the near future the production of soya oil and soya cake may become an important branch of the German oil industry.

The chief use of the new material in the manufacture of soap is as a partial substitute for cotton-seed oil in the production of hard soaps, while for soft soaps it can completely replace cotton-seed oil and partly replace linseed oil. Soya-bean oil has also been extensively used as an edible oil, and in admixture with cotton-seed oil large quantities of it have been consumed in England. It has also been employed as an oil for the preservation of sardines. Attempts were made to use it as a substitute for linseed oil in the color and varnish industries, but it can never replace the latter oil completely.

The composition of soya-bean oil renders it particularly suitable for the adulteration of both linseed and cotton-seed oils, while it is also frequently employed as an adulterant of Japanese rape oil.

The chief ports for the export of soya beans are Newchang, Dalny, Vladivostok, and Hankow, while the principal European ports for their importation are Hull, London, and Liverpool, and, more recently, Hamburg. The supply of the beans is assured for several years, for, in addition to that produced in Manchuria and South China, attempts, which appear likely to be successful, are being made to cultivate the plant in West Africa and in the East Indies.

In the Southern States of North America the soya plants are already grown for fodder, and experiments are now being made to cultivate them for the production of oil seed. It has already been proved that the beans grown in West Africa from Asiatic seed do not yield less oil than the original seed. The author lived 1857-1913.

Note 1. This is the earliest document seen (March 2001) concerning soybeans in connection with (but not yet in) Panama or the Canal Zone. Address: London.

1446. *Times* (*London*). 1910. Soy bean as a fertilizer. Nov. 21. p. 14, col. 6.

• ***Summary:*** "Several subjects of importance to this country are discussed in the *Daily Consular and Trade Reports* published by the Bureau of Manufacturers, Department of Commerce and Labour, Washington [DC]. A note upon soy beans as a land fertilizer is particularly noteworthy in view of the doubt expressed in this country last year as to their manurial value."

There follows a summary of: Gilbert, A.W. 1910. "Soy beans and fertilizer question." *Daily Consular and Trade Reports* (U.S. Bureau of Manufactures, Department of Commerce and Labor). Oct. 5. p. 55.

1447. *Daily Post* (*Australia*). 1910. On the land: A column for rural producers. Growing importance of soya bean trade. Nov. 29. p. 3.

• ***Summary:*** "The extraordinary development of the export of Manchurian [soya] beans to Europe which began in the autumn of 1908 is considered by the British Commercial Attache at Pekin to form the most marked feature of the trade of China during the last year. It is a trade of special interest to us, as the United Kingdom, in consequence of the high import tariff of other countries, enjoyed practically a monopoly of the shipments, although we believe that both Germany and France have now arranged to admit the beans free of duty or at a much reduced tariff.

"In the meantime, British oil crushing industries have derived much profit from the large importations of the beans, being made to a great extent independent of the scarce supplies of cotton seed, linseed seed, etc., and the cake made from the crushed residue has provided an excellent cattle cake.

"During the last complete shipping season, from November 1908 to September 1909, as many as 34 steamers loaded cargoes of the beans, and the shipments for the year which ended last December was 234,000 tons from one port, shipped by British and Japanese firms. The total shipments to Europe from Manchuria in 1909 amounted to about 548,000 tons, and in Japan it is estimated that 294,000 tons were exported.

"The purchase of beans in the interior of the country is said to be an operation involving no small difficulty and financial risk. The effect of the keen competition which naturally followed the successful business of 1908-09 was to raise the price of beans, and difficulties were experienced in getting deliveries in accordance with contracts fixed when prices were low. The business lends itself to gambling, and large sums are said to have been lost by the less fortunate speculators.

"In the report of his Majesty's Consul at Newchwang on the trade of the port for 1909 will be found an estimate an estimate of the total production of [soya] beans in South Manchuria, based upon the amounts of beans and bean cake exported from Newchwang and Dairen. The conclusion is reached that these exports represent a total of 1,333,000 tons of beans, and that the production under favorable conditions can be estimated at not far short of 1,480,000 tons."

• ***Summary:*** Contents: Botanical history and identity of the soy bean. Botanical classifications of soy-bean varieties. Varietal characteristics of soy beans: Habit of growth, foliage, pubescence, flowers, pods, seeds. Frost resistance. Period of maturity (soybeans were planted at the Arlington Experimental Farm, near Washington, DC, from 3 June 1905 to June 1909). Changes in life period (soybeans were planted at the Arlington Farm in 1902). Pollination and hybridization. Mutations. Nomenclature and classification. Early agricultural history in the United States. Varieties introduced in the United States independently of the Department of Agriculture or previous to 1898: Enumeration, Ito San, Mammoth, Buckshot, Guelph, or Medium Green, Butterball, Kingston, Samarow, Eda, Ogemaw, or Ogema.

Varieties grown in Europe (p. 32-33; Early history, Samarow, Etampes, Chernie [from Khabarovsk, Siberia], "Yellow Riesen," Buckshot, "Yellow," "Brown," Butterball, S.P.I. No. 5039. European seed companies carrying soybeans include Dammann & Co., Naples, Italy; Haage & Schmidt, Erfurt, Germany; Vilmorin-Andrieux & Co., Paris, France).

The soy bean in Asia (p. 34-35): Asiatic sources of soy beans, list of varieties with SPI numbers from each of the following countries and places: Siberia (South Usuri [Ussuri], Khabarovsk, Merkoechofka), Manchuria (Newchwang, Harbin, Tieling), Korea (Pinyang, Ko-bau), Japan (Tokyo, Kobe, Yokohama, Hokkaido, Anjo), China (many places), Formosa (Taihoku), Cochin China (Saigon), India (Darjiling [Darjeeling] and Khasi Hills–Assam; Pithoragarh–Kumaon Dist.; Safipur, Hasangani, Ranjitpurwa–Unao, Uttar Pradesh; Etawah, Manipuri–Uttar Pradesh; Cawnpore, Dehra Dun, United Provinces; and Poona Bombay), Java (Buitenzorg), Celebes (Macassar).

Desirable characters in soy-bean varieties (p. 36-37): Considerations governing choice, habit of the plant ("Erectness of stem with upright or ascending branches is a prime requisite of a desirable variety. A tall habit is also important, as dwarf varieties usually bear pods very close to the ground, so that many will be left on the stubble..."), coarseness (a coarse, woody stem makes mowing difficult. However slender varieties often have small pods and seeds, often with vining tips and a tendency to lodge), ability to retain leaves, color of the seed ("Yellow or green seeds are preferable to darker colors, as the shattered seeds are more easily found by hogs pasturing the field or stubble"), shattering, resistance to disease ("In sections where nematodes and cowpea wilt occur most soy-bean varieties are seriously affected by both these diseases"), nonfilling of pods. Synopsis of the groups (plants bushy vs. twining). Synopsis of the varieties (within each group lists the total number and acquisition numbers of varieties with various colored seeds and germs: Group I–190 varieties (seeds straw-yellow, germ yellow–71 varieties; seeds olive-green, germ yellow–45 varieties; seeds chromium-green, germ green–17 varieties; seeds brown to olive, germ yellow–28 varieties; seeds black, germ yellow–18 varieties; seeds black, germ green–7 varieties; seeds bicolored, germ yellow–4 varieties). Group II–4 varieties. Group III–8 varieties. Group IV–76 varieties. Group V–7 varieties.

Of the 285 varieties in the five groups, 152 varieties (53.3%) have yellow (straw-yellow or olive-yellow) seeds, 55 varieties (19.3%) have black seeds, 44 varieties (15.4%) have brown seeds, 24 varieties (8.4%) have green seeds, and 10 varieties (3.5%) are bicolored).

Catalogue of soy-bean varieties (by S.P.I. number, from no. 480 in 1898 to no. 27,501 in 1909; p. 39-74). In 1908 USDA acquired soybean seeds from Vilmorin-Andrieux & Co. (Paris, France), Haage & Schmidt (Erfurt, Germany), and Dammann & Co. (Naples, Italy) (p. 57-60).

The best varieties of soy beans (p. 75, in 7 groups from very early to very late). Explanation of plates. Index.

The "Catalogue of soy-bean varieties" (p. 39) is "a complete list of soy beans imported by the United States Department of Agriculture, arranged chronologically in accordance with the sequential S.P.I. (Seed and Plant Introduction) numbers assigned to them by the Office of Foreign Seed and Plant Introduction." These numbers start at #480 (imported from South Ussuri, Siberia, in 1898) and end at #27501 (imported from Shanghai, Kiangsu, China, in 1909). Concerning No. 21825 (p. 58): "From Hokkaido, Japan, 1908... This variety is said to be used principally in the manufacture of 'soy,' 'miso,' 'tifu' [sic, tofu], etc. It has also been obtained again from the same place and grown under Nos. 21830 and 21831."

"The best varieties of soy beans" (p. 75) lists 35 varieties, each with a name and S.P.I. number, arranged in seven groups based on time to mature, from "Very early.–Ogemaw, 17258" to "Very late.–Barchet, 20798; Riceland, 20797 (In 1908 at Biloxi, Mississippi, it displayed astonishing diversity)." This list is "based primarily on the results at Arlington Experimental Farm [in Virginia], but those obtained in cooperation with various experiment stations have also been given due consideration:

"Very early.–Ogemaw, 17258.

"Early.–Early Brown, 25161 (from Indiana Agric. Exp. Station, 1909); and Vireo, 22874.

"Medium early.–Chernie, 18227; Auburn, 21079 A; Merko, 20412 (from Merkoechofka, Siberia); Elton, 20406; Chestnut, 20405 B.

"Medium.–Ito San, 17268; Medium Yellow, 17269; Tashing, 20854; Shingto, 21079; Swan, 22379; Brindle, 20407; Sedo, 23229; Lowrie, 22898 A.

"Medium late.–Brooks, 16789; Flava, 16789 A; Cloud, 16790; Ebony, 17254; Haberlandt, 17271; Peking, 17852 B; Wilson, 19183; Taha, 21999; Austin, 17263.

"Late.–Mammoth, 17280; Edward, 14953; Acme, 14954; Flat King, 17252; Tokyo, 17264; Hope, 17267; Hollybrook, 17278 (from Arkansas Agric. Exp. Station, 1904); Farnham, 22312.

© Copyright Soyinfo Center 2014

"Very late.–Barchet, 20798; Riceland, 20797."

Matsuura (1929 and 1933) cites this as the world's earliest publication on soybean genetics: "Recording segregation of seed- and flower-color in its natural hybrids." Page 11 notes that soybeans named "New Japan peas" were obtained from Norway (Source: Martens 1869). Page 20 notes that the Ogemaw variety of soybeans, which takes 92-97 days to mature, was obtained in 1908 from the Idaho Agricultural Experiment Station, where it had been grown for several years. Note 1. This document contains the earliest date seen for soybeans in Idaho, or the cultivation of soybeans in Idaho (about 1906).

Page 20 also notes that Buckshot variety of soybeans, which takes 92 days to mature, was obtained in 1908 from the Minnesota Agricultural Experiment Station, where it had been grown for several years. This is the second earliest document (April 2004) seen concerning the cultivation of soybeans in Minnesota. "Potomac Flats" is not mentioned in this report.

Concerning "Habit of Growth" (p. 12-13), the author states: "All soy beans are strictly determinate as to growth; that is, the plants reach a definite size according to the environment and then mature and die. The great majority of the varieties are erect and branching, with a well-defined main stem (Plates I and III)... In other varieties the stems and branches, especially the elongated terminals, are more or less twining, and usually weak, so that the plant is only suberect or even procumbent (Plates I-III)."

Photos show: (1) Plants of a wild soy bean grown in a greenhouse in a pot. (Fig. 1) (2) Plants of a wild soy bean from Soochow, China, grown at the Arlington Experimental Farm.

(3) Plants of a soy bean from Cawnpore, India. (4) Rows of different varieties of soy beans at Arlington Farm.

(5) Plants of seven varieties of soy beans, showing types of habit: Meyer 17852, Peking 17852 B, Austin 17263, Pingsu 18259, Unnamed 22504, Hollybrook 17278, Haberlandt 17271. (6) The same seven varieties shown in plate 4 after hanging in a dry room for 6 months.

(7-8) Eleven soy bean pods, ranging in size and shape.

(9) 36 varieties of soy bean seeds, showing variation in size and form.

Note 2. This is the most important document ever published on early soybean varieties in the USA.

Note 3. This is the earliest document seen (Oct. 2010) that uses the word "determinate" in connection with soybeans. Determinate plants terminate main stem elongation at, or soon after, the onset of flowering. Indeterminate cultivars continue main stem elongation several weeks after beginning flowering. Determinate / indeterminate is a genetic trait.

Note 4. This is the earliest publication see (Aug. 2011) written jointly by Piper and Morse, two of the most influential early advocates of the soybean in the USA. It is also the earliest document by or about Morse in connection with soybeans. Morse graduated from Cornell University, New York, on 20 June 1907 and 2 days later reported for duty at the Bureau of Plant Industry in Washington, DC, to work under Dr. C.V. Piper.

Note 5. This is the earliest document seen (Feb. 2004) in which Piper or Morse mention miso, tofu, or the use of soy beans as a coffee substitute.

Note 6. This is the second earliest document seen (July 1998) that uses the word "shatter" (or "shattered" or "shattering") in connection with soybeans. The earliest document (in 1854) used the word "shatter" in a very general sense. This document uses it more precisely, as the title of a section and for comparing varieties (p. 36): "When grown for grain alone, shattering is a serious fault. Some varieties, like Guelph, shatter inordinately; others, like Peking, scarcely at all... As a rule the varieties with large pods and seeds shatter much worse than those with small pods and seeds..."

Note 7. This is second the earliest English-language document seen (Oct. 2004) that uses the term "germ" to refer to a part of a soy-bean seed. The germ or embryo is the part of the seed inside the seed coat.

The section titled "Seeds" (p. 15) states: "The germs or embryos of soy-bean seeds are yellow, except in the green-seeded and part of the black-seeded sorts, in which they are green." Address: 1. Agrostologist; 2. Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

1454. Piper, Charles V.; Morse, W.J. 1910. The soy bean: History, varieties, and field studies: Botanical history and identity of the soy bean (Document part). *USDA Bureau of Plant Industry, Bulletin* No. 197. p. 9-11. Dec. 31.

• ***Summary:*** "The soy bean was first made known to Europeans by Kaempfer, who spent three years, 1690 to 1692, in Japan. Kaempfer (Amoenitatum Exoticarum, 1712, p. 837) gives the Japanese name 'Daidsu Mame' and describes it as an erect bean, with the pod of a lupine and the seeds like a large white pea. Linnaeus (Flora Zeylanica, 1747, p. 534) describes the plant briefly under 'Dolichos' and states that it is cultivated in Ceylon. This last statement is probably an error. He also cites the descriptions of Kaempfer. In 1753 Linnaeus repeats the description of the Flora Zeylanica and formally names the plant *Dolichos soja,* giving its habitat, however as India. What Linnaeus's Ceylon or India plant may be is not certain, as will appear.

"Moench in 1794 rechristened the Linnaean plant *Soja hispida.* Savi in 1824 called the Japanese soy bean *Soja japonica.* Miquel in 1855 named a narrow-leafed form from Java *Soja angustifolia,* and Maximowicz in 1873, using Moench's specific name, published the soy bean as *Glycine hispida,* which name has been generally adopted. Siebold and Zuccarini had previously (1843) named a plant from Japan *Glycine soja,* supposing it to be the *Dolichos*

© Copyright Soyinfo Center 2014

soja of Linnaeus. This plant, however, was not the soy bean cultivated by the Japanese but the wild plant later described as *Glycine ussuriensis* by Regel and Maack. Under existing botanical rules, the soy bean, which is known only as cultivated, has been called *Glycine hispida* (Moench) Maximowicz, and its nearest relative *Glycine soja* Siebold and Zuccarini (*G. ussuriensis* Regel and Maack). Maximowicz considered that the soy bean was probably derived from the latter by cultivation, but this idea has not generally been accepted.

"*Glycine soja,* as heretofore known, differs from *G. hispida* in its more slender and more vining stems, in being less hairy, in bearing smaller pods and seeds, and especially in having smaller flowers. The flower is 3 to 5 mm. long, while that of *G. hispida* is 6 to 7 mm. The structure of the flower is the same in both, but the calyx lobes are usually longer in proportion to the tube in *G. hispida* than in *G. soja.* It is apparent, therefore, that the fundamental differences between the species are slight. The smaller flower we regard as the best single character to separate *G. soja* from *G. hispida,* but using this as a criterion *G. soja* is also a cultivated species."

Note: This is the earliest English-language document seen (Nov. 2002) that uses the word "vining" in connection with soybeans–in this case *Glycine soja,* the wild soybean.

"Among numerous lots of seeds received from India (S.P.I. Nos. 24672 to 24693 inclusive) representing seven varieties, there are at least two (see Nos. 24675 and 24682) which have very small flowers, 3 mm. long, indistinguishable from those of the wild *G. soja* that we have grown. Typical plants of *Glycine soja* obtained from the Botanic Garden, Tokyo, Japan (S.P.I. No. 22428), and from Soochow, Kiangsu, China (S.P.I. No. 25138), have been grown three seasons. The India plants are coarser stemmed, less vining, and bear somewhat larger pods and seeds, but the flowers are much smaller than those of any variety of *G. hispida* and precisely like those of *G. soja.* Other numbers from India are probably *G. hispida,* but the flowers are somewhat smaller than the Japanese varieties and the pods and seeds as small as any variety of *G. hispida.* It is therefore apparent that both *G. soja* and *G. hispida* are cultivated in parts of India, if we accept the flower character as decisive. This fact makes it doubtful which of the two plants Linnaeus named *Dolichos soja.* There seems no good reason why *G. hispida* may not have been derived from *G. soja* by cultivation, the smaller flowers of the latter being the principal difficulty to explain. In all other respects the two supposed species seem to merge completely. The identity of the plant cultivated in India has been commented on by Watt (Dictionary of the Economic Products of India, 1890, p. 509)...

"Prain apparently does not apply the size of the flower as a critical character. Applying this, however, two of the Indian varieties (see No. 24675 and 24682) are certainly *Glycine soja* [the wild annual soybean] but the plants are stouter and less twining, and the pods and seeds larger than the wild form from Japan. Three other varieties (Nos. 24672, Khasi Hills [in today's Indian state of Meghalaya], and 24673 and 24674, Darjiling [Darjeeling in West Bengal, India]) we would refer to *G. hispida* [the domesticated soybean] though the flowers are somewhat smaller than the Japanese and Chinese varieties. The first is erect and bushy, but the other two are procumbent and vining. A variety from Taihoku, Formosa, No. 24642, is very similar to the two varieties from Darjiling. On the whole, we are therefore inclined to believe that there is but one botanical species, which has been profoundly modified by cultivation."

Note: This is the earliest document seen (Oct. 2010) that contains the word "procumbent" in connection with the soybean.

To summarize: In most botanical works the soybean is named *Glycine hispida* (Moench) Maximowicz. By a few writers it is named *Soja hispida* Moench. The use of either of these names is based on the idea that the wild soybean *Glycine soja* Siebold & Zuccarini or *Glycine ussuriensis* Regel & Maack is a different species. Piper and Morse (above) have shown that this view is untenable, the wild and cultivated plants representing but one species. Address: 1. Agrostologist; 2. Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

1455. Piper, Charles V.; Morse, W.J. 1910. The soy bean: History, varieties, and field studies: Early agricultural history in the United States (Document part). *USDA Bureau of Plant Industry, Bulletin* No. 197. p. 26-27. Dec. 31. [14 ref]

• ***Summary:*** "The first mention of the soy bean in American literature is by Thomas Nuttall, in the New England Farmer, October 23, 1829. Nuttall grew a variety with red flowers and chocolate-brown seeds in the botanic garden at Cambridge, Massachusetts.

"In the same journal two years later, November 23, 1831, is an account of the successful culture of the plant at Milton, Massachusetts, the seed having been obtained from Nuttall. No further mention of the plant in American literature appears until 1853, when a brief account appeared under the name 'Japan pea,' by A.H. Ernst, Cincinnati, Ohio...

"In the following year, 1854, the Perry expedition brought back two varieties of 'soja bean' from Japan, one 'white' seeded, the other 'red' seeded. These, together with the Japan pea, were distributed by the Commissioner of Patents in 1854, and, thereafter, frequent references to the plant occur in agricultural literature under such names as Japan pea, Japan bean, and Japanese fodder plant. Most of these articles speak of the plant as the Japan pea, none of them as the soy or soja bean. It is apparent from the early accounts that there were at least two Japan peas, one early enough to mature in Connecticut (Patent Office Report,

© Copyright Soyinfo Center 2014

1854, p. 194), the other very late (American Agriculturist, 1857, vol. 16, p. 10). Judging from all the accounts, we suspect that the early Japan pea may be the Ito San variety, which, however, has red flowers, while the late variety may be the Mammoth. The Ito San is still occasionally called the Japan pea, while the introduction and source of the Mammoth has never been definitely determined. From these early accounts the Mammoth may well be the 'white-seeded' soja bean obtained by the Perry expedition. The 'red-seeded soja bean' was perhaps, the Adsuki [azuki] bean (*Phaseolus angularis*), as no red-seeded soy bean is known.

"Prof. G.H. Cook, of New Brunswick, New Jersey, obtained seed of the soy bean at the Bavarian Agricultural Station in 1878. In the same year Mr. James Neilson obtained seeds of several varieties at Vienna, Austria. Both of these gentlemen planted the seeds and gathered crops of the different varieties in 1879. These varieties were without doubt those grown and distributed through Europe by Professor Haberlandt, of Vienna.

"A yellow-seeded soy bean was grown at the North Carolina Agricultural Experiment Station in 1882 and reported on in some detail. The source of the variety is not given, but by implication it is the same as the variety stated to be grown by a number of persons in the State, and is probably the Mammoth.

"Two varieties, one black seeded, the other with white seeds, were grown at the Massachusetts Agricultural Experiment Station in 1888. In 1890 Prof. C.C. Georgeson secured three lots of soy beans from Japan which were grown at the Kansas Agricultural Experiment Station in 1890 and subsequently. Prof. W.P. Brooks, of Amherst, Massachusetts, brought with him from Japan in 1889 a number of soy-bean varieties, including the Medium Green or Guelph, and the Ito San. It is quite certain that other importations of soy beans from Asia were made by others, but no definite records have been found. [Note: The Guelph variety was NOT developed in Canada.]

"Since 1890 most of the agricultural experiment stations have experimented with soy beans and many bulletins have been published dealing wholly or partly with the crop." Address: 1. Agrostologist; 2. Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

1456. Piper, Charles V.; Morse, W.J. 1910. The soy bean: History, varieties, and field studies: Soy-bean varieties described and indexed in this publication (Document part). *USDA Bureau of Plant Industry, Bulletin* No. 197. p. 79-81. Dec. 31. [27 ref]

• ***Summary:*** Named soy-bean varieties described and indexed in this publication, listed alphabetically below with the color of their seeds, are: Acme (straw yellow), Amherst (straw yellow), Arlington (black), Auburn (black), Austin (olive yellow), Baird (brown), Barchet (dark olive brown), Black Beauty (black), Brindle (brown and black), Brooks (straw yellow), Brown (brown), Brown Eda Mame (brown), Brownie (brown), Buckshot (black), Butterball (straw yellow), Chadaidzu (brown), Chernie (black), Chestnut (brown), Cloud (black), Columbia (chromium green), Daidsu Mame (yellow), Dwarf Brown (brown), Early Black (black), Early Brown (brown), Early Japan (straw yellow), Early White (yellow), Early Yellow (yellow), Ebony (black), Eda (brown), Eda Mame (yellow), Edward (straw yellow), Elton (straw yellow), Etampes (yellow), Extra Early Black (black), Fairchild (black), Farnham (straw yellow), Flat King (black), Flava (straw yellow), Giant Yellow (yellow), Green Samarow (green), Guelph (or Medium Green) (green), Habaro (straw yellow) [From Khabarovsk, Siberia, Russia 1907], Haberlandt (straw yellow), Hankow (brown banded with black), Hansen (brown), Hollybrook (straw yellow), Hongkong (black), Hope (olive yellow), Ito San (straw yellow), Jet (black), Kingston (black), Kiyusuke Daidzu (yellow), Large Black (black), Late Yellow (yellow), Lowrie (olive yellow), Mammoth (straw yellow), Manhattan (straw yellow), Medium Black (black), Medium Early Black (black), Medium Green (Guelph) (green), Medium Yellow (straw yellow), Merko (brown), Meyer (black and brown), Morgan (olive yellow), Morse (olive yellow), Natsu (straw yellow), Nemo (olive yellow), Nielsen (olive yellow), Nigra (black), Nuttall (black), Ogemaw (Ogema) (brown), Okute (olive yellow), Peking (black), Pingsu (black), Riceland (black), Samarow (green), Sedo (deep brown), Shanghai (black), Sherwood (straw yellow), Shingto (olive yellow), Southern (yellow), Stuart (olive yellow), Swan (straw yellow), Taha (black with olive saddle), Tashing (chromium green), Tokyo (olive yellow), Trenton (brown), Vireo (olive yellow), Wilson (black), Wisconsin Black (black), Yamagata Cha-daizu (brown), Yellow (yellow), Yellow Eda Mame (yellow), Yellow Etampes (yellow), Yellow Riesen (yellow), Yosho (olive yellow).

Note 1. This is the earliest document seen (Sept. 2013) that mentions the following soy-bean varieties: Acme, Auburn, Arlington, Barchet, Black Beauty, Chernie, Columbia, Elton, Fairchild, Farnham, Flava, Lowrie, Morgan, Natsu, Nemo, Nielsen, Nigra, Okute, Peking, Sedo, Stuart, Swan, Taha, Trenton, Vireo.

Note 2. This is the earliest document seen (Sept. 2013) by Piper or Morse that is mainly about soybean varieties.

Note 3. This is the earliest document seen (Aug. 2013) which states that Black Beauty is a synonym of Ebony (see p. 43).

Note 4. This is the earliest English-language document seen (Sept. 2004) that uses the word "banded" (or "banding" or "bands") (with Hankow), or the term "olive brown" or "dark olive brown" (with Barchet) to describe the color of soybean seeds. Address: 1. Agrostologist; 2. Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

1457. Honcamp, F. 1910. Die Sojabohne und ihre Verwertung [The soybean and its utilization]. *Tropenpflanzer* (*Der*) (*Berlin*) 14(12):613-34. Dec. (Chem. Abst. 30:45). [9 ref. Ger]
• ***Summary:*** Contents: Introduction. Utilization as food and food adjuncts (stimulants / enjoyables) (*als Nahrungs- und Genussmittel*). Use for technical purposes. Use for fodder.

According to English consular reports the total production of soya beans in China amounted in 1907 to 580,000 tons, rising in the following year to 850,000 tons. During the year 1909 no less than 35 million kg of the beans passed through the Suez Canal.

Harz classified the varieties of Soja hispida into 2 main groups, one containing those of strongly compressed form and of olive green to brownish-black color, and the other swollen varieties more or less sickle-shaped, and of yellowish-brown to deep brown color.

Dietrich and König [1891] conducted 20 analyses of the soybean and found the following average composition: Water 11.34%, crude protein 35.11%, crude fat 16.98%, nitrogen-free extract 26.18%, crude fiber 5.88%, and ash 4.51%.

An analysis of the inorganic constituents of the beans by Schwackhöfer gave the following results: Potassium oxide, 44.56%; sodium oxide, 0.98%; lime, 5.32%; magnesia, 8.92%; iron oxide, trace; silica, trace; phosphoric acid, 36.89%; sulphuric acid, 2.70%; and chlorine, 0.27%.

Both in China and Japan the black varieties are boiled and roasted and eaten with rice, while the green and white varieties are ground to meal and baked into cakes, etc. The soy sauce, which is now largely exported to England and America, and used in the manufacture of other sauces, is prepared from wheat and a small light yellow variety of the bean, with the addition of salt and water, the prepared mass being fermented in open vessels at as low a temperature as possible for a period of 8 months to 5 years, and the sauce then separated from the residue. Another product made from the beans in Japan, and used in the preparation of soups and flavors for cooking, is know as miso. In addition to these, a so-called bean cheese (tofu), and a similar product from which the bulk of the water has been removed (kori-tofu), are prepared from soya beans in Japan.

Attempts to acclimatize the plant in Germany have not yet proved successful, although it may be possible to introduce an early-ripening variety with a short vegetation period.

Note: This is the earliest document seen (Aug. 2007) that gives soybean production or area statistics for China. It is not clear whether or not this includes Manchuria, or refers only to Manchuria. Address: Prof., Germany.

• ***Summary:*** "Soya meal is finding its biggest outlet in Scandinavia, especially in Norway and Sweden" (p. 7).

A section titled "English Soya-Bean Industry" (p. 10-13), written from London by Brodé on April 23, discusses the following: Rapid development during past few years. Cause of fluctuation in price–current quotations. England may lose monopoly–exploitation by railroad. English process of refining oil. Secret process of English company. Production of "soya flour." Solvent process applied to cotton seed.

© Copyright Soyinfo Center 2014

"Soya beans were first imported by an English firm some ten years ago. Being free from sugar it was thought they would make an excellent food for patients suffering with diabetes. At that time a quantity was also shipped into Germany for the same purpose.

"It was known that the beans contained considerable oil and in 1907 a crusher at Liverpool was induced to buy 400 or 500 tons, which were shipped from Hankow at a cost of $50 per ton c.i.f. Liverpool, the freight rate at that time being over $10 per ton from Chinese ports. This crusher, from previous experiments with small lots, found he could produce an oil acceptable to soap makers, and the only problem was to find an outlet for the by-products–cake and meal. The latter, it was found, ran high in protein and could be utilized by the compound-cake manufacturers.

"From this time shipments gradually increased until in February, 1908, a cargo of 9,000 tons was imported. This went to Hull, and the selling price of the beans was $32 per ton c.i.f... The beans are grown in the interior of Manchuria, at points from which there are no wagon roads to the railroad. The beans are not moved until snow has fallen, enabling the farmers to bring them across country on sledges [sleds, sleighs]." A late snow at the beginning of the present season acted to increase prices and cause many problems. "The best way in which American mills can buy these beans is in cargo lots c.i.f. New Orleans [Louisiana].

"It is thought that next year England will not enjoy the monopoly in soya beans it has heretofore had. Germany has taken the import duty off them, and it is thought other countries will do likewise. The fact that they are called beans has prevented them from having a wider outlet, since in Germany, France, and Austria oil seeds have been on the free list, but beans have been subject to a tax. Under the new French tariff soya beans are subject to a duty of 2.50 francs per 100 kilos... Mills at Odessa [in the Ukraine] are preparing to crush the beans..."

"The North Easter Railway in England has built docks and warehouses for handling the beans and is advertising the products along its lines. At Hull it has a large window display of the products, which is attracting considerable attention. In this exhibit are samples of soya cake, oil, and meal, soya flour, soya bread, and soya biscuits. There are also large photographs showing the manner in which the beans are gathered, stored, and loaded in Manchuria, and how they are manufactured into products in England.

"Soya oil is not refined as is American cotton-seed oil, with caustic soda, but by means of sulphuric acid and fuller's earth. It is best adapted to soft-soap making, since it does not chill easily and is difficult to handle in making hard soap... One refiner is placing on the market an edible soya oil sold under the name of 'Omega soya oil.' This oil has a good color, is almost neutral in odor, and is rather palatable, the flavor being similar to that of peanut oil. The process for rendering crude soya oil edible is kept a close secret, but is thought to be by means of superheated steam... Soya cake is finding its biggest outlet in Denmark, about 150,000 tons having been purchased this season. Soya meal made from ground soya cake finds its biggest sale in Sweden, Norway, and from the northernmost part of Germany."

"The most interesting and, to the writer's mind, the most significant thing about the new soya industry is the process used by three mills in England for extracting the oil. This secret process belongs to the Premier Oil Extracting Company, of Hull, and for its use the two other mills are said to pay the company 40 cents royalty for every ton of seed treated. The seed are first finely crushed and then treated directly by a fat solvent, presumably benzine." No trace of the solvent remains in the oil and only about 1% of the oil remains in the meal. "Mills making meal by this process find their largest market in Scandinavia"–including Denmark.

"The Premier Oil Extracting Company also operates a large flour mill, and is placing on the market a so-called 'soya flour,' which is 25 per cent soya meal and 75 per cent wheat flour. The company has induced a number of bakers to use it in making a soya bread, which is finding sale on the market, although the price asked is the same as for all-wheat bread... The same mill has induced a large biscuit manufacturer to use soya flour in making a brand of biscuits called 'soya biscuits.' These are for sale all over England and are very palatable" (p. 12-13).

In India in 1909 there was "a large decrease in the value of exports of seeds, which may be possibly accounted for by the competition of the soya bean which is being extensively shipped from China and Japan" (p. 27).

A table (p. 27) shows that India's main seed exports are linseed, gingili seed [sesame seed], rape seed, and cotton seed. Destination countries, amount exported and value to each country, are given for the years 1908 and 1909.

"Soya meal has not found much favor in England or Ireland, but is gaining ground in Scotland. Owing to the scarcity of cotton-seed, many of the farmers were compelled to substitute soya."

Note: This is the earliest document seen (Jan. 2004) concerning commercial solvent extraction equipment and soybeans. Address: Special Agent for the Dep. of Commerce and Labor.

1465. Hosie, Alexander. 1910. Manchuria: Its people, resources, and recent history. Boston, Massachusetts: J.B. Millet. x + 320 p. Illust. Index. 25 cm. Oriental Series Vol. 14

• ***Summary:*** This book is similar in many ways to the 1901 edition with the same title except: (1) It contains 25 more total pages. (2) Chapters 7-10 in the 1901 edition have the same titles, are in the same order, and contain most of the same information as chapters 4-7 in the 1910 edition. (3) Most of the information on soybeans and soyfoods in this 1910 edition is identical or similar to that in the original

© Copyright Soyinfo Center 2014

1901 ed, but usually on different pages. For example, the long, excellent section on tofu and related products on pages 183-84 in the 1901 edition is identical to that on pages 78-79 in this 1910 edition. And the description of how a traditional crush-stone mill and wedge press are used to make bean-cake and bean-oil, on pages 218-24 of the 1901 edition is identical to that on pages 121-27 of this 1910 edition. Many more such examples could be cited. (4) There is extensive and very interesting new information on railways, which are discussed at great length in this 1910 ed.; they are found in a separate record in this database as a "document part."

Editorial note by Charles Welch (p. ix-x): The whole world is now closely linked together as newspapers keep us informed of the events in far-of lands. Manchuria was practically unheard of until the last two wars which Japan had to fight there against China (1894-1895) and Russia (1904-1905). Port Arthur fell easily when held by the Chinese, but its strong defense by the Russians "turned the eyes of the world to the citadel which lay at the point of the far Eastern peninsula called Manchuria." The Trans-Siberian Railway, started in 1889, ran east-west, eventually connected St. Petersburg (the capital of Russia from 1712 to 1918) to the Pacific Ocean port of Vladivstok–a distance of 5,772 miles. The Chinese Eastern Railway, started in 1897, ran north-south, connecting Mukden and Port Arthur. The building of these two railroads has shown to the world the great wealth of Manchuria, a province of China.

The war between Japan and Russia was fought in large part because Russia claimed special exclusive rights to mining, timbering, etc. in Manchuria. Japan fought for an "open door" policy in this wealthy region, the right to trade and commerce in Manchuria. Sir Alexander Hosie has been a resident of China for practically 40 years.

The Chinese call Manchuria the Tung-san-shêng (Three Eastern Provinces); it "is an agglomeration of petty Tartar or Manchu principalities, lying to the north-east of China Proper" (p. 3).

Soy beans or [soy] beans, bean oil, bean cake, or soyfoods are mentioned or discussed on the following pages of this 1910 edition: 69 (outer leaves of kao-liang or tall millet are woven into mats used for packing loads of grains and beans), 71 (barley in large amounts is ground with peas or beans as a ferment in the distillation of native spirit {*Shao chiu*} from tall millet / kao-liang), 75-80 (beans are the most important agricultural crop for external trade, and the second most important article of cultivation after kao-liang. The most important bean, considered together with its products bean-cake and bean oil, is the soy bean–*Glycine hispida;* discusses the many varieties of soy beans and soy bean products), 82 (Mao-Tou, soy beans cultivated as a garden bean for food), 84 (soy bean is one of six plants grown in Manchuria whose seeds yield oil), 101 (each skein or hank of silk is dipped in bean-flour water), 121-28 (how the oil is expressed from soy beans; Recent prices of soy beans and products. 1896 bean oil factory driven by steam), 142 (how boats carry soy beans and other export crops down the Liao River each spring after the ice breaks up), 146-47 (value of exports of soy beans and products; total value in Manchuria), 168 (the flourishing bean-oil and bean-cake industry at Dalny started in 1908, practically speaking), 172 (the 1907 depression in Manchuria's soy bean market), 174 (the 1907 depression is now over and the outlook for American goods in Manchuria is hopeful), 181-84 (value and amount of exports of soy beans and products from Dalny and other ports, mostly in 1908; ports of destination and uses at each), 196 (the matting, woven by hand from the outer sheaths of millet stalks, that rises high around every large cart carrying loads of loose beans and millet), 208-11 (city of T'ieh-ling on the Liao and its growing importance in the soy bean trade; met 1,000 carts heavily laden with produce from the interior), 216 (a large cart carrying beans and pulled in an ongoing sort of race by mules or ponies, has overturned, and the beans are scattered all over the roadway; such accidents are taken as a matter of course, and the way is cleared so that traffic can resume), 234 (Yi-t'ung [pinyin: Yitong, in central Jilin province] Chou, like T'ieh-ling [pinyin: Tieling], is a great storehouse for beans and grain, and there is extensive trade between the two cities), and 237 (met several caravans laden with empty "bean-oil boxes." Beans are carried from Newchwang by boats when the river is open and by carts when it is closed by ice).

Also discusses (see index): Job's tears or pearl barley. *Phaseolus radiatus* (the ray-fruited dwarf bean [azuki] which is red or white). Hemp (*Cannabis sativa*) and Abutilon hemp, the true hemp plant, *Abutilon avicennæ,* both valuable fiber crops. Sesamum seed. Ground-nuts [peanuts] (*Arachis hypogæa,* L.) Seaweed. Address: British Consul-General at Tientsin [Tianjin, China].

1466. Hosie, Alexander. 1910. Manchuria: Its people, resources, and recent history. Railroads (Document part). Boston, Massachusetts: J.B. Millet. x + 320 p. Illust. 25 cm. Oriental Series Vol. 14

• ***Summary:*** Railroads in Manchuria are discussed at great length in this book. These include the Chinese Eastern Railway Co., the Siberian Railway (incl. the Trans-Baikal and the Southern Ussuri sections), South Manchuria Railway, Trans-Manchurian Railway, and the Trans-Siberian Railway.

The South Manchuria Railway, the newest, is discussed in the most detail, especially in Chapter 7, titled "Trade of Manchuria" (p. 138-191). Page 145: "In addition to the purely foreign imports, however, there should be mentioned an item of $10,000,000 worth of railway materials imported from the United States by the South Manchuria Railway Company, on which no duties were paid, and which was omitted from the Chinese Customs Returns."

Page 149: "Although considerable interest in the mineral deposits of Manchuria has been evinced by American,

© Copyright Soyinfo Center 2014

British, and German engineers during the year, but little has been accomplished by them toward the development of the country's mineral resources. The South Manchuria Railway Company, on the other hand, has pushed forward development work on the Fu-shun (pinyin: Fushun) coal mines with great energy, and extensive additions to the equipment of the mines have more than doubled the output" daily during the year from 500 tons the beginning to 1,200 tons by the end of December. The Fu-shun coal mines constitute one of the chief assets of the Company."

Page 153. "Railway developments: The South Manchuria Railway has been standardised and the installation of new rolling stock has greatly increased the road's carrying capacity. Under the narrow-gauge regime the line's daily carrying capacity was about 2,000 tons, whereas at the present time, with its standard gauge, new American rolling stock, and improvement in its freight service, the capacity is more than 6,000 tons. Similar improvement has been made in the passenger service."

Page 154: "These trains are thoroughly modern in every respect, the cars and locomotives being of the latest designs of American make. Each train is composed of a mail car, a Pullman sleeper, a diner, and a combination day coach and baggage car. In addition to these improvements the South Manchuria Railway Company has established a weekly steamship service between Dalny and Shanghai, which shortens the time of travel between the latter city and Manchuria by two to five days, and will also bring about a reduction of freight rates. The Company is already issuing through bills of lading between Shanghai and Manchurian points."

Page 162: "The net increase of the Japanese population in Manchuria for the year 1908 was 14,149, of whom 5,296 settled in the leased territory and 8,853 scattered throughout the country, mostly along the line of the South Manchuria Railway. A conservative estimate of the number of Chinese immigrants during the year would place the figure at 25,000, the majority of the newcomers being of the agricultural class, who have come to Manchuria to find permanent homes and have settled in the fertile regions surrounding Fakumen and Chengchiatun. Should the plans of the Government for the settlement of waste lands meet with success, the number of Chinese arrivals will rapidly increase."

Page 165: "The general plans sanctioned by the management of the South Manchuria Railway provide for a northern terminal at Suchiatun, a station on the main line of the South Manchuria Railway some 10 miles south of Mukden. Suchiatun is already the junction of the branch line to the Fu-shun collieries, having the necessary yards and transshipping facilities. By making Suchiatun instead of Mukden the terminal of the line the company will obviate the necessity of bridging the Hun River and at the same time will save several miles of track."

Page 169-70: "First place in the import trade of Dalny is held by goods from Japan, which were valued by the customs last year at $6,824,440, but which Japanese figures place at $8,429,393. This total is made up of a large variety of articles, from lumber and railway material to notions and a great part simply represents the supplies of food, clothing, furniture, etc., drawn from Japan by Japanese residents in Manchuria for their own use. Of the staple goods for the Chinese market, the most important are cotton goods and cigarettes."

"The United States is second in the import list, with $3,762,653, according to customs figures, or about 32 per cent. This was almost entirely trade with the Japanese in Manchuria, and was made up mainly of supplies for the South Manchuria Railway Company. The figure seems to be too small, as the value of railway supplies ordered in America and received during 1907 and 1908 was approximately $10,409,000, of which much less than half came in during 1907. The explanation may be that entries of duty-free goods for the railway or for general consumption in the leased territory are less carefully prepared, as to details, by the consignees."

Page 171: "The domestic goods brought in from Chinese ports were valued at $1,310,622. The rails, locomotives, bridge work, and most of the cars purchased on the first orders for supplies for the South Manchuria Railway were bought in the United States and delivery was completed in 1909. Of the new purchases under this head, the most important were an order placed in Russia for some 6,600 tons of steel rails worth about $250,000, a new electric-power outfit costing $135,000, ordered in the United States; rails, cars, and trucks for the Dalny street railway, ordered in Germany and England and costing approximately $277,000; and a gas-generating plant and distributing pipes, purchased in Germany and Great Britain, respectively."

Page 182-83: "Coal seems destined to become an important item among the exports, but the business is still in an experimental stage. In 1908 shipments to foreign countries amounted to 4,686 long tons. Already the South Manchuria Railway Company has a contract for furnishing coal to the mail steamers of the Osaka Shosen Kaisha, which come here twice a week from Osaka and Kobe. The price has not been made public, but it would seem to be not far from $2.75 to $3 per ton delivered on board, and at this low cost it is said to be quite satisfactory. With the exception of $239,828, representing the customs valuation of [soy] beans shipped to England, and $1,209 for exports to Korea, the entire foreign export trade of Dalny is with Japan, the total value of exports to that country being $4,574,057."

Page 186: "In August, 1908, the South Manchuria Railway Company began a weekly freight and passenger service between Dalny and Shanghai, and while little business offered at first, both the number of passengers and the freight tonnage seem to be steadily increasing, as the railway company is making special efforts to develop this

© Copyright Soyinfo Center 2014

line by selling through tickets and by offering through bills of lading to interior stations at moderate rates.

"The trade to South China ports continues in the hands of two leading British coasting lines, whose business has greatly increased of late, so that they have had as many as eight ships in port at one time loading cargo or waiting for berths." Address: M.A., F.R.G.S., Once Acting British Consul, Tamsui; Now at Aberdeen (Scotland or Hong Kong).

1467. Inouye, Jukichi. 1910. Home life in Tôkyô. Tokyo, Japan: Printed by the Tokyo Printing Co. vii + 323 p. No index. Illust. (some color). 23 cm. Facsimile edition reprinted in 1985 by KPI (London & Boston). [Eng]

• ***Summary:*** Chapter 5, "Meals," states (in a description of making breakfast): "But in point of utility the soy bean comes next to rice, for our soy sauce which enters into almost all dishes is made from the bean, wheat, and salt. So extensively is this sauce employed that table salt is comparatively little needed. The bean is also the principal ingredient in *miso,* which is a mixture of the soy bean, steamed and pounded, with rice-yeast [koji] and salt. This *miso* is largely used in making soup; and the soups into which it does not enter are usually flavoured by boiling shavings of sun-dried bonito and straining them off" (p. 58).

"After the rice-pot is removed, another pot is put over the hearth for making *miso*-soup... *Miso*-soup contains strips of garden radish [daikon], edible seaweed (*alopteryx pinnatifida*) [wakame], bean-curd [tofu], egg-plant, or other vegetables according to season. These two, the rice and the soup, are all the cookery required in the morning. There must, of course, be hot water for tea." Pickled vegetables (called *kôkô* or *kô-no-mono*) especially garden radish, invariably accompany Japanese meals (p. 58-59).

"The breakfast, then, is very simple. Sometimes the family take their meals at a large low table which is set before them [as they sit on their heels in the *seiza* position on tatami mats] at each repast; but often a small tray, about a foot square and standing six inches or more high, is placed before each member. In the left corner of the tray near the person before whom it is set, is a small china bowl of rice, while on the right is a wooden bowl of *miso*-soup. A tiny plate of pickled vegetables occupies the middle or the farther left corner, while any extra plate would fill the remaining corner. This plate also holds something very simple, such as [*umeboshi*] plums preserved in red perilla leaves, boiled kidney beans, pickled scallions, minute fish or shrimps boiled down dry in soy sauce, a pat of baked miso, shavings if dry bonito boiled in a mixture of soy and *mirin."* An illustration (line drawing) shows such an individual meal tray, with chopsticks resting on the rim of the tray (p. 59-60).

"Soy [sauce] is usually sold in wooden kegs as it does not change [spoil] with time; but the poor buy it in half-pint bottles" (p. 68).

The midday meal is very simple. But the "evening repast is the principal meal of the day... fresh fish is more frequently served than at noon. The fish may be boiled in a mixture of *mirin* and soy, be put into a soup made with an infusion of dried bonito shavings, be roasted on the iron netting with a sprinkling of salt or repeated coatings of soy, or be taken raw in thin slices [*as sashimi*]**.** This raw fish is a peculiarly Japanese dish" (p. 70).

Note 1. In Japan, almost everything is done in an orderly way, followed by nearly everyone. There are rules (often unwritten) for how to do almost everything.

Chapter 6, "Food," states: "Sea-weeds are also in great demand. Of these the principal are the *konbu* (*Laminaria japonica*), which is largely exported into China, and the laver [*Porphyra tenera*], which is obtained in this sheets [*nori*] and taken with soy alone or with rice rolled into it." Yellow chrysanthemum flowers are also used as food, "either fried with a coating of *kuzu* (*pueraria Thunbergiana*) or boiled in brine and pressed" (p. 72).

Eels are eaten, with bamboo skewers passed through them; "they are roasted over a fire, being from time to time dipped in a gravy [sauce] of *mirin* and soy. Tokyo is especially noted for eels served this way." Sun-dried cuttlefish, which are flat and hard, "are cut into slices which are roasted and dipped in soy" (p. 73).

"As we do not use a knife and fork at table, all fowls have to be cut up before they are served... The commonest method with the domestic fowl and duck is to boil them in small slices in a shallow pan with bits of onion in a gravy [sauce] of soy, *mirin,* and sugar." "It is only of recent years that we have begun to eat beef and pork; but we have in Tokyo a large number of shops where they are sold." One kind of shop is "a sort of restaurant where beef is served in the same manner as the domestic fowl and duck above mentioned" (p. 74).

"Though cooking is mostly done at home, no small quantity of small quantity of prepared food is bought for the meals. The most important of such food is the bean-curd [tofu]. For this the soy bean is soaked in water, ground, steamed, and strained; and the liquid is allowed to coagulate by the addition of brine [nigari] and then pressed in a square box with a cotton-cloth bottom until the water has been drawn off, leaving behind a soft white curd. This curd is cut into small slices and put into soup in the morning; it is sometimes thrown into hot water, and as soon as it is warmed [as *yudofu*], dipped into a mixture of soy and *mirin* and eaten. It is also fried. Indeed, the bean-curd shares with the *tai* [sea-bream] the distinction of having a special treatise dealing with a hundred ways of dressing [cooking / serving] it" (p. 74).

"As there is no dessert at a Japanese meal, fruits are commonly eaten at odd hours, especially by children." Apples are grown mostly in Yezo [Hokkaido], "the most northerly of the larger islands" (p. 75).

A common dish for the bever [a light lunch eaten

© Copyright Soyinfo Center 2014

between meals] is the (*soba*) or buckwheat noodles. Soba "is dipped before eating, into an infusion of bonito shavings flavoured with a little soy and *mirin,* to which small bits of onion [*negi*] and Cayenne pepper have been added" (p. 77).

Another inexpensive food "is a kind of cracknel [*senbei*] made by baking and dipping small disks of rice or wheaten flour in soy" (p. 78).

"The bulk of confectionery is made of rice, red beans [*azuki*], millet or sugar. Glutinous rice is steamed, pounded in a wooden mortar into a pasty consistency, and left to cool" [to become mochi]. "The red bean is boiled, pounded, and strained through a coarse cotton bag to get rid of the skin, though the latter is sometimes retained, in which case the straining is unnecessary, and finally mixed with sugar" to make "red bean jam" [*an*], which "is the most important ingredient of Japanese sweetmeats as there is in our confectionery no other equivalent... The red bean jam is also used in making soup into which small rice dumplings are thrown; this soup is much in demand, especially in winter, to while away the tedium of long evenings. The red bean is also boiled with rice to give it a colour; the red-bean is eaten in old-fashioned families three times a month, on the first, fifteenth, and twenty-eighth" (p. 80).

Note 2. This is the earliest document seen (May 2011) that uses the term "red bean jam" to refer to Japanese *an* [sweet azuki bean paste].

"Starch extracted from the root of the *kuzu* (*pueraria Thunbergiana*) is also much employed in confectionery." "By steaming a mixture of red beans, sugar, wheat, and *kuzu,* we get a sweet dark-red cake, which is almost as popular as the sponge-cake" (p. 80).

Inouye, who lived 1862-1929, lived to witness the Meiji period end and westernization begin. A scholar, journalist, translator and Japanese diplomat, he served at Japanese embassies in Belgium and the United States. Returning to Japan in 1918, he devoted the remaining years of his life to compiling English-Japanese and Japanese-English dictionaries.

Note 3. This book comes in an elegant, traditional "folding case" (*chitsu*), consisting of five stiff pieces of paperboard, covered with cloth, and held in place by two ivory-looking pegs (each 3 cm long), each of which slips into a cloth sleeve. This folding case performs much the same function as a Western slipcase. Address: Tokyo, Japan.

1468. Lafar, Franz. 1910. Technical mycology: The utilization of microorganisms in the arts and manufactures. Vol. II. Eumycetic fermentation. Part II. Translated from the German by Charles T.C. Salter. London: Charles Griffin & Co. ix + p. 191-748. Illust. Index. 23 cm. [3240* ref. Eng]
• ***Summary:*** An extensive bibliography on mycology and fermentation (3,240 references) for both this volume and volume I appears at the back of this volume (p. 561-695). The first chapter in this volume is Chapter 49, titled Mineral Foodstuffs (p. 191-202).

Chapter 55, titled "Classification of the families Saccharomycetaceæ and Schizosaccharomycetaceæ" is on p. 270-295. Section XVII (starting p. 456) is titled "The enzymes and the enzyme actions of yeast." It begins with Chapter 53, on "Alcoholase," by Dr. Rudolf Rapp, which starts with an historical introduction. Page 506 mentions the "Amylo process."

Chapter 56, by Prof. Dr. Carl Wehmer, titled "Morphology and subdivision of the family Aspergillaceæ" discusses (p. 296-346): Eighteen illustrations of Aspergillus conidiospores (p. 300-19).

"*Aspergillus Oryzae* (Ahlburg) Cohn (=*Eurotium Oryzae* Ahlburg). This species is of practical importance as a saccharification fungus, and has been cultivated for centuries in Japan for the preparation of the rice mash for Saké, as well as for the production of Soja sauce and miso." It was first identified (as *Eurotium oryzae*) by Ahlburg in 1876, and was renamed *Aspergillus oryzae* by Cohn in 1883, though a full morphological description was not given until 1895 (by Wehmer) (p. 308).

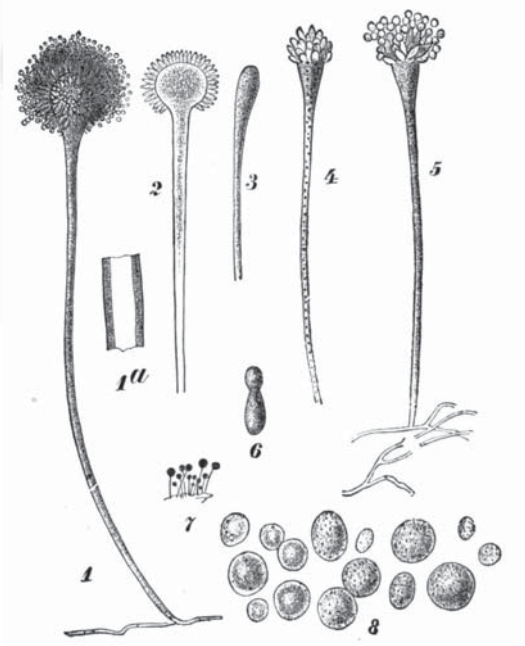

Fig. 166 shows *Aspergillus oryzae.* "1-2. Conidiophores with clavate and almost spherical glubule. 2. In optical section. 3-5. Development of a small conidiophore, distension of the hypha, protrusion of the sterigmata and incipient formation of conidia. 1a. Optical section of tough stem. 6. Sterigmata. 7. Conidial herbage, slightly magnified. 8. Conidia. Approximate magnification of 1-5 = 75 times. Of 6 = 400 times. Of 8–900 times. (After Wehmer).

Fig. 167. Conidiophores 1-5, 2 and 5 in optical section. Figs. 3-5, development of the globule (3) and sterigmata (4). The separation of the conidia is beginning in 5. Approximate magnification of 1-4 = 20 times. Of 5 = 120. *Aspergillus*

Wentii (Wehmer), which is used in Java to make Tao-Yu (Chinese-style soy sauce). It appears spontaneously on the boiled Soja beans that have been covered with *Hibiscus* leaves, as described by Wehmer in 1896 (p. 311).

Chapter 57, also by Prof. C. Wehmer, titled "Chemical activity of the Aspergillaceæ," discusses (p. 350-74): Saccharification of starch, Takamine's research using Aspergillus to make diastase (Taka-diastase) and its efficiency compared with similar enzymes of different origins, koji extract which contains amylase and other enzymes, use of *A. oryzae* in the preparation of rice-wine, Soya [shoyu], and Miso (p. 352).

This volume also discusses: The degradation of proteids and their derivatives, protease (p. 369-70). Film-forming surface yeasts and their accompanying phenomena, *Mycoderma* (p. 411-15). Invertase (p. 516). Other enzymes discussed in this chapter include maltase, melibiase, lactase, trehalase, raffinase, and amylase. Address: Prof. of Fermentation-Physiology and Bacteriology, Imperial Technical High School, Vienna.

1469. Li, Yu-ying. 1910. Ta tou: Le soja [The soybean]. Paris: Société Biologique de l'Extrême Orient. 66 p. Illust. 28 cm. [Chi]

• ***Summary:*** This remarkable work, written entirely in Chinese, was the first of Li's major works on soybeans and soyfoods. Published in Paris, it was written in Chinese and meant to be read by young people in China interested in coming to Paris to study or in helping Li with research on Chinese soybean varieties. An expanded and revised version was published into French the next year (1911).

Contents: Soybeans: 1. Introduction. 2. Names and varieties (colors, sizes, and shapes) of soybeans. 3. Where soybeans are produced and their history. 4. The place of soybeans in the hierarchy of plants (taxonomy). 5. Nutritional composition of soybeans. 6. Characteristics of soybeans (physiological, morphological, etc.). 7. Food uses of soybeans (incl. tables comparing the price of tofu with various meats, and the various sicknesses associated with eating different types of meat). 8. Equipment used in making soyfood products (a photo shows the equipment in Li's modern soymilk and tofu plant near Paris; p. 37), and compares soymilk with cow's milk. A large soybean utilization diagram in Chinese (p. 44) shows all the products that can be made from soybeans using the wet process (from soymilk) or the dry process (from flour). Note: This is the earliest document seen (July 2002) that contains a diagram of this type.

9. Value of soybeans in agriculture (incl. fertilizer use). 10. Conclusion. Appendixes: (1) About the *Société biologique de l'Extréme Orient* (Far-East Biological Society). (2) Membership form for the Far-East Biological Society (Paris): Date, name, A.K.A., Address, Occupation or subject of study, Place of birth. Please enclose 2 yuan membership fee (p. A6). (3) Bibliography of publications on soybeans by the Society of the Far East (p. A7-8). (4) Special announcement concerning soybean research (p. A9).

Illustrations (line drawings) show: (1) Comparison of shapes and colors of 7 different colors of soybeans (p. 5). (2) Five views of soybean pods with beans, incl. outside of pod, inside of both halves when open, with beans in one half, the two cotyledons of a single soybean (p. 11). (3) Soybean plant with pods (p. 12). Photos show: (1) The cellular components and layers of soybeans and hyacinth beans (p. 22, 23). (2) The interior and equipment in Li's soymilk and tofu plant on the outskirts of Paris (p. 37). (3) Microscopic views of soymilk (*doujiang*) and a liquid resembling soymilk made from soy flour (p. 38).

Tables show: (1) Size range (length, width, and thickness; maximum, average, and minimum) of 7 colors of soybeans: yellow bean, green skin bean, green bean, dark bean {"black" or "crow" bean}, black bean, red bean, spotted bean (p. 4). (2) Composition of four parts of a soybean plant: Comparison, water, protein, oil, carbohydrates, ash (p. 18). (3) Comparison of oil and protein content of 5 colors of soybeans (red, black, green, white, yellow) from various countries and regions: China, Japan, Southeast Asia, Russia, Hungary, and France (p. 19). (4) Composition of soybeans, hyacinth beans, and wheat (p. 21). (6) Comparison of the price of tofu with that of various meats (p. 29). (7) Ash content of soybeans, hyacinth beans, duck, uncooked rice, cabbage, egg, beef, chicken, lamb, pork, carp, wheat flour (p. 31). (8) Carbohydrate content of uncooked rice, wheat flour, hyacinth bean, soybean (p. 32). (9) Weight of products containing 100 gm of protein: Soybeans, tofu (somewhat firm), hyacinth bean, uncooked rice, bread, cooked rice, vegetables (p. 32).

Publications listed in the Bibliography (p. A7-8): *Ta tou–The soybean* (this book; published 1909). *Bean curd–20 centuries of great craftsmanship around the world* (1908). *Soycrafting–China's manufacturing specialty* (1908). *The Paris Bean Curd Company* (1908, illustrated). *An outline of the agricultural societies of France* (1908). Note: the above publications concern industrial matters.

A description of herbs (*Chinese medicinal plants etc.*) (1909). *TB* [*Tuberculosis*] *and its cure* (1909). Note: the above publications concern medicinal herb and health matters.

The benefits of soyfoods (1909). *Smoking and its relationship to health, economics and industry* (1909). Note: the above publications concern industrial and health matters.

Special announcement concerning soybean research (p. A9): "Gentlemen–Many of us in this society are researching the benefits of the soybean. It may be considered as China's greatest resource. We have already published a number of specialized reports. These have been made available to you. In view of the fact that there are so many varieties of soybean in China and that the regions of cultivation are so extensive, we must rely upon you, our colleagues, in all parts of the country to go into the field and collect data for us. Only then will we be able to complete our research into every variety of Chinese soybean. If we should receive your kind consent, we beg you to be so good as to send the soybean varieties to the Peking postal address of this Society (address is given). We are interested only in soybeans (see pages 1-6 of this book) and need one or two catties (0.5-1.0 kg) of each. Once our research into the benefits and properties of these beans is complete, we will submit a further report to this Society, in order to repay your goodwill. If you would please advise us of the cost of the beans and the postal charges, we will make the appropriate refunds. We will also send you a copy of this book as a modest token of our gratitude. Enclosed please find an explanatory document. Please take the trouble to complete this and send it together with the beans.

"The Paris/Far-East Biological Research Society"

On page A-10 is a form to be used when submitting the Chinese soybean varieties.

• ***Summary:*** Until a year or two ago, millions of otherwise well informed people in Europe and the USA were largely ignorant of China and "all matters Chinese." This book has one a chapter on each of China's 22 provinces.

The chapter on Shantung states (p. 38): Salt is largely obtained from the evaporation of sea-water and is used very extensively for the purpose of salting fish and vegetables, the making of soys [soy sauces] and bean sauces, and the like.

In Chapter 22, titled "Manchuria," the section on "Products" states (p. 158): "Manchuria is but sparsely populated. The settled inhabitants are re-inforced every spring by willing labourers from Shantung and Chihli coming to till, to sow, and to reap. Twenty thousand pass over to Newchwang and ports in south Manchuria from Chefoo alone; and these nearly all return in the autumn, when the harvesting is done. So that shortage of labour is a serious drawback in Manchuria. Next comes the climatic disadvantage. Agricultural and indeed all outdoor pursuits are confined to seven months of the year–from Mid-March to the middle or end of October."

The most important crop for Manchuria's external trade is pulse. "A large variety of beans is grown in Manchuria and, together with their products, bean-cake and bean oil, they constitute by far the most important item in the export trade of the Three Eastern Provinces. The beans are of many kinds, yellow, green, black, white, red, and small green. The yellow, green and black are varieties of the soy bean, and each variety has sub-varieties. Besides these beans of commerce there are several kinds of garden bean, cultivated for food." Two varieties of hemp, opium, tobacco, and ginseng are also grown in large quantities.

The section titled "Mammon" notes (p. 169): On all sides new enterprises have been springing up and new industries started. From Manchuria the export of beans has very rapidly, and largely during the past year, become a most important trade, so much so that the Indian exporters of oil seeds of one kind or another are beginning to feel the effect and to consider the possibility 'of producing the soy bean on Indian soil."

China's chief foreign complications have been with Russia and Japan, but "it is emphatically with Japan that the most serious trouble has taken place" (p. 172). The Japanese

© Copyright Soyinfo Center 2014

were found to be stealing supplies of nitrates from China's Pratas Islands–an incident which came to be known as the "Tatsu Maru case." This unwarranted intervention led to the "Manchurian Convention" which "is so obviously unfair to China." The publication of its terms "aroused great indignation in China and a boycott of Japan was immediately set in motion" (p. 173).

"It is possible that the terms of the Convention would have been vastly different had not Japan previously set all the canons of international morality at defiance by the seizure on the flimsiest of pretexts of the Antung-Mukden Railway. By the terms of an arrangement made in 1905 it had been arranged that Japan might within two years convert the Antung-Mukden Railway from a narrow gauge military railway to a standard gauge line suitable for all purposes. This privilege had lapsed with the flux of time and China was therefore exercising more than the necessary patience in acceding early in the year now under review to the survey of the line by a joint commission. The reason of Japan's delay had been obvious. If she delayed to begin the reconstruction of the line her term of tenure night be made to overreach that of the South Manchuria Railway, and would or could be pressed to imply an extension of the lease of the South Manchuria itself. When it was found that China was not so complaisant as she was expected to be the only alternative was to steal the line; this Japan promptly proceeded to do. This theft precipitated the Manchuria Convention for which Japan is never likely to be forgiven."

"Beans" (meaning soybeans) are also mentioned in passing, usually in section on "Productions" under Shensi (p. 9), Chihli (p. 28), Shantung (p. 36. "The beans are used for the manufacture of bean-oil and bean-cake, the oil being extracted [expressed] during the process of pressing the beans into cakes; the latter are exported for use as manure."), Szechwan (p. 49, in the Chengtu plain), Hupeh (p. 54. A table shows exports of beans and beancake each year from 1905 to 1908), Anhwei (p. 71, beans are exported), Kiangsu (p. 86, beans and beancake are exported from Shanghai), Yunnan (p. 92), Kweichow (p. 99).

Page 164 discusses the South Manchuria Railway and Newchwang (literally "Cattle Mart"), which was the leading port of entrance to Manchuria before the railway. Newchwang was formerly at the mouth of the Liao, but silting has left it 10 miles inland and the new port of Yinkow has been developed at its former place.

1474. *Board of Trade Journal* (*London*). 1911. Japan: Drawback of import duty on soya beans used in the manufacture of oil for exportation. 72:148. Jan. 19. [1 ref]
• ***Summary:*** "The Board of Trade are in receipt of information from H.M. Commercial Attaché at Yokohama to the effect that the Japanese Official Gazette of the 13th December contains an Imperial Ordinance providing that drawback of Customs duty paid on imported soya beans shall be allowed at the rate of 13 *sen* per 100 *kin* (2 3/4d. per cwt.) [1 cwt = hundredweight = 112 pounds] where the beans are used for the manufacture in Japan of soya bean oil for exportation. The drawback is to be allowed on the actual quantity of beans so used.

"Under the existing Japanese Tariff, soya beans are dutiable at the rate of 43 *sen* per 100 *kin* (8.92d. per cwt.).

"The regulations under which the drawback is to be allowed may be inspected by British traders interested at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C."

1475. Shaw, Norman. 1911. The soya bean of Manchuria. *Shanghai, Statistical Department, Inspectorate General of Customs. China Imperial Maritime Customs. II. Special Series* No. 31. 32 p. Also published by P.S. King & Son, 2 Great Smith St., Westminster, London SW, England. [6 ref. Eng]
• ***Summary:*** Contents: Introductory. Varieties. The plant. Soil and climate. Cultivation. Soil infestation. Yield. Uses of the soya bean: In the Far East: Bean sauce or soy (called shoyu in Japan [whence the name "soya"] and *chiang-yu* in China), the Chinese paste *chiang* (incl. *ta chiang* {great, made with yellow soybeans} and *hsiao chiang* {small, made with soybeans and maize}), tofu (incl. firm tofu {*tou-fu kan-tzu*}, tofu curds {*tou-fu nao,* curded with calcium sulphate instead of brine}, curd skin or yuba {*tou-fu p'i*}, layers of tofu pressed in cloth [pressed tofu sheets] {*ch'ien-chang tou-fu*}, and "frozen curd" {*tung tou-fu,* tofu that is frozen then dried}), bean flour, bean refuse {okara}, bean oil for food or industrial uses. Beancake and its uses. Uses in the Western world (beancake in Europe, and bean oil in Europe). The bean oil and cake industry in Manchuria. Trade development (statistics on exports from Newchwang have been kept since 1864). Beginnings of the European trade. Bean oil and cake production in South Manchuria. Chief sources of supply. Map references. Supplementary note.

Appendixes: 1. Table showing values (in Haikwan taels) per picul of [soya] beans, beancake, and bean oil at Newchwang, 1864-1909. 2. Graph showing monthly values (in silver yen) at Dairen of beans, bean oil, and beancake, 1907-10. 3. Table showing estimated [soya] bean production of Manchuria in normal years, compiled by the South Manchuria Railway Co. in 1909. 4. Estimates of [soya] bean production of Manchuria for the last 5 years by province and territory, compiled by the South Manchuria Railway Company in 1909: Fengtien province 1,092,350 tons. Kirin province 626,500 tons. Heilungkiang province 280,250 tons. Grand total for all Manchuria: 1,999,100 tons. Estimated soya bean production in Manchuria has increased from 600,000 tons in 1906 to a peak of 1,500,000 tons in 1908, to 1,400,000 tons in 1910. Percentage contributed by various colors of soya bean in 1910: Yellow 80.1%, green 9.4%, white-eye 3.8%, black-eye 3.2%, and black 3.4%. 5. Table

© Copyright Soyinfo Center 2014

showing total export of [soya] beans and bean products from Manchuria, 1909. For export of soya beans: Dairen 51% of total, Suifenho [Suifenhe] 25%, Newchwang 23%. For export of bean cake: Newchwang 50%, Dairen 44%, Antung 2%. For export of oil: Newchwang 75%, Dairen 21%, Harbin 1%. The writer frequently refers to Sir Alexander Hosie's book on Manchuria (1901, 1904).

The introduction begins: "It is only in the last three years that soya beans have become important in intercontinental commerce, and their rapid emergence from obscurity has, indeed, been one of the most remarkable commercial events of recent times. The circumstance that 'the rise of a great export trade in beans is that fact that overshadows all others,... the soya bean thus taking at a bound a position equal to that of tea in the list of exports and, with the addition of beancake, even challenging the position of silk at the top of the list'"* (Footnote: * = "Statistical Secretary's Report on the Foreign Trade of China in 1909").

The "bean district *par excellence* is the upland country beyond Moukden [Mukden] where the hills... are overlaid with wind-deposited soil..."

"Cultivation: In Manchuria the beans are produced almost entirely by hand methods. The plough, which is drawn by quaintly mixed teams of oxen, mules, and donkeys, has only one handle and a rough steel-tipped cutter. The seed is sown by hand, on top of the drills, in April, and is covered by hand. A heavy hoe is used for a good deal of the turning and breaking. When the plant appears the earth is heaped up round it, so that the roots may derive the maximum of nourishment from the soil."

"The harvest takes place in September, and the pods are usually harvested before they are quite ripe, as otherwise they are liable to burst on drying, a loss of seed being thus occasioned. The plants are pulled up by hand or cut with a straight-bladed sickle in Manchuria, and collected into small heaps in order to facilitate drying, and, when dry, the seed is separated by means of a cylindrical stone roller having longitudinal cuts on its surface, which is dragged over the plants by a mule as they lie on the threshing-floor. After this primitive threshing operation has been completed, the beans are winnowed in the usual Chinese method–that is, by throwing them against the wind. The only manure used is a compost of stable manure and earth, which is often taken from the miry pools formed in the roads–the despair of the carter but a boon to the farmer. In countries where chemical manures are used, it is only necessary to apply potash and phosphoric acid where they are lacking, for nitrogenous manure is unnecessary, owing to the property which the soya bean possesses, in common with other leguminous plants, of obtaining nitrogen from the air by means of colonies of bacteria."

Yield: In 1867 the Rev. A. Williamson, who travelled in the upper Sungari district at the time and who appears to have been a very close observer, estimated a maximum yield of 2,000 lb., or 15 piculs, to the acre.

The Chinese paste *chiang* is not the same as the Japanese paste miso. Chiang "is made by farmers and eaten with fish, meat, and vegetables, while the more expensive Chinese soy [sauce] is only made by wealthy families and restaurant keepers and is not consumed by the very poor. There are two kinds of *chiang: ta* (great) and *hsiao* (small)." Describes in detail how each is made. Great chiang is made from yellow soybeans, salt, and water. Small chiang contains a small amount of maize (p. 7).

Industrial uses of bean oil: (1) As an illuminant, where it has not been superseded by kerosene oil. One advantage is that "no lamp is needed to hold it, the wick being inserted into the basin or plate containing the oil." (2) As a lubricant, bean oil is used to a very considerable extent in north China and Manchuria "for greasing axles and parts of native machinery" (p. 8-9).

In China, bean oil "is used as a substitute for lard, in cooking. Although it is inferior to rapeseed and sesamum oils for this purpose, these oils cannot compete with it in point of price... In spite of its unpleasant characteristic odour and unpalatability, the poorer classes in China consume it in its crude state, but among the rich it is boiled and allowed to stand until it as become clarified" (p. 8). In Europe "Refined bean oil may be used as a salad dressing in place of other oils (but, owing to its unpleasant odour, is usually mixed with an oil of animal origin or with rapeseed oil), or in the manufacture of margarine, when a greater percentage of soya oil than of copra oil is allowed" (p. 10).

Traditional methods of pressing out the oil yield only about half of that present in the seed (9% of the weight of the beans); the rest is left in the cake, and this distracts very much from its fertilizing value. "By gasoline extraction the beans give up practically all their oil, which, as refined by this process, is a clear, pure liquid, hardly resembling the muddy, dark oil produced in the old way" (p. 14).

Photos on unnumbered pages show: (1) Seven varieties of soya beans: Large black, small black, large flat black, small flat black, two green, and two yellow. (2) Soybean root nodules. (3) A massive granite roller for crushing beans. (4) "Steaming vat with grating on which [soya] beans are placed in gunny bags during the steaming process." (5) Native bean press, showing cakes in receptacle and log wedges driven in to press out the oil. (6) Modern bean press [hand turned screw?] set up in bean mill. (7) Oil-motor and crusher. (8) Modern crushing machinery. (9) Piles of beans in sacks awaiting loading onto trains at Changchun. (10) Color fold-out map titled [soya] "Bean districts of Manchuria." A schematic diagram (in the form of a rhombus / diamond) shows the probable relationships of the different groups of soya beans based on their color. A beautiful map, approximately 17 by 22 inches, is attached between page 26 and page 27. "Wuchang" [not Wochan] is in the area labeled "Yellow Beans" in the map. Other labeled

© Copyright Soyinfo Center 2014

growing areas on the map include "Grasslands," "White eye," "Black beans" [soy], "Maize" and "Green beans." The major railways, rivers, roads, and towns / cities (with their Chinese characters) are shown. The major soybean markets (underlined) are Fenghwa / Maimaikai, Kungchuling, Changtufu, Tungkiangtze, Sinminfu, Tienchwangtai, Newchwang, Kaiyüan, Tiehling, Mafengkow, Moukden, Takushan, Antung, Harbin, and Shwangcheng.

Shaw finished writing this yellow book on 31 December 1910.

Note 1. This is the earliest document seen (July 2000) that mentions the South Manchuria Railway Company in connection with soybeans. This company was run by Japan. According to the *Encyclopedia Nipponica* (vol. 22, at "Minami"), the South Manchuria Railway Company (*Minami Manshu Tetsudo K.K.*) was established in 1905 based on the Portsmouth Treaty ending the Russo-Japanese War; Japan took over the rights to the railway from Russia. The company started to actually run the railway in 1907.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "frozen curd" to refer to dried-frozen tofu.

Note 3. This is one of the earliest English-language documents seen (Sept. 2006) that repeatedly uses the word "bean" (not preceded by the word "soya") to refer to the soya bean.

Note 4. This is the 2nd earliest English-language document seen (Oct. 2012) that uses the term "tou-fu p'i" (regardless of capitalization or hyphenation) to refer to yuba.

Note 5. This is the earliest English-language document seen (April 2012) that uses the term *chiang-yu* to refer to Chinese soy sauce. Address: 4th Asst., Custom House, Dairen.

1476. Shaw, Norman. 1911. The soya bean of Manchuria: Trade development, 1860-1909 (Document part). *Shanghai, Statistical Department, Inspectorate General of Customs. China Imperial Maritime Customs. II. Special Series* No. 31. 32 p. See p. 15-20. Also published by P.S. King & Son, 2 Great Smith St., Westminster, London SW, England. [6 ref. Eng]

• ***Summary:*** A chronology of important developments: 1860–The earliest available import returns for Swatow show 379,009 piculs of beancake, valued at $783,762 and 61,154 piculs of soya beans valued at $107,235. [Note: 1 picul = 132.27 pounds weight.]

1861–When the first British Consul at Newchwang, Mr. Meadows, took up his residence there, he found the bean trade an ancient and flourishing institution. Yingtzu–the new Newchwang–had been since 1835 a growing port of shipment for the great coastal trade in beans and beancake on which Manchuria's prosperity has always depended. In 1861 only 34 ships visited Newchwang, but four years later 271–most of which were engaged in the pulse [bean] trade entered and cleared. The first figures showing the amount of [soya] beans brought into Newchwang from the producing districts are those from the season 1861-62, when 1,450,000 *shih* (1 *shih* = 400 lb) came to the port.

1864–The first export statistics from Newchwang are recorded when the Customs Office opens. In 1864 816,000 piculs of [soya] beans, 842,000 piculs of cake, and 7,312 piculs of oil were exported. The import of beans from Newchwang to Swatow was more than double that of four years previously. "By the British Treaty of 1858, which opened Newchwang, the export of pulse and beancake from that port and from Tungchow (Chefoo), in British vessels, was prohibited; but this prohibition was removed by agreement in March 1862, and the trade developed with great rapidity."

1868–The first steam bean mill began operation at Newchwang, but largely due to Chinese opposition it proved a failure and was closed.

1880–An experiment was made with Manchurian bean cake as fertilizer in the coffee plantations of Ceylon; although a high opinion was formed of its qualities, the expenses of the transaction were too great to warrant further trial. "In Hawaii the same obstacle prevented any development of trade."

1887–A major increase and turning point in the bean trade with Japan.

1880s overview–"Even in the early days it was recognized that the promising feature of the trade of Newchwang was that the prosperity of the port did not depend, as was the case at most treaty ports, on a country already thickly populated and cultivated, but that the increase year by year of the area of cultivation over vast tracts of virgin soil would bring with it a corresponding increase in external trade. That no striking development of trade occurred for many years was due to the restrictive policy of the Central Government, which until the 'eighties' discouraged immigration into Manchuria."

1896–A "steam bean mill began working, and (unlike its unfortunate precursor) met with instant success, which led to the erection of others–one each in 1899, 1900, and 1901–so that the output of cake and oil was largely increased by the end of the century, the total output of these four mills being 15,600 cakes daily."

1898–And 1899 were each record years, with exports increasing 206% in ten years. In 1899 an import duty was levied for the first time on the beans and cake entering Japan, but no adverse affect was felt.

1900–The first careful survey of soybean production in Manchuria was made by Sir. A. Hosie, who estimated the amount at 600,000 tons; but Newchwang was no longer able to control the whole trade, for Dalny, the terminus of the new Chinese Eastern Railway line, was begun in 1898, and by 1902 the Russians were making strenuous efforts to attract freight.

© Copyright Soyinfo Center 2014

1905–After the Russo-Japanese war [Feb. 1904-1905], which left the Japanese in possession of the Kwantung peninsula, the rapid development of the bean trade became a matter of course, and Dairen (the new name for Dalny) soon rivalled Newchwang in its volume of exports. The importation of beancake to Japan, which in 1899 amounted to slightly over 2 million piculs, rose to 3 million piculs in 1905, to 4 million piculs the following year, and by 1908 had reached the very high figure of 7¼ piculs, of which over 2½ piculs were imported from Dairen. There is a small export trade from Russian Asia, while that from Chefoo is steadily decreasing. A table shows the market value, per piece, of cake imported to Japan from 1899 to 1909 (in gold yen). From 1.26 in 1899 it rose to a peak of 1.64 in 1907, then dropped to 1.18 in 1909. Address: 4th Asst., Custom House, Dairen.

• ***Summary:*** "During the Russo-Japanese war [Feb. 1904-1905] the vast armies which occupied the whole of South and Central Manchuria depended for their cereal food largely upon the local supplies, and a great impulse was given to Manchurian agriculture at that time. But after the withdrawal of the troops the cessation of local demand called, in the natural course of events, for the discovery of a fresh market, and especially so for the money crops of wheat and beans. The market for these crops seemed at first to be the neighbouring one of Japan, and the trade *via* Vladivostock [Vladivostok] received the earliest benefit from the new development; but when the *post-bellum* wave of depression swept over Japan the demand ceased there, and it became necessary to find a new field for the consumption of the surplus supplies. Before the creation of this new situation farmers had been content to plant small areas with but slight annual increase, merely adjusting the supply to the restricted demand; but the time was now ripe for a great development of the trade.

"It was in November 1908 that Messrs. Mitsui & Co. made the first considerable trial shipment to England. The result was so satisfactory that an order for a large consignment followed, and in March 1909 the first large cargo–5,200 tons–was landed in Hull. Contracts were at once made, as the suitability of the new oil seeds for many purposes became known and the good condition in which they arrived. During the season 400,000 tons were exported, almost all to England, and 'many of the large oil crushing mills set their entire plant to work on the crushing of the beans, to the exclusion of cotton seed, linseed, and other oleaginous seeds; the supposed shortage of the flax and cotton crops in the United States and the anticipated shortage of linseed in the Argentine, with the resultant scarcity of cotton seed and linseed products, found the English market comparatively unperturbed, for the reason that soya oil and cake can supply most of the requirements as well.' Messrs. Lever Brothers, of Port Sunlight, were the first soap manufacturers to use bean oil on an extensive scale, and were followed shortly by others, so that the demand increased to such an extent that for the new season (1909-10) 50 steamers were chartered to load beans at Dairen and Vladivostock, 300,000 tons, worth £2,000,000, being contracted for in December alone."

"The removal of the duty which had until this year (1910) been imposed on beans in Germany, followed by similar action on the part of the Canadian Government (which is said to be desirous of obtaining soya beans as feed for hogs, in order to revive the bacon trade), has opened fresh channels for export and stimulated competition for the raw material. But apart from this, the bean oil trade seems likely to receive the most rapid development: the first steamer to carry away a cargo of the oil in tanks has recently visited Newchwang. At present bean oil is carried in old kerosene oil tins or drums; but the method is not very satisfactory, complaints being made of loss by leakage. The tins cannot be returned to Manchuria, for freight is too high, and casks are not so suitable for stowing as tins in cases, so that the solution of the problem of conveying the oil to Europe seems to lie in the tank steamer, which would take the oil as a return cargo." Address: 4th Asst., Custom House, Dairen.

1478. Shaw, Norman. 1911. The soya bean of Manchuria: Bean oil and cake production in South Manchuria (Document part). *Shanghai, Statistical Department, Inspectorate General of Customs. China Imperial Maritime Customs. II. Special Series* No. 31. 32 p. See p. 21-24. Also published by P.S. King & Son, 2 Great Smith St., Westminster, London SW, England. [6 ref. Eng]

• ***Summary:*** "There are now at Newchwang one Japanese hydraulic mill (the Kodera, which may open a branch at Dairen), seven large Chinese steam mills, five small oil-motor mills, and nine crush-stone mills worked by animals." A table shows the output of the port from 1907 to 1909. [Soya] bean oil grew from 280,000 piculs in 1907 to 360,000 piculs in 1909. [Note: 1 picul = 132.27 pounds weight.] [Soya bean] cake grew from 2,896,000 piculs in 1907 to 3,726,000 piculs in 1909. Export statistics for the three years are also given.

"At Antung (where, though at present the industry is of small proportions, is capable of development) there are 12 Chinese crush-stone mills, and one steam mill owned by a joint Chinese and Japanese enterprise this mill has been running since last year. The total output of these mills is probably only about 25,000 piculs of cake annually, and it is

© Copyright Soyinfo Center 2014

consumed locally or taken away by junks. At Liaoyang the native mills have a daily capacity of some 4,000 beancakes with a corresponding proportion of oil, and, in face, every town in the bean country has its quota of mills, whose output is susceptible of increase if the demand requires it.

"At Dairen, besides some 40 native mills which can turn out 5,000 cakes daily, there are two large modern mills- the San Tai, a joint concern, with hydraulic power and a daily capacity of 6,000 cakes, which began work in April 1908; and the Nisshin, an electric mill, which has been at work since June of the same year, and can make 4,000 cakes daily. The united outturn of all these mills in 1909 was 2,214,624 cakes and almost 100,000 piculs of oil. This was an advance of 50 per cent. on the preceding year; but the figures are disappointing, as the total output in a 10-months working year should be 4½ million cakes. The mills in Dairen are primarily intended for cake manufacture; the oil is shipped to Japan for transhipment [transshipment] to Europe by large Japanese firms, and, as the Chinese manufacturers refuse to make oil without an 80 per cent. advance of 'earnest money,'direct trade has hitherto been slack."

Also discusses: Freights, insurance, charges, expenses of production, London market prices, bean oil and its changing prices.

"The eager competition to secure beans in Europe shows no signs of slackening; and the North American continent appears to be about to enter the field as a consumer, for a large shipment of beancake has just been sent to Seattle [Washington], and there appears to be a very good opening for the product on the Pacific coast, where the heavy railway freights from the east have caused dairymen and feeders to look round for a cheaper feed than that which comes across the Rockies. With freight from Dairen to Seattle at only (Gold) $4 per ton a good market should be developed. Soya beans are being grown in British West Africa, and experimental planting is carried on in practically every British colony; but it seems doubtful whether such experiments can meet with success in competition with the Manchurian product, which is raised under ideal climatic conditions and by the cheapest possible labour. The general impression prevailing seems to be, therefore, that the bean trade has a good future before it; that the time of stress through which it is passing will not last much longer, and that business will settle down when once normal conditions have been restored." Address: 4th Asst., Custom House, Dairen.

1479. *Advertiser* (*The*) (*Adelaide, South Australia*). 1911. To the Antarctic: The Japanese expedition. Feb. 10. p. 7.
• ***Summary:*** "Wellington [New Zealand], February 9. Further acquaintance with the Japanese exploring party confirms the first impression that they are a hardy, lot of men, not likely to be deterred in any task they may attempt... their food supply is certainly in odd contrast to the enormous quantities of provender carried southward by Scott and Shackleton. The list of goods aboard, as supplied to the Customs, comprises 90 bushels of rice, 90 bags of flour, 3 bushels of wheat, 40 dozen of canned meat, 143 cases of takuwanzuke [takuan-zuke], 4 sacks of soya beans, 3 dozen boxes of bread, 4 of butter, and 12 cases of pickled plums [umeboshi]. These are the leading items,... There is very little liquor aboard."

Note 1. This expedition reached Antarctica, and with them the first soybeans arrived in Antarctica.

Note 2. This was the expedition of Nobu Shirase in the Kainan Maru. From Wellington they sailed to Sydney, and from there they set off to Antarctica. For details see www.south-pole.com.

1480. Clerget, Pierre. 1911. La question du Soja [The question of the soy bean]. *Revue Generale des Sciences* (*Pures et Appliquees*) 22(3):100-01. Feb. 15. (Chem. Abst. 5:1637). [2 ref. Fre]
• ***Summary:*** Contains a brief description of the soybean and discusses its commercial importance, distribution, soil requirements, the value of the oil and its uses, and the composition and commercial value of the cake. During the past 2 years, the large amounts of soybeans exported from Manchuria to Europe have called attention to this plant. It is cultivated all over China, but especially in Manchuria (in the Liao Valley, where it is the second most important crop after sorghum), Japan, Korea, and Indo-China. In China it is often cultivated with maize; it demands a great of work, care, and good soil. The main exports come from the Manchurian ports of Newchwang and Dairen, and from Vladivostok. In 1908 some 859,200 tonnes of soybean and cake were exported from Manchurian ports, up from only 88,900 tonnes in 1905. Until 1908, Japan was the principal outlet for Manchurian soybeans (615,900 tonnes), but at the start of that year, exports to Europe began: 69,200 tonnes to Great Britain, 21,390 tonnes to France, 7,290 tonnes to Holland, etc.–for a total of 204,440 tonnes.

According to chemical analyses made at the Colonial garden of Nogent-sur-Marne, Manchurian soybean seeds contain 17.64% oil and 33.5% protein; yellow varieties contain more oil than black varieties. The soybean is used as a forage plant and for soil improvement, but its most important role in China and Japan is as a human food among people who consume little meat. According to Bloch (1908), it is most widely used in making a sauce [soy sauce] and a cheese [tofu]. It is also used to make numerous pastes and a sort of soymilk (*lait de soja*).

It also has industrial uses, thanks to its oil content of 16-18%. Indigenous mills can obtain only 8-10% oil, but modern hydraulic presses can obtain 12-14%. The oil and cake have made the soybean rise so rapidly on European markets. The oil, which has an agreeable smell and taste, is widely employed for culinary purposes in Manchuria. In England, as in France, it is used in making soap and

© Copyright Soyinfo Center 2014

margarine. It is more drying that cottonseed oil and can likewise be used in making paints. Soybean cakes (*Les torteaux de soja*) would give the same results as cottonseed cakes in terms of milk yield from dairy cows. As a fertilizer, they are used throughout Japan and on the sugarcane plantations of southern China.

The soybean could be introduced to Indo-China where, even if it has to compete against Manchurian soybeans, it could be service locally for soil improvement in the rice fields and as a food in the densely populated districts where there is hardly any room for animals, or where the animals have been decimated by disease. Address: Professeur à l'Ecole supérieure de Commerce (Graduate School of Commerce) de Lyon [France].

• ***Summary:*** In the English-language table of contents, shoyu is called "Soya." Address: Nôgaku-shi, Japan.

1482. Mitsuda, Ryuichi. 1911. Notes on yeasts of "sho-yu"-mash [moromi]. *J. of the College of Agriculture, Tokyo Imperial University* 1(3):345-56. March. German summary in Zentralblatt fuer Bakteriologie, Series II. 37:289 (1913). [2 ref. Eng]
• ***Summary:*** This is the third Japanese investigation on the yeasts in shoyu mash (*moromi*). "Three samples were used for the purposes of isolation, one from Noda, one from Tatsuno, and the other from Handa. Eight different varieties of yeast, 3 bacilli and 3 mould fungi were obtained from them." Among these was a red yeast and two film-forming yeasts. The first yeast variety discovered by the author "ferments sucrose, raffinose, dextrose, etc. but not lactose etc. (Cf. Table 2)."

The author believes that the five varieties of yeast he describes are different from the *Saccharomyces Soja* discovered by Saito, since they ferment "Sucrose and raffinose, while his does not ferment either" (p. 351).

Note: This is this is the earliest English-language document seen (March 2002) that contains the word "raffinose" (See p. 347, 351, 353). Address: Japan.

1483. Quintus Bosz, J.E. 1911. De samenstelling van Indische voedingsmiddelen [The composition of Indonesian foods]. *Bulletin van het Kolonial Museum te Haarlem* No. 46. 261 p. March. Also published in Amsterdam by J.H. de Bussy as a book. [8 ref. Dut]
• ***Summary:*** The nutritional composition and the source of information is given in a table for the following: Soybean seeds (p. 74-77). Soybean oil (*sojaboonen-olie*) (p. 76-77). Soybean flour or meal (p. 154-55). Soybean biscuit (*Beschuit*, 170-71). Japanese soy sauce and soybean tempeh (*Japansche soja, Tempé kedeleh* p. 242-43). Indonesian soy sauce (*Ketjap, Bataviasche soja* p. 244-45). Firm tofu (*Tao-koan,* 79.8% water. p. 244-45). Address: Dr., naar onderzoekingen in het Laboratorium van het Koloniaal Museum verricht onder leiding van Dr. M. Greshoff.

• ***Summary:*** "The soya bean, which has come into prominence recently owing to its commercial value, has now been successfully experimented with in the island of Ceylon. The Agricultural Society secured a large quantity of seed some years ago from the Far East, and experiments were carried out at the botanic gardens at Peradeniya, but the cultivation proved a failure. The secretary of the Ceylon Agricultural Society has now succeeded, however, in turning out a large crop in the Government stock gardens in Colombo, producing two varieties, the Japan (white seed) and the Java (black seed), and seed will shortly be available for distribution.

"It is expected that the cultivation of the soya bean will be taken up largely in Ceylon, for besides its value as an article of food it can be exported to the European and American markets." Address: Consul, Colombo.

1488. Takeuchi, T. 1911. Eine technische Anwendung der Urease [A technical application of urease]. *Chemiker-Zeitung* 35(45):408. April 15. [1 ref. Ger]
• ***Summary:*** Urease does not act on uric acid, guanidine, arginine, creatine, or allantoin. Footnote 1. cites an early paper by Dr. Takeuchi: "Journal, College of Agriculture, Tokyo, 1909, Vol. 1." Address: Prof., Japan.

1489. Bontoux, Emile. 1911. Le Soja et ses dérivés [The soybean and its products]. *Matieres Grasses* (*Les*) (*Paris*) 4(36):2195-99. April 25; 4(37):2239-43. May 25; 4(39):2326-29. July 25; 4(40):2364-66. Aug. 25; 4(41):2405-07. Sept. 25. [48 ref. Fre]
• ***Summary:*** Contents. Introduction. The plant: origin and history, species and varieties, culture, and production: USA, Japan, Manchuria, France, England, China, Korea, Indochina (it is cultivated for the needs of the population in Cochin China {especially in the provinces of Chaudoc and Baria}, Annam, Tonkin, Cambodia), Formosa, Java, India, Africa. The soybean–a food plant: The plant, the seed, large table showing many analyses from many countries of the chemical composition of many soybean seed varieties.

Introduction to food products made from soybeans in East Asia. Shoyu [soy sauce] (and koji). Miso. Natto (from Japan). Le Tao-yu (a Chinese condiment also widely used in Japan. It is a thick, clear liquid [sometimes] made from black-seeded soybeans) Tao-tjiung (doujiang, from China). Tuong (from Annam). Tofu. Li Yu-ying. Table showing composition of powdered soymilk, fresh tofu, and soy flour.

The soybean–an oilseed plant. The soybean as an oilseed in the Far East. Table showing exports of soybean cake and oil from various Manchurian and Chinese ports in 1908 and 1909. The soybean as an oilseed in Europe and the United States. Table showing imports of soybeans to various British ports in 1909 and 1910 (the leading port by far is Hull, followed in 1909 by Liverpool, London, Bristol Channel, Scotland, and Other ports {Rochester, etc.}). Table showing exports of soy oil from Great Britain in 1910: To Germany, Austria, Australia, USA, Belgium, Denmark, Egypt, France, Holland, Italy, the Indies (*Indes*), Norway, Russia, Sweden, other, total (115,372 barrels, each weighing 175 kg). Discussion of soy oil and cake in most of the above countries.

Trade in soybean seeds: Mitsui Bussan, Manchuria, England, China, Japan. Soybean cake.

Soy oil: Physical and chemical properties. Applications and uses as food and in industry: Margarine, for illumination, soaps, as a drying oil, paints and varnishes, linoleum, artificial rubber. An extensive bibliography is at the end of the last article in the series.

Note: This is the earliest document seen (May 2010) concerning the cultivation of soybeans in Cambodia. This document contains the earliest date seen for the cultivation of soybeans in Cambodia (April 1911). Earlier documents imply that soybeans were being cultivated in Cambodia by 1900, and it is highly likely that they were being cultivated for at least a century before that time. Address: Ingénieur-chimiste E.C.I.L., France.

1490. Horne, H.; Sly, E.A.H. 1911. Effect of plague on the Manchurian bean trade. *Board of Trade Journal* (*London*) 73:185-86. April 27.
• ***Summary:*** "The British Acting-Consul at Dairen (Mr. H. Horne) states that probably no great influence will be felt during the present season. So far as can be ascertained, the total export of beans and bean cake has been larger this year than last, in spite of the adverse conditions, but the trade has been practically limited to the ports of Japan and South China, Europe taking some 7,000 tons only, as compared with 228,000 tons during the corresponding period of last season. The Harbin bean has been selling at 10s. per ton cheaper than the Southern bean. This season's large export to Southern China has caused considerable surprise in view of the high prices which have ruled throughout...

"It is in the coming season and possibly in the one following that the real effect of the plague will be felt...

"The British Acting Consul at Harbin (Mr. E.A.H. Sly) states that among the various reasons which have caused the plague to interfere with the business in last year's bean crop may be mentioned the following:–(1) lack of carts and coolies, (2) the danger of making monetary advances to the Chinese owing to their liability to fall victims to the plague, (3) the closure of the gates of certain cities, such as Pinchou, Hulan, Shuangch'engp'u, T'aolaichao, and Shih T'ou Ch'eng Tzu, all of which are bean centres, and (4) the consequent difficulty of getting produce out of the country. On the other hand, the shipments *viâ* Vladivostock [Vladivostok] to Europe have, so far, exceeded those of the corresponding period of last season...

"... the great bulk of the beans destined for Europe are this year being shipped *viâ* Vladivostock, since Dairen is

© Copyright Soyinfo Center 2014

apparently fully occupied with satisfying the demands of Japan, South China and Formosa, the prices paid by these places having been, on an average, 10 s. per ton higher than those given on cargo shipped to Europe. The 1910 crop also is considered to have exceeded that of the previous year." Address: 1. British Acting-Consul, Dairen; 2. British Acting-Consul, Harbin.

1491. Hattori, H. 1911. Ueber die Brauchbarkeit japanische Soja als Kulturmedium fuer die bakteriologischen Untersuchungen [On the usefulness of Japanese shoyu as a culture medium for bacteria]. *Botanical Magazine* (*Tokyo*) 25(291):97-103. [8 ref. Ger]
• ***Summary:*** The author refers to shoyu in German as "Soja" and discusses one brand named Yamadju [Yamaju]. "Japanese shoyu was first used by Prof. Miyoshi of this Institute as a liquid cultural medium for various molds. He recommended a mixture of 20 parts shoyu, 25 parts concentrated cooked onion juice, 5 parts raw sugar, and 5 parts distilled water." Address: Botanisches Institut der Kaiserl. Universitaet in Tokyo.

• ***Summary:*** Japanese university baseball teams have taken Chicago by storm. "The Takeda club, 2017 Prairie avenue, is the social center for young Japanese in Chicago, and here the ecstasy of baseball is at its height... Chef Hata exerted himself to make the banquet one to be remembered...

"The dinner began with misosshiru [sic, misoshiru, miso shiru], and included sashimu [sic, sashimi], garnished with che [?]. The main item was delicious sukiyaki. Speeches were made..."

Note: This is the earliest document seen (Aug. 2010) that mentions sukiyaki; no attempt is made to describe what it is or how it is prepared.

1496. Dahle, Alfred. 1911. Ueber das fette Oel der Sojabohne [On the oil of the soybean]. Dissertation from University of Jena. Published in Neustadt by J.K.G. Wagner (Wagnerschen Buchdruckerei). 43 p. 22 cm. See Jena Dissertations 1910-11. v.1, no. 7. [28 footnotes. Ger]
• ***Summary:*** The author's advisors were Prof. Dr. H. Matthes, and Prof. Dr. Haussner. Contents: Introduction: Nomenclature, history in Asia and Europe (Kaempfer, Haberlandt), taxonomy, chemical composition, Maggi and shoyu, miso, tofu, soy bread for diabetics, coffee substitute, soy oil in China and Japan, in England and Germany, use in soaps and as a substitute for linseed oil, constants (such as iodine number), fatty acids, the work of Prof. Matthes. Experimental part.

In Japan and China, two fermented products are made from soybeans: Shoyu or bean sauce (*Bohnensauce*) and miso. Shoyu is enjoyed with almost all foods as a seasoning, and for quite some time has been exported in abundance to England and America, where it is used in the manufacture of English and American sauces. Shoyu is even used in the well-known Maggi seasoning. With respect to its nutritional value and stimulating effect (on the appetite), shoyu sauce (*Shoyu-Sauce*) is somewhat comparable to meat extract. For the preparation of shoyu sauce, milled wheat, soybeans broken into large pieces then cooked until half soft, water, and table salt are combined in specific proportions and allowed to ferment in large vats. The fermentation lasts anywhere from 8 months up to 5 years.

The preparation of miso seems similar to that of shoyu except that barley or rice are used [instead of wheat]

Moreover, in Japan, a type of raw cheese, so-called "bean cheese" (*Bohnenkäse*), is made from soybeans (*Soja*); in Japan it is called tofu (p. 8). (p. 8).

Biography: The author was born on 20 March 1884, in Halberstadt, the son of a chemist, who was later the director of a sugar factory. Address: Halberstadt, Germany.

1497. Dubard, Marcel. 1911. A propos de quelques variétés de soja [Concerning some varieties of soybeans]. *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) 11(98):422-26. May. [1 ref. Fre]
• ***Summary:*** "The *Jardin Colonial* (Colonial Garden) is involved in the study of soybean varieties, and starting this year 15 of them have been grown out." Discusses the characteristics of the seeds and of the plant. Varieties described include Shirasaya, Akasaya, Gowari, Nakade, Dozan, and Juninzuki (all of Japan), and a soybean from

• ***Summary:*** The author, a Japanese living in Manchuria, gives a detailed discussion of the physical and chemical characteristics of soy oil, and its composition. The sample of oil examined contained about 12% saturated fatty acids, mainly stearic and palmitic acids, and about 80% unsaturated fatty acids, about half of which consisted of an acid isomeric with linolic acid yielding a hydroxy acid of melting point 158º-159ºC. Ordinary linolic acid [later known as linoleic acid] (yielding a sativic acid of melting point 173º-175ºC) and oleic acid were also present, together constituting about 15% of the unsaturated acids. The oil contained 0.2% of phytosterol, in which no stigmasterol could be detected. Address: Dalny, Manchuria.

• ***Summary:*** In the English-language table of contents, shoyu is called "Soya." Address: Nôgaku-shi, Japan.

1503. Oyama, Jiro. 1911. Pootorando ni okeru yunyû Nihon shôyu ni kansuru ken [The market for imported Japanese shoyu in Portland, Oregon]. Portland, Oregon. 15 p. Aug. 8. Handwritten unpublished manuscript. [Jap; eng]
• ***Summary:*** This is a market report from Mr. Oyama at the Japanese consulate in Portland to Mr. Yoshitaro Komura at the Japanese Ministry of Foreign Affairs.

During the past 18 months 10,509 taru (170,460 liters, or 947 koku) of shoyu has been imported to Portland. A Japanese run shoyu company in Portland [probably *Sanyo Shoyu Jozo Gaisha;* see 1909 entry] made or makes about 300 koku (54,000 liters) a year. Address: Japanese Consulate, Portland, Oregon.

1504. Allen, T.J. 1911. Daily diet and health hints: The soya bean. *Boston Daily Globe.* Aug. 9. p. 12.
• ***Summary:*** "An American consul reports that the German government is introducing the soya bean extensively from Japan. This bean is superior to any of the varieties used in this country, which, while they are nutritious, are digested with difficulty, and their starch and their tough outer coating require so much cooking that the albuminous and mineral elements are largely injured. The soya bean contains about 20 percent fat and 40 percent proteid. It is much like the peanut in composition, but it is more easily cultivated. It is an excellent food in diabetes and should be generally be cultivated." Address: Dr., Food Specialist.

