meal but also the entire feed industry in Japan." Address: PhD, Adviser to the Japanese American Soybean Institute.

5167. Miller, Harry W. 1965. Meeting the world's nutritional needs with soy milk. *Soybean Digest.* May. p. 19-21.
• ***Summary:*** In East Asia, milk is in short supply and expensive. A replacement made from soybeans has proved acceptable both tastewise and nutritionally. Moreover, animals are not an efficient means of producing protein. In East Asia, soybeans for food use have traditionally been soaked and then milled. Thus a "wet milling operation" is used instead of dry milling, as to make flour. "For adult use, they have built up a number of soy protein dishes, called 'meat without bones'. However they have not taken into consideration the nutritional needs of infants and growing children, and malnutrition is seen everywhere in these developing countries."

"In Japan, 30 pounds per capita of soybean are consumed as food but to provide soy milk for infants and children another 15 pounds per capita need to be added." For soy milk processing two systems are in use: the small community soy milk plant (the fresh milk may be dispensed from the conventional milk can without bottling, thus lowering the cost) and the large commercial bottling plant. "In Hong Kong, soy milk is made, bottled, and distributed everywhere in the colony for 3½ cents for a 7-ounce bottle. It has the largest sale of any bottled beverage in the colony... In Hong Kong are two factories of the most modern type, with upwards of 40 large delivery beverage trucks, under the genius and leadership of K.S. Lo, general manager. These plants daily manufacture some 25,000 cases each containing 24 bottles of soy milk [i.e. 600,000 bottles/day]. These are delivered to hospitals and schools, and this milk is on sale at all beverage places..." In Singapore, in Bangkok, Thailand, and in Manila, Philippines, soy milk is also made and well accepted. In Formosa, where 2-3 years ago there was only one soy milk plant in Taipei, today more than a dozen rural pilot plants have sprung up all over the country.

Photos show: (1) A bottling machine at a soy milk plant in Hong Kong. (2) Boy scouts in Hong Kong drinking bottled soy milk. Address: M.D., Director Emeritus, International Nutrition Research Foundation, Arlington, California.

5168. Nakamura, Hiroshi. 1965. Market for soybean oil and other edible fats and oils in Japan. *Soybean Digest.* May. p. 44-45.
• ***Summary:*** "In Japan practically all of the refined soybean oil produced is consumed in the liquid form either as cooking oil or salad oil. Very little soybean oil is used in the manufacture of shortening, margarine, or other edible oil products. This basic pattern of consumption has not changed much in the past few years in spite of the rapid increase in the production and utilization of soybean oil in the Japanese market.

"The major liquid edible oils consumed in Japan are shown in table 1. It must be pointed out that all these oils are produced from imported oilseeds, the only exceptions being rice bran oil and about half of rapeseed oil production. The table indicates that total consumption has been rising rapidly but that the consumption of safflowerseed [safflower seed] oil has increased most relative to other oils. This is due partly to the higher prices of U.S. soybeans in 1963 and 1964, and also to the lower import duty of 5% ad valorem on safflowerseed as compared with the import duty on soybeans. The duty on soybeans is the lower of either 13% ad valorem or a specific duty of 4,800 yen ($13.33) per metric ton. The table also shows that the consumption of rapeseed oil has tended to decline in the past few years. This tendency results from the decreasing domestic production of rapeseed.

"Roughly 75% of cottonseed oil consumed in Japan is used for the manufacture of mayonnaise and the rest is used in the liquid form for fish canning and other edible purposes. Rice bran oil and sesame oil are both consumed as cooking oil or salad oil.

"Per capita consumption: The per capita annual consumption of soybean oil has increased at a rate of 15% per annum in the recent 5-year period from 1959 to 1963, while that of rapeseed oil has declined considerably during the same period (table 2). The per capita consumption of other edible fats and oils has increased faster than soybean oil. Along with the westernization of modes of living the dietary habits of the Japanese people have been changing in recent years resulting in increasing consumption of livestock products and fats and oils. The rising income of consumers and the relatively stable consumer price level in the past have certainly promoted and permitted consumer preference for better quality foods.

"The consumption data of edible vegetable oils in the past decade indicate an income elasticity of demand of +1.4. This means that in the past 10 years the consumption of edible oils in Japan has increased on the average of a rate 1.4 times faster than the rate of increase of consumer income. The question now is the prospect for future consumption. The real income of Japanese consumers is expected to rise steadily in the next few years at an annual rate of 6% to 7%. But will the consumption of edible oils keep on rising at a still faster rate as in the past?

"The annual per capita consumption of edible fats and oils in Japan is still only one-third the level of U.S. consumption. Of course, the dietary habits of the two countries differ greatly and the Japanese types of food do not provide as much fats and oils as the American types of food contain. We do not expect, therefore, that the level of per capita consumption of fats and oils in Japan will rise to the high level of U.S. consumers even in the long run. However, we can reasonably anticipate that as the consumer income continues to rise in Japan the consumption of edible fats and

© Copyright Soyinfo Center 2014

oils will also continue to increase at a rate about equal to that of the rise in income for a few years to come.

"Future potential and problems: The aggregate consumption of soybean oil and other edible fats and oils in Japan depends on the size of the population and the annual per capita consumption. The population of Japan, as shown in table 1, increases by about 1% per annum, but annual per capita consumption tends to increase by 10% or a little more. In the next 10 years these two factors will remain basically unchanged, except that the rate of increase of per capita consumption will decline as the absolute level of consumption gets higher. Nevertheless, it may be expected that the aggregate consumption of edible fats and oils in Japan will be doubled in the next 10 years. As the generations change from the old prewar people to the postwar children, the patterns of food consumption will tend to be further westernized with increased use of edible fats and oils.

"To meet such an increasing demand for edible fats and oils soybeans will be preferred as a suitable oilseed because of the very rapidly expanding market for soybean meal as an important ingredient in mixed feeds (table 3). As a matter of fact, the demand for high-protein oilseed meals has been increasing at a much greater rate than fats and oils consumption. Consumer preference for livestock products continues to be very strong and this will be reflected in ever-increasing demand for mixed feeds by livestock farmers. Under these circumstances, of the two products of the oilseed crushing industry, oil tends to be in surplus in relation to oilseed meal. Therefore, an oilseed with a lower level of oil content but higher in protein is preferable and soybeans can best meet such requirements as compared with other oilseeds.

Thus, the Japanese oilseed processing industry will increasingly depend on soybeans as its main raw material, although the current high level of import duty on soybeans certainly has an adverse effect on such a trend and permits other less favored oilseeds to be processed in Japan. The same is true of the prospect for the future potential of soybean oil consumption in the Japanese market, since the high import duty on soybeans is reflected in the prices of soybean oil relative to those of competing fats and oils.

Photos show: (1) An aerial view of the Shimizu crushing plant of Hohnen Oil Co. with a tanker berthed at the dock. (2) A small portrait photo of Hiroshi Nakamura.

Tables show: (1) Domestic consumption of major edible vegetable oils, 1960-1964 (crude oil basis). In 1964, soybean oil accounted for 45.8% of edible oil consumption in Japan, followed by rapeseed oil (17.2%), safflower oil (15.8%). rice bran oil (10.1%), cottonseed oil (9.4%), and sesame oil (1.7%).

(2) Per capita annual consumption of edible fats and oils in Japan, 1959-63 (crude oil basis; fiscal year starting April 1).

Per capita consumption of soybean oil increased from 2.43 lb in 1959 to 4.78 lb in 1966.

Per capita consumption of rapeseed oil decreased from 2.67 lb in 1959 to 1.60 lb in 1966.

Total per capita consumption of all oils and fats in Japan increased from 9.15 lb in 1959 to 14.19 lb in 1966 (a 55% increase).

Japan's population increased from 92,640,000 1959 to 96,160,000 in 1966. Source: Compiled from official statistics.

(3) Annual consumption of soybean meal for mixed feeds in Japan, 1959-1963 (metric tons). Soybean meal increased from 84,234 metric tons in 1959 to 402,220 metric tons in 1963. All other raw materials in mixed feed increased from 1,661,488 metric tons in 1959 to 5,654,537 metric tons in 1963. Source: Feedstuffs Section, Ministry of Agriculture and Forestry. Address: Asst. Manager, Business Dep., Hohnen Oil Co., Ltd., Tokyo.

5173. *Soybean Digest.* 1965. Research leads to a new food market for soybeans. June. p. 16.

© Copyright Soyinfo Center 2014

• ***Summary:*** "Acceptance of U.S. soybeans in traditional foods of Japan is growing as U.S. exporters and Japanese processors apply results of research, the U.S. Department of Agriculture reports.

"More than 10% of the nearly 49 million bushels exported to Japan during the 1963 market year went into production of three staple foods in the Japanese diet. These are shoyu, or soy sauce; tofu, a soft, white gelatin-like food used in soup or for frying; and miso, a food paste used in soup.

"Until about 6 years ago, Japan imported no soybeans from the United States for use in making these foods–all U.S. imports were processed into oil and meal.

"Reinforcing this new Japanese food market is a new export industry in the United States–selecting soybean varieties for Oriental food processing and maintaining the identity of the selections during shipment.

"These developments are the direct result of research by USDA's Agricultural Research Service and Japanese institutions working under grants from ARS. The work was begun in 1957 at the Northern Utilization Research Laboratory, Peoria, Illinois, when ARS scientists, with the cooperation of two Japanese scientists on leave from their institutions, set out to find differences between U.S. and Japanese soybeans that might explain why Japanese food processors preferred domestically grown beans. Later, companion studies were initiated in Japan–by the Japan Shoyu Research Institute, the Japan Tofu Association, the Food Research Institute, and the Central Miso Institute. The American Soybean Association, through its operating arm in Tokyo, the Japanese American Soybean Institute, was active in initiating the project.

"These studies show that:

"1–U.S.-grown soybeans can be used to make traditional Japanese foods equal in quality to food made from Japanese beans.

"2–U.S. No. 2 beans–the most commonly available commercial grade–yield more shoyu than Japanese beans selected for shoyu production.

"3–Hawkeye variety is the best of 12 varieties tested for making tofu.

"4–Comet, Yelnanda, and Harosoy varieties are best for making miso.

"5–Characteristics required in soybeans for Oriental foods can be used as a basis for selecting and breeding U.S. varieties for this purpose.

"The Peoria scientists demonstrated for the first time that high-quality miso and tofu can be made from U.S. soybeans. The miso processing time was shortened by cracking the beans and removing the seedcoats. This dehulling reduces soaking and cooking time and increases protein content and uniformity of the finished miso.

"The Japanese scientists have found (1) that lower production costs and higher yields of shoyu make U.S. soybeans more profitable in Japan than domestically grown beans; (2) that Chippewa and CNS-4 varieties rank next to Hawkeye in tofu yields and quality and that a high protein content is essential to high tofu quality; and (3) that miso color is affected by cooking time before fermentation is started–better color is produced by shorter cooking.

"A laboratory test of soybeans for tofu production, now being developed, will be made available to U.S. plant breeders for screening and improving varieties for the export market.

"The grants to Japan, awarded under Public Law 480, were financed with foreign currency obtained by the United States from the sale of farm products abroad. This money cannot be converted into dollars for use in the United States, but a portion of it can be used to pay for foreign research that will benefit U.S. agriculture."

A photo shows: USDA scientists Dr. C.W. Hesseltine and Dr. A.K. Smith, and Japanese scientists Dr. Tokuji Watanabe and Dr. Kazuo Shibasaki (left to right). They started research in 1957 at the Northern Utilization Research Laboratory, Peoria, Illinois, on using U.S. soybeans in traditional Oriental Foods.

5174. *Yin Yang–The Unique Principle* (*Chico, California*). 1965. Miso. 5(6):8. June. [1 ref]

© Copyright Soyinfo Center 2014

• ***Summary:*** This magazine is the same as *The Macrobiotic Monthly* and *The Macrobiotic.* It started as *Macrobiotic News* in 1960 in New York. After being moved to Chico, California, it was renamed *Yin Yang.*

"Miso, a traditional... Contains a nutritional analysis of barley miso from S. Yamada's *Manual of the Fermented Food Industries of Japan* (1957, Tokyo. p. 44).

Miso has long been recommended as one of the basic elements of the Macrobiotic way of eating. Individuals who use it every day have found it remarkable in health-promoting qualities–a valuable aid in instances of general weakness, anemia and iron deficiency. "Miso is a mixture of soyabeans, barley, salt and water–cooked and then aged for at least eighteen months." Address: Ohsawa Foundation, P.O. Box 238, Chico, California.

5175. *Macrobiotic Monthly* (*The*) (*Chico, California*). 1965-1968. Serial/periodical. Ohsawa Foundation, Inc. Vol. V, No. 7 (June 1965) to Vol. VIII, No. 11 (Nov. 1968). Frequency: Irregular.
• ***Summary:*** Preceding title: Yin Yang: The Unifying Principle. Succeeding title: The Macrobiotic. Most issues are dated.

Place of publication varies: Vol. VI, No. 1 (June 1966) to Vol. VII, No. 4 (Oct. 1967) were published in Los Angeles, California–By Shane Oles.

5176. *Times* (*London*). 1965. Eating Japanese. July 26. p. 13, cols. 6-7.
• ***Summary:*** From a correspondent. Interest in things Japanese is waxing strong in Britain, "stimulated, perhaps, by last year's Tokyo Olympics. Several small shops selling solely Japanese goods have opened in London... On the subject of Japanese food, however, most people would confess their complete ignorance. In the whole of Britain there is not one restaurant specializing in Japanese meals, compared with thousands of Indian and Chinese establishments that have shot up since the war."

Contains 3 recipes. For sushi: "Brush each one lightly with *shoyu* (soy bean sauce), using a pastry brush." Mizutaki calls for 1 teaspoon of *shoyu* as an ingredient.

5177. Ebine, Hideo; Nakano, Masahiro; Kosaka, Shokichi. 1965. Daizu chiizu no seizô-hô [Process for manufacturing a soy cheese]. *Japanese Patent* 16,737. July 30. 2 p. [Jap]
• ***Summary:*** This pioneering Japanese-language patent (the world's third earliest patent related to a soy cheese) is widely miscited as Kenkyusho, C.M. 1965. The key steps in making this soy cheese are: Prepare soymilk, then add enough water soluble acid casein (milk protein) so that there are 25 to 35 parts by weight of casein per 100 parts of soymilk solids. To this "improved soymilk" add calcium chloride and lactic acid to reduce the pH to 5.4. Then add rennet and lactic acid starter which is extracted from miso. The soy protein will coagulate with the milk protein to form curds. Also add glucose at the level of 0.2% by weight of the soymilk to improve the curd formation.

Note: This is the earliest document seen (Oct. 2003) concerning a Western-style, nonfermented soy cheese. Address: National Food Research Inst., Tokyo.

5178. Thrapp, Dan L. 1965. Thousands owe lives to doctor's soybean "milk." Noted surgeon nutritionist, now 86, devised formula as missionary in 1925 [Dr. Harry Miller]. *Los Angeles Times.* July 31. p. 19. Saturday.
• ***Summary:*** "Starving babies, often cast out to die because the parents have no way to feed them, inspired Dr. Miller to undertake his research [on milk from soybeans 40 years ago]... Today in Hong Kong about 25,000 cases of 24 bottles in a case are delivered daily... In America, the use of soybean formula for infants is growing rapidly–at a rate of 15-20% a year. Dr Miller has seen plants to create his product rise in China, Japan, Formosa, the Philippines, Singapore, Thailand, and, of course, Hong Kong. 'The nutritional qualities of the soybean are a gift to the world,' he said, 'and I have not copyright.' He said that U.S. studies showed that 14% of the people here are allergic to some degree to cow's milk and 7% of new-born infants get severely ill from cow's milk formula. There is no allergy rate from soybean milk, he said... Since 1960 he has been in Hong Kong raising money for two hospitals." One served refuges from Red China. As a surgeon, he has performed more than 3,000 goiter operations during his lifetime. Address: Times religion editor.

5188. *Christian Science Monitor.* 1965. Just cook it all at table. Aug. 19. p. 6.
• ***Summary:*** Gives recipes for Sukiyaki and for rice. Sukiyaki calls for: "1 tofu (optional) (This is a bean curd made fresh daily of soya). 1 cup shoyu sauce."

5189. Mizunoe, Seiryo. Nihon Koyu Kogyo Company. 1965. Daizu-ko o genryô to suru chiizu-ruiji shokuhin seizô-hô [Production of cheese analog using soy flour]. *Japanese Patent* 21,230. Sept. 20. Application filed 17 Sept. 1964. [Jap]

5190. Dodson, J.C. 1965. U.S. soybeans in the economy of Japan. *Soybean Digest.* Sept. p. 27-28.
• ***Summary:*** Three broad elements have an important bearing on how well we do in maximizing our sales of soybeans to Japan: (1) the state of the Japanese economy, (2) the present market situation for soybeans, and (3) the ASA-USDA market development program. He discusses each of these in detail.

There is presently a recession in Japan, a normal part of the business cycle. Yet the "Japanese economy has great underlying strength and is basically sound. The foreign trade balance is good, foreign exchange reserves remain at a high level, consumer expenditures are holding up well, and there is virtually no unemployment. The current problems are temporary."

"Japan's domestic production of soybeans is on a steady downtrend, as the planted area declines each year. On the other hand, requirements for soybeans for food and feed are going up. This obviously means an increasing reliance on imports.

"The competition for the Japanese soybean market is between the United States and Communist China. If quality is maintained and if the price relationships are satisfactory, the Japanese processors prefer to buy from the United States because of the reliability of supplies and their preference for the free market mechanism. Purchases from Communist China tend to be hampered by political considerations and arbitrary pricing.

"At the same time, there are strong pressures in Japan for expansion of trade with Communist China to provide an outlet for more of Japan's products. Not too many products which Japan can use are available from China. Soybeans are one commodity in ready demand."

"Consumption of the traditional Japanese soybean foods–miso, tofu, and shoyu–has leveled off, and may begin to decline as the shift in diet [toward a Western diet] continues." Address: Former Agricultural Attache, U.S. Embassy, Tokyo.

5191. Fujimaki, Masao; Arai, S.; Kirigaya, N.; Sakurai, Y. 1965. Studies on flavor components in soybean. I. Aliphatic carbonyl compounds. *Agricultural and Biological Chemistry* 29(9):855-63. Sept. [13 ref]
• ***Summary:*** n-Hexanal is likely to be one of the main components of green bean flavor in soybeans. Address: Dep. of Agricultural Chemistry, Univ. of Tokyo, Tokyo, Japan.

5192. Grow, Howard E. 1965. The ASA program in Japan. *Soybean Digest.* Sept. p. 29-30.
• ***Summary:*** "The market development program in Japan has been in operation for over 9 years. We have learned many things in those 9 years. In the beginning, major emphasis was on improved human nutrition. Now we are at a stage where we need to concentrate our efforts in the areas which today offer the greatest potential for increased use of U.S. soybeans. The two areas most likely to expand are soybean meal in livestock and poultry feeds and increased consumption of soybean oil in the human diet."

An edible oil survey will be conducted: An analysis of the results should point out special opportunities that could lead to increased edible oil consumption and to main factors that seem likely to influence significant future trends in markets. The report will make suggestions and recommendations for marketing strategy in the promotion and expansion of soybean oil in the Japanese diet."

"Oil consumption in Japan was 4.61 pounds per person annually when our American Soybean Association market development program started in 1956. It has increased to over 13 pounds now, but is far below the World Food Organization's recommendation of 30 pounds, or the 46 pounds consumed per person in the United States."

Also discusses: Visitors from Japan at ASA's 45th annual convention. Animal agriculture developing rapidly in Japan: 446,000 metric tons of soybean meal were used in feed during 1964.

"Feeding trials: Some feeding trials have been and are being carried out to demonstrate the economy and efficiency of soybean meal in comparison with other protein feeds. Recommendations for poultry and swine include more soybean meal as an increased source of protein. The results of these demonstrations are being reported to feed company representatives and poultry producers at meetings throughout Japan. The feed companies are interested and cooperative support is developing." Address: Asst. to the Executive Vice President, American Soybean Assoc., Hudson, Iowa.

Japan oil industry. *Soybean Digest.* Sept. p. 31.
• ***Summary:*** "Quality is wanted: I now sincerely wish to all of my friends in the American soybean industry the betterment of quality which you export to us, and secondly a stable supply in all respects.

"First, the shipments we have been receiving from you still show considerable admixture and cause many problems. I would like to take this opportunity to ask you to consider supplying us on pure basis as has been customary for other oilseeds. I also draw your kind attention to shipping us good soybeans with higher oil and protein content.

"Second, erratic price swings and shipment irregularities also force us to try to be less dependent on American soybeans due to the risks involved during the rather long ocean voyage. I am concerned with the possible danger of the traditional share of American soybeans in our growing crushing industry being affected adversely due to these problems.

"However, I would like very much to see that you could continue to improve and stabilize the supply for us and remain as the largest supplier of soybeans in the World. I also wish your Association prosperous progress in its capacity to help us all in the soybean processing business."

A small portrait photo shows Kiyoshi Hirano. Address: President, Japan Oilseed Processors Assoc., Tokyo, Japan.

5197. Pogeler, Glenn H. 1965. What the Soybean Council is doing for you. *Soybean Digest.* Sept. p. 38-40.
• ***Summary:*** "Just a few short years ago, Howard Roach had a dream and it was about Spain. His research showed that the per capita consumption of edible oils was pitifully low in that country. Because Spain was almost entirely dependent on the olive crop as a source of edible fat, she was finding her supply of fats for the population always at a low level. Because olives are a tree crop, the production is based on a cycle of on one year, and off the next. This makes a tremendous fluctuation in supply from year to year.

"Howard Roach convinced the Spanish government that a program of supplementing their olive oil supply with soybean oil would make it possible to increase the per capita consumption of oil for the benefit of all. This would also allow Spain to continue her normal exports of olive oil which were needed to produce foreign exchange to enable them to continue the industrial expansion of the nation.

"Spain negotiated a P.L. 480 agreement, and for several years bought soybean oil under P.L. 480 [using local currency, pesetas]. As her financial situation improved, she was able to switch to dollar purchases and today, Spain is the largest buyer of soybean oil from the United States."

"Iran is another example of a country which originally began by buying U.S. soybean oil under P.L. 480 and has now switched to dollar purchases. Iran, in the fiscal year ending 1960, took from the United States 11,000 metric tons of soybean oil and, just 5 years later, is expected to import 45,000 metric tons."

"India is our newest large buyer of soybean oil and last fall signed an agreement with the U.S. government to take in approximately 75,000 tons..." Other users of U.S. soybean oil this past season include Pakistan, Greece, Guinea, Iceland, Tunisia, Egypt, Sierra Leone, Yugoslavia, Chile, Taiwan and several others.

"Europe and Canada are the major dollar buyers of U.S.-produced soybean oil." Major buyers of U.S. soybeans are Japan, Netherlands, Canada, West Germany, Denmark and many other countries.

"Spain is building up a crushing industry and, by the end of 1965, is expected to be able to crush very close to 700,000 metric tons of oilseeds per year..."

Soybean exports will top 200 million bushels this year and are expected to continue to rise. "Latest government estimates indicate that approximately 2 million tons of soybean meal will find their way overseas from the 1964 crop of soybeans. This is another record breaker with France, Germany, Netherlands, Canada, Belgium, Yugoslavia, Italy, Denmark, and Spain being the major users.

There has been a tremendous expansion in the exports of U.S. soybeans and soybean products. The Soybean Council of America deserves part of the credit. "In my travels overseas, it seems as though everyone is talking about soybeans and soybean products."

Also discusses how the Soybean Council operates and is financed, its relationship to USDA's Foreign Agricultural Service, its overseas offices, some of its problems, and reasons for expanding the program. A portrait photo shows Glenn Pogeler. Address: President, Soybean Council of America, Inc.

Foreign Agriculture 3(40):11. Oct. 4.
• ***Summary:*** Excerpts from a speech given at the annual convention of the American Soybean Association in Memphis. The soft spot in the potential magnitude of Japanese soybean consumption may well be the level of oil consumption. The level needs to be raised substantially. Address: Former U.S. Agricultural Attaché in Tokyo.

5199. *Foreign Agriculture.* 1965. Japanese soybean study. 3(42):12. Oct. 11.
• ***Summary:*** The Japan Shoyu Research Institute, Tokyo, will compare Japanese and U.S. soybean meals for making shoyu (soy sauce), under a grant awarded by the U.S. Dep. of Agriculture. Previous research at the Institute showed that whole soybeans from the United States yielded slightly higher quantities of shoyu than Japanese beans, and that the quality of shoyu was about equal. In recent years, defatted soybean meal has replaced whole beans as the foremost raw material for making soy sauce.

5200. Ohsawa, George. 1965. Zen macrobiotics: The art of rejuvenation and longevity. Revised, edited and annotated by Lou Oles and Shayne Oles Suehle. Los Angeles, California: Ohsawa Foundation, Inc. xiv + 128 p. No index. 17 cm. Series: The Philosophy of Oriental Medicine, Vol. 1. [20 ref]

• ***Summary:*** Note: This book was probably published after July 1970, even though the copyright date is 1965. This is probably the 4th English-language edition of *Zen Macrobiotics.* The 1st edition was published in Nov. 1960 in New York and the 2nd edition in 1965 in Los Angeles, revised by Lou Oles.

Note 1. Shayne's maiden name was apparently Shirley S. Federbush. The California marriage records state that she married Ferdinand E. Suehle on 24 July 1970. So this book was almost certainly published after their marriage date.

Note 2. The date on this book is too early, as explained by Carl Ferre (e-mail of 15 April 2011), president of the George Ohsawa Macrobiotic Foundation. "The libraries are going by copyright dates and do not correspond to when they were printed and made available to people. The second one was printed after Lou Oles had died, which was in 1967 if I recall correctly, and she had remarried! It should have had a new copyright date, but didn't.

"From the early magazines, it appears Lou and Shayne Oles moved to Los Angeles in December, 1965. He announced the move in the January 1966 issue of the magazine and there is nothing about an intended move in the November 1964 issue... Note also that they used 'Ignoramus Press' for some of their books." Address: Los Angeles, California.

5201. *Foreign Agriculture.* 1965. The export and promotion of U.S. oilseeds and oilseed products. 3(48):10-12. Nov. 29.
• ***Summary:*** "U.S. oilseeds and oilseed products have continued as the nation's top dollar export earner of all agricultural commodities in the past year–a firm member of the 'billion dollar club.' FY [fiscal year] 1965 was a record export year with $1.1 billion total trade up 30 percent over 1963-64 and over 90 percent represented dollar business... Most of the 'nondollar' exports were soybean and cottonseed oils that moved under Public Law 480."

The year 1964-65 was a record year for exports of soybeans and soybean products. Leading importers of U.S. soybeans (in million bushels) were Japan (48.4), Canada (33.9), Netherlands (26.9), and West Germany (22.4). Leading importers of U.S. soybean meal (in 1,000 tons) were France (358.4), West Germany (300.7), Canada (249.4), and Netherlands (245.2). Leading importers of U.S. soybean oil (in million lb; 2,204.6 lb = 1 metric ton) were Spain (239.5), Pakistan (195.2), India (137.0), Morocco (79.5), Iran (70.7), Greece (54.7), Israel (42.9), and Yugoslavia (41.7).

"In Japan, one of the largest U.S. markets, continued check sampling at the rate of 5-10% is being made on imports to insure that the same quality of beans purchased is actually shipped and that U.S. exporters are informed of low-quality shipments. The American Soybean Association, through the Japan Oilstuff Inspectors Corporation, points out specific shipments of low quality thus allowing ASA to back up requests for exporters to maintain grade standards.

"ASA sponsored trips of two teams of Japanese Soybean Crushing Association officials to the United States in 1965 (the larger team came at its own expense) to view U.S. soybean production, marketing, and shipping methods. Since then, Japanese crushers have had a better understanding of the dependable supply and quality of U.S. soybeans."

5202. Grow, Howard E. 1965. Need 6 million bu. more soybeans: Japanese American Soybean Institute. *Soybean Digest.* Nov. p. 17.
• ***Summary:*** Japan has the fastest growing economy in the world. "The increased income is being used to purchase more food, such as animal products and fats and oils. Increased animal production requires more feed. The outlook for increased use of soybean meal is favorable and for 1965-66 the estimate is for 736,000 metric tons. This is up from 565,800 metric tons for the present year. After allowance for imports of soybean meal, there will be a need for Japan to import approximately 6 million bushels more soybeans than during 1964-65.

"Edible oil intake during the past few years has increased by more than 10% each year. The Japanese Food Agency forecasts an increase of only 2.7% during 1965-66. On this basis there will be more soybean oil produced in Japan than is expected to be used. An effective program must be developed that will stimulate increased oil intake, which is still at only about one-half the level recommended for proper nutrition.

"Imports from China: Japan will import about 300,000 metric tons or about 11 million bushels of soybeans from China this year. Expectations are that the volume will be about the same in 1966. Chinese soybeans contain less foreign material, are about 2% lower in oil content than U.S. soybeans. Chinese beans can be purchased for about $7 per ton less than U.S. beans, because of the lower oil content. Chinese beans also have the advantage of a shorter time in delivery and fewer split beans. The Chinese government determines the volume of soybeans to be exported and there isn't much we can do about it. Some food manufacturers in Japan use Chinese soybeans..."

"There will be a further shrinkage of soybeans in native foods as more western-type foods are consumed. There will continue to be activity in the promotion of the native foods, but major emphasis for market development activities will be in soybean meal and soybean oil." Address: Asst. to the Executive Vice President, American Soybean Assoc.

• ***Summary:*** Dates of research period covered by report: 14 Oct. 1964 to 31 Oct. 1965. Includes 3 tables and 4 graphs. Introduction: "It is significant to study the nutritional value of tempeh in detail from various points of view, not only to study the biologically active substances but also to find changes in content of nutrients of tempeh during the fermentation of soybeans."

Summary: Hemolysis-preventing and antioxidant activities were detected in tempeh but not in boiled unfermented soybeans. Among the biologically active substances isolated from tempeh, it was found that the isoflavone 6,7,4'-trihydroxyisoflavone, which was originally isolated from tempeh but never isolated previously from natural foods, was most active in preventing in vitro dialuric acid-induced hemolysis of red blood cells. The content of riboflavin and nicotinic acid increase significantly during tempeh fermentation.

Note: This is the earliest document seen that contains the term "biologically active substances." By the early 1990s these substances were renamed "phytochemicals." Address: Food and Nutrition Lab., Faculty of Science of Living, Osaka City Univ., Nishi-ku, Osaka, Japan.

5211. Arimoto, Kinitaro; Sakurai, Yoshito. 1965. Food and nutrition in Japan. In: Martin S. Peterson and Donald K. Tressler, eds. 1965. Food Technology the World Over. Vol. II. South America, Africa and the Middle East, Asia. Westport, Connecticut: AVI Publishing Co., Inc. ix + 414 p. See p. 359-94. Illust. Index. 24 cm. [13 ref]

• ***Summary:*** This chapter, after the Introduction, is divided into two parts: 1, titled "Nutrition (p. 360-74)" by Arimoto, and 2, titled "Food technology" (p. 374-94)" by Yosito [Yoshito] Sakurai. In Part 1, table 110, "Food supply in Japan" includes average statistics on soybeans, miso, and shoyu in kg/year and gm/day for 1944-1948, 1961, and 1961. in kg/year for the three periods: Soybeans: 3.5, 5.4, and 5.0. Miso: 10.6, 8.1, and 7.7. Shoyu: 15.9, 13.0, and 11.1. Source: Ministry of Agriculture and Forestry, Balance Sheets. Surprisingly, supplies were greater for each during and immediately after World War II than in the early 1960s.

Table 116, "Intake of foods classified into food groups and type of work (gm per capita per day), 1963" gives statistics for the entire nation, agricultural households, and non-agricultural households, as follows: Soybeans: 1.3, 1.7, 1.0. Miso: 25.1, 30.1, 22.5. Soybean products: 37.3, 29.9, 41.5. Seaweeds: 4.6, 4.2, 4.7. Shoyu: 26.2, 30.0, 23.6. Soybean products as a source of high quality protein are discussed (p. 366).

Part 2 begins with a section on "Rice" (p. 374-77) which notes that rice supplies half the calories in the Japanese diet. Japan produces all of the rice it needs–about 13 million tons. Imported rice (about 150,000 tons) is used only as a raw material in confections and miso. Japan imports most of its soybean from the USA and China, and these soybeans are processed by characteristically Japanese methods to make tofu, miso, and shoyu (p. 377).

Animal husbandry is not widely practiced in Japan, largely because the land is hilly with few grazing lands. Thus most beef, pork, and chicken are imported. The production of cow's milk is gradually increasing; it is now 27 million hectoliters.

Packaging of foods has changed greatly during the past decade. Packaged foods are now common. Shoyu and miso, once sold by the measure, are now sold in bottles and plastic bags, respectively. Table 128 (p. 378), titled "Supply of raw materials and food consumption of their products in 1959 (Japan)" shows the following for soybeans (in metric tons = tonnes). Soybeans–Domestic supply: 410,000 tonnes. Imports: 1,000,000 tonnes. Miso consumption: 850,000 tonnes. Shoyu: 1,280,000 tonnes. Tofu: 640,000 tonnes. Aburaage 170,000 tonnes. Natto 60,000 tonnes. Meat 330,000 tonnes. Fishery products: 6,170,000 tonnes.

The section titled "Soybeans" (p. 380-86) has the following contents: Introduction. Miso, shoyu, natto, tofu, koritofu (dried tofu) [dried-frozen tofu], yuba. Photos show: (1) Shoyu brewing in tanks in a large factory. (2) Pressing and washing of tofu in koritofu manufacture in a large, modern factory. (3) Aerial view of a large, modern plant for koritofu production. (4) The thawing operation in making koritofu. (5) The drying operation in making koritofu. Address: 1. PhD, Director, National Inst. of Nutrition, Tokyo, Japan; 2. PhD, Prof., Dep. of Agricultural Chemistry, Faculty of Agriculture, Tokyo Univ., Tokyo, Japan.

5212. Brandemuhl, William. 1965. Soybean utilization in Japan. San Francisco, California. xxii + 478 p. Unpublished manuscript. Illust. No index. 28 cm. [189 ref]

• ***Summary:*** A superb, in-depth, pioneering study, based on extensive original field research in Japan. It is carefully documented with hundreds of original interviews and published sources properly cited in two different lists of sources (numerical and alphabetical) Contains 30 tables and 190 excellent photos–including 7 of the author.

Table of contents: Preface. Notes. List of tables. List of figures. Map. Part I: Background. 1. The soybean: Birth and spread (legend, botanical inception, Nagata's theory of origin, spread to Japan and beyond, the American story).

Part II: Japan's production and supply of soybeans. 1. Japan the country and supply of domestic soybeans (Japan the country, domestic soybean production, planting and harvesting, marketing domestic soybean). 2. Importation of Red Chinese soybeans (background, mechanics, advantages, and prospects). 3. Importation of U.S. soybeans (history, method and mechanics of importation, the American shippers, concluding comments on importation). 4. Distribution (use in brief, super-wholesaler, wholesaler, retailer wholesaler, Japan's grain exchange).

Part III: Soybean utilization in Japan. 1. Utilization of soybeans for oil and meal (oil crushing history, soybean source, delivery of soybeans, the crushing industry, liberalization of soybean oil and meal, oil utilization in Japan, meal utilization in Japan). 2. Tofu (history, use of soybeans, manufacture, the tofu factory, marketing tofu products, recently developed tofu products, tofu as food, concluding comments). 3. Miso (importation, home production of miso, quantity of miso produced, soybean used for producing miso, kinds of miso, fermentation time, comparison of miso firms, manufacturing, packing and marketing, price, instant miso, use of miso, miso consumption outlook). 4. Shoyu (introduction, production and manufacturers, manufacture, raw materials, preparation of raw materials for natural shoyu, preparation of materials for chemical method shoyu, preparation of materials for mixed method shoyu, fermentation, filtering and pressing, sterilization, bottling, price, use of shoyu, miscellaneous

© Copyright Soyinfo Center 2014

shoyu products, concluding comments). 5. Natto (description, history, Daitokuji natto, the natto industry, consumption, natto soybeans, processing, making cost and price, marketing, use of natto, problems, new ideas and natto products). 6. Frozen tofu (history, development, frozen tofu soybeans, processing, freezing, defrosting, drying, treatment with ammonia and packing, marketing, preservation, use). 7. Kinako. 8. Yuba (history and development, the plight of the yuba industry, soybeans for yuba, manufacture, classification of yuba, use). 9. Tsukudani and nimame (description, soybean tsukudani, nimame). 10. Hamanatto (history, manufacture, use). 11. Edamame. 12. Moyashi [bean sprouts] (manufacture, use). 11. Miscellaneous products (fermented soybean curd, MSG–monosodium glutamate, confectionary products {roasted soybeans for Setsubun, soybean candy, isonori, mameheto, shinseimame, suhama}, other products). Conclusion. Sources (numerically arranged). Sources (alphabetically arranged).

Tables: 1. U.S. soybean production, 1924-1963. 2. United States, Red China, and world production of soybeans (bushels), 1950-1963. 3. U.S. soybean importation, exportation and amount processed for oil and meal, 1924-1963. 4. U.S. exportation of soybeans (1,000 bushels) total, by continent, and to six largest importing countries, 1958-1962. 5. Japan's soybean acreage, production, and merchandising rate. 6. Japan's importation of soybeans, total, and Red China's portion, 1945-1963. 7. Japan's total importation of soybeans and U.S. portion, 1945-1963. 8. Soybean usage in Japan, 1963. 9. Japan's processing of oilseeds, 1963. 10. Crushing capacity of selected Japanese oilseed crushers. 11. Eight largest crushers of soybeans and amount of soybeans crushed per month in 1963. 12. Total quantity of soybeans crushed in Japan, 1950-1963. 13. Japan's daily per capita intake of edible fats and oils. 14. Japan's consumption of edible fats and oils, 1945-1961. 15. Use of soybean meal. 16. Chemical composition of tofu and aburaage. 17. Quantity of soybeans and soybean meal used for tofu-aburaage productions (all Japan), 1950-1963. 18. Miso production and quantity of soybeans and soybean meal used, 1950-1963. 19. Composition of miso. 20. Daily per capita consumption of miso in Japan, 1950-1963. 21. All Japan production of shoyu and use of soybeans and soybean meal, 1950-1963. 22. Composition of shoyu. 23. Yearly per capita consumption of shoyu, 1950-1963. 24. Composition of natto. 25. Production of frozen tofu and use of soybeans. 26. Composition of frozen tofu. 27. Yearly per capita consumption of frozen tofu. 28. Composition of kinako. 29. Composition of yuba. 30. Monosodium glutamate production and use of soybeans and soybean meal. Continued.

This typed manuscript was sent to Soyfoods Center in July 2004 by Tomoko Brandemuhl, the wife of the author. About the author (based on several interviews with Tomoko, July 2004): William Victor Brandemuhl was born on 30 Nov. 1940 at Iron Mountain, Michigan. He grew up in Florence, Wisconsin, then attended the University of Wisconsin at Madison. He roomed for 3-4 years with various Japanese cancer researchers at the university. He also became close to Tomoko Arai (born 12 Dec. 1937 in Tokyo), a Japanese woman, who was doing graduate studies in social work there as a Rotary International Fellowship student. William initially intended to graduate in June 1962, but stayed an extra year in order to pursue independent studies in Japanese language and soybeans. He became interested in the soybean and its history in an anthropology class taught by Dr. R.J. Miller; William finished his excellent research paper on soybeans in Jan. 1963. He also took one year of Japanese language instruction (night classes). William graduated in Jan. 1963 with a BSc degree in economics.

William obtained a grant (no strings attached) from Honeymead Products Co. of Mankato, Minnesota, to study soybean utilization in Japan. Only one American had studied this subject in Japan after World War II–Allan K. Smith of the USDA, who visited Japan and wrote short but detailed reports in 1948-49 and 1958. In Jan. 1963 Brandemuhl arrived in Japan and became a research fellow at the Department of Agricultural Economics, Kyoto University, Kyoto, Japan. Between Feb. 1963 and May 1964 (15 months) he conducted field research on soybean utilization in Japan. In June 1963 (after William had been in Japan for 4 months), Tomoko completed her graduate studies, graduated from the University of Wisconsin, and (since her scholarship was finished), returned to Japan–to be with William and to help him with his research in Japanese, which he spoke only moderately well. She traveled with him throughout Japan and translated for him during the many interviews he conducted. At each destination, she spoke about America to the local Rotary club–which paid her transportation, room, and board. William's monthly check from Honeymead paid for his room and board–but not for his travel and research, so he had to work part time doing English translation for a Japanese company. On trips, he took many photos using his expensive Nikon camera. Tomoko's family lived near Kobe, where she and William were married on 8 Aug. 1964–three months after he finished his field research. Several days after the marriage, they returned to the USA to visit his parents in Florence, Wisconsin, and enjoy a wedding party there.

William now knew he wanted to pursue a career in international business. He was soon offered a job at Crocker Citizen National Bank (International Division) in San Francisco, California. They drove to San Francisco and got an apartment at 1701 21st Avenue; he began work that fall, and was soon learning the basics of international business. Every evening after work at the bank he returned home to work on transforming his field notes into a manuscript. As he wrote the rough draft, Tomoko (a skilled pianist but not a skilled typist) typed it on a manual typewriter. The next day he would correct any mistakes and she would retype each page into final form. In 1965 he had the best carbon copy

© Copyright Soyinfo Center 2014

bound and sent it to Honeymead; he kept the original. It was never published and he received no academic credit for it.

On 26 May 1966 their first son and only child, Konrad Victor Brandemuhl, was born in San Francisco. They bought a house in Pacifica. In 1967 he was offered a job with Caterpillar Tractor Co. (International Div.) in Peoria, Illinois. In 1968 he moved with his boss to work at Allis-Chalmers Manufacturing Co., West Allis, Wisconsin. In 1969 he was transferred to Tokyo, Japan, as Far East Representative of the company. In 1970 he was transferred to Singapore as Far East Manager of the company.

William and Tomoko later lived for about 10 years near Tokyo, Japan (mostly in Mitaka), and for a while in Singapore. Over the years he showed his typescript on "Soybean Utilization in Japan" to many people, but nobody was interested. In 1986 he started his own trading company, specializing in textiles, natural rubber, latex thread, and various machine mechanisms. Tragically, William died on 2 April 1998 in Bangkok, Thailand, of pneumonia, during a business trip. He loved the excitement of international business and interaction with people of different cultural backgrounds. Address: San Francisco, California.

5213. Brandemuhl, William. 1965. Soybean utilization in Japan: Figures (Document part). San Francisco, California. xxii + 478 p. Unpublished manuscript. 28 cm. [189 ref]
• ***Summary:*** 1. Black soybeans from Japan's Tanba region and American Harosoy soybeans. 2. Soybeans growing on a dike. 3. Soybean plants drying on rack. 4. Soybean plants drying just prior to harvesting. 5. Soybean plants drying just prior to harvesting. 6. Soybean harvester. 7. Depodding rack and pod filled stalk. 8. Depodding soybeans. 9. Entrance to the Red Chinese Trade Fair held in Tokyo, during April, 1964. 10. One of the agricultural exhibits at the Chinese Trade Fair (corn and soybeans). 11. Soybeans and soybean plants exhibited at the Chinese Trade Fair. 12. Soybeans and other bean products that Red China is capable of exporting (exhibition at the Red Chinese Trade Fair). 13. Soybeans on display at retail store. 14. Soybeans on display at retail store. 15. Barge unloading of soybeans at oil mill. 16. Barge unloading of soybeans at oil mill. 17 Soybean tank receiver at oil mill. 18. Multi-spout soybean feeder at barge side. 19. An oil gift assortment.

20. Selling oil at a small oil retail shop. 21. Dispensing oil. 22. Selection of oil at oil retail shop (notice birds in cage at right). 23. Vegetable oil displayed with petroleum products. 24. Vegetable oil displayed with petroleum products. 25. Bottling facilities at oil wholesaler's. 26. Bottling facilities at oil wholesaler's. 27. Prepackaged oil products displayed at wholesaler's. 28. Seafood fried in soybean oil. 29. Selling soybean oil fried products. 30. Temperature controlled fryer. 31. At a chicken farm. 32. Handling 20 kilograms bags of chicken feed. 33. Soybean meal on top of other components of mixed feed prior to hand mixing. 34. Bag fastener for mixed feeds packed at wholesaler. 35. Fermenting agent for bakery (contains equal quantities of soybean flour, yeast, and water). 36. Silk worms eating mulberry leaves. 37. Silk worms eating soybean protein mixed with mulberry leaves. 38. Tofu. 39. Soybean grinder.

40. Soybean grinder. 41. Soybean grinder. 42. Open pit live steam cooker. 43. Open pit wood-stoked cooker. 44. Okara tank and press. 45. Outdated okara press. 46. • ***Summary:*** "Daitokuji Natto: Sources: (1) Dr. Hiroshi Nonoura, asst. prof., Kyoto Women's Univ., interview on 6 May 1963. (2) Nomura Tsukudani Co., Kyoto, visit on 20 May 1963. (3) H. Tada, Kyoto Prefectural College, visits on May 19, June 17, 1963.

"Daitokuji Natto (see Figure 124) was developed by the Zen sect of Buddhism as a source of food value [and seasoning] because the Zen Sect observes strict vegetarian habits [incl. vegan diet]. Its name indicates its origin, Daitokuji temple in Kyoto, where it is still produced and used in the everyday diet of the priests as well as used in many of that temple's ceremonies. Although a few other temples may produce a similar product in extremely small quantity, Daitokuji temple is recognized as the only place of production. Production is accomplished in the early summer during the rainy season supposedly because that time promotes desired bacterial [sic, mold] growth.

"The exact method of processing is known only to the priests that manufacture it but it is made entirely by hand and makes use of a great amount of salt as evidenced by its extremely salty taste. Because of its saltiness, Daitokuji

© Copyright Soyinfo Center 2014

Natto cannot be eaten by itself but should be consumed [as a seasoning] with rice. Daitokuji Natto's black paste-like appearance does not in any way resemble regular [sticky] natto or the whole soybeans that are used to make it. Since Daitokuji Natto is not a commercial product, most Japanese although having a vague knowledge of what it is, have never seen or tasted it. Its use even among the priests of Daitokuji temple will decrease as even their diets have become increasingly modernized."

Note 1. This is the earliest English-language document seen (Nov. 2011) that contains the term "Daitokuji natto."

Note 2. The Daitokuji Natto in Fig. 124 look like individual whole and broken black raisins, rather than like a black paste.

Note 3. The author says that Daitokuji natto is not a commercial product; however by Oct. 2011 it was being sold. Address: San Francisco, California.

5216. Brandemuhl, William. 1965. Yuba: History and development, plight of the yuba industry, soybeans for yuba (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 367-86, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** "Yuba (see Figure 157) a film removed from the surface of heated Tonyu and sold as either a fresh or dried high protein food enjoys, as many other traditional foods, only limited use;

"History and Development: Yuba is believed to have originated in China and was first carried to Japan by Buddhist priests supposedly in part by the same priest who discovered frozen Tofu, around 1400 A.D. That priest (Kobodaishi) not only established the Koya-san temples in Wakayama but as he was quite famous; he traveled extensively establishing temples in many parts of Japan. In Kyoto the center of Yuba consumption today, he established a large number of temples and resided the longest. As Kyoto was the capital of Japan and the home of many noble families Yuba quickly developed into a favorite although not exclusive food of the military, governmental, and noble families.

"In that way Yuba grew very popular and expensive but when the capital was moved to Tokyo most of the noble families also moved so Yuba began its long and gradual decline extending even to the present. In trying to maintain their sales the Yuba makers sent Yuba to Tokyo but with transportation what it was the venture was unsuccessful. After that a few Yuba makers moved and established themselves in Tokyo of which two still remain today. Demand for Yuba is indicated by the fact that there are only two Yuba shops, not much larger than the average Tofu shop for Tokyo's 10 million people.

"Most of the Yuba producers at present can trace their production back to the time of selling to noble families indicating that the Yuba industry is vested in tradition with very few new plants developing. The number of Yuba plants has in fact been decreasing, because when a maker of the older generation dies there is no one to take his place as in the words of one maker, 'If I don't have a stupid son my business will die with me.' In the past at least the oldest son was bound to conduct the affairs of his father's business even if he did not want to. Today however this same lad can attend college by virtue of his father's hard earned wealth and later begin a life of his own choice. With such situation existing the present number of Yuba makers stands at about 50 throughout Japan with the majority of them in the Kyoto and Osaka areas of Japan. Kyoto has between 20 and 30 plants, Osaka less than 10 and Kobe less than seven. Nara has a few plants with the rest being mainly located separately throughout the Kansai area.

"With a few exceptions Yuba makers produce at plants operated with more pronounced traditional procedures than do Tofu plants. At one time Tofu and Yuba were produced in the same plant but with specialization, developed independently with Tofu taking the lead as far as innovation is concerned. The usual plant will utilize an average of 150 kilogram of soybeans per day with the Osaka shops consuming slightly more.

"The largest Yuba maker in Japan does not use more than 200 kilograms [of soybeans per day]. Although soybean usage is not calculated for Yuba, with only 50 plants it is apparent that yearly usage is not large. A National Association of Yuba makers existed at one time but not at present because such a small number of makers could not afford promotional activities of the kind that would be effective in addition to the fact that the National Association would not receive much of an advantage if they purchased soybean for the maker because distribution cost would counteract any savings. In Kyoto a Yuba Association exists but not for any expressed purpose except, possibly, brotherhood. Even that is not achieved as the traditional makers are constantly reprimanding the more progressive elements for attempting to put them out of business. Although competition is not greatly suppressed at present before World War II the Yuba industry was highly competitive. Price wars were a common occurrence. Observing the Yuba industry and operation at present one finds such nearly unbelievable.

"The Plight of the Yuba Industry: Although unlike the Tofu industry in that Yuba is only made during the day, labor is one of the most important problems facing the industry. Larger Yuba plants cannot be constructed because at crucial points in the manufacturing process a large amount of manual work is required. By virtue of its raw material Yuba is already a high priced product so if high wages were paid the price of Yuba would have to be increase further. Even if demand would not decrease as a consequence it is very likely that at such price some of the large efficient food firms would begin producing and marketing Yuba. Instead of encouraging

© Copyright Soyinfo Center 2014

or allowing this to happen Yuba continues to be produced in small inefficient factories utilizing of as much family labor as possible. Automation to displace this zero-cost labor would seemingly be unwise as would automating to increase capacity even if the difficult to produce Yuba could, from a technical viewpoint, be produced under automated principles. Assuming that Yuba will continue to be produced without the benefits of modernization and possibly rightly so a number of conditions such as sanitation require long-needed attention."

Note: This is the earliest document seen (Oct. 2012) that gives yuba industry and market statistics, trends, and analyses for a geographical region (Japan).

"Soybeans for Yuba: The makers of Yuba prefer and use domestic soybeans for virtually all production. This is further defined as Shiga prefecture soybeans, an area not far from the majority of Yuba production but not an area of large soybean production so price is extremely high. The Yuba makers do not like to use U.S., Red Chinese, or even Hokkaido soybeans. Red Chinese soybeans are least preferred with both Hokkaido and U.S. soybeans occasionally used. The Yuba makers desire a fresh large white hilum, high protein soybean with very few splits. Many soybean food product makers prefer soybeans with such quality but cannot afford to use them. Yuba makers are willing to pay the price and count on selling Yuba to a certain type of consumer regardless of price.

"After the war whole soybeans were in short supply so Yuba makers attempted to use soybean meal. They found such procedure impossible so have not attempted use of meal since. The future of using domestic soybeans seems rather questionable with decreasing production especially outside of Hokkaido. This may mean that for the small quantity of soybeans required, U.S. soybeans, especially the selected types, may come to be used" (Continued). Address: San Francisco, California.

5217. Brandemuhl, William. 1965. Yuba: Manufacture, classification and use (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 367-86, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** The section titled "Manufacture–Initial steps" begins with "Soaking and grinding: Soybeans are first soaked in well water for 6-8 hours in summer and 12-24 hours in winter. Checking the state of soaking is accomplished in the same way as with Tofu, that is, to examine the inside color of the soybeans, as well as the appearance of bubbles rising in the container used for soaking. If soybeans for Yuba happen to soak too much they become too sticky after cooking and too much Okara results. After soaking 5-10 kilograms (dry weight) of soybeans they are ground in the same way and with the same type of equipment that is used to grind Tofu soybeans except that more often the grinder will be smaller. When grinding, an equal quantity of water is added.

"Cooking: The ground soybeans and water are transferred to a live steam, oil, or sawdust heated cooker either by negative pressure in the case steam is used or by hand. Water in the quantity equal to the quantity of ground material may be added portion by portion before, during, and after cooking depending on the makers method for obtaining the most protein from the Okara.

"Use of an open pit steam cooker is rather limitedly used because of its cost. It is said by makers who cook in other ways that a steam cooker does not give the desired quality Tonyu [soymilk] but this seems to be a rationale for their financial inability to purchase same. Yuba makers that use open steam cookers believe that cooking under pressure would even be better but then a more skilled operator is required and considering the production economics of the Yuba industry such a operator would be difficult to find. Traditionally charcoal then wood was used to cook but now the common source of heat is pine sawdust. Its pitch content and intermediate hardness makes it an ideal inexpensive fuel. Commercial companies selling such sawdust receive $.28 (100 yen) for a bushel burlap bag. With a steam cooker cooking time is very similar to Tofu while heating with saw dust necessitates boiling the ground material for 30-40 minutes. Stirring is done a number of times to insure even cooking.

"Pressing: After the ground material is cooked, pressing is accomplished in much the same way as with Tofu. The cooked material is pressured, pumped, or hand dippered from the cooker to a course nylon filter which is placed in the press box. The press used to separate the Tonyu and Okara is seldom power driven but tends to be of an older kind than most Tofu presses. The pressing operation is an important part of manufacturing Yuba because as much Tonyu as possible is desired, while with frozen Tofu much more use of the Okara is the rule. After pressing the Tonyu flows through a very fine cotton filter into a 100 liter container (quantity of Tonyu is usually around 90 liters per batch). Bubbles that form on the top of the cooking liquid are removed because if allowed to remain they would make it difficult for film to form. At this point the similarity between Tofu and Yuba end as Yuba is not precipitated with magnesium sulfate.

"Film formation: After all the possible Tonyu is obtained for a batch it is transferred by hand to a large shallow wood partitioned tank as can be seen in Figure 158. Usually the tanks are made of brass but the more progressive firms use stainless steel because brass tarnishes and is easily damaged. The 2½ inch deep tank is usually partitioned into 20, 24, or 30 squares 18 inch square (or sometimes that large and slightly narrower) forming a double row 10, 12, or l5 squares long. The 24 square tank seems to be the most favored because one person can most efficiently manage lifting protein film from 24 squares. In former times Yuba was made in separate containers rather than the one tank

© Copyright Soyinfo Center 2014

with removable wood partitions as are how used. This caused very individual but ununiform production. At present Yuba is not made in separate containers. Underneath the 2-10 Tonyu tanks that the Yuba maker may have is another tank which acts as a double boiler when hot water is circulated through it. Before Tonyu for Yuba was heated directly but it was found that greater control could be exercised if the double boiler system was used. This type of heating tank is now used at all Yuba plants with the source of heat for the water usually being sawdust. Even the makers which use steam cookers used the slow burning sawdust to maintain the temperature of the circulating water at 90-95ºC for maintaining the Tonyu at 80-85ºC. Yuba Tonyu should not be heated to the boiling point as it would produce a final product that is hard, however if temperature were too far below boiling film would not form. After Tonyu is poured into such a tank it flows under the partitions to an even level. After the level is even bubbles if any are removed and the Tonyu in the tank is allowed to stand untouched for about 15 minutes at which time a thin yellow film can be seen on the surface of the Tonyu in each square.

Film removal: After the entire surface area of a square is covered with the film it is lifted off (see Figure 159) with a small wood shaft 12-18 inches in length. The shaft is first inserted into the Tonyu at the right near side of a square and slide underneath the surface to the rear along the right side partition. Then the shaft is gently lifted which also lifts the film. As the film is being lifted it is turned broadside to the maker and lifted entirely out of the squares The shaft with a piece of Yuba hanging from it is then attached to a rack above the tank as shown in both Figure 158 and 159. The method of removal varies with plant but all follow the above description in principle. After raising one piece of Yuba from the square the maker moves to the subsequent squares of the tank. When the last square is finished a film has again formed on the first one so that a maker can work almost continuously until the last of the Tonyu is gone. More likely he will add his available Tonyu when the level becomes low so that Yuba is never removed from the bottom until a days work is nearly finished.

"After the Yuba sheets have dried slightly they may or may not be rehung with two or more hung together, depending upon the way the sheet is to be folded as a final product. For certain forms of Yuba the lifting shaft may be inserted so that the sheet is doubled upon lifting. Lifting Yuba from the surface of Tonyu requires a great amount of manual work and it is believed that the lifting process can not be automated even if the remainder of operations were.

Note. This is the earliest document seen (Oct. 2012) that contains a detailed description of how to make yuba on commercial scale.

"Classification of Yuba: Although there are many sub-types there are only two different kinds of Yuba, that is fresh Yuba and dry Yuba. Fresh Yuba, only produced in Kyoto, is only allowed to remain on the rack above the Tonyu tanks until the unsolidified portion drains. Then it is removed and racked together as shown in Figure 160. The fresh Yuba remains in the rack until sale is expected or order for same is received. At that time from two to five sheets of fresh Yuba are hand rolled as shown in Figure 161 and wrapped in paper. Fresh Yuba may also be cut in particular size pieces and folded with cooked vegetables as shown in Figure 162. Fresh Yuba may also be fried with burdock wrapped inside" (Continued). Address: San Francisco, California.

5218. Brandemuhl, William. 1965. Yuba: Manufacture, classification and use (Continued–Document part II). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 367-86, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** Continued. "Originally all Yuba was made as fresh Yuba but as it only lasts a short time, drying began. At present only about 20 percent of total Yuba production is sold fresh. Fresh Yuba is very perishable lasting only two to four days in winter and for four to eight hours in summer. In summer it is only marketed at the Yuba shop. Yuba meant to be marketed as dry needs to dry on the rack only one to three hours in summer while 12-24 hours in winter. Rain in any season will lengthen the drying time required. For dry Yuba the process of making, drying, folding, and packaging usually requires one day so a certain day's production is usually marketed the following day.

"Part of the quality difference of dry Yuba stems from the fact that a Yuba sheet is lifted from the top of a Tonyu batch is lighter and of much better quality than subsequent sheets with the sheets lifted with Tonyu that has remained on the bottom very dark, relatively poor quality, sweeter tasting, and thicker. Of whatever quality, Yuba usually darkens as it dries although bottom lifted pieces become the darkest.

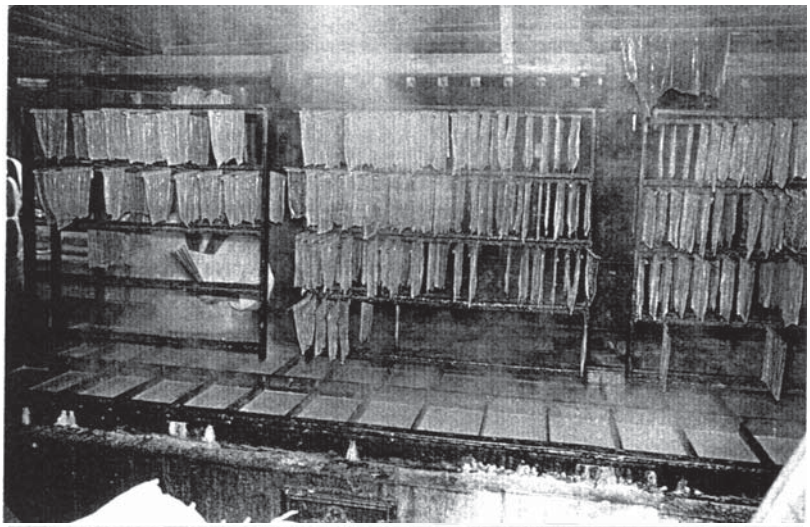
"If a sheet of Yuba is of such a size and consistency that it can be easily folded (see Figure 163) it is graded higher than a sheet which does not have these characteristics. Broken and cracked pieces are very often not even folded but just bagged. When folding, a sheet of Yuba that is slightly wet is used for shaping the dry Yuba with greater ease. The natural color of yuba is tan but often it is colored yellow for the purpose of food arrangement. It is for that purpose that some Yuba is colored blue but the people who appreciate Yuba the most prefer it in its natural color.

"Dry Yuba can be stored with no adverse effects for two to three years if humidity is not extremely high. This ability is one of its most important advantages but since it is such an expensive product, (290 grams for $.97 or 350 yen) Yuba cannot realize its inherent advantages. Fresh Yuba while being $.0.56 (20 yen) for one sheet is only available in the neighborhood of the Yuba shop.

"Use: Most Yuba sales are conducted at the Yuba retail shop usually located at the front of a factory or through

© Copyright Soyinfo Center 2014

telephone orders from steady customers. In Yuba production areas, department stores may stock Yuba (see Figure 164) even though it is a slow moving item. Outside the immediate area of production Yuba cannot be found except possibly at New Years. The above fact is somewhat the reason why at least 90 percent of the Japanese people do not know what Yuba is. The Shiga prefecture farmers who supply soybeans for Yuba have no idea of what the product is. Because of expense nation-wide promotion cannot be done and because of the present nature of the Yuba industry Yuba makers do not particularly desire to promote Yuba on a national basis because each Yuba shop has a large number of steady customers with rather set Yuba consumption patterns so he can easily predict expected sales and lead a relaxed life producing only that amount. This type of feeling is amazingly professed by the makers themselves.



"Yuba unlike Tofu, Natto, and Miso is not eaten every day by even a connoisseur of Yuba. Most Yuba consumers do not eat Yuba for its excellent food value (see Table XXIX) but rather for its taste and adaptability for traditional Japanese food. Traditional Japanese food is so closely connected with Yuba that Yuba is along with frozen Tofu an important component of the completely vegetable dish mentioned in respect to frozen Tofu usage. For traditional food purposes Yuba is often requested by telegram or mail order from parts of Japan where Yuba is not produced. With the gradual disappearance of such traditional foods it is hard to believe, as Yuba makers state, that Yuba consumption is increasing. This is amplified by the fact that most young people neither know how to prepare Yuba or like its taste. For the small group of people that appreciate the taste of Yuba or value it history Yuba may be prepared and used in the following way:

"Fresh uncooked Yuba is very often eaten with Shoyu and other seasonings. Dry Yuba must be precooked and, then for example, placed in the following foods as fresh Yuba might be directly placed: (1) Sukiyaki. (2) Yudofu. (3) Many types of soup. (4) Substitute for or complement to raw fish and rice. (5) Fried in Tempura.

"A specialty product that Yuba makers have capitalized upon is in respect to the beer drinking habits of Japan. Most often when beer is ordered at places serving same, a small dish of food will accompany each order. The customer is usually charged for this even though he may not want it although sometimes it is served without charge. Of the hundreds of possible foods for this dish Yuba makers produce a fried Yuba with the basic material the dark waste Yuba that gathers on the shaft for lifting Yuba from the Tonyu tank. It is unfortunate however that the people who eat such food do not know it is Yuba.

"Yuba should not be precooked or cooked too much as with overcooking Yuba's taste becomes very bad. This fact makes it a food requiring delicate attention and therefore not considered suitable for use in the average meal.

"The fact that Yuba is light makes it an ideal traditional food for use by Japanese residing in other countries. A limited quantity of Yuba is exported for this purpose but an export market among the natives of any country is questionable as even most Japanese prefer other foods to Yuba."

• ***Summary:*** "Kinako is the Japanese traditional equivalent of U.S. full-fat soybean flour although it is made from whole soybeans. The origin of the commercial product as it exists today is from one of the uses that farmers put to soybeans since ancient times. Farmers would roast soybeans and then grind with a stone pestle in a container that most likely would be generations old. With the availability of commercial Kinako the practice of making Kinako at home has all but disappeared. Although home making has disappeared, rural people continue to consume substantially more Kinako than urban residents.

"Most of Japan's 80 Kinako makers do not make Kinako on a full time basis but make it along with other roasted products for themselves or on custom order from a soybean wholesaler or retail store. Distribution is therefore handled by at least three different kinds of firms, each usually not handling Kinako as a sole product. There are Kinako makers that produce Kinako as their chief product, although even such makers, producing around three to five tons of Kinako per day, usually makes other products that can be manufactured utilizing the same facilities.

Note: This is the earliest document seen (Oct. 2012) that gives kinako or roasted whole soy flour industry and market statistics, trends, and analyses for a geographical region (Japan).

The manufacturing process begins with the cleaning of whole soybeans. In the past domestic soybeans were used but at present because of price nearly all Kinako is made from Chinese soybeans. The soybeans are then conveyed to an oven that is usually fired with oil and roasted with sand for 40 seconds. Since the roasting is accomplished by experienced personnel the temperature of roasting is unknown, however the oven operator can easily tell if the temperature is too low or too high by the state of the removed soybeans.

"After removal from the oven (sometimes removal is effected by a combination of shaker and conveyor) the roasted soybeans are cooled to natural temperature. Then 10 percent of the fiber of the toasted soybeans [the hull / seed coat] is removed by an instrument designed especially for Kinako making, then finely ground, and packed by hand (see Figure 154).

"Kinako is available in 80 grams, two and three kilogram packages plus in bulk as shown in Figure 155. Since bulk Kinako is very often displayed in open or inadequately covered containers it is, to say the least, an unsanitary method of marketing. Fortunately it is becoming less popular with the 80 gram package now accounting for an important portion of purchased Kinako. The 80 gram package is priced at $.056 (20 yen) while $.056 (20 yen) also purchases 100 grams of bulk Kinako. The price is markedly different, however Kinako in a package can be stored for one year if the seal is not broken whereas bulk Kinako is not storable even if placed in a tightly sealed container.

"One of the greatest disadvantages of Kinako is that it is an excellent spawning place for bugs so it has to be stored very carefully. The two and three kilogram packages market at $.356 (l10 yen) per kilogram, however the average non-rural family does not have general use for such quantity. The larger packages are purchased for particular occasions such as New Years. The traditional dishes prepared for New Years utilize a large amount of Kinako causing the seasonal production of Kinako to be mainly concentrated in December. While the large maker may produce Kinako the entire year, most of the small makers only produce then. An interesting fact regarding New Years consumption is that many people who do not use Kinako throughout the year consume large quantities at this time even though it is readily available at all times.

"Research on the per capita consumption of Kinako has never been seriously undertaken, however considering Japan as whole it would be extremely low although certain areas consume much greater quantities then others and people in the lower economic ranks eat more Kinako using it as an inexpensive source of food value as indicated by Table XXVIII. The method of processing suggests that the optimum amount of food value is not utilized, however tradition governs the consumption of this product so changing the manufacturing process and consequently causing a change in final product would not be well accepted.

"The amount of Kinako produced per year as well as the quantity of soybeans used for producing that amount is not known, however it is not more than a few thousand tons. With increasing population (see Table XX) Kinako production is only remaining stable if not decreasing and the number of makers is remaining stable. The principal use of Kinako is for covering pounded rice cake [mochi] as shown in Figure 156. For this purpose sugar is usually although not necessarily mixed with the Kinako. The Kinako industry has not made an attempt to market their product for the fortification and enrichment of other foods although Kinako in its present state most likely would not be the optimum product suitable for such, especially with the increasing availability of soy flour as the U.S. knows it. Although soy flour produced in the oil mills will never replace Kinako it is a likely possibility that the consumption of Kinako will gradually decline in absolute quantity produced with such decrease caused by the increase in consumption of western type foods, very few of which are suitable for use with Kinako."

5220. Brandemuhl, William. 1965. Miscellaneous products–Confectionary products (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 426-33. Unpublished manuscript. 28 cm. [2 ref]

• ***Summary:*** "Introduction (source 183): Although the traditional candies of Japan are becoming less and less consumed with chocolates and other types of western confectionary capturing a larger share of the market there are still thousands of small candy manufacturers producing in addition to the other traditional candies, many types of soybean contained products. These makers, in using from a few kilograms of soybeans per year to over 10 tons, prefer and only use domestic soybeans. The candy makers buy cleaned select soybean at $18.06 to $20.83 (6,500-7,500 yen) per 60 kilograms. The largest portion of the soybeans used for candies are roasted over a low flame in ovens such as pictured in Figure 187 and 188 and may be soaked in water and dried before being roasted. Relative to manufacture of western type candies the traditional candy makers produce under very inefficient and labor intensive conditions so that very often the traditional candy is higher priced. Even though it is usually quite attractive and appreciated by certain groups of people, children, the largest group of candy consumers, do not seem to like the traditional, particularly ones with hard roasted soybeans inside.

"Although by no means limited to the following, a number of the candies containing soybeans are briefly described below.

Roasted soybeans (184): The most common type of soybean candy is plain roasted soybeans. It is especially popular around the third of February as at that time it takes on a ceremonial function. In many households that day is the day to chase away bad fortune being called the Setsubun Festival. This is done by throwing soybeans in the number of one for every year of age. This ceremony although serious in the past is now mainly for children. Buddhism still honors the ceremony with some temples selling smalls bags of soybeans containing about 18 pieces at $0.056 (2O yen). Other temples may have a short drama for public viewing in which a devil is chased away by a priest throwing soybeans

© Copyright Soyinfo Center 2014

after which both dance for a period of time.

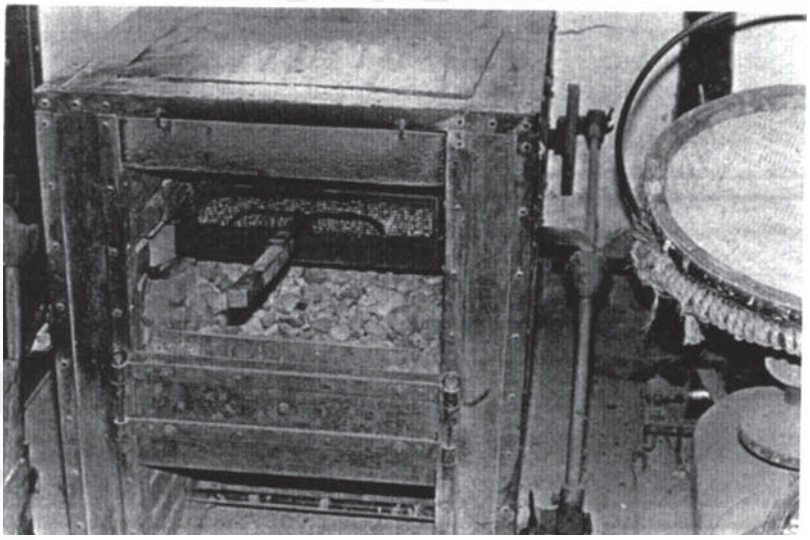
"It was common for high priests or celebrators to throw soybeans to the crowd from a platform but supposedly the custom was too expensive so it is seldom done at present. During that season the price of such roasted soybeans is for example $0.14 (5O yen) for a 15O gram package. Packaging is somewhat costly at that time because of the decoration involved. For other times of the year roasted soybeans are most often sold over the counter although various size bags are also available, both at lower prices than during the Setsubun Festival season.

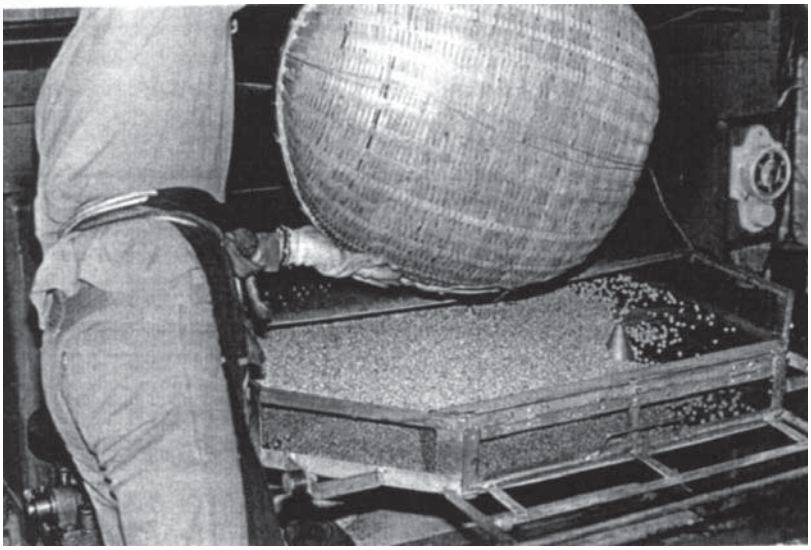
"Isonori (185): Isonori is closely related to plain roasted soybean as Isonori is composed of roasted soybean that have small pieces of dried seaweed adhered to and covering part of the soybean. The seaweed is moistened and added to a batch of soybeans immediately after roasting. Isonori is usually eaten as a complement to beer or liquor and is sold at $0.084 (3O yen) for a 60 gram package and $0.84 (3OO yen) for one kilogram.

"Mameheto (186): Mameheto is a two to six inch transparent shaft of golden brown sugar with roasted soybeans completely enclosed within the 1/3-inch diameter shaft. The manufacture of Mameheto is invariably a family business with the process technique passed from generation to generation, The soybeans used for this candy can only be from a certain place within Japan so the price of this candy is very high. The roasting of the soybeans is accomplished very easily but uniform shaping of the sugar as well as encasing the soybean are very difficult. The skilled maker begins with a hot shaft of sugar 2½ inches thick and six inches long. He then selects a portion of this material and soybeans in the quantity of one, two, or three for every 1½ inch of shaft. As a result of careful rolling of the hot sugar the desired characteristics are effected. The makers of this delicate but unpopular type of candy consider themselves to be artists. Although the future is questionable the present makers seems to have an adequate profit margin although volume is not great, the plight of so many of the traditional industries.

Shinseimame (187): Shinseimame is a roasted black soybean covered with sugar, Kinako, and powdered green seaweed. Its history is long and closely connected with Japanese traditional tea. At present the number of places making it are few and the total consumption of soybeans for Shinseimame probably does not exceed one metric ton per year. The amount of labor required to produce such candy is tremendous. First sugar and water are simmered over a charcoal stove. When a suitable temperature is reached the syrup is poured over the roasted soybean. When the soybeans are completely covered they are placed in a wire screen, hand shaken, and powdered sugar is placed on top. Then the shaker is shaken for 30 seconds so that the soybeans roll and gather sugar. This is done 10 times after which the same thing is done 10 more times with a mixture of sugar and a mixture of Kinako. Then the same thing is done five times with green seaweed so the final appearance is a green sphere about 3/4 inch in diameter containing besides the black soybeans, six parts soybean, one part sugar, two parts Kinako and one part seaweed.

"Suhama (188): Suhama is a tan or green colored candy that does not contain whole soybeans but is principally made of soybean flour nearly like Kinako but less roasted. A quantity of the flour is placed in a container of simmering sugar syrup and stirred for 15 minutes. After a paste-like substance has formed it is formed into rectangular bars and allowed to cool. Then it is coated with sugar and more of the Kinako-like flour and packaged. Suhama is a well known but little used product that is usually made in a portion of the





© Copyright Soyinfo Center 2014

maker's home or even the kitchen of same.

"Miscellaneous candies (189): The above mentioned candies only begin to enumerate the large number of soybean based products that are produced in Japan. Depending upon section of Japan it is also possible to find soybeans wrapped in a small piece of seaweed (see Figure 189), soybeans individually covered with green powdered sea-weed, a roasted green seed coat soybeans, sweet Miso-covered soybeans, soybean flour (Kinako-like) twists, cookies with flakes of whole roasted soybean frosting it, and many others. Most of these uses sprang from the long history of domestic soybean production and cannot be easily adapted to imported soybean whether they are from Red China or the U.S. It is likely therefore that use of domestic soybeans will continue even at higher prices and with higher price soybeans, the final product will corresponding increase in price. This trend will cause the candies to be purchased by even a more select, smaller sector of people, resulting in the gradual disappearance of these products."

• ***Summary:*** "Manufacture: Japan has two basic types of Moyashi (bean sprouts), one made from Burmese mappe beans and the other from soybeans. The mappe bean is imported duty free by trade companies and contracted for by the National and Local Moyashi Associations. Soybean Moyashi [soybean sprouts] can be made only from Hokkaido soybeans which cost $194.45 (70,000 yen) per ton as other soybeans are too hard or contain too many splits. The type of soybean that is suitable for soybean Moyashi is also suitable for Natto."

Note: Black mappe (*Vigna mungo*) also known as black gram, black lentil [not to be confused with the much smaller true black lentil (*Lens culinaris*)], white lentil, black matpe bean, is a bean that originated in India and is now grown in southern Asia (Thailand, Burma. India). The mung bean (*Vigna radiata*), a close relative of the black mappe, is also widely used for sprouting in many countries–but apparently not at this time in Japan.

"The Moyashi maker in Japan, unlike the small scale operators of other Asian countries, can be very large, at least with respect to his mappe facilities. Temperature and humidity control are common as well as automatic soaking machines. As will be apparent soybean Moyashi is not produced on this scale in Japan because demand is not high.

"The process of making soybeans Moyashi is accomplished under the same condition as for mappe Moyashi, that is, the sprouting room at 22-23ºC and water used to soak the growing sprout at 18ºC although since soybean sprouts are less sensitive, these conditions are not required but exist because they are required for mappe Moyashi.

"First 15-20 pounds of soybeans are placed in a container (see Figure 180) and washed with water. The container has outlets at the bottom so at no time is there water standing in the container but rather the soybeans are washed down. From that time the soybeans must be washed with water every four hours night and day the entire seven days it takes to finish the sprouting process. While the environmental conditions of sprouting soybean Moyashi do not need to be delicate, the inherent nature of the soybean cause it to be difficult to sprout so it is important that new soybeans be used. The first day the container need not be covered but is just allowed to stand in the dark room. The next day the soybeans in the container mentioned above are put in four containers and covered with a straw mat (see Figure 181).

"In addition to protecting the sprouting soybeans from light so they do not turn green, the container is covered so the heads of sprouts grow straight up. The head of the mappe bean is removed after sprouting but the head of the soybean is eaten. After one or two days in the second container the soybeans have sprouted as shown in Figure 182. While near the end of the seven day sprouting period they look as shown in Figure 183. After the container is covered with straw, washing is accomplished by running water into the container (see Figure l84) until it fills. As the water flows out the outlet at the bottom of the container, the straw mat as well as the sprouting soybean absorbs an adequate quantity of water. After seven days the sprout becomes about five inches long. The growth of the sprout can be regulated by raising and lowering temperature which quickens or slows growth respectively. With average facilities the Moyashi maker

© Copyright Soyinfo Center 2014

claims that soybean Moyashi is extremely simple to make. After the seven days sprouting period the sprout is ready to be marketed at $.014 (5 yen) per 100 grams, the same price as mappe Moyashi.

"Use: The consumption of mappe Moyashi is greatly dependent upon the supply of fresh vegetables. At certain times fresh vegetables because extremely high priced even during a particular vegetable's season. At this time mappe Moyashi's demand greatly increases. The production of mappe Moyashi is therefore considered highly profitable but economically dangerous for the maker while the production of soybean Moyashi has an element of scarcity but profit is low. The scarcity stems from the fact that the demand of soybean Moyashi is constant over a short term because the only people that eat it are the Korean residents of Japan (except in case of extreme food shortage).

"The concept of Moyashi originated in China, became popular in Korea then passed to Japan's southernmost island, Kyushu, where inhabitants eat more mappe Moyashi than other areas of Japan even today. Soybean Moyashi is a popular Korean food so it might be expected that the 500,000 Koreans that reside in Japan might demand same instead of consuming the mappe Moyashi which they consider tasteless. As the Korean people do not substitute soybean Moyashi for vegetables but eat it regularly, demand is constant. Demand level is indicated by the fact that for the 50,000 Koreans who live in Kyoto four of seven Moyashi makers produce 240 kilograms of soybean Moyashi in addition to mappe Moyashi. Although soybean Moyashi are required for Korean ceremonial occasions, the Korean population in Japan is decreasing and becoming more Japanized so consumption of soybean Moyashi is decreasing. Even though decreasing the present number of Koreans is rather conspicuous as they tend to group together. The prejudice that the Japanese have toward the Koreans is well illustrated by the following: when a Japanese family desires to rent or construct a home, their visits to the area prior to moving there may well include an examination of the market place. If a pan of soybean Moyashi (see Figure 185) is displayed with mappe Moyashi (see Figure 186) the family seriously considers whether or not to move into the neighborhood because they then know that Koreans live nearby. Whatever the social implication might be, soybean Moyashi is sold wherever Korean people live, with such food usually consumed by the Korean people in large quantities either boiled or fried by itself or with vegetables and meat."

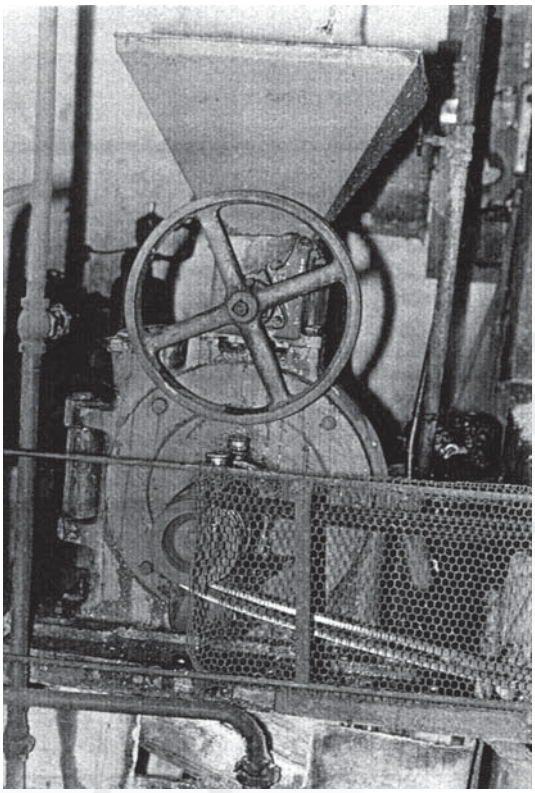
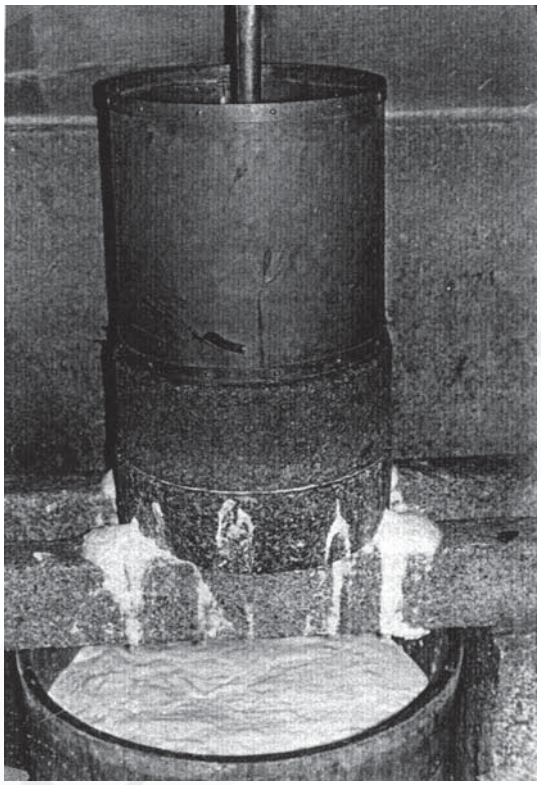
5222. Brandemuhl, William. 1965. Tofu (including Aburaage and related products): History, use of soybeans, manufacture (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 137-201, Unpublished manuscript. 28 cm. [18 ref]

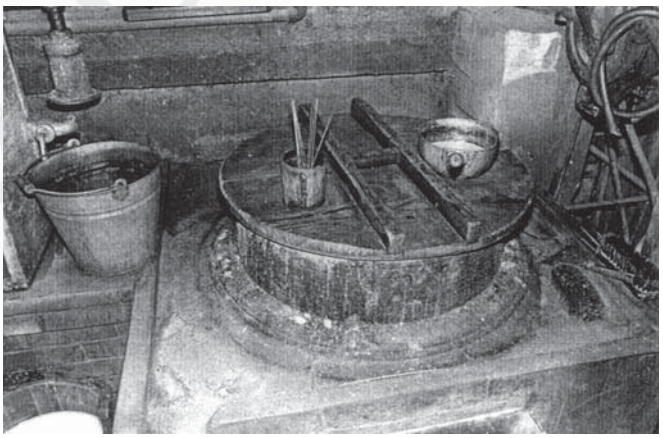
• ***Summary:*** "History: Tofu, the coagulated protein and fat of ground cooked soybeans (see Figure 38) according to an ancient Chinese book was invented by a philosopher, prince *Hamintze* of the Han dynasty, while another source attributes the invention of Tofu to another Chinese philosopher *Whai Nain Tze.* Manufacture was supposedly begun in China in 164 B.C. during Emperor *Hwai Wen's* reign by *Liu an,* duke of *Hwai an. Liu an* was a good friend of the Buddhists monks so it is believed he started manufacturing Tofu, so as to give them a somewhat more varying diet. Tofu come to Japan (probably through Korea) for the first time during the Toyotomi period (880 years ago). Although not completely documented, Buddhist priests probably were the transmitting agents as the priests used Tofu long before it was in general use.

"Use of soybeans: Throughout Japanese history domestic soybeans were used to make Tofu, however Chinese soybeans began to be used after trade began between Japan and China. During and at the end of World War II all soybeans were in short supply, however in the early fifties U.S. soybeans began to be used for Tofu. This use developed so that now Tofu accounts for the largest Japanese food use of U.S. soybeans. The Tofu makers would use domestic soybeans if they were not too expensive however. Some makers still use a certain percentage of domestic beans although such practice is becoming less popular. More often used are U.S. specialty beans such as Illinois, Indiana, Ohio, Hawkeye, or select No. 2 ordinary even though such soybeans are higher priced then regular soybeans. Chinese soybeans are again starting to be used for Aburaage although because of custom U.S. soybeans are not likely be replaced in the foreseeable future. The existence of over 60,000 Tofu makers consuming over 200,000 MT of soybean per year with each maker consuming between 15-300 kilograms per day presents somewhat of a problem regarding soybean purchasing. Each particular maker is too small to purchase directly from anyone but the smallest wholesaler where the price of soybeans is too high for efficient operation. The Japanese people are association minded with the Tofu makers being no exception. The Tofu makers authorize their local association to purchase soybeans in large lots for future distribution to individual makers. The Tofu makers do not especially like to purchase through the association as the association charges for handling, however the makers have a desire to support the association so accept purchasing through it. The association deals with the importer, crusher, and large wholesaler, selecting whichever seller will give the

© Copyright Soyinfo Center 2014







best terms.

"The numerous Tofu makers that do not belong to the association (about 1/6) as well as members whose association does not purchase usually work out an arrangement with the smaller wholesalers. Soybeans are delivered to the maker by truck with the maker receiving material for a number of weeks each time he receives. The shipment is kept in bag form until the day before use.

"Manufacture–Regular Tofu (white Tofu): The manufacturing procedure described below is for the most used type of Tofu, 'Shirodofu' (white Tofu) as is seen in Figure 38. Other related products such as Yakidofu, Kinugoshi dofu, Aburaage, Hirosu, and others are processed in much the same way. Additional or different methods of processing these latter products are described in respective sections.

"The process of making Tofu consists of ten steps, that is, soaking, cooking, filtering, coagulating or precipitating, shaping, pressing, submerging [in water], cutting, and again submerging.

"Soaking: Depending upon season of year, 5-15 hours before processing, clean whole soybeans are put in containers of any size but most used are metal drums, wooden barrels or 20 liter tins. Water is added to the container until the soybeans in the container are completely submerged. Although length of soaking is not such a strict factor, generally soybeans are soaked 10-l4 hours in winter and 5-10 hours in summer. Soybeans soaking in any one

© Copyright Soyinfo Center 2014

container should be of uniform size as soaking would not be even. Because of their small size, U.S. soybean are soaked for less time than Hokkaido soybeans. In winter Hokkaido soybeans may require as much as five additional hours of soaking. There seems to be to guides besides experience that indicate when soaking is sufficient, that is, the appearance of bubbles rising to the surface of the water and the whiteness of they inside of the soybeans.

"Grinding: Tofu processing usually begins at 3:00-5:00 in the morning so that the final product may be ready for use during that day. Processing is initiated by the removing of unabsorbed water from the containers. After that between five and eight kilograms of the soaked soybeans are put into an electric powered grinder of the types shown in Figures 39, 40, and 4l. The type of grinder pictured in Figure 39 is the most popular. Water is run into the grinder's intake container and the grinder is started. After ground as small as possible the soybeans in the form of thick white cream (see bottom of Figure 41) enter a container positioned at the outlet of the grinder. The cream could be called more paste-like than a liquid although it flows If it cannot water is added. If the cream is too thin, the residue after filtering will contain too much of the protein. For a batch of approximately seven kilograms of soaked soybeans the volume of creamy substance should be around 54 liters.

"Cooking: The type of cooker used depends upon the economic situation of the maker. Two of three types of cookers commonly used are shown in Figure 42 and 43. Although, wood (Figure 43) or oil stoked cookers are used, use of a steam boiler is slowly replacing all other methods. Either a small steam pressure cooker or a live steam open pit steam cooker (Figure 42) might be used if the factory has a steam boiler. To indicate that making Tofu is a cottage type industry very often makers with steam boilers will use same for heating their bath. The ground soybeans and water are usually drawn into the cookers by negative pressure but this procedure may also be done manually. Such is necessary if the maker does not have a steam boiler. After the cream is pulled into the cooker, water is added to the container to collect the residue remaining on the container's surface. This thin solution is also drawn into the cooker, Cooking lasts about four or five minutes or until pressure reaches approximately 10-12 pounds per square inch or the equivalent of it if another type of cooker is used. Cooking is very important for removing distasteful flavor, protein, causing good or bad cohesiveness and water holding capacity, although it is done without gauges, meters, or time control by the experienced Tofu maker. As an indication of the time of operation the cooking of 35-40 different batches may be completed by 6:00 a.m.

"Filtering: After cooking, a valve is opened. This valve is connected to a 1½ inch diameter pipe which bends upward so that it is positioned over a container usually around 24 inches square and made of metal although wood and tile are also used. A tile tank is shown in Figure 44. At the end of the pipe a course nylon bag is attached. The opening of the outlet value with pressure still fed to the cooker causes the cooked material to be forced through the looped pipe and into the nylon bag filter. Steam flow is then terminated then started again to force out what remains in the cooker.

"At some factories gravity may be used to remove the material from the cooker and such also might be accomplished by hand. The tank which the bag rests in also has an outlet at its bottom so the liquid (called Tonyu [soymilk]) which can readily pass through the coarse filter makes it way by pipe to a container. The temperature of this material is 100ºC when it leaves the cooker, however it drops to 80ºC by the time it reaches the container. The material that does not flow through the nylon filter is called Okara. As soon as all the material is forced out of the cooker and what liquid there is flows to the precipitating container a quantity of cold water (15-20 liters) stored in a tank above the container is dumped upon the nylon filter dropping the temperature of the Okara to 60ºC so that as much protein as possible can be removed. At some places this water may run directly into the cooker after the initial liquid was forced out.

Note 1. The author and his wife, Tomoko, did most of their tofu research in Kyoto. Companies they visited and observed in the spring of 1963 (listed alphabetically) were: Hamano Tofu Co., Hamamoto Tofu Co., Namikawa Tofu Co., Ryo Tofu Co., Shimamoto Tofu, and Uno Tofu. They also learned much from the Tofu-Aburaage Association (Kyoto). And they visited and observed Sasanoyuki Tofu Restaurant (Tokyo, 11 June 1963).

Note 2. The word *Shirodofu* is occasionally (but rarely) used to distinguish "white tofu" from non-white tofu (such deep-fried tofu, grilled tofu, dried-frozen tofu, etc.). This is the earliest English-language document seen (April 2013) that contains the word *Shirodofu.* (Continued). Address: San Francisco, California.

5223. Brandemuhl, William. 1965. Tofu (including Aburaage and related products): Manufacture (Continued–Document part II). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 137-201, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** (Continued). "As the water flows upon the filter it is worked over with a wooden club and then pressed. The press usually is like the one pictured in Figure 44 although an old fashion stone weight with lever may be used (see Figure 45) or as is becoming popular an electric driven press. It is important to get as much of the Tonyu out of the Okara as possible (because Okara is nearly a complete waste) so when pressing is finished the nylon filter may be stripped with the club before mentioned to remove the remaining Tonyu. Some makers are now using centrifuges but as a result too many bubbles appear so that a bubble suppressing agent has to be used although this agent affects the taste of final product.

© Copyright Soyinfo Center 2014

Some makers used this agent even though they do not centrifuge. After as much Tonyu is removed from the Okura as thought possible the nylon bag is unhooked from the pipe holding it and carried to a drum at which time the Okara is dumped (see Okara section for more information on its use). The nylon bag is then dipped into water and beat with a club while it is lying on the floor. After most Okara particles have been removed the bag is returned to its position at the end of the pipe and used again. All of the Tonyu which flowed from the cooker to the container to the next container is again filtered just before it runs into the latter as a fine cotton bag is attached to the pipe outlet. For this purpose a round wire screen bottom box may also be used.

"The bag or screen box collects the Okara that passed through the course nylon filter. Only a small quantity of Okara is collected at this time with what is collected being discarded. The container that the Tonyu flows into is pictured in Figure 46. One or two more cotton filter bags line such container. These filters are removed from the container with the one minute amount of Okara in it, and used again without removing the Okara from the bag. When the amount collected nears one pound it is discarded or re-pressed for further extraction. At this point the Tonyu looks somewhat yellow. The number of containers and number of outlets for inflowing Tonyu very often determines the scale of operation of a particular Tofu maker. A maker nearing retirement may have only one wood plugged outlet and two containers which have to be moved for every batch while other more progressive makers may have over 6 brass valve stoppered outlets. Most Tofu makers fall between that above two cases with the efficiency of operation seemingly directly related to the efficiency of this procedure. The material of these containers are either wood on metal (stainless) depending upon the final product. White Tofu makes use of wood more often but wood is not absolutely necessary. Wood is used because it maintains temperature better than metal for the adding of the calcium sulfate, the subject of the next section.

"Precipitation: When the Tonyu enters the precipitation at containers it is around 68ºC. If hotter, the temperature is reduced by adding cold water. Because of work with other portions of manufacture the Tonyu may be allowed to remain in the container to cool naturally to 68ºC or even lower. However if temperature became lower than 60ºC precipitation would begin to get difficult so generally the adding of calcium sulfate takes place while the Tonyu is between 60-70ºC with the most desired temperature being 66-68ºC. The amount of calcium sulfate added varies slightly with each maker and varies slightly with each batch as seldom is a scale used for accurate measurement, however the most usual quantity for the size batch mentioned above is around 200-300 grams. A guide seems to be to add about 30 grams for each kilogram of soybeans used. Methods of adding the precipitating agent also vary by place so that the below descriptions are only examples of many used. First 100 grams of the agent is mixed with cold water in a two liter pan. A wooden paddle is inserted into the Tonyu and using the near edge of the container as a pivot point the maker stirs the Tonyu in an up and down fashion five times while slowly adding the agent with water on the fifth stir. Then the solution is stirred three more times, when 100 more grams of agent is mixed with water in the same manner as before and the solution is once again stirred five times with the agent being added on the fifth stir. At the end of the fifth stir the wooden paddle is brought up breaking the surface of the solution. In each case the four first stirs are rapid while the fifth is rather slow.

"Another method of adding the agent may be to stir the solution is circular fashion for three complete rounds then dump the whole 200 grams of agent mixed in water into the solution in the opposite direction of the current. After this the solution is stirred each way two times at the end of which the paddle is used to quiet the current. At this time certain makers will add small quantities of certain chemicals to enrich their Tofu in order to have advertising advantage. Immediately after adding the agent, a change in the nature of the solution can be observed. At this time the experienced Tofu maker can tell if the batch under watch will be of good quality. After stirring, a cover is put on the tank and left to stand for precipitation about 25 minutes during which time supernatant solution forming at the top of the precipitating solution is removed by placing a light bamboo basket on the surface. The cracks between the bamboo straps allow water but not precipitating curd to enter the basket. The water that collects in the basket is dippered out. About 50 percent of the quantity of water contained in the curd is removed. A small stone is placed in the basket to increase the speed of collecting water.

"During the 25 minute precipitation period the solution may also be stirred although gently. The amount of agent added, the amount of water removed, and the amount of above stirring determines the softness of Tofu. Generally soft Tofu is desired although certain restaurants, schools, and other institutions, may request hard Tofu. The maker accommodates them by stirring more and removing more water so that the hard Tofu contains only 80 percent water instead of 90 percent as soft Tofu does. Stirring the Tofu divides the mass into more pieces allowing more water to be taken off whereas hard Tofu because of the adding of too much agent probably would be a mistake on the part of maker rather than a calculated effort however more of less calcium sulfate may be added in making related products.

"Although the method of removing water mentioned above is probably the most used, Figure 47 indicates the same process being accomplished with a cloth covered rack. After completion of the above process the curd is ready to be shaped.

"Shaping and pressing: After precipitation is completed one or two boxes (see Figure 48) made of wood or metal

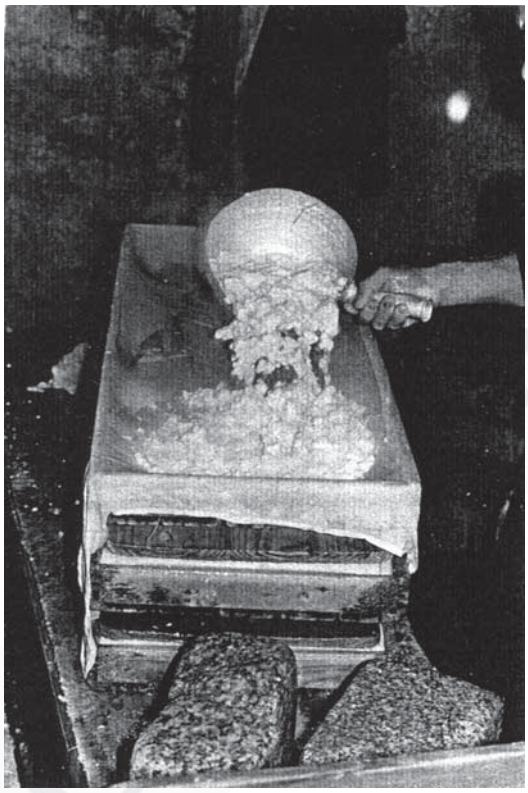
© Copyright Soyinfo Center 2014

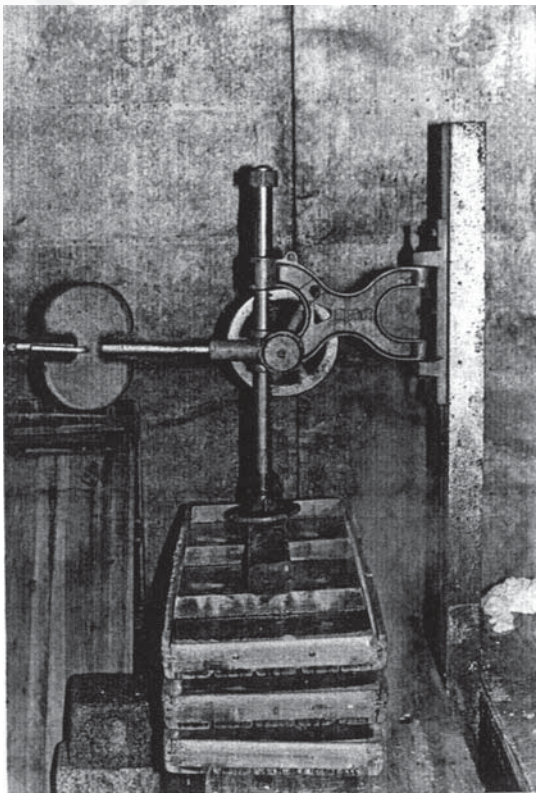
and having many 3/8 inch holes on all sides and bottom with side holes slanting downward for efficient water draining are prepared with a cross-shaped cotton filter cloth. This cloth is moistened for easy forming and positioning inside the box. More waster (usually the supernatant solution) is poured into the box to make the cotton filter cling to the sides. Precipitated curd is then dippered into the box with the maker first removing small pieces from the precipitation tank and gently pouring to the middle of the Tofu shaping box letting the curd run to the edges. If large pieces are dippered they are broken into small pieces by pouring from a greater distance away from the level of curd. About 18 liters of curd are poured into two boxes for each batch although some makers will only make one box from each batch. A block of formed Tofu weighs therefore between four and eight kilograms.

"If too much curd exists for the available box, an extension is added to one of the boxes. Because the curd is semi-solid at this time it can be added to the box higher than the height of the box, especially in the middle. The middle is always more densely packed then the edges as when pressed the middle receives more pressure. After the filled the box is allowed to stand for 10 minutes at which time the curd at the edges of the box is pushed to the center and then the portion of the cross shaped cotton filter remaining outside of the box is made to cover the top of the curd in a carefully folded fashion and a wooden cover that fits completely inside the box is positioned as are stone weights totaling about 20 pounds (see Figure 48). The boxes are then allowed to set for 40-90 minutes" (Continued). Address: San Francisco, California.

5224. Brandemuhl, William. 1965. Tofu (including Aburaage and related products): Manufacture of Yakidofu and Aburaage (Continued–Document part III). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 137-201, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** (Continued). "Submergence, cutting and resubmergence: After pressing for the desired length of time the stone weights and cover are removed and the box is taken to a sink (stainless steel or tile) and submerged in a large quantity of water and then inverted so that the formed block of Tofu can slide out of the box into the water. Depending upon how busy the shop is the block may or may not be cut immediately upon being put into the water. When it is cut the block is brought near the surface and a wood frame with three to six nylon wires strung across it is put over the top of the Tofu block. The block is then inverted and the frame is quickly pulled upward cutting the Tofu into a number of pieces. These pieces may then be cut even smaller to the standard marketing size or may remain large for cutting to standard size at time of sale. At all times Tofu must be stored in water to maintain its form and also to improve taste.





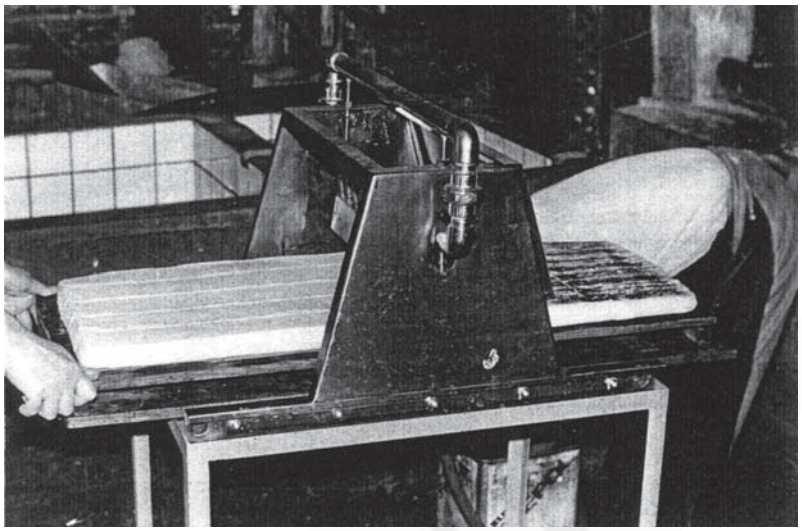
Optimum taste is achieved after three hours soaking although taste difference is not very great. One block when cut to marketable size (440 grams) makes about 80 pieces With dimensions equaling 2½ x 6 inches x 1 inch. Occasionally

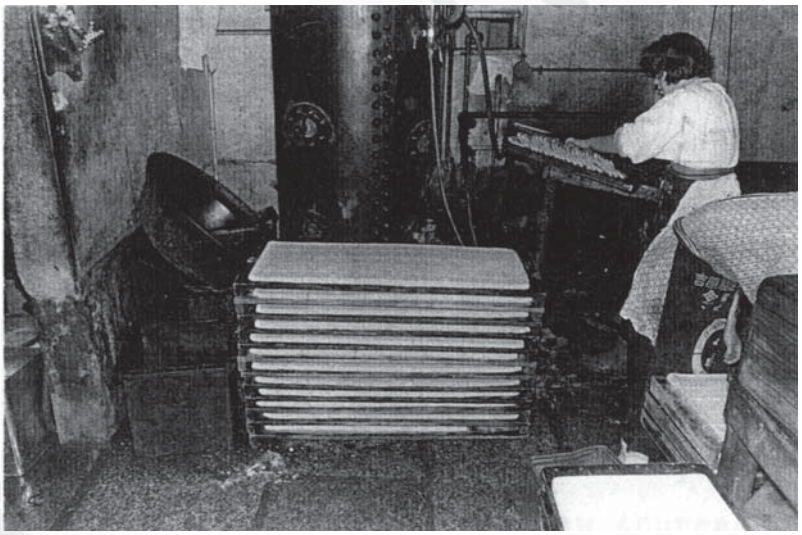
© Copyright Soyinfo Center 2014

this type of Tofu is also sold without regard to shape as for a special order a certain quantity would be put into a cotton bag and delivered.

"After cutting Tofu into suitable shape for the ways it is marketed the manufacturing process is completed. Marketing and use treated after treatment of additional and different manufacturing processes of related products.

"Yakidofu (see Figure 49) is Tofu that is slightly surface roasted It is processed in the same way as regular Tofu except that it is cooked at a somewhat higher pressure and contains less water. While the wicker basket is resting upon the surface of a Yakidofu batch more water is removed and pressing is with greater pressure. Instead of being put into a box like regular Tofu (see Figure 48) one batch of Yakidofu is dippered into three filter covered wooden trays as shown in Figure 50, covered, and then pressed with a mechanical press as shown in Figure 51. The tray that holds Yakidofu is about 39 inches long, 14 inches wide, and 2½ inches high. There are many 3/8 inch holes in the bottom of this box and well as in the cover to drain excess water. The bottom is grooved so as to provide guide lines for cutting Yakidofu into pieces. The cover fits inside the tray with two ribs projecting 1½ inches from the upper side. These ribs make it possible to stack one tray upon the other and still be able to press effectively. Pressing is done for 15-20 minutes during which time the trays under press may be changed in order (as many as ten trays may be under the press at one time).





"After pressing is completed the cover is removed and the cloth filter is unwrapped from the top of the Yakidofu. A cover which completely covers the tray and has ribs on its end is placed on the tray and quickly turned over allowing the sheet of Yakidofu to position itself on the cover. The sheet is then cut into 25 pieces (see Figure 52) using the guide lines provided by the grooves in the tray. Cutting may be accomplished by such a knife as used in Figure 52 or with a gang knife. The kind of knife used is likely to be made of brass as supposedly its cutting properties are better than stainless steel. After cutting Yakidofu is put on a slanting rack to dry. Then when the majority of the morning's operations are finished the Yakidofu sheet is roasted by the instrument pictured in Figure 53. Many other methods of roasting are used such as gas torches moved over the surface of the sheet or a charcoal stove fanned by a blower. The later case necessitates the skewering of each individual piece, positioning and repositioning near the hottest area of the charcoal stove. This method is not very sanitary as coke dust circulates and settles everywhere including on other products. After roasting, Yakidofu is slid into water and stored until time of sale, delivery, or pick up. Yakidofu is stored in water only after it has been cut into the standard consumer size, unlike regular Tofu. Because it remains out of water for so long and because of its method of cooking, Yakidofu is much harder than regular Tofu;

"Kinugoshi (see Figure 54) is slightly different than regular Tofu in that it is softer and smoother. The smoothness is the reason why the first few letters of Kinugoshi means silk filtered. In ancient times this may have been a possibility but at present silk filtered Tofu does not exist. The Tofu makers believing that the silk filtered rumor is worth the advertisement value so do not discourage the belief.

Note. This is the earliest English-language document seen (April 2013) that mentions silken tofu or uses the term "silk filtered tofu" or the string "Kinu" or the word "Kinugoshi" to refer to silken tofu.

"Kinugoshi is only produced in summer because it is eaten cold with green onions and Shoyu with a little ginger for flavoring. Yakidofu Tonyu may be used for Kinugoshi although filtering is more carefully done, The Tonyu for Kinugoshi is not precipitated in the large containers however

© Copyright Soyinfo Center 2014

as each maker has a number of small metal boxes about 16 x 8 x 4 inches for such purpose. The boxes have a stopper outlet on their bottom for assistance in the removing of the Kinugoshi pieces at the appropriate time. When Kinugoshi is about to be made the inside walls of the box are coated with a minute quantity of rapeseed oil. After coating with oil enough of the precipitation agent needed for precipitating the amount of Tonyu put into the box of above dimension is added. Then Tonyu is poured into the box with the pouring active enough to cause slow precipitation of the Tonyu. The Tonyu filled container is allowed to set for 20-30 minutes and then is submerged in water (container included) for two hours. After two hours the box is brought to the surface of the water and the precipitated curd is divided into 24 pieces. The stopper at the bottom of box is then removed. This in combination with the oil coating allows the 24 pieces of Kinugoshi to slide out of the container into water;

"Aburaage–Initial processing: Although Aburaage treated as an end product is much-different than Tofu, until a certain point in the manufacturing process the procedure is nearly the same. Aburaage (see Figure 55) is Tofu deep fried in vegetable oil, being of various sizes but usually eight inches long, three or four inches wide and 3/4 inch thick. It is a soybean product that did not originate in China but was developed in Japan. Aburaage uses whole clean soaked soybeans as raw material but in addition soybean meal specifically manufactured for Tofu products may be added.

"Uses of soybean meal: A number of years ago oil crushers saw a possible market for soybean meal if it could be successfully used in the manufacture of Tofu. As mentioned before, meal promotion was conducted to convince Tofu makers to use soybean meal. Through experimentation it was found that soybean meal would not seriously effect the taste of Aburaage since oil is absorbed by Aburaage during the frying process. Since oil is an important taste factor, only small quantities of meal could be used with none used during prosperous times. As also mentioned before, the crusher now believes his meal market is better for cattle than for Tofu so he is trying to discourage an increase in demand for Tofu meal. And also since the crushers now sells select whole soybeans in great quantity to the Tofu maker he does not want to not be able to sell whole soybeans although this is somewhat unusual reasoning on the part of the crushers. After the advertising program conducted by the crushers, most Tofu makers because of economic reasons began to use soybean meal for Aburaage although not in the quantity advertised as acceptable. Usually for one batch of Aburaage 1 to 2.5 kilograms of meal might be added with places that produce poor quality Tofu products using a greater quantity although very few use 100 percent soybean meal. Soybean meal is mixed with the ground soybeans or is mixed with water and drawn into the cooker after the ground soybean substance. As long as taste of good Tofu remains a factor soybean meal will not likely become the main component of regular Tofu although if promotion continued, soybean meal would become more and more used for Aburaage, as meal has an advantage over whole soybeans in that it need not be soaked. If therefore an emergency order appeared the Tofu maker could comply.

"Cooking Aburaage material is the same as for regular Tofu but since Aburaage needs more cohesiveness (because it not stored in water) a harder material is produced by increasing the amount of precipitating agent (about 1/5 more), removing a greater quantity of water than for either regular Tofu or Yakidofu, and stirring more while precipitating to break the curd into small pieces so that more water can be removed. It is dippered, trayed, and pressed in the same way as Yakidofu. About four trays of Aburaage can be made from one batch giving 100 pieces of Aburaage. In contrast to other types of Tofu products if a portion of a batch remains it can be added to the next batch attesting to the fact that of all types Aburaage is the least delicate. After pressing it is cut in the same way as Yakidofu and stored for further drying, cover upon cover as shown in Figure 56.

"Although the process and appearance of Yakidofu and Aburaage are similar until this point the water content of Aburaage is much lower so they are not interchangeable" (Continued). Address: San Francisco, California.

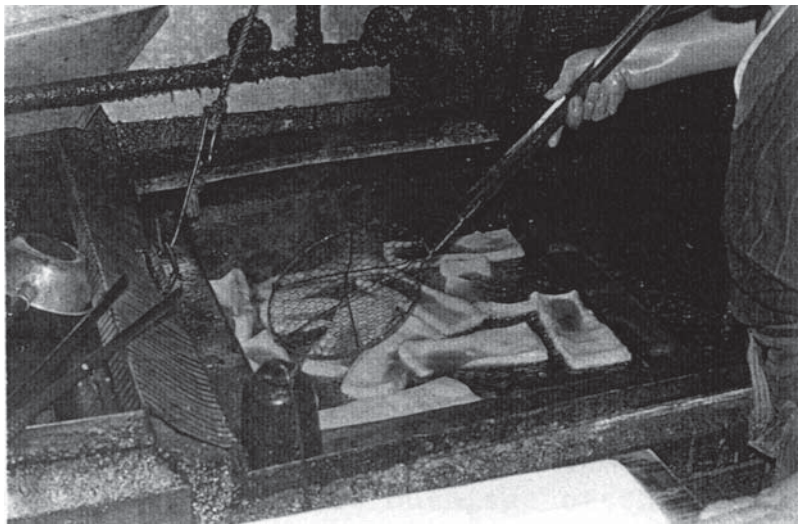
5225. Brandemuhl, William. 1965. Tofu (including Aburaage and related products): Frying Aburaage, Atsuage, Hirosu / Ganmodoki, Okara, Soybean Milk (Continued–Document part IV). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 137-201, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** (Continued). "Frying Aburaage: Aburaage is usually fried in rapeseed oil with soybean oil being occasionally used. Frying is accomplished in two stages as Figure 56 indicates. The containers used to fry are usually housed with bricks and heated by oil and blower although wood is sometimes used. A wood stoked fryer has the disadvantage of uncontrollable temperature. The oil containers are provided with hoods but as seen in Figure 57 cleanliness is difficult to maintain.

"The number of double oil containers varies with the size of the maker with a slightly larger than average maker processing about 1,000 Aburaage at a frying rate of about 120-150 per hour so at least two vats are needed. Each of the double containers are about 28 inches square and 2½ inches deep. Although it seems that the containers are completely separated by a partition actually a three millimeter space exists between the bottom of the oil vat and the partition so that a certain amount of oil circulates between the two vats.

"Although most vats are as pictured in Figure 57 some have slanting sides for easier insertion of the raw Aburaage and conservation of oil. To insure even frying on both sides of the Aburaage as well as to increase speed of frying one of the two vats used for frying the same Aburaage has a wire

© Copyright Soyinfo Center 2014



mesh rack that is constructed to fit inside the vat. Such mesh is hinged to the container at the rear so by suitable attached wire or rope, the mesh can be easily controlled. A weight is put on the mesh so that the buoyancy of the frying Aburaage will not raise the mesh and defeat its purpose. In addition to the above equipment three hand utensils are used for frying Aburaage, one is a dipper (seen in foreground of Figure 57), for pouring oil over the Aburaage, another is a wire mesh spatula about 10 inches in diameter (see Figure 58) used to turn and individually press certain Aburaage, and the third is a long metal forceps for removing the Aburaage from the oil. Although equipment is supposedly cleaned everyday the oil in use is unusually dark although clean oil usually stored in a tank above the working area delivers large quantities of oil quite often.