1505. Maynard, Lester. 1911. Vladivostok bean trade. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 14(194):794-95. Aug. 19.
• ***Summary:*** "Before Manchuria was opened up and connected by railway with the seacoast Manchurian beans were of purely local importance and were used as food for both man and beast. The first attempts to export beans were made as early as 1902, principally to Odessa, but the shipments met with little success, as the market was not prepared for the beans in the raw state, and the oil was not properly manufactured to stand competition with other vegetable oils.

"This failure killed the export trade for several years, and it was not until after the war–that is, during the season of 1906-7–that attempts to export beans were revived and small shipments were made to Japan. During 1906 the exports were 16,130 tons of beans and 64,520 tons of cake, and in 1907, 17,359 tons of beans and 26,605 tons of cake. In Japan the bean cake was used as a fertilizer and the oil in manufacturing.

"Beginning of direct shipments to Europe: About the end of 1907 a St. Petersburg firm sent the first shipments of beans direct to Europe. In the meantime large shipments of beans were being exported to Japan. The price at that time was $5.75 to $7.65 per ton, and was sufficiently low to enable the Japanese to import the beans in large quantities and reexport to Europe; the expense of this transaction was from $1.50 to $1.60 per ton.

"In 1908 the first European exporters came to the Far East, and as a result the Japanese transferred their interests

© Copyright Soyinfo Center 2014

from Vladivostok and concentrated the exporting of beans at Dalny, and attempted to keep the control of the European market, but the European firms being financially stronger, opened offices at Harbin and began making their purchases direct. The Chinese Eastern Railway, by introducing lower freight rates, succeeded in attracting large shipments of beans to Vladivostok for export, and to a certain extent stopped the rapid growth of Dalny as a bean exporting point. According to figures compiled by the London Exchange for the seasons of 1908-9 and 1909-10 the exports were as follows: From Vladivostok, 227,653 and 253,003 tons; Newchwang, 524,545 and 379,728 tons; Dalny, 717,945 and 556,983 tons, respectively.

"The purchase of beans is still carried on through Chinese dealers, and the exporters are not in a position to come in direct contact with the purchaser. For this reason, and because the beans come in various quantities from far outlying districts, some of which are not properly equipped for sorting, drying, and otherwise preparing them for export, the beans arrive at the seacoast mixed with dust and sand, and during the winter with snow, and in Vladivostok no attempt is made to clean the shipments before exportation. Certain precautions are taken in loading the beans on board ship, such as the installation of ventilating tubes, but these are not sufficient to guarantee the cargo arriving in good condition, as the beans are often frozen during railway transportation, and after being loaded on board ship have to pass through the Tropics on the way to market. Beans spoiled in this way during the 1909-10 season amounted to 35,657 tons out of 253,003 tons exported from Vladivostok.

"Difficulty of shipping through Vladivostok: One great drawback has been the shipment of beans by the railway on platform cars. Despite the tarpaulins that cover the bags snow sifts in, not alone between the bags, but into them, and although the bags are brushed on arrival at Yeagersheldt, the shipping port of Vladivostok, only the outside snow is removed. Yeagersheldt is poorly equipped for handling cargoes of this kind, and no facilities whatsoever exist for the handling of beans in bulk. According to statistics compiled by the Chinese Eastern Railway the capacity of the storing facilities at Yeagersheldt is as follows: Six tea warehouses, 6,970 tons; 26 warehouses and sheds, 54,296 tons; open areas, 11,590 tons; total, 72,855 tons. the capacity of these storage places is based on the following estimate: Five hundred pounds of beans in bags per square foot under roof, and 360 pounds of beans in bags per square foot in the open.

"Another drawback to shipments from Vladivostok is the lack of wharfage, there being room for only 5 steamers to load at a time, and, as a rule, there are 2 steamers discharging tea or salt or loading timber. The Chinese Eastern Railway made efforts to control the loading of bean steamers by requiring exporters to place this work in the hands of a workmen's society. This has been refused by the exporters, with the result that private stevedoring has been organized and the expenses reduced about 50 per cent. Regardless of this, the expense of loading and other charges are very high, amounting to $3.35 per ton. The exports of beans through the port of Vladivostok from 1908 to May, 1911, were as follows: 1908, 65,291 tons; 1909, 230,394 tons; 1910, 239,926 tons; 1911, 212,181 tons." Address: Consul.

1506. Boulter, R. 1911. Japan. Report for the year 1910 on the trade of Japan. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4768. 87 p. Aug. See p. 62.
• ***Summary:*** A table titled "Return of principal articles of import into Japan during the years 1908-10" has a category "Manures" (p. 62) of which the largest items are as follows: "Oil cake–[Soy] Bean." Imports of this cake rose from 461,950 tons in 1908 to 575,180 tons in 1908, then decreased to 395,582 tons in 1910. Imports of phosphorite rose from 119,169 tons in 1908 to 166,896 tons in 1910. Imports of ammonium sulphate rose from 66,445 tons in 1908 to 68,813 tons in 1910.

• ***Summary:*** In the English-language table of contents, shoyu is called "Soya." Address: Nôgaku-shi, Japan.

1508. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1911. Soya beans in the USA. 14(208):1067. Sept. 6.
• ***Summary:*** "Extensive articles on the immense soya-bean trade of Manchuria have appeared in various numbers of Daily Consular and Trade Reports, and inquiries have also reached the Bureau of Manufacturers as to the progress being made in producing them in the United States. It has now become a considerable crop in the middle part of the South. D. A. Carpenter, a Tennessee farmer, writes for the *Southern Field* in regard to the growing of the bean as follows:

"'I grow the Mammoth Yellow variety, planting in rows 36 inches apart, and cultivating about the same as corn. I cut with a mower when ripe and allow them to lie on the ground for a couple of days. After being in shock for 10 days, they are hauled to the shed and thrashed. We consider the bean straw, after the beans are thrashed, as fully equal to timothy or redtop for a feed for cattle.

"'For late summer pasture I sow with a wheat drill about 1½ bushels to the acre. I am now feeding beef cattle and hogs on soya beans, and my dairy animals are producing more milk than ever before on a bean ration. Of course, other feeds are mixed with the bean, as soyas are rather rich when fed alone.

"'The Mammoth Yellow grows here from 3 to 5 feet

© Copyright Soyinfo Center 2014

high, according to cultivation, and yields 30 bushels of seed per acre, which will bring around $3 and $3.50 per bushel.

"'There is no finer improver of the soil than the soya bean. I have tried many other legumes, but none has given such uniformly high quality hay and returned such large amounts of nitrogen to the soil. I consider the soya bean the greatest crop ever introduced into this part of the country, both as a money crop and as a soil improver.'

"About $100,000 worth of soya-bean oil was shipped last year from Manchuria to the United States, against almost none the year before. From Hull, England, shipments last year of soya-bean oil to the United States amounted to $140,000; this was crushed from the Manchurian beans. Considerable shipments of soya-bean oil were also made in 1910 from Kobe, Japan, to the United States."

1509. H.L. 1911. Le Haricot soja ou Fève de Mandchourie: Cultures exitoques [The soybean or Manchurian bean: Exotic crops]. *A Travers le Monde* 17(36):288. Sept. 9. Bound in the back of *Le Tour du Monde.* [Fre]

• ***Summary:*** Contents: Introduction. Its utilization by the Japanese: Fertilizer, oil, and oil cakes. Its utilization by the Annamites [Vietnamese]: Milk and cheese. How will soybeans be used: The first exports to Europe. Some figures on the present trade in soybeans. The Germans are becoming masters of the European soybean market. Soya in France: It is utilized by foreigners.

Concerning the Germans: "Until the spring of 1909, the Japanese were the masters of the soybean market. Some German companies have in turn entered into competition in places of production, and there followed a rather significant rise [in production]. There resulted as a counter-measure some soybean cultural trials in terrains that seemed favorable to them in China. The result of these trials is not yet known.

"Be that as it may, the Germans hasten to assume first rank among the importers of soybeans in Europe.

"In effect, it follows from a report published by *The Chemical Trade Journal* (10 June 1911) that the port of Stettin recently received from Vladivostok a shipment of 4,823 tonnes (metric tons) of soybeans; the manufacturers of Stettin have established a society with capitalization of 1,875,000 francs for the utilization of this product.

"Its importation into Germany duty-free will favor its use for several reasons: first, soybean oil, a substitute for linseed oil, can be sold at a price that is one-third lower; secondly, it can be used in soap-making; thirdly, the cakes remaining after the extraction of oil can be used to feed livestock in the same way as cottonseed cakes. Finally, after the appropriate extraction of oil, the pulp, reduced to a flour and mixed with cereal flour, yields an edible bread or biscuit.

"The nascent industry in Germany of cottonseed oil, flour, and oil cakes, whose primary material is cottonseed imported from America, will have before long to struggle against the formidable competition of soybean products."

Concerning soya in France. "Soya (*soja*) is hardly known in France except by a few products that are found in certain food stores and that are bought sometimes, but without realizing their origin. (Footnote: Notably many flour products whose fortifying qualities are incontestable.)

"For, there would be every advantage to introduce this industry into our country where the mechanical and chemical resources would permit an improvement of yields. The example, moreover, is already given, not by French industries, but by the Chinese, who have established a factory at Vallées, Colombes, near Paris, where a Chinese workforce, exclusively employed, make all types of soy-based food products.

"Our industries would draw great profit from entering this path and not allowing themselves to be surpassed by German chemistry any longer."

1510. Krauss, F.G. 1911. Leguminous crops for Hawaii. *Hawaii Agricultural Experiment Station, Bulletin* No. 23. 31 p. Sept. 20. See p. 23-27, 30.

• ***Summary:*** "Soy bean (Glycine hispida): While possessing most of the good qualities common to other leguminous forage plants, the great diversity of type to be found in the soy bean adapts it to many uses and conditions unsuited to other legumes."

"Among its most important uses is that for culinary purposes especially in the manufacture of the Japanese products (soy and miso). These products are imported into Hawaii from Japan in large quantities, but their manufacture is being rapidly extended in Hawaii. This has created quite a demand for the bean locally. At present two and one-half million pounds of the bean are being imported into Hawaii annually. The average cost is about $3 per hundred pounds landed in Honolulu and the beans sell for $3.25 to $3.40 per hundred pounds. The Japanese coffee growers in the Kona district in Hawaii have been growing the bean as an intercrop for years. The total production is said to be about 200,000 pounds per annum. It will thus been seen that the immediate local demand is very far from being supplied at present."

Note 1. This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for part or all of the United States (Hawaii).

"The yield of seed obtained by the station from small experimental plantings ranges from 600 to 1,000 pounds per acre for the dwarf early maturing varieties, and about twice that amount from the medium late and medium tall sorts."

"The following list has been selected from about 100 varieties tested by the station. It is believed to include the best sorts for each of the several purposes for which the soy bean is especially recommended. In the case of culinary varieties, both quality and yield of seed have been considered. The soy and miso manufacturers demand a large, hard, light colored seed, with a thin skin, and the writer is indebted to Mr. N. Yamakami, manager of the Hawaiian

© Copyright Soyinfo Center 2014

Soy Co., for his assistance in selecting varieties according to these qualities.

"Under Group I has been collected the best culinary varieties. These are usually found among the dwarf, early maturing sorts, qualities which make them well suited for intercultures, short rotations, and catch crops. Group II contains the heaviest seeding sorts irrespective of their culinary qualities. These varieties are especially well suited for growing as grain for cattle feeding. Group III contains the rankest growing sorts. These supply the maximum yields of both forage and grain, which makes them especially valuable for fodder and green manuring." Two photos show two types of soy bean plants: (Fig. 1) Three dwarf types (culinary varieties). (Fig. 2) Three intermediate types (general purpose varieties). These are accompanied by a list of the soybean names in the 3 groups with SPI numbers and basic characteristics. The six culinary varieties in Group I include Hollybrook, Manhattan, Swan, Elton, and Acme. The four culinary and grain varieties in Group II include Acme, Edward ("Mr. Yamakami, of the Hawaiian Soy Co., pronounces this the largest seeded yellow soybean he has ever seen and considers it a very desirable variety for the production of miso and other Japanese food products"), Ito San, and Ruralnook. The two forage varieties in Group III (tall, rank-growing, and best suited for green manuring) are Riceland and Barchet.

Another photo (Plate VIII) shows "Seeds of leguminous plants described in this bulletin, natural size–including three colors and sizes of soy beans.

Note 2. This is the earliest English-language document seen (June 2005) that uses the word "intercrop" (or "intercropped" or "intercropping") in connection with soybeans.

1511. Ruhräh, John. 1911. Soy bean cookery. *Medical Record* (*New York*) 80:626-27. Sept. 23. [4 ref]
• ***Summary:*** Two tables give the nutritional composition of yellow soy beans and of "soy-bean flour" (also called "soy bean flour" and "soy flour" in this article). The flour [a whole- or full-fat soy flour] contains 44.64% protein and 19.43% fat.

"Egasse [1888] first suggested the use of the bean in the diet of various diseases, particularly in diabetes, and the first trials in this disease were made by Dujardin-Beaumetz at the Cochin Hospital in Paris.

"Since publishing the articles referred to above [3 articles relating to soy published between July 1909 and Dec. 1910], I have had so many requests for information about the preparation of the soy bean, especially for diabetics and also for its use in other diseases, that I thought it best to bring together a few of the methods of preparation which have been used with success."

"The simplest way to use the beans is to cook them like the ordinary navy bean, preparing either bean soup, boiled beans, or baked beans, the flavor usually being rather improved by the addition of a piece of fat salt meat. It is also a good plan to soak the beans for eight to ten hours, stir them up, and remove the rather firm envelope which encloses them, most of which will be found to come to the surface, from which they may be easily skimmed off."

The author then gives recipes for using soybeans or soy bean flour: Gruels, broths, muffins, nut-cakes, soy bean cakes, breakfast food, pancakes, soy bean cheese (tofu; "In Seattle, Washington, and other places in the West, I am informed that tofu is made by the Japanese and sold to the Oriental residents"). The following suggestions for cooking the bean are made by Goff (*Gazette des Hopitaux,* 7 March 1911, p. 399): Grilled soy beans, soy beans with butter, soy beans au gras, bread or cakes of soy beans. Address: M.D., 839 North Eutaw Street, Baltimore, Maryland.

1512. *Matieres Grasses* (*Les*) (*Paris*). 1911. Culture du soja a Ceylan [Soybean cultivation in Ceylon]. 4(41):2429-30. Sept. 25. [Fre]
• ***Summary:*** "Soybean cultivation is the order of the day. It has been tried with success in Ceylon. The Agricultural Society obtained a large quantity of seeds from East Asia some time ago and agronomic trials were conducted at the botanical garden at Peradeniya–but the crop did not succeed very well. However now the secretary of the society has attained success and has been able to obtain a good harvest at the Colombo garden. He obtained two varieties; a white-seeded one from Japan and a black-seeded one from Java. Shortly he will be able to provide seeds, then one must wait to see cultivation of this new crop undertaken in Ceylon. We predict that it will undergo a large expansion."

1513. Abel, Mary Hinman. 1911. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 38 p. See p. 11-13, 17-20, 35-36. Revised Nov. 15, 1906. Reprint, Sept. 30, 1911. [1 ref]
• ***Summary:*** This is a reprint of the 1906 revised edition. The information about soy is unchanged. On pages 17-18 is a section titled "The peanut" (*Arachis hypogæa*). On pages 35-36 is a section titled "Peanuts and peanut preparations" which includes a subsection titled "Peanut butter.–The roasted peanut ground to an oily meal has somewhat the consistency of butter and is now marketed under the name of peanut butter. Salt is perhaps quite generally added during the process of manufacture. Water is also sometimes added–usually before serving. Peanut butter is used like other butter to spread on bread, for the making of sandwiches, and in the preparation of a number of made dishes. Many persons like its flavor when it is fresh and of good quality, and it seems fair to say that the use of this and other sorts of nut butter is growing. As regards composition, peanut butter, which is essentially the ground roasted peanut, contains more protein and less fat than ordinary butter. Little is known regarding

© Copyright Soyinfo Center 2014

the digestibility of peanut butter, but the fine grinding would naturally seem to be of an advantage. Judged by Jaffa's experiments with a ration containing peanuts, it would be well digested. (See p. 26)

"Peanut oil.- At present the American peanut crop is not large enough to more than supply the roaster and the confectioner, hence the expressing of oil from the peanut has never become established here, but in Europe large quantities of the African-raised nuts are used for this purpose. The shelled nuts contain from 30 to 50 per cent. of oil. The oil is said to be of fairly good flavor, but inferior to olive oil. In 1899 some 80,000 tons of the nuts were used in Marseille alone for oil making. The unhusked nuts are passed between a pair of rapidly revolving grooved rollers and the shells and red inner skins are then removed by a winnowing process with the use of air currents and oscillating sieves. The cleaned kernels are ground and enveloped in fibrous mats and pressed to extract the oil.

"According to Brannt, "the first cold pressure yields 16 to 18 per cent of very fine table oil. The residue is then broken up, moistened with water, and again cold pressed, yielding 7 to 8 per cent of more or less valuable oil, used for table purposes and burning. The residue from this is heated and then pressed, giving 7 to 8 per cent more oil, unfit for table use, but used for soap and lubricating." The grades of oil are sold as salad oil alone or mixed with olive oil.

"Peanut cake.- When the oil has been pressed from the ground nut, the mass remaining, called oil cake, is used for fattening. Some experiments have also been made as to its food value for human beings. Containing, as it does, 47 per cent of protein and 9 per cent of fat and starch, and costing about 5 cents a pound, this attracted the attention of German scientists. The oil cake broken up and cooked a long time in water and eaten as a soup or porridge in a hospital. Most of those who tried it ate it with apparent relish, not once only, but again and again. No effort have been made to ascertain to what extent it was digested, and the use of the cake does not seem to have passed the experimental stage."

1514. Li, Yu-ying; Grandvoinnet, L. 1911. Le soja [The soybean]. *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) 11(102):177-96. Sept. See also: 11(103):270-94. • ***Summary:*** This series of articles, published in book form in 1912, is one of the earliest, most important, influential, creative, interesting, and carefully researched documents ever written about soybeans and soyfoods. Contents: Introduction. Origin and history of the soybean. Soybean culture. 1. Species and varieties of soybeans (botanical characteristics, species {vernacular names in Asia}, varieties {from China, Japan, India, Indochina, Hawaii, United States, and Europe}). 2. Needs of the soybean: Climatic (temperature, humidity), geographical area and varieties grown (in Asia [Manchuria, Japan, Formosa, Korea, Indochina], America, Guyane ("En Guyane, le soja mûrit" [ripens or matures]. Note: This probably refers to French Guiana [*Guyane française*], where Sagot and Raoul reported in 1893 that soybeans had been grown successfully), Europe [France, Italy, Russia], Southeast Asia (*Océanie* / Oceania) [Philippines, Java, Borneo], and Africa [Algeria, Tunisia, South Africa]), agrological needs of the soybean (physical, chemical).

"Oceania.–The soybean has been cultivated for a very long time in the Philippines, Java, and Borneo" (p. 194).

Illustrations (line drawings) show: Soybean plant with roots (p. 182). Soybean pods and beans (p. 183). A table (p. 191) and a graph (p. 192) show trade of soybeans, soybean cake, and the total of the two from five Manchurian ports (Newchwang, Antung, Ta-tung-ho, Dairen, and Suifenho [Suifenhe]) from 1905 to 1909; all have increased dramatically. Also contains 12 other tables from other sources. Note that this influential series of articles, like its predecessor by Itie in the same journal, were in large part prompted by the huge rise in imports of soybeans to Europe, starting in 1908. The contents of these articles is almost identical to that of the book by the same name, published in 1912, which see. Address: 1. Counseiller de 1ere classe au Ministère de l'Agriculture de la Chine; 2. Ingénieur agricole (G.).

1515. Nishimura, Torazô. 1911. Shôyu moromi oyobi shôyu ni shôzuru sanmakusei kôbo kinrui (zoku ni shôyu no kabi to shôsu) ni kansuru kenkyû [Species of film-building yeasts on shoyu]. *Nogaku Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 111. p. 42-63. Oct. 5. [Jap]

• ***Summary:*** In the English-language table of contents, shoyu is called "Soya." Address: Nôgaku-shi, Japan.

1516. Williamson, A.A. 1911. Commerce of the Liaotung Peninsula. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 14(255):535-40. Oct. 31.

• ***Summary:*** "The Dalny (Manchuria) consular district comprises the entire territory held under lease by Japan from China, lying at the extreme southern end of the Liaotung Peninsula, and is known and officially designated by the Japanese as the Kwangtung Province. Its area is given as 205 square 'ri,' or 1,220.57 square miles, and it has a population of 462,399 or 379 persons per square mile.

"The country is very hilly in the southern part of the Province, the elevation, however, seldom reaching over 900 feet above the sea. Toward the north the surface gradually becomes more level and partakes of the nature of the flat bean fields of north Manchuria."

"Dalny, the chief city and port of Kwantung Province,

© Copyright Soyinfo Center 2014

is said to have the finest wharves in the Far East., vessels drawing up to 28 feet being moored alongside the quay. Goods can be discharged from a ship and placed aboard the freight cars, which run out onto the wharves, in one operation. While ice forms in the protected parts of the bay at Dalny, it never becomes sufficiently thick to interfere with navigation, so that the port is open the year round and, Dalny being the southern terminus of the main line of the South Manchuria Railway, the advantages offered are at once evident."

The export returns for 1910 "show a decided decrease in shipments of beans and bean cake. The causes of this are undoubtedly the (for the farmers) favorable preceding year and the outbreak of plague with which the country was smitten during the export season. The first caused the farmers to sell rapidly in 1909 and to hold back in 1910; the latter, because of isolation and segregation measures, brought measures, brought traffic to a standstill. Undoubtedly the bean season will, in the end, show no falling off, as the estimates of production which have been obtainable show a considerable increase in cultivation."

The section titled "The export trade" states that "the Chinaman" has a strong hold upon the trade passing through Dalny; a high percentage of the imports came in the shape of native products and "the export trade with native products showed the greatest increase, over 90 per cent." A table shows "the principal articles exported through the Maritime Customs at Dalny during 1909 and 1910 by steamer and by junk." For 1909 and 1910 by steamer: Bean cake 615,252,933 / 526,030,267 pounds. [Soya] beans 981,274,267 / 713,489,867 pounds. [Soya] bean oil 19,021,067 / 31,642,267 pounds. For 1909 and 1910 by junk: Bean cake 22,398,000 / 28,863,733 pounds. [Soya] beans 43,657,007 / 13,827,333 pounds. [Soya] bean oil 2,679,000 / 2,864,133 pounds.

Under "Soya-bean trade," another table shows the destination of these three products (in pounds) during 1910 from the Dairen customs district, as given in the Imperial Chinese Maritime returns: Bean cake: Japan (incl. Formosa) 443,406,267 (99.9% of overseas total). Korea 307,333. Total overseas 443,730134. Chinese ports 111,163,866 (20.0% of grand total). Grand total 554,894,000.

[Soya] beans: Egypt 302,240,800 (#1). Japan 192,499,733 (#2). United Kingdom 59,455,867 (#3). Other: Denmark, Hongkong, Netherlands, Straits Settlements [today's Singapore]. Total overseas 603,120,800. Chinese ports 124,196,400 (17.1% of grand total). Grand total 727,317,200.

Bean oil: Japan 17,208,133 (#1). Belgium 6,097,200 (#2). Other: Denmark, Egypt, Hongkong, Netherlands, Straits Settlements. Total overseas 27,829,333. Chinese ports 9,677,067 (25.8% of grand total). Grand total 37,506,400.

A 3rd table shows prices of the three products month by month in 1910 in U.S. currency as reported by the Manshu Juyo Bussan Yushutsu Kumiai (Manchurian Staple Products Export Association). For bean cake, the price is per 61.33 lb. For soya beans and oil per 133.33 lb.

"There are still no American export and import houses in this district, and until some thoroughly American house opens here, trade with the United States will necessarily remain half-hearted, being in the hands of natural competitors." The main export from this district to the USA is soya bean oil, of which $93,974 was exported in 1910; only $8,532 worth of soya-bean cake was exported. Address: Vice Consul, Dalny, Manchuria.

1517. *Queensland Agricultural Journal.* 1911. Soya beans. 27(4):187. Oct. [1 ref]
• ***Summary:*** From Tropical Life: "Last year Corea [Korea] exported £584,500 of Soya beans, mostly to Japan. The Corean bean is said to be superior to its Manchurian rival, and so large an increase in its export (£200,000, or more than 30 per cent. over 1909) has released that quantity of Manchurian beans, required for the Japanese manufacturers of soya, &c., and enabled them to be sent to Europe, where the demand is rapidly increasing." Address: Australia.

1518. *Stanstead Journal* (*Rock Island, Stanstead, Quebec, Canada*). 1911. Farm and field: Export of soy beans from Japan. New industries are created. Nov. 2. p. 4.
• ***Summary:*** "Since the war between Japan and Russia, the export of soy beans from the East to Europe has largely increased. At one German port alone, we are told, 4,823 tons of these were imported in one shipment. The oil from these beans is said to be one-third cheaper than linseed and can be used for making soap and many other products including food. The bean meal is used for cattle feeding and also mixed with flour for human food. In fact, few agricultural products have made such changes in both farm and manufacturing industries as the soy bean promises to do in Europe.

"The soy bean has been grown in a comparatively small way in Ontario. It is not only a soil improver, but a very rich food, ranking with linseed."

1519. Kochi, Genichiro. 1911. Hatsuga daizu chû ni ganyûseru ni san no kôso (Enzymes) ni tsuite [Some enzymes in germinating soybean seeds]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 6(11):13-16. Nov. 10. [Jap]
• ***Summary:*** Mentions diastase, cytase, urease, proteolytic enzymes, lipase, invertase, maltoglucase, lactase, tannase, and inulase.

Note. This is the earliest Japanese-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *Hatsuga daizu.* Address: Sanjo Kaiin [Japan].

1520. Greene, Roger S. 1911. Manchurian trade and commerce: Harbin. *Daily Consular and Trade Reports* (*U.S.*

Bureau of Manufactures, Department of Commerce and Labor) 14(271):880-88. Nov. 18.
• ***Summary:*** The year 1910 was the first for which there were available complete customs returns of the traffic carried on over all the important trade routes connecting North Manchuria with the Russian Provinces upon which it borders"

The five customs stations in this region are Manchouli, Suifenho, Harbin, Sansing, and Aigun. "Nearly four-fifths of this trade passed through Suifenho and Manchouli,..."

"Shipments of bean products and grain: Exports of beans through the five customs stations of the Harbin consular district amounted to 268,333 tons in 1910, against 230,118 tons in the preceding year. Adding the rail shipments to the south from Changchun gives a total of 411,930 tons, in contrast to an aggregate of 454,486 tons in 1909.

"The exports of bean cake from the five stations came to only 11,186 tons. In 1909 the amount was also small (12,434 tons). Most of this product goes to Japan via Suifenho. Shipments of bean cake southward from Changchun aggregated only 6,990 tons.

"The exports of bean oil from all the stations amounted in round numbers to 11,127,000 pounds, as against 3,193,000 pounds in 1909, the bulk of the business being with the Russian Amur ports." Address: Consul, Harbin.

1521. Kent, William P. 1911. Manchurian trade and commerce: Newchwang. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 14(271):888-93. Nov. 18.
• ***Summary:*** Table 2 (p. 891) shows that significant "decreases occurred in the 1910 [soy] bean, [soy] bean-oil, and [soy] bean-cake shipments through the Newchwang customs. Beans were exported to Japan, Hongkong, and Samarang [Semarang, a port city on the north coast of the island of Java]; bean oil to Japan, the United Kingdom, Samarang, and Belgium; while Japan imported all the bean cake not consumed locally. All units for these three commodities are in piculs; A picul is equivalent to 133.33 pounds.

"The soya bean and its products... continue to grow in importance throughout Manchuria and to furnish the principal articles of commercial activity at Newchwang. When it is recalled how recently the soya bean and its extensive uses have come to the knowledge of the commercial world and how rapidly it has taken its place as an article of commerce, it must be regarded as a marvel of agricultural transformation, comparable alone in modern times to the discovery of Indian corn, tobacco, and the potato. The average price for 1910 of beans, bean cake, and bean oil, laid down at Newchwang, was: Beans, $4.90 per 400 pounds; bean cake, $5.55 per 687 pounds; and bean oil, $5.75 per 133.33 pounds.

"One of the by-products of the soya bean whose manufacture is increasing is soy sauce, a condiment much used in Japan and other parts of the East. The Japanese established a factory at Newchwang in 1903 for the manufacture of soy [sauce], starting with a small capital. It has been so successfully conducted that from the profits the plant is being englarged by an expenditure of $30,000. Some prominent Chinese capitalists from the south of China propose erecting two additional factories at Newchwang during the coming season.

"The most important and profitable adjustment of the bean trade is bean milling, and during the 1909-10 season great progress was made in the substitution of modern machinery for the old type of press, in which a system of wooden wedges was used. Up to December, 1910, the number of bean mills in operation at Newchwang was as follows: Seven steam mills with an average capacity of 5,000,000 pieces of bean cake and 21,000,000 catties (catty=1.33 pounds) of oil per annum; 7 smaller ones with an average annual capacity of 1,800,000 pieces of cake and 7,900,000 catties of oil; and 3 others with an average annual output of 300,000 pieces of cake and 1,300,000 catties of oil. One of steam mills employs hydraulic power on the mold presses; all the others utilize steam and oil engines simply to crush the beans preparatory to their being placed in the molds, which are worked by hand on a cog and screw system.

"What is desired is a machine similar to a cottonseed press, meeting certain requirements peculiar to the bean. This suggestion implies a matter of great importance to the first devisers of a machine meeting the approval of local bean-mill owners. To accomplish this end will require a personal investigation to acquire a close knowledge of the minor details of the industry. Descriptions and details are of no avail, owing to the probable omission of some item overlooked by an inexpert investigator.

"Declared exports–shipping: Beans have not as yet been shipped direct from Newchwang to the United States. A small shipment of bean oil was sent on trial to a New York firm, and should this prove satisfactory larger returns may confidently be expected." Address: Consul, Newchwang.

1522. *Washington Post.* 1911. Manifactured [sic, manufactured] milk: Tid bits. Nov. 26. p. MS2.
• ***Summary:*** "Cows are not numerous in Japan, but the Japanese are fond of milk, and to meet this demand in the face of a natural shortage they long ago put their wits to work and evolved a product that the average person cannot distinguish from the regular dairy article.

"The artificial milk is derived from the soja bean, The beans are first soaked, then boiled in water. Presently the liquid turns white; sugar and phosphate of potash in proper quantities are added, and the boiling continues until a substance the thickness of molasses is obtained [sic]. This fluid corresponds very accurately with ordinary condensed

© Copyright Soyinfo Center 2014

milk, and when water is added cannot be told from fresh. If the present rise in the price of British milk continues we can foresee a big run on soja beans. Now, Mr. Milkman, beware!"

Note: A very similar article appeared about two months later on 14 Jan. 1912 in the *Boston Daily Globe.*

1523. Barrett, O.W. 1911. Rice ally crops. *Philippine Agricultural Review* 4(11):592-98. Nov. See p. 594-96. [1 ref]
• ***Summary:*** The section titled "Soybeans" (p. 594-96) begins: "Probably every tourist who has visited any of the cities of Japan or China has noticed in the markets these peculiar blocks of a grayish white, jelly-like substance and wondered whether they were really good to eat, but comparatively few have ever tried there the three or four varieties of vegetable 'cheese' prepared from the soybean*."

*Footnote: A 3/4 page footnote, extracted from USDA Farmers' Bulletin No. 58 by Langworthy, discusses five preparations commonly made in Japan from the soybean: natto, tofu or bean cheese (eaten in the fresh state or frozen), miso, yuba, and shoyu.

"Experts in threpsology, the new science of nutrition, seem to be in accord on the fact that in dietary matters two kinds of food are at least four times as good as one... Recently the European food experts have realized the high nutritious value of the soybean and a factory has been established near Paris [by Li Yu-ying] for the manufacture of various food products from this wonderful seed."

"Now is the time for the Philippine Agriculturist to take up soybean culture in earnest, and to develop it in the same way, even if not to the same degree, as our neighbors across the way have been doing for centuries. The fact that there are practically no seeds of this valuable crop at the present in the Philippines is a sad commentary on the progressiveness of the Philippine farmer; but it is never too late to learn" (p. 596). Address: Chief of the Div. of Experiment Stations, Philippines.

1524. Ishikawa, S. 1911. Seishu oyobi shôyu-chû no horumuarudehiido kenshitsu ni tsuite [On the determination of formaldehyde in sake and shoyu]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 357. p. 787-803. Nov. [Jap; ger]
• ***Summary:*** The German title is "Ueber die Ermittelung von Formaldehyd in 'Sake' und 'Shoyu' (So-ya)." Address: Tokyo Eisei Shikensho, Japan.

1525. Takahashi, Teizô; Yukawa, Matao. 1911. Shôyu kôji oyobi shôyu moromi-chû no gaseikin ni tsuite (1) [Studies on the budding fungi of shoyu koji and shoyu moromi (mash) (1)]. *Nogaku Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 112. p. 1-26. Dec. 5. [Jap]
Address: 1. Nôgaku-Hakushi (Doctor of Agriculture), Japan; 2. Nôgaku-shi, Japan.

1526. *Christian Science Monitor.* 1911. Soy bean exports large. Dec. 15. p. 16.
• ***Summary:*** "Boston, by tradition, is a large center of bean consumption... A region of the world where the bean is indigenous, and where it has been a staple commodity of diet for centuries, is Asia, conspicuously India, China, and Japan. Until a comparatively recent date native consumption has kept pace with production and there has not been much export trade. But with recent development of Manchuria the soy bean crop has come to have a bulk and value that is astounding, the demand from Europe and Japan steadily growing, so that the latest reports of shipments from Dairen (formerly Dalny) and Vladivostock [Vladivostok] indicate that the Manchurian farmers are now raising annually about 1,800,000 tons of beans and beancake."

"Japanese capital and managers are profiting by the sudden and yet substantial expansion of the Manchurian export trade through their wise administration of the port of Dairen and the trading enterprises which they carry on in the zone along the railway that they control. Japanese in Japan are also profiting by the new and inexpensive form of food supply; there the soybean provides much for a people not over rich in foods and taxed at present to a point that only a people as loyal as the Japanese would bear long without complaint."

1527. *J. of the New Zealand Department of Agriculture.* 1911. The soya bean. Its possibilities in commerce. 3(6):487-88. Dec. 15. [1 ref]
• ***Summary:*** "In a recent communication to the Department, the High Commissioner in London conveys much interesting information of the soya-bean industry. This bean, which is taking a commanding position in the Old World [Europe] as a food for stock, has not yet been tested on a commercial scale in this part of the world; but added interest is being attached to it with the growing appreciation of the need of better feeding of our live-stock. The department is testing a number of varieties of soya bean received from the United States Department of Agriculture at the Tauranga Experimental Farm..."

The report notes that from Dalny (in Manchuria) and Vladivostok (in Russia) large quantities of soya beans are shipped to the United Kingdom. Small consignments of the bean and oil are received from Japan. "'These beans contain from 17 to 18 per cent. of oil, which is pressed out by ordinary crushers or extracted by the solvent extraction process. Originally the oil was used for soap-making but now it is used not only for this purpose, but much more largely for replacing linseed-oil. It is also used for lubricating, burning, and for edible The residue, after the oil has been extracted, is now well recognized as being one of the best foodstuffs for cattle. It is exceedingly rich in albuminoids in a readily

© Copyright Soyinfo Center 2014

digestible form. The opinion is expressed that in time this residue will come to be used as human food. Note: This is the earliest English-language document seen (March 2003) that uses the term "solvent extraction" in connection with the commercial crushing of soybeans to give oil and meal.

"'The greater quantity of the soya-bean supply is shipped direct to this country, is crushed either in Hull or Liverpool, and large quantities of the oil are shipped to the [European] Continent. I am informed that bean-oil, without the aid of driers of some kind, will not dry hard...

"'Experiments have been made in many countries to grow soya beans and apparently some of these experiments have been perfectly successful, as the Hull Oil-manufacturing Company have received samples grown within 200 miles of Calcutta, and the bean is now offered in small quantities from South Russia. Experiments are being made in Rhodesia, Canada, South America, and other places within the wheat and cotton belts.'" Address: New Zealand.

1528. Nishiwaki, Yasukichi. 1911. Kaki-iro kabi, kôji kabi oyobi kumonosu kabi o motte, shôyu jôzô hikaku kenkyû [Shoyu manufacturing experiment using orange-colored mold, koji mold, and *Rhizopus* mold]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 14(166):1161-65. Dec. [Jap; eng]

• ***Summary:*** The orange colored mold is actually called "persimmon colored" and refers to *Oidium lupli* or *Monilia sitophila* (used to make onchom or ontjom). The koji mold is *Aspergillus oryzae. Rhizopus japonicus* is called "spider-web mold." It is clear that shoyu can be made with molds other than just the koji mold. Good shoyu koji was made easily with the orange mold, which is little attacked by other molds. The *Rhizopus* mold gave unfavorable results. Address: Nôgaku-shi, Japan.

1529. Miyake, K. 1911-1912. Ueber das Verhalten der Pentosane und Methylpentosane der Samen von Glycine hispida und von Phaseolus vulgaris waehrend des Keimungsvorganges [On the conduct of pentosans and methylpentosans in the seeds of soybeans and common beans (*Phaseolus vulgaris*) during germination]. *Journal of the College of Agriculture, Tohoku Imperial University* (*See Hokkaido Daigaku, Nogaku-bu*) 4:327-35. [10 ref. Ger]

• ***Summary:*** Pentosans and methylpentosans are distinctly skeletal constituents not used in germination unless other substances are exhausted, and then methylpentosans are appropriated more than pentosans. Address: Japan.

1530. Kinoshita, K.; Taido, J. 1911. Seishu-chû "forumuarudehiido" kenshutsu-hô ni tsuite [Detection of formaldehyde in sake. I-IV.]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 6(10):15-28; 6(12):5-15; 7(6):10-16; 7(2):12-25. [Jap]

1531. Kita, Gen-itsu. 1911. Shôyu seizô ni kansuru kenkyû hôkoku. IV. [Research report on shoyu production. IV.]. *Kogyo Kagaku Zasshi* (*J. of the Society of Chemical Industry, Japan*) 14(156):109-28. [Jap]

• ***Summary:*** "Traditional shoyu production depends on alcohol fermentation as well as on protein degradation and acid fermentation. Therefore starch or the majority of the sugar is converted into alcohol, then into esters, which the flavor of shoyu. In 1907 Dr. Saito Kendo published a report titled "Microbiological studies on the preparation of soy sauce" (*Zentralblatt für Bakteriologie.* Series 2. 17(1/2):104-09, 152-53) in which he discussed shoyu yeasts. The major yeast is the new variety *Saccharomyces soya,* and there are others such as *Sacc. farinosus.*

"I tried to isolate the yeast in order to study the process of fermentation, the growth of yeast, the side effects the yeast, etc. After plating the yeast many times on a medium containing koji solution plus salt, the yeast can be purified by Lintner's method. Samples were obtained from Noda, Choshi, Shizuoka, Handa, Sakai, Shodoshima (island) and Tatsuno.

"I observed four types of yeast: Type 1 was isolated from the samples from Noda, Shizuoka, Sakai, Shodoshima, Tatsuno, Choshi, and Handa. It is the most common type which has the medium fermentation ability. Type 2 was isolated from the Shizuoka sample. Its characteristics are about the same as Type 1. Types 3 and 4 were isolated from the Noda sample; they do not ferment during cold weather.

The author then discusses: Microscopic observation. Plate culture. Large colonies. Agar culture. Liquid culture. Small droplet culture. Fermentation characteristics using various kinds of sugar. Apparent optimal temperature and the actual optimal temperature. Test for spore formation. Fermenting ability of the shoyu yeast (p. 115): 1. The growth condition when the medium contains salt and sugar. 2. The fermenting ability of various yeasts grown in boring (?) 10º or boring 20º sugar medium without salt (boring is a unit of concentration). 3. The fermenting ability of various yeasts grown in boring 10º sugar medium containing 10% salt. 4. The effect of alcohol on shoyu yeast. 5. The reaction of yeast to salt. 6. The fluctuation of nitrogen compounds in the culture medium due to the presence of yeast.

"The importance of alcohol fermentation in shoyu making (p. 125): Alcohol fermentation is one of the most important changes that takes place during the process of making shoyu. Although the flavor of shoyu depends a lot on alcohol fermentation, we don't know exactly how important its role can be. When the flavor and color of shoyu was evaluated, we did not find a significant difference, so that it seems unnecessary to add a large amount of wheat when making shoyu. Currently equal volumes of wheat and soybeans are mixed in order to make the best quality shoyu. However considering that regular quality shoyu doesn't require wheat at all makes us think that addition of wheat is

© Copyright Soyinfo Center 2014

arbitrary and irrational. I conducted the following tests (p. 116): 1. The effect of decreasing the amount of wheat on the taste and flavor of shoyu and the relationship between profit and cost. 2. The characteristics of koji (?) when cheaper soybeans are used instead of wheat. 3. characteristics of koji (?) when other cheaper starchy grains are used instead of wheat. These tests should be conducted with great caution, using a large quantity, and we should avoid drawing conclusions obtained from only a few experiments. I hope the shoyu makers will volunteer to conduct them. Here are some results which I obtained: The possibility of storing koji enzyme in salty water." Three photos (p. 111) show microorganisms growing in petri dishes. Address: Kôgaku-shi, Japan.

1532. Bowie, Henry P. 1911. On the laws of Japanese painting: An introduction to the study of the art of Japan. San Francisco, California: Paul Elder and Company. xv + 117 p. See p. 90. With prefatory remarks by Iwaya Sazanami and Hirai Kinza. Illust. Index. [14 ref]

• ***Summary:*** In Chapter 6, in the section on "Month and holiday subjects," under the month of "May" (p. 90) we read: "The fifth of May is the boys' festival, and the carp (*koi*) is the favorite subject for painting... When this fish is caught and about to be cut up alive for *sasshimi* [*sashimi*], a Japanese delicacy, once the carver has passed the flat side of the knife blade over the body of the fish the *koi* becomes motionless, and with heroic fortitude submits to being sliced to the backbone. Served in a dish, a few drops of soy being placed in its eye it leaps upward in a last struggle, to fall apart in many pieces."

References (Japanese title in Roman letters, English translation of that title, and author) to 14 of the best Japanese-language books about Japanese painting appear on p. 28; none have yet been translated. Address: Japan.

1533. Hooper, David. 1911. Soy bean in India: Glycine hispida. *Agricultural Ledger* (*Calcutta*) No. 3. p. 17-33. (Vegetable Product Series No. 114). Also reprinted in Tropical Agriculturalist, 1912. 38:11-15, 99-103.

• ***Summary:*** Contents: Introduction. Experimental cultivation in India. Vernacular names of the soybean. Method of cultivation: Green manure, harvesting. Races and varieties. Races in India: Yellow [grown in Poona Experimental Farm, Burma, Darjeeling, Dehra Dun, Simla, Punjab], green [Poona], black [Poona, Kashmir to Darjeeling, Simla], brown [Kashmir, Kalimpong to Darjeeling], mottled [Shillong, Assam]. Composition of the seed: From Church, from König, from Dr. J.W. Leather (1903), tables showing analyses made in India of Indian-grown Soy beans from various provinces (Burma, Hill Tracts, United Provinces [black seeds], and Poona). Soy bean oil. Soy bean oil-cake. Composition of hay. Use as food: Soy-bean milk, bean cheese (topo, sic tofu, or "Soy-bean cheese"), shoyu ("Under the name of 'Soy sauce' and other fanciful names it has formed the basis of most of the important sauces of Europe for many years."), roasted soy beans as a coffee substitute, soy beans in diabetic diets. Trade (exports of Soy bean from Manchuria to England). Price.

"The plant was introduced into the United States of America in 1854 and was grown to a small extent in the Southern States, but from the year 1885 its cultivation as a forage crop has gained in importance in all the agricultural centres. Within the last two or three years a great deal of interest has been taken in the cultivation of Soy, and experiments are in progress in Government Farms in Cape Colony, Natal [South Africa], East Africa, Gambia, Mauritius and Australia.

Contains a good early history of the soybean in India: "It is difficult to ascertain the date of the introduction of Soy beans into India. There is no doubt that certain hill tribes, mostly of Mongolian origin, have cultivated the bean for a long time. At the Punjab Exhibition held at Lahore [later divided between India and Pakistan] in 1864 Soy beans identified by Dr. Cleghorn, were sent from the Hill States. This is the first record of the beans being exhibited in this country, and shows that the cultivation was on a insignificant scale.

"Experiments in India. In 1882 Messrs. Jardine, Matheson & Co. of Hong-Kong sent a sample of Soy beans for experimental cultivation in the Saidapet Experimental Farm, Madras. The plants raised from these seeds were healthy but the yield of the crop was small.

"In 1897 Surgeon-Colonel W.G. King, Sanitary Commissioner, Madras, strongly advocated the cultivation of Soy bean as a valuable food worthy of the attention of the people. In two experiments carried on at Saidapet during 1897-98, the yield of seed per acre was 468 to 495 lbs., respectively. Recent enquiries in Madras resulted in the opinion that the cultivation in the Presidency is still in an experimental stage.

"In 1882 some Japanese Soy beans were sent by the Government of India for trial to Saharanpur. In 1885 very good results were obtained, the black seeded variety giving a yield of 1,124 lbs. per acre, and the white seeded variety giving a yield of 561 lbs. per acre. In 1886 the acclimatised seed was widely distributed; in some cases the crop failed and in others it was fairly successful, but as a rule where seed was harvested it was said that the pulse was not popular in any form. The Botanical Gardens grew the crop for a few years longer but as there was no demand for the seeds the cultivation was abandoned. An interest in Soy bean, however, seems to have revived for the Agricultural Department has this year sent to the Reporter on Economic Products samples of the black variety of Soy beans from forty villages of the United Provinces.

"At the Experimental Farm at Nagpur, Central Provinces, the bean was grown experimentally from

© Copyright Soyinfo Center 2014

Japanese seed first planted in 1885. The yield at the end of the first year was at the rate of 180 lbs. per acre, but taking the average of five years the result was 88 lbs. per acre. In the Report for 1908-09 it is stated that Soy beans were grown on a small area under field conditions and the yield was fair, but there was little local demand for the seed. It was, however, ground and formed an excellent addition to the diet of the farm cattle. Last year only 43 lbs. were obtained on light soil on the Nagpur Farm, the crop being practically a complete failure; on heavier soil 380 lbs. of seed were raised.

"Soy beans have been grown at Poona for nine or ten years with varying results, and they have also been tried at Nadiad in Gujrat [Gujarat] and elsewhere in the Bombay Presidency. In the Experimental Farm Report for 1901 a large yield was chronicled, but next year the crops at Poona and Surat failed. In 1904 a yield of 300 lbs. per acre was obtained in light land. One year later nineteen plots were under trial but with unpromising results, for only five yielded seed enough to repay the cost of cultivation. The yield varied from 50 to 293 lbs. per acre, and it was found that only when the yield exceeded 200 lbs. was the crop profitable. In 1905-06 the Manjri Farm, Poona, grew nineteen plots with better results, probably due to better soil. The yield of some of the plots was on an average of 680 lbs. per acre–a highly remunerative return. A year later it was reported by Mr. Fletcher, Deputy Director of Agriculture, that an experiment made on the edge of black cotton soil gave a yield of 1,166 lbs. per acre, while adjacent plots gave from 395 to 650 lbs. per acre.

"In the Agri.-Horticultural Gardens at Lahore Soy bean planted on a small area in 1894 yielded an estimated crop of 349 lbs. of seed per acre and 349 lbs. of fodder. Evidently it varies greatly in suitability to different soils and climates and does not seem to be adapted to the sea level plains of India.

"Gollan observed that the Japanese plant is erect, attaining a height of 12 to 15 inches, while the Himalayan form is a trailing plant. So far this vigorous growing plant does not appear in India to have been attacked by any insect or parasitic fungus.

"With regard to Burma, Mr. Burkill remarks: 'The Burmese grow it under the names of Pe-nga-pi and Pe-kyat-pyin, sowing it never in great quantities along with other beans on the mud banks as the falling rivers leave them bare in October, or more sparingly still away from the rivers. The Kachins and other hill tribes grow a little of it on their hill clearings, the Kachins call it Lasi. The Khasis, the Nagas and other tribes between the Brahmaputra and Upper Assam cultivate it similarly... In the Brahmaputra Valley it is grown as far as known only towards Barpeta in the Kamrup District.'

"Soy beans are called 'Bhut' in the Punjab, 'Bhat', 'Bhatwas' or 'Bhatmas' in the United Provinces and in the hills as far as Darjeeling, and 'Rymbai ktung' in Shillong and the Khasi Hills. Mr. B.C. Basu gives the Assamese name for *Glycine* as 'Patani jokra' and the corresponding Bengali name as 'Chhai.' In the Naga Hills it is called 'Tsudza' or 'Sudza.' It is grown by the Lepchas in Sikkim and is called by them 'Salyang' or 'Silliangdun.' 'Pe-nga-pi' is the usual name for Soy bean in Burma, but it has been received under the name of 'Lasi shapre tum' from Bhamo, and as 'Lasi N'Loi' and 'Lasi N'Hti' from Myitkyina. The Santali name appears to be 'Disom Horee.'"

"Dr. J.W. Leather in 1903 analysed the seeds of seven samples of Soy bean from Japanese seeds cultivated at Manjri, near Poona. The amount of oil in them varied from 14.92 to 23.05 per cent. being on the dry weight 15.97 to 24.41 per cent. with an average of 19.99. In 1902 Dr. Leather examined five samples grown on the Dumraon Farm. They yielded from 14.27 to 19.72 per cent of oil on the air-dried seeds.

"Fourteen samples of the seeds grown from Japanese seeds at the Manjri Experimental Farm were again analysed last year by a leading European firm. The percentage of moisture varied from 9.90 to 12.06, and the percentage of oil from 16.80 to 22.48...

"The following analyses of Indian-grown Soy beans were made in the laboratory of the Indian Museum in 1909 and 1910." Gives names and composition (oil [as is and on a dry basis], water, and ash) for 17 varieties from Burma, 21 from the Hill Tracts, 11 from the United Provinces [black seeds], and 15 varieties from Poona. "An attempt in 1903 to extract oil from these beans with the country *ghani* or indigenous oil-mill was a failure in Bombay."

Note: This is the earliest English-language document seen (April 2013) that uses the term "soy-bean cheese" to refer to tofu.

1534. Inaba, Riotaro [sic, Ryôtarô]. 1911. Ueber die Ernaehrung der Landarbeiter Japans [On the food and nutrition of the peasants of Japan]. Tokyo. 81 p. [Ger]

• ***Summary:*** Contents: 1. Introduction. 2. Preparation and conduct of the experiments. 3. Method of analysis of the foodstuffs, urine, and excrement / feces. 4. Result of the experiment. 5. Reflections upon the results of the experiment (1. On the worth of the peasant food in connection with the nutritional needs. 2. On the reabsorption {digestibility?} of the peasant food. 3. On the volume of the peasant food, distribution of the food among the individual meals. 4. On the quantity of urine and feces and individual constituents of the same among the Japanese, especially those who work the land).

Note 1. Why is a Japanese researcher doing nutritional and chemical research on Japanese peasant diets in Japan, writing in German? There are probably two reasons: (1) His professor at the Japanese or German university probably spoke and taught in German. (2) German was the language of science before World War I, largely because German scientific research was the most advanced in the world.

© Copyright Soyinfo Center 2014

Note 2. Since we have seen only the first 3 pages of this report, we do not know whether any soyfoods are mentioned. However it seems likely that either miso, soy sauce (shoyu) and/or tofu would be mentioned. Address: Oberstabarzt, kommandiert zum medizinisch-chemischen Institut der medizinishen Fakultaët [Fakultaet] der Universitaët Tokyo [Regimental Medical Officer, commanded by the Medical-Chemical Institute of the Medical Faculty, Univ. of Tokyo].

1535. Jingu Shicho. 1911. Koji ruien [Encyclopedia of early references to things Japanese]. Tokyo: Koten Kokyusho. Revised editions publ. in 1931 and 1971 by Yoshiko Bunkan; 51 volumes. Key volumes are Inshoku (#39) and Shokubutsu (#50). [50+ ref. Jap]

• ***Summary:*** Koji means "ancient things" or "origins." Rui means "varieties" or "description." En means "dictionary." This is one of the best books for doing historical research on Japanese culture, including foods. The book is divided into 30 major subject areas, such as Food and Drink. Within that section all basic Japanese foods and beverages are listed. After each one is listed many of the important early works in which that food is mentioned, with a quote of what is said. Furigana are used liberally to assist with pronunciations of hard-to-pronounce early document names and terms. Compiled from 1896 to 1914, volume 1 of the original edition is dated 1908. The works cited are from ancient times to 1867. The final volume is an index to the whole.

The volume on Food and Drink is titled *Inshoku-bu* (Vol. 51). Whole soybeans, p. 229-35. Black soybeans, p. 235-36. Green soybeans (*ao-daizu*), p. 236-37. Green vegetable soybeans (*edamame*), p. 239-40. Soybean cultivation, p. 240-42. Soybean utilization, p. 243-47. Daizu-ko Mochi, p. 555. Amazake, p. 695-97. Shirozake, p. 697-98. Hishio (Chiang), p. 836-40. Shoyu, p. 840-49. Miso, p. 851-68. Kuki (fermented black soybeans), p. 868-71. Natto, p. 871-74. Tofu (incl. Dengaku), p. 984-1005. Yuba, p. 995-96.

1536. King, F.H. (Franklin Hiram). 1911. Farmers of forty centuries, or permanent agriculture in China, Korea and Japan. Madison, Wisconsin: Mrs. F.H. King. ix + 441 p. Preface by Dr. L.H. Bailey. Portrait. Illust. Index. 20 cm. Reprinted in 1927 by Harcourt & Brace (NY, 379 p.). Facsimile reprint by Rodale Press, 1972.

• ***Summary:*** A superb, classic work which Wendell Berry called "one of the richest sources of information about peasant agriculture... one of the pioneer books of organic farming." Dr. Franklin Hiram King (lived 1848-1911; his portrait photo faces the title page) was former chief of USDA's Division of Soil Management. This is his journal, filled with many fine photos, of a voyage in the early 1900s through coastal China, Korea, and Japan. King was impressed by the productivity and efficiency of Chinese agriculture, and the strength and hardiness of the people.

In Japan: "How the fields are crowded with crops and all the land is made to do full duty... even the narrow dividing ridges but a foot wide, which retain the water on the rice paddies, are bearing a heavy crop of soy beans" (p. 31, photo p. 33).

In China, in printing blue on white cotton calico cloth, a thick paste of lime and freshly-ground soy bean flour was used. A stencil was placed on top of the cloth. "The paste was then deftly spread with a paddle over the surface and thus upon the cloth beneath wherever exposed through the openings in the stencil... The paste is permitted to dry upon the cloth and then the bolt has been dipped into the blue dye the portions protected by the paste remain white. In this simple manner the printing of calico has been done for centuries" (p. 122-23). A photo (p. 122) shows a stone mill, pulled by a blindfolded donkey, "in common use for grinding beans and various kinds of grain."

"Sprouted beans and peas of many kinds and the sprouts of other vegetables, such as onions, are very generally seen in the markets of both China and Japan, at least during the late winter and early spring,..." (p. 134).

In a section titled "Economy of Vegetable Diet" (p. 134-35) the author notes that these people "are vegetarians to a far higher degree than are most western nations, and the high maintenance efficiency of the agriculture of China, Korea, and Japan is in great measure rendered possible by the adoption of a diet so largely vegetarian." From every 100 lb of dry substance (feed) eaten by various kinds of livestock, only 4 pounds of flesh is returned for human food from cattle, only 5 lb from sheep and 11 lb from swine. "In view of these relations, only recently established as scientific facts by rigid research, it is remarkable that these very ancient people came long ago to discard cattle as milk and meat producers; to use sheep more for their pelts and wool than for food; while swine are the one kind of the three classes which they did retain in the role of middleman as transformers of coarse substances into human food."

Pages 145-48 describe how cotton seed is crushed and pressed to make cotton seed oil and cotton seed cake–one of the most common family industries in China. Page 226 notes that small farmers in Shantung province grow wheat, barley, large and small millet, sweet potatoes and soy beans or peanuts. Shelled peanuts are sold in gunny sacks. Pages 256-57 give a similar description for soy beans and peanuts used to make oil and cakes in Shantung, China, with a photo of the large stone mill. The "bean and peanut cakes," also used for fertilizer in Japan and China, are about 18 inches in diameter and 3-4 inches thick.

The section titled "Rotation of Crops" (p. 309) states of Nara, Japan: "To secure green manure for fertilizing, soy beans are planted each year in the space between the rows of barley, the barley being planted in November. One week after the barley is harvested the soy beans, which produce a yield of 160 kan per tan, or 5,290 pounds per acre, are turned under and fitted for rice."

© Copyright Soyinfo Center 2014

The chapter titled "Manchuria and Korea" notes of Lwanchow, Manchuria (p. 348-49): "The planting here, as elsewhere, is in rows but not of one kind of grain. Most frequently two rows of maize, kaoliang or millet alternated with the soy beans and usually not more than 28 inches apart, sharp high ridge cultivation being the general practice." A photo shows carts pulled by donkeys or horses piled high with sacks of soy beans at Lwanchow, Chihli, China, ready for export.

Note: As of Jan. 2013, Lwanchow is in Hebei province, in northeastern China.

When King's train reached Sinminfu [Xinmin in Liaoning province on the Mukden-Tientsin railroad] he saw "the first extensive massing of the huge bean cakes for export, together with enormous quantities of soy beans in sacks piled along the railway and in the freight yards or loaded on cars made up of trains ready to move." They soon arrived at "another station where the freight yards and all of the space along the tracks were piled high with bean cakes and yet the fields about were reflecting the impoverished condition of the soil through the yellow crops and their uneven growth on the fields.

"Since the Japanese-Russian war [1904-05], the shipments of soy beans and of bean cake from Manchuria have increased enormously. Up to this time there had been exports to the southern provinces of China where the bean cakes were used as fertilizers for the rice fields, but the new extensive markets have so raised the price that in several instances we were informed they could not then afford to use bean cake as fertilizer" (p. 357).

In Japan (p. 378-79): "Where bean cake is used as a fertilizer, the applications may be at the rate of 496 pounds per acre, carrying 33.7 pounds of nitrogen, nearly 5 pounds of phosphorus and 7.4 pounds of potassium." A table shows that typical fertilization for each crop of paddy rice, in pounds per acre, is: Manure compost 5,291. Green manure from soy beans 3,306. Soy bean cake 397. Superphosphate 198. The soy bean cake provides the most nitrogen (27.8 lb/acre). A photo (p. 420) shows peanuts being grown in the Tokyo plain (Chiba prefecture, July 17). "Peanuts, sweet potatoes and millet were the main dry land crops then on the ground, with paddy rice in the flooded basins" (p. 422). Address: Former Prof. of Agricultural Physics, Univ. of Wisconsin, and Chief of the Div. of Soil Management, USDA, Washington, DC.

1537. Lafar, Franz. 1911. Technical mycology: The utilization of microorganisms in the arts and manufactures. Vol. II. Eumycetic fermentation. Translated from the German by Charles T.C. Salter. London: Charles Griffin & Co. ix + 558 p. Illust. Index. 23 cm. [3240* ref. Eng]

• ***Summary:*** An extensive bibliography (3,240 references) for both this volume and volume I appears at the back of this volume (p. 417-518). The opening chapter begins: "Already in the first volume (sect. 22) the algae and the fungi were arranged in a single group. that of the Thallophytes, in contradistinction to all other plants, the latter being classed in the group Cormophytes." The latter group has "an articulation of the body of the individual organism into leaf and stem."

Chapter 43, titled "Morphology and systematology of the Mucors (p. 48+) contains sections on "Subdivision of the Mucor family" (p. 49-51), "The genus Mucor" (p. 51-53; The genus was established by Micheli as far back as 1729. It contains *Mucor Rouxii* and *Mucor mucedo*), and "Rizopeæ" (p. 53-56). An illustration (p. 55) shows *Rhizopus nigricans* (After Brefeld). *Rhizopus nigricans* is the best and longest known member of this family. In 1818 it was described by Ehrenberg under the name *Mucor stolonifer,* which is still used by several workers." "The name *Rhizopus oryzae* has been given by Went and Prinsen Geerligs (I.) to a fungus discovered by them in Ragi (sect. 241), the sporangia and spore of which organism are considerably smaller than those of *R. nigricans.*

Chapter 44, is titled "Fermentation by Mucors" (p. 57-62). Chapter 45, titled "The use of Mucoreæ in the spirit industry" (p. 63-71) has three sections: Sect. 240. "Mucor rouxii and other species of Amylomycetes" (p. 63-67) states: "For the preparation of rice spirit there is produced in China, Cochin China, and neighboring countries, an article known as Chinese Yeast, and put on the market in the form of flat mealy balls, about the size of a half-crown. Its preparation, composition, and application were first described in 1892 by E. Calmette (I.), whose reports were extended and supplemented by C. Eijkman (II.) in 1894." The method of preparation is given. More important than its bacteria are "the yeast cells, which must be regarded as the exciting agents of the alcoholic fermentation; and certain Mucors, which affect the saccharification of the starch. Of the last-named organisms, which concern us here,. Calmette isolated a species which, in honour of his teacher and colleague, E. Roux, he named *Amylomyces Rouxii."* Two illustrations show this organism, which produces a "diastatic enzyme" (p. 65). The so-called amylo process and the work of Colette and Boidin with *Beta-Amylomyces* and α-*Amylomyces* in this process are discussed (p. 65-66).

Sect. 241 titled "Ragi and tapej" [tapé or tapeh] (p. 67-69) states that "Tapej... is prepared from rice by the aid of a secondary auxiliary material, which the Malay natives of Java term Ragi or Raggi, and the Chinese settlers call Peh-Khah." A.G. Vorderman (1893) describes the preparation of Ragi. According to Eijkman (1894) Tapej, which is also called Tsao, is prepared with the aid of Ragi, by boiling husked Mochigome rice (*Oryza glutinosa* [*Oryzae sativa glutinosa*], known as "Ketan" in Java) in water until soft. The flora of Ragi and Tapej comprises three groups of microorganisms; bacteria, budding fungi, and fungi belonging to the family *Mucoraceæ.*

© Copyright Soyinfo Center 2014

Sect. 242, titled "The so-called Amylomyces process," (p. 69-71), or Amylo process for short, states that "this is the name given to the process for the industrial utilisation of the diastatic activity of *Mucor Rouxii* and several allied fungi. A company, the *'Société d'Amylo,* was founded by A. Collette and A. Bodin (I, 1897), who also, in 1897, took out in the name of this company a German patent for a 'process for producing alcohol from starchy materials, by means of aseptic saccharification and fermentation with *Mucedineæ,...'"*

Fernbach (II, 1899) has given a lucid description of the practical performance of this process in the patentees' works, the maize distillery at Seclin near Lille, France. This description is summarized. "An English patent for the mechanico-technological modification of the process was also taken out by Collette and Boidin (III.) in 1898." See also two other 1897 English patents by Collette and Boidin No. 19858 and No. 1155. "The reader interested in this matter will find more precise data in the review published by M. Delbrück (III, 1899). The chief advantage of the Amylomyces process is the abolition of the expensive additions of malt requisite in the older method of saccharification, the amount formerly needed being up to 15 per cent. in the case of maize, and 2 to 3 per cent. in the case of potatoes. With regard to the yield furnished by the Amylomyces process, it is stated that in the Seclin works, 37.8 litres of absolute alcohol are obtained per 100 kilos. of maize containing 57.5 p, a yield corresponding to 66.2 litres per 100 kilos of starch. Owing to the large amount of mycelial hyphae, the residue filters easily." "Finally it should be said that, since 1898, the aforesaid patentees have replaced *Mucor* (*Amylomyces*) *Rouxii* by another species, namely, so-called *Beta-Amylomyces,* or *Mucor Beta.* This organism is capable of dealing with more highly concentrated mashes than the other, and enables a charge of 25,000 kilos. of maize to be mashed to 1000 hl (22,000 gallons) of goods. per cent. of starch

Page 213 states that *Pichia farinosa* (Synonym: *Saccharomyces farinosus* Lindner, a film yeast) has been found by K. Saito (II, 1905, *Botanical Magazine,* Tokyo) in Japanese Soja sauce.

Chapter 51 discusses the genus *Aspergillus* (p. 228-31) with many fine illustrations, including conidiophores, conidia, ascospores, different stages of *A. oryzae* and *A. glaucus.* Page 228-29 state: *"Aspergillus Wentii,* Wehmer, was observed by Went in the preparation of Tao Yu (*see* vol. 1, p. 248) according to the method practised in Java, and was described by Wehmer (XIX.) in 1896. It appears spontaneously on the boiled Soja beans that have been covered with *Hibiscus* leaves, and affects a loosening and disintegration of the firm tissue of the bean. The species forms a pale coffee-coloured, dense mold vegetation (Fig. 167)."

In Chapter 57 titled "Chemical activity of the Aspergillaceæ," by Prof. Dr. C. Wehmer, page 270 states: "Two species, *Asp. oryzæ* and *Asp. Wentii* are reported as able to grow through the substance of soft-boiled rice and Soja beans..." The "enzyme mixture from *Asp. oryzae* (the so-called 'Takadiastase')" is also mentioned.

Chapter 62 titled "The Monillæ and Oidia," by Dr. H. Wichmann mentions *Monilia javanica* (occurring in association with others in Ragi, p. 333)., *"Monilia sitophila* (Mont.), Saccardo, is said by Went (IV.; reference missing) to be used by the natives in West Java in the preparation of a sweetmeat known as 'ontjom' composed of the seeds of the ground-nut or earth-nut (*Arachis hypogæa*). The ground-nuts, which are thoroughly permeated by the fungus, are made up in the form of small, orange-colored cakes, the surface of which is covered with the conidia, whilst the interior is both chemically altered and loosened in structure by the mycelium." Sect. 315 (p. 336-39) is titled "Oidium lactis and allied species." Also discusses *Oidium lupuli,* Matthews and Lott (p. 338). Address: Prof. of Fermentation-Physiology and Bacteriology, Imperial Technical High School, Vienna.

• ***Summary:*** Chapter 47, titled "The Soya Bean," begins: "The history of the growth of the bean trade in Manchuria is a captivating as the story of the rise of Jack's famous beanstalk of our nursery days. It reads more like a fairy tale than a page from the Board of Trade Returns. Only after one has travelled through the region where the Soy Bean reigns supreme, and has seen the wharves and the warehouses, the stations and the platforms, laden with bags of Beans, and noted the thousands of queer-looking stacks with pagoda-like roofs with which the country is dotted, and which serve as temporary storehouses for the produce while awaiting shipment, does one realise that it is not a fable, but a veritable fact in the history of international commerce... And the manifold uses, agricultural and industrial, as well as dietary, to which the bean can be put, invest this generous vegetable with increasing importance, and the future of the Bean crop with romantic mystery."

1543. Sawer, E.R. 1911. Cedara memoirs on South African Agriculture. Vol. II. Containing reports on feeding crops and livestock experiments in South Africa. Natal/ Pietermartizburg, South Africa. 371 p. See p. 131, 177, 183-218. Report X. The Legumes as Grain and Oil Crops: Soya Beans. [15 ref]

• ***Summary:*** A superb, early overview of soybeans and their uses in South Africa and England. Contents: An agricultural romance. Early experiments with the soya bean [in Europe and South Africa]. Export trade from Manchuria. The course of prices. Consumption in Great Britain. Botanical character. The commercial aspect. History of the oil market during 1910. The adaptability of the bean. Germination of seed. Climatic requirements. Classification of varieties. Variety tests at Cedara: Black seeded (Buckshot and Nuttall tested in 1906), brown seeded, green seeded (Samarow and Guelph), yellow seeded (Mammoth and Hollybrook, planted Nov. 1908). The cultivation of the crop. Times of planting. Distances of planting. Manure experiments at Cedara. Nodule formation and composition of the plant. Harvesting soya beans. Storage of seed. Comparative yields of grain. Soya bean oil. Uses of the oil [for cooking, paint, soap, etc.]. Soya beans as human food (incl. natto, tofu, miso, yuba, shoyu {p. 209-11}). Digestion experiments [on humans in Japan]. Milling experiments. Soya beans as stock food and fertiliser. Live-stock experiments. Soya cake as fertiliser. Soya bean as green forage.

Concerning industrial utilization: The Vice-Consul-General at Yokohama writes that "the annual value of fertilisers employed in this country (Japan) amounts on an average to about £8,000,000 represented in equal proportions by artificial fertilisers and soya bean cake." The year 1908 was exceptional, however, in that the value of the bean cake was 3.5 times that of the artificial fertilizers.

During 1910 the linseed oil reached its highest price in 50 years. Soya oil, now produced in large amounts in Manchuria after the Russo-Japanese war took its place. It was used in making paints, candles, and soaps. "Soya bean oil has been found eminently suitable for the soap-makers' purpose on account of its low content of free fatty acids and of unsaponifiable matter or impurities. In the latter respect it has been shown superior to any of the other oils or fats of commerce, whether of vegetable or animal origin. The glycerine, which is secured as a by-product of soap and candle manufacture, is subsequently distilled for explosives, such as dynamite, blasting gelatine, cordite, etc., and for various purposes in the arts, for filling gas-metres, for the manufacture of inks, printers' rollers, etc. The residue from the distillation of glycerine is used in the manufacture of boot blacking."

Concerning germination (p. 191): At Cedara: "The first crop was planted in 1903, and a maximum yield of 920 lb. of grain obtained per acre. In the following season, characterized by unfavourable weather conditions, the heaviest yield on a new series of plots was 780 lb. per acre. A third season's trial on the same ground, however, witnessed a marked increase with local seed, the heaviest crop totalling 1,252 lb. of grain."

Concerning soybean cultivation in British colonies in Africa (p. 192): "Early last summer the late Sir Alfred Jones shipped to West Africa soya beans for experimental purposes, and it was subsequently reported by Mr. A.G. Turner, who was entrusted with a special mission to encourage this culture on the west coast, that the soya bean could be successfully cultivated throughout the Gambia, Sierra Leone, Nigeria, and the Gold Coast Colony, but that the yield to the first experiment had only been from six to

© Copyright Soyinfo Center 2014

eight bushels per acre, there having been a considerable loss owing to faulty germination. Later results, however, were phenomenally successful."

Concerning soybean trials in South Africa (p. 192-93): "During the past year favourable results have been received from Umzinto [from Messrs. Archibald and Co., 52 miles south of Durban; elevation 300 feet], Nel's Rust Estate [64 miles north of Durban; elevation 2,710 feet], Nottingham Road [elevation 4,807 feet], and Naval Hill [Mr. J.R.T. Clouston of Garrow planted a few acres in 1908], Colenso [elevation 3,200 feet], and Cedara [82 miles by rail from Durban; elevation 3,540 feet; a number of varieties were tested in 1906] in Natal; and from Barberton and Pretoria in the Transvaal."

Concerning comparative yields (p. 203): "As a grain producer, the soya bean compares very favourably with other leguminous crops, such as field beans, peas, etc. At Cedara no other legume has produced, with chemical manures only, so heavy a yield of seed; and no other legume, except the lupine, has showed itself so much to be depended upon as a grain producer." "Land that will produce 10 muids of maize per acre should yield at least six muids of beans after the second year's cultivation,..."

Concerning human digestion experiments (p. 212): "The general opinion of Japanese investigators, and others familiar with Oriental dietetics, is that the protein in articles of food prepared from soya beans is in a very available form, and that these preparations are most valuable foods."

Five photos show various men standing in a crop of soya beans and in some of the variety plots at Cedara (1909-11). An illustration (line drawing) shows a curing frame for soya beans.

Tables show: (1) Yields in lb. per acre of soya beans sown at different times, during 3 years (19-3-04 to 1905-06). For each year is given: Date of sowing, date of harvest, yield of grain and straw, and manures used (superphosphate, gypsum, and potash). The variety tested was Henderson's Early Green (Guelph) (p. 198). (2) Results of manure experiments with soya bean (Early Green) in lb. per acre. Sown 4 Nov. 1904. Harvested 13 March 1905. Increasing yields "may be attributed to the association of nitro-bacteria, the benefits of constant cultivation, and the accumulation of humus and residues of fertilizers" (p. 200). (3) Feeding value of soya bean cakes for manure, based on experiments by Messrs. Lever Bros., Port Sunlight, Liverpool (p. 215).

Note 1. This is the earliest document seen (June 2004) that mentions the use of a soy oil derivative (glycerine) in printing inks.

Note 2. This is the earliest document seen (May 2004) that mentions the use of soy oil to make candles (one of two documents).

Note 3. This is the earliest document seen (June 2004) concerning the use of soy oil (or the glycerine derived from it) to make explosives.

Note 4. The next section of this report (p. 218+) is about ground nuts (*Arachis hypogoea*). Address: Director, Div. of Agriculture and Forestry, Natal; Principal, Cedara School of Agriculture; Formerly Asst. Secretary of Agriculture, Southern Rhodesia.

1544. Stuart, George A. 1911. Chinese materia medica: Vegetable kingdom. Shanghai, China: American Presbyterian Mission Press. 558 p. See p. 189-96, 411. 23 cm. Reprinted in 1928 in Shanghai at the Presbyterian Mission Press. [6 ref]
• ***Summary:*** Below the title is written: "Extensively revised from Dr. F. Porter Smith's work." This excellent book contains good summaries of the information on soyfoods found in the famous *Pen-ts'ao kang-mu* (1578-1597) by Li Shih-chen. Rev. Stuart, a physician (M.D.), minister, and missionary in China, adds a number of observations on medicinal properties ascribed to these foods by the Chinese. He began to write this revision of Dr. Smith's 1871 work in 1900 when the Boxer trouble (movement) drove him to Shanghai. He died shortly before the work was published and before he was able to finish the Preface. The section on the soy bean (p. 189-96) begins: "Glycine hispidia [sic, hispida].–(Ta-tou), (Shu), (Jên-shu), (Jung-shu), (Shih-tou), (Hei-tou), (Huang tou) (Chinese characters given before each term). This is the same as *Soja hispidia* [sic, *hispida*] and *Dolichos soia* [sic, *soja*], and is the Chinese and Japanese *soy bean.* It has been known in China from ancient times, and has always been considered by the Chinese as the most important of the cultivated leguminous plants. A very large number of varieties is found throughout the Empire, especially in the north. The name 'great bean' applies to the plant, not to the seeds, as these are quite small. It is employed in China and Japan in the preparation of three products which are of almost universal use in oriental cookery. These are 'bean oil,' 'bean-curd,' and 'soy.' There are many varieties of this bean, which the Chinese distinguish by the color of the seeds; these being black, white, yellow, gray, azure, and spotted."

"The black sort [of soybean] is used in medicine, and the yellow is especially valued in the preparation of bean-curd [tofu] and soy [sauce]. The black kind is not used much as food as it is thought to render the body heavy. The Chinese regard those things which give lightness to the body with more favor than those which promote flesh and sluggishness. The characters (Shu) (three separate Chinese characters are given) are the classical name, while (Jên-shu) and (Jung-shu) (Chinese characters given before each) are equally ancient compound names for this plant. (Chinese characters given) (Shih-tou), 'bean-relish bean,' indicates its use in making the bean relish and soy [fermented black soybeans and soy sauce].

"Medicinally, the black beans are considered to have much value. Their frequent use is thought to have a most beneficial effect upon the body, giving strength and vigor,

© Copyright Soyinfo Center 2014

albeit with heaviness. This latter fact is the only objection offered to the use of these beans. They are regarded as an admirable counter-poison against most of the vegetable poisons, such as *Aconite* and *Croton tiglii.* Carminative and quieting properties are also ascribed to them. They are prescribed in a large number of difficulties, notably post-partum and sexual disorders; but as they are always in combination with other active drugs, it may be readily supposed that the beans play no very important part in these prescriptions. The green bean hulls, 1317, chewed into a pulp, are applied to small pox ulcers, corneal ulcer, and the excoriation produced in children by urine. The bruised leaves of the plant are used as a local application in snake bite. The flowers, 1310, are used in blindness and opacity of the cornea."

"The *bean sprouts,* called (Ta-tou huang-chüan) and (Tou-nieh) (Chinese characters are given before each term) are also mentioned in the *Pentsao.* Bean-sprouts (Chinese characters are given, Tou-ya) are a common article of diet with the Chinese, but these former are made with the black bean and are especially used in medicine. Li Shih-chen gives the following method of preparation: "On a water day (Three Chinese characters) soak black beans in clear water, and after the sprouts have grown, take off the hulls and dry the sprouts in the shade." Their medical properties are considered to be laxative, resolvent, and constructive. They are reputed to have special influence upon the growth of the hair, and to be curative in ascites and rheumatism.

Note 1. This is the earliest English-language document seen (Jan. 2013) that uses the term *Ta-tou huang-chüan* or the term *Tou-nieh* to refer to soy sprouts.

Note 2. *Webster's Dictionary* defines ascites (pronounced uh-SAIT-ez, and first used in the 14th century) as "accumulation of serous fluid in the spaces between tissues and organs in the cavity of the abdomen."

"The yellow variety of beans is also given a separate discussion in the *Pêntsao.* As was before said, these are used for the most part in the preparation of bean oil, bean-curd, and soy [sauce]. The beans and pods of this variety are larger than those of the black kind, and in the green state they are highly esteemed by the Chinese as an article of food [green vegetable soybeans]. But they are also considered 'heavy,' and if partaken of too freely they are thought to produce jaundice. They are considered to be carminative and deobstruent, and are recommended in ascites. Locally they are applied to smallpox ulcers. The ashes of bean stalks are specially recommended as an application to unhealthy granulations in hemorrhoids (possibly fungous growths of the anus).

"The [soy] oil, (Chinese characters for bean + oil) (Tou-yu), is considered to be very slightly deleterious, and is used as a local application to ulcers and skin diseases, and for removing bandoline (defined by the *Oxford English Dictionary* as "a gummy preparation for fixing the hair or a moustache" and in use by 1846) from the hair. This oil is manufactured in large quantities, especially in Manchuria, and is shipped to every part of China. It is used as food, chiefly by the poorer people, and was formerly used as a burning oil; but kerosene has now almost superseded it for this latter purpose. It is usually dark colored, and has a not very pleasant odor."

On page 411 we read: "Soja hispida–(Chinese characters for white + bean) (Pai-tou). Also called (Chinese characters are given) Fan-tou. This is a small bean, a variety of *Glycine hispidia* [sic, hispida], the stalks of which, when young, are eaten as a pot-herb. The bean is sometimes used to make soy [sauce] and bean-curd, and is eaten boiled and as a congee. It is considered to belong to the kidneys, therefore those suffering from diseases of this organ should use it. The bean is regarded as very nutritious, and both it and the leaves benefit the viscera."

Note 3. Congee is rice cooked with excess water to make a porridge. In China, there are many types of medicinal congee (*jook*) containing grains, vegetables or herbs, eggs, meat, etc. See: Flaws, Bob. 1995. *The Book of Jook: Chinese medicinal porridges.* Boulder, Colorado: Blue Poppy Press. $16.95. Address: Rev., M.D., Shanghai, China.

1548. Zavitz, C.A. 1911. The professor of field husbandry and director of field experiments. *Ontario Agricultural College and Experimental Farm* (*Guelph*)*, Annual Report* 36:169-247. For the year 1910. See p. 217-18.
• ***Summary:*** The section titled "Varieties of soy beans" (p. 217-18) states: "Soy beans or Japanese beans have been advertised in seed catalogues under the name of Soja beans. During recent years, a considerable interest has been taken in this crop in England, the United States, and in Canada... Probably thirty varieties in all have been under experiment in our college, but only a few of these ripen their seed. The two varieties that have become the most prominent in our experiments at Guelph are Early Yellow and Medium Yellow. [Note: The Guelph variety was not developed in Canada.] The Early Yellow variety has proven to be one of the best for most parts of the Province as it yields very well and matures early. In the average results of growing the Early Yellow Soy Beans at the College in each of fifteen years we have obtained exactly 15 bushels of threshed seed per acre.

"In 1909 and again in 1910, no less than sixteen varieties of Soy Beans were grown in the Experimental Department. A number of these were tested in 1909 for the first time, several of them being obtained from Dr. Piper, Department of Agriculture, Washington [DC]."

In 1910 soybean trials, the greatest yields were obtained by the following varieties: Chernie 23.5 bushels/acre, Habara [Habaro] 21.6 bu, Buckshot 21 bu, Tsurunoko 19.6 bu, Akasaya 17.5 bu, and Early Yellow 17.2 bu. All other varieties gave 15 or less bushels per acre. Address: Guelph, Ontario.

1552. Howland, John A. 1912. The week's progress: Substitute from rubber from bean. *Chicago Daily Tribune.* Feb. 4. p. E4.
• ***Summary:*** "One of the many proposed substitutes for rubber is obtained from the soya or Manchurian bean, which resembles the kidney bean, and is being introduced from Japan and the East Indies into other countries. A rubberlike product that can be vulcanized is obtained by treating the bean with nitric acid, alkalies, and great heat."

1553. Horne, H. 1912. China (Manchuria). Bean trade. *Board of Trade Journal* (*London*) 76:489. Feb. 29.
• ***Summary:*** "Something like a deadlock has recently been experienced in the staple export trade of this district as a consequence of over-trading and speculation on forward contracts. The radical cause of the trouble is the non-existence of any custom which demands earnest money from buyer or seller at the time of transacting forward business...

"Increased prosperity has enabled the Chinese farmer, who is still mindful of the high prices ruling at the close of the last two seasons, to hold up his stocks. As a result of this action high prices ruled, and the smaller dealers, who speculated on normal conditions, were not able to fulfil their forward contracts with the market against them. Speculation was not confined to bean dealers alone; the local oil and cake millers acted on similar lines.

"As a remedy for the disturbance three measures were proposed, two of which are, indeed, already in operation. The first was the suspension of all forward contracts; the second, a compulsory deposit, upon definite terms, of guarantee money ranging from 10 per cent. to 50 per cent. from buyer and seller. These measures were proposed by a Committee of the Staple Produce Dealers' Association. The third measure was a proposal for the settlement of prices on forward contracts then falling due by a committee composed of the Civil Administrator of Dairen, and representatives of the Yokohama Specie Bank and the Mitsui Bussan Kwaisha.

"Up to the end of January the exports of beans to South China showed a decrease of 65 per cent. on the figures for the corresponding period of last year; exports to Japan maintained their position; Europe has taken about 15,500 tons." Address: British Acting Consul, Dairen.

1554. Li, Yu-ying; Grandvoinnet, L. 1912. Le soja [The soybean]. *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) 12(107):120-32. Feb. [12 ref. Fre]
• ***Summary:*** Contents (continued): 2. Soy flour and its derivatives: Soy flour (preparation, chemical composition), soy bread (*pain de soja*), wholemeal bread (*pain complet*), other products based on soy flour (as biscuits and cakes for diabetic diets). 3. Soy oil and by-products of the oil mill: Soy oil (physical and chemical properties, usage, price), residue of the oil mill: the cake (price, uses). 4. Use of the soybean as a legume: Whole soybeans (composition, digestibility),

© Copyright Soyinfo Center 2014

soy sprouts (*germes de soja*), green vegetable soybeans (*le soja frais*). 5. Fermented soy condiments–Solid condiments from Japan: Tokyo natto (*Le Tokio-Natto,* whole fermented soybeans, without salt) and Ping-Ming natto. (*Le Ping-ming-Natto;* fermented black soybeans with salt, ginger, orange rind, etc. A similar product is made in China and called *tao-tche*).

Note 1. This is the earliest French-language document seen (Feb. 2004) that uses the term *Tokio-Natto* to refer to natto.

Note 2. Footnote 2 under Soy bread (p. 122) states: "M. Dujardin-Beaumetz, *L'Alimentation et les Régimes;"* Soy bread constitutes a major step forward in the feeding of diabetics; it has a long shelf life and a relatively agreeable flavor.

Note 3. The book referred to here is probably: Dujardin-Beaumetz, Georges Octave. 1889. "L'hygiène alimentaire: Aliments, alimentation, régime alimentaire dans les maladies. Deuxième édition revue, corrigée et augmentée" [Food hygiene: Foods, feeding, special diets for illnesses. 2nd ed., revised, corrected, and expanded]. Paris: Octave Doin. viii + 239 p. Series: Conférences de Thérapeutique de l'Hopital Cochin, 1885-1886. Illust. Address: 1. Counseiller de 1ere classe au Ministère de l'Agriculture de la Chine; 2. Ingénieur agricole (G.).

1555. Williams, C.G.; Welton, F.A. 1912. The soybean and cowpea. *Ohio Agricultural Experiment Station, Bulletin* No. 237. p. 239-61. Feb.

• ***Summary:*** Contents: Uses: As grain, hay, silage, a soiling crop, pasture, and for soil renovation. Culture: Soils, fertilizers and inoculation, seedbed, cultivation, time of seeding, rate of seeding, manner of seeding. Harvesting: Hay, silage, seed, threshing. Varieties: Table III (p. 252) describes 32 varieties of soybeans including their weight, color, manner of growth, date of bloom, color of bloom, and average height of plants. Table IV (p. 253) gives the yield of grain and straw for 32 varieties and includes the average date of maturity, average number of days to maturity (112-135), average yield per acre of beans (1908-11, plus 2 year and 4 year averages; highest 2 year average was 25.5 bu/acre) and of straw (highest 2 year average was 2,275 lb/acre), pounds of straw per bushel of grain (63-116), and retention of beans (Good, fair, or excellent), and enemies of soybeans ("So far as this Station is aware, there are no enemies of economic importance to the soybean in the state."). Table V (p. 255) shows many varieties of soybeans grouped into early (116 days or less), medium (117-126 days), and late (127-132 days). For each variety is given: Average date of maturity in Ohio, average number of days to maturity, two-year average yield per acre of beans and straw, and weight per bushel of seed.

"Within the last twenty or twenty-five years it [the soybean] has gained considerable prominence in the agriculture of several states, notably Massachusetts and Kansas, into both of which states the seed was imported direct from Japan. The wide variations in different varieties as regards time of maturity, permit it to be grown pretty generally throughout the United States. Roughly speaking, the earliest varieties can be grown successfully as far north as corn. In Ohio the acreage at present is not large, but is rapidly increasing. The Ohio Experiment Station has been growing soybeans continuously in a small way since 1894. From year to year the acreage has been gradually increased, until now about fifteen acres are grown annually."

Harvesting: The harvesting of soybeans for hay is "the most difficult work connected with the growing of the crop. No satisfactory machinery especially adapted to handling them has as yet been placed on the market... For the harvesting of soybeans for seed, probably the best machinery available is either the ordinary mower with side delivery attachment, or the old-time self-raking reaper.

"Threshing: While it is essential to have soybeans well cured before threshing, yet at the time of threshing it is desirable that they be damp or 'tough.' In this condition they can be threshed in an ordinary threshing machine with very little cracking of beans, providing the machine be run slowly and with blank concaves."

Photos show: A field of soybeans, July 27, 47 days after planting (oval photo on cover). A soybean plant with leaves removed and many pods visible (p. 242). Soybean roots with and without nodules (p. 246, from *First Principles of Soil Fertility,* by Vivian).

Note 1. This is the 2nd earliest English-language document seen (July 2003) with the word "soybean" or "soybeans" in the title. Note that this is an experiment station publication.

Note 2. This is the earliest English-language document seen (Aug. 2001) that uses the term "enemies" (or "enemy") in connection with soybean pests.

Note 3. This is the earliest document seen (Jan. 1998) that mentions the use of a reaper (self-raking reaper) for soybean production. Address: 1. Chief, Agronomy; 2. B.S., Asst., Agronomy. Both: Wooster, Ohio.

• ***Summary:*** "The new bean-oil mill of Kiosensha & Co. (Japanese), at old Harbin, has been completed, inspected, and passed by the technical and sanitary committee of the Chinese Eastern Railway, and will soon be in operation."

"The soya bean market of Harbin is inactive now and has been for three weeks. This may be partially accounted for by the Chinese new year, but the main cause was the heavy purchases prior to the holidays by Mitsui & Co. These purchases totaled about two-thirds of the available stocks, and forced the price so high that it was impossible to ship. The heavy purchases were apparently made in an effort to corner the market... The price has gradually dropped to 64 kopecks (33 cents) per pood (36.112 pounds), but no sales are being recorded." It is reported that "Mitsui & Co. have a stock of 1,000 cars at Vladivostok."

"Two bean-oil tank cars constructed at the railway workshops, Dalny, were subjected to a trial run with satisfactory results. Each car has 27 tons capacity and is partitioned into four chambers for transporting oil in small consignments."

Note: This the earliest document seen (Jan. 2010) that uses the term "tank cars" (or "tank car") to refer to a railroad car with a tank mounted on top for carrying liquids–in this case [soy] bean oil. Address: Consul, Harbin, China.

1561. *Agricultural J. of India* (*Calcutta*). 1912. Soy beans. 7(2):207-08. [1 ref]
• ***Summary:*** "The Report on the Agricultural Stations in the Central Provinces and Berar for the year 1910-11 contains a few notes on the experiments with the cultivation of Soy Bean at the Powarkhera and Nagpur College Farms." At Powarkhera, a small-seeded Japanese variety grew splendidly and gave a yield of about 800 pounds of beans per acre. But analysis showed that these beans contained only 10% oil and are thus more suited for forage purposes. On the Nagpur College Farm, the farm variety, introduced in 1882, was grown on an extended scale this year with and without superphosphate: 10 acres were sown... Some 15 new varieties were tried this year. At Pusa, too, soy beans obtained from Nagpur were tried, with the result that a yield of nearly seven maunds per acre was obtained, which is not sufficient to pay for the cultivation and for the occupation of the land for two seasons.–[Editor].

1562. Eichenger, A. 1912. Ueber Leguminosenanbau und Impfversuche [Regarding legume cultivation and inoculation experiments]. *Pflanzer* 8(4):190-219. April. English-language summary in USDA Experiment Station Record 27:419. [8 ref. Ger]
• ***Summary:*** Soy beans are discussed extensively on p. 210-15. Experiments were made to determine the value at Amani, German East Africa, of inoculating soils with nitrogen-fixing bacteria, with and without fertilizers, for the growth of various crops including soy beans, cowpeas, *Desmodium tortuosum,* and *Canavalia ensiformis* [jack bean], and the value of these crops for green manuring purposes. Eichinger observed that superphosphate increased the production of nodules, whereas sodium nitrate inhibited nodule formation.

Eight soybean varieties were tested–with all but the first obtained from Yokohama. Chinese white type (2). Natsu-Mame (white). Shiro Daizu (white). Kuro Teppo (black). Kuro Mame (black). Ao Mame (white). Gogatsumame (white). Daizu (white). Soy beans require a special type of bacterium for inoculation. However these studies seemed to indicate that the production of soy beans is not profitable in

this area.

Note 1. As of Jan. 2000, Amani is in Tanzania.

Note 2. This is the earliest document seen (Aug. 2009) concerning soybeans in Tanzania, or the cultivation of soybeans in Tanzania.

Note 3. This is the earliest English-language document seen (Oct. 1999) that uses the term "sodium nitrate" (as a fertilizer) in connection with soybeans. It was often previously named "nitrate of soda." Address: Dr., Amani [German East Africa].

1563. *J. of the Board of Agriculture* (*London*). 1912. Cultivation of soy beans in Britain. 19(1):33-35. April.
• ***Summary:*** "Previous to 1909 a few attempts to grow the crop [soy bean in England] had been made, but without any great success; at best, the plants obtained grew up to the flowering stage, but no seed was formed. The Board, thinking it possible that the seeds previously tried might have come from hotter climates and have been of varieties quite unsuited to this country, obtained from an Experiment Station in North Japan, seed of sixteen varieties of soy bean, along with a small quantity of soil in which the crop had been grown. These were grown in 1909 by Mr. Jay Golding at the Midland Agricultural College, and Professor [Roland] Biffen at Cambridge.

"In the autumn of 1909 Mr. Golding reported that the seeds were sown on May 6th, and many of them grew well and vigorously, but none flowered. Even some lifted and placed in a greenhouse refused to do so. The plants were, however, strong and healthy, and the roots were covered with an abundance of large nodules. At Cambridge the results were similar..."

"These experiments appeared to suggest that Japanese varieties were not suited for conditions here, so in the following year the Board obtained, through the Seed Crushers' Association, some Manchurian soy beans. One sample had been grown in North Manchuria, the other in the South, and each clearly contained several distinct varieties. These were grown as before by Mr. Golding and Professor Biffen. The former reported that again, though the crop had grown vigorously with abundant formation of root nodules, no seed matured. At Cambridge the test was more successful, the plants, though not growing very vigorously, flowered about mid-August and ripened a small quantity of seed about the end of September. This seed was sown in April, 1911, but the crop made very little growth, and in spite of the hot season no seed was produced.

"These results soon to prove fairly conclusively that none of the varieties of soy bean yet tried can be relied on to produce seed... Apart from seed-production, the plant has, however, a considerable value as a forage crop, and it is quite possible that in some cases it may be found useful for that purpose in this country... Mr. Golding has supplied the following analyses of the green forage produced by the two varieties of Manchurian bean in 1910."

1564. Yokohama Nursery Co., Ltd. 1912. Descriptive catalogue... Bulbs, plants seeds. 1912-1913. Yokohama, Japan. 112 p. April. Illust. Index. 26 cm. [Eng]
• ***Summary:*** On the cover of this English-language catalog is an illustration of leguminous flowers. In the section on "Seeds" (p. 90+) is a subsection (p. 97) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is identical to that in the 1911 catalog. Address: P.O. Box No. 72. 21-35 Nakamura, Yokohama, Japan. Phone: 509.

1565. Pontius, Albert W. 1912. Soap from soya beans. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 15(107):494. May 6.
• ***Summary:*** "A good portion of the many thousand tons of Manchurian beans exported to Europe returns to the Far East in various forms of manufactures, such as soap (bean oil constituting an important ingredient), refined oil, soya biscuits, etc.

"The merits and economy of bean oil as a substitute for coconut oil and tallow have been scientifically established. For this purpose, however, the crude bean oil, as produced by the crushing mills here, must undergo a refining process. This is still a technical experiment at the local central laboratory, which seeks to provide a process commercially feasible and available to those with small capital. The few soap factories in Dalny and elsewhere in Manchuria must now mix other fats, such as coconut oil, to the bean oil to secure the proper solidity.

"About one and one-half years ago Lever and other large British soap makers became interested in Manchurian beans as a desirable material. It is understood that Lever will establish a soap factory at Kobe for utilizing Manchurian bean oil, notwithstanding that soda, another important soap ingredient, is not yet produced in Japan..."

A note appended by the Bureau of Manufacturers states that American soap factories imported $2,685,596 worth of soya bean oil in 1911. Address: Consul, Dalny, Manchuria.

1566. Hanzawa, Jun. 1912. Ueber Pilze und Zusammensetzung des japanischen Tamari-koji [On the mold and composition of Japanese tamari-koji]. *Mycologisches Centralblatt* 1(6):163-66. June 8. [9 ref. Ger]
• ***Summary:*** There are three types of Tamari-Shoyu: Kibiki- (the best, made by short cooking of the soybeans), Niira- (made by long cooking of the soybeans), and Ban-Tamari-Soja (made by cooking the residue from one of the first two types in salt water).

Note: The author was in Hannover, Germany, when he finished this paper in May 1912. Address: Lab. for Applied Mycology, Agricultural Institute of the Tohoku Imperial Univ., Sapporo, Japan.

1569. Pontius, Albert W. 1912. Manchurian trade notes. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 15(205):1100-01. Aug. 30.
• ***Summary:*** A table shows the exports of [soya] beans, bean oil, and bean cake from Dairen, for the four years from 1908-09 to 1911-12. The export season starts in November and closes in May of the following year.

Soya beans rose from 348,878 tons in 1908-09 to a peak of 357,166 in 1909-10, then fell to 258,731 in 1910-11, and even further to 161,285 tons in 1911-12.

Soya bean cake fell from 285,546 tons in 1908-09 to a peak low of 146,688 tons in 1909-10, then rose to 351,119 in 1910-11, and even further to a peak of 370,490 tons in 1911-12.

Soy bean oil rose steadily from 8,957 tons in 1908-09, to 13,552 in 1909-10, then to 28,669 in 1910-11, and finally to a peak of 33,574 tons in 1911-12.

Upon first glance at the foregoing figures one might infer that the export trade in staple produce might be seriously affected by the steady decline in export of beans. It can be shown, however, that the contrary is actually the case. Apart from bean cake, which is merely a by-product obtained in the manufacture of bean oil exported during the foregoing respective seasons may be had by calculating at the rate of 12½ pounds of beans to 1 pound of oil.

"In the following table the exports of oil have converted to beans on the basis stated, and these, added to the exports of beans as given in the preceding table, show the actual total exports."

Total exports of bean equivalents rose from 466,840 tons in 1908-09, to 526,566 in 1909-10, reaching a peak of 617,103 in 1910-11, then falling 6% to 581,060 in 1911-12.

"At the beginning of the 1911-12 season there were 45 bean-oil mills in operation in Dairen, all under the control of either Japanese or Chinese owners." The manufacture of soya bean oil is the most important local industry. Address: Consul, Dalny.

1570. Carlyle, W.L.; Iddings, E.J. 1912. Hog raising for the Idaho farmer. *Idaho Agricultural Experiment Station, Bulletin* No. 74. 31 p. Aug.
• ***Summary:*** A table (p. 4) shows results of a test by the Missouri Agric. Exp. Station of the pork producing capacity of various pastures. Soy beans gave poorest results in terms of both pounds of pork per acre of pasture (183.1, vs. 598.5 for alfalfa) and value of pork from an acre of pasture ($10.99 vs. $35.71 from alfalfa). The Idaho station has conducted three of its own experiments for finishing hogs for market during the last 2 years. A table (p. 6) shows that one of the feeds used was "Soy bean meal (Proteina)" costing $1.90 per 100 lb on average. Note 1. This Proteina brand meal was probably made by Pacific Oil Mills in Seattle, Washington, starting in 1911.

Some of the meal was "imported from Japan and cost $38.00 per ton (2,000 lb) laid down in Moscow, Idaho. It is the ground form of the cake left after the extraction of oil from the soja or soy bean. It is guaranteed by dealers to contain 50 per cent protein."

Note 2. There is no mention in this publication of soybeans being grown in Idaho. Address: 1. Director of the Station; 2. Animal Husbandman, Dep. of Animal Husbandry, Moscow, Idaho.

1571. *New York Times.* 1912. Gives out secrets of making ammonia. Sept. 12. p. 6.
• ***Summary:*** An overview of the Eighth International Congress of Applied Chemistry, held in New York City at the Horace Mann Auditorium.

The section titled "Natto, a cheese" states: "S. Muramatsu of the College of Agriculture, Morioka, Japan, read an interesting paper on natto. Natto is a vegetable cheese much used in Japan. It is made by fermenting boiled soya beans wrapped in rice straw and set in a warm cellar for one or two days. It is consumed as 'an accessory,' (by which Dr. Muramatsu apparently means a relish or condiment,) after having been mixed with table salt and several stimulants 'amongst others the powdered mustard is preferred.'

"It is, according to the Doctor, a very good and economical foodstuff, rich in protein, and particularly valuable to the Japanese because of their large dependance on rice, which is almost entirely carbohydrate."

• ***Summary:*** Includes a discussion of *Saccharomyces Soja,* a yeast that forms a film on the surface of shoyu. Address: Technological Faculty, Imperial University, Tokyo [Japan].

1574. Li, Yu-ying; Grandvoinnet, L. 1912. Le soja: Sa culture. Ses usages alimentaires, thérapeutiques, agricoles et industriels [The soybean: Its culture. Its food, therapeutic, agricultural, and industrial uses]. Paris: Augustin Challamel (Rue Jacob 17). 150 p. Illust. Index. 25 cm. Translated into French and expanded from the Chinese edition, published by la Societé Biologique d'Extréme-Orient (1910). [151 ref. Fre]

• ***Summary:*** One of the earliest, most important, influential, creative, interesting, and carefully researched books ever written about soybeans and soyfoods. Its bibliography on soy is larger than any published prior to that time. It was first published as a series of eight articles in *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) from September 1911 to April 1912. Before being published as a book, it was revised slightly by adding a table of contents at the back, dividing the material into 5 parts with 19 chapters, and adding several photos (p. 16-17), a world map showing the distribution of soybean cultivation (p. 21), and an interesting 2-page table (p. 66-67).

Contents: The soybean: Origin and history. Part I: Soybean culture. 1. Species and varieties of soybeans: Botanical characteristics, species, varieties (Chinese, Japanese, Indian, Indochinese, Hawaiian, USA, European). 2. Needs of the soybean: Climatic, geographical area of the soybean by region worldwide, agrological/soil needs, fertilizers, soil preparation, the place of the soybean in crop rotations. 3. Soybean seeds: Study of seeds (by weight, by germination rate, selection of seeds), time of planting, plant spacing, depth of seeding, rate of seeding per hectare, method of seeding (broadcasting, in rows, in mounds). 4. The soybean during its vegetative stage: Germination, transplanting, types of care (e.g., second dressings), irrigation, flowering and fruiting, enemies of the soybean (e.g., insects). 5. Harvest of soybeans: Time for harvest (forage or grain), methods of harvesting (forage or grain; mechanical mower), threshing (use of machine), yields of soybeans (forage and grain in various countries, ratio of seeds harvested to straw is about 1 to 2, yield of nutrients). 6. Fixation of atmospheric nitrogen by soybeans, and improvement of the soil. 7. The soybean in mixed cultures and alternate rows: With corn, cowpeas, rice, sweet sorghum, or millet.