"Given the above equipment Aburaage are fried in the following fashion. About 12 Aburaage are taken by hand four at a time from the trays shown in Figure 56 and inserted into the number one vat of oil. The oil in this vat has a temperature of around lOOºC. Immediately upon insertion the Aburaage sink to the bottom of the oil. Two and one half minutes later they rise to the surface and at that time another batch of Aburaage are inserted in the same vat but the latter do not interfere with the frying of the first batch because they sink. As soon as the first batch rises they are turned and selectively pressed with the wire mesh spatula and the dipper mentioned above is used to pour oil from vat number two at 180-21OºC onto the uncooked side of the Aburaage. About five minutes after insertion the Aburaage are transferred to vat number two and pressed under the surface of the oil with the hinged wire mesh and weight. About three to four minutes later the golden brown Aburaage are removed with the metal forceps and placed on a slanting wire rack adjacent to the number two vat. The length of frying time varies with the temperature of oil that each maker might use so that generalizations cannot be made, however each maker attempts to produce the largest Aburaage possible given the size of raw Aburaage used. If frying is successful the Aburaage will first become very puffed and then collapse having then a skin-like surface. The void space may then be used after suitable cutting for holding rice, one of the most popular ways to prepare Aburaage. The 1.8 liters of oil that are absorbed into 100 Aburaage make the protein rich Aburaage very rich in oil also. One reason why the use of meal has been successful for Aburaage is that oil absent from raw Aburaage is replaced in great part by frying.

"After excess oil has dripped from the Aburaage on the wire tray, they are removed and placed on another wire tray and stored in a wooden rack until marketed. The form the 240 gram Aburaage takes is as shown in the center rear of Figure 59.

"Sushiage is made using exactly the same materials and procedures as Aburaage except that Sushiage is less than one half the size of Aburaage as can be seen when comparing both in Figure 59 and Figure 57 (Sushiage) with Figure 58 (Aburaage). Length of frying Sushiage has to be compensated so that total frying time is usually less than eight minutes.

"The Japanese people delight in consuming a slice of raw fish set upon a small ball of rice but since fish is expensive a quantity of rice packed inside a split Sushiage often acts as an inexpensive substitute.

"Atsuage (see right front, Figure 59) may best be described as being two different products although marketed as the same. Standard Tofu which cannot be sold on the day it is processed is on the next day cut into triangular pieces one inch thick with legs about two and one half or three inches long. This product when fried only in the hot oil vat for a short time is called Atsuage. Since it is small

© Copyright Soyinfo Center 2014

it can easily be used when a piece of Aburaage is too large for the required use. Demand for Atsuage is usually higher than what can be made from the varying quantity material remaining each day so Atsuage also has to be made from regular batches of Aburaage resulting in products of two different qualities but not distinguished as such. A little known fact is that Tofu makers make nearly as much profit on cutting old regular Tofu into four pieces, frying, and selling as Atsuage as they do on selling regular Tofu.

"Hirosu (also called Ganmodoki) is pictured in Figure 59 on the left front. It is composed of old regular Tofu, old Yakidofu (after the roasted surface is removed), the trimmings obtained when cutting Aburaage products, a shredded vegetable (usually carrots), ground yam, and sesame seeds. The first three materials are put into a cotton bag and pressed with a stone or the mechanical press if it is free so that a great portion of the water is removed.

"After removing the material from the press, the shredded carrots, ground yam, and sesame seeds (the sesame seeds may also be placed in the top of the material after formed) are mixed together by hand. Then the paste-like material is shaped into balls the size of one scoop of ice cream. In fact an ice cream scoop is sometimes used for shaping; otherwise it is done by hand. The balls are then put in the low temperature oil vat and allowed to remain submerged for a short while, then transferred to the high temperature oil (180-200ºC) and fried until golden brown. Hirosu is more often used by poor people than other Aburaage products but not limited to same.

"Okara, as mentioned before, is the residue of the various filterings [sic] of the raw Tonyu. It is usually sold to dairy farms for feed at $.01 (four yen) a kilogram. Figure 60 shows a farm owned truck with Okara from a number of Tofu shops located in the farm's milk market. Not all Okara is fed to cows however, as it is also a popular food for rabbits, and Tofu delivery people also carry it for selling as dog food. Although for cleaning purpose other commercial products have replaced Okara, it can be used as a floor and hand cleaner. A small amount is also sold for human food (see Figure 61) with very poor people accounting for most of the food use.

"Soybean milk: Although other places in Asia use soybean milk with large and small scale factories producing same for a milk deficient population, in Japan soybean milk is not significantly consumed, although one modern factory is producing a similar product, however initiation of production is too recent to tell if this product will be successful. The Tonyu of Tofu production would seemingly be marketed but it is not because of the availability of fresh milk. Such was not the case up to about 25 years ago when nearly every Tofu shop sold Tonyu for direct human consumption and even for enriching other food products such as bakery goods.

"The Tofu factory: Figure 62 shows the production area of a Tofu factory employing six persons and producing the following amount of Tofu per day:

"Products. Pieces
"Regular Tofu 560
"Yakidofu 150
"Aburaage 1,200
"Sushiage 2,700
"Atsuage 400

"This factory is much larger than average yet for the above Production only 140-200 kilograms of soybeans are used. It might be imagined that to employ six people, hand work is the rule rather than the exception" (Continued). Address: San Francisco, California.

5226. Brandemuhl, William. 1965. Tofu (including Aburaage and related products): The Tofu factory, marketing Tofu, preservation (Continued–Document part V). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 137-201, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** (Continued). Although all members of the family help the business in some way, labor cost is not yet so high (Tofu worker receive $60-75 per month live in salary) and the Tofu industry makes use of much inexpensive equipment. With the development and rapid expansion of food and other industries, Tofu production is becoming far behind with respect to modern methods so cost of production is increasing, forcing many Tofu makers into bankruptcy. The number of Tofu makers is decreasing in still another way and that is at present the sons of Tofu makers observe that making Tofu is not a desirable job, either prestige or condition wise, so are refusing to assume ownership of the shop at the suitable time.

"This creates somewhat of an advantage for the young people who do enter the business as the older men running their own business can neither maintain quantity of production as they increase in age or handle young employees to maintain same so the young producer can slowly increase his sales by capturing the local market from an old maker. Also young aggressive makers are in a much better profit position as the profit margin seems to be high but more volume than a few bushels a day is needed to insure a comfortable financial position.

"Although Tofu makers as a whole believe that modernization and automation cannot be accomplished with Tofu in the form it is because of its distribution, a few individual makers are making real progress, such as frying Aburaage while it continuously moves through an oil container on a stainless steel conveyor.

"Unfortunately as with many traditional industries in Japan, old methods are adhered to as if they were part of the maker. This is fact is partly true but such makers are going to suffer the most when innovation is finally realized. A traditional industry in Japan is bound by a great number

© Copyright Soyinfo Center 2014

of customs and rules that are not written but not bound as yet to scientific measuring, weighing, testing, and providing adequate sanitation, even though there is one government inspection per year. The latter seems to be especially important as Japan's large modern industries are showcases of sanitation but yet people do not have concern when they are handed a piece of Aburaage with the same hand that a moment before connected a fuel oil pipe to the boiler.

"Marketing tofu products: For Tofu products these are five chief sales places or ways of selling:

"(1) Directly at the shop

"(2) By Tofu peddlers (carrying particular sounding horns to announce their presence and pulling carts by hand or bicycle as seen in Figure 63)

"(3) Maker owned sales outlets in market places

"(4) At shops in and outside of markets where other foods are also sold (see Figure 64)

"(5) To institutions, school, and factories

"Because of the nature of Tofu, its manufacture is not conducted in the manufacturing section of a city or village but rather in an area of dense population. This indicates the lack of zoning laws that Japanese citizens live with but such is necessary for the Tofu maker. So located, the housewives of the immediate area stop at the Tofu shop on their way home from shopping for other foods, or as is the case in the morning, go directly from their home and buy Tofu, to put in the every day soup, *Miso-shiru.* Most often the housewife carries a pan to carry the wet Tofu, but at present a machine which seals plastic around an order for about $.006 (0.5 yen) is becoming popular. This machine is becoming used for a great number of foods although $.006 is still a high cost for packing Tofu.

"If a particular shop is small the owner himself may take care of peddling Tofu door to door. If somewhat larger his employees will do same and if in the wholesale class, independent peddlers will buy and sell for themselves. The independent peddler can buy Tofu from the wholesaler for $.041 (l5 yen) and sell it for $.056 (20 yen) so can make more money counting other related products than he could working in a factory. There is no equivalent of the Tofu peddler in the U.S. except possibly the milk deliverer but the Tofu man may pass each area three times a day and deals personally with his consumers although always maintaining the status of a peddler. More progressive Tofu makers may own one or more shops in a market place and have one or two employees handle his entire line. This type of venture probably earns the greatest amount of money for the maker as more people can be contacted with less effort and time. Unfortunately there are so few market places in relation to the number of Tofu makers in any particular area.

"The Tofu wholesaler and even retailer sells Tofu at wholesale prices to many shops such as the one pictured in Figure 64. This type of sale is not so profitable for the maker or for the end seller as volume is so small and delivery must be every day. As the number of markets increase this type of seller will decrease in number.

"Sales to hospitals, schools, and factories offer volume outlets but since such sales are so competitive, custom necessitates discounting, so profit is not large although demand is somewhat predictable. Many of the firms that only wholesale Tofu aim for this market. Food sales to factories assume an unusual proportion compared with counterpart industries in the U.S. because as job fringe benefits, dormitories, breakfast, lunch, and dinner are often provided. The quality of such benefits is somewhat debatable but it is sure that Tofu products are used so that less meat need be.

"Preservation: One of the greatest disadvantages of Tofu is that it cannot be stored for a great length of time. By test if regular Tofu is kept in water that is under 5ºC it lasts for one week, if stored in 10ºC water it will last two days. If stored in water above 15ºC it will only last for one day and except for certain winter days the latter is the most real case so every day delivery is necessary. Aburaage is easier to market especially in winter as it lasts about one week however in summer it lasts the same as regular Tofu. Besides taste, preservation is the only other major problem confronting the automation of the Tofu industry. Quantitative production could most likely be achieved but distribution would have to be conducted in the same way so increased delivery cost would most likely outweigh the costs of local production that is now prevalent. The only solution seems to be what numerous places have tried without success and that is for many small makers in one area to combine, incorporate, and construct an automated factory with each of the combined members assuming a directorship. Delivery is still within the area covered by the makers acting separately while economies of scale are achieved because of size and such a method is probably the only way that capital could be raised. Outside investors including most banks do not consider the prospects of the Tofu industry favorably so will not invest. An individual maker even if successful does not have but a small part of the money necessary for constructing and operating an automated factory. One problem that constantly exists wherever these combines are formed is that the individual maker after having decided all business matters himself for many years cannot adjust to group decision making by the corporate board. This problem has until the present caused the combines to fail

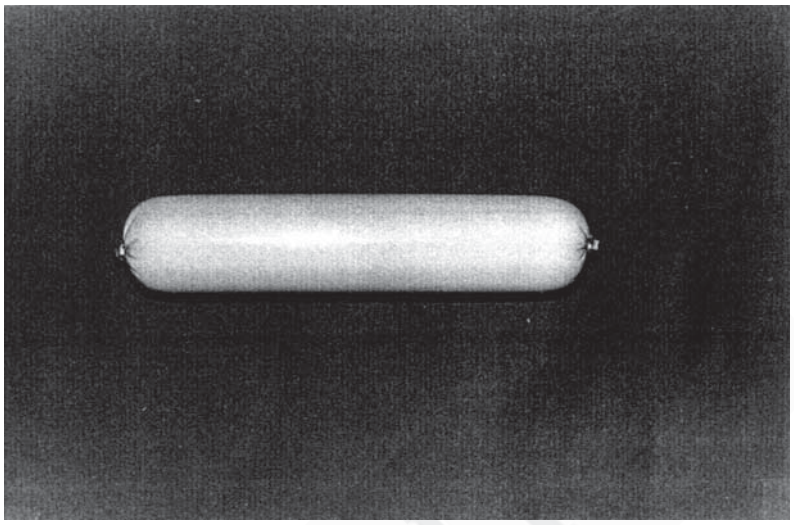
"Price: The price of Tofu has been increasing but it is still a low cost item on the food budget. Regular Tofu sells for $.06 (20 yen), production costs approximately $.03 (11 yen) with the wholesale price at $.042 (15 yen). This would seem to indicate that the makers who own outlets have quite wide profit margin while those that only wholesale have to operate on a much narrower margin. Such wholesalers producing around 560 regular Tofu per day would only earn $6.23 (2,240 yen) with quite a large amount of capital investment given the Tofu industry. Yakidofu although

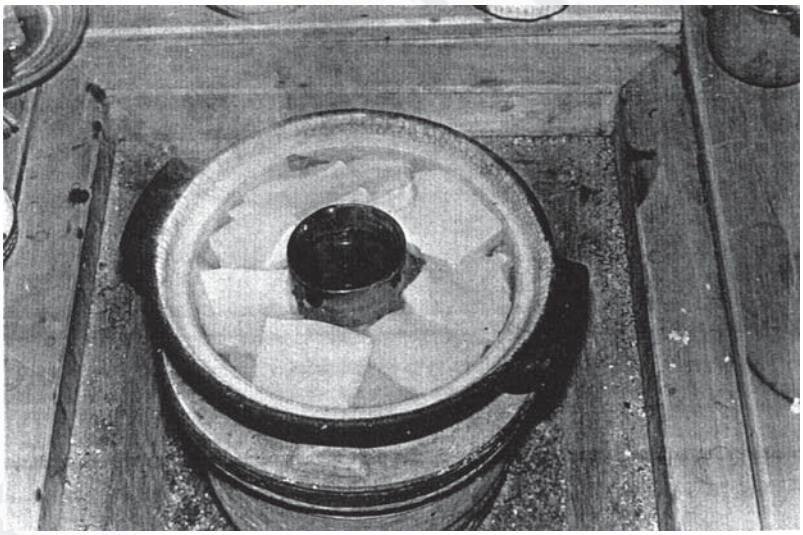
© Copyright Soyinfo Center 2014

taking less time to produce has to be handled more (roasting) sells at the wholesale and retail level at the same price as regular Tofu. Yakidofu also contains less water. It is unsure why the makers make such sacrifice but probably demand for Tofu would decrease if that type was not available at the same price as Shiradofu [Shirodofu?]. Housewives could not substitute regular Tofu in the place of Yakidofu so they might very well substitute a completely different product. One of the 24 pieces of Kinugoshi contained in the Kinugoshi tank sells for $0.44 (16 yen). Aburaage retails at $.056 (20 yen) but because of the oil used in frying, cost of production is $.033 (12 yen) in contrast to $.03 (11 yen) for regular Tofu. This is compensated for by the fact that Aburaage lasts longer than regular Tofu so there is less waste. Both Hirosu and Atsuage wholesale for $.014 (5 yen) and retail for $.019 (7 yen).

"As mentioned previously profit margin appears to be adequate (considering all products over 35 percent) however volume is a real problem" (Continued).

Table 16 (p. 189) gives the chemical composition of tofu and aburaage (per 100 grams). Table 17 (p. 190) gives the quantity of soybeans and soybean meal used in Japan for making tofu and aburaage products (1956-1963, year starting April 1). The amount of whole soybeans used increased from 143,800 metric tons (tonnes) in 1956 to 285,100 tonnes in 1963. The amount of [defatted] soybean meal used increased from 3,200 tonnes in 1956 to 65,000 tonnes in 1963. Address: San Francisco, California.





5227. Brandemuhl, William. 1965. Tofu (including Aburaage and related products): Recently developed Tofu products, Tofu as a food, concluding remarks (Continued–Document part VI). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 137-201, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** (Continued). Recently two revolutionary Tofu products were developed improving some of the defects of Tofu in its present form. The first product (bagged Tofu; see Figure 65) is more akin to regular Tofu in that it can easily be made in the ordinary Tofu shop if a few additional pieces of equipment are procured. This equipment is now available commercially so most makers that are interested purchase it. Tonyu is prepared in the same way as for regular Tofu and then stored in drums without being precipitated. It is then put into a machine that delivers a certain quantity of Tonyu at 20-25ºC into a plastic bag along with a small quantity of precipitating agent. The bag is then bound by wire with a manually operated machine or bound by hand with a multi-looped rubber band. With this process the Tonyu plus calcium sulfate is compressed into a tight round cylinder so that only a few air bubbles remain. Then a large number of the bags are put in a barrel of water heated with live steam and cooked for 30 minutes at a temperature slightly under boiling which precipitates the Tonyu into curd. The finished product is a very smooth round shaped piece of Tofu 250 grams in weight which need not be stored in water and lasts one week without deterioration. Such a product might retail for $.069 (25 yen), wholesale for $.05 (18 yen) and costs about $.044 (16 yen) to make. If too much calcium sulfate is added the curd separates from the water and if too little the Tonyu does not solidify, however an element of standardization can be effected in making this product even in the small shop.

"Another product called "Proton" is very similar as an end product although a soybean meal processed specifically for Tofu is used to make the Tonyu and factories producing Proton operate on a automated mass production scale. Proton has most of the advantages of bag Tofu and many additional ones.

© Copyright Soyinfo Center 2014

"Both of these products are experiencing only a small degree of success however as the tradition based Tofu industry is not supporting such products to any great extent, especially Proton which potentially could put many small Tofu makers out of business. In addition the taste of both bagged Tofu and Proton is supposedly inferior to regular Tofu and consumers greatly hesitate accepting a round shaped piece of Tofu in place of the usual rectangular one. In recent years Japan has increasingly accepted completely new products, however when such product is a substitute for a traditional one such new product only slowly gains acceptance. All of the above factors inhibit the growth of the enterprising firms that are developing new Tofu products, ones that with slight modification will become the future Tofu of Japan.

Tofu as a food: One might say that Tofu products can be used in nearly all Japanese food dishes although a few uses account for most of Tofu consumption. Both regular Tofu and Aburaage are used more than any other way in the every day breakfast soup Miso-shiru (see Figure 66) a dish that has Miso as a base with Tofu, Aburaage, and vegetables also contained.

"Nearly all Yakidofu is used in that famous Japanese dish Sukiyaki. Although it may occasionally be used as shown in Figure 67, that is, covered with Miso and placed over low heat for an item called Dengaku. Besides Miso-shiru, Aburaage in its various forms is eaten with rice shaped as shown in Figure 68 or in the same way that raw fish is eaten with rice. Another important way in which Aburaage products are used is as a protein source for the many types of noodle soups that exist in Japan. Aburaage is particularly suited for a 100 percent wheat noodle called Udon.

"A very famous regular Tofu dish (Yudofu) originated in a Buddhist temple and is now also often eaten at home. A large casserole dish is filled with water, heated (very often over charcoal in temples) while a sheet of dried sea tangle [konbu] clings to the bottom inside surface and a jar of Shoyu-based sauce standing upright in the center of the container (see Figure 69). A few minutes is all that required to cook Tofu (Tofu should not be overcooked as it becomes porous) after which it is put into a small bowl of the sauce which contains Shoyu, green onions, and ginger (see Figure 70). A small number of restaurants specialize in preparing only Tofu but although all quite famous by preparing 60 dishes made from Tofu. Such places are not common dining places as when served as an only food Tofu becomes boring even for the Japanese. Such traditional restaurants may be reserved two to three weeks in advance because of their uniqueness. Japanese housewives sometimes use the near tasteless Tofu as an extender putting it into meatballs, hamburgers, or scrambled eggs, while the fish sausage companies use Tofu as a fish extender for cheaper fish sausages.

"Kinugoshi is the only kind of Tofu which is usually eaten without cooking as it is served from ice water into a dish which contains Shoyu, ginger, and possibly green onions.

"The above indicated a great variety of uses for the easily digested Tofu products. In addition, Tofu or Aburaage may be used as the main ingredient of many other dishes as in the examples below,

"Tofu:

"Tofu pudding

"Whale meat rolled in Tofu

"Tofu and vegetables boiled with tomato sauce

"Tofu dumplings and meat,

"Tofu hamburgers

"Tofu vegetable soup

"Tofu salad

"Aburaage:

"Okara stuffed Aburaage

"Fried Hirosu with vegetables

"Concluding comments: Tofu the product that has survived hundreds of years of Japanese history is now experiencing somewhat of a crisis as Japan's economy and most industries are expanding at a rate that is without equal. Per capita demand for Tofu is decreasing so if population increase was not causing absolute quantity consumed to increase soybeans would slowly decline in importance as the chief soybean food. Japan's population growth has been quite high but efforts have been undertaken to stabilize growth so even Tofu may feel the effects.

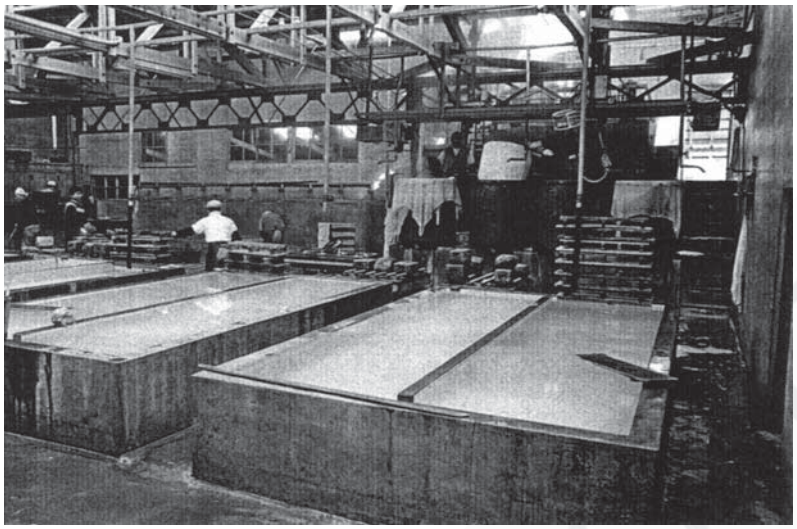
"Tofu being such a well known food never had to be advertised, but recently to compete with the heavily advertised western type foods Tofu producers have had to. For a small Tofu maker, advertising is impossible so the local association is used but its economic situation is not the best either so advertisement assumes a completely different form than the advertisement of the large food companies. The latter most often uses expensive television spots while it is doubtful whether Tofu has ever been advertised on television. Instead the Tofu association may solicit funds from their raw material suppliers (large companies) to publish a small pamphlet for distribution by the maker in proportion to his share of production relative to total production of all members. This is generally true however the large makers will support such advertisement even if the smaller maker is favored.

"Another method of advertising is to engage a temple to create a festival honoring an aspect of Tofu. This results in free newspaper space as most always such festivals are covered by a feature writer (a number are sure to be invited). How effective each advertisement is a debatable question but it is sure that such efforts will not eliminate the increasing need for modernization and rational business decisions. If such is not achieved economic factors will cause much suffering among thousands of Tofu makers. Tofu making can no longer remain the family business it is when a large

© Copyright Soyinfo Center 2014

productive unit such as a few that do exist successfully and efficiently produce if originally founded in a correct way. Progress may have been long in coming for the Tofu industry but the climb has started. The question that remain however is whether most Tofu makers will join." Address: San Francisco, California.

5228. Brandemuhl, William. 1965. Frozen tofu: History, development, frozen tofu soybeans, processing (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 328-359, Unpublished manuscript. 28 cm. [18 ref]



• ***Summary:*** This excellent chapter contains the most detailed information on frozen tofu to date. "Frozen Tofu (Koyadofu or Koridofu) is processed in the same way as regular Tofu until curd (although harder curd than regular Tofu) is formed at which time the curd, cut into small pieces, is frozen for a few hours at -20ºC, and then stored for two weeks at -5ºC. After it is removed from cold storage the pieces are placed in water for defrosting, centrifuged, dried in ovens and open air, trimmed, treated with ammonia, packed, and sold as a dry, highly preservable, high protein product for use in traditional Japanese dishes.

Note: This is the earliest English-language document seen (April 2013) that uses the word "Koyadofu" or the word "Koridofu" to refer to dried-frozen tofu.

"History: China supposedly has or had a product somewhat similar to frozen Tofu, although frozen Tofu as Japan knows it is completely of Japanese origin. Although a number of theories have been put forth regarding the method of origin it is agreed that the place of origin is the Koyasan Mountain in Wakayama prefecture. Connection between Koyadofu (frozen Tofu) and Koyasan is not coincidental as the name of frozen Tofu also originated in Koyasan Mountain. The most acceptable theory of method of origin seems to involve a priest, Kobodaishi, the originator of the Koyasan temples. Kobodaishi, journeyed to China as did scores of other priests, for the study of Buddhism. It was there that he learned about Tofu. When he returned he grew soybeans so that his priests and converts might eat the new product. Soon Tofu began to be used regularly and with that a piece of Tofu accidently remained outside during a very cold Koyasan winter about 800 years ago. Legend has modified this to state that a priest wearing wooden shoes was returning from the Tofu shop a dark slippery night, fell in the snow, lost a piece of the Tofu, and proceeded home. Whether the latter is true is highly questionable although whatever the reason for remaining outside overnight, the next morning the piece of Tofu, by that time frozen, was found and the priests then experimented with the possibility of freezing Tofu and in the process developed frozen Tofu into a dry cake after it has been frozen. After the priest developed foods that could utilize frozen Tofu they popularized such foods in the Koyasan area so that soon commercial production began, with consumption and then production spreading to other places in Japan.

"Although because of the availability of regular Tofu, frozen Tofu did not become as popular as regular Tofu except among the priests of certain temples particularly those at Koyasan. The Koyasan temples still use a large quantity of frozen Tofu for making a multi-course dinner (for themselves and visitors) in which Koyadofu is carefully prepared to appear as a large number of items such as fish, meat, or vegetables. The Koyasan temples are not the only place one might find this type of dinner but the type at Koyasan is the most famous.

"Development: The production of frozen Tofu is now partially automated with all freezing done by machine but such was not the case in the near past. Before the Meiji period only natural frozen Tofu was produced. Production was limited to areas with very cold weather and even in such places only in winter and high in the mountains; A few people produced Koyadofu at home (those living high enough), however the usual way in which commercial frozen Tofu was produced was for six or seven people to go to a suitable place on the mountain for about 90 days each winter producing approximately 700,000 pieces of Koyadofu. At present, frozen Tofu factories can produce that same quantity in three days. Since the Koyasan area was not the only area suited for making frozen Tofu other areas began production, notably the Nagano area, the same area famous for Miso. Production of natural Koyadofu although surviving until recently was too dependent upon environmental factors so a Mr. Nakahama, one time a Columbia University student, imported American freezing equipment and produced machine made Koyadofu for the first time in Yonago city in Totori prefecture in Meiji 43 (1910). This man some 18 years before had imported an ice-making machine and

© Copyright Soyinfo Center 2014

attempted to commercially produce and sell ice and frozen fish but failed. After receiving a patent for the machine frozen Tofu process Mr. Nakahama began production in the city of Osaka but found water in short supply and the cost of production too expensive for efficient operation so he moved to the Wakayama area. His success slowly prompted other producers to begin machine production. Although ten years ago natural production could be found, shortly after the end of World War II machine produced frozen Tofu accounted for the majority of production. Utilizing freezing equipment, frozen Tofu production is not limited to three months per year or only certain geographical locations and can be produced in much greater quantity for a given time period. Even though the machine process can provide a cheaper more uniform product, the consumers of frozen Tofu have just begun to accept that the machine process produces a better product. As in the Miso industry the number of factories is decreasing, although production of frozen Tofu is remaining constant or increasing. Until ten years ago there were many small producers operating only a short time each year. These have all but disappeared with approximately 45 plants now operating, all processing with moderately large and semi-automated facilities. Figure 136 indicates the scale of an average frozen Tofu factory. Although only the portion of the factory which operates similarly to tofu is shown it can be seen that Tofu and frozen Tofu processing are not similar in production scale.

"As Miso is developing in the Nagano area so is frozen Tofu. The scale of operations, outside of Nagano is not as large or as automated as one half of the frozen Tofu makers are located in Nagano and they produce over 80 percent of Japan's production of frozen Tofu. Nagano has the only frozen Tofu factory that is completely automated.

"Many of the frozen Tofu factories outside of Nagano are finding it difficult to compete with the large scale maker so are forced to curtail production because of lack of demand. Since the frozen Tofu factories represent a substantial capital investment it would be very inefficient to allow the factory to be nonoperative for part of the year so even the most successful October-June producer of frozen Tofu may now produce a summer demand product such as ice cream. The smaller producers may also rent freezer space to companies during the summer months. It remains to be seen if such companies will continue to operate profitably.

"Frozen Tofu soybeans: The National and Prefectural Frozen Tofu Associations, while not as active as the Miso Association, do purchase and distribute soybeans for most of their members. As domestic soybeans are priced much too high for frozen Tofu use, U.S. soybeans (No. 2 ordinary) began to be used in recent years. However with soybean trade with China restored, U.S. soybeans may well be replaced. At present the typical maker uses varying proportions of both U.S. and Chinese soybeans. Although considering the stable supply of U.S. soybeans, the makers prefer Red Chinese soybeans mainly because of price although the foreign matter present in U.S. soybeans also plays a part. Frozen Tofu producers can usually purchase sixty kilograms of Red Chinese soybeans $.84 (300 yen) cheaper. The selected types of U.S. soybeans would be ideally suited for frozen Tofu but price is prohibitive.

"The 45 frozen Tofu makers produce the quantity of frozen Tofu indicated in Table XXV and annually consume the amount of soybeans also denoted in Table XXV. Even in peak years use of soybeans total less than 30,000 tons so even if Red Chinese soybeans did come to be used it would not mean a great decrease in use of U.S. soybeans.

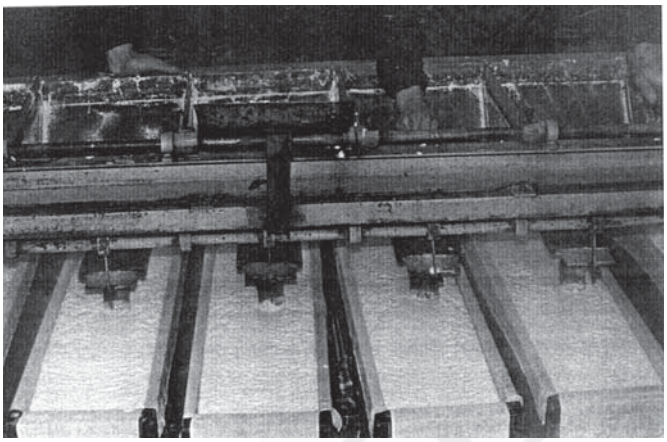
"Processing: For the production of frozen Tofu, soybeans are soaked, ground, and steamed in much the same way as regular Tofu except all procedures are conducted on a larger scale. Soybeans are soaked 8-20 hours depending on season, water ground as fine as possible, and steamed for 10 minutes at 6 kg per square cm or the equivalent of that in an open cooker. Okara is usually removed from the ground cooked substance in the same way as regular Tofu however use of a centrifuge for this purpose is much more popular. The Okara obtained is sold for cattle feed at $12.50 to $13.89 (4,500 to 5,000 yen) per ton. The Tonyu [soymilk] flows through nylon and cotton filters to precipitation containers that are similar to but larger than precipitation containers for Tofu (compare Figure 46 and Figure 137). At this point the efficiency of the frozen Tofu maker would greatly decrease if he used regular Tofu methods of adding magnesium sulfate, of removing water and putting curd into shaping boxes so generally the precipitation agent is added at 60ºC with an electric mixer and water is removed by mechanical means (pump) and shaping boxes may be filled simultaneously using a custom built apparatus as shown in Figures 138 and 139."

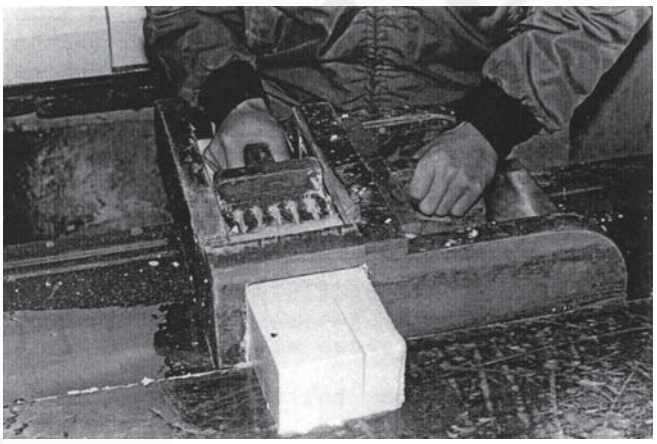
Note: Table 25 shows that production of frozen tofu in Japan increased dramatically from 150 million pieces in 1950 to 630 million pieces in 1963. The amount of soybeans used to make frozen tofu in Japan increased from 6,000 metric tons (tonnes) in 1950 to 25,300 metric tons in 1963 (Continued). Address: San Francisco, California.

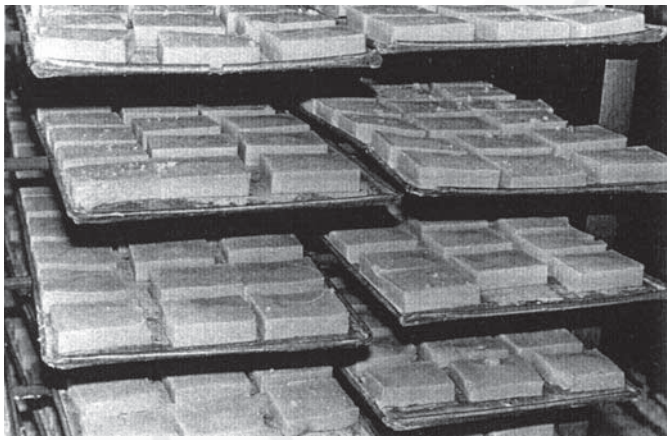
Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 328-359, Unpublished manuscript. 28 cm. [18 ref]

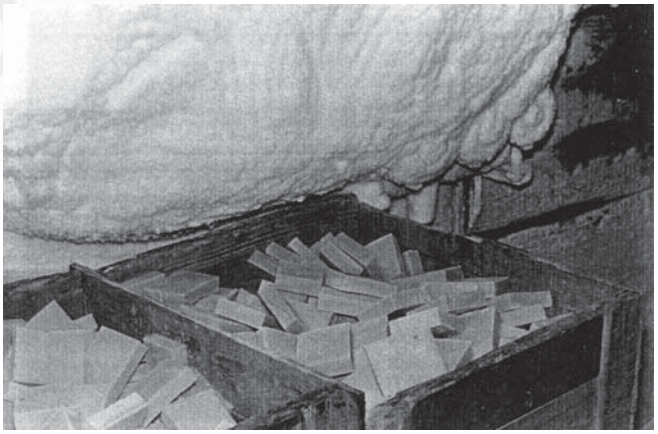
• ***Summary:*** Continued: "A great amount of labor is still required for this process but relative to Tofu the quantity placed in shaping box per man hour is significantly greater. Frozen Tofu Tonyu and curd are much less sensitive to handling than Tofu so they can be mechanically handled without adverse effects. Frozen Tofu curd is formed in a box that is 13 x 30 x 6 inches. It contains a cotton filter

© Copyright Soyinfo Center 2014

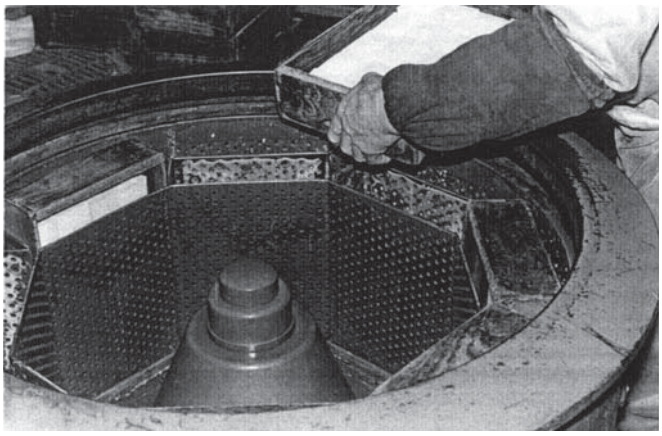


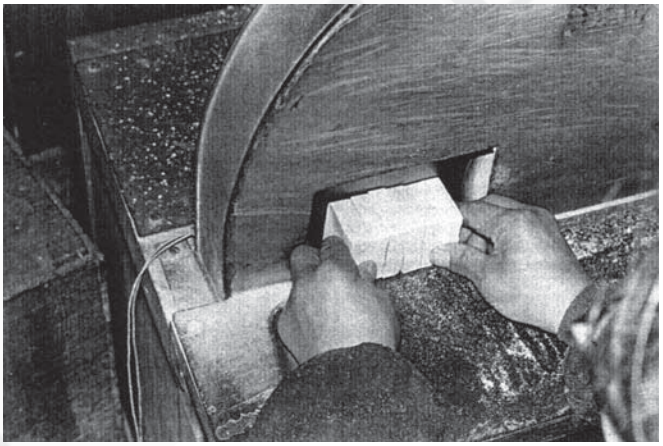






© Copyright Soyinfo Center 2014





© Copyright Soyinfo Center 2014

cloth and is pressed with a 10-20 kilogram weight (stone) for one to two hours in much the same way as regular Tofu although as the frozen Tofu industry is very interested in improving their methods of production, time saving devices such as shown in Figure 140 (curd foaming guide) are utilized throughout the production process. More water is removed from precipitating curd and the curd is pressed with greater pressure than regular Tofu as a hard curd is desirable because frozen Tofu curd is handled while out of water and is to be frozen. After the curd is formed it is submerged in water. Usually the Tofu maker has one small sink in which to submerge Tofu, while frozen Tofu makers usually have a number of large sinks for this purpose (see Figure 136).

"From this point the procedure for Frozen Tofu differs from regular Tofu in that the submerged curd is removed (see Figure 141) only after soaking 24 hours while Tofu is removed and marketed only a few hours after. Since the final frozen Tofu product is storable manufacture is carried on only during the day, not in the early morning as Tofu. After the curd is removed from the water it is cut crosswise mechanically or manually in four to six pieces and then each piece is cut in small pieces 1 x 3 x 3 inches with a mechanical cutter as shown in Figure 142. A few factories have automated the entire cutting process but the method mentioned above is the most popular at the present. The cut pieces are then ready for freezing.

"Freezing, defrosting, drying, treatment with ammonia, and packing: After the formed curd has been cut into small pieces it is placed on trays (see Figure 143) in a freezer at approximately -20ºC for four hours. After quick frozen in such a way the pieces are removed from the trays and put in boxes as shown in Figure 144 and stored at approximately -5ºC for two weeks. Freezing at -20ºC is supposedly for insuring that the piece becomes completely frozen while the two weeks cold storage is for cohesiveness, porosity, maintaining size, and softness. The duration of both types of freezing vary with manufacturer although the above temperatures and time seem to be used the most frequently. After freezing for a desired period the pieces are removed from the freezer and placed in a tank of water for defrosting (see Figure 145). The soaking lasts for about five hours after which defrosting is completed and the now soft piece of curd are then centrifuged to partially remove the large percentage of water that is contained (see Figure 146). Centrifugation achieves this but for reducing same to 10-12 percent a hot air oven is used. For 13 hours the oven temperature is maintained at 110ºC then reduced to 45ºC for another three hours. After the oven treatment the frozen Tofu pieces are inspected by hand for relative dryness (see Figure 147) with pieces of like dryness shelved together and completely dry pieces stored as in Figure 148. Pieces with greater moisture are shelved so that adequate circulation may dry them properly. Until a few years ago natural drying was done in the open air on the roof of the factory or other suitable place however improved centrifugation and oven drying techniques have removed the need for such along with reducing the time required for natural drying from 27 to 20 days. Drying frozen Tofu outside is still practiced by a few makers although such will disappear completely within a few years just as natural freezing disappeared. In 1931 it was found that treating frozen Tofu with ammonia was advantageous in respect to softening after cooking, water absorption, and size increase.

"From its advent in 1931 ammonia's use with frozen Tofu increased in popularity so that at present virtually all frozen Tofu produced in so treated. After frozen Tofu is completely dry it is placed on racks in a small room that is saturated with ammonia gas and allowed to absorb ammonia for approximately one hour. Then frozen Tofu is allowed to aerate so that volatile ammonia can escape. After a certain time the pieces are trimmed as shown in Figure 149 and then graded into four to six grades. Packing frozen Tofu is very important with respect to storability so much care is taken to insure a tightly closed package for all except bulk orders as such are usually displayed in the open air at the market (see Figure 151). Besides in bulk, a box with 10 pieces of frozen Tofu packed in a plastic bag is available as are Cellophane packages (see Figure 150) containing six and 10 pieces. Broken pieces are very often packed in plastic bags. Because of price the broken sell quite readily. A little known fact is that the broken pieces also have the best cooking characteristics. Each type of package may be divided by quality into as many as three grades. Each grade usually can be distinguished by the consumer according to color, although while size is standard for all companies, colors with respect to grades are not.

"Marketing: After being packaged, except for what is marketed in the immediate proximity of the factory, frozen Tofu is trucked to the central markets of the larger cities which handles distribution to retail outlets as well as act as middlemen for the village and country wholesalers and retailers. For high quality frozen Tofu the manufacturer's price is approximately $.0139 (5 yen) with wholesale price about $.018 (6.5 yen) and retail price about $.022 (8 yen). The manufacturer considers it unfortunate that high quality frozen Tofu is the least demanded because poorer grades realize relatively less profit.

"Since production of frozen Tofu is no longer seasonal the quality purchased at one time is decreasing so that the 100 piece box is no longer in great demand except for Buddhist ceremonies, hotel cooking, and other special purposes. Households that do not lack money purchase the ten piece package while poor households purchase piece by piece from shops which very often display unpackaged frozen Tofu without covering as shown in Figure 151.

"The Frozen Tofu Associations at the prefectural level attempt to fix the price of frozen Tofu however with the many grades that exist, such is unsuccessful as it is too

© Copyright Soyinfo Center 2014

difficult to compare price of one company's frozen Tofu with another. With the existence of a competitive market, frozen Tofu is, coupled with its food value, a very inexpensive product. Its virtues are not well known however, as given the scale of even the largest company, national advertising cannot be conducted because of costs. This causes the item to remain a specialized product among older people and to be unknown among the younger people. It is thought by the various makers that greater emphasis should be put upon advertising, however they are not exactly sure how they can do this.

"If properly manufactured and packaged frozen Tofu is an extremely long lasting product. If stored in ideal condition, i.e. low humidity, stable temperature, et cetera, frozen Tofu would last many years. Ideal conditions very seldom exist especially in Japan so the frozen Tofu makers recommend that frozen Tofu should be consumed within three months in summer and within six months in winter. These recommendations may be for sales purposes, however in about three months the ammonia smell will disappear and supposedly that is a sign of decreasing taste. If the surface of frozen Tofu changes to dark yellow the piece has decreased further in taste but remains edible. If the piece becomes dark yellow throughout it should not be eaten. The preservation potential of frozen Tofu could most likely be increased through research and development of new methods of making and packing. At that time and even at present frozen Tofu seemingly would be ideally suited for use in parts of the world where environmental conditions are not suitable for fresh foods. Japanese frozen Tofu makers are too small to explore the possibilities of the export market but it is the hope of the makers that such a market will develop even on a small scale.

"Use: Frozen Tofu, a food product with composition as stated in Table XXVI is, as indicated, high in food value particularly protein, Unfortunately it is not a popular food nor well liked so its actual value to the Japanese diet is limited as per capita consumption for Japan is a whole is extremely low (see Table XXVII). Somewhat the reverse is true in rural areas especially those which do not have regular Tofu delivered. Rural consumption of frozen Tofu is double that of urban consumption" (Continued). Address: San Francisco, California.

5230. Brandemuhl, William. 1965. Frozen tofu: Use, closing comments (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 328-359, Unpublished manuscript. 28 cm. [18 ref]

• ***Summary:*** Continued: "Frozen Tofu is so identified with Buddhism such as Buddhist conducted funerals and other ceremonies that although the food is not considered sacred, it is considered to have a special role in religion. Liberalization from this role may be what is needed to develop the consumer market. The initial steps of preparing frozen Tofu is rather easy but subsequent steps to blend frozen Tofu with other foods are difficult. Consequently most young housewives do not prepare frozen Tofu. At first the desired number of pieces are placed in a pan of boiling water for 30 seconds and upon removal squeezed if possible. At this time the pieces are cooked with a number of foods. When cooking is completed the piece will have expanded 2½ times its original size, significantly increasing the water content from the 5-10 percent content before cooking. Because of the work involved, certain foods shops do sell cooked frozen Tofu (see Figure 152) but the price more than doubles. The most difficult part of cooking frozen Tofu however is making it taste like the food it is cooked with as frozen Tofu has very little inherent taste. If taste is not successfully added, partaking of frozen Tofu is similar to consuming a sponge. Cooked frozen Tofu mixed with certain foods is available in certain shops (see Figure 153) but it is not a popular carry home food item because of the price.

"For the experienced cook, especially a farmer's wife, frozen Tofu can be prepared in the following ways:

"(1) In Sukiyaki (some frozen Tofu makers market Sukiyaki size pieces).

"(2) As a breading for meat.

"(3) Simmered with boiled vegetables.

"(4) After a dry piece is crushed and soaked, fried with carrots.

"(5) After a dry piece is crushed, soaked, and sauteed, mixed with eggs for making omelets.

"(6) Lightly cooked with Shoyu and sugar (a dish liked by poor people).

"(7) After being cooked with Shoyu and sugar, fried with onions.

"For the most of the above uses, frozen Tofu does not add much or could easily be replaced with an easy to prepare substitute so the rushing urban housewife in fact uses the substitute. The progressive segment of the frozen Tofu industry believes that for expansion of use, modernization of the product is necessary.

"For this group modernization means an instant frozen Tofu most likely in powder form. Recently patents were procured on an initial type of instant frozen Tofu although such products are not ready to be marketed. As with Miso and Tofu, modernization involves a great change in the shape, appearance and other characteristics that are time honored and a part of the way of using. Instant frozen Tofu may have an advantage over Tofu and Miso though as instant frozen Tofu would definitely be easier to prepare than the traditional product. If instant frozen Tofu is technically impossible (which seems unlikely given the initial success) or if it is unaccepted it is quite possible that frozen Tofu consumption will gradually decline with the expiration of the aging segment of the population that now use frozen Tofu."

Note: Table 26 gives the composition of frozen tofu (100

© Copyright Soyinfo Center 2014

gm) on a dry weight basis; it contains 53.5% protein, 26.4% fat, 480 calories, and 590 mg of calcium.

Table 27 gives the yearly per capita consumption of frozen tofu in Japan from 1950 to 1963. It grew dramatically from 1.8 pieces weighing 35 grams in 1950 to 6.6 pieces weighing 132 grams in 1963. Yet the absolute amount is still very small. Address: San Francisco, California.

5231. Brandemuhl, William. 1965. Tsukudani and nimame (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 387-99, Unpublished manuscript. 28 cm. [2 ref]

• ***Summary:*** "Description (Endnote 170): With the hope that certain types of food–mainly fish–could be preserved, an emperor of Japan at one time gave an island to certain parties for the development of a long lasting food made of common perishable food items. The result was Tsukudani, (mentioned in the Shoyu section), one or more of a variety of foods that are soaked if necessary, steamed, cooked with Shoyu, sugar, and other seasonings, cooled, and packed. The first to develop was Tsukudani made of whole small fish. After that came shrimp, other types of fish, and sea foods, many kinds of kelp, many kinds of seaweed, vegetables, beef, red beans and soybeans. All such types of Tsukudani have found acceptance among certain groups, attested to by the fact that such items were made in great quantity at home throughout Japan. With the thought of capturing a portion of the market, companies began to promote commercial Tsukudani and did same with a great degree of success. At present Tsukudani is very often produced in large modern factories. The greatest advancement that the companies brought forth was in the field of packing as sealing a quantity of Tsukudani in plastic after exhausting the air results in a product that lasts six months to one year. The most used Tsukudani is made from kelp, although whatever kind is produced, quick-method Shoyu is an important component. Figure 165 somewhat indicates Shoyu's use for Tsukudani as pictured are five large vats that are used exclusively for quick-method Shoyu for Tsukudani. In certain kelp Tsukudani as much as 30-50 percent of total volume is accounted for by Shoyu. Soybean Tsukudani has only 10 percent Shoyu because of the inherent qualities of the whole soybean.

"Manufacture (Endnote 171): Soybean Tsukudani as mentioned before contains about 10 percent Shoyu. In addition to soybeans it usually contains water, carrots, lotus root, kelp, and sugar in possible proportions as follows:

"Soybeans 56 kilograms
"Kelp 2 kilograms
"Carrots 3 kilograms
"Lotus root 4 kilograms
"Sugar 13 kilograms
"Light Shoyu 20 liters
"Water 20 liters

Note. This is the earliest English-language document seen (June 2013) that contains the term "Soybean Tsukudani." "A very large maker might use 300-350 kilograms of soybeans per day however statistics on total soybean usage for Tsukudani are unknown as data are not kept for soybean Tsukudani alone. U.S. soybeans are too small for making Tsukudani so only Hokkaido soybeans are used at present. If domestic soybeans continue to decrease in production it is believed that Tsukudani producers will shift to using imported soybeans, possibly Red Chinese. At first the Hokkaido soybeans are soaked for 8-16 hours depending on the season then steamed in an autoclave with a small quantity of kelp for 30 minutes at one kg per square cm pressure.

"While the soybeans and kelp are steaming the water, Shoyu, carrots, lotus root, and sugar are boiled for 30 minutes in a steam cooker as shown in Figure 166. Some Tsukudani makers believe that high grade Tsukudani can only be made if the proportion of material and size of cooking facilities are reduced from the quantity and capacity mentioned above. Such makers therefore may have as many as 40 small size cookers and many small autoclaves. The boiling material is stirred a number of times during the 30 minutes. When both steaming and cooking are completed the steamed soybeans and kelp are added to the boiled material and boiled for an additional 15 minutes. After such cooking the entire batch is placed in a container and allowed to cool naturally and soak for 12 hours in the liquid that it was boiled in (see Figure 167). After soaking, the liquid is drained but by this time the volume has increased two-fold. The drained material is then vacuum packed and sterilized making it ready for marketing.

"Use of soybeans Tsukudani (Endnote 172): Soybean Tsukudani is usually packed in 140, 200, or 300 gram packages. The making cost of the 140 gram package is supposedly $0.061 (22.5 yen) while the wholesale price is $0.065 (25 yen) and retail price might be $0.083 (30 yen). The 200 and 300 gram packages may retail for $0.097 and $.16 (35 and 58 yen) respectively. Soybean Tsukudani is available at all department stores (for the purpose of advertisement), all market places, Shoyu shops, and variety food shops. Tsukudani of all types increased in demand more than six times since World War II however since 1955 growth has been rather stable. Soybean Tsukudani, as with most other types, is mainly consumed by the lower classes. If combined with rice Tsukudani makes an adequate if not complete meal. Since it is a cooked product it can just be unpacked and eaten. Because of this, Tsukudani is very often used every day in the laborer's as well as the lower ranked office worker's lunch box. Besides of the product similar to Tsukudani mentioned below, people eat soybean Tsukudani very infrequently, if ever, preferring instead a high quality kelp Tsukudani.

"Nimame (Endnote 173): Nimame is a product very similar to soybean Tsukudani except that Nimame is most

© Copyright Soyinfo Center 2014

often sold from open containers (see Figure 168) and it does not have as many ingredients in one type but it may be combined with a greater number of other foods depending upon the season, festival, financial status, and other factors.

"Nimame was originally a farm household dish that provided a use for domestically grown soybeans. Such soybeans were first put in an iron pot with water, salt, and sugar and cooked for as long as 24 hours. Experimentation proved that a small quantity of sea weed or kelp improved the flavor. After that the practice of eating Nimame spread to the cities where other foods were found suitable for complementing the taste of the soybeans. At present shrimp (see Figure 169 and 170), other seafood, and vegetables all can be found in small shops that prepare cooked foods. It is made by Tsukudani companies as well so its usually sold in Tsukudani shops. Nimame is made from domestic soybeans and is commercially prepared in the same way as Tsukudani minus a number of components. Nimame is prepared at home by boiling the components between 12-24 hours. Nimame eaten as an ordinary dish is, like Tsukudani, a lower class food except around the New Year's season when the original form of Nimame, that is, just soybeans cooked with Shoyu and sugar are consumed by virtually all Japanese regardless of class. At that time Nimame may be prepared in the home or purchased (see Figure 171). For an unknown reason black soybeans (Figure 171) rather than yellow ones are preferred for New Year's consumption although it is thought that since black soybeans have the tendency to become very shiny when boiled with sugar so when served as shown in Figure 172 a more decorative setting can be achieved. Black Tanba paddy field soybeans (mentioned previously) are the most demanded for New Year's purposes, with black Tanba dike soybeans following and Hokkaido black soybeans a close third. Japan's total consumption of Nimame is completely unknown as there are unknown thousands of unspecialized shops selling an unrecorded amount of Nimame. Nimame is considered an important way in which farmers use their unmarketed domestic production, although again statistics are lacking."

Figures (black and white photos) show: (165) Shoyu vats, outdoors but under a roof, at a Tsukudani factory. (166) A Tsukudani cooker. (167) Cooling Tsukudani. (168) Nimame being sold retail in a market. (169) Nimame with shoyu and shrimp. (170) Nimame with shrimp. (171) A Japanese woman with a scale selling Nimame. (172) Nimame as served.

• ***Summary:*** This book is about the "Christian century" in Japan, which includes these key events (chronology): 1542–Portuguese arrive in Japan. 1549–Arrival of St. Francis Xavier. 1568–Nobunaga becomes ruler of central Japan. 1582–Hideyoshi succeeds Nobunaga. 1587–Edict issued expelling missionaries. 1598–Ieyasu succeeds Hideyoshi.

1614–General persecution of Christians begins. 1624–Expulsion of Spaniards. 1639–Expulsion of Portuguese. 1640–Unsuccessful embassy from Macao [to Japan].

This anthology is composed of selections / excerpts from the writings (original texts) of more than 30 Europeans who visited Japan during the period from 1542 to 1640. The material is organized into 23 chapters, by subject, including: The country. History. The people. Social relations. The language. Food and drink. Shinto. Buddhism. Temples and idols. Persecution.

In the chapter on "Food and drink" is a section (p. 190) titled "Their diet," by John Saris, in which he states: "... of Cheese [probably tofu] they have plentie, Butter they make none, neither will they eate any Milke, because they hold it to bee as bloud [blood], nor tame beasts."

Sources: "Saris, John. (1) The Voyage of Captain John Saris to Japan, 1613. E.M. Satow, ed. London, 1900. (2) The First Voyage of the English to Japan. Takanobu Otsuka, ed. Tokyo, 1941."

Another section (p. 191) titled "Three meals a day," by Jorge Alvares states: "Their food consists of rice, chick-peas [probably soybeans], mangoes, maize, Indian corn, yams and wheat, and I think all of it is served dressed with some paste [probably miso].

Source: "Alvarez, Jorge. 1547. Report in *Missoes dos Jesuitas no Oriente,* by Jeronimo P.A. Camara Manoel, p. 112-25."

The author, who was born in 1930, is a Jesuit who has written much on the early history of Japan. Address: S.J. [Jesuit], Campion Hall, Oxford [and Sophia Univ. (Jesuit), Tokyo, Japan].

Daizu seihin oyobi shoku-en ga nezumi no hatsuiku oyobi kôjo-sen ni oyobosu eikyô [The effect of soybean products or sodium chloride in diets on the thyroid and growth of rats]. *Eiyo to Shokuryo* (*J. of Japanese Society of Food and Nutrition*) 18(3):190-93. [17 ref. Jap; eng]
• ***Summary:*** Tests with rats showed that the feeding of heated soybeans, natto (fermented soybeans containing no sodium chloride), miso (fermented soybeans containing sodium chloride) or tofu (soybean curd) produced a high incidence of thyroid enlargement in the rats, but the enlargement was prevented by increasing the iodine content of the diets by a small amount.

The inclusion of sodium chloride in iodine-deficient diets at the 3% level caused a pronounced hypertrophy of the thyroid and weight loss in rats. In this case, the supplementation of iodine alone did not prevent the weight loss, but adding methionine plus iodine did.

Axelrod et al. have reported that thyroxine production in rats was increased with increasing sodium chloride intake. Thus, the effects of a large intake of sodium chloride resemble in some respects those of administration of thyroxine.

"It is well established that thyroxine increases the metabolic rate and oxygen consumption of animals and beyond small and very critical levels the thyroid hormone decreases growth and feed efficiency. Charkey found that all of these effects of thyroxine can be reversed by methionine. The present findings that methionine prevented the weight decrease of rats fed a diet of high sodium chloride content may be explained by the antithyrotoxic effect of methionine." Address: Tohoku Daigaku Nôgaku-bu, Eiyo Kagaku Kyôshitsu [Lab. of Nutrition, Faculty of Agriculture, Tohoku Univ., Sendai, Japan].

5236. Kurokawa, Kazuo. 1965. Daizu oyobi sono kakkô shokuhin no suiyôsei chisso ni tsuite [Study of water soluble nitrogen of soybean and its products]. *Eiyo to Shokuryo* (*J. of Japanese Society of Food and Nutrition*) 17(5):333-36. (Chem. Abst. 64:11768. 1966). [5 ref. Jap; eng]
• ***Summary:*** The water soluble fraction of the nitrogen in soybean products varied depending on the way that each product was processed. In the case of miso, approximately 60% of the nitrogen was extractable, mostly as formol nitrogen. Address: Tokyo-toritsu Hakuô [Shiro Kamome] Kôtôgakko.

5237. May, Jacques M. 1965. Food technology and nutrition in Communist China. In: Martin S. Peterson and Donald K. Tressler, eds. 1965. Food Technology the World Over. Vol. II. South America, Africa and the Middle East, Asia. Westport, Connecticut: AVI Publishing Co., Inc. ix + 414 p. See p. 245-74. Illust. Index. 24 cm. [7 ref]
• ***Summary:*** This chapter is reprinted with permission from "The Ecology of Malnutrition in the Far and Near East," by Dr. Jacques M. May, with the collaboration of Irma S. Jarcho, M.P.H., New York, 1961.

Despite its vast territory, China lacks good arable land. Only 11% of the total surface area is presently cultivated. In 1958 China was one of the poorest fed nations in the world, with 1,830 calories per capita per day; 75% of these came from grain foods, 9.2% from vegetable fats, and only 4.5% from animal proteins.

Forced industrialization competes with agricultural growth for financial and labor resources. Table 79 shows production of various food crops (in millions of tons) in five recent years (see below). For soybeans these figures were 9.5 in 1952, 10.2 in 1956, 10.0 in 1957, 12.5 in 1958, and 15 in 1959 (target).

China's Second Five-Year plan (1958-1962) divided China into zones and sought to increase agricultural production.

China's main trading partner is Japan. Table 85 (p. 258) shows exports to Japan in metric tons. For soybeans: 204,000 in 1954, 66,000 in 1955, and 200,000 in 1956.

Relaxation of the Western economic embargo against communist bloc nations may cause China to purchase more products from the West. Address: Director, Medical Geography Dep., American Geographical Society, New York City, NY.

completed in 1965. According to Tomoko Brandemuhl this black-and-white photograph (4½ by 6½ inches) was taken in late 1965, shortly after the book was completed

This photo was sent to Soyinfo Center in Oct. 2012 by Tomoko Brandemuhl (Stratford, Connecticut), his wife.

5240. Raper, Kenneth B.; Fennell, Dorothy I. 1965. The genus *Aspergillus.* Baltimore, Maryland: The Williams & Wilkins Co. 686 p. Illust. Index. 24 cm. [400+* ref]
• ***Summary:*** The authors discuss the koji molds in Chapter 18 titled "Aspergillus flavus group." Contents: Outstanding characters. General considerations (incl. *A. oryzae, A. oryzae* var. *effusus, A. flavus, A. tamarii,* and *A. flavo-furcatis*). Occurrence and significance: Introduction, enzymes (amylolytic, proteolytic, lipolytic). "Members of this group are widely distributed in nature. They are regularly isolated from soils, particularly those from tropical and subtropical areas, from forage and decaying vegetation, from stored seeds and grains, and from various types of food products. They contribute to decomposition processes... Except for *A. Niger* and allied species, they have been used more widely in industry than any other group of molds, particularly for the production of enzymes.

"Members of the *Aspergillus flavus* group produce diastatic and proteolytic enzymes abundantly. In large measure the alcoholic and soy food industries of the Far East are based upon these molds and their enzymes. In the soy industries, closely related molds, or even the same strains, are used as a source of proteolytic enzymes. In 1894 Takamine secured a series of U.S. patents covering the production of diastatic enzymes and the making of alcoholic liquors. Subsequent to this, other investigators, mostly Japanese, published a number of papers in this field. Oshima, in 1922 and 1928, reported on the production of protease by members of the *A. flavus-oryzae* group. Today, considerable quantities of diastatic enzymes, proteolytic enzymes, and mixed diastatic and proteolytic preparations are being manufactured from these molds for use in the food, textile, and tanning industries." Address: Dep. of Bateriology, Univ. of Wisconsin, Madison, Wisconsin.

5241. Richmond, Sonya. 1965. International vegetarian cookery. London and Glasgow: Collins. 192 p. Index. 22 cm. Published in the USA by Arco in 1967.
• ***Summary:*** This book, dedicated to the author's yoga pupils, arranges recipes (mostly entrees and soups) by country. The only Asian countries included are China and India; Japan is not. The author, who appears to be British, has collected these recipes from other vegetarians during her travels. The only soy-related recipe in the book is "Soya Bean Noodles," listed under China (p. 49). The introduction to the recipe reads: "This is a most useful recipe for the vegetarian because it requires soya bean flour. As I have said before [where?] soya bean is one of the most valuable sources of protein known to man. It is easy to buy soya beans, both whole and cracked, in health-food shops and delicatessens. It is equally easy to obtain soya bean flour which is yellow in colour. Do not attempt to use it like ordinary flour for it contains no starch and therefore is not a thickening agent. It has to be cooked according to its own nature. This Chinese recipe makes excellent use of it, and this recipe is also extensively used in Japan." The only ingredients are: 1 lb. soya bean flour, 2 egg yolks, 1 tsp. salt, and cold water as required. No wheat flour is used.

5242. Sakurazawa, Nyoiti [Ohsawa, George]. 1965. You are all sanpaku. English version by William Dufty. Secaucus, New Jersey: University Books. 224 p. Index. 22 cm. First paperback edition published in 1980 by Citadel Press, Secaucus, NJ.
• ***Summary:*** Contents: Introduction. The divine ritual. A land of sanpaku. Faith and medicine. The cause. The cure. The daily check-up. Food and sex. Prayer and fasting. The sacred act. About salt. About sugar. About milk. About liquids. About chewing. About principal foods. Soulfood: Brown rice, rice cream, buckwheat, buckwheat cream, wheat, cous cous, chapati, millet, raw rice, bread, gomasio [gomashio] (sesame salt), umeboshi plums, miso and shoyu, tahini, miso cream, about tea, coarse green tea (bancha), soya ban (coarse green bancha tea with soy sauce), mu tea, lotus tea, lotus tea, mint tea, thyme tea, Ohsawa coffee (Yannoh; made of rice, wheat, aduki beans, chick peas, chicory, and a little oil), Dandelio (dandelion coffee substitute), kokoh,

© Copyright Soyinfo Center 2014

kuzu, umeboshi juice, ume syo kuzu (umeboshi + shoyu + kuzu), aduki juice, radish drink (daikon #1 and #2), special rice cream, brown rice tea, wheat tea. The oneness of the universe [Ohsawa's profound and beautiful credo]. Tables: 1. Macrobiotic table of daily food in order of yin to yang. Note: The most yin foods are indicated by 3 downward-pointing triangles; the most yang foods by 3 upward-pointing triangles. Beans (except aduki) are quite yin, being symbolized by 2 downward-pointing triangles. Eggplant, tomato, and potato are the most yin vegetables. The most yang cereal is buckwheat, followed by rice. 2. Physical phenomena–Yin/yang table. Biographical note on Ohsawa (p. 213-18).

This was the first popular book in English to explain the principles of macrobiotics. "*Sanpaku* describes a condition in which they white of the eye can be seen between the pupil and the lower lid as the subject gazes directly forward. This, we quickly learn, connotes a grave state of physical and spiritual imbalance." It is the Oriental sign of impending disaster.

Soy-related recipes and information include: Soya bean plaster (p. 140). Tofu plaster (p. 141; tofu is called "white soya bean cheese"). Tekka [miso] for anemia and general weakness (p. 143). Miso and shoyu (p. 190). Miso cream (with tahini, p. 190-91). Soya ban: Coarse green bancha tea with soy sauce (p. 194). Ume syo kuzu (p. 199; a proven medicinal beverage [made from umeboshi, shoyu, and kuzu]).

About sugar (p. 165): "I am confident that Western medicine will one day admit what has been known in the Orient for years: sugar is without question the number one murderer in the history of humanity–much more lethal than opium or radioactive atomic fallout–especially for those people who eat rice as their principal food."

About milk (p. 169): "There is no reason for man to live on the milk of an animal–especially an animal inferior to him biologically and intellectually." People of the Orient avoid milk "because they respect the biological natural laws of the Order of the Universe... Once the young offspring of animals have their teeth and are weaned from nursing, they no longer drink milk... No animal ever does." "The quality and quantity of a mother's milk controls her child's destiny. In cases where the mother's milk is not available, babies can be fed with *Kokoh*–a macrobiotic cereal milk made with roasted rice, glutinous rice, oatmeal, soya beans and sesame seeds reduced to powered form" (see recipe p. 198).

Miscellanea: The Ohsawa Foundation at 317 Second Avenue in New York City, located on the first floor of an old tenement, had a 4-table restaurant in the front and a kitchen in the rear. There were several macrobiotic restaurants in Paris, plus a tiny macrobiotic food store named Les Trois Epis and the Librarie Ohsawa, both on Rue Lamartine Guy Massat was editor of the French monthly journal *Yin/Yang*. The author: "I could not remember a single doctor, out of dozens who treated me, who had ever shown the slightest curiosity about what I ate and drank."

"The stark facts presented to the President of the U.S. by his Special Commission on the Nation's Health in December of 1964 are staggering: In 1963 heart-artery disease caused 55% of all U.S. deaths, and cancer 16%. Strokes 210,000; diseases of arteries outside the brain combined with diseases of the heart to kill 793,000. Cancer killed 285,000" (p. 66). Occidental medicine is symptomatic medicine; it does not seek to cure the basic causes. And it is microscopic/analytical. It seeks the truth in a maze of details; but the "truth is whole." The "ultimate cause of every illness is violation of the order of the universe through ignorance or through arrogance,..." (p. 80-81). "Disease is a divine warning, a message from nature seeking to guide us to the correct path" (p. 98). The essential factor in the proper nutrition of the human body is the proper proportion of Yin and Yang. The best proportion of Yin/Yang or Potassium/Sodium is 5 to 1. All those foods whose K/Na ratio is greater than 5 to 1 are Yin. The books ends with a "Biographical Note: Sakurazawa-Ohsawa" who is said to have "published some 300 works in Japanese and more than 20 books in Western languages, principally French." His wife, Lima, is a professor of traditional Japanese music. There is a selected bibliography of Ohsawa's books, especially those published in French. Address: New York.

5243. Shibaki, Yoshiko. 1965. Yuba. Sumidagawa [Yuba and the Sumidagawa river]. Tokyo: Shinchôsha. 221 p. 16 cm. [Jap]*

5245. *SoyaScan Notes.* 1965. Chronology of The Infinity Company (Originally named Perseverance Foods). 16 Jan. 1992. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1965?–This company was founded in New York City under the name Perseverance Foods by Howard Rower. 1964 or 1965–The company name was changed to The Infinity Co., but it was popularly known as Infinity Foods. In 196? it was incorporated as The Infinity Food Co. Inc.

After Herman Aihara and the Chico group left New York in 1961 and the Kushis left in 1963, something of a void was left–which Infinity filled. It was a macrobiotic and natural foods warehouse, importer, and wholesale distribution company that was a prime source of food for many of the early macrobiotic and natural foods groups and students, including the Kushi Study Houses in Boston, Massachusetts.

© Copyright Soyinfo Center 2014

Infinity imported foods (including Mugi Miso by 1965) from Tokyo CI (Centre Ignoramus), which "guaranteed" the foods' quasi-medicinal effects. The food was of top quality. The owners (including Howard Rower and Jason Hammond) were involved with the Church of Scientology.

1971–Greenberg's Natural Foods in New York City and Mother Nature & Sons in New York City both advertise that they carry foods supplied by Infinity Food Co. which was located at 171 Duane Ave., New York City, New York 10013 [later 10005]. Phone: 212-925-2062. Infinity was located in the old produce district of New York, an area of town called Tribecca.

Bruce Macdonald (1992) remembers that for a while, in the late 1960s, Erewhon was Infinity's largest customer, even though Infinity was always a relatively small company. As Howard Rower moved up in the Scientology hierarchy, he gradually lost interest in Infinity. He married someone who was very wealthy, soon got in the "fast lane," was traveling to Europe, etc. Bruce doubts that the decline of Infinity was attributable to Erewhon in any way. Bruce thinks Infinity went out of business in about 1970 or 1971.

Jan. [4 ref. Jap; eng]
• ***Summary:*** The action of several protease preparations on soybean protein was studied to elucidate the possibility of making cheese-like products from soybean. Dried frozen tofu (kori-dofu) was powdered then mixed with the protease solution, kneaded for 30 minutes, then allowed to stand for 24 hours at 45ºC while digestion / hydrolysis took place.

Under the proper conditions, products with about the same level of total free amino acids as processed cheese can be produced. "Although some were good, most of them had a rather queer taste and dark color." The pattern of free amino acids in those products was somewhat different from that of cheese.

The possibility that these products could be "used as a cheese-like food or a raw material for some processed foods is discussed."

5263. *Sunset* (*Menlo Park, California*). 1966. Cooking with *dow foo.* 136:190, 192-93. Feb.
• ***Summary:*** "The Chinese call it *dow foo;* the Japanese, *tofu.* Both terms refer to a soft, cheese-like food made of soybean curd. The picture below shows the three forms of fresh dow foo available in Chinese markets. The water bean cake (*suey dow foo*) has a high water content and is used in Chinese soups. The smaller, compressed cakes (*dow foo yuen*), with medium water content, are diced and sautéed with meat or vegetables. The little fried bean cakes (*dow foo bok*) can be sautéed whole or sliced, or stuffed with a meat mixture.

Note 1. This is the earliest English-language document seen (April 2013) that contains the term "fried bean cakes" or the term *dow foo bok.* Both refer to fried tofu.

Note 2. This is the earliest English-language document seen (April 2013) that contains the term "water bean cake" or the *suey dow foo* [*shui doufu*]. Both refer to Chinese-style soft tofu. tofu.

"Japanese tofu is similar in texture and flavor to the Chinese dow foo yuen, and can be substituted for dow foo bok, although the tofu pieces are twice as large.

"Soybean cake has little flavor of its own, but it quickly takes on the flavors of foods with which it cooks, while its soft texture provides an interesting contrast."

Gives recipes for: Chinese soup with suey dow foo. Dow foo yuen with leeks. Dow foo yuen with oyster beef (uses oyster sauce). Dow foo yuen with chicken or pork (uses brown bean sauce). Sliced dow foo bok with steamed fish. Dow foo bok stuffed with pork.

Note 1. This is the earliest of many tofu recipes seen in *Sunset* magazine. This is also the earliest English-language document seen (Feb. 2004) that uses the term "soybean cake" or "dow foo yuen" to refer to tofu.

5264. Claiborne, Craig. 1966. New Yorkers take to tempura and chopsticks with gusto. *New York Times.* March 10. p. 22.
• ***Summary:*** "But gastronomically there has been no phenomenon in recent years to equal the proliferation of Japanese restaurants [in Manhattan], East Side, West Side and up and down the town."

There have been Japanese restaurants in New York for many years but in the early days, unless one spoke Japanese, the choice was between tempura and sukiyaki. Today the choice of dishes is almost unlimited.

The first of the "grand luxe Japanese restaurants" in Manhattan was the Saito; it offered tatami mat rooms (*ozashiki*). Next came the Kabuki, then the Nippon.

Mizutaki is "boiled chicken and vegetables served with soy and lemon sauce." Appetizers include "bits of tuna with soy [sauce] and ginger, and stashi, the traditional dish with soy and ginger." Kabayaki is [eels] "glazed with a light soy sand sugar sauce." Three recipes are given: Shabu-shabu calls for "2 pieces tofu (bean curd), each cut into four pieces." Ponzu sauce (Soy and lemon sauce) calls for ½ cup each lemon juice and "Japanese soy sauce, ¼ teaspoon ajinomoto (monosodium glutamate)..." Gomazu sauce (sesame sauce) calls for "4 ounces sesame seeds or one-half cup tahini (sesame paste...), ½ cup Japanese soy sauce. ¼ teaspoon ajinomoto (monosodium glutamate)..."

5265. *Foreign Agriculture.* 1966. Japan's city people, bakeries, institutions responsible for increased use of soybean oil. 4(12):11-16. March 21.
• ***Summary:*** ... according to a market research study on edible oils recently completed for the American Soybean Association. The key to continuing gains in U.S. exports to Japan is promotion of soybean oil consumption. Japan's consumption of all fats and oils–at around 14 pounds per person–still lags behind that of most other highly developed nations. It is one-fourth that of the Netherlands at 60 pounds and one-third the U.S. level of 46 pounds. Approximately half of the 313-grams of vegetable oil consumer per person each month is soybean oil.

5269. Meade, Mary. 1966. Raw chicken best in many oriental dishes. *Chicago Tribune.* April 4. p. C13.
• ***Summary:*** Japan Air Lines says there is much interest in authentic Japanese sukiyaki, but adds that it would be almost impossible to duplicate the dish as it is served in Japan.

"Tofu is bean curd." If not available, it may be omitted. "Shoyu is Japanese soy sauce. It is important to use this instead of American or Chinese soy sauce because it is less

© Copyright Soyinfo Center 2014

salty.

The recipe for Sukiyaki includes "12 1-inch cubes of tofu" and "½ cup shoyu."

5270. McCormick, Sally. 1966. Azuma Sukiyaki House: For leisurely dining in the Japanese manner–5120 N. Broadway, Chicago (Advertorial). *Chicago Tribune.* April 7. p. H12.
• ***Summary:*** Next came the Sukiyaki. "Chieko glided in once more with an hibachi stove, large frying pan, and an attractive tray full of appetizing, fresh vegetables, thinly sliced prime rib, and soy cakes... She removed the suet and added generous slices of beef, fresh mushrooms, bamboo shoots, Tofu (soy bean cakes), Shiratake [Shirataki] (yam noodles) and assorted fresh vegetables." The restaurant also serves Beef Teriyaki, Chicken Teriyaki, and Salmon Teriyaki. Three photos show Azuma.

Note 1. This might be called an "advertorial."

This ad also appeared in the 29 Sept. 1966 issue of this newspaper (p. J9).

Note 2. Shirataki are thin noodles of konnyaku, a gelatinous paste made from the root of the devil's tongue plant, *Amorphophallus konjac.* Konnyaku has no flavor, and no nutritional value, because its starch is not digestible by the human body. However it is an excellent source of dietary fiber and is appreciated for its chewy texture.

5271. *SoyaScan Notes.* 1966. Chronology of Erewhon. Renamed Erewhon Trading Co. in 1967. 12 Dec. 1991. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1966 April 9–Erewhon opens as a small (10- by 20-foot) macrobiotic and natural foods retail store at 303-B Newbury Street (below street level) in Boston. Aveline and Michio Kushi are the founders, but Aveline is the sole owner. Evan Root is the first retail store manager. The origin of the natural foods industry and movement in America can be traced to this date. Erewhon is the first store of its kind in America and it soon serves as a model for many other similar natural food stores across the nation. Erewhon sells several soyfoods, mainly miso and shoyu purchased from Howard Rower's Infinity Foods or Japan Foods Corp., both in New York.

1967 Aug.–Paul Hawken takes over the management of Erewhon (one small retail store) from Evan Root. He changes the name to Erewhon Trading Co. (from simply "Erewhon") and starts to expand the business.

1968 May–Paul Hawken incorporates Erewhon Trading Company. Paul later states that he and Aveline Kushi each own 50% of the stock. However Aveline Kushi and her attorney, Morris Kirsner, agree that they offered him 50% of the Erewhon stock shortly before he left for Japan (in March 1969) but he did not accept it. To this day (Feb. 1999) Aveline has no idea why Paul did not accept such a generous offer.

1968 June–Hawken establishes his first supplier of organically grown grains, Ted Whitmer, a wheat farmer in Montana. By 1973 Erewhon had established and contracted with 57 farms in 35 states to provide the company directly with organically-grown foods.

1968 Aug.–Erewhon starts to import foods from Japan, initially from Muso Shokuhin, later by correspondence with Mr. Akiyoshi Kazama, who worked for an import/export company named Mitoku, which sold no food at the time. The initial orders contained red miso (made by Sendai Miso Shoyu Co.) and natural shoyu (made by Marushima).

1968 Nov.–On Thanksgiving day, Erewhon moves up and across the street to a much bigger and nicer location at 342 Newbury St. Paul had hired Bruce Macdonald, a carpenter, to remodel this store. The company now has 6 employees: Paul Hawken, Roger Hillyard, Bruce Macdonald, Bill Tara, Jim Docker, and Jean Allison. One day later, Bill Tara leaves to start a macrobiotic East West Center in Chicago. The original downstairs room is taken over by Tao Books, then Redwing Books. Tofu, curded with calcium sulfate and made by a Chinese company in Boston, starts to be sold.

1969 March–Paul Hawken and Evan Root leave for Japan. Bruce Macdonald takes over as general manager of Erewhon. Paul stays in Japan for 9 months, arranging for individual packaging of products that were formerly imported in bulk, and finding new items for Erewhon to import. He visits suppliers, works with Mitoku and Muso, and studies Japanese language and culture.

1969 spring–Erewhon starts wholesaling foods, under the direction of Bruce Macdonald. Their first wholesale product is natural sesame oil.

1969 Aug.–Aveline Kushi moves to Los Angeles where her youngest son, Hisao, undergoes traditional Japanese bone massage therapy. In Los Angeles, she establishes the first macrobiotic study house at 7511 Franklin Ave. Bill Tara arrives about a month later to set up a retail store, Erewhon West, which opens on 8001 Beverly Blvd. in about September.

1969 Oct. (early)–Bruce Macdonald leaves for Los Angeles with his new bride, Maureen Traill, to run the new Erewhon West retail store there. Roger Hillyard takes over as general manager of Erewhon in Boston.

1970 Jan. 1–Erewhon's earliest existing catalogue seen (wholesale and retail) lists 7 pages of natural food products–most of them imported from Japan. By March 1970 Erewhon lists 96 products in its catalog.

1970 July–Erewhon's rapidly expanding distribution business moves into a large (20,000 square feet) fifth-floor leased brick warehouse at 33 Farnsworth St., on the docks in South Boston. *East West Journal* and Tao Books soon move to the same area.

1970 fall–Erewhon receives its first shipment of brown rice from the Lundberg brothers in Richvale, California; it is "unsprayed" but not organic. Chico-San has exclusive rights

© Copyright Soyinfo Center 2014

to all Lundberg's organic brown rice.

1971 Jan.–*East West Journal* begins publication in Boston, Massachusetts.

1971–Erewhon Trading Company of Los Angeles has expanded and is now at 8001 and 8003 Beverly Blvd., Los Angeles, CA 90048.

1971 March–Roger Hillyard is replaced as general manager of Erewhon–Boston.

1971 March–Paul Hawken finalizes a contract with Carl Garrich of Lone Pine, Arkansas, to grow short-grain brown rice organically and exclusively for Erewhon. 330 acres are planted in April. That fall, Erewhon starts to retail and wholesale its first organic brown rice.

1971 May–Bruce Macdonald leaves Erewhon in a dispute over ownership of the company.

1972–John W. Deming Jr. plans to invest $150,000 in Erewhon in exchange for stock, and Advest Co. plans to conduct Erewhon's first public stock offering–but neither happens after Michio Kushi nixes the plans.

1972 fall–Erewhon first buys organic brown rice from Lundberg brothers of California; a fire that destroyed Chico-San's plant in early Aug. 1972 rendered their exclusive contract with the Lundbergs null and void.

1973 Aug.–Paul Hawken writes a critical history of Erewhon and its problems. Published in *East West Journal* it is titled "Erewhon: A Biography. The View Within." Shortly thereafter Paul Hawken resigns, saying that running Erewhon was a nightmare. Some say he sells his 25% ownership back to the company, which was subsequently managed by Bill Garrison, Tyler Smith, Jeff Flasher, and Tom Williams, in that sequence.

1974 July to 1977–Erewhon becomes the exclusive representative and agent for both the Muso and Mitoku companies in North America. The labels of all products imported from these companies must bear the Erewhon label.

Starting in late 1969 a number of macrobiotic and/or natural foods companies grew into distributors following the models established by and with help from Erewhon: Eden Organic Foods in Ann Arbor (started by Bill Bolduc on 4 Nov. 1969), Food for Life (started in 1970 by Bill Tara as a retail store on the 10th floor of a Chicago office building), Janus in Seattle, Washington (Jan. 1972, by George Gearhart and Blake Rankin, formerly of Spiral Foods), Essene in Philadelphia, Pennsylvania (by Feb. 1971), Laurelbrook in Maryland (Aug. 1971), Ceres in Colorado Springs (1973), and The Well in San Jose, California (1973, by Phil Parenti). These macrobiotic distributors had a strong influence on the numerous other non-macrobiotic natural food distributors, such as Lifestream (started in 1969 as a retail store), Westbrae in Berkeley, California (wholesale distribution: July 1970, by Bob Gerner; retail: Feb. 1971, Gerner). Shadowfax (New York, 1971), and Tree of Life in St. Augustine, Florida (retail: May 1971; wholesale distribution: Feb. 1972, by Irwin Carasso).

1975 Aug. 1–Erewhon sells all of its West Coast Division in California (Los Angeles and Culver City) to John Fountain and John Deming for cash and notes, realizing a net gain of $86,872.

1977 March 23–Erewhon sues natural foods retail stores in several states for boycotting Erewhon for selling to co-ops. Erewhon eventually wins the case, but its legal bills are something like $250,000. There was not enough money to pay these fees and Erewhon never recovered.

1978 (early)–Erewhon moves into a huge warehouse and office complex at 3 East St., Cambridge, Massachusetts 02141.

1979 April 27–The workers in Erewhon's production, trucking, shipping, and kitchen departments vote 42-19 to form a union affiliated with Local 925, the Service Employees International Union.

1979–John Deming steps in to liquidate all the assets of financially failing Erewhon–Los Angeles. Tom DeSilva, Tyler Smith, and Jeff Flasher buy the retail store at 8001 Beverly Blvd.

1981 Feb.–Erewhon currently lists 4,000 products in its catalog–in its bid to become a full-line distributor. It services 2,000 customers and provides jobs for 175 people in its warehouse and retail stores.

1981 Nov. 10–Erewhon files for bankruptcy protection under Chapter 11 of the Federal Bankruptcy Act because of debts totaling $4.3 million. At this time, Aveline Kushi is the sole owner of Erewhon. Stow Mills picked up the lion's share of the Erewhon business, with Westbrae also getting a significant part of it.

1982 May–A $1.3 million offer by Ronald Rossetti, president of Nature Food Centres, is accepted as the reorganization plan in the Erewhon, Inc. bankruptcy. Rossetti purchased Erewhon as an individual; it was never part of Nature Food Centres.

1986–Erewhon acquires U.S. Mills, which had been founded in 1908. In effect U.S. Mills and Erewhon were merged, and U.S. Mills was chosen as the corporate name, largely since it had been around longer.

1988 May–Chuck Verde (who was the president of Erewhon) and Cynthia Davis acquired the U.S. Mills / Erewhon business. They became the main joint shareholders. Address: 303-B Newbury St., Boston, Massachusetts.

5272. Arai, Soichi; Suzuki, H.; Fujimaki, M.; Sakurai, Y. 1966. Studies on flavor components in soybean. II. Phenolic acids in defatted soybean flour. *Agricultural and Biological Chemistry* 30(4):364-69. April. [12 ref]

• ***Summary:*** The ethanol (ethyl alcohol, 1:1) extract of defatted soybean flour was systematically fractionated and the resulting phenolic acid fraction was studied. The authors identified a series of at least 7 phenolic acids (syringic, vanillic, ferulic, gentisic, salicylic, *p*-coumaric, and *p*-hydroxybenzoic acids) and two isomers of chlorogenic

© Copyright Soyinfo Center 2014

acids found in the flour. The main component among the phenolic acids was syringic acid, which was isolated as 3,5-dinitrobenzoate. These phenolic acids may have some influence on soybean flavor since they possess sour, bitter, and astringent tastes. Address: Dep. of Agricultural Chemistry, Univ. of Tokyo, Japan.

• ***Summary:*** "Immature soybeans" refers to "Edamame," which were obtained from a local market. Address: Dep. of Agricultural Chemistry, The Univ. of Tokyo, Japan.

5274. Altschul, Aaron M. 1966. A look at the world protein situation: We can solve the world food problem but not easily and not without new ideas. *Soybean Digest.* May. p. 15-16, 19-22.
• ***Summary:*** Begins with an autobiography of Aaron Altschul. His first interest was in proteins, particularly seed proteins. Then he moved to New Orleans and was given broad opportunities in the Seed Protein Laboratory, organized almost 8 years ago. His second interest was in cottonseed, traditionally a southern crop, and on ways to realize to the maximum the potential of its proteins. "The success of this effort led the to opening of new markets to cottonseed protein in foodstuffs for monogastric animals. "Another important event was my meeting Don Sabin of UNICEF who invited me to become a consultant to his group to help this UN agency to develop new sources of protein for humans to replace skim milk powder. At one of the UNICEF meetings I met Professor Nevin Scrimshaw, then head of INCAP in Guatemala, and this led to my involvement in his development of Incaparina. a corn-cottonseed food for infants."

In 1958 his first book, *Processed Plant Protein Foodstuffs,* was published. It was followed by *Proteins–Their Chemistry and Politics.*

Contents: Protein malnutrition. Situation is urgent. Cottonseed as food (Incaparina, soybean foods in Japan–tofu, miso, shoyu–provide about 10% of Japan's protein, soymilk in Hong Kong, ProNutro in South Africa). Limiting amino acids. Tailormade foods (aleurone grains as seen by electron microscopes, the majority of the proteins are the so-called globulins). Purified proteins (three major proteins appear pure by ultracentrifugation, ion exchange chromatography, gel electrophoresis on polyacrylamide gel, the major seed proteins of aleurins, ergastic proteins in seeds, ultimate structure of seed proteins is unknown). New foods required (until world population can be stabilized and controlled).

A small portrait photo shows Altschul. Address: Seed Protein Pioneering Research Lab., New Orleans, Louisiana.

5275. Hayashi, Shizuka. 1966. There's an increasing trend to soybean oil in Japan. *Soybean Digest.* May. p. 68-69.
• ***Summary:*** In 1965-66 some 1,852,000 tonnes of soybeans were used in Japan. Of this, 1,341,000 tons (74.5%) were crushed, 297,000 tons (16.0%) were made into tofu and frozen tofu, 150,000 tons (8.1%) were made into miso, 32,000 tons (1.7%) were made into natto, and 32,000 tons were made into soy sauce and other soy products.

Crushing the soybeans yielded 1,073,000 tons of soybean meal. Of this, 736,000 tons (68.6%) was used for animal feeds (largely as a component of mixed feeds), 174,000 tons (16.2%) to make shoyu, 65,000 tons to make tofu, 63,000 tons for other food uses, and 35,000 tons for other non-food uses. Thus, a little over 50% of all soybeans used in Japan in 1965 were used to make foods–not including soy oil.

Per capita consumption of edible oil in Japan has increased dramatically, from 7.52 grams per day in 1956 to 18.44 grams in 1965. During the same period, total soybean oil consumption has risen from 74,010 tonnes to 219,967 tonnes. In recent years a number of the large soybean crushing companies, such as Hohnen, Nikkoh, Nisshin, Showa, and Yoshiwara have expanded their extraction plants. "The various soybean food processors including soy sauce, miso, and tofu are consolidating into fewer large-scale plants with financial support from the government for improvement and better efficiency." Address: Japanese American Soybean Inst.

5276. Hirano, Kiyoshi. 1966. Situation of soy industry in Japan. *Soybean Digest.* May. p. 38-39.
• ***Summary:*** "In addition to importing soybeans, Japan produces domestically about 200,000 tons of soybeans, one-half of which are consumed locally, the remaining 100,000 tons being brought to the commercial market.

"Since the domestically produced soybeans contain less oil than imported soybeans, they are all used for traditional Japanese foods such as miso (soy paste) and tofu (soy curd). Practically all of the soybeans used by the oilseed processing industry in Japan have been imported from the United States."

Tables show: (1) Supply and demand for soybeans in Japan–1954-1965. (2) Consumption of oilseeds in Japan–1954-1964. Address: President, The Japan Oilseed Processors Assoc.

5277. Hoshino, Masao. 1966. Japanese margarine situation. *Soybean Digest.* May. p. 39-40.
• ***Summary:*** In 1909 margarine production started in Japan. The two main oils used (since olden times) in Japanese margarine are soybean oil and rapeseed oil.

Since 1946 the diet of Japan has improved greatly, especially as the younger generation is coming "to prefer

© Copyright Soyinfo Center 2014

a bread diet to a rice diet. Thus, meals are being balanced with the utilization of protein and fat. This popularization of the bread diet is attributable to the great influence of its adoption in the school lunch program of primary and junior high schools The liking of the young people for a bread diet stimulated by school feeding is now firmly rooted and ineradicable. The effect of this tendency is statistically demonstrated by the spectacular growth in physique of children and youths.

At present, Japanese margarine, shortening and lard are produced by 25 companied operating 27 factories..."

A table shows production of three products in 1966. Margarine 59,700 tons. Shortening 64,400 tons. Refined lard 59,700 tons.

In recent years margarine production has increased around 10% annually.

Because Japan is an island, "the oils used in margarine production are chiefly marine oils," such as fish oil and finback whale oil. Address: Vice President, Japan Margarine Industrial Assoc.

5278. *Today's Food* (*Loma Linda Foods, Riverside, California*). 1966. Celebrating our 60th anniversary [Loma Linda Foods]. 11(1):5 (back cover). Spring.
• ***Summary:*** Loma Linda Foods has been guided by the wise counsel of Ellen G. White, who began discussing healthful nutrition in 1863. "Actually, the nutrition work of Seventh-day Adventists, who own and operate Loma Linda Foods, began 100 years ago at Battle Creek Michigan... But the denominational affiliation with the old Battle Creek San breakfast foods ended in 1903 and it was not until 1906 that it was reactivated at the Loma Linda Sanitarium in California. Here stoneground wheat bread and healthful cookies and fruit crackers were made in the sanitarium bakery, and in 1907 demand for the products from residents of the growing community forced the construction of a separate building. Here in a combination bakery and store, the business thrived for 30 years.

"Now known as Loma Linda Foods, the new factory continued making fine bread and cookies but added high protein products perfected to take the place of meat in vegetarian menus; whole grain breakfast foods; Breakfast Cup cereal drink [coffee substitute]; and about 1930, began making the first soy milk.

"Demand for Loma Linda Foods quickly outgrew the small delivery truck service developed within a 125 mile area, and when land for a new plant was offered by what was then La Sierra Junior College, ten miles west of Riverside, the move was made.

"Our present plant and Western Division general offices opened in 1938, and in 1951 the Eastern Division headquarters opened in Mount Vernon, Ohio. Developed for 25 years under the leadership of George T. Chapman from Australia, and now managed by Charles P. Miles, Loma Linda Foods is one of 30 food factories owned and operated by Seventh-day Adventists in Australia, New Zealand, South America, England, France, Denmark, Germany, Switzerland, Africa and Japan.

"Some 300 workers, plus nearly 100 salesmen, are dedicated to the production and distribution of more than three dozen tasty products bearing the Loma Linda Foods label..."

Color photos show: The general offices and main Loma Linda Foods plant at Riverside. Sales representatives and management personnel of the Western Division of Loma Linda Foods.

5279. Purcelli, Marion. 1966. Japanese fare surprises Westerner. *Chicago Tribune.* June 3. p. B4.
• ***Summary:*** "Mention Japanese food and most people [Americans] think of tempura, sukiyaki, and steamed rice." But at homes in Japan, these dishes [except for the rice] are rarely served. A traditional, elaborate appetizer includes a platter of raw fish, "sauces for the fish, water lotus, noodles, egg and fish cakes, and baked soy bean curd."

5280. Abiko, Nobuo. 1966. Japanese teachers point to void. *Christian Science Monitor.* June 10. p. 5.
• ***Summary:*** One rural schoolteacher says that what Japanese need most and now lack in Japan is "deep religious feeling" to restrain and channel individualism. Before World War II "militaristic nationalism" bound Japan together, but now Japanese have nothing to unify them.

For Akira Miyashita, a teacher in a rural high school, the issue is acutely personal. He is also a cultural historian who is deeply interested in the history of tofu. In olden times, the religion of Japan was Buddhism. Today, he says, few people "realize that such uniquely Japanese foods as 'nori' (seaweed) and 'tofu' (strained bean curd) are bequests from the nation's Buddhist past, handed down from the ascetic diet of ancient Buddhist monks."

He believes "the humble diet tells the inner story of the Japanese people."

A photo shows Mr. Miyashita with his wife and two children.

Note: Miyashita's book, *Kôri-dôfu no rekishi* [History of dried-frozen tofu], published in 1962 in Tokyo by the Japanese National Frozen Tofu Association (Zenkoku Kori-dofu Kogyo Kyodo Kumiai Rengokai) (591 p.) is a unique and outstanding piece of historical scholarship.

5282. Norton-Taylor, Duncan. 1966. World hunger. *Fortune* 73(6):111-14, 170, 174, 177, 180, 184. June.
• ***Summary:*** The subtitle reads: "No problem presses more remorselessly on this generation. Giving food away only postpones crises and may compound them. What the U.S. should be exporting is a practical version of the capitalist revolution that made its own agriculture one of the wonders of the world."

How can we feed whose population is now doubling every 30 years or so, and is expected to reach 7.4 billion by the year 2000? And population growth is most rapid in those regions least able to support more people. Most burdensome is India, with its 500 million. The challenge is to raise the Third World to a state where it can feed itself. Note: This is the earliest English-language document seen (July 2003) that uses the term "Third World" for what French call the *tiers monde,* to refer to "underdeveloped countries not in the Communist bloc."

During the 1940s population worldwide began to accelerate as DDT and antibiotics reduced the death rate in the Third World from about 30 per 1,000 right after World War II to about 20 per 1,000 at present. Meanwhile the birth rate in the Third World continues to exceed 40 per 1,000. Before World War II, the Third World had net exports of about 11 million metric tons (tonnes) of grain to industrial nations. From 1948 to 1952 the flow reversed: the Third World imported an average of 4 million tonnes a year, increasing to 13 million tonnes/year from 1957 to 1959 and 25 million in 1964.

Economist Theodore W. Schultz of the University of Chicago, Illinois, in his book *Transforming Traditional Agriculture,* has shown how Western European farmers have successfully substituted capital for land. With a population density much greater than that of Asia and a generally poor endowment of farm land, farmers in Italy, Austria, Greece (and Israel) have been increasing agricultural production at a remarkable rate.

The U.S. Public Law 480 (once called "Food for Peace" and first developed during the Eisenhower administration) has failed; it may have helped feed hungry people but it has not helped the needy countries to be able to feed themselves. During the past 11 years the U.S. has shipped, mainly to Third World countries, food that cost it some $25 billion. When food was shipped in emergencies, the recipient countries were not billed at all. Taiwan and Japan have used this food successfully so that now they no longer need it. But the three countries which have received the most PL 480 aid, India, Pakistan, and the United Arab Republic [Egypt and Syria] have not. Turkey, for example, received soybean oil in exchange for an agreement not to export its olive oil.

Can U.S. private enterprise help Third World agriculture and food? Corn Products sells Maizena–a mixture of edible corn oil and soybean oil. And in order to make this new food more profitable, Corn Products is teaching Brazilian farmers how to grow soybeans, which now have to be imported to Brazil from the U.S. In Brazil, Mexico, and Peru, Anderson, Clayton provides agricultural service for local farmers who grow soybeans, peanuts, and cotton seeds for a line of cooking and salad oils, shortening, and margarine that the company processes and markets. "It finances seed, fertilizers, and insecticides, and gives advice on planting and harvesting." Anderson, Clayton plants provide 6,000 jobs in Brazil, 4,500 in Mexico, and 800 in Peru.

The Ford and Rockefeller foundations are also doing important work in the Third World. The Ford Foundation has already spent $300,000 in an experiment to crossbreed West Pakistan's wheat with high-yielding Mexican dwarf strains.

Americans must realize that the world will be unsafe unless there is economic and political stability–and adequate food–throughout the Third World.

5283. *Soybean Digest.* 1966. Says Japanese feed men will double meal usage by 1970 [E.D. Griffin]. June. p. 20.
• ***Summary:*** "The Japanese feed industry will use 1.2 million tons of soybean meal in 1970 compared with a 1965 usage of 581,000 tons. This is the prediction of E.D. Griffin, director of member relations for the American Feed Manufacturers Association. That would mean a demand for 56.4 million bushels of soybeans for the feed industry alone. Total U.S. exports of soybeans to Japan in 1965 amounted to 52.5 million bushels.

"Mr. Griffin spent a month in Japan as a speaker at the U.S. feed trade seminar in Tokyo, and later at meetings for feed manufacturers in a number of Japanese cities. He toured Japan studying the poultry and livestock industry.

"Mr. Griffin's trip was under the sponsorship of the American Soybean Association.

"Dr. Vaughn Speer, Iowa State University animal nutritionist, who also spoke at the feed trade seminar and accompanied Mr. Griffin on his tour, said he agreed with Mr. Griffin in his estimate.

"He reports Japan produces a very small percentage of the ingredients needed to compound feed. The United States is the chief source of feed grains and soybeans. Currently the manufactured feed tonnage in Japan is about 8 million tons, with some 70% of the total poultry feed.

"The per capita consumption of all meat and poultry in Japan is about 17 pounds, compared to over 200 pounds in the United States. A very small portion of that is poultry.

"The economy of Japan has shown a faster expansion than in any free country in the world over the past 10 years–and it continues to expand. History shows that with improved living standards comes an increased demand for meat, milk, and eggs. That change is taking place in Japan today.

"Mr. Griffin predicts that the greatest rise in Japanese living standards will come from expansion of its own

© Copyright Soyinfo Center 2014

agriculture rather than from buying poultry or meat from the United States. This will be primarily an expansion of poultry for eggs, broilers for meat, and pork. Broilers offer the best feed conversion ratio.

"There is evidence of much interest in the development of an integrated broiler industry in Japan. Egg and pork production are moving ahead along scientific lines. That means an increased demand for feed grains and soybean meal.

"Mr. Griffin estimates a total volume of 10 million tons of livestock feed mixed in Japan by 1970 and calls this figure conservative. 'That's a 25% increase over 1965. At the present time soybean meal represents 8% of the feed manufactured. This percentage could double and still be far below U.S. usage. Figuring soybean meal usage at 12% of the ration, and a 25% increase in the feed tonnage in Japan by 1970, that would mean 1,200,000 tons of soybean meal being used in mixed feeds in Japan by 1970.

"The Japanese are beginning to realize that feed is a major cost item, says Mr. Griffin. Fish meal continues to increase in price. In due course they will come to depend on soybean meal as a source of protein.

"In America we have learned to depend on soybean meal as our main source of protein for hog and poultry rations. This will likely happen eventually in Japan. 'Some of the American Soybean Association's market development work of past years is showing tangible results,' says Mr. Griffin."

A small portrait photo shows E.D. Griffin.

5284. Takahashi, Hideo; Saito, Hiuga; Ikeda, Yonosuke. 1966. Genetic relatedness of spore bearing *Bacilli* studied by the DNA agar method. *J. of General and Applied Microbiology* (*Tokyo*) 12(2):113-18. June. [11 ref]

5285. *Los Angeles Times.* 1966. Patio show stopper in a Japanese mood. July 31. p. 16.
• ***Summary:*** Nipponese cuisine is known for its eye appeal, and sukiyaki is a shining example of this. It is cooked at the table and the ingredients are arranged like flowers. Ingredients include "sliced mushrooms, cubed soy bean curd (tofu) and yam noodles (shirataki)" [thin konnyaku noodles]. Large photos show Sukiyaki.

5286. *Los Angeles Times.* 1966. Patio show-stopper in a Japanese mood. July 31. p. 16.
• ***Summary:*** Sukiyaki is a shining example of the eye appeal for which Japanese food–Nipponese cuisine–in famous. Although it is cooked at the table, the most impressive feature is the flower-like arrangement of the uncooked ingredients.

One of the ingredients is "cubed soy bean curd (tofu)." A key ingredient in the pungent sauce is "½ cup soy sauce." Suet is normally used, but vegetable oil can be substituted.

Note: Suet is raw beef or mutton fat, especially the hard fat found around the loins and kidneys. Suet is usually made into tallow in a process called rendering, which involves melting and extended simmering, followed by straining, cooling and usually a repetition of the entire process.

Several large photos show the arrangement of the uncooked ingredients like petals on flowers.

Address: Hyogo Noka Daigaku, Sasayama, Hyogo-ken.

5288. Bowen, William; Shook, Edgar. 1966. Why they call those soybeans "golden." *Fortune* 74:126-29, 186, 191. Aug.
• ***Summary:*** Soybeans have become a $2.5-billion crop in the U.S., a major U.S. export, and the basis of a hefty domestic processing industry. In the futures market, soybeans have outdistanced all other commodities in dollar volume of transactions. At Chicago's Board of Trade soybean futures are bought and sold in the largest of the seven commodity pits–*the* pit, the famous arena formerly occupied by the old-time champion, wheat...

"The U.S. produces about 70 percent of the world's soybeans, and is the only nation with a substantial surplus for export. The only other big producer of soybeans, Red China, consumes most of its crop at home...

"Last fall's crop was four times as big as 1945's, and about 170 times as big as that first officially recorded crop in 1924...

"Since the early 1950's, demand for meat, and hence for soybean meal, has grown faster in Western Europe and Japan than in the U.S., and as a result U.S. soybean exports have expanded at an average annual rate of 16 percent since 1953... In dollar earnings, soybeans and soybean products now rank as the U.S.'s No. 1 agricultural export...

"In recent years margins have tended to be uncomfortably narrow...For a big, efficient crusher, the breakeven crushing margin comes to about 17 cents a bushel. During the past several years average industry-wide crushing margins... have tended to run considerably below that breakeven level...

"Intense competition and meager margins have driven many companies out of soybean processing. The number of companies in the business has shrunk from about ninety in 1946 to sixty-five or so today. Some big companies have dropped out, including Spencer Kellogg and General Mills. The companies still in soybean processing include six giants,

© Copyright Soyinfo Center 2014

all headquartered in the Midwest. Among them they have something like 60 percent of the industry's total crushing capacity. The biggest are Central Soya Co. of Fort Wayne, Indiana, with a capacity of 84 million bushels a year, and Cargill, Inc., of Minneapolis [Minnesota]. Cargill claims to have about the same capacity as Central Soya. The other four members of the Big Six all have capacities on the order of 50 million to 60 million bushels a year: Archer Daniels Midland Co. (Minneapolis), Ralston Purina Co. (St. Louis), Swift & Co. (Chicago), A.E. Staley Manufacturing Co. (Decatur, Illinois).

"These companies all have large interests apart from soybeans, Archer Daniels, Cargill, Ralston, and Staley in grains, and Swift in meats. Even Central Soya, despite its name, gets less than half its revenues from soybean processing; the company has spread out on a grand scale into other fields, including feed manufacturing and grain merchandising...

"Soybean futures work like other commodity futures. The future bought or sold constitutes an enforceable contract to take delivery of, or deliver, a specified quantity at a specified price in a specified month at a specified place. But at any time prior to the delivery month the buyer or seller can cancel out the contract at will (though not always, of course, without loss), simply by taking an equal action in the opposite direction. The trader who bought sells, or the trader who sold buys, and, lo, everything washes out. The earlier and later transactions offset each other. Most futures contracts are offset in this way, prior to maturity; at the Board of Trade only 1 percent or so are settled by actual delivery of the commodities.

"Basically, the commodity-futures market enables holders of large inventories to hedge against inventory losses resulting from price declines."

Contains a detailed discussion of hedging and its complexities and uncertainties. "Hedging is more sophisticated than crushing."

• ***Summary:*** "The flavor components such as isoamyl alcohol, n-butyl acetate, ethyl maleate, ethyl levulinate and ethyl caprate, which have not been reported until now, were detected in at least 2 or more columns" of the 4 used.

"The other components, i.e., ethyl alcohol, ethyl acetate, n-propyl alcohol, isobutyl alcohol, n-butyl alcohol, acetic acid, butyric acid, ethyl lactate, furfurol, 2,3-butyleneglycol, benzaldehyde, methionol, ethyl succinate, ethyl benzoate, Beta-phenylethyl alcohol, ethyl isovalerate, isobutylaldehyde, isopropyl alcohol and diacetyl were detected in at least 2 or more columns." Address: Shoin Junior College, Kobe, Japan.

5294. *USDA Economic Research Service, Statistical Bulletin.* 1966. U.S. fats and oils statistics 1909-1965. No. 376. 222 p. Aug.

• ***Summary:*** Table 74 (p. 67) gives "Soybeans: Acreage, supply, disposition, and price, 1924-65." The 21 column heads include: Production (increased from 4.9 million bushels in 1924 to 701.9 million in 1964). Exports (began in Oct. 1931, with 2.2 million bu reported for 1931, increasing to 205.9 million bu in 1964; based on inspections by Federal licensed inspectors). Crushings (increased from 0.3 million bu in 1924 to 473.1 million bu in 1964). Average price per bushel received for the season by farmers ($2.46 in 1924, falling to a low of $0.50 in 1931, staying below $1.00 until 1941 except for $1.27 in 1936, first topping $2.00 again at $2.05 in 1944, reaching an all-time peak of $3.33 in 1947, then staying between $2.00 and $2.75 until 1964).

Production of oil (increased from 2 million lb and 7.4 lb per bushel crushed in 1924 to 5,146 million lb and 10.9 lb per bushel crushed in 1964). Production of meal (increased from 8,000 tons and 49.5 lb per bushel crushed in 1924 to 11,286,000 tons and 47.7 lb per bushel crushed in 1964).

Table 86 (p. 76) shows "Soybean oil: Supply and disposition and oil equivalent of exports of soybeans, 1916-64." Soybean oil production increased from 2 million lb in 1922 (the earliest year for which figures are reported) to 5,146,000 lb in 1964. Soybean oil imports started at 27 million lb in 1911, dropped slightly for several years, then skyrocketed to 118 million lb in 1915 after the start of World War I, and peaked at 332 million lb in 1917. They were negligible after 1922, when a tariff effectively shut off imports and promoted domestic U.S. soy oil production. The earliest figures for soy oil exports show that 58 million lb were exported in 1919, but in the following years soy oil exports were negligible, and did not top the 1919 figure until 1943. The big increases came starting in 1955 and by 1964 had reached 1,353,000 lb/year. Consumption/disappearance of soy oil in the U.S. was very large during World War I (when the amount consumed equaled the amount imported), then it was very small until the mid-1930s. It grew from then on, first in industrial uses, and after World War II in food uses. It rose from 1,076,000 lb in 1941 to 4,072,000 lb in 1964.

Table 87 (p. 77) shows "Soybean oil: Supply, disposition, and utilization, and oil equivalent of export of soybeans, 1912-1965. Utilization is divided into food uses and nonfood uses. Food uses included (in order or importance in 1917): Cooking and salad oils, shortening, and margarine. Nonfood uses included (with the earliest year reported after each): Soap (1912), paint and varnish (1931), linoleum and oilcloth (1931), resins (1949), other (1931). In 1965 the main food uses (in million lb) were: Shortening (1,471), cooking and salad oils (1,135), and margarine (1,112). In 1965 the main nonfood uses (in million lb) were: Paint and varnish (96), resins (96).

Table 173 (p. 155) lists "Soybeans: United States exports by country of destination, 1947-64." In 1964 the leading importers of American soybeans (in 1,000 bushels) were: Japan (49,298), Canada (34,951), Netherlands (28,066), West Germany (23,325), Denmark (13,444), Italy (10,401). In South America, the leading importer was Venezuela (1,228). In Eastern Europe it was Poland (1,785) and the USSR (1,320). In Africa it was Morocco (418).

5296. Grow, Howard E. 1966. The Japanese market development project. *Soybean Digest.* Sept. p. 63-65.

• ***Summary:*** Contents: Introduction. Increase in exports. Use of vegetable oil. Expansion in crushing. The activities of Mr. E.D. Griffin, director of member relations for the American Feed Manufacturers Association and former vice president and sales manager of Allied mills. Team of U.S. producers visits Japan for 3 weeks (Laurel Meade and Harris Barnes).

"Many of you will remember that at last year's convention in Memphis we had three men from Japan representing the oil industry. Mr. Kiyoshi Hirano, president of the Japan Oilseed Processors Association, presented a report at the convention. Mr. Masao Hoshino, president of the Margarine Manufacturers, was present, as well as Mr. Ichiro Omori, an oil press reporter.

"In October a team of 15 representatives of the processing firms in Japan visited the United States for 15 days under the leadership of Mr. Y. Sakaguchi, who is

© Copyright Soyinfo Center 2014

president of the Japan Oilseed Processors Association. This team of 15 men represented processing firms that crush over 50% of the 62 million bushels of soybeans sold to Japan this year.

"These two groups saw how soybeans are produced and harvested under our production methods and practices and they were much impressed. They viewed the marketing system in operation and were intrigued by what they saw. Because of these visits the Japanese are now more inclined to purchase their requirements from the United States when prices are competitive." Address: Assistant to the Executive Vice President, American Soybean Assoc.

Address: Dep. of Food Chemistry, Faculty of Agriculture, Tohoku Univ., Sendai, Japan.

5299. Randolph, Chet. 1966. Agree on oil promotion for Japan. *Soybean Digest.* Sept. p. 66.
• ***Summary:*** The American Soybean Association reached final agreement recently with the Japan Oilseed Processors Association on a jointly financed and jointly administered consumer promotion program to increase the sale of vegetable oil in Japan.

"The eight major buyers of U.S. soybeans in Japan, under the leadership of Y. Sakaguchi, Association president, agreed to match U.S. funds with cash and institutional tie-in advertising.

"After reaching final agreement on financing, administration and broad program goals with the executive committee made up of leaders from each of the participating processors, a technical management committee was named, composed of the key advertising men from the companies and ASA representatives."

5300. Taira, Harue. 1966. Studies on amino acid contents of processed soybean. X. The influence of added sugars on the heat destruction of the basic and sulfur containing amino acids in soybean products. *Agricultural and Biological Chemistry* 30(9):847-55. Sept. [17 ref]
Address: Food Research Inst., Ministry of Agriculture & Forestry, Fukugawa, Koto-ku, Tokyo, Japan.

5301. Kasai, Tadasi; Kawamura, Shin'itiro. 1966. Soybean oligosaccharides: Isolation by gel filtration and identification by acetylation. *Kagawa Daigaku Nogakubu Gakujutsu Hokoku* (*Technical Bulletin of Faculty of Agriculture, Kagawa University*) 18(1):9-15. Oct. [9 ref. Eng; jap]
• ***Summary:*** The authors used dextran gel filtration for the isolation and purification of sucrose, raffinose, stachyose, and verbascose from soybeans. They found that Sephadex G-15, which may be applied to compounds with molecular weights below 1500, was superior to carbon column chromatography, especially for isolating and purifying stachyose. The Sephadex G-15 elutes first the highest molecular weights whereas the carbon column elutes the lowest molecular weight.

The sugars were extracted from both the defatted raw and autoclaved flakes. The melting points and specific rotations were determined on the sugars and their acetate derivatives, and are reported for sucrose, raffinose, and stachyose in tabular form.

Note: This is the earliest document seen (June 2006) that mentions "verbascose," a soybean oligosaccharide. Address: Japan.

Hydrolysis of the hemicellulose B-1 of soybean cotyledons by Taka-diastase. *Kagawa Daigaku Nogakubu Gakujutsu Hokoku* (*Technical Bulletin of Faculty of Agriculture, Kagawa University*) 18(1):16-22. Oct. [5 ref. Eng; jap]
• ***Summary:*** Taka-diastase liberated xylose, arabinose, galactose, galacturonic acid in the hydrolyzate and gave an unhydrolyzable polysaccharide residue rich in rhamnose, fucose, xylose, glucose, and galacturonic acid. Moreover, five intermediate hydrolysis products were formed in an early stage of the incubation and two of them remained unchanged in the hydrolyzate after 48 hours of incubation. Address: Lab. of Agricultural Products Technology, Kagawa Univ., Japan.

Address: Food Research Inst. of Aichi prefecture, Nishi-ku, Nagoya, Japan.

5307. [Commodity classification: Yearly amount of expenditures, quantities by commodities per household by cities, groups, districts, cities within prefectural government (all households)]. 1966-1981. Serial/periodical. Tokyo: Norinsho, Government of Japan. Serial/periodical. Tokyo: Norinsho, Government of Japan. [Jap]
• ***Summary:*** Gives statistics for the quantities consumed per household and the amount expended (in yen) for the following foods: Soybean products, tofu, fried tofu, natto, other soybean products, sea vegetables (nori, wakame, kombu), and umeboshi. Statistics are for the following groupings: (1) City groups (All Japan, all cities, cities with population of 50,000 or more, major cities, middle-sized cities, small cities, towns and villages); (2) Districts (Hokkaido, Tohoku, Kanto, Hokuriku, Tokai, Kinki, Chugoku, Shikoku, Kyushu, Okinawa); 49 major cities.

For example, for tofu in 1981: The average Japanese household consumed 86.91 cakes (cho). Consumption per household was highest in small cities (92.04 cakes) and lowest in major cities (84.19 cakes). In the districts, consumption per household was highest in Tohoku (northeast Japan, 101.91 cakes) followed by Chugoku (98.15), and lowest by far in Hokkaido (the soybean production center of Japan, 58.28 cakes). The major cities with the highest per household consumption are Toyama (capital of Toyama prefecture in northeast Japan, 118.96 cakes) and Morioka (capital of Iwate prefecture in northeast Japan, 118.42 cakes). The major city with the lowest per household consumption is Sapporo (capital of Hokkaido prefecture, Japan's northernmost island, 59.83 cakes).

For natto, the major consuming district was Tohoku, followed by Hokkaido, then Kanto. The city with the largest per household consumption was Mito, followed by Aomori, then Morioka and Utsunomiya. Address: Tokyo, Japan.

5318. Nakamura, James I. 1966. Agricultural production and the economic development of Japan, 1873-1922. Princeton, New Jersey: Princeton University Press. xxiii + 257 p. Illust. Index. 24 cm. Series: Studies of the East Asian Institute, Columbia University. [149* ref]
• ***Summary:*** Japan's economic growth is usually described in superlatives and agriculture is widely viewed as playing an unusually important role in this growth. In reexamining government statistics about Japan's historical agricultural growth, the author finds that the median growth rate was not 2.4% as previously believed, but probably no more than 1.0%. This remarkable finding dispels much of the mystery surrounding Japan's miraculous "take-off" in the Meiji period.