Part II: Chemical composition of the soybean. 1. Composition of the plant: Minerals in the leaves and total plant. 2. Study of the seed: Composition, chemical composition, microscopic comparisons, table of analyses by 28 previous researchers, albumins, sugars, starch, dextrin or dextrine, diastase, lipids, ash/minerals.

Part III: The soybean as human food and animal feed. 1. The soybean as feed for animals: Green forage and hay. 2. The soybean in human feeding: From the viewpoints of physiology, economy, and gastronomy. The role of soya in special diets: Vegetarianism, remineralization, diabetic, and lactose intolerant.

Part IV: Food products based on soya. 1. Soymilk and its derivatives: Soymilk (Methods of manufacture, Chinese and modern at l'Usine de la Caséo-Sojaïne, nature and properties [physical and chemical] and composition of the milk, action of ferments and diastases (enzymes) on the milk, uses of the milk, the residue from the soy dairy [okara], condensed soymilk, powdered soymilk, fermented soymilk (kefir, yogurt, etc.)), tofu (called Caséo-Sojaïne, or fromage de soya; methods of production, coagulants, yield of tofu, storing tofu, composition and comparison with various meats, digestibility, culinary preparations made from tofu (smoked tofu, tofu pâté, tofu sausages)), Soy casein (food and industrial uses). 2. Soy flour and its derivatives: Soy flour, soy bread, wholemeal bread, other products based on soy flour (as biscuits and cakes for diabetic diets). 3. Soy oil and its by-products: Soy oil, physical and chemical properties, usage, residue of the oil mill: the cake, price, uses. 4. Use of the soybean as a legume: Whole soybeans (composition and digestibility), soy sprouts (*germes de soja*), green vegetable soybeans (*le soja frais*). 5. Fermented soy condiments: Solid condiments from Japan: Tokyo natto (*Le Tokio-Natto*) and Ping-Ming natto or tao-tche (*Le Ping-ming-Natto;* fermented black soybeans with salt, ginger, orange rind, etc. A similar product is made in China and called tao-tche). Paste condiments: Miso (four types and composition), tao-tjung (Chinese miso). Sauces: Shoyu (its production, varieties, properties, composition), chiang-yu (*tsiang-yeou*), ketjap [kechap, from Java], tuong (from Annam, with rice or corn), tao-yu (widely used in China and Japan, described by Prinsen Geerligs). 6. Confectionery products: Comparison with chestnuts, roasted soy flour to replace chocolate. 7. Soy coffee (with analysis by Kornauth). 8. Special fermented products: Kiu-tsee (a special commercial ferment from Canton described by Thiersant), fermented soymilks.

Part V: Industrial uses of soybeans. Oil based: soap, wax candles (*bougie*), and paint oils. Protein based: sojalithe or soy stone which corresponds to lactite, insulators for electrical apparatus, glue, etc. Conclusion. Addendum (*Complément*) to Part III, Chapter 1: Soybean straw and stems. Composition of various seeds, including soybeans. Soy flour. The cakes from oil mills. Soymilk and the cake from soy dairies (*tourteau de laiterie,* okara).

A very interesting table (p. 66-67, which does not appear in the original 8 articles) shows earlier nutritional analyses of the composition of soybeans by Steuf (from Hungary, Mongolia and China), Schroeder, Caplan, Pellet (from China, Hungary, Etampes), Muntz, Nikitin (black soybeans from Russia, 2 samples), Lipski [Lipskii] (yellow, from Russia), Giljaranski (yellow from Russia, China and Japan; black

© Copyright Soyinfo Center 2014

from China and Japan; green), König (*Hispida platycarpa* black, Tumida yellow, brown and black), Prinsen (white from Java and China), Goessmann, Kellner, USDA, Chemiker Zeitung (white from Java and China, 29 Jan. 1896), Scuff (misomame; miso soybeans), Zulkovski (yellow from China, reddish brown from Mongolia), Institut Agr. de Vienne (Austria; yellow from Vienna, reddish brown from Tirol), Ecole Imp. et Roy d'Ag. Hong (yellow from Mongolia and China, reddish brown from China), Chez M. Olivier Lecq (from Moravia), Lechartier (Etampes and black), Joulie (yellow), Stingl and Morawski, Bloch (yellow, green, and black), Balland, Cavendish Evelyn Liardet (yellow, brown, green, black, and white), Jardin Colonial (Laos, Tonkin, China), Aufray (Tonkin, Yun-nan), Homes Laboratory (black from China, or white). Photos and illustrations are the same as those referenced in individual sections of the book, except for the following: A field of soybeans (p. 16). A soybean plant growing in Europe (p. 17). Color illustrations appear facing pages 12, 22, and 64. Address: Li is from Societe Biologique d'Extreme-Orient (Chine). Grandvoinnet is from Ingenieur Agricole (G.).

1575. Muramatsu, S. 1912. Preparation of "natto." *Eighth International Congress of Applied Chemistry, Original Communications* 18:251-63. Section VIIIb: Pharmaceutical Chemistry. Held 4-13 Sept. 1912 in Washington and New York, USA.

• ***Summary:*** Contents: Introduction. Soya beans. Rice straw. Cellar. The preparation of natto. The microbes of natto: Bacillus no. 1, bacillus no. 2, bacillus no. 3. The application of cultured bacteria for the preparation of natto. Natto as a food accessory.

Natto is "a kind of vegetable cheese made by fermenting boiled soy beans wrapped in rice straw and set in a warm cellar one or two days. Thus the product becomes white and mucliageous [mucilaginous] by the development of bacteria. *Natto* is consumed as an accessory after having been mixed with table salt and several stimulants, amongst others the powdered mustard is preferred. It is chiefly consumed in Tokyo and the north-eastern districts of Japan and for the production of it Aizu is the noted place. It is chiefly consumed in Tokyo in the summer time, but in the north-east during the winter time, as these are rather poor in vegetables at that season." The author prepared natto with the different types of soya beans grown in Japan "and could not find a more suitable kind than the small yellowish white bean."

The straw serves to flavor the product as well as to permit ventilation and so keep down the content of free ammonia. The various organisms found in the samples examined were isolated and described. "I express many thanks to Dr. Satô, Director of our College." Address: College of Agriculture, Morioka, Japan.

1576. Sawamura, S. 1912. On *Bacillus natto. Eighth International Congress of Applied Chemistry, Original Communications* 14:145-47. Section VIb: Fermentation. Held 4-13 Sept. 1912 in Washington and New York, USA. [1 ref. Eng]

• ***Summary:*** Natto is prepared by wrapping boiled "soya-beans" in rice straw then leaving them in a warm place overnight to ferment. The author formerly isolated two species of bacteria from natto obtained in Tokyo. Over the years, he has examined bacteriologically many natto samples obtained from various places and found that all contain "Bacillus natto," which produces natto of good flavor and strong viscosity. He then gives a detailed bacteriological description of this bacillus, including: Form, mobility, spore-formation, Gram's method decolorization, oxygen needs, scum in bouillon, scum in pepton water, agar plate culture, gelatine plate culture, agar streak culture, gelatine streak culture, agar stab culture, gelatine stab culture, soya bean agar, potato, gas, azolithmin-milk, indol, hydrogen sulfide gas formation, etc. Address: College of Agriculture, Imperial Univ., Tokyo [Japan].

1577. Takahashi, Teizô; Yukawa, Matao. 1912. On the budding fungi of "shoju-moromi." *Eighth International Congress of Applied Chemistry, Original Communications* 14:155-71. Section VIb: Fermentation. Held 4-13 Sept. 1912 in Washington and New York, USA. [22 ref. Eng]

• ***Summary:*** In the title, and throughout this paper, the word "shoju" should be spelled "shoyu," meaning soy sauce. The following budding fungi were isolated from 52 samples of shoyu-moromi of different ages (2-24 months) collected from 11 different factories: 1. *Zygosaccharomyces major,* nov. spec. 2. *Zygosaccharomyces Soja,* nov. spec. 3. *Zygosaccharomyces japonicus,* Saito. 4. *Zygosaccharomyces Salsus,* nov. spec. 5. An asporogenic species of *Zygosaccharomyces* (?). 6. A species of *Mycoderma.* 7. A species of *Pichia.* 8. Several species of *Torula.* 9. A species of *Monilia.*

The following shoyu breweries granted samples to the author: Those owned by Sh. Magi [Mogi] and S. Mogi in Noda, province of Shimôsa. Those owned by Mr. Hamaguchi, G. Tanaka, and J. Iwasaki in Choshi, Shimosa province. One owned by K. Nakamura at Gaju, Owari province. The Asahi, Maruo, and Kikuchi breweries, and that owned by Mr. Takano, all at Tatsuno, Harima province. Kagawa shoyu brewery experimental station at Shôtoshima [Shodoshima], Sanuki province.

Zygosaccharomyces species Nos. 1, 2, and 5 did not form films on shoyu, whereas Nos. 3 and 4 did form films. *Zygosaccharomyces major* was the main yeast isolated from mature samples of moromi, whereas *Zygosaccharomyces soja* was the main species isolated from young samples. There is no doubt that these two species play an important role in the ripening of shoyu. *Zygosaccharomyces japonicus* and *Zygosaccharomyces salsus* easily produce greyish-white

© Copyright Soyinfo Center 2014

films resembling crepe-paper on top of even concentrated shoyu. Moreover these two species easily form a large number of sporulated cells. Thus they are harmful when storing shoyu.

Note: This is the earliest English-language document seen (June 2011) with the word "moromi" in the title. Address: College of Agriculture, Imperial Univ., Tokyo [Japan].

1578. Tokyo Plant, Seed & Implement Co. (Tokyo Konoen). 1912. Wholesale price list of seeds, plants, bulbs, etc. No. 45. 1912-1913. Tokyo, Japan. 22 p. Sept. 23 cm. [Eng]
• ***Summary:*** The section titled "Garden and agricultural seeds" (p. 5+) includes: "Beans, soy, $0.08 per lb., 7.00 per 100 lbs." (U.S. gold dollars).

Also gives prices for Japanese buckwheat and Japanese giant hemp. Cable address: "Watase, Tokyo." Branch store: 2 & 5, Tameike, Akasaka, Tokyo, Japan. Telephone: Shimbashi 2421. Address: 26-32 Miyamasu, Shibuya, Tokyo, Japan. Phone: Shiba 1058.

1579. Barrett, O.W. 1912. Soya soap. *Philippine Agricultural Review* 5(10):565-66. Oct.
• ***Summary:*** "The vast area planted with 'Manchurian beans' in northeastern China and the contiguous portion of Siberia may in the near future be greater still. A new field for bean oil has been found and the new factories in Mukden and Dalny are now turning out very large amounts of both laundry and toilet soaps.

"It is understood that the Lever Bros. Ltd., of Port Sunlight, England, will also establish a monster soap factory at Kobe; the only drawback thus far is the lack of alkali in Japan and northern China. According to the Bureau of Manufactures of the United States Department of Commerce and Labor, the United States uses considerably over 5,000,000 Philippine pesos worth of bean oil annually.

"Soya oil affects the price of copra. Soya soap relieves the overproduction tendency of bean oil and thus becomes a long-distance enemy of the Philippine coconut, although it directly assists in a degree in keeping up the price of soya oil." Address: [Chief of the Div. of Experiment Stations, Philippines].

1580. Hawthorne, H.L. 1912. An official visit to the Japanese army. *J. of the Military Service Institution of the United States* 51(179):156-72. Sept/Oct.
• ***Summary:*** The first Appendix, titled "Schedule for carrying out theoretical and practical studies of the recruits in the first term, 1911-1912. By the 2d [2nd] Company, the 3d [3rd] Battalion, Engineers" states (p. 172) under "Bills of fare. Prepared by the 1st Battalion, the 68th Regiment, Infantry. (Extract)."

Sunday (March 10, 1912). Breakfast includes: *Moritsuki,* with Soy, 2 shaku. Tiffin includes: *Furofuki* radish [daikon] with Miso (bean paste), 13 momme. Supper includes: *Shitashi,* with Soy, 15 sai. Cost of fish and vegetables per man, Yen 0.11 7/10.

Monday (March 11, 1912). Breakfast includes: Miso soup with Fried bean-curd 1/3 piece. Bean curd 1/4 piece. Miso, 18 momme. Tiffin includes: *Nimame* with Black [soy] bean, 4 shaku. Soy, 1 shaku. Supper includes: Fresh beef, 10 momme.

"Note: Momme–about 3.8 gram. Shaku–0.004 gallon. Sai–1/10 shaku." Address: Lieut-Col., U.S. Army, Military Attache, Tokyo, Japan.

1581. Muramatsu, S. 1912. On the preparation of natto. *J. of the College of Agriculture, Tokyo Imperial University* 5(1):81-94. Oct. Journal name also written as Tokyo Noka Kiyo. Also published in 8th International Congress of Applied Chemistry, Orig. Comm. 18:(251-63). [Eng]
• ***Summary:*** Contents: Introduction. Soya beans. Rice straw. Cellar. Preparation of natto. The microbes of natto; Bacillus no. 1, 2, and 3. The application of cultured bacteria for the preparation of natto. Natto as a by-food (incl. table of nutritional composition of fresh and fermented natto).

"There are several kinds of *natto* prepared in Japan, but here I mean common natto, which is a kind of vegetable cheese made by fermenting boiled soya beans wrapped in rice straw and set in a warm cellar for one or two days. Thus the product becomes white and mucilageous [sic, mucilaginous] by the development of bacteria. Natto is consumed as a by-food after having been mixed with table salt and several stimulants, of which amongst others powdered mustard is preferred. It is chiefly consumed in Tokyo and the north-east districts of Japan, and for the production of it Aizu [in Fukushima prefecture] is the noted place. It is consumed in Tokyo in the summer time, but in the north-east districts during the winter time, as these are rather poor in vegetables at that season."

In Section "V. The microbes of natto," after summarizing the published findings of Dr. Yabe and Dr. Sawamura, Muramatsu continues:

"Mr. Nonzen isolated several kinds of bacteria, among them on bacillus to which Dr. Omori gave the name of *Bacillus viscosus natto* and which, he said, is the principal microbe that produces strong viscosity. The two kinds of bacilli, which he named *Bacillus odorans natto 1,* and *Bacillus odorans natto 2,* produce good aroma in natto; and another one which he named *Pseudomonas odorans natto,* produces also good aroma. The latter three did not produce good natto, unless the material is inoculated also with *B. viscosus natto.* Thus the author [Monzen] concluded that there are necessary for the preparation of natto at least two kinds of bacteria, one producing the peculiar aroma and the other strong viscosity.

"Mr. Muto [1905] isolated several bacteria and concludes that only one bacillus belonging to the *B. subtilis*

© Copyright Soyinfo Center 2014

group is necessary for the production of natto.

Muramatsu investigated several kinds of natto prepared in Tokyo, Aizu, and Morioka. He found that they all contained the same microorganisms, among which three bacilli (which he described) were the principal ones. He learned that the three bacilli were similar to those isolated previously by Sawamura, Muto and others. He also agreed with Muto that only one bacillus was necessary for natto fermentation, and that any one of the three would do the job. He agreed with Sawamura that the organism similar to *B. natto* Sawamura did not yield enough viscosity, however Muramatsu discovered that whenever the fermentation was carried out at high temperature (45ºC), the Bacillus No. 1 "produces the best quality of natto, providing much mucilage [high viscosity] and good aroma. For each of the three bacilli about 18 characteristics are examined and described.

For example: Bacillus No. 1. "Enzyme: Diastase and proteolytic enzyme of tryptic nature are recognized." Note: All three bacilli produce diastase (which hydrolyzes starches to make sugars) plus trypsin-like proteolytic enzymes. This bacillus [Muramatsu's No. 1] may be the same as those which Dr. Sawamura represented as Bacillus No. 2 and *Bacillus viscosus Omori,* and also that which Mr. Muto thought was the only bacterium which produces natto, though there are several differences in its behaviour investigated by these author."

"Bacillus No. 2. This bacillus develops more energetically at high temperature and produces natto of the best quality, forming much mucilage and a rather higher aroma than Bacillus No. 1."

"Bacillus No. 3. This bacillus develops most energetically at 40ºC, and when it is developed on boiled soya beans at this temperature it produces good natto with strong viscosity and good aroma; but its mucilage is somewhat less than Bacillus No. 1 and Bacillus No. 2."

Note 1. This is the second report (after Sawamura) of separating *Bacillus natto* from natto.

Note 2. This is the earliest document seen (Jan. 2012) that mentions the word "enzyme" (or "enzymes") in connection with natto, or that describes the specific types of enzymes produced by the natto bacteria. Address: College of Agriculture and Dendrology, Morioka, Japan.

1582. Sawamura, Shin. 1912. Ueber den Bacillus Natto [Concerning the Bacillus Natto]. *Chemiker-Zeitung* 36(134):1306. Nov. 7. [Ger]
• ***Summary:*** Contains a brief description of how natto is made and details of its chemical composition after 14 hours and 7 days. Address: Tokyo.

1583. Takahashi, Teizô; Yukawa, Matao. 1912. Die Pilze von "Shoju-Moromi" [The molds of "shoyu moromi"]. *Chemiker-Zeitung* 36(134):1307. Nov. 7. Summarized in Zentralblatt fuer Bakteriologie, Series II. 41:257 (1914). [Ger]
• ***Summary:*** Japanese understand the term "shoyu-moromi" to refer to a semi-solid liquid that is made from shoyu-koji, salt, and water. Shoyu koji is made from steamed soybeans and roasted wheat in much the same way that saké koji is made from rice. In the brewing (*Brauen*) of shoyu, three species of Torula yeasts seem to play a significant role: *Torula shujo, T. Shujo var. minuta,* and *T. Turbinata.* The authors have made a plate culture using shoyu-koji-agar as a culture medium after purifying the resulting colonies through the Lindner Drip Culture Method (*Tröpfchenkulturmethode*) and obtained 9 different molds, from which they isolated five *Zygosaccharomyces* (yeast) species. Address: Tokyo.

1584. Yada, Naganosuke. 1912. Honpô shôyu shôkyô hôkoku no ken [The Japanese shoyu market in Vancouver, British Columbia, Canada]. Vancouver, BC, Canada. 10 p. Nov. 22. Handwritten unpublished manuscript. Requested by Mogi Shichirouemon of Noda, Chiba-ken. [Jap; eng]
• ***Summary:*** This is a market report from Mr. Yada at the Japanese consulate in Vancouver, BC, Canada, to Mr. Yasunari Uchida at the Japanese Ministry of Foreign Affairs.

There are about 9,000 Japanese living in Canada. Japanese shoyu imports were about 15,400 taru (249,500 liters) a year, and it was used almost entirely by Japanese. The best selling brand is Kikkoman. Address: Japanese Consulate, Vancouver, BC, Canada.

1585. Kuijper, J. 1912. Soja [Soya]. *Departement van den Landbouw, Suriname, Bulletin* No. 29. p. 24-29. Nov. [Dut]
• ***Summary:*** In recent years, since 1908, soya has become a product of great importance on the world market. There are few products whose exports have risen so dramatically in just a few years. The reason for the great expansion of trade in soya can be found in the great demand by industry for oilseeds. For more than 30 years, experiments have been conducted on growing soybeans in Europe, but the results have not been very promising. Some people have suggested that soya might be able to be grown in Suriname. It is grown in many tropical countries, including Siam, British India, and Java. Requirements for cultivation and yields are discussed. Japan reports the highest yields, 2,500 kg/ha, compared with 1,000 to 1,400 kg/ha from the USA. Soybeans produce more protein and oil per unit area of land than any other farm crop. The seed is used mainly for human consumption but the plant also yields, fresh or dried, an excellent livestock feed, which is why so much research on it is now being conducted in Australia and America. It is important for Suriname that soya can be used as a green fodder, for example interplanted and fed with corn.

From soya one can make numerous products such as soymilk (*soyamelk*), soy cheese [tofu] (*soyakaas,* whose food value is higher than that of meat), soy flour, soy bread (*soyabrood*), oil (*olie*), various sauces (soya sauce, Worcester

© Copyright Soyinfo Center 2014

sauce, etc.), and various substitutes for coffee and chocolate, etc. (*surrogaten voor koffie en chocolade enz.*).

In Suriname soya is cultivated on a small scale by the Javanese, for example in Lelydorp and in the settlements of Johan and Margaretha. Many experiments with Soya have already been conducted in the experimental garden (*Cultuurtuin*). Seeds imported from America did not give good results; the plants remained small, yielded few fruits, and died quickly thereafter. It is a common occurrence that plants from temperate or subtropical regions do not grow well in the warm tropics in the rainy season. Of the seeds cultivated in Suriname, two varieties give good results. Those cultivated by the Javanese give hardy plants and a lot of seed though exact yield figures are not available; the planted area is still quite small. But the yield is about 1,000 kg/ha. Apparently the necessary bacteria are present in the soil, for the roots show nodulation.

In the experimental garden two beds of soya were planted on May 24. The first seeds ripened after 3 months and within 4 months all was harvested. Thus the plants developed during the rainy season, and they probably got too much water. The results would probably be better if this season could be avoided. Soya is sold in Suriname for hfl 30 per bag, a considerably higher price than that paid in Europe. On the plantations Peperpot and Jaglust experiments with soya have also been conducted. The European seed that was used gave very limited results. The experiments will be conducted again using Suriname seeds.

With the market price at hfl 10 per bag, it seems very unlikely that the cultivation of soya in Suriname will ever be profitable, unless high yields can be obtained. As mentioned above, this seems unlikely. Small scale cultivation for sale in Suriname, however, seems advantageous at present, while in areas where cattle are raised the use of soya as a green feed to replace more expensive secondary feeds will likely give good results.

Note 1 This is the earliest document seen (May 2009) concerning soybeans in Suriname, or the cultivation of soybeans in Suriname.

Note 2. This is the earliest Dutch-language document seen (Nov. 2012) that uses the term *surrogaten voor koffie* to refer to soy coffee.

Note 3. This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *soyamelk* to refer to soymilk.

Note 4. This is the earliest Dutch-language document seen (April 2013) that uses the term *soyakaas* to refer to tofu. Address: Surinam.

1586. Maynard, Lester. 1912. Notes from Manchuria. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 15(283):1134-35. Dec. 2.

• ***Summary:*** "The [soya] bean crop of South Manchuria is believed to be below the average, and therefore it may be expected that beans from North Manchuria will be supplied to the Japanese oil mills in the south... The railway is planning to haul about 550,000 tons of beans and 430,000 tons of grain of all kinds [incl. wheat, barley, millet, kaoliang, etc.], or a total of 980,000 tons. It is expected that between 35,000 and 40,000 tons will be transported via the Sungari River [Songhua River in Chinese] before the close of navigation." Address: Vladivostok.

1587. Nishiwaki, Yasukichi. 1912. Kôji-kin no hatsuiku narabini tôka sosei no saiteki ondo ni tsuite [The optimum temperature for growing the koji mold, *Aspergillus oryzae*]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 15(178):1295-98. Dec. [2 ref. Jap]

1588. Yabuta, Teijiro. 1912-1913. On koji acid, a new organic acid formed by *Aspergillus oryzae. Eighth International Congress of Applied Chemistry* 25:455-62. Held 4-13 Sept. 1912 in Washington, DC, and New York. [1 ref. Eng]

• ***Summary:*** Volume 25 (of 29 volumes total) is "Appendix: Section I to Section Ve." Contents: Introduction. Isolation of koji acid. The copper salt. The acetyl derivative. The benzoyl derivatives (di- and tetra-benzoate).

The 1st page begins: "Dr. K. Saito * has recently isolated a new organic acid from *Aspergillus oryzae.* * = Footnote: K. Saito. The Botanical Magazine (Tokyo). Vol. XXI, No. 249 [Oct. 1907].

Note: There is no article by Saito in issue No. 249 of *The Botanical Magazine.*

On the last page (p. 462) we read: "Different culture media behave also differently upon the production of this acid. Thus, the latter is produced when the aspergillus has grown on certain cereals, such as maize wheat, barley, rye, oats and italian millet, but not on leguminous peas as peas, beans, horse beans, broad beans, soja beans, Indian beans, black beans, quaial beans, etc." Address: College of Agriculture, Imperial Univ., Tokyo.

1595. Nishimura, Torazô. 1912. Shôyu oyobi miso ni kansuru kenkyû seiseki hôkoku [Results of studies on shoyu and miso]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 7(4):1-8; 7(5):5-14; 7(6):16-24. [Jap]

1596. Beltzer, Francis J.-G. 1912. Industries du lactose et de la caséine végétale du soja [Industries producing lactose and soy vegetable casein]. Paris: Librairie Bernard Tignol. 144 p. Undated. (Bibliotheque des Actualites Industrielles, No. 144). [17 ref. Fre]
• ***Summary:*** Contents: Preface. Part 1: The lactose industry (p. 9-95; 4 chapters). Part II: Vegetable milk, vegetable casein, and products from soybean seeds. Introduction. 1. Vegetable milk (*Le lait végétal;* soymilk), microscopic examination of vegetable milk. 2. Vegetable cheese (*Le fromage végétal;* tofu). 3. Industrial uses of vegetable casein, proximate analysis of soybean seeds, quantity and dosage determination, the price of soybeans, price of recovery of vegetable casein, industrial production of vegetable casein, cleaning the soybeans, extraction of soy oil, extraction of soy casein. 4. Plan and installation of a factory for processing (10 tons/day of) whole soybeans [to make industrial vegetable casein], estimate and specifications for special materials, general materials, the buildings, price of recovery of vegetable casein, industrial uses of vegetable casein. Illustrations (line drawings) show: (1) Microscopic view of soymilk globules. (2) Microscopic view of soya bean tegument (exterior). (3) Schematic drawings (cross section and overview) of a factory for making vegetable casein.

Matagrin (1939, p. v) states that with this book, Francis G. Beltzer, a practical chemist, became a major force in visualizing new industrial uses for the soybean in the West.

The Preface notes that in Indochina, vegetable milk and vegetable cheese made from the soybean form the base of the people's nutrition. Cow's milk is largely unknown, and the people raise and nourish their children largely with soymilk. Tofu serves equally for the current nourishment of the poor (p. 6).

The Introduction (p. 101-07) notes that soy protein is a globulin, called glycinin or vegetable casein (*caséine végétale*). Osborne & Clapp submitted this substance to acid hydrolysis and found its composition, which is very rich in glutamic acid (p. 102). Soy flour (*farine de Soja*) contains little starch but a large amount of nitrogenous materials, similar to gluten; it is widely used in making bread for diabetics. It can also be used as the basis of foods that are rich in protein and very nutritious, as for colonial or European troops (p. 103).

Soy sauce (*Soja fermenté*) is made in Japan from a mixture of soy and wheat (*koji*). The number of brewers (*brasseurs*) of soy sauce exceeds 12,000 in the entire Japanese Empire, furnishing more than 2,500,000 hectoliters of this condiment (p. 103).

A Chinese factory has been founded on the outskirts of Paris (at Vallées, near Colombes) for the production soy-based food products (*produits alimentaires à base de soja*). This factory currently makes *Caséo-sojaïne* [tofu] and the following food products: Soy flour (*Farine de soja*), soy bread (*Pain de soja*), soy sauce (*Sauce de soja*), soymilk (*Lait de soja*), fermented soymilk (*Lait de soja fermenté*), soy cheese [tofu] (*Fromage de soja*), soy confections (*Confitures de soja*), etc. The Journal, in its issue of 9 Jan. 1911, under the title *"Une usine chinoise fonctionee dans la banlieue parisienne* [A Chinese factory is operating on the outskirts of Paris]" gives some details (p. 106).

In our colonies in Indo-China, the indigenous people have long prepared soymilk, tofu, and several other foods. Soymilk is used like regular milk for feeding babies. Soy cheese, when cooked, is analogous to gruyere cheese; fresh soy cheese resembles our goat cheese. Many Europeans are now preoccupied with making the best of the abundant nutritive principles found in the soybean. One can eat green vegetable soybeans (*Les fruits verts*) like green peas (*pois verts*). In Annam and Japan a sauce is also made from soybeans; its use has spread from East Asia just like that of tofu (*fromage végétal*) (p. 107).

The introduction into Europe and France of soyfoods (*aliments retirés du Soja*), especially soymilk and tofu, will enable us to combat periods of scarcity of animal milk and periods when the prices of certain foods are high. Will the substitution of vegetable casein for milk casein enable us to likewise conserve milk for food use instead of delivering it to industry? (p. 107).

Chapter one, "Soymilk" (p. 108-13), discusses the work of the Japanese chemist T. Katayama (1906) with soymilk and notes that it can be homogenized and condensed. Illustrations show a microscopic view of the globules of soymilk and of okara. The absence of starch in soybeans is a very positive characteristic.

Chapter two, "Tofu" (p. 114-18), notes that in Cochin-

© Copyright Soyinfo Center 2014

China, calcium sulfate is called *Tchack-kao,* and there are three main varieties of tofu: (1) The fermented variety, which is gray or yellow in color, has a piquant taste and resembles Roquefort cheese. (2) The white salted variety resembles goat's cheese. (3) The baked (*cuite*) or smoked variety resembles gruyere cheese and keeps as well as the salted variety.

Chapter three, "Industrial uses of vegetable casein" (p. 119-32), observes that the oil in soybeans must first be removed by pressing or extraction. A table (p. 120) gives the chemical composition of soybeans from Laos and Cochin China, Tonkin, and China and Manchuria. They contain 17.64 to 18.28% oil. In Indochina a food which Beltzer calls *La caséine végétale en lames* ("vegetable casein in sheets" = yuba) has a rather high oil content–about 25-28%. There follows a section (p. 126-32) which contains details on industrial production of soy casein. Chapter four, "Design and installation of a factory for processing soybeans into industrial vegetable casein," describes each piece of equipment and its cost, itemizes the costs of general and special materials plus, buildings and working capital. Also includes a detailed schematic diagram (p. 136-37) with three production lines, and both top and side views. Finally, it lists expenses, income, and profit (p. 139). The last section, applications of industrial vegetable casein, includes paints, paper coatings, silk and artificial textiles, Galalith, and waterproofing of textiles and straw hats. The book contains no bibliography, few footnotes, and no mention of the work of Li Yu-ying–from whom the author appears to have borrowed much.

Note: Although this book is undated, all major sources (except a Seattle Public Library bibliography) give its date as 1912. Address: Ingenieur-Chemiste-Expert, Professeur de Chimie Industrielle.

1597. Davis, Nathan Smith, Jr. 1912. Food in health and disease. 2nd ed. Philadelphia, Pennsylvania: P. Blakiston's Son & Co. xii + 449 p. Illust.

• ***Summary:*** This book is an extensive and practical guide to general dietetics. It discusses both vegetarian and fruitarian diets. It is divided into two main parts: (1) General principles of diet and diet in health; (2) Diet in disease. The author says that the preservation of health is as important as the treatment of the sick. Nathan Smith Davis, Jr. lived 1858-1920. His father, Nathan S. Davis, lived 1817-1904. Chapter 5, "Quantity and kinds of food needed in health" contains a section titled "Diet, Japanese" which states (p. 60): "The diet of the Japanese has been carefully studied by competent men of that country. Beef, mutton, pork and their products are scarcely eaten and were not at all until very recently, but fish is eaten by all who can afford it. The laborers in the country, however, do not average a meal of fish oftener than twice a month. They are vegetarians because they cannot afford meat and fish. They derive the protein which they need from cereals, beans and vegetables. Rice, barley and soy-beans are the staple articles of food of all classes. Wheat, millet, buckwheat and vegetables are also eaten but in smaller quantities. Fish is the staple meat, though poultry and eggs are eaten in small amounts and other meats in insignificant quantities."

On page 59, vegetarian and fruitarian diets are compared.

Chapter 8, "Vegetable foods," contains a section titled "Peas and beans" (p. 117-18) with a table showing the "Composition fresh and dried legumes compared with that of other foods." Among the dried legumes are: Soy beans, lima beans, navy beans, frijoles, lentils, dried peas, cowpeas, chick-pea, peanuts, and St. John's bread (carob bean). Soy beans have the highest protein content (34.0%). Peanuts have the highest fat content (38.6%).

In Chapter 12, "Diet in disorders of nutrition," in the section on "Diabetes," a table (p. 411-12) gives the composition (carbohydrates and sugar, fat, protein) of substitutes for flour products, including: Soya bread, gluten bread, almond cakes, cocoanut, and peanut. Also mentions: Sea kale (p. 119). Taka-diastase (p. 210).

Note: The first edition of this book is not listed at OCLC (Sept. 2007). Address: Chicago, Illinois.

1598. Fairchild, David. 1912. Plant introduction for the plant breeder. *Yearbook of the U.S. Department of Agriculture.* p. 411-22. For the year 1911. See p. 416.

• ***Summary:*** The article begins: "It is now nearly two centuries since the first successful attempt to hybridize plants was made by an English gardener."

The section titled "Extent of the work of the Office of Foreign Seed and Plant Introduction" states: "To stimulate this research and make it possible for a growing number of enthusiasts to breed plants with intelligence, the Office of Foreign Seed and Plant Introduction has been importing from various parts of the world the wild relatives of our cultivated plants and such promising wild forms as seem to offer a chance for domestication.

"When one canvasses the whole world for the varieties of one of our cultivated plants it is surprising to find how many forms there are. In 1907, for example, when the systematic work of bringing in soybean varieties for the Office of Forage-Crop Investigations first began, there were known in this country only 23 varieties. In a recent bulletin of the Bureau of Plant Industry 300 are mentioned as having been tested (Footnote: Piper & Morse. 1910. "The soy bean: history, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 197. See p. 24). These forms have been gathered since 1907 from the bazaars of oriental villages or bought from peasants in Japan, India, China, Siberia, Chosen (Korea), and the Dutch East Indies by trained explorers, American consuls, missionaries, or special correspondents." Foreign Seed and Plant Introduction.

1599. Giles, Herbert Allen. 1912. A Chinese-English dictionary. 2nd ed., revised & enlarged. 2 vols. Shanghai, China: Kelly & Walsh, Ltd.; London: Bernard Quaritch. 33 x 26 cm. Reprinted in 1964, 1978. [4 ref. Eng; chi]
• ***Summary:*** These two massive volumes, each weighing about 9½ lb, contain more than 1,800 pages and 13,848 Chinese characters. Contents of Vol. I: Part I. By the same author (25 books). Dedication. Preface. Extracts from preface to first edition. Dialects (The romanized pronunciation of each character is given in Cantonese, Hakka, Foochow, Wênchow, Ningpo, Peking, Mid-China, Yangchow, and Ssuch'uan {Szechwan} dialects, as well as in Korean, Japanese, and Annamese, each being distinguished by its initial letter). Tables: Insignia of official rank, the family names, the Chinese dynasties, topographical, the calendar, miscellaneous (the Chinese digits, the Chinese decimal system). The 214 radicals. Radical index. Part II. A Chinese-English dictionary (p. 1-1711, in two volumes). Examples of soy-related characters:

Chiang (p. 149, No. 1220). "A soy made by mixing salt with bean flour. Sauce." Fourteen compounds using this character are given, including: Bean sauce, soy. Pickled bean curd. Bean sauce. Soy is of two kinds, the clear and the thick. Dry relishes. Soy [sauce] colour–a dark reddish drab. He won't use money for vinegar to buy soy.

Ch'ih (p. 249, No. 1996). "Salted fruits, etc., dried and used as relishes." Four compounds incl.: Salted beans. Soy, sauce.

Fu (p. 458, No. 3686). "Rotten; putrid; worthless." Eleven compounds and sayings include: Bean curd, see No. 11,417. Bean curd officials–a term of contempt applied to certain of the poorer classes of official servants who are compelled to feed largely on this cheap food. Also explained as flabby or unenergetic officials. A Mongol name for cheese. A kind of milk made from beans (milk + fu) [Note: Probably fermented tofu].

Huang (p. 635, No. 5124). Yellow. Compounds: Yellow beans.

Mao (p. 955, No. 7,679). "Hair, down, feather." But the word *Maodou* ("Hairy beans") = edamame does not appear here.

Ta (p. 1,294-96, No. 10,470). "Great." But the word "Great bean" = soybean does not appear here.

Tou (p. 1,412, No. 11,417). "Beans; pulse." See also No. 11,412. Thirty compounds, incl.: Bean-sprouts. Bean-curd. A cheap restaurant (a bean-curd restaurant). Like making bean curd–very tedious. A tongue like a knife, but a bean-curd heart (soft). Bean-cake. Bean oil. Big bean, black bean, or yellow bean = the soja or soya bean (*Glycine hispida,* Max.), used for making bean-curd, soy, oil, etc. Ground-nuts.

Yu (p. 1,661, No. 13,409). "Oil, fat, grease." 45 compounds incl. Oil, salt, soy, and vinegar = condiments generally. Sesamum-seed oil. Linseed. Wood oil. An oil factory. Oil dregs. But "bean-oil" = soybean oil does not appear here.

Note 1 (see p. vii): Other earlier important Chinese dictionaries are: Morrison (1819, English). Medhurst (1843, English). Williams (1874, American). Giles (1892, English). Giles lived 1845-1935.

Note 2. Unfortunately, the pronunciation of the compounds is not given (as in Mandarin). Address: Prof. of Chinese, Univ. of Cambridge, Cambridge, England; and sometimes H.B.M. Consul at Ningpo.

1600. Hashimoto, Yojizaemon. 1912. The dairy industry in Japan. MSc thesis, University of Wisconsin. [2] + 67 p. See p. 41-42 [3 ref. Eng]
• ***Summary:*** Chapter X, "The manufacture of tofu," states: "Three gallons of Soya beans soaked in pure, cold water about 10 hours so that the beans absorb water until [they] become of soft texture. Then grind the beans with a stone mortar, adding water little by little until you have 10 gallons of water. Then boil with water from about 20 to 30 minutes. If it boils over, add a little rape oil in order to prevent foam. After 20 or 30 minutes, pour into a hemp cloth bag and press with the hydraulic press so that a milky substance [soymilk] is squeezed out of the bag which is collected. The deposit remaining in the bag is cooled and is known as Kirazu [okara]. This is very palatable and is eaten by the people and domestic animals.

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the term "milky substance" to refer to soymilk.

"To this boiling, milky substance is added, little by little, saturated magnesium sulphate (obtained from sea salt) until about 1/20 of a gallon is added. Then cover about ten minutes without disturbing. This curd is poured into a wooden mold, which has a hoop of cheese cloth, and pressed about 30 minutes with light weights.

"The Tofu is a little firmer in texture than junket, which can be handled easily without breaking. Tofu has a mild, pleasant flavor and smooth texture. It is prepared economically and conveniently throughout the Japanese empire and is a most digestible food. It is cut into blocks about four or five inches square, weighing about one pound, which are sold for about one half cent each to consumers. It is eaten fresh or may be frozen and kept for a year or more."

\ Two tables (p. 42) give the "Chemical composition of tofu" and "Digestibility" [of tofu]. Digestibility: Crude protein: 2.7. Carbohydrates: 7.1? Fat 1.2.

\ Chapter XII (p. 63), "Future development of dairying in Japan" begins: "Some of the reasons why dairying has developed slowly in Japan are as follows:

"1. After introduction of Buddhism the slaughter of animals was forbidden under a severe penalty.

"2. Comparatively, our country is more thickly

© Copyright Soyinfo Center 2014

populated than any other civilized country, so that the entire area of fertile soil is cultivated and there are few pastures and meadows.

"3. Because our country is surrounded by oceans, fish are an abundant source of protein supplies.

"4. Tofu made out of soy beans is an economical, digestible food high in protein and is widely made by farmers and tofu makers throughout Japan.

"5. The native cattle are poor milk producers.

"In studying the future growth of the dairy industry in Japan, we have to consider, from an economical standpoint, (1) Whether there is room enough for the further development of the dairy industry in the island empire? (2) What quantities of dairy products will be consumed by the whole nation? (3) To what countries we might export dairy products? (4) What influence the dairy Industry would have on general agriculture?"

Note 2. This thesis was submitted for the Degree of Master of Science in Agriculture.

Note 3. At this time, the word "kirazu" appears to have been more popular than "okara" or "unohana."

1601. Hawaii Shimpo-sha (The Hawaii Shimpo). comp. 1912. Hawai Nihonjin nenkan [Hawaiian-Japanese annual. No. 10]. Honolulu, Hawaii: Hawaii Shimpô-sha (The Hawaii Shimpo). [Jap]*

• ***Summary:*** Name of company with diacritics is: Hawaii Shimpô-sha. Address: Los Angeles.

1602. Hiroshima Kenritsu Nôji Shikenjô. 1912. Kansaku daizu [Intercropped soybeans]. Hiroshima-ken, Japan: Hiroshima Kenritsu Nôji Shikenjô. 15 p. 23 cm. [Jap]* Address: Japan.

1603. Iinuma, Yokusai [Chôjun]. 1912. Zôtei sômoku zusetsu. Kusa-bu Sômoku-dzusetsu; or an iconography of plants indigenous to, cultivated in, or introduced into Nippon (Japan). Part I. Herbaceous plants. Revised and enlarged by Omitaro Makino. 3rd ed. III (Vol. 11-15). Tokyo: Seibidô (Tôri 3-chôme, Nihonbashi-ku). See vol. XIII, p. 929, 945-51, 964 (p. 1, 17-23, 36 in this volume's pagination). [Jap; eng]

• ***Summary:*** This work consists of 20 volumes bound in 4 physical volumes. Volume I (containing vols. 1-5) was published in 1907, Vol. II (vols. 6-10) in 1910, Vol. III (vols. 11-15) in 1912, and Vol. IV (vols. 16-20) also in 1912. Soybeans are discussed only in Vol. III (vol. 13).

The English-language title page lists the author's name as Yokusai Iinuma but it is often catalogued as Chôjun Iinuma; he lived 1782-1865. Omitaro Makino was a "Lecturer in Botany in the Science College, Imperial University of Tokyo." The text, a taxonomy of the soybean and its varieties, is mostly in Japanese, but with key terms romanized and simple illustrations (line drawings) describing the various varietal shapes. For each species, the text is on pages with Arabic page numbers, while the illustrations (line drawings) are on pages with only Japanese page numbers. Three main species of soybeans are listed, all members of the genus *Glycine* and the family Leguminosae:

(1) *Glycine Soja* Benth. (the cultivated soybean; *ômame, mame*). Text: p. 945-51. Illustration: (Ch. 13, Pl. XVII, p. 793). Also called: Dolichos Soja or *Japansche Slingerboon.* It has 15 forms, each based on the seed shape and color, and first named by Makino. Two simple illustrations (line drawings) show the shape, and hilum size and location, of each soybean form. Note that *mame* means "bean" in Japanese: Forma Gogatsu-mame (5th month bean), Forma Wase-mame, Forma Nakate-mame, Forma Okute-mame, Forma Maru-mame, Forma Shiroteppo-mame, Forma Kuro-mame (black soybean), Forma Kuroteppo-mame, Forma Goishi-mame, Forma Aomame (green soybean), Forma Kage-mame, Forma Aka-mame (red soybean, with 4 additional forms and colors), Forma Chamame (brown soybean, with 2 additional forms and colors), Forma Kurokurakake-mame, Forma Akakurakake-mame, Forma Fuiri-mame [speckled].

(2) *Glycine Soja* Benth. *forma lanceolata* Makino. (*midzu-kugiri*). Text: p. 951. Illustration: p. 794 (Ch. 13, Pl. XVIII, p. 794).

(3) *Glycine ussuriensis* Regel et Maack. (wild soybean; *Tsuru-mame*). Text: p. 964. Illustration: p. 808 (Ch. 13, Pl. XXXII, p. 808).

Vol. III also discusses: *Pueraria lobata* (kudzu; *kuzu*). Text: p. 954-55. Illust.: p. 798. *Arachis hypogaea* (the peanut; *rakkase, nankin mame*). Text: p. 971. Illust.: p. 816. *Sesamum indicum* (sesame seeds; *goma*). Text: p. 854-56. Illust.: p. 696. *Phaseolus radiatus* L. *var. aureus* Prain. (*adzuki*). Text: p. 956-58. Illust.: p. 800. Forma Natsuadzuki Makino. Forma Akiadzuki. Forma Oadzuki. Forma Udzuraadzuki. Forma Hokorikadzuki. Forma Shiroadzuki. Forma Akaadzuki. *Phaseolus radiatus* L. *var. flexuosus* Matsum. (*tsuru adzuki*). Text: p. 959. Illust.: p. 801. *Dunbaria villosa* Makino. (*no-adzuki*). Text: p. 964. Illust.: p. 809.

Note: The is the earliest document seen (Oct. 2004) that uses the word "Forma" in connection with soybean variety names. Address: Japan.

1604. Kantô Totokufu Minseibu; Shomuka. 1912. Manshû daizu ni kansuru chôsa [Survey of Manchurian soybeans]. Dairen: Kantô Totokufu Minseibu; Shomuka. Tokyo: Ryûkei Shosa. 117 p. 23 cm. Series: Meiji Kôki Sangyô Hattatshi Shiryô No. 525. Reissued in year 2000. [Jap]

• ***Summary:*** Name of organization with diacritics is: Kantô Totokufu; Minseibu; Shomuka. In 1905 the Kwantung Leased Territory was leased to Japan. Located at the southernmost tip of Manchuria, this mountainous peninsula contains the two ports of Dalian (Dairen) and Lüshun (W.-

© Copyright Soyinfo Center 2014

G. Lü-shun, Jap. Ryojun, traditionally Port Arthur). After the Russo-Japanese (1904-05), victorious Japan, through the Portsmouth Treaty, became the lessee of the Kwantung Leased Territory (1,337 square miles), the southernmost point of Manchuria. It contained the greater part of the southern branch of the Chinese Eastern Railway, which is now known as the South Manchuria Railway. This was Japan's first foothold on Manchuria–long before the Manchurian Incident of 1931. This survey was conducted 7 years after the Japanese began to lease the peninsula. Address: Manchuria.

1605. Kawakami, Kiyoshi Karl. 1912. American-Japanese relations: An inside view of Japan's policies and purposes. New York, Chicago, Toronto, London and Edinburgh: Fleming H. Revell Co. 370 p. Index. 22 cm.
• ***Summary:*** The author argues for naturalization rights for Japanese in America. Contents: Introduction. Book I: The Manchurian question (p. 23-142). Book II: The Korean question (p. 143-284). Book III: The immigration question.

In Chapter 4, titled "Chinese diplomacy in Manchuria," Kawakami argues that by defeating Russia in the Russo-Japanese war of 1905, Japan (at great sacrifice) saved China from dismemberment by foreign powers (p. 81): "Suppose Japan had not dared to combat Russia, what would have become of Manchuria, and indeed of China? With the Three Eastern Provinces irretrievably lost to China, other powers would not have hesitated to follow the suit of Russia and slice for themselves such regions as they had fixed their covetous eyes on. The defeat of Russia at the point of the Japanese bayonet, therefore, meant the prevention of the dismemberment of China, which would have become imminent had the Muscovite been allowed to stay in Manchuria."

In Chapter 6, titled "Japan's commercial advance in Manchuria and the 'Open Door' (p. 113-20), Kawakami discusses soybeans and Japan's policy in Manchuria. He argues convincingly that, since May 1906, Japan has followed an "Open Door" policy toward Manchuria, "... that China's sovereignty should be respected and the principle of equal opportunity for all nations should be adhered to with the utmost sincerity. In spite of all the harsh judgments passed by foreign critics, I do not hesitate to assert that Japan has been faithful to this fundamental policy sanctioned by the throne." Japan has promoted her own interests in the "Three Eastern Provinces" and allowed other nations to do likewise. Indeed: "Japan has subsidized her steamship lines to Manchuria, installed commercial museums in various important Manchurian towns in order to advertise her merchandise, sent commercial agents to inquire into the Manchurian markets, and, what is more important, has become a most liberal purchaser of Manchurian products, thus establishing close business relations with the native producers and merchants. These, reinforced by the advantage which she enjoys over Western nations in geographical position and the cost of production and transportation, have enabled her to push her trade in Manchuria with remarkable success.

What is the secret of Japan's secret of commercial success in Manchuria? This question Westerners usually answer with the hackneyed two words–cheap labor." This is true, however, the main reason is "that Japan, of all foreign nations, has been the only customer for Manchurian products..."

Kawakami believes that the only man who perceives the crux of the Manchurian question is George Bronson Rea, as described in his article of March 1910 titled "Beans: The solution of the commercial situation in Manchuria," published in his periodical the *Far Eastern Review* (Shanghai).

"The real basis of Japan's success in Manchuria is, Mr. Rea believes, the operation of the fundamental economic law, that the country consuming the major portion of the exports of another country holds the most advantageous position in supplying its necessary imports. Now Japan has for years been the chief consumer of Manchuria's principal export, consisting of [soy] beans and bean cake." Before the Russo-Japanese war, Chinese traders controlled this trade. But since Japan's victory in the war, all that has changed. "Japan began an aggressive campaign to gain control of the Manchurian trade, and success soon crowned her efforts. Says Mr. Rea:

"Under these conditions the foreign merchants and their agents in the interior are placed at a disadvantage from the outset. As they could not penetrate into the interior and purchase beans by an exchange of commodities, they are reduced to selling their wares for cash–the one thing the nation was short on."

"Not a few critics have been at pains to create in Europe and America the impression that Japan discriminates against foreigners in Manchuria in shipping and railway rates. The subsidized shipping of Japan, as one of such critics insinuates, carries Japanese goods at a minimum charge, subject to further rebates as quantities rise, from the place of manufacture to the port of Tairen [Dairen], thence the goods are carried at special rates to their selling place over the tracks of the South Manchuria Railway. In Mr. Rea's opinion, such charges and insinuations fall short of the mark in explaining the loss of the Manchurian market for American and European products, and he sums up the whole situation in these words:

"It is a far cry from high diplomacy to the humble soya bean, yet we hold to the belief that the past and present commercial situation and ultimate solution of the vexatious Manchurian question are bound up in the control of this one product."

In the next sentence, Mr. Kawakami writes: "That really furnishes the key to the Manchurian question."

Note 1. In the index, the soya bean is indexed under "Manchurian bean," and not under "soy" or "soya."

Note 2. Kiyoshi "Karl" Kawakami (1873-1949) was a Japanese Christian journalist who was born in Yonezawa, educated in the law in Japan, and was for a short time involved in newspaper work in that country. In 1901 he came to the United States and studied at the universities of Iowa and Wisconsin. In 1905, engaged in journalism, he traveled extensively in China, Siberia, and Russia. He was a correspondent for leading newspapers in Tokyo and a frequent contributor to American magazines and newspapers. (Continued).

1606. Kawakami, Kiyoshi Karl. 1912. American-Japanese relations: An inside view of Japan's policies and purposes (Continued–Document part II). New York, Chicago, Toronto, London and Edinburgh: Fleming H. Revell Co. 370 p.
• ***Summary:*** Continued: Book III (p. 285+): The immigration question. 18. Japanese immigration before the exclusion agreement. 19. Denis Kearnyism once more–I. 20. Denis Kearnyism once more–II. 21. Japanese immigration after the exclusion agreement. 22. The Japanese in California. 23. The naturalization of Japanese.

Chronology of Japanese in California, and anti-Japanese activities. Most of this chronology is summarized from Kawakami (1912), but key events after 1912 have been added from other reliable sources.

1790 March 26–Naturalization Act of 1790 provides the first rules to be followed by the U.S. in granting citizenship. It limits naturalization to aliens who are "free white persons" and thus leaves out slaves, native Americans, indentured servants, free African-Americans, and later Asians.

1866–The first Japanese immigrants enter the USA, 7 in number vs. 278,916 European immigrants the same year. From 1866 and 1885 the peak number of Japanese immigrants to the USA is 78 in 1871, compared with 648,000 European immigrants in 1882.

1882 May 6–Chinese Exclusion Act, barring Chinese immigration, is passed by Congress.

1884–Amendments to the 1882 Exclusion Act tightened the provisions that allowed previous immigrants to leave and return, and clarified that the law applied to ethnic Chinese regardless of their country of origin. This facilitated the introduction of Japanese labor into California. Large landowners in California tried to encourage Japanese immigration by offering alluring terms.

1886–Japanese immigration to the USA begins to rise. From 1886 to 1898 the number of Japanese immigrants rose from 194 to 2,230.

1890–The U.S. census reports 2,039 Japanese residents in the U.S., including 1,147 in California, mostly student-laborers in San Francisco.

1892 May–The first anti-Japanese movement on American begins in San Francisco, led by local three newspapers: *Morning Call, San Francisco Examiner,* and *San Francisco Bulletin.* It culminated on 10 June 1893 in the San Francisco Board of Education resolution relegating Japanese students to the segregated Chinese school. After intervention by the Japanese consul, the resolution was soon rescinded, ending this early chapter of anti-Japanese agitation.

1899–Japanese immigration figures jump to 12,635 (still insignificant compared with 297,000 European immigrants) for two reasons: (1) This is the first year that Japanese immigration to Hawaii is included in immigration statistics to the USA. In fact, more than half of the total Japanese immigrants stayed in Hawaii. (2) Western U.S. railroads, finding that Japanese made excellent section workers, used every possible means to attract them to the USA.

Note: By the late 1900s, the word "unassimilable" (or "inassimilable") was being applied to both Japanese and Chinese immigrants on the west coast of the United States by Caucasian writers."

1900 April 30–The Organic Act is signed by President McKinley, incorporating Hawaii as a territory of the United States. The act went into effect on June 14, after which date contract labor was no longer legal. As a result, more than 8,000 laborers took part in 20 strikes within a month, calling for higher wages, reduced working hours, and hiring of Japanese overseers.

1900–The U.S. census reports 24,326 Japanese / Nikkei in the U.S., with 10,151 living in California and 1,781 in San Francisco.

1900–The first anti-Japanese protest rally in California takes place in San Francisco, instigated by local labor groups and led by Mayor James D. Phelan, who later became State Senator. In response, the Japanese Deliberative Council of America is formed.

1905 May 14–The Asiatic Exclusion League is formed in San Francisco, marking the official beginning of the organized anti-Japanese movement. Among those attending the first meeting were labor leaders (and European immigrants) Patrick Henry McCarthy and Olaf A. Tveitmoe of the Building Trades Council of San Francisco and Andrew Furuseth and Walter McCarthy of the Sailor's Union. Tveitmoe was named the first president of the organization.

1906 April 18–The Great Earthquake and Fire devastates San Francisco. Japanese enclaves in Chinatown and South of Market are devastated but South Park and Western Addition survives and thrives. The Japanese government contributes $246,000 to the City of San Francisco for earthquake relief, more than all other foreign nations combined. The Japanese community relocates to the present Japantown (*Nihonjin Machi, Nihonmachi*)–which celebrated its 100th anniversary in 2006 as the first and oldest Japanese community in the continental United States.

1906–The Japanese population of the United States (incl. Hawaii) first tops 75,000.

• ***Summary:*** In the chapter on "The legumes or pulses," the section on "Beans" (p. 529) lists ten species of beans (including the soy bean) that "are used in dry condition in many parts of the world."

The section titled "The Soy Bean (*Dolichos soja,* or *Glycine hispida*) states (p. 531-33): "The soy bean is a native of Cochin-China, Java, and Japan, where it has been cultivated from the remotest antiquity. It is said to be the *shu* mentioned in the writings of Confucius, although the modern name is *ta-tou.* Its introduction into India is comparatively modern. It was introduced into Southern Europe and America in 1880, where it is now cultivated chiefly as a forage plant. There are numerous varieties of the plant, but, excepting in colour, the seeds do not differ much from each other in size and appearance. Those sold in the Chinese markets of Australia and Western America are either yellow or black. The seed resembles a pea, but the botanical characteristics of the whole plant are those of the bean. The seeds are one of the most important beans of China, Japan, and some other Oriental countries, where they are eaten like other beans–viz., boiled or baked. But in China and Japan they are elaborated into a variety of products, all of which are valuable for their high proportion of protein, and, when eaten with rice–the staple food of the people–make a fairly well-balanced dietary. Some of these articles are eaten at every meal by rich and poor alike, particularly in the interior of China. Some of these preparations are as follows:

"Soy Sauce, or Shoyu, is prepared from a mixture of cooked beans, roasted wheaten flour, and salt, which are put

© Copyright Soyinfo Center 2014

into a cask and allowed to undergo a prolonged fermentation. The result is a thick brown liquid, of pungent and agreeable taste. It is used in Europe as a basis for various proprietary sauces.

"2. Bean Cheese, or Tao-hu [Tofu].–There are several preparations. According to Prinsen-Geerligs, bean cheeses are made from white beans, which are soaked in water for three hours, afterwards being reduced to a paste and cooked. The milky fluid is then strained through a coarse cloth to remove starch and fibre, and when cool is precipitated by the addition of crude salt–i.e., salt containing calcium and magnesium as well as sodium chloride. The precipitate, which is rich in protein and fat, is then kneaded and pressed into cakes, called fresh Tofu, or 'Taahuor tofu.' They are then dipped into an alkaline solution of curcuma. An analysis of fresh tofu gives the following composition: Water 81.35, protein 11.46, fat 5.19, carbohydrate 0.81, ash 0.79, per cent. There are several varieties of the cheese, known as 'Natto,' 'Miso,' and 'Tofu.' Natto is made from beans which have been boiled for several hours until they are soft. The hot mass is then pressed into small cakes, wrapped in bundles of straw, and kept in a warm, tightly-closed cellar for twenty-four hours, when the action of minute organisms from the air or straw work a change in the mass, and produce an agreeable flavour. Miso is made by boiling the beans until they are soft, when they are beaten to a pulp, mixed with concentrated sea-brine or crude salt, and boiled rice. The substance is then put into a barrel which has previously contained a fermented liquor, and allowed to ferment. It is ready for use in two months, and is eaten like butter. Soy Milk: When beans have been boiled until they are soft, and beaten to a pulp, a considerable portion of the vegetable casein passes into solution, and forms a milky-looking liquid. It further resembles milk by a thin pellicle or skin [yuba] forming on its surface when it is boiled, just as in the case of boiled cow's milk, and the casein can be precipitated from solution by rennet or acids. Such milk has many uses. Tofu is also prepared from soy milk by the addition of sea-brine, which precipitates the casein by virtue of the calcium and magnesium salts. The coagulum is then pressed into tablets, which are snow-white. Tofu made in this way is prepared fresh daily, and therefore but little bacterial action occurs. Moreover, dried cheeses are made in China and Japan by freezing such cakes, afterwards thawing them and drying them in the sun."

Section 4 (p. 535) titled "The legumin of soy beans" mentions glycinin, legumelin, proteose, and vegetable casein.

A table (p. 537) gives the chemical composition of the following: Soy beans (black, or yellow). Soy cheese (*tao-hu*)*:* Tofu (fresh, frozen, dry matter). Natto. Miso (white, red, or Swiss). Soy sauce (Tao-yu): Shoyu. Three sources for these figures are cited.

On page 537-38 is information about the fats, carbohydrates, and minerals of soy beans and other legumes.

In the section on "Sauces" (p. 776) we read: Many of these sauces, or relishes, consist of a basis of vinegar, with Indian soy, mushroom ketchup, walnut ketchup, cayenne pepper, allspice, garlic, and other condiments and aromatic spices, to give flavour, pungency, and aromatic properties. A notable example is *Worcestershire Sauce,* which is composed of the following ingredients: Soy–1 quart. Malt vinegar–7 pints. Lime-juice–3/4 pint. Tamarind–1 pound. Chillies–1¼ ounces. Cloves–1¼ ounces. Garlic–3 ounces. Shallots–6 ounces. Anchovies–3 ounces.

"These substances are prepared by peeling and bruising the garlic and shallots with the anchovies. They are then mixed with the vinegar, soy, and spices, boiled together for twenty minutes, allowed to get cold, and strained. There are many other examples; most of the ingredients have been described in the foregoing pages.

"An imitation [soy sauce]. called English soy, is made by heating together 10 parts treacle, 16 parts extract of malt, 4 parts mushroom ketchup, and 9 parts common salt; it is allowed to stand twenty-one days, and afterwards clarified." Recipes for Mushroom ketchup and Walnut ketchup are also given (p. 776).

The section on "Rice as a food" (p. 475-76) notes that rice is poor in protein and fat and rich in carbohydrates. "It is consumed enormously by the inhabitants of Eastern countries... It should not be overlooked, however, that the same people consume the soy bean and its preparations, especially soy cheese and sauce, which largely compensate for the deficiency of protein. The deficiency of rice in stimulating properties, infinitely less than those of oats and oatmeal, accounts to some extent for the indolence and apathy of many Orientals, and it is a significant fact that the advance of the Japanese as a nation [incl. winning two major wars] is contemporaneous with the larger consumption of flesh foods."

The section on "Common Wheat" (p. 372) states: "The Chinese grew wheat 2700 B.C., and considered it a special gift from Heaven. It was classed with rice, sorghum, and the soy-bean, which the Emperor Chin-nong [Shen-Nung] ordered to be sown annually with sacred rites."

Note: William Tibbles lived 1859-1928. Address: LL.D., M.D. (Hon. Causa) Chicago, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A. Lond. Medical Officer of Health, Fellow of the Royal Institute of Public Health, etc.

1615a. Product Name: Solite (Liquid Water-based Paint Containing Soy Protein. Also named Solight).
Manufacturer's Name: Solite Manufacturing Co.
Manufacturer's Address: Dairen, Manchuria.
Date of Introduction: 1912.
New Product–Documentation: Hoshino, Tokuji. 1920. Economic history of Manchuria. Seoul, Chosen: Bank of Chosen. x + 303 p. See p. 144-45. "Two novel uses of soya beans have been discovered by Mr. Suzuki of the Central

© Copyright Soyinfo Center 2014

Laboratory of the South Manchuria Railway Company. The one is the making from it of a new sort of paint, named solight,... A joint-stock company was established in Dairen to manufacture these articles in 1912, and it is now doing a prosperous business. The merits of solight are enumerated thus: it may be applied as it is; it dries quickly, that is, in about half an hour; it has no bad odour like paint; its easy combination with any colour; its cheapness."

Sadakichi Satow. 1921. Tohoku Imperial University, Technology Reports (Sendai, Japan) 2(2):1-124 (41-164). Oct. p. 5. "Researches on oil and proteids extraction from soy-bean." "In Japan, a new use of the soy-bean meal for the purpose of a water-color paint called 'Solite' was discovered by Mr. Y. Suzuki. This consists in subjecting the soy-bean meal to fermentation, mixing caustic lime with the meal, and thus causing the disintegration of fibrous material through fermentation and making the whole mass homogeneous." It can also be used as a nutritious food called "Legumon." Note 1. This is the world's earliest known commercial soy protein product–i.e., one made with soy protein isolates or concentrates; it is an industrial product. Note 2. This is the earliest known commercial soy product (with a brand name) made in Manchuria. Note 3. This is the earliest known commercial water-based paint made from soy protein.

Light of Manchuria. 1922. No. 17. p. 2-24, 29-31. Jan. 1. "Central Laboratory of South Manchuria Railway Co. I. Its history. II. Results of work. V. Beans and products." Includes a discussion of Solite water based paint containing soy protein. "It is being manufactured and sold at the Solite Manufacturing Co., Dairen."

H. Komatsu. 1922. Light of Manchuria. No. 23. p. 20-27. July 1. "Tantalus from bean oil." The author is Works Mgr., Dairen Solite Co. Ltd., Dairen, Manchuria. Thus the Solite Co. was in business by July 1922.

South Manchuria Railway Co. 1926. "Soya beans in Manchuria." Dairen: SMRC Agricultural Office. 40 p. Nov. See p. 17-18. Solite is a water-based paint, invented by Mr. T. Suzuki and manufactured and sold by the Dairen Solite & Co. until a few years ago.

South Manchuria Railway Co. 1937. Bean oil industry in Manchuria. p. 24. "Bean cake in manufacturing liquid paint. The Solite is a paint produced by mixing the protein content of [soy]beans with lime. It was invented by Mr. Yosei Suzuki and was manufactured and sold by the Solite Company at Dairen. The future of this industry is believed to be a hopeful one."

Contemporary Manchuria 1937. "Bean Oil Industry in Manchuria." p. 33. Note: Most soy-based paints used soy oil, but this one uses soy protein.

1615b. Product Name: Tantalus (Waterproofing Material Made from Soybean Oil. Also named Tantalse).
Manufacturer's Name: Solite Manufacturing Co.
Manufacturer's Address: Dairen, Manchuria.
Date of Introduction: 1912.
New Product–Documentation: Hoshino, Tokuji. 1920. Economic history of Manchuria. Seoul, Chosen: Bank of Chosen. x + 303 p. See p. 144-45. "Two novel uses of soya beans have been discovered by Mr. Suzuki of the Central Laboratory of the South Manchuria Railway Company. The one is the making from it of a new sort of paint, named solight, and the other, a chemical composition called tantalse, which imparts its waterproof characteristic to the cement, mortar, or concrete with which it is mixed, or to paint upon which it is applied. A joint-stock company was established in Dairen to manufacture these articles in 1912, and it is now doing a prosperous business."

H. Komatsu. 1922. Light of Manchuria. No. 23. p. 20-27. July 1. "Tantalus from Bean Oil." Tantalus is a substance used for waterproofing mortar, cement, or concrete, developed from soybean oil by Mr. T. [or Yosei] Suzuki, then in the service of the South Manchuria Railway Co.

Contemporary Manchuria 1937. "Bean Oil Industry in Manchuria." p. 26. "Waterproof Material. Mr. Yosei Suzuki, noticing that the aluminum soap of fatty acid has a waterproofing quality, invented an aluminum soap made of bean oil and named it Tantalus. It was manufactured until recently by the Solite Company at Dairen and its future seems to be interesting."

1616. Kondo, M. 1913. Der anatomische Bau einiger auslaendischer Huelsenfruechte, die jetzt viel in den Handel kommen [The anatomical structure of some foreign legumes, now widely used in commerce]. *Zeitschrift fuer Untersuchung der Nahrungs- und Genussmittel* 25(1):1-56. Jan. 1. See p. 1-12, 50-56. [7 ref. Ger]

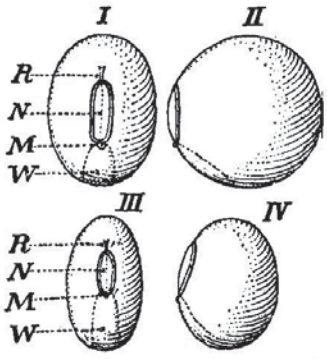

FIG. 50.—Soybean seed. I, II. A yellow variety from Japan. III, IV. Another variety. *N*, hilum; *R*, chalaza; *M*, micropyle; *W*, outline of hypocotyl seen through the testa. (*After Kondo.*)

• ***Summary:*** This is the second earliest microscopic study of the structure of the soy bean seed. Good summaries with details in English and clearer line drawings are given by

© Copyright Soyinfo Center 2014

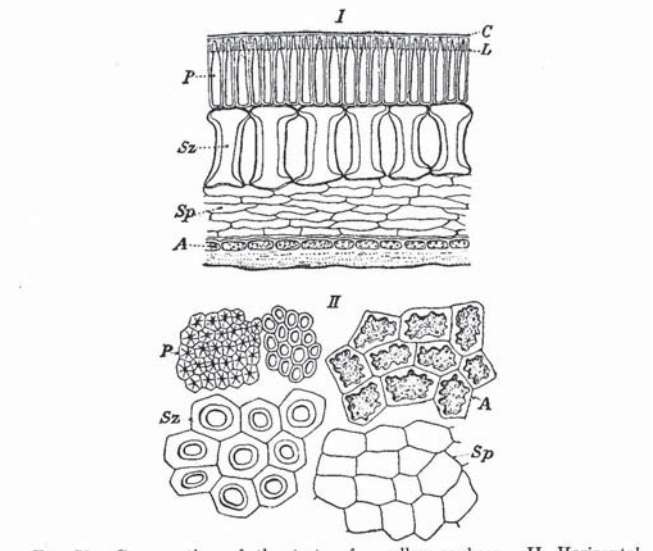

Fig. 51.—Cross-section of the testa of a yellow soybean. II. Horizontal section of same. *C*, cuticle; *L*, light-line; *P*, palisade cells; *Sz*, hour-glass cells; *sp*, spongy parenchyma. *A*, aleurone layer. (*After Kondo.*)

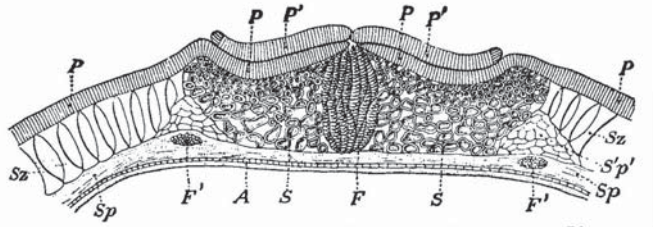

Fig. 52.—Cross-section of hilum of a yellow soybean from China. *P'*, outer palisade layer; *P*, inner palisade layer; *S*, asteroid parenchyma; *Sp*, spongy parenchyma; *F'*, fibro-vascular bundle; *F*, fibro-vascular bundle of the testa; *A*, aleurone layer; *Sz*, hour-glass cells. (*After Kondo.*)

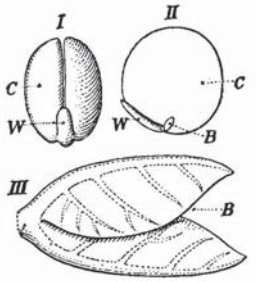

Fig. 53.—Embryo of a yellow soybean seed from Japan. I. Whole embryo from the ventral side. II. Half of embryo seen from the inner side. III. The two leaves of the plumule. *C*, cotyledons; *W*, hypocotyl; *B*, leaves of plumule. (*After Kondo.*)

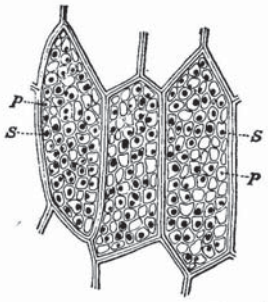

Fig. 54.—Soybean. Cells of the cotyledon filled with fat, protein and starch; *P*, protein; *S*, starch. (*After Kondo.*)

Piper and Morse (1923, p. 187-89), and Winton and Winton (1932, p. 513-15).

The cellular structure of the seed coat or spermoderm consists of 4 layers of cells. Moving from outside inward, below the surface cuticle and its underlying light-line are the palisade cells, hour-glass or column cells, the spongy parenchyma, and the protein-rich aleurone layer. The cells of the cotyledon are filled with fat, protein, and starch.

Detailed illustrations show: (1) Two yellow soybean seeds (one from Japan, one from China) showing the seed coat and a front and side view (ventral, facing the hilum) of each and with each part labeled (Fig. 1, p. 3): R = chalza (*Samennaht*), a small linear groove at one end of the hilum, the point where the seed coat was joined to the body of the ovule. N = hilum (*Nabel*) or seed scar, which is linear-elliptical in shape and nearly flat. M = micropyle (*Keimmund*), at the opposite end of the hilum from the chalza, it is a minute orifice in the seed coat through which the primary root of the young seedling emerges in germination. W = outline of hypocotyl seen through the seed coat / testa (*Würzelchen*), visible in many, but not all, varieties. Note: This is the earliest document seen (March 2009) that contains the word "micropyle."

(2) Cross section of the testa (the seed coat; "the hard external coating or integument of a seed") and horizontal section of the testa of a yellow soybean from China with each part labeled (Fig. 2, p. 5): C = cuticle (*Cuticula*). L = light-line (*Lichtlinie*). P = palisade cells (*Palisadenzellen*). Sz = hour-glass cells (*Säulenzellen*). Sp = spongy parenchyma (*Schwammparenchym*). A = aleurone layer (*Endospermüberreste*).

(3) Cross-section of hilum of a yellow soybean from China, with each part labeled (Fig. 3, p. 8): P' = outer palisade layer (*Aeussere Palisadenschicht*). P = inner palisade layer (*Innere Palisadenschicht*). S = asteroid parenchyma (*Sternparenchym*). Sp = spongy parenchyma (*Schwammparenchym*). F' = fibro-vascular bundle (*Gefässbündel des Nabels*). F = fibro-vascular bundle of the testa (*Gefässbündel der Samenschale*). A = aleurone layer (*Endospermüberreste*). Sz = hour-glass cells (*Säulenzellen*).

(4) Cross-section through the chalza of a green soybean from Japan (Fig. 4, p. 10): P = palisade cells. Sz = hour-glass cells. S = Process, appendix or process of the parenchyma? (*Fortsatz des Nabelsternparenchyms*). F = Fibro-vascular bundle. Sp = Spongy parenchyma. A = Aleurone layer.

(5) The embryo of a yellow soybean seed from Japan (Fig. 5, p. 10): I. Whole embryo from the ventral view; II. Half of the embryo seen from the inner side. III. The two leaves of the plumule. C = Cotyledons (*Keimblätter*). W = Hypocotyl (*Würzelchen*). B = Leaves of the plumule (*Blatterfederchen*).

(6) Soybean cotyledon cells filled with fat, protein, and starch (Fig. 6, p. 12): P = Protein (*Protein*). S = Starch (*Stärke*), the black points. The material between the protein bodies is fat/oil.

An interesting chart (p. 50-51) gives an analytical comparison of the morphological characteristics of the seeds of seven plants. A table (p. 52-56) makes a similar comparison in more complex terms. Address: Tokio.

1617. Pontius, Albert W. 1913. Modern [soya] bean mill for Manchuria. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*)

© Copyright Soyinfo Center 2014

16(8):172. Jan. 10.
• ***Summary:*** "The South Manchuria Railway Co. proposes to establish a new bean mill for the experimental manufacture of bean cake and bean oil on a most up-to-date system. The railway has decided to set apart the sum of $125,000 for such experimental work. The construction of the building will commence early in 1913 and the plant will be ready for operation in 1914. The machinery is reported to have been purchased in Germany at a cost of about $40,000 and is due to arrive at the beginning of 1912. The plant will have a capacity of 50 tons of beans per day, with a resultant oil output of approximately 7 tons.

"The chief object of the experimental plant will be to resolve by chemical process fatty substances at present still remaining in the bean cake, with a view to extracting ultimately from beans the maximum amount of oil of finer quality than any now put out in South Manchuria. The same process of manufacture is in vogue in Europe with splendid results, and the proposed plant is expected to entirely change the bean-milling industry in Manchuria."

The absence of fatty substance in the cake is likely to permit the safe export of the cake to Europe and America, whereas under present conditions fermentation en route is only too likely to occur.

The modern bean will replace the Santai mill which burned in late 1912, as described in the following report from Dalny (Dairen) that appeared in the *London and China Telegraph* (London). "Destruction of big mill: Fire broke out at the Santai bean mill above the Dairen wharves on November 13. The flames, feeding on the combustibles at the mill and fanned by the gale, defied all attempts at control. They razed to the ground the bean mill containing the oil expressing department and oil refinery, and spread to the oil-tank depot, standing at the east of the mill. The ill-fated mill was constructed in 1906. The plant is capitalized at $250,000 gold, of which the Mitsui Bussan Kaisha invested $150,000, and the balance was divided among a few of the leading Chinese merchants. The mill was one of the few best appointed factories in South Manchuria."

"The Formosan Government intends to purchase 70,000,000 pieces of Manchurian bean cake during the coming year as fertilizer for the Formosan sugar cane. A tender for the shipping of 150,000 pieces has been recently secured by the Mitsui Bussan Kaisha." Address: Consul, Dalny, Japanese Leased Territory.

1618. Fisher, Fred D. 1913. Commercial activities in Manchuria. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 16(11):225-32. Jan. 14. See p. 227.
• ***Summary:*** This article begins: "While Manchuria was not an active field in the political unrest [revolution] of 1911, these Provinces felt many ill effects from the turbulent conditions further south."

The section titled "Most important articles of foreign trade" states: "The exportation of soya beans and their products from the ports of Manchuria in 1910 and 1911 were, respectively, as follows: Beans, 828,924 tons and 818,108 tons; bean cake, 621,927 tons and 911,881 tons; bean oil, 44,083 tons and 65,992 tons. About 280,000 tons of beans and 32,000 tons of bean oil were exported to Europe. The average export prices for the year were about $19 per ton for beans, $16 for bean cake, and $72 for bean oil. Two of the largest British houses exporting beans suspended in 1911 because of difficulties in securing delivery on forward contracts. On the other hand, one of the largest Japanese firms is rapidly increasing its proportion of the bean export trade." Address: Consul General, Mukden.

1619. *New York Times.* 1913. Latest customs rulings. Seaweed is not shellfish–Amasake assessed as miso. Jan. 28. p. 13.
• ***Summary:*** "The Board of United States General Appraisers yesterday overruled the Asia Company, who contended that bottled seaweed could be duty free under the Tariff act of 1909 as shellfish. The commodity was assessed by the Collector at 40 per cent ad. valorem under Paragraph 252 as prepared vegetables."

"Amasake, a Japanese beverage imported by Okada and Ischida [Ichida], was properly assessed at 40 per cent. ad valorem under Paragraph 252 of the present law as being a product similar to miso. Amasake is composed of rice yeast [koji], combined with boiled rice."

Note 1. This is the earliest English-language document seen (April 2004) that uses the term "amasake" to refer to amazake.

Note 2. This is the earliest document seen (April 2004) showing amazake in the United States.

1620. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1913. Vegetable-oil industry and trade. 16(35):737-44. Feb. 11. See p. 740.
• ***Summary:*** The section titled "Ceylon" states: "The cultivation of the soya beans is not making very much headway in Ceylon, according to the Times of Ceylon, whereas in Java, Burma, Japan, and Manchuria cultivation is carried on on a very extensive scale. Some time ago the Ceylon Agricultural Society ordered beans from Java for a few members, the beans from that country being found more suitable to Ceylon. At first the beans were obtained on successfully in Jaffna, Kalutara, and Puttalam, and even in the Kandy district, and at present the beans are being used as a vegetable and for making green manure. It is claimed they are a good specific for diabetes, and the oil that is expressed from them is equal to olive oil. It has an agreeable flavor and is known as sweet oil. It is a formidable rival to coconut oil for the purpose of soap manufacture, but its cultivation

© Copyright Soyinfo Center 2014

in this island does not seem to have 'caught on.' It can be interplanted with coconuts and as it is a nitrogenous plant the larger trees would benefit."

1621. Tanret, Georges. 1913. Sur la présence du stachyose dans le Haricot et les graines de quelques autres Légumineuses [On the presence of stachyose in kidney-beans (haricots) and in seeds of some other legumes]. *Bulletin de la Societe Chimique de France* (*Paris/Bayeux*) 13-14(4):176-82. Feb. 20. 4th Series. [10 ref. Fre]
• ***Summary:*** As is well known, stachyose is a crystalline sugar that Schulze and von Plata discovered in 1890 in *Stachys tuberifera,* an edible tuber (Labiate) from Japan. Here the author reports the isolation of sucrose and a tetrasaccharide stachyose from soybeans.

1622. Kita, Genitsu. 1913. Some properties of koji-diastase. *J. of Industrial and Engineering Chemistry* 5(3):220-22. March. [3 ref. Eng]
• ***Summary:*** "I have lately been occupied in a series of investigations relative to Soya or Shoyu (Japanese [soy] sauce fermented from beans, wheat and salt) making, and incidentally cleared up certain" points about the saccharifying enzyms [enzymes] of koji."

"Summary: I. Though koji may contain two different saccharifying enzyms, *viz.,* amylase and glucase, the total quantity of glucose saccharified solution could not be produced from maltose by the action of glucase alone; hence, koji must contain some other kind of diastase which produces glucose directly from starch without the aid of glucase.

"II. Common salt has a protecting action on koji-diastase under heating but not on malt-diastase, while sodium hydrogen phosphate (Na_2HPO_4), asparagine and sulfuric acid impair its activity more quickly.

"III. The inhibitory action of salt on koji-diastase has a certain relation to the concentration of diastase. In a dilute enzymic solution it is very strong but not in a concentrated enzymic solution. It is therefore necessary in every case to note concentration of diastase when we consider the influence of some salt upon it.

"IV. The activity of koji-diastase is conserved in brine for a long time." Address: Dep. of Applied Chemistry, Tokyo Imperial Univ.

1623. Lemarié, Charles. 1913. Les plantes alimentaires du Tonkin [The food plants of Tonkin]. *Bulletin de la Societe d'Acclimatation* 60:367-76. March. See p. 371. [Fre]
• ***Summary:*** In the section on legumes, we read: *"Glycine hispida* Moench.–Soybeans (*Les Sojas*) are cultivated everywhere for the preparation of purées or of kinds of cheeses [probably tofu], or else for the production of sprouts, a food of which the indigenous people are fond. They are not used as a source of oil.

"Varieties from Japan, distributed by the Colonial Garden (*Jardin colonial*) in 1910, to Tonkin, as well as to the Sudan, have given nothing but poor results. These varieties were not adapted to the soil or the climate.

"But the improvement of local varieties and, if possible, the introduction of better varieties, continues to be studied."

Note: The term "Sudan" refers imprecisely to a region (not a political unit) that extends across the African continent from the west coast to the mountains of Ethiopia. Much of it was under French rule from 1898 as part of French West Africa, and included Dahomey (*Dahomey*), French Guinea (*Guinée*), French Sudan (*Soudan français*), Ivory Coast, Mauritania (*Mauritanie*), Niger, Togo (*Territoires Militaires du Niger et Togo*), Senegal (*Sénégal*), & Upper Volta (*Haute-Volta*). It is not clear to which part of the Sudan the soybeans were introduced, nor whether or not they were cultivated there, nor with what results. Address: Director of Agriculture, Tonkin [Vietnam].

1624. Sawamura, Shin. 1913. On bacillus natto. *J. of the College of Agriculture, Tokyo Imperial University* 5(2):189-91. March. [1 ref. Eng]
• ***Summary:*** "Natto is an article of food prepared by leaving boiled soy-beans wrapped in rice straw in a warm place for a night, and thus making them ferment. Soy-beans of natto are coated with a characteristic slimy substance. The author separated formerly two species of bacilli from natto obtained in Tokyo, No. 1 of which produced good flavored natto when inoculated to boiled soy-beans, and No. II strongly slimy one. The former bacillus was considered to be the chief actor in natto fermentation and received the name of *'Bacillus natto.'* In later years the author examined bacteriologically many samples of natto obtained at various localities, and found that the producer of natto is the same in all cases, viz. *'Bacillus natto.'* This bacillus can produce natto of good flavor and strong viscosity, and the presence of other microbes is not necessary in the fermentation of natto." A detailed bacteriological description of *Bacillus natto* is then given. "It was confirmed by the previous investigation that *Bacillus natto* produces a trypsin-like enzyme, and decomposes protein of soy-beans... *Bacillus natto* produces diastase, but reducing sugar was not found in natto thus prepared."

When *B. natto* acts on boiled soy beans at 35ºC for 14 hours and for 7 days, the following results are obtained, respectively: Total nitrogen, 7.36, 7.42; insoluble albuminoid nitrogen, 5.89, 2.10; soluble albuminoid nitrogen, 1.48, 5.31; soluble coagulable nitrogen, 0.31, 0.18; soluble non-coagulable nitrogen, 0.32, 0.48; nitrogen, of peptone and polypeptides, 0.21, 0.41; nitrogen, of arginine, histidine and lysine, 0.07, 0.09; nitrogen of purine bases, 0.09, 0.14; nitrogen precipitated by phosphotungstic acid, 0.11, 2.11; soluble organic matter, 21.95, 41.55. Carbohydrates of soy beans are mainly galactans, not much starch being present.

© Copyright Soyinfo Center 2014

Note: This is one of the key early research articles in understanding *Bacillus natto,* the natto bacterium.

Note 2. This is the earliest English-language document seen (July 1998) that mentions polypeptides in connection with soybeans. Address: Japan.

1625. Takahashi, Teizô; Yamamoto, Takeharu. 1913. On the physiological difference of the varieties of *Aspergillus oryzae* employed in the three main industries in Japan, namely saké-, shôyu-, and tamari-manufacture. *J. of the College of Agriculture, Tokyo Imperial University* 5(2):153-61. March. Previously published in *Jozo Shiken-jo Hokoku* (Report of the Brewing Inst., Tokyo), March 1911. [6 ref. Eng]

• ***Summary:*** "The physiological differences between the fungus of saké koji, shôyu koji and tamari koji are remarkable, especially in the formation of amino-acids, sugars, esters, ammonia and the liquefaction of gelatine... The formation of sugars is more conspicuous in the varieties of the fungus customarily used in the brewing of saké than in that of the varieties of shôyu or tamari, and vice versa in regard to the peptonification on the formation of amino-acids or ammonification.

"Still further, the formation of large quantities of amino acids at the stage of the spore formation of the fungus, in spite of their being less of them at the mycelium stage, explains why we use koji at spore stage in shôyu or tamari industry, and at the mycelium stage in saké brewing."

Contents: Introduction. Varieties [of Aspergillus oryzae] used in the experiments. The preparation of koji and the method of analysis. The content of sugar in the whole mass of the prepared koji, namely the growth on 100 g. of rice. The amounts of organic acids. The esters. The amino-acids and ammonia. The liquefaction of gelatine in the culture of the fungus in koji gelatine. Summary. Address: Tokyo Imperial Univ., Japan.

1626. Takahashi, Teizô; Abe, Goro. 1913. Preliminary notes on the chemical composition of miso. *J. of the College of Agriculture, Tokyo Imperial University* 5(2):193-98. March. Published in 1908 in *Tokyo Kagaku Kaishi* 29(2). Feb. [5 ref. Eng]

• ***Summary:*** This article begins: "'Miso' is a food very common in Japan. The raw materials used in making it are soy beans, rice or barley, common salt, and water. In preparing 'Miso,' rice or barley is changed first into 'Koji'..."

A full-page table compares the chemical composition of Hatsuchô-miso [Hatcho miso], Sendai-miso, and Inaka-miso, including amino acid content. "Assuming 37.5 grams to be the least quantity daily consumed per head and that 30 million out of the 50 millions of the whole population eat 'miso' every day, the annual consumption of 'miso' would amount to nearly 45 million kilograms."

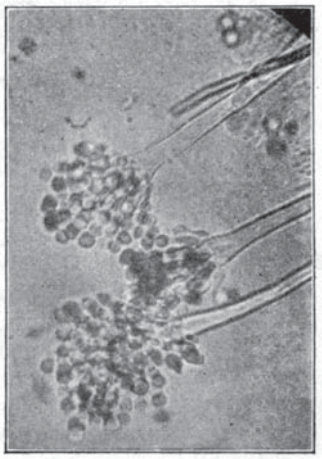
Note: This is the earliest document seen (March 2009) that mentions "Hatsuchô-miso" [Hatcho miso]–a type of miso made with soybean koji. Address: Japan.

1627. Yokohama Nursery Co., Ltd. 1913. Descriptive catalogue... Bulbs, plants seeds, etc. 1913-1914. Yokohama, Japan. 110 p. March. Illust. Index. 26 cm. [Eng]

• ***Summary:*** On the cover of this English-language catalog is an illustration of 3 flowering plants. In the section on "Seeds" (p. 90+) is a subsection (p. 97) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is similar to that in the 1912 catalog except that soy bean costs $0.15 per lb., or $4.00 per 100 lbs. (U.S. gold). Address: P.O. Box No. 72. 21-35 Nakamura, Yokohama, Japan. Phone: 509.

1628. Kita, Gen-itsu. 1913. Einige japanische Schimmelpilze [Some Japanese molds]. *Zentralblatt fuer Bakteriologie. Series 2.* 37(17/21):433-52. April 30. [7 ref. Ger]

• ***Summary:*** Contents: Introduction. *Aspergillus tamarii,* new species. Morphological. Physiological. Affinity. Diagnosis. Incidence of mold parts isolated from soybean koji used to make tamari soy sauce. *Aspergillus glaucus,* varieties α, Beta, gamma. For each of the three varieties the same categories of information are given as for *Aspergillus tamarii.* A new white *Aspergillus* species. Comparison with *A. Okazaki*, *A. candidus,* and *A. albus.*



Kita named the species *Aspergillus tamarii.* Twenty-one photos and illustrations (see next page) show: Spores of the mold magnified x 370. Sterigmata and spores. Conidio bearers and spores. Hyphae. *Aspergillus glaucus.* "The moist wind and warm climate of Japan enable the flora, and especially the microorganisms, to grow very luxuriantly."

1635. Pontius, Alfred W. 1913. Manchurian soya bean trade and industry. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 16(147):1560-61. June 25.

• ***Summary:*** "The export season of beans commences usually in October and ceases early in the May following. The present season closed rather early. A table shows exports of [soya] beans, bean cake, and bean oil in 1911-12, and 1912-13 to Japan, China, Europe, and total.

"New model bean mill–Its effect on other mills: The local bean mills, which formed a union to adjust their output to the demand in order to prevent prices from falling abnormally low, face a new danger in the chemical extraction process, whose merits will be tested thoroughly by the South Manchuria Railway, which will erect an experimental bean mill. This modern scientific process is used in the bean mill established, during the past year near Osaka, Japan, by Lever Bros., English soap manufacturers. The bean consumption of this factory is estimated to be 100 tons per day, while the new Dairen mill is designed upon a scale half as large. As previously noted the two chief advantages of this new process is that 12 to 14 per cent of oil may be extracted against only 8 to 9 per cent now obtainable. The residue suits better for fertilizing purposes and for feeding stock, as it is in meal form, thus avoiding the expense of grinding the cake.

"Local millowners have another worry. One cause of the recent depression in the South Manchurian bean-mill industry was the establishment of rival mills in Japan, which is said to be more advantageously situated."

"Soy [sauce] breweries in South Manchuria: While reliable statistics are lacking regarding the manufacture of soy from Manchurian beans, it is claimed locally that the total output in South Manchuria has been increasing steadily year after year while imports from Japan have deceased. Annual imports from Japan and outputs in South Manchuria are estimated as follows:"

A table shows that in 1910 imports of soy sauce were 2,264 tons and total output in South Manchuria was 875 tons. Total: 3,139 tons. In 1911 imports were 1,871 tons and local output was 1,125 tons. Total: 2,996 tons. In 1912 imports were 1,683 tons and local output was 1,625 tons. Total: 3,308 tons.

"The demand for soy [sauce] has increased as the Chinese have gradually learned to like it. Of the total consumption of soy of superior and medium quality each takes up about 20 per cent, the remaining 60 per cent being of inferior quality. The steady increase of the South Manchuria output in recent years signifies that the imported product will be entirely supplanted by the local manufactured article. Japanese have $65,000 invested in these local soy breweries, apportioned as follows: Dairen, $30,000; Port Arthur, $18,000; Newchwang, $10,000; and five smaller places $7,000. Present prices for the product are $1.40 to $1.80 per 50 pounds wholesale, and $1.60 to $2 per 50 pounds retail." Address: Consul, Dalny (Dairen), Japanese Leased Territory.

1636. Curtice, Raymond S. 1913. Dairen. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 16(177):597-608. July 31. See p. 604-05.

• ***Summary:*** This is part of a larger article on "Commerce and industries of southern Manchuria" (p. 593+). The section on Dairen begins: "The Dairen (Dalny) consular district compromises the southern end of the peninsula of Liaotung, the southernmost part of Manchuria, and embraces the whole of the Kwantung Leased Territory, which was originally leased to Russia by China in 1898. The unexpired term of the lease was ceded to Japan by Russia at the close of the Russo-Japanese War."

The section titled "Bean trade" (p. 604) notes that there has been a marked decrease in the trade of soybeans and products from Dalny. The reasons for this have already been given. A table shows exports for the calendar year 1912 of bean cake, [soy] beans, and bean oil (in tons of 2,000 lb) to various countries. Most of the bean cake (302,402 tons) is sent to Japan. Most of the [soy] beans are also exported to Japan (101,903), followed by Hong Kong (9,694), Great Britain (5,700), Dutch Indies [today's Indonesia] (2,829), and Netherlands (1,108). The largest amount of [soy] bean oil is sent to Belgium (13,550), followed by Japan (7,636), and Great Britain (1,116). Small amounts of beans and/or products are exported to: United States (oil only), Singapore / Straits, etc., Sweden, Germany, France, Russia (Pacific ports), and Chosen (Korea). For bean cake: Total to foreign countries 302,551. Total to Chinese ports 76,172. Grand total (1912) 378,723. For [soy] beans: Total to foreign countries 121,3241. Total to Chinese ports 61,304. Grand total (1912) 182,629. For [soy] bean oil: Total to foreign countries 23,493. Total to Chinese ports 13,973. Grand total (1912) 37,467. Corresponding totals are given for 1910 and 1911. "The fact that share taken by the Chinese ports was so much greater proportionally in 1912, in all three items, was due to the lessening of the European demand." "It is expected that a new factor in the export trade of bean cake will be introduced when the new chemical process of extracting the oil is put into operation, for the residue, now in the form of bean cake, will be in a powder, and will be capable of shipment through the tropics without decaying. This should open up profitable markets in America and Europe for this article."

The section titled "Bean milling the chief industry" (p. 605) begins: "The industries of this consular district center around the [soy] bean trade and the South Manchuria Railway Co. Gives statistics by bean mills on production of bean cake and oil in 1910, 1911, and 1912. The Chinese have 40 [soy] bean mills in operation with a combined capital investment of $528,500, while the Japanese with their six mills of most modern construction total $1,687,000.

© Copyright Soyinfo Center 2014

Although most of the Chinese mills are operated by crude methods, still it is significant that their combined output during the season just past (October–April) was $8,308,098. The output of five modern Japanese mills (one having been destroyed by fire) during the same period was $2,360,170." Address: Vice consul.

1637. Kent, William P. 1913. Newchwang. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 16(177):608-13. July 31. See p. 611.
• ***Summary:*** This is part of a larger article on "Commerce and industries of southern Manchuria" (p. 593+). The section titled "Soya beans and products–Exports" states (p. 611): "The soya bean and its products of oil and bean cake continue to hold first place in the commerce of the port, but there was a falling off in the export of all of these articles during 1912. Competition with Dairen is probably more clearly defined in this trade than in any other of those referred to in this report. The progressive decline in exports year by year in beans, oil, and bean cake can be accounted for in no other way than that these are being diverted to Dairen, where the berthing of ships and a port open throughout the year, as well as railway competition in transportation, give advantages to shippers. None of these products go directly from Newchwang to the United States. Whatever beans or oil is imported come through reshipment at the ports of Japan or from Shanghai. Neither is it possible from any available statistics to know to what countries of Europe, or in what quantities, beans or oil shipments originating at Newchwang are finally destined." Address: Consul.

• ***Summary:*** The section titled "Trade of Changchun" states: "In 1909 the East Asiatic Co., Samuel & Co., the Manchurian Co., L. J. Healing & Co., and Jardine, Matheson & Co. established branches at Changchun and erected spacious premises on yards leased from the South Manchuria Railway Co. containing railway sidings, but with the exception of the last-mentioned firm, which uses its branch for the distribution of Shanghai-made piece goods and Hongkong sugar, all have withdrawn."

"The withdrawal of the firms mentioned is the direct result of certain changes which have taken place in the bean trade of South Manchuria. The export of the soya bean from this district, which three or four years ago developed so rapidly, has, as far as Europeans are concerned, ceased for the present to possess any interest, the trade being in the hands of Japanese and Chinese dealers who confine their operations to supplying the Dairen market, where the beans are to a great extent either crushed at the local mills or shipped to Japanese or South China ports.

"Among the principal reasons why the exportation of beans from this district has ceased to attract European attention are the following: As Changchun is in direct railway connection with Dairen, prices run as much as 5 to 10 per cent higher than rates ruling along the northern Russian lines, the cause being the daily demand in Dairen for crushing purposes and in Far Eastern markets, in contrast to the absence of such demands at Vladivostok, and the smaller number of Japanese buyers in the north; the impossibility of making forward contracts with native suppliers, an embarrassment which also exists in the north; the instability of the Kirin currency, the Tiao paper; and the greatly increased prices which the Chinese are demanding, as compared with a few years ago, which have caused beans to compare unfavorably for crushing purposes with either flaxseed or cotton seed.

"The trade at Changchun in the hands of European merchants is now confined almost entirely to a few lines of imports, the larger export trade having been lost to Japanese and Chinese concerns."

A table (p. 183) shows "Declared exports from Manchuria to the United States." They were declared through the American consular offices at Mukden, Harbin, Dairen, Newchwang, or Antung. For [soy] bean oil, the value was $73,359 in 1911, and $19,945 in 1912. Address: Vice Consul General, Mukden, China.

1642. Bickford, Geo F. 1913. Manchurian soya bean market. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 16(238):216. Oct. 11.

• ***Summary:*** "At present there is little activity in the local soya bean market. Of the 17 mills at Newchwang, 5 of the large and 6 of the small are in operation, and those at reduced capacity–about 70 per cent of their average shown below." A table shows the number of mills at the port of Newchwang, with the maximum daily capacity and average output of each of cake and oil. One piece of cake weighs about 67 pounds; 1 catty is 1.33 pounds.

For the 7 large mills, the maximum daily capacity is 5,000 pieces of cake and 22,000 catties of oil. But the average daily output is 4,000 pieces of cake and 18,000 catties of oil.

For the 10 small mills, the maximum daily capacity is 1,500 pieces of cake and 6,600 catties of oil. But the average daily output is 1,400 pieces of cake and 5,280 catties of oil.

"The chief reason for closing mills is the shortage and resultant high price of supplies... Last year's [soya] bean crop in Manchuria fell below the average.

"Prices and crop prospects. The average price last year per picul (133.33 lb) was 13 taels ($8.55); now the price is 14.30 taels ($9.58) per picul." Last year the average value of a "transfer tael" was $54 local currency; now it is about $62.

The shortage of beans "has induced a number of millers to move into the Japanese Railway Zone, where sufficient supplies can be obtained by rail, as it is with difficulty that heavy-laden junks can navigate the upper reaches of the Liao River on account of its increasing shallowness." Address: Vice Consul, Newchwang, China.

1643. Kita, Gen-itsu. 1913. Japanische Sojaindustrie [Japanese shoyu industries]. *Wochenschrift fuer Brauerei* 30(42):549-52. Oct. 18; 30(43):559-61. Oct. 25. (Chem. Abst. 8:984). Summarized in Zentralblatt fuer Bakteriologie, Series II. 41:257 (1914). [8 ref. Ger]

• ***Summary:*** An excellent and very detailed description of how shoyu is made in Japan, with many photos. Contents: Introduction. Overview of the process. The raw materials. Preparing the koji: Pre-preparation, mixing the beans with the wheat, the koji room (*muro*), handling the mass of koji, characteristics of koji. Part II: The fermentation process. Pressing. Scientific investigations of soy sauce brewing. Summary.

The author calls soy sauce *Soja* and *Sojasauce.* The two basic types of shoyu are made with soybeans and wheat, or just with soybeans. But some special sauce is also made with fish meat, such as Lintenfish. The addition of sugar and other sweeteners, and of colorings such as molasses to low-grade shoyu is not rare.

Preparation of soy sauce: The fermentation usually takes 6 to 12 months or more. Some years ago the "quick method" was widely introduced but after several years it unfortunately fell into ruin. The shoyu process has never been developed with modern processes like the sake processes, because sake must be a certain way when finished but shoyu is acceptable in many ways. The aroma from the roasted wheat adds a special component to Japanese shoyu, not found in Chinese soy sauce. The roasted wheat is coarsely ground (using a roller miller or, earlier, a granite mill), and the meal produced thereby serves to enrobe the steamed soybeans, while the larger particles hold the beans, thus aiding aeration. So the wheat must not be ground too fine. The beans are steamed, usually at a pressure less than 2 times atmospheric pressure; higher pressure creates a bad aroma. If the beans are cooked in an open kettle, a bamboo mat is placed in the bottom to prevent the beans from browning. The liquor left after cooking is called *amé.* The beans and wheat koji are then mixed. The beans, after being removed from the kettle, are spread out on the koji floor in front of the koji room (*koji-muro*) to a depth of about 3 cm. They are stirred from time to time until cooled to about 30-35ºC. The spores (*keim*) of *Aspergillus oryzae,* when they are used, are then sprinkled on. The mixture is put into wooden koji trays (*kojibuta*) each about 60 by 30 by 10 cm deep (24 by 12 by 4 inches), and holding 18 liters of raw material. In some places (such as Shozushima) a wide straw mat (80 by 180 cm) is used in place of these koji trays. The koji room is typically 10 by 3.5 by 2.2 meters high. The walls are thick. A modern room is of tiles in order to prevent changes of temperature from the outside. For cleanliness, the walls should be made of cement, with a door at one end and a window at the other. The room contains many vents to remove moisture and carbon dioxide. Steam pipes are laid in the floor, or a fire-pot is used instead. As noted above, the koji mold spores are either mixed in, or they settle from the air in the koji room, or come from the koji trays. The koji trays are stacked in a zigzag fashion to allow ventilation, which is necessary for shoyu koji but not for sake koji. Dampness and lack of oxygen favor the growth of Mucor molds and undesirable bacteria. After 20 hours, the koji is mixed well in the trays, and the upper trays are placed on the bottom–and vice versa. Stir again after 7-10 hours; the temperature is now 38-40ºC. After 10-15 hours conidia formation begins. The koji is usually ready in 3 days. Good koji has yellow-green conidia, very numerous on the inside. The surface is white and the mass dry. Contaminants: *Mucor, Rhizopus* and bacteria due to too much moisture, especially with heat. Black koji has a bad aroma from the disease *kurotoko,* which is caused mostly by excessive moisture.

© Copyright Soyinfo Center 2014

During fermentation about 20% of the original mass is lost; starches are changed to sugars, which are used up by the koji mold. The goal is to obtain koji which is rich in enzymes.

The brewing process: The ingredients are mixed in a vat to make the mash (moromi), which contains enzymes. The vats are made of sugi wood (*Cryptomeria japonica* Don.) with bamboo hoops. In the large shoyu factories they usually have a capacity of 4,000 to 4,500 liters (1,057–1189 gallons). The proportions of raw materials are as follows: Soybeans (2,700 liters = 1,875 kg), wheat (2,700 liters = 2,025 kg), salt (NaCl, 2,700 liters = 1,690 kg), and water (5,400 liters = 5,400 kg). The salt may be dissolved in hot or cold water, usually to 20º baume. Less salt gives better quality. The mash is mixed with a pole or with compressed air. The mash must usually ferment for a year before it can be pressed. A longer fermentation improves the color and aroma, but the flavor becomes weaker. Where a 2 or 3 year mash is used, it is mixed with 1-year mash to improve the quality. In order to shorten the fermentation time, the mash is sometimes warmed; this and other suggestions for improving the process will be discussed later. The mash contains microbes, especially yeasts and bacteria.

Pressing: The mash, after it finishes aging, is pressed in cotton bags that have been dipped in tannin from astringent persimmons (*kaki-shibu*). Each bag holds about 2 liters. More than 2 liters may causes the bag to tear in the *fune* (literally "boat"), which is about 230 by 73 by 91 cm and which holds about 800 such bags. Formerly a log was used in the form of a lever press, but now screws and hydraulic presses are widely used. The yield of shoyu is about 70-80% of the volume of the moromi. The remaining presscake still contains soluble constituents, which are extracted by mixing the presscake (*Der Presskuchen*) with water. The remaining cake is sold as fodder.

Treatment of the pressed liquid: This liquid is heated in an iron kettle in order to partially pasteurize it, separate the coagulable constituents, and darken the color. Better grades are heated at a lower temperature (never above 70-80ºC), and poorer grades at a higher temperature, mainly to concentrate and darken the color. For good grades, darkening of the color is seen as a disadvantage, as is the resulting change of aroma. Kita then gives a detailed analysis of both shoyu and the second-pressed liquid. Shoyu contains 30-32% solids, has a specific weight of 1.189 to 1.234, and contains 16.15 to 18.61% minerals.

Scientific investigations and various proposals for the shoyu brewery: Kita experimented with the use of defatted soybean meal. He notes that koji contains a powerful proteolytic enzyme. Cooking under pressure and defatting promote decomposition. Pressure cooking is more and more widely used. Defatting of the beans proved to be disadvantageous since it lowered the quality of the final shoyu, but he thinks the problem lay in the improper treatment of the beans during defatting. He proved this hypothesis with coarse beans defatted with benzine (*Benzin*) to make flawless shoyu. Sake koji has stronger diastatic and weaker proteolytic enzymes than shoyu koji. The proteolytic and diastatic power of mold enzymes are inversely related. There are different varieties of *A. oryzae* with different morphologies. Photos (p. 550-51) show equipment used in making shoyu in a factory: (1) Presses for pressing the sauce from the aged moromi. (2) Brick roaster for the wheat, with a belt-driven mechanical stirrer. (3) Wooden fermentation vat. (4) Many wooden moromi fermentation vats, held together by braided bamboo hoops, with a wooden plank across the top of each. (5) A man in a white coat, with a moromi stirrer in one hand, standing among many tall fermentation vats. Address: Technical Inst., Tokyo Imperial University.

• ***Summary:*** A brief account of the history, nutritive value, and utilization of the soy bean. One of the earliest food uses of soybeans in the West was in the use of Japanese soy sauce in Worcestershire sauce, in England. The soybean was also used secretively, unbeknownst to food chemists and experts, as a popular coffee substitute until it was exposed in 1912 in Weller-Darmstadt (see *Chemiker-Zeitung*). This substitute, made from roasted soybeans, was used to extend coffee at levels of up to 33%. It was shown that this soy-extended coffee was much richer in nutrients than real coffee.

In Paris, France, Bergey roasted soybeans and added

© Copyright Soyinfo Center 2014

molasses or grape sugar to make a coffee substitute, or he added vanilla, sugar, and cocoa-butter (the fat in butter) to make a chocolate substitute.

"As far as we know from the literature, the soybean has been used heretofore, with the exception of Worcestershire sauce and other sauces and soup seasonings, only as coffee or chocolate substitutes. However the real superiority of this plant lies in its high nutritional value and therefore it should be used directly as a food, as it is in the countries of its origin." Address: Germany.

1647. Keimatsu, Katsuzaemon. 1913. Daizu-yu no seibun ni tsuite [Components of soybean oil]. *Minami Manshu Tetsudo K.K., Chuo Shikenjo Hokoku* (*South Manchuria Railway Co., Central Research Institute, Report*) No. 1. p. 67-77. Nov. [8 ref. Jap]
Address: Manchuria.

1648. *Weekly Commercial Appeal* (*Memphis, Tennessee*). 1913. U.S. Department of Agriculture: Organized in 1847, when Congress appropriated $1,000 for distribution of seeds and plants–Has grown steadily and now spends $25,000,000 annually. Able and practical men at its head. Dec. 2. p. 7.
• ***Summary:*** At the center of this article are individual portrait photos of 13 men who are at the head of the USDA. These include (from upper left to lower right): Beverly T. Galloway (Asst. Secretary of Agriculture), William A. Taylor (Chief, Bureau of Plant Industry), David Fairchild (Agricultural Explorer in Charge of Foreign Seed and Plant Introduction), A.C. True (Director of Agricultural Experiment Stations), Bradford Knapp (Head of Farmers' Co-operative and Demonstration Work), David Franklin Houston (Secretary of Agriculture), C.V. Piper (In Charge of Forage Crop Investigation). William J. Spillman. Accompanying each photo is a description of the office, the man himself, and his work and philosophy.

"The work of Mr. Taylor is ably seconded by that of Mr. Fairchild, who is searching the whole world for plants which may be of value to American farmers. In this work, he has been around the world three times, has faced fever and famine and discomfort in every form and has brought us not hundreds, but thousands, of new plants, many of which are now adding greatly to our comforts and profits. He has brought us new cow peas and soys from Japan, plums from Siberia and semi-tropical fruits from all parts of the world. During the last 19 years more than 35,000 varieties of seeds and plants have been collected by the department, and the larger part of this has been done by Mr. Fairchild."

1649. Sly, H.E. 1913. China (Manchuria). Soya bean crop in North Manchuria. *Board of Trade Journal* (*London*) 83:596. Dec. 11.
• ***Summary:*** "The quantity of soya beans available for export from North Manchuria this season will be approximately the same as in the 1912-13 season, when the total amount exported *viâ* Vladivostok amounted to 297,063 tons, of which 219,438 tons were exported to Europe, 53,567 tons to Japan, and 24,013 tons to Dairen. The total exported in 1912-13 was 56,897 tons less than that of the previous season." Address: British Consul, Harbin.

1650. Ito, Teiji. 1913. Sho-kôji seizô-chû kôso no kenkyû [Enzyme production during koji-making for shoyu]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 382. p. 1237-47. Dec. 26. [Jap]
Address: Hiroshima, Japan.

1651. Pontius, Albert W. 1913. Manchurian soya bean production. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 16(305):1518. Dec. 31.
• ***Summary:*** "Investigations made by the South Manchuria Railway show the 1913 season crop of soya beans about Changchun, Kungchuling, Kaiyuan, Taolu, Shanchengtzu to be of fine quality, this zone having experienced favorable weather. On the other hand, the belt lying between Liaoyang and Tashihchiao and along the Mukden-Antung Railway suffered to a considerable extent from drought."

"Output of bean cake: The daily combined output of bean cake at the Dairen mills has heretofore been estimated at 70,000 pieces. The establishment of four new mills and the reconstruction of the Santai bean mill [which was destroyed by fire on 13 Nov. 1912 near the Dairen wharves] will increase the daily output to 100,000 pieces. During 1912 a total of 10,503,595 pieces of bean cake was produced at the local mills, and as each piece weighs approximately 62 pounds, the output was in excess of 325,000 short tons. About 300,000 tons were shipped to Japan, the remainder finding its way to south China ports. Of the 51 bean mills now in operation, 6, owned and operated by Japanese, produce two-thirds of the total output.

"Motive power for mills: Two Japanese and seven Chinese bean-oil mills at Dairen have recently altered their motive power from petroleum to steam. Hitherto electricity, gas, and petroleum were in more popular use than steam, but a comparative study of the cost of machinery operation by different kinds of motive power, instituted within the past year, showed that for each 62-pound piece of bean cake manufactured, the net cost of electricity and gas was" highest (7 mills U.S. currency) and steam was the least expensive (2½ mills). "As the use of power other than steam necessitates the installation of special equipment for steaming beans, this feature gives steam a decided advantage over other kinds of motive power." Address: Consul, Dalny, Japanese Leased Territory.

• ***Summary:*** The material in this book up to page 578 is identical (page for page) to that in the 1876 edition. Thereafter begins "Book III: Supplementary chapters, including history to the beginning of 1912"–about 129 pages of new information in the following chapters:

1. Japan in 1883. 2. Japan in 1886. 3. Japan in 1890. 4. Japan in 1894. 5. War with China (Sino-Japanese War, 1894-1895). 6. Facing the twentieth century. 7. Japan a world power (including a detailed description of the Russo-Japanese War, 1904-1905). 8. Japan on the Asian continent. A separate index covers this supplementary material; soy is not mentioned.

The author reveals his basic viewpoint on the last page of this book (p. 734) by expressing his fervent hope that all of Japan's traditional religions will be "transformed by the spirit of Christ." Address: D.D., L.H.D., Late of the Imperial Univ. of Tokio; presently in New York.

1663. Kin, Choshi. 1913. Shôyu enkaku-shi. ed. 3 [History of shoyu production. ed. 3]. Choshi, Japan. 186 p. First edition was 1909. 28 cm. [Jap]
• ***Summary:*** Contents: 1. Overview (p. 1): Shoyu as a special East Asian product, shoyu as superlative seasoning, relationship between shoyu and sauce, shoyu as an influence in life. 2. Origins of Japanese shoyu (p. 7): About Chinese jiang, Japanese shoyu in history, origin of the shoyu industry in Japan, trends and growth of shoyu production (output), the shoyu industry and taxation, household makers of shoyu and changes in home usage, the Japanese government's attitude toward shoyu, overseas demand for shoyu, the development of shoyu in the Kantô (Tokyo/eastern Japan) region.

3. Choshi shoyu (p. 117): Shoyu in the Kantô region, the shoyu makers guild in Choshi, the development of the shoyu-makers' union (or cartel) in Choshi and Noda, names and identification of the best quality shoyu brands, current varieties of shoyu, Choshi shoyu and raw materials (ingredients), Choshi shoyu and the local topography, Choshi shoyu and transportation, Choshi shoyu and micro-climate, Choshi shoyu's trademarks and brands. 4. Higeta shoyu (p. 151): The origins of Higeta shoyu, how to judge good-quality shoyu, the raw materials for Higeta shoyu, a chemical analysis of Higeta shoyu, the handling of Higeta shoyu, shelf life (period of freshness) of Higeta shoyu, awards received by Higeta shoyu. 5. Conclusions (p. 174). A table (p. 35-36) shows national production statistics for shoyu for the years 1885-1910, including the amount and number of makers. Appendixes: 1. The reputation and names of Japanese shoyu in Europe (in English, French, and German) according to various early documents (p. 175). Historical documents in Asian languages about raw materials (soybeans and wheat) used for shoyu (p. 182).

Notes and observations by Mark Fruin: Kin Choshi was the pen name of Genba Tanaka XIII, the head of an important shoyu brewing family in Choshi during the Tokugawa and Meiji periods. Forty percent of the book is early shoyu

history and 60% is the history of Choshi Shoyu–Higeta.

Yuasa shoyu appears to be the first true shoyu in Japan; it gradually separated from miso production. Yuasa shoyu was sold throughout Japan by Osaka merchants and it benefited as well from the political protection of the Daimyo of Wakayama. The Osaka shoyu trade developed gradually and it was not important until the 17th century. Yet shoyu developed somewhat independently in Western Japan (Yuasa) and Eastern (Noda and Choshi).

The earliest record of an Osaka merchant (one Komatsuya Ibei) handling Yuasa shoyu dates from 1535; some 50 years later some Osaka merchants had certain ships earmarked for the exclusive task of carrying Yuasa shoyu to and from market, which by this time had spread from Osaka to the Inland Sea trade area.

In 1908 shoyu was the fifth most important export from Wakayama prefecture [to other parts of Japan]; there were 59 makers in a locally organized cartel producing 52,700 koku with a value of 850,000 yen.

Tatsuno shoyu began its history some 319 years ago (from the year 1913) when in 1594 a local farmer in the Tatsuno area, Yokoyama Gorobei, began to make sake as a sideline to his farming. Later he added shoyu to his household industries. In 1596 Yokoyama turned over his sake making activities to a branch household established for that purpose and concentrated his own efforts on farming and shoyu manufacture. By the late Tokugawa Period (1600-1868) the Yokoyama family sold its shoyu business to the Kataoka family and the latter merged with the Nakahara family in 1893 to form Kikuichi Shoyu.

Shodoshima shoyu began being made in the middle of the Tokugawa period. In 1882 production stood at 34,000 koku and in 1908 at 98,832 koku. In 1901 many of the various shoyu makers in numerous villages on the island amalgamated into a cartel and in 1908, the first corporation for making shoyu in Japan was formed. Later, three other forms merged to establish Marukin Shoyu. p. 35-36 gives Japanese national statistics for total shoyu production and the number of manufacturers each year from 1885 to 1910. In 1,176,535 units? were produced by 10,971 companies. In 1910 some 2,205,574 units were produced by 14,364 companies.

1665. Saitamaengei & Co., Ltd. 1913. Wholesale trade list... bulbs, plants, seeds: 1913. Saitama prefecture, Japan. 36 p. Illust. Index. 27 cm. [Eng]
• ***Summary:*** The section titled "Vegetable seeds" (p. 34-36) gives the price of 38 plants in U.S. gold dollars per pound and per 100 lbs. However 3 plants are given less detailed treatment: "Rice, Soja Bean, Japan peas: Special lowest price will be quoted on application." Many varieties of Japanese climbing cucumber, radish (*daikon*), turnip (*kabu*), and glutinous yam are listed.

Photos and illustrations show these other plants. Note: Saitama prefecture is just northwest of Tokyo. Address: Toyono, Nr. Kasukabe St., Saitama prefecture, Japan.

1666. Takenob, Y.; Kawakami, K. 1913. Japan Year Book. Tokyo: Japan Year Book Office. 702 p. See p. 163-64, 230, 351, 356, 358, 438, 654, 659, 672, 690. Eighth annual issue. [Eng]
• ***Summary:*** In chapter 11, "Agriculture" (p. 155-77) is a table titled "Beans, sweet potato and potato (p. 163) which gives "Soy bean" production in Japan for 1906-1910 (in *koku*).

On page 164 we read: "The three daily articles of diet for all classes, viz. soy [sauce], *miso,* and *tofu* are manufactured from this bean..."

In chapter 15, "Industry," is a paragraph titled "Soy" (p. 230) on the patented Suzuki process for brewing soy [sauce]. "For soy the prefecture of Chiba, which is contiguous to Tokyo municipality, heads all other places on the list. Parched wheat mixed with salt and beans is a principal ingredient. The process is still far from scientific, requiring about 12 months before the liquid is ready for sale. It is also costly, as it does not admit so much labor-saving appliances. To obviate these advantages, several patented processes, notably that by Mr. Suzuki, have been tried, but they do not seem to have attained ideal perfection. It was on the strength of the Suzuki process that a company backed with yen 2,500,000 paid up was started, in 1907, and the 2-months' brewing, the chief merit of the invention, was started. It is to be regretted that this first machine-brewing has failed to produce the soy which can compare with the old process soy in taste and flavor, and that the company has been wound up."

In Chapter 25, "Home trade" is a table (p. 351) titled "Prices of principal commodities in Japan," which includes prices for 1905-1911 in yen for soy beans (per *koku*), soy [sauce] (per *koku*), and miso (per *kwan*).

In Chapter 26, "Foreign trade" is a table (p. 356-58) titled "Imports" (in 1,000 yen). Under the heading "Staples articles of over yen 1,000,000" (p. 356) is given the value of soja bean imports for 1908-1912. Under the heading "Trade with China (p. 359) is given the value of imports of "beans" and of "oil-cakes" for 1906-1911.

© Copyright Soyinfo Center 2014

In chapter 30, "Finance," is a paragraph (p. 438) titled "Tax on Japanese soy" [sauce].

In chapter 34, "Chosen (Korea)," a table (p. 654) on "Exports (in 1,000 yen), under the heading "Foreign trade" has data on exports of beans and peas for 1906-1912 (in yen).

In the same chapter, under the heading of "Agriculture" is a paragraph (p. 659) which states: "Barley and soya bean.– Barley covers 421,828 cho, yielding 4,194,425 koku. Beans are exported chiefly to Japan for manufacturing soy. The acreage is 358,000 cho and the yield [production] 1,925,000 koku. Export to Japan amounted to about 3,500,000 yen in 1909."

In Chapter 35, "Taiwan (Formosa)," under the heading "Agriculture," a table (p. 672) titled "Agricultural products" has production data on "Beans and peas" (in 1,000 *koku*) for 1905-1909.

In Chapter 37, "South Manchuria," is a paragraph (p. 690) titled "The soya bean" which states: "The fame of Soya bean has spread all over the world since 1906 when the Mitsui Bussan first shipped a trial consignment to England. As substitute of cotton seeds for extracting oil the bean met with a favorable reception not only in England but in Germany, France and elsewhere, and the following year the enterprising firm received large orders. The yield [production] of [soya] bean in Manchuria is between 1,500,000 and 2,000,000 tons and the output of bean-cakes about 1,000,000 tons. In 1909 the export amounted to 800,000 tons of which about 50% went to Europe, 30% to China and 20% to Japan. The export is made through Dairen, Newchang (which monopolized it before the export to Europe began), and Vladivostock, the first claiming about one half and the other half is divided between the two ports." Address: Prof. at Waseda Univ. and Late of the *Japan Times*, Japan.

• ***Summary:*** Contents: 1. Outline (p. 1): Preface, microbiology outline, outline for how to treat and examine microorganisms, general theory of shoyu fermentation. 2. Raw material outline (p. 85): Raw materials for shoyu, soybeans, wheat, salt, water, storing raw materials, coal. 3. Preparation of raw materials (p. 175): Making salt water, preparing raw soybeans, preparing wheat, mixing cracked wheat and cooked soybeans, koji starter (*tane koji*).

4. Making koji (p. 293): The purpose and need for making koji, how to make koji, the koji room (*koji mura*), improving the koji room, koji for shoyu. 5. Shoyu moromi or mash (p. 383): The fermentation room (*shikomi-gura*) and fermentation vats (*shikomi oke*), fermentation, shoyu moromi, chemical and physical changes in shoyu moromi, microorganisms in moromi, ripening (*jukusei*) of moromi, warm temperature-controlled fermentation (*on-jôzo*), quick fermentation (*sokujôzo*). 6. Shoyu (p. 489): Pressing the liquid sauce from moromi, heating the shoyu (*shoyu no hiire*), clarification (*seichô*), history of one generation of shoyu, components of shoyu, the flavor and fragrance of shoyu, relationship between the quality of shoyu and its components, methods of testing the quality of shoyu, the value of shoyu as a raw material for sauces, (*bansui*) and (*bankasu*), mold on shoyu, containers for shoyu.

7. The theory of marketing shoyu (p. 639): History of marketing / selling shoyu, selling shoyu, outlook for selling shoyu, precautions in selling shoyu. 8. Constructing and running a shoyu factory (p. 653): Building the plant, equipment and labor, the economics of building and running the factory. 9. The method of testing the microorganisms (p. 693): The need for testing microorganisms, the method of testing the microorganisms found in water, method of testing the microorganisms found in the air, method of testing the microorganisms found in koji starter and koji, method of testing the microorganisms found in moromi.

10. The method of analysis (p. 725): The need for analysis, general method of analysis, method of analyzing raw materials, method of analyzing koji, method of analyzing moromi, method of analyzing shoyu, method of analyzing shoyu presscake (*shoyu kasu*), method of detecting saccharin, qualitative analysis of formalin, method of qualitative analysis and measurement of salicylic acid (*sarichiru-san, saruchiru-san*), method of analyzing coal. 11. Conclusion (p. 809): Brewing and exporting, improvement of quality, quick fermentation of shoyu, application of machinery, the necessity of having a shoyu fermentation laboratory. Appendix (p. 825): The Togano method and equipment for moromi stirring. 12. Fifteen charts and tables concerning shoyu fermentation (mostly scientific information on physical and chemical properties). A portrait photo (located just after the title page) shows Meijiro Togano, formally dressed.

• ***Summary:*** "Dear Prof. Piper: During the last summer I was advised by a Japanese student who was visiting at Arlington Farm that there are four or five smooth varieties of soy beans cultivated in Japan. He also advised me that the growing of the soy beans in Japan was affected to a considerable extent by weevil attack and the only varieties immune to the weevil attack were the smooth ones.

"Thus far we have obtained only one smooth variety, No. 22876, in our introductions, and that one from Japan. I wonder if it would not be possible for you to obtain some of the smooth varieties from some of your correspondents in Japan.

"Very truly yours,..."

Address: Jozo Shikensho, Gishi.

1671. Turner, A. Grenville. 1914. The soy bean. *Agricultural J. of the Union of South Africa* 7(1):67-77. Jan.
• ***Summary:*** This report was sent to South Africa by the Union Trades Commissioner in London, Mr. C. du P. Chiappini. Contents: Botany and habitat. Varieties. Conditions of growth. Methods of culture and soil inoculation. Harvesting: Yield per acre, yield of forage, as a grain crop, thrashing. Manurial value (as a green manure). Storing soy bean seed. Feeding value: For sheep, dairy cows, or hogs. Experiments in South Africa (conducted by Mr. Turner during the 1910-1911 season). Chemical analyses. The commercial aspect. The bean (utilization). The oil (utilization).

"Up to the year 1907 the export of soy beans from Manchuria did not exceed 120,000 tons, of which the bulk was absorbed by Japan" (p. 68)

"As a commercial oilseed, however, the soy bean was undoubtedly first introduced to the notice of the British and Continental manufacturer towards the end of the year 1908, when the export commenced to Europe through Vladivostock [Vladivostok]; the cargo was nearly all carried in British bottoms and destined to oil mills in the United Kingdom."

"Experiments in the cultivation of the soy bean are being conducted in practically every British colony; during the year 1909 experiments were conducted in the Argentine Republic, Mr. A. Grenville Turner, the soy bean expert, reporting that a crop of beans may be secured in about thirteen weeks, as against six months in Manchuria. World-wide interest now was evinced in the culture of the soy bean; the late Sir Alfred Jones, K.C.M.G., entrusted Mr. Turner with a mission to introduce the cultivation of the bean throughout West Africa; on his return Mr. Turner reported that he had travelled 12,000 miles through the Gambia, Sierra Leone, Southern and Northern Nigeria and the Gold Coast Territories; the results of experiments being successful: on sowing the seed the plants made their appearance above ground in about four days, ultimately attaining a height of two feet, and reaching maturity in six, eight, or ten weeks, according to zone and climatic conditions. On his return from the coast, Mr. Turner was entrusted with a mission by Messrs. Lever Brothers, Limited, to encourage the cultivation of the soy bean throughout the Union of South Africa, during the season 1910-1911 the scheme was taken up by the farmers with enthusiasm, a large quantity of seed, together with descriptive pamphlets, was distributed by Messrs. Lever, the result of the experiments proving that South Africa can raise a crop of soy beans equal, if not superior, to Manchuria."

At the Government Experiment Farm in South Africa, where 80 varieties were tested (there are over 300 varieties of soy beans), yields of seed "as high as 2,000 lb. per acre were recorded, while in many instances the yield was well over 1,000 lb. per acre. In Manchuria the yield per acre is from 1,100 to 1,600 lb. per acre." If grown for forage, yields as high "as 12 to 13 tons of fresh fodder may be produced per acre, which may be used for hay or for silage purposes." "Growing soy beans for the grain is distinctly profitable, owing to the large demand in the United Kingdom and Europe" (p. 71).

When Mr. Turner conducted soybean cultivation experiments in South Africa during the 1910-1911 season, the "scheme enjoyed the hearty support of the Union Government Agricultural Department, the Agricultural Union, and Messrs. Lever Brothers, Limited, by whose assistance, through Mr. Turner, see for the planting of three to five acre plots was distributed to over three hundred farmers in all parts of the Union, together with printed report forms, and descriptive bulletins" (p. 72). Natal experience the worst drought in 40 years took at this time, but the soybeans resisted the drought and were able to grow under conditions that would probably in many instances be too

© Copyright Soyinfo Center 2014

severe for even maize. Soybeans were also grown in the Transvaal, Orange Free State, and Cape Province.

The highest recorded oil content in soybeans was 23.20% from beans grown by Mr. Turner in Sierra Leone.

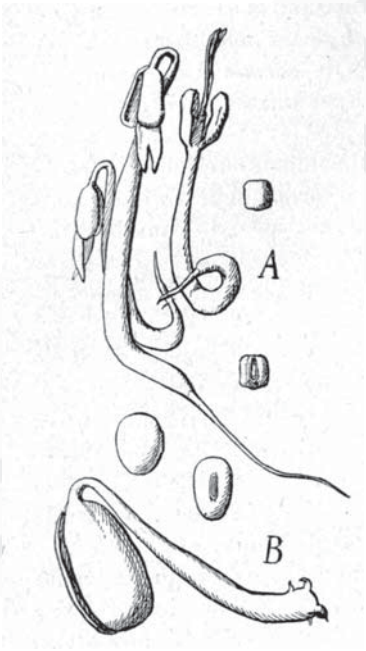
"The oil mills of Great Britain crush annually upwards of 1,000,000 tons of oil seeds,... Great Britain is the heaviest importer of oil seeds in Europe, and is, in fact, after the United States of America, the most important manufacturer of oils in the world."

Great Britain imports and crushes about 600,000 tons of cotton seed and about 350,000 tons of soy beans; the balance is linseed. Recently, however, these soy bean imports have been decreasing, since Germany has rescinded the import duty and installed soy bean crushing plants in their oil mills.

"It is estimated that Great Britain and Europe can take ten million tons of soy beans per annum in the event of the beans being used for human as well as for animal consumption and for industrial purposes, so there is a large market for South Africa to ship all the beans she can produce..."

Note: This document contains the second earliest clear date seen for soybeans in Argentina, or the cultivation of soybeans in Argentina (1909). The source of these soybeans is unknown, but might have been Great Britain.

1672. Bois, D. 1914. Germes de soja et germes de haricot mungo: Un produit alimentaire faussement dénommé [Soy sprouts and mung bean sprouts: A food product falsely named]. *Bulletin de la Societe d'Acclimatation* 61:334-36. Feb. [Fre]



• ***Summary:*** In November 1911, the *Journal des Halles et Marchés* reported the appearance in Paris of a vegetable designated under the name *Yamado* and considered new. The author identified it as mung bean sprouts (*germes du Haricot Mungo*), a green seed well known to the Society and described by Paillieux in the 3rd edition of his book *Le Potager d'un curieux* on p. 222. The mung bean/mung bean sprouts are known as *Lou teou/Ghia* in China and *Yaye nari/ Moyashi* in Japan. The sprouts are called Taugé in Java.

"We see them appear now every winter, sold in Paris by a certain number of food merchants, who also sell the ungerminated mung beans.

"But, perhaps to facilitate the sale of these products, the shopkeepers have seen fit to offer them to the buyers under the names 'soy sprouts' and 'soybeans' (*germes et de graines de Soja*), a confusion that would not be appropriate to perpetuate."

Footnote: "A circular has been printed and is distributed to the buyers, titled *Le Soja, alimentation économique et hygiénique. Une légume nouveau importé de Chine: Le Soja frais en germes* ['The soybean, an economic and hygienic food. A new vegetable imported from China: Fresh soya sprouts']. It contains some recipes using the sprouts, also falsely named."

"The soybean (*Le Soja*), whose products are coming to be used more and more in Europe, has seeds which are completely different from those of the mung bean, not only in their form and volume, but also in their special chemical composition, which requires that they be used quite differently. I must add that all the sprouts I have seen in Paris under the name of soy sprouts (*germes de Soja*) actually came from the mung bean."

"Since I have introduced the subject of soybeans, I will say that the seed of this precious legume is presently imported into Europe in considerable quantities. The Information Leaflet of the Ministry of Agriculture announced recently, according to the *Molkerei Zeitung,* that an organization named "Soyama-Werke" has been established at Bockenheim (Germany) for the production of milk, cream, butter, and cheese from this seed.

One can see from the accompanying illustration the great difference that exists between the seeds of the mung bean and those of the soybean, and between their respective sprouts.

An illustration (line drawing, p. 336) shows the seeds and sprouts of the Mung bean (A, top) and soybean (B). Mung beans, which are smaller than soybeans, give ready-to-use sprouts in 4 days, compared with 8 days from the larger soybeans. "Because of this difference, the soybean seems to me absolutely unsuited to the production of etiolated sprouts."

Messrs. Li and Grandvoinnet have published in the *Journal d'Agriculture pratique des pays chauds,* 1911-1912, a series of articles about the soybean, and they mention the sprouts among the products obtained from this plant. But the sprout in the illustration (fig. 21, p. 130, of 1912) is that of the mung bean. Address: France.

1673. Sahr, C.A. 1914. Report of the Assistant Agronomist. *Hawaii Agricultural Experiment Station, Annual Report.* p. 43-49. For the year 1913. March 16. [1 ref]
• ***Summary:*** In this report's only section, titled "Experiments with leguminous plants," all crops are grouped into three types based on the length of their growth period. The soy bean appears in both the first group (quick rotation, short season, 3 to 4 months) and the second group (medium time, 4½ to 6½ months). The importance of inoculation is emphasized.

The subsection on "Soy bean" (p. 46-49) states: "Soy beans were grown more or less extensively by Japanese farmers in Kona to defray expenses while their coffee trees came into bearing, finding a ready market for culinary purposes and also among local soy sauce brewers. Since the coffee orchards now demand the entire attention of the growers, the soy brewers depend upon soy beans imported from Japan for their supply.

"The brewing of Japanese soy sauce having become a well-established industry in Hawaii, a visit of inspection to several of the largest factories was made to ascertain the method of manufacture, which is given here briefly..." Equal parts of boiled soybeans and roasted California wheat are mixed, "poured into molds, and left to stand for 3 or more days, or until slightly covered by mold fungi. The molds are then emptied into large cedar vats of 500 to 800 gallons capacity. A starter made from cass [soybean presscake] and brine is then added, and the mass is left to ferment for a period ranging from 6 months to a year or 18 months, the mass being thoroughly stirred twice each day. The fermented mass is then transferred into a large press and the liquid sauce is pressed out, boiled 2 or 3 hours, and put in cedar tubs of 4½ to 6 gallons capacity... The ferment starter is made of a small quantity of soy-bean cake, or cass, sprinkled over a few handfuls of parboiled soy beans and left in a warm place for several days. The cass is sold for 20 cents per 100 pounds to rice planters as a fertilizer, and contains about 20 per cent salt. It is also fed to hogs, after soaking in water to draw out the salt. The brewers buy imported soy beans at $72 per ton in Honolulu, wheat at $40, and salt at $10. The tubs in which the soy sauce is put up are made of Japanese cedar, shipped knocked down from Japan, and put together as wanted. The cost per tub is from 40 to 70 cents, according to their capacity, which ranges from 4½ to 6 gallons. Soy sauce is eaten by all classes of Japanese as a table sauce, with their rice, fish, and meats. It has the color of strong black coffee.

"Miso, another Japanese table sauce, is brewed from soy beans and rice. The brewed liquid is clear white. The climate of Hawaii is too warm for its manufacture."

A table (p. 48) shows five soybean varieties (each with an "Agronomy accession number, three also with an S.P.I. number–20798, 19183, and 14953) and their yields as hay, fodder and/or seed, and stages of growth in Hawaii. The only named variety, Otootan [black seeded], was "grown from seed received from the College of Hawaii in May 1911. This variety is undoubtedly the coarsest, rankest soy bean ever grown by this station. It is also most tolerant of both dry and wet conditions, but only makes a rank growth during a cool and moist growing period." Trials of this variety were made at the Hilo and Glenwood substations.

No. 698, a Russian soy bean, was received from S.R. Cope of London, England. Seven varieties were received from the College of Hawaii. Eight varieties were received from the Bureau of Plant Industry (USDA) under the [S.P.I.] numbers 19183, 22379, 32906, 32907, 34857, 34934, 34924, 34987, and 34123; they were planted in May. "Four varieties, said to be rich in oil content, were received from an eastern paint and oil company for trial by this station. Samples of these will be analyzed and the oil content determined."

A photo shows two Otootan variety soy bean plants, valuable for forage and green manuring; one is bigger than the other and both are hanging up-side down.

Other leguminous plants tested: Kulthi or horse gram, cowpeas, sunn hemp (*Crotolaria juncea*), a variety of Cuban peanut, asparagus bean (*sasagi;* probably yardlong cowpea) and sesbania.

Note 1. This is the earliest document seen (July 2013) that mentions the soybean variety Otootan.

Note 2. This is the earliest document seen (March 2004) that mentions the asparagus bean (*Vigna sesquipedalis*).

term first used in 1851, as "a white crystalline strongly basic compound $C_4H_7N_3O$ formed from creatine and found especially in muscle, blood and urine." Address: 1. Nôgakuhakushi; 2. Nôgakushi. Both: Japan.

1677. Yokohama Nursery Co., Ltd. 1914. Descriptive catalogue... Bulbs, plants seeds, etc. 1914-1915. Yokohama, Japan. 106 p. April. Illust. Index. 26 cm. [Eng]
• ***Summary:*** On the cover of this English-language catalog is an illustration of a bird sitting in a tree on one of its fruits or flowers. In the section on "Seeds" (p. 88+) is a subsection (p. 96) titled "Some vegetable seeds." The contents (incl. the entry for "soy bean") is similar to that in the 1913 catalog except that the cost of soy bean has risen to $4.70 per 100 lbs. (U.S. gold). Two large photos on this page show: (1) Shôgoin mammoth turnip. (2) Chinese white cabbage.

The company has a new branch office in Tokyo at 10, Shin-Ogawa-machi, Ushigome-ku. Address: P.O. Box No. 72. 21-35 Nakamura, Yokohama, Japan. Phone: 509.

1678. Hanson, George C. 1914. Manchuria's soya-bean trade. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(115):921-23. May 16.
• ***Summary:*** A table (p. 922) shows exports of soybeans, bean cake, and bean oil from the principal ports of South Manchuria (Antung, Dairen, and Newchwang), a from 1909 to 1913, inclusive. Vladivostok is the principal port of export for North Manchuria. Figures supplied by the Chinese Maritime customs for the calendar year 1913 are now available. "The Maritime Province crop is reported from Vladivostok to be less than in 1912-13 when it was 540 tons. This relatively small amount shows that the beans shipped from Vladivostok are mainly of Manchuria production. The Manchurian crop for 1913-14 probably totals 1,054,500 tons.

"Vladivostok's export figures for [soy] beans the years 1912 and 1913 amounted to 338,451 tons and 319,410 tons, respectively. Adding these quantities to the exports from South Manchuria gives 654,705 tons for 1912 and 599,278 tons for 1913, figures which may be taken as representing the total amount of beans exported from Manchuria for these two years."

"Dairen is the chief milling center. Beans sent to Vladivostok are principally consigned for export to Europe, although a few shipments have recently been made from that Siberian port to Dairen. There is but one bean-crushing mill in Vladivostok, hence the shipments of bean cake and bean oil are practically nil. The beans reaching Antung, Newchwang, and Dairen are for the most crushed in the mills at those places."

In 1913 the 49 power mills in Dairen produced 309,159 tons of bean cake and 25,223 tons of bean oil. The 15 power mills in Newchwang produced 167,643 tons of bean cake and 14,679tons of bean oil. The 15 power mills in Antung produced 43,550 tons of bean cake and 4,340 tons of bean oil. "Besides the power mills, there are numerous hand and animal-driven mills in these places. The power mills in Dairen are operated largely by kerosene engines imported from Osaka, Japan. In the city of Mukden there are 32 horse mills but no power mills." Address: Vice Consul, Dalny (Dairen), Japanese Leased Territory.

1679. *Tropical Life* (*England*). 1914. Coco-nut products, &c. 10(5):97. May. [2 ref]
• ***Summary:*** The section titled "Soya oil.–Hull" gives statistics (from the *Public Ledger*) for prices on May 15th. The unit of weight or volume is not given. The section titled "Soya oil beans" gives additional statistics for soya bean prices.

A table from the *Indian Trade Journal* gives reliable statistics for exports (in tons) of soy beans from the port of Vladivostock [Vladivostock] (Siberia) from 1909 to 1913 inclusive to Europe, Japan, China, and Total. Exports to Europe rose from 214,185 in 1909 to a peak of 407,213 in 1911, then decreased to 221,099 in 1913. Exports to Japan leaped from 1,161 in 1909 to a record 77,186 in 1913. Exports to China jumped from 106 in 1909 to a record 16,909 in 1913. Total exports from Vladivostock [Vladivostok] rose from 215,752 in 1909 to a peak of 430,310 in 1911, then decreased to 315,194 in 1913.

1680. Kita, Gen-itsu. 1914. Einige japanische Schimmelpilze. II. Ueber die Aspergullusarten aus "Katsuobushi" und Vergleichung von vier A. ochraceusartigen Pilzen [Some Japanese molds. II. 1682. Oshima, K.; Ariizumi, M. 1914. On the occurrence of creatinin in leguminous seeds. *J. of the College of Agriculture, Tohoku Imperial University* 6(2):17-25. June. [7 ref. Eng]
• ***Summary:*** "The presence of creatinin was confirmed for the first time, in the seeds of Adzuki bean, black soy bean, yellow soy bean, kidney bean, horse bean and green peas. The amounts of creatinin in the seeds of Adzuki bean, kidney beans and soy beans are apparently in much larger quantity than in horse bean and green peas, though its absolute amount seems to be very small." Address: Japan.

1683. Thompson, Erwin W. 1914. Cottonseed products and their competitors in Northern Europe. I. Cake and meal. *Special Agents Series* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 84. 93 p. [1 ref]
• ***Summary:*** Contents: Letter of submittal. Introduction. Germany: The need of more protein, Germany as a customer, future competition of Egyptian cake, suggestions for increasing American exports, competing feedstuffs (incl. soya-bean meal and schrot), theoretical valuation of feedstuffs, prevalent methods of feeding, adulteration of feedstuffs, methods of purchase and sale, list of addresses. United Kingdom: Oil-cake feeding (incl. soya beans), theoretical valuation of feedstuffs, list of addresses (incl. Lever Bros. [Liverpool], J. Bibby & Sons [Liverpool], and Liverpool Seed Oil & Cake Trade Association [A. Grenville Turner, secretary, Liverpool]). The Netherlands: Promoting cottonseed cake, oil-mill methods, succulent feeds, experiment stations. Denmark: Sunflower cake, Russian transportation, purchase and sale, bulk cake, cake versus meal, valuation and choice of cake, ordinary cattle rations, cooperative societies, government supervision, list of addresses [p. 86, incl. "Dansk Sojakage Fabrik [Dansk Sojakagefabrik], Islands Brygge: Soya-bean oil mill; belongs to East Asiatic Co...; Hofmann Bang: Director Agricultural Experiment Laboratory."] Sweden: Prof. Hansson's experiments, feeding in the Skane district, competition of other feedstuffs, list of addresses. Norway: List of addresses.

"No nation excels Germany in the application of science to agriculture and in the dissemination of practical scientific information to the remote and small farms. The yield per acre in Germany of the principal food crops is now two to three times that of the United States, though 20 to 50 percent below that of Belgium, which is the highest in the world" (p. 9).

A table (p. 15) shows the kinds of oil cakes and meals consumed in Germany in 1912. Of the 1,417,920 metric tons (MT) consumed, 332,839 were cotton seed cake, 275,000 rape and similar cake, 200,000 linseed cake, 150,000 sesame cake, 150,000 poppy and sunflower cake, 120,000 palm kernel cake, 100,000 peanut cake, 50,000 soya cake, 30,000 copra cake, and 10,081 other. Thus soya cake is only 3.5% of the total.

A section titled "Soya-Bean Meal and Schrot" (p. 30) states that in Germany "Soya-bean cake is a product that has sprung into prominence within the past five years... Some of the first cake imported from Manchuria was moldy and contained too much oil, but now the principal imports are from England, where the oil is well extracted and there is not enough moisture to cause molding during the short journey. However, there is a general feeling that even small quantities of soya oil is [sic, are] not good for cattle, and so the preference is growing for the flakes, or 'schrot,' resulting from the treatment of the beans by the extraction process. This product contains only 1 or 2 per cent oil and is fast becoming popular. Some is imported from England, but more and more of it is being made in Germany."

Dr. "Kellner is the leading authority on feeds in Germany... The foundation stone on which most of the valuation theories are built is his celebrated feed unit 'Staerkewert,' which may be translated 'starch equivalent'..." A table (p. 35) shows the German feed units, or starch equivalents, of the constituents of 23 feedstuffs. Corn has the highest value at 81.5 starch equivalent, followed by sesame (79.4), copra (76.5), peanut (75.7), then soya (74.7). Another table (p. 36-37) shows that soya cake is one of the least expensive feedstuffs per feed unit.

In the UK, the main oilseed crushed is cottonseed (about 50% of the total), followed by linseed. A table (p. 50) shows the imports, exports, and production of various seeds, oils and cakes for 1912 for the UK. An illustration (p. 69) shows a pair of large "edgestones" and the beveled gears which turn them. Called "kallergang" on the European continent, these stones are used for crushing cottonseed in most parts of the world except the United States. They grind the cottonseed hulls more finely and greatly improve the appearance of the cake and meal. "SoyaBeans:... At one time it was predicted that soya beans would predominate the crush [in the U.K.], but they reached their maximum in 1910 with 413,267 tons and have been declining ever since, the receipts [imports] for 1913 being only 76,452 tons. Reasons assigned for this decrease are: The increase in freight rates, the increase in crushing in China and Japan, the growing competition from Denmark and from Germany (whose import duty was lately removed from these beans), and the slow demand for the cakes among English feeders. This last seems the most important reason, and it is involved with some of the others.

"Denmark (p. 74): Producers of oil cake the world over owe a debt of gratitude to Denmark for demonstrating the superlative value of this product [cottonseed cake] for making butter. This strictly agricultural country has been continuously concentrating its energy on those products that could be exported at the highest prices." The main export is butter, followed by milk, cream, and cured meats [i.e. value-added products]. In 1912 butter, valued at $40 million, accounted for nearly one-third of the country's exports.

In Sweden, within the past 5 years the Swedish

Agricultural Department has been giving great attention to cattle breeding and feeding. "This experimental department is under the direction of Prof. Nils Hansson, a student of the celebrated German Kellner. Prof. Hansson has been making some extensive experimental studies in dairy-cattle breeding and feeding." Kellner's theories were mainly formulated for feeding cattle for beef. Prof. Hansson has clearly demonstrated that the Kellner valuation for nitrogen is too low when applied to milk production.

Norway's principal exports are fish and fish products (worth $27.8 million in 1912), followed by lumber, wood pulp, paper, and other forest products ($23,000,000). Address: Special Agent, Bureau of Foreign and Domestic Commerce.

1684. Hanson, George C. 1914. Commerce and industries of Kwantung. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(153):7-17. July 1. See p. 11-12, 15-16.
• ***Summary:*** "The Dairen (Dalny) consular district embraces the Kwantung Leased Territory (Japanese), comprising the tip of the Liaotung Peninsula and the islands adjacent thereto... Its area is 1,221 square miles and its population in 1913 was 517,147, of whom 469,651 were Chinese [90.82%], 47,381 Japanese [9.16%], and 115 foreigners."

A table (p. 8) of "Foreign trade by countries" shows that the lion's share of its imports (71.5% of gross value) come from Japan, followed by Germany, UK, Belgium, and USA.

A table (p. 11) shows "Shipments from Manchuria into Kwantung during 1912 and 1913, including: Bean cake 103,787 / 127,690 tons. [Soy] beans 553,438 / 622,205 tons. Beans (small=azuki) 16,794 / 16,297. Sauce, bean and soy 50 / 78 pounds.

The export trade in soybeans and products expanded. A table (p. 12) shows the "native exports" (to within China; quantity and value), including bean cake, [soy] beans, and bean oil.

The section titled "Last year's improvement in bean trade–unfavourable outlook" includes a table which shows exports (incl. reexports) of [soy] beans and bean oil "in 1913, by countries of destination. Exports of bean cake to foreign countries increased in 1913 to 527,507 short tons, of which 520,947 tons went to Japan and the remainder to Chosen [Korea]. The amount shipped to Chinese ports was 38,629 tons in 1913, as against 76,172 in 1912." "A large proportion of the bean oil shipped to Japan is transshipped to the United States." Address: Vice Consul, Dalny (Dairen), Japanese Leased Territory.

1685. Boulter, R. 1914. Soya bean export trade of Dairen. *Board of Trade Journal* (*London*) 86:97-98. July 9. Summarized in the Bulletin of the Imperial Institute. 1914, p. 621.
• ***Summary:*** The export of soy beans from Dairen decreased slightly in 1913, owing to the demands of the local mills. These mills, 50 in number, consume about 450,000 tons of beans annually, producing over 50,000 tons of oil. The exports of bean cake amounted to 555,428 tons in 1913, compared with 469,089 tons in 1912: over 80% of this was sent to Japan, for use there or for transshipment to the United States. The exports of bean oil in 1913 increased by about 3000 tons; the export to Japan fell from 10,889 tons in 1912 to 3,964 tons, and the export to China increased to 22,487 tons; heavy freight rates and high prices contributed to curtail the exports.

"Recently there have been some changes in the receptacles used for transporting bean oil, drums made of mild steel being used. The cost of sending oil to Europe in drums in £1 10*s.* [1 pound 10 shillings] per ton higher than in secondhand kerosene oil tins–the original practice–but this is compensated by the absence of leakage...

"The experimental mill erected by the South Manchuria Railway Company at Dairen was not expected to start work before the middle of the year. The capacity of the mill is to be 50 tons of beans in 24 hours and the oil is to be extracted by the benzine process. This mill and the new Santai oil mill [owned by Mitsui & Co.], which was erected in 1913 to replace the one burned down the year before, are the only ones in Dairen which extract oil by this process, all the others having adopted the crushing method. It is contended that by the benzine process more oil of a better quality is extracted from the beans, while the cake, though proportionately less in weight, is richer in fertilising matter." Address: Acting British Consul, Dairen.

1686. *San Francisco Chronicle.* 1914. Harbor news. July 22. p. 16.
• ***Summary:*** The *Nippon* arrived in San Francisco harbor only one day behind schedule. "Principal items in the liner's cargo of 2613 tons measurement were:... 371 cases of cigars, 6,665 sacks of rice, 885 tubs of shoyu [soy sauce], 700 bags of shelled peanuts,..."

Note the large amount of shoyu being imported into the United States in 1914.

1687. Thompson, Erwin W. 1914. Cottonseed products and their competitors in Northern Europe. II. Edible oils. *Special Agents Series* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 89. 31 p. [1 ref]
• ***Summary:*** Contents: Letter of submittal. Introduction. The margarin industry: Germany, Netherlands, United Kingdom, Denmark, Norway, Sweden. Ingredients of margarin: Soft fats (sesame oil, colza and rape oils, soya-bean oil, peanut oil, cottonseed oil), hard fats (copra oil, palm oil and palm-kernel oil, shea-nut oil, summary of hard fats), artificially hardened fats (linseed oil, fish oils, soya-bean oil, peanut and cottonseed oils). Addresses.

Denmark (p. 11-12) "is one of the few countries where

© Copyright Soyinfo Center 2014

exact statistics are kept of the margarine made and the ingredients used. The Danes claim to make and export the best butter in the world, and they take every precaution to render it impossible in any way to adulterate or falsify it... All margarine must contain enough sesame oil to insure the prescribed color reaction." The main three "soft fats" used in Danish margarine (in descending order of importance, 1910-1912) are sesame oil, American cottonseed oil, and peanut oil; soya-bean oil is not mentioned. Margarine production grew from 34,320 metric tons (tonnes) in 1910 to 39,620 tonnes in 1912.

Ingredients of margarine: Soya-bean oil. A table (p. 15) shows the approximate net import and crush of soybeans in the United Kingdom, Germany, Netherlands, and Denmark from 1908 to 1913. The U.K. first imported soybeans in 1908 (40,600 tonnes). Germany first imported soybeans in 1909 (8,000 tonnes). The Netherlands first imported soybeans in 1911 (14,400 tonnes). Denmark first imported soybeans in 1911 (20,000 tonnes), rising to 36,900 tonnes in 1912 and 45,000 in 1913. The total soybean crush in these four countries peaked at 355,100 tonnes in 1912, falling to 246,300 tonnes in 1913. "The decline of the [soya-bean] industry in Europe is attributed to the advance in freight rates, to the difficulty of selling the cakes, especially in the United Kingdom, and to the resumption of normal oil milling in Manchuria since the close of the Russo-Japanese War. In Germany and Denmark the cake is growing in favor, especially the [solvent] extracted kind, which contains very little oil. The crush will probably continue to increase in those countries, and to decrease in the United Kingdom, where the cake is not liked. Meanwhile there is a disposition to import [soya-bean] oil from Japan and Manchuria. The United Kingdom imported 3,000 tons of oil in March, 1914. China exports to all countries about 100,000 tons of oil every year. In Denmark and Germany this oil is chiefly used for soap, but latterly in Germany, and even more so in the United Kingdom, it is being deodorized and exported to the Mediterranean to blend for salad oil. Margarin makers are taking it sparingly (not over 6,000 tons altogether). Perhaps the refiners may learn how to prepare it to suit them; but its most logical use seems to be as a salad oil as it is a natural winter oil containing oily 10 to 15 per cent stearin compared with 20 to 25 per cent for cottonseed oil."

"Peanut oil (p. 16): "Peanut oils vary greatly in quality, the best grades being made in Bordeaux, France, and Delft, Netherlands, from peanuts (*Arachis hypogaea*) that arrive in the shell from West and Southwest Africa, and to some extent from shelled nuts from China. The lowest grades are made in Marseille [Marseilles], France, from shelled peanuts shipped from the Coromandel, or east, coast of India." The present European supply of peanut oil is 184,000 tonnes, of which 135,000 tonnes (73.3%) are made in France.

Pages 26-27 discuss "Artificially hardened oils." "The combined capacity of the hydrogenating plants of Europe is estimated for 1914 at 250,000 tons (1,375,000 barrels), which is two or three times as much as has ever been treated. These plants are in England, Norway, Germany, and France, and are engaged at present chiefly on fats for soap and candles. They are hardening linseed, whale, soya-bean, and cottonseed oils.

Note: This is the earliest document seen (Dec. 2005) indicating hydrogenation of soya-bean oil to make candles.

"Edible oils: The great increase in the demand for margarin in Europe, for compound lard in the United States and for hard soap all over the civilized world has resulted in closely crowding the supply of natural hard fats, while liquid oils are relatively abundant."

Pages 30-31 give addresses of major edible oil processors and margarine manufacturers in Germany (incl. Berliner Pflanzen Butter Margarine Fabrik), Denmark (incl. Otto Monsted of Copenhagen, margarin), Norway, Sweden, Netherlands (incl. Van den Berg Margarin Works, Jurgens Margarin Works), and the United Kingdom (incl. Maypole Dairy Co.–affiliated with Otto Monsted of Copenhagen–makes margarin; Lever Bros. of Liverpool–oil mill, soap works, hardeners of oils; Crossfields [sic, Crosfield] Ltd. of Warrington–oil mill, soap works, hardeners of oils). Tables show: Total production of edible oils in the European countries (p. 7). Imports and exports for various countries and oils.

Note 2. This is the earliest document seen (Sept. 2007) stating that soybean oil is used as a salad oil in the Western world. Address: Commercial Agent, Bureau of Foreign and Domestic Commerce.

1688. *Board of Trade Journal* (*London*). 1914. Foreign trade of China in 1913. 86:355-61. Aug. 6. See p. 360.
• ***Summary:*** In 1913, exports of beans from China were 10,326,000 piculs. A picul weighs 133.33 lb on average. The original export to all destinations from Manchurian ports and marts, which has steadily declined since 1909, underwent a further reduction of 1,236,000 piculs. There was an increase in the quantity sent abroad of 3,655,000 piculs, nearly all to Japan and Formosa. And though shipments of bean oil have declined in recent years, the bean and its products yield a total value of 52,000,000 taels, which is fully up to the average. The average value of a Haikwan tael is 3 shillings and ¼ pence in 1913. 100 Haikwan taels = 111.40 Shanghai taels.

1689. Parlett, H.G. 1914. China (Manchuria): New bean oil extracting mill at Dairen on the benzine system. *Board of Trade Journal* (*London*) 86:385. Aug. 6. Summarized in the Bulletin of the Imperial Institute. 1914, p. 621.
• ***Summary:*** A new experimental bean-mill belonging to the South Manchuria Railway Company "started operations in the middle of April last. The mill is situated at Ji-ji-ko, about two miles from the Dairen wharves, and cost about £30,000,

© Copyright Soyinfo Center 2014

of which the plant cost about £20,000. The manager of the mill received part of his training in Germany." Except for two British-made boilers, the whole "plant consists of the most modern type of German extracting machinery.

"There are about 50 bean mills in Dairen, but this is the only one which extracts the oil by the benzine process... The maximum capacity of the mill is 80 tons of beans per day of 24 hours. At present only 50 tons are used daily, producing 7 tons of oil, 40 tons of meal, and 3 tons of moisture, dirt, etc...

"The crude oil is tainted with benzine and therefore unsuitable for edible purposes–its chief use in China; for this reason it has fetched smaller prices than the oil from the crushing mills. The oil must therefore be refined and deodorised before being put on the market, and it will probably be necessary to find a market in Europe or America...

"As far as the residue is concerned, it fetches a higher price by 20 per cent. than bean cake; but against this must be set the fact that from equal quantities of beans the residue obtained is 20 per cent. less than the amount of bean cake obtained by the crushing method, whilst there is the additional expense of providing bags for packing."

Note: This is the earliest document seen (Jan. 2009) that contains statistics concerning the processing capacity or storage capacity of individual soybean crushing plants. Address: British Consul, Dairen, Manchuria.

1690. Piper, C.V.; Morse, W.J. 1914. Five Oriental species of beans. *USDA Bulletin* No. 119. 32 p. Sept. 2. [22 ref]
• ***Summary:*** The five beans are the adsuki [adzuki, azuki] bean, the rice bean (*Phaseolus calcaratus*), the mung bean (*Phaseolus aureus*), the urd (*Phaseolus mungo*), and moth bean (*Phaseolus acontifolius*). Soy is mentioned only briefly.

"The adsuki bean (*Phaseolus angularis* (Willd.) W.F. Wight; Pl. I) is much cultivated for human food in Japan and Chosen [Korea] and to a less extent in China and Manchuria, but is apparently unknown in India and elsewhere in Asia. No mention of its cultivation in Europe has been found in agricultural literature. Next to the soy bean it seems to be the most important legume grown in Japan." In 1910 345,634 acres of adsuki beans were grown in Japan, compared with 1,171,438 acres of soy beans.

The first knowledge of the adsuki, or atsuki [azuki] bean to Europeans is the brief description by Kaempfer (1712). Kaempfer's drawing of the plant was later published by Banks (Kaempfer, 1791). This illustration is excellent and unmistakable. Willdenow (1801), named the plant *Dolichos angularis* on the basis of Kaempfer's description and illustration.

The adsuki bean was grown at Arlington Farm, Virginia, in 1906 (6 varieties), 1908, 1909, 1912, and 1913 (8 varieties).

Use in Japan: In Japan the adsuki commands a higher price than any other bean, the varieties with maroon-colored seeds being most widely used. "Adsuki-bean meal is sometimes prepared simply by grinding the dry beans and then removing the seed coats with sieves. More commonly, however, a wet process is employed. The wet process seems to vary somewhat in different parts of Japan, but consists essentially of 4 stages: 1. Boiling the beans until soft, usually after a preliminary soaking. 2. Crushing the cooked beans. 3. Removing the skins by forcing the mass through sieves or by putting the bean paste in cold water, when the skins are easily separated. 4. Drying the bean paste. The fresh, undried bean paste is called *an* and the dried product *sarashi-an.*

In whatever way prepared, the bean meal is eaten in soups and gruels of various kinds, often sweetened. It is also used for making various kinds of cakes and confections. Adsuki beans are also eaten popped like corn, as a coffee substitute, and candied by boiling in sugar. The last product is called *amanatto.* The flour is also used for shampoos and to make facial cream. "The use of beans to make sweetmeats seems to be purely a Japanese invention."

"Among the seed brought back from Japan by the Perry expedition in 1854 was a 'red-seeded bean.' (Browne, 1855, p. XV.) The identity of this bean has never been definitely determined, but it was doubtless the most common form of adsuki bean.

"Two varieties of the adsuki bean were tested at the Kansas Agricultural Experiment Station in 1891 by Prof. C.C. Georgeson (1891). Both of these had red seeds, one having the pods 'white,' the other 'black.' The white-podded variety yielded 16.3 bushels per acre; the black-podded, 8.7 bushels. In thrashing, the beans were found to crack easily, and so they were flailed. The beans were tested only as human food. 'These beans have been submitted to several housekeepers for trial, who all, with two exceptions, give them most favorable recommendations.' The professor of household economy, in a letter to Prof. Georgeson, praised the beans highly both for use in soups and baked."

"S.P.I. No. 226. A maroon-seeded variety from North China, March, 1898, under the name 'wei-tou (vay-do).' No cultural notes." Address: 1. Agrostologist in Charge; 2. Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

1691. Hanson, George C. 1914. Manchurian bean-crop prospects. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(233):75. Oct. 5.
• ***Summary:*** "The [soy] bean-crop prospects in South Manchuria are improving daily everywhere under the good weather condition since the end of the long drought in June... The regions about Old Newchwang, Haicheng, and Newchwang, which had poor crop returns last year, have a fine outlook." Address: Vice Consul, Dalny (Dairen), Japanese Leased Territory.

1692. Hathaway, Charles M., Jr. 1914. Foreign trade at ports of Humber. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(233):65-69. Oct. 5.
• ***Summary:*** Hull, a port on the River Humber, stands 3rd in foreign trade in the United Kingdom. A table shows the five main oilseeds crushed are cotton seed, soya beans, linseed, rapeseed, and castor beans. A table (p. 63) shows that imports of soya beans to Hull decreased from 147,317 long tons in 1912 to 63,046 in 1913. "The outlook for the soya bean is not thought to be bright."

A table (p. 69) shows the value exports to the United States. The leading vegetable oil exported was rape oil, worth $208,704 in 1912, increasing to $268,057 in 1913. Exports of soya bean oil were small: $314 in 1912 increasing to $2,485 in 1913. Address: Consul, Hull, England.

1693. Bishop, Crawford M. 1914. Trade of North Manchuria. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(237):145-50. Oct. 9. See p. 145-46.
• ***Summary:*** During 1913 for Harbin (including the Chinese city of Fuchiatien), there was a decrease in the exports of [soy] beans by rail, but the average market price of these beans was higher than during the previous year. During the year five major factors, which are discussed, caused a sharp financial crisis.

The section titled "Export of soya beans and hempseed" (p. 146) states: "The exports of beans and other grains by the Chinese Eastern Railway (Russian) to the East during the winter of 1913 amounted to 18,439 carloads, an increase of nearly 2,000 carloads over the corresponding period of 1912. By far the major portion of this increase was shipped to the Ussuri district, the increase in shipment to Vladivostok being much smaller in comparison." The Ussuri district is becoming an increasingly good market for these Manchurian products.

"The total export of beans in 1913 was 334,992 tons, of which 247,344 tons were shipped to Europe, 72,864 tons to Japan, and 14,784 tons to Dairen (Dalny). Of the foregoing total, 15,000 tons were shipped via Nikolaiefsk.

"There were one Japanese and two Chinese bean-oil mills in operation in 1913, and the total quantity produced was 1,214 tons. The average price of bean oil was 5 cents per pound." Address: Vice Consul, Harbin.

1694. Takamine, Jokichi. 1914. Enzymes of *Aspergillus oryzae* and the application of its amyloclastic enzyme to the fermentation industry. *Chemical News* 110:215-18. Oct. 30. [11 ref]
• ***Summary:*** Originally published in *Journal of Industrial and Engineering Chemistry* 6:824-28 (Oct., 1914).

1695. Takamine, Jokichi. 1914. Enzymes of *Aspergillus oryzae* and the application of its amyloclastic enzyme to the fermentation industry. *J. of Industrial and Engineering Chemistry* 6(10):824-28. Oct. [11 ref]
• ***Summary:*** This is the first review of the early history of the application of East Asian fungal fermentations to modern industrial processing, which began in the 1880s. A principal impetus for the development of the fungal enzyme industry was the discovery that *Aspergillus oryzae,* the fungus involved in the shoyu, miso, and saké industries, produced amylases that could be used to saccharify starch in place of barley malt in the production of distilled spirits. The first commercial enzyme was Takadiastase (a white to yellowish powder rich in amylases) produced by precipitating an aqueous extract of *Aspergillus oryzae* koji with 70% v/v ethanol. The precipitate was then dehydrated with strong alcohol and pulverized.

Though *Aspergillus oryzae* plays an important role in the national economy of Japan, "its utilization in Occidental countries is singularly lacking. Calmette and Bodin's investigation on amylomyces with a view of utilizing it in the spirit industry is an isolated instance in Europe, and their process, known as the amylo-process, has been in operation in France since 1891.

"In 1891, I made an arrangement with the Distilling and Cattle Feeding Co. [popularly known as the "Whiskey Trust"], of Peoria, Illinois, and carried out on a practical scale the application of the *Aspergillus oryzae* to the American Distillery. My experiments, which ran for a couple of months on a 2,000 bushel scale at the Manhattan Distillery, were partially successful, but unfortunately the process did not attain general recognition of its merit..."

Aspergillus oryzae has been used in Japan for many centuries to make products such as Sake or rice beer, Soy [sauce], and Miso. In 1912 the tax on fermented sake in Japan contributed the $41,974,630 to the national treasury. "The tax on the production of Soy (Bean sauce) amounted to $2,048,141" [only about 5% as much as sake]. The total cost of all articles produced with the aid of the *Aspergillus oryzae* fungus is put at roughly $200 million.

"To the growth of *Aspergillus oryzae* on wheat bran as a culture medium I gave the convenient name of Taka-Koji and have employed it for a number of years to distinguish it from that known in Japan as Koji which is a culture on steamed rice.

"Taka-Koji is designed for a substitute for malt as an amyloclastic agent in varied fermentation and other allied industries. Its proposed use is encouraged by the fact that the cost of malt is subject to fluctuations according to the crop conditions of barley while bran is exempt from similar market conditions. Besides, the transformation of bran into Taka-Koji can be accomplished in 48 hours, while malting needs three or four times as long for completion of the process."

The author made his Taka-Koji in a revolving drum with

© Copyright Soyinfo Center 2014

up to 70 kg capacity. Then he ordered a drum of about 4,800 pounds capacity–the size of an 8-ton malt drum. The cylinder turned at 1 revolution per minute. This resulted in an 83% saving in labor costs as well as a considerable saving in space. The "process promises well for furnishing a substitute for malt in alcoholic fermentation and other industries where amyloclastic enzyme is required." The process was tested by Dr. Niels Ortved, Chief Chemist of Hiram Walker & Sons of Walkerville, Ontario, Canada. In his results, which were presented in a paper at the last Congress of Applied Chemistry (held in New York), and published, he noted: "Takamine was the first to introduce the Koji process to America. As far back as 1899 he advocated the use of Koji in the distilling industry... Lately, I understand, he has succeeded in adapting a modification of the Galland-Henning malt drum system to his process. This should be a great improvement over the old floor system..."

"Taka-Diastase: An aqueous extract from the Taka-Koji can be easily made by percolation and an enzyme can be precipitated by adding alcohol to such an extent as to contain 70 per cent by volume of same in the mixture. The precipitate is dehydrated by means of strong alcohol, dried and powdered. It is a white or yellowish white powder or hygroscopic nature. It is marketed in this form for medical use under the name Taka-Diastase. Though known as an amyloclastic agent, it contains various enzymes; nevertheless, amyloclastic and proteolytic enzymes predominate." Taka-Diastase is a Koji extract whose function is to transform starch directly into glucose.

The paper closes: "The author extends his thanks to Mr. Wooyenaka for his untiring and valuable assistance and to Parke, Davis & Co. for affording every facility for carrying out the 'Drum Experiments." Address: 552 West 173rd St., New York.

1696. Williamson, A.A. 1914. Larger bean crop in Manchuria. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(265):699. Nov. 11.

• ***Summary:*** "While there is no regular, organized method of estimating the bean and cereal crops in Manchuria, the reports of persons interested based on their observations are of interest and generally approximately near the mark."

"It now seems that the bean crop will be larger than usual" due to weather conditions. "In ordinary years the proportion is generally put at about 40 per cent kaoliang, 30 per cent other cereals; but this year it is said the ratio will be reversed, beans taking 40 per cent, kaoliang 30 per cent, and other cereals 30 per cent."

"Bean meal versus bean cake: Local papers expatiate on the fact that bean meal is meeting with increased favor in Japan. Bean meal is the by-product of extracting oil from soya beans with chemicals, while the cake is obtained from the expression process. The extraction process gives a higher yield of oil and the resultant meal is better suited for fertilizer, as it contains less oil (and is therefore more quickly absorbed by the soil) and does not require to be broken and pulverized–a process through which cake must be put and which adds to the cost of the fertilizer to the consumer.

"There are said to be only three mills operated on the extraction principle in the East, one, the Lever Bros. mill at Amagasake, Japan, another at Nagoya (owned by a Japanese corporation), and the experimental bean mill of the South Manchuria Railway Co.'s central laboratory at Dairen." Address: Consul, Dalny (Dairen), Japanese Leased Territory.

1697. Williamson, Adolph A. 1914. South Manchurian notes. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(292):1149. Dec. 14.

• ***Summary:*** "Standard weights for bags of staples established: The Manchurian Staple Products Dealers' Association has established standard weights for bags of cereals and legumes as follows: [Soya] Beans, 150 kin (1 kin = 1.32277 pounds);... red beans [azuki] 160 kin; kaoliang (tall millet), 154 kin," millet 166 kin, sesame 113 kin, linseed 134 kin, wheat 136 kin, buckwheat 118 kin, peanuts 50 kin. The containers are generally gunny bags.

"Depression in soya-bean business: The business depression in the countries affected most by the present war on account of lack of shipping, markets, etc., has brought about... Exchange is very favorable to buyers paying in gold, being to-day (Oct. 26) 79 gold yen to 100 silver yen.

"An attempt has recently been made to organize a bean millowners' union, modeled after the cotton spinners' union about Osaka, Japan, to regulate the output of oil and cake and keep prices up, but a number of Chinese owners would not join and the attempt failed. The promoters estimated the daily potential output at 90,000 pieces (cakes) and the daily demand at about 50,000."

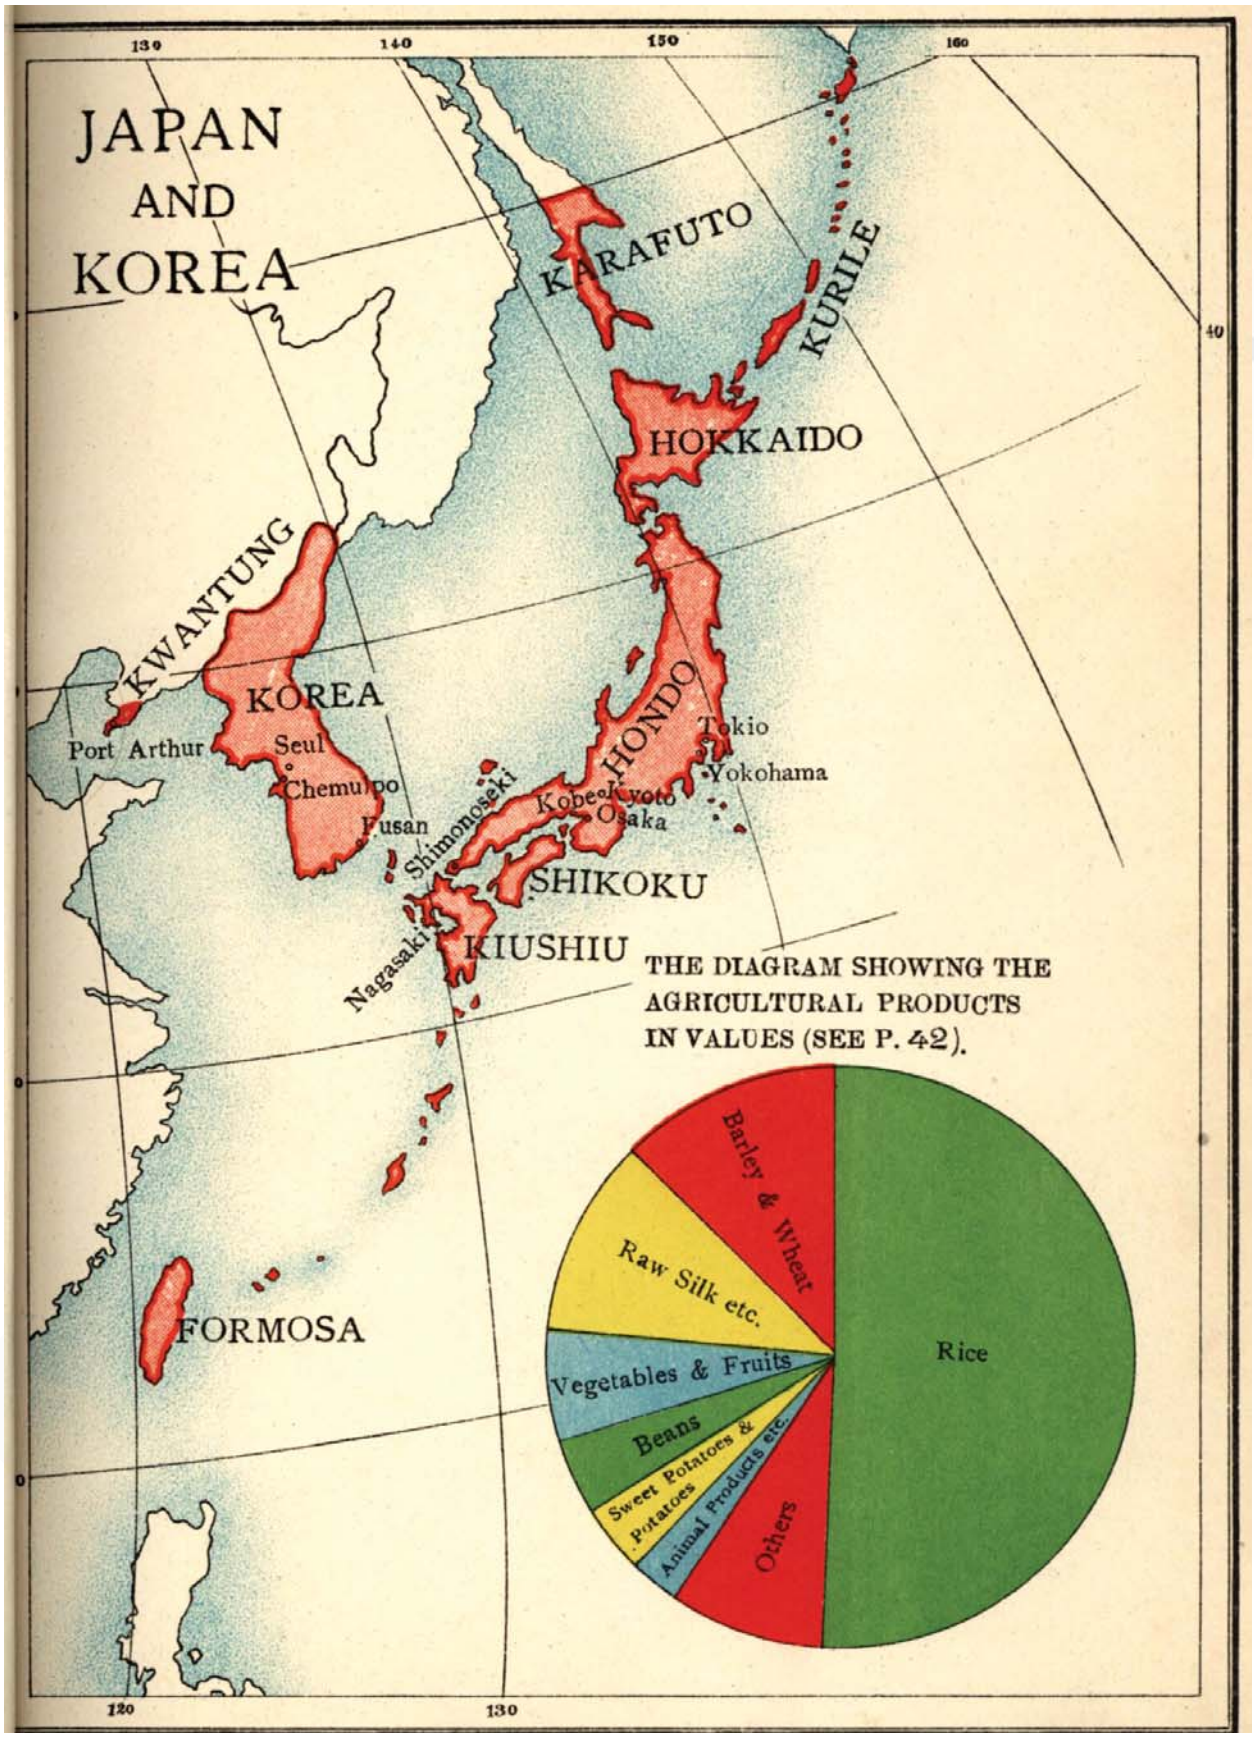
Note: This is the earliest document seen (Jan. 2009) concerning World War I and soya beans. Address: Consul, Dalny (Dairen) [Japanese Leased Territory].

1698. Agricultural Bureau, Dep. of Agriculture and Commerce Japan (Norinsho, Nomukyoku). 1914. Outlines of agriculture in Japan. Tokyo: Agricultural Bureau, Department of Agriculture and Commerce. 20 + 35 p. Dec. No index. 15 x 22 cm. [Eng]

• ***Summary:*** Name of organization with diacritics is: Nôrinsho, Nômukyoku. The structure of this book is unusual. The table of contents (p. 1-3) is followed by a list of "illustrations" [all photographs] (p. 1-2), a colored map of Japan and pie chart, 20 unnumbered pages of black-and-white photos, and finally the text in four chapters (p. 1-34).

The pie chart (average of the 3 years 1910-1912, excluding Chosen, Taiwan, and Karafuto) shows the percentage of agricultural products in value; Rice has about

© Copyright Soyinfo Center 2014



© Copyright Soyinfo Center 2014

60% of the total value, followed by barley, naked barley and wheat, cocoon and silk worm eggs, and vegetables. Leguminous beans are one of the smallest categories.

Interesting photos include:

(1) The hall [building] of the Imperial Department of Agriculture and Commerce. (2) The Agricultural College of Tokyo University (fields, with buildings in the background). (3) The Agricultural College of Tohoku University (trees and walkways, with buildings in the background). (4) The Imperial Agricultural Experiment Station. (13) Interior of filiature at Okaya, Nagano prefecture (many women kneeling in two long rows like machines behind silk spools). (15) Silk conditioning house. (16) The sericulture institute. (20) Shibuya live-stock breeding farm, and long-tailed fowl (on a perch with a 9-foot tail).

Chapter 1–Condition of agriculture. At the end of 1912 about 60% of all households in Japan are farming households. Of these 5,510,000 farming households, 32% have occupations in addition to farming–primarily sericulture, followed by making items from straw (fancy matting, braids), tea manufacture, then chicken raising. There are three classes of farmers: Land-owners, peasant proprietors (32% of total number of farmers; cultivate their own land), and tenants (28% of total number; rent farms from land-owner). Both peasant proprietors and tenant farmers (40% of total). About 15% of Japan's land is under cultivation. Of this, about half is taken up by paddy fields (for raising irrigated rice) and half by upland fields. Many paddy fields give two crops a year. Soja beans are mostly grown as a summer crop on upland fields in rotation (p. 5). Because of the smallness of its scale, Japanese agriculture traditionally relied mostly on human labor. But in recent years the number of farm animals has increased. In late 1912 there were 2,290,000 of which 1,220,000 were horses, 1,070,000 cattle, and 300,000 swine. About 20 years ago, fertilizer meant mainly human excrement, weeds, and stable manures, plus small amounts of oil-cake [soja bean cake], fish-guano, and rice bran. Today the value is three times what it was 10 years ago, and now includes soylees [okara]. "Of these market manures, the bean cake, which is imported from China and Kwantung Peninsula, is most important and demanded the sum of 25 million yen [25% of the value of all fertilizers]. Next came the various composition manures [chemical fertilizers], the material of which is imported in large quantities, and super-phosphates of lime" (p. 8). There are more than 10,400 agricultural cooperatives in Japan with 1.16 million members; they are promoted by the Co-operative Societies Law of 1900. There are four types: Credit, Purchase, Sales, and Productive Societies (p. 9).

Chapter 2–Agricultural products. The value of all agricultural products is estimated at 1,720 million yen for the 3 years preceding 1912. These fall into six groups (value shown in million yen): 1. Cereals (incl. soja beans)–1,246 (72.4% of total). 2. Industrial crops (incl. tea, rape, tobacco, sugar cane)–65.3 (3.79%). 3. Horticultural products (fruits, vegetables, and flowers)–196.8 (11.4%). 4. Livestock and poultry–42.27 (2.45%). 5. Cocoons and silkworm egg cards–164.2 (9.5%). 6. Miscellaneous–5.1 (0.03%). Looking now at the value of individual cereals in million yen: Rice 966.4 (56.2% of total of 6 groups). Naked barley 74.2.

© Copyright Soyinfo Center 2014

Barley 63.3. Wheat 52.5. Soja beans 35.95 (2.1% of total). Indian millet 15.84. Miscellaneous 38.1.

A table (p. 12-13) shows the acreage of the principal crops (in units of 1,000 *cho*) at 5-year intervals from 1887 to 1912. For soja beans: 466 in 1887, 443 in 1892, 435 in 1897, 466 in 1902, 471 in 1907, 475 in 1912. Thus, the are planted to soja beans was roughly static. For small red bean [azuki] it was: 109 in 1897, 129 in 1902, 135 in 1907, 136 in 1912. So azuki area was about 25-28% of soja bean area.

Another table (p. 13-14) shows the yield of the principal crops (in units of 10,000 *koku*) at 5-year intervals. For soja beans: 325 in 1887, 311 in 1892, 310 in 1897, 313 in 1902, 366 in 1907, 351 in 1912. Again, fairly static. By comparison, between 1887 and 1912 the average yield of wheat increased by 70%, naked barley by 39%, barley by 38%, and rice by 26%–but only 8% for soja beans.

Japan's top three export items (value on 1,000 yen) are raw silk (166,963), tea (12,639), and sugar (10,384). The main imports are cotton (193,735), rice (32,128), soja bean cake (for manure; 27,469), sugar (20,694), wool (14,531), and soja beans (8,571). Peanuts are exported to the USA.

Chapter 3–Agricultural administration. The highest organ is the Department of Agriculture and Commerce, which is divided into five sections. The highest organ of agricultural research is the Imperial Agricultural Experiment Station; there are 39 local agric. exp. stations. Agricultural statistics are compiled at the Section of Correspondence in the Secretariat of the Department. A statistical report on all matters concerning agricultural products is issued once a year.

Chapter 4–Outline of agriculture in the colonies. I. Agriculture in Formosa. Rice is the principal crop, followed by sugar cane, sweet potatoes, tea, beans, and peanuts. No statistics are given. II. Agriculture in Chosen [Korea]: A table (p. 32-33) shows area (in 1000 *cho*) and production (in 1,000 *koku*) in 1912: Rice 980 / 8,969. Indian millet 403 / 3,118. Barley 386 / 4,293. Soja bean 375 / 2,452. Wheat 169 / 1,094. Small red bean (azuki) 165 / 835. The largest export from Chosen in 1912 was rice, followed by soja beans. But the largest export from Chosen to Japan was soja beans, worth 4,917,000 yen. III. Agriculture in Karafuto (the Japanese name for Sakhalin Island). In 1875 it came entirely under Russian control when Japan ceded it in exchange for the Kuril / Kurile Islands. It was occupied by Japan in 1905, and the southern half (below 50ºN) was granted to Japan by the Treaty of Portsmouth, which ended the Russo-Japanese War. It was returned to the USSR in 1945 after the Allies defeated Japan in World War II. It is too far north to grow soybeans. But barley, naked barley, wheat, oats, rye, and rape grow well. Address: Tokto, Japan.

1704. Bosse, Sara; Watanna, Onoto. 1914. Chinese-Japanese cook book. Chicago and New York: Rand, McNally & Co. 120 p. Index. 17 cm.
• ***Summary:*** A remarkable and pioneering East-Asian cookbook. It may well be the earliest Japanese cookbook seen published in America. It is one of the earliest Chinese cookbooks published in America. The cover illustration shows a well dressed Japanese woman in a Japanese room kneeling and cooking over a brazier. Contents: Preface. Part I: Chinese recipes (12 sections, p. 9-64). Part II: Japanese recipes (7 sections, p. 74-110). List of Chinese and Japanese groceries.

The Preface begins (p. 1): "Chinese cooking in recent years has become very popular in America, and certain Japanese dishes are also in high favor. The restaurants are no longer the resort of curious idlers, intent upon studying types peculiar to Chinatown, for the Chinese restaurants have pushed their way out of Chinatown and are now found in all parts of the large cities of America." "There is no reason why these same dishes should not be cooked and served in any American home."

Concerning shoyu, or Japanese-style soy sauce (p. 2-3): "Syou, sometimes called Soye, is similar to Worcestershire and similar European sauces. In fact, the latter are all said to be adaptations of the original Chinese syou, and most of

© Copyright Soyinfo Center 2014

the European sauces contain syou in their makeup. It lends a flavor to any meat dish, and is greatly esteemed by the Oriental peoples."

Note 1. This is the earliest English-language document seen (April 2012) that uses the word "syou" to refer to shoyu or soy sauce.

Syou (soy sauce) is an ingredient in at least 55 recipes in this book, both Chinese and Japanese–starting with Chinese soups (p. 12-17). When first mentioned here it is called "syou (Chinese sauce)," but thereafter simply "syou."

"Miso paste" appears in 5 Japanese recipes: Satsuma soup ("one quarter pound of aburage {oil-fried Tofu}; one quarter pound of miso paste {soy bean and rice cheese}," p. 71-72). Uwo shiru (Fish soup) ("one pound of miso paste {bean and rice paste}; one half cupful of syou sauce," p. 73-74). Shika shiro (Pot-roasted venison) ("one cupful of syou sauce;... one quarter pound of miso paste," p. 80). Tamago bolan (Peony eggs) ("finely mashed miso," p. 91-92). Shiro uri (Stewed squash) ("syou sauce... two tablespoons of miso," p. 95).

"Aburage (oil-fried Tofu)" and regular tofu appears in Satsuma soup (p. 71, see above). Yaki zakana (Fried fish) (with "oil-fried Tofu... Note: Tofu is made from a mixture of syou bean [soy bean] and rice. It is mashed and rolled into a thin cake, and fried in oil, very much like pancakes," p. 77-78). Note 2. A poorer definition of tofu would be hard to find. Yaki udzura (Broiled quail or pigeons) ("aburage {bean cheese paste}" and "Tofu cakes," p. 79). Fried squab (with "fried Tofu," p. 81). Tamago tofu (a tofu-like custard made with eggs and syoyu sauce, but no real tofu, p. 89-90).

Bean sprouts are used in many recipes, but we are never told what type of beans are sprouted [probably mung beans]; a recipe for homemade bean sprouts (p. 109) calls for "ordinary white beans, or dried lima beans." Other interesting ingredients include: "Adzuki (purple beans)" (mentioned once in Yohan candy). Goma seeds [sesame] or goma-seed oil (mentioned 15 times). Kudzu starch (6 times, misspelled once as "kudze"). Peanut oil (at least 10 times). Seaweed (1 can of seaweed; small piece of seaweed), seaweed jelly or gelatine, or Kanton [kanten, agar] (15 times). Sweet rice [mochigome].

The authors, "Winnifred and Sara Eaton were sisters, daughters of a Chinese-born mother and an English-born father, and grew up in a large family in Montreal, Canada. Winnifred Eaton was a very successful fiction writer who, by taking on a Japanese identity, both exploited the public's craze for 'Japonica' at the time, and obscured her Chinese heritage during an age of anti-Chinese sentiment and policies. This cook book was her first collaboration with Sarah, who may have done very little of the writing. A painter, Sarah (1868-1940) lived out her life with her German artist husband, Karl Bosse, in New York. Winnifred (whose Japanese pseudonym was Onoto Watanna) lived 1879-1954, knew almost nothing about Japanese cooking. Winifred's biographer and granddaughter, Diane Birchall, says that the authors' claim in the Preface that the Chinese recipes are "... secret recipes handed down from Vo Ling, worthy descendant of a long line of noted Chinese cooks...' is just a hoax. "According to Birchall, Eaton was awful at cooking Chinese dishes" (MSU introduction and biography).

1705. Davison, Mrs. 1914. Domestic economy in Japan. [Tokyo, Japan]: Kyo Bun Kwan (Methodist Publishing House). Tokyo Katei Mondai Kenkyu Kurabu. v + 73 + [16] p.; 17 + 1157 + 6 p. No index. 19 cm.

• ***Summary:*** On the title page: "Compiled by the Home Problem Club, Tokyo." Contents: Soups. Fish. Meats and substitutes. Vegetables. Salads. Puddings. Pudding sauces. Sweets. Cakes. Breads. Native cereals. Preserves. Jams. Pickles. Suggestions. Japanese disinfectants. Useful addresses. Menu-maker (from *Ladies Home Journal*).

The front part of this book (p. v + 73 p.) is in English. The back part (17 + 115 + 6 p., reading from back to front) is in Japanese, and numbered separately. In the middle is a 16-page "Advertising section," mostly in English, on unnumbered pages. Each recipe is numbered sequentially, from 1 to 1-186, in each part. The recipe numbers in the English part correspond exactly to the numbers in the Japanese part.

Soy related recipes: "Tofu" (bean curd) soup (p. 2). [Soy] Bean roast (p. 12). "Tofu" roast (3 types; calls for 1 *cho* or 1 square of tofu, p. 12-13). "Tofu" and celery stew (p. 14). In the chapter on vegetables: "Daizu" (p. 23): "Soja or Soy bean. There are white, green and black soy beans. This bean is used in the preparation of *miso, tofu,* etc. A drink is made from the black soy bean and unhulled barley. These are parched and then boiled in a tea, sweetened with sugar ad used in the summer time." Soya beans (p. 24): "Hull and boil; remove the skins and dress like lima beans. *Azuki* a little red bean may be prepared in many ways. One way, boil, place in center of a mound of rice, and serve with a curry sauce made with apple and onion in it."

Tofu (p. 26-29): "Tofu is a most nourishing inexpensive curd made from the bean. It may be served in many ways. The process of preparation takes away part of the bean difficult to digest and leaves one of the most wholesome of foods. It is especially good for diabetic patients. It may be bought in any part of Japan. Always pour boiling water over it before using." These recipes follow: Scrambled "tofu". "Tofu" and cheese. "Tofu" croquettes (3 recipes). "Tofu" box. "Tofu" and tomatoes. "Tofu" and peanut butter. "Tofu" and cheese (2 recipes). "Tofu" and corn.

"Tofu" (bean-curd) salad (with 2 *cho* [= cakes] of "tofu," p. 38). "Tofu" custard (p. 40).

This book also calls for peanuts in many recipes. A few recipes call for *goma* (sesame seeds), *kanten* ("a kind of gelatine made from seaweed. A substitute for gelatine," p. 61). in a few. Pudding sauces and sweets include many

© Copyright Soyinfo Center 2014

recipes for "mizu-ame" ("1 pint of golden-colored mizu-ame." Some is made from millet, and some from rice). "Health food" is mentioned on p. 52. Address: Tokyo, Japan.

1706. Fujikuro, Kosaburo. 1914. Taiwan baiyô shokubutsu no kiseikin mokuroku. II. [List of parasites on plants cultivated in Taiwan. II.]. *Botanical Magazine* (*Tokyo*) 28:423. See entry No. 80. [Jap]
• ***Summary:*** Under *Glycine Soja* Bth [Bentham] are listed: *Hypochnus centrifugus, H. Sasakii, Peronospora trifoliorum, Phacospora sp., Sclerotinia Libertiana.* Address: Taiwan.

1707. Fujimoto, Taizo. 1914. The nightside of Japan. London: T. Werner Laurie, Ltd.; Philadelphia: Lippincott. xii + 233 p. Plus 40 p. plates on unnumbered pages. Illust. No index. 21 cm.
• ***Summary:*** "Howling of a 'oinarisan' pedlar [peddler] (oinarisan is a kind of sushi, and its pickled rice is wrapped with a piece of fried bean-curd flavoured with sugar and soy [sauce]) and flute of a Chinese buckwheat seller are faintly heard in a distant street" (p. 39).

"To classify the labourers who are staying in these lowest lodging-houses, according to the kinds of their work or business, one half of them are stall- keepers who sell... amé (wheat gluten),... *shiruko* (a dish made of rice cake [mochi] and sugared beans), *inarisushi* (another name of *oinarisan,* which is a mass of pickled rice wrapped up with a piece of fried bean curd),..." (p. 44-45).

Note: This is the earliest English-language document seen (April 2013) that contains the word *inarisushi* (one word without hyphenation).

"Consequently, every night till midnight the streets in the vicinity of these lowest inns are full of small shops and stalls of cheap food and drinks, awaiting the customers from those *kichinyado.* Stalls of hot wine and *oden, inarisushi, shiruko, mochi* (rice-cake), *tsukeyaki pan* (pieces of bread toasted and flavoured with soy [sauce]),..." (p. 47). Note: Mochi is also mentioned on pages 172, 173, and 202.

"In this book you read often of stalls of *odenya,* but the Marugin is a large house situated at the cross-roads of Sudachô, and though it belongs to the eating-houses of the lowest class, it may probably be the first and largest *odenya* in Tokyo. The room, lighted with electric lights, is furnished with tables and chairs, in place of mats and futon, very common in the shops of the lower rank. Oden is, as previously explained, a special kind of food boiled down with soy, its chief materials consisting of fish, bean-curd, konnyaku, and taro" (p. 63-64).

"You often find little boys of nine or ten years at the temple, and their true object of the visit seems not to be prayer to the temple, but they are ambitious to taste the sweet *amazake* (hot beverage made of fermented yeast [sic]), which the temple entertains to the visitors" (p. 153).

1708. Gulick, Sidney L. 1914. The American Japanese problem: A study of the racial relations of the East and the West. New York, NY: Charles Scribner's Sons. 349 p. Index.
• ***Summary:*** The author believes that Japanese in America are being treated unfairly, and that they are a real asset to the United States. He tackles each of the accusations against Japanese head-on and very effectively. Of special interest are his summaries of the report of J.D. Mackenzie (p. 29, Appendix B).

Dedication: "To Andrew Carnegie and the host of loyal workers for universal peace and the friendship off the East and West this book is dedicated."

Page 29: "Fortunately, the State of California itself has conducted such an investigation, an appropriation of $10,000 having been made for this purpose in 1909. Much to the surprise of those who had inside information, the report proved unexpectedly favorable to the Japanese. No appropriation, however, was made for its publication. Some assert that it was purposely suppressed. We are, accordingly, dependent for our knowledge of its contents on a brief 'Summary for the Press' furnished by J. D. Mackenzie, Labor Commissioner, May 30, 1910.1 As it is impossible, advantageously, to condense further the material there summarized, the entire summary is reproduced" in Appendix B. Footnote: "Portions of the statistical tables were subsequently published in the Biennial Reports for 1911 and 1913 of the State Department of Labor."

Appendix B: "Summary by Labor Commissioner J. D. Mackenzie of the report of the "Special State Investigation of 1909" of Japanese in California. Given to the press May 30, 1910.

"In 1909 the legislature of California appropriated $10,000 to provide for a "drastic investigation of the Japanese question... This covered free-hold and lease-hold lands, the estimation of Japanese by their neighbors, their value and need of them as farm laborers, their moral relations to society and the industrial, financial, and social effect of their presence here. This exhaustive inquiry was ordered in the language of the act authorizing it, 'to inform the legislature and the President and Congress.' The investigation was made by the State Labor Commission, and the testimony taken by him, names of witnesses, and all facts went into his report. The result was that this investigation so thoroughly disproved the ground upon which anti-Japanese legislation demanded by the legislators who promote it, that our State Government has suppressed the report and it has never been published."

"Quotation from the letter of the Delta Association of California to Hon. William J. Bryan, April 24, 1913, on the occasion of his visit to California to confer with Governor Johnson and the State legislature in regard to the proposed anti-alien legislation."

"The investigation of Japanese in agriculture covered visits to 4,102 farms scattered over thirty-six counties

© Copyright Soyinfo Center 2014

and growing almost every crop common to the State of California. Of this total number of farms visited, 1,733 were operated by Japanese farmers as owners, cash lessees and share lessees. The remaining 2,369 farms were operated by white farmers, being equally distributed between those employing white help exclusively and those employing mixed races, including Japanese. These 4,102 farms contained 697,236 acres and produced crops valued approximately at $28,000,000 annually. On these farms there were employed during the past year an aggregate of 80,982 persons of all races, 9,452 of whom were women, the length of employment varying from a few days to a year. On the 2,369 farms operated by white farmers, employing a total of 63,198 persons, 53.4 per cent of the labor employed was white, 36.4 per cent Japanese, and 10.2 per cent various other races, including Chinese, Mexicans, Hindus, and Indians. On the 1,733 farms operated by Japanese farmers, employing 17,784 persons, 96 per cent of the labor employed was Japanese, while 872, or 4 per cent, was equally divided between male and female white; in other words, on the basis of numbers employed, the Japanese furnished practically 50 per cent, or one half, of the labor necessary to grow and harvest the crop, valued at $28,000,000, produced on the farms visited in this investigation.

"The farms on which Japanese were not employed were, as a rule, much smaller than those on which they were employed, the former averaging 159 acres, the latter 357, demonstrating the necessity of a class of temporary laborers on large acreages. Another important fact developed by this investigation was the relation between the character of the crop grown and the employment of Japanese. On the farms where whites were employed exclusively, no berries or nursery products were grown and very little vegetables outside of beans."

There are sections on average wages paid Japanese vs. white farm workers, "Japanese farms," Landownership by Japanese," "Leasing by Japanese," "Japanese in commercial pursuits," "Japanese population," and Japanese school children."

Japanese in Commercial Pursuits.–That part of the investigation relating to Japanese in business and activities other than agriculture is practically complete. 2,548 establishments [such as tofu shops] were visited throughout the State. 1,934 were owned by individuals, 550 by partnerships, and 64 by corporations. 19.4% have been in business less than one year, 24.2% for one year, 17.2% for two years, and 15.9% for three years, making a total of 76.7% of the total established since 1906. Only 58 establishments, or 2.3% of the total, have been in existence for ten years or more. The capital invested in most instances was very small, 68.7% of the total having a capital of less than $1,000. The total aggregate cash invested amounted to over $4 million. The total annual transactions of these Japanese establishments amounted to $16,114,407, of which $5,938,012 or 36.8% was with white people. The total annual rent paid by these firms was over $900,000. 6,556 persons were engaged in the conducting of these establishments, of which number 2,546 were males and 562 females (principally wives of owners) were employers and 3,214 males and 234 females employees. In addition there were employed by these Japanese firms 35 male and 20 female white persons.1,410, or 55.3% of the total establishments, were conducted entirely by the owners. In 1,782 establishments, or 69.9%, the employees lodged at the place of work.

The sanitary conditions of the places of work were: Good 81.8%. Fair 16.8%. The sanitary conditions of the places of lodging were: Good 68.5%. Fair 27.3%. Bad 4.2%.

1,568, or 61.5% of the total number of establishments were located in seven principal cities of the State, as follows: Los Angeles 505, San Francisco 497, Oakland 178, Sacramento 154, Fresno 100, San José 79, Stockton 54.

Although San Francisco did not contain the largest number of establishments, 34% of the entire investment was represented there and 40.2% of the total amount of business transacted therein.

The prevailing number of hours worked per day was ten and over, and the prevailing wages paid were from 25 to $35 per month with board and $40 to $50 without board. Address: M.A., D.D., Prof. in Doshisha Univ. and Lecturer in the Imperial Univ. of Kyoto, Japan; also author of 4+ books incl. The White Peril in the Far East.

1709. Kawakami, Kiyoshi Karl. 1914. Asia at the door: A study of the Japanese question in Continental United States. New York, Chicago, Toronto, London and Edinburgh: Fleming H. Revell Co. 263 p. With a prologue by Doremus Scudder and an epilogue by Hamilton W. Mabie.

• ***Summary:*** The author responds to the charges of nonassimilability and economic competition, while recording the achievements and prominent Japanese and discussing the 1913 California Alien Land Law.

Page 106: "The habit of intensive cultivation, which he must perforce acquire in such a country [Japan], he naturally brings with him to the new country whither he emigrates. It is, therefore, but natural that the Japanese farmers in California should show unique skill and fastidiousness in cultivating their lands. Because of the care which they lavish on the soil, the farm rented to a Japanese commands an unusually high price. This fact is unreservedly recognized in the special report on the Japanese prepared a few years ago by the commissioner of labour of California, Mr. J. D. Mackenzie. The charge that the Japanese abuse the soil finds no endorsement either in the annual report of the Bureau of Labour of California or in the voluminous reports of the United States Immigration Commission, of which Senator Dillingham was chairman."

"When Mr. John D. Mackenzie, commissioner of labour

© Copyright Soyinfo Center 2014

statistics of California, instituted at the direction of the State legislature a special investigation into the conditions of Japanese in the Golden State [including their commercial enterprises, such as tofu shops] one of the surprising facts disclosed was that almost every Japanese, whether a farmer or a farmhand, had in his possession English-Japanese dictionaries and conversation books. All were eager to learn English, and through the knowledge of the language American customs and institutions. Many of them subscribed to local English papers, while their favourite magazines were not fiction magazines, but such substantial publications as the *Outlook,* the *Independent,* the *Review of Reviews,* and the *Literary Digest.* The United States census states that fifty-five per cent. of those Japanese who have been in this country less than five years can speak English. Among those who have lived here more than five years the rate of illiteracy is very small."

1710. Takenob, Y. 1914. Japan Year Book. Tokyo: Japan Year Book Office. 740 p. See p. 334, 400, 433-34, 439-40, 442, 689, 692, 705, 718. Ninth annual issue. [Eng]

• ***Summary:*** This annual book was first published in 1905. Facing the Preface is a table of Japanese weights, measures and moneys. In chapter 16, "Agriculture" (p. 337-57) is a table titled "Beans, sweet potato and potato (p. 345) which gives "Soy bean" production data in Japan for 1908-1912 (in *koku*).

3.892 million *koku* in 1908
3.766 million *koku* in 1909
3.396 million *koku* in 1910
3.693 million *koku* in 1911
3.511 million *koku* in 1912.

The next paragraph contains information on soy [sauce], *miso,* and *tofu* similar to that in the 1913 year book.

In chapter 20, "Industry," is a table on soy [sauce] production in Japan from 1908-1911, and a paragraph (p. 400) on the patented Suzuki process for brewing soy [sauce].

In Chapter 22, "Trade" is a table (p. 433-34) titled "Prices of principal commodities in Japan," which includes prices for 1907-1912 in yen for soy beans (per *koku*), soy [sauce] (per *koku*), and miso (per *kwan*).

In Chapter 23, "Foreign trade" is a table (p. 439) titled "Imports" (in 1,000 yen). Under the heading "Staples articles of over yen 1,000,000" (p. 438) is given the value of soja bean imports for 1911-1913. In a table titled "Soja bean" (p. 442), under the heading "Staple exports and destinations (in 1,000 yen)" (p. 440) is given the value of soja bean exports to China, Kwantung, India, and other places for 1911-1913.

In chapter 35, "Chosen (Korea)," under the heading "Agriculture" (p. 691) is a paragraph (p. 692) titled "Barley and soja bean," which gives acreage and yield for soja (year not specified) with the value (in yen) of exports to Japan in 1912.

In Chapter 36, "Taiwan (Formosa)," under the heading "Agriculture," a table (p. 705) titled "Agricultural products" has production data on "Beans and peas" (in 1,000 *koku*) for 1911-1912.

In Chapter 38, "South Manchuria," is a paragraph (p. 718) titled "The soya bean" which has information on South Manchuria's soya bean yield, [soya] bean-cake output, amount exported for specific years, and production of various milling centres.

In the advertisements at the rear (p. xiii) is a full page ad for Higeta Shoyu, showing many medals: "Patronized by the Imperial Household. Trade mark. The celebrated Japanese sauce. Established in 1616. Manufactured by G. Tanaka, Chioshi [Choshi], Chiba-ken, Japan." Address: Prof. at Waseda Univ. and Late of the *Japan Times,* Japan.

1711. Terry, Thomas Philip. 1914. Terry's Japanese empire: Including Korea and Formosa, with chapters on Manchuria... A guidebook for travelers. Boston and New York: Houghton Mifflin Co.; London: Constable & Co., Ltd.; Tokyo: Kyo-Bun-Kwan, Ginza, Shichome. cclxxxiii + 799 p. See p. 515. Maps. Index. 16 cm. [75 ref]

• ***Summary:*** This guidebook, after its 283-page introduction, is organized geographically into: 1. Central Japan. 2. Northern Japan. 3. Yezo, the Kuriles, and Saghalien. 4. Western Japan. 5. Kyushu and the Loochoo and Goto islands. 6. Korea, Manchuria, ad the Trans-Siberian Railway. 7. Formosa (Taiwan) and the Pescadores. Abbreviations (p. ix). List of maps (13).

In the Introduction: Japanese inns (p. xxxvi, xxxix-xl): The best food is not always to be had in the most pretentious places. In certain modest inns, where the rooms are as bare as a monk's cell, and the general appearance of austerity might argue a strict economy, there will often come, as an agreeable surprise, dainty food served in dishes that delight the lover of beautiful porcelain or lacquer. Later the traveler may learn that the place enjoys fame for some savory specialty–eels boiled in soy, broiled crayfish, stewed octopus, buckwheat-macaroni, or the like."