Japan was a net food exporter until about 1895. By 1920 Japan had become heavily dependent on food imports, including wheat, soy beans, sugar, and animal products (p. 126).

During the Meiji period and until relatively recently, most rural households in Japan were nearly self-sufficient, producing almost all of their own cloth, clothes, footgear, housing, many farm implements, and most processed foods and beverages including "soy sauce, bean paste sauce (*miso*), pickles, rice wine (*sake*), etc. (p. 127, 139-40).

Table 5 (p. 228-30) gives the yield of ten Japanese crops from 1879 to 1925. The yield of soy beans increased from 0.516 *koku/tan* [10.45 bushels/acre] in 1879 (1 koku = 4.96 bushels; 1 tan = 0.245 acres) to 0.778 *koku/tan* in 1900 to 0.915 *koku/tan* [18.52 bu/acre] in 1919.

Soybeans are also mentioned on pages 97, 231, and 233. Address: New York.

5319. Nelson, Andrew Nathaniel. 1966. The modern reader's Japanese-English character dictionary. Revised ed. Rutland, Vermont, and Tokyo, Japan: Charles E. Tuttle Co. 1109 p. Index. 24 cm. [15 ref. Jap; Eng]
• ***Summary:*** Radical 37 = dai or oh = big + 3 strokes = #1171 = *daizu* or *ômame* = soy bean (p. 290).

Radical 75 = tree; at left = ki hen. #2211 = eda of edamame. Radical 82 = Hair of animals, ke. Radical 85 = Water + 11 strokes = soymilk. Radical 151 = Bean + 7 strokes = mame (bean) or tou = toufu. Radical 164 = Liquid (Sake sukuri) + 11 strokes = shoyu no sho. Radical 201 = Yellow (variant is 11 strokes).

5322. Photograph of Evan Root at the first Erewhon retail store at 303B Newbury St. in Boston, Massachusetts. 1966.
• ***Summary:*** Evan Root wrote in Nov. 2010: This "one is me, circa 1966, at 303-B Newbury St., Boston, below street level, at the corner of Hereford Street, wearing a Japanese clerk's coat, something like what is called a Happi Coat, hand made by Aveline [Kushi]. This picture was in Lilly Kushi's marvelous photo album, which you may well have had a chance to see. She took it out and gave it to me near the end of her life.

"There are, to my knowledge, very few photo archives of that first little Erewhon store. You can't see anything of the store or the shelves in the picture. I am sitting at the check-out desk, upon which there is a decorative bouquet of wheat grain in a vase.

"This store defied all business reason as so few people came through the doors to shop. It was principally a place where people came to talk and wonder about our place in the universe, and how macrobiotic practice could align us with that order. It took about one year before we had our first $100 day, and that was worth a celebration."

Question: In those early days, which important macrobiotic addresses were in Boston and which were in Brookline (which was enclosed on three sides by Boston)?

Evan: "Before I left for Japan (spring 1969), in Brookline there was the Kushi's house at 216 Gardner Road. This is the first house the Kushis rented when they moved from Wellesley in March of 1966 and was their home along with as many other people as could fit in, myself included. There were several apartments where groups of mb (macrobiotic) students lived, as well. Sometime later (I can't recall the timing here) 29 University Road opened up as the first 'study house' outside of the Kushi's home. I think another one opened on Washington Street before I left, though my memory is hazy on just when. These first ones were rented by Aveline and were all under the Kushi umbrella with 'house leaders' usually a couple whose studies of Macrobiotics qualified them as 'senior students.' There may have been one or two others.

"By the time I returned, there were numerous 'study houses,' more in Brookline and in various other locations such as Brighton, Cambridge, Boston, Jamaica Plain, and Wakefield as well. At this time, maybe 6 or 7 of them were in the Kushi study house system, and many were independent.

"Before I left for Japan, the important Boston addresses were: 303B Newbury Street (first as Erewhon retail store, then as Tao Books), 342 Newbury Street (Erewhon retail), 272A Newbury Street, and The Arlington Street Church, a Unitarian Universalist church at 351 Boylston Street where Michio's lectures and large community events were held. I could say (only somewhat facetiously) that the Half Shell, a seafood restaurant on Boylston Street was important as well, as it was very near Erewhon, and served as a place for many a meeting with Michio and fish dinner for the working crew.

"When I returned from Japan, arriving in Boston in late October of 1972, added to the list above, the Seventh Inn restaurant, an outgrowth of Sanae was operating near the corner of Boylston and Arlington Street. Aveline had rented space in the building next to the Arlington Street Church on Boylston St. and had installed a Noh Stage there. This was referred to as the Noh Center, and most of the downtown classes were held there at this time. Erewhon's warehouse at 33 Farnsworth Street in Boston had, of course, been up and running for some time.

"In an eight-block stretch, running from Erewhon on Newbury Street to Seventh Inn on Boylston, there were 5 (6 counting the Church) active Macrobiotic "hot spots." During any given walk down Newbury or Boylston Street, a macrobiotic person of those days would encounter many friends just by virtue of walking down the street."

Note: Evan helped the Kushis open the pioneering natural / macrobiotic food store, Erewhon, and was it's first manager. This first Erewhon retail store was located at 303B Newbury Street in Boston and opened for business on 9 April 1966. The business was registered in Aveline's name.

Evan continues: "Interesting side note: During a certain period of time, not too long after we opened the retail store, when the U.S. government was attempting to have the Kushis deported, the registration of the business was transferred to my name. For almost a year, I was the straw owner. After some time, the Kushis prevailed, and the ownership went back to Aveline.

"You may ask, why do I prefer the wording 'registered' rather than 'owned'? This is because questions, and even thoughts about ownership did not arise until later. The store was opened to serve a need, and the Kushis acted more like the custodians of a communal trust or mission. In essence, I believe they tried to act in this manner throughout Erewhon's existence, although many factors came into play to muddy that water."

This photo was sent by Evan Root to Patricia Smith (of Mill Valley, California) and by Patricia to Soyinfo Center

5323. Schenk, E.G.; Naundorf, G. 1966. Lexikon der tropischen, subtropischen und mediterranen Nahrungs- und Genussmittel [Dictionary of tropical, subtropical, and Mediterranean foods and food adjuncts (stimulants / enjoyables)]. Herford, Germany: Nicolaische Verlagsbuchhandlung Herford. xiv + 199 p. Index. 21 cm. Series: Manualia Nicolai 1. [200* ref. Ger]
• ***Summary:*** Pages 70-71 give a list of Japanese foods (after Mayerhofer and Pirquet 1926) in no apparent order, with the Japanese name followed by a translation of that name into German. Included in the long list are: Akamiso, miso, shiromiso, tofukasu [okara], daizu, fu [dried wheat gluten], kingyo-fu, kiri-fu, kiri-mochi [frozen and dried rice cake], ame [malt extract], mirin, aburage [tofu fried in vegetable oil], natto–Bohnenkäse, Tofu–Sojatopfen, Tonyu–Sojamilch, azuki [small red beans], kwansen-fu, kinako–Sojabohnenmehl, geröstet, amasake–unvergorener Sake, umeboshi, koritofu [frozen and dried tofu], midzuame [soft ame = rice syrup], shoyu–Sojasauce, yuba–eine Bohnenspeise. Plus many types of sea vegetables.

On pages 140-42 the following terms are defined in German: Soja [soya], Sojabohne [soybeans], Sojabohnenkäse [soy cheese or tofu], Sojabohnenmehl [soybean meal], Sojabohnenöl [soybean oil], Sojakäse [fermented soy cheese], Sojamilch [soymilk], Soja-Nahrungsmittel [soyfoods]: Koji, Miso, Tofu, Nato [sic, natto], kondensierte Soja-Milch [condensed soymilk], Japanische Verarbeitungen [Japanese processed foods: Japanische Soja-Sauce Shoju (Shoyu), Miso, Tofu], Soja-Nahrungsmittel, javanische [Javanese] soyfoods: Tao-Hoe, Tempeh, Ketjap, Tao-Tjiong [a term, and perhaps a product, between *doujiang* and *tao-tjo,* Indonesian-style miso], Sojatunken, Soja-Verarbeitungen: Sojamilch, Bohnenkäse, Teoufou (China), Tofu (Japan), Dan Phu (Vietnam), Natto (Japan), Tao-tehe (China).–Bohnenbrei Miso (Japan), Tao-tjiung (doujiang, China).–Sojasauce: Shogu [sic, Shoyu] (Japan), Tsiang-Yeou, Tao-yu (China), Ketjap (Java), Tuong (Vietnam).–Gärmittel: Kiut see (Japan). Then a table shows the nutritional composition of 8 of these foods.

Note 1. This is the earliest German-language document seen (April 2013) that uses the term *Sojabohnenkäse* ("soybean cheese") to refer to tofu.

Note 2. This book contains more than its fair share of errors and could be better organized. Address: 1. Prof. Dr. med. habil., Dr. phil. nat, Laurensberg ueber Aachen, Germany.

5326. Misuzu-Tofu K.K. 1966? Misuzu-dôfu no jôzu na tsukaikata [How to use Misuzu Tofu skillfully]. Nagano City, Japan. 8 p. Undated. Illust. 12 x 18 cm. [Jap]
• ***Summary:*** Contains 7 recipes for dried-frozen tofu, each accompanied by a black-and-white photo. On page 4 are five photos showing how the tofu is made inside the factory. On page 6 is an illustrated flow chart of the process. The steps are: Cleaning the soybeans, soaking, wet grinding, heating the slurry, filtering off the soymilk, pricipitation with the coagulant, filtering the curds, washing the curds, cutting the tofu into small cakes, freezing, cold storage, thawing in water, pressing out the water, drying, trimming, ammonia treatment, packaging. A photo shows the package. Steps translated into English by Eiji Yonemura of Misuzu Co.

On p. 7, a colored pie chart shows the nutritional composition of dried-frozen tofu. A second chart shows that Misuzu Tofu is much less expensive per calorie than other common foods such as eggs, meat, or fish. Cartoons by Hiro. Address: Nagano City, Japan.

5327. Fujii, Hisao; Oki, Kuniko; Makihara, Miyoko; Keshino, Junko; Keshino, R.; Takeya, Ryuko. 1967. Nattô-kin ni yoru nenshitsu-butsu no seisei ni kansuru kenkyû. VII. Nattô-kin faaji no bunrui to sono ippan teki seishitsu [On the formation of mucilage by *Bacillus natto.* VII. Isolation and characterization of a bacteriophage active against "natto"-producing bacteria]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 41(1):39-43. Jan. (Chem. Abst. 67:8826). [15 ref. Jap]
• ***Summary:*** "A new bacteriophage was isolated from an abnormally fermented 'natto' and named phage PN-1... The phage had a hexagonal head about 75mμ in diameter and a tail with a swollen end." The tail was about 240 mμ long, 10 mμ wide in the middle, and 25mμ at the swollen end. This phage was found to attack 9 strains of the 23 tested, all belonging to the *Bacillus subtilis* group.

The 9 susceptible strains were all characterized by their ability to produce natto and had been named *Bacillus natto* (Table 2).

Note 1. This is the earliest English-language document seen (Jan. 2012) that contains the word "phage" or the word "bacteriophage" in connection with natto.

Note 2. The word "phage" derives from the Greek, "to devour." A bacteriophage is any one of a number of viruses that infect bacteria. They do this by injecting genetic material (in either a circular or linear arrangement), which they carry enclosed in an outer protein capsid. Bacteriophages are among the most common and diverse entities in the biosphere. The term is commonly used in its shortened form, "phage." (Source: Wikipedia, at Bacteriophage). An illustration at this Wikipedia entry is titled "The structure of a typical myovirus bacteriophage." Myovirus bacteriophages use a hypodermic syringe-like motion to inject their genetic material into the cell.

Bacteriophages (and their ability to kill harmful bacteria) were discovered independently in 1915 by British bacteriologist Frederick Twort (in London) and in 1917 by French-Canadian microbiologist Félix d'Hérelle (working at the Pasteur Institute in Paris). Address: Faculty of Home Life Science, Fukuoka Women's Univ., Fukuoka, Japan.

• ***Summary:*** "Before 1948, soybean culture in Taiwan was quite limited except for growing them for green manure. Later, a few varieties introduced from the U.S.A. and Japan were extended to certain areas of the island. At present, soybean production is growing year after year, arriving at 55,563 hectares and 61,897 tons in 1965. In retrospect, at the beginning of this study, the writers wanted to know why no soybeans had been grown in Taiwan, though this valuable legume of Asian origin was cultivated in all countries or areas surrounding the island. We then learned that this was due to lack of adaptive varieties." Address: 1-2. College of Agriculture, Chung-Hsing Univ., Taichung, Taiwan, Rebublic of China; 3. • ***Summary:*** Organic acids studied include oxalic, malic, and lactic acids. Address: Shoin Junior College, Kobe, Japan.

5336. *Soybean Digest.* 1967. Research grants: To search for the best tofu varieties. Jan. p. 28-29.
• ***Summary:*** "The best varieties of U.S. soybeans for making dried tofu and the best processing methods for manufacturing this traditional Japanese food will be sought by Japanese food scientists under a grant awarded by the U.S. Department of Agriculture.

"The grant will be paid for with foreign currency obtained by the United States from sales of farm products abroad under P.L. 480. This money cannot be converted into dollars for use in the United States.

"There are two forms of tofu–fresh and dried. The dried form also has other names, such as Kori, Koya. It is sometimes called frozen tofu because freezing is part of the drying process.

"Under the 3-year research grant of $35,802, paid in Japanese yen, food chemists at the Japan Frozen Tofu Association in Tokyo will experiment with numerous American soybean varieties to try to determine which are best suited for manufacturing dried tofu. They will also try to determine the effect of various processing methods on the yield, cost, physical properties, and flavor of dried tofu.

"Fresh tofu resembles cottage cheese in appearance, taste, and composition. Dried tofu, made with present processing methods, is darker than the fresh and has less desirable flavor and texture. However, fresh tofu is very unstable, having a shelf life comparable to that of fresh milk, While the dried product has a shelf life of more than 6 months and can be transported long distances without loss in quality.

"The Japanese tofu makers have been mixing a small percentage of American beans with the native varieties; but recently they have started using higher percentages of the American Hawkeye variety in both fresh and dried tofu.

"If they can find additional U.S. varieties that make good quality dried tofu and can improve processing methods, they may import more U.S. soybeans, as U.S. beans are cheaper than native varieties.

"Foreign agricultural research done under P.L. 480 is administered by USDA's Agricultural Research Service."

5337. Takeuchi, Tokuo; Yoshii, Hisao. 1967. Miso, shôyu no peptides ni kansuru kenkyû. V. Genryô C/N hi o i ni shita miso no peptides keitai (2) [Studies on the peptides in miso and soy sauce. V. Address: Inst. of Food Technology, Aichi prefecture, Nagoya, Japan.

5338. Takeuchi, Tokuo; Yoshii, Hisao. 1967. Miso, shôyu no peptides ni kansuru kenkyû. IV. Genryô C/N hi o i ni shita miso no peptides keitai (1) [Studies on the peptides in miso and soy sauce. IV. Relation between the C/N ratio of the raw materials and the distributive patterns of peptides in miso]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 45(1):29-33. Jan. [16 ref. Jap; eng]
• ***Summary:*** "Soybean koji (low carbon/nitrogen ratio) contained more amino acids and peptides than any other koji of higher C/N ratio. This tendency seemed to have originated from the proteolytic character of soybean koji, because the neutral and alkali protease of *Asp. oryzae* (principal protease in soybean koji) would be more active in soybean protein than in acid protease.

"In the ripened miso the same distributive pattern of peptides was observed regardless of C/N ratio of raw materials. Therefore, the peptide patterns may be virtually similar for all types of miso." Address: Inst. of Food Technology, Aichi prefecture, Nagoya, Japan.

5341. Lebumfacil-Davide, Clara S. 1967. Corn and sorghum as possible substitutes for wheat in soy sauce production. *Philippine Agriculturist* 50(9):843-60. Feb. [10 ref]
• ***Summary:*** Soy sauce was made from three different cereal-soy combinations: Wheat-soybean, corn-soybean, and sorghum soybean. Chemical analysis showed that the traditional wheat-soybean substrate had the highest pH, highest total titratable acidity, and highest percentage of total nitrogen, proteins, amino nitrogen in total nitrogen, non-chloride solids, amino nitrogen and reducing sugars.

In the soy sauce made from the sorghum-soybean substrate, the amino acids tryptophane, lysine, and histidine were relatively higher.

In the soy sauce made from the corn-soybean substrate, the aspartic and glutamic amino acids were relatively higher. In all the soy sauces, cystine was present in traces only.

"Results obtained showed that neither corn nor sorghum can suitably substitute for wheat in the combinations mentioned. Organoleptic tests for aroma and flavor of the soy sauce showed that wheat-soybean" was the best of the three substrates.

Introduction: For many years Japanese and Chinese food companies have had monopoly on the manufacture of soy sauce for the Philippine market. "However a number food companies in the Philippines are making headway towards soy sauce manufacturing." However one of the basic problems facing these local companies is the high cost of production, and especially the high cost of importing raw materials, such as soybean and wheat. Unless Filipino farmers can produce and provide these raw materials, a local soy sauce industry will never flourish.

• ***Summary:*** Continued: Chapter 5, "MFM and the United States government." "Over a period of nearly twenty years, the executive and legislative branches of the federal government have been a source of both assistance and frustration to MFM's staff as it sought to promote the use and production of MPF and MFP-type foods throughout the world." Dr. Allan K. Smith of the USDA's Northern Regional Research Laboratory (Peoria, Illinois), "an expert on soybean protein and its uses gave great encouragement to the infant Foundation [starting with a letter dated 30 Dec. 1947] and undoubtedly brought to its attention a potential source of technical advice,..." (p. 115-18).

The Bureau of Educational Affairs of the State Department provided ongoing help. The Foreign Training Division of USDA's Foreign Agricultural Service also responded favorably and now furnishes MFM the names and itinerary of individuals brought to the United States by the USDA to study American food and nutrition programs. "As a result, many foreign nutritionists, politicians, officials, and businessmen on U.S. government sponsored tours have visited MFM headquarters and have listened to Miss Rose and staff explain the MPF answer to protein scarcity in developing nations of the world." This "represents another step in the slow process of educating the citizens of other countries about the potential of vegetable proteins as a source of human food and the wisdom of manufacturing MPF-type foods." Perhaps the U.S. "officials believed that the example of an American-supported voluntary agency motivatd by an unselfish desire to help improve the living conditions of people in other countries would create a favorable impression of the United States in the minds of its guests. In any case, the routing of visitors to MFM by two federal departments appears to be a satisfactory arrangement for everyone involved" (p. 118-20).

The U.S. government sometimes helped in transporting MPF to foreign countries for relief. In one case, in 1959-60, MFM sent (with transportation paid) "over 74,000 pounds of MPF to Hong Kong, Japan, the Philippines and Taiwan in less than a year" (p. 120). It might be seen as part of the fight against communism. Also discuses Public Law 480–the Agricultural Trade and Assistance Act of 1954, which was signed into law on 10 July 1954–which offered to pay for some shipping (p. 120). "The lack of an MFM representative in Washington, who could personally press appropriate officials, greatly hurt MFM."

In Feb. 1958, in a speech delivered at Caltech, President Richard Nixon mentioned "Multi-Purpose Food which has meant so much to undernourished peoples all over the world" and congratulated Dr. Borsook for his "imaginative work" (p. 132-33; See also *Pasadena Star News* 17 Feb. 1958).

Also discusses the Armed Forces, school lunch program, civil defense and bomb shelters, and the American Soybean Association. The "Foreign Agricultural Service of the USDA and the American Soybean Association had entered into an agreement, on 7 Feb. 1956, which committed 108 million yen or $300,000 of PL 480 counterpart funds for a project to 'expand the market for U.S. soybeans in Japan.'" This was part of Section 104 within Public Law 480. MFM unsuccessfully tried to attach itself to this agreement (p. 143).

Continues the discussion of PL 480, Senator Hubert Humphrey (encouraged MFM; cordial relationship), MFM's

© Copyright Soyinfo Center 2014

"ambitiously conceived but sporadically executed campaign to convince U.S. officials that high-protein vegetable supplements, i.e., MPF, should be incorporated into the relief and emergency feeding programs authorized by PL 480" (p. 144-51). George McGovern (Director of the Food for Peace program). Dec. 1961 Eddie Albert of MFM shows the film "People to People" to McGovern, who calls it "an inspiration" and requests a copy for his office (p. 154-55). But the benefits to MFM of all this effort were negligible.

At the national level, pressed by "a keen and understandable desire to augment the limited resources and modest capabilities of the Foundation, Miss Rose and Mr. Chamberlain seem to strike out in any direction that they feel might lead to an improvement in the fortunes of their organization. What started to be a relatively simple effort on the part of MFM to obtain a PL 480 grant of $18,000 to develop a Japanese version of MPF, soon spiraled into an increasingly complex campaign to alter the focus of the United States overseas surplus food disposal program. The question of whether MFM, or more specifically Miss Rose and Mr. Chamberlain, should embark on such a campaign was never raised" (p. 159).

Chapter 6, Meals for Millions and the United Nations Children's Fund (UNICEF). The apparent identity of interest between the Fund and the Foundation "helps to explain why Miss Rose and Mr. Chamberlain concentrated so heavily upon the establishment of a cooperative relationship with UNICEF" (p. 161). However from its beginning in 1947, when MFM first offered to donate MPF to UNICEF, until the present, this relationship was filled with disappointments and frustrations for MFM (p. 161-96).

Dr. James Hundley of UNICEF told a MFM delegation of three (on 26 Feb. 1958) that the Saridele (soybean milk powder) plant in Indonesia had cost UNICEF approximately $480,000. But villagers found the powder "difficult to blend with water and prone to absorb moisture and harden when left exposed to the air" (p. 179).

The unfortunate and unhappy relationship shattered unmistakably on 9 June 1959 when Dr. Henry Borsook delivered the opening address at the Second Annual Inter-American Food Congress in Miami Beach, Florida. The "answer he gave to the question posed in the title of his address, 'We can at this time provide fairly adequate nutrition for the world. Why isn't it being done?' included a bitter and poignant indictment of 'official agriculture' in general and United Nations nutritional scientists in particular" (p. 182-87). Thereafter, UNICEF officials showed no desire to cooperative with MFM. Yet both sides were at fault. "Thus, it is little wonder that MFM–UNICEF relations were filled with more discord than collaboration and understanding" (p. 196).

Chapter 7, "Meals for Millions overseas," concentrates on the development of the production of MPF-type foods in India and Brazil, where they are still (as of 1967) being produced, in order to describe and analyze MFM's approach to famine prevention (p. 197). "India: In 1957, Meals for Millions achieved its most significant advance in the field of hunger prevention when the Mysore Central Food Technological Research Institute [CFTRI] started to produce on a regular albeit limited basis an Indian version of American MPF for use in a school lunch program in the state of Mysore." The formulation was based on peanuts and bengal gram. But it was not until 1960 that a large-scale Indian MPF plant went into operation (p. 221-23). From 1946 to 1956 MFM gave India 1.39 million pounds of American MPF but there were ongoing problems with its distribution (p. 199-202).

Brazil: "In June 1956 a Brazilian company began processing its own soybean-based, fortified food supplement patterned after the American MPF." Here Maurice Abrahams had taken the initiative–not MFM. Pages 223-56 describe, step by step, the chain of events that led to the ill-fated attempt to start making an MPF-type food in Brazil. The idea for this project "started in the later summer of 1953 when Mr. Abrahams, a United States citizen residing in Sao Paulo, Brazil, happened to read a glowing account of MFM and MPF in the July, 1953 issue of *Readers' Digest.* He was stimulated to think of the commercial potential, as well as the humanitarian value of an inexpensive soybean food if sold on a large scale to lower-income and malnourished Brazilians. After an exchange of letters with Miss Rose, Mr. Abrahams concluded that a commercial venture was feasible and flew to Los Angeles to discuss the details of a contract to produce MPF in Brazil. Though later events were to show that Mr. Abrahams had made an error in judgment, when they signed an agreement on 19 April 1954 [with Mr. Abrahams doing business as the Capital Research and Management Company], he and MFM's officers were highly optimistic about the great market potential of a Brazilian MPF." Details of the contract are given (p. 223-24). Continued. Address: Seattle, Washington.

(p. 26) gives world soybean production by continent and country, from 1955-59 to 1966 (preliminary) as follows: North America: Canada, United States, Mexico. South America: Argentina, Brazil, Colombia, Paraguay. Europe: Italy, Romania, Yugoslavia, Other Europe (excluding U.S.S.R.). USSR (Europe and Asia). Africa: Nigeria, Rhodesia, Tanzania. Asia: Turkey (Europe and Asia), China–Mainland, Cambodia, China–Taiwan, Indonesia, Japan, Korea–South, Thailand. Total #1. Total #2.

Soybean production in Mexico increased from about 39,000 bu in 1955-59, to 1,315 in 1964, to 2,205 in 1965 to 4,410 (preliminary) in 1966.

A table (p. 29) gives U.S. exports of soybeans, oil and meal from 1962 to 1965 (preliminary) to the following regions and countries (for marketing years beginning Sept. 1; in bushels): North America: Canada, Mexico, other, total. South America: total. Western Europe: Belgium & Luxembourg, Czechoslovakia, Denmark, Finland, France, Germany–West, Italy, Netherlands, Norway, Spain, Sweden, Switzerland, United Kingdom, other, total. Eastern Europe: Czechoslovakia, Hungary, USSR (Europe and Asia), Poland, other, total. Africa, total. Asia and Oceania: Hong Kong, Israel, Japan, Korea–South, Philippines, Taiwan, other, total. Grand total.

Exports of U.S. soybeans to Mexico increased from 33,000 bu in 1962 to 177,00 in 1964. Note: This is the 2nd earliest document seen (Feb. 2009) that gives statistics for trade (imports or exports) of soybeans, soy oil, or soybean meal to Mexico or Central America. Address: Hudson, Iowa.

5347. Hayashi, Shizuka. 1967. Serve Japanese soy noodles. *Soybean Digest.* March. p. 24.
• ***Summary:*** "A soybean exhibition was recently held for 3 consecutive days in Yokohama at the Takashimaya Department Store, one of the three largest department stores in Japan. The exhibit, devoted exclusively to soy foods, was under the sponsorship of the store, the prefectural government of Kanagawa, and various soybean groups.

"It was held to promote increased consumption of various soy products such as salad and cooking oils made from soybean oil, soy sauce, miso, frozen tofu, tofu products, and soy flour. Approximately 25 booths were used by manufacturers to display their products."

The Japanese American Soybean Institute set up a snackbar named "Protein House" (Tanpaku-an) and served Japanese udon noodles made with a mixture of 15% soy flour and 85% wheat flour. The noodles were very popular and crowds swarmed the booth. "It was emphasized that the soy noodle has over three times the nutritional value of an ordinary noodle." 7,000 people visited the 3-day exhibition and 381 entered the contents to name the noodle. The name selected by a committee was "Protein Noodle" (Tampaku-Udon). Address: Managing Director, Japanese American Soybean Inst.

5353. Ohta, Teruo; Nakano, Masahiro; Kobayashi, Y.; Muto, H. 1967. Dai ikkai Zenkoku Nattô Kanhyôkai no sôgô seiseki [Report of the first All-Japan "Natto" Exhibition, April 1965]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 22. p. 68-91. March. (Chem. Abst. 66:104143. 1967). [1 ref. Jap; eng]
• ***Summary:*** In order to promote consumer acceptability and to rationalize the natto manufacturing process, 56 samples of natto products were collected from throughout Japan. They were submitted to sensory evaluation and chemical analysis, and the soybean varieties and manufacturing facilities of each natto maker were investigated. Results:

1. Soybeans: 59% were grown in China, 30% in Japan, and 2% in the USA. The remaining 9% were a mixture of these.

2. The distinctive factor of natto that received the highest sensory evaluation is the production of sufficient mucous substance which shows long-lasting viscosity with fine elastic threads that develop uniformly.

3. No correlation was found between the origin or type of soybeans and the natto quality.

4. Natto is still made in the traditional way, and the scale is mostly domestic or home based.

The outline of the natto-making process can be summarized as follows: Soak the soybeans in water at 15-20ºC for 15-20 hours or at 7-10ºC (winter) for 20-24 hours. Steam under pressure for 30-40 minutes at 1 to 1.2 kg per square cm, or for 15-30 minutes at 1.5 to 2.0 kg. Inoculate with a pure-culture natto starter after the temperature of the soybeans has decreased to: (a) 70ºC. (b) 40-60ºC. (c) Below 30ºC. These three traditional temperatures appear to make no difference in the final product. Pack 80-120 gm of weighed, inoculated soybeans into a container made of wood shavings or synthetic film. Ferment the soybeans in the containers (often with many containers on shelves in a rolling rack) for 15-20 hours in a small incubation room, keeping the temperature at 40-50ºC.

5. The shelf life of fresh natto has been prolonged by the installation of cold storage (refrigeration). 30-45% of natto makers sell their natto refrigerated, depending on their location in Japan.

Natto given the highest scores in sensory evaluation had the following characteristics: Moisture around 60%. Protein water-solubility 45-60%. Protein decomposition rate (amino-acid formation) 5-6%. Ammonia formation rate 4-5%. Ph value 7.2 to 7.4. Curdmeter hardness 30-40 gm. unit. Colorimetric Rd is 16-22. Address: 1-2. Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

• ***Summary:*** Soybean oil is the leading edible oil in Japan. In 1967 some 902,900 tons of edible oils and fats were consumed in Japan, of which 305,900 tons (33.9%) were soybean oil. Of this soybean oil, only 5,300 tons are used in a solid form, largely as hydrogenated fat, while the rest is used in a liquid form. However flavor reversion in soybean oil is a major problem compared with other popular oils. And soybean salad oil has special problems because of its poor flavor stability. Producers of this salad oil are hoping to improve its flavor stability, and this can be done through partial hydrogenation. Address: Dep. of Applied Chemistry, Faculty of Engineering, Toyo Univ., Kujirai, Kawagoe-shi, Saitama-ken, Japan.

• ***Summary:*** This is the first paper in Session I, titled "Potentials for soybean production and use as related to world protein needs," Nevin S. Scrimshaw presiding. Contents: Introduction: "It is generally agreed by students of world food problems that the shortage of protein is the most critical need now and in the foreseeable future." Historical overview: Piper and Morse, Mildred Lager. An overview of worldwide soybean production: USA, Europe. Production in Eastern Asia: China, Indonesia, Japan, Taiwan, Thailand, India, Soviet Union, Latin America (Brazil, Paraguay), Mexico, Colombia, Argentina, Australia (no statistics given), Europe (European Russia, Bulgaria, Yugoslavia, Rumania, and Czechoslovakia).

Prospects for further production: USA, southeastern Europe, Russia, Thailand, Japan, Brazil, Colombia, Argentina, Mexico. Summary.

"In southern European Russia, commercial soybean plantings were reported in the 1870s. In the Far East, soybean cultivation may be even older as a part of the culture of the local Chinese. Before the revolution, acreage was small, however."

"Latin America is a relative newcomer in soybean production. Brazil is the only country where large acreage has been planted for more than a decade. In recent years soybeans have been planted in Argentina, Colombia, Mexico, Paraguay, and Surinam. Brazil is the major exporter with smaller amounts coming from Paraguay and Surinam. Venezuela is a major importer and Mexico imports some.

"Estimates for 1965 show that Brazil produced 16,610,000 bushels (453,000 metric tons), Mexico produced

© Copyright Soyinfo Center 2014

2,482,000 bushels (67,690 metric tons), Colombia produced 1,835,000 bushels (50,000 metric tons), Paraguay 660,000 bushels (18,000 metric tons), and Argentina 360,000 bushels (9,800 metric tons). Total production of Central and South America would be only slightly more than 1 percent of world output. In Brazil about 90% of the production is concentrated in the state of Rio Grande do Sul, the southern-most part of the country. The balance is grown in nearby Santa Catarina and Parana. The climate is similar to some of our southern states... A major processing plant has been built near Porto Alegre."

"In Mexico, production began very recently. Almost all acreage is in the State of Sonora, bordering Arizona and Southern California. Here plantings started in 1959... In the Yaqui Valley, soybeans are always grown under irrigation where they fill in successfully as a second crop following wheat and cotton." In Colombia, acreage is concentrated in the Cauca Valley on the western slope of the Andes. In Argentina, acreage up to a few years ago amounted to about 1,000 hectares, most of which is grown in the state of Misiones, the far northeast area bordering upon Rio Grande do Sul in Brazil. In recent years there has been expansion in the pampas.

In the USA, "some expansion to the West is possible under irrigated conditions. Research trials in Oregon, Washington, and California show yields as high as 80 bushels an acre. But where water is limited, the highest value crops will be favored." Address: Dean, College of Agriculture, Univ. of Illinois.

5365. Grow, Howard E. 1967. "Hard-sell" oil campaign under way. *Soybean Digest.* May. p. 52-53.

• ***Summary:*** "The various programs and activities of the Japanese American Soybean Institute since 1957 have been successful in increasing U.S. exports of soybeans to Japan from approximately 20 million bushels in 1957 to over 65 million bushels in 1966. The activities have been carried out in cooperation with various quasi-governmental agencies and product organizations in the promotion of traditional Japanese foods and increased use of soybean oil in the human diet, and greater use of soybean meal in feeds for livestock and poultry. Mr. Hayashi's report shows the increased use of U.S. soybeans in the production and manufacturing of these traditional foods over the past 10-year period. He has also indicated the possibilities for future use of these products.

"Several programs and activities have been carried out during the past 10 years to promote greater use of edible oils in the human diet. The per-capita edible-oil intake has increased from 4½ pounds in 1956 to slightly over 16 pounds per person in 1966. This increase has come about through activities such as demonstrations, cooking schools, and group-feeding seminars, which have been on a soft-sell basis, carried out through educational and extension-type meetings. The Japan Welfare Ministry, through the Japan Nutrition Association, has established a goal of per-capita intake of oil of 30 pounds as a minimum for the Japanese population.

"An increased demand for manufactured feeds has resulted from the developing livestock and poultry industry in Japan. In 1958-59 slightly over 58,000 metric tons of soybean meal were used in the manufacture of feed for poultry and livestock. This amounted to 4.4% of the total tonnage of feed ingredients. The demand for manufactured feeds has grown so that in 1966 over 623,000 metric tons of soybean meal were used in the manufacture of feed, 7.6% of the total tonnage of feed ingredients. It is expected that the broiler industry will expand rather rapidly in the next few years and as a result the need for soybean meal will continue to increase. This will provide additional supplies of soybean oil from the processing of the required tonnage of soybeans to supply the meal.

"Eight of the major oilseed processors who are members of the Japan Oilseed Processors Association and who in the past relied on brand advertising for the promotion of oils have joined with the American Soybean Association in developing a consumer type of promotion for vegetable oil, with major emphasis on soybean oil, in a program covering a 15-month period ending Dec. 31, 1967.

"In 1965, the J. Walter Thompson Co. was employed by the American Soybean Association and Foreign Agricultural Service to conduct a study on edible oil consumption in Japan. Based on this study, negotiations were undertaken with the oilseed crushers in Japan toward an industrywide edible-vegetable-oil promotion campaign.

"In July 1966, agreement was reached between eight major oilseed crushing companies, the American Soybean Association, and FAS to institute such a program. A working agreement between ASA and JOPA was first drawn, and then these two organizations, with FAS approval, selected Dentsu Advertising Ltd. to conduct the campaign. Funds came from oilseed crushers and from the ASA Market Development Project.

"The mass media hard-sell vegetable oil promotion program, the first ever conducted in Japan on an industry-wide basis, includes a 25-minute video tape television program on Saturday morning over four tv stations in Tokyo, Osaka, Nagoya, and Fukuoka. Viewers over these four stations total 65 million people, which is two-thirds of the population of Japan. The entire program of promotion is channeled to the housewife. A symbol was designed and used along with slogans in all the promotion activities. In addition to the tv program, publicity is channeled to newspapers and women's magazines, with some newspaper advertising.

"Other promotion activities will be distributed throughout the period with major activity during May, June, September, and November. These are the periods preceding the gift-giving seasons in June and December when a large amount of brand advertising is done by the processors.

© Copyright Soyinfo Center 2014

"This new approach to promotion for increased use of oil in Japan will be evaluated by a research organization through surveys. Benchmarks from which the evaluation will be determined were established by a survey made in November 1966. A half-way evaluation will result from a survey made this May, and a second evaluation will be made on the basis of a survey in November. The results of these evaluation studies will be used in determining the type and extent of future programs.

"In addition to the mass media program, increased activity has been carried out in the past few months in the promotion of vegetable-oil margarines. Very little vegetable oil has been used in the manufacture of margarine in Japan until recently. Only 370 metric tons of soybean oil were used in the manufacture of margarine and shortening in 1964. This increased to 990 metric tons in 1965 and to approximately 4,000 metric tons in 1966. This increase came about as a result of a few margarine manufacturers in cooperation with the Japanese American Soybean Institute developing interest in a high-quality vegetable-oil margarine.

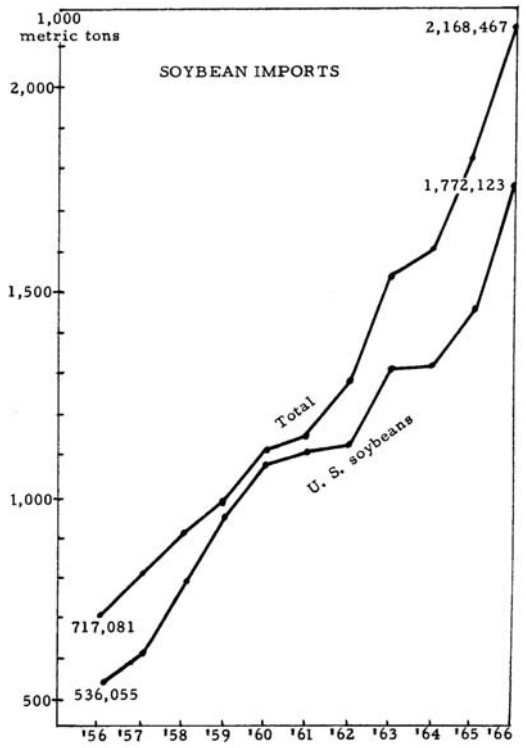
"During December 1965 and January 1966 a pilot program was carried out, demonstrating the use of vegetable-oil margarine with sampling in stores. As a result of these demonstrations and sampling activities, reports from 10 selected stores during the following 12 months indicated that margarine sales had increased by over 20%.

"A program for promotion of vegetable-oil margarine has just been completed with the sampling and demonstrations by trained demonstrators in 200 stores for a period totaling 600 days. Results from these activities in increased sales of margarine are not yet available. In addition to the in-store demonstrations, 50 outdoor signboards were used for the promotion of vegetable-oil margarine during February and March, and car cards were used in trains, subways, streetcars, and buses during the same period. These activities were all coordinated. An attempt was made to tie in the promotion through the use of the same symbol and slogan used in the oil promotion campaign carried out by Dentsu."

An illustration shows the smiley-face "Symbol used extensively in the vegetable oil promotion campaign." See also pages 25 and 27. A photo (p. 53) shows a large billboard / signboard with a woman's hand, using a butter knife to spread margarine on a piece of toast. Written, in Japanese, on the billboard is "Delicious. Vegetable-oil margarine." The caption states: "Signboards in Japan promote both use of margarine made from U.S. soybean oil and toast made from U.S. wheat. Even the use of toast is relatively new in Japan."

Note: Wheat contains almost twice as much protein as rice. Address: Asst. to the executive vice president, American Soybean Assoc., Hudson, Iowa.

5366. Hayashi, Shizuka. 1967. Soybean exports to Japan have tripled. *Soybean Digest.* May. p. 50, 52.



• ***Summary:*** A graph shows that total soybean imports to Japan have tripled from 1956 to 1966; about 82% of these imports come from the USA. Address: Managing Director, Japanese American Soybean Inst., Tokyo, Japan.

5367. Kawamura, Sin'itiro [Shinichiro]. 1967. Review of PL 480 work on soybean carbohydrates. *USDA Agricultural Research Service.* ARS-71-35. p. 249-54. May. Proceedings of International Conference on Soybean Protein Foods. Held 17-19 Oct. 1966 at Peoria, Illinois.

• ***Summary:*** The soybean consists of 90% cotyledons, 7% hull, and 2% hypocotyl by weight on a moisture-free basis. The soluble carbohydrates consist of sucrose 4.5% and the oligosaccharides stachyose (3.7%) and raffinose (1.1%).

5368. Sakaguchi, Yukio. 1967. Japan's oilseed crushing industry and U.S. soybeans. *Soybean Digest.* May. p. 25, 27.

• ***Summary:*** "Oil, meal balance: The Japanese crushing industry is confronted with the important problem of balancing oil and meal. It needs to exert its utmost efforts to secure oil-bearing seeds other than soybeans. In this connection, Canadian rapeseed is attracting special attention recently. Rapeseed has a long history as an indigenous oil source familiar to the Japanese people. Because of the recent steady decline of their domestic production, imports from Canada have been increasing year by year, reaching 210,000 tons in 1966.

"In Japan, as rapeseed meal is in special demand as fertilizer, rapeseed processing is on a more profitable basis than that of soybeans. However, the foreign currency allocation system is applied to rapeseed imports with a view to protecting domestic production. And yet, considering the future supply-demand situation in all kinds of seed oils and meals and the potential demand for rapeseed meal for feedstuffs as well as fertilizer use, imports of rapeseed are expected to continue to increase as it grows more difficult to obtain other oilseeds.

Since U.S. soybeans predominate in the oilstuffs crushed at Japanese mills, we crushers want to express our desire to the United States for an improvement in quality and trading terms. The unusual low oil content of the arriving 1966-crop U.S. soybeans is being pointed out frequently. Formerly No. 2 yellow soybeans were thought to have an oil content over 19%, but recent arrivals have been barely 18%. Of course, some variation of quality of farm products by crop year is inevitable. But much more effort to ensure maximum higher oil content is desirable since such a variation of this level greatly affects the paying basis of crushers.

"Further, strong appeals have often been made to the United States for measures to reduce foreign materials to the lowest possible level for efficient transportation as well as for the efficiency of Japanese mill operations. We therefore hope that the terms of trade will be revised to pure basis with landed quality and weight final. It is our ideal to be able to purchase U.S. soybeans of stable quality and price, and we wish American cooperation toward this end.

"The joint U.S.-Japanese public relations campaign for vegetable oils, which started last November, is in progress through primarily newspapers and TV. A cooking contest has also been opened to make the campaign more impressive. This campaign often proposed in the past has finally come true through the cooperation of the American Soybean Association, USDA Foreign Agricultural Service, the American Embassy, and the Japanese American Soybean Institute. It is certainly gratifying that the present campaign is effective and contributing toward elevation of the people's physical standard through encouraging increased intake of edible fats and oils. It is evident that this success directly leads to increased crushing of soybeans and eventually to increased imports of U. S. soybeans. We firmly believe that continuation of this joint U.S.-Japanese campaign will benefit both the United States and Japan.

"The Japanese oilseed crushing industry, confronted with the two critical problems, liberalization of oil and meal imports and liberalization of capital, is making all-out efforts in the structural improvement of enterprise and strengthening of international competition. In conclusion, I eagerly desire for the sake of U.S.-Japan co-prosperity that the U.S. soybean industry, after understanding the situation of Japanese processors, will make more efforts to ensure a dependable supply of high-quality soybeans at stabilized prices. This will enable the Japanese industry to increase consumption of oil and meal processed from U.S. soybeans."

5372. Strayer, George M. 1967. A review of 27 years. *Soybean Digest.* June. p. 5.
• ***Summary:*** "In 1940 soybeans to many people were still an oriental curiosity that had affected certain people like W.J. Morse, W.L. Burlison, Keller Beeson, Bill Riegel, John T. Smith, Glenn McIlroy, Dave Wing and others, but had never really caught on as a crop. Total soybean production in 1940 was only 78 million bushels, much of it used for forage purposes.

"Then came the war, with the intense drive to replace the fats and oils which had been imported up to that time–two-fifths of our entire consumption of fats and oils. The sea lanes were cut off, ocean shipping was scarce, we had to produce our own oil and some for our allies. We doubled soybean production, built processing plants, provided that oil. In so doing we also provided something which triggered the greatest explosion in livestock production the world had ever seen–high-quality protein at a relatively cheap price. Out of it came our broiler industry, our turkey industry, and all livestock feeding as we know it today.

"There were those who said soybeans were a 'War Baby'–that we never again would have use for a 100-million-bushel crop when the war ended. They were sincere in their beliefs, but they were looking backward and not forward. Instead of reducing production we have continued to move upward rapidly to the expected 1-billion-bushel mark in 1967...

"I was hired by the board of directors on a part-time basis in September 1940 at Dearborn, Michigan, to start a soybean news letter. The time had come, in the estimation of that board, that we needed some medium of exchanging information about the soybean crop. As the first and only part-time employee of the Association I sold the advertising, wrote the copy, read the proofs and did the mailing of the *Soybean Digest.*

"Back in 1949 I was asked by what was then ECA [European Co-operation Administration] to be a member of a two-man technical assistance team to go to Europe–particularly Germany–to make a study of possible use of and production of soybeans as human food supplies were still the major postwar problem. The huge potential markets for U.S. soybeans and products became apparent to me on that trip. Again in 1952 and 1954, trips through Northern Europe–not at Association expense–brought home to me the huge potential market which someone was going to supply.

"In 1955 I was asked by USDA to make a survey of potential markets for U.S. soybeans in Japan. This resulted in the formation of our market development project in Japan, the organization of the Japanese American Soybean Institute, and the execution of the contract with USDA to use foreign currency funds to promote markets for U.S. soybeans and soybean products. This is the largest market development project on any commodity in any country of the world today.

"In 1956 I was asked to do the same type of job in Europe, surveying market potentials for soybeans and soybean products in 10 countries. Out of this survey came the organization of the Soybean Council of America...

"As I leave my responsibilities in the American Soybean Association after these 27 years I do so with great regret." This is the last issue of Editor's Desk, which ceases with Strayer's departure from the magazine. A photo shows Strayer.

5373. Tada, Masakazu. 1967. Some features of Japanese vegetarianism. *British Vegetarian.* May/June. p. 225-28.
• ***Summary:*** For 1,850 years Japan kept no livestock farms as one sees in Europe. The main source of animal protein was only from fish and shellfish. But modern Japanese, especially those living in big cities, think animal protein is indispensable. One important feature of Japanese vegetarianism is the development and use of fermented foods, such as miso, shoyu, and natto. Address: Dr., 718 Daisen, P.O. Nirayama, Shizuoka, Japan.

in shoyu. XXVI. Flavorous components produced by yeast fermentation (2)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 41(9):434-41. Sept. [12 ref. Jap; eng]
• ***Summary:*** *Torulopsis* species of yeast were found to produce alkylphenols during shoyu fermentation. Address: Central Research Inst., Kikkoman Shoyu Co. Ltd., Noda Inst. for Scientific Research.

5377. Grow, Howard E. 1967. New faces, new program in Japan. *Soybean Digest.* Sept. p. 61-64.
• ***Summary:*** Contents: Introduction. Oil promotion. Margarine (made from vegetable oil) promotion campaign. Soybean meal. Seminars and demonstrations.

"New faces" refers to the seven visitors who have come from Japan to be at ASA's annual convention. Bunzo Watanabe is president of the Japan Oilseed Processors Association, Scott Sawyers has been designated country director for the American Soybean Association in Japan.

Scott "is now stationed in Japan and working with Shizuka Hayashi and Yoshiko Kojima in directing the program there. Mr. Hayashi is continuing in his capacity as managing director of the Japanese American Soybean Institute. He continues directing many of the activities along with Miss Kojima, as he has been the past several years." Address: American Soybean Assoc., Hudson, Iowa.

5378. Hanaoka, Yoshio; Yokotsuka, Tamotsu. 1967. Shôyu hozon ni kansuru kenkyû. VII. Shôyu-chû no ansoku kôsan to sono seiin ni tsuite [Studies on preservation of soy sauce. VII. Benzoic acid in soy sauce and its mechanism of formation]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 45(9):826-31. Sept. [8 ref. Jap; eng]
• ***Summary:*** "Naturally fermented soy sauce contains many kinds of aliphatic and aromatic acids including trace amounts of benzoic acid (B.A.). It was found that the content of B.A. in soy sauce can be most accurately determined by gas chromatography with a hydrogen flame ionization detector."

"By this procedure the amount of B.A. in raw soy sauce was found to be about 3 parts per million (ppm), and after heating 0.3-1.0 ppm increase was observed. The occurrence of B.A. in soy sauce was found not to be derived from the metabolites of *Aspergillus sojae,* yeasts and bacteria of fermentation, but from the B.A. of raw materials, defatted soybean flour (B.A. about 18 ppm) and wheat (B.A. about 4.0 ppm)." Address: Central Research Inst., Kikkoman Shoyu Co. Ltd., Noda, Chiba, Japan.

5379. Watanabe, Bunzo. 1967. Report from Japan [on the Japanese soybean crushing industry]. *Soybean Digest.* Sept. p. 64-66.
• ***Summary:*** "Thirdly, I wish to mention the advanced usages of soy protein in Japan. You may already be aware of the large quantities of soybeans that are used in a broad range for the production of traditional Japanese foods, such as soy sauce, miso (a soup base in paste form), tofu (bean curd) and others. Studies on concentrated soy protein are conducted by scholars and soybean processing firms for various uses, chiefly as food products. Soy protein is already used in large quantities in bakery products, confectioneries, ice cream, fish sausages, processed meat products, alimentary pastes, etc., and further applications are under research. At present, approximately 110,229,000 pounds of soy protein are consumed for such purposes. Soy protein of special high content is marketed for specific uses, and concentrations of even over 90% [soy protein isolates] protein are being developed."

"Fourthly, I would like to make a request, which I believe should be for the benefit of all.

"At present, 2% is set as the maximum allowance of foreign matter for No. 2 yellow soybeans, but the actual imports to Japan show this allowance is taken for granted as a privilege. The 1966 crop proved to be better than the 1964 crop, but 30% of the arrivals were at the maximum allowance of 2% or more. Forty-seven percent of the 1965 crop arrivals fell in this poor category. It is a great loss to the Japanese processors, who are not receiving guaranteed quality products, on top of which they are paying extra freight and other charges for the extra foreign matter.

"Pure-soybean basis: As all crushers naturally prefer to take delivery of clean beans, some inducement, if necessary, should be given to transactions on a pure-soybean basis. This problem is so grave that I hope it will be given prompt consideration and cooperation by all the people concerned, from growers to shippers, exporters or any others involved in the distribution channel."

A small portrait photo shows Bunzo Watanabe. Address: President, Japan Oilseed Processors Assoc., Tokyo, Japan.

5380. Yokotsuka, Tamotsu; Sakasai, T.; Asao, Y. 1967. Shôyu kômi seibun ni kansuru kenkyû. XXVI. Shôyu kôbo ni yoru kômi no seisei (1) [Studies on flavorous substances in shoyu. XXV. Flavorous components produced by yeast fermentation (1)]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 41(9):428-33. Sept. [11 ref. Jap; eng]
• ***Summary:*** Three hundred strains of yeast were isolated from several kinds of shoyu mash, which were found to have good flavor. This good flavor was shown to be caused by the formation of 4-ethylguaiacol and other phenolic components. This research was financed in part by the USDA Agricultural Research Service. Address: Central Research Inst., Kikkoman Shoyu Co., Ltd., Noda Inst. for Scientific Research.

5381. Yokotsuka, Tamotsu; Asao, Y.; Sakasai, T. 1967. Shôyu kômi seibun ni kansuru kenkyû. XXVII. Torura-zoku kôbo ni yoru 4EG fukô to hinshitsu hyôka [Studies

© Copyright Soyinfo Center 2014

on flavorous substances in shoyu. XXVII. The production of 4-ethylguaiacol during shoyu fermentation, and its role for shoyu flavor]. *Nippon Nogeikagaku Kaishi* (*J. of the Agricultural Chemical Society of Japan*) 41(9):442-47. Sept. [7 ref. Jap; eng]
• ***Summary:*** "4-Ethylguaiacol, one of the important flavorous components of shoyu, was microbiologically produced by *Torulopsis* species of halophilic yeast added during the process of shoyu fermentation." Address: Central Research Inst., Kikkoman Shoyu Co. Ltd., Noda Inst. for Scientific Research.

5382. McCormick, Sally. 1967. Azuma Sukiyaki House: Enjoy an evening of dining Japanese style–5120 N. Broadway, Chicago (Advertorial). *Chicago Tribune.* Oct. 26. p. J15.
• ***Summary:*** "Beef Sukiyaki cooked at the table over a Hibachi grill... made with thin slices of beef, fresh vegetables, soy bean cakes [tofu] and Japanese noodles." This deluxe dinner costs only $4.75 per person. They also serve Teriyaki and Tempura with soft Samisen [Shamisen] music in lovely, authentic Tatami rooms with sliding shoji screens.

5383. Murata, Kiku; Ikehata, Hideo; Miyamoto, Teijiro. 1967. Studies on the nutritional value of tempeh. *J. of Food Science* 32(5):580-86. Sept/Oct. [27 ref]
• ***Summary:*** The nutritional composition of tempeh and unfermented soybeans were compared. There were no large differences in protein and ash content between tempeh and unfermented soybeans. Fiber was slightly increased during fermentation. The fat content of tempeh was slightly lower than that of soybeans, but the acid value was noticeably higher. Free amino acids were increased during fermentation. The amount of different free amino acids in the palatable tempeh was from 1 to 85 times as much as that of unfermented soybeans. Riboflavin increased 8 to 47 times, vitamin B-6 (pyridoxine) increased 4 to 14 times, and nicotinic acid (niacin) increased 2 to 5 times in tempehs made and sun-dried in Indonesia. Pantothenic acid also increased during fermentation, although thiamine was little altered.

Tables: (1) Chemical composition of tempeh and unfermented soybeans. (2) Amino acid composition of tempeh and unfermented soybeans. (3) Changes in free amino acids of tempeh during fermentation. (4) Chemical characteristics of oils from tempeh and unfermented soybeans. (5) Vitamin content of Indonesian tempeh and unfermented soybeans (in dry matter).

Figures: (1) IR spectra of oil fractions from soybeans and tempeh. (2) Changes in thiamine and riboflavin content of tempeh during fermentation. (3) Changes in pantothenic acid and vitamin B content of tempeh during fermentation. (4) Changes in nicotinic acid content of tempeh during fermentation. Address: Food and Nutrition Lab., Faculty of Science of Living, Osaka City Univ., Osaka, Japan.

5384. Dubawsky, Rebecca. 1967. Cooking with grains and vegetables plus: Booklet one–A beginning. Boston, Massachusetts: Order of the Universe Publications. 29 p. Illust. No index. 28 cm.
• ***Summary:*** This was the first macrobiotic cookbook written entirely by a Westerner. Rebecca, an older woman who never married and who later moved to Florida, collected these recipes from Aveline Kushi's cooking classes in Boston. The dedication (p. 3) states: "The teaching of Aveline Kushi has made the information that follows possible." The preface (p. 7), written by Michio Kushi on 20 Oct. 1967, begins: "Life is a dream. The purpose of our life is to realize our dream. Those who see a happy, peaceful dream shall become happy and peaceful..." The book has no copyright page, date or place of publication. It was printed by Jacques de Langre [DeLangre], 7557 Sunset Blvd., Hollywood, California 90046. Address given by Farmilant (1972) as Box 203, Prudential Center Station, Boston.

The section titled "Condiments" (p. 11-12) states: "Soya sauce–(Tamari- Japanese word for thick soya sauce)–always used in cooking–never at table, except with noodles, tempura, or soup. Miso–is a dark brown vegetable protein–much more digestible than animal protein." Recipes are given for making Scallion miso, and Carrot top miso.

The section titled "Beans" (p. 17) mentions black beans: "Dried beans–*aduki, navy, pinto, kidney, black beans and chick peas*–double in bulk on cooking. 1 cup = 4 servings (side dish to main course)–wash 3 times and soak beans 1 to 3 hours before using." It then warns: "Cook *black beans* by pot–they clog pressure cooker." The section titled "Soups, Sauces, and Spreads" (p. 19) includes a recipe for "Vegetable, soya vegetable, and miso vegetable soup." There are simple recipes for: Miso sauce (p. 22). Cooking black beans (p. 25). Vegetable soya soup (p. 27). Vegetable miso soup. Vegetable sauces (with soya or miso, p. 27).

Description of book: The covers are dark green, with the title printed in black ink and all lowercase letters. In the lower left corner of the cover is written: The Order of the Universe Publications, Box 203 Prudential Center Station, Boston, Massachusetts–02199. At the bottom of page 29 (the last numbered page): "Booklet II, *More About Grains and Vegetables,* will come out as soon as possible." Near the bottom of the rear cover: "November 1967. Revised edition–July 1969. $1.00."

Note: Jacques de Langre, Ph.D., also spelled his name DeLangre and Delangre. Address: Boston, Massachusetts.

5393. *Soybean Digest.* 1967. Extensive broiler operation by Marubeni. Nov. p. 31.
• ***Summary:*** "Marubeni-Iida Co. of Osaka, Japan, has entered the broiler business with a tie-up with Sterling Poultry Products, Ltd., Norfolk, England, according to the Japan Economic Journal...