"Food is served in the guest's room on a lacquered tray... One of the soups may be made of... lobster, or seaweed, in which case it is amazingly thin and unpalatable; the other of beans [miso], bean curd or something of that nature. Salt is not provided unless asked for. Many of the dishes are cooked in soy; a tiny dish of which is supplied for dipping bits into before eating them."

Japanese food (p. xliii-xlvii): "Rice is a luxury with thousands of the peasants; it takes the place of bread with the well-conditioned; and wherever it is eaten to the exclusion of other foods it produces (because the thin phosphorous skin is polished off it) the prevalent beriberi. The proportion of animal food is small. Beans eaten in a variety of ways occupy a conspicuous place in the food of all classes and they supply the nitrogenous matter essential to those who rarely eat meat and who do not get the casein obtained by

© Copyright Soyinfo Center 2014

cheese-eating peoples. The soy-bean (*daizu; omame*) ranks first in extent, variety of use, and value among the pulse of Japan, and in point of nutriment is quite near to meat. It contains nearly two fifths of its weight in legumin, nearly one sixth in fat, and is rich in nitrogen. It is to the Nipponese what frijoles are to Mexicans and garbanzos (chick-peas) to Spaniards. Of the numerous varieties some are made into curd [tofu], and into the widely celebrated bean-sauce (the Worcestershire of Asia) called shoyu (sho, soy; yu, oil), and which is almost as indispensable as rice. It forms the daily relish of the rich man and the beggar, and is in as general use as tea and tobacco."

Fish (sakana)... Teriyaki: Fish in a sauce of soy, mirin, and sugar... Sashimi: raw fish cut in thin slices and eaten after being dipped in shoyu.–Kabayaki: fish which is first steamed then dipped into soy and roasted (or eels cut open on the dorsal line, covered with soy mixed with sugar, and roasted). The latter dish, usually called Unagi-no-kabayaki, is a favorite with the Japanese,..."

"Rice:... Azuki-meshi: rice and red pea-beans mixed (boiled).–Mochi: small dough-cakes made of rice and sold throughout Japan.–Sushi: a general name for food of boiled rice and fish, eggs, vegetables, etc., seasoned with vinegar and soy...–Inari-zushi: fried tofu stuffed with chirashi-zushi.

Note: This is the earliest English-language document seen (April 2013) that contains the term *Inari-zushi.*

- Maki-zushi: boiled rice and other vegetables rolled and wrapped in a sheet of the sea weed called Asakusa-nori...–Kombu-zushi: fish seasoned with vinegar and wrapped in a piece of the edible seaweed known as Laminaria japonica. A differentiation of this popular food is the Kombumaki: baked or roasted fish wrapped in kombu, then tied, and boiled in sugar and soy.

Various:... Tsukudani: small fish boiled in soy and used as a relish or condiment (named for Tsukudajima, a place in Tokyo famous for its preparation).–Oden: a stew (greatly enjoyed by the proletariat) of fried bean-curd, lotus-roots, potatoes, etc." Ame and midzu ame.

"Soup (shiru): Tôfu-jiru: bean-curd soup.–Miso-shiru: bean-soup with vegetables."

Railways–Dining cars (p. lxxxiv): Discusses "The unique and not unpalatable bento,–a sort of national sandwich,–put up (usually cold) in thin, flat, twin boxes (bento-bako) of dainty white wood (1 in. high, 5-7 in. long), along with a paper napkin (kuchifuki) and a pair of chop-sticks (hashi), and sold at many stations, is distinctively Japanese and widely popular... Besides the full box of plain boiled rice, the ordinary (15 sen) bento contains usually... a few boiled black beans (nimame)... seaweed (kobu)..." Rice cakes (mochi) with the kernel of yokan, or sweet [azuki] bean paste, which usually forms their center.

Buddhism (cxc): Again the rice-flour cake [mochi] is offered at the domestic altar. It now takes the form of a lotus-petal with capsule of [azuki] bean-paste." (an).

Yokohama (p. 13): "The return gifts from the emperor and princes included...jars of soy [sauce]; coral and silver ornaments;..."

Tokyo (p. 199): "The hill beyond the intersecting roadway is called Suribachi-yama because of the similarity in shape to a suribachi–an earthenware vessel in which bean-soup [miso soup] is prepared."

Nikko–Shops: "... the kuri-yokan (so-called from the chestnuts mixed with the sweetened bean-paste [azuki]) is good and cheap (10 sen)."

Kyoto–The Shinto Shrine of Inari. There are many local festivals, the most important of which is the Inari-matsuri which usually falls on June 5. There are trick riders on horseback and decorated sacred cars [carts] are "placed in the procession, and the day is devoted to general jollity–and pocket- picking. On this occasion the people eat Inari-zushi, or fried tofu stuffed with boiled rice, since tofu [fried, as aburage] is the favorite food of the fox popularly believed to be the messenger of Inari (and by extension, the God of Rice)."

Kyoto–Miidera (p. 504-05): Travelers visit Benkei's Iron Pot (*Benkei-no-shiru nabe*), a very old, rusted, and broken contraption (about 5 ft. wide and 3 deep) resembling a soap-boiler, and from which Yoshitsune's devoted servitor (and popular hero) is supposed to have eaten his bean-soup [miso soup]–which may well be doubted."

Kyôto to Kôya-San (p. 515): For the Western traveler there is "a tiny kitchen, a blessed refuge wherein, if he is making a prolonged stay, he may cook his un-Christian food without the vegetarian priests knowing (or caring) that such a sacrilege is being committed! Meals are served in one's apartment; the food is purely vegetable, and after the second day distressfully unpalatable. Fish, flesh, fowl, butter, cheese, eggs, milk, bread, coffee, and other necessaries of life are absent, and are replaced by seaweed, greens, bamboo-shoots, cabbage, daikon in various unappetizing forms, and other garden-truck which one eats as a novelty the first meal and rejects with an involuntary tightening of the throat when it is offered at the second and third. In addition there are flabby mushrooms boiled in very thin water without seasoning; the omnipresent boiled rice without sugar, milk, or salt; a bean-curd (*tofu*) for which one acquires a liking only after much patient effort; a yellow substance (known as *yuba*) made of the skin of bean-curd, and looking and tasting like thin sheet rubber;..."

Kobe excursion–The Tansan Hotel (p. 630): The strawberries and other ground fruits and vegetables, which grow nearly all the time in this favored spot, are enriched with [soy] bean-cake only [no human excrement is used] (as a precaution against typhoid)."

Korea (p. 725): "Among the dishes dear to the native heart are pounded capsicum, bean curd [tofu], various sauces of abominable odors, a species of sour kraut (kimshi [kimchi]), seaweed, salt fish, and salted seaweed fried in

© Copyright Soyinfo Center 2014

batter."

Manchuria and the Trans-Siberian Railway (p. 756): "Considerable [soy] bean-cake and furs, and vast quantities of lumber, etc., come down the river from upper Manchuria and Siberia."

Also discusses edible seaweed (p. xliv, 330): Japanese food: "Seaweed in almost endless variety enters largely into foodstuffs. Not only are the giants of the marine flora taken up and utilized in various ways, but also the more delicate red and green sorts–the use of which has been adopted by other nations. Most of the edible green and red algae bear the generic term nori, while the words *umi-kusa,* or *kai-so* (which also means *bêche-de-mer*), are used for algae in general. Many of the weeds are eaten fresh, others in soup. Some are dried or pickled and eaten in vinegar. They usually appear in commerce in the form of little packages, to the sale of which special stores are dedicated. Certain varieties are converted into jelly."

Yezo–fisheries: "Certain of the many varieties of edible seaweed which flourish along the Japanese coast are found in Yezo, particularly the circumpolar tangle (*Laminaria*) and seawracks (*Fucus* species), which prefer cold water and a heavy surf. For this reason sea-algae add considerably to the value of the Yezo exports."

Note: The author resided for almost 12 years in Japan and made repeated journeys on foot (and otherwise) from one end of the country to the other. Address: F.R.G.S. [Fellow of the Royal Geographical Society, England].

1712. Togano, Meijiro. 1914. Saishin shôyu jôzô-ron [Principles of modern shoyu brewing]. Tokyo: Otani Shoten. 1040 p. Illust. 23 cm. [Jap; eng+]*

• ***Summary:*** This book is the same as the 1913 edition, except that the publisher is now Otani Shoten.

1713. Yokoi, Yokiyoshi. 1914. Agricultural economy of Japan: Principal features, present conditions of production. *Monthly Bulletin of Agricultural Intelligence and Plant Diseases* (*International Institute of Agriculture*) (*Rome*). p. 331-36.

• ***Summary:*** The section on "Cultivation of grain crops" (p. 322-23) states: "Leguminous products such as peas, soy-beans, kidney-beans, and red beans (*Phaseolus radiatus* [azuki beans]) are among the important crops." "Among textile plants hemp retains its importance... no forage of crop of importance is produced."

A table (p. 335) gives data on the twenty principal crops for the year 1910. For each is given the acreage (in *cho* and acres) and production (in *koku* and bushels or pounds). Soy-bean: On 1,171,436 acres, some 16,857,562 bushels are produced. Red bean [azuki]: On 345,631 acres, some 4,793,149 bushels are produced. Hemp: On 30,177 acres, some 20,049,232 lb are produced.

Note: This is the earliest document seen (Dec. 2001) concerning the International Institute of Agriculture and soy. Address: Prof. of Agricultural Science, Imperial Univ. of Tokyo, Japan.

1714. *Japan Weekly Mail* (*Yokohama*). 1915. Oil milling in Japan. 63(3):12. Jan. 11. Supplement.

• ***Summary:*** Oil milling is one of the few Japanese industries that has been favorably influenced by the war. Before the war, Germany and Russia were two leading oil milling countries, and both looked to China, especially Manchuria, for their supply of raw materials. But Germany's supply was cut off as soon as she started hostile actions against her neighbors. This extra supply, and lower prices, has made it easy for the Japanese to buy [soy] beans from China. After refining the oil, the Japanese sold it to Great Britain, where it was used to fight the Germans.

In Japan, milling of rape-seed is conducted mainly in Kyushu, while the milling of other seeds in conducted in and around Nagoya. However Chinese [soya] bean and seed oil milling is conducted mainly in and around Kobe; the Kobe industry has been most favored by the war, for they have been able to store up inexpensive materials.

• ***Summary:*** "C.S. Bush & Co., Los Angeles [California] and other Pacific ports, were sustained in a claim that Japanese shoyu is an unenumerated article within the meaning of that term as used in the Tariff acts of 1909 and 1913... The action of Collector in assessing the shoyu at higher rates was reversed."

1716. *USDA Bureau of Plant Industry, Inventory.* 1915. Seeds and plants imported by the Office of Foreign Seed and Plant Introduction during the period from October 1 to December 31, 1912. Nos. 54426 to 54676. No. 33. 60 p. Jan. 23.

• ***Summary:*** Soy bean introductions: *Soja max* (L.) Piper. (*Glycine hispida* Moench.)

Note: This is the earliest document seen (Aug. 2011) in which the scientific name of the soybean is given as "*Soja max* (L.) Piper." This indicates that the name "*Soja max* (L.)" was first given by Dr. Charles V. Piper of the USDA. This name continued to be used in this publication and by the USDA Bureau of Plant Introduction until at least June 1940 (Inventory No. 126, p. 18).

"34643-34654. From Kioto [Kyoto], Japan. Presented by Miss E.R. Scidmore, Seoul, Chosen (Korea). Received November 29, 1912. Quoted notes by Miss Scidmore:

"34645. The soy bean has been listed in previous inventories as *Glycine hispida* Moench. Mr. C.V. Piper has recently shown (Journ. Amer. Soc. Agron., vol. 6, p. 75-84, 1914) that the earliest name given by Linnæus to this plant was *Phaseolus max,* that the generic name should be Soja,

© Copyright Soyinfo Center 2014

and that the correct name is therefore *Soja max* (L.) Piper.

"'Kuro [meaning "black" in Japanese]. Used for making sweet paste, but more usually boiled with a pinch of salt and a pinch of sugar added when the water is poured off or shoyu poured on and kept hot until saturated. Served as a relish or accompaniment to each meal and always found in lunch boxes sold at railway stations.'

"34654. '*Shiroi daiozu* [*daizu*] [meaning "white soybean" in Japanese]. Used for making tofu or bean curd.'

"34700/34702. From Shantung Province, China. Grown by Dr. William R. Faries, Coachella, Cal. [California]. Received December 17, 1912. Quoted notes by Dr. Faries:

"34702. 'The yellow bean with the hairy pods (soya) I sent to the department in December, 1894, I think, from Pacific Grove, California, as 'Manchuria beans,' and they were sent to Maine station. This would result in failure, I think. They did not do well in Orange County, California, but grow well here. They are fine for green shelled beans.'"

Note 2. This is the earliest English-language document seen (June 2009) that uses the term "green shelled beans" to refer to shelled green vegetable soybeans. Address: Washington, DC.

1717. Kinoshita, Asakichi. 1915. Nidan shikomi shôyu jôzô-hô yobi shiken no seiseki hôkoku [The double brewing of shoyu]. *Jozo Shikensho Hokoku* (*Report of the Brewing Experiment Station*) No. 55. p. 165-76. Jan. [Jap]
Address: Jozo Shikensho, Gishi.

1718. Togano, Meijiro. 1915. Shôyu, miso, tamari sokujô-hô [The quick process for brewing shoyu, miso or tamari]. *Jozo Shikensho Hokoku* (*Report of the Brewing Experiment Station*) No. 55. p. 121-51. Jan. [Jap]
Address: Jozo Shikensho, Gishi.

1719. Fruwirth, C. 1915. Die Sojabohne [Soybeans]. *Fuehlings Landwirtschaftliche Zeitung* 64(3/4):65-96. Feb. 1 and 15. [65 ref. Ger]

• ***Summary:*** Contents: Introduction (work in East Asia and Europe from 1905-10). History. Botanical aspects. Varieties. Breeding. Needs of the plant (incl. "heat units," *Wärmesumme*). Utilization (incl. in German *Tofu, Miso, Chiang, Schoyu* or *Sojatunke* (shoyu, p. 83), *Natto, vegetabilische Milch* (soymilk), soy sprouts). Measures and precautions in cultivating soybeans (incl. yields). The soybean as a crop in central Europe. Conclusion.

Note 1. On p. 83 the term "Sojas" is used to refer to soybeans

Note 2. This is the earliest German-language document seen (April 2012) that uses the term *Sojatunke* to refer to soy sauce.

In 1905 the Japanese made the first attempt to import soybeans from Manchuria to Europe, but it failed because they did not arrive in good condition. The repetition of the attempt in 1908, however, gave good results. Then imports of soybeans grew, followed by imports of soybean cake (*Sojabohnenkuchen*). Major importers today are England, France, Germany, Denmark, Italy, Belgium, Netherlands, Sweden. The high import duty hinders imports to Austria-Hungary.

Toward the end of the 1800s in Russia, Owinsky took early-ripening soybean varieties from China and Japan and requested the expansion of soybean cultivation. In 1899 in Kiev, Owinsky wrote the name of the soybean as Soja hispida praecox (p. 67). Owinsky in Derajne [Derazhne?] grew Podolie soybeans (p. 77). Sempolowsky in Derebzin, Russian Poland, also grew soybeans. European Russia gets soybeans overland (probably from Manchuria). Russia was one of the first countries to take an interest in growing soybeans after 1908. Russia now grows large amounts of soybeans in Podolia. In Germany, Prof. Kallo in Wiesbaden was a pioneer who recommended soybeans as an inexpensive food for the people. North America first started to import lots of soybeans as a source of oil because of a bad cottonseed harvest.

"Since the start of my teaching activities, I have had an interest in the soybean plant and have carried on my own investigations." In 1900 the author received 7 soybean varieties from L.V. Jurdiewicz from Deraznia in Podolia; these had been imported by Owinsky. In 1901 at Hohenheim he began to study the time needed for soybeans to mature; He found it ranged from 141 to 163 days. He continued this research at Hohenheim from 1901 to 1903, getting soybean seed yields of up to 1,560 kg/ha. From 1910 to 1914 he continued at Waldhof-Amstetten, with 5 varieties. The maturity range there was 112-166 days and the yields were up to 1,500 kg/ha (about 23 bushels/acre), but the yields of many varieties were low, about 300 to 500 kg/ha (4.5 to 7.5 bu/acre). Yields of soybean straw, however, were up to 3,600 kg/ha. Fruwirth uses three terms to refer to soybeans: (1) Die Sojabohne; (2) Die Soja; and (3) Sojas, as "Zuechtung von Sojas" or "Sojas, meist gemahlte." There are now a proposal to establish a joint stock company for growing soybeans in central Europe (probably in Germany), using big money. But it may not succeed because soybean yields in Germany and Austria are low. Seedsmen who sell soybeans commercially in 1915 include: Haage and Schmidt (Erfurt, Germany), Vilmorin Andrieux (Paris, France), Dammann & Co. (St. Giovanni at Tedaccio, near Naples, Italy), and Wood and Son (Richmond, Virginia, USA). The main soybean varieties sold by each of these companies are described in detail (p. 73-74).

Utilization (p. 82): Since soybeans are rich in protein and fat, they can be used as a good meat substitute. In Europe the use of soybeans for food is still very small. "In Europe, the first foods from soybeans were made in France, at Vallées near Asnieres: Flour, bread, and cakes for diabetics, and cheese. In Germany not long ago the Soyama-Works at Frankfurt am Main likewise began the production

© Copyright Soyinfo Center 2014

of such foods. Similar foods were also made in Romania. Soybeans sprouted in the dark yield a bitter-tasting salad. Production of vegetable milk started in France at 'Caséo Sojaine' at Vallées (Seine); and is now being studied by the Synthetic Milk Syndicate in England. Using the process developed by Fritz Goessel, this Syndicate made 100 liters of soymilk from 10 kg of ground soybeans at a factory at Liverpool." "It is in no way certain that soybeans will ever be widely used in human foods."

A fairly large amount of soybeans are ground for use as fodder. The main use is for oil extraction. Yet Haberlandt considered that since the soybean contained only about 18% fat (range: 13-22%), its use as a source of oil would not be economical. The main use of soy oil is in soaps, for which it is highly prized. It is also used in making paints as a partial substitute for linseed oil. The best quality may be used as food. In England soy oil is used for margarine production.

Conclusion: The soybean originated in central Asia and is now widely cultivated in China, Japan, Manchuria, and India. Its seeds are rich in protein and, unlike most other legumes, also rich in fat. The plant is used in its homeland mostly as a source of human foods and seasonings, made by fermentation; the oil is used mostly for industrial non-food purposes. In recent years soybean production has expanded significantly in the southern part of the United States. There it is used mainly as green fodder, hay, silage, and soil building. The main expansion of soybean cultivation in Europe has been in Italy, southern France, Hungary, and southern Russia. Good early varieties give yields of 1,100 to 1,300 kg/ha. A large expansion of soybean production in central Europe is possible only in southern Austria and Hungary, and maybe in a few other places where it is warm. But late-maturing soybeans may be grown for forage and silage in the cooler parts of Germany and Austria. Address: Prof., Dr., Wien (Vienna).

1720. Morton, William. 1915. Soya bean situation in North Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 18(48):809. Feb. 27.

• ***Summary:*** "The soya bean crop of North Manchuria in 1914 was estimated to be 15 per cent larger than that of the preceding year. The total exports of beans from North Manchuria from November 1, 1913, to November 1, 1914, amounted to 415,000 tons, of which about 33,000 tons were exported via the Sungari and Amur Rivers, 100,000 tons to Dalny and Japan, and the remainder to England, Germany, the Netherlands, and Denmark.

"Shortly after the outbreak of war in Europe the transportation of Russian troops over the Chinese Eastern and Trans-Siberian Railways began, and so interfered with the shipment of commercial freight that not more than one-third of the bean cargoes have reached Vladivostok, the remainder being stored at the various stations of the Chinese Eastern Railway. Now that the transportation of troops has ended it is expected that there will soon be enough freight cars for carrying the beans to Vladivostok. [The names of Harbin firms engaged in the soya-bean trade may be had from Bureau of Foreign and Domestic Commerce or its branch offices.]

"Modern and Native Mills–Oil Containers:

"There are three small modern bean-oil mills in North Manchuria, one of which belongs to a Japanese and the other two to Chinese. The full capacity of these mills is about six short tons of oil daily. Besides these three mills, a large modern mill (oil) has been built by the Anglo-Chinese Trading Co. at Harbin, but it is not working yet, as its machinery is not complete. There are numerous small Chinese oil mills operated either by hand or by horse power scattered throughout the town and villages of North Manchuria, but no statistics are available as to the total output from these mills.

"Baskets are used for transporting oil from the surrounding country to Harbin, but wooden boxes and tins packed in wooden boxes are used for containing oil for export abroad. One wooden box contains about 252 pounds of oil and one tin contains about 36 pounds of oil, two tins being packed in one box. The tins and boxes are of local manufacture. No empty tins were imported into North Manchuria in 1914." Address: Deputy Consul, Harbin.

1721. *Good Health* (*Battle Creek, Michigan*). 1915. Vegetable protein not inferior to animal protein. 50(2):92, 93 + 10a. Feb.

• ***Summary:*** "For many years a stock argument against the non-flesh dietary has been the claim that animal protein is much more readily and completely assimilated than vegetable protein. At best this argument would be only a matter of economy and would amount to nothing, since the cost of vegetable protein is not more than one-fifth to one-tenth the cost of animal protein, so that one could easily afford to lose five to ten per cent of the raw material while making a saving of three hundred to four hundred per cent in cost.

"But a review of the supposed experiments of comparative indigestibility of protein has shown that there is no real foundation for the claim that vegetable proteins are less digestible than animal proteins. In the earlier experiments it was observed that when a large amount of protein of the diet was derived from peas or beans, only three-fourths to four-fifths of the protein was assimilated, whereas in the case of animal proteins in the form of eggs or meat eighty-eight to ninety per cent was assimilated.

"Experiments made by an eminent Japanese physiologist with the pure protein of the soy bean have shown it to be digestible to the extent of ninety-six per cent, a degree of digestibility fully equal to that of any animal protein. It appears that the only reason why animal proteins have

© Copyright Soyinfo Center 2014

seemed to be more digestible than vegetable protein has been the fact that vegetable proteins are combined with various substances, especially cellulose, which is indigestible, so that digestion is hindered.

"These experiments have been repeated in this country by Doctor Mendel of the Yale University laboratory [Connecticut] and with practically identical results. Doctor Mendel does not hesitate to state that vegetable proteins are equally as digestible as animal proteins."

1722. Heintzleman, P.S. 1915. Soya bean situation in South Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 18(50):863. March 2.
• ***Summary:*** "The soya-bean crop of the Mukden district amounted to some 1,200,000 tons in 1913 and approximated 1,150,000 tons in 1914; of this production, 639,200 tons in 1913 and 603,548 tons in 1914 were transported by rail to South Manchurian seaports.

"Of the beans exported, 150,000 tons went to Europe, 70,000 tons to Japan, and 80,000 tons to South China. Bean cake, the total production of which was 800,000 tons, was shipped mainly to Japan (500,000 tons) and South China (200,000 tons). Of the 70,000 tons of bean oil produced last year, 10,000 tons went to America, 10,000 tons to Europe, and 500 tons to Vladivostok, all being transshipped via Japan. Japan itself took 15,000 tons and South China 10,000 tons. Five firms, all Japanese, are engaged in the export business at present [their names being obtainable from the Bureau of Foreign and Domestic Commerce or its branch offices], other foreign firms having suspended trade in beans and bean products.

"Since the war the exportation of all these products has been reduced, but local mills continue working at their full capacity." Address: Consul General, Mukden.

1723. Scidmore, George H. 1915. Oil milling in Japan. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 18(54):941. March 6.
• ***Summary:*** The following is an extract from the *Japan Mail* of 11 Jan. 1915. "One of the few lines of industry which has been favorably influenced by the war is seed oil milling. On account of the withdrawal of Germans, because of the war, the laying in of beans in China has become very easy for the Japanese in China. Particularly the decline of prices has offered to them a vast chance of underselling even Russian millers in their own country, while the demand for various descriptions of vegetable oil has been inflated both at home and abroad, due to the increased requirements of the navies of the different countries. Though at one time the trade with Europe was suspended at the fall of Antwerp [at port city Belgium, conquered by Germany], soon the trade was resuscitated and now is unusually active. The only drawback is the inadequacy of shipping to take the goods to the consuming countries.

"The industry in this country may be divided into three lines, namely, seed oil milling in and around Nagoya, rape-seed oil milling principally conducted in Kyushu, and Chinese bean [soya] and seed oil milling conducted in and around Kobe. Millers engaged in the former two lines have never been favored by the war, for they have been unable to obtain cheap materials, which in their cases are home produced... It is the last line which has been most favored by the war." Address: Consul General, Yokohama, Japan.

1724. Akaghi, Tasuku; Nakajima, I.; Tsugane, K. 1915. Researches on "Hatsucho-Miso." *J. of the College of Agriculture, Tokyo Imperial University* 5(3):263-69. March. Journal name also written as Tokyo Noka Kiyo or Tokyo Teikoku Daigaku Nogaku-bu Kiyo. [12 ref. Eng]
• ***Summary:*** "Hatsucho-miso" is a special variety of "miso" chiefly manufactured in Mikawa Province. Its chemical composition was reported by T. Takahashi and G. Abe in 1908.

In preparing "Hatsucho-miso," the cleaned soy-bean is steeped in water and boiled for 6 to 7 hours. The boiled soy-bean is crushed and then moulded in a round or cylindrical mass suitable to lay on the floor of the "koji" -chamber. "Koji" ripens after 20-40 days. It is then mixed with salt and water and is introduced into a fermenting vat covered by straw mats, weighted with a large number of stones to ensure the materials ripening en masse. The ripening of "Hatsucho-miso" is generally attained in from 3 to 5 years.

Lists the ten species of mould fungi found in almost every matured "koji." The species of fungi predominating during the stages of preparation differ in accordance with the season in which the preparation is carried on.

3 species of yeast were isolated from "koji": *Torula, Willia anomala and Mycoderma.*

"Hatsucho-miso" is reported to have a special flavor and aroma. "The nature of the aroma is not explained at present, but the taste is ascribed to the water soluble matter beside protein-matters, so that part of it at least must consist of the decomposed substances derived from protein matters." Address: Japan.

1725. Ide, Hayamizu. 1915. Daizu shushi-chû no jiyasutaze ni tsuite. I. [On the diastase of soybean seeds. I]. *Chosen Sotokufu Chuo Shikenjo Hokoku* (*Korean Governor-General's Central Research Laboratory, Report*) 1(1):2-1 to 2-19. March. [Jap]
Address: Gishu [Japan].

1726. Kinoshita, Asakichi. 1915. Shôyu no kaon jôzô ni okeru moromi dennetsu no jôtai [On the heat conductivity in moromi (mash) during "heated brewing" of shoyu]. *Jozo Shikensho Hokoku* (*Report of the Brewing Experiment*

Station) No. 58. p. 447-69. March. [Jap]
Address: Jozo Shikensho, Gishi.

1727. Nishimura, Torazô. 1915. Shôyu jôzô-yô en enshitsu hikaku shiken. II. [On common salt and its quality as a raw material for shoyu production. II.]. *Jozo Shikensho Hokoku* (*Report of the Brewing Experiment Station*) No. 57. p. 331-62. March. [Jap]
Address: Jozo Shikensho, Gishi.

1728. Nishimura, Torazô. 1915. Komugi, daizu ni kansuru 2, 3 no kenkyû [Several studies on wheat and soybeans for shoyu brewing]. *Jozo Shikensho Hokoku* (*Report of the Brewing Experiment Station*) No. 58. p. 425-45. March. [Jap]
Address: Jozo Shikensho, Gishi.

1729. Takahashi, Teizô; Yukawa, Matao. 1915. On the budding fungi of "shôyu-moromi" and "shôyu-koji." *J. of the College of Agriculture, Tokyo Imperial University* 5(3):227-61. March. [10 ref. Eng]
• ***Summary:*** "Up to now several studies on the budding fungi of 'shôyu-moromi' and 'shôyu-koji' have been published, but with regard to the botanical classification all these studies have very little merit, as we cannot derive any systematic classification from them."

The author gathered 52 samples of moromi, aged for 2 to 24 months, from 11 shoyu factories in various parts of Japan. The factories were: 1. Shichirouemon Mogi's shoyu brewery at Noda, Shimousa province. 2. Saheiji Mogi's shoyu brewery at Noda, Shimousa prov. 3. Hamaguchi's shoyu brewery at Choshi, Shimousa prov. 4. G. Tanaka's shoyu brewery at Choshi, Shimousa prov. 5. J. Iwasaki's shoyu brewery at Choshi, Shimousa prov. 6. K. Nakamura's shoyu brewery at Goyu, Owari prov. 7. Asai shoyu brewery at Tatsuno, Harima prov. 8. Maruo shoyu brewery company at Tatsuno, Harima prov. 9. Kikuichi shoyu brewery company at Tatsuno, Harima prov. 10. Tatsuno shoyu brewery company at Tatsuno, Harima prov. 11. Kagawa shoyu brewery experimental station at Shôtoshima, Sanuki prov.

The following budding fungi were isolated from the samples: 1. *Zygosaccharomyces major* [a yeast] nov. spec. 2. *Zygosaccharomyces soja,* nov. spec. 3. *Zygosaccharomyces japonicus,* Saito. 4. *Zygosaccharomyces salsus,* nov. spec. 5. An asporogenic species of *Zygosaccharomyces* (?). 6. Two species of *Mycoderma.* 7. *Pichia alcoholophila,* Kloecker var. 8. Several species of *Torula.* 9. A species of *Monilia* [Note 1. The mold *Monilia sitophila* is used to make onchom in Indonesia].

"General conclusions: The occurrence of *Zygosaccharomyces* in 'shôyu'-mash furnishes us with a very interesting field for future researches in microbiology. The application of pure cultures of *Zygo. major* and *Zygo. soja* must naturally result in the future improvement of our 'shôyu.' The two species of *Zygosaccharomyces* i.e. *japonicus* and *salsus,* and the species of *Torula* and *Monilia* must be regarded as harmful or damaging fungi for 'shôyu', but their common property of decolorizing 'shôyu' may sometimes be utilized for the preparation of the colorless or 'shiro-shôyu', by taking the precaution of lessening the deteriorating effect of the fungus. The *Mycoderma* species in 'shôyu-koji' will be more appreciated in future on account of its energetic generation of a pleasant aroma."

Note 2. This is the earliest document seen (June 1999) that mentions the shoyu yeasts *Zygosaccharomyces major Zygosaccharomyces salsus.*

Note 3. This is the earliest English-language document seen (April 2012) that uses the term "shiro-shôyu" [regardless of hyphenation or diacritics] to refer to clear shoyu, which has the lightest color of the five basic types of Japanese shoyu. Actually, the color of shiro-shoyu resembles that of honey. Address: Tokyo, Japan.

1730. Yukawa, Matao. 1915. The fate of tyrosine in "shôyu-moromi". *J. of the College of Agriculture, Tokyo Imperial University* 5(3):291-99. March. [8 ref. Eng]
• ***Summary:*** When the proteins from soy beans and wheat are hydrolyzed by enzymes during the ripening process of shoyu moromi, a significant amount of tyrosine and a number of amino acids are always obtained. "Both tyrosol and tyrosamine were isolated from 'shôyu' and 'Tamari-shôyu' [Tamari shoyu], whilst p-hydroxyphenyllactic acid was never found in them. 'Shôyu' contains more tyrosol and less tyrosamine compared with 'Tamari-shôyu.' The occurrence of tyrosol in 'shôyu' or 'Tamari-shôyu' is partly or entirely due to the decomposition of tyrosine by the budding fungi dwelling in 'moromi.' The experimental results, according to which the cultured budding fungi have never produced tyrosamine from tyrosine, led me to presume that tyrosamine in 'shôyu' or 'Tamari' is certainly produced from tyrosine or its decomposed products formed by *Aspergillus Oryzae* or directly from protein matters by the actions of the same bacteria in 'moromi.'...

"In our country 'shôyu' or 'Tamari-shôyu' are used in cookery as a necessary seasoning on account of their content of amino-acids, carbohydrates, sodium chloride, etc. Moreover, they seem to act as stimulants. The occurrence of tyrosamine in 'shôyu' or 'Tamari-shôyu' makes me easily recognize this. According to the descriptions of Barger, Dale and Dixon, and Bickel and Pawlow p-hydroxyphenylethylamine (tyrosamine) causes a contraction of the blood vessels and a rising of blood pressure. Judging from the pharmacological significance of this compound, the consumer of 'shôyu' or 'Tamari-shôyu' receives a moderate stimulation on his blood circulation."

Note: This is the earliest English-language document seen (April 2012) that contains the term "tamari shôyu" (or "tamari shoyu"). Address: Tokyo Imperial Univ.

© Copyright Soyinfo Center 2014

1731. *Bulletin Economique de l'Indochine* (*Hanoi*). 1915. Surface cultivée et production du Soja au Japon de 1904 à 1913 [Area cultivated and production of soybeans in Japan from 1904 to 1913 (and in Korea from 1909 to 1912)]. 18(112):260. March/April. [Fre]

• ***Summary:*** This table for the years 1904 to 1913 inclusive in Japan gives for each year: Area cultivated (in *cho;* 1 *cho* = 2.451 acres). Soybean production (in *koku;* 1 *koku* = 180 liters = 47.6 gallons). Average yield (in *koku* per *tan;* 1 *tan* = 0.245 acre). The cultivated area rose from 446,843 *cho* in 1904 to a peak of 495,802 *cho* in 1908, then fell to 475,284 *cho* in 1913. Production rose from 3,710,459 *koku* in 1904 to a peak of 3,892,934 *koku* in 1908, then fell to a low of 2,993,095 *koku* in 1913. Yield fell from a peak of 0.830 in 1904 to a low of 0.629 in 1913.

A second table gives statistics for soybean production in Korea from 1909 to 1912. The area cultivated rose dramatically from 280,090 *cho* in 1909 to a peak of 375,340 *cho* in 1912. Production also rose sharply from 1,533,027 *koku* in 1909 to 2,452,203 *koku* in 1912. Address: Hanoi.

1732. Meyer, Frank N. 1915. Re: Condensed soybean milk, made in Japan and sold in China. In: Letters of Frank N. Meyer. 4 vols. 1902-1918. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 2068-69. Letter of 21 May 1915 from Peking, China, to David Fairchild of USDA.

• ***Summary:*** "I am also enclosing a can of so-called condensed milk, as sold here in China under the name of 'The Eagle Brand.' I strongly suspect this stuff to have been made in Japan from Soybeans, with something added. It is of a brown color, quite lumpy, not very sweet and it dissolved but poorly. One also gets effects of flatulency from it, especially when taken on an empty stomach. Do you consider it worth while to have it analysed by the Bureau of Chemistry?"

In a letter of 15 Dec. 1915 (p. 2166, from Washington, DC) to Fairchild we read: "Morse soy beans are desired, especially from southern China. Prof. Tracy at Biloxi got a mutant among his soybeans which is of extremely great value to the Gulf Coast sections... The *Kudzu vine* is not as desirable as was first thought; it occupies the land too long and does not always make a dense stand."

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

1733. *Edison Monthly* (*The*). 1915. The Nippon Club. 7(12):474-76. May.

• ***Summary:*** The Nippon Club was formed about ten years ago and now has about 100 members. "The present house [club building, on West 93rd St. in New York City], begun three years ago, speaks the prosperity of the organization, whose membership has grown proportionately. The present officers are: president, Dr J. Takamine;..." Architecturally, the building and decor combine both Western and Japanese features and styles; in it, East and West meet.

"There remains but to speak of the 'Sukiyaki,' an apartment unknown to Americans in use as in name. This is the chafing-dish room, taking its name from a favorite dish of meats and vegetables prepared, by preference, individually. Ranged on each of five broad tables are a dozen or more of the native chafing-dishes, sufficient to supply an ordinary dinner company. The ingredients, sent up from the kitchens by electric lift, are flavored as each diner–and each an accomplished cook–prefers.

"The club, apropos of ingredients, is itself a glorified Sukiyaki–in substance evident, but in flavor fascinating and indescribable.

Note: This is the 2nd earliest document seen (Aug. 2010) that mentions sukiyaki; it gives only a minimal description.

1734. Brewer, Lucile; Canon, Helen. 1915. Beans and similar vegetables as food. *Cornell Reading Courses* (*New York State College of Agriculture*) *Food Series* 4(89):181-200. Food Series No. 16. June 1. [20 ref]

• ***Summary:*** The section titled "Long and extensive use of legumes as food" states (p. 182): "The cowpea and the soy bean have only within recent years come into common use in this country." "The first reference to the soy bean in American literature was in 1829; it had been grown in the botanical garden at Cambridge, Massachusetts and was referred to as 'a luxury, affording the well-known sauce, soy, which at this time is only prepared in China and Japan.' About twenty-five years later [1854], seed of the soy bean, or Japan pea as it then was called, was brought from Japan to California, and thence to Illinois and Ohio. Within the last twenty-five years, it has come to be a crop of great economic importance in the United States."

"The peanut, properly classed with the nuts, is thought to be a native of tropical America. It has long been grown in Africa, the East Indies, China, and Japan. It is said that in the seventeenth century it had become so important an article of food in Africa that the slave dealers loaded their vessels with it as food for their captives. Since the Civil War, the peanut has become important in the Southern States as a human food, a forage crop, and a fertilizer."

The section titled "Digestibility" (p. 184) states: "In Japan the soy bean is grown almost entirely for human food. According to Mr. Oshima, next to rice in the Japanese diet are the legumes, which are universally used.

In the section on "The cooking of legumes" we read (p. 188) that the use of a small amount of baking soda (sodium bicarbonate; ¼ teaspoon to 1 quart of water) serves to loosen the skins of legumes, "to render their protein more digestible, and to soften water of average hardness..." "Soft water, either distilled or rain water, is the best in which to soak and cook the legumes. Hard water interferes with their becoming soft

© Copyright Soyinfo Center 2014

and also with their digestibility. Hardness of water caused by the carbonate of lime or magnesium, may be remedied for use in the cooking of legumes by boiling the water, pouring it from the sediment, and adding a small amount of soda; when the hardness is caused by the sulfate of lime of magnesium, boiling has no effect, but soda may improve it for this purpose.

This publication contains many recipes for "beans" but without any specific reference to soy beans in a recipe.

1735. Schieber, W. 1915. Die Sojabohne und deren volkswirtschaftliche Bedeutung als Nahrunsmittel [The soybean and its economic significance as a food]. *Seifensieder-Zeitung* 42(22):471-72. June 2. (Chem. Abst. 10:1558). [Ger]
• ***Summary:*** Descriptions and nutritional analyses are given of a number of different food products prepared from the unfermented and the fermented soy bean. Unfermented: soya milk, tofu (*Sojakäse*), soy flour ("because of its composition it can be recommended as a first class food for diabetics and vegetarians"), soya bread, soya confections (resembling marzipan), soya chocolate, soya coffee, soy grits, whole dry soybeans, and soy sprouts ([*Soja*] *Schoten, Bohnen, und Keime*). Fermented: Solid seasonings such as Japanese natto, pastes such as Japanese miso, sauces (in Japan each year 10,000 factories make 700 million liters of soy sauce), a new German fermented soyfood product is made by a secret process; its contains 45% protein, 6% nutritional salts, and about 2% lecithin.

Note. This is the earliest German-language document seen (Jan. 2013) that uses the term [Soja] Keime to refer to soy sprouts. Address: Dr.

1736. Nishimura, Torazô. 1915. Shôyu kôji oyobi kôji-kin ni kansuru bubun-teki kenkyû [Limited research on shoyu koji and the koji mold *Aspergillus oryzae*]. *Jozo Shikensho Hokoku* (*Report of the Brewing Experiment Station*) No. 60. p. 1-9. June. [Jap]
Address: Jozo Shikensho, Gishi.

1737. Ueno, Seiichi. 1915. [On the hardening {hydrogenation} of oils]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 18(208):545-564. June. [Jap; eng]
• ***Summary:*** The author conducted experiments with various oils, including: The hydrogenation of sardine oil on a semi-industrial scale. Examination of the intermediate products of hydrogenation. Durability of the activity of nickel catalyst and the revitalization of spent catalyst. Hydrogenation of oils and unsaturated fatty acids at low temperatures. Relation of the catalytic activity of nickel-kieselguhr-catalyst to the proportions of nickel and its carrier (kieselguhr). Soy oil is mentioned on p. 553 and 554.

1738. *New York Times.* 1915. Latest customs rulings. July 15. p. 14.
• ***Summary:*** "Importers of Japanese shoyu and nigari [a traditional Japanese tofu coagulant] were sustained yesterday by the Board of General Appraisers in the claim for lower duty on these products." A list of the many protesting importers is given.

Paragraph 606 specifies the duty on "soya beans."

1739. Parlett, H.G. 1915. China (Leased Territory of Kwantung). Bean trade of Dairen in 1914. *Board of Trade Journal* (*London*) 90:334-35. July 29.
• ***Summary:*** "The value of beans exported during 1914 was £1,779,865, an increase of £800,568, of bean cake £2,347,098, a decrease of £249,475, and of bean oil £763,370, and increase of £43,293. The year's export of beans amounted to 255,112 tons, being 100,533 tons in excess of that for 1913. Japan was the heaviest purchaser with 139,222 tons, followed by South China with 65,498 tons. Exports to Europe amounted to 25,806 tons, an increase of 23,644 tons as compared with 1913. In bean cake there was a decrease of 32,605 tons compared with the year previous."

Note: According to *Webster's New Geographical Dictionary* Kwantung Leased Territory (also Kwanto) was located in the southern part of the mountainous Liaotung Peninsula, in today's Liaoning Province. Its capital is Dairen and its other major port is Port Arthur. In 1898 it was leased to Russia by China under pressure. In 1905 it was taken over by Japan by the Treaty of Portsmouth and the lease extended in 1915 to 99 years. In 1945 it was again leased to the USSR by treaty. In 1950 it was returned to China and in 1955 Soviet forces were withdrawn. Address: British Consul, Dairen.

1740. Parlett, H.G. 1915. China (Leased Territory of Kwantung). Bean trade of Dairen in 1914. *Board of Trade Journal* (*London*) 90:334-35. July 29.
• ***Summary:*** Reports the value of the exports of soya beans, bean cake, and bean oil during 1914. "The year's export of [soya] beans amounted to 255,112 tons, being 100,533 tons in excess of that for 1913. Japan was the heaviest purchaser with 139,222 tons, followed by South China with 65,498 tons. Exports to Europe amounted to 25,806 tons, an increase of 23,644 tons as compared with 1913." Address: British Consul, Dairen.

1741. Williams, C.B. 1915. Soy-bean growing in North Carolina. *North Carolina Agricultural Experiment Station, Circular* No. 31. 8 p. July. Reprint.
• ***Summary:*** Contents: History. The growing plant. Distribution in North Carolina. Suitable varieties (for seed production and for hay production). Selecting and preparing the soil. Inoculation essential. Fertilization. Seeding and cultivation. Soy beans in mixtures (with cowpeas, sweet

© Copyright Soyinfo Center 2014

sorghum, or millet). Harvesting for hay. Soy beans for soil improvement. Soy beans for soiling purposes. Soy beans for pasturage.

"The soy bean is probably a native of tropical Africa and was introduced into the southeastern part of Asia more than 3,000 years ago by ancient travelers between Zanzibar and India or Ceylon... The bean was carried to England in 1790 and was introduced into the United States from Japan in 1860. It has been successfully cultivated in the Southern States for many years, where it has been grown for soil improvement and as a forage crop. In Japan and China it is grown chiefly as a human food. It is also known as Soja Bean, Coffee Berry and Japan Pea."

In North Carolina, the soy bean "is grown more or less from the seashore to the western boundary, but at the present time is chiefly produced in the northeastern part of the State." Commercial cultures for inoculation may now be secured at very reasonable prices.

Fertilization: If "the soil is poor, it will pay to make an application of barn-yard manure or add sufficient cotton-seed meal, dried blood, fish scrap, or other commercial carriers of nitrogen to give the fertilizer mixture used on the beans 1 to 2 per cent nitrogen. Ordinarily, from 200 to 400 pounds of 16 per cent acid phosphate and 25 to 50 pounds of muriate of potash will supply the necessary amount of phosphoric acid and potash needed by this crop when grown on average soils in the eastern part of the State."

Photos show: (1) Soy beans drilled in corn rows (p. 1). (2) A man standing in a field of soy beans sown broadcast on "black land" for hay (p. 3). (3) A field of soy beans with two barns in the distance (p. 5). Address: Chief, Div. of Agronomy, NCES, Raleigh and West Carolina.

1742. *Los Angeles Times.* 1915. Alliance–Japanese beans for Germans: The soy and soja said to be valuable foods. Experiments are to be made to determine if they can be used in the prison camps–together they yield flour, meal, milk, cheese, coffee and fodder. Aug. 8. p. III25.
• ***Summary:*** This article, via A.P. [Associated Press] foreign correspondence, is very similar to one published a week earlier (Aug. 1) in the *Washington Post* titled "'Soy' bean as war food: German dieticians experiment with it in many prison camps." (p. M8).

The last sentence in the article, however, is new: "Exhaustive experiments with the soja bean have already been made at the agricultural station of the University of Wisconsin, all tending to bear out, it is said, the contention of German dieticians in favor of the bean."

1743. Arita, Hachirô. 1915. Honoruru ni okeru shôyu juyô jôkyô ni kansuru ken [The demand for Japanese shoyu in Honolulu]. Honolulu. 11 p. Aug. 12. Handwritten unpublished manuscript. [Jap; eng]
• ***Summary:*** This is a market report from Mr. Arita at the Japanese consulate in Honolulu, to Mr. Shigenobu Okuma at the Japanese Ministry of Foreign Affairs.

Shoyu imports from Japan are 80,807 taru (1.309 million liters). Production by 4 Japanese companies in Hawaii is about 4,200 koku (756,000 liters). Domestic production is up by 20% over last year. Address: Japanese Consulate, Honolulu, Hawaii.

1744. *New York Times.* 1915. From here and there. Oct. 24. p. SM11.
• ***Summary:*** "The usual Japanese breakfast consists of rice, miso soup, pickles, and occasionally fish. Tea is always served with meals, and is drunk clear, without sugar. Miso soup consists of strips of radishes, seaweed, eggplant, or other vegetables cooked with bean curd and water. The cooking is not continued for a long, and so few vegetables are used that the soup partakes only slightly of the flavor of the ingredients."

1745. *Bulletin Economique de l'Indochine* (*Hanoi*). 1915. Les exportations du Soja en Mandchourie [The exports of soya from Manchuria]. 18(115):773. Sept/Oct. Extract from Echo de Chine. [1 ref. Fre]
• ***Summary:*** "The quantities of soybeans forwarded from Dairen to the South China Sea by ships / vessels which offer regular service between Dairen, Shanghai, and Hongkong, to be expedited again to other destinations, increase significantly each year. The quantities in 1913 attained 3,061,336 kg; in 1914 they were only 2,976,049 kg, and for the year 1915, the quantities already exported rose to 6,667,000 kg."

A table shows the imports of soybeans (in million kg) at the following ports in 1914 and 1915: Singapore (1.460 / 1.426), Hongkong (4.760 / 0.923), southern Chinese ports (36.946 / 13.580), Dairen (2.976 / 6.667), and Japanese ports (1.503 / 1.060). Note 1. In 1914 southern Chinese ports imported 77.5% of the total imports of 47.645. In 1915 the total imports dropped to 23,656, and southern Chinese ports imported 57.4% of that total.

"The Indies (*Les Indes*) had exported 49,705 kg to these different places in 1913, but since then, no new exportation has been done, the Indies sending all available soybeans into the city (*dans la Métropole*)."

"In the South China Sea, mainly in Malaysia and Oceania (*les Iles Océanique*), soybeans are used to prepare Chinese food sauces from certain special farms, and the residue is used as fertilizer on sugarcane plantations." Address: Hanoi.

1746. Negoro, Motoyuki. 1915. Hawaii hôjin katsuyaku-shi, Meiji 41-42 [Japanese activities in Hawaii, 1908-09. 2 vols.]. Tokyo: Bunsei Shoin. 23 cm. http://ci.nii.ac.jp/ncid/BA65947911. [Jap]*
• ***Summary:*** In the section on soy sauce brewers, it lists:

© Copyright Soyinfo Center 2014

1. Fukushima Shoyu Jozo-sho. 2. Terada Shoyu Jozo-sho, founded by Tajiro Terada, as a brewer of Kikko-ki brand soy sauce, located on King St., Palawa, Honolulu. 3. Hawaii Shoyu K.K. as a soy sauce brewer on King St., Palawa, Honolulu. The ad on page 39 states that in 1915 this company produced 166,600 gallons of shoyu.

1747. Tsujimoto, Mitsumaru; Ueno, Takeo. 1915. Shôyu no abura oyobi seishû no abura ni tsuite [On "soy" and "saké" oils]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 18(212):1072-76. Oct. [Jap]
• ***Summary:*** "Soy" oil is a mixture of soy bean and wheat oils obtained as a by-product in the brewing of soy (i.e. soy sauce, yield 0.25-0.3% by volume). It is a dark red to brown liquid or semi-solid mass with an aromatic odor of soy. "Saké" oil consists chiefly of rice oil and is found floating on the surface after the fermentation of saké (yield 0.01-0.02% by volume). It is an orange-yellow liquid with an odor of saké. Samples of soy oil (2 samples) and saké oil (values in parentheses) had the following characteristics: Specific gravity at 15ºC, 0.9000, 0.9835, and (0.9031); solidification point, -5ºC, -13ºC, and (turbid at 0ºC); acid value, 59.24, 55.03, and (22.56); saponification value, 184.12, 182.81, and (179.11); iodine value (Wijs), 127.79, 133.22, and (101.56); refractive index at 20ºC, 1.4650, 1.4633, and (1.4660); % unsaponifiable matter, 2.88, 2.72, and (-).

Soy oil, which is best refined by reduction with zinc dust and sulfuric acid, followed by treatment with Kambara earth, is a commercial product used in the manufacture of low-grade soaps. Saké oil is not yet a commercial article. Address: Kôgaku hakase, Japan.

1748. Williamson, A.A. 1915. Marketing the new soya bean crop in Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 18(260):518. Nov. 5.
• ***Summary:*** "Cooperative selling–Fall shipments: At Kaiyuan a produce dealers' association and trust company has been formed, modeled after that at Dairen. Kaiyuan is a promising bean center. It is likely that an exchange will be established at Changchun also.

"North Manchuria beans, which are considered superior to those grown in South Manchuria, have been brought to Dairen in considerable quantities both by train and by steamer...

"Nevertheless the export of beans to Europe, notably Holland, has kept up remarkably, considering conditions there. These shipments have to be covered by documents guaranteeing their ultimate consumption in order to avoid capture at sea by belligerent cruisers.

"At present, the local trade is depressed, as Japan, the principal market, is suffering from overproduction of rice, as noted above, and European markets are not what they were, despite some shipments that have gone there. A few mills have begun work, but only in a small way. One of the largest was driven to making peanut oil during the summer."

"More crushing mills: The experimental mill built by the South Manchurian Railway Co. at Dairen, which uses the chemical extraction process, has been sold to Messrs. Suzuki & Co., of Kobe, the seller stipulating that the purchaser should enlarge the mill to double its capacity. Suzuki & Co. will spend about 200,000 yen (about $100,000) on the mill; but it is said the railway will aid the new owners financially. The fatty acid factory attached to the mill will also be operated by Suzuki & Co. This firm intends to establish two more mills, using the same benzine extraction process, at Kobe and Moji, in all probability. The fatty acid and glycerine factory is only used when the price of bean oil is too low for profit."

Note: This is the earliest document seen (Jan. 2014) concerning the work of Suzuki & Co. with soybeans. The Japanese company, which built the first solvent extraction mill for soybeans in Manchuria (Dairen), later became Hohnen Oil Co. Address: Consul, Dairen, Manchuria.

1749. *Los Angeles Times.* 1915. Japanese breakfasts. Nov. 27. p. II6.
• ***Summary:*** From the *Boston Transcript:* This article is identical to the following, published about a month earlier: *New York Times.* 1915. "From here and there." Oct. 24. p. SM11.

1750. Hori, Shôtarô. 1915. Byôgai-roku. Senchû no kisei yori okoru daizu kenchi-byô (churo-byô) [Phytopathological notes. V. Sick soil of soybean caused by the nematodes]. *Byochu-gai Zasshi* (*J. of Plant Protection, Tokyo*) 2:927-33. Nov. [Jap]
• ***Summary:*** This document reports the discovery of the soybean cyst nematode. The author stated that the parasitic nematode is a species allied to *Heterodera Schachti,* according to the determination of Mr. S. Uchida. *Heterodera* sp. was found in soils causing a serious disease of soybeans at Shirakawa Prov., Iwaki, in Honshu, Japan. Soil treatment with calcium cyanamide is recommended. Note: Katsufuji (1919) stated that he believes this to be the earliest document seen describing nematode injury to soybeans in Japan. Address: Nôgaku-shi, Rigakushi.

1751. Williamson, A.A. 1915. Dairen soya-bean market becomes animated. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 18(298):1132. Dec. 21.
• ***Summary:*** "The local market for soya beans and products has become somewhat animated, after a long period of stagnation on account of the European war, and the consequent lack of shipping facilities to Europe, the dullness

© Copyright Soyinfo Center 2014

of the manure market in Japan, and other influences, among which high freights may be reckoned. New beans are now coming down to Dairen in small quantities, but the real outflow will not begin until the advent of winter causes the roads in the interior to freeze.

"The direct cause of the present animation is the arrival of orders for a large quantity of bean cake from Formosa, for the sugar plantations there. On the 23rd, 17,000 pieces were bought at $0.57 each, while on the following Monday 38,000 cakes were bought at an advance to $0.59 each." Address: Consul, Dairen, Manchuria.

1752. Tsujimoto, M.; Ueno, T. 1915. "Soy" and "saké" oils (Abstract). *J. of the Society of Chemical Industry* (*London*) 34(24):1259. Dec. 31. [1 ref]
• ***Summary:*** An English-language summary of the following Japanese-language article: Tsujimoto, Mitsumaru; Ueno, Takeo. 1915. "Shôyu no abura oyobi seishû no abura ni tsuite [On 'soy' and 'saké' oils]." *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 18(212):1072-76. Oct. Address: [Japan].

1753. Hemmi, Takewo. 1915. A new brown-spot disease of the leaf of Glycine hispida Maxim. caused by *Septoria glycines* sp. n. *Transactions of the Sapporo Natural History Society* 6(1):12-17. Dec. [Eng; Jap]
• ***Summary:*** This article begins: "*Glycine hispida* Maxim. or soy bean is one of the most important leguminous crops in the Far East. In Hokkaidô it is most extensively cultivated, as the climate is well suited for its production. There are many destructive diseases which attack the soy bean in our country and of which the investigations have already been done to a greater or lesser extent. But we have not yet heard of a destructive Septoriose on this important crop in our country. The only species of Septoria, which has been recorded as a causal fungus of a leaf-spot disease of the soy bean plant in mycological and pathological literatures, is *Septoria sojina* Thüm.* (Von Thümen, III p. 63 (1879)).

"It was in the early summer of the last year that my attention was first drawn to a diseased appearance of the leaves of this plant in the experimental plots of our college and in the adjoining fields. The microscopical examination showed at once that it was die to a kind of Septoriose."

Describes the symptoms of the disease and the morphology of the causal fungus. The difference between *Septoria glycines* and *S. sojina* are tabulated. Address: Nôgakushi, Sapporo, Japan.

1761. Hopkins, Albert Allis. ed. 1915. Scientific American cyclopedia of formulas: partly based upon the twenty-eighth edition of *Scientific American Cyclopedia of Receipts, Notes and Queries.* 15,000 formulas. New York, NY: Munn & Co. vii + 1077 p. See p. 752, 772, 768. Illust. Index.
• ***Summary:*** In Chapter 21, titled "Preserving, and canning, condiments, etc. (p. 735+) is a section on "Catsups" (p. 752) which includes: Anchovy catsup. Cucumber catsup. Horseradish catsup. Mushroom catsup. Soy, Indian. Soy, Japanese. Tomato catsup. Walnut catsup.

"Soy, Indian.–This sauce is usually bought ready prepared. It is imported from China and Japan, where it is made from a small bean, the produce of Dolichos Soja. Japanese soy is usually preferred to that of China, because it is free from the sweet treacly flavor which distinguishes the latter. When well made it has a good brown color, thick consistency, and is clear.

"Soy, Japanese.–An equal weight of beans, coarse barley meal and salt. Wash the beans well, boil them in water until

© Copyright Soyinfo Center 2014

tender, and pound them in a mortar, adding the barley meal gradually. Put the mass into an earthenware bowl, cover with a cloth, and let it stand in a warm place for several days, until it is sufficiently fermented, but not moldy. To each pound of salt add 4 pt. of water, stir until the salt is dissolved, then stir into the fermented mass. Keep the bowl or pan closely covered for 3 months, during which time it must be daily stirred for at least 1 hour. At the end of this time strain through fine cloths, pressing the insoluble portion well, in order to extract as much of the moisture as possible. Let it stand again until quite clear, then drain off and bottle for use. In making Chinese soy, the liquid extracted is boiled and reboiled with a varying amount of sugar, mace, ginger and pepper until it acquires the desired consistency."

On pages 771-72 is a section on "Vinegars" are two formulas for "Camp vinegar." The first calls for 3 tablespoonfuls of soy [sauce] (plus 1½ pints walnut catsup); the second calls for 4 oz. soy sauce.

On pages 767-68 is a section on "Sauces and salad dressings," which begins with home-scale recipes for various sauces including: Anchovy butter. Anchovy essence. Anchovy paste. Anchovy sauce. Fish [sauce]. Gravies. Harvey sauce. Herb sauce. Soy [sauce]. Tomato sauce. Vegetable butters. Worcestershire sauce.

The formula for Harvey sauce begins: "Good vinegar, 1 qt.; anchovies, 3; soy, 1 tablespoonful; walnut catsup, 1 tablespoonful; finely chopped shallot,..."

The formula for "Soy" states: "Genuine soy sauce is a species of thick black sauce, imported from China, prepared with white haricots, wheat flour, salt and water; but a spurious kind is made in England as follows: Seeds of dolichos soja (peas or kidney beans may be used for them), 1 gal.; boil till soft; add bruised wheat, 1 gal.; keep in a warm place 24 hours; then add common salt, 1 gal.; water, 2 gal.; put the whole thing into a stone jar, bung it up for 2 or three months, shaking it very frequently; then press out the liquor; the residuum may be treated afresh with water and salt for soy of an inferior quality."

Likewise: "Worcestershire Sauce.–There are many concerns, we believe, who make a sauce which they call Worcestershire. That made in England by Lea & Perrin is considered the best and many have tried to imitate it, but with indifferent success. Of the many formulas appearing in print, the following will serve as an example; Vinegar, 1 qt.; powdered pimento, 2 dr.; powdered cloves, 1 dr.; powdered black pepper, 1 dr.; powdered mustard, 2 oz.; powdered Jamaica ginger, 1 dr.; common salt, 2 oz.; shallots, 2 oz.; tamarinds, 4 oz.; sherry wine, 1 pt.; curry powder, 1 oz.; capsicum, 1 dr. Mix all together, simmer for 1 hour, and strain. Let the whole stand for a week, strain it, and fill in bottles. Worcestershire sauce is never quite clear; straining to remove the coarser particles is all that is necessary."

Note: The publication date printed on the title page is 1915, however the copyright for this edition is 1910. Address: New York, Query Editor of the "Scientific American".

1762. Kôno, Nakanosuke. 1915. Manshû daizu oyobi sono kakôhin [Manchurian soybeans and their products]. Kwantung Leased Territory, Manchuria: Minseibu, Shomuka. 328 p. [Jap]*
Address: Kwantung Leased Territory, Manchuria.

• ***Summary:*** The author lists two Glycine species: (1) *Glycine hispida,* Maxim. = G. Soja, Bth. [Bentham] (Leguminosae) daizu. Chinese characters for ten different soybean varieties from Japan, China, Manchuria, and Formosa are given.

(2) *Glycine ussuriensis,* Reg. et Maack. (G. Soja, S. et Z.) tsuru-mame. Chinese characters for three different soybean varieties from Manchuria and China are given.
Address: Sc.D., LL.D., Prof. of Botany and Director of the Botanic Gardens in the Imperial Univ., Tokyo Univ., Japan.

1764. Morita, Sakae. 1915. Hawai Nihonjin hatten-shi [History of progress of Japanese in Hawaii]. Hawaii: Waipahu Shin Eikan. 866 p. See p. 260-65. Jozo-gyo (Brewing/fermentation industry) section. 23 cm. A second edition was published in 1919 under the title Hawai gojûnen-shi. [Jap]
• ***Summary:*** "The first Japanese who lived in Hawaii and brewed shoyu there was Haruhachi Shimada, who originally came from Yamaguchi-ken, Japan. He started in June 1891 and tried to make shoyu on a large scale. But bad transportation made it difficult for him to expand his market. This plus lack of capital forced him to quit."

Note: It is not clear where the soybeans used to make this shoyu were grown. They were probably either grown in Hawaii (probably on Oahu) or imported from Japan. If they were grown in Hawaii, this document would contain the earliest date seen for soybeans in Hawaii, or the cultivation of soybeans in Hawaii (June 1891). Address: He had a photo shop in Hawaii.

• ***Summary:*** Japan (regardless of race and colour) intervened in the Great War on the side of her ally Great Britain. They worked together successfully against Germany in the siege of Tsing-Tau in 1914 from Oct. 31 to Nov. 7.

Near the front of the book is a table of "Weights, measures and moneys, for Japan, Great Britain, and the USA."

Page 149-50: "The annual average number of immigrants from Japan is about 20,000. Roughly, half go to China and the United States of America... Since 1907 two batches of Japanese emigrants, under 2,000 in all, have gone to Brazil, the majority of which have been under contract with the Sao Paulo Government to work in the coffee plantations." There are now about 155,000 Japanese in the United States. Since a 1907 agreement between Japan and the USA, immigration of Japanese labour to the USA has been restricted. Some Japanese have tried to enter the USA by going first to Mexico. There are not more than 2,000 Japanese in Canada at present.

Page 232: In Japan: "The necessity for increased military and naval expenditure, which rose in connection with Korea in 1881, called for considerable additional revenue. Fresh military taxes were therefore levied; income-tax was introduced along with indirect imposts [taxes] on soy [sauce], tobacco, confectionery, and stamps, and the tax on *sake* was raised, augmenting the receipts to such an extent that the Government was able in 1886 to reduce the land-tax again. But following the war with China [1894-95] it became necessary to establish occupation and registration taxes, to raise again the *sake* tax, and to create a Government monopoly of leaf tobacco."

A table (p. 233) shows how the ordinary State revenue of Japan was derived in the financial years 1898-99 and 1909-10. The two main sources of revenue were: Land tax (38.4 and 85.7 million yen respectively) and liquor tax (33.0 and 91.5 million yen). By comparison, the soy tax was relatively small: 1.54 and 4.73 million yen.

Page 235-36: "The tax on liquors is levied upon (a) brewers of *shurui* (alcoholic liquor), which is divided into five classes, viz. *seishu,* or refined *sake, dakushu,* or unrefined *sake, shirozake,* or white *sake, mirin,* or sweet sake, and *shochu,* or distilled sake; (b) brewers of beer; and (c) wine and alcohol and alcoholic liquors other than sake or beer."

"Soy tax: The soy tax is levied upon manufacturers of this sauce at the rate of about 1 3/4 yen per *koku.* A tax on soy for household use was introduced in 1900, and ranges from 50 sen to 4 yen per *koku,* according to the amount manufactured. No more than 5 *koku* of soy per annum may be made for household use."

Page 240: A full-page table shows the "Budget for financial year 1911-12." The main sources of "Ordinary revenue" are liquors tax (88.7 million yen), land tax (75.1 million), customs duties (50.5 million), and tobacco monopoly (50.5 million yen). Revenue from the soy [sauce] tax is 4.6 million yen. The sugar excise is 14.7 million yen.

Page 261-62: "The upland fields, being for all intents and purposes unirrigable, are only to a very limited extent utilized for the cultivation of rice. Rotation crops are, however, raised twice a year, usually barley, 'naked barley,' and wheat as winter crops, and soya (more properly soja), sweet potatoes, and millets as summer crops." A key unit of area in agriculture is one *tan* = 0.245 acre. On [lowland] paddy fields, nationwide over the past 10 years, the average yield per *tan* is 7.913 bushels of rice and 6.668 bushels of barley, which may be considered a representative winter crop. "Upland fields, upon the same basis, produce 6.638 bushels of barley as a summer crop and 3.756 bushels of soya bean."

Another key (larger) unit of area in agriculture is one *cho* = 2.45 acre.

A table (p. 263) shows the total area, production, and yield of 17 major crops in Japan in 1897 and in 1910. Both years, the leading crop (by far) in area was rice, followed (in 1897) by barley, naked barley, wheat, and soya bean. For 1897 the three figures for soya beans were: 1,067,000 acres under cultivation, 15,381,000 bushels total production, and 14.41 bushels per acre yield. For 1910 the three figures for soya beans were: 1,137,000 acres, 18,834,000 bushels total production, and 16.56 bushels per acre yield.

Statistics for "small red bean" [azuki] are also given: For 1897 268,000 acres under cultivation, 3,069,000 bushels total production, and 11.45 bushels per acre yield. Thus, in 1897 and 1910 the production of soybeans was roughly 5 times the production of azuki beans.

Chapter 15, "Agriculture," contains a section titled "Soya bean" (p. 264-65): The soya, or soja, bean is well enough known in England as a cattle-food, but in Japan its application is by no means limited to this use. It is the basis of the Japanese sauce, soy, of which enormous quantities are brewed; of *miso,* or bean cheese [sic], used extensively for

© Copyright Soyinfo Center 2014

soup and in cookery in general; and of *topu* [sic, tofu], or bean curd, a cheap, highly nutritious and very popular article of diet. The residue from these manufactures is used both as fertilizer and as cattle food, or, alternatively, an oil of some value may be obtained from it. It is the principal summer crop of the upland fields, and its cultivation, which requires less fertilizer and less labour than other products, is general throughout Japan and particularly in Hokkaido. But the supply is far from equal to the demand, and a large quantity of beans and bean cake is imported from Chosen and Manchuria, the value of the present importation amounting to £3,000,000 annually.

"Among other beans the small red bean is largely cultivated, especially in Hokkaido, and is used for cakes and confectionery, and boiled with rice on occasions of ceremony. The Japanese are very fond of peas, horse-beans, and kidney-beans, which are grown as a stolen crop after rice in the paddies and just before it in the upland fields."

Page 269: "A comparison of the relative positions of human and animal labour in paddy fields and upland farms for the years 1903 and 1908 (the latest year for which figures are available) shows that the area tilled exclusively by human labour still forms a very large proportion of the total, though it tends steadily to decrease." "Manual labour is plentiful and it is chiefly by reason of its abundance that the intensive system can be carried on. Rice-growing requires, for instance, the labour of 17 men and 9 women per *cho* (2.45 acres), barley and wheat 11 men and 6 women, tobacco 25 men and 23 women, soya bean 7 men and 5 women, and so on. Farmers, in the vast majority of cases, are their own labourers, and those who may be distinguished as 'professional labourers' are a very small class."

Page 292: Sea-weeds: "Chief among the sea-weeds used as food is that known as 'Kombu' (*Laminaria*). It grows mostly on the shores of Hokkaido and the south-east of Honshiu [Honshu], and is eaten sliced into very thin shreds. 'Kanten' is made by dissolving the weed Tengusa in water and exposing the resulting gelatinous infusion to the action of cold by night and the sun by day. Only the Chinese use it as food, however; in the West it is a substitute for gelatine, isinglass, starch, and the like. Other sea-weeds are used as paste." Address: Queen Anne's Mansions, London, England.

1768. Takenob, Y. 1915. Japan Year Book. Tokyo: Japan Year Book Office. 789 p. See p. 349, 391, 401-02, 436, 634, 714, 716-17, 730, 743. Tenth annual issue. [Eng]

• ***Summary:*** This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa.

The population of Japan Proper (based on the census taken every 5 years) was:

1898–45.4 million.
1903–48.5 million.
1908–51.7 million.

A table of "Weights, measures and moneys" is on p. xxxii (near the front).

Page 349. In the chapter on "Agriculture," a table shows production of soy beans, sweet potatoes, and potatoes, 1911-1913 (in 1,000 koku). Production of soy beans decreased from:

3.69 million *koku* in 1911, to
3.51 million *koku* in 1912, to
2.99 million *koku* in 1913.

Note: The decrease of soy bean production in Japan during this period was due mainly to imports of soy beans from Manchuria and Korea (see below).

The text below the table states: "Among subsidiary farm crops there is perhaps nothing which plays so important a part in the Japanese kitchen as soy beans. The three daily articles of diet for all classes, viz. *soy, miso,* and *tofu* are manufactured with this bean either in part or wholly, The tofu (bean curd) is one of the most popular articles of diet, being cheap and highly nutritious; the miso makes Japanese soup and is used in various other ways. The soy is indispensable in Japanese cooking. Then for extracting oils, as manure, and food for horses, beans are equally important. The supply being insufficient, quite a large quantity comes in from Manchuria and Korea. In Japan Hokkaido is the principal centre of production. Red beans [azuki], also very extensively produced in the northern island, are used for making confectionery, are boiled with rice on ceremonious occasions, and for other purposes. Peas and horse-beans, whether green or fully ripe, are favorite food-stuffs in Japan, and they are extensively cultivated as a second crop after rice and as a forerunner to rice, indigo, etc. on upland farms. Groundnuts are among a few subsidiary farm produce that go abroad, mostly to U.S.A. In Japan they are used by confectioners and also for pressing oil..."

Pages 390-91. A table titled "Industrial companies classified by amount of investment" states for "Soy and miso." Number of companies: 251. Paid up capital: 5.9 million yen. Reserves: 580,000 yen.

Page 401-02. In the chapter on "Industry" under "Brewing industry" we read: "The brewing industry in Japan comprises sake, beer and soy, for wine is still insignificant and as yet enjoying the benefit of non-taxation, The two indigenous industries of sake and soy are still primitive in process, and various new methods, several of them patented, have so far failed, especially as regards soy.

Page 402. "Soy.–For soy the prefecture of Chiba, which is contiguous to Tokyo municipality, heads all other places on the list as to output. Parched wheat mixed with salt beans is a principal ingredient. The process is still far from scientific, requiring about 12 months before the liquid is ready for sale. It is also costly, as it does not much admit labor-saving appliances. To obviate these advantages have been tried several patented processes, but most of them have failed. The collapse of the short-lived Nippon Soy Co., started in 1907 near Osaka with 2,500,000 yen paid up, has

© Copyright Soyinfo Center 2014

dampened the cause of scientific process of soy brewing."

A table shows annual production of sake, beer, and soy (in koku) from 1912-13 to 1914-15 (three years). Note: Since all three of these are taxed by the federal government, careful records are kept. Sake averaged 4.32 million *koku* (the largest output). Soy averaged 2.37 million *koku* (roughly half of sake). Beer averaged about 0.219 million *koku* (by far the smallest).

A 2nd table gives exports of these three products during the same years. Sake averaged 3.61 million *sho* (100 *sho* = 1 *koku* = 47.6 gallons). Soy averaged 3.15 million *sho.* Beer exports (in 1914) were by far the smallest: 117,000 pints, 377,000 quarts, and 22,000 casks of 1 *sho* each. Note: "Beer brewing first started about 1876 in Hokkaido. The brewing was at first under the tutelage of German experts... At present there are four or five breweries, the Dai Nippon, Kirin, and Kabuto."

Page 465. A table titled "Prices of commodities in Japan" (1911-1913) includes the following for 1913:

Rice 21.01 yen per koku.
Barley 7.93 yen per koku.
Soja beans 11.54 yen per koku.
Red bean [azuki] 16.02 yen per koku.
Soy [sauce] 23.85 yen per koku.
Miso 0.37 yen per kwan [kan; 1 kwan = 3.75 kg].

Page 518. A table titled "Carrying trade on main routes" shows that China was exporting a lot of Soja beans and [soja] bean can to Japan. China (including Manchuria) had exports to Japan worth 142.3 million yen and imports from Japan worth 80.5 million yen.

Page 634. In the chapter on "Finance" under "6. Tax on Japanese soy" we read: "The tax is assessed both on the soy manufactured for sale and on that for home consumption. In the former the tax is yen 1.75 [per koku] for refined soy and yen 1.65 for the unrefined soy and in the latter it ranges between the two extremes of yen 4.00 and yen 0.50 according to quality.

Page 714. In chapter 35, "Chosen (Korea)," under the heading Foreign Trade," is a table on "Staple exports" (in 1,000 yen) which has data on "Beans and peas" for 1910-1914.

Page 717. In the chapter on "Chosen (Korea): Agriculture," under "Barley and Soja Bean" it is stated that "Soja and other beans are exported chiefly to Japan for manufacturing soy [sauce]. Acreage of soja beans in Korea is 553,077 *cho* and the yield 3,345,472 *koku.*" Note: 1 *cho* = 2.45 acres and 1 *koku* = 47.6 gallons or about 6 gallons. Thus, in English units, in Korea 1,355,039 acres produce 20,072,832 bushels, for a yield of 14.8 bu/acre.

Note: This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for Korea (which has been a "province" of Japan since 1910).

Note: Japan was importing a lot of soybeans from its colony, Korea, in 1912. Korea had exports to Japan worth 20.9 million yen and imports from Japan worth 27.1 million yen (p. 518).

Page 730. In Chapter 36, "Taiwan (Formosa)," under the heading "Agriculture," a table (p. 730) titled "Agricultural products" has production data on "Beans and peas" for 1912-1913. The beans were probably mostly soy beans.

102,000 *koku* in 1912
137,000 *koku* in 1913

In Chapter 38, "South Manchuria," is a paragraph (p. 743) titled "The soya bean" which has information on South Manchuria's soya bean yield, [soya] bean-cake output, amount exported for specific years, and production at various milling centres (almost same wording as 1914 Year Book). Address: Japan.

1769. Woll, Fritz Wilhelm. 1915. Productive feeding of farm animals. Philadelphia, Pennsylvania: J.B. Lippincott Co. xi + 362 p. Illust. (96 in text). Index. 22 cm. Series: Lippincott's Farm Manuals. [10 ref]

• ***Summary:*** Soybeans are mentioned on pages ix, 9, 11, 12, 68, 90, 96, 114, 125, 127, 157, 161, 175, 176, 202, 221, 275, 308, 327, 332, 337, 339, 340-43, 349, 350-52, 361.

Chapter 1, "The composition of feeding stuffs," contains a section on "Classification of proteins" which states (p. 9): "Protein substances are generally classified as (1) simple, (2) conjugated, and (3) derived proteins... *b. Globulins* are insoluble in water, but soluble in a 10 per cent sodium chloride solution. The globulins are abundant in plant materials and have been identified in many seeds of plants. The following are present in the cereals and other common seeds: Maysin in corn kernels, edestin in corn, wheat, cotton seed, hemp and flaxseed, avenalin in oats, legumin and vicilin in leguminous seeds (peas, lentils, horse beans), glycin in soybeans, and conglutin in lupines."

Page 11: Concentrates (p. 11): "Peanut cake meal, containing about 48 per cent protein; cotton-seed meal and soybean meal, 40 to 45 per cent; gluten meal, 34 to 36 per cent; soybeans and linseed meal, 34 to 36 per cent; dried distillers' grains, 32 per cent; malt sprouts and dried brewers' grains, 26 per cent."

"Fats are organic compounds consisting largely of mixtures of fatty acids, combined with glycerine (so-called glycerides). The more common fats are stearin, palmitin, and olein... Lineoleic [sic, Linoleic] and linolenic acids are also found in the seeds of some plants, like flaxseed and soybeans; on exposure to the air in a thin layer, they take up oxygen and 'set,' i.e., they dry and harden. This difference in the behavior on exposure to the air is characteristic of drying and non-drying oils.

A bar chart titled "Fats in common feeding stuffs, in per cent," based on the ether extract of these foods, shows: Flaxseed 34%. Soybeans 17%. Dried distillers' grains 12%. Cotton-seed meal 10%. Linseed meal 8%.

A section on "The siloing process" states (p. 68): "From

© Copyright Soyinfo Center 2014

what has already been said, we should not expect that the siloing process will appreciably affect the digestibility of feeding stuffs, since the heat generated in the silo fermentation will rarely exceed 60º C. (140º F.). The following average digestion coefficients for three kinds of silage will show the influence of the siloing process as regards digestibility:" Included in the table are soybeans and soybean silage. The coefficient for the dry matter of both is 67%.

Part II, "Description of feeding stuffs" begins with "Coarse feeds." Chapter 12, "Green forage and hay crops," begins with a section on "Pastures" which notes that in the Cotton Belt, the main grasses and clovers are "Cowpeas, Johnson grass, soybeans, Bermuda grass, crab grass, Japan and crimson clover."

The section on "Soiling crops" notes (p. 96): "Among crops that have proved satisfactory soiling crops may be mentioned: Indian corn, alfalfa, clover, vetch, sorghum, peas, oats, winter grains (cut before blooming), soybeans, cowpeas, rape, millet, etc."

The section on "Hay from leguminous crops" states (p. 114): "The most important species of legumes adopted for feeding farm animals are clover (red, mammoth, alsike {pronounced AL-sak}, white, crimson, Japan), cowpea, soybean (Fig. 15) vetch, pea, bean, beggar weed, and peanut." A brief description is given of each in the following pages.

"Soybean (*Glycine hispida,* Fig. 21) is of greater importance for seed production than for forage purposes, except in the South, where its value as a forage plant, for feeding green, as hay or as silage, is about as great as for production of seed. It is grown for the sake of the seed throughout the United States about as far north as corn will mature. In the Gulf States it will usually yield six to ten tons of green forage or silage to the acre and one and one-half to three tons of hay. Soybean fodder is a high-protein feed that can be produced under practically the same conditions as can Indian corn. The composition of the soybean plant is quite similar to that of alfalfa, as will be seen from the following table." A gives the composition of the soybean plant in the forms of green fodder, hay, straw, silage, and seed, compared with "Alfalfa hay."

Chapter 15, "Silos and silage," says (p. 157): "The fact that corn silage is relatively low in protein has led to the suggestion that leguminous crops be placed in the silo with the corn. The most successful crops for this purpose are cowpeas or soybeans grown in the corn, both being cut for the silo at the same time. Cowpeas mature at about the same time as corn in the South, and furnish large yields of feed; they make a valuable mixed silage for southern stock farms. Soybeans may be successfully used for the same purpose and can be grown farther north; grown together with Indian corn, they make a good quality of silage that is considerably richer in protein than corn silage alone (p. 340)." Page 161: "Corn-soybean silage gave better results with dairy cows than straight soybean silage, in experiments by Professor Humphrey and the author at Wisconsin station (9)."

In chapter 16, "The concentrates," the section on "Leguminous and oil-bearing seeds" notes (p. 175): "The leguminous seeds, like peas and beans, soybeans and cowpeas, are valuable concentrated feeds, and their use for feeding farm animals is increasing every year, as farmers come to realize their value and appreciate that they can greatly reduce their feed bills by growing high-protein forage and grain crops on their farms. At the same time the fertilizer bills may be reduced, since these crops render available for plant use the free nitrogen of the air through symbiosis with certain soil bacteria, and leave the soil richer in this expensive fertilizer element than it was before the crop was grown thereon (p. 113). These grains have a high digestibility and contain two or three times as much digestible protein as the cereal grains." A table (p. 176) gives the chemical composition of four leguminous seeds: Canada field pea, horse bean, soybean, and cowpea.

The section on "Oil meals" states (p. 202): "Soybean meal is the ground residue obtained in the manufacture of soybean oil. The meal fed in this country is imported from either Japan, China, or Manchuria; so far as is known, none is manufactured here, although soybeans are now grown quite extensively in various sections of the United States. It is a valuable concentrate for farm stock, and is one of the richest nitrogenous feeds on the market, containing about as much protein and fat as cotton-seed meal (41.4 per cent and 7.2 per cent, respectively); it has a lower fiber content (5.3 per cent) and a higher digestibility than this meal. According to Kellner, only 3.4 per cent of the protein is present in amide form, and the protein has a digestibility of 97.7 per cent. The soybean meal is, therefore, a highly digestible feed, well adapted for feeding young stock, dairy cows, steers, and other farm animals. It is fed in this country almost entirely on the Pacific coast, where it is used largely for poultry feeding. It makes a good substitute for linseed meal, pound for pound, for dairy cows, and is one of the most promising concentrates available for stock feeding; the only objection to its use, so far as is known, is its cost, which is, as a rule, considerably above that of linseed meal or cotton-seed meal."

Chapter 21, "Calf feeding," says (p. 221): "Some feeds cannot, on the other hand, be used for calf feeding with skim milk, or must be fed with great care, for the reason that they tend to increase the danger of scouring; examples are cod-liver oil, molasses, soybeans, and oil meal."

Chapter 23, "Feeding beef cattle," states (p. 275): "Excellent forage crops, like alfalfa, cowpeas, velvet beans, sorghum, soybeans, etc., together with cotton-seed meal, are the main feeds which will enable southern farmers to raise and fatten beef cattle cheaply and which will lead to a gradual development of the cattle industry in the South."

Chapter 25, "Feeding swine" has a table (p. 308) titled

© Copyright Soyinfo Center 2014

"An approximate ration for pigs intended for breeding purposes" based on the elaborate system of Dietrich. The pounds of feed per 100 pounds live weight per day is based on the age of the pigs in months (2 to 8 months). Corn increases from 2.7 to 2.9. Soybeans (seed) from 0.4 to 0.7. Skim milk decreases from 6.0 to zero. Water varies in the range 4.4 to 9.2.

Illustrations: (15) A soybean nitrogen factory (p. 114). (21) A field of soybeans (p. 126). (32) Corn and soybeans grown for silage (p. 160).

1770. *Times* (*London*). 1916. The grain trade: A strong opening in wheat. Government intervention. Jan. 21. p. 15.
• ***Summary:*** The section titled "Minor crops" notes that beans and peas are now [during World War I] quite expensive, and the imported kinds even more so. The price per qr. [quarter of a hundredweight, or 28 lb] is: "53*s.* for Indian chick peas, 48*s.* for Chinese and Manchurian [soy] beans, 105*s.* for Rangoon [Burma] haricot beans, and 47*s.* for Japanese soya beans. The last named are a good bargain, but the trade is a very wholesale one, and sellers expect the buyer as a rule to take not less than a ton, for which 10 guineas is the price, ex London warehouse." Address: [London].

1771. Puig y Nattino, Juan. 1916. El cultivo de la soya [The cultivation of soybeans]. *Revista del Ministerio de Industrias* (*Montevideo, Uruguay*) 4(19):78-91. Jan. [7 ref. Spa]
• ***Summary:*** Describes variety trials conducted in Uruguay using seeds supplied by the USDA. The varieties harvested in March 1915 included Peking, Arlington, Pinsu [Pingsu], Jaba, and Mammoth. A table (p. 79) shows that the yields of seed were very small, but that Mammoth gave by far the largest seed yield, 320 kg/ha. Discusses the many ways that soybeans (*las habas de soya*) are used as food in Japan, including soy sauce (*Shoryu* [*sic, shoyu*]), cooked whole soybeans, tofu or soybean cheese (*Tofú ó Queso de habas de Soya*), and soymilk. They used Mammoth variety soybeans, grown in Uruguay, to make soymilk. Seven tables (p. 84-90) give the nutritional composition of five different soybean varieties tested in Uruguay, planted in 1914 or 1915. An 8th table (p. 91) gives the nutritional composition of soymilk.

Note 1. This is the earliest document seen (May 2009) concerning soybeans in Uruguay, or the cultivation of soybeans in Uruguay.

Note 2. This journal is published in Uruguay by the *Ministerio de Industrias y Trabajo.*

Note 3. This is the earliest Spanish-language document seen (April 2013) that uses the word *Tofú* or the term *Queso de habas de Soya* to refer to tofu. Address: Ing. Agrón., Director del Laboratorio Agronómico en la Inspección Nacional de Ganaderia y Agricultura.

1772. *San Francisco Chronicle.* 1916. From coast ports. Feb. 1. p. 17.
• ***Summary:*** "Seattle. Special dispatch to The Chronicle... January 31..." "The Japanese freighter *Kumi Maru,* under charter of Osaka Shôsen Kaisha, after a stormy voyage of twenty-one days from Kobe [Japan], via Hakodate, arrived at 2 P.M. with 4,666 tons of cargo, consisting of [soy] bean-oil cake, matting, bamboo goods and toys. She will load at Tacoma and Vancouver, B.C."

1773. Davis, John K. 1916. Foreign bean production and trade: Manchuria–Antung export statistics. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 19(42):694-705. Feb. 19. See p. 703-04.
• ***Summary:*** "It is impossible to secure estimates of the acreage of beans in this district that sufficiently approximate accuracy to be worth recording. The only available figures from which estimates can be made are the customs statistics of the total exports of beans of all kinds from this port, which of course include soya as well as purely edible beans."

A table shows direct exports of beans from Antung directly to foreign countries from 1912 to 1914. Only soya beans and "red beans" [azuki] are exported in large amounts. For "Yellow (soya)" beans: 4,899,866 pounds in 1912. 8,404,533 pounds in 1913. 21,025,4666 pounds in 1914. Clearly a huge increase. For "Red" [azuki] beans. 4,175,600 pounds in 1912. 4,647,200 pounds in 1913. 3,344,533 pounds in 1914. A decrease.

"While there are no figures showing exactly the destination of the beans exported from Antung it is commonly known that the larger part of the edible as well as the soya beans exported is sent to Japan and Korea (Chosen)." Address: Consul, Antung, China.

1774. Latham, F.P. 1916. Soy beans as a cereal: Soy beans a great crop for southern farmer. *Progressive Farmer* 31(8):254-55. Feb. 19. See also p. 286 (Feb. 26) and p. 342 (March 4).
• ***Summary:*** "The first mention of the soy bean in this country was in the early part of the 19th century; however, it attracted little attention prior to 1854, when 2 varieties were brought to this country from Japan by the Perry expedition. It followed that other varieties were found and introduced, among them that 'old standard,' the Mammoth Yellow, which came to our shores sometime previous to 1882. The success with Mammoth furnished an encouraging lead to our diligent research workers, resulting in the importation into this country by the Department of Agriculture of some 800 distinct varieties."

As a cereal, it is widely produced in Japan, China,

Korea, and Manchuria. "By certain processing of the ground beans a milk is extracted which is not such a poor substitute for the real article; from this a cheese [tofu] is made that resembles in texture and nutrient value, our cottage cheese. Another product is a heavy, rich sauce [miso], similar to our peanut butter, which is consumed in large quantities. Soys occupy the place in the diet of these people that navy and lima beans do in our own, and are prepared in a like manner. They furnish the brown man his 'peanut.' By the simple process of soaking in salt water, then roasting they at once become a close competitor of the famous American delicacy."

"So far as I have been able to ascertain there is but one mill in the United States built for and operating exclusively on soy beans. The Pacific Oil mills, of Seattle, Washington, have build up a lucrative business in this line and only get foreign beans for crushing, its output of both oil and meal meeting a ready demand in the West. That such can be done profitably in the South is no longer a question. The fact has already been demonstrated by several cotton oil mills in eastern North Carolina... If these satisfactory results can be obtained in mills not constructed for the purpose of handling beans, it is entirely reasonable to suppose that specially constructed machinery will in time be installed that will further enhance the profits accruing from such operations."

A portrait photo shows F.P. Latham.

Note 1. This is the earliest document seen (Aug. 2011) that mentions Pacific Oil Mills of Seattle, Washington.

Note 2. This is the earliest of many articles seen (Aug. 2011) that likens tofu to cottage cheese, or roasted soybeans to peanuts. Address: Belhaven, North Carolina.

1775. Moser, Charles K. 1916. Foreign bean production and trade: Manchuria–Varieties of beans in north Manchuria–Exports and prices. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 19(42):694-705. Feb. 19. See p. 703.

• ***Summary:*** "Two different classes of edible beans are cultivated in northern Manchuria, viz, Siao-tou [*xiaodou,* azuki beans] and Leu-tou [*lüdou,* mung beans]. The Siao-tou, which means small beans, are divided into the following three kinds: Red beans, which are considered to be the best in quality; white beans; and mixed beans, which may have red, black, white, marble, and other colors mixed together. All these beans are used for food. The second class of beans, the Leu-tou, which means green beans, are used principally in the manufacture of vermicelli and starch.

"In northern Manchuria edible beans are not grown in such quantities as the soya bean, on account of the small demand for export purposes, but large quantities are grown for native use, and the majority of Chinese farmers plant them as a regular crop. It is not possible to secure figures of the extent to which they are actually cultivated."

"The Siao-tou [azuki beans] beans are exported principally to Japan and the Leu-tou [mung beans] to the interior cities of China." Address: Consul, Harbin, China.

1776. Scidmore, George H. 1916. Foreign bean production and trade: Japan. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 19(42):694-705. Feb. 19. See p. 700-01.

• ***Summary:*** Tables show: (1) Four major varieties of beans grown in Japan in 1911-1913 based on statistics published by Japan's Department of Agriculture and Commerce. For "Daidzu (soya bean)." In 1911–1,198,919 acres and 18,318,236 bushels. In 1912–1,165,401 acres and 17,416,861 bushels. In 1913–1,164,445 acres and 14,865,751 bushels. Thus, both soya bean acreage and production are decreasing. For "Azuki, small bean (*Phaseolus radiatus*)." In 1911–345,682 acres and 4,740,262 bushels. In 1912–334,920 acres and 4,697,839 bushels. In 1911–345,442 acres and 2,976,388 bushels. Thus, azuki bean acreage is static while production is declining. Statistics are also given for "Endo mame (pea)" and "Sora mame, broad bean (*Vicia faba*)."

(2) Exports and imports of beans in 1914 based on customs returns: Exports–Soya beans: 972,615 pounds valued at $22,333. Imports–Soya beans: 332,625,247 pounds valued at $5,079,787. "Of the soya-bean exports in 1914, more than one-half went to the United States, British America, and Hawaii; the imports nearly all came from China." Address: Consul General, Yokohama [Japan].

1777. Williamson, Adolph A. 1916. Foreign bean production and trade: Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 19(42):694-705. Feb. 19. See p. 701-02.

• ***Summary:*** Many kinds of beans are grown in Manchuria. The soya bean is not one of the four "edible" beans that are well known in America. "No crop statistics are prepared by the Chinese and even the acreage of soya bean plantings is never well known. The nonedible oil-producing soya bean is planted on a large scale, whereas edible beans are planted by the Chinese farmers for their own use only, as a rule..." "Beans are sold here by the Japanese picul of 132.277 pounds."

The climatic and other conditions of northern and southern Manchuria are well suited to bean culture, as is shown by their general production everywhere and by the soya-bean crops. It is possible that the soya bean, which has not yet been shown to be a profitable crop and business to all concerned, will in a few years be replaced by other kinds of beans..."

"Beans do not figure in the statistics of trade, and information about them is hard to obtain. The Japanese do not seem to know anything about them. The only edible

© Copyright Soyinfo Center 2014

beans about which Japanese seem to have information are what they call 'mungo beans,' several varieties of which (red, white, red and white) are sold locally." Some Mungo beans are known at Dairen as 'azuki.'" Address: Consul, Dairen [Manchuria].

1778. Suzuki, Tozaburo. 1916. Process of making foods. *U.S. Patent* 1,175,839. March 14. 1 p. Application filed 2 Sept. 1913.
• ***Summary:*** In the process of making soymilk, after boiling, a centrifugal machine is used to removed the lees [okara, or pulp]. Then the milky liquid [soymilk] is condensed by evaporation into a dough-like mass, which is placed on flat trays, fully dried, then powdered or molded into any desired forms.

Note: The author, a citizen of Japan, was also an inventor and innovator in the manufacture of soy sauce. Address: No. 401, Jineishinden, Sunamura, Minami-Katsushika, Japan.

1779. Ishikawa, Tatsutaro. 1916. Taishô yonen-chû kenka ni hasseiseru shuyô byôchû-gai [Principal insect pests and diseases occurring during the fourth year of Taisho]. *Byochu-gai Zasshi* (*J. of Plant Protection, Tokyo*) 3(3):196-200. March. See p. 197. [Jap]
• ***Summary:*** Section II (p. 197) is titled "Occurrence of 'moon night' and wilt disease of soybean." Moon night disease is probably soybean cyst nematode. Katsufuji (1919) stated that in March 1916 Ishikawa reported that "soy bean at Shomengahara, Echigo Prov., in Honshu, Japan, was attacked by Nectaria, a larva of beetle and nematode." Address: Niigata-ken Nôji Shikenjô, Japan.

1780. *J. of the Board of Agriculture* (*London*). 1916. The soya bean. 22(12):1286-87. March. Summarized in the Bulletin of the Imperial Institute. 1916. 14:293-95. [1 ref]
• ***Summary:*** "Experiments with soya bean cake tend to show that, when fed in moderation, it is a useful feeding stuff; otherwise it is apt to prove distinctly laxative. For this reason it is usually given along with undecorticated cotton cake. At present prices it is one of the cheapest feeding stuffs on the market. (See also p. 1277 of this *Journal*)." In 1912, some 188,760 tons of soya beans were imported to England, worth £1,567,960. Imports were 76,452 tons in 1913, then 71,161 tons in 1914, and 175,136 tons in 1915.

Discusses early attempts to grow soybeans in Great Britain. "Previous to 1909 a few attempts had been made to grow the crop in England, but without any success; at best, the plants grew up to flowering stage but formed no seed. About this time, with the object of securing the hardiest sorts in cultivation, the Board obtained from an experiment station in North Japan, seed of 16 varieties, together with a small quantity of soil in which the crop had been grown. These were sown at the Midland Agricultural and Dairy College and on the Cambridge University Farm. At both centres the results were similar–many of the varieties grew well, but none formed flowers. Where the Japanese soil had been applied the nodule formation was all that could be desired, but where no inoculation had taken place, no nodules were formed.

"In 1910 the Board obtained seed of several varieties from Manchuria. These were grown at the same centres as before. At the Midland College the crop grew vigorously, but formed no seed, while at Cambridge the plants ripened a small quantity of seed. This seed was sown in 1911, but the crop made little growth, and in spite of the hot season no seed was produced.

"These results prove conclusively that the Japanese and Manchurian varieties hitherto tested cannot be relied upon to produce seed in this country. As the plant appears to be a very variable one, however, it is not impossible that a variety suited to conditions in this country may yet be produced.

"In some experiments at Wye College, Kent, with seed supplied by the Macdonald College, Quebec [Canada], well-filled pods were produced in 1910, from a variety known as "Early Tennessee," when the soil was inoculated.

"Apart from seed production the plant might have some value in this country as a forage crop. It appears to resist drought well, and is largely grown in the United States for green fodder, which appears to be liked by all classes of farm stock. In general composition the green plant resembles clover." Address: London, England.

• ***Summary:*** "The general value of the soya bean has not attracted the general attention it deserves, according to experts who are bringing it to the attention of the American

© Copyright Soyinfo Center 2014

people. The Japan Society Trade Bulletin points out that the secret of the soya bean is its universal usefulness. Almost more remarkable than the rise of the bean trade itself is the number of discoveries of the uses to which it can be put. The trades commissioner for the government of South Africa gave the following list of soya bean products: Vegetable (like marrowfat peas) soups, meat substitute, chocolate substitute, macaroni preparation, flour, artificial milk, coffee substitute, cheese [tofu], biscuits, [soy] sauce, meal for cattle, oil, oilcake, fertilizer, beancake.

"The oil extracted from the soya bean, he pointed out, was used in the manufacture of the following articles: Dynamite and high explosives, soaps, linoleum, rubber substitute, margarine, paints and varnishes, toilet powder, waterproof cloth, paper umbrellas and lanterns, salad oil, lubricating oil, lamp oil, preserving sardines, lard substitute."

1785. *San Francisco Chronicle.* 1916. A British view of the yellow peril. April 30. p. 26.
• ***Summary:*** The author of this article is given as "O.B. Server." "If the people who are senselessly alarming themselves over the possibility of a war with Japan would take the trouble to read a very comprehensive account of the progress and rise of the Japanese empire, by Robert P. Porter [1915], their apprehensions would probably be allayed."

"As Porter points out, the backbone of Japan's industrial system is agriculture... Modern methods of tillage are almost unknown... This result represents a degree of intensive farming unmatched except in China. Japan is a land of small farms. Only three farmers in a hundred cultivate as much as 8 acres each, and 70 percent of the farms do not exceed two and a half acres each. Manual labor is so abundant that for rice growing seventeen men and nine women are spared for cultivating and harvesting 2.45 acres;... and the soya bean, the cheapest of all Japanese agricultural products, seven men and five women. Wages, as may be imagined, are low, ten yen (about $5) a year being the prevailing rate in many sections."

Note: The phrase "yellow peril" was common in the U.S. newspapers (such as the rival *San Francisco Examiner*) owned by William Randolph Hearst.

1786. Beille, L. 1916. Le Soja [Soya]. *Gazette Hebdomadaire des Sciences Medicales de Bordeaux* 37(9):67-70. May 7; 37(10):73-76. May 21. [4 ref. Fre]
• ***Summary:*** "The question of the soybean (*haricot Soya or Soja*) reappears in our scientific and medical journals from time to time; the importance that this grain has acquired in the diet of the essentially vegetarian peoples of the Far East, and its richness in oil, albuminous materials, and minerals, have long called it to the attention of hygienists. Some authors have wanted to portray the soybean as an ideal food, a little jewel with a nutritive power comparable to that of eggs and meat; others have extolled the milk-like emulsion, obtained by grinding soybeans with water, as an advantageous substitute for cow's milk.

A factory, established on the outskirts of Paris, at Vallées (Seine), was able to supply French consumers with flour, cheeses [tofu], sauces, and many other soy-based preparations used in China and Japan.

"Leaving aside the inevitable exaggerations that accompany a product which is new to us, but which already has an established reputation elsewhere, it is necessary to recognize that the chemical composition of the soybean is of real interest. The Parisian clientele promptly abandoned the sauces, cheeses, and milk made from soya, but they appreciated the sprouts, which are still selling well as vegetables in the markets of Paris and its suburbs; soy-based flour and biscuits are very well adapted for use in diabetic diets."

The author then gives an overview of the soybeans from a medical viewpoint, including a brief history and review of worldwide production and nutritional studies. "In 1779 this plant was introduced to France and cultivated in Paris at the Jardin du Roi. Since that period, despite the laudable efforts of the National Society for Acclimatization, the cultivation of the soybean has not gone beyond botanical gardens and some experimental fields. Nor has it had any more success in England or Italy. However in North America it is cultivated in all the southern parts of the United States, but as a forage plant."

Through the merchant and importer Mr. A. Denis of Bordeaux, the author obtained two varieties of soybeans, one from Manchuria and one from Japan. He conducted a nutritional and microscopic analysis of these.

The author concludes that the soybean has great potential as both a food and an in industrial uses, where the precipitated protein for example, can be used in place of milk casein to make Galalith, artificial ivory, glue, and paper coating.

Part II of this article discusses more about the general nutritional value of soybeans. He then discusses soy flour (*farine de soja;* he has a sample produced by the factory at Valées), soy milk (*lait de soja*), tofu (*fromage de soja*), shoyu and various soy-based sauces (such as *Tao-Tjung* of China, or *Touong* of Indo China).

"In summary the soybean is of great interest from the industrial point of view. The place that it occupies in the oil mills of Europe is already important... Its oil, for food or industrial uses, and its by-product, soy casein, are likely to receive a host of diverse applications. On the other hand, the future of the soybean as a food substance in Europe would seem to be more modest: its disagreeable taste removes it from daily consumption and enables it to be used only as an ingredient in mixtures."

"If, in Europe, with a few reservations, we can include soya in the diet of healthy people, then there will be even stronger reasons to give it to sick people. At first glance

© Copyright Soyinfo Center 2014

soya, which is rich in fats and protein, with little or no carbohydrates, appears to be a food of choice for diabetics. And we must recognize that it has attained the greatest success among these sick people. But, here again, it would be appropriate to give soya in the form of rusks/zwieback (*biscottes*), or mixed with vegetables or fruits; if it is not tolerated by sick people in these forms, then we should not hesitate to stop using it." Note: In Europe, rusks are widely given to sick people, like chicken soup in the USA. Both are considered to be good medicinal foods that are easy to digest. Address: Professeur â la Faculté de médecine et de pharmacie de Bordeaux.

1787. *Washington Post.* 1916. Admiral Togo, 'Nelson of Nippon,' 'simple life' model, servants say. May 21. p. ES14.
• ***Summary:*** Admiral Togo, the victor of Tsu Shima, has never been interviewed and he never speaks about himself. Note: Tsushima Strait was the site of a naval battle in May 1905 in the Russo-Japanese War in which the Russian fleet was destroyed or captured by the Japanese fleet under Admiral Togô Heihachiro.

So the *Katei Zasshi,* a popular monthly magazine, sent reporters to "interview the count's butcher and baker and candlestick maker, his barber and fishmonger and man at the corner." By paying attention to his monthly housekeeping bills, they were able to conclude that the hero led a simple, frugal life–which all the tradespeople sincerely admired.

The man at the sake (spirits) shop said: "I get no orders for sacke [saké] nowadays and only send in some soy (sauce) and miso (a curd [sic] made from beans and eaten for breakfast) of the commonest quality, occasionally."

1789. Nemzek, L.P. 1916. The soya bean and soya oil. *Paint Manufacturers' Association of the U.S., Educational Bureau, Scientific Section, Circular* No. 37. 8 p. June 10. [1 ref]
• ***Summary:*** This address was presented on May 18, 1916 (during World War I) at the meeting of the Mississippi Cotton Seed Crushers' Association, New Orleans, Louisiana. Accompanied by three exhibits, it states: "As early as 1907 the Bureau interested itself in a campaign to promote the increased production of flaxseed in the United States. The rapidly increasing demand for linseed oil, by the industries in this country, indicated that we should soon face a shortage of his commodity. It remained for the 1910 flaxseed crop failure to demonstrate what a menace to the pain trade such a shortage meant. Due almost entirely to the resultant scarcity of linseed oil, the price commenced to soar during the latter part of 1910. Linseed oil reached the high price of $1.00 per gallon during 1911 and high prices prevailed throughout most of the year 1912. This condition forcibly showed the necessity for a more profound investigation of oils which might find application as substitutes for linseed in the different industries which use the oil in large quantities. In view of the fact that the work which was done toward promoting an increased production of flaxseed had been so marvelously effective, it was decided to do work of similar magnitude with miscellaneous oils."

"A series of practical paint exposure tests were begun on test fences located at Washington, D.C., in connection with the Institute of Industrial Research. The paints were exposed in May, 1911. The repainting tests were made during the latter part of 1914. This series of tests is referred to in Circular No. 30, 'Repainting Tests on Paint Oils,' issued by the Educational Bureau during December, 1914.

"Soya oil was one of the oils decided upon for the experiments largely because it was already available in quantities and could readily be imported. After looking into the matter it was found that the production of it might be developed on a satisfactory basis in this country. Soya beans were already being grown in considerable quantities, but up to that time domestic oil on a commercial scale had not been produced.

"Soya oil is crushed from the bean bearing that name. The bean is commonly referred to by the agriculturists in this country as 'Soy,' but the oil, ever since it was first imported, has been known as 'Soya Bean Oil' or 'Soya Oil.' Largely for the sake of convenience the title 'Soya Oil' has been adopted and is coming into general use. The title 'Soya' was, very likely, introduced from Manchuria, where the bean is grown in enormous quantities, and is a derivation from the Japanese 'Shoyu' or 'Soja.' 'Soya' is replacing 'Soy' when used in reference to the bean as such, even in the language of the agriculturist, and it is only a question of time when the word 'Soya' will be adopted generally."

"The first step in connection with the Bureau's endeavor consisted of the importation of soya beans from Manchuria for oil-extraction tests and the distribution of this seed, together with seed from a number of varieties already grown in this country, and the soliciting of the assistance of the State Agricultural Experiment Stations and other interested persons to urge the farmer to grow more soya beans for seed. While soya beans had been grown in this country for a good many years, this was done as a forage crop and for fertilization purposes. Only enough seed was being harvested to take care of the succeeding year's planting. The far-reaching propaganda, through the active co-operation of the State Agricultural Experiment Stations and the different Bureaus of the U.S. Department of Agriculture, was solely for the purpose of inducing the farmer to increase his population."

The Bureau reached farmers through the State Agricultural Experiment Stations. "While growing tests

© Copyright Soyinfo Center 2014

during 1911 and 1912 were limited to North Dakota, Minnesota, Missouri, New Jersey and Kentucky, they were extended in 1913 to every State, with the exception of a few where conditions are unfavorable from an agricultural standpoint.

"The tests were also extended to the Philippine Islands and to several places in Canada. It is noteworthy in this connection that there are at least two varieties which can be successfully matured as far north as the southern portions of Quebec.

"During 1912, forty-eight varieties were experimented with, including four imported from Manchuria. This number was greatly increased in 1913, so that all available types would be included."

By 1916 the number of varieties had been reduced to about fifteen (see Exhibit No. 1), which were already popular: "Mammoth, Medium Yellow, Ito San, Holly Brooks [Hollybrook], Haberlandt, Peking, Wilson, Auburn, Black Eye Brow [Black Eyebrow]. Arlington, Tokio, Mikado, Virginia, Chiquita, Sable and the Yellow Manchurian bean...

"No sooner were the farmers interested in the larger growth of soya beans than they began to ask for information as to how and where the beans could be disposed of to be converted into oil.

"It was soon evident that the cotton seed mills in the South were best situated for crushing the beans. The location of the hundreds of these mills is fortunate, inasmuch as the South is naturally adapted to become the great soya bean-producing section of the country. Definite plans have not been evolved in sections where the cotton seed mills are not located, but in the northern section of the country the linseed oil mills will, very likely, crush the beans as soon as the production is large enough to warrant their going into the matter. In some sections, notably Tennessee, it was suggested that the farmers in a certain locality club together and conduct their own mill, disposing of the oil in the regular manner, and each farmer to use the cake from his crop for feeding purposes. In this way there would be returned to the land the full fertilizing values of the crop. The promoters of successful agriculture see in this a means to increase the production of soya beans, mainly because of the value which the farmer obtains by the improvement of his soil.

"During August and September, 1913, I made a trip of nearly twenty-four thousand miles, visiting most of the Agricultural Experiment Stations, to discuss matters relating to the increased production of beans for oil-crushing purposes and to determine whether or not the cotton seed mills were in a position to handle the crop without materially altering the machinery they use for the crushing of cotton seed or going to the expense of installing new equipment. Most of my time was spent in the States growing cotton and where cotton seed mills were already established."

Also discusses the oil-bearing properties of different varieties of soya beans (the oil content averages 19% and ranges from 16 to 25%), and the drying properties (see Exhibit No. 2). "During the past six or seven months there has been produced in this country in the neighborhood of one hundred thousand gallons of soya oil. The largest part of this quantity has been produced by the Elizabeth City Oil & Fertilizer Co., Winterville Cotton Oil Co. and the New Bern Cotton Oil & Fertilizer Mills."

Discusses prices at which soybeans should be purchased for profit in the oil industry, and opportunities for disposing of the oil and meal. The author points out the limited uses of soy bean oil in paints; in 1916 some 98,171,275 lb of soy bean oil were imported into the United States. The five samples of soybeans analyzed had an average iodine number of 125.8. But iodine value and drying power do not necessarily go hand in hand, although such is often the case.

"In those sections of the South where the cotton fields are infested by the boil weevil, the growers may find it to their advantage to produce soya beans on a large scale. The Alabama Cotton Seed Crushers' Association has the matter under careful consideration at the present time. The cotton crop of certain sections of that State has been seriously affected by the disastrous results which accompany the boil weevil.

"It is at once apparent that it is to the advantage of the cotton seed mills to take up the crushing of soya beans. In the first place it will help to give the mills a longer season and thereby shorten the period of idleness. This period generally varies from four to six months every year with different mills.

"The crushing of soya oil has advantages over cotton seed; it is a cleaner and easier material to handle preparatory to crushing, and the bean releases its oil as freely, at least, as cotton seed.

"Soya oil can be disposed of just as readily, at least, as cotton seed. The A.M. Parks Company, Philadelphia, commencing with the May issue of 'The Oil Miller,' advertise for domestic soya oil. This is the first ad to appear, and opens up what is likely to prove the most satisfactory outlet for the product of so many mills... In some cases the consumers who could handle it in tank cars would be able to deal direct with the crushers. The A.M. Parks Company was one of the first to import soya oil, and still imports it in large quantities. Two or three years ago the Company distributed an interesting pamphlet entitled 'Soya,' in which the commercial possibilities of the oil are referred to in some detail."

"While practical tests started in 1911 have not yet been completed, and the Bureau, in line with its adopted policy, does not intend to make a definite report until the investigation has been finished, the writer feels safe in stating that large quantities of soya oil will eventually be consumed in the manufacture of paint and varnish. Because of the inferior drying properties of soya oil as compared with linseed oil it cannot entirely displace linseed, and its use in

© Copyright Soyinfo Center 2014

connection with linseed oil will be limited to from 25 to 50 per cent., depending on the product in which it is used."

Note 1. This is the earliest English-language document seen (Nov. 1999) with the term "soya oil" in the title.

Note 2. This is the earliest document seen (July 2013) that mentions the soybean variety Chiquita. Address: Special Technical Representative, Educational Bureau, Paint Manufacturers' Assoc. of the United States, Philadelphia, Pennsylvania.

1790. Kawakami, K.K. 1916. The people's safety valve (Letter to the editor). *San Francisco Chronicle.* July 17. p. 14.

• ***Summary:*** "The Chronicle disclaims responsibility for the utterances in this column."

"Japanese influence on the Asian continent has benefited and will continue to benefit American trade." For example, since the "inauguration of the Japanese regime in Korea," American exports to Korea have expanded dramatically. They increased 20 times in the decade from 1902 to 1913. "This is all the more remarkable considering that America buys practically nothing from Korea." In short, Japan did not slam closed Korea's doors.

The situation in Manchuria is somewhat different. "Though Manchuria, after Japan's advent there, bought a great deal of American rails, rolling stock, kerosene and flour, Japanese cotton goods have to a considerable extent replaced American cottons. This, however, is due mainly to the fact that Japan has been almost the sole buyer of Manchuria's premier product, beans, and their by-products, bean cake and bean oil, amounting in value to some $20,000,000. The secret of Japan's commercial success in Manchuria lies chiefly in the operation of the fundamental economic law that the country consuming the major portion of the exports of another country holds the most advantageous position in supplying its necessary imports." Address: San Francisco.

1791. Davis, John K. 1916. China: Antung. *Supplement to Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) No. 52c. p. 1-12. Aug. 16.

• ***Summary:*** The section titled "Increased exports of beans and bean products"(p. 9) states: "The value of the exports of [soya] beans, bean cake, and bean oil amounted to 24 per cent of the total value of exports from Antung, and showed an increase of 40 per cent in 1915, as compared with 1914. The increase in quantity in these exports is seen from the following figures: Beans exported in 1913, 15,233,200 pounds, and in 1915, 45,132,400 pounds; bean cake in 1913, 72,644,400 pounds, and in 1915, 100,509,200 pounds; bean oil in 1913, 384,133 pounds, and in 1915, 1,044,400 pounds.

"The increased exports in 1915 were due to the excellent crops of 1914, to the demand in Japan for bean cake as a fertilizer for the rice fields, and to the strong demand in South China ports for 'raw' beans."

The next section, titled "Several bean mills closed at end of year" (p. 9-10) begins: "In 1915 there were 11 small bean-oil mills, 10 Chinese and 1 Japanese, in operation in Antung, each of which employed 15 to 30 workmen. In these mills the oil is pressed from the soya bean and the residue is then made into large, round, flat cakes, which are exported to China ports and to Japan for use as cattle feed and as fertilizer.

"The bean-cake trade is highly speculative, since the market demand is contingent on two factors, the bean crop and the price of rice in Japan. When the bean crop is good and the price of rice in Japan is high, the owners of the bean mills are able to make large future contracts for bean cake to be used as fertilizer on Japanese rice fields. When, however, it is anticipated that the price of rice in Japan will be down, Japanese farmers do not feel warranted in the purchase of fertilizer and the market for bean cake becomes slack."

"Anticipating still further increases in price, holders of beans refused to sell, with the result that the last months of 1915 saw only a few of the local mills in operation." Address: Consul, Antung, Manchuria.

1792. Moser, Charles K. 1916. China: Harbin. *Supplement to Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) No. 52c. p. 32-43. Aug. 16.

• ***Summary:*** The section titled "Soya beans the leading export" (p. 40) notes that soya beans are by far the leading export from northern Manchuria. "From Nov. 1, 1914, to Nov. 1, 1915, the close of the beans season, the quantity exported amounted to 512,236 tons." The total annual production is about one millions tons. "The balance is retained by the growers and the local market for domestic purposes.

"Of the exports, 411,236 tons were sent through the ports of Vladivostok and Nikolaiefsk (via the Sungari and Amur Rivers), and 101,000 tons by way of Changchun and Dairen. The whole of the shipments through Changchun and Dairen went to Japan, as well as 209,236 tons of the beans shipped by way of Nikolaiefsk and Vladivostok. The remainder, 202,000 tons, went to England, Denmark, and the Netherlands. The striking feature of the year's trade was the great share taken by Japan as compared with former years, when Japan bought but a small share of the exports through Changchun and no part of the other shipments. But in 1915, on account of the extraordinarily high freight rates to Europe, Japan was able to buy the beans at a much cheaper rate than Europe and to resell them to considerable advantage."

The next section, titled "Bean prices and freights–Uncertain prospects" (p. 40-41) begins: "At the beginning of 1915 the bean business was almost paralyzed, owing to the closing of certain European markets, the congestion of the

© Copyright Soyinfo Center 2014

local railway lines with war materials, and the uncertainties of ocean freights. Prices dropped to the lowest level known in the local market, and a period of great deprivation threatened the Chinese population. Then conditions changed for the better."

The "outlook for 1916 is considered very uncertain in view of the high freights, the scarcity of transportation facilities, and the difficulty of securing sufficient labor to handle shipments."

Note: This is the earliest document see (Jan. 2009) that gives general information about the transportation of mature soybeans to market within a particular country or region. Address: Consul, Harbin, Manchuria.

1793. Williams, Adolph A.; Dickover, Erle R. 1916. China: Dairen. *Supplement to Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) No. 52c. p. 13-32. Aug. 16.

• ***Summary:*** Of the 77,153 inhabitants of Dairen, 55.0% are Chinese and 44.8% are Japanese. The remaining 0.2% are foreigners. Trading and shipping are now largely in the hands of Japanese and Chinese. "Dairen is a free port, and therefore the Japanese authorities keep no accurate record of imports and exports. But as it is also the principal seaport of southern Manchuria as well as of the Japanese Leased Territory, and is the southern terminus of the South Manchuria Railway, it is the entrance port and distributing center for a large share of the commodities going into and coming out from those parts of Manchuria lying outside the Leased Territory. Therefore the Chinese Maritime Customs maintain an office in Dairen, and it is from their returns that the accompanying tables of statistics were compiled."

"The decrease in exports to the United States [in 1914 and 1915], which was never large, was due to a depression in the bean and bean-oil trade during the early part of 1915." However, this trade has increased again (p. 15).

Although economic changes were brought about by the European War, the principal exports–"soya beans, bean oil, bean cake, corn, and coal"–still moved out steadily. A table (p. 20-21) shows the quantity and value of these commodities exported to foreign countries and to Chinese ports in both 1914 and 1915.

One section, titled "Soya-bean industry–The storage problem" (p. 27-28) begins: "The soya bean, which has been responsible for much of the prosperity of the port, sustained its reputation in 1915. In spite of loss of some European markets and the difficulties attending shipping to others, the volume of business was large and more beans were handled at this port than ever before." "At Dairen the storage capacity of the wharves was taxed to its uttermost, and could not contain the produce arriving in a ceaseless stream.

"While beans may be stored in the open, piled up in bags and covered with tarpaulins, or in temporary ozier [osier] bins, bean cake can not be stored, as its value depends largely upon its weight, which would be affected by snow or rain; hence bean cake must be stored under cover. The railway authorities warned the bean mill union that their output should be decreased or the cake would have to be stored in the open while awaiting shipment" (p. 28).

The next section, titled "Condition of bean market" (p. 28) begins: "The large crop of rice in Japan brought down the prices of beans so that the purchasing power of the farmer and the broker was severely weakened. The large supply of beans, the rise of freight rates to more than double the usage charge, the loss of certain markets in Europe, and difficulties connected with guaranteeing delivery into the hands of neutrals, all worked against beans, as did the low price of silver and the scarcity of containers, both for beans and for oil. Beans were shipped in larger quantities than heretofore to Java, which appears as almost a new market."

The next section, titled "Mixed storage of bean cake" (p. 29) begins: "During 1915 several plans for assisting the bean trade were brought up. The mixed storage of bean cake is now an accomplished fact, while the mixed storage of beans (not in bulk, but in bags) is accepted in principle. Produce exchanges were nearly arranged for at Kaiyuan and at Changchun by the end of the year and will be opened early in 1916. The South Manchurian Railway changed its standard carload of cake to 1,000 pieces, or about 30½ tons per car for a 30-ton car.

"There are three kinds of cake on the market–mixed storage cake, rejected cake, and train cake. The first named is the best, being standard at 46 kin (61 pounds) each, while the others may be several pounds or ounces over or under the standard. In 1915 so much cake was stored that the cakes came out considerably lighter than they went in. This loss was due to the evaporation of water absorbed in the process of manufacture... Mixed storage works to the advantage of owner, buyer, and railway by facilitating the financing of owners and the making of shipments, as well as the securing of sellers and buyers. The cake put out at Dairen is the best on the market." Address: 1. Consul; 2. Vice consul. Both: Dairen, Manchuria.

1794. Murakami, Kamekichi. 1916. Bean-curd and the process for making same. *U.S. Patent* 1,195,843. Aug. 22. 3 p. Application filed 11 March 1916. 5 drawings.

• ***Summary:*** The inventor, a citizen of Japan, describes the process and apparatus for making "bean cubes" from "beans known as the 'soy' bean, raised largely in Korea and Japan and to some extent in California." Illustrations (line drawings) show: (1) Two views of one of the cubes. (2) A vertical sectional view of the stone grinder or mill, in which the soaked beans are ground with water. (3) A similar view of a lever press for pressing the soymilk from the pulp. (4) A box in which the "bean jelly" is formed; it has drainage holes in the sides and bottom. (5) Detailed views of the bottom and

© Copyright Soyinfo Center 2014

one side of the forming box.

The ground beans are slowly poured into boiling water; the mass of bean paste is kept in a boiling condition for 15-20 minutes. During boiling a mixture of 3 parts slaked lime and 7 parts edible vegetable oil is added, causing the foam on the surface to sink. Salt water or nigari is used as the coagulant, and it is added in 4 steps.

Note: The person who wrote the final patent apparently had difficulty understanding the process Mr. Murakami was describing. He wrote "skins" instead of okara or pulp, and wrote "pulp" instead of soymilk. Address: Seattle, Washington.

Address: 1. Zeimu Kantoku Kyoku Gishi; 2. Zeimu Kantoku Kyoku Gishu.

1796. Cunningham, Edwin S. 1916. China's production of beans, bean oil, and bean cake. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 19(209):886-87. Sept. 6.
• ***Summary:*** "The soya or soy bean in recent years has become an important article of trade. It grows on a plant from 2 to 3 feet in height and is contained in pods about 2 inches long. The plant is cultivated everywhere, in fields by itself, around rice and similar crops, and as an undercrop to maize and sorghum. There are 25 to 50 varieties of the soya bean, but in commerce only 3 are ordinarily recognized–yellow, green, and black.

"The yellow bean, which is of greatest importance, is found generally throughout Manchuria, and it is reported that the finest crops come from the highlands to the north of Mukden. The green variety comes from the Liaotung district and the Yalu basin, and the black bean from Liaoyang and the south of Mukden. There are two other varieties, the brown bean and the mottled bean, which are grown to some extent in the Yangtze Valley, but these varieties are of little importance.

"Grown largely for its oil in Manchuria: The Soya bean is put to many uses in the Far East. It is cooked and eaten as a vegetable, made into a sauce or soy, preserved as a pickle, ground into a flour and made into vermicelli, and employed extensively in the manufacture of vinegar. One particular variety, having small yellow seeds, is used in making bean curd. In Manchuria, however, the soya bean is grown almost exclusively for its oil properties and for the residual material called bean cake.

"The soya bean contains about 18 per cent oil. When the hydraulic-press method is employed only 11 to 12 per cent of the oil can be extracted, but with the use of benzene in the chemical process 17 per cent is obtainable. This oil is used as an illuminant, a lubricant, for culinary purposes, and in the manufacture of soap. In southern China it is also used in the making of waterproof cloth, paper umbrellas and lanterns, and when mixed with lacquer is employed in the manufacture of varnish and printing ink.

"Dairen is the center for the bean-oil industry, exporting more than eight times as much as Hankow, its nearest competitor. The oil mills, which are to be found in every town throughout the bean district, are growing in numbers and becoming more modern all the time. The old crush-stone mills worked by animals are rapidly giving way to up-to-date hydraulic, steam, and oil-motor plants. Hankow has about 10 such mills. During 1914 the local exportation of bean oil was 4,714 tons, valued at $393,759 gold, and during 1915 there were 6,882 tons, valued at $482,694.

"Japan takes practically all bean cake exported: After the oil has been pressed from the bean, the residue is pressed into the round, flat cakes known as bean cake. The product is very valuable as a fodder for animals, and as a fertilizer... Japan takes practically all the bean cake exported, and the United States none.

"The greatest original exporting center for bean cake is Dairen; Newchwang is second, and Hankow a poor third..."
Address: Consul General, Hankow.

1797. Ohira, Chugo. 1916. The open door. *Los Angeles Times.* Sept. 8. p. II4.
• ***Summary:*** "In a country like Japan, with an ever-increasing population and yet with very limited resources, a policy that does not aim at industrial and commercial expansion is unthinkable... It is natural, therefore, that Japan is reaching out for markets in China, as elsewhere.

"Does this Japanese ambition come in conflict with the Hay doctrine, commonly known as the 'open door' policy? Does this Japanese policy menace American trade in China?"

Note: In Sept. 1899, U.S. Secretary of State John Hay issued his first Open Door notes advocating equal opportunity trade with China and equal taxation of foreign trade in all treaty ports, inside as well as outside the new 'spheres of influence.' By 1900 China's survival as a state seemed more dubious than ever. Hay's second note, a circular of July 1900, sought to preserve the integrity of China. Open Door became the established U.S. Policy toward China.

"It is unmanly, more than unjust, to quote as do certain critics the falling off of American trade in Manchuria as an instance of Japan's interference with the full and free course of commerce in that Japanese sphere of influence. The decrease, as was found by an American investigating committee sent over there, is not due to unfair methods employed by the Japanese but to the following reasons: the Japanese are practically the sole consumers for the soya bean–Manchuria's premier product–which gives Japan the

© Copyright Soyinfo Center 2014

most advantageous position to supply the necessary imports of Manchuria;..." Address: Editor, East and West News; Member of the Law School at Tokio Univ. [Japan].

• ***Summary:*** "In 1914, 464,889 *cho* (1,138,978 acres) were devoted to the cultivation of soy beans in Japan, and 130,003 cho (318,507 acres) to the cultivation of red beans [azuki]. No later figures of the extent of the acreage devoted to the cultivation of beans are available.

"Dairen, Manchuria, is the principal port of shipment of beans in the Orient." Address: Consul General, Yokohama, Japan.

1803. Piper, C.V.; Morse, W.J. 1916. The soy bean, with special reference to its utilization for oil, cake, and other products. *USDA Bulletin* No. 439. 20 p. Dec. 22. [9 ref]
• ***Summary:*** Contents: Introduction. Soy beans in Manchuria. Soy beans in Japan. Soy beans in Europe. Soy beans in the United States. Methods of oil extraction. Soy-bean meal as human food. Soy-bean meal as stock feed. Soy-bean meal as fertilizer. Uses of soy-bean oil. Analysis of important varieties of soy beans. Possibility of developing a manufacturing industry with American-grown soy beans.

"Analyses of important varieties of soy beans (p. 16-17):... In determining the range in the oil and protein contents of over 500 varieties grown in the variety tests at Arlington Farm, Virginia, the percentage of oil was found to range from 11.8 to 22.5 [Tokyo had 20.7% and Biloxi had 20.3% oil] and of protein from 31 to 46.9 [Chiquita had 46.9% protein]... At the present time the Mammoth Yellow variety is the most generally grown throughout the South and is the one used in the production of oil. The yellow-seeded varieties, which are most suitable for the production of oil and meal, contain the highest percentage of oil.

"Environment has been found to be a potent factor in the percentage of oil in the same variety. Considerable differences occur in oil content when soybeans are grown in different localities. The Haberlandt variety grown in Mississippi, North Carolina, Missouri, Virginia, and Ohio gave the following percentages of oil, respectively: 25.4, 22.8, 19.8, 18.3, 17.5; while the Mammoth Yellow variety grown in Alabama, South Carolina, Tennessee, North Carolina, and Virginia gave, respectively, 21.2, 19.6, 19.5, 18.4, and 18.8. Variety tests conducted in various parts of the country indicate a higher percentage of oil with the same variety for southern-grown seed. Similar results have been obtained in Manchuria, the North Manchurian beans showing an oil content of 15 to 17 percent and the South Manchurian beans from 18 to 20 percent."

Photos (both by Frank N. Meyer) show: (1) A fleet of junks carrying soy beans to Newchwang, Manchuria.

(2) Coolies at Newchwang, carrying loads of soy beans from junks to big stacks.

An outline map of the USA (p. 8) shows the area to which the soy bean is especially adapted for growing for oil production. The area of double hatching shows that it is especially well suited to the Deep South. The northern boundary of the area were it is "less certain of profitable production" includes the southern one-third of Ohio, Indiana, and Illinois, and most of Missouri. On the west, the "less

© Copyright Soyinfo Center 2014

certain" area includes the eastern one-third of Nebraska, Oklahoma, and Texas.

Tables show: 1. "Exports of soy beans, bean cake, and bean oil from the principal ports of South Manchuria (Antung, Dairen, Newchwang), 1909 to 1913, inclusive." 2. "Quantity and value of exports of soy beans and soy-bean oil from Japan to foreign countries, 1913 and 1914." The countries are: China, United Kingdom, France, Germany, Belgium, United States, Hawaii, British America, Australia, other countries. 3. "Quantity of imports of soy beans, soy-bean cake, and soy-bean oil from Dairen, Manchuria, into Japan, 1911 to 1914, inclusive. The greatest imports were of soy-bean cake, followed by soy beans, with only small amounts of oil.

(4) "Quantity and value of imports of soy beans, bean cake, and bean oil by European countries, 1912 to 1914, inclusive." The countries are: Austria, Belgium, France, Germany, Italy, Netherlands, Russia, Sweden, United Kingdom. In 1912, the UK imported the most soy beans, while Netherlands imported the most cake and oil. (5) "Quantity and value of imports of soy beans, soy-bean cake (Footnote: Includes bean cake [perhaps fermented tofu or canned regular tofu], or bean stick [probably dried yuba sticks], miso, or similar products, with duty, 40 per cent) and soy-bean oil into the United States, 1910 to 1915, inclusive." The quantity of soy bean imports was greatest in 1915 with 3.837 million lb. The quantity of soy-bean cake imports was greatest in 1913 with 7.005 million lb. The quantity of soy-bean oil imports was greatest in 1911 with 41.106 million lb. "Prior to 1914 soy beans were not classified separately in the customs returns" (p. 9). (6) "Composition of soy-bean flour in comparison with wheat flour, corn meal, rye flour, Graham flour, and whole-wheat flour."

(7) "Value of a short ton of soy-bean cake and other oil cakes in the principal European countries" (Incl. cottonseed, linseed, peanut {Rufisque}). Countries: Germany, United Kingdom, Netherlands, Denmark, Sweden. (8) "Analyses [nutritional composition] of soy-bean meal and other important oil meals." (Incl. Cottonseed, linseed (old and new processes), peanut (decorticated), sunflower seed). (9) "Fertilizing constituents [nitrogen, ammonia, phosphoric acid, potash] of soy beans, soy-bean meal, and cottonseed meal."

(10) Analyses for protein and oil of important varieties of soy beans grown at Arlington Farm (Virginia), Newark (Delaware), and Agricultural College (Mississippi). The varieties are: Mammoth, Hollybrook, Manchu, Haberlandt, Medium Yellow, Ito San, Chiquita, Tokyo, Lexington, Guelph, Black Eyebrow, Shanghai, Peking, Wilson, Biloxi, Barchet, Virginia. Note 1. "At the present time, the Mammoth Yellow variety is most generally grown throughout the South and is the one used in the production of oil" (p. 16). (11) "Acreage, production, and value per ton of cottonseed in the boll-weevil states." "Since the boll weevil first entered Texas in 1892," it has steadily decreased production of cottonseed. The soy beans offers a good replacement. (12) "Comparative prices per ton of cottonseed and soy beans on the European market, 1911 to 1914, inclusive." Soy beans are usually slightly more expensive.

Note 2. This is the earliest published document seen that contains soy-related photos by Frank. N. Meyer.

Note 3. This is the earliest document seen in which William Morse describes soy milk, or mentions natto, or correctly mentions tofu.

Note 4. This is the earliest document seen (Aug. 2013) that mentions the soybean variety Lexington. Address: 1. Agrostologist in Charge; 2. Scientific Asst. Forage-Crop Investigations, USDA, Washington, DC.

1804. Piper, C.V.; Morse, W.J. 1916. The soy bean, with special reference to its utilization for oil, cake, and other products: Soy beans in Japan, in Europe, and in the United States (Document part). *USDA Bulletin* No. 439. 20 p. Dec. 22. [2 ref]

• ***Summary:*** "Soy beans in Japan (p. 4):... In many districts it is cultivated not in fields by itself, but in rows along the edges of rice and wheat fields. Although not grown to any considerable extent as a main crop by the Japanese farmer, the average annual production is about 18,000,000 bushels. In quality the beans raised in Japan are said to be superior to those of Manchuria and Chosen [Korea] and are used exclusively in the manufacture of food products. The imported beans, of which very large quantities are obtained from Manchuria and other Asiatic countries, are used principally in the manufacture of bean cake and oil."

"The soy bean forms one of the most important articles of food in Japan. It is one of the principal ingredients in the manufacture of shoyu (soy sauce), miso (bean cheese), tofu (bean curd), and natto (steamed beans). The beans are also eaten as a vegetable and in soups; sometimes they are picked green, boiled, and served cold with soy sauce, and sometimes as a salad. A 'vegetable milk' is also produced from the soy bean, forming the basis for the manufacture of the different kinds of vegetable cheese. This milk is used fresh and a form of condensed milk is manufactured from it. All of these foodstuffs are used daily in Japanese homes and for the poorer classes are the principal source of protein. To a limited extent, soy beans are used as a horse or cattle feed, being sometimes boiled and mixed with straw, barley, and bran."

"Soy beans in Europe (p. 6): The soy bean was first introduced into Europe about 1790 and was grown for a great number of years without attracting any attention as a plant of much economic importance. In 1875 Professor Haberlandt, of Vienna, begun an extensive series of experiments with this crop and strongly urged its use as a food plant for man and animals. Although interest was increased in its cultivation during the experiments, the soy bean failed to become of

© Copyright Soyinfo Center 2014

any great importance in Europe. At the present time it is cultivated only to a limited extent in Germany, southern Russia, France, and Italy."

"Soy beans in the United States (p. 7): Although the soy bean was mentioned as early as 1804 (Footnote: Willich, A.F.M. American Encyclopedia, 1st Amer ed., v. 5, p. 13. Philadelphia, 1804), it is only within recent years that it has become a crop of importance in the U.S. At the present time the soy bean is most largely grown for forage. In a few sections, such as eastern North Carolina, however, a very profitable industry has developed from the growing of seed... The yields of seed to the acre in various sections of the United States range from about 15 bushels in the Northern States to about 40 bushels in the northern half of the cotton belt. The average yield in eastern North Carolina is about 25 bushels, although many fields produce 35 bushels or more to the acre..." Note: This is the earliest U.S. document seen (June 2003) that cites the 1804 publication by Willich [and James Mease] concerning the soybean in Philadelphia. Note that this article appeared 112 years after 1804.

"The first extensive work in the U.S. with the soy bean as an oil seed was entered upon about 1910 by an oil mill on the Pacific coast. The beans, containing from 15-19% of oil, were imported from Manchuria, and the importations, most of which are used in the manufacture of oil and cake, have gradually increased, as shown in Table V. The oil was extracted with hydraulic presses, using the same methods employed with cottonseed and linseed. It found a ready market, as a good demand had been created for this product by soap and paint manufacturers, which up to this time had been supplied by importation from Asiatic countries and England. The soy cake, ground into meal, was placed on the market under a trade name and was soon recognized as a valuable feed by dairymen and poultrymen. The use of the cake has been confined almost wholly to the Western States, owing principally to the high cost of transportation."

"An industry which promises to be of importance in a further utilization of the soy bean is the manufacture of 'vegetable milk.' At the present time a factory in New York State is being equipped for this purpose." Address: 1. Agrostologist in Charge; 2. Scientific Asst. Forage-Crop Investigations, USDA, Washington, DC.

1805. Combe, Ad. 1916. Comment se nourrir en temps de guerre? Troisième partie [Where can one find proper nutrition in time of war? Part III]. *Bibliothèque Universelle et Revue Suisse* 84:446-73. Dec. See p. 450-51. [Fre]
• ***Summary:*** Vegetable milk (*Le lait végetal*)–For a long time in infant medicine we have used Lahmann's vegetable milk (*Le lait végetal de Lahmann*) which is nothing more than concentrated almond milk, sterilized and preserved in tin cans. It was formerly widely used by German pediatricians to prepare an artificial milk. But its high price does not recommend it as a war food.

Soymilk (*Le lait de soya*)–We will not say as much about other artificial milks, widely used in Germany since the war, as about that prepared from soybeans (*fève de soya*). But there is no need to get excited about a German discovery; soymilk comes from Japan where it has been used for a long time to replace natural milk; it has been used only rarely in France. It is prepared as follows: Soybeans are cooked until the liquid becomes white [sic], then sugar is added along with phosphates and potash [potassium]. It is then condensed into a creamy liquid analogous to condensed milk; this is soy butter [sic]. By diluting it with water, one obtains an artificial milk which somewhat resembles regular milk in taste and appearance.

Apparently inspired by this [Japanese] method, soymilk has been prepared in Germany for some years in ever larger amounts–so much so that in 1913 Germany imported 125,448 metric tons (tonnes) of soybeans a year, from which they obtained that year 18,000 tonnes of soy oil and soymilk. This artificial milk, it must be said in passing, is the ideal milk for diabetics, for whom it is suited because of its high content of fats and protein and its low content of carbohydrates. A table show the content of protein, fat, carbohydrates and calories in whole soy flour, soymilk, and cow's milk.

Soymilk is used with great advantage is times of war. Because of its high fat [vegetable oil] content, it can replace butter in the diet, to which it adds calories, for it is easy to digest and inexpensive. Address: Prof. of children's clinical studies, Univ. of Lausanne (Professeur de clinique infantile à l'Université de Lausanne).

1806. Williams, C.B. 1916. Soy-bean products and their uses. *North Carolina Agricultural Experiment Station, Circular* No. 34. p. 1-7. Dec.
• ***Summary:*** Contents: Introduction. First commercial crushing from domestic beans (started on 13 Dec. 1915 by the Elizabeth City Oil and Fertilizer Company of Elizabeth City, North Carolina). Soy-bean oil. Uses for the oil. Soy-bean meal. Composition and exchange value of the meal. Prices paid for beans by the oil mills. Soy-bean oil industry in England, Manchuria, and Japan. Importation of oil. Soy-bean meal as feed. Soy beans and products for human food.

The article begins: "In order that any people may maintain their soils in the highest state of productivity in an economical way it will be necessary that proper systems of crop rotation are used, and in these rotations it will be necessary to bring in leguminous crops at as frequent intervals as practicable. For North Carolina conditions one of the crops of this nature that may be used to good advantage in all parts of the State is the soy bean. If properly handled, this crop may be used as the means of adding to the productivity of the soils as well as to increase the net returns from the farm. Recently there has been a marked interest throughout this State and the South in the growing of soy

© Copyright Soyinfo Center 2014

beans." A "new outlet for the beans has developed from the crushing of the seed by a number of oil mills of the State..." The spread of the boll weevil should lead to increased interest in the soy bean.

"This crop was introduced into the State something like thirty-five years ago, yet very little was heard of it, outside of very limited areas, until quite recently, when a campaign was begun to induce the cotton oil mills of the State to use beans for crushing purposes in the same general way that cotton seed had been used for many years before. This campaign not only opened the eyes of the oil crushers to the possibilities of the soy bean in a commercial way, but of the farmers, also, to the great opportunities of this crop.

"During the spring of 1915 farmers, particularly in the Eastern part of the State, were casting about to find a crop or crops that might be substituted, satisfactorily, for cotton, as the price of this latter crop during the previous fall had been, in many cases, below the cost of production. Many farmers increased their acreage of soy beans, and as a result of this increase at least a million bushels or more of beans were produced last year." Something like 80,000 to 100,000 bushels of soy beans were used by the cotton oil mills of the State during the past fall, winter, and spring.

"The first commercial manufacture of soy-bean oil and meal from domestic soy beans in the United States was started on December 13, 1915, by the Elizabeth City Oil and Fertilizer Company of Elizabeth City, North Carolina.

"From the start this mill operated night and day solely on soy beans until it had crushed it supply of about 20,000 bushels. This mill was able to crush about twenty tons during each twenty-four hours...

"It is understood that before the mill had ground a single bean they had contracted their entire output of oil to one of the leading manufacturers of the country at fairly reasonable prices. It, too, had no difficulty in selling its entire output of soy-bean meal, most of it going to a fertilizer manufacturer. From a ton of the beans this mill was able to secure something like 32 to 35 gallons of oil and about 1,650 pounds of meal... Other oil mills in North Carolina that crushed more or less soy beans during the past season were those located at New Bern, Hertford, Winterville, Washington, Wilson, Farmville, Lattimore, and at a few other places."

"Uses for the oil: At the present time the oil is used in this country chiefly in the manufacture of soaps, varnishes, paints, enamels, linoleums, and water-proofing materials. It has entered, also, to some extent in the manufacture of edible salad oil and butter substitutes" (p. 3). "Soy-bean meal: The meal secured from crushing the beans is the most valuable product and will have the widest usefulness. That secured from the crushing of yellow-colored beans is of a bright yellow color... Meal, too, that has been treated with ordinary solvents, employed for this purpose to remove the oil, is of a brighter color than are those meals from which the oil has been removed by heating and pressure. The oil, however, secured by a solvent process would be of a darker color... The soy-bean cake secured by expression methods, has a pleasant taste, not unlike malted milk, and when ground into meal may be used, at the present time, chiefly for feeding to livestock or for fertilizing purposes. The meal as a feed is highly concentrated and nutritious, and all kinds of stock seem to relish it when fed to them properly. It should not be fed in large quantities for any great length of time, because of its highly concentrated nature. As a fertilizer it acts satisfactorily. Much of the meal produced by the oil mills of the State during the past year seems to have been sold, without any difficulty, to manufacturers for the making of mixed fertilizers."

"... during 1913 and 1914 the British Oil Mills, located mainly at Hull, England, paid from $1.00 to $1.17 per bushel for Asiatic beans. During 1915 the price paid at the mills at Hull varied from $1.04 per bushel in January to $1.82 per bushel at the end of the year.

"In England, the oil from the soy bean is extracted largely by a secret process owned by an oil extracting company of Hull. By this process the seed are ground finely and are then treated directly by means of a solvent, which is thought to be benzine. Afterwards the oil is removed from the solvent by distilling off the latter, the solvent being used over and over again in the extractive process."

"By use of gasoline extraction the whole of the oil may be secured, the oil being of a clear, pure color, and hardly bearing any resemblance at all to the dark, muddy oil secured by the old hand-press method.

"The machinery used by the larger operators of England, Continental Europe, as well as of Japan, Korea, Manchuria, and China, is of Anglo-American manufacture, which is the kind ordinarily used in the expression of oil from cotton seed. In 1910 Stewart and Chard secured patents in England for a special machine which was particularly adapted for breaking up the beans. This machine has been very useful in solving some of the difficulties experienced in the soy-bean crushing industry in England.

"In England soy-bean oil for general purposes is not refined, as is cotton-seed oil in America, by the use of caustic soda, but by means of sulphuric acid and fuller's earth.

"Processes of refining soy-bean oil for edible purposes have been devised, but these, like those used for extracting the oil from the seed, have been kept secret; but they are thought in most cases to be by means of superheated steam."

"Importation of oil: In this connection it may be of interest to know that for the five years ending with 1916 there were imported into this country more than 174,000,000 pounds of soy-bean oil, which represented crushings amounting to more than 12,000,000 bushels. Of these, 47.6 per cent came through the port of New York; 36.1 per cent through Seattle [Washington]; 9.6 per cent through San Francisco [California]; 2.2 per cent through Philadelphia

© Copyright Soyinfo Center 2014

[Pennsylvania]; 1.6 per cent through Boston [Massachusetts]; 1.1 per cent through Chicago [Illinois]; and 1.3 per cent through all other ports of the United States. In 1916, 75 per cent of the importations came through the ports of Seattle and of San Francisco, the chief port of entry being Seattle, with 62.9 per cent of the total importation. During 1916 more than 98,000,000 pounds of soy-bean oil came in from other countries, 99.9 per cent of the total coming from Asia. Of the total amount imported from Asia, almost 72 per cent were shipped from Japanese ports. The total importations during 1916 wore valued at little more than $5,000,000."

"Soy beans, before crushing, and the meal secured by crushing, seem to have great possibilities in the way of different human foods. They are not only rich in food nutrients, but when properly prepared make very appetizing products...

"In this country some enterprising manufacturers are putting out prepared pork and beans, part of all of the beans being soy beans. A regular preparation of these which the writer has tried proved to be of as high grade as could be desired...

"Muffins made from soy-bean flour have been found to be very palatable [a recipe is included]...

"The chief value of the flour lies in its high content of protein (muscle-forming material) and mineral matter, one pound of it containing as much protein as two pounds of meat. Bread made from the soy-bean flour in Germany, where it is being largely used at the present time, secures about the same amount of food value as six dollars spent for meat. The flour seems to have especial value in the preparation of foods for delicate infants which have difficulty with digesting cows' milk, and for persons suffering with diabetic troubles." A diagram (p. 7) shows "Products secured from the crushing of a ton of soy beans by the oil mill, and the material made from these products." One ton yields 1,650 lb of meal, 32 gallons of oil, and 120 lb of trash and moisture. From the meal one can make food (human and animal), fertilizer, and celluloid. The human food can be macaroni, flour, sauce, milk, cheese, coffee, and lard. From the oil one can make food (cooking oils, butter [margarine?]), paints, enamels, blown oil (linoleum, India rubber substitutes, varnishes), and soap stock (soaps, glycerine). Note: This is the earliest English-language document seen (August 1996) that contains a diagram of this type. Address: Chief, Div. of Agronomy, North Carolina Agric. Exp. Station.

1815. Sornay, Pierre de. 1916. Green manures and manuring in the tropics, including an account of the economic value of leguminosæ as sources of foodstuffs, vegetable oils, drugs, etc. Translated from the French by F.W. Flattely. London: John Bole, Sons and Danielson, Ltd. xvi + 466 p. Illust. 26 cm. [12 soy ref]

• ***Summary:*** This book is dedicated "To my esteemed Master and Friend M.P. Bonâme. A token of deep gratitude and sincere admiration." It "was awarded a gold medal by the *Société Nationale d'Agricole de France."* The translator is from the International Institute of Agriculture, Rome, and the Dep. of Zoology, University College of Wales, Aberystwth. In the introduction H. Pellet states (p. viii) "M. de Sornay, who for a number of years has been a member of the Agronomic Station of Mauritius, had already published, some time ago, in the *Bulletin* of the Station, a short treatise on the Leguminosæ." This volume is a major expansion of that work. The author was one of the first to study intercropping of sugar cane with legumes. Working in Mauritius, he found that legumes used in mixed cultivation with sugar prevented the growth of weeds and retained the soluble salts which would have been washed away by rain. A trailing variety of peanut was used. He also suggested soybean as an intercrop because "it does not interfere in any way with the small canes; the soybean may be used on a mixed cultivation and may even be sown in two rows in interspaces of canes" (p. 184). Also includes concise information about the cultivation and yield of soybeans.

Chapter 1, "General remarks" (p. 1-9) begins: "The family of the Leguminosæ, which numbers not less than 7,000 species distributed over every portion of the globe, contains, according to Van Tieghem, 430 genera." "The Leguminosae are generally divided into three great sub-families: Cæsalpineæ, Mimoseæ, and Papilionaceæ." The first two sub-families prefer tropical climates, whereas the Papilionaceæ "adapt themselves to every climate and are found distributed from the Equator [Ecuador] to the Poles." The Papilionaceæ are divided into eleven tribes; a table shows these and the subtribes or genera they contain. The genus Glycine is in the tribe Phaseoleæ, subtribe Glycina.

Chapter 2 is an "Account [history] of the theories on the absorption of nitrogen from the air by the leguminosæ." Chapter 3 (p. 9-46) is a "Description of the various leguminous plants of agricultural value." The 37 species discussed include the peanut (p. 47-70), Bambarra ground-nut or Voandzou (p. 70-72, native of Madagascar), *pois carré* [winged bean] (*Psophocarpus tetragonolobus*), and Soja, or Soy bean (p. 182-92).

The rambling treatment of the soy bean discusses bits and pieces of its history, botany, and yields in India, South Africa, and Mauritius. Nineteen tables show its composition. Concerning uses: "The seed of the soy bean is eaten as a vegetable by the majority of Chinese and Japanese, and they make numerous other uses of it." The chief ones are: Soy milk, soy cheese [tofu], and shoyu. "The roasted seeds of the soy bean are used in the United States and Switzerland as a substitute for coffee. Not containing any starch, these breads are used in the manufacture of breads and biscuits for people suffering from diabetes. They are found on the European market... The seeds are pressed in order to extract the oil, the oil resulting from the first expression being used in the manufacture of soap, whilst that from the second is used as machine oil. The cake is given to cattle mixed with other nutriments of lower nitrogen content. The trade in soy has increased considerably during the last five years." Trade statistics (exports of soy beans from Manchuria and imports to Europe) and prices on the London market (of soy beans, oil, and cake) are given.

Chapter 7, "Starch in the leguminosæ" (p. 246+) discusses the "Characters of the principal starches in the Leguminosæ." It contains an illustration (line drawing) of the starch in Soja hispida (Fig. 42, p. 251), and a description (p. 255) as follows: "Soja hispida.–Soy contains very little starch. The shape of the grains is fairly uniform, whilst their size is very variable. All the grains polarize clearly. The hilum is linear, occasionally stellate, but of rather rare occurrence. The striations are only visible at the edges and are very close together. Starch only very slightly homogeneous." Address: Chemist, Ex-Asst. Director of the Station Agronomique of Mauritius, Laureate of the Association des Chimistes de Sucrerie et de Distillerie de France et des Colonies, Laureate of the Société Nationale d'Agriculture de France.

1817. Woodroffe, Joseph Froude; Smith, Harold Hamel. 1916. The rubber industry of the Amazon and how its supremacy can be maintained. London: Fisher Unwin Ltd.; Bale, Sons & Danielson, Ltd. xlviii + 435 p. Illust. Index.

• ***Summary:*** Title page: This book is based on the experience of Joseph F. Woodroffe, author of "The Upper Reaches of the Amazon," edited and with additions by Harold Hamel Smith, editor of *Tropical Life.* Note: Woodroffe does not mention soya beans in his book, but Smith mentions and recommends them repeatedly as a valuable new crop for Brazil.

Pages 122-23: Brazilians should clear new ground and plant young rubber trees. "The ground round about the new shoots should be kept clear of weeds, &c., by a judicious

© Copyright Soyinfo Center 2014

planting of sweet potatoes, soya beans, groundnuts, or other suitable pasture grasses. This is really the only practical and profitable method of raising plantation rubber along the Amazon."

Chapter 10, titled "The Japanese as planters, artizans, &c." recommends attracting both Japanese and Chinese to Brazil to raise rubber trees, soya beans, and rice (p. 163-64). "... the introduction of the Orientals to the Amazon region would ensure her rapidly becoming one of the world's chief producers, and not of rice only but of soya beans and other foodstuffs as well" (p. 176).

The Chinese have a great love of progeny (which has led to over-population in many large districts), and they are very hard working. "All these circumstances combine to make the Chinese frugal and thrifty and so cause them to be even more ideal as a colonizing and populating people in Brazil. Again, rice is cultivated by them, in face of great natural disadvantages, on a scale which no other race has attempted, and I have more faith in the rice field and soya-bean gardens for resuscitating the people of Brazil and its various industries than all the 'Defesas' ever thought of. Like the Japanese, and perhaps more so, they are practised in all branches of farming and agriculture,..." (p. 188).

An industry of wood-pulp and paper-making would be very profitable along the Amazon. After the unwanted brush and shrubs are removed, ground-nuts, soya-beans, maize, sugar, cotton, etc. could be planted (p. 249).

"If in choosing a site for extensive cultivation one of these large *playas,* as the sandbanks are called, were selected, huge quantities of mandioca [cassava], maize, soya and other beans, ground-nuts, and other quick crops could be grown without any of the charges incidental to clearing ground;..." (p. 265).

"Then we come to soya-beans (*Glycine hispida*), which have already been tried in the neighbourhood of Manaos [Manaus, Brazil] and are doing well, whilst the *Review of River Plate,* some time back, was recommending its cultivation in Argentina, urging as a reason for so doing that present supplies are not equal to the demand. Acclimatized seed gave 869 lb. to the acre (in Argentina), and I understand that the bean can be harvested there within 110 to 115 days after sowing, against 150 to 180 days in Manchuria.

"'For the following reasons,' wrote my friend, Mr. E. H. Heron [of Mozambique], who has had great experience in the production and introduction of economic products in several tropical centres, 'the soya-bean has, during the past few years, since the Russo-Japanese War in particular, risen from comparative insignificance in European countries to being a product of great importance. The beans contain a high percentage of oil, which can be used for edible purposes or in the manufacture of soap; whilst the residue is used in the manufacture of cattle cake and meal. As a fodder plant it is rich in nitrogen, albuminoids and fat, and is fed in the green state as hay and silage. Under favourable conditions the plant may reach a height of 4 ft. or more, rising 3 to 5 ft. high, as a rule, and bears prolifically, say 1,100 to 1,600 lb. per acre, whilst at the Government Experimental Farms in South Africa an output as high as 2,000 lb. has been recorded, a good average yield of pods per plant being forty, whilst some are said to yield 100 pods. As a forage crop it gives, under favourable circumstances, 12 tons of fresh fodder to the acre, but since there are supposed to be over 300 varieties, it behoves [behooves] the planter to see that he secures the one most suited to his soil, climate, &c., putting down experimental plots here and there, in the first place.'"

"A report was issued in 1913 by the Trade Commissioner of the Government of the Union of South Africa, with a view of encouraging the cultivation of this useful crop out there. It would be a good thing for Brazil to secure a copy of this and, translating it into Portuguese, have it widely distributed throughout the Republic. Anything and everything contained in its seven pages (foolscap size) is worth noting, and at the same time it gives enough information for anyone to start on."

"Stock-raisers of cattle, pigs, poultry, &c., will find both soya-beans and ground-nuts of great value as a feed, either as a green forage or as cake or meal. Both, and especially soya-beans, can be grown satisfactorily with maize, and if grown for silage the two can be cut together. The percentage of the oil (in soya-beans) varies greatly: some talk of as low as 10 per cent., others of over 20 per cent., but with 12 per cent. to 15 per cent. its cultivation should still pay well" (p. 316-19). Soya beans are also mentioned in passing on pages 324 and 347.

1818. *Washington Post.* 1917. Putting it over on the cow: Japanese manufacture artificial milk from vegetables. Jan. 26. p. 6.

• ***Summary:*** From the Youth's Companion: "The milk problem is by way of being solved in Japan, where cows are scarce, by an extensive use of artificial milk derived from the soy bean. First, the Japanese soak the beans, then boil them [sic, after grinding] until the liquid turns white, when [after filtering] they add sugar and phosphate of potash. The boiling is resumed until a fluid results very similar in consistency and appearance to ordinary condensed milk. When water is added, soy milk is hardly to be distinguished from fresh cow's milk.

"In composition also the artificial milk is almost like genuine milk. Its proteins, fats and sugars are in very nearly the same proportion, although, of course, they are wholly vegetable in origin.

"Whether the substitute is equal to real cow's milk as a form of nourishment is not quite clear, for much of the value of milk as a food comes from the enzymes or vitamines it contains. The Japanese, however, declare that it serves all the purposes of cow's milk, and that it has the advantage of being less liable to infection when properly and carefully

© Copyright Soyinfo Center 2014

manufactures."

1819. *Oil, Paint and Drug Reporter.* 1917. Market for other vegetable oils. Prices highest in years–Production increased–Soya imports enormous. 91(7):74-75. Feb. 9. Annual review–Extra edition.
• ***Summary:*** The section titled "Soya bean oil" begins (p. 75): "Imports of soya bean oil into the United States for the calendar year amounted to approximately 250,000 barrels, the largest in the history of the trade. In 1915 the total importations amounted to but 50,000 barrels, and in 1914 the arrivals were even smaller. The tremendous increase in imports during 1916 was inspired by the shortage in fats and vegetable oils and the entire quantity was readily absorbed, consumers paying comparatively high prices for the material. Practically all of the oil imported came from Japan. Owing to the success of the 1916 season even greater quantities will be shipped to these shores over the coming year. Trade authorities predict that in 1917 the importations of soya bean oil will amount to approximately 500,000 barrels."

Heavy speculation in this commodity was a factor in the large imports and high prices. "The shortage in the supply of cottonseed oil made consumers look around for other oils and fats to fulfill their needs. Soya bean oil, being the lowest in price of all competing oils, importers and consumers immediately took advantage of the situation. Owing to the unusual conditions prevailing in the freight market arrangements were entered into whereby large shipments could come to this country via Seattle [Washington] and other Pacific coast points. This arrangement proved satisfactory, especially to Western consumers. The soapmakers were the principal buyers, but large quantities also were taken by manufacturers of edible oils and lard compound. Through the perfection of the hydrogenation process lard compound makers were enabled to consume large quantities."

"The year opened with soya bean oil quoted in the New York market, spot delivery, at 7.75@8c. per pound, in barrels." The price rose steadily during the year and "in December sellers were asking from 11½c. [cents] to 12c. per pound, cooperage basis, spot delivery" [= available for immediate delivery after sale].

"Early in the year paint makers bought soya sparingly, owing to the comparatively low market [price] for linseed oil." But demand increased in the fall, as linseed oil prices rose.

A table shows the high and low prices for soya bean oil (per pound in barrels) each month from Jan. 1914 to Dec. 1916.

1820. *New York Times.* 1917. Japan's Copper King owes fortune to father. March 4. p. X8.
• ***Summary:*** Japan ranks 2nd, after the USA, among the world's copper producing countries. Japan's Copper King is Baron Furukawa, whose father, Ichibei Furukawa, was a self-made man. Ichibei was born in Kyoto's suburbs. When his father, a sake brewer, sank into poverty through business reversals, young Ichibei turned from brewing sake "to selling tofu, or bean curd." One day, while working as a "peddler of tofu... he collided with a palanquin bearing a stately samurai or nobleman, and his stock of bean curd was thrown into the street. Refusing to be overawed by the splendor of the nobleman, the boy requested that he be compensated for his loss, but the bearers of the palanquin, filled with a sense of their master's importance, scornfully refused to heed his request and continued on their way." From that moment, he made up his mind to rise in life. Yet he peddled tofu for at least 2 more years to save up his money.

1821. *San Francisco Chronicle.* 1917. From coast ports. March 5. p. 9.
• ***Summary:*** "Seattle–Special dispatch to The Chronicle. March 4. With a cargo consisting principally of 1,130 bales of raw silk, 847 cases of silk goods, 9,500 cases of firecrackers and 80 barrels of soya bean oil, the O.S.K. [Osaka Shosen Kaisha] liner Canada Maru arrived early this morning from the Orient. She brought eight first-class passengers and thirty-eight steerage passengers."

1822. Morse, W.J. 1917. Re: Soybean varieties obtained by Cromer / Indiana directly from Japan. Letter to Prof. C.O. Cromer, Associate in Crops, Purdue University, Lafayette, Indiana, March 6. 1 p. Typed, without signature (carbon copy). [1 ref]
• ***Summary:*** "Dear Prof. Cromer: In looking over my notes taken on the soy bean variety tests at your station the past season I find reference to a number of new varieties which were obtained by you directly from Japan. I should like to obtain, if possible, an ounce or two of seed of each of these different varieties, if you find it convenient to spare this amount of seed. I wish to test them out in comparison with some of our introductions from Japan and Korea in our variety tests at Arlington Farm [Virginia].

"I should also like to obtain a one or two ounce sample of the Chestnut, Mongol, Black Champion, and Sable varieties.

"Inclosed is a franked tag which may be used in sending this seed and which requires no postage."

1823. *Christian Science Monitor.* 1917. Soya bean oil from the Orient. March 17. p. 19.
• ***Summary:*** "Tacoma, Washington–Soya bean oil from Japan, worth $2,000,000, has been received in two cargoes and forwarded to one of the large soap manufacturers of the country by a special train of 30 tank cars. Soya bean oil, which is growing in favor with soap manufacturers in America, is used in England as part of the process of manufacturing lard, or is used without being mixed as a lard or cooking oil. The consignment just shipped is the largest ever received in the United States."

1824. *Wall Street Journal.* 1917. Oil from Orient. March 17. p. 2.
• ***Summary:*** Except for a slight difference in title, this article is identical to that published on this same date in the *Christian Science Monitor* (p. 19).

1825. *International Review of the Science and Practice of Agriculture* (*International Institute of Agriculture, Rome*). 1917. International trade in feeding stuffs: Annual Review No. 3. 8(4):489-551. April 1. See p. 490-91, 502-05, 535-43. [29 ref]
• ***Summary:*** The Introduction begins: "This third *Annual Review* gives the *International Trade in Feeding Stuffs* up the end of 1916 as far as the present conditions allow, and according to the scheme established in the send Review (1).

"Two new headings have been introduced: soya and soya-cake, brewing residues; for these are given, under the heading *coefficients,* the factors used to calculate the production of concentrates on the basis of the available supply of raw materials."

The section titled "Production of concentrated foods for livestock," under coefficients (p. 491), states: "Soya cakes–For countries importing soya, the production of cakes has been estimated at the rate of 80% of the net importation."

Three tables (p. 502-04) give figures in metric tons for 1912 to 1916. The first table, titled "Trade in soya [soybeans]" (p. 502) gives figures as follows: (a) Producing countries: China (exports), Korea (exports), and Japan (production, imports, exports). (b) Importing countries: Germany, Belgium, Denmark, United States, France, Netherlands (imports and exports), United Kingdom (imports and re-exports), Russia, and Sweden. The largest exporter of soybeans in 1912 is China (661,004 tonnes), followed by Korea (98,674). The largest importer in 1912 is United Kingdom, followed by Germany, Netherlands, Denmark.

The second table, titled "Trade in soya cake" (p. 503) follows the same format with the same countries as the first table. The largest exporter of soya cake in 1912 is China (493,477 tonnes), followed by Korea (1,063). The largest importer is Japan (518,056), followed by Netherlands (23,852).

The third table, titled "Production of soya cake in importing countries" (p. 504) gives estimated figures for Germany, Belgium, Denmark, United States, France, Netherlands, United Kingdom, and Russia. The largest producer in 1912 was the United Kingdom (143,431 tonnes), followed by Germany (77,014) and Denmark (27,185).

1826. *Los Angeles Times.* 1917. Grow soya beans: Movement to start a new and profitable industry at Tacoma [Washington]. April 8. p. III22.
• ***Summary:*** From Philadelphia Public Ledger: "An attempt to inaugurate an entirely new and profitable industry in Tacoma and the Puyallup Valley [both in Washington state], in the growth of the soya bean, with the probability that the experiment will prove successful and result in the erection in Tacoma of an oil-extracting plant to cost from $50,000 to $75,000, is announced.

"The soya bean is one of the most valuable imports of the United States from Japan, and a product which may be put to more uses than probably any other." Many uses are listed.

"Some time ago W.H. Paulhamus of the Puyallup and Sumner Fruit Growers' Association suggested that the Keystone Cereal Company of this city, which imports an enormous quantity of the bean in cake form, make an effort to obtain some seed. The agents of the company in Japan, after lengthy negotiations, were finally able to purchase a quantity of seed, the concession being made by the Japanese only because of the trade the local company gave them. This seed will be distributed free of charge to farmers of the Puyallup Valley and Western Washington by the growers' association and cereal company. The seed will be sown in January, and it is expected a good crop will result, as the Puget Sound climate is very similar to that in Japan."

"Two shipments of the cake form of the beans are due here next week, each amounting to 1,000 tons. All of the beans received in America have passed through an oil-extracting mill, where from 16 to 18 per cent. of their oil has been extracted, and the cake is then sold at from $35 to $38 a ton. If the bean could be grown in this country an immense profit would result to the grower and manufacturer, it is said.

"Previous attempts have been made to get seed of the bean and test it in this country, but a sufficient quantity has never been obtained, the Japanese merchants being unwilling to jeopardize their trade in the commodity.

"The soya bean is very common in Japan,... Cakes made from the bean [probably tofu] form one of the delicacies in the diet of the common people."

1827. *J. of Home Economics.* 1917. The soy bean. 9:183-84. April.
• ***Summary:*** "The soy bean, already one of the most important crops of Asia, promises to take an important place in the agricultural industry of the United States. It is said that it may be utilized in a greater number and a greater variety

© Copyright Soyinfo Center 2014

of ways than almost any other agricultural product. Not only are the beans, and the oil expressed from them, available as food, but soy bean oil is used for making paints, varnishes, soaps, rubber substitutes, linoleum, waterproof goods, and lubricants, besides its use in the Orient for lighting and other purposes.

"In Japan the soy bean is one of the principal ingredients in the manufacture of shoyu (soy sauce), miso (bean cheese), tofu (bean curd), and natto (steamed beans). The beans are eaten also as a vegetable and in soups; sometimes they are picked green, boiled, and served cold with soy sauce, and sometimes as a salad. A 'vegetable milk' is also produced from the soy bean, not only forming the basis for the manufacture of the different kinds of vegetable cheese, but used fresh, while a form of condensed milk is also made from it. All of these food stuffs are used daily in Japanese homes, and for the poorer classes are the principal source of protein.

"Soy bean oil resembles that of cotton seed in many ways. The meal remaining after the oil is extracted from the beans has become important during the last few years as a food of low starch content, and so adapted to the use of diabetic patients.

"Soy bean flour enters as a constituent into many of the so-called diabetic breads, biscuits, and crackers manufactured as food specialties. The flour or meal may be used successfully in the household as a constituent of muffins, bread, and biscuits in much the way in which corn meal is used.

"An artificial milk like that manufactured in the Orient has been produced in small quantities in the United States, and recently a factory has been equipped to make this product. Such milk may be used for cooking in the household, and by bakers, confectioners, and chocolate manufacturers. Such products must, of course, be properly labeled.

"The soy bean has also been utilized as a substitute for the coffee bean. When roasted and prepared, it makes an excellent substitute for coffee."

1828. Yukawa, Matao. 1917. Daizu no tansuikabutsu oyobi sono shôyu jôzô to no kankei ni tsuite [Soybean carbohydrates and their relation to shoyu fermentation]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 38(4):318-58. April. [12 ref. Jap]
• ***Summary:*** The author found the following carbohydrates in matured soy-bean seeds: Total carbohydrates (in anhydride form): 21.69%. Cane sugar [sucrose]: 5.90%. Stachyose: 3.52%. Araban: 3.80%. Galactan: 4.64%. Fiber (crude): 3.85%.

1830. Prinsen Geerligs, H.C. 1917. Ueber die Anwendung von Enzymwirkungen in der Ostasiatischen Hausindustrie [On the application of enzymes in East Asian cottage industries]. *Zeitschrift fuer Angewandte Chemie, Wirtschaftlicher Teil* 30(3):256-57. May 8. [Ger]
• ***Summary:*** Paper read before the *Niederlaendische Chemische Vereinigung* (Dutch Chemical Union), General session in The Hague, December 28, 1916.

This paper is on the domestic application of enzyme actions in Eastern countries, and describes, among other things, the making of fermented and non-fermented soybean food products. "To make soymilk (*Milchersatz*), only white soybeans are used, softened in water for 3 hours until they have swollen to 3 times their original size. Then, while water is added continuously, they are milled between two hard stones and fall through a hole in the bottom stone into a pail. A very small amount of the thin soybean slurry is set aside; through the proliferation of lactic acid bacteria it quickly becomes so sour that after several hours that lactic acid content has risen to 1.5%. The above mass is cooked in a large pan. The now pasteurized liquid is filtered through a large sieve to remove the hulls and hard pieces. The filtered milk-white liquid has, in appearance and chemical composition, the greatest similarity with animal milk. A sample contains 6.9% solids, 3.13% protein, and 1.89% fat. It gives an alkaline reaction and contains a solution of legumin bound to potassium phosphate, while the fat is emulsified in the thick protein solution. Unfortunately this soymilk (*Bohnenmilch*) tastes very much like raw French-beans (*Schneidebohnen*), so that people who are accustomed to cow's milk do not enjoy it much. But infants should be very content with it.

"If cheese is to be made from this milk, a small amount of the slurry soured with lactic acid is added to it. Thereby, the legumin (protein) is dissolved from the potassium phosphate and coagulated, then settles out with the fat with which it is emulsified. When the milk, through several hours mixing with the coagulation liquid, has become fully firm, it is packed in cloths and pressed between boards, in order to remove any excess water. Then the cakes are cut into square pieces; if they are to be eaten raw, it must be done quickly, lest they continuing souring and spoil. In order to impart a pleasant color to the cakes, they may be placed for several moments in a Curcuma [turmeric] decoction. Mostly the cakes of cheese (*Kaesekuchen*) are dried in the sun or fried (*gebraten*). They then keep better and acquire a pleasant flavor."

"Of much greater significance is the preparation of the most popular and prevalent soybean preparation, soy

© Copyright Soyinfo Center 2014

sauce (*der Soja*), which in East Asia is an indispensable seasoning for a variety of dishes, and is produced and used in unbelievably large quantities. There are various types, some of which contain wheat flour. But here we will consider only the type that is made [in the Dutch East Indies] with soybeans plus some added ingredients to improve the flavor.

Note: This is the earliest German-language document seen (April 2012) that uses the term *der Soja* to refer to soy sauce.

For the preparation of soy sauce, brown or black soybeans are cooked for several hours. After pouring off the cooking water, the beans are placed in flat trays (*Hürden* [*tampah*]) of woven bamboo and dried for half a day in the sun, then cooled in the shade. When they are cooled, the beans are covered with leaves of *Hibiscus tiliaceus,* a species of mallow, and they are soon covered with a layer of Aspergillus mold, which is usually found on the tiny hairs or cilia on the underside of the hibiscus leaves and so is transferred to the beans. The mold filaments or hyphae penetrate between the tough and thick cell walls, dissolve these through hydrolysis, and thus make the cell contents accessible to the influence of the molds. The mold is allowed to work until it forms spores (*Fruchtstaende*). The beans then appear to be covered with a brownish green felt. The beans are then dried in the sun and placed in a strong, cold salt solution. The mixture is placed in the sun for several days and then cooked. The brine solution, which contains the soybean extract, is poured off and the beans are cooked several more times until they have lost their salty taste. The various cooking extracts are mixed, filtered through a fine sieve, then mixed with palm sugar, aniseed [*Pimpinella anisum*], and an herb extract, which one can buy at a druggist's shop, and finally cooked until salt crystals appear. The soy sauce (*Soja*), which is now ready to use, is a dark brown, thick, very salty liquid, in which a viscous sediment forms. By diluting with water, it becomes turbid. But the solution again becomes clear with the addition of salt. This thorough investigation has shown that the mold hyphae branch out into the cell walls, hydrolyze and dissolve the pectin substances, and likewise break down the protein content of the cells to leucine, tyrosine, asparagine, and other decomposition products of legumes.

"But this action and result is of secondary importance. The main point is the dissolution of the cell walls, whereby the protein becomes free and can be dissolved in the concentrated salt solution. The composition of soy sauce, except for the salt content, is very similar to that of meat extract, so that it can completely replace meat in the largely vegetarian diets of the people of the East.

"In a similar way, various other foods are obtained, whereby a mold dissolves the cell wall and so fulfills the function otherwise accomplished by cooking. We mention here only the bean paste (*Bohnenbrei*) [*tao-tjo*], for the preparation of which, dehulled white soybeans are cooked and then mixed with rice flour and glutinous rice flour (*Kleereismehl*). The mixture is placed in a small basket that is lined with the same hibiscus leaves mentioned above, and the Aspergillus molds growing on the leaves are allowed to develop. This saccharifies the rice starch flour and dissolves the bean cell walls. Thereby, the mixture becomes sticky and glutinous, and tastes sweet. It is dried and placed in a pot with saltwater. There it remains until each bean is permeated with salt and a sample tastes salty. Palm sugar is added to taste and it is ready for use without further cooking. Microscopic analysis showed that the cell walls were completely dissolved and the contents lay free, so that the mold growth had greatly improved the digestibility of the beans.

"In Java, soybeans are also cooked and made into flat cakes on a flat bamboo lattice. A small piece of an old cake is added and the mass is covered with banana leaves. One soon observes a rise in temperature and the development of moisture. The mass is penetrated by hyphae of *Rhizopus Oryzae,* which again dissolves the cell walls and frees their contents. The cake [tempeh, though the term is not mentioned] with its covering of mold, is consumed without further processing, raw or fried (*gebraten*).

Also discusses the preparation of onchom from peanut press-cake. Address: PhD, Netherlands.

1831. *Argus* (*Petaluma, California*). 1917. Hay, grain and feed market. May 12. p. 4, col. 3.

• ***Summary:*** Includes: "Soyo bean meal–$2.75."

"Cotton seed meal–$2.75."

"Oil cake meal–$3.25."

Note: "Soyo" seems to be a brand name, and "bean meal" clearly means "soybean meal." It is possible (even likely) that this meal was made in Petaluma by the *Daizu Seisan Gaisha* (Soybean Food Products Co.), which has a full-page ad that appeared on 1 Jan. 1919 in the *Japanese-American Directory* (*Nichibei Jushoroku*), published in San Francisco on page 40 near front. One of the items that they make is soybean meal, listed in the ad as *Mamekasu* [Soybean presscake, probably left over from making soybean oil]. However the brand name "Soyo" is not mentioned in the ad. Petaluma had a large poultry industry at the time, that supplied San Francisco and the Bay Area with chickens and eggs.

The 1919 Sanborn fire insurance map for Petaluma (p. 22) shows the "Soy Bean Co. Soy bean meal mill" was located on Weller St., near the corner of Weller and Adams.

1832. Williamson, A.A. 1917. Soya beans for American mills. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 20(125):795-99. May 29. [1 ref]

• ***Summary:*** Discusses the Manchurian soybean industry with reference to the possibility of soybean imports for use

© Copyright Soyinfo Center 2014

in American mills. Contents: Introduction. Trade developed originally with England. Special regulations established. Arrangements for settling future deals. Advisable course for American buyers. Production in the Harbin consular district. Varieties of soya beans. Put to many uses in Far East (in central and western China it is ground into a flour to be made into vermicelli, and employed extensively in the manufacture of vinegar and bean curd). Dairen a center for oil industry. Places of production–export figures. Differences in quality of oil.

"Soya beans have never been shipped from Dairen to the United States so far as is known at the American consulate. Certainly they have never been among the declared exports, although they may have gone by way of a Japanese port...

"The soya bean first became known to world trade in 1908 when shipments to England were made by the Mitsui Bussan Kaisha, although it has long been an article of everyday use among the Chinese. In the boom that followed many evil practices arose, as a result of which losses of considerable amounts were sustained by firms interested in the business and not engaged in speculation, largely through the failure of some dealers and speculators to deliver merchandise contracted for in advance. By 1910 things had come to such a condition that whenever a ship came in to load for Europe the price of beans would soar far above the normal market prices, as it was known that several of the foreign firms had contracted to deliver beans but had not been able to obtain delivery of the 'future' beans they had bought. So it came about that the date of a ship's arrival was kept secret by its agents as long as possible to enable the charterers or special clients quietly to get together their cargo before the market began to rise. Several firms became bankrupt as a result of their losses, and the soya-bean business itself began to fall into bad repute.

"Japanese officials sought a remedy, and as a result the Dairen Staple Products Exchange and the Dairen Trust & Guaranty Co. were formed in June, 1913. By the regulations then put into force, all deals had to be made between licensed dealers, and both parties were protected...

"Beans are generally shipped in gunny bags holding 150 kin (198.42 pounds). The 100-pound bag favored by the American trade is not known here... The picul (133 1/3 pounds in China) is a standard weight in the Far East, 100 kin or catties making a picul...

"Soya beans, under the 1909 tariff, were subject to an import duty in the United States of 45 cents per bushel of 60 pounds. Oil was duty free. Under the 1913 tariff both are on the free list...

"The Dairen wharves are good and are well equipped to handle large ships. Although elevators and loading machinery are not employed here because of the cheapness of coolie labor and for other reasons, the work is done expeditiously, 17,000 tons having been loaded in one day, while about 10,000 tons may be put down as the average, without night work...

"Dairen is the center of the bean-oil industry, shipping about eight times as much each year as Hankow which is its nearest competitor... Japan takes practically all the bean cake exported. The United States takes none...

"The exports of soya beans from Hankow during 1915 were: Black 8,927 tons, green 10,513 tons, and yellow, 52,218 tons." Exports for 1916 are also given in a table. Address: Consul, Dairen, Manchuria.

1833. *Hartford Courant* (*Connecticut*). 1917. The soy bean. June 12. p. 8.
• ***Summary:*** "At last the motive for urging the cultivation of soy beans has been discovered, it being nothing less than to increase the available supply of soap. which is doubtless a praiseworthy purpose. News comes by way of Seattle, Washington, from which port Mitsui & Co. have shipped in one lot forty tank cars, each carrying 8,000 gallons of soy bean oil, to Ivorydale, Ohio, the location of a soap factory [Procter & Gamble Co., makers of Ivory Soap].

The oil was made in Japan and the shipment is said to be the shipment is "said to be the largest on record."

Address: Nôgaku-shi, Japan.

1835. Ishii, Eiichi. 1917. Mamekasu-sei pate [Paste from soy bean refuse]. *Japanese Patent* 31,331. July 19. 2 p. [Jap]
Address: Manchuria (probably); Kanto-shu, Ryojun-shi.

1836. *Christian Science Monitor.* 1917. Little known foods from sea and shore. July 21. p. 18.
• ***Summary:*** "Squid is another fish little known in America. It is a common food in Japan,... Frequently it is served raw, cut in very thin slices and eaten with soy beans, sometimes with both soy beans and vinegar."

Seaweeds (which include kelp. kombu, and dulse) are much eaten in Japan.

1837. *Hartford Courant* (*Connecticut*). 1917. The case of the soy bean. July 21. p. 10.
• ***Summary:*** That the soy bean "will become forthwith an article of food for New England folk is very unlikely even though the National Emergency Food Garden Commission is now urging the public to can the beans.

"The strange campaign for the introduction of this new article of diet has moved W.P. Brooks of the Massachusetts Agricultural Experiment Station to publish a fairly conclusive statement upon the matter. He says the advocates of the soy bean say something like this about it: -

© Copyright Soyinfo Center 2014

"'The soy bean is a very rich food; it can be successfully grown in Massachusetts and will give a large yield; it is palatable prepared and served in similar ways to those employed in the cooking of ordinary field and garden beans. The last statement is, I believe, absolutely incorrect, and the others require qualification. The fact that I have had unusual opportunities of observation and experience with this crop leads me to ask space for this article since I hope it may be the means of preventing discouragement and disappointment. I lived for twelve years in Japan. In that country the soy bean has for many hundreds of years been an important crop. The Japanese made practically no use of it as a vegetable prepared by ordinary methods of cooking. They are very largely vegetarians, and if it were adapted to such use there can be no doubt they would so employ it.'

"Then Mr. Brooks goes on to say that since coming to this country he has tried baking the soy bean and the members of his family were a unit in agreeing that it was nowhere near as desirable as the native varieties. He had roasted and ground the bean and used it as a substitute for coffee and found it a trifle less worse than when baked.

"He says that the bean is rich in protein and fat but he adds that it is much too rich to be palatable. While the Japanese do not use it as a cooked food they contrive to make a cheese [tofu] of it, but this they do not prepare in the family but buy it of manufacturers. They also use the bean in preparing a sauce [soy sauce] and make extensive use of it as a food for cattle. Finally he says that while he does not wish to discourage experiments he does not think it will be regarded as useful as an article of food.

"The most productive varieties, he says, are not likely to mature in Massachusetts but several varieties will generally produce a crop. They need, he says, a season a little longer than the larger sorts of field corn and they will produce from twenty to twenty-five bushels to the acre. Do Connecticut people care to raise soy beans with this outlook, especially when it is considered desirable to inoculate the soil with a certain bacteria before attempting to get a crop?"

1838. *San Francisco Chronicle.* 1917. Milk of the soy bean. July 27. p. 16.
• ***Summary:*** From Philadelphia Public Ledger: "The milk from soy beans, which cannot be distinguished from cows' milk by taste or by chemical analysis, is wholly practical, asserts Dr. Arao Itano, of the Massachusetts Agricultural College at Amherst. Dr. Itano, who is a native of Japan, and studied at European universities before coming to the United States, says that the soy bean is identical with cow's milk in composition. In Manchuria soy bean milk is in general use. Dr. Itano has improved upon the Manchurian process so that the slight bean flavor has been wholly eliminated. Soy bean milk can be produced at low cost, and Dr. Itano believes that it can be made to yield butter and other products. Members of the New England Milk Producers' Association, which has announced the intention of boosting the price of milk 2 cents a quart this month, says that while soy beans are rich in protein, the beans needed to produce a given amount of milk would produce more if fed to high-bred dairy stock."

• ***Summary:*** Section 25, titled *Aphis glycines* n. sp. (presented as a new species), discusses the hosts, distribution, and morphology of these aphides (insects). Its body is 1.6 mm long. Its habitat is Hokkaido, Japan. It feeds on soybeans (*Glycine hispida*). Its Japanese name is *Daizu-abura.* Address: Prof. College of Agriculture, Tohoku Imperial Univ.

1840. *National Geographic Magazine.* 1917. Russia's man of the hour: Alexander Kerensky's first speeches and proclamations. 32(1):24, 35. July.
• ***Summary:*** A full-page photo (p. 35, from the Boston Photo News Company) shows a bustling scene with many men and large sacks of soybeans. The caption states: "Soy-beans on the docks at Dalny, destined for Russian armies on the European battle front." Below that: "The soy-bean takes the place of meat in the diet of the Japanese and its nutritive properties are gradually being recognized by the peoples of occidental nations. It has been grown for centuries in China and Japan, and has recently been introduced into America and Europe as an important food and forage plant."

Note: This is the earliest article seen in *National Geographic* magazine that mentions the soy-bean.

1841. Williamson, A.A. 1917. Soya beans as an Oriental product. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 20(181):457-60. Aug. 4.
• ***Summary:*** "In response to requests from the United States for estimates of the quantities of soya beans and bean oil produced in this part of the world, the American consulate at Dairen, which is the center of the soya-bean industry in Manchuria, has prepared figures of exports of beans, bean oil, and bean cake for five years from the Chinese customs reports. It is generally understood that Manchuria's annual production of beans is between 1,500,000 and 2,000,000 tons.

"It is generally considered at Dairen that 48 kin of beans should produce one cake weighing 46 kin and 4 kin of oil. This kin is the Japanese measure of weight, which is equal to 1.3227 pounds avoirdupois, and 100 kin make 1 Japanese picul (132.27 pounds), which is the ordinary measure used by the bean trade here. This picul, however, is slightly different from the Chinese customs picul, which is 133 1/3 pounds. The latter is the picul used in the tables presented

© Copyright Soyinfo Center 2014

with this report, and 15 of them make 1 short ton of 2,000 pounds...

"It may seem strange that 48 kin of beans should produce 50 kin of products; but the 2 extra kin are taken up by the beans when, after being rolled, they are steamed before pressing...

"One mill at Dairen is using the extraction (benzine) process. This produces, of course, not bean cake but bean meal."

According to statistics compiled from Chinese customs reports, exports of soybeans from Manchuria rose from 1,724,292 tons in 1911 to 2,076,688 tons in 1915, as shown in a table. During the same period, exports of soya-bean oil rose from 65,919 tons to 81,863 tons, and exports of soya-bean cake rose from 911,821 tons to 1,112,661 tons.

Statistics (in tons) are also given for average annual production of soya beans at each of the main stations along the South Manchuria Railway. Changchun in the north is by far the largest at 300,000 tons. The total is 1,300,000 tons.

Note: This is the 2nd earliest English-language document seen (Feb. 2000) that uses the term "bean meal" to refer to ground, defatted soybeans. Address: Consul at Dairen, Manchuria.

1842. Langdon, William R. 1917. Bean and pea crops in the Hokkaido. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 20(193):654-55. Aug. 18. Submitted June 15.

• ***Summary:*** "The island of Hokkaido is Japan's principal producing district for beans and peas. An increased foreign demand for these products, which resulted from the war [World War I], stimulated production in Hokkaido enormously. The high prices that foreign purchasers are willing to pay for beans and peas, it is said, have created large fortunes for some of the Hokkaido growers.

"The areas under cultivation for the growing of these products in Hokkaido during 1916 were: Soya beans, 207,344 acres; small red beans, 107,539."

"Last year's production and prices: The production of beans and peas in Hokkaido in 1916 in long tons of 2,240 pounds each, by varieties was: Small red beans (*akashozo* or *adzuki*), 27,000; medium red beans (*dainagon*), 2,200; soya beans (*daizu*), 89,000...; large red beans (*kintoki*) 18,000...; total production of all kinds of beans and peas, 219,460 tons. These statistics were compiled by the local administration of Hokkaido."

A substantial increase in area cultivated to beans and peas in Hokkaido is expected next year, but the "1917 crop of soya beans in Hokkaido and the mainland of Japan is expected to be about the same as that of 1916."

"The total beans and peas for Japan proper, excluding Chosen [Korea] and Taiwan, in 1915, according to the official statistics of the Japanese Department of Agriculture and Commerce was: Soy beans, 18,848,283 bushels, valued at $16,247,118; small red beans [azuki], 4,771,183 bushels, valued at $5,002,667..."

A table shows total exports of beans and peas from Japan in 1915 and 1916. Exports of soya beans were 1,056,616 pounds worth $25,009 in 1915, and 1,715,347 pounds worth $38,823 in 1916. Address: Vice Consul, Yokohama, Japan.

1843. Frazer, Robert, Jr. 1917. Kobe's position in the bean trade. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 20(199):748-51. Aug. 25. Submitted June 26.

• ***Summary:*** Some soya beans and small red beans [azuki] are grown in the Kobe consular district, which comprises the central and western part of the main island of Japan. "The local trade, however, is by no means confined to beans grown in Japan, as very large quantities of soya beans, colored beans of various kinds, and a few white beans are brought here from Manchuria, North China, and Korea. The soya beans are bought chiefly for the extraction of their oil. When so used, drawback of duties is granted, and they do not appear in the customs statistics of imports." Note: It is not clear whether "white beans" refers to white azuki beans (probably) or white soybeans.

A table, based on statistics from the Department of Agriculture in Tokyo, shows production of various beans from 1913 to 1915. For soya beans: For 1913–Area planted: 1,043,058 acres. Production: 15,314,646 bushels. Value: Unknown. For 1914–Area planted: 1,138,282 acres. Production: 18,762,414 bushels. Value: Unknown. For 1915–Area planted: 1,153,577 acres. Production: 19,495,316 bushels. Value: $16,296,006.

Exports of soya beans from Japan in 1916 were 857 tons (1 ton = 2,000 lb) valued at $38,938. Imports of soya beans to Japan the same year were 80,691 tons valued at $2,270,000. Two great shipping ports in Japan are Kobe and Yokohama. The beans are graded by women pickers who earn the equivalent of 12½ to 15 cents a day. Address: Consul, Kobe, Japan.

1844. Tanaka, Soichiro. 1917. Shokubutsu hai o genryô to suru kasei kari eki seizô oyobi sono wara mushi kaihô ni okeru ôyô ni tsuite [On the manufacture of potash-lye from vegetable ashes and its application for the straw boiling process in the paper-making industry]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 20(234):844-50. Aug. English abstract. p. a32-33. [Jap; eng]

• ***Summary:*** "Various kinds of vegetable ashes were analyzed, but in the experimental preparation of KOH [potassium hydroxide], only the soybean pod ash and chestnut ash were used, owing to the deficiency of the other ashes. On lixiviating the soy bean pod ash containing

© Copyright Soyinfo Center 2014

16.19% of potassium carbonate with water and adding CaO [calcium oxide] to the filtered liquor a yield of 52.7% KOH was obtained. On adding water to the same ash and heating, and then adding CaO without filtering, the yield of KOH was 42.2%; chestnut ash containing 13.96% potassium carbonate similarly treated, but with 3 lixiviations, yielded 75.5% KOH; after 4 lixiviations, 85.6%. The yield of the lye apparently depends upon the filtering process. The lye obtained from the soy bean pod ash was used for boiling straw and the straw thus treated was further bleached with bleaching powder, the results being satisfactory...” Address: Kôgaku-shi, Japan.

1847. Stoddard, William Leavitt. 1917. Soy: The coming bean. *Good Housekeeping* 65:77, 126-28. Sept. [4 ref]
• ***Summary:*** *"Good Housekeeping* asked the Department of Agriculture to tell its readers the truth about the soy bean. This article is the department's answer. In the [Good Housekeeping] Institute Kitchen new recipes and methods of using the soy bean were evolved and tested. These recipes will be found at the end of this article. A list of dealers in various sections of the country who carry a supply of soy beans will be mailed upon request accompanied by a stamped addressed envelope.

"'The soy bean, also called the soja bean, is a native of southeastern Asia, and has been extensively cultivated in Japan, China, and India since ancient times... The beans are there grown almost entirely for human food, being prepared for consumption in many different ways. Their flavor, however, does not commend them to Caucasian appetites and thus far they have found but small favor as human food in either Europe or America.' Thus declared a bulletin of the Department of Agriculture [Piper and Nielsen. 1909. Farmers' Bulletin 372] before the war. Less than three months after our entrance into the war–and the entrance of the United States as a nation for the first time into a food moderation and conservation campaign–this same authority stated that 'the soy bean has already reached a place of high economic importance in America and Europe as a foodstuff... During the past season the demand for seed by food manufacturers has resulted in greatly increased prices.' The soy is a coming bean if not *the* coming bean."

Sold in some American markets under the name Togo bean, the soy bean "now flourishes in an increasingly large acreage in Tennessee, North Carolina, Virginia, Maryland, Kentucky, and the southern parts of Illinois and Indiana. The earlier varieties even mature in Ontario [Canada] and our Northern states."

The American housewife probably does not care "that there is a factory in New York is making a 'vegetable milk' of soy beans; the "flour or meal [okara] which remains after the milk is manufactured is valuable both as a stock for feed and for human consumption; that soap manufacturers and paint manufacturers are using the oil of soy beans to replace more expensive oils; and that the substitute butter makers are using the fat of the soy bean in products which thousands of consumers are using all unwitting of its true nature.

"The thing that the American housewife wants to know today is where soy beans can be bought and what are the simplest uses of them... Probably the easiest and commonest method of cooking soy beans is to use them either for soup or to bake them."

Eight recipes are given; all but two call for "soy beans." Soy-bean bread (containing 20% of the flour in the form of "soy-bean meal" [a full-fat soy flour]), Soy beans and rice (with "1 tablespoonful Worcestershire sauce"), Soy-bean loaf with tomato sauce, Vegetable roast (baked), Savory baked soy beans, Soy-bean soup, Soy-bean muffins (with "1 cupful cold baked soy-bean pulp"), and Salted soy beans (deep fried).

Photos show: (1) Muffins made with soy-bean meal. (2) Soy-bean meal ground at the Good Housekeeping Institute; the hand-turned mill and two small piles of soy beans are shown. (3) A dish of soy beans and rice. (4) A soy bean plant. (5) A vegetable roast with soy beans as an ingredient.

Note 1. Theodore Hymowitz writes (12 Feb. 1990): "I have no idea if William Leavitt Stoddard was related to Illinois soybean pioneer William Hoyt Stoddard. William Hoyt had one brother named Charles Lumas Stoddard."

Note 2. This is the 2nd earliest document seen concerning soybeans in connection with (but not yet in) Togo.

Note 3. This is the earliest English-language document seen (Dec. 2012) that uses the term "Salted soy beans" to refer to soynuts. It is also the earliest document seen in any language describing the frying or deep-frying of whole soybeans to make soynuts. Previously soynuts had always been dry roasted.

Note 4. This is the earliest article on soy seen (Aug. 2002) in *Good Housekeeping* magazine.

Note 5. In the recipe for Soy-bean muffins the meaning of the ingredient "1 cupful cold baked soy-bean pulp" is not completely clear. This is the earliest document seen (June 2013) that uses the term "soy-bean pulp" (regardless of hyphenation). It probably refers to whole soybeans that have been baked then ground or mashed to a pulp and allowed to cool. However, the writer discusses okara earlier in this article, and this recipe may be calling for okara as an ingredient. If it is, this would be the earliest English-language document seen (June 2013) that calls for okara as an ingredient in a recipe. Address: [Macoupin Co., Illinois].

1848. Furukawa, Seiji; Tomizawa, Zenjirô. 1917. Kôryô no shôyu bôfu sayô ni tsuite [On the action of spices/perfumes as preservatives for shoyu. I & II.]. *Nogaku Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 182. p. 708-720. Oct. 5; No. 183. p. 781-83. Nov. 5. [Jap]
• ***Summary:*** Some 35 different *"koryo"* (spices) were tested. Most of these are not commonly known substances. They include menthol, folmarin, etc. Address: Itô Kochôen Kenkyû-bu.

1849. Satow, Sadakichi. 1917. Vegetable proteid product and process of making the same. *U.S. Patent* 1,245,975. Nov. 6. 3 p. Application filed 25 Nov. 1916.
• ***Summary:*** "The object of this invention is to provide commercial products utilizing vegetable proteids which

© Copyright Soyinfo Center 2014

products possess a high degree of transparency, flexibility and elasticity, and a simple, efficient, and economical process of manufacturing the same.

"A further object is to provide a non-inflammable celluloid-substance as a condensation product of vegetable proteids..." "Proteids possess amphoteric properties..." For example glycinin, which forms the chief constituent of soya beans, has strong acid properties and has a strong tendency to form complex salts with alkaline reacting agents. The author calls these "alkali compounds," and they differ in properties from the original proteids in many commercially important respects: They have (1) greater adhesiveness and are therefore easier to mold; (2) a high degree of elasticity and flexibility; (3) only a moderate speed of condensation; (4) no tendency to crack while drying; (5) a transparent color. The "vegetable proteidal substances" or "refined proteidal matter" can be coagulated or "glutenized" and are then usually immersed in a formaldehyde solution. They may then be molded and dried. They are good insulators of electricity and may be used as a substitute for ebonite, celluloids, bakelite, ivory, or marble. Address: Sendai, Japan.

1850. Satow, Sadakichi. 1917. Proteidal composition and process of making the same. *U.S. Patent* 1,245,984. Nov. 6. 3 p. Application filed 17 May 1917.
• ***Summary:*** "The object of the invention is to provide a vegetable proteidal composition suitable for use in the manufacture of various commercial products, such as linoleum, wood carpet, floor coverings, boards, tiles, insulating compounds, rubber substitutes, celluloid-like articles, and the like." Seven types of coagulants (called glutinizing agents) for the protein(s) are listed: "(1) inorganic acids, such as phosphoric acid, sulfurous acid, and the like; (2) fatty or oxy-fatty acids, such as formic, acetic, propionic, phenyl-propionic, malonic, lactic, tartaric, citric, matic, and the like; (3) aromatic acids, such as salicylic, benzoic, or the like; (4) phenols, such as carbolic acid, cresol, resorcin, nitro-creosol, and the like; (5) organic bases, such as pyridin, urea, analin, glycin, naphthylamin, or other amino compounds, or the like; (6) organic bases such as caustic alkali, ammonia, or the like; or (7) alkali salts of weak acids, such as borax, sodium phosphate, and the like." "The properties of the mass are still further improved if a small quantity of alkali is added thereto."

The result is a "plastic composition." Soybeans are not specifically mentioned. Address: Sendai, Japan.

1851. Satow, Sadakichi. 1917. Celluloid-like substance and process of making the same. *U.S. Patent* 1,245,976. Nov. 6. 3 p. Application filed 11 Dec. 1916.
• ***Summary:*** "This invention related to the condensation products of vegetable proteins... Example 1: The proteid or soja bean, glycinin, is dissolved in formic acid at a low temperature. If necessary to effect the solution of the proteid the temperature may be raised to about 50º C. The excess of the formic acid and water is evaporated under a high degree of vacuum. The viscid mass thus obtained is molded into the desired shape and dried after which the molded article is hardened by being immersed in a solution of formaldehyde.

"The product obtained as above described is a celluloid-like substance, is non-inflammable, waterproof and acid proof. It is a good insulator of electricity and may be used as a substitute for ebonite, celluloids, bakelite, ivory, marble or the like."

Note: This is S. Satow's first U.S. patent relating to soja beans. Address: Sendai, Japan.

1852. Satow, Sadakichi. 1917. Insulating compound and process of making the same. *U.S. Patent* 1,245,980. Nov. 6. 3 p. Application filed 30 Dec. 1916.
• ***Summary:*** To obtain insulation for electricity, the author uses "vegetable proteids or proteidal substances... such as beans, peas, wheat, corn or other leguminous cereal or grain products." After the oil is removed with a solvent such as "benzin," the benzin is removed and from the resulting meal a refined proteid product is produced. This is processed in various ways, including with formaldehyde.

Note: Although soybeans are not mentioned in this patent, Satow did extensive research on soybeans, and he mentions "beans" as his first source of vegetable proteids; he was clearly referring to soybeans.

Note: This is the earliest English-language document seen (Aug. 2003) that uses the word "proteidal" in connection with the soybean–to refer to its protein. Address: Sendai, Japan.

1853. Satow, Sadakichi. 1917. Lacquer and process of making the same. *U.S. Patent* 1,245,981. Nov. 6. 4 p. Application filed 30 Dec. 1916.
• ***Summary:*** "The objective of the invention is to utilize vegetable proteids in the manufacture of lacquer." An oil solvent such an benzin may be used to remove the oil. Raw materials include soja bean or corn. One process consists of glutinizing vegetable proteids with cresol. Address: Sendai, Japan.

1854. Satow, Sadakichi. 1917. Lacquered product and process of making same. *U.S. Patent* 1,245,982. Nov. 6. 3 p. Application filed 1 Feb. 1917.
• ***Summary:*** "This invention relates to lacquered products such as tile, glass, brick boards, and the like... The objective of the invention is to utilize vegetable proteids in the manufacture of lacquered products..." Raw materials include beans, peas, wheat, corn, etc. When the lacquer has dried, it may be polished to produce a desirable luster. "Very beautiful ornamental effects are produced by applying differently colored coating liquids to different parts of such surface..." Address: Sendai, Japan.

© Copyright Soyinfo Center 2014

1855. *Board of Trade Journal* (*London*). 1917. Japan (Corea). Inspection of rice and soya beans for export. 99:326. Nov. 8.

• ***Summary:*** There are new regulations concerning the inspection of soya beans exported from Corea, or from one province of Corea to another. "H.M. Consul-General at Seoul (Mr. A.H. Lay C.M.G.) has forwarded a translation of amended regulations (published in the 'Official Gazette' of 8th September) for the inspection of rice for export to foreign countries or to Japan or for conveyance from one province of Corea to another. These regulations (Order No. 62 of the Government-General of Corea), which take effect from 1st October, 1917, are more detailed than those they replace (i.e., Order No. 4- of 1915), and provide for the grading of rice into five classes, viz.–superior, first, second, and third class, and that which does not come up to standard and the exportation or conveyance of which is consequently prohibited. The Order does not for the time being apply to the Provinces of Kogen (Kong-won) and North and South Kankyo (Hambyeng), the three divisions of the country in which the production of rice is less than elsewhere.

"H.M. Consul-General has also forwarded a translation of Order No. 63 of the Government-General, which applies to the whole of Corea and takes effect from 1st October, 1917, making regulations for the inspection of soya beans, these regulations being practically identical with those contained in the above-mentioned Order referring to rice.

"The above-mentioned translations may be consulted by British firms interested at the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2." Address: British Consul-General at Seoul.

1856. Davis, John K. 1917. China. Antung. *Supplement to Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) No. 52f. p. 1, 4, 8-9. Dec. 4.

• ***Summary:*** Discusses: 1. Exports of beans and bean products. A table shows that soybean exports from Antung rose from 15.2 million lb in 1913 to a peak of 45.1 million lb in 1915, falling to 36.2 million lb in 1916. Exports of bean cake rose from 72.6 million lb in 1913 to a peak of 100.5 million lb in 1915, falling to 98.6 million lb in 1916. Exports of bean oil from Antung rose from 384,133 lb in 1913 to a peak of 5,034,933 in 1916.

2. Bean cake sent to Japan and oil to United States. Most bean cake is used in Japan as fertilizer. "A strong American demand for bean oil caused an unusually large proportion of the product of southern Manchuria to pass through Antung to Japan, whence it was ultimately shipped to United States Pacific ports. During 1916, there were 12 small bean-oil mills, 11 Chinese and 1 Japanese, operated in Antung. The output of these represents but a small part of the bean oil and bean cake exported through Antung." 3. Trade with the United States. Soya-bean oil and pongee silk are shipped from Antung to Japan and then to America. Chinese firms are not equipped to export to western countries. Address: Consul, Antung, Manchuria.

1857. Davies, W.J. 1917. Oil industry of Japan. *Board of Trade Journal* (*London*) 99(1,100):675-80. Dec. 27.

• ***Summary:*** Since the outbreak of the war, "the trade in coconut oil has expanded tremendously. The export of [soy] bean oil and rape oil has also developed,..."

Before the war, the oil industry in Japan was not considered a lucrative one, and only the very largest factories, which processed several types of oilseeds, were able to make a profit. The increase has taken place despite the loss of the German market; before the war, Germany imported large quantities of oil from Japan.

"The main reason for the former unprosperous condition of the Japanese oil trade was due to the existence of innumerable small oil companies struggling against each other with old-fashioned and non-efficient methods." Moreover, most of the oilseeds had to be imported and processors situated at or near a port had a strong advantage. Kobe and Osaka emerged as the key port cities for Japanese oil mills.

"While the soap industry was in its infancy in Japan, there was not much opening for the use of vegetable or animal oils at home. Now, however, the industry is in a flourishing condition; large quantities of soap being exported annually to China, there is a more extensive home consumption of oils than was formerly the case. The residue, too, finds a wider home market."

There are now in Japan 10 companies with a capital of £10,000 and over; they are located in Nagoya (3), Osaka (2), Otaru (2), and Kobe (2). Several new oil companies are being planned. One, founded in Osaka with a £50,000, will build a new factory at Fukai Bay to make coconut and soya bean oils, and [soy] bean cake. Plans are also in process to establish a company with £100,000 to harden [hydrogenate] oil, to manufacture candles for export. "In Dairen experiments in connection with the hardening of bean oil have been so successful that a company has been formed to exploit the discovery on a commercial scale." It could be used as a substitute for tallow in the manufacture of soap and candles, or for making margarine and other food products.

"Methods of oil expression–In Japan the primitive wedge press is fast giving way to the more up-to-date hydraulic press which is to be found installed in all the large mills in the Osaka and Kobe districts. Even in the smaller mills the circular press, which is merely a more efficient modification of the wedge-press, is to be found. Hot expression is generally used.

"Vegetable oils: The vegetable oils produced in Japan in their natural classification according to properties are:– Drying: Linseed, perilla, hempseed, tung. Semi-drying: [Soy]

© Copyright Soyinfo Center 2014

bean, rape (or Colza), cotton seed, sesame. Non-drying: Coconut, peanut, camellia, castor. There follows a long discussion of most of these.

"Soya bean oil.–There was a great increase in the export from Japan of bean oil during 1916.

"The present prosperous condition of the soya bean oil trade owes a great deal, of course, to the general shortage abroad of fats of all descriptions, especially in the soap-boiling trade, and, in addition, the failure of the cotton crop in the United States in 1915 caused a brisk demand from that country for bean oil. The chief buyer had been, of course, the United Kingdom, but a remarkable feature off the oil trade of Dairen during the last three years has been the growth of the exports to the Netherlands. As showing the developments referred to, the following figures for the export of soya bean oil from Dairen may be given:–To the United Kingdom, 204 tons in 1913; 8,495 tons in 1914; and 16,498 tons in 1915. To the Netherlands, 211 tons in 1913; 1,064 tons in 1914; and 9,600 tons in 1915.

"Most of the factories in Japan which are engaged in the expression of oil from seeds include the manufacture of bean oil in their operations, whilst many soap factories express the oil for their own purposes.

"In Dairen their are two large mills, one with a capacity of 6,000 cakes daily, and the other of 4,000 cakes capacity. In addition there are 40 or so native mills producing over 5,000 cakes daily. These mills are primarily intended for cake manufacture and the oil is shipped to Japan for transhipment [transshipment] to Europe. The cake is also shipped to Japan. As a fertiliser bean-cake enjoys a great vogue, and it is also occasionally fed to horses on account of its muscle-forming properties. The cake is also, after pounding, treated in Japan by solvent methods for the extraction of the residue of oil.

"The following figures show the enormous increase in the export of bean-oil from Japanese ports during the last three years:–1914, 236,797 yen; 1915, 255,655 yen; and 1916, 921,292 yen."

Also discusses vegetable wax (obtained from the berry of the "Haze" tree, and widely used to make candles for Japan), fish oil, whale oil, glycerine (sold to arsenals) from fish oil, and tallow (though there are few live stock in Japan). Address: H.M. [British] Consular Service in Japan.

1858. Frazer, Robert, Jr. 1917. Japan. Kobe. *Supplement to Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) No. 55c. Dec. 31. p. 15-40.
• ***Summary:*** Goods shipped from Osaka to all countries: Pea cheese (miso): In 1915 612,517 lb worth $16,379 was exported; in 1916 this rose to 886,245 lb worth $23,268. Soy sauce: In 1915 80,977 gallons worth $32,157 were exported; in 1916 this decreased to 73,261 gallons worth $29,881.

Imports at Kobe from other countries included soya beans and oil cake. Tables summarize imports to and exports from Osaka for the years 1915 and 1916. Address: Consul, Kobe, Japan.

1859. Scidmore, Geo. H. 1917. Japan. *Supplement to Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) No. 55c. 40 p. Dec. 31.
• ***Summary:*** One "important item of import is bean-oil cake, which comes practically all from Kwangtung Province and China. These imports were valued at $17, 234,382 for 1916 and the quantity amounted to 1,727,079,733 pounds." In the table of articles imported, bean-oil cake is listed under fertilizers, and is by far the largest value. Cottonseed and rapeseed oil-cake were also imported for use as fertilizer in 1916, but the value of each was only about 4% that of bean-oil cake. Small amounts of manures and bone dust were also imported as fertilizers. Of the $2,263,504 worth of soya bean imported, 74% came from China [including Manchuria], 19% came from Kwangtung Province [controlled by Japan], and 7% came from Asiatic Russia. But of the $17,234,382 worth of bean-oil cake, 57% came from Kwangtung Province, 25% came from China, and 2% came from Asiatic Russia.