"Four other Japanese firms are already in the broiler business. Mitsui & Co. and C. Itoh & Co. are producing broilers in tie-ups with U.S. interests. Mitsubishi Shoji Kaisha is preparing to launch a similar venture in cooperation with Nippon Ham Co. of Osaka and Swift & Co. of the United States. Kanematsu-Gosho, long experienced in broiler trading, has agreed with Peterson Farms, Inc., to start a similar integrated chicken venture...

"The Japanese Ministry of Agriculture has approved establishment of a joint egg-processing venture–Shosan Seymour–by Showa Sangyo Co. of Tokyo in cooperation on a 50-50 basis with the Seymour foods division of Norris Grain Co. of the United States. Shosan Seymour will be the first joint venture with foreign capital in this field in Japan since World War II."

5394. *Soybean Digest.* 1967. U.S. visit of Japanese processors. Nov. p. 30.

© Copyright Soyinfo Center 2014

• ***Summary:*** A team, consisting of representatives of major Japanese soybean processing firms, is in the U.S. for 2 weeks visiting soybean farms and industry. They are discussing mutual problems of Japanese buyers and U.S. soybean growers. The team is headed by Shogo Kuroda, manager of the Tokyo branch, Yoshihara Oil Mill, Ltd. The following other firms are represented: Kumazawa Seiyu Sangyo Co. Ltd., Ajinomoto Co., Inc., Nisshin Oil Mills Ltd., Nihon Koyu Kogyo Co., Ltd., and Hohnen Oil Co. Ltd. Three photos show members of the team, who are apparently sponsored by the American Soybean Assoc.

5395. A.F.P. 1967. Artificial meat from soyabean. *Times of India* (*The*) (*Bombay*). Dec. 28. p. 9.
• ***Summary:*** Tokyo, Dec. 27. Artificial "meat" made from soyabeans has been developed by Nisshin Seiyu ("oils and fats") Company, of Yokohama–a food manufacturing company. The company plans, within the year, to test-produce the "meat" for mixing into processed meat such as sausages, meat balls, and meat paste. The company claims that its new plant in Yokohama is the largest of its kind in the world.

The company also claims that the new product, made from defatted soybean meal, will make the meat items less expensive and more nutritious, without affecting the taste of the meat.

"Its selling price will be one-eighth the price of beef and one-third the price of pork or chicken in Japan."

5396. Ebine, Hideo. 1967. Miso seibun ichiran. II. Tô-rui, yuki-san oyobi sono ta no seibun [A glance at miso's constituents. II. Sugars, organic acids, and other components]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 62(12):1368-73. Dec. [57 ref. Jap] Address: Norinsho Shokuryo Kenkyujo.

• ***Summary:*** Forty-two clinical cases were reported due to allergy to soybeans. Address: Gunma Univ. School of Medicine.

5398. Murakami, Hideya; Takase, S.; Ishii, T. 1967. Non-productivity of aflatoxin by Japanese industrial strains of *Aspergillus.* I. Production of fluorescent substances in agar slant and shaking cultures. *J. of General and Applied Microbiology* (*Tokyo*) 13(4):323-34. Dec. [14 ref. Eng]
• ***Summary:*** "Two hundred and fourteen strains of the *Aspergillus* were cultured both in agar slants and in a liquid medium by shaking, and the productivity of aflatoxins was studied, respectively, by observation of the fluorescence of the medium and by fluorometry and thin-layer chromatography, using the aflatoxin-producing strain ATCC 15517 as a control." None of the resulting products were aflatoxins. "However, the fact does exist that certain strains belonging to the *Aspergillus flavus-oryzae* group or the *A. flavus* group produce aflatoxins..."

"Materials and methods–Microorganisms: We used 214 strains including 176 strains of the yellow-green-spored *Aspergillus* and 38 strains of the other *Aspergillus.* All of the formers were isolated or collected in our institute during 1904 to 1965, consisting of 100 strains for Sake brewing, 32 strains for Miso brewing and 44 strains for Shoyu brewing. Among the latter 38 strains, 16 strains were those used for manufacturing Shôchû (Japanese distilled liquor) and the remainings [sic, rest] were non-industrial strains received from the Institute of Applied Microbiology, University of Tokyo. Aflatoxin-producing ATCC 15517 was sent from the National Institute of Health, Tokyo, and used as a control." Address: Research Inst. of Brewing, Tokyo.

5406. Kawamura, S.; Tada, M.; Irie, N. 1967. [Effect of autoclaving on sugars of defatted soybean flakes from selected varieties]. *Kagawa Daigaku Nogakuba Gakujutsu Hokoku* (*Technical Bulletin of the Faculty of Agriculture, Kagawa Univ.*) 15:147-53. [Jap]*
• ***Summary:*** The authors examined the sugars of the whole soybean and of the defatted seed parts for 6 U.S. and 9 Japanese varieties by quantitative paper chromatography. They estimated the maximum variation by this method as ± 10%; they reported finding verbascose, but they did not have a standard for it. They determined the total sugars by anthrone colorimetry.

Their results on a dry basis for U.S. whole soybeans are sucrose 4.5%, raffinose 1.1%, stachyose 3.7%, and traces of arabinose and glucose for a total of 9.3% sugars. For the Japanese soybeans the values are sucrose 5.7%, raffinose 1.1%, stachyose 4.1%, and traces of arabinose and glucose for a total of 10.9% sugars. Thus the Japanese soybeans appear to be somewhat higher in sugars, especially sucrose, than U.S. soybeans.

The authors state that the arabinose reported in the hull may not be free, but could have come from the water-soluble saccharides that were liberated in the course of isolation of the other components.

Boxer provides an account [p. 348] of a Yedo (Tokyo) jail by Spanish Franciscan, Fray Diego de Francisco in 1615. "The official ration was a handful of rice daily, barely enough to sustain life for forty or fifty days,... On the other hand, the guards could sometimes be bribed to allow the prisoners' friends to smuggle in a little rice, *soy,* [sauce] or fish by way of supplementing the starvation diet." Note: This passage was first cited by Hymowitz 2007, in "History of the Soybean." Address: Camoens Prof. of Portuguese, King's College, Univ. of London, England.

5413. Dai Nihon hyakka jiten [Encyclopedia Japonica]. 23 vols. 1967. Tokyo: Shogakukan. [Jap]
• ***Summary:*** Amazake (Vol. 1, p. 380-81). When rice koji is mixed into cooked rice or rice porridge, the starch of the rice is converted to sweet substances such as glucose and maltose by the enzyme action to make a fragrant, sweet drink. During the Nara period (A.D. 710-784) and Heian period (795-1185) it was called Kosake or Hitoyo-zake. In the Nihon Shoki (A.D. 720) it was written that amazake was offered to the emperor Ojin Tenno (who reigned A.D. 270-310). Originally amazake was made for use in religious ceremonies, but by the Edo period (1600-1868) amazake sellers (amazake-uri) appeared and sold amazake in a earthenware pots (donabe) or brass pots placed in tall, red lacquerware boxes suspended from each end of a shoulder pole (see illustration). The amazake seller would carry these through the streets of the neighborhood calling out "sweet, sweet" (amai, amai). On a shrine or temple's festival day amazake was widely sold at wayside stalls, as it still is today. One old amazake shop that still exists is Amanoya at Kanda Myojin-mae [Soto Kanda 2-18-5, Chiyoda-ku, Tokyo. The koji is made in the ancient mounded way in long, earth-walled tunnels 20 feet below the streets of Tokyo]. Amazake became very popular during an era when there were very few sweet foods available to the common people. Initially it was served only in the winter as a hot drink, but later it came to be consumed throughout the four seasons. It was enjoyed at tea houses and oceanside swimming places to banish tiredness or to warm one's body. Also an instant amazake, which could be made at home easily, became popular.

Famous amazake products in Japan: There are many festivals throughout Japan that center around amazake, and transmit tradition to the next generation. 1. Yamakawa-zake of the Rokujo district of Kyoto has a long history. At the Ohara Shrine in Kyoto (at Sanwa-cho, Amada-gun, Kyoto-fu) each March 23 and September 23 they celebrate the spring and fall offerings respectively (haruzashi and akizashi). In this famous festival, they offer amazake to their god and to visitors. 2. At Horikana village in Nagano prefecture (Karasu-mura, Minami Azumi-gun) there is an amazake festival each January or February. In Saitama prefecture (Kita Katsushika-gun) there is an amazake festival each September 9. 4. At the Shimomaino Shrine in Miyazaki prefecture (Nanpo, Nobeoka-shi) there is the Ichiya-zukuri amazake festival.

To make amazake, either glutinous rice or regular short-grain rice can be used. One can make it soft (yawaraka-zukuri) or firm (kata-zukuri) by adding more or less water. Cook white rice or make rice porridge. Add rice koji and hot water (about 70ºC); use about the same amount of water as

© Copyright Soyinfo Center 2014

rice for the firm consistency or 3-4 times as much for the soft consistency. Keep the temperature at 55-60ºC for 8-10 hours. Good amazake, in which almost all the rice starch has been converted to glucose, will be very sweet. Thin it with water, bring to a boil, and drink. Adding a little freshly grated gingerroot lends a nice fragrance. Another type of amazake is made with sake lees (sake kasu) sweetened by adding sugar.

The word amazake is used in Japanese waka (31-syllable poems) as an indicator of summer, as are the words Hitoyozake, Kozake, and Amazake-uri.

• ***Summary:*** Raw soybean flour was processed to kinako (parched full-fat soy flour) by heating at 140º for 6 minutes, or about 160º for 4.5 minutes.

5418. *Malawi Department of Agriculture, Ministry of Natural Resources, Annual Report.* 1967. Legumes. For the year 1963/64. Part II. 142 p.
• ***Summary:*** In the section on "Legumes," the subsection titled "Soya" (p. 28) reports that two soybean variety trials were conducted at Bvumbwe [the Bvumbwe Tung and Agricultural Experiment Station, Box 748, Limbe]. The first trials were from 1961-63. During this period, Hernon 107 gave the best seed yields (1,153 lb/acre), followed by Pelican (1,090), and Hernon 147. The mean yield for 5 varieties was 946 lb. The second trial tested 3 varieties from Japan and 6 from Southern Rhodesia. They were planted on 3 Dec. 1963. Geduld gave the best yield (1,742 lb/acre), followed by Lee (1,307) and Hood (1,307).

The subsection titled "Soya Beans" (p. 29) states that the variety collection at Chitedze [Agricultural Research Station, Chitedze, Box 158, Lilongwe] was planted to renew seed. Ten varieties that yielded over 800 lb/acre are listed. "At Chitala [Chitala Experiment Station, Salima] the long term variety Malaya gave 640 lb/acre seed and the medium term Volstate 590 lb/acre. There was no response to single superphosphate at 200 lb/acre.

Note 1. Nyasaland achieved independence and was renamed Malawi in 1964. Note 2. The title page reads, from top to bottom: Ministry of Natural Resources. Annual Report of the Department of Agriculture for the Year 1963/64. Part II. 1967. Printed and Published by the Government Printer, Zomba, Malawi. Address: Malawi.

• ***Summary:*** Contents: Part I: Bacterial and algal toxins. Part II: Fungal toxins. One chapter in each part is about soy. They are cited separately. Address: MIT, Cambridge, Massachusetts.

5421. Nakano, Masahiro. ed. 1967. Hakkô shokuhin [Fermented foods]. Tokyo: Korin Shoin. 244 p. See esp. p. 81-101. [Jap]
• ***Summary:*** Includes sections on soymilk yogurt (cultured with *Lactobacillus bulgaricus*) and *nyu fu* [fermented tofu].

Chapter 6, *Nyu fu* notes that this is an ancient food that came from China and Taiwan, but has never become a part of Japanese cuisine. In the United States (and in English) it is known as "Soybean cheese" and "Vegetable cheese," while in China it is known as "Nyufu" as well as Chaw taufu, Sufu, Funyu, etc.

6.1.2–Places of production and varieties: Nyufu is made mainly in the middle to southern four coastal provinces of China. These include (pinyin / Wade-Giles): Jejiang / Chekiang (Jap: Sekkô), Jiangsu / Kiangsu (Jap: Kôso), Fujian / Fukien (Jap: Fukken), Guangdong / Kwangtung (Jap: Kanton). A lot of Nyufu is also made in Taiwan, which

© Copyright Soyinfo Center 2014

is located off the coast of Fujian province.

Since nyufu has been produced for a long time over a vast area, there are many varieties. A study conducted in the 1920s found the varieties shown in chart 6.1 in the Shanghai market (Shanghai is in Jiangsu province near the mouth of the Yangtze River).

(1) Pickled without mold on the tofu. (i) Jianning-dofu: Drain then dry the tofu, add salt, and pickle in jiang or the residue / dregs left after making soy sauce.

(ii) Doufuru: Drain then dry the tofu. Sprinkle it with salt then pickle it in koji.

(2) Culture mold on small cubes of tofu until a fragrant white mycelium surrounds each cube, then pickle.

(iii) Jiangrufu: Pickle in jiang or the residue / dregs left after making soy sauce.

(iv). Honjiang rufu [red jiang fermented tofu]: Pickle in a mixture of red rice / angkak (a red koji made by growing *Monascus* mold on rice) and the residue / dregs left after making soy sauce.

(v) Zaorufu: Pickle in sake lees.

(vi) Hongrufu: Pickle in red sake lees.

(vii) Jiujia rufu: Pickle in white sake / daku-shu, like unrefined sake (*doburoku*).

(viii) Xiangrufu (fragrant rufu): Pickle in jiang with olive leaves, fragrant mushrooms, etc.

Dr. Masahiro Nakano was born in 1907. Address: National Food Research Inst., Tokyo.

5424. Riesman, David; Riesman, Evelyn Thompson. 1967. Conversations in Japan: Modernization, politics, and culture. New York, NY: Basic Books, Inc. xii + 371 p. See p. 58. Index. 25 cm.
• ***Summary:*** These are the authors' published diaries and tape recorded conversations with Japanese during a 2-month visit to Japan from Sept. 30 to Dec. 2, 1961. The visit was sponsored by the Japan Committee for Intellectual Exchange. The husband is a Harvard professor; his wife accompanied him. On 12 Oct. 1961 the authors visited Mr. Sekihara (an architect) and his wife at their home in Tokyo. "The whole effect of the room... was a blending of the cosmopolitan and the Japanese, like the meal, which began with cocktails and hors d'oeuvres, then went on to raw fish and delicacies such as fresh ginger root, soybean soup, meat and vegetables, rice and pickle, then on top of all this, apple pie and green tea. It was served buffet style." Note: "Soybean soup" probably refers to miso soup. The authors also enjoyed raw fish and seaweed (p. 319). Address: Brattleboro, Vermont; Cambridge, Massachusetts.

5425. Yokotsuka, Tamotsu; Sasaki, M.; Kikuchi, T.; Asao, Y.; Nobuhara, A. 1967. Production of fluorescent compounds other than aflatoxins by Japanese industrial molds. In: R.I. Mateles and G.N. Wogan, eds. 1967. Biochemistry of Some Foodborne Microbial Toxins. Cambridge, MA: MIT Press. ix + 171 p. See p. 131-52. [17 ref]
• ***Summary:*** Early study showing absence of aflatoxins in fermented soyfoods. "Conclusions: 1. None of the 73 seed cultures or starter strains of *Aspergilli* tested under our conditions produced aflatoxins. These findings confirm the reports of Hesseltine et al. (1965), Aibara and Miyake (1965), and Masuda et al. (1965)." Address: Noda Inst. for Scientific Research and Central Research Inst. of Kikkoman Shoyu Co. Ltd., Noda, Japan.

5426. Misoshiru [Miso soup]. 1967? Tokyo: NHK [Jap]*
• ***Summary:*** An early postwar Japanese-language book about the many types of miso soup by Japanese National Broadcasting (NHK). Address: Tokyo, Japan.

5427. Kameda, Yukio; Kanatomo, S.; Kameda, Y.; Saito, Y. 1968. A contact antitumor activity of *Bacillus natto* on solid type Ehrlich carcinoma cells. *Chemical and Pharmaceutical Bulletin* 16(1):186-87. Jan. [2 ref]
• ***Summary:*** The authors have been searching for familiar bacteria that have high selective toxicity on human tumor cells. "The first choice was the bacillus of 'Natto' (fermented Japanese beans) which is a popular and cheap daily food for Japanese."

They found a strain (tentatively called KMD 1126) of *Bacillus natto* (the natto bacterium) which had contact antitumor activity in male inbred mice. "A mouse was transplanted intraperitoneally with approximately 10^7 Ehrlich ascites carcinoma cells." A table shows in detail the antitumor effect. The tumors on the treated side of each mouse were either nonexistent or much smaller than those on the untreated side.

Note: In medicine, ascites (also known as peritoneal cavity fluid) is an accumulation of fluid in the peritoneal cavity. The peritoneum is the smooth, transparent membrane that lines the cavity of the abdomen of humans and other mammals, and is folded inward over the abdominal and pelvic viscera. Address: Faculty of Pharmaceutical Sciences, Kanazawa Univ., Kanazawa, Japan.

• ***Summary:*** This article is about three American children who attend regular Japanese school in Kyoto. The instruction is in Japanese. Concerning lunch, one child said: "Today we had fried tofu, an apple, milk, and three pieces of bread with butter." Address: Education educator.

5434. Mattson, Marie. 1968. Visiting a Buddhist monastery at Koyasan. *Chicago Tribune.* Feb. 18. p. H15 or N15.
• ***Summary:*** Koyasan [Koya-san, "Mt. Koya"], "one of the most unusual communities anywhere on earth," is perched atop Mt. Kôya [Koya], in Wakayama prefecture south of Osaka, where it was founded over 1,000 years ago [in 819] by the Buddhist monk Kûkai (known posthumously as Kobo-Daishi), founder of the Shingon sect.

In the community today there are 120 buildings [many quite old] and a resident population of 9,000–making it one of the world's largest religious communities.

"The food at Koyasan is vegetarian, for strict Buddhists do not believe in killing any living thing. This even eliminates eggs... a vegetarian breakfast includes [miso] soup, rice, *tofu* (bean curd, which is a prime source of protein), fruits, vegetables, and tea."

Everyone goes to bed early in order to be up at 6 a.m. for Buddhist service. Photos show: (1) A pagoda [*Konpon Daitô,* the central point of Mt. Koya]. (2) A wandering Buddhist monk playing his flute. A small map of Japan shows the location of Koyasan.

5435. Ebine, Hideo; Yamamoto, Kôki. 1968. Dappi daizu ni yoru miso jôzô. II. Dappi daizu no miso genryô to shite no hyôka [Miso manufacturing from dehulled soybeans. II. Evaluation of dehulled soybeans for making miso]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 23. p. 1-4. Feb. [11 ref. Jap; eng]
Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5436. Ebine, Hideo; Sakano, Keichi; Kizaki, Michiyo; Kimura, Haruo. 1968. Eiyô kyôka miso no kenkyû. VII. Mechionin oyobi yûdôtai no miso e no tenka [On the manufacture of enriched miso. VII. Addition of L and DL form methionine and methionine sulfoxide]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 23. p. 9-13. Feb. [5 ref. Jap; eng]
• ***Summary:*** L-methionine, DL-methionine and methionine sulfoxide were added to two varieties of miso at the level of 0.2%. One was a light-yellow rice miso and the other a dark-colored rice miso. One group was pasteurized at 60ºC; the other was not. Both were allowed to stand at 30ºC for one month. There was no significant loss of methionine. In general, the non-pasteurized miso was organoleptically superior to the pasteurized miso. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5437. Ebine, Hideo; Nakano, M.; Kuroha, I. 1968. Eiyô kyôka miso no kenkyû. VI. Mechionin no tenka jiki to seihin ni oyobosu eikyô [On the manufacture of enriched miso. VI. Effects of added methionine on the quality of miso]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 23. p. 5-8. Feb. [10 ref. Jap; eng]
• ***Summary:*** The lysine content of rice or barley miso is comparatively high, whereas the content of sulfur-containing amino acids and tryptophan is low. DL-methionine was added to unripened miso at the level of 0.2–3% at the time the cooked soybeans were mixed with salted rice koji and ordinary salt. It was allowed to ferment at room temperature for a month and then at 30ºC for 3 weeks. During the fermentation, much of the added methionine was lost, accompanied by an off-flavor, probably due to the activity of microorganisms in the miso. This drawback was improved by pasteurization of miso to which DL-methionine had been added–after it had ripened adequately. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

• ***Summary:*** Includes a description to Kamehachi Sushi, a Japanese sushi restaurant in Chicago. Sushi is the most popular of all snack foods in Japan. Every neighborhood of each city in Japan has its tiny sushi bar. Dinner at Kamehachi "began with the traditional soy bean soup [miso soup], delicate and delicious... Also appealing to my taste buds was inari-zushi (soy bean pockets filled with a slightly sweetened rice)." There was also a bowl of "yu-dofu,... delicate bean curd squares. These were served in a bowl of steaming liquid and each person helped himself, transferring the curd to his plate, then dipping each bite of it into a sauce with dried fish base."

• ***Summary:*** Conditions for manufacturing cheese-like products from soybeans were investigated. Among three bacteria examined, *Streptococcus thermophilus* produced remarkably greater amounts of acids in soymilk than *S. lactis* and *Lactobacillus bulgaricus.* In conditions of 70-98ºC for 5 minutes, higher temperatures resulted in a higher level of solid content in final product. Difference in initial pH of soymilk only slightly affected the quality of the product. Based on these and other results, the following procedure was used for manufacturing: Soymilk containing 11% solid was heated at 98ºC for 5 minutes, cooled to 50ºC, the temperature at which *S. thermophilus* was inoculated, and calcium chloride (0.4%) was added for coagulating. The curd was kept for 10 minutes at 50ºC, cut, hooped, and pressed overnight. In addition, mold starter (*Penicillium caseicolum*) and sodium chloride were spread over the surface. During ripening of the curd at 15ºC and 85% RH for three weeks, water-soluble nitrogen increased to 50% of the total nitrogen. The product contained 70% moisture, and significant darkening developed with the process of ripening. Address: 1. Laboratory of Food Chemistry, Tachikawa College of Tokyo; 2-3. Dep. of Home Economics, Kawamura College, Toshima-ku, Tokyo.

• ***Summary:*** Orville Freeman, U.S. Secretary of Agriculture, wants to export more American products to Japan. In Tokyo, he and his wife attended the recent "American Festival of Fun, Food, and Fashion." He noted that "The Japanese diet is still low in protein..." which means a great market for American brooder chicks.

"Such traditional Japanese foods as 'miso' (soybean paste), 'shoyu' (soy sauce) and 'tofu' (bean curd) are made for the most part from American-produced soybeans." Address: Staff correspondent.

5452. Saikowski, Charlotte. 1968. America's foods expand Japan's menu. *Christian Science Monitor.* April 19. p. 6.
• ***Summary:*** At the recent "American Festival of Fun, Food, and Fashion" in Tokyo, Japan, officials of the USDA and their wives were on a "buy-American campaign" and on a campaign to encourage Japanese officials to reduce Japan's trade restrictions [such as protective import duties and tariffs]. Mrs. Orville Freeman, wife of the U.S. Secretary of Agriculture, said that America was trying to sell "nutrition, variety, and convenience."

Japan, which does not have enough land to met its own food needs, already depends heavily on America for its food needs, importing nearly $1 billion worth last year. "Such traditional Japanese foods as 'miso' (soybean paste), 'shoyu' (soy sauce), and 'tofu' (bean curd) are made for the most part from" soybeans grown in the United States.

glutamate."

5457. Fukushima, Danji. 1968. Internal structure of 7S and 11S globulin molecules in soybean proteins. *Cereal Chemistry* 45(3):203-24. May. [36 ref]
• ***Summary:*** The internal structure of soybean protein molecules (7S and 11S, native soybean globulins) was investigated by optical rotary dispersion (ORD), ultraviolet difference spectra, infrared absorption spectra, and other techniques. The 11S globulin contained more sulfur-containing amino acids than the 7S globulin. The major soybean proteins have primary, secondary, tertiary, and quatenary structures.

Native soybean proteins were found to possess a fairly compact internal structure, in which most of the peptide bonds are buried and cannot be hydrolyzed by proteinase without disruption of the internal structure. Only when the closely packed peptide chains are unfolded upon denaturation do they become accessible to proteinase molecules. Thus the substrates are hydrolyzed in proportion to the degree of denaturation of the substrate protein molecules.

Hydrolysis by proteinase appears to occur step by step, especially in the native protein. This could be explained as follows. When a peptide bond located at the surface of a tightly folded molecule is hydrolyzed, the molecule would be partly unfolded in the form close to a random coil, then it would be refolded in a new conformation after a certain time.

The "author concluded that (1) the major internal structures of both 7S and 11S globulins of soybeans are not alpha-helix, but are both the antiparallel betastructures and the disordered structures; (2) the molecules are fairly compact as a whole and even in their disordered parts; (3) the molecules are folded tertiarily and the water-impenetrable hydrophobic region is formed; (4) the hydrophobic bonds play an important role for stabilization of the internal structure; and (5) the molecules are not hydrolyzed by proteinase before the internal structure is disrupted, and the initial velocity of the hydrolysis by proteinases is proportional to the degree of its disruption." Address: Central Research Inst., Kikkoman Shoyu Co., Noda, Japan.

5458. Hayashi, Shizuka. 1968. Japanese diets need still more oil and protein. *Soybean Digest.* May. p. 32, 35.
• ***Summary:*** For the first time in 12 years (since JASI started promoting U.S. soybeans in Japan in 1956), Japan's import of U.S. soybeans, figured on a calendar year basis, lost its momentum. In 1967 Japan imported 1.770 million metric tons of U.S. soybeans, down slightly from 1.772 million metric tons in 1966. Fortunately [for the American Soybean Assoc.] total Japanese consumption of oils and fats was 850,000 metric tons, up 11% over 1966–largely due to imports of sunflower seed from the USSR.

A table shows percentage consumption of various oils and fats in Japan in 1966 and 1967, with 1968 projected. For 1967: Soybean oil 32%. Other vegetable oils 42%. Animal fats and fish oils 26%.

The remedy: Three alternatives could turn the tide: (1) Lower the cost of U.S. soybeans to Japanese crushers. (2) Stop the import of competing oilseeds. (3) Increase Japanese consumption of oils.

Almost all of the U.S. soybeans imported to Japan are crushed to make oil and meal. "Of the total 1.77 million tons of U.S. soybeans imported last year about 1.6 million tons [90.4%] went for crushing." Other seeds widely crushed for oil and meal in Japan are rapeseed, sunflowerseed, safflowerseed [safflower seed], kapok, cottonseed, copra, sesameseed, corn, peanut, palm kernel, and rice bran.

JASI must persuade the Japanese government to share its promotional campaigns and programs. "The intake of oil and protein, especially oil, urgently needs to be increased. This is the guideline of the Japanese government," which is also encouraging the Japanese people to eat more green vegetables. "The future soybean program needs more emphasis on salad oil, vegetable margarine, and fried tofu (aburaage).

Fried tofu consumes 45% (152,000 tons or 5.5 million bushels) of the total soybeans used by tofu makers. In addition 30,000 tons of soybean oil (from 6.6 million bushels of soybeans) is required to fry aburaage. Fried tofu therefore presently uses a total of 12 million bushels of soybeans. "In fact it is one of the largest of U.S. soybeans. A nationwide campaign to double this consumption needs to be planned. A total of 18,000 sushi shops and 30,000 noodle shops are buyers if fried tofu." A photo shows Shizuka Hayashi.

Note: This is the last article seen by Shizuka Hayashi in Soybean Digest. Address: Japanese-American Soybean Inst., Tokyo.

5459. Randolph, Chet. 1968. Japan Soya operates on U.S. soybeans. *Soybean Digest.* May. p. 24.
• ***Summary:*** Located near Kobe is a soybean processing plant named Japan Soya Product Co. (Nihon Daizu Seiyu Co. Ltd.). A photo shows the plant. Built as a joint venture by Hohnen Oil Co. and Yoshihara Oil Mill, it "is the first company in Japan to tie its name to soybeans." It began operation in about Dec. 1967. The president is Yoshio Noguchi.

5460. Watanabe, Bunzo. 1968. The Japanese oilseed processing industry. *Soybean Digest.* May. p. 36, 38.
• ***Summary:*** Tables show: (1) Imports of soybeans to Japan during calendar year 1967 by country of origin: USA 81%, Red China 19%, Other countries 1%. Total imported: 2,169,000 metric tons (79,710,000 bushels). (2) Consumption of edible refined oils and fats in Japan (1963-1967). Per capita consumption rose from 13.58 lb in 1963 to 18.08 lb in 1967. (3) Total oils and fats production in

Japan (1963-1967), imports and domestically grown, by oilseed type. Soybeans are by far the most important oilseed, followed by rapeseed. Rice bran is the main domestic source of oil. (4) Consumption of soybeans in Japan classified by utilization (1963-68, 1,000 metric tons). The following figures are for 1968 (1,000 metric tons): Crushed for oil 1,739. Foods: Tofu and aburage 294. Miso 170. Natto 50. Frozen tofu 40. Shoyu 15. Kinako 13. Other 70. The total used for food grew from 497 in 1963 to 652 in 1968.

Photos show: (1) American Soybean Association (ASA) executives seated around a table holding chopsticks at tempura luncheon with Mr. Watanabe, who is president of the Japanese Oilseed Processors Association, and other Japanese oilseed officials. From left, Shohei Takai, managing director Japan Oilseed Processors Association (JOPA); S. Yamada, manager oils and fats division, Ajinomoto Co., Inc; Scott Sawyers, ASA country director in Japan; Chet Randolph, ASA executive vice president; Mr. Bunzo Watanabe; and Hiroshi Higashimori, chief secretary JOPA. Tempura is a substantial outlet for soybean oil. (2) Portrait of Bunzo Watanabe. Address: Japanese Oilseed Processors Assoc., Japan.

5461. Ikehata, Hideo; Wakaizumi, M.; Murata, K. 1968. Antioxidant and antihemolytic activity of a new isoflavone, "Factor 2" isolated from tempeh. *Agricultural and Biological Chemistry* 32(6):740-46. June. [14 ref]
• ***Summary:*** "A new isoflavone assigned the trivial name 'Factor 2' which was first isolated from tempeh, a fermented soybean product, and identified as 6,7,4'-trihydroxyisoflavone was technically synthesized and tested for antioxidant activity by several methods. Factor 2 was proved to be a potent antioxidant in aqueous solution at pH 7.4. However it was not effective in preventing autoxidation of soybean oil and soybean powder. Factor 2 given orally to rats fed a vitamin-E deficient diet was also negative in hemolysis preventing activity. Biological activity of tempeh and the isolated Factor 2 to prevent hemolysis of red blood cells of rats fed a vitamin-E deficient diet was discussed." Address: Food and Nutrition Lab., Faculty of Science of Living, Osaka City Univ., Nishi-ku, Osaka, Japan.

5462. Shinoda, Osamu. 1968. O-tôfu no hanashi [The story of tofu]. *Rakumi* 6:4-8. June. [Jap]*
• ***Summary:*** An exhaustive search of the early Chinese food literature leads the author to believe that the world's earliest reference to the word *dofu* appears in the *Qing Yilu / Ch'ing I Lu* (Jap. *Seiiroku*), written by T'ao Ku in about A.D. 950, just before the Sung dynasty. This was more than 1,000 years after the supposed discovery of tofu by Liu An prior to 122 B.C. Address: Japan.

5463. Tajima, Yoshio; Kunioka, Etsuo. 1968. Homogeneous hydrogenation of soybean fatty esters by the Ziegler type of catalyst systems. *J. of the American Oil Chemists' Society* 45(6):478-79. June. [7 ref]
• ***Summary:*** Homogeneous hydrogenation of fatty esters (methyl linolenate, methyl linoleate) by binary catalyst systems of transitional methyl linoleate, by binary catalyst systems of transitional metal compounds (Ni (acac)3, $CoCl_2$, Co (acac), and $FeCl_3$) and organo-aluminum compounds (triethyl aluminum) is reported. Address: Central Research Lab., Toyo Rayon Company Ltd., Otsu, Shiga, Japan.

5464. *East* (*The–Higashi*). 1968. Charming flavor, traditional fragrance: The story of shoyu for the gourmet. 4(4):45-47. June/July. [Eng]
• ***Summary:*** Contents: Introduction (Nuoc mam, sashimi, shoyu). The history of shoyu (incl. shojin-ryori, kaiseki ryori). The chance discovery of shoyu (incl. Zen priest Kakushin, Keizanji miso, Yuasa in Wakayama prefecture, tamari, Yamasa Shoyu brewery at Choshi in Chiba prefecture). How is shoyu produced?

"It is said that toward the end of the Muromachi Period around 1560, the people of Yuasa began to sell this seasoning [*shôyu*] in the Osaka-Kyoto area. Later, during the Tokugawa Period, around 1635, with the establishment of the alternate-year residence of the daimyôs in Edo (*sankin-kôtai*), and the accelerated urbanization of Edo, *shôyu* breweries sprang up at Chôshi and Noda in Chiba Prefecture making it available in the Kantô Plains. Production methods were gradually improved, and wheat began to be used, thus producing the present-day *koi-kuchi* [*koikuchi*] (deep-colored) *shôyu* which took the place of the old *tamari* (settled) *shôyu.* This new deep-colored *shôyu* spread from Edo throughout the whole country. Thus the Yamasa Shôyu Brewery of Chôshi became the main big enterprise producing deep-colored *shôyu,* while *usukuchi* (light-colored) *shôyu* produced in the Kansai Area [Kyoto-Osaka] and *tamari shôyu* produced in Aichi Prefecture [especially around Nagoya] also developed, and continued to hold their places on the market."

The main reasons Yamasa traditionally maintained its facilities at Choshi are because of the temperate climate and the plentiful supply of under-ground water.

5465. *East* (*The–Higashi*). 1968. Yamasa Shoyu: Authentic Japanese quality soy sauce (Ad). 4(4):?? June/July. [Eng]
• ***Summary:*** At the center of this full-page color ad is a large, rectangular photo of sukiyaki ingredients on a plate above a Japanese table setting. The caption: "Heightens the full natural taste of foods with just the slightest touch, no matter whether cooking is Japanese or western style." Below that are small photos of a bottle and a yellow and purple can of Yamasa Shoyu. The logo reads: "Since 1645." Brewed by Yamasa Shoyu Co., Ltd., Choshi, Chiba-ken, Japan.

Note 3. This is the earliest document seen (Oct. 2009) that gives the date 1645 as the beginning of Yamasa Shoyu.

5466. Fujimaki, Masao; Kato, H.; Arai, S.; Tamaki, E. 1968. Applying proteolytic enzymes on soybean. I. Proteolytic enzyme treatment of soybean protein and its effect on the flavor. *Food Technology* 22(7):77-81. July. [9 ref]
• ***Summary:*** It is demonstrated that enzymatic proteolysis is useful for removing trypsin inhibitors and undesirable flavors from soy protein concentrate under mild conditions. Spray-dried soy sodium proteinate (Promine-D from Central Soya Co.) was as the substrate; it contain 97% protein on a dry basis. Three well-known enzymes (papain, bromelin, and pepsin), and nine commercial proteolytic enzyme preparations of microbial origin (Molsin, Rapidase, Prozyme, Takadiastase-SS, Coronase, Thermoase, Pronase, Bioprase, and alkaline proteinase of *Bacillus subtilis*) were tested. Molsin gave the best results; optimum conditions are given (incl. pH 2.8, temperature 60ºC).

Undesirable flavors were mostly removed by treating the soy protein preparation with an appropriate proteolytic enzyme. Beany flavor generally decreased in the early stage of digestion/fermentation, however bitter flavor often increased with increasing digestion time. In some cases astringent flavor and oily or maltol-like flavor appeared, the latter being prominent after long digestion.

Takadiastase-SS was produced from *Aspergillus oryzae* by Sankyo Co. in Japan. Address: Dep. of Agricultural Chemistry, The Univ. of Tokyo.

5467. Saio, Kyoko; Watanabe, Tokuji. 1968. Daizu shokuhin no bisai kôzô [Observations of the minute structure of soybean foods, as seen under an electron microscope]. *Nippon Shokuhin Kogyo Gakkaishi* (*J. of Food Science and Technology*) 15(7):290-96. [8 ref. Jap]
• ***Summary:*** Of the electron microscopic pictures taken in the investigation on protein bodies and the protein in soybean seeds, some were presented to elucidate their fine structures and their changes in processing. No change in protein bodies and spherosomes in intact cells of soybean cotyledons occurred as a result of soaking in water overnight, while remarkable changes, such as bursting of protein bodies, curdling of their protein in mass without dissolving, and converting of spherosomes into rather large oil droplets, were observed after successive heat-steaming and fermentation with *Bacillus natto.* In tofu gel, a network is formed with protein microgranules, and oil droplets located in groups along it. The meshlike structure of the fresh tofu used to make dried frozen tofu (kori-dofu) is denser than that of ordinary tofu. During freezing, protein microgranules are localized and denatured by the growth of ice crystals (from the online abstract at http://www.journalarchive.jst.go.jp/english/).

This is the earliest document seen (Jan. 2012) that describes the use of an electron microscope to examine soyfoods. Address: Food Research Inst., Ministry of Agriculture & Forestry, Koto-ku, Tokyo.

5468. *Soybean Digest.* 1968. Hayashi steps down as JASI head in Tokyo. July. p. 3.
• ***Summary:*** After 12 years of service, Shizuka Hayashi retired as managing director of the Japanese American Soybean Institute in Tokyo, effective July 1. He has been in charge of the organization since it was founded. Under his leadership, millions of Japanese became "better acquainted with soybeans and the part they play in a more adequate diet. Mr. Hayashi's greatest achievement in the early days of JASI was to erase the bad image U.S. soybeans had in Japan right after World War II. His achievement was a major factor in leading Japan to become the world's No. 1 buyer of U.S. [soy] beans.

"During his tenure the Japanese margarine industry has begun to turn to soybean oil as an ingredient in its product; and soybean meal, as an ingredient in feeds for the growing swine and poultry industries in Japan, has become a major outlet for U.S. soybeans."

"Scott Sawyers will head the Japanese operations as country director in Japan for ASA-JASI." A portrait photo shows Mr. S. Hayashi.

• ***Summary:*** Soybeans are cleaned, moistened, and sprouted at 90-100ºF for about 3 days to produce sprouts approximately ½ to 1½ inches long. The sprouting step is found to (1) largely eliminate the disagreeable aspect of soybean flavor in the final "soy-base milk," (2) improve the vitamin content of the soybeans, and (3) cause the soybean hulls to be loosened, thereby facilitating their subsequent removal. The sprouted soybeans are then ground to a slurry, using a stone grinder. Add water to the slurry and mix. Cook in a pressure cooker or open vat, then strain to remove the hot suspension liquor [soy milk]. Now slowly add and stir in a mixture of calcium sulphate and magnesium chloride to form a curd. Wash the precipitated curd, then removed all excess water, and press the curd in a cloth-lined forming

© Copyright Soyinfo Center 2014

box to make bean curd [tofu]. Now grind the curd to a very fine state using an emulsifying machine or colloid mill. Formulate the milk to resemble, as nearly as possible, natural cow's milk, by adding oil, sugar, salt, calcium gluconate and ferrous sulphate. To produce a fortified milk, vitamins A, D, and C may also be added. Pasteurize, homogenize, cool, and pack. Address: 1. 3151 S. Elm Ave., 93706; 2. 2411 Divisadero St., 93721. Both: Fresno, California.

5473. Associated Press (AP). 1968. Tofu is good for you. *Hartford Courant* (*Connecticut*). Sept. 29. p. 9E.
• ***Summary:*** Los Angeles (AP)–Tofu? Americans are familiar with many Japanese words such as sukiyaki, sayonara, jiujitsu [jujitsu], karate, etc. "But what or who is tofu?" Defined in the simplest terms "tofu is a soybean curd cake. It is of Japanese origin [sic; "tofu" is a Japanese word, but the food was invented in China] and is produced as a staple in Japan and many other Asian countries."

Although "tofu" is far from becoming a household word in America, "the number of Americans eating the product appears to be increasing, at least in Los Angeles.

"The sale of more than one million packages of tofu last year is an increase of 15 per cent over the previous year."

Although it is a good source of protein, it is low in cost, retailing for only 39 to 40 cents for a 20 3/4 inch package [= 30.5 cents a pound].

Two local hospitals serve it to heart patients as a substitute for meat.

Describes briefly how tofu is made. In America it is best known as white cubes in sukiyaki or as the "curd cake in clear soup."

5477. Murakami, Hideya; Sagawa, H.; Takase, S. 1968. Non-productivity of aflatoxin by Japanese industrial strains of *Aspergillus.* III. Common characteristics of the aflatoxin-producing strains. *J. of General and Applied Microbiology* (*Tokyo*) 14(3):251-62. Sept. [13 ref. Eng]
• ***Summary:*** The following mycological characteristics were found to be most common in aflatoxin-producing strains of *Aspergillus:* (1) Color of conidial heads is green even in old cultures; (2) The reverse side of the colony is wrinkled and colored; (3) The following are present–sclerotia, globose to subglobose vesicles, biserate stigmata, and conidiophores with roughened walls; (4) High productivity of pigment, total acid, and kojic acid; (5) Low ability to brown rice koji or to produce deferriferrichromes.

Sixteen mold strains were selected from 160 industrial strains as mycologically similar to the so-called aflatoxin strains. Their aflatoxin productivity together with the productivity of 13 aflatoxin strains was investigated using the same methods described in parts I and II. It was found that all of the industrial strains and four of the 13 aflatoxin strains did NOT produce aflatoxin.

Most of the aflatoxin strains used in these experiments were sent from the Northern Utilization Research and Development Division, Peoria, Illinois, USA; most had been proved to produce aflatoxin by the duckling assay. "Rice kojis were made using 10 g of polished rice in 100 ml flasks." On p. 255, two photos show the oval-shaped vesicles of aflatoxin strains, and an illustration shows chromatographic patterns of 29 aflatoxin-producing strains. Table 3 (p. 260) lists the morphological characteristics of 16 industrial aflatoxin strains, including details on the color of the old slant culture, vesicles, conidia, and colony. Table 4 (p. 261) lists physiological characteristics of 16 industrial aflatoxin strains, including details on the pigments, total acid, kojic acid, rice-koji (browning, and DF-value), relative intensity of fluorescence (blue, or green), and pattern of

5478. Ouchi, Ichiro; Mochizuki, Tsutomo. 1968. Miso jukusei-chû no chisso seibun no shôchô ni kansuru kenkyû. III. Miso jukusei-chû no yûri amino-san no shôchô ni tsuite [Studies on the degradation of soybean protein during miso making. III. Changes in amino acid content]. *Nippon Shokuhin Kogyo Gakkaishi* (*J. of Food Science and Technology*) 15(9):418-21. [11 ref. Jap]
• ***Summary:*** "Changes in free amino acids during miso making were investigated. Total free amino acids showed a rapid increase in the first 10 days of fermentation and then a slow increase in the latter part. Except for glutamic acid, aspartic acid and proline, liberation of individual free amino acid indicated the same tendency. Free glutamic acid, aspartic acid and proline increased almost linearly with progress in fermentation up to 50 days. The rate of liberation was high for lysine, arginine, threonine, serine, proline and tyrosine, and low for valine, histidine, glycine and aspartic acid. Glutamic acid showed the lowest liberation among all other amino acids." Address: Shinshu Miso Research Inst., Nagano.

5479. Sawyers, Scott. 1968. The soybean market in Japan, Taiwan, and Korea. *Soybean Digest.* Sept. p. 68, 70-72.
• ***Summary:*** The American Soybean Assoc. office in Japan, known as the Japanese American Soybean Institute, has concentrated on mass media and consumer promotions to increase the utilization of soybean oil, meal, and traditional foods prepared from soybeans. In Japan, this means liquid cooking oil, tempura oil, salad oil, vegetable oil margarine, miso, tofu, and soy sauce. Also, the growing preference for more meat, milk, and eggs in the Japanese diet requires the use of more soybean meal to support an expanding livestock and poultry industry. Efforts were made to popularize two slogans: "Take Oil Once a Day for Foods Cooked with Vegetable oil." And: "Take Oil for Health, Stamina, and Vitality." The key focus is to encourage the Japanese to consume more soy oil in their diet. A portrait photo shows Scott Sawyers. Address: Country Director, Japanese American Soybean Inst.-American Soybean Assoc., Tokyo.

5480. Schnittker, John A. 1968. The supply-demand imbalance of soybeans. *Foreign Agriculture.* Oct. 14. p. 4-5.
• ***Summary:*** Discusses the world abundance of soybeans and the opportunities and responsibilities which fall on producing countries. Trade in oilseeds was freed somewhat in the Dillon Round of negotiations back in the early 1960's. The trade door was opened wider in the Kennedy Round of discussions which ended in 1967, when the United Kingdom agreed to completely eliminate the import duty on soybeans and Japan, our major market, agreed to a 50% cut in the import duty on soybeans. Address: Undersecretary of Agriculture.

5481. McCormick, Sally. 1968. Azuma Sukiyaki House: Dine graciously in the Oriental manner–5120 N. Broadway, Chicago (Advertorial). *Chicago Tribune.* Oct. 24. p. G17.
• ***Summary:*** "Other Japanese dinners worthy of trying are New York Steak Teri-Yaki, Filet Mignon Teriyaki, Chicken Teri-Yaki, Fresh King Salmon Teri-Yaki, marinated in soy sauce and Mirin Sake and charcoal broiled, Fresh Rainbow Trout, charcoal broiled Sansho-Miso-Yaki style, Maine Lobster tail Teri-Yaki or Curry Yaki, Tuna or Sea Bass Teri-Yaki or Shio Yaki."

The dinner menu prices range from $4.35 to $6.15.

"The menu also features many side dishes with such exotic names as Cold Tofu, Miso Shiru, Chawan Mushi and many more."

Contains three photos featuring women taken inside the restaurant.

5486. Shinoda, Osamu. 1968. Tôfu-kô [Thoughts / treatise on tofu]. *Fuzoku* (*Historical Review of Manners and Customs*) 8(11):30-37. Nov. [10 ref. Jap]
• ***Summary:*** An exhaustive search of the early Chinese food literature leads the author to believe that the world's earliest reference to the word *dofu* appears in the *Ch'ing I Lu* (Jap. Seiiroku), written by T'ao Ku in about A.D. 950, just before the Sung dynasty. This was more than 1,000 years after the supposed discovery of tofu by Liu An prior to 122 B.C.

Shinoda (born 1899, and considered by many to be Japan's greatest modern food historian) believes that after the middle of the T'ang dynasty (i.e., after about A.D. 750), the Chinese, who still had no dairy animals, began to make tofu instead of dairy cheese. By the start of the Sung dynasty in A.D. 960, tofu was popular all over China. After publication of the *Ch'ing I Lu,* reference to tofu began to appear in many other Chinese works.

On p. 35 of this article is a table showing the 12 earliest known Japanese documents that mention tofu. The table contains three columns: (1) The title of the document in Japanese. (2) The year it appeared. (3) The name given to tofu in the document (for example, Tofu-jiru, or shirakabe, or dengaku).

The following is our best effort to romanize and translate these. (1) *Kagenki.* [Record]. 1238. Taufu-jiru. (2) *Gion shigyô nikki* [Diary of the execution of Gion]. 1350. Mori. (3) *Inryôken nichiroku* [Daily records of Inryôken]. 1437. Dengaku. (4) *Jinson Daisôjô ki* [Record of Jinson Daisôjô]. 1457. Tôfu. (5) *Oyudono no Ue no nikki* [Diary of Oyudono no Ue]. 1477. Oden. (6) *Gohôkôin Konoe Masaie ki* [Record of Gohôkôin Konoe Masaie]. 1479. Shirakabe. (7) *Ninagawa Chikamoto ki* [Record of Ninagawa Chikamoto]. 1483. Shirakabe. (8) *Shoken nichiroku* [Journal of Shoken]. 1486. Dengaku. (9) *Inryôken nichiroku* [Journal of Inryôken]. 1487. Mura Dengaku. (10) *Rokuon nichiroku* [Journal of the Deer Garden]. 1489. Tofu. (11) *Tsuneatsu Hôin nikki* [Diary of Tsuneatsu Hôin]. 1532. Tofu. (12) *Shishinki* [Record of my heart]. 1534. Tengaku. Address: Japan.

5487. *SoyaScan Notes.* 1968. Chronology of soybeans, soyfoods and natural foods in the United States 1968 (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1968, March. Saci, a liquid soymilk in chocolate and caramel flavors, launched by Coca-Cola Industrias Ltda. in Brazil. Indicates growing interest in commercial soy beverages in Third World countries.

1968, April. First Workshop on Soybean held in New Delhi by the Indian Council of Agricultural Research.

1968, April. *Aerobics* by Dr. Kenneth Cooper published. The book soon becomes a major force in America's new wave of interest in health, fitness, and jogging.

1968, May. Conference on Protein Rich Food Products from Oilseeds held by the USDA in New Orleans, Louisiana. Oilseed proteins are increasingly seen as the answer to the "protein crisis."

1968, May. *Ten Talents* self-published by Frank and Rosalie Hurd of Chisolm, Minnesota. An early vegan cookbook (using no meat, eggs, or dairy products) with many innovative soy recipes.

1968. *International Action to Avert the Impending Protein Crisis,* a United Nations publication, recommends soybeans as the single most promising protein source to close the "protein gap."

1968, Aug. Erewhon starts importing foods from Japan, initially from Muso Shokuhin, then later by correspondence with Mr. Akiyoshi Kazama, who worked for an import/export company named Mitoku, which sold no food at that time. The initial orders include red miso (made by one of George Ohsawa's cronies) and natural shoyu made by Marushima. These soon become high-volume items.

1968. *Plant Foods for Human Nutrition,* a scientific journal, starts publication from the Vegetarian Nutritional Research Centre, Watford, Herts, England. Runs many articles on soy nutrition and on vegan diets.

5488. Photographs of Erewhon retail at 342 Newbury Street. 1968. Boston, Massachusetts.
• ***Summary:*** (1) Front of the store. (2) Back of the store. To the left is the door to the office. On the pallets stacks of both multiwall paper sacks (left) and burlap bags (rear). They arrived at the store by the truckload and the workers (including Jean) had to unload them by hand–sometimes hoisting them onto one shoulder. (3) Jean Allison seated at a desk in the Erewhon office.

These photos were sent to Soyinfo Center by Jean Allison Young of Chatham, Massachusetts, in Feb. 2011.

Letter (e-mail) from Norio Kushi. 2011. Feb. 8. These photos were "both taken at 342 Newbury Street, Boston, in 1968 soon after the move from 303-B Newbury to 342 Newbury, in Boston. I am guessing that both photos were taken within minutes of each other.

"The person behind the cash register, facing towards the right in the photo is Eric Utne, who later worked at *East West Journal,* eventually becoming the editor. He later left *East West Journal* and he, along with his then wife, Peggy Taylor, started New Age Journal. When Eric and Peggy split up, Peggy retained *New Age Journal,* with Eric Utne soon thereafter starting *The Utne Reader.* Eric Utne currently lives in Minneapolis [Minnesota] with his wife, Nina...

© Copyright Soyinfo Center 2014

"The person facing Eric Utne, might be Jim Ledbetter,... or it could be a customer who I have never met. Jim Ledbetter and Jean Allison both lived at 216 Gardner Road. in Brookline with our family during this time. Eric Utne lived in one of the other study houses, 6 Ellery St, Cambridge, Massachusetts.

"The 2nd photo is of the stockroom in the rear half of the store. The size of the stockroom and how the bags of rice and other commodities are stacked would indicate the photos were taken soon after the move. Shelf space in the retail section kept growing along with business, and the rear storage room, once half the square footage of the store began shrinking as the need to expand the retail space increased, eventually necessitating the opening of the warehouse at 33 Farnsworth St. in Boston. Other than brown rice being in the burlap or paper 100 lb sacks, I don't know what any of the other products would be in the other sacks or boxes.

"As I recall, we didn't start getting the 50 lb organic rice in the paper sacks till after the opening of the Erewhon warehouse. Up till that point I recall the brown rice came in the 100 lb burlap sacks. Therefore, I feel that what is in the paper sacks would be beans and grains other than brown rice.

"I was noticing on the selves to the left there are smaller sacks. All the rice, grains, beans, etc were all packaged from bulk into these bags by hand. The item that was in these bags were rubber stamped onto the front of the bag just prior to filling them.

"We also received many Japanese items, such as shoyu (which we called tamari), miso, and umeboshi in those bulk wooden kegs. They were hand poured or scooped into bottles and jars. I don't see any of these items in this photo. The store photo was also rather Spartan, which is what lead me to feel that these photos were taken soon after moving from 303-B Newbury St. to 342 Newbury St. "I would stop by the store regularly but didn't actually 'work' there during this time. I used to come in and just help out after school or on Saturdays just for the fun of it.

"At the prior location at 303-B Newbury St, I spent many full Saturdays helping out. I was there one Saturday when we had the very first day we did over $100.00 in sales. The other person who was working on that day was Jean Mohan. At least during the 303-B Newbury Street days, people who lived in our house at 216 Gardner Rd, Brookline, MA, would take turns working at the store, although Evan Root was the manager."

Letter (e-mail) from Evan Root. 2011. Feb. 10. These two photos "are of the store at 342 Newbury St. This was the 'first edition.' It was, of course, remodeled from the shell that was rented. But it is before a bigger remodeling which yielded the whole first floor for the store, bins for grains and beans, and a walk-in refrigerator where the office was. The accounting office and storage moved to the basement and a winched lift to bring the goods up for stocking." Address: Boston, Massachusetts.

5505. Abehsera, Michel. 1968. Zen macrobiotic cooking. New Hyde Park, New York: University Books/Avon. 224 p. Index. 18 cm. [15 ref]
• ***Summary:*** Abehsera's first macrobiotic cookbook contains a strict approach to macrobiotics. Includes many short stories by and about George Ohsawa.

In the Introduction, the author states (p. 13) that if he had been asked to write a cookbook 5 years ago, he would have been utterly amused, for he was in a precarious state of health and, for him, a cookbook was basically a collection of "recipes for stuffing one's belly.

"These five years have been an exhilarating adventure and happiness spent with my dear wife and children together with a 'thousand' friends. The anguished thoughts of a 28-year-old have been dissipated and he has been freed from the tortures and agony that previously pervaded his existence.

"This new and happy change has been due to the profound influence of George Ohsawa, who made it possible for me to recover my health so that I could leave France [Paris] and journey to New York, the city of my dreams. Now, I have decided to write a cookbook."

Contains the following soy-related recipes: Miso spread (with sesame butter, p. 105). Miso onion spread (p. 106). Miso in green (with green pepper and scallion, p. 106-07). Miso soup (p. 117). Chinese soup (with miso, p. 120). La belle jardiniere (with miso, p. 123). Koi-koku (with carp, burdock, and miso, p. 125-26). French onion soup (with tamari, p. 132). Soup stock made with miso paste (p. 137). There are no tofu or seitan recipes in this book. It is not a vegetarian cookbook, since many recipes call for fish and seafood.

Monthly publications (p. 208): (1) *Yin-Yang,* Centre International Ignoramus, 26 Rue Lamartine, Paris 9eme, France. (2) *The Macro-Biotic Monthly,* Ignoramus Press, Los Angeles, California. (3) *The Order of the Universe,* Order of the Universe Publications, Box 203, Prudential Center Station, Boston, Massachusetts.

Shopping guide (p. 209-10): Those marked with an asterisk (*) welcome mail orders. (1) Chinese products (incl. tofu, woks): Wo Fat Co., 16 Bowery, New York, N.Y. 10013. Mon Fong Wo Co., 36 Pell St., New York, N.Y. 10013. Yuit Hing Market Corp., 23 Pell St., New York, N.Y. 10013.

(2) Organic fruits, vegetables and whole grains. Also oil, sea salt and many other health foods. * Good Earth–Natural

Glossary (p. 211-15): Aduki or azuki beans, bancha, bonito flakes, brown rice, bulgur, burdock, cellophane noodles, chapati, couscous, daikon, ginseng tea, gomasio [gomashio], hiziki [hijiki], Japanese knife, kasha, kokkoh [grain milk; weaning food for babies], kuzu, lotus tea or kohren tea, miso, mu tea, nituke [nitsuke], nori, sea salt, semolina, soba, soy or soya sauce (see tamari), suribachi, tahini, tamari, tempura, tofu, udon, umeboshi plums, vegetable brush or tawashi, wok.

A few glossary definitions: "Tamari: A pure soy sauce concentrate, a byproduct of miso. Commercial soy sauce is not recommended; macrobiotic stores have the right kind."

"Tofu: A curd made of the liquid in which crushed soybeans have been softened; it is solidified by boiling" [sic].

Note: This book was published in London in 1969 by Anchor Press, Ltd. (201 p.). Address: New York.

5506. Akizuki, Tatsuichiro (Akiduki). 1968. Miso. Translated by Herman Aihara. *Macrobiotic Monthly* 8(5):6-12. [1 ref]
• ***Summary:*** Discusses miso in the treatment of tuberculosis and atomic radiation exposure. On 9 Aug. 1945 the atomic bomb was dropped on Nagasaki. It killed many thousands of people. Dr. Akizuki was in charge of the St. Francis Hospital, located only 1 mile from the center of the blast in Nagasaki. The hospital was completely destroyed. He and his assistants helped may victims who suffered the effects of the bomb. He noticed that none of his co-workers suffered or died from radiation. He attributed this to the fact that they had developed a strong constitution by consuming miso soup and brown rice daily. He considers miso to be the highest form of medicine. It produces an alkaline condition in the body. Address: Chico, California.

5507. Borgstrom, Georg. 1968. Principles of food science: Food microbiology and biochemistry (Vol. 2). New York, NY: Macmillan. xiv + 473 p. Index. 26 cm. [9 ref]
• ***Summary:*** In Chapter 4, "Fermentation," is a section titled "soybeans" (p. 110-12) which discusses: Tofu or teou-fu, miso, sufu, natto, tempeh, taotjo and ketjap (shoyu / soy sauce).

"Frozen tofu (kori tofu, or koya dofu) is tofu that has been frozen for several weeks and dried. Aburage is fresh tofu dried in deep fat. Namaage is fresh tofu that has been surface-fried."

In Chapter 10, "Trends in food utilization," is a section titled "Soybean" (p. 297-301) which discusses: Soybean products and fermented products ("These foods are all rather unknown among Western peoples, although they are eaten by millions of people and constitute some of the most common foods on earth." Yet some "typical oriental soy foods," such as tofu and tempeh, are finding acceptance in the West. One soy product that is widely used in most parts of the world is soy sauce. Soy flour and soy grits were first made commercially in the USA in the early 1930s. Milk made from the soybean is important in China {see Vol. I, Chap. 15}. Fermented products include taotjo, soy sauce or ketjap). Soybean protein, including soybean oil and defatted soybean oil meal (In 1961, 9.5 million tons of soybean oil meal was used in the USA, mainly for animal foods, with special grades used for food and industrial products, such as isolated soybean protein. Purified proteins extracted from dehulled and defatted meal, when toasted, are used in "Civil Defense emergency rations" and by the "international organization Meals for Millions." Some 90% of the processed soybean oil in the USA now goes into food uses. Soybean oil is now the most important ingredient in oleomargarine {see Fig. 10.1}. About one-third of the soybeans moved off the farm are exported; Japan is our biggest customer {taking about 57%} followed by Western Europe {27%}, Canada {8%} and Israel {5%}). Soybean uses (Despite its nutritive value, "the soybean is not looked upon with favor in many areas" for two main reasons: it does not soften well during cooking and it is difficult to digest. Many other legumes share these problems, but they are generally require less cooking. When soy flour is used, alone or with cereal flours, the drawbacks almost vanish. "Soybean milk is not comparable to animal milk or human milk except in protein content." And it usually has an unpleasant, bitter taste, but this can be removed at least cost by bulk processing. When soybean curd is made in the typical way, "many nutritious components are lost," yet it is easy to digest. Soy sauce can be used only as a condiment because of its high salt content. Germinated soybeans make an excellent vegetable, which is rich in vitamin C).

Table 10-1 (p. 300) shows utilization of soybean oil (in millions of pounds) (1947-49 to 1967). The columns are: Shortening (the largest use and steadily increasing),

© Copyright Soyinfo Center 2014

margarine, cooking, salad and other edible oils (No. 2), total for food uses, total nonfood uses.

Toasted soy protein (Made by General Mills, starting in Belmont, Iowa, and named Hi-Pro and Protein Plus. "The Belmont plant has been running at capacity to supply for American Civil Defense stockpiling of toasted soy protein"). MPF (Multi-Purpose Food) made by a joint venture between General Mills and the Meals for Millions foundation. Gelsoy (the "first vegetable protein found to have gelling properties"). Promine (an edible soy protein). Fibrotein (soy protein spun into edible filaments). Soybean oil (The initial purpose of the U.S. soybean crushing industry was to obtain oil. The residual meal was considered virtually useless).

Chapter 13, titled "The world food issue," is about world hunger, which is "an ever-present specter for 2.3 billion people of the present world population of 3.4 billion." These people are concentrated largely in warm parts of the globe. Also discusses "protein malnutrition" (the main problem) and the need for more animal protein. North America has an animal protein "intake nine times that of the Far East." A section on "Plant milks" (p. 428-29), which are made from pulses and cereals, includes a subsection titled "Soybeans" which begins: "Soybeans form the basis of the most widely used and successful plant milks in China, Hong Kong, Indonesia, and the Philippines. Such milk has recently become available in Europe and the United States, primarily for clinical purposes"–for children allergic to the proteins in cows' milk.

Notes: Many references, divided into English and non-English, books and papers, are given at the end of each chapter. Address: Michigan State Univ.

5510. Fukui, Juro. 1968. Soy-bean breeding in Japan. *JARQ* (*Japan Agricultural Research Quarterly*) 3(3):5-9. [Eng]
• ***Summary:*** The local soybean varieties local to the cold part of Kushiro, Hokkaido are "a survival after long and severe natural selection." Note: Kushiro is in the far eastern part of Hokkaido. In Japan, these local varieties are collected, investigated and widely used in modern soybean breeding. Address: Prof., Faculty of Agriculture, Iwate Univ.

5511. Hawkes, Alex D. 1968. A world of vegetable cookery: An encyclopedic treasury of recipes, botany and lore of the vegetable kingdom. New York, NY: Simon and Schuster. 274 p. See p. 213-14. Illust. by Bill Goldsmith. 29 cm.
• ***Summary:*** The section titled "Soybean" focuses on green vegetable soybeans, noting: "In the Orient and increasingly in such places as Hawaii and California in this country, green Soybeans are for sale as a fresh vegetable. The plants have pod-laden branches, each short, narrow, very hairy pod containing three or four edible seeds. The fresh Soybean pods are washed, then boiled in lightly salted water until they are soft. Drained, they are seasoned to taste with soy sauce and a bit of sugar, then served, the beans being shucked from the pods at table."

There is a casserole recipe named "Miss Diddley's Green Soybeans." Also discusses briefly dried soybeans, roasted soybeans "ground into a meal and into flours of various degrees of coarseness [roasted soy flour] and "even used as a substitute for coffee, sprouted soybeans (a recipe is given for "Soybean Sprouts Cantonese"), soy oil, soy sauce, tofu, and miso. The author notes: "I often prepare my own version of *miso,* using dried navy or other white beans (see p. 44), instead of utilizing the commercial imported variety."

"Tôfu is the curd of cooked, mashed white soybeans, which has been precipitated, then pressed into cakes. It is perishable, hence most conveniently bought in cans, water-packed. The rather soft but firm cakes–sometimes baked or even fried prior to canning, and respectively known as *yakidôfu* and *aburage*–have a bland flavor, vaguely reminiscent of a custard. It is just this suavity which makes *tôfu* so valuable, since it quickly absorbs the flavors around it in such things as soups, sukiyaki, and mizutaki, yet retains its exceptionally pleasant substance. *Tôfu* is to be found in many of our domestic markets, imported from Japan. With its high content of readily digestible protein, it should be better known by all Americans."

traditional shoyu facility, Central Research Center. 3. The distribution and view of the buildings (p. 36): Distribution chart of the main buildings in the Noda area, view of the plant, water providing facility. 4. Products (p. 41): Shoyu, products made by food manufacturing department and sake brewing department. 5. Sales and marketing (p. 44): Domestic, overseas. 6. Welfare facilities (p. 48): Health center house, attached hospital, cultural gymnasium, dormitory and company housing quarters. 7. Connected enterprises (p. 50): *K.K. Senshûya* (*Chiaki*), foundational juridicial person / (*kôfûkai*), foundational juridicial person / (*Noda Sangyo Kagaku Kenkyusho*), *Sôbu-Tsûun K.K.*, Kikkoman International, Inc., Tone Coca-Cola Bottling Co., Kikko Food Industry K.K., Seishin Seiyaku K.K. (pharmaceutical company), Mann's Wine K.K. 8. The staff members (p. 58).

III. History. 1. The history of shoyu (p. 61): History of shoyu, origin of character meaning shoyu, Daishokuzen and Shoin, Zashin of Shoin, the beginning of shoyu exports (p. 76), the first shoyu plant overseas, shoyu which was protected by the Lord of the Han (*Hanko*), references to Noda Shoyu in literature. 2. Trademarks (p. 86): The change of trademark, the origin of the Kikkoman trademark. 3. Management of the organization (p. 91): Changes in organization, changes in management, changes in bookkeeping. 4. Production (p. 118): History of the method, raw materials, processes, containers, sauce, new seasonings, various kinds of sake. 5. The plant (p. 231): Noda plant, Kansai (Osaka-Kyoto area) plant, sake making plant. 6. Research center (p. 265): History of the research center, achievements. 7. Businesses (p. 269): Sales, wholesale, business customs, export, transportation, prices, advertising, business offices, overseas activities. 8. Labor (p. 375): Changes in labor conditions, the labor union, labor relations board. 9. Welfare (p. 393): Health insurance union, medical facilities, dormitories for single workers and company housing quarters, day care center, travel club, fire department, committee for funerals, weddings, etc. (*Kyozaikai*), athletic association, cultural committee, Noda Shoyu co-op.

IV. Pre-history–Before the company's establishment. 1. Natural and environmental history of Noda (p. 415). 2. Development of the shoyu industry in Noda (p. 432). 3. Family tree (p. 440). 4. Brief description of the major contributions (p. 448, incl. Kotohira Shrine, Kameo Mogi's theory of business, founding of the Senshu-kai, the man who emphasized thrift and simplicity, the 1st president of the company, the 2nd president–Mogi-Honke, the 3rd president Chu-do Kikkoman Kuramoto).

V. Company history. 1. Developmental stage and established stage (p. 469): Outline, foundation of the company, beginning of the business, developments and labor problems, overproduction and the business world. 2. The new order and the controlled economy during World War II (p. 494): Outline, changes during the war, process under controlled economy during the war. 3. The U.S. occupation period (p. 519): Outline, development of democracy, danger of the business world, changes caused by international conditions. 4. Development period of new Japan (p. 547): Outline, quickening of economic growth, advancing technology, a step forward to modernization, diversification of the business.

Appendixes: 1. Company time table (20 p.). 2. Charts and graphs concerning the company's history (5 p.). 3. Food history and shoyu (193 p., including many old illustrations, photos, a 38-page chronology of Japanese food culture {p. 137-75}, and a bibliography {p. 191-93}). Closing remarks (2 p.). Contains many photos, illustrations, and copies of early documents.

Note: Ichiyama is not listed in this book as the author, even though he wrote it. On the copyright page the author is given as Kikkoman K.K. Continued. Address: Noda, Japan.

5515. Kikkoman Shoyu K.K. 1968. Kikkôman Shôyu shi [History of Kikkoman Shoyu (Continued–Document part II)]. Noda, Japan: Kikkoman Shoyu K.K. 804 p. Illust. [113 ref. Jap; eng+]

• ***Summary:*** The section on the beginning of shoyu exports (p. 76) states that the exporting of shoyu from Japan began when a group of merchants were allowed to do business after the closing of Japan during the Kan-ei era (1624-30) of the early Tokugawa period. In 1641 a group of Dutchmen moved to Nagasaki from Hirado. At that time, two merchants already in business were allowed to conduct trade: Their names were Koyanagi Heizaemon and Sameya Hisazaemon. They established a stock company with 16 shares. The shareholders were called *Dejima shoshiki urikomi shônin.* To the original two merchants, in 1653 four more were added and in 1666 ten more were added, making a total of 16. These were called the "Comprador Merchant Guild" (*Konpura Nakama*). They started exporting shoyu from Japan. According to documents in the Hague: 1668–It was exported to Coromandel on the southeast coast of India. 1670–To Ceylon. 1699–To Ceylon, Bengal, and Nakabatanam. 1716–To Coromandel. 1717–To Suratt, in northwest India. Furthermore, the Dutch took shoyu to Europe. So we can see that in the late 1600s and early 1700s the people of Europe started to use shoyu.

The section on exports (p. 294-99) states that it is difficult to tell when shoyu from Noda was first exported from Japan. In 1879 a person named Domoto (?) got one Kikkoman brand and its logo (in the shape of a hexagon, but not the current Kikkoman logo) registered in California, and then he started to sell the product there. In about 1899 the Saheiji MOGI family's Kikkoman brand shoyu began to be exported to Hawaii via Okada-shoten, a company with offices at Koamicho 3-5 in Tokyo. In 1907 the Verleysen-Nyssens company in Brussels, Belgium, began to import

© Copyright Soyinfo Center 2014

shoyu in large kegs. They repackaged it in grey ceramic bottles of their own design, then published a pamphlet in French (see p. 295) describing the product (which they called "Soya") and showing a photo of two sizes of bottles. A 1.2 liter bottled retailed for 1.75 francs. Page 296 shows a gift coupon from the year 1922 from America. When a person buys a bottle of shoyu, he or she gets this $0.50 coupon.

Excerpts from Appendix 3 (p. 152+): Chronology of food history. 1610–Tamari was made in Nagoya using only soybeans when the Nagoya Castle was built. 1615–Dried nori sheets invented in Edo.

1616–Shoyu started to be made in Choshi, Shimousa.

1661–Takanashi (1661) and Mogi (1662) families in Noda started to make shoyu and miso.

1666–Usukuchi shoyu started to be made in Tatsuno, Hanshu / Banshu by a certain man. And Bizen shoyu started to be made in Bizen.

1698–Shoyu wholesaler (*tonya*) first appeared in the literature in *Sonazaki Shinju,* by Chikamatsu Monzaemon.

1781–Kanro shoyu starts to be made. Mr. Takada offered shoyu to Yoshikawa-ko and received the admiration / appreciation of *kanro* ("sweet dew").

1810–Choshi Shoyu received the *gozengoyô* Tanaka-gen han bakufu.

1829–The Takanashi house of Noda received the Bakufu's order for shoyu (*goryomaru*)**.** Address: Noda, Japan.

5516. Kojiki: Record of ancient matters. Translated and with and introduction by Donald L. Philippi. 1968. Tokyo: University of Tokyo Press. vii + 655 p. See p. 87, 404-05. Index. 24 cm. [Eng]
• ***Summary:*** This is an English-language translation of Japan's oldest chronicle, the Kojiki, written in 712 A.D. The text concerning the origin of soy beans in Japan is given under the original document. In Appendix A (p. 404-05) is a translation of the portion of the *Nihon Shoki* that relates to soybeans. Philippi notes, in comparing the two: "The similarities of this myth [the Nihon Shoki] with the Chinese P'an-ku myth have often been pointed out, but there appear to be even more strikingly similar myths in Taiwan and the Philippines. Matsumura, arguing from the rather large divergences in detail between the *Kojiki* and *Nihon shoki* versions, concludes that this myth was originally a native Japanese folk tale which was incorporated into the official mythology in various current versions.

"Some of the explanations suggested for the slaying of the food-goddess are: the idea that all things of value in life originated in a criminal act; the practice of slaying a victim to ensure a good crop; the practice of performing rites to pacify the grain spirits slain when plants are cut down at harvest."

Concerning azuki, the *Kojiki* states that when the god *Susano no Mikoto* came to earth, he killed a man and azuki sprang from the man's nose. Address: Philippi: Tokyo.

5521. Watanabe, Tokuji. 1968. Advanced technology in non-fermented soybean foods in Japan. *JARQ* (*Japan Agricultural Research Quarterly*) 3(4):9-13. [7 ref. Eng]
• ***Summary:*** A landmark article, filled with new and accurate information. Contents: Introduction. Tofu and derived foods: Fresh tofu (incl. "momen tofu," "kinugoshi," and "packed tofu." Glucono-delta-lactone has been known for the past several years as a coagulant for kinugoshi and packed tofu), aburage ("Thin sliced tofu"), kori-tofu (also called "dried tofu" it is made by freezing hard fresh tofu). Soybean protein concentrates: Dried soybean milk, 70% protein concentrates, soybean protein curd. Isolated soybean protein. Soybean protein fiber (a thick solution of alkaline isolated soybean protein is forced through spinnerettes into a batch consisting of an acid and salt mixture). Conclusion.

Note. This is the earliest English-language document seen (April 2013) that uses the term *momen* refer to a type of tofu.

Each year about 2,000,000 metric tons of soybeans are consumed in Japan. Most of these are imported from the United States or Communist China. Of this total, about 1,300,000 metric tons are crushed to make soybean oil and meal; about 75% of defatted soybean meal is fed to animals. Of this total, one million metric tons (included a portion of the defatted soybean meal) are used by the food industry to make human foods and condiments.

Although the demand for soybeans in Japan is increasing steadily, domestic production is decreasing, largely because imported soybeans are less expensive.

Traditional Japanese fermented soybean foods include

© Copyright Soyinfo Center 2014

miso, soysauce, and natto. Traditional non-fermented foods include tofu, aburage, koritofu, and kinako. Moreover a number of new foods or food materials are derived from defatted soybeans; they can be used in fish and meat products.

In fresh tofu, a nitrofuran derivative is permitted to be added as a preservative in amounts up to 5 parts per million.

Kinugoshi is made by mixing thick soybean milk at about 70ºC with calcium sulfate suspended in water in a box which has no holes. The milk coagulates into a homogeneous gel without separation of curds and whey.

Packed tofu is made by mixing cold thick soybean milk with a calcium salt in sausage-shaped plastic film bags. Each bag is then sealed closed and immersed in hot water at 90º C for 40 minutes. The soybean milk coagulates into a homogeneous gel like kinugoshi. "Packed tofu is more sanitary, transportable and preservable than momen or kinugoshi."

In some modern factories, aburage is made on a larger scale than momen tofu, using a continuous deep-fryer. There are more than 10-20 aburage factories in Japan which consume at least 600 kg of soybeans per day.

A detailed description of the process for making kori-tofu is given. Several kori-tofu factories consume at least 10 metric tons of soybeans a day.

Small photos show: (1) Fresh tofu soaked in cold water ready to be sold. (2) Continuous manufacture of packed tofu (made with GDL). (3) Equipment for making packed tofu from spray dried soybean milk. (4) Continuous deep-frying equipment for making aburage. (5) Bird's-eye view of a large-scale kori-tofu factory. (6) Soaking tofu cakes in cold water for pre-cooling and removing excess calcium chloride in making kori-tofu. (7) Continuous freezing of cut tofu cakes in making kori-tofu.

Flow sheets show: (1) Kori-tofu making. (2) Fresh tofu making. Address: Head, Food and Nutrition Div., Food Research Inst., Japan.

Investigations on comparative production of shoyu (soy-sauce) from defatted soybean meals obtained from United States and Japanese soybeans and processed by United States and Japanese methods. Japan Shoyu Research Inst., #9, 3-chome, Koami-cho, Nihonbashi, Chuo-ku, Tokyo. 103 p. Final technical report. USDA P.L. 480. Project no. UR-A11-(40)-21. Grant no. FG-Ja-117. 1 Aug. 1965 to 20 Feb. 1969. [Eng]
• ***Summary:*** In accordance with the Europeanization and instantization of Japanese cooking styles these days, soy sauce consumption per capita has been decreasing. In 1957, total Japanese production of soy sauce exceeded 1.1 million Kl [kiloliters = 1,000 liters]. Thereafter, however, production stagnated and is currently at 1.2 million Kl.

There are more than 4,000 soy sauce manufacturers in Japan, however most of them are smaller enterprises, and only five have large factories. The big five produce 35% of soy sauce made in Japan.

About 160,000 tons of defatted soybean meal and only 15,000 tons of whole soybeans are used to make soy sauce in Japan. Address: Japan Shoyu Research Inst., #9, 3-chome, Koami-cho, Nihonbashi, Chuo-ku, Tokyo, Japan.

5549. Spilsbury, Calvin C. 1969. Three stages in Far East soybean markets. *Foreign Agriculture.* April 14. p. 6-8.
• ***Summary:*** Today soybean markets in the Far East, the original home of the soybean, have emerged from time-honored Eastern patterns and have differentiated into what may be called three types–traditional, transitional, and industrial. In traditional markets soybeans continue to be sold and used chiefly for human protein foods, and volumes traded are comparatively small. Also, volumes processed by modern methods are small. Transitional markets are characterized by larger volume, the modern processing of considerable quantities of soybeans for oil for human consumption, and the developing use of soybean meal for human food products and for high-protein animal feeds for emerging livestock and poultry industries. In industrial markets very large quantities of soybeans are efficiently imported, marketed, and processed for oils and fats for human use and for meal for vigorous livestock industries; at the same time soybeans are still used in traditional foods and soybean meal is used to make a variety of new food products.

Korea is a traditional soybean market. Nearly all soybeans are processed into human protein foods such as synthetic milk, flour, paste for soup [miso], curd for consumption in more solid form, mash, sprouted beans, soy sauce, and even fermented "cheese". About 60 to 70% of the domestic crop of about 200,000 tonnes annually is sold in the country's food markets directly to private and commercial consumers. Total imports in 1968 were 28,000 tonnes–all from the U.S.

Most processing of soybeans for human use is done in individual homes by housewives. For example, nearly every Korean family makes a product known as kochojang, or hot bean mash, which consists of powdered, fermented soybeans mixed with red pepper, salt, and water. Some foodmaking (soybean curd and soy sauce) is organized into cottage industry. Most of the soybeans imported from the U.S. are made into traditional soybean foods for rations for the Korean army by one large food factory. Crushing soybeans and other oilseeds for oil is done by about 100 small mills throughout the country. The estimated capacity of all the mills added together is about 200,000 tonnes per year of oilseeds of all types. The largest mills have capacities less than 25 tons per day.

In Taiwan, very little of the imported soybeans are used to make traditional Far East foods. The larger crushing and extraction facilities are clustered around large cities–Taipei, Taichung, Tainan, and Kaohsiung. Only the last is a port, and even there no mills are located on deep water. Imported soybeans are discharged by ships' equipment onto docks, where they are bagged and then stored. Bagged beans are sent by truck or rail to inland processing plants. Modern deep-water bulk discharge facilities are to be built at Kaohsiung along with storage for soybeans and grain.

Japan is the giant of Far Eastern markets for U.S. soybeans. One of the most important recent improvements in soybean logistics has been the development of modern deepwater grain and soybean terminals where soybeans can be rapidly discharged from ships' holds directly to storage, interim transportation, or crushing mills. The first fast-discharge elevator on deep water for soybeans or grain was built by an American-Japanese company. At present four terminals have been built in the Tokyo and Kobe areas, and two more are under construction. Unloading is accomplished by pneumatic suction tubes with capacities of 600 to 800 tons per hour (about 6,000 tonnes per 8-hour day). In Korea and Taiwan, facilities for the fast unloading of large tankers do not exist. Many large, new crushing mills have been built on harbor frontage rather than inland so that they can benefit from bulk transportation methods. The annual capacity of the 15 large, modern mills in Japan is estimated at 1.8 million tons of soybeans. The first mills in Japan were in the mountains because most oilseed crops were grown there. Address: Fats and Oils Div., Foreign Agricultural Service.

5550. Barnes, Harris H., Jr. 1969. President's report: Let's put our men where the action is. *Soybean Digest.* April. p. 4-5.
• ***Summary:*** "New marketing organization: Recently in Washington [DC], in company with Sheldon Houck, representing the National Soybean Processors Assn., final plans were made for closing the Soybean Council of America office as of June 30. The work of this office will be taken over and expanded by the newly named American Soybean Institute, a market development organization, conceived by the American Soybean Assn. in St. Louis [Missouri] last December.

"The sole purpose of the new organization will be to increase sales of whole soybeans and soybean meal and soybean oil all over the world, including the U.S.

"ASA members think this is the time for action. Never was there a time where unity in the soybean industry was needed as much as today. With this in mind we have asked the processors–who along with the growers will be the greatest financial contributors to this agency–to band together with the exporters and country elevators and the terminal elevators, the exporters and transporters of soybeans, the soybean trade such as farm machinery, chemicals and fertilizers, the national farm organizations, extension service, research and Foreign Agricultural Service.

"It is felt that this band of interested soybean people can pool knowledge and be able to come up with concrete recommendations where market development money should be spent and in what amounts.

"As I write this, Chet Randolph, our executive vice president, is winging his way to Japan to supervise our activities there, under the capable leadership of Scott Sawyers, our Far East director. From Japan, Chet will

© Copyright Soyinfo Center 2014

move on to Taiwan where we hope to do our next market development work in the Far East.

"Markets in Europe:

"Europe will be included in Chet's trip this time as we contemplate new markets and the enlarging of markets which we will take over from the Soybean Council as more funds from growers, processors, and agribusiness become available to ASI.

"Money is the only thing that keeps us from moving right now into countries like Taiwan, Iran, Egypt, Turkey, Yugoslavia, Australia, and North Africa... to mention several."

"If we are to sell soybeans, we have to have people where the action is... in purchases of soybeans and soybean products! It takes big money to open offices in spots where we need them. And the grower must be motivated in the direction of market development.

"In the fall we are going into our Phase 2 program, that of collection of the ½¢/bu at first point of sale... the elevator or the oil mill. Your help will be greatly appreciated as you visit with your neighbor and with your good friend, your elevator operator." Address: President, American Soybean Assoc.

5551. *Soybean Digest.* 1969. Randolph on market development visit. April. p. 26.
• ***Summary:*** Chet Randolph, executive vice president of the American Soybean Assn., is on a worldwide supervisory visit for soybean market development. Most of his time will be spent in Japan, reviewing details and progress of ASA's active program in the Far East. Then he will visit market development contacts in Hong Kong, Iran, Israel, Italy, Germany, and the Netherlands. The trip is entirely financed by soft currency generated by PL 480 programs. A photo shows ASA's men in Tokyo: Scott Sawyers (Far East Director) and Mitsugi "Jack" Yamashita (assistant country director).

• ***Summary:*** "This paper reports mathematical investigations into the effect of blending on the preference of soy sauce and the correlation among 3 components." Address: Central Research Inst., Kikkoman Shoyu Co., Ltd., Noda, Chiba, Japan.

5554. Dosti, Rose. 1969. Happy holiday for Japanese. *Los Angeles Times.* May 8. p. H20.
• ***Summary:*** On April 29th, the Emperor of Japan celebrated his birthday, and wherever Japanese live there were banzai cheers. The hurrahs were especially loud in Los Angeles, for more Japanese-Americans live here than in any other part of the United States.

A photo shows Japanese Consul General Kanji Takasugi, with his wife, Shinako. They hosted a party for 800 guests honoring the Emperor's birthday.

The meal is described and recipes are given for tempura and its dipping sauce (*tentsuyu*), based on soy sauce, mirin and grated daikon (white radish). "Plain rice is served with a thin soup called omiso [miso soup] to which soy bean cakes (tofu) and green onion pieces are added."

5555. Tabuchi, Ichiro. 1969. Tônyû inryo ni kansuru chôsa to kongo [A survey on soymilk and its future]. *Daizu Kaihatsu, Shokuhin Kaihatsu* (*Soybean Development, Food Development*). May 27. p. 10-15. [Jap]
• ***Summary:*** Contents: Why we started producing soymilk. First is the economic reason; getting soymilk directly from soybeans is less expensive than feeding cows and getting milk from them. Second is the health reason. Our school has 3 goals in our education; the help develop a sound mind in a sound body with high moral values. We also emphasize independence and self-sufficiency, in part be encouraging students to be active in one of the businesses that are part of the school. And we encourage students to produce, as much as possible, what we eat at school.

We used to run a self-sufficient dairy farm and produced milk, which we used at the school and sent any extra to the Tokyo Eisei Byôin (Tokyo Adventist Hospital), etc. But during World War II for about 2 years, Christianity in Japan received pressure from the Japanese government. After the war we lost the milk cows and couldn't run the dairy farm. We switched these plants to make other foods. At this time we were using the nonfat dry milk from the USA–which was not tasty, or a little milk which we got somewhere. But that was not enough for the growing children at school. We needed the least expensive and most nutritious milk we could find.

Right at this time, Dr. Harry W. Miller visited us. He was an honorary member of the Japan and American Soybean Association, and a developer and researcher of soymilk; he urged us to make soymilk.

© Copyright Soyinfo Center 2014

But actually we were not so sure about making soymilk, so we hesitated. It was a long time later that we decided to do so.

The main reason for our hesitation was that even if we made soymilk, we were not sure that the children would like it and drink it. But as we think about it now, it was an unnecessary worry.

Anyway, Dr. Miller stayed for two months at our school and taught us how to make soymilk. He also gave three lectures on soymilk. mostly from a nutritional point of view. He did this because some thought that soymilk was nutritionally inferior to cow's milk and therefore it would not be a good idea to feed soymilk to growing children. Therefore he had to correct this point of view.

So in 1959, from the earnest recommendation (*nesshin na susume*) of Dr. Miller and the wise decision of our school principal, we discontinued the use of dairy milk and switched to soymilk only.

There was the opinion that we should keep both and let individuals decide which they wanted to drink.

It has been just ten years since we made the decision to switch to 100% soymilk. As I look back, I realize that we were now free of the work of feeding, caring for, and milking dairy cows; that was a big plus.

At present we make 1,000 bottles of soymilk a day, and this work is done by 1 person in half a day; it is very efficient.

Also discusses: Physical condition improves with ongoing soymilk consumption. Boys (male students) tend to like soymilk more than girls. Try not to lose the characteristics of soymilk.

Note: This is the earliest publication seen written by Mr. Tabuchi about soymilk and Soyalac. Address: Nihon San-iku Gakuin.

5556. Asao, Yasuo; Sakasai, T.; Yokotsuka, T. 1969. Shôyu no fûmi kettei ni okeru kôbo no yakuwari [The role of yeasts in the production of shoyu flavor]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 47(5):318-26. May. [12 ref. Jap; eng]

• ***Summary:*** Several yeast strains isolated from various kinds of shoyu mash were studied for their ability to produce good flavor in shoyu. Besides *Saccharomyces rouxii* (which is the most indispensable yeast for shoyu fermentation), *Torulopsis* strains were studied and found to play a very important role in producing good shoyu flavor.

Alkyphenols such as 4-ethylguaiacol and 4-ethylphenol were produced by *Torulopsis* strains when they were added to the shoyu fermentation. These alkyphenols were not produced in mash fermented by *Saccharomyces rouxii.* Address: Central Research Inst., Kikkoman Shoyu Co., Ltd., Japan.

5557. Barnes, Harris H., Jr. 1969. The Japanese market for soybeans. *Soybean Digest.* May. p. 36-37.

• ***Summary:*** Contents: Introduction. Gyosai Tamura's cooking school demonstrations (1,000+ attendees at each of three classes in Tokyo). Japan Margarine Association. Oil and meal promotion campaigns (89% of the current market development budget is being spent on vegetable oil promotion). Livestock growers must be educated on the importance of high-protein, high-performance feed. New approach needed in promoting traditional foods–shoyu, miso and tofu. Shoyu makers want high-protein soybeans. Scott Sawyers, our Far East Director, doing a good job and living with his family in a Japanese neighborhood. Address: President, American Soybean Assoc.

5558. Photographs of Paul Hawken and Evan Root inside the Great Buddha at Kamakura, Japan, looking out the rear window. 1969.

• ***Summary:*** This Buddha is hollow and there are windows in the rear and a staircase up through the inside. This photo was taken shortly after Paul and Evan arrived in the spring of 1969.

Evan writes (Nov. 2010): "Paul and I went to Japan together, by boat from San Francisco to Yokohama. We took the *Brazil Maru* of the Mitsui OSK line. This was a combination passenger and freight vessel taking 15 days to cross with a one day stop in Honolulu, Hawaii."

Q: Why did you go and why did Paul go? Was it Michio or Aveline Kushi's idea? "In conversations with Michio, he often said, 'when you go to Japan...' such and such. He never said 'if you go to Japan.' I had been running Sanae Restaurant for about a year and a half (a long time in those youthful days). We had gone from a few loyal customers to lines down the block waiting to get in every night. I was starting to think about opening a second restaurant. Michio counseled me not to limit myself by getting tied down to business. At that time, the Boston Macrobiotic community was like a school, and people were coming from all over the country to study. Many of these people worked at Erewhon, Sanae or other macrobiotic enterprises. I wanted to take on a new adventure, and, at the same time make room for others to grow. I did not know exactly what to do, but Michio's words 'when you go to Japan' filled that gap. Of course, I thought, the next step was to go to the country of origin of this movement.

"As far as the case with Paul, I cannot speak for him. My sense is that it was for cultural education plus business.

"Paul and I had been close friends since he arrived in Boston in the summer of '68. He hung out at the little Erewhon (303B), and picked my brain about everything. I wanted to start a restaurant and convinced Aveline that Paul was the best man to take over the store. When this was settled, Martin Russell and others filled in at Erewhon while Paul and I took a drive away car out to California so he could arrange to make the move to Boston. On the way, we

© Copyright Soyinfo Center 2014

stopped in all sorts of places to give classes in macrobiotic philosophy and cooking. We also visited Jacques and Yvette DeLangre, Reme's ranch and Chico-San, places where food processing was going on (Reme's tekka [miso] and onion concentrate were excellent).

"It seemed like Paul and I were both on the same timetable in terms of needing some new horizons, so it was convenient and natural that we went at the same time. Though Erewhon paid for his trip, and Sanae paid for mine, we both went on business visas connected to Erewhon."

Q: Did you stay together or see each other often?

"Our arrival was celebrated by a big dinner party at Lima Ohsawa's. Because we were Michio's students, many people were there to welcome us. It was a testament to the esteem with which Michio was held in the Japanese *seishoku* [macrobiotic] community. Michio and Aveline themselves had not been back to Japan since leaving for the U.S.

"Note: *seishoku* is the word that was used for 'macrobiotic' in Japan when I was there. It is written with the characters for correct / proper + food. The word 'macrobiotic' was not commonly used in Japan at that time.

"Paul and I were taken here and there for some sight-seeing including the trip to Kamakura. We also met Mr. Kazama [of Mitoku]. After a short time together in Tokyo, Paul went to Osaka to stay with the Okada family and connect into the food scene and make connections for Erewhon. We saw each other from time to time, once to visit some food production sources like shoyu, rice vinegar and sesame oil. Another time we went on an outing to meet Kôji Ogasawara, the noted proponent of *Kototama* (the word soul); he was the author of a book titled *Kototama: The Principle of One Hundred deities of the Kojiki.* This was something Michio had told us about, related to a kind of esoteric history of Japan. Mrs. Okada took us to Ogasawara's and we listened to him tell us about the *Kototama* and the *Kojiki,* though due to the language difference and the esoteric nature of the subject, it went largely over my head."

Q: What of importance did each of you accomplish? How long did each of you stay?

"I recollect that Paul stayed somewhere around 9 months. During that time he did a lot of relationship building for Erewhon, as well as learning about foods and processing. Certainly, the relationship with Muso Shokuhin was deepened.

"As for me, after a month or two, I realized that I didn't really know what I was doing over there. I had begun to take lessons in Japanese at the Tokyo Nippongo Gakko in Shibuya, but this was no easy language that I could pick up without really applying myself. There quickly came the day that I had to decide to let it go or really dig in. I choose to dig in. That became the what that I was doing. To me that was probably the single most important decision because it affected everything else. After about two years of study, I serendipitously met a teacher who could actually teach the language to Westerners. This was a revelation, and I began to learn the language according to the Japanese way rather than the translated from English way. This deepened my ability to relate and opened many doors for me. My last year there, I worked for Muso Shokuhin as their translator / international correspondent.

"I stayed in Japan for 3 years and 7+ months. By agreement if I did not return within 18 months, I let go of my 50% ownership position in Sanae Restaurant at a prearranged figure (a modest sum) and used that money to support my living and education in Japan until I knew enough to utilize my Japanese in gainful ways."

Note: This photo was sent by Evan Root to Patricia Smith and by Patricia to Soyinfo Center (Nov. 2010).

5559. Sawyers, Scott. 1969. Japan could buy 80 million bushels this year. *Soybean Digest.* May. p. 34-35.

• ***Summary:*** "Additional shipments of soybeans to Japan will have plenty of company and there could even be increased competition. Canadian rapeseed is available in greater volume and at lower prices. Soviet sunflower plus Malaysian palm and other sources of oils will continue to compete for this important market.

"Soybeans are now priced rather competitively with other oilseeds. This is more evident when full value is attributed to the protein from soybean meal.

"Rapeseed is being aggressively promoted to Japanese buyers and feed manufacturers. Rapeseed meal is being pushed as a cheap replacement for some soybean meal in swine and poultry feed rations."

Last year Japan purchased 74 million bushels of soybeans valued at $228 million.

A small photo portrait shows Scott Sawyers. Address: American Soybean Assoc., Far East Director.

5560. *Soybean Digest.* 1969. The Soybean Council of America. May. p. 41.

• ***Summary:*** A brief summary of the activities of SCA during its 13-year history. "Some of the last reports to come from the Soybean Council of America are carried on following pages. The Council, which has had a distinguished 13-year history in market development work for soybeans and soybean products, is now being superseded by other organizations geared to project marketing efforts in-to new dimensions.

"The Council and the Japanese American Soybean Institute, both founded in 1956, have been pioneering efforts in this field. The Council was a joint effort of the American Soybean Assn. and the National Soybean Processors Assn.; JASI, of ASA alone.

"Both were created to match what was considered to be an abundant supply of soybeans back in 1956 with the need of the world's people for a better diet. Government and growers and industry were just beginning to perceive the

© Copyright Soyinfo Center 2014

immensity of this problem.

"ASA-JASI signed with the U.S. Department of Agriculture the first contract for market development work for a U.S. farm commodity. And SBC made the first contract on a global basis.

"At its zenith, the Council was actively engaged in 50 countries and had 15 country offices overseas in addition to supervisory offices in the U.S. and Europe. Both production and exports of soybeans have tripled in the 13 years since SBC and JASI were founded.

"Many people both in the U.S. and abroad have participated in the Council's work, including dedicated staff members and officials and directors of both NSPA and ASA.

"Worthy of special mention are the two men who have served as president–the late Howard Roach and Glenn Pogeler; also George Strayer, one of the founders and executive director until 2 years ago."

Address: Dep. of Agricultural Chemistry, Tokyo Univ., Bunkyo-ku, Tokyo.

5562. *Soybean Digest.* 1969. Nisshin Oil Co. markets Soymea, leads in manufacture of vegetable protein in Japan. June. p. 44.
• ***Summary:*** "Manufacture of high-grade vegetable protein is developing rapidly in Japan, according to Elmer W. Hallowell, U.S. agricultural attache at Tokyo.

"The effort is being led by Nisshin Oil Co., which has put its product, Soymea, on the market, says Hallowell.

"Thirteen of the larger companies organized a 'New-Protein-Food Conference' in late February. The conference plans to start market development programs for the new protein foods.

"In addition to the 13 companies of the conference, 19 others are reported to be currently dealing with high-grade vegetable protein. Some companies have contracted joint ventures with foreign firms.

"In addition to these Japanese firms, which use proteins of soybeans or wheat, some manufacture protein from petroleum through fermentation. This protein likely will be used in animal feed, at least in the early stages of the industry.

"The Japanese government is interested in the production of high-grade protein and plans to budget funds to the Food Research Institute, which is conducting intensified research in this area."

5563. *Soybean Digest.* 1969. Japan's soybean demand expected to increase 66%. June. p. 44.
• ***Summary:*** "Japan's demand for soybeans by 1977 will be about 4.5 million tons, or an increase of 66% over 1968 and more than three times the demand in 1961, Yasuyuki Suzuki, manager of the Chicago produce department of Mitsui & Co. (USA) Inc., says.

"Mitsui is one of the largest of Japan's international trading firms.

"Ninety-nine percent of Japan's imported soybeans, he said, is for human consumption–72% to extract oil and produce meal, and 27% to make such traditional Japanese staple foods as tofu (soybean curd), miso (soybean paste), and shoyu (soy sauce).

"Mr. Suzuki said that U.S. soybeans compete throughout the world with other source materials such as sunflowerseeds, peanuts, rapeseed, palm kernels, and copra as sources of oil; and urea, fish meal, and perhaps future petro-proteins as sources of protein. He said that, while Japan is in a position to choose from among these sources, Japan prefers to concentrate on its present good relation- ship with U.S. soybean growers, rather than change to alternate sources.

"As an example of this, he cited his own company's active promotion of Hawkeye soybeans in Japan for the last 13 years."

5564. *Guardian* (*England*). 1969. Japan: Sculptures from a hard-boiled egg. July 16. p. 16.
• ***Summary:*** A recipe for Sukiyaki calls for "½ lb tofu (bean curd) in 1-in. cakes." The dipping sauce includes "12 tablespoons shoyu." Three suppliers of Japanese food products in London are listed. Mikadoya has two locations and Cydilda has one.

5565. Hansen, Barbara. 1969. Sukiyaki with a Yankee accent: 'Better than Japan version.' *Los Angeles Times.* July 17. p. F1.
• ***Summary:*** Taro Yashima, of East Los Angeles, is an artist who likes to cook sukiyaki, which he likes better than the traditional Japanese dish. In it he uses three types of tofu: regular tofu (packed with water in 12 oz blocks), age tofu ("puffy, French fried soy bean cakes"), and koya tofu ("which is labeled as frozen tofu"). "The frozen tofu is actually a dried product and is found on market shelves, not in the freezer." He uses 4 slices of koya tofu, split lengthwise. A photo shows Mr. Yashima making his style of sukiyaki.

5567. Fukushima, Danji. 1969. Enzymatic hydrolysis of alcohol-denatured soybean proteins. *Cereal Chemistry* 46(4):405-18. July. [24 ref]
• ***Summary:*** The author studied the effect of denaturation conditions on the enzymatic digestion of soybean proteins. The maximum amount of hydrolysis was 5-10% higher in alcohol-denatured proteins than in water-denatured ones, although the initial speed of hydrolysis was slower in the former. The enzyme trypsin possesses the strongest ability to hydrolyze water-denatured soy proteins. During both denaturation treatments, and especially with water, some of the oligosaccharides in the soy flour disappeared. The degree of hydrolysis increases rapidly at the beginning then quickly slows. The acid-precipitated fraction and the whey fraction increased in their degree of maximum proteolysis after alcohol denaturation, as compared with water denaturation.

For soy sauce manufacture, only the maximum hydrolysis values with mold proteinases are important. Today most of the soybean meal used in Japan for making fermented soy sauce has been extracted with alcohol, and this has made a great contribution to increasing soy sauce yields. Address: Central Research Inst., Kikkoman Shoyu Co., Noda-shi, Chiba-ken, Japan.

5568. Photograph of Paul Hawken and Evan Root before the Shinto temple gate at Ogasawara. 1969.
• ***Summary:*** Paul Hawken (left) and Evan Root (summer 1969) in front of the gate of a Shinto shrine. This particular shrine was said to house ancient historical documents regarding the esoteric meaning of the Japanese language, "word soul" or *Kototama.*

They had met Kôji Ogasawara, the author of *Kototama, The Principle of One Hundred Deities of the Kojiki.* He also founded Dai San Bunmei Kai (The Third Civilization Association).

Note: This photo was sent by Evan Root to Patricia Smith and by Patricia to Soyinfo Center (Nov. 2010).

5569. *Soybean Digest.* 1969. ASA [American Soybean Assoc.] expands market development worldwide. July. p. 10.
• ***Summary:*** "ASA, which pioneered commodity market development in Japan 13 years ago, is now undertaking such projects in 17 countries. ASA signed a long-range agreement with USDA's Foreign Agricultural Service in mid-June. The agreement guarantees financing of the projects totaling approximately $1.6 million for a 2-year period. Industry organizations in other countries are expected to match that amount, which will mean an action program of over $3 million in the next 2 years to expand soybean markets in many parts of the world."

"Offices in Germany and Iran are being opened... The German office will handle projects in Germany, Austria, and Switzerland. The Iranian office will be responsible for market development programs in Iran and the Middle East..." An American Soybean Institute is being developed.

5576. *Agricultural Research.* 1969. Hakko tofu: new food from soybeans. 18(3):14. Sept.
• ***Summary:*** *Hakko tofu* is a Japanese term meaning "fermented soybean curd." This food, to be made from American-grown soybeans, was developed through a Public Law 480 project in Japan sponsored by the U.S. Agricultural Research Service (ARS). The ARS sponsoring scientist, Dr. Clifford W. Hesseltine, says this food contains high quality protein, based on a 21-day rat growth study; the PER is 2.7, compared with 2.2 for regular tofu.

The principal Japanese investigator, Dr. Tetsujiro Obara (at the Dep. of Agricultural Chemistry, Tokyo Univ. of Education) found that a 1:420 ratio of calcium sulfate to soymilk added at 158ºF gave the best product.

Traditionally the enzymes from a mold were used to ripen the tofu, but the investigators experimented with commercial enzymes. Papain gave the best individual performance, but a mixture of papain, pronase, and bioprase gave optimum results for faster ripening and improved texture. For bacterial starters that lower the PH, the best results were obtained from a blend of half *Streptococcus cremoris* and half *S. lactis.*

Note: This is the earliest English-language document seen (Oct. 2011) that uses the term "Hakko tofu" to refer to fermented tofu.

5577. Barnes, Harris H., Jr.; Randolph, Chet. 1969. A massive program mounted: ASA report. *Soybean Digest.* Sept. p. 19-22.
• ***Summary:*** At the annual meeting of the American Soybean Assoc. in New Orleans last year, there was evidence of a new outlook and attitude. "An entire section of the growers' convention dealt with market development and more precisely the need to mount a massive program to move soybeans and soybean products." The ASA's 15-year-old program in Japan has provided experience and the nucleus for expansion into other countries, including Taiwan, Korea, Germany, and Iran. The ASA has signed a $1.6 million agreement with the Foreign Agricultural Service for market development in 17 countries during the next two years.

"It's particularly encouraging to note that three states have now held soybean checkoff referendums that passed by sound majorities. In Louisiana it was 77%, North Carolina 82%, South Carolina 80%... In addition, Minnesota, Missouri, Texas, and Ohio have all passed enabling acts... The above is evidence growers support the ASA effort to step up market development work." Yet ASA membership has failed to grow. Address: 1. President; 2. Executive vice president. Both: American Soybean Assoc.

5578. Hirano, Kiyoshi. 1969. The fats and oils situation in Japan. *Soybean Digest.* Sept. p. 62.
• ***Summary:*** "In 1968, 66 million bushels of soybeans were crushed resulting in the production of 1,520,000 s.t. [short tons; 1 short ton = 2,000 lb] of soybean meal. A total of 1,170,000 s.t. were used in formula feeds while the balance of the 350,000 s.t. were used for the production of soy sauce, tofu and other traditional foods.

"However, since 1967, a big change has been taking place in this area of soybean meal: that is (1) the development of vegetable protein products, and (2) the development of petroleum protein products.

Regarding vegetable protein products in Japan, there are two kinds. One is soy protein and the other wheat protein using wheat gluten as its basis. Since 1968, vegetable protein has been promoted by the mass media. In fact, in 1968 and 1969, a 2-year period, 37 companies have either announced their new products or will be announcing them shortly. These new products will be distributed mainly for institutional use. Two American companies have already tied up with some Japanese companies. In the future I am sure we can anticipate more.

"In a joint effort to bring about a wholesome development of this new protein product, 19 major manufacturers in Japan got together and organized the New Protein Food Council in March of 1969.

"Future of the meat analogue: The future of this new meat analogue is difficult to predict. However, if it is accepted that means it will become a big outlet for soybean meal.

"As to petroleum protein, several chemical industries have made plans to produce synthetic protein by fermentation. In fact, one or two companies have already started the construction of a factory having the production capacity of 60,000 to 120,000 tons. It is being forecast that petroleum protein will be used first in mixed feeds. Experimental work is being carried out on a rather large scale.

"In 1968, Japan imported 2,900,000 tons of oilseeds

© Copyright Soyinfo Center 2014

for crushing, which is equivalent to 85% of our total need. Soybeans totaled 1.8 million tons, rapeseed 250,000, cottonseed 246,000, sunflower 71,000, safflower 63,000, copra 126,000, linseed 100,000, and miscellaneous 230,000 tons.

"We trust that the members of ASA and the people related to the American soybean industry will continue their efforts to supply us with good-quality soybeans at a fair price." Address: President, Japan Oilseed Processors Assoc.

5579. Palmby, Clarence D. 1969. Production and world sales of U.S. soybeans. *Soybean Digest.* Sept. p. 48-51.
• ***Summary:*** Discusses: How soybeans more than make up for declines in cotton production. Sales of soybeans to western Europe, Asia, and Oceania. The mistake in 1966 which raised the price support level from $2.25 to $2.50 per bushel. The threat of the proposed EEC internal consumption tax of $60/tonne on vegetable and marine oils, and $30/tonne on oil cakes. The growing importance of substitutes–especially those made from soybeans.

"The soybean is a typical American. It came as a lonely immigrant. It struggled in obscurity. Slowly it began to thrive–to succeed in its new environment–to become a part of the American scene. Finally, a century and a half after its first introduction, the soybean began the sudden expansion that has made it the second ranking income producer among cash farm crops. This is a phenomenon of only the past 20 years."

A photo shows Palmby. Address: U.S. Asst. Secretary of Agriculture for International Affairs and Commodity Programs.

5580. Palmer, Lane. 1969. Can we save our export markets? *Farm Journal* 93(9):20-21, 42. Sept.
• ***Summary:*** The American Soybean Association, an aggressive commodity group, has been very successful in developing export markets for soybeans. 40% of all U.S. soybeans are now exported. ASA has increased soybean exports to Japan from 20 million bushels in 1954 to nearly 80 million in 1968. "ASA has made a remarkable record on a small budget." ASA is now launching a 3-stage program to expand exports. A key part of the program is a ½ cent per bushel [checkoff] from farmers. Address: Editor.

5581. Saio, Kyoko; Kamiya, Makoto; Watanabe, Tokuji. 1969. Food processing characteristics of soybean 11S and 7S proteins. I. Effect of difference of protein components among soybean varieties on formation of tofu-gel. *Agricultural and Biological Chemistry* 33(9):1301-08. Sept. Reprinted in English in Shokuryo Kenkyusho Kenkyu Hokoku 25:189-97 (1970). [10 ref]
• ***Summary:*** It was showed that the 11S and 7S protein fractions could contribute to the textural characteristics of tofu. Tofu made from crude 11S protein was much harder than tofu made from 7S protein. The crude 11S fraction contributed greatly to the springiness, chewiness, and gumminess of tofu. Address: 1&3. Food Research Inst., Ministry of Agriculture and Forestry; 2. Japan Protein Industry Co., Ltd.

Address: Research Inst. of Marukin Soy Sauce Co., Kagawa prefecture, Japan.

5592. Sakaguchi, Yukio. 1969. Soy protein foods in Japan. *Soybean Digest.* Nov. p. 28.
• ***Summary:*** "In Japan the soybean has been called "the meat of the field" [*hatake no niku*] and has been an important protein source since olden times. With an outstandingly high nutritive value, soybeans have been providing traditional Japanese foods such as miso, soy sauce, tofu, natto and others, and have become indispensable in our eating habits.

"However, as the Westernization of the people's eating habits has progressed rapidly in recent times, food intake has shifted from the traditional products to protein of animal origin–livestock products. On the other hand. from an international viewpoint, the increase in supplies of animal protein (such as fish and meat) cannot catch up with the growth of world population. Especially in Japan it is difficult to hope for marked development of animal husbandry due to the restrictive climatical and geographical condition in this country. Thus, the shortage of animal protein presents a significant problem for the near future.

"Demonstrate merits of vegetable protein: If the familiar soy protein is introduced in the modernized style in the people's diets in order to cover the shortage of animal protein, meeting the rapidly increasing demand, this will serve to demonstrate more definitely the merits of vegetable protein. This is the background of our marketing of new food products based on vegetable protein.

"Nisshin Oil Mills Co. marketed Soymee, a fiber-form soy protein food [soy protein isolate fiber], in January last year, the first of its kind in Japan. Since then, similar new food products based on soy protein or wheat protein in fiber form, textured form, or powder form have been introduced to the market one after another. As a result, 18 manufacturers of such vegetable protein foods organized the New Protein Foods Council in March of this year. The objective of the organization is to popularize vegetable protein and development of this industry through the promotional activities for such new protein food products.

© Copyright Soyinfo Center 2014

"We are aiming to develop a new phase in people's diets by supplying entirely new protein foods, not substitutes for fish and meat. Such food products will demonstrate their merits perfectly as health foods in spite of their low cost.

"Is extender and improver: In Japan, also, soy protein has been used so far as an extender and improver of food products processed from fish and meat, of milk products, bread and confectionery. For such uses the soy protein has all been marketed in the powder form. However, since last year many such products have been marketed in the highly purified fiber form, textured form, and block form. Moreover, these products have gone beyond the boundary of ingredients of food products and are now cooked in their original forms. It appears processed products to be served directly at the table will increase rapidly in production, actually establishing themselves as new food products compatible with fish and meat.

"We want to develop more inexpensive and delicious new protein food products by enhancing the outstanding nutritive value of soy protein in order to contribute toward dietary improvement in Japan."

Note: An example of such new foods, soon to be developed, is surimi–a crab meat alternative. Address: President, New Protein Foods Council, Japan.

5593. *SoyaScan Notes.* 1969. Chronology of Eden Organic Foods, Inc. Renamed Eden Foods, Inc. in April 1971. Part I. 1969 to 1972. 31 Jan. 1992. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** 1969 Nov. 4–Eden Organic Foods is named and incorporated as a non-profit corporation by Bill Bolduc. Other names on the articles of incorporation are Judith Bolduc, Ronald Teeguarden, Gloria Dunn, and Linda Succop. It is a natural foods co-op retail store at 514 East William St. in Ann Arbor, Michigan. Bill is president of the company and his wife, Judy, is part-time secretary. The date of incorporation, Nov. 4, was selected by an astrologer, Michael Erlewine, because it was astrologically propitious. Michael also designed the Eden logo of four sprouts in a circle. Also in Nov. 1969 Eden begins selling soyfoods, tamari and miso purchased from Erewhon.

Prior to this, starting in about the summer of 1969, Ronnie Teeguarden and Gloria Dunn had started a loosely-knit food buying co-op–which had no name, no assets, no formal structure, and no bank account. Original or very early members included Tim and Pattie Redmond, Mark and Nancy Retzloff, Linda Succop, Iona Teeguarden, and Bob Thorson. On about 3-5 different occasions they collectively ordered macrobiotic staples (including tamari and miso) from Erewhon in Boston, Massachusetts, using the Erewhon catalog. When the foods arrived, the members got together and divided them up at the Teeguarden-Leabu General Store, at 209 South State St. in Ann Arbor. This general store, located in the basement below Marshall's Bookstore, carried mostly antique clothing and records, and the art of local artists. By September 1969, Bill and Judy Bolduc joined the food co-op. They also joined the Zen Macrobiotic Supper Club; all of its members were also members of the food co-op.

In the fall of 1969 the Teeguarden-Leabu second-hand store looked like it was about to close, which would leave the food co-op without a home. The group (especially Ronnie Teeguarden) convinced Bill Bolduc to take charge of the food co-op and find it a permanent home, which he did–in an upstairs apartment at 514 East William St. Members of the informal food-buying co-op who worked at Eden Organic Foods included Bill Bolduc, Gloria Dunn, and Tim Redmond. An environmental group named the Environmental Defense Education Network (EDEN) also operated out of the Teeguarden-Leabu General Store; it was from this group that Eden got its name. That fall, after the Eden Organic Foods co-op was up and running, Tim Redmond went to Boston to work and study at Sanae, a macrobiotic restaurant on 272A Newbury St.

1970 summer–Bill Bolduc establishes Eden's first contact with an organic food grower (Bill Vreeland of Ypsilanti, Michigan, who grows organic wheat and soybeans). He soon makes Eden's first direct purchase of organically grown wheat, which the company mills and sells.

1970 July 6–Eden Organic Foods, Inc is reorganized upon a stock basis. Bill Bolduc (who resides at 6210 Bethel Church Rd., Saline, Michigan) owns all the shares (1,000). Other people listed on this document are Judith Bolduc, Ronald Teeguarden, and Gloria Dunn.

1970 Sept.–The fledgling company has an offer from Cynthia Shevel to move into a newly decorated mini-mall at 211 South State St. on the main street of campus. They need money to finance the move. Tim Redmond's father says he will help finance the expansion only if the business is reorganized as a for-profit corporation. So Eden is changed into a for-profit corporation, and Redmond invests the $10,000 he borrowed from his father in Eden in exchange for 50% ownership. In Nov. 1970 Eden moves into the mini-mall (they register the new address on Nov. 17) and soon begins to mill flour and bake granola at the new store. Bolduc and Redmond are now equal partners.

1971 April 8–Bolduc registers a change in the company name to Eden Foods, Inc. from Eden Organic Foods, Inc. After the store was up and running, Redmond returns to Boston and Sanae restaurant, where he completed his studies.

1971 Jan.–Michael Potter is hired by Bill Bolduc. Mike had initially had a good-paying job at an art gallery in Royal Oak, Michigan. Then he began working for, and eventually became a partner in Joyous Revival, a macrobiotic and natural foods retail store in Birmingham, Michigan. At that time he and his wife, Carol Roller Potter (Ron Roller's sister), moved from Royal Oak to Walnut Lake, Michigan–to be nearer to Joyous Revival. In the fall of 1970 Michael

© Copyright Soyinfo Center 2014

Potter, while still working at Joyous Revival and at Bill Bolduc's request, had done volunteer work to try to help a failing new Eden retail store in downtown Detroit on the campus of Wayne State University. This store was owned jointly by Eden and two people named John and Darleen–two of the first people in the area interested in macrobiotics. By Jan. 1971 it had become evident that the store would not be able to survive financially, so Michael's first job after being hired was to make one last try to save it, then to help in shutting it down.

1971 May or June–Tim Redmond returns to Ann Arbor permanently, having finished his macrobiotic training in Boston. He planned to open a restaurant like Sanae in Ann Arbor but instead got increasingly involved with Eden Foods.

1971 June–Eden starts to wholesale natural foods out of the back of their retail store at 211 South State Street. They buy increasingly from original sources instead of other wholesalers. Buying clubs and co-ops come to the retail store to pick up their bulk foods.

1971 July–Eden's wholesale pricelist, dated July 26, shows that Eden is selling bulk (50 and 100 lb) soybeans, corn, soft wheat, and rye, which are being grown organically in Michigan (by Tom Vreeland). Eden stone-ground a portion of them into flour–on order. Eden is also selling numerous bulk and packaged grains, cereals, flours, and beans from Arrowhead Mills in Deaf Smith County, Texas; some are organically grown.