Exports of "soy" (soy sauce) from Japan were worth $491,596 in 1915 and $533,545 in 1916. Of the 1916 amount, 34% went to the United States, 26% went to Hawaii, and 13% went to Kwangtung Province. A small amount was exported to the Philippine Islands. The volume exported is not given; "soy and vinegar" are grouped together.

Within the report from Japan is a report from Kobe by Consul Robert Frazer Jr.

Note: This is the earliest document seen (Feb. 2001) concerning soybeans in the former USSR after it was established in Nov. 1917. This document contains the earliest date seen for soybeans in the USSR (1917). Address: Consul General, Yokohama.

1860. Williamson, A.A. 1917. Methods of making soya-bean oil in Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 20(305):1227-29. Dec. 31.
• ***Summary:*** "Two processes are employed at Dairen for making oil from soya beans. One, known as the 'extraction process,' is a chemical method which, by the use of benzine, extracts the greatest amount of oil from the beans. When it is employed, not cake but bean meal is produced, and this is said to be preferred to cake for fertilizer, as it requires no breaking before it is used on fields. The oil, however, is said to sell for less than that produced by the 'expression process,' as it is difficult to remove all traces of benzine from the oil. The term soya-bean oil is generally understood to mean expressed oil.

"Only one mill at Dairen uses the extraction process. It

© Copyright Soyinfo Center 2014

was built as an experiment by the South Manchuria Railway, and was subsequently sold to the firm of Suzuki & Co., at Kobe, Japan. The machinery was brought out in sections from Germany, set up by German experts, and operated by them for some months. It is not possible to visit this plant, as it is closed to the public, and those who wish to inspect it must obtain permission from the head office at Kobe."

"Fifty-odd mills, large and small, are using the expression process at Dairen... Vertical presses of four columns of about 25 cakes per column are used, some mills having double presses–presses on two floors, one directly above the other and built as one machine, with the power applied at the same time in one operation. It is customary to work these presses by hydraulic power. They are displacing the old hand-power screw press."

A detailed description is then given of how the soybeans are pretreated, the forms are made, and the oil is expressed and then strained and the sediment allowed to settle out. The oil is not refined. The presses used at Dairen are made chiefly by the Osaka Iron Works, Osaka, Japan; and by the workshops of the South Manchuria Railway at Shakako, a suburb of Dairen.

Note: This is the earliest document seen (Feb. 2001) concerning Suzuki & Co. (*Suzuki Shoten*), which later became Hohnen Oil Co., Ltd. Address: Consul, Dairen [Manchuria].

• ***Summary:*** Vegetable butters, made from cocoa butter or coconuts, are very useful as butter substitutes. There are many kinds of artificial milk; they are easily digested and low in cost. Vegetable milk is the concentrated milk of almonds, sterilized and sold in cans. It is used as a medicine for infants, but it's high price makes it unsuited as a wartime food.

Soya milk (*Le lait de soya*), a milk extracted from soya beans, comes from Japan where it has long replaced natural milk that is very rare in that country. It is easy to digest and inexpensive. In times of war, it can be used advantageously to replace butter. In 1913 Germany was already importing 125,448 tonnes of soybeans, from which it extracted 18,000 tonnes of oil and milk. A table shows the nutritional composition of soy flour, soymilk, and cow's milk.

1868. Couling, Samuel. 1917. Encyclopaedia Sinica: Bean, Soya. London: Oxford University Press, Humphrey Milford; Shanghai: Kelly and Walsh. See p. 46. 28 cm. [2 ref]
• ***Summary:*** "*Glycine hispida,* Monch. or *Dolichos soja,* L. This bean, so valuable for the oil which is expressed from it, has come into great prominence of recent years, owing to the enormous dimensions of the export trade in it since the Russo-Japanese War... The oil-yielding variety par excellence is the yellow bean, of which nearly 15 million piculs, or not far short of one million tons, were exported in 1915, 90% of this being from Manchuria, and the balance from Chihli, Hupei and Kiangsi... For several generations beans, but more especially beancake, had been sent to South China as manure for the sugar plantations; exportation abroad was prohibited until 1869, when shipments were made to Japan, which soon became a large customer both for beans and bean oil... In the Far East soya beans are used, as human foodstuffs, for making soy [sauce], bean paste, or *chiang,* as *tou fu* or beancurd, in soups, etc.; in cooking instead of rapeseed and sesamum oil; and the cake is employed as a fertilizer and for fattening hogs... Besides the Soya Bean there are many other kinds of bean cultivated in China, and entering largely into the diet of the people. The chief of these is *Phaseolus mungo* L, the green bean Lü Tou [mung bean], which contains little oil but is used in the manufacture of vermicelli.

© Copyright Soyinfo Center 2014

"The annual export of vermicelli, principally from Chefoo, is considerable–amounting in both 1913 and 1915 to nearly Hk. Tls. [Haikwan Taels] 3,000,000; it goes to Chinese emigrants abroad." Address: M.A. (Edin.), Lately honorary secretary and editor, North China Branch, Royal Asiatic Society.

• ***Summary:*** Dedicated to the Prof. Friedrich Haberlandt, who introduced the soybean to Central Europe. Contents: Foreword. Introduction: The soybean. Ways of using the soybean in its homeland (East Asia, especially Japan and China). Shoyu or soy-sauce. Miso (vegetable cheese). Natto. Tofu of the Japanese or Tao-hu of the Chinese (bean cheese). The soybean as an oilseed. Soybean meal (and flour). Soy as a coffee substitute or extender. Soybean milk. Soy meat substitutes. Soybeans as a chocolate substitute. Soy rubber substitute. The utilization of the soybean in agriculture: As cow fodder. Summary. Bibliography.

Photos show: (1) A field of soybeans (p. 6). (2) A soybean plant with the leaves removed to show the pods (p. 12). (3) Soy beans and pods from inoculated and uninoculated plants (p. 13).

Contains numerous tables, most without captions and mostly from other sources–See pages 11, 16-17, 19, 25, 27, 30, 35-37. Contains one of the best early European bibliographies on the soybean.

The author wrote this book during World War I. In his first book, published one year earlier in 1916 and titled "The Introduction of Soya, a Revolution in the Food of the People," he discussed what he believed to be the great agricultural and nutritional value of the soybean. He uses two terms, *Die Soja* and *Die Sojabohnen* to refer to soybeans.

Chapter 1 (p. 5-7): In 1908 England started to import large quantities of soybeans; in 1909 these increased to 400,000 tonnes and in 1910 to 800,000 tons. Also in Germany, in the years just before World War I, imports of soybeans climbed in an unexpected way, reaching 43,500 tonnes in 1910, 90,600 tonnes in 1911 and 125,200 tonnes in 1912. Note: These units are given in dz. One dz (*doppelzentner*) = 100 kg.

The first manufacture of soyfoods in Europe took place in France, at Valees near Asnieres, where they made flour, bread, cakes, cheese [tofu], and soymilk (*Mehl, Brot, Kuchen und Käse, vegetabilischer Milch*)–though only in small quantities and, above all, for diabetics. In England, soy flour has been used for a long time in the preparation of cakes (p. 5-6).

However it was in Germany that the utilization of soybeans for food took place on a large scale; this began shortly before the war. The supply of foods to Germany was almost completely cut off during the war, so general attention soon turned to the new foods prepared from soybeans and people quickly became aware of their great nutritional value. Thus, in the middle of the war, a soybean industry was built in Germany. Unfortunately this youngest twig of the food industry was left crippled due to lack of raw materials. However one can predict that this industry has a bright future because of the great encouragement given to these products in so short a time. For example, in October 1914 the *Agumawerke* (Aguma Works) located in Harburg (near Hamburg) on the Elbe, first began mass production of a soy flour according to its own process. During the next few years it made many thousands of tonnes of this meal, until the production had to be stopped for lack of raw materials (p. 6).

Equally gigantic sales of soy products were made by the *Soyamawerke* (Soyama Works) in Frankfurt am Main; this company made only soy food products. In addition to a meal (flour), it also produced a meat substitute (*Fleischersatz*), and, largely from soybeans, fresh and dried milk (*Frisch- und Trockenmilch*) as well as a fresh and dried cream preparation (*ein Frisch- und Trockenrahm-Präparat*). Likewise, this firm had to cease production of most of its soy products because of difficulties in soybean procurement, and concentrate only on the production of meat substitutes (*Fleischersatz*). These articles likewise entered all classes of the population splendidly as is seen from the large demand for them. Within 3-4 weeks this firm had orders for more than 1½ million pound cans, of which unfortunately it was able to satisfy only a small part. In addition to these two well-known firms, there are in Germany still a number others that are occupied with the production of foods from the soybean.

In Austria [the Austro-Hungarian empire], there exists a unique firm, the food factory Santosa in Prague [in the Czech Republic as of Sept. 2002], which is still processing soybeans. They introduced soy coffee into commerce. I understand that in Austria a large-scale soy processing venture is now being planned.

Certainly the soy processing industry finds itself in a beginning state and, like all young industries, in need of improvement. Remember the sugar-beet industry was also once young but it made improvements and went on to great success, as will be expected of this new twig on the food industry. In any case, the beginning of utilization of the soybean as food for the people has been made, and in the foreseeable future the soybean may, as in China and Japan, become an indispensable part of our people's food.

It is different with the introduction of the soybean as a cultivated plant in Central Europe. Forty years ago Friedrich Haberlandt showed (and after him countless others have shown) that the soybean grows well in Central Europe. Although additional new tests verify this, there are still those who object to soybean culture. One objection is the long time

© Copyright Soyinfo Center 2014

required by the soybean to come to maturity; the answer is the development of new varieties. Another is the relatively low yield compared with other beans; the answer lies in the use of inoculation. The author then discusses nutrient yield per acre and per unit of money, showing both to be high for soybeans.

Pages 10-11: It is well know that legumes possess the ability to transform and fix free nitrogen from the air. In 1886 Prof. Hellriegel discovered that this capability is due to certain bacteria that live in the soil and move through the root hairs into the root, where they cause nodule formation. The nitrogen-fixing bacteria living in the nodules nourish the plant. The author then talks about inoculation using either soil from a previous planting or "Nitragin," a pure culture of root bacteria, which is well known and has recently been improved. Dr. Kuehn of Berlin-Grunewald showed that soil inoculated with Nitragin gave a 3- to 4-fold increase in yield, plus an increase in protein in the roots and leaves. He then discusses improved cultural practices. Winkler says that transplanting improves yields. Continued. Address: Frohnleiten, Steiermark [Austria].

1870. Fuerstenberg, Maurice. 1917. Die Soja, eine Kulturpflanze der Zukunft und ihre Verwertungsmoeglichkeiten [The soybean, a cultivated plant of the future, and possibilities for its utilization. Part II (Document part)]. Berlin: Paul Parey. 40 p. 28 cm. [59 ref. Ger]

• ***Summary:*** Continued on p. 14. Ways of using the soybean in its homeland (East Asia, especially Japan and China): Note: In this section, starting on p. 15, the author repeatedly uses the word *Sojaspeisen* meaning "soyfoods." The soybean probably originated in India. The Chinese and Japanese used it to fortify their rice-based, protein-poor diet. The practice came before the theory. The author says (incorrectly, p. 15) that all the basic soyfoods are fermented. He then gives a long description of koji and how it is made.

Shoyu or soy sauce (*Shoju oder Soja-Sauce*) (p. 15-17): In Japan, 540-720 million liters are manufactured each year so each Japanese uses 60-100 ml/year. The fermentation time is 8 months to 5 years. The best soy sauce is fermented for 3 to 5 years. He explains how, as soy sauce is fermented, the protein is broken down into amino acids such as leucine, tyrosine, and members of the "Xanthin" group.

Miso (vegetable cheese, p. 17-18): Miso is widely used in soups. More than half of the yearly Japanese soybean harvest is used for making miso. This is 30 million kg per year. Types of miso include *shiro miso* and Sendai miso. Winkler, in his small work titled "The Soybean of Manchuria," mentions two other types of miso: Aka or red miso and nuka miso. Kellner investigated five types of miso; a table shows their composition. Loew reports that this vegetable cheese (miso) is consumed either raw or in soups. Kellner, Nagasaka and Kurashima report that, based on their investigations, the amount of amino-nitrogen increases 3-fold and the quantity of carbohydrates is significantly diminished through lactic acid and alcoholic fermentation. The carbonic acid created thereby rises significantly during fermentation (Loew).

Natto (p. 18): Discusses the findings of Yabe.

Japanese tofu or Chinese Tao-hu (p. 18-20): This is the so-called "bean cheese" (*Bohnenkäse*). A table (p. 19, from König) shows the nutritional value of fresh tofu (84.8% moisture) and frozen tofu (17.0% moisture). E. Senft studied frozen tofu, a Japanese military preserved food (*Militärkonserve*) that is not canned; he found it had a beige color and a unique, slightly sour aroma which was at times reminiscent of dextrin. It has a uniform texture throughout, with many tiny pores. Winkler refers to five other types of soy cheese. Concerning the military preserved foods, they were highly regarded during the Russo-Japanese War and (according to Senft) played a key role in the war. (Footnote: The descriptions of the various preparations made from soya make E. Senft's treatises (1906 and 1907) valuable; in them he published his investigations of a number of Japanese vegetable foods and military preserved foods or conserves). The well-known food manufacturer Maggi in Kempttal, Switzerland, has tried for many years to introduce a commercial miso-like product, but was not successful.

The soybean as an oil plant (p. 20-26): Winkler, in his brochure, discusses the uses of soybeans in Manchuria. After 1908, soybeans were sold in Europe at incredibly low prices which resulted in the expansion of imports and production. Then tariffs were levied on soybeans. There were some major problems in the Austrian oil industry.

Soybean flour (*Sojabohnenmehl;* p. 26-28): In recent years, various processes have been patented. One manufacturer is Soyamewerke in Frankfurt am Main, which makes *Soyama Kraftmehl*. Yellow soybeans are mechanically cleaned, washed, dried, and dehulled according to the process of Dr. Fritz Goessel. Agumawerke in Harburg also makes soy flour.

The soybean as a coffee substitute and extender (p. 28-31): Coffee is known to be detrimental to good health and void of nutrients. Rye, for example, has been used since the 17th century as a coffee substitute. Barley also plays a major role, especially as malt. A table (p. 30) shows the nutritional composition of ten coffee substitutes, including chicory, figs, lupin, and carob. Soy coffee tastes remarkably similar to real coffee. In Istria (*Istrien*), in the Austrian alps, in Switzerland as well as in Alsace (*Elsass*), the soybean has been used since its introduction as a coffee substitute. Haberlandt reported in his work that a teacher from Capo d'Istria told him that the soybean was used as a coffee substitute in Istria, and a friend told him that there was no difference between the flavor of the two. The Thunschen is used to make good soy coffee. The soybeans are mechanically cleaned, put into a trommel, agitated with water at 65-70ºC,

© Copyright Soyinfo Center 2014

brushed and thereby freed of a large number of impurities which can leave a burned smell. The aroma of soy coffee can be improved by impregnation with an extract of largely decaffeinated coffee. It has roughly twice the nutrients of regular coffee and no harmful constituents.

Soybean milk (*Sojabohnen-Milch,* p. 32-33): The most popular vegetable milk is Dr. Lahmann's Vegetable Milk (*Lahmannsche Vegetabile Milch*), an emulsion made from almonds and nuts. In Japan, they make milk from soybeans; he describes the process, inaccurately, based on information from Winkler. This milk is also used to make cheese [tofu]. Also in Europe there have been successful attempts to make a soymilk adapted to European tastes, as in France by the Caseo-Sojaine at Vallées near Asnieres, and in England by the Synthetic Milk Syndicate. Using the process of Dr. Fritz Goessel, the latter company has a factory in Liverpool; it makes 100 liters of soymilk from: 10 kg ground soybeans plus 5 gm sodium phosphate, 2.4 kg lactose, 2 kg sesame oil, 6 gm common salt, and 60 gm sodium carbonate. Also the Soyamawerke in Frankfurt makes a soybean milk, named Soyama, as mentioned above (fresh and dried milk and cream). Recently Prof. Melhuish developed a new method using soybean, peanuts, and added coconut milk fat.

Soy meat substitutes (*Soja-Fleischersatz;* p. 33): Soyamawerke makes a product named *Soyama-Fleisch-Ersatz.*

Soybean as a chocolate substitute (p. 34): Haberlandt reports such a product.

Soya rubber substitute (p. 34): Goessel and Sauer have developed a rubber substitute made from soybean oil.

The utilization of soya in agriculture (p. 34-38): Use as fodder for cows. In 1880 Blascowicz [Blaskovics], Assistant at the Royal Hungarian Academy in Hungarian Altenburg, conducted fodder tests, whose results are given in various tables.

Conclusions (p. 38).

Note: This is the earliest document seen that uses the word *Ersatz* or the word *Fleischersatz.* They mean "artificial or inferior substitute" and "meat substitute" respectively. Though often associated with World War I, the word "ersatz" (which means simply "substitute" in German) was actually adopted into English as early as 1875, in reference to the German army's "Ersatz reserve," or second-string force, made up of men unqualified for the regular army and drawn upon only as needed to replace missing soldiers. Hence the meaning "inferior substitute." Address: Frohnleiten, Steiermark [Austria].

1871. Fuji, Shôzô; Endô, Kôtarô. 1917. Tokubetsu hôkoku. 1, Ryokuhi daizu no kenkyû Special report no. 1: Research on soybeans as a green manure crop]. Nagaoka, Niigata prefecture, Japan: Niigata prefecture Agricultural Research Lab (Niigata-ken Nôji Shiken-jô). 6 p. 23 cm. [Jap]*

• ***Summary:*** Nagaoka is a city located in the central part of Niigata Prefecture, Japan. It is the second largest city in the prefecture, after the capital city of Niigata. Address: Japan.

1872. Kinoshita, Asakichi. 1917. Shôyu seizô ni kansuru kôjô keisû [On the yield of products in the production of shoyu]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 20(236):1124-43. [Jap]

• ***Summary:*** Gives figures on the amount of ingredients used in "shoyu" and the amount of finished product resulting.

The proportion of ingredients employed are as follows: Soy beans, 0.5 koku (1 koku = 180.39 liters); wheat, 0.5 koku; common salt, 0.5 koku; and water, 1.0 koku. The beans when washed, steeped, and steamed, gain about an equal amount in weight and volume compared with the original. The wheat, when parched/roasted and crushed, increases to about 1.8 times its original volume and loses about 0.16 of its original weight. The mixture of beans and wheat is transformed into "koji," the yield of koji being about 1.6 by volume and 0.9 by weight. The koji is mixed with a salt solution (specific gravity 1.143-1.152) and stirred occasionally. When the summer comes, active fermentation sets in and after one year, finished "moromi" is obtained, its weight being 85 kwan (1 kwan = 3.75 kg). This moromi is pressed, and the liquor is pasteurized, yielding about 1 koku of Japanese soy.

1873. Lyman, Benjamin Smith. 1917. Vegetarian diet and dishes. Philadelphia, Pennsylvania: Ferris & Leach. 416 p. See p. 155-58. Index. Portrait. 21 cm. [3 ref]

• ***Summary:*** Discusses the physiological, economical, and ethical advantages of a vegetarian diet, with recipes and principles of preparation. The author, who wrote mostly about geology, lived 1835-1920.

A large table titled "Composition of foods" (p. 44-47) gives the percentage of protein, fat, carbohydrates, and ash (on a dry basis) for many foods, including natto, fresh tofu, soy bean–dried, Swiss miso, soy [shoyu] No. 1 and 2, and white miso (all figures from Abel 1900), plus peanuts–dried.

In the chapter titled "Foods of vegetable origin" (p. 141-267), the section on "Pulse" (p. 152-78) contains a subsection titled "Soy bean" (p. 155-58), which begins: "The soy bean of China and Japan is perhaps the most important food plant there, next to rice. The bean is eaten to a small extent boiled like other beans; but is generally elaborated into a variety of products remarkably rich in protein and fat and therefore going well with rice so deficient in those constituents." The following soy-related subjects are discussed, based largely on the writings of others: Soy sauce (Abel), natto (Abel), miso (R. Takahashi), tofu (Abel), *aburage, koritofu,* substitutes for milk and cheese, and nutritional comparison with eggs, milk and cheese (Abel, Atwater).

The section titled "Substitutes for milk and cheese" states: "The Chinese in Paris [probably Li Yu-ying] have

© Copyright Soyinfo Center 2014

been urging the culture of the soy bean. The seeds, when boiled, mashed, and pressed, yield both milk and cheese; if thinned with water, a very good substitute for animal milk; and if coagulated with mineral salt, a cheese that is usually eaten fresh, though it may be preserved by salting or smoking, after being cooked. Three varieties of the cheese are common in the oriental markets; a fermented kind [fermented tofu], white, yellow, or gray in color, with a piquant taste, like roquefort; a salty and white kind, like goats' milk cheese; and a third kind, smoky and resembling Gruyére. The soy cheese costs about a fiftieth as much as animal cheese; and in nutritive value, like the vegetable milk, compares very favorably with the ordinary products of the cow. ('Phila. Ledger,' Sept. 27, 1906)."

Note 1. No such article in the *Philadelphia Ledger* or the *Public Ledger* (Philadelphia, Pennsylvania), of this date, can be found.

Note 2. The idea of "Three varieties of cheese" came from Li Yu-ying (1905-1912) and in this case, where they are common in oriental markets, almost certainly refers to fermented tofu, and not to a Western-style cheese made from fermented tofu.

Note 3. This is the earliest U.S. document seen (Dec. 2008) that mentions smoked tofu.

The section on peanuts (p. 158-62) includes roasted peanuts, peanut butter, peanut taffy, and "Terralac or peanut-milk (here first published)." Details on how to make peanut-milk at home are given, followed by many recipes for its use–each preceded by the word "Terralac." Thus: Terralac custards, Terralac punch. Terralac cream, salad dressing, sauce, cream sauce, creams, blanc-mange [blancmange], cream pie, Bavarian cheese, Terralac in soup, "Ice-Terralac, or peanut ice-cream," peanut soup, salted peanuts.

There are also sections on the cowpea (p. 163+), almonds (p. 263-65; incl. salted almonds, marchpane, macaroons, nougat or almond cake, almond milk, orgeat syrup, burnt almonds, replacing almonds), vegetable-gelatine (p. 384-87, incl. carrageen or carragheen [carrageenan], Irish moss, and kanten), sesame oil or gingelly oil (p. 388), peanut oil or groundnut oil (p. 388), almond oil (p. 389), and sago and sago recipes (p. 390-91, incl. three sago puddings).

Note 3. *Merriam-Webster's Collegiate Dictionary* (1998) defines orgeat (a word first used in 1754) as "a sweet almond-flavored nonalcoholic syrup used as a cocktail ingredient or food flavoring."

1874. Morse, Edward S. 1917. Japan day by day, 1877, 1878-79, 1882-83. 2 vols. Boston & New York: Houghton Mifflin Co. Vol 1, xiv + 441 p.; Vol. 2, 453 p. Illust. (Color frontispieces + sketches). Index. 22 cm. [20+* ref]

• ***Summary:*** These charming books, illustrated with 777 illustrations from sketches in the author's journal, is a diary (to avoid the duplication of home letters; subjects are treated chronologically rather than topically), filled with detailed observations about most aspects of Japanese life and the author's pioneering work there as a professor. It gives a vivid picture of daily life in Japan in the late 1870s. Morse quickly grew to admire and love the Japanese people; his greatest problem was learning to enjoy Japanese food.

Volume 1: "Almost everything in the sea furnishes food for the masses... Seaweed, a thin green leaf, is also eaten; it is dried and put up in tin boxes," apparently a species of ulva. "I have mustered courage enough to taste a few of the dishes, and have succeeded in swallowing but one of them, and that was a kind of soup... Water was boiled in a tin vessel with a sauce [shoyu or miso] made from fermented bean [sic, beans], dark in color like Worcestershire sauce; into this were put slices of what looked like a cucumber, and then followed large blocks of a substance which resembled new white cheese [tofu], fresh from the press; this was cut into triangular slices. This last substance was made from [soy] beans, strained to remove the skins, and then made into a paste-like block. This soup was certainly nourishing and with a little practice one might come to like it. Another common article of food is made from seaweed an is known as *tokoroten"* (p. 87-88).

"It was delightful... to sit down again to a dinner of rare roast beef, real butter, and good bread. It is difficult to understand a country in which there is no milk, butter, cheese, bread, or coffee, and never has been. Butter is so distasteful to the Japanese that they cannot eat cake or other article of food in which composition butter is used" (p. 120).

A famous preparation is "cold raw fish, cut in this slices from the fish while fresh and alive. The idea of eating raw fish is particularly repulsive to our taste, though we eat raw oysters; nevertheless, foreigners soon get accustomed to it. The sauce [soy sauce] made of fermented [soy] bean, barley, and some other grain seems to have been specially created for this kind of food. I ate a great deal of it and must confess that my first experience was fairly good,... (p. 143-44).

"The tail of the fish was cut off and flung overboard... the [raw] fish was chopped into small pieces, head, eyes, bones, and all, and this hash was put into a wooden bowl... From a box was added a substance [miso] that had a very sour odor, something made of beans and allowed to ferment, a little water was added, and it was all stirred up together, and such an unsavory-looking mess I never saw before. The gusto, however, with which the man ate it to the last grain, showed that it was palatable to him at least" (p. 185).

"I have lived on rice, sweet potatoes, egg plant, and fish for two weeks. I would give all my old shoes, and new ones too, for a good slice of bread-and-butter, a bowl of bread-and-milk, or any other thing you are enjoying at home" (p. 227).

"The cakes had a stamp of the chrysanthemum on top; these were red and white and were made of [azuki] bean paste and sugar. The Japanese are very fond of them, but they are rather insipid in taste" (p. 395).

© Copyright Soyinfo Center 2014

"I have finally resigned myself to the Japanese food of this region [Yezo {Hokkaido} near Hakodate]... And of all places to start such an experiment in this village! It required some courage and a good stomach to eat for dinner the following: fish soup, very poor; bean paste [miso?], which was not so bad;... and holothurian, or sea cucumber,... by no means agreeable. It was eaten with Japanese sauce, *shoyu,* which renders everything more or less palatable... On the whole, I am keeping body and its animating principle together, but long for a cup of coffee and a slice of bread-and-butter. I am the only outside barbarian in town" (p. 440-41).

Volume 2: The New Year's food included "a bean pickle in sugar syrup and Japanese sauce" [probably black soybeans (*kuromame*)] (p. 93). A detailed description of mochi and its pounding are given, with two illustrations (p. 95).

As they left Izumi and entered the Province of Kii [today's Wakayama], "I saw the process of manufacture of a curious kind of food one often sees in certain soups. It has a bright-yellowish color, as thin as paper, and has no definite flavor. The substance is made from soya beans by a curious and simple process. The beans are boiled in a large boiler till they are very soft; they are then ground in a mill to a fine paste, and mixed with water and colored by some stuff that is imported from abroad (fig. 675). This material is then put into a shallow trough divided by square partitions, beneath which is a charcoal fire which keeps the stuff gently boiling. The surface coagulates as it does on boiled milk, or on a cup of cocoa, and the film that forms is taken off very skillfully with slender bamboo sticks and hung up to dry (fig. 676). Other films form and are promptly removed by a girl who is kept busily at work" (p. 286-88).

In Kawagoe [a city in today's Saitama prefecture, about 20 miles northwest of Tokyo]: "It is a common custom... to eat grasshoppers as a relish... The Japanese prepare them by boiling them in shoyu, sugar, and a little water, till the water has nearly all boiled away" (p. 324-25).

At New Year's "our old cook brought me a box of *yokan* (made of sugar and [azuki] beans)... (p. 393).

Edward Sylvester Morse, a marine biologist specializing in Brachiopods, lived 1838-1925. Address: Salem, Massachusetts; Former Prof. of Zoology, Imperial Univ., Tokyo.

1875. Tadokoro, Tetsutarô. 1917. Shôyu moromi no kôso sayô ni taisuru en-rui no sokushin genshô ni tsuite [Stimulating effect of salts on the enzyme action of shoyu moromi]. *Kogyo Kagaku Zasshi* (*J. of Industrial Chemistry*) 20(236):1114-24. [Jap]

• ***Summary:*** The enzymic activities of Japanese soy have a very important effect on the formation of its proper odor and taste during fermentation. These activities are very much checked by the presence of a large quantity of common salt, such as is usually added in the preparation of the "shoyu." They may, however, be stimulated either by decreasing the quantity of salt or by increasing the temperature during fermentation. The author has found yet another method whereby the inhibitive effect of the salt may be controlled, by the antagonistic action of other neutral salts. Potassium chloride, aluminum chloride, calcium chloride and magnesium chloride are good antagonistic agents; aluminum chloride and calcium chloride show a powerful stimulating effect on amylase and pepsin in "shoyu-moromi." Better results are obtained by using a mixture of 2 or more salts together than with a single salt. When the concentration of common salt is 3 normal, a beneficial result is obtained by adding 0.0001-0.002% of a mixture of antagonistic salts to the common salt, whereby the enzymic activities of the shoyu-moromi are increased by 20%. Address: Nôgaku-shi, Tohoku Teikoku Daigaku, Noga Daigaku, Nogei Kagaku Jikkenshitsu.

1880. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1918. Shipments of bean oil from Manchuria. 21(6):87. Jan. 8.
• ***Summary:*** "Extract from the *Manchuria Daily News,* forwarded by Consul A.A. Williamson, Dairen, Nov. 14.

"The Mitsui Bussan Kaisha is now exploiting the Dairen-Seattle service with half a dozen steamers, including four chartered vessels, the aggregate deadweight tonnage of which is put at about 70,000. During the past five months the following consignments of bean oil have been shipped exclusively to Seattle from Dairen: June, 140,000 cases; July, one full cargo; August, 5,400 tons by one steamer and 100,000 cases by another; September, 8,000 tons by one steamer, 6,747 tons by a second, and 100,000 cases by a third; and October, 5,500 tons.

"Another slump has been experienced in the steamer freight on bean cake from Dairen to Japanese ports. The Dairen-Kobe 'tramp' rate has finally declined as low as 40 sen per picul from 60 sen quoted toward the latter part of September, and threatens to go lower (sen=½ cent United states currency; picul=133.33 pounds)."

1881. Hori, S.; Bokura, U. 1918. Soy bean cake as a substitute for peptone in the preparation of the nutrient media. *Nippon Shokubutsu Byori Gakkaiho* (*Annals of the Phytopathological Society of Japan*) 1(1):27-31. Jan. Summarized in Experiment Station Record 42(4):334. March 1920. [3 ref. Eng]
• ***Summary:*** "Since the outbreak of the present European war, the importance of peptone, indispensable in the preparation of the nutrient media for the culture of fungi and bacteria, has been checked and the price has risen to about eight or ten times its former figure; even the home made peptone is actually sold at present at the high price of ¥ 15 per lb. Thus the cost of preparing the culture media in mycological and bacteriological laboratories has greatly increased."

"This led one of the authors to investigate some economic material as a substitute for peptone in the preparation of the nutrient media." After experiments with ammonium sulphate, Kinako powder, and soy bean cake, "it was found that pulverized soy bean cake gives the most satisfactory results, 30 grams of which (for 1 liter of water) may be substituted for 20 grams of peptone... Thus since 1915, the soy bean cake extract has come into general use in our laboratory as media for the culture of fungi and bacteria, except for some special investigations, and the said media are now almost universally employed for the culture of mouse typhus bacteria throughout the country." Information is furnished regarding the preparation and expense of this medium. "Soy bean cake is largely imported every year from China as a nitrogenous fertilizer. In 1916 it reached the amount of 760,000 tons valued at 34,500,000 Yen. One cake weighs about 59 pounds and costs about 1½ Yen."

Note 1. This is the earliest publication seen on the use of soybeans to make cultural media, as for bacteriological use.

Note 2. This is the earliest English-language document seen (Nov. 2012) that uses the term "Kinako powder" to refer to roasted soy flour. Address: Phytopathological Lab., Imperial Central Agric. Exp. Station, Nishigahara, Tokyo, Japan.

1882. Terao, H. 1918. Maternal inheritance in the soy bean. *American Naturalist* 52(613):51-56. Jan. [3 ref. Eng]
• ***Summary:*** Discusses the inheritance of cotyledon- and seed-coat color. Contents: Introduction. Transmission of the color of the cotyledons. Transmission of the color of the seed coat. Explanation of these phenomena. Conclusions.

"The soy bean, *Glycine hispida* Maxim., shows as different types two cotyledon colors, yellow and green. The beans with yellow cotyledons have two types of seed-coat colors, namely, green and yellow, while the beans with green cotyledons have always green seed-coats. The inheritance of these types of cotyledons and of seed-coats has been proved by the author's experiments [since 1910] to be maternal." That is, these colors are transmitted by the female plant only.

The author also studied the behavior of artificial hybrids in Japan. Although there are a large number of soybean varieties in East Asia, it is clear that they are the results of natural crossing and selection.

Note: This is the earliest document seen (Dec. 2006), published in Japan, on soybean genetics, and one of the world's first comprehensive studies. Address: Imperial Agric. Exp. Station, Tokyo, Japan.

1883. Suzuki & Co. 1918. Established 1887. Manufacturers and general merchants (Ad). *Times of India* (*The*) (*Bombay*). Feb. 12. p. 9.
• ***Summary:*** The company's head office is in Kobe, Japan. They have offices in London and New York. This large ad lists: Branches or agencies (in what cities). Dealers in (what goods, incl. "soya bean oil"). Factories and refineries and refineries for (what commodities, incl. [soya] "Bean oil). Managing agents for (what other manufacturers). "Sakura" brand beer (made in what cities and countries). Agents for (what manufacturers).

Note: This ad also appeared in the Feb. 19 (p. 2), Feb. 26 (p. 4), and March 5 (p. 2) issues of this newspaper.

1884. Howell, E.V. 1918. Soy beans and soy bean oil. *J. of the American Pharmaceutical Association* 7(2):159-63. Feb. [14 ref]
• ***Summary:*** "This bean is a native of southeastern Asia. It is at present the most important legume grown in China and Japan, where it is grown almost exclusively for human food. It has been cultivated from a remote period, each

© Copyright Soyinfo Center 2014

district having its own distinct variety, some two hundred kinds in all... The bean was introduced into England in 1790. Apparently the first mention of soy beans in American literature was in the *New England Farmer,* October 23, 1829, in an article by Thomas Nuttall." There follows a summary of this article and several other early U.S. documents that mention the soy bean.

"Importance: I think the soy bean is the most important plant introduced into the South within a hundred years. This opinion is based on the range of the plant, the value as a soil improver, and the numerous uses of the seed and oil, together with the fact that the present cottonseed oil mills can produce the oil with practically no change in machinery and thus double their mill season. The beans can be stored, as they are practically immune to insects. Especial emphasis is placed on this statement in the present demand for food on account of the war. In Japan the bean forms one of the most important articles of food, by nature a meat, to go with the starch of rice. The Chinese make from the beans a cheese resembling our own cheese, while the Japanese make the well-known sauce for rice or fish, soy or suey sauce. It is one of the principal ingredients in 'Tofu' (bean curd), natto (steamed beans), and white and brown miso, which is like our molasses brown bread."

"A factory for the production of this [soy] milk has recently been established in America. This can be used in cooking, by bakers, confectioners, and chocolate manufacturers. I have before me the following food articles in which soy bean meal is the principal ingredient: Egg substitute No. 1, egg substitute No. 2, colored cocoanuts, coffee substitute, cocoa substitute, roasted malted nuts, coloring curry powder, cutlet powder, soy and navy beans with pork, the equal of any pork and beans.

"The use of the soy meal for soups, for proportional use in muffins, cookies, fritters, croquettes, biscuit, and loaf bread is unlimited. Its use is checked only by our prejudice for certain customary flavors, just as northern people and Europeans do not use corn meal. In other words, North Carolina, if forced to by war conditions, could largely exist on the soy beans crushed in the State this year, including the imported and native beans crushed, the oil from which I estimate to yield this year 400,000 gallons. This oil can be used for frying, and for a salad oil in French dressing or in mayonnaise. I fried a partridge in the crude unrefined oil, and found it delicious.

"While the chief use, so far, of the oil has been for soaps and paints, the particular object of this paper has been to call attention to the use of soy oil in pharmaceutical preparations."

Tables show: (1) The specific gravity, saponification value, and iodine for three samples of Manchurian soy oil purchased in New York. (2) The chemical composition of soy bean meal (8.77% fat), compared with the meal of five other seeds (including cottonseed, linseed {old and new process}, decorticated peanut, and sunflower seed). (3) Four chemical constants of seven samples of domestic and imported soy oils (from L.P. Nemzek). (4) The food values (nutritional composition) of soy beans and six other foods, including lean beef, milk, and eggs.

Because of World War I: "During the past six or seven months there has been produced in this country in the neighborhood of one hundred thousand gallons of soy oil. The largest part of this quantity has been produced in North Carolina by the Elizabeth City Oil & Fertilizer Co., Winterville Cotton Oil Co., and the New Bern Cotton Oil & Fertilizer Mills. Samples from the different crushings have been examined in comparison with the imported oil."

"Medicinal use: In England a diabetic biscuit is manufactured. In this country an infant's food from the soy bean is on the market. The enzyme in the bean is also attracting attention and opening a field for investigation."

Note 1. This paper was presented at the Scientific Section, American Pharmaceutical Assoc., Indianapolis meeting, 1917.

Note 2. This is the earliest English-language document seen (Oct. 2008) that contains the word "crushings."

1885. Makino, Magotaro. 1918. Soy-bean food (tofu). *U.S. Patent* 1,258,427. March 5. 2 p. Application filed 5 Dec. 1916.

• ***Summary:*** Soy bean flour is mixed with water and a small quantity of an edible oil, the mixture is heated, filtered, and the proteins in the filtrate are precipitated/coagulated with Epsom salts and separated from the liquid.

Note: This is the earliest document seen (Sept. 2011) with the term "Soy-bean food" (or "soy bean food") in the title. Address: San Francisco, California.

1886. Satow, Sadakichi. 1918. Procédé pour l'extraction de matières protéiques de substances contenant de la protéine végétale, pour emploi dans les arts industriels [Process for extraction of proteins from substances containing vegetable protein for use in the industrial arts]. *French Patent* 486,190. March 14. 5 p. Application filed 30 June 1917. [Fre] Address: Japan.

1887. Itano, Arao. 1918. Soy beans (Glycine hispida) as human food. *Massachusetts Agricultural Experiment Station, Bulletin* No. 182. 10 p. March. [16 ref]

• ***Summary:*** Contents: Introduction. Chemical composition and digestibility. Human food prepared from soy beans (practical recipes for making Japanese foods at home; names in parentheses indicate the Japanese name). Soy bean milk (*Toniu*)*:* The ordinary method employed in Japan, toniu from soy bean meal (made by grinding soybeans in a wheat flour mill or fine coffee mill), author's method [from soy bean meal, plus inoculation with *Bacillus coli* and *B. lactis aerogenes*], synthetic toniu, condensed soy bean milk

© Copyright Soyinfo Center 2014

(condensed toniu). Evaporated soy bean milk (yuba). Soy bean curd (tofu): Fresh curd (tofu), frozen tofu (*kori tofu*), fried tofu (*abura-age*). Baked beans. Boiled beans. Roasted beans.

"Powdered beans–Roasted: 1. Roast as in the roasted beans [either in an oven or in an ordinary corn popper]. 2. Let them stand until cool to harden them. 3. Grind them in a coffee mill or any other suitable grinder. Note.–The powder can be used as a salad dressing or cooked with cookies like peanuts or other nuts, or employed as a substitute for coffee."

Powdered beans, raw (soy bean meal). Green beans. Soy bean pulp (*kara*). Fermented boiled beans (natto). Ripened vegetable cheese (miso; discusses koji). Soy bean sauce (shoyu). Vegetable butter, ice cream, oil (table use) and lard (cooking): "The manufacture of these articles from soy beans needs further investigation." How to make "Evaporated soy bean milk (Yuba)" at home (p. 5): "1. Boil the soy bean milk until a film is formed on the surface. 2. Collect the film and cut it into any shape desired. Note.–The film consists of coagulated albuminoids and fat. It may be used as an article of food, cooked in soup, etc."

Note 1. Even though it is very brief and inadequate, this is the earliest document seen (Oct. 2012) that contains a description of how to make yuba at home.

How to make "Baked beans" at home: (p. 7). "1. Soak the beans, suspended in a cloth bag, in a large quantity of hot water over night. (Soaking for twenty-four hours in ice-cold water which is changed occasionally will give the same result.) 2. Change the water, when hot water is applied, in the morning and an hour or two before cooking. 3. Add 1 teaspoonful of soda [sodium bicarbonate] per quart of beans and boil until the beans become soft. 4. Bake like other beans. Note.–The characteristic strong flavor of the beans is removed by soaking before cooking; the addition of soda [sodium bicarbonate] makes the beans soft. Cooking with salt pork, potatoes, onions, molasses and other substances makes the beans more palatable to some tastes."

Concerning the "Roasted beans" (p. 7). "1. Roasting can be done either in an oven or in an ordinary corn popper. 2. Roast until the skin of the bean is burst by popping. Note.–The beans can be kept soft by immersing them in a syrup while they are hot. Thus very wholesome candy is prepared."

Concerning the "Powdered beans: Roasted" (p. 7). "1. Roast as in the roasted beans. 2. Let them stand until they cool to harden them. Grind them in a coffee mill or other suitable grinder. Note.–The powder can be used as a salad dressing or cooked [baked] with cookies like peanuts and other nuts, or employed as a substitute for coffee." Note 2. This is the earliest English-language document seen (Nov. 2012) that uses the term "Powdered beans: Roasted" to refer to roasted soy flour.

Concerning "Green beans: 1. Pick them when the beans are three-fourths to full grown. Boil them in salt water. 3. Discard the pods. 4. Serve the beans with butter or milk. Note–The pods are tough and they can be removed easily on boiling."

Concerning "Soy bean pulp (kara): 1. This is the residue after the milk is extracted in the process of preparation of soy bean milk. 2. Cooked like any other vegetable with proper seasoning. Note.–Makes a very rich dish; an addition of green onions, cabbage or parsnip may improve it."

Tables contain analyses of the chemical composition of each of the basic foods discussed.

Note 3. This is the earliest English-language document seen (Sept. 2013) concerning soy ice cream, which it calls simply "ice cream." This is also the earliest document seen (Sept. 2013) concerning the etymology of soy ice cream.

Note 4. This is the earliest English-language document seen (June 2013) that uses the term "soy bean pulp" to refer to okara.

Note 5. This is the earliest English-language document seen (June 2013) that describes how to use okara in a recipe.

Note 6. This is the earliest English-language document seen (Aug. 2013) that uses the word "toniu" to refer to soymilk; the Japanese word is *tônyû*. Address: Amherst, Massachusetts.

1888. *Wall Street Journal.* 1918. The stock market: Better sentiment prevails. April 4. p. 4.

• ***Summary:*** The section titled "Chemicals" states: "It is worth noting that Japan is finding a tremendous market in the United States for vegetable oils. New business enterprises on the Pacific coast have started up and made millions in the last twelve months. Cocoanut oil, soy bean oil, castor oil, and similar products are finding a big market."

Note: A similar article titled "War favorites record gains" appeared on this same day in the *Washington Post* (p. 11).

1889. *USDA Bureau of Plant Industry, Inventory.* 1918. Seeds and plants imported by the Office of Foreign Seed and Plant Introduction during the period from January 1 to March 31, 1915. Nos. 39682 to 40388. No. 42. 123 p. April 17.

1890. Baker, E. Carleton. 1918. Marketing the bean crop in Mukden district. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 21(98):366-68. April 26.

• ***Summary:*** Owing to a severe drought in the upland districts and to floods along the Liao River, the soya bean crop of 1917, compared with the 1916 crop, decreased by about 20 per cent in some districts and as much as 40 per cent in others. In North Manchuria, where weather conditions were more favorable, a 90 or 100 per cent crop is reported, and in South Manchuria the 1917 harvest is estimated to be about 60 per cent of the normal crop. In the Liao River districts the drought was not so damaging as the floods, which destroyed a large part of the crops on the west bank of the river at such places as Kwangning, Chinchow, and Hsinmintun. In the first of the above-mentioned places the white bean is largely grown, and in the two latter named places the black bean is produced. There is consequently a shortage in those varieties. In the upland districts the crops were affected by drought soon after planting and by floods at about harvesting time.

"Marketing methods: There have not been any radical changes in the methods of marketing the beans. Most of the bean dealers at Changchun make their purchases in the outlying bean districts of the Kirin Province and in different districts southeast of Manchouli. In some cases the growers themselves convey their beans to the most convenient markets. About 80 per cent of the buyers purchase their beans in the growing districts, the remaining 20 per cent purchasing in the various markets.

"At Mukden the beans are mostly brought in by the growers themselves, and those not already contracted for before the harvest are, sold to the highest bidders.

"There appears to be a growing tendency to establish collecting centers for accumulating the beans. In most of the growing districts there are already certain places recognized as collecting centers to which the bean growers bring their products by carts for selling to the collectors (local traders or agents of large dealers) who transport the beans (usually by rail) to the large dealers at Changchun, Tiehling, Kaiyuan, Hsinminfu, etc., where the beans growing in the surrounding districts of those places are collected. A number of the middlemen are innkeepers, who receive the beans from the farmers and pass them along to the buyers.

"In South Manchuria beans generally pass through only a few hands–from the growers to the collectors located in the producing districts and from the collectors to the large dealers, who may sell them to the bean mills or to exporters. But beans from distant districts or North Manchuria may-pass through many hands; for instance, the beans from Manchouli are sold to the collectors there, then at Harbin, Changchun, or Kaiyuan, and finally at Newchwang or Dairen.

"Money advanced on growing crops: In some instances money is advanced by the buyers on growing crops. In most cases such advances are made to the farmers who cultivate rented lands and are therefore not well off financially. In return the farmer contracts to sell his beans at from 10 to 20 cents less than the normal market value on each 'tow' or 40 pounds.

"Native dealers in the larger bean markets, such as Mukden, Newchwang, and Changchun, are inclined to speculate in beans. In some cases the buyers collect large quantities and hold them in the hope of selling at higher prices, and in other cases they speculate in growing crops by selling on forward contract, often agreeing to sell beans for future delivery at a price cheaper than the market price prevailing at the time the contract is made. In forward-contract deals the buyer is generally required to pay 80 per cent or the full contract price for the beans, the sellers in return furnishing the buyers with adequate guaranties for delivery. These methods of buying and selling beans are confined to the large dealers and do not, as a rule, directly affect the growers. The large dealers who make forward contracts generally endeavor to secure an option on certain amounts of the growing crops in order to be sure that they will be able to procure enough beans to meet their forward-contract obligations. For these options they will sometimes advance the grower as much as 50 per cent of the estimated value of his crop. Even a larger proportion of the value may be advanced when the buyer is convinced, by scrutiny of the title deeds, that the farmer is the owner of the land upon which the beans are growing.

"The sale of beans in the interior is conducted as a rule on a strictly cash basis. Some branches of the larger bean firms sell foreign and Chinese goods, these goods often being sold on credit against the growing bean crops. The prices of the goods thus furnished are somewhat higher than the ruling market quotations, as the buyers wish to obtain sufficient profits to cover the interest on the money invested in the goods.

"Currency used in transactions: In bean transactions, several kinds of money are used. In the Fengtien Province small silver coin notes are generally used, in Heilungkiang Province copper cash notes, in Kirin tiao notes, in the Chinese Eastern Railway zone rubles, and in the South Manchuria Railway zone silver yen notes are used. The high rate of silver has not affected the prices of beans very much,

© Copyright Soyinfo Center 2014

except where they are purchased in gold standard currencies, such as rubles and gold yen. However, the prices of beans are raised proportionately with the discount of the paper money, based on silver, in which most transactions are made. The strong foreign demand during the year, owing to shortage of foods, minimized to a great extent the exchange difficulties.

"As a general rule the larger bean dealers visit the growing districts just before the harvest in order to ascertain the conditions of the crop. The Mitsui Bussan Kaisha, the Kodera Co., and the Tung Ho Co. (all Japanese companies) have a large number of traveling agents who visit the bean districts from time to time, from the planting season until harvest.

"The early freezing of the roads facilitated the transportation of the last crop of beans to the various markets and enabled the growers to dispose of their products. No important changes have been made in the routes over which beans are brought to market. The charges for transporting the beans were increased considerably in some cases. The native cartage increased by more than 100 per cent and freight charges on the Chinese Eastern Railway by more than 400 per cent; the charges of the South Manchuria Railway and the river transportation charges remained about the same. The fall in the value of the ruble accounted for the enormous increase in the freight rate.

"Bean mills in district–Exports from Newchwang: There are about 100 bean mills, large and small, in Mukden and the immediate vicinity. No statistics are available as to their annual output, as most of the mills are small and do not operate regularly. There are about 30 mills in Liaoyang, 13 in Haicheng, 10 in Changchun, and 8 in Newchwang. There are also mills located at Kaiyuan and Tiehling, but at present their number is not known.

"The mills at Newchwang have the following monthly capacities (given in piculs of 133.33 pounds): A table with 4 columns gives the names of 8 Chinese mills, with the number of presses, and the soya bean oil and cake output capacity (in piculs) for each. The largest (Tung Yung Mao) has 100 presses, 3,600 piculs of oil, and 90,000 piculs of cakes; the smallest has 20 presses. "Exports of beans and bean products from Newchwang were as follows for 1916 and 1917, respectively: Beans, 98,905 and 41,000 tons; bean cake, 194,089 and 151,127 tons; and bean oil, 5,050 and 1,414 tons. The decreases were due to the shortage in the 1917 crops, and, it is believed (though no statistics are yet available), to the diverting of the trade to Dairen.

"At Newchwang the beans arrived by three routes–by river, by rail, and by carts–from the southeast districts. The beans are sold by measure; those arriving by boat and by train are carefully leveled off by the seller, and those bought from the carts (generally a mile or two out of the town, where the buyers meet the carts) are smoothed off by the buyer, who naturally gives himself a slight benefit by heaping the measures. This custom is also said to prevail upcountry. Beans brought by train by middlemen and bought at the Japanese station are always paid for in sycee [silver money in the form of ingots]. Those brought for sale by boats are sold from the boats alongside the bund.

"(A list of bean dealers In the Mukden consular district may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative offices. Refer to file No. 99483)." Address: Consul General, Mukden, China.

1891. Dorsey, Henry. 1918. Growing soybeans. *West Virginia Univ., College of Agriculture, Extension Dept., Circular* No. 204. p. 1-8. April. [1 ref]
• ***Summary:*** "Within the last five years soybeans have assumed, due to their many desirable qualities, an important place in West Virginia agriculture and their importance is quite likely to increase. Less than a decade ago the crop was practically unknown. A conservative estimate derived from county agents' annual reports indicates an acreage of more than 6,000 in 1917. This acreage is almost equal to that of clover alone according to the census figures of 1910."

Contains sections on the importance of the crop, harvesting, yields, suitable varieties, special uses, human food, and in crop rotations.

The section on human food uses states: "The scarcity of meats will doubtless lead to a wider use of soybeans in the human dietary. For centuries they have supplied a large proportion of the nitrogenous part of the food of the Chinese and Japanese. In the Orient the whole beans are not eaten directly but soy sauce, bean milk, bean curd, and vegetable cheese are made from them. Americans would doubtless object to many of these products. The whole beans have often been used like other beans–boiled, baked, or with pork. They need to be soaked several hours to remove the strong flavor. Soybean flour has great possibilities as a substitute for part of the constituents of various breads. When Americans learn to use the products of the seed, then there will be a ready market for the crop and it will take a regular place in our cropping scheme." Address: Asst. Prof. of Agronomy, West Virginia Univ., Morgantown.

1892. Kanzawa, T. 1918. Daizu royô ni tsuite [On the soybean pod gall midge]. *Byochu-gai Zasshi* (*J. of Plant Protection, Tokyo*) 5(4):283-85. April. [Jap]
• ***Summary:*** Discusses *Asphondylia*. Address: Yamanashi ken-ritsu, Noji Shikenjo (Agric. Exp. Station).

1893. Takahashi, Teizô. 1918. Re: Design of koji trays. Letter to Dr. Charles Thom, Washington, DC, May 17. 2 p. Handwritten. [Eng]
• ***Summary:*** Takahashi has Dr. Thom's letter of May 18th and he is very pleased to see Miss Church working on this problem [of how to make shoyu using koji]. If Miss Church comes to visit him, she should come to Rutland, Massachusetts (c/o Mrs. Brown); he moved there from

© Copyright Soyinfo Center 2014

Boston a little while ago.

"I imagine that the apparatus needed for this problem is a wooden tray." He sketches a three-dimensional wooden koji tray, 1.5 feet long, by 8-9 inches wide, by 2-3 inches deep, with short legs on the bottom. "This tray is used for the preparation of 'kôji,' which is mentioned in my former letter. Other apparatus, such as steaming, roasting and crushing, I suppose are easily obtained in your Bureau." Address: 82 St. James Ave., Boston, Massachusetts.

1894. Gray, Olive. 1918. The new. Latest view in stores and homes. Novelties, ideas, and practical suggestions. *Los Angeles Times.* May 19. p. III-15, III-15.
• ***Summary:*** The section titled "Soy dairy products" states: "At a Japanese place, where groceries and produce popular with the orientals are always in stock, I was interested in observing the 'soy bean milk,' 'soy bean cottage cheese'– maybe it is pagoda cheese [probably tofu]. Soy bean flour [probably roasted] is also there, and recipes are issued which teach many ways of utilizing this so-nutritious food product."

1895. *Chemische Umschau auf dem Gebiete der Fette, Oele, Wachse und Harze* (*Germany*). 1918. Technologie: Fettgewinnung, Fettwirtschaft [Technology: Obtaining fats and oils, and their economics]. 25(5):53-54. May. [Ger]
• ***Summary:*** Soybean oil: During the years 1912-1914 England imported 192,000 tonnes (metric tons), 78,000 tonnes, and 72,000 tonnes of soybeans, and Germany imported 96,000, 106,000, and 64,000 tonnes of soybeans. In 1915, naturally [due to World War I], German imports came to an end, while English imports amounted to 174,000 tonnes. In 1913, Japan's soybean production was about 5.4 million tonnes; exports [of soybeans] from China were 624,000 tonnes and from Korea 95,000 tonnes.

1896. Thurston, Azor. 1918. Soya bean oil. *Midland Druggist and Pharmaceutical Review* 52(5):202-03. May. [3 ref]
• ***Summary:*** This oil is called *huile de soja* in French, *Sojabohnenoel* in German, and *olio di Soia* in Italian. "Soya beans are cultivated in Russia, Japan, China and the Southern part of the United States. Constants: Refractive index at 20ºC, 1.4768; specific gravity at 25ºC, 0.9194; solidification value, -15 to -16ºC; saponification value, 191 to 194; iodine value, 130 to 135; Reichert-Meissl value, 0.45 to 0.69. Principal components: Glycerides of oleic, linolic, stearic and palmitic acids." After discussing the oil's preparation, properties, and tests of purity, the author describes its uses: "Soya bean oil is used in soap making, in paints and varnishes as well as in making waterproof clothing. It is used as an edible oil in the manufacture of lard substitutes and oleomargarine. It is used to a limited extent as a lubricant and burning oil. 'German Coffee Berry' is a species of soya bean the seed of which, being parched and ground, is used as coffee. As a by-product the soya-bean meal is a valuable stock food." He then discusses natto, based on a 1912 article by S. Muramatsu. He adds, incorrectly, that "Tofu is a liquid preparation resembling cow's milk and manufactured from soya beans."

Note: Azor Thurston lived 1861-1922. Address: Ohio State Univ.

1897. Tu, Chow-Tien. 1918. Zhiwuxue daci dian [Botanical nomenclature: A complete dictionary of botanical terms]. Shanghai, China: Commercial Press. 1590 + 48 p. Illust. Index. 23 cm. [Chi]
• ***Summary:*** The text is in Chinese, with scientific names in Roman letters and Japanese names in *katakana.* Many plant descriptions, including that of the soybean, are accompanied by an excellent, original illustration, as indicated by an asterisk (*) below. The soybean is discussed in several places: Yellow soybean* (*Glycine hispida,* Maxim.) Daizu, mame. (p. 1133, 1239). Green soybean (*Glycine hispida,* Maxim.) Ao mame. (p. 1286-87). Wild soybean (*Glycine soja,* S. et Z.). Tsuru mame, no mame (p. 1335-36).

Also discusses: White azuki* (*Phaseolus radiatus,* L. var.). Shiro azuki. Shyapon mame (p. 294). Sesame seeds* (*Sesamum indicum,* L.). Goma (p. 674, 676). Kuzu (*Pueraria thunbergiana,* Benth.) (p. 1135). Kuzu. Peanut* (*Arachis hypogaea,* L.) Nankin mame. (p. 1197).

Other authors of this book are: Kong Qinglai, Wu Deliang, Li Xianglin, Du Yaquan, Du Jiutian (Tu Chow-Tien), Zhou Yueran, Zhou Fan, Chen Xueying, Mo Shulue, Xu Jiaqing, Huang Yiren, Ling Changhuan, and Yan Baocheng. Address: China.

1898. *Los Angeles Times.* 1918. The last of the House of Honda. June 2. p. MF4-5.
• ***Summary:*** In this short story (fiction), an American traveler finds himself on the island of Luchu (perhaps Okinawa, in today's Ryukyu Islands, which extend in a 600-mile-long arc between Kyushu {Japan} and Taiwan). He is taken, at night, to the home of a stranger–a Japanese aristocrat–on a large estate. There, the servant "set before me more awamori and a dish of bean curd and bamboo root" (p. 2, col. 1.4).

1899. *Board of Trade Journal* (*London*). 1918. Exploitation of vegetable oils [in Japan]. 100:778. June 20.
• ***Summary:*** According to H.M. Consulate at Shimonoseki, the Japanese oil industry is still in its infancy, but it should have an important future. Imports of Manchurian bean oil are valued at over 1,000,000 yen annually. A new company for the exploitation of vegetable oils, formed in June 1917, with a capital of one million yen, has completed the first section of its works at Wakamatsu, and manufacturing operations will soon be commenced. The consumption of soy beans will, it is stated, be 100 tons/day, and when the second section of the works is completed, 150 tons/day, with a yearly yield of 37,000 tons of bean-cake, and 6300

© Copyright Soyinfo Center 2014

tons of oil. The output of the works will be all taken by Mitsui Bussan Kaisha under a contract. The refined oil will be exported to the United States, and the bean-cake sold to farmers in Japan.

1900. *Board of Trade Journal* (*London*). 1918. Imports and exports of fertilisers in 1917. 100(1125):778. June 20.
• ***Summary:*** "Oil-seed fertilisers. Imports of oil-seed fertilisers (bean cake, rape-seed cake, cotton-seed cake, etc.) during 1917 amounted to 1,066,660 tons, valued at 55,967,822 yen, as compared with 835,681 tons (37,540,214 yen) and 402,190 tons (39,249,341 yen) in 1916 and 1913 respectively. The average price for bean cake in Japan in 1917 was 2.0 yen per cake (approximately 60 lb.); for rape-seed cake 4.30 yen per picul (133 1/3 lb.)." Address: British Commercial Attaché, Yokohama, Japan.

1901. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1918. Improvement of soy beans in Manchuria. 1(1):21. June.
• ***Summary:*** "The *Manchuria Daily News* states that the South Manchuria Railway's agricultural station has been experimenting on the improvement of Manchurian beans for several years. Ssupingkai special have been distributed to different places.

"The results in 1917 were favorable on the whole, and about 20 per cent increase in the yield was realized. Moreover, the new output is superior in weight, percentage of oil, luster, etc. These seeds are to be more widely distributed in 1918.

"The exports of soya bean-oil from Dairen, Manchuria, to the United States increased from 44,966,930 pounds, valued at $3,057,370 for 1916, to 198,534,626 pounds, valued at $19,740,640, for 1917."

1902. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1918. Shipments of bean oil from. 1(1):45. June.
• ***Summary:*** The Mitsui Bussan Kaisha [of Japan] is now exploiting the Dairen-Seattle service with half a dozen steamers, including four chartered vessels, the aggregate deadweight tonnage of which is put at about 70,000. During the past five months the following consignments of [soy] bean oil have been shipped exclusively to Seattle [Washington] from Dairen: June, 140,000 cases; July, one full cargo; August, 5,400 tons by one steamer, 6,747 tons by a second, and 100,000 cases by a third; and October, 5,500 tons.

"Another slump has been experienced in the steamer freight on bean cake from Dairen to Japanese ports. The Dairen-Kobe 'tramp' rate has finally declined as low at 40 sen per picul from 60 sen quoted toward the latter part of September, and threatens to go lower (1 sen = ½ cent United States currency; 1 picul = 133.33 pounds)."

1903. Onodera, I. 1918. Genge oyobi daizu kasu no suitô seiiku ni oyobosu eikyô [The influence of soy-bean cake and Chinese milkvetch (*genge* or *renge, Astragalus sinicus*) on the growth of rice plants]. *Nogaku Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 191. p. 786-827. July 5. [Jap]

1904. Norton, Jeanette Young. 1918. National dishes the world over: Favorite foods in all the principal kitchens of the Earth,... *San Francisco Chronicle.* July 7. p. SM5.
• ***Summary:*** "A well known Japanese dish is gyunabe ["beef + pot"]. The dish is made with vegetables stewed in shoyu sauce and mirin, a cooking wine. Chicken or meat cut in small thin slices is cooked on top of the stew.

"Chinese chop suey served in China has soy beans and pork in it that are used in place of the more expensive chicken and mushrooms that appear in the American version."

Note: We know of no other source stating that soy beans are used in chop suey in China. Soy sauce is used, although chop suey is much better known in the USA than in China.

1905. Hahto: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1918. Seed color: Yellow (olive), hilum black.
• ***Summary:*** Sources: Morse, W.J. 1918. "The soy bean: Its culture and uses." *USDA Farmers' Bulletin* No. 973. 32 p. July. See p. 14. "Hahto.–This variety recently introduced from Japan is a large producer of seed and forage, and the seeds when from three-fourths to full grown make an excellent green vegetable, similar to the Lima or butter bean. Plants stout, erect, maturing in about 135 days; pubescence tawny; flowers purple; seeds olive yellow, with a black seed scar, much flattened, very large, about 75,000 to the bushel; oil, 14.8%; protein, 40.6%."

Madison Survey (*Madison, Tennessee*). 1919, "Beans." 1(2):5. March 5. "The soy bean lima, or *Hito,* [most likely Hahto] is an exceptionally good garden vegetable, making a very heavy yield of seed."

Piper, Charles V.; Morse, William J. 1923. *The soybean.* New York, NY: McGraw-Hill Book Co. xv + 329 p. March. See p. 52, 53, 111, 152, 154, 165-66, 171, 192-93, 222, 259. "Introduced from Wakamatsu, Japan, 1915. Plants stout, erect, bushy, maturing in about 130 days; pubescence tawny; flowers purple, 55 to 60 days to flower; pods brown, 60-80 mm. long, 13 to 15 mm. wide, 6 to 7 mm. thick, shattering little; seeds olive yellow, 10 to 12 mm. long, 8 to 9 mm. wide, 5 to 6 mm. thick; hilum black; germ yellow; oil 17.9 per cent.; 74,800 to the bushel."

Morse, W.J. 1927. "Soy beans: Culture and varieties." *USDA Farmers' Bulletin* No. 1520. 34 p. April. See p. 7. "Hahto–Introduced under S.P.I. No. 40118 from Wakamatsu, Japan, in 1915. It is commonly known in Japan as 'dove killer,' and is said to be used boiled in the green stage... Especially valuable as a green vegetable bean when three-

© Copyright Soyinfo Center 2014

fourths to full grown."

Morse, W.J.; Cartter, J.L. 1937. "Improvement in soybeans." *Yearbook of Agriculture* (*USDA*). p. 1154-89. For the year 1937. See p. 1163. "In Japan, certain varieties of soybeans were found that were used solely as green shelled beans... The vegetable soybean offers an excellent food of high nutritional value, especially in the fall when other green beans are lacking... As a result of selection, cooking tests, and adaptation studies, eight green vegetable varieties... have been introduced in various sections of the country." One of these is Hahto. See p. 1187. Hahto: Origin: Introduction, Japan. Year: 1915. Days to mature: 130. Flower color: Purple. Pubescence color: Tawny. Seed coat color: Olive yellow. Germ color: Yellow. Hilum color: Black. Seeds per pod: 2-3. Seeds per pound: 1,250. Use: Green vegetable, or dry edible beans. Note: This is the first of many documents in which Morse classified the Hahto as a "green-vegetable" soybean, one of a limited number of "edible varieties of soybeans."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 10-11. Hahto is in the USDA Germplasm Collection. Maturity group: VI. Year named or released: 1918. Developer or sponsor: USDA. Literature: 04. Source and other information: 'Hato Koroshi Daizu' from Kawamata, Fukushima, Japan, in 1915. Prior designation: PI 40118.

Note: This is the earliest large-seeded vegetable-type soybean introduced into the United States. The second was Easycook in 1919. Address: USA.

1906. Morse, W.J. 1918. The soy bean: Its culture and uses. *Farmers' Bulletin* (*USDA*) No. 973. 32 p. July. Superseded by Farmers' Bulletin 1520. [27 ref]

• ***Summary:*** Contents: Summary. Commercial importance. Climatic adaptations. Soil requirements. Preparation of the seed bed. Fertilizers. Inoculation. Time of planting. Depth of planting. Rate of seeding. Method of seeding. Cultivation. Varieties (22): Barchet, Biloxi, Black Eyebrow, Chiquita, Early Brown, Elton, Guelph ("also known as Medium Green, Early Green, Medium Early Green, and Large Medium"), Haberlandt, Hahto, Hollybrook, Ito San ("has been known under the names of Japan Pea, Yellow, Medium Yellow, Dwarf Yellow, Early Yellow, Early White, and Coffee Berry"), Lexington, Mammoth, Manchu, Medium Yellow ("has been grown under the names Early Yellow, Mongol, Banner, and Roosevelt"), Mikado, Peking ("In variety tests the Peking, Sable, and Royal varieties appear to be identical, and it is quite evident that the latter two are selections from the Peking."), Shanghai ("has been grown in North Carolina under the name of Tarheel Black"), Tokyo, Virginia, Wilson-Five [black seeded], Yokotenn [Yokoten].

Soy beans in rotations. Soy beans in mixtures: With cowpeas, corn, sorghums, or Sudan grass. Soy beans for seed: Yields of seed, feeding value, for human food, for oil and meal, viability of soy-bean seed, cost of production, soy-bean straw. Soy beans for hay: Time of cutting, curing soy-bean hay, feeding value of soy-bean hay, yields of soy-bean hay. Soy beans for soiling. Soy beans for pasture. Soy beans for ensilage. Soy beans for soil improvement. Enemies of the soy bean: Rabbits, root-knot caused by a nematode, cowpea wilt due to a Fusarium, caterpillars, and black blister beetles.

"Commercial importance: The soy bean, also called the soya bean, the soja bean, and in North Carolina the stock pea, is an annual leguminous plant, a native of southeastern Asia. It has been cultivated in China, India, and Japan for more than 5,000 years and in extent of use and value is the most important legume now grown in these countries."

"The soy bean was introduced into the United States as early as 1804, but it is only during the last decade that it has become a crop of much importance. At the present time it is most largely grown for forage. In many sections, especially southward and in some parts of the corn belt, a very profitable industry has developed from that growing of seed. During the past few years the acreage has increased to a very considerable extent. The large yield of seed, the excellent quality of forage, the ease of growing and harvesting the crop, its freedom from insect enemies and plant diseases, and the possibilities of the seed for the production of oil and meal and as a food all tend to give this crop a high potential importance and assure its greater agricultural development in America" (p. 3).

Concerning the variety Hahto (p. 14): "This variety recently introduced from Japan is a large producer of seed and forage, and the seeds when from three-fourths to full grown make an excellent green vegetable, similar to the Lima or butter bean. Plants stout, erect, maturing in about 135 days; pubescence tawny; flowers purple; seeds olive yellow, with a black seed scar, much flattened, very large, about 75,000 to the bushel; oil, 14.8%; protein, 40.6%." Note 1. This is the earliest English-language document seen (May 2003) that uses the term "butter bean" to refer to the lima bean.

Uses for human food (p. 22-23): "Until 1916 the soy bean had been used but little in the United States for food and only as a special diet for persons [diabetics] requiring foods of a low starch content. Much interest has been shown during the last two years in the possibilities of the soy bean for food. The United States Department of Agriculture and many schools of cookery and domestic science have conducted successful experiments in utilizing the dried beans in the manner of the navy bean and the green beans when three-fourths grown to full grown as a green-vegetable bean. The variety and palatability of the forms in which the bean can be served make it a very desirable article of food, and undoubtedly it will grow in favor as it becomes better known. Soy-bean meal or flour may be used as a constituent of bread and muffins and in pastry."

Photos show: (1) A man standing in a field of soy beans (front cover). (2) A typical mature soy-bean plant (p. 4).

(3) Roots of a soy-bean plant with abundant development of nodules (p. 7).

(4) Cultivating soy beans. Cultivation should begin as soon as the seedling plants appear. Two horses pull a man on a harrow or weeder. (5) A field of the Biloxi variety of soy beans in Mississippi (p. 13). (6) A field of the Black Eyebrow variety of soy beans in South Dakota. (7) Plats of the Mammoth and Virginia varieties of soy beans at Arlington Farm, Virginia (p. 15). (8) A man standing in a field of the Peking variety of soy beans grown in 24-inch rows. (9) A field of soy beans and corn grown for ensilage (p. 17). (10) A field of soy bean and Sudan grass grown in mixture for hay (p. 22).

(11) Opened pods of Hahto variety soy beans on a plate, showing the large seeds (p. 23). (12) Soy-bean hay on frames (p. 25).

A diagram (p. 5) shows 67 different ways in which soy bean plants and seeds are utilized. The plants are used for green manure, forage (hay, ensilage, soiling), and pasture. The seeds are used to make oil, meal, and food products. The oil is used to make various non-food industrial products (glycerin, explosives, enamels, varnish, waterproof goods, linoleum, paints, soap stock {for hard or soft soaps}, celluloid, rubber substitute, printing inks, lighting oil {illuminants}, and lubricating oil), and four food products (butter substitute, lard substitutes, edible oils, and salad oils). Food products include dried beans and green beans. From dried beans are made soy sauce, boiled beans, baked beans, soups, coffee substitute, roasted beans, breakfast foods, and vegetable milk (from which is made soy cheese {fresh, dried, smoked, or fermented}, condensed milk, fresh milk, confections, and casein). The green beans are used as green vegetables, canned, or in salads.

An outline map of the United States (p. 6) shows the areas to which the soy bean is especially adapted, as to varieties and purpose. The eastern half of the country is divided horizontally into 3 zones: Southern, for later and larger varieties for seed production; Central, for medium and medium-late varieties for seed and the same varieties and later varieties for forage; Northern (the line runs through central Ohio, Indiana, and Illinois, and southern Iowa) for very early varieties for grain production and the medium and medium-late varieties for forage and ensilage.

Note 2. This is the earliest document seen (July 2013) that mentions the soybean varieties Hahto, Yokoten, or Wilson-Five.

Note 3. This is the earliest document seen (June 2009) that describes a vegetable-type soybean variety (Hahto), or says that a specific variety makes an excellent "green vegetable."

Note 4. This is the earliest English-language document seen (June 2009) that contains the term "green-vegetable bean." Address: Scientific Asst., Forage-Crop Investigations, USDA Bureau of Plant Industry, Washington, DC.

1907. *San Francisco Chronicle.* 1918. Incombustible celluloid. Aug. 11. p. SM2.

• ***Summary:*** "Great interest has been aroused by the announcement that a professor in one of the Japanese universities had invented a successful incombustible substitute for celluloid, to be manufactured from soya bean cake. The new product has been given the trade name of 'Satolite,' derived from the name of the inventor, Prof. S. Sato, and a company for its manufacture has been started with a capital of 2,000,000 yen ($1,000,000).

"Satolite is described as a galalith made of the glycine of soya bean, coagulated by formaline."

1908. Satow, Sadakichi. 1918. Process of manufacturing vegetable proteid substances. *U.S. Patent* 1,275,308. Aug. 13. 3 p. Application filed 25 Nov. 1916.

• ***Summary:*** "The object of the invention is to provide vegetable proteid substances of improved quality and a simple, efficient, and economical process of manufacturing the same from vegetable substances, such as cereals, leguminous products or other material for food purposes or for use in the manufacture of celluloid-like substances, linoleum-like substances, lacquer, varnish, artificial rubber, artificial leather and the like."

Soja bean is the main protein source used. The beans are first dried and, where a light-colored material is desired, the hulls are removed prior to flaking by the use of rollers. One efficient way to remove the oil is by treating the mass of flattened beans with a suitable solvent for oil, such as benzin [benzine]. The solvent-extracted meal is treated by dry-heated air (not over 40ºC) with agitation or by vacuum to remove any remaining benzine. Steam treatment should be avoided since it denatures the protein.

The "meal" obtained is then treated with an aqueous solution of sodium, potassium, or ammonium hydride (or carbonate) and the protein extract separated by filtration, centrifuging, or by other means (physico-chemical or chemical). From the liquid obtained, the protein (glycinin) is precipitated by dilute acids, such as sulfuric, sulfurous, phosphoric, acetic, or lactic. The precipitate is allowed to settle, the supernatant liquid is drawn off, and the settled precipitate is then pressed into cakes, and, if desired, dried and pulverized. "The product obtained is termed hereinafter 'refined proteid,' and is employed as food material either alone or as a component of food preparations, or in the manufacture of a great variety of [non-food] articles..." "It is easily rendered transparent, is adhesive, and can be easily molded into permanent shape." Address: Sendai, Japan.

1909. *Board of Trade Journal* (*London*). 1918. Japan (Corea). Bean crop, 1917. 101:262. Aug. 22.

© Copyright Soyinfo Center 2014

• ***Summary:*** "According to a report received from H.M. Consul-General at Seoul, the bean crop of Corea for 1917 amounted to 19.366,124 bushels. Of this total soya beans accounted for 14,583,159 bushels, being a decrease of 5 per cent. as compared with the previous year.

"The official figures of the bean and pea crop of the island of Hokkaido (Japan) for 1917 have also been announced. The yield of beans was 1,016,666 koku (5,042,663 bushels), valued at yen 22,305,661, and that of peas 612,973 koku (3,040,346 bushels), valued at yen 13,307,662.

"Compared with the preceding year, the output of beans shows an increase of 549.856 koku (2,727,286 bushels), valued at yen 11,983,243, and that of peas 317,075 koku (1,572,692 bushels), valued at yen 4,962,639. (Yen = 2*s.* 0*d.* at par)." Address: British Consul-General at Seoul.

1912. Ueno, Seiichi. 1918. [On the velocity of the hydrogenation of oils]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 21:749-62. Aug. [15* ref. Jap; eng]
• ***Summary:*** The velocity of these reactions, with a nickel catalyst, can be expressed by the following linear equation: (dk/dt) = k(a-x). Soy oil is mentioned on p. 757-58.

1913. Williamson, A.A. 1918. Bean oil: Methods of making soy bean oil in Manchuria. *Bean-Bag* (*The*) (*St. Louis, Missouri*) 1(3):34-35. Aug.
• ***Summary:*** This is a reprint of an article by the author published under the title "Methods of making soya-bean oil in Manchuria" in *Commerce Reports* [USA] (Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce) (31 Dec. 1917, p. 1227-29). Address: Consul, Dairen [Manchuria].

1914. *J. of Agriculture and Horticulture* (*Quebec*). 1918. Soy beans as food. 22:48. Sept. 1.
• ***Summary:*** "The housewife of to-day who desires to patriotically conserve needed foods for overseas and at the same time provide adequately for her own household is naturally on the lookout for new articles to add to her dietary list. Such a one which has much to recommend it is soy beans...

"Most varieties require a longer season for maturity than our northern climate provides but there are one or two that appear to thrive in Quebec and a number of people are trying them this year. They are said to produce abundantly so it is probable that many housewives will be giving them a trial this season for the first time, and a few suggestions as to their treatment may be welcome.

"In Japan and China soy bean milk is prepared and used extensively. This milk is also sold in a condensed form and as curd [tofu]. Other preparations are vegetable butter and cheese, and the extracted oil is sold for table use and for cookery.

"The Food Preservation Demonstrations of the Canada Food Board form an interesting feature of the fall fairs this year."

Describes the preparation of: (1) Green soybeans. "If cooked when about three-fourths grown as green beans the water should be changed once during cooking". (2) Dry soybeans. Long soaking in a large quantity of water improves the flavor by assisting "in the removal of any disagreeable principle." To serve as baked beans, in a crock, add to 2 cups cooked beans, ¼ teaspoon mustard, salt, a few grains of cayenne pepper, ½ cup tomato catsup, or if desired a few drops of onion juice, or 2-3 tablespoons molasses, or a teaspoonful of Worcestershire sauce. (3) Soy flour. "The raw soy beans may be ground into meal and combined with flour for bread, biscuits, or muffins. In the bread 1/3 soy bean meal may be used, in the biscuits and muffins a larger proportion." The meal tastes best if slightly browned.

Note 1. This is the 2nd earliest document seen (Jan. 2010) concerning soybeans in Quebec province, Canada, or the cultivation of soybeans in Quebec province (one of two documents).

Note 2. This is the earliest English-language document seen (June 2013) that contains the term "raw soy beans" (or raw soy-beans). Address: Canada.

1915. Frazer, Robert, Jr. 1918. Japan's output of vegetable oils. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 21(207):867. Sept. 4.
• ***Summary:*** "Owing to the tremendous increase in demand for vegetable oils in the United States during the past 2 years, the soya-bean and coconut-oil mills in and about Kobe have enjoyed remarkable prosperity. At present there is an output, in all Japan, of 223,500 cases (7,550 long tons [there are 29.60 cases per long ton]) of oil per month, divided as: Soya-bean oil 92,500 cases, coconut oil 68,000 cases, rapeseed oil

© Copyright Soyinfo Center 2014

44,000, cottonseed oil 16,000, peanut oil 3,000 cases.

"There are 25 large vegetable oil mills in the Kobe consular district, producing approximately 75 per cent of the vegetable oil manufactured in Japanese. All except three, I believe, use the pressure system of oil expressing, the other three use the benzine extraction process. Three types of pressure mill are generally used: (1) The round type, with a bed about 18 inches in diameter, used for crushing beans and rapeseed; (2) the oblong flat-bed type, about 30 by 14 inches, used for pressing copra, and (3) the bowl type, in which a stone bowl is pressed into a mass of seed pulp held by iron hoops, used in second and third pressings of peanuts and beans. One mill in Japan–the Kashiwara Oil Mill–is using the latest type of American rotary screw oil expressor. When filtering is necessary, the usual clay filter presses are used."

Existing mills are being enlarged and new ones built to meet the demand for oil, and American or Japanese-American cottonseed oil machinery is being installed. Address: Consul, Kobe [Japan] (July 15).

1916. Registration card: For Heiji Ohta. 1918.

Stamp of local board, Portland, Oregon.

1917. Registration card: For Saizo Ohta. 1918.
• ***Summary:*** Serial number: Illegible. Order number: A2553. Permanent home address: 223½ Madison, Portland, Oregon. Age in years: 38. Date of birth: April 14th 1881. Race: Japanese.

U.S. Citizen–Native born: No. Naturalized: No. Citizen by father's naturalization before registrant's majority: No. Alien–Delinquent: No. Present occupation: Hotel. Employer's name: (blank = self employed?). Nearest relative–Shina Ohta. Address: Okayama, Japan. "I affirm that I have verified above answers and they are true." Signed: Saizo Ohta.

Registrar's report: 36-1-10 "C." Description of registrant: Height: Medium. Build: Medium. Color of eyes: Brown Black.

"I certify that my answers are true..." Signed: N.J. Tochio, Sept. 12th 1918.

Stamp of local board for Division No. 1, City of Portland, State of Oregon. 316 Mo...

Note: This document relates to the Ota Tofu Co. of Portland, Oregon. From this we can almost surely conclude that Saizo and Shina are married and that she is in Okayama, Japan; why she did not come to the USA with him we do not know. Since Saizo and Heiji were registered by the same person on the same date at the same place, they probably traveled to Portland from Japan together; why, we do not know.

1918. Satow, Sadakichi. 1918. Varnish and process of making the same. *U.S. Patent* 1,280,861. Oct. 8. 3 p. Application filed 25 Nov. 1916.
• ***Summary:*** "It is among the special purposed of my present invention to utilize vegetable proteids in the manufacture of varnish and to thereby produce a varnish which possesses many important and valuable advantages over hitherto known varnishes." Raw materials include beans, peas, wheat, corn, etc. The process involves glutinizing vegetable proteids. Address: Sendai, Japan.

1919. *Board of Trade Journal* (*London*). 1918. Trade of Seattle in Oriental vegetable oils. 101:528. Oct. 24.
• ***Summary:*** "The growth in the volume of vegetable oil imports from the Orient (Japan and China) has made Seattle [Washington] the leading port in the United States in handling vegetable oils...

"The bulk of the oils imported is the product of the soya bean, which is grown largely in Japan, Corea [Korea], China proper, and Manchuria, the last-named locality having the largest area of productivity, besides being very accessible, the beans being moved to the sea in two directions, part going over the Eastern China Railway to Vladivostok, part via the South Manchurian Railway to Dalny... At Vladivostok, the beans are transported to Japanese mills for treatment."

The world war has had a major effect on trade and use of oils and fats. The west coast has become the major arena of trade since the European war effects trade on the east coast. In Feb. 1916 a Japanese ship arrived in Seattle with 100,000 cases of oil and from that time oil has flowed to the Pacific coast in a constantly increasing stream. U.S. imports of soya bean oil (which is duty free) for each year ended June 30, are as follows: 1916 = 98,119,695 lb. 1917 = 162,690,235 lb. 1918 = 336,824,646 lb. Soya bean oil was the main oil imported to the USA during these years, followed by coconut oil. Address: British Consul, Portland, Oregon, USA.

1920. Dickover, E.R. 1918. The vegetable-oil industry of Kobe (Japan). *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic*

© Copyright Soyinfo Center 2014

Commerce, Department of Commerce) 21(255):403-12. Oct. 30.

• ***Summary:*** The process of crushing seeds for oil has been used in Japan for centuries; the art was probably brought from the Asiatic mainland during the 7th and 8th centuries, when Chinese and Korean civilizations were introduced to Japan. Rapeseed oil has long been used for frying fish and lobsters, and is to-day the principal fat in the Japanese diet.

The production of vegetable oils in sufficient quantities to enter largely into Japan's foreign trade began during the last 10-12 years, or since the Russo-Japanese War. "One of the first fields to attract the attention of Japanese capitalists in Manchuria after the war was the soya-bean oil industry. Large power mills were established in Dairen, and their success encouraged the capitalists to build mills in and about Kobe, where skilled labor could be easily obtained and where the subsidized Japanese steamship lines could bring soya beans from all of north China and Siberia. The industry was more or less successful, but suffered severely at times from the low price of bean cake, upon which the millers depend for their profit.

"The real prosperity of the vegetable-oil industry in the Kobe consular district did not begin until about 1916, when the world scarcity of oils brought on by the war [World War I] created a demand which it was difficult to fill and raised the price until the mills became nearly independent of the sale of bean cake. The factories have been steadily enlarging their plants and increasing the variety of oils extracted, until to-day the Kobe district has become one of the world's centers of vegetable-oil production.

"There are two principal causes for the remarkable development of the vegetable-oil industry in this section of Japan–a supply of cheap labor and adequate shipping facilities. Japan's excellent steamship lines converge at Kobe," bringing soya beans from Dairen, Newchwang, Vladivostok, or Antung; peanuts from Tsingtao and Tientsin, etc. "The oil, moreover, can be loaded at Kobe on ships going to any part of the world. This does away with the necessity of transshipment, and thus prevents large additional leakage."

The output of oils from the Kobe consular district is now about 5,783 long tons per month divided approximately as follows:–Soya 2,100 tons, coconut 1,734, rapeseed 1,400, cotton seed 534 long tons. Soya beans are usually shipped in jute or straw bags containing about a picul (133.3 pounds) each.

A table (p. 406) shows the value of the various oilseeds imported to Japan during 1917. The total value of the three leading seeds (entered through customs or at temporary warehouses) was as follows (in million dollars): Soya beans $9.965, Copra $4.126, and Rapeseed $2.141. The figure for soya beans has grown 65% since 1913.

The Kobe oil mills vary in size from a productive capacity of 10,000 to 360,000 gallons per month, they are all located on the coast and all except one use the pressure system, the one exception uses the benzine extraction method at Imazu, near Kobe. The principal advantages of the benzine process "are that practically all of the oil is extracted from the material and that the residue is in the form of a meal, instead of hard cakes, and therefore is in condition for use as a fertilizer or as cattle food without further treatment.

"To offset these advantages, however, it has been found that, although fewer men are required to operate a benzine extraction plant than a pressure plant, labor is higher, owing to the fact that more skilled men are required. The overhead is also considerably higher, as the first cost of a benzine extraction plant is rather large. Other disadvantages are that the flash point of the extracted oil is lower than that of the oil obtained by the pressure system, owing to the benzine remaining in the oil after distillation; and that the process is not adapted to oil seeds other than soya beans, as the loss of the solution is greater with seeds which have a large oil content. At the present time, also, the mills using the benzine process are suffering from the high price of benzine, due to reduced imports from the United States. Effort to use Japanese benzine have not proved very successful, as it does not have a uniform flash point, and consequently the loss in distillation is very large. Experiments are now being made to substitute carbon bisulphide and other volatile chemicals for benzine."

The flat bed rectangular presses give a higher yield of oil per crushing but the oil needs more refining. One plant [probably Kashiwara] is using the latest type of rotary screw expeller mill with great success. The benzine extraction process is at present suffering from the high cost of spirit. Perilla oil obtained from the seed of an Asiatic mint (*Perilla ocymoides*) is made in considerable quantity; it is a drying oil used largely in Japan as a substitute for linseed oil.

The oils are generally shipped from Kobe in secondhand tins which have previously been used for kerosene or petrol. This usually entails a leakage loss of about 5 per cent. The importance of oil cake prices is shown by the fact that at the June prices of this year, 70% of the proceeds realized from soya beans came from the cake and only 30% from the sale of the oil.

One table (p. 412) gives the weight (pounds) and value (U.S. dollars) of exports of vegetable oils from Japan; coconut oil is the leader in both categories (34.9 million lb and $3.558 million), followed by soya bean oil in weight (22.6 million lb) but rapeseed oil in value ($1.996 million). A second table (p. 412) gives the declared value in 1915, 1916, and 1917 of vegetable oil exports from Kobe; coconut oil was the leader in 1915, but soya bean oil was the leader in 1916 and 1917. Address: Vice Consul, Kobe, Japan.

1921. Winkler, Gustav. 1918. Die Sojabohne: Aus einem Vortrage... gehalten in der Hauptversammlung der Gartenbau-Gesellschaft Frankfurt a.M. am 17. April 1914.

© Copyright Soyinfo Center 2014

Zweite Auflage [The soybean: From a lecture... presented at the main meeting of the Gardening Society of Frankfurt am Main, on 17 April 1914. 2nd ed.]. Mainkur bei Frankfurt am Main, Germany: Published by the author. ii + 28 p. Illust. 22 cm. [4 ref. Ger]

• ***Summary:*** On the cover: "Die Sojabohne der Mandschurei [The soybean of Manchuria]. Much of this lecture (as stated on the title page) was based the following English-language article, translated into German by Werner Winkler (Gustav's son) in 1913: Shaw, Norman. 1911. "The soya bean of Manchuria." *Shanghai, Statistical Department, Inspectorate General of Customs. China Imperial Maritime Customs. II. Special Series* No. 31. 32 p.

Contents: A 2-page insert at the front. Photos show: (1) The author (with a large white beard and moustache) with a many-branched soybean plant, stripped of its leaves, mounted on a 2 x 3 foot wooden board, from his beanfield (*Winklers Bohnenfeld*) at Mainkur. This one plant grew from May 10 to Oct. 15, 6 months, producing 242 pods containing 503 completely mature soybeans. This line was acclimatized for 6 years and cultivated in the soil for 5 years. (2) The author standing and holding (with the roots facing upward) one soybean plant in each hand. In his right hand is an acclimatized soybean which produced 58 beans in 100 days. In his left hand is a plant grown from Chinese seeds of 1912-13 which produced 224 flowers and no seeds in 100 days. (3) A many-branched soybean plant, stripped of its leaves, from Winkler's beanfield, affixed to a board. Grown from Chinese seeds harvested in 1911/12. It grew from 15 May 1917 until Oct. 1, five months. 105 pods produced about 250 completely mature soybeans. From seeds that were not yet acclimatized grown on cultivated soil. (4) A similar looking plant from Winkler's beanfield. Grown from Chinese seeds harvested in 1911/12. It grew from 15 May 1918 until Oct. 15, five months. 160 pods produced about 350 soybeans. The seeds were not yet completely ripe because of bad, raw weather in 1918.

Foreword to the 2nd edition. Introduction. Diagram in the shape of a rhombus / diamond, showing how the various colored soybeans change from one color into another (adapted from Shaw 1911, p. 2). Description of the diagram: Discusses: (1) Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No. 98. 30 p. + 5 plates. May 27. (2) Hosie, Alexander. 1910. *Manchuria: Its People, Resources, and Recent History.* London: Methuen & Co. xii + 293 p. Hosie describes 3 types of soybeans: Yellow, with 3 subvarieites. Green, with 2 subvarieites. Black, with 3 subvarieites.

The rest of the contents is fairly similar to that of the 1st edition (1914), but the details within many sections are greatly expanded. On the rear cover is a photo of two soybean plants attached to a board, one month after planting the seed, Summer 1917; 15 May to 15 June. In the Supplement (p. 26-28), the author summarizes the results of his 8 years of soybean cultivation in Frankfurt; he concludes that it can be grown with good results in southern Germany. Frankfurt am Main is about midway between the northern and southern tips of Germany. Address: Mainkur bei Frankfurt am Main, Germany.

1922. *Christian Science Monitor.* 1918. Manchuria's soy bean oil industry: Expansion of manufacture of product said to have transformed country into land of thrift and opulence. Nov. 14. p. 10.

• ***Summary:*** "Seattle, Washington–Manchuria, through expansion of the soy bean oil industry as reflected in the abnormal increase in the movement through this port since 1915, is enjoying an industrial reconstruction similar to that of the United States, according to figures presented by M. Ogawa, an export official of the largest soy bean mills in the Orient, who is looking over shipping conditions here on the eve of the season's annual movement.

The growth of this vegetable and its manufacture into commercial products has transformed Manchuria from an obscure, poverty-stricken province into a land of thrift and opulence, Mr. Ogawa asserts, and the demand for the oil is increasing so rapidly that thousands of acres of unbroken land will be put under cultivation in 1919. Production of the oil this season will be 2,000,000 tons, to be increased next year to 50,000,000 tons."

The industry has been in the process of development for 20 years. Before the war the chief export was to Europe. When the war began the American trade was entered and the shortage of vegetable oils in the United States was so great that the demand for the product exceeded the supply."

Many new oil mills "have been established in Manchuria or are in the process of construction." The beans are imported to Japan from Manchuria, for although the soy bean "grows in Japan, the quality is secondary to that grown in Manchuria."

1923. Vantine (A.A.) & Co., Inc. 1918. Oriental delicacies: Vantine's–The Oriental store (Ad). *New York Times.* Nov. 24. p. 38.

• ***Summary:*** "Toothsome tidbits from Oriental lands, for your Thanksgiving Dinner, or to send to the boys in the Service, including an almost unlimited selection of specially packed 'goodies' for Christmas gifts."

"Imported Japanese shoyu or soy sauce. A delicious sauce for flavoring gravies, meats, fish, etc.–Prices 55¢, 85¢, $1.35."

"Japanese 'Midzuame' or rice candy. Made from rice, barley, malt, sugar and gelatine." 4 flavors–Price 35¢.

1924. *Christian Science Monitor.* 1918. Kei Hara cabinet: New Japanese Prime Minister heads ministry of self-made men, whose policy is for economic advancement of the nation. Nov. 28. p. 7.

© Copyright Soyinfo Center 2014

• ***Summary:*** "Mr. Utaro Noda, Minister of Communications, is one of the best-known characters of Japanese public life. His very humble parents lived in a village near Nagasaki, where his young manhood was passed as a vendor of 'tofu,' or bean-curd, a staple food of the poor of his native district. Tramping the country roads with his tofu stick over his shoulder, he found time to study sufficiently to give himself quite a fair education,..."

1925. *Chemische Umschau auf dem Gebiete der Fette, Oele, Wachse und Harze* (*Germany*). 1918. Technologie: Fettgewinnung, Fettwirtschaft [Technology: Obtaining fats and oils, and their economics]. 25(11):126-28. Nov. See p. 128. [Ger]
• ***Summary:*** The section titled Soybean oil (*Sojabohnenöl*) (p. 128) states: In Makamatsu [sic, Wakamatsu; Seaport city, Fukuoka prefecture, Northern Kyushu. Merged into Kitakyushu in 1963], Japan, a new oil factory (oil mill) has begun operation, with a processing capacity of 45,000 tonnes (metric tons) of soybeans per year; it is expected to produce 6,300 tonnes year of soybean oil. A small amount of this oil is expected to be exported to the USA.

On the same page are similar entries for sunflower seed oil, olive oil, peanut oil, and coconut oil.

1926. *International Institute of Agriculture, Bureau of Statistics* (*Rome*)*, Review.* 1918. International trade in concentrated cattle foods. No. 4. 72 p. Nov. [1 ref]
• ***Summary:*** This is the IIA's fourth review on concentrated cattle foods. "The first three reviews were published in the *International Review of the Science and Practice of Agriculture,* in the numbers of April 1915, 1916, and 1917." This publication is divided into six chapters. In Chapter 4, titled "Oil seeds and oilcake" the section on "Soya beans and soya cake" contains statistics on three subjects: Production, trade, and prices. Tables show: (1) "Produce in soya cake in the importing countries (estimated on the basis of the quantities of soya beans available) (p. 51). Figures are given in quintals for the years 1913-1917 for the following countries: Denmark, Great Britain and Ireland, Netherlands, Russia (including Asiatic provinces), China, Formosa, Japan, Dutch India (Java and Madura), and New Zealand. The top 3 countries in 1917 are: Japan 727,418. Denmark 284,000, and Great Britain and Ireland 223,969. However in 1915 Great Britain and Ireland produced 1,513,059. Note: 1 quintal = 100 kg.

(2) "Foreign trade in soya cake" (p. 51). Statistics are given in quintals for the years 1913-1917. Import figures are given for Denmark, Canada (incl. soya beans), Formosa, and Japan. Japan was by far the biggest importer, with 9,912,850 quintals in 1917. Export figures are given for Denmark, Great Britain, and China. China was by far the biggest exporter with 7,034,459 quintals in 1916.

Canadian imports of soya cake (including soya beans) was as follows (in quintals) for each financial year (p. 51): 2.345 in 1913. 2.412 in 1914. 1.121 in 1915. 1.358 in 1916. 4.730 in 1917. Note: This is the earliest document seen (Jan. 2010) that gives Canadian trade statistics for soybeans or soy products. This document contains the earliest date seen (1913) for trade of such products to or from Canada.

(3) "Foreign trade in soya beans" (p. 51). Statistics are given in quintals for the years 1913-1917. Import figures are given for Denmark, Great Britain and Ireland, Netherlands, Russia (incl. Asiatic provinces), Sweden, Formosa, Japan, and Dutch India (both Java and Madura, and Other possessions). The biggest importers in 1917 were: Japan 841,942, and Great Britain and Ireland 254,510. Export figures are given for Netherlands, China, Formosa, and Japan. China was by far the biggest exporter with 5,315,324 quintals in 1916.

(4) Foreign trade in sundry and unspecified oilcakes (p. 62). Gives imports statistics for soya cake by Roumania [Romania]: 79,378 quintals in 1913, 36,650 quintals in 1914, 5,554 quintals in 1915. Gives export statistics for soya cake by Russia: 54 quintals in 1913.

(5) "Prices of sundry oilcakes at the close of each week" (p. 55-56). For soya cake, the prices are given at Copenhagen, Denmark, for 1917 and 1918 in gold francs. The price rose by about 41% between Jan. 1917 and Jan. 1918 from 46.47 to 62.16 gold francs.

(6) "Other vegetable products" (p. 71). In 1913 Denmark exported 1,390 quintals of soya meal.

This document also contains extensive information on groundnuts and groundnut cake, sesamum and sesamum cake, etc.

Note 1. This is the earliest English-language document seen (Aug. 2000) that contains the word "oilcakes." Note 2. This is the earliest English-language document seen (Jan. 2001) that uses the word "quintals" (or "quintal") in connection with soybeans. Address: Rome, Italy.

1927. Satow, Sadakichi. 1918. Improvements in process of recovering proteids from vegetable proteid containing material for use in the industrial arts. *British Patent* 121,141. Dec. 12. 5 p. Application filed 28 June 1917.
• ***Summary:*** The object of this invention is to produce "pure undenatured proteids from suitable vegetable raw materials containing them." Such proteids are transparent and have other desirable characteristics. The Japanese soya bean is a particularly rich source of vegetable proteids.

Efforts to utilise these proteids have been hampered by the fact that the processes which have been used for extracting the proteids have also extracted deleterious impurities, or changed the natural state of the proteids. The use of heat or alcohol can change the natural state and may cause decomposition. In this new process the soybeans are crushed, the oil removed by use of a solvent, then the solvent separated from the oil. The oil-free meal is white or slightly

© Copyright Soyinfo Center 2014

yellow in color. The proteids are then precipitated by use of an acid such as sulphuric acid or acetic acid. Address: Chemist, Imperial Univ., Sendai, Japan.

1928. Holman, Charles William. 1918. Preliminary confidential report of the soya bean industry of Manchuria, China... Covering some phases of the production, manufacture and export of soya beans, soya bean oil and soya bean cake. 44 p. Unpublished typescript.
• ***Summary:*** This report contains observations made by the author during a 4-month trip (which ended 23 Sept. 1918) to Manchuria. Manchuria is divided in two large divisions, North and South. North Manchuria was, for all practices, a Russian-controlled territory until the recent dissolution of the Russian government. South Manchuria may be considered Japanese territory.

Contents: Introduction. Japanese trade policy. Acreage of soya beans. Production of soya beans in 1917. Details of crop production in 1911 (by districts). Estimates of soybean beans production, North Manchuria in former years (1906-1909). Primitive farming methods. Exports of soya beans (incl. cake and oil; 1911-1917). Export tariff. Storage at export points. Stocks on hand. Condition of stocks. Sack shortage in North Manchuria. The milling capacity of beans of Manchuria. Bean mills of Harbin. Bean mills of Dairen (Nisshin, Santai, Fushungheng, and Kodera all produce 110,000 or more pieces of cake per month). Bean mills of Antung. Bean oil mills of Newchwang. Oil factories in Japan and their capacities (Suzuki is biggest bean oil producer). Method of manufacture. The contents of soya beans. Future of milling industry. How the war affected soya bean trade (incl. unsuccessful attempt by Suzuki & Co. to corner the bean cake market). How the soya bean is marketed. How the beans change hands. Selling bean products on exchange (produce exchanges are located at Harbin, Changchun, Kaiyuan, and Dairen; in June 1913 Japanese officials set up the Dairen Staple Products Exchange and Dairen Trust and Guarantee Company to control unscrupulous speculators). The fluctuating money market. The bean market 1917-1918. Transportation of beans. Preparing soya beans for ocean shipment. Containers for oil. Trade policy of the Japanese. Trade control of beans and bean products. How to buy beans for the Government.

Page 32 notes: "Speculation. The attempt of Suzuki and Company to corner the bean cake market. This began in the summer of 1917, and extended through the present time. The bean cake is one of the principal fertilizers in use in Japan and Suzuki and Co. made a wrong guess as to the size of the bean crop and the stocks and undertook to corner the market. In order to maintain the corner it was necessary for Suzuki and Co. to enter the market and buy beans heavily. This led to a frenzied speculation on the part of all the members of the trade at Dairen which shot the prices of beans and beancake up to exorbitant figures. The attempt to corner the market failed because of two main factors: A. The price of fertilizer was beyond the reach of the Japanese farmers and they refused to purchase in the usual quantities. B. The stock of soya beans on hand in Manchuria proved unusually large due both to the large crop and to the accumulated surplus which ordinarily would go to Europe."

Page 43 notes: "Without doubt Mitsui and Co. handle the greatest quantity of bean oil and possibly beans, at the present time. Suzuki, Kodera, Yoko, T. Yuasa Masuda, and the Nisshin Oil Mills comprises the principal Japanese firms. They do an all Manchurian business. In Dairen the firm of Thomson and Hannan is the largest foreign buying firm; they are closely associated with Vassard and Co. In North Manchuria, (another name for the Danish East Asiatic Company) Danish Soshin Brothers Russian and Klemantaski-Bates and Co. British are the chief competitors of the Japanese."

Tables show production, exports, movements, and chemical composition of soy beans, bean cake, and bean oil. Note: According to Manchurian expert David Wolff of Princeton University, Holman originally went to Russia with John Stevens (an American railway builder), to work for the Russian railway system to help the war effort (1917). After the Russian Revolution in 1917, he stayed on under Stevens to work for the technical board of the Interallied Railway Corps headquartered in Harbin. Address: USA.

Address: Rigaku Hakase.

1930. Bell, Archie. 1918. Sunset Canada: British Columbia and beyond. Boston, Massachusetts: The Page Company. xii + 320 p. Illust. Index. Series: See America First.
• ***Summary:*** Chapter 10, titled "The Royal City," is about New Westminster in British Columbia, Canada. In 1859, New Westminster was selected as the first capital of the new Colony of British Columbia by Queen Victoria, who named the city after part of London. It soon became known as "The Royal City." Located on the north bank of the Fraser River, 12 miles southeast of Vancouver City, it was the only freshwater harbor of any consequence in Western Canada.

Yet the Canadian Pacific Railroad bypassed New Westminster (a crushing disappointment to the city's people) and went instead to Vancouver. Still its location "is strikingly similar to that of New Orleans on the Mississippi river or Shanghai above the mouth of the Yangtzu-Kiang. Both of the latter compelled the commerce of the world to come up the river to them.

Across the Fraser river one soon arrives at Steveston, which is almost an Oriental City; most of the inhabitants are Japanese fisherman, and they live much as if they were still

© Copyright Soyinfo Center 2014

in Japan. On Lulu Island at Steveston, "the native instinct for beauty and love for the picturesque has prompted the planting of shrubs and flowering plants. Sometimes they are in painted tin cans, in [wooden] soy kegs or in China urns; the idea is the same, the beautification of the dooryard, which is as noticeable among Nippon's very poor, where the dooryard may not be more than two square yards in area, as among the rich and noble who can build extensive parks and landscape gardens." Address: Author, Cleveland, Ohio.

1931. Chalmers, Thomas Wightman. 1918. The production and treatment of vegetable oils: Including chapters on the refining of oils, the hydrogenation of oils, the generation of hydrogen, soap making, the recovery and refining of glycerine, and the splitting of oils. New York: D. Van Nostrand Co.; London: Constable & Co., Ltd. 152 p. See p. 9-10, 87, 107. Illust. Index. 29 cm. Series: The Engineer.
• ***Summary:*** The chapters in this book "Originally appeared as a series of articles in *The Engineer...* "Eighteen articles, February 9 to June 29, 1917." Chapter 2, titled "The principal vegetable oils" contains a section on "Soya bean oil" (p. 9-10) which notes that the bean and its oil were almost unknown in Europe until after the Russo-Japanese war. Now the oil rivals cotton seed oil in Europe and, at least on the Continent, soya bean cake rivals linseed and cotton seed cake for use as a food for milch cows. The oil belongs to the semi-drying class, but can also be used for edible purposes.

In Chapter 11, "Extraction of oils by chemical solvents," soya beans are mentioned in passing (p. 87).

Chapter 13, titled "The hydrogenation or hardening of oils," begins (p. 106) by noting that "Fatty vegetable and animal oils may be described as consisting of a glycerine part and an acid part." The glycerine part is the same for each, but the composition of the acid part differs from oil to oil. In the acid parts of soya-bean oil and cotton-seed oil, four hydrogen atoms are missing. If these missing atoms are replaced by adding hydrogen, through hydrogenation, the liquid oil will become a solid fat. This is important because natural hard fats are in short supply and expensive, whereas liquid oils are very abundant and relatively inexpensive.

If the soap maker, for example, uses hardened whale oil, soya-bean oil, or the like, he can obtain a soap practically identical in quality to that made with more expensive tallow. The main oil hardened at present is whale oil, but increasing amounts of cotton-seed, linseed, soya-bean, cocoa-nut, and other oils are being subjected to hydrogenation. The result is an oil that is white, tasteless, and odorless, and has a tallow-like consistency. There are signs that producers of soya-bean oil in Japan and Manchuria may harden it before exporting it (p. 107). Address: B.Sc., A.M.I.Mech.E. (On the editorial staff of "The Engineer").

1932. Crevost, Charles. 1918. Plantes oléifères de l'Indochine [Oil-bearing plants of Indochina]. In: Congrès d'Agriculture Coloniale, Gouvernement Générale de l'Indochine. 1918. Hanoi-Haiphong: Impr. d'Extrême-Orient. 57 p. Series: Hanoi No. 6. See p. 26-27. [100* ref. Fre]
• ***Summary:*** Following an overview, the various oil-bearing plants are described in detail, organized by family. The section on Soja (p. 26-27) states: Indigenous names in Cochin China, Annam and Tonkin: Dau nanh, Dau tuong. Cambodia: Sandek sieng. China: Teou [dou]. Japan: Daizu mame. The plant is widely cultivated in Indochina for its seeds which, although not consumed directly as food, are used nevertheless to make various other foods: cheeses (dau phu and dau oc [tofu]), and a condiment sauce [soy sauce] (tuong).

In Indochina there is only one variety of soybean, which has oblong yellowish-white seeds, slightly flattened, more or less large according to its place of origin, whereas in China and Japan soybeans come in various colors and colorations.

The best seed in the colony come from Cambodia and the province of Lang-son in Tonkin.

It is well known that soy protein (*graine de soja à base de caséo-sojaïne*) serves as the basis for numerous food preparations; but the seeds are now most widely used in the manufacture of an oil, used for illumination [in lamps] or food; it tends to replace cotton oil in the soap industry, whereas soybean cakes (*les tourteaux de soja*) are considered excellent for use as a fertilizer or for fattening cattle.

A table shows nutritional analyses of soybeans from three locations, conducted at the colonial garden of Nogent-sur-Marne: Laos, Tonkin, and Manchuria. For each the moisture, protein, oil, carbohydrate, and mineral content are given.

Also discusses: Peanuts (p. 25-26, with illustration facing p. 25, and 9 references), sesame (p. 29-30, with illustration facing p. 29), perilla (p. 30).

Note the interesting phrase *graine de soja à base de caséo-sojaïne,* based on the work of Li Yu-ying near Paris, France. Address: Inspecteur des Services agricoles et commerciaux; Conservateur du Musée [Maurice Long] agricole et commercial de Hanoi.

1933. Kodama, Suisei. 1918. Shôkôgyôjô yori mitaru Manshû no daizu [A look at Manchurian soybeans from the viewpoint of commerce]. [Dairen]: South Manchuria Railway Co., Regional Dept. (Minami Manshû Tetsudô Kabushiki Kaisha Chihôka). 3 + 101 p. 22 cm. Series: Shôkô chôsa no. 2. [Jap]*
Address: Dairen, Manchuria.

• ***Summary:*** Contents: Early history of the soy-bean industry.

© Copyright Soyinfo Center 2014

Soy beans in the United States. Cultural requirements. Varieties. Soy beans as forage. Soy beans for oil. Soy-bean meal. Soy beans for human food: Dried beans, green beans, soy-bean milk, soy-bean cheese, soy sauce, soy-bean sprouts. Possibilities of the soy-bean industry in the United States.

"The annals of Old China set forth the fact that the soy bean was an important food fully 5,000 years ago. When the ports of China were first opened to foreign commerce, the trade in [soy] beans and bean products was found to have been a long-established and flourishing institution. In value and in extent and in variety of uses the soy bean is the most important legume grown in Asiatic countries." Note: This is the earliest document seen (May 2003) which gives the age of the soybean as "5,000 years."

"Near the close of the eighteenth century the soy bean found its way its way to Europe, its cultivation being recorded in England in 1790. It is mentioned in the United States as early as 1804. For several decades, however, it was regarded more as a botanical curiosity than as a plant of much economic importance. In 1875, Prof. Haberlandt began an extensive series of experiments in Austria with the soy bean and strongly urged its use as a food for both man and beast. Although considerable interest was aroused during the experiments, the soy bean failed to attend the success hoped for by the experimenter.

"Previous to the Russian-Japanese war [1904-05] China and Japan were not only the greatest producers but also the greatest consumers of the soy bean and its products. During the war the production of the crop was greatly increased throughout Manchuria. After the war, however, it became necessary to find new markets for the surplus beans, and trial shipments were made to Europe. The first attempts to introduce the soy bean and its products into European markets were generally unsuccessful because of the unsatisfactory condition in which the beans and cake were received, owing to poor shipping facilities. About 1908 a large trial shipment made to the English oil mills was received in much better condition than previous shipments, and the results obtained were so satisfactory that larger imports were made."

"Soy beans in the United States. As previously stated, the soy bean was introduced as early as 1804, but it is only within recent years that it has become a crop of much importance in the United States. Until the present season it has been grown primarily as a forage crop, though a constantly increasing demand for seed for food and planting has led to the development of a very profitable soy-bean seed industry in many sections of the South and the corn belt. The large yield of seed, the ease of growing and handling the crop, the value of the beans for both human and animal food, and the value of the oil and meal all tend to make this crop one of great potential importance and to assure its greater agricultural development in America."

"Varieties:... At the present time about 20 varieties are handled commercially by growers and seedsmen, although more than 500 distinct varieties are known and have been grown by the Department of Agriculture on its testing grounds. The yellow-seeded sorts are preferred for food and the production of oil and metal and include the following: Mammoth (late), Tokyo (late), Hollybrook (medium late), Haberlandt (medium late), Medium Yellow (medium), Mikado (medium), Ito San (early), Manchu (early), and Elton (early). For forage, the black and brown seeded varieties are most suitable and include Barchet (late), Biloxi (late), Peking (medium), Wilson-Five (medium [black seeded]), Virginia (medium late), Early Brown (early), and Black Eyebrow (early).

"Soy beans for oil: The soy bean was first utilized for the production of oil and meal in the United States about 1910 by an oil mill on the Pacific coast. The beans were imported from Manchuria, and the success of the industry is indicated by the continued production of the oil and meal and the increasing imports of soy-bean seed from Manchuria.

"American-grown seed was first crushed for oil the latter part of 1915 by a few cottonseed-oil mills in North Carolina. A shortage of cottonseed and a surplus of soy-bean seed led to a rather extensive use of domestic-grown seed for this purpose. However, during the season of 1916-17 no domestic-grown beans were utilized for oil, owing to the extremely high price of seed. The cottonseed-oil mills of the South saw the possibilities of the soy bean as an oil seed, and many mills throughout the cotton belt contracted with planters for seed of the 1917 crop. This led to a considerable increase of acreage. Large quantities of Manchurian beans have been imported during the past few months and utilized by southern mills in the production of oil and meal.

"The utilization of the soy bean as an oil seed has not required any extensive changes in the equipment of the modern oil mills. The methods are similar to those employed with other oil seeds, such as cottonseed and linseed. According to data obtained from different mills, 1 ton of soy-bean seed yields from 28 to 31 gallons of oil and about 1,600 pounds of meal.

"The oil extracted from the soy bean in many respects resembles cottonseed oil, though it dries more rapidly. This oil has a good color, has but a faint odor, and is rather palatable. New trade uses are being constantly found for soy-bean oil, and it has become an important competitor of other vegetable oils. It was first used in the United States in its crude state, principally in the manufacture of soft soaps. In the search for new oils to replace linseed oil for paint purposes, partly or wholly, soy-bean oil was found most suitable. Paint grinders are using successfully large quantities of this oil in the manufacture of certain types of paint. Manufacturers of butter and lard substitutes are using considerable amounts of soy-bean oil in their products. Other uses for which this oil is employed are in the manufacture of explosives, linoleum, varnish, and foodstuffs.

© Copyright Soyinfo Center 2014

"Soy-bean oil has been studied with other oils by the Office of Home Economics and found to compare favorably with the more common table oils with respect to digestibility. In view of the rapid improvement in the process of refining this oil, there seems to be scarcely any use to which oil is put in the manufacture of foodstuffs in which soy-bean oil may not eventually be found to have an important place" (p. 104).

"Soy-bean meal:... The meal or flour produced from American-grown yellow varieties is bright yellow in color when fresh and has a sweet, nutty flavor. Samples of meal from different sources range from 46 to 52 per cent protein and from 5 to 8 per cent oil. As a human food, soy-bean flour has been used in the United States principally as a special article of diet and sold by companies manufacturing special foods of low starch content. The flour or meal can be successfully used as a constituent of bread, muffins, biscuits, or pastry. Extensive tests have been conducted by the United States Department of Agriculture with soy-bean flour in the making of bread and pastry. In these various food products about one-fourth soy flour and three-fourths wheat flour has been found to be the proper proportion. In some of the pastry products, however, as much as one-half soy flour can be used. During the past year the use of soy-bean meal has gained in popularity on account of the many palatable products that may be made from it" (p. 105). Photos are described in Part II. Continued. Address: Scientific Asst. in Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

1935. Morse, W.J. 1918. The soy-bean industry in the United States (Continued–Document part II). *Yearbook of the U.S. Department of Agriculture* p. 101-11. For the year 1917. See p. 106-10. Contains many photographs by Frank N. Meyer. • ***Summary:*** Continued from p. 106. "Soy beans for human food: In Asiatic countries, especially China and Japan, the soy bean and the various food products made from it are so largely consumed that it is second only to rice in importance as a food crop. The soy bean is eaten only to a very small extent like other beans, but in China and Japan it is elaborated into a great variety of products, all having a high percentage of protein and making a well-balanced diet when eaten in connection with the staple food, rice. Some of these products are said to be eaten at every meal and by rich and poor alike. Of these numerous preparations, only one, 'shoyu,' or 'soy sauce,' has been introduced to any extent in other countries. It is quite possible that some of these products would appeal to the American taste and with proper exploitation become established on the American market.

"Although the soy beans as an article of food has attracted attention from time to time in the United States, thus far it has been used but little except as a special food for invalids. The beans contain only a trace of starch and are highly recommended as a food for persons requiring a diet of low starch content. During the past year, however, much interest has been manifested in the possibilities of the soy bean as a staple food.

"Many schools of cookery and domestic science throughout the country have conducted experiments rather successfully, utilizing the dried beans in the manner of the navy bean. As a result, the dried beans can now be purchased in the markets in nearly all of the large cities. The variety and palatability of the forms in which the bean can be served make it a very desirable article of food, and it may be expected to grow in favor as it becomes better known (p. 107)."

"Dried beans:... During the season of 1916 about 100,000 bushels of American-grown soy beans were packed as baked beans by several canning companies in the Central and Eastern States." Properly roasted, the dried beans "make a good coffee substitute. Those fond of cereal beverages pronounce it equal to many of the preparations on the market. In China, the beans are soaked in water and roasted, the product being eaten after the manner of roasted peanuts. This method of preparing the beans is improved by soaking the beans for about twelve hours in a 10 per cent salt solution, boiling slowly for about 30 minutes, and then roasting to a light-brown color. The yellow-seeded and green-seeded varieties are preferable, as they make a product of better appearance.

"Green beans: When soy beans are three-fourths or more grown, the seed makes a most palatable and nutritious green vegetable. As such it may be used much as is the green pea or the Lima bean. The pods are somewhat tough and not desirable to eat. The green beans are rather difficult to shell, but after cooking in the pods for about five minutes, they shell out very easily."

"Soy-bean milk:" If dried soy beans are soaked, crushed, and boiled "a milky emulsion is obtained which is very similar in appearance and properties to cow's milk. This liquid, separated out by means of a very fine sieve or through a cloth filter, is the soy-bean or 'vegetable' milk used so extensively in China." "Soy-bean milk has a rather strong characteristic taste and odor which may be masked by the addition of a small quantity of coumarin or vanillin. This 'vegetable milk' can be used in numerous preparations, such as breads and cakes, in creaming vegetables, in milk chocolate, and in custards. If allowed to remain in a warm place the milk becomes sour, like animal milk, and in that form may be employed just like sour milk or buttermilk...

"After separating the milk from the solid material, the residue [okara] is still very rich in nutritive substances. It can be dried and used for cattle feed or possibly made into a meal or flour for human consumption."

"Soy-bean cheese: "The addition of magnesium or calcium salts (about a 1 per cent solution) to soy-bean milk when hot precipitates some of the proteid substances, forming a grayish white curd which settles out, leaving a yellowish watery liquid. This curd, after being drained

© Copyright Soyinfo Center 2014

and pressed, represents the tofu, or bean curd, which is so extensively eaten and forms the basis of numerous fermented, smoked, and dried cheeses in China and Japan (Plates III and IV). Tofu is made fresh daily and is a staple article of diet of oriental peoples. In many cities of the United States having a large Asiatic population, fresh bean curd generally may be found in the Chinese markets. Although the fresh curd, or tofu, is tasteless, it is a highly nutritious food and no doubt could be elaborated by the American housewife into a variety of palatable dishes.

"Soy sauce: Soy or shoyu sauce is a dark brown liquid prepared from a mixture of cooked and ground soy beans, roasted and pulverized wheat (barley is sometimes used), salt and water. This mass is inoculated with a culture known as rice ferment (*Aspergillus oryzae*) and left in casks to ferment from six months to a year and sometimes longer (Plate V)... This product may well serve as the basis of sauces of the Worcestershire type... The manufacture of soy sauce is conducted on a large scale in China and Japan, and to some extent in India. The yearly production of Japan is said to amount to nearly 2,000,000 barrels. The brewing of this sauce has also become a well established industry in Hawaii. Although there are no factories in the United States, considerable quantities of the sauce are imported annually, and it can be obtained at Chinese stores in most of our cities."

"Soy-Bean sprouts: Several species of beans are sprouted and used as a green vegetable by the Chinese (Plate VI). Soy beans are used to a very considerable extent for this purpose, as these sprouts are larger and firmer than those of most other legumes. Bean sprouts can be used as a home winter vegetable, for the dried beans are sprouted easily in a short time under proper conditions of heat and moisture. It is quite possible that sprouted soy beans utilized in various vegetable dishes would appeal to the American taste."

Note 1. This is the earliest English-language document seen (Jan. 2013) that uses the term "sprouted soy beans" (or "sprouted soy bean") to refer to soy sprouts.

A table (p. 111) shows the "Quantity and value of soy beans, soy-bean cake, and soy-bean oil imported into the United States, 1910-1917, inclusive.

Photos on unnumbered pages show: (1) A typical soy bean plant. (2) A field of the Biloxi soy bean grown at Biloxi, Mississippi. (3) Pods and seeds of 7 common varieties of soy beans.

(4) "Large blocks of freshly made bean curd, 'tofu' [on a round wooden table], ready to be cut up into squares and sold to the housewife."*

(5) "Large bamboo tray of various kinds of soy-bean cheese of the drier type" [pressed tofu sheets].*

(6) "A dark room of even temperature where wooden trays, full of bean curd [tofu] are piled. This is another method of preparing soy-bean cheese" [fermented tofu].*

(7) "Large earthen jars full of squares of bean curd, which are covered with spiced brine and soy sauce. After several months' curing a bean cheese [fermented tofu] is formed, which can be kept for many years."*

(8) A "courtyard full of covered pots of fermented soy beans and brine from which soy sauce is made."*

(9) The basket on the left contains "sprouted soy beans, which are sold and used as a green vegetable" [in China]* * = Photographed by Frank N. Meyer, Agricultural Explorer, USDA.

Note 2. This is the earliest published document seen (Jan. 2001) that contains photos of soyfoods by Frank. N. Meyer. Most of the photos appear to have been taken in China.

Note 3. This is the earliest document seen (Jan. 2013) in which William Morse describes "soy-bean sprouts" or "soy-bean cheese" (tofu).

Note 4. This is the earliest English-language document seen (Oct. 2011) that uses the term "soy-bean cheese" to refer to fermented tofu.

Note 5. This is the earliest English-language document seen (May 2005) that uses the term "masked" (or any other form of that verb) in connection with the undesirable taste or odor of soyfoods (soy-bean milk) or soy beans.

Note 6. This is the earliest document seen (June 2013) that gives statistics for the amount of whole soybeans used as food in the United States, or that gives a figure (about 100,000 bushels) for the amount of soybeans canned in the USA in 1916–the first time they are known to have been canned. Address: Scientific Asst. in Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

1936. Saito, Kendo. 1918. Ueber die chemischen Bedingungen der Askenbildung bei *Zygosaccharomyces major* Takahashi et Yukawa [On the chemical conditions of asci formation in *Zygosaccharomyces major* Takahashi et Yukawa]. *Botanical Magazine* (*Tokyo*) 32(373):1-13. Jan.; 32(374):15-25. Feb. [Ger]

• ***Summary:*** *Zygosaccharomyces major* (later renamed *Saccharomyces rouxii*) is an important yeast that grows in soy sauce and was later found to contribute to its flavor. Asci are small sacs which some yeasts, under certain conditions, produce to contain their sexual spores.

Contents: Introduction. Preliminary remarks concerning materials and methods (soy sauce is mentioned on p. 4). The need for a definite salt solution for ascospore formation. Theory concerning the effect of salt. The need for a carbon source for the development of the ascospores.

Note 1. Yeasts have been defined as fungi in which the usual dominant, or conspicuous form in unicellular (single-celled). This unicellular form gives yeasts two advantages over the mycelial (multi-cellular) form of molds: (1) There is greater surface to volume ratio which allows greater metabolic activity; (2) The unicellular form is more readily

© Copyright Soyinfo Center 2014

distributed than the mycelial form. On the basis of their method of reproduction, the yeasts can be divided into four groups. Only two of these groups contain yeasts involved with foods. One group produces sexual ascospores in asci (small sacs) and is in the class Ascomycetes. These are the so-called true yeasts. For most yeasts, the maximum number of spores per ascus is four, but a few yeasts can produce eight. The usual form of vegetative (asexual) reproduction is by budding; all yeasts can reproduce asexually. The yeasts in the other group form no sexual spores and have no sexual life cycle; they are the false yeasts, Fungi Imperfecti, or Deuteromycetes (See Banwart, G.J. 1979. *Basic Food Microbiology,* p. 97-98).

Note 2. This yeast *Zygosaccharomyces major* was renamed *Saccharomyces rouxii* by the late 1950s (see Sakaguchi 1959). It is halotolerant (can tolerate high salt concentrations), and contributes to the flavor and aroma of soy sauce, in part by producing ethyl alcohol.

Note 3. Part 1 of this 3-part series was written in Japanese and published in this journal in 1916.

1937. Takenob, Y. 1918. Japan Year Book. Tokyo: Japan Year Book Office. 784 p. See p. 303, 492-93, 514, 530-31, 574, 584-85, 606-07, 611-12, 614, 691, 713, 721, 736, 782. 13th annual issue. [Eng]

• ***Summary:*** This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa. The Preface is dated 31 Aug. 1918.

At the front of the book are 34 pages of large ads on pages enumerated with Roman numerals. At the rear of the book are 49 pages of large ads on pages similarly enumerated.

Near the front is a page of "Weights, measures, and moneys." 1 koku = 10 to = 100 sho = 4.65389 gallons (liquid) (U.S.A.) = 180.39 liters.

Page 303 shows how inflation in Japan during the great European war is making it difficult for regular families to make ends meet. The price of common foods such as "Sugar, soy, etc." has increased by 50% from June 1914 to Feb. 1918.

Page 584-85. The section on "Brewing industry" gives information about soy sauce plus production statistics for sake, beer, and soy [sauce] from 1913 to 1916.

Page 493. A table titled "Prices of principal commodities," 1914-1916 shows that the price of soja beans decreased from 11.55 yen per koku in 1914 to 10.28 yen per koku in 1916. The price of red [azuki] beans and miso also decreased. But the price of soy [sauce] increased from 24.91 yen per koku in 1914 to 25.05 yen per koku in 1916.

Page 492. A section titled "Guilds of stable commodities" lists: "The principal production guilds as classified according to the kind of commodities handled were as follows at the end of the year 1913:–Raw silk, 238; Rice, 68; Artificial fertilizers, 30; Paper, 24; Porcelain, 22; Medicines, 23; Weaving, 138; Timber, 32; Soy and miso, 31; Charcoal, 26; Matting, 20; Total, incl. others, 975."

Page 530-31. In the chapter on "Agriculture." A table shows production of soy beans, potatoes, and sweet potatoes, 1912-1916 (in 1,000 koku). Production of soy beans increased from:

3.511 million *koku* in 1912
2.993 million *koku* in 1913
3.664 million *koku* in 1914
3.807 million *koku* in 1915
3.750 million *koku* in 1916

The text immediately after the table (p. 531) states: "Among subsidiary farm crops there is perhaps nothing which plays so important a part in the Japanese kitchen as soy beans..."

Pages 573-74. A table of industrial companies classified by amount of investment states for "Soy and miso." Number of companies: 281. Paid up capital: 6.653 million yen. Reserves: 552,000 yen.

Pages 606-07 show record tax revenues in 1917-18, including 5.28 million yen from soy [sauce].

Pages 611-12. Discuss the history of taxation in Japan, including the tax on soy. The system is said to be irrational, and excises taxes applied to daily necessities, such as soy, place an unfairly heavy burden on the poor.

Page 614 repeats basic information about "6. Tax on Japanese soy [sauce]."

Page 691. The chapter on "Chosen (Korea)" states (p. 691): "Barley and soya bean.–Barley covers 584,664 cho, yielding 4.600,000 koku. Soya and other beans are exported chiefly to Japan for manufacturing soy, the export amounting to about 5,000,0O0 yen annually; the acreage is 553,077 cho and the yield 3,200,000 koku [415,252 metric tons]." Address: Prof. at Waseda Univ. and Late of the *Japan Times,* Tokyo, Japan.

1938. *Virginia Department of Agriculture and Immigration, Bulletin.* 1918. Soy bean useful crop. May be utilized in greater number of ways than almost any other agricultural product. No. 126. p. 174-76.

• ***Summary:*** "In addition to its availability as a food, soy-bean oil has found important uses in the markets of the world for making paints, varnishes, soaps, rubber substitutes, linoleum, waterproof goods, and lubricants. It is also used in the Orient for lighting and in the manufacture of printing ink. In Japan the soy bean forms one of the most important articles of food in use. It is one of the principle ingredients in the manufacture shoyu (soy sauce), miso (bean cheese), tofu (bean curd), and natto (steamed beans). The beans are eaten also as a vegetable and in soups; sometimes they are picked green, boiled, and served cold with soy sauce, and sometimes as a salad. A 'vegetable milk' is also produced from the soy bean, forming the basis for the manufacture of the different kinds of vegetable cheese. This milk is used fresh, and a

© Copyright Soyinfo Center 2014

form of condensed milk is manufactured from it. All of these foodstuffs are used daily in Japanese homes, and for the poorer classes are the principle source of protein."

"An artificial milk like that manufactured in the Orient has been produced in small quantities in the United States, and recently a factory has been equipped to make this product." Photos show: (1) Soy beans as a forage crop, arranged in stacks. (2) Lime spreader at work. Address: Virginia.

1939. *Yearbook of the U.S. Department of Agriculture.* 1918. Origin of principal farm products imported into the United States, 1914-1917. p. 797. For the year 1917.
• ***Summary:*** This table shows that in 1916 some 98,119,695 pounds of soya-bean oil were imported to the USA. Of this 70,384,049 lb came from Japan, 187,772 lb from the United Kingdom, and 27,547,924 lb from other countries. In 1917 an estimated 162,690,235 lb will be imported. In 1915 some 19,206,521 lb were imported, and in 1916 some 16,360,452 lb.

1940. Takahashi, Teizô. 1919. Re: Sample of shoyu sent by his brother to Margaret Church. Letter to Margaret B. Church, Bureau of Chemistry, USDA, Washington, DC, Jan. 18. 2 p. Typed, with signature. [Eng]
• ***Summary:*** "Yours to hand and very much pleased to know that you received 'shoyu' from my brother [of Pacific Trading Co., in San Francisco, California]. I hope that you will order the same to my brother at any time. An interesting news is that you have an organic chemist working on the chemistry of 'shoyu.'

"If press cake of peanut may be utilized for 'shoyu' manufacture, it is a great progress in this business. A further culture material from Dr. Thom's mycological collection is deeply appreciated. Respectfully yours,..."

On the back of the letter are 3 illustrations (his sketches) of small wooden implements, apparently related to making shoyu. One appears to be a stirrer. Address: Agricultural College, Tokyo Imperial Univ., Tokyo, Japan.

1941. Albers Bros. Milling Co. 1919. Importers of Oriental beans, peas, peanuts, seeds and grains of all kinds (Ad). *Bean-Bag* (*The*) (*St. Louis, Missouri*) 1(8):47. Jan.
• ***Summary:*** "Offices: New York, Seattle, Tacoma, Bellingham, Spokane, Lewiston, Salt Lake [City, Utah], Portland [Oregon], San Francisco Francisco [California], Oakland, Los Angeles, Kobe, Japan. Address all import and export communications to the Seattle office. Cable address, 'Albers'–all codes."

1942. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1919. Soy beans arrive on Japanese ship. 1(8):23. Jan.
• ***Summary:*** "Seattle, Washington–The first large consignment of soy beans from the 1918 fall crop was delivered in port the middle of the month by the Osaka Shosen Kaisha liner Kofuku Marun [probably *Kofuku Maru*]. She had 1,500 tons.

"Last season 1,000,000 tons of soy beans were imported from Manchuria and Japan and several months were consumed in moving the consignment. The shortage of the domestic crop and the high market prices were responsible for the big import.

"Importers are somewhat skeptical about market futures for soy Oriental beans. American crops have improved. The probable size of imports from Manchuria will be difficult to forecast. It is not probable that the output through Puget Sound will be as large as last year."

1943. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1919. Trade in soy bean oil in Kobe [Japan] in 1917. 1(8):24. Jan.
• ***Summary:*** "The amount of soy bean oil, largely originating or manufactured in the Kobe, Japan, district and exported in 1917 was slightly less than in 1916, but its value was far higher, and there was a greatly increased trade in the oil from the mainland and South Seas transshipped and marketed at Kobe.

"Causes tending to make Kobe a large vegetable oil market are: (1) The great decrease of all but Japanese merchant tonnage in the Pacific, as the Japanese lines converge and carry on their principal trans-shipment business here; (2) the high rate and rapid fluctuations of silver exchange in China, of which Japanese buyers can take quicker advantage than the representatives of purchasers in more distant countries; (3) the great increase in oil mills owned and operated by Japanese, both in Japan and in the mainland. October, 1917, saw the beginning of the largest buying season yet known in Japan, it being estimated by exporters that between the beginning of that month and the end of the year about $25,000,000 worth of vegetable oils were sold for future shipment to the United States alone. Quotations rose very rapidly during that period. Soy oil that was worth $8.90 per hundred pounds landed net weight c. i. f. Pacific coast ports at the beginning of the year was quoted at $15.50 at the end of the year.

"Soy bean oil, which originates principally in Manchuria, is almost entirely controlled by Japanese. The supply of beans last year was very large, and the amount of oil turned out was limited only by the capacity of the mills. A number of large new plants were started both in Manchuria and Japan and most of the already established mills increased their capacity."

1946. U.S. Department of Commerce, Far Eastern Div. 1919. Oil and oilseeds of the Orient. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 22(33):611-16. Feb. 8.
• ***Summary:*** Contents: Introduction. Method of cultivation [and harvesting] in China. Bean curd a Chinese delicacy. Domestic methods of marketing oil in China. Japanese production of vegetable oils [and exports to the United States]. China's production of oil steadily growing.

Tables show: (1) Total quantity and value of Chinese vegetable-oil exports, and the value of exports to the United States, including transshipments [from Manchuria], in 1917. Of total oil exports, coconut oil is by far the leader in quantity and value, followed by soya bean oil. But of oil exports to the USA, soya bean oil is by far the leader. Dairen exported 90% of the soya bean oil in 1917.

(2) Exports of vegetable oil from China in 1915, 1916, and 1917 (the quantities are expressed in piculs of 133.33 pounds and the values in Haikwan taels worth $0.62 in 1915, $0.79 in 1916, and $1.3 in 1917). Soya bean oil was by far the largest oil export in both quantity and value all three years. The quantity increased from 1.017 million in 1915 to 1.566 million in 1916 to 1.891 million in 1917.

(3) Exports of oil-bearing seeds and beans from China in 1915, 1916, and 1917. Soya beans were by far the largest bean or seed export in both quantity and value all three years. The quantity was 10.235 million in 1915, then 6.732 million in 1916, rising to 7.927 million in 1917.

"No single vegetable product has developed such importance in the Far East as the soya bean... As a food it is the principal ingredient of soy sauce, bean curd, and steamed beans. The bean cake, containing a high percentage of nitrogen, is a valuable fertilizer and is used extensively in Japan, and recently bean oil temporarily replaced petroleum for lighting in China when lack of shipping facilities kept that product off the market. The center of soya-bean production is Manchuria, and Japan is the chief crusher and producer of oil and cake, though the manufacture of bean oil and cake is also a very important industry of Dairen, Kwantung Leased Territory. Mukden is the center of the bean trade and the beans are there bought for cash from the farmers."

"Bean curd a Chinese delicacy: Bean curd is made mostly from the two kinds of oil beans described [Eighth Month White Bean and Water White Bean], although all varieties may be used in its preparation. As a rule, however, the other varieties of beans are not planted for oil or curd, but are eaten steamed when the bean is young and tender.

"Bean curd is prepared by first steeping the beans in cold water for 6 or 7 hours in summer or 24 hours in winter, and, after washing, grinding with cold water to form a bean milk. This milk is cooked in a large kettle and the film removed from the surface after a quarter of an hour and dried. This film or skin is known as Tou Fu Yi [doufu pi, usually called "bean curd skin" in English; yuba in Japanese] and 20 or 30 films can be obtained from a kettle without thinning the milk too much. After boiling half an hour the remaining milk is poured into a jar and a gypsum or salt solution added to curdle it. The proportion is 6 ounces of salt to 1 picul (133.33 pounds) of beans.

Note 1. This is the earliest English-language document seen (Oct. 2010) that uses the term "doufu pi" (regardless of hyphenation or spacing) to refer to yuba.

Note 2. Yuba is described as an early step in the tofu-making process. Viewed in this way, the word "bean curd skin" makes more sense.

"After standing 15 minutes a curdled substance called Tou Fun No [bean curd brain] is the result. This product is molded in wooden frames by a heavy block of wood for 15 minutes and is then cut into small pieces with a dull brass knife. A piece 2 inches square and half an inch thick retails for 5 cash (0.5 cent). This curd forms the basis for numerous Chinese articles of food and is prepared in various ways. Perhaps the most usual form of serving is to press the curd, wrapped in cloth, for six hours in a box 1 foot square and 8 inches high and then cook in oil. It is also boiled, after such preparation, with pork or cabbage."

"Japanese production of vegetable oils: The present estimated production of Japanese oil mills is 90,600 long tons of vegetable oils annually and is made up as follows: Soya-bean oil, 37,509 tons; coconut oil, 27,542 tons; rapeseed oil, 17,848 tons; cottonseed oil, 6,433 tons; and peanut oil, 1,268 tons. Seventy-five per cent of this crush is made in the Kobe district and is handled by 25 oil mills, modernly equipped." In 1917 Japan exported (including transshipments) 34,916,260 lb of coconut oil, 22,643,623 lb of soya bean oil, and 19,677,825 of rapeseed oil. He concludes that "American importers of Far Eastern products may well investigate the domestic market for Far Eastern oilseeds with a view to supplying oil mills in the U.S. with raw material." A table shows import and export data. Address: Asia.

1947. *Wall Street Journal.* 1919. Oiling the way. Feb. 22. p. 2.
• ***Summary:*** Besides fuel oil, there "are other kinds of oil, hitherto little exploited, of which the United States imports vast quantities. Japan sends about $10,000,000 worth every year, mostly soya bean oil, and the Philippines more than

© Copyright Soyinfo Center 2014

that of cocoanut oil alone. China is the principal producer of these raw materials [esp. soya beans]. Even Japan buys from her, then presses and ships the oil.

Profitable "exports are conditioned upon full return cargoes. The Orient wants our goods. It has unlimited supplies of oilseeds. We have 278 cottonseed mills and the civilized world is calling for vegetable oil as well as for fuel oil. Logic of the situation seems to be to bring back oil seeds, crush them here, and consume or sell the oil and meal. Foreign trade means goods going and coming."

1948. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1919. The home of Oriental beans. 1(9):12-13. Feb.
• ***Summary:*** "From Tsitsihar, westward to the Hingan Range along the river, the plain narrows down and is alternate with land under cultivation and pasturages. Beyond the Hingan Range, a boundless plain spreads itself on high levels, and in point of climate and soil it reminds one of being an extension of the Mongolian desert land. The plain is employed as sheep farms in a good portion.

"The Bean Belt in North Manchuria extends over Hulan Prefecture or the Hulan Uchimi Valley are carried out to the station of the selfsame name. Harbin is not particularly suited geographically as a bean center, but it attracts produce in considerable quantities by reason of the liberal financing facilities with which the city is equipped.

"Anta used to be only a small hamlet of about a dozen buildings some years ago. Its growth dated only a few years back. It has now a population of some 16,000.

"The beans are transported to Harbin either by carts or by train during winter when the ground is frozen hard. However, a good quantity is sent westward to either Anta or Tuichingshan. Anta Station holds now about 1,500 (C.E.R.) carloads of beans, inclusive of products of 1916."

A large photo shows: "Beans–acres of them–in sacks and in bean cake, awaiting shipment at Dairen, the great shipping port and terminal of the South Manchuria railway. According to recent statistics, Dairen now ranks fourth among the shipping ports of Asia. The beans, as shown above, constitute an important part of her exports, whose value amounts to millions annually. As shown in the engraving, the docks are modern and allow ocean carriers to lay alongside and take cargo. The railway company's cars are brought directly to the piers for unloading."

"Dairen was originally built by the Russians under the name of Dalny, a corruption of the Chinese name Talien. It has wide streets which radiate like the spokes on a wheel from a park called 'Central Circle.' Around this circle many substantial and modern buildings have been built by the Japanese, including the famous Yamato Hotel, the finest of the South Manchuria Railway Co.'s chain. The railroad operates over several hundred miles of track along the most advanced lines. It has been a potential factor in developing this city and the territory reached by its rails."

1949. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1919. Improved seed beans for cultivation in Manchuria. 22(61):1232. March 14.
• ***Summary:*** Source: Clipping from the *Manchuria Daily News,* 21 Dec. 1918, transmitted by Consul A.A. Williamson, Dairen. The South Manchuria Railway Co. Agricultural Experiment Station "succeeded in improving the seed [soy] beans a few years ago, and has been distributing 30 to 40 koku (154 to 205 bushels) of the improved beans throughout Manchuria, and the new variety is now very favorably received. This year at Szupingkai 400 koku (2,048 bushels) were harvested and shipped to Kobe where they were so well received that advance orders for next year's crop are coming in.

"The improved variety has the advantage of containing more oil and being uniform in shape and size. It possesses a very fine luster. Furthermore, the raising of this variety is known to bring in about 15 to 20 per cent greater crop from the same area of land. At the place of production it fetches 20 sen (10 cents) more per koku than other varieties. Naturally there is now an increasing demand for the seeds of the new bean, which the experimental station is unable to supply. Some newspapers warn that the new variety is a strong rival to the Chosen [Korean] or Hokkaido beans, but the Manchurian beans are produced for the purpose of obtaining oil, and the new variety is specially fitted for that purpose, while the Chosen or Hokkaido beans are used for food." Note: Hokkaido, Japan's northernmost main island, has long been a leader in soybean production in Japan.

1950. Kita, Genitsu. 1919. Re: Okazaki fungus not suited for soy sauce production. Letter to Miss Margaret B. Church at Bureau of Chemistry, Washington, DC, March 20. 1 p. Handwritten. [2 ref. Eng]
• ***Summary:*** "'Okazaki fungus' is described under the name of *Asp.* [*Aspergillus*] *Okazaki* in the *Zentralblatt für Bakteriologie* [Series] II, Vol. 19, p. 481-85 (1907) & I have once studied it (Ibid, Vol. 37, p. 441, 1913). But now I have no culture and it is not sold as usual 'Tanekôji.' I think you can get [it] from Dr. K. Saito.

"I can however inform you that I have never heard of it applied in soy sauce making. According to my experience it is impossible to use for that purpose. Besides others it is difficult to get sound koji at first. Respectfully..." Address: 113 Gainsboro St., Boston, Massachusetts.

1951. Katsufuji, Koichi. 1919. "Yellow Dwarf," a new nematode disease of soy bean. *Nippon Shokubutsu Byori Gakkaiho* (*Annals of the Phytopathological Society of Japan*) 1(2):12-16. March. [12 ref. Eng; jap]
• ***Summary:*** The symptoms, distribution, and hosts of the disease are described, and the causal organism is said to be

© Copyright Soyinfo Center 2014

Heterodera schachtii. "Soy bean (Glycine hispida Maxim.) is one of the most important and most extensively cultivated leguminous plants in our country. In Hokkaido (northern Japan), the crop is affected annually by many parasitic fungi, viz. Sclerotinia, Septoria, Peronospora and Cercospora." Address: Hokkaido Agric. Exp. Station, Sapporo, Japan.

1952. Nakano, Katsuyoshi. 1919. Daizu no yôgyô-byô (ichimei daizu shôhanten-byô) (Shinshô) [Leaf scorch in soybean]. *Byochu-gai Zasshi* (*J. of Plant Protection, Tokyo*) 6:217-21. March. [Jap]
• ***Summary:*** An account of the symptoms and the causal organism which is named *Pseudomonas glycines* n. sp. Address: Noji Shikenjo Kyushu Shijo.

1953. Holland, J.H. 1919. Food and fodder plants. *Kew Bulletin of Miscellaneous Information* Nos. 1&2. p. 1-84. April 16. See p. 11-12. [5 ref]
• ***Summary:*** Great Britain imported large quantities of soy oil before World War I to make up for the shortage of cottonseed oil needed to manufacture soaps: 875,526 hundredweight from Manchuria, 816,032 hundredweight from China, and 43,209 hundredweight from Manchuria. Note: A hundredweight is 112 pounds weight.

"Considerable interest has been taken in the cultivation in England, but results of experiments made at Cambridge, Midland Agricultural College, South Eastern Agric. College, Wye, &c., go to show that no variety so far has been found that can be relied on to produce seed here.

"In Japan and China they [soy beans] are largely known in the preparation of the sauce known commercially as 'Soy,' and they make there a preparation used as a substitute for milk, and from this a food product call 'Tofu,' which in turn forms the basis of the bean cheeses of Japan. The meal [flour] in this country is used in the manufacture of biscuits and in making a bread for special use in diabetes; but the principal use here is for the extraction of the oil of which the beans contain about 18 per cent., suitable for soap-making and in general as a substitute for cotton seed oil, the residue being a valuable cattle feed.

Also discusses the adzuki bean (*Phaseolus angularis,* Wight). "This bean appears to have been coming into the market recently in quantity. Trade samples have been submitted to Kew for name as 'Dainagon Azuki Beans.'" They are important human food in Japan, Korea, China, and Manchuria, cultivated for the purpose.

1954. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1919. Commercial items from Japan. 22(121):973-74. May 23.
• ***Summary:*** "Japan exports bean oil chiefly to Australia, England, and the United States, and the amount exported has greatly increased during the past five years. In 1914 exports were valued at $724,284, while in 1918 they were valued at $3,430,483"–a 4.7-fold increase.

"The amount of Japan's bean cake output during the past year was valued at $6,100,000."

• ***Summary:*** A summary of: Dickover, E.R. 1918. "The vegetable-oil industry of Kobe" [Japan]. *Commerce Reports* (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). No. 255. p. 403-12. Oct. 30.

1957. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1919. Hahto soy bean brought to U.S. by missionary. 1(12):43. May.
• ***Summary:*** "An American missionary in Japan, interested in the introduction of good crops from the Land of the Rising Sun into the domain of Uncle Sam, sent a sample of Hahto soybeans, which he had purchased at an agricultural fair, to the United States Department of Agriculture about three years ago. This bean has since been grown successfully at the department's Arlington (Virginia) experimental farm, and has been tested in other parts of the country. Although the Hahto bean, which produces excellent green vegetables similar to lima or butter beans, is preferably adapted for culture in the southern states, the variety also produces profitable yields of green beans during favorable seasons in the corn belt.

"The Hahto soybean is a bush variety which grows high enough to produce abundant forage, yielding nearly as large hay crops as the Mammoth Yellow, and is believed to be superior in seed production to that variety. When the seeds are from three-fourths to full grown they make, an excellent green vegetable. A number of residents of the District of Columbia and several states grew the bean in their gardens last summer and canned the product, which has been pronounced by epicureans to be at least the equal if not the superior of the ordinary butter or lima bean.

"Dried Hahto beans cook up easier than any other variety of 'soys' and have a more pleasant flavor than most of the other sorts which have been used in this way. A growing season of approximately 130 days is required to produce mature beans, while the green beans are ready for

© Copyright Soyinfo Center 2014

harvest at least two weeks earlier. During the current season a Michigan canning company is to test out the Hahto bean for commercial canning purposes. The department will not be able to comply with requests for seed, as arrangements have been made for the distribution of all the seed that is available among boys' and girls' garden clubs of the South, where the variety is best adapted."

1964. Oka, Takeo. 1919. Nippon in New York. *New York Times.* July 6. p. 34.
• ***Summary:*** An estimated 5,000 to 7,000 Japanese now live in New York City, including about 300 Japanese women. "Dr. Jokichi Takamine of the Takamine Industrial Company has broken into the company of 'Who's Who.'"

"The metropolis boasts no less than a dozen Japanese restaurants. Your casual visit will introduce you to fresh sliced fish taken raw [sashimi], seasoned bamboo shoots, and lotus root and pickled radish served on the same table with 'sukiyaki,' palatable at least to the Japanese. 'Sukiyaki,' a compound word still unauthorized in any standard English dictionary, is the Japanese 'quick lunch,' eaten while being cooked on a small charcoal table stove.

"Beef, onions, cabbage, beancurd [tofu], and other vegetable additions, not forgetting Japanese soy [sauce], sugar, and a little sake, are ready to be prepared in a shallow pan à la japonaise on the fire. The rest devolves upon you and your company, ladies not honorably excluded! A great time saving it is for the proprietor, this having his guests prepare their own meals!"

Note: This is the earliest document seen (Aug. 2010) stating correctly that the basic ingredients in sukiyaki include tofu and soy sauce.

Kobe, Yokohama, and Shimizu had been about 20,000 tons per month."

1966. *Millard's Review* (*China Monthly Review*). 1919. Dr. Yamei Kin returns to America. 9(7):281. July 19.
• ***Summary:*** "Dr. Yamei Kin, who lately visited in Shanghai, accompanied by Miss Lily Crane, niece of the Hon. Charles R. Crane, and who spent considerable time at different ports in China, sailed for America on the s.s. China on July 6 from Yokohama [Japan]. Dr. Kin was doing investigation work among the industrial Chinese women workers in China and also obtaining data on the soya bean. She has said that America is her adopted country as it was when she was a small child that she was taken there by Dr. McCartee, a physician who was travelling in the East who sent her to America for an education. She is a graduate of a medical college in New York City.

"Dr. Kin has gained wide prominence in America as an intelligent Chinese woman physician working in cooperation working in cooperation with her own country the entire time. She has spent most of her time lecturing in various cities in the States on behalf of China and her lecture and picture has appeared many times in the leading American magazines. At the same time Dr. Kin has held an appointment from the Chinese government to promote better relations between America and China. She and Miss Crane accompanied Charles R. Crane to the Orient when he was sent on tour of investigation in China by the United States government, and when Mr. Crane was recalled on the signing of the armistice Miss Crane remained in China with Dr. Kin as companion. She has spent most of her time in the study of the Chinese language and is a student at Vassar College." Address: Shanghai, China.

1967. *Times of India* (*The*) (*Bombay*). 1919. Import manifests [at Bombay harbour]. July 24. p. 14.
• ***Summary:*** "S.S. Kosoku Maru, from Yokohama [Japan], Agents N.Y. Kaisha.–312 cases silk goods,... 22 cases Japanese provision, 15 cks [casks] Japanese miso, 15 cks Japanese soy [sauce], 9 cases nails,..."

1968. Williams, C.B. 1919. Soy-bean products and their uses. *Pure Products* (*New York*) 15(7):339-45. July.
• ***Summary:*** Contents: Introduction. A wider usefulness for soy-beans. First commercial crushing from domestic beans. Soy-bean oil. Uses for the oil. Soy-bean meal. Composition and exchange value of the meal. Prices paid for beans by the oil mills. Soy-bean oil industry in England, Manchuria and Japan. Importation of oil. Soy-bean meal as a feed. Soy beans and products for human food.

The soy-bean was introduced into North Carolina about 35 years ago (i.e. in about 1884). "During the spring of 1915 farmers, particularly in the Eastern part of the State, were casting about to find a crop or crops that might be substituted, satisfactorily, for cotton, as the price of this latter crop during the previous fall, in many cases, below the cost of production. Many farmers increased their acreage of soy beans, and as a result of this increase at least a million bushels or more of beans were produced last year."

"The first commercial manufacture of soy-bean oil and meal from domestic soy beans in the United States was started on December 13, 1915, by the Elizabeth City Oil and Fertilizer Company of Elizabeth City, N.C. From the start this mill operated day and night solely on soy beans until it had crushed its supply of about 20,000 bushels. This mill was able to crush about 20 tons during each twenty-four hours. The change from the manufacture of cotton-seed oil to soy-bean oil was made by them without any expense as to extra machinery and with but little expense for adjustment... It is understood that before the mill had ground a single bean they had contracted their entire output of oil to one of the leading manufacturers of the country at fairly reasonable prices. It, too, had no difficulty in selling its entire output of soy-bean meal, most of it going to a fertilizer manufacturer."

"Other oil mills in North Carolina that crushed more or less soy beans during the past season were those located at New Bern, Hertford, Winterville, Washington, Wilson, Farmville, Lattimore, and at a few other places."

"At the present time the oil is used in this country chiefly in the manufacture of soaps, varnishes, paints, enamels, linoleums, and water-proofing materials. It has entered, also, to some extent in the manufacture of edible salad oil and butter substitutes." Address: Chief, Div. of Agronomy, North Carolina Agric. Exp. Station.

1969. Takahashi, A. 1919. Re: Response to request for sample of miso. Letter to Miss Margaret B. Church at Bureau of Chemistry, Washington, DC, Aug. 12. 1 p. Typed, with signature on letterhead. [Eng]
• ***Summary:*** In her letter of May 27, Miss Church asked him to please send a sample of miso. She received his sample of shoyu. "There are two or three kinds of Miso manufactured in Japan, but we usually import only one kind–*shiro miso. Shiro* means 'white' in English. I am sending sample bottle under separate cover, and this is the best quality of shiro miso manufactured in Japan; this is a fresh sample, only having been made four or five months, as it is a commodity that is easily manufactured."

He is also trying to find her a sample of *aka miso* or Red Miso, "which requires a considerable time to manufacture."

Note: The writer is the younger brother of Teizo Takahashi, who is a lecturer at the "Imperial University of Tokyo." Address: Pacific Trading Co., 331-343 Battery St., San Francisco, California. Phone: Sutter 270.

1970. *Chemische Umschau auf dem Gebiete der Fette, Oele, Wachse und Harze* (*Germany*). 1919. Technologie: Fettgewinnung, Fettwirtschaft [Technology: Obtaining fats

© Copyright Soyinfo Center 2014

and oils, and their economics]. 26(10):130-31. Aug. 25. [Ger]
• ***Summary:*** Japan: Japan imports soybeans from Manchuria. In and around Kobe, about 210 tonnes (metric tons) per month of soybean oil are produced.

Soybean oil: In Dalny [Dairen, Dalian], Manchuria, the Japanese firm Mitsui & Co. has built seven storage tanks / reservoirs with a capacity of about 6,750 tonnes of soybean oil (*Bohnenoel*). They are made of prefabricated steel and are connected to the harbor via pipes.

1971. Yamamoto, Yoshitaro. 1919. Process of deodorizing and decoloring bean-flour. *U.S. Patent* 1,314,298. Aug. 26. 1 p. Application filed 21 May 1919.
• ***Summary:*** "This invention relates to a process of preparing deodorized and decolorized bean flour from raw bean, or deoiled bean and consists in steeping in a weak solution of an organic acid bean coarsely broken and deprived of its bran, until it has swelled and lost all of its offensive smell, and color; then removing all the traces of the acid by carefully washing the material with water, and then drying and grinding it. The object of this invention is to obtain bean flour suitable for use as material for making sweetmeats, as a substitute of powdered milk, or for preparing bath powder."

Note: This is the earliest English-language document seen (Sept. 2010) that contains the word "deoiled" (spelled as one word) in connection with soybeans.

In detail: Steep the bean powder in a solution of 1-2 liters of vinegar mixed with 100 liters of water, heat the mixture to a temperature not exceeding 60ºC, remove the powder from said solution and wash it with water, then steep the powder in a solution of 140-200 gm of bicarbonate of soda mixed with 100 liters of water. Remove the powder again, wash it in water, then dry it at a low temperature. This process will not cause "condensation of the albumin, matters which give out the offensive smell and color of the bean, are decomposed and removed, such matters being changed into soluble substances. Thus the product obtained by my process is almost pure white in color, and retains it albuminous components unaltered, that is, in the condition they exist in raw bean. Thus the bean flour produced by my process can be used in place of wheat flour or rice flour in making sweetmeats, as a substitute of powdered milk for drinking purpose and as food stuff for other purposes. It can be also used as material for preparing bath powder, and also as body of soap." Address: No. 5 Zitchome, Taikaidori, Hyogo city, Kobe, Japan.

1972. *Christian Science Monitor.* 1919. Japanese children. Aug. 28. p. 14.
• ***Summary:*** "The Japanese also have... wafers [rice crackers] which are made of rice paste, dipped into 'shoyu' and dried in the sun. 'Shoyu' is a sauce with a salty taste, which is the Japanese equivalent of Worcester sauce."

Also discusses a sweet called "ame," which is made from malt, and "'yokan' consisting of mashed [azuki] beans and sugar, which is made in the mountain districts of Japan. It is much nicer than it sounds and looks so attractive packed in its long, narrow, white, wooden boxes and wrapped in a single big bamboo leaf."

1973. Arnold, Julean. 1919. Commercial handbook of China. 2 vols. Washington, DC: Government Printing Office. 629 p. + 472 p. Dep. of Commerce, Bureau of Foreign and Domestic Commerce, Miscellaneous Series No. 84.
• ***Summary:*** In Vol. 1: The "Letter of submittal" from the Department of Commerce, Bureau of Foreign and Domestic Commerce, states that the Bureau "realizes keenly the desirability of an immediate, vigorous, and systematic effort to promote American trade with this great friendly nation in the east of Asia. Such an effort... must be based on the most recent and dependable economic information. To supply that information is the purpose of this handbook.

"This handbook, the most detailed publication of its kind ever issued by the Department of Commerce, will appear in two volumes." The basic organization will be by each of the 17 American consular districts.

Digital searches for "soy" or "soya" or "beans" or "bean curd" or "bean cake" or "bean oil" will result in many hits and a vast amount of information. For example:

Pages 42, 45: A table titled "Commercial statistics for China as a whole," under "Exports, sundries" includes:

"Bean cake" (pounds). For 1913. Quantity: 1,575,792,400 pounds. Value: $18,197,871.

"Bean cake" (pounds). For 1918. Quantity: 2,182,241,744 pounds. Value: $35,650,215.

"Bean curd" (pounds). For 1913. Quantity: 4,846,543 pounds. Value: $144,849.

"Bean curd" (pounds). For 1918. Quantity: 3,765,591 pounds. Value: $265,141.

"Beans" (black, green white, yellow, other kinds) (pounds). For 1913. Quantity: 1,376,795,200 pounds. Value: $16,983,422.

"Beans" (black, green white, yellow, other kinds) (pounds). For 1918. Quantity: Yellow (#1): 849,479,313 pounds. Value: $17,106,454. Values are also given for Other kinds (#2), White (#3), Green (#4), and Black (#5): 13,481,033 pounds. Value: $295,796.

"Oil, Bean" (pounds). For 1913. Quantity: 65,575,600 pounds. Value: $2,720,637.

"Oil, Bean" (pounds). For 1918. Quantity: 393,621,508 pounds. Value: $29,802,630.

"Soy" (pounds). For 1918. Quantity: 820,531 pounds. Value: $45,871.

Page 115: "Canton Consular District." "Other native industries of Canton that give employment to large numbers of people in the aggregate are:... The making of a Chinese sauce called 'soy,' which is made from a certain bean which

© Copyright Soyinfo Center 2014

as been boiled slowly and to which wheat or barley flour is added (soy is exported for the use of Chinese living abroad and also for the making of certain foreign sauces and condiments);" [such as Worcestershire sauce?].

Page 200: "Export trade:... The leading products shipped from Hongkong to all parts of the world are:... beans,...soy, tapioca flour, tea..." Pages 202-03: Trade between Hongkong and the United States during 1918. Hongkong Consular District. Value in 1913: Soy. Shipped to the United States: $51,595. Shipped to the Philippine Islands: $1,430. Shipped to Hawaiian Islands: $1,140.

In the section on "Mukden Consular District" under "Agriculture" we read: (p. 216): "Soya beans furnish material for bean oil, bean curd, and bean sprouts, besides serving as a food when boiled. Bean oil is used locally for cooking and as an illuminant; the bean oil for export is employed in soap and olive-oil manufacture, while in the mixing of paints it serves as a substitute for cotton and linseed oils. Bean cake is used as fertilizer and as food for cattle. About 70 per cent of the output of beans is annually exported, the rest being consumed locally. The annual production of bean cake and bean oil in the Mukden consular district is estimated at 433,992 and 54,279 tons, respectively.

"It is estimated that one-eighth of the beans exported are shipped to Hongkong, the Straits Settlements, and Europe, three-eighths to South China ports, and the remaining four-eighths to Japan. Of bean oil, Europe, China ports, and Japan are buyers in about equal proportions. A somewhat smaller quantity goes to the United States. Bean cake exported from Manchuria is marketed almost exclusively in Japan, Taiwan, and South China."

Page 365-66: "Amoy Consular District." Manufacturing and other industries. The Amoy Tinning Co. (Ltd.) and The China Canning Co. (Ltd.): The output of these two factories includes "soy and soy sauce."

Page 380. The section on Agriculture in Antung states: "Soya beans and their products, bean oil and bean cake, are exported, principally to Japan, Chosen (Korea), and South China ports."

Page 391. The section on Antung, Beans states: "The value of the beans and bean products exported from Antung during the year 1918 constituted 27 per cent of the total value of exports and amounted to $4,941,982. The bean that constitutes the great bulk of this export is known commercially as the soya bean and is grown practically throughout this entire district.

"The bean crop ripens earlier in the southern section of the district than in the northern but is practically all harvested in normal years by the end of September. However, because of the superior transport facilities enjoyed during the winter, when roads and rivers are firmly frozen, it is at this time that the bean harvest is assembled at the various interior towns which serve as collection centers and from which it is forwarded to Antung in the spring.

"The soya bean is exported in three forms–as 'raw beans' (natural condition), as bean oil, and as bean cake.

"The proportion of the export of beans, cake, or oil that goes to any given destination varies from year to year according to several determining factors. However, the following statement, which can only be regarded as approximate and not as exact, gives a general idea (through average percentage) of the destinations of the soya bean products exported from Antung: Beans–Japan, 76 per cent; Shanghai, 6 per cent; Chosen (Korea) 5 percent; other Chinese ports and Dairen, 13 per cent. Bean cake–Japan, 72 per cent; Shanghai, 20 per cent; Chosen, 1.8 per cent; other Chinese ports and Dairen, 6.2 per cent. Bean oil–Japan, 31 per cent; Shanghai, 36 per cent; Chosen, 21 per cent; other Chinese ports and Dairen, 12 per cent. It will be seen that Japan and Chosen (Korea) receive eight-tenths of the beans, almost three-fourths of the bean cake, and slightly more than one- half of the bean oil exported.

"Beans are exported packed in gunny bags which, when filled, weigh about 175 pounds; bean cake in the form of large, round, flat cakes weighing on an average 75 pounds; and bean oil in empty 5-gallon kerosene oil cans, two of which are packed in a wooden case.

"Most of the beans exported are doubtless milled and transformed into cake and oil on reaching their destination. Bean oil is put to many uses, but one that is of common interest is as the base of practically all table sauces. Bean cake is principally used as a fertilizer for rice and in China as a cattle food.

"The trade in beans is a highly speculative one, since the market is contingent on two factors, the bean crop and the price of rice in Japan. When it is anticipated that the price of rice in Japan will be high, brokers will buy 'forward' beans from the large Chinese firms in Antung. This form of speculation is one that has great charm for Chinese merchants, and there are few firms in Antung that do not 'take a flier' occasionally in beans."

Page 394. The section on "Antung–Import trade" states: "Four circumstances have combined to raise the city of Antung to its present importance as a port for the importation of foreign merchandise into Manchuria: (1) The completion of the Chosen Railway, which, through Chosen, connects the Yalu River with Japan; (2) the opening of Antung as a port for foreign trade in 1907; (3) the completion of the standard-gauge railway from Antung to Mukden in 1911; and (4) the erection of the 3,100-foot steel bridge across the Yalu River in the same year, by means of which the Chosen and South Manchuria Railways now furnish a through service from Fusan to Changchun. When this system of railways was completed Antung at once became the natural gateway through which all rail-borne merchandise from Japan enters Manchuria. When the one-third reduction in duty on goods imported into Manchuria from or through Chosen went into effect in 1913 the rail route through Antung became cheaper

© Copyright Soyinfo Center 2014

for the Japanese exporter than the water route through Dairen or Newchwang. This advantage of the Antung route was further enhanced when, in 1914, the South Manchuria Railway granted a special discount, amounting to 30 per cent, on 11 specific through imports from Japan via Chosen when carried over its Antung-Mukden branch."

Note: As of Jan. 2014 Antung (now known as Dandong), is in China, a prefecture-level city in southeastern Liaoning province, and is the largest Chinese border city. It is a port city on the Yalu River, which divides China and North Korea. The population is more than 1 million people.

Page 397. Antung Consular District. Exports include soy.

Page 478: "Shantung Province is the original home of the soya bean and the bean-crushing industry in this part of the world, and until the possibilities of Manchuria were discovered and developed this Province led the industry." "Manufacture of vermicelli: The principal crude native industry is the manufacture of Chinese vermicelli from a small green bean known as the 'lu tou' [mung bean]. This vermicelli is manufactured not only in large factories but also by individual farmers and in the homes of the natives in all parts of the Province."

Page 517-19: Dairen Consular District, Agriculture. The principal crops and their yield per acre: soya bean, 4.5 bushels. "The principal fertilizers are manures and bean cake (the residue after the oil has been pressed from soya beans)." "Soya beans, and the bean oil and bean cakes manufactured therefrom are the principal agricultural products exported from this district... The soya beans raised in this district are of four kinds, the yellow soya, the small green soya, the black soya, and the red mungo. They are not considered as edible beans in their natural states. Some of them are exported raw to Japan, to be manufactured either into 'soy' (a sauce largely used by the Japanese) or into bean oil (used in making soap and for various other purposes) and bean cake (largely used as fertilizer on rice and sugar-cane fields). However, the greatest proportion of the bean products are manufactured in Dairen and other parts of the Leased Territory, and the subject will be considered later under 'Industries' and 'Exports.'" Address: Commercial Attaché, Peking, and various American Consular Officers, China.

1974. Bowers, William G. 1919. Some studies on the nutritive value of the soy bean in the human diet. *North Dakota Agricultural Experiment Station, Special Bulletin, Food Department* 5(13):278-328. Aug. Reprint of his 1919 PhD thesis, Ohio State Univ. 28 cm. [65 ref]

• ***Summary:*** Contents: Part I: Introductory. Extent of production. Human food preparation made from the soy bean. Varieties and chemical composition. Character of the carbohydrates of the soy bean and its bearing on nutrition. Character of the fats of the soy bean and its bearing on nutrition. Character of the protein and its bearing on nutrition. Vitamines of the soy bean. Minerals of the soy bean. The soy bean compared to some other legumes used as human food as to fuel value and organic nutrients. Digestibility of soy bean products.

Part II: Experimental part. The character of the materials used in the experiments. Digestibility of soy cake meal baked into bread. Digestibility of soy cake meal mush. A study of the nutritive value of the nitrogen free contents of the soy bean. Malt digestion. One per cent HCl [hydrochloric acid] extract (incl. pentosans, galactans, true cellulose). Milling of the soy bean: Composition of parts (incl. "the bran"), digestibility of the bran, the nitrogen-free extract, crude fiber, physical effects of a diet solely of a mush made from the bran, the calcium oxide and phosphorus pentoxide content of the soy bran and soy meal. Toxic and disagreeable or unpalatable substances of the soy bean: Some investigations as to the possible poisons, location and elimination of the disagreeable and unpalatable substances (20 experiments, incl. soy and navy bean bran, benzine extracted soy and navy bean meal, alcohol extracted soy and navy meal, a steam distillation for the purpose of separating objectionable flavor). Discussion of results. Summary.

Introductory: Only within the last 35 years "has the soy bean been considered with much favor as a food for stock. Only within the last ten or fifteen years has it met with any favor at all as a food for man" (p. 279). "Soy milk and soy milk products are being made in the United States now" (p. 280). "Roasted beans. Soy beans may be roasted in an oven or ordinary corn popper. They are heated until the beans are burst like popcorn. The beans thus roasted may be softened by immersing in a syrup while they are hot. This is said to make a wholesome candy. The roasted beans may be powdered and used as a salad dressing or employed as a substitute for coffee" (p. 281). "The fresh green beans, those that have been dried without being allowed to ripen thoroly [sic, thoroughly], or those that have ripened on the vine after the vine has been pulled show slight amounts of starch" (p. 282).

"Experimental part (p. 287): "In our experimental work we propose to inquire into the digestibility of soy cake meal. We shall then determine the digestibility of the different carbohydrates as found in a representative variety of the soy bean. After passing some of the beans thru a milling process we shall study the composition and digestibility of the meal and bran and determine their relative amounts of calcium and phosphorus, and locate any possible poisons or objectionable substances that my be present in either of these. This will make it possible, then, to determine whether or not it would be profitable to carry on the milling process and eliminate certain products, or whether by the use of certain extractives we can get rid of the objectionable constituents."

Recalling the fact that "navy bean bran is so indigestible and is responsible for fermentation and discomforting gas in the digestive system, we were led to the effort to separate the

© Copyright Soyinfo Center 2014

bran and the meal of the soy bean and make determinations of each separately... we found the bran to constitute 8% of the whole bean." The germ was 1½% and the remainder was cotyledon. "The bran consisted of very large flakes. We had to grind it thru a burr mill three times before it would pass thru a twenty mesh sieve" (p. 301-02). The bran can be easily separated from the soy bean by milling. It is composed of about 37% crude fiber and 43% nitrogen free extract. "Digestibility experiments on the bran showed that the nitrogen free extract, including the hemicelluloses and waxes, is about 84% digestible, which is much less than that of the whole bean. (p. 323).

"In order to see what would be the physical effects of a day's diet on the bran alone, we made three meals of 30 grams each for one day. Next day we were a little uncomfortable on account of a slight amount of gas in the bowels. We were a little weak and very hungry but not sick. The next day the stool was voluminous but not so very soft. The diet had neither a laxative nor a constipating effect that could be noticed" (p. 304).

"In most of the Japanese foods made from the soy bean the disagreeable flavor is avoided by the nature of the preparation made. These, of the most part, involve some sort of fermentation which changes the flavor entirely. The Domestic Science Department of the Ohio State University [under the leadership of Dr. J.F. Lyman, with help on milling from Dr. Park of the Farm Crops Dept.], has carried on considerable experimentation making different preparations, combinations and extractions, as well as making use of different methods of cooking soy bean preparations, to avoid the disagreeable flavor."

The calcium oxide content of the bran was found to be 0.8% and the phosphorus pentoxide content 0.27%. No salicylic acid was found in the bran, and no hydrogen cyanide or cyanates in the samples tested. There was no trace of tannin in the bran and only a slight trace of alkaloids.

"As far as flavor is concerned there is no point gained in removing the bran from either the soy bean or the navy bean. The beany flavor and some of the disagreeable taste can be easily removed from the soy bean by steam distillation, but the disagreeable flavor in the oil cannot be removed in this way."

Nineteen tables (all but one without captions) show compositional percentages of soy beans, and a summary of results. An illustration (line drawing; p. 297) shows the apparatus for extracting meal with 95% alcohol. Three bar charts (p. 316-18) gives a summary of experimental results.

Note 1. Although this document was reprinted as a Special Bulletin by the Food Department of the North Dakota Agricultural Experiment Station, it has nothing to do with North Dakota per se, and makes no mention of soybeans being used or grown in North Dakota.

Note 2. This is the earliest English-language document seen (June 2013) that mentions soy bran, which it calls "soy bran." It is also the earliest document seen concerning the etymology of soy bran.

1975. Tanaka, Katsuhide. 1919. [Cold test of blended oils]. *Kogyo Kagaku Zasshi* (*J. of Chemical Industry, Japan*) 22(258):633-44. Aug. [Jap; eng]
• ***Summary:*** Petroleum-derived mineral oil, used to lubricate axles, tends to solidify at low temperatures (below -20ºC) in very cold climates such as that of North Manchuria. This can cause the axles of trains to overheat during the cold winter months. Experiments with vegetable oils such as rape seed oil, soya bean oil, earthnut [peanut] oil, and hemp seed oil showed that they are thoroughly miscible with mineral axle-oils and do not separate at all, even on long exposure to temperatures as low as -34ºC. By mixing the proper quantity of each oil with mineral axle-oils, the fluidity of the axle-oil can be maintained at temperatures as low as -30ºC. The best vegetable oil for this purpose is hemp seed oil (40-50% of the total), followed by rape seed oil (30-35% of the total). Includes a detailed discussion of the physical and chemical characteristics of soy oil. Tanaka obtained his oil from Nisshin Oil Mills, Ltd., Dairen.

1980. Morse, W.J. 1919. Re: Report on inspection tour to Mississippi. Letter to Prof. C.V. Piper [Agrostologist in Charge, BPI, USDA], Washington, DC, Sept. 26. 2 p. Handwritten, with signature on letterhead.

• ***Summary:*** Morse is writing from Gulfport, a coastal city west of Biloxi, Mississippi. "Dear Prof. Piper: Have just returned from a visit to Mr. [G.A.] Swan's place near Lyman [Mississippi]. I saw a very considerable acreage of soya, mostly Biloxi, some Barchet and some Otootan (Laredo–our black). The varieties all appeared very promising and no doubt Mr. Swan will have considerable of the Biloxi. He has ordered one of the Carolina Harvesters.

"Spent Thurs. with Mr. Abbott, Mobile, Alabama. I like Mr. Abbott's plantation very much. He also will have considerable Biloxi seed and also some Bush Velvet [a variety of velvet bean].

"The soys at all places visited thus far look very good. Am very much pleased with the Victor cowpea. At Raleigh [North Carolina] and Monetta [South Carolina] it appeared very promising in comparison with other sorts. At Athens, Georgia, the Victor led in hay yield, 2.07 tons to the acre, and the next day the Brabham, with 1.87 tons. The seed yields have not yet been calculated or rather weighed at the time of my visit. Am sure we have a good thing in this new variety.

"I do not remember whether I told Mr. Lee to order 30 cylinder teeth or spikes for the harvesters at Arlington or not. Will you please have Lydenberg look the matter up and if they have not been ordered, to order them from Hardy & Newsome [Newsom], La Grange, North Carolina–Little Giant Bean Harvester. Very truly yours,..."

Note: This is the earliest document seen (July 2013) that mentions the soybean variety Laredo.

1988. Satow, Sadakichi. 1919. Process of manufacturing vegetable proteid substances. *U.S. Patent* 1,321,479. Nov. 11. 3 p. Application filed 25 Nov. 1916.
• ***Summary:*** This patent is quite similar to the author's U.S. patent 1,275,308, patented Aug. 13, 1918, but it is somewhat longer. "The object of the invention is to provide vegetable proteid substances of improved quality and a simple, efficient and economical process of manufacturing the same... for use in the manufacture of celluloid-like substances, linoleum-like substances, lacquer, varnish, artificial rubber, artificial leather and the like." The main raw material used is "the soja bean," which is placed in a revolving cylinder and the outer skin removed (to produce a light-color finished protein). It is crushed between rollers and the oil is removed by a solvent, such as benzin. When removing the benzine from the crushed mass, the use of moisture and high temperatures should be avoided; use either dry air of moderate temperature or a vacuum, keeping the mass below 40ºC and circulating the air through a condenser to remove the solvent. The resulting "meal," which should be light in color and have a pleasant odor, is placed in a suitable vessel and treated with an alkaline solution, such as a dilute solution of caustic or carbonated alkali or ammonia. The resulting liquid containing the proteids together with impurities may be further purified (by filtration or centrifuge, etc.) or subjected to direct precipitation using lactic or acetic acid. The precipitate is allowed to settle and the supernatant liquid is drawn off. The precipitate is then pressed into cakes; if desired the cakes may be dried and powdered. The result is "refined proteid," which may be employed as a food material or used in the manufacture of a great variety of non-food, industrial products. "It is easily rendered transparent, is adhesive, and can be easily molded into permanent shape." Address: Sendai, Japan.

1989. Satow, Sadakichi. 1919. Process of manufacturing vegetable proteid substances. *U.S. Patent* 1,321,480. Nov. 11. 3 p. Application filed 25 Nov. 1916.
• ***Summary:*** This patent, based on "the soja bean," is very similar to the author's U.S. Patent No. 1,321,479. Address: Sendai, Japan.

1990. Baker, E. Carleton. 1919. Marketing the Far Eastern bean crop. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 22(279):1170-73. Nov. 28.
• ***Summary:*** Contents: Introduction. Shipments of beans and bean oil. Marketing methods. Packing for export. Chinese weights employed in the bean trade. Method of buying bean oil from Chinese mills. American purchasing organization method.

By George H. Scidmore, Consul General, Yokohama: Statistics of bean crop in the Hokkaido. Exports of beans for two years [from Hokkaido]. Total exports of chief varieties [species] of 1918 crop. Speculation a strong factor in bean trade.

"Manchuria is essentially an agricultural country, about 70 per cent of the people being directly or indirectly dependent upon the land. Soy beans form the staple crop of Manchuria, and upon them the prosperity of the people depends."

"The Mukden consular district comprises the greater part of South Manchuria and produces an enormous quantity of soy beans. This crop is given preference to others because it yields the surest and greatest profit." I 1918, the following shipments were made from the principal bean markets along the South Manchuria Railway. A table (p. 1170) gives, for each station, the tons of soy beans and bean oil shipped: Liaoyang, Fushen, Mukden, Tiehling, Kaiyuan (178,050 #2 for beans), Changtu, Shuang Miaotzu, Szuping Kai, Kuochiatien, Kungchuling, Fanchiatun, Changchun (706,000 #1 for beans).

Hokkaido, Japan: "Practically all of the beans destined for export from Japan are grown in the Hokkaido. The total crop for 1919 it is estimated will amount to 318,000 long tons, of which about 277,000 long tons [87%] will be obtainable for export." The beans are sold in bags of 100 *kin* (132 pounds) each. Varieties of beans produced in Hokkaido: Shozu [azuki], Dainagon shozu, Other shozu. Daizu (soybeans; with number of bags produced in Hokkaido in 1916) 615,114, Akita daizu 754,996, Tsurunoko daizu

© Copyright Soyinfo Center 2014

52,970, Sodefuri daizu 77,673, Kuro daizu [black] 143,152, Other daizu (No data until 1919). Daifuku, Chufuku, etc.

Another table (p. 1172) shows which foreign countries imported the exportable surplus of the Hokkaido bean crop in 1916 and 1917. The biggest customer for soy beans by far, in both years, was the USA, followed by Canada. Canada's imports from Hokkaido, Japan, were as follows: In 1916: 131,421 *kin* (173,476 pounds weight or 77.44 long tons of 2,240 pounds per ton). In 1917: 256,042 *kin* (337,974 pounds weight or 150.88 long tons). Note: These two years were during World War I, when Japan and Canada were allies. Canada probably used these soybeans as a source of both oil (for soap) and meal (probably fed mostly to hogs to increase bacon production).

The USA also imported large amounts of small red [azuki] or white beans (*Phaseolus subtrilobata*). Address: Consul General, Mukden, China.

1991. Cromwell, Richard O. 1919. Fusarium blight of the soy bean and the relation of various factors to infection. *Nebraska Agricultural Experiment Station, Research Bulletin* No. 14. 43 p. Nov. Based on his PhD thesis, Univ. of Nebraska. [32 ref]

• ***Summary:*** The blight of soy beans is due to *Fusarium tracheiphilum.* The first report of this soy bean disease appeared in a publication by the author in 1917. "The disease is characterized by a chlorosis and shedding of the leaves or leaflets, followed by the death of the plants, and is herein called 'blight.' Soy bean blight has been observed in several localities within North Carolina on soils infested with cowpea wilt..." The physical structure of soils under natural conditions is not the limiting factor in the infection of the disease, but acidity under certain conditions has some influence. The nematode (*Heterodera radicicola*) also has some influence.

The section titled "Economic importance of the soy bean" (p. 6-7) states: "Its culture in England was begun in 1790. The plant was introduced into the United States from Japan in 1860. Since that time its cultivation as a soil-improving and a forage crop has been confined for the most part to the Southern States. North Carolina is probably foremost among these States in the production of soy beans. The yield in 1909 was only 13,313 bushels (29, p. 632), and in 1915 was estimated as approximately 1,000,000 bushels. Within the last three or four years, and especially since the war began, this crop has become increasingly important because of the large variety of products manufactured from the oil and meal and because of its introduction in the United States as a human food.

"The following is a list of the most important products obtained from soy beans or in which soy beans enter: Soy bean milk, vegetable cheese, meal or flour, macaroni preparation, soups, pork and beans, meat substitutes, toilet powder, fertilizer, and cattle feed from the meal, and high explosives, soaps, linoleum, rubber substitutes, margarine, Japanese sauce, paints, varnishes, water-proof cloth, salad oil, lubricants, and lard substitutes from the oil."

The section titled "Other soy bean diseases" (p. 7) mentions nine, including Heterodera, and "Chlorosis and crinkling (cause?)."

The section titled "History, occurrence and importance of the disease" (p. 8) states that in 1900 Orton conducted tests for disease caused by *Fusarium* on soy beans at Edisto Island and at Monetta, South Carolina (see Orton 1902, p. 16-19). Eight varieties of soy beans [planted on 29 May 1901 in Monetta] were tried on ten plats. "The varieties tested were Tokio, Buckshot, Yosho, Ito San, Manhattan, Guelph, and Amherst [Footnote: The names in use for these varieties in 1890 were respectively as follows: Best Green, Early Black, Yoshoka [sic, Yoshioka], Rokugatsu, Gosha, Black Round, Green Medium, and Bakaziro]. Orton reported that at Edisto Island the soy bean made a heavy growth, 3 or 4 feet high, and was free from the wilt disease. It may be said that a very considerable proportion of the several varieties of cowpeas grown in adjacent plots succumbed to wilt. The results of these tests accord with the observations of others who have had opportunity to observe these crops when they were grown on soil known to be infested with cowpeas wilt."

The section titled "Field experiments to determine the susceptibility of varieties" (p. 38-40) states that the following soybean varieties were planted in May 1916 in Red Springs, North Carolina: Black Eyebrow, Brown, Haberlandt, Mammoth Yellow (which suffers greatly from *Fusarium* blight), Medium Yellow, Pekin, Tar Heel Black. and Virginia. Black Eyebrow seems to show some evidence of resistance.

A larger number of varieties were tested in this field in 1917, including the following not tested in 1916: Arlington, Auburn, Austin, Barchet, Chiquita, Early Dwarf Green, Guelph, Jet, Manchu, Peking (spelled differently this time), Tokio, and Wilson Black. Again, Black Eyebrow showed resistance. "The Brown variety, altho as badly infected by the nematode and *Fusarium* as any of the other varieties, deserves special mention because of its tolerance to these parasites." Address: Extension Plant Pathologist, Iowa State College. Formerly Asst. Plant Pathologist, North Carolina Agric. Exp. Station.

• ***Summary:*** "S.S. Shingo Maru, from Osaka [Japan], Agents, N.Y. Kaisha.–350 bundles, 100 bales, 25 packages and 5 cases stram board,...–12 bundles, 19 cases, 8 casks and 27 packages Japanese provision; 25 casks and 1 tub Japanese soys, 20 casks Japanese miso; 10 cases wine;..."

Note: This is the earliest document seen (Aug. 2010) that uses the word "soys" in this way–perhaps to refer to types of Japanese soy sauce or fermented soy products.

1995. Frazer, Robert, Jr. 1919. Japan. Kobe. Exports to United States and possessions. Trade in vegetable oils. *Supplement to Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) No. 55b. Dec. 22. p. 15-18.
• ***Summary:*** The quantities and values of soya bean oil invoiced at the Kobe consulate for the United States for the past two years were as follows: In 1917: 64,932,091 lb worth $4,947,962; In 1918: 71,493,264 lb worth $7,399,096.

Trade in vegetable oils: The quantities and values of rapeseed (colza), coconut, and peanut (groundnut) oils shipped from the port of Kobe increased very greatly in 1918. "The amount of soya-bean oil exported, however, decreased slightly in amount although the value increased... Business in soya-bean oil in 1918 was somewhat limited by the difficulty of bringing the beans out of Manchuria, owing to the military use of the railways and the lack of cargo space [on ships] for Europe. Pacific coast prices, which are considerably below those obtained in Europe, ruled from $14 to $16 per 100 pounds from the beginning of 1918 until November, when they began to fall, reaching $10 early in 1919, but they recovered rapidly and in April and May stood at $15 to $15.50.

Practically all the groundnut (peanut) oil shipped at Kobe comes from North China. The following are the amounts of oils, in pounds, exported from Kobe during 1917 and 1918 (in parentheses): Rapeseed oil 17,585,000 (25,268,129); coconut oil 21,809,996 (36,510,831); soybean oil 5,221,931 (4,975,932). Note: The figures in the first and second tables are dramatically different; it is not known which is correct. Address: Consul, Kobe, Japan.

1996. Thom, Charles. 1919. [The Aspergilli]. Paper presented before the American Bacteriological Society, Dec. 1919. 9 p. Handwritten. Unpublished manuscript.
• ***Summary:*** The paper begins: "The specific name *Aspergillus oryzae* is generally recognized in Japan as belonging to such molds of the genus *Aspergillus* as are used for their enzymatic activity in the preparation of sake, shoyu or soy sauce, etc." "The rice overgrown with mold and therefore fermented thru the agency of the mold activity is called a koji or more specifically sake-koji." "The Takamine patents have incorporated in them this specific name, *A. oryzae.* Because of such current usage we wish to state emphatically before this group of scientific workers that *A. oryzae* Ahlburg having narrow and easily delineated boundaries can not be used to identify the entire group of yellow-green Aspergilli.

"Our studies have proved to us that the species name, *Aspergillus oryzae* as used in Japan applies (1) to such yellow-green Aspergilli as come with the description *A. oryzae* Ahlburg, (2) to such green, shorter-stalked forms as we are sure justly come under the name of *A. flavus* Link in the sense of Brefeld, (3) to innumerable yellow-green forms morphologically between these two descriptions, (4) to brown Aspergilli as *A. tamari* Kita having spores similar to *A. niger,* and spore-bearing structures similar to the yellow-green forms and even (5) to a certain brown Aspergillus (*A. oryzae* var. fulvus) which does not at present seem to us as belonging to the group at all." Address: USDA.

1997. Hanzawa, Jun. 1919-1921. Nattô. I-III gô [Natto. I, II, and III.]. Sapporo, Hokkaido, Japan: Sapporo Nattô Yôki Kairyôkai. [Jap]*
• ***Summary:*** In 1919 Dr. Jun Hanzawa, of Hokkaido University's Department of Agriculture, published the first of three key reports which helped to bring natto production in Japan out of the "Dark Ages." Serving simultaneously as a microbiologist, and extension worker, and a pilot plant operator, Dr. Hanzawa began by making a pure-culture bacterial inoculum for natto; this enabled commercial natto manufacturers, for the first time, to discontinue the use of rice straw as a source of inoculum.

Secondly, disliking the use of rice straw even as a wrapper, he developed a simple, low-cost method for packing, incubating, and selling natto wrapped in paper-thin sheets of pine wood (*kyogi*) or small boxes of pine veneer (*oribako*).

A third important improvement followed shortly; the development of a new incubation room design (*bunka muro*), which had an air vent on the ceiling and substantially decreased the natto failure rate. These three developments laid the basis for modern industrial, sanitary, scientific natto manufacture.

Commercial natto makers filled his classes and he worked as a consultant for them. Like Dr. Muramatsu before him, Dr. Hanzawa sold his "University Natto" from his

© Copyright Soyinfo Center 2014

research lab, promoting it as a rival to cheese. He was given the appellation of "the father of modern natto production."

In 1971 he was given the honor of addressing the emperor of Japan on the subject of natto. Address: PhD, Dep. of Agriculture, Hokkaido University.

1998. *Trans-Pacific* (*The*). 1919-1940. Serial/periodical. Tokyo, Japan. B.W. Fleisher. Vol. 1, No. 1. Sept. 1919–Vol. 28, No. 45 Nov. 7, 1940. Frequency: Monthly Sept. 1919–March 1923; Weekly 12 May 1923–7 Nov. 1940 (Published by The Japan Advertiser). 30-39 cm. [Eng]*
• ***Summary:*** This newspaper includes Chinese and Japanese sections. "A financial and economic magazine of international service." Merged with Japan Times Weekly (Tokyo, Japan, 1938) to form: Japan Times Weekly & Trans-Pacific.

1999. **Product Name:** [Sendai Miso].
Foreign Name: Sendai Miso.
Manufacturer's Name: Sendai Miso Shoyu K.K.
Manufacturer's Address: Furujiro 1-5-1, Sendai-shi 982, Japan.
Date of Introduction: 1919.
Ingredients: Water, rice, soybeans, salt.
How Stored: Shelf stable.
New Product–Documentation: The present owner is the ninth generation. Letter from Mitsuo Miyazawa. 1988. Jan. This company, Sendai Miso Shoyu K.K. was founded in 1919, as an amalgamation of many smaller miso and shoyu companies in the area. The first miso made was called Sendai Miso, and the first Shoyu was called Josen Shoyu. The Josen brand originated in 1919.

2000. **Product Name:** [Josen Shoyu].
Foreign Name: Jôsen Shôyu.
Manufacturer's Name: Sendai Miso Shoyu K.K.
Manufacturer's Address: Furujiro 1-5-1, Sendai-shi 982, Japan.
Date of Introduction: 1919.
Ingredients: Water, wheat, soybeans, salt.
New Product–Documentation: The present owner is the ninth generation. Letter from Mitsuo Miyazawa. 1988. Jan. This company, Sendai Miso Shoyu K.K. was founded in 1919, as an amalgamation of many smaller miso and shoyu companies in the area. The first miso made was called Sendai Miso, and the first Shoyu was called Josen Shoyu. The Josen brand originated in 1919.

2001. Calvino, Mario. 1919. La soya [The soybean]. *Informe de la Estacion Experimental Agronomica* (*Santiago de las Vegas, Cuba*). p. 98-103. For the years 1917-1918. [1 ref. Spa]
• ***Summary:*** This report, which describes the first soybean experiments in Cuba, begins by discussing the composition of the seed, and its various uses in China, Japan, and Europe (including for manufacture of soaps and as a drying oil in paints, and as foods such as whole dry soybeans, soy coffee, roasted soybeans [soynuts] {*"Se comen también tostados..."*}). In China they are sprouted in darkness and the white sprouts, up to 3 cm long, make an excellent green vegetable."

Note. This is the earliest Spanish-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *sus gérmenes blancos.* From soybeans the Chinese also make a special soy cheese (*un queso especial*), a type of milk (*una especie de leche*), and other drinks. The author then states: "We thought it would be useful to test varieties of soya suited for hot/tropical countries, and we were able to obtain two types of Japanese soybeans, those that gave satisfactory results without having been inoculated.

"Since these soybean types did not find suitable bacteria for the purpose of being inoculated naturally in our terrain, I asked the Mulford house (*casa de Mulford*) for a special bacterial strain for soy (Soya) and proceeded with the artificial inoculation of the seed. The result has been magnificent, as one can see in the accompanying photographs.

"Now we have inoculated land, with which we have been able to ensure the most success for our crop. The harvest [yield] during this first year in Cuba was 2,000 kg/ha of seed. We have also found that it is best to cultivate soya in rows 60 cm apart, with the seeds planted 10 cm apart in each row. This is very dense planting, but it is better to thin the plants than to transplant in others to get the desired plant density. Transplanting is often unsuccessful, and if a crop is not planted evenly the first time, it is difficult to make it even later by transplanting.

"I have had a chemical analysis done of the soybean seeds from our crop. The report prepared by the Department of Chemistry shows that they contain 10.4% water, 41.95% protein, 17.5% oil, 2.45% carbohydrates, 2.5% fiber, and 5.2% ash. The analyst was F. Dominguez." An analysis is also given of assimilable or digestive elements in the soybean from a book by R. Gouin titled *Alimentation rationelle des animaux domestique* [*Rational feeding of domestic animals*]. Three full-page photos show soybean plants: (1) Root nodules on a soybean plant grown in Cuba without the use of inoculant (p. 99). (2) Two soybean plants grown at the agronomic station that contain many pods (p. 101). (3) Four soybean plants with roots; two were inoculated and bear nodules (p. 103).

Note 1. This is the earliest Spanish-language document seen that refers to soynuts. Note 2. This experiment station is under the Secretary of Agriculture, Commerce and Labor (*Secretaria de Agricultura, Comercio y Trabajo*). This 515-page report is published in Havana by Alvarez López y Cie. Address: Director, Estacion Experimental Agronomica, Doctor en Ciencias Agricolas de la Universidad de Pisa

2002. *Kangyo Mohanjo Kenkyu Hokoku* (*Bulletin/Research Report of the Industry Model Station*). 1919. Gaichu ni kansuru chôsa [Researches on injurious insects]. No. 2. 82 p. + plates. (Suwon, Korea). [Jap]*
• ***Summary:*** An English-language summary states that this report describes the life-histories of, and preventive measures for dealing with various insects in Korea. "*Serica* sp. occurs once a year, the adult beetles occurring from April to June. It hibernates in the larval stage or occasionally as an imago. It attacks barley, tobacco, cotton, hemp, soja bean, cabbage, peach and mulberry."

2003. Ministry of Agriculture and Commerce, Farm Bureau (Nôshômushô Nômukyoku). 1919. Daizu sonota no mamerui ni kansuru chôsa [Survey of soybeans and other beans]. Tokyo: Nôshomu-sho, Nômu-kyoku. 3 + 16 + 305 p. Illust. Color maps. 27 cm. [Jap]
• ***Summary:*** This survey by Japan's Bureau of Agriculture, in the Department of Agriculture, includes a statistics on soybean imports and exports (trade). Address: Japan.

2004. Mitchell, Wesley C.; Goldsmith, Margaret I.; Middaugh, Florence K. 1919. History of prices during the war: International price comparisons. *War Industries Board, W.I.B. Price Bulletin* (*USA*) No. 2. xii + 395 p. See p. xii, 108, 379-81.
• ***Summary:*** This bulletin, "prepared in cooperation by the Department of Commerce and the War Industries Board, forms part of the History of Prices During the War [World War I, 1914-1918], planned by the latter agency" (p. 1).

A table titled "Commodities quoted for which no United States equivalents were found" (p. xii) includes the following from Japan: (1) Beans, Soja, Hokkaido, medium (p. 376). (2) Miso (sauce (soy bean, rice, water)), red, common (p. 378). (3) Soy (condiment, bean juice), Noda (p. 380).

A table titled "Wholesale prices in Japan, by months, quarters, and years, 1913-1918" in Yokohama, includes: (1) Beans, soja, Hokkaido, medium (p. 376-77, in yen per koku): Base price: 10.85. Increased from 10.5 in Jan. 1913 to 18.70 in Oct. 1918.

(2) Miso, red, common (sauce) (p. 378-79, in yen per kwan): Base price: 0l.34. Increased from 0.38 in Jan. 1913 to 0.60 in Nov. 1918.

(3) Soy (condiment, bean juice), Noda (p. 380-81, in yen per koku): Base price: 18.25. Increased from 17.00 in Jan. 1913 to 44.00 in Oct. 1918.

The source of all these statistics from Japan was *Chamber of Commerce Journal, Yokohama* (p. 385, 390, 393). Address: War Industries Board.

2005. Rouest, Leon. 1919. Contribution à l'Étude sur le soja [Contribution to the study of the soybean]. *Genie Rural* (*Le*) 11(99-100):23-26. (New Series Nos. 39-40). Continued: See Rouest 1920. [Fre]
• ***Summary:*** Gives a brief overview of the history of the soybean in Europe and France, starting at the top left of page 24: It was introduced into Europe, where it has been cultivated at the Museum of Natural History since 1779.

In 1855 M. de Montigny sent, from China, several soybean varieties to the National Society for Acclimatization (France), which used them for trials in various localities in France.

At the Vienna World Exposition of 1873 there were soybeans from Japan, China, and Mongolia.

In 1874 soybean cultivation was undertaken at Etampes.

In 1875, and during the following years, experimented with its culture in Austria.

In 1888 it was introduced into the United States and adopted as a forage crop in the southern states. From 1880 to 1896 it was discussed in many agricultural bulletins in the USA. The soybean was also studied in Russia.

In 1905 Mr. Li Yu-ying foresaw the use of soya in France as a commercial food. He established a laboratory and a factory named *La Caséo-sojaine* was established at Colombes (Seine).

Also discusses: Dr. Bloch, the Soyanna [sic, Soyama] Werke near Bockenheim, Messrs. Paillieux, Sagot, Raoul, and Jumelle, and the various soyfoods from China and Japan that they describe (Miso, shoyu {*Shoyua*}, tofu {*Tofou*}, dried frozen tofu {*Kouri Tofou*}, yuba {*Uba*}), and the potential threat of soya to the French cheese industry. "Finally in 1910-11 numerous soy products were presented at the expositions in Brussels [Belgium], Turin [France], and Dresden [Germany]."

Describes work on the *Ferme Expérimentale de Néoculture du Sud-Est,* at Villardonnel, Aude. Mr. Semichon, Director of the wine station at Aude, sent this experimental farm some soybean seeds which he received from the USDA accompanied by a bulletin written by William Morse (probably "The soy bean: Its culture and uses," 1918). Rouest translates the Bulletin into French (p. 25-26). The most important varieties mentioned are: Mammoth, Hollybrook, Ito San, Guelph, Haberlandt, Medium Yellow, Wilson, Peking, Tokio, Manchu, Black Eyebrow, Barchet.

Rouest was born on 11 Nov. 1872 in Paris; he died on 27 Feb. 1938 in Chartres, France. Illustrations (line drawings, both non-original) show: (1) Soja hispida plant, with close-up of a cluster of pods. (2) Soja Hato [Hahto] soybean plant. Address: Director, *Ferme Expérimentale de Néoculture du Sud-Est,* at Villardonnel (Aude), France.

2006. Sanborn Map Company. 1919. Sanborn fire insurance map of Petaluma, California. New York City, New York. See p. 22.
• ***Summary:*** At 28 Weller St., near the corner of Wellar and Adams in Petaluma, is a fairly large rectangular

© Copyright Soyinfo Center 2014

building, inside the outline of which is written: "Soy Bean Co., Soy Bean Meal Mill & W. Hu. Power: Elec. (Runs Occasionally)."

Note 1. A map of Petaluma shows that Weller St. is near the center of town and on a railroad siding. It is located next to and runs parallel to the Petaluma River which flows into San Pablo Bay–part of San Francisco Bay. As of April 2009, the building is no longer there.

Note 2. This is probably the *Daizu Seisan Gaisha* (Soybean Food Products Co.), which has a full-page ad that appeared on 1 Jan. 1919 in the *Japanese-American Directory* (*Nichibei Jushoroku*), published in San Francisco on page 40 near front. One of the items that they make is soybean meal, listed in the ad as *Mamekasu* [Soybean presscake, probably left over from making soybean oil]. Petaluma had a large poultry industry at the time, that supplied San Francisco and the Bay Area with chickens and eggs. The soy bean meal was probably used as the protein source in chicken feeds.

2007. Sawada, K. 1919. Taiwan-san kinrui chôsa hôkoku o tôsai suru [Survey and report on the fungi in Formosa. Part I.]. *Taiwan Noji Shikenjo, Tokubetsu Hokoku* (*Government of Formosa, Agricultural Experiment Station, Special Bulletin*) No. 19. 695 p. See p. 225, 406, 481. [Jap]
• ***Summary:*** Including descriptions of the following fungi on soybean: *Hypochnus centrifugus, H. sasakii, Sclerotinia libertiana* (=Whetzelina sclerotiorum). Address: Taiwan Sôtoku-fu Nôji Shikenjô.

2008. Smith, Joseph Russell. 1919. The world's food resources. New York, NY: Henry Holt and Company. 634 p. See pages 326-27, 360-65. [1 ref]
• ***Summary:*** Contains a brief overview of the soybean, soybean production, and soybeans as a food product, with several long excerpts from Dr. J.H. Kellogg, and the *USDA Year Book of Agriculture* (about food uses, including shoyu or soy sauce).

A photo shows "Soy bean curds and cheeses in a Japanese factory," in large earthenware containers (p. 362). Note: This photo of "curds and cheeses," taken by Frank N. Meyer, shows the production of fermented tofu, probably in a Chinese factory (See: {1} Morse 1918. "The Soy-bean Industry in the United States." Plate IV, fig. 2; {2} Piper & Morse. 1923. *The Soybean.* p. 242).

Concerning use of food resources, in the USA and Canada, the chief goal of agriculture is not to feed humans but to feed animals. This was true even in the food crisis of 1918 [at the end of World War I]. About 5,191 million bushels of grain are now grown in the USA; in descending order of importance (in million bushels) they are corn (2,863), oats (1,422), wheat (643), barley (195), rye (54), and buckwheat (14). Of this total of 5,191 million, the American people eat less than 550 million (14.1%). Adding the 340 million bu exported, the total amount used for human food was 900 million bu (17.3%). "The rest, 4,300 million, went to our four-footed brethren, who outnumber us and whose food requirements, because of their greater size, are several times our own.

"In addition to the grain, they get all of the 85,360,000 tons of hay grown on 54,618,500 acres. (More than ten per cent of the half billion acres under cultivation in the United States). They also roam over millions of acres eating all the grass. It is therefore plain that more than four-fifths [80%] of the produce of American agriculture, even in 1918 [a war year], went to feed beasts." Address: Prof. of Geography, Columbia Univ., New York.

2009. Yoshimura, Kiyohisa. 1919. Shokuyô shokubutsu no kenkyû. Dai ju-san (Glycine Lispida [sic], Max.) [Chemical studies of food plants. 13. Soy beans (Glycine hispida, Max.)]. *Kagoshima Kotonorin Gakko Gakujutsu Hokoku* (*Bulletin of the College of Agriculture, Kagoshima*) 3:4-7. [Jap]

2010. Noda Shoyu. K.K. 1919? Noda Shôyu Jôzô Kumiai-shi [History of the Noda Shoyu Brewers Association]. Noda, Japan. 350 p. Undated. Handwritten unpublished manuscript. A translation of pages 5-15, Rules and Regulations of the Noda Shoyu Brewers' Association is given in W.M. Fruin, 1983, p. 309-312. [Jap]*
• ***Summary:*** In the 1870s a group of soy sauce manufacturers in Noda formed a cartel named Noda Shoyu Brewers' Association. In 1917 some of them formed a new company Noda Shoyu K.K., which later became Kikkoman. In about 1919 it was decided to write a history of the former association. This key early document is widely cited by Mark Fruin in his 1983 history of Kikkoman, as follows: Anonymous, Noda Shoyu Kumiaishi (n.p., 1919?).

Talk with Mark Fruin. 1991. Oct. 22. The chapters on the clan and carter business in his book on Kikkoman are largely from this rare, old, valuable manuscript. Copies of this manuscript exist at the Kikkoman archives at Noda, and with Mark Fruin in Palo Alto, California. Address: Noda, Japan.

2011. Sato, H. 1920. Jôzô enkaku-shi [Chronology of brewing in Japan]. *Nogaku Kaiho* (*J. of the Scientific Agricultural Society, Japan*) No. 209. p. 61-107. Jan. 5; No. 210. p. 119-42. Feb. 2; No. 211. p. 189-208. March 5; No. 214. p. 469-82. June 5. [Jap]
Address: Nôgaku-shi, Japan.

2012. *Market Reporter* (*The*) (*USDA*). 1920. Price of soy beans advances in Japan. 1(2):32. Jan. 10.
• ***Summary:*** The droughts during the summer damaged soy-bean crops in Manchuria and Chosen [Korea]. "Spot cargo is still quoted at 9.4 to 9.5 yen per picul of 133.33 pounds (about $0.036 per pound). Forward quota range up to 9.64

© Copyright Soyinfo Center 2014

yen per picul ($0.037 per pound).

"Old crops are much preferred by buyers because they are of a better quality, and, although they are quoted at higher figures, their sale is brisker than that of the new crop. The soy-bean oil trade is dull and inactive, as European buyers do not buy and only consignments to the United States are now being made from Dairen." Address: Bureau of Markets, Washington, DC.

2013. Wile, Frederic W. 1920. Japan takes lead in import trade: Unnoticed, yellow nation bounded into first place among nations from which the United States imports goods. *Atlanta Constitution* (*Georgia*). Jan. 11. p. 11A.
• ***Summary:*** The value of imports from Japan ("Nippon") have risen from $107.4 million in 1914, to $284.9 million in 1918, to a record $304.0 million in 1919.

In 1914, the U.S. import figures from the three leading European countries were: Great Britain $294 million. France $141 million. Germany $20 million.

"Next to raw silks the principal American purchases from Japan in 1919 consisted of soy bean oils, $8,994,776; tea, $13,420,067, and silk fabrics, $10,959,396." In recent years, American exporters have also been increasing their sales in Japan.

Note: Similar information, under the title "Importation of Japanese goods" appeared in the *Christian Science Monitor* on Feb. 24 (p. 9).

2014. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1920. Review of Far Eastern commercial press. 23(13):312. Jan. 16.
• ***Summary:*** "Soya bean market in Japan becomes more steady: The market for soya beans which has been subject to violent fluctuations in the past months became more quiet during the second week of December, says the *Japan Advertiser* [an English-language newspaper published in Japan] of December 13."

2015. Itano, Arao. 1920. Re: Comments on the first batch of shoyu made by Margaret Church. Letters to Miss M.B. Church at Bureau of Chemistry, Washington, DC, Jan. 24 and Feb. 4. 1 p. Typed, with signature. [Eng]