1971 early summer–Bill Bolduc asks Mike Potter to manage the Eden retail store at 211 South State St. Mike and his pregnant wife, Carol, move to Ann Arbor from Walnut Lake. By this time the company name was Eden Foods, Inc.

1971 Aug.–Eden Foods starts to distribute its wholesale bulk products, especially in the Detroit area. The company starts to bring in small trailer loads of staples from Arrowhead Mills in Texas. Bolduc and Redmond, realizing that Eden is the only natural foods store in the area, borrow some money and rent a 4,000 square foot Quonset hut warehouse on North Main Street north of Ann Arbor near the Huron River. They expand their wholesale and distribution operations.

1971 Oct.–Mike Potter is given 13.5% of the common stock of Eden Foods, Inc. largely to compensate him for his many hours of unpaid volunteer work. According to Michael Potter (Dec. 1986), at this point the common stock ownership of Eden Foods is: Between Bill and Judy Bolduc 43.5%, Tim Redmond 43.5%, and Michael Potter 13.5%. Potter later says (Feb. 1993) that Bill Bolduc and Tim Redmond now own the same number of shares, but Judy Bolduc owned a small number of shares so the Bolducs owned the largest block.

1972 fall–Ron Roller starts to work part time for Eden Foods. Continued. Address: 514 East William St. in Ann Arbor, Michigan. Phone: 313-769-8444.

5594. *SoyaScan Notes.* 1969. Chronology of Eden Foods, Inc. Part II. 1973 to Nov. 1981. 31 Jan. 1992. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** Continued: 1973 March–Eden moves into a larger warehouse at 310 West Ann Street in Ann Arbor, sharing it with Midwest Natural Foods, which initially was not a competitor. At about this time, Ron Roller starts working full-time for Eden. While at this warehouse, in late 1973 or early 1974, Eden receives its first shipments of imported Japanese natural foods from Mr. Kazama of Mitoku in Tokyo. Tim Redmond had ordered these foods from Mr. Kazama at a meeting of the Natural Foods Distributors Association in Florida. Initially Eden was forced to import Erewhon-branded products. Redmond recalls that at this time he was working at and managing the warehouse and Potter was working at and managing the retail store. Redmond was managing the corporation because he controlled it.

1973 summer.–The Eden retail store moves to a much larger location at 330 Maynard St. in Ann Arbor, on the University of Michigan campus. It now includes three operations under one roof in 6,000 square feet of leased space: A large natural foods retail store, a natural fast-food deli, and a natural foods bakery named Sun Bakery that had relocated itself from Kalamazoo, Michigan. This operation proved to be very profitable; it paid off all Eden's debts and paid for the new warehouse, offices, trucks, and equipment.

1973 July–Bill and Judy Bolduc leave Eden Foods, selling their stock to Mike Potter for $2,500 cash. Tim Redmond becomes president. Redmond ends up owning 51% and Potter 49% of the shares in Eden Foods. Potter recalls that he bought the stock directly from the Bolducs, then gave a small amount to Redmond so that Redmond would have majority ownership. Redmond recalls that the Bolducs sold their stock back to the corporation, then Redmond sold enough shares to Potter so that he (Redmond) would keep control with 51% of the shares.

1973 late or 1974 early–Potter and Redmond become equal owners of Eden Foods after Potter loans the company $44,000 (entrusted to him by his father), then converts the loan into an investment in the company in exchange for equal ownership.

1973 Sept.–Mike Potter becomes president of Eden Foods at the unanimous recommendation of an employee steering committee. At about this time Midwest Natural Foods starts to compete with Eden Foods, carrying many of the same products that Eden carries plus dairy products and frozen foods. Eden has never sold dairy products or frozen foods and, in the face of new competition from Midwest, Michael Potter reaffirms this position. This decision makes it impossible for Eden to become a full-line distributor like Midwest, and lays the groundwork for Eden's eventual decision in 1986 or 1987 to discontinue distribution to retail stores and focus on manufacturing of natural foods.

1974 spring–Eden moves from 310 West Ann St. into a

© Copyright Soyinfo Center 2014

larger warehouse at 4601 Platt Road. This move extricates Eden from what had become a "pathetic relationship" with Midwest Natural Foods. Redmond is sure that he and Potter became equal partners before this move.

1974 March 7-8–Michael Potter represents Eden at the meeting of Natural Foods Distributors at the Janus conference room in Seattle, Washington.

1974 Oct.–Potter makes the first of his eleven trips to the People's Republic of China. On the way back he visits Yuko Okada at the Muso Company in Osaka, Japan. Potter decides to import exclusively from Muso.

1977 Aug.–Eden Foods opens Turtle Island restaurant at 315 South State St. in Ann Arbor.

1979 spring–Cliff Adler, a painter renovating apartments in Ann Arbor, is hired by Michael Potter to work for Eden in Chicago, Illinois, to try to expand their sales to natural food retail stores. During that summer Cliff lends Eden Foods $100,000, for which he is paid bank interest rates. Tim Redmond, however, believes Cliff was hired as a salesman in 1976, and that on 15 March 1979 Cliff became a shareholder in Eden Foods, buying 10% of the stock.

1979 Nov. 26–The Eden warehouse at 4601 Platt Road is destroyed by a large fire. According to the *Ann Arbor News* (Nov. 27-29) total damages are estimated at $650,000. Eden Foods, organized in 1970, employs some 100 persons in distribution and production, supplies about 500 natural food stores and restaurants, has annual sales of about $5 million, and is said by its owners to be "the largest natural foods distributorship in the Midwest." This fire burned many of Eden's key records, including records that would have helped in determining dates and facts for this chronology. Eden has never kept a written chronology of key events in the company's history.

1979 Dec.–Within 10 days after the fire, the board of directors (Potter, Adler, and Redmond) meets, authorizes a large number of additional shares of common stock, and decides to give away (free of charge) shares of Eden Foods' common stock to six key employees/managers to try to motivate them to stay with the company and help try to rebuild it. They also decide to lay off 35 other people. Shortly thereafter Cliff Adler decides to convert his $100,000 loan to stock (equity)

1980 Jan.–Tim Redmond decides to leave Eden Foods; he leaves in May, selling most of his stock (he kept 1,000 shares) in exchange for ownership of the Maynard Street Connection, Inc., which has a retail store and restaurant at 330 Maynard St., which are now separate companies.

1980 Feb.–Now Michael Potter and Cliff Adler each own 34% of Eden Foods shares, Frank Dietrich (of Natural Foods, Inc., Toledo, Ohio) owns 10% (which he bought for $100,000), Ron Roller owns 5%, Michael Gordon 4%, Mark Cook 4%, Kathy Knor 3%, Bill Swaney 3%, and Bob Duha 3%. Michael Potter notes that four things saved Eden Foods (which now had a negative net worth of more than $800,000) after the fire: (1) Cliff Adler's conversion of his $100,000; (2) The incredible cooperation, generosity, and kindness that Eden received from its suppliers in the natural foods industry, and their trust that Eden would do its best to pay back they money at a time when interest rates were over 20%; (3) Frank Dietrick's investment of $100,000 in the company; and (4) The great effort made by natural foods retail stores and consumers to go out of their way help Eden survive by purchasing more Eden products. Note that it was not until Feb. 1982 that Eden ended up receiving from its insurer (Hartford Insurance Company) $400,000 net, or $0.50 for each dollar Eden felt it was owed.

1980 Nov.–Eden Foods headquarters moves into a 20,000 square foot building at 701 Tecumseh Road in the tiny town of Clinton (population 2,000) about 60 miles southwest of Detroit.

1981 Nov.–Erewhon Trading Co. files for Chapter 11 bankruptcy protection. Trying to keep up with the super-distributors in their region (especially Balanced Foods) Erewhon had moved into an 80,000 square foot warehouse and added too many items to their product line too fast–which destroyed the company. Stow Mills picked up the bulk of their business, with Westbrae scooping up most of the business for their Japanese imports. Eden had not yet recovered enough financially to take advantage of this opportunity. Continued.

5595. *SoyaScan Notes.* 1969. Chronology of Eden Foods, Inc. Part III. 1983 to present. 31 Jan. 1992. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** 1983 July–Eden Foods surprises the U.S. natural foods industry by introducing Edensoy, a long-life soymilk in plain, carob, or cranberry flavors, imported from Marusan-Ai Co. in Japan, and packaged in a stand-up foil retort pouch.

1984 Jan.–The Muso Company of Osaka, Japan, appoints Eden Foods its General Agent for North America.

1984 March 2–A series of calamities hit Eden Foods in quick succession. The FDA (U.S. Food and Drug Administration) informs Eden Foods, in a strongly worded letter, that it considers eleven claims in a promotional pamphlet for Edensoy to be erroneous. The FDA advised that the "Good for Babies" section of the pamphlet be deleted.

1985 June 14–The FDA informs Michael Potter that a six-month-old child in Canada had become seriously ill after being fed the company's soymilk as an infant formula. The mother said her decision to forgo regular infant formula was inspired by Eden's own literature–the promotional pamphlet cited above which said that Edensoy was "Good for Babies." Eden took the position: "There's a problem and we're responsible for it." To date some 18 million packs of Edensoy have been sold.

1985 June 23–Eden Foods voluntarily mails 10,686 requests for a recall of the pamphlet to its distributors and to

© Copyright Soyinfo Center 2014

individual retail stores.

1985 July–Eden Foods forms a joint venture partnership with four Japanese companies, and incorporates in the state of Michigan as American Soy Products, Inc.

1985–Eden opens a west coast sales office and warehouse in San Francisco, California.

1986 May–The Lima Company of Belgium appoints Eden Foods its General Agent for North America.

1986 Nov.–American Soy Products, Inc. launches a new generation of Edensoy soymilk products, in original, vanilla, and carob flavors. Made at a large, new factory in Saline, Michigan, they are packaged in Tetra Brik Aseptic cartons. This is the earliest known aseptic soymilk plant in the USA.

1987 Jan. 1–Eden Foods stops distributing products directly to retail stores (which comprised only 10% of Eden's total sales), drops 150 products, and starts serving as a master distributor, selling only through other distributors. This decision had a very positive effect on Eden's growth; all the energy that was formerly required to attend to 10% of the business was now free to be focused on developing new products and the Eden brand.

1988 April 13–Cliff Adler and Michael Potter are in a serious car accident. Cliff is killed and Michael is seriously injured. Upon Cliff Adler's death, Michael immediately and automatically acquires Cliff's 34% share in the company–because Eden Foods Inc. and Michael and Cliff, jointly and severally, had a buy-sell contract that came into effect in the event that either Cliff or Michael should die. The value of Cliff's stock was $500,000. Michael pays this amount from his personal funds for the stock. Potter now owns a large majority of Eden Foods' stock.

1988 May–While Eden Foods is still reeling from the effects of the car accident, the FDA files charges against Eden for publishing inaccurate information in a pamphlet which stated that Edensoy was "Good for Babies." Eden's previous major effort to recall all of these pamphlets from retail stores apparently had little or no effect on the FDA charges.

1988–Eden Foods joins OCIA, the Organic Crop Improvement Association, for independent certification of organically-grown crops.

1989 Jan. 20–Nearly 6 years after Eden Foods published its ill-fated Edensoy pamphlet, the company is fined $110,000 by a federal judge in Detroit, and its president, Michael Potter, is fined $25,000 and sentenced to 30 days imprisonment. On Feb. 24 he begins to serve out his sentence in Bay City, Michigan.

1989 Oct. 12–Michael Potter is convicted of manslaughter and sentenced at the circuit court in Ann Arbor to 8-15 years in jail for his role in the April 1988 automobile accident that caused Cliff Adler's death. He begins to serve out his sentence in Oct. 1989 in Coldwater, Michigan. Ron Roller takes over as president of Eden Foods–the top position.

1989–Eden and OCIA establish standards for food processing as well as growing crops.

1991 mid-June–Ron Roller, president of Eden Foods, is asked to resign from his position. He chooses to leave and go to American Soy products to work full time. There he becomes CEO.

1992–Eden Foods now has 180 distributors, virtually all of whom distribute Edensoy. Owners of stock in Eden Foods include Mike Potter (who owns more than 50% of the shares), Tim Redmond, Mark Cook, Bill Swaney, and at least one other person.

1992 Aug.–Michael Potter returns to work at Eden Foods. He was re-sentenced and his sentence is changed to 60 months probation. 1993 Dec. 31–Potter purchases Tim Redmond's remaining 1,000 shares of Eden Foods stock, which Tim has kept since 1980.

5596. *Soybean Digest.* 1969. MPF provides protein for world's hungry. Nov. p. 3.

• ***Summary:*** Multi-purpose food, developed for the Meals for Millions Foundation nearly 25 years ago, "continues to provide vital protein-enrichment to the diets of the hungry both at home and abroad."

"Of equal significance, through the Foundation's pilot plant and training center in Santa Monica, California, students from all over the world learn how to process their own protein-rich food supplement from their own resources.

"Today, soy-based MPF is being manufactured in Japan, Brazil, Mexico, and Korea. These plants, operated by the inhabitants of the countries, with the technological assistance of Meals for Millions, personify the self-help philosophy of the Foundation which believes in a hand-up rather than a hand-out program."

A photo shows two young boys carrying a case of "Meals for Millions–Friendship Food."

5597. *Soybean Digest.* 1969. Scientists develop new soy food, hakko tofu. Nov. p. 33.

• ***Summary:*** This is a summary of the following article: *Agricultural Research.* 1969. "Hakko tofu: new food from soybeans." 18(3):14. Sept.

5598. *Soybean Digest.* 1969. Chen, Sera to posts in Far East for ASA [American Soybean Assoc.]. Nov. p. 58.

• ***Summary:*** "Dr. Steve Chen will be ASA country director for Taiwan in a new office to be opened soon in Taipei. Karl Sera will be feed and meal specialist in ASA's office in Tokyo, Japan, working with Scott Sawyers, Far East director. Dr. Chen has most recently been doing research on carbohydrate of soybeans and development of high-protein food items for Ralston Purina International at St. Louis. Previously, as director of marketing for Ralston Purina Eastern at Hong Kong, he was engaged in promotion of Purina mixed feeds, animal health products, and consumer

products...

"Dr. Chen holds a B.S. degree at National Taiwan University and M.S. and Ph.D. degrees at West Virginia University... Mr. Sera attended St. Joseph's College at Yokohama, Japan; and received his B.S. in dairy science at Iowa State University... Both Dr. Chen and Mr. Sera will be working with Scott Sawyers, ASA Far East director. Both mean are married and have families." A photo shows Chen and Sera.

5599. *Soybean Digest.* 1969. Soy sauce leader of Japan is gone. Nov. p. 50-51.
• ***Summary:*** Saihei Toriumi of Chiba, Japan, was president of one of Japan's leading soy sauce manufacturing firms. He was also one of the organizers of the All Japan Soy Sauce Brewers Association and its first managing director. He had been permanent advisor to the Association since 1956. Mr. Toriumi was a strong supporter of the Japanese American Soybean Institute, and was a director of JASI representing his Association from JASI's organization until his death. A photo shows Toriumi.

5600. *Soybean Digest.* 1969. Phase II kicked off in several states. Nov. p. 13.
• ***Summary:*** Phase II is a voluntary ½ cent per bushel checkoff on soybeans at the first point of sale. This American Soybean Assoc. program has been kicked off in several states according to ASA field director Merv Syverson. Funds collected from this program will go for market development in Japan, Germany, and Iran. Some states have moved directly into Phase III, which uses state enabling legislation to gain the ½ cent per bushel deduction. "North Carolina, Louisiana, and recently south Carolina have circulated referendums and will automatically collect the funds at the first point of sale."

Progress from other Midwest states: The Ohio legislature has passed a checkoff bill and is anticipating a referendum. In Indiana a checkoff bill has not yet passed, but the Indiana Soybean Growers Assn. has voted to go to Phase II. In Illinois the Land of Lincoln Soybean Assn. has gone into Phase II both at the elevator and later on in direct grower contact. Minnesota has passed a checkoff bill but has not yet set the date for a second referendum. The Minnesota Soybean Growers Assn. is working on a membership drive and has instituted a voluntary checkoff. The Nebraska Soybean Assn. plans a drive in December for the minimum 400 members for affiliation with the ASA. The Missouri legislature has passed a checkoff bill and the Missouri Soybean Assn. is preparing for a referendum; the date is to be set.

5601. United Nations Industrial Development Organization (UNIDO). 1969. Expert group meeting on soybean processing and use. UNIDO Document ID/WG.45/3. Held 17-21 Nov. 1969 at Peoria, Illinois.
• ***Summary:*** Consists of ten papers by various authors, each cited and paginated separately. These proceedings were never published in bound form. Address: Vienna, Austria.

5602. Watanabe, Tokuji. 1969. Industrial production of soybean foods in Japan. Paper presented at United Nations Industrial Development Organization Expert Group Meeting on Soya Bean Processing and Use. 38 p. Document: ID/WG.45/3. Held 17-21 Nov. 1969 at Peoria, Illinois. [16 ref]
• ***Summary:*** Contents: Tofu and its industrial production: Process of tofu making, tofu production as an industry, equipment for tofu production, varieties of tofu, new materials of tofu, new types of tofu, aburage and other deep fried tofu.

Note 1. This is the 2nd earliest English-language document seen (April 2013) that contains the term "deep fried tofu" (regardless of hyphenation).

Kori-tofu and its industrial production: Process of kori-tofu making, kori-tofu production as an industry, equipment for kori-tofu production, distribution of kori-tofu, utilization of by-products.

Yuba and its industrial production.

Kinako [roasted whole soy flour] and its industrial production. The Japanese word can be written either in hiragana or using two Chinese characters which mean "yellow flour." Kinako is made from whole soybeans. Sometimes the soybean hulls are removed before roasting. Kinako is widely used as an ingredient in Japanese confections [such as kinako mochi or Abekawa mochi (toasted mochi in kinako); it was traditionally sold along the banks of the Abekawa River in Shizuoka, Japan]. About 12,000 metric tons of soybeans are used per year in making kinako.

New soybean food materials and their industrial production: New soybean food materials, usage of new soybean food materials, future of new soybean foods, other food uses of soybeans.

Natto and its industrial production: Process of natto making, equipment for natto production, natto production as an industry.

Miso and its industrial production: Varieties of miso, Process of miso making, miso production as an industry, industrialization of miso making, distribution of miso, future prospect of demand for miso, mycotoxins and fermented soybean foods.

Shoyu and its industrial production: Process of shoyu making, shoyu production as an industry, nitrogen utilization ratio in shoyu making, special shoyu.

Figures show: (1) Flow sheets of production of traditional soybean foods in Japan: Tofu, kori-tofu, yuba, kinako, natto, miso (with koji), shoyu. (2) NK-type soybean cooker (by courtesy of Kikkoman Shoyu Co. Ltd.). (capacity: 1 metric ton of defatted soybean meal). (3) (3) Continuous

cooker of soybean meal (by courtesy of Yamasa Shoyu Co. Ltd.). (capacity: 1 metric ton of defatted soybean meal per hour).

Photos show: (1) Tofu soaked in water for sale. (2) Large-scale tofu factory (by courtesy of Tokyo Tofu Co., Ltd.). (3) Continuous cooker of ground soybeans (by courtesy of Masuko Sangyo Co., Ltd.). (4) Decanter, a kind of continuous centrifuge (by courtesy of Kokusan Seiko Co., Ltd). (capacity: 3,000 kg of ground soybeans per hour). (5) Factory of packed tofu from spray-dried soybean milk (by courtesy of Nippon Tanpaku Kogyo Co., Ltd.). (6) Continuous deep-fryer of aburage (by courtesy of Iwase Tekkosho Co., Ltd). (capacity: 1,000 to 1,500 pieces per hour). (7). Daiya Kori-tofu (Left one in the dish is swollen by hot water). (8) Bird's-eye view of large scale factory of kori-tofu (by courtesy of Misuzu Tofu Co., Ltd). (capacity: 10 to 15 metric tons of soybeans per day). (9) Soaking of large cake of tofu for precooling during making of kori-tofu (by courtesy of Misuzu Tofu Co., Ltd). (10) Continuous freezing equipment used in making of kori-tofu (by courtesy of Misuzu Tofu Co., Ltd). (11) Continuous thawing apparatus of frozen tofu (by courtesy of Misuzu Tofu Co., Ltd). (capacity: 10,000 to 15,000 pieces per hour). (12) Yuba plant (by courtesy of Ohara Co., Ltd). (13) Natto mixed up by chopsticks. (14) Inside of fermentation room for natto making (by courtesy of Suzuyo Kogyo Co., Ltd). (15) Two brands and varieties of miso, both in plastic bag and on dish. (16) Rotary cooker of soybean (by courtesy of Hinode Miso Co., Ltd). (capacity: 1 metric ton of soybeans). (17) Continuous rice cooker (by courtesy of Hinode Miso Co., Ltd). (capacity: 1.5 metric tons of rice per hour). (18) Rotary koji fermenter (by courtesy of Miyasaka Miso Co., Ltd). (capacity: 1.8 metric tons of rice in each fermenter). (19) Pasteurizer of miso (by courtesy of Nagata Machinery Co., Ltd). (capacity: 1 metric ton of miso per hour). (20) Fermentation tank of moromi [mash] (by courtesy of Kikkoman Shoyu Co., Ltd). (capacity: 1.5 metric tons of rice per hour). (21) Shoyu in large glass bottle and smaller plastic container. (22) (22) Large-scale koji fermenter (by courtesy of Yamasa Shoyu Co., Ltd).

Concerning natto: The surface of each natto "soybean is covered with a viscous sticky substance, which has the property of forming long stringy threads when mixed up (Photo 13). The longer the strings, the better the quality of natto." The texture of the cooked soybeans is softened by the enzymes of *Bacillus natto.* About 50,000 metric tons of soybeans are used each year to make natto. It is most popular in northeastern Japan (Tohoku region). Natto is fairly perishable, and excess ammonia will be produced by overfermentation. There are about 1,300 plants that make natto in Japan; the average plant consumes about 100 kg/day of soybeans. Recently, however, large, mechanized factories that consume 2-3 metric tons/day of soybeans have been constructed. From 10 kg of whole dry soybeans about 18 kg of natto can be made. One package of natto containing 100 gm costs 15-20 yen (about 4-6 cents U.S.).

Note 2. This is the earliest English-language document seen (Jan. 2012) that uses the word "sticky" to describe natto. Address: Food and Nutrition Div., Food Research Inst., Ministry of Agriculture & Forestry, Tokyo, Japan.

5603. *SoyaScan Notes.* 1969. Chronology of soybeans, soyfoods and natural foods in the United States 1969 plus overview of the 1960s (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** 1969 Jan. Volume 1, Number 1 of *Food Science and Technology Abstracts* published; the earliest records in it go back to Jan. 1968. It is created from the world's first computerized database specializing in food.

1969 Jan. Richard M. Nixon inaugurated as President of the United States. Clifford M. Hardin of Indiana is Secretary of Agriculture.

1969 March. Paul Hawken takes a 9-month trip to Japan and arranges for Mitoku and Muso Shokuhin to export natural foods to Erewhon.

1969 March. Soybean yields in tests top 100 bushels/acre for the first time.

1969 March. Essene Macrobiotic Supply starts business in Philadelphia, Pennsylvania. Denny Waxman and Charles Smith are founders.

1969 June. A.E. Staley Manufacturing Co. acquires Gunther Products, a pioneer in the field of modified (enzyme hydrolyzed) soy whipping proteins. Gunther had been founded in 1948, incorporated in 1949.

1969 Aug. Erewhon–Los Angeles opens as a small macrobiotic natural foods retail store at 8003 Beverly Blvd. Bill Tara is the first manager.

1969. USAID starts actively encouraging U.S. businesses to launch low-cost commercial protein products in Third World countries.

1969 fall. Erewhon Natural Foods in Boston starts to distribute macrobiotic and natural foods. They had begun to wholesale these foods out of the back of their retail store in the spring of 1969. They are America's first natural foods distributor, and remain the largest for many years.

1969 Oct. *Protein-Enriched Cereal Foods for World Needs,* edited by Max Milner, published by American Assoc. of Cereal Chemists.

1969 Nov. Bac-o-Bits, meatless bacon bits made from extruded soy flour, start to be sold nationwide by General Mills. Its forerunner, Bac*O's, made from spun soy protein fiber, had been introduced in May 1966. Frozen Bontrae meat analogs are sold to the foodservice trade. This pioneering work by one of America's largest food companies indicated to the U.S. food industry that the time for soy protein foods of the future had arrived.

1969 Nov. 4. Eden Organic Foods incorporated in Ann Arbor, Michigan by Bill Bolduc, and their macrobiotic retail

© Copyright Soyinfo Center 2014

store begins operation, selling soyfoods including tamari and miso purchased from Erewhon. The company grew out of a loosely-knit food buying co-op which had started in about July 1967 but which had no name, no formal structure, and no bank account. Bolduc was joined 9 months later by Tim Redmond.

1969 Nov. 17-21. United Nations Industrial Development Organization Expert Group Meeting on Soya Bean Processing and Use held at Peoria, Illinois.

1969. The first of the new wave of tempeh shops in the Western world, Handelsonderneming van Dappern (later renamed Tempeh production Inc.) started by Robert van Dappern in Kerkrade, The Netherlands. It soon becomes the world's largest tempeh manufacturer.

1969. The Program for International Research, Improvement, and Development of Soybeans (PIRIDS) established at the University of Illinois with funding from a Rockefeller Foundation grant. The forerunner of INTSOY, it is directed by Earl R. Leng.

1960s overview:

Oilseed Proteins and the Protein Gap. Worldwide, there is a growing consensus that Third World countries are facing a "protein crisis," that protein malnutrition is the world's most widespread deficiency disease, and that low-cost oilseed proteins (such as defatted soybean meal and flour) offer the most promising hope for remedying the problem. The leading architect and proponent of this view is Dr. Aaron Altschul of Georgetown University School of Medicine. The United Nations' FAO/WHO/UNICEF Protein Advisory Group, composed of the world's leading authorities in the field, is very active from the mid-1960s to the mid-1970s, supporting wider use of soy protein products and soyfoods.

Food for Peace Shipments of Soy Fortified Foods begin. The first shipment of such foods, CSM (corn-soy-milk), took place in 1966, when 28,000 metric tons (tonnes) were shipped. The next year 54,000 tonnes were shipped. Shipments increased dramatically during the 1970s.

Growing Interest in Modern Soy Protein Products. These new products, including soy protein isolates and concentrates, and textured soy protein products, now appear to have major potential in the food systems of all countries.

Leading Soyfoods Research Centers in America are the Northern Regional Research Laboratory at Peoria, Illinois (Hesseltine, Wang, Mustakas, Wolf), and the New York State Agricultural Experiment Station at Geneva, New York (Steinkraus and Bourne).

Vitasoy sales are booming in Southeast Asia. The introduction of Vitasoy by K.S. Lo in Hong Kong in the early 1940s brought soymilk into the modern era. Takeoff began in 1955 when Vitasoy began to be marketed like a soft drink. Sales grew from 8.4 million bottles that year to 42 million in 1960 and 100 million in 1970, a 2.4-fold increase during the 1960s. By 1962 Vitasoy had become Hong Kong's best-selling soft drink, ahead of such internationally known brands as Coca-Cola, Pepsi-Cola, and Seven-Up.

Shoyu (Soy Sauce) Becomes a World Class Seasoning, Thanks to Kikkoman. Shoyu has long been the world's most popular seasoning other than salt, and Kikkoman has been the world's largest manufacturer since about 1918. During the 1960s Kikkoman internationalized its operations, developing new markets for shoyu throughout the world by exporting from Japan and promoting the products for use in Western-style recipes, largely with meat, fish, and poultry. Production climbed from 183,000 kiloliters in 1960 to 340,000 kl in 1970. During the same period its share of the Japanese shoyu market rose from 18% in 1960 to 30% in 1970.

Steady Rise in Soybean Production in Latin America and Africa. In Latin America production rose from 231,000 tonnes in 1960 to 1,535,000 tonnes in 1969, a 6.6-fold increase during the decade. Brazil accounted for 87% of that production in 1969, followed by Mexico and Colombia.

African soybean production rose from 27,000 tonnes in 1960 to 74,000 tonnes in 1969, a 2.7-fold increase. Nigeria accounted for 84% of that production in 1969, followed by South Africa and Ethiopia.

American Soybean Association Funding Increases Dramatically from Checkoff Programs. This was a decade of great growth for ASA. In 1962 the Minnesota Soybean Growers Assoc., the first affiliated state association, was founded. The ASA's biggest breakthrough to date came in 1966, when soybean growers began to support their own market development and research activities (previously funded by USDA's Foreign Agricultural Service) using funds provided by state checkoff programs. Typically ½ to 1 cent of funding was generated from each bushel of soybeans sold in states where a checkoff referendum had passed. By the early 1970s the checkoff programs had begun to generate large sums of money, which allowed ASA to expand its activities. Expanded market development activities overseas led to a steady, long-term increase in soybean exports.

Soybean Changes from an Oilseed to a Protein Seed. Prior to the mid-1940s the soybean, worldwide, had been crushed primarily for its oil. The meal was considered a by-product. But in the post-war period, with growing affluence driving increased demand for meat, the demand for meal outstripped that for oil, and the oil became the by-product. This trend, which started in America, was in full swing by the 1960s and expanded to other countries thereafter.

Soybean Digest and ASA Interest in Soyfoods. During the past two decades *Soybean Digest* has published a steady stream of articles on soyfoods worldwide. Soyfoods were given big play at many ASA annual conventions. This interest in the USA had largely stopped by the mid-1970s, focusing on soybean production instead.

Eng] Address: Dep. of Food Chemistry, Faculty of Agriculture, Tohoku Univ., Sendai.

5606. *Soybean Digest.* 1969. Growers continue to back soybeans nationally: Market development. Dec. p. 3.
• ***Summary:*** "Funds continue to flow in from farmers supporting the American Soybean Assn.'s campaign to promote soybean sales abroad. Many states are in Phase II of the development program which is a voluntary checkoff of ½ cent per bushel made at the [first] point of sale.

"Phase II is an interim program until states pass legislation which enables an automatic deduction of ½¢/bu from all soybean sales. (The ½ cent will be refunded to any farmers who prefer not to support the market development activities in states where growers have passed a checkoff referendum.)

"The legislative program and referendum, Phase III, have already been passed in North Carolina, South Carolina, and Louisiana.

"Funds raised under these programs will be used to develop and expand world markets for soybeans. Funds are matched by the Foreign Agricultural Service [FAS], and in some cases by local processors–so every dollar contributed by farmers is multiplied 5 to 10 times.

"Results of market development activities have been so successful in Japan and Spain that additional funds will be used to develop markets in France, Italy and other nations in Europe and the Far East. Japan and Spain are the biggest importers of U.S. soybeans..."

5607. *Soybean Digest.* 1969. News in brief: ASA-JOPA win prize in Japan. Dec. p. 11.
• ***Summary:*** "A salad dressing advertisement used in the joint advertising campaign of the American Soybean Association and the Japan Oilseed Processors Assn. in Japanese women's magazines has won the top award for a magazine advertisement in Japan."

5608. Tanaka, Teruo; Saito, Nobuo. 1969. Studies on sensory evaluation of soy sauce. X. Relation between odor patterns and chemical factors (1). *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 47(12):780-89. Dec. [19 ref. Eng]
• ***Summary:*** Tring to determine which odor components play an important role in or have an important effect on the odor of soy sauce is a momentous problem. The author discuss the linear relationship that exists between odor patterns and 19 chemical factors (on the one hand) and quality patterns (on the other). Address: Central Research Inst., Kikkoman Shoyu Co., Ltd., Noda, Chiba, Japan.

5609. Tanaka, Teruo; Saito, Nobuo. 1969. Studies on sensory evaluation of soy sauce. IX. Construction of odor pattern on the odor judgment. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 47(12):772-79. Dec. [27 ref. Eng]
• ***Summary:*** The major components of soy sauce odor are related to: (1) The ratio of brewed soy sauce to amino acid solution obtained by hydrolysing soy beans with hydrochloric acid and adjusting the resulting solution to pH 5.0 with sodium carbonate; (2) Microbial contamination; (3) Medicinal dependent strains of *Aspergillus oryzae;* (4) Degree of ripening; (5) Pasteurization. These 5 factors explain 75% of the total variance. The strongest is number (1). Address: Central Research Inst., Kikkoman Shoyu Co., Ltd., Noda, Chiba, Japan.

5610. **Product Name:** [Soyalac {Soymilk}].
Foreign Name: Soiyarakku Neo.
Manufacturer's Name: College Health Foods. Later renamed San-iku Foods.
Manufacturer's Address: 1-1 Nagaurataku, Sodegaura-machi, Kimizu-gun, Chiba-ken 299-02, Japan.
Date of Introduction: 1969.
Wt/Vol., Packaging, Price: 180 ml glass bottle. Caned by 1980.
New Product–Documentation: Letter from Charles D. Howes. 1978. Oct. List of Seventh-day Adventist soymilk plants. In Japan: San-iku Foods, Kanno 4162, Sodegaura-machi, Kimitsu-gun, Chiba-ken 299-02. M. Urumba, Manager. Hidekazu Watanabe, production manager for Soyalac.

Shurtleff & Aoyagi. 1979. Tofu & Soymilk Production. p. 227-28. Gives a detailed description of the method used to make Soyalac.

William Shurtleff. 1981. Soyfoods. p. 35. "Dr. Harry Miller: Taking soymilk around the world." "Starting in about 1955 Dr. Miller started to recommend that the Adventist-run Japan San-iku School serve soymilk instead of cow's milk to the students; however the staff hesitated because of its nutritional value and flavor. In 1957 two Japanese Adventists, Mr. Hidekazu Watanabe and Mr. Hanzo Ueda (who ran a tofu shop at the time), started making Japan's first soymilk on a small scale in Hachioji, Tokyo, bottling it in 180-ml bottles, and selling it locally. Mr. Watanabe later described the great value to them of Dr. Miller's ongoing technical, nutritional, and spiritual guidance. After some time, directors of the San-iku School visited the small soymilk plant, liked the soymilk flavor, and understood its nutritional value. In 1959 they bought similar equipment, set up a small plant in the school, and started to produce soymilk, which was bottled in 180-ml bottles and served to the students at every meal. In 1969

© Copyright Soyinfo Center 2014

the San-iku School set up an independent food production company called College Health Foods (which later became today's San-iku Foods) and through it, with the help of Loma Linda Foods in America, began to produce Soyalac soymilk infant formula." By 1980 this product was canned in plain and carob flavors.

Letter (in Japanese) from Hidekazu Watanabe. 1981. July 19. Discusses the early history of this product. "The Ueda Tofu Shop in Hachioji helped with the product development; I was there at the time. In those days our name was San-iku Gakuin Shokuhin-bu (the food department of the San-iku School). The purpose was to provide a place of labor for the students and opportunities to learn food processing. It was not a business. Dr. Perry Webber was the principal of our school at the time." K. Tsuchiya. 1982. Dec. *Tonyu* [*Soymilk.* 2nd ed.]. p. 74. States that Soiyarakku Neo was introduced in 1969. It is now sold by Saniku Fuuzu in a 425 gm can and distributed nationwide.

Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 63-64. "In 1958 Dr. Miller set up a small soymilk plant in the kitchen of the Adventist-run Tokyo Sanitarium. It was used to make soymilk, soy whipping cream, soymilk ice cream, and soy spread, which were served to the staff and patients. In 1959 a small soymilk plant was established in the Seventh-day Adventist San-iku School. From this year, Japan's oldest existing soymilk company, San-iku Foods, traces its origin. By 1982 San-iku Foods was Japan's fourth largest soymilk manufacturer.

Letter from San-iku Foods. 1990. June. This product was introduced in 1969.

Letter from Ichiro Tabuchi. 1990. July 4. In 1970 San-iku Foods became independent from the San-iku Gakuin Food Department and started to make and sell infant formula.

5632. Cooking good food. 1969. Order of the Universe Publications, Box 203, Prudential Center Station, Boston, MA 02199. 34 p. No index. 28 cm.
• ***Summary:*** A simple, concise source of the basic macrobiotic ideas adapted to the American way. Note 1. This booklet was written by Jim Ledbetter, a student of macrobiotic teacher Michio Kushi, although his name does not appear in it.

Contents: The traditional food of man. The way of eating. Salt and oil. Special foods. Useful kitchen items. Cooking brown rice. Cooking other grains. Cooking vegetables. Cooking sea vegetables. Cooking beans. Cooking soups. Cooking with flours (Cooking noodles, cooking creams, baking bread, variations with flour). Cooking animal food. Preparing salads. Preparing condiments. Preparing drinks. Cooking desserts. Plasters. Traveling and eating out. he manner of eating. The seven levels of cooking.

In Chapter 4, titled "Special Foods" is a section on "Soybean foods" (p. 6), which states: "The soybean has been called the 'Vegetable Cow' of the Orient. It is full of good vegetable quality protein (43%). It was not traditionally eaten without special preparation, because it is fairly yin, except by monks who wished to limit their sexual desires. When cured

© Copyright Soyinfo Center 2014

with salt, however, it was used as a daily food. You will find these traditional preparations very helpful in your kitchen.

"Tamari is the ancient form of soysauce, fermented for at least eighteen months from soybeans, salt, wheat or barley, and water, without chemicals or preservatives. It has a very distinctive, delicious taste. It is used mainly in cooking vegetables when it is added after salting and just before the end of cooking time, and in broths. It is rarely used directly on grains, but is often found on the table to use with deep-fried foods. Some women mix tamari with an equal amount of water to make it less strong.

"Miso is a paste made from the same ingredients as tamari. There are two varieties; one (Hacho) is a little harder and darker in texture than the other. It has many uses, especially in soups, in which case it is added towards the end of cooking time so that the wonderful digestion-aiding bacteria it contains will not be destroyed. (All of these soybean condiments produce their best flavor when cooked slightly.) Miso soup has a deep, satisfying bouillon flavor, and is often taken every day as a delicious source of energy. It is helpful to thin miso in a little water before adding it to soups and sauces.

"Morromi [sic, moromi] is the pulp from which tamari has been made. It has a very special tangy flavor, and is used like miso.

"Seitan or 'Protein X' is made from the same ingredients as the above condiments. A slightly different process produces a strong jerky which, when boiled or sauteed, resembles beef in appearance and taste. It is very good in soups" (p. 6). Note 2. This is the earliest document seen (March 2011) that mentions "seitan." It is also the earliest English-language document seen (March 2011) that contains the word "seitan." By placing seitan in the category of "Soybean Foods," the author is apparently emphasizing the importance of soy sauce as one of its two main ingredients. He seems to have tasted seitan, but it is not clear that he knows what its other main ingredients are (wheat gluten, ginger, sesame oil) or how it is prepared.

"Tofu is made from fresh soybeans. This curd or 'cheese' is a good quality, strong yin food which is very refreshing for occasional use in summer when it is cooked with tamari. It is helpful to store tofu in water. The more yang pulp, which is usually thrown away, can sometimes to obtained from the Oriental stores which make tofu, and used to make delicious casseroles or well-sauteed vegetable dishes."

The section on "Condiments" (p. 6-7) discusses Gomasio (Sesame salt), umeboshi (salted plums), and Tekka. The section on "Oriental vegetables" (p. 7) discusses lotus root, daikon, ginger root, Chinese cabbage, jinenjo (Japanese potato), and kuzu arrowroot.

In the chapter titled "Cooking Beans" the author considers "Aduki Beans" to be the "King of Beans."

"Black Beans: The imported Japanese black beans are higher nutritional quality and superior taste. They are very sweet, delicious beans. They should be soaked and boiled, because their skin can become loose and clog a pressure cooker spout."

"Miso Soup: This hearty bouillon is the staple everyday soup. Prepare vegetables and boil for at least one-half hour (if you want a really good soup); thin miso with a little of the stock in a bowl and add it to the soup towards the end. Do not boil the soup after adding miso or the beneficial digestion-aiding bacteria will be harmed. If it is simmered very slowly, it can be cooked from 5 minutes to one hour.

"Tamari Soup: Prepare as above using tamari instead of miso for flavoring. A simple tamari broth with onions or carrots and onions is often served over dishes such as noodles."

In the chapter titled "Preparing Condiments" (p. 27) we read: "Vegetable Miso. Slice vegetables finely and saute. Add diluted miso and water and cook. Scallions, chives, carrot tops and many other vegetables are good prepared in this manner. 'Tekka' is made from lotus root, burdock root and carrots. 'Sigure' [Shigure] ('November Rain') is prepared with lotus roots, carrots, and onions. A little freshly grated ginger is often added towards the end of the cooking. A small amount of these condiments is usually sufficient."

The chapter titled "Preparing drinks" (p. 28-29) discusses Mu tea, umeboshi tea, chicory, Yannoh [Ohsawa coffee], dandelion coffee, Bardan, Kokkoh, kuzu, ume-syo-kuzu, and daikon drink.

The chapter titled "Cooking Desserts" (p. 30) states: "Amasake (Homemade Rice Wine). For special occasions this drink is very smooth and sweet."

Tofu is also mentioned in the chapter titled "Plasters" (p. 31). "Tofu Plaster. Squeeze tofu (soy bean curd, see *Special Foods*) and mix with 10% flour to make it more manageable. Apply this to any painful, feverish, or inflamed area. Alternating tofu plasters with ginger compresses often helps stubborn cases."

Note 3 This is the earliest document seen (July 2000) that mentions "Hacho" miso (spelled that way). Subsequently, many macrobiotic publications used this word and spelled it that way.

The chapter titled "Cooking sea vegetables" briefly defines kombu, wakame, hiziki (the incorrect idea concerning "black rice" comes from a casual remark by Evan Root), arame, dulse, and nori (laver).

Note 4 One original edition of this booklet, sent to Soyfoods Center by Tim Redmond (a founder of Eden Foods), has one dark blue stalk of wheat against a light blue background. In the lower right corner of the cover the following has been stamped with a blue ink stamp: "Eden Organic Food Store, 514 E. William. Ann Arbor, Mich. [Michigan] 48104." Address: [Massachusetts].

5636. Hosokawa, Bill. 1969. Early Japanese immigrants to and farming communities in California. The Wakamatsu Tea and Silk Farm Colony (Document part). In: B. Hosokawa. 1969. Nisei: The Quiet Americans. New York: William Morrow and Company, Inc. xvii + 522 p. See p. 31-34, 37, 496.
• ***Summary:*** The earliest Japanese farming community in California, the Wakamatsu Tea and Silk Farm Colony, was established in 1869 near Coloma in El Dorado County (35 miles northeast of Sacramento and 5 miles northwest of Placerville). Chapter 4, "The Vanguard Arrives," notes (p. 31-33, and 37) that the founders of this colony arrived in San Francisco from Japan on 27 May 1869 on the sidewheeler *S.S. China* of the Pacific Mail Co. This was probably the first immigrant party from Japan to arrive in the United States. It consisted of venturesome Japanese from the vicinity of Aizu Wakamatsu located about 200 miles northeast of Tokyo. "While most Japanese immigrants came to the United States for economic reasons, this first group was in effect made up of political refugees. Matsudaira Katamori, feudal lord of Aizu Wakamatsu, had sided with the Tokugawa shogunate in opposing the restoration to power of the imperial family. When the Tokugawas finally lost the struggle, their allies were stripped of wealth and influence, their retinue of warriors cast adrift as *ronin* (masterless samurai)." One of Matsudaira's advisors, Henry Schnell (a Dutchman, or perhaps a German), suggested that they seek refuge in the United States. "Schnell was commissioned to lead an advance party which would pave the way for later groups. Apparently the project had special approval, for general emigration was still prohibited.

"The records of the time are incomplete, but Mrs. Fern Sayre and Soichi Nakatani of Sacramento through painstaking research have uncovered considerable information about this project, called the Wakamatsu Tea and Silk Farm Colony. Henry Taketa of Sacramento in an article based on this research, has written in *The Pacific Citizen:*

"'Much of the group was made up of farmers and those in the trades, but several were samurai followers of Lord Matsudaira. Four women, including teen-age nursemaid Ito Okei of the Schnell family, were with the pioneer party.

"'The settlers, arriving in San Francisco, proceeded to Sacramento by riverboat and wagontrained to Placerville and nearby Gold Hill, where Schnell had arranged to purchase 600 acres for the farm colony. With them came 50,000 three-year-old mulberry trees for silk farming, a large quantity of bamboo shoots for food and craft industry, tea seeds, grape seedlings and other varieties of plants and seeds of their native land.'

"The colony was short-lived. The plants from Japan, weakened from the long voyage, failed to thrive in the dry soil, and water for irrigation was scarce. Financial aid expected from Japan failed to materialize. Schnell left with his wife and two daughters, promising to return with money, but he did not come back. The colony lasted less than two years. Some of the Japanese are believed to have returned to the homeland. Others drifted away and left no trace of their passage.

"There is reliable record of only three. One was Okei, the second a samurai and carpenter named Sakurai Matsunosuke, the third Masumizu Kuninosuke. Within two years Okei died of a fever that periodically swept the West and was buried atop Gold Hill... The original stone over her grave bears this stark epitaph: 'In memory of Okei, died 1871, age 19 years, a Japanese girl.'...

"The state of California in 1966 recognized the arrival of the Wakamatsu colony as an 'historic event' and the Japanese American Citizens League designated 1969 as the centennial of Japanese immigration to the United States. On June 7, 1969, a State Historical Plaque, telling the story of the Wakamatsu Colony, was placed on the grounds of Gold Trail School in El Dorado County some one hundred yards from the Okei grave.

"There are, however, indications that Japanese settlers were in California prior to the Wakamatsu Colony. The San Francisco *Chronicle* under date of June 17, 1869, mentions the arrival of Japanese 'upwards to a year ago.' They were described as 'gentlemen of refinement and influence in their country, from which they were compelled to flee, almost destitute, because their travel in civilized countries had made them too liberal in their ideas to suit the Mikado.' The report goes on to say the Japanese spoke English and French,

© Copyright Soyinfo Center 2014

and on the advice of a Mr. Van Reed, 'father of the United States consul at Jedo [sic, Edo, today's Tokyo],' leased a farm in Alameda County. Nothing further is heard of these gentlemen."

A photo (p. 496) shows California registered historical landmark No. 815: "Wakamatsu Tea and Silk Farm Colony. Site of the only tea and silk farm established in California. First agricultural settlement of pioneer Japanese immigrants who arrived at Gold Hill on June 8, 1869. Despite the initial success, it failed to prosper. It marked the beginning of Japanese influence on the agricultural economy of California." Address: Denver Post, Denver, Colorado.

5640. Kawashima, Ryoichi. 1969. Trends of research of soybean cultivation in Japan. *JARQ* (*Japan Agricultural Research Quarterly*) 4(4):15-19. [4 ref. Eng]
• ***Summary:*** Contents: History of research. High productivity: Photosynthesis, growth analysis, soil and fertilizer, method of cultivation, high yield cultivation. Good quality seed. Pest control. Preventative measures against cold-weather damage.

History: The area of soybean cultivation in Japan remained at about 450,000 ha until about 1920, when it began to decrease gradually, falling to half (225,000 ha) by the start of World War II. This decrease was caused by increasing imports of soybeans from Manchuria. During this period of decrease, research on soybean cultivation was seldom conducted, except for breeding, and that continued with difficulty.

In the years immediately after World War II, soybean production in Japan showed no signs of increasing, being thrust aside by production of urgently needed starch foods [such as rice and barley].

Then in 1950 soybean production began to increase rapidly and an area of 400,000 ha was maintained over the next five years. Detailed studies of soybean cultivation were undertaken during those years.

In 1945 the first laboratory of soybean cultivation was established at the Imperial Agricultural Experiment Station. And with the rapid increase in cultivated area, studied on soybean cultivation began at the national and public agricultural experiment stations and universities.

But starting in 1955, as imports of soybeans from the United States increased rapidly, the area of soybean cultivation decreased year after year. But to strengthen the competitive position of Japanese soybeans, research on these soybeans was intensified, even after the free trade of soybeans was opened up in 1961.

However by 1968, due to increasing soybean imports, the area of soybean cultivation in Japan had decreased to 120,000 ha and soybean production in Japan decreased to 7% (170,000 tons) of all demand. Nevertheless, soybean research is still considered important as it is one of the major sources of plant proteins.

Today, research on soybean cultivation is being conducted at five breeding institutes and at some national agricultural experiment stations and universities. Here, in laboratories, advanced studies are being made. An outline of the research results is published by the Ministry of Agriculture and Forestry, and detailed results obtained during successive years were collected and published in 1953 (obtained in 1939-1951) and in 1967 (obtained in 1952-1963). Address: Chief, 2nd Lab., 2nd Div. of Plant Physiology, Dep. of Physiology and Genetics, National Inst. of Agricultural Sciences, Japan.

22(9):615-20. [9 ref. Jap]
• ***Summary:*** Three kinds of natto were prepared using 3 different strains of *Bacillus natto.* Likewise a liquid natto was made from steamed soybeans, fermented under aeration and crushing. In regular natto water soluble nitrogen decreased to 85% of that in raw soybeans. TCA soluble nitrogen, amino nitrogen, and peptide nitrogen increased significantly in natto and their proportions differed in the natto made from two strains of *Bacillus natto.* Note: TCA is probably trichloracetic acid. Address: Gifu Daigaku, Kyôiku-bu (Dep. of Education, Gifu Univ.).

5642. Meals for Millions Foundation. 1969. Annual report 1968. Santa Monica, California: MFM Foundation. 8 p. Typed with signature on letterhead.
• ***Summary:*** Submitted by I.F. Saunders, Executive Director. Contents: Summary. MFM board and staff. Technical training. Research & development. Multi-purpose food shipments (278,113 lb to 33 countries). Financial condition (Donations in 1968 were $408,000, the highest in MFM's history. Only 7% of income was used for administration and management, and only 13% for fund raising and public relations). U.S. Projects: California ("Governor Ronald Reagan has readily accepted the title of Honorary Chairman of the Meals for Millions California Chapter." He has participated in MFM "activities over the past years, and is acquainted with what we are doing and firmly believes in the way we are doing it"), Nevada, Arizona, Mississippi, South Carolina. Overseas Projects: Japan, Korea, Taiwan, Philippines, Hong Kong, Thailand, India, Ceylon, Pakistan, Iran, Ecuador, Chile, Brazil, Mexico. Remarks.

Note 1. This is the earliest document seen (Dec. 2010) which shows that Meals for Millions Foundation was now located at 1800 Olympic Blvd. in Santa Monica–15 miles west of Los Angeles. Actually, MFM moved to this location in 1967.

Note 2. This is the earliest annual report seen (Dec. 2010) for Meals for Millions.

Chris Dodson of Freedom from Hunger (FFH), who kindly sent this annual report (and almost all subsequent MFM / FFH annual reports) to Soyinfo Center (Dec. 2010), says she can find no evidence of annual reports for 1965, 1966, or 1967 in the FFH archives. Address: 1800 Olympic Boulevard (P.O. Box 1666), Santa Monica, California. Phone: 870-0451.

5643. Misumi, Kan. 1969. Miso daigaku [Miso university: The great teaching on miso]. Tokyo: Bungeisha. 230 p. Illust. 22 cm. Reprinted in 2001 by Gendai Shokan in Tokyo. [Jap]
• ***Summary:*** Contents: 1. The art and skill of making miso. 2. Thoughts about miso. 3. Barley miso. 4. Aged miso. 5. The limitless art of miso. 6. Wheat miso. 7. American miso. 8. Farmhouse miso. 9. Kumakusu miso. 10. Selective art. 11. Hangover treatment. 12. Kinzanji miso. The author's thoughts about miso. Additional discussion on pickles.

Kan Misumi, the author, lived 1903-1971. This book, which contains numerous excellent photos (many in color) and recipes, is a highly personal and literary approach to the subject of miso by a Kyushu-born novelist who, upon retirement, turned his spacious Tokyo home into a center for the study and preparation of miso and miso pickles. This volume and its companion, *Pickle University* (*Tsukemono Daigaku*) contain a wealth of information about the preparation of both these foods in the traditional, natural way.

Note: This is the earliest document seen (March 2009) that gives detailed, illustrated directions for making miso at home. Address: Dr. of Literature (Bungei Hakase), Tokyo.

5644. Misumi, Kan. 1969. Tsukemono daigaku [The great teaching on pickles]. Tokyo: Bungeisha. 266 p. Illust. No index. 22 cm. [Jap]
• ***Summary:*** This book contains many excellent photos and recipes. Contents: Pickles and health. Then 25 chapters on various types of pickles. Chapter 10 is umeboshi (salt plums). Chapter 15 is koji pickles. Chapter 16 is miso pickles and sand pickles (*suna-zuke*). Address: Bungei hakase, Tokyo.

5645. Moore, Raymond S. 1969. China Doctor: The life story of Harry Willis Miller. 2nd ed. Mountain View, California: Pacific Press. 215 p.
• ***Summary:*** The original edition of this book was published in 1961. This 1969 edition, although it has been completely re-set, contains only minor revisions: (1) A new color paperback cover shows a large illustration of Dr. Miller's face. (2) This second edition contains a 3-page Postscript (p. 150-52), which describes his work in Hong Kong (1960-65, 1969), Philippines (1966), expansion of his work with soymilk in Hong Kong ("The Hong Kong soft drink industry dispenses more milks derived from his soybean milk than all others combined"), other work with soy ("His grain-and-soybean-based foods are being adopted as alternates to meat in lands which cannot support animals as a principal diet source. They range from soy cheese, milk, ice cream, and butter-like spreads to simulated steaks, wieners, and sausages. These vegetable foods now are making headway even in the United States and other Western countries. In an era of population dilemmas, Harry Miller reminds the experts that meat, as compared with vegetable protein, takes several times the acreage to produce the same amount of food."), George McGovern and Food for Peace (1961) which resulted in sharply increased exports of soybeans from the USA. (3) The number of pages in the book has been reduced to 152, from the original 215. (4) The valuable index in the first edition has (unfortunately) been omitted. (5) The number of photos has been reduced to 11, from 16 in the first edition, and many photos from the first edition were omitted.

© Copyright Soyinfo Center 2014

New photos (located on unnumbered pages 142-47) show: (1) Harry and Maude Miller at the time of their wedding in 1902. (2) Dr. Miller with a woman victim of goiter in China. (3) Hong Kong Hospital for Chinese refugees at Tsuen Wan, completed in June, 1965. (4) Dr. Miller with little Mohammed Ali, a Bedouin child in Libya. (5) Harry and his wife Mary in 1957 waiting at the airport in Benghazi, Libya. (6) Mr. Chan Shun donates 1 million Hong Kong dollars for the construction of a Seventh-day Adventist hospital in Hong Kong. Dr. Miller looks on. (7) In 1968 at Albuquerque, New Mexico, Dr. and Mrs. Miller are given a red-carpet welcome by Governor David F. Cargo.

5646. Nishiyama, Buichi; Kumashiro, Yukio. trans. 1969. Seimin yôjutsu. 2nd ed. [Ch'i-min yao-shu (Qimin yaoshu)]. Tokyo: Asian Economic Press (Ajiya Keizai Press). [Jap]
• ***Summary:*** Translation into Japanese with explanatory notes and extensive general discussion.

5647. Obara, Tetsujiro; Kobayashi, M.K.; Kobayashi, T.; Watanabe, Y.; Ohata, M.; Tanaka, M. 1969. Basic investigations on the development of foods from enzymatically treated soybean protein concentrates to increase the use of United States soybeans in Japan. Tokyo: Dep. of Agricultural Chemistry, Faculty of Agriculture, Tokyo University of Education. 97 p. Undated. Final report, P.L. 480. Project no. UR-A11-(40)-26. Grant no. FG-Ja-122. Report period: 13 Oct. 1965–12 Oct. 1968. Summarized in Soybean Digest, May 1969, p. 77. [12 ref. Eng]
• ***Summary:*** The group prepared a cheese-like soy protein food by enzymatic treatment. They began by extracting soymilk. The enzymes papain, Bioprase, and Pronase were tested. Address: Dep. of Agricultural Chemistry, Tokyo Univ. of Education, Komaba 2-19-1, Meguro-ku, Tokyo, Japan.

5648. Ohsawa, Georges (Nyoiti Sakurazawa). 1969. Le Zen macrobiotique; ou, l'art du rajeunissement et de la longévité [Zen macrobiotics, or the art of rejuvenation and longevity]. Paris: Librairie Philosophique J. Vrin. 212 p. Index. 19 cm. Preface by Cauvet-Duhamel. [Fre]
• ***Summary:*** Contents: Preface, by Cauvet-Duhamel. Foreword, by G. Ohsawa. 1. Macrobiotics and the medicine of the Orient. My therapeutics. 3. The seven conditions of health and happiness. 4. With faith, nothing is impossible. 5. Yin and yang. 6. My macrobiotic cuisine and the ten ways of eating properly. 7 Principal foods (*Les aliments principaux*). 8. Secondary foods. 9. Special dishes. 10. Suggestions for some illnesses / maladies. 11. Healing regimens. 12. Food for infants. 13. Some ideas.

Appendixes: A cure in 10 hours. Pro-forma death certificate for the world empire of the American gold dynasty. My talks in the United States (starting in Nov. 1959, in New York, Los Angeles, and San Francisco). The despair of American doctors according to the *Times* of 7 March 1960 (listing of the number of people with 17 incurable diseases). How much does the death of a civilization cost? The real cause of sickness, unhappiness, and war. Professional education and religion. Medicine's last cry of despair. The medical revolution in the China of Mao Tse-tung. Medicine: God alone understands it. My prophecy.

The following foods are discussed: Rice, buckwheat, millet and other cereals (p. 67-77). Azuki beans (p. 98). Sesame tofu (p. 98). Sea vegetables (konbu, hijiki, p. 101-05). Miso and miso recipes (p. 105-08, incl. Tekka). Shoyu and shoyu recipes (p. 108-10). Ohsawa coffee (Yannoh, with azuki, p. 111-12). Syo-ban (Natural green tea with shoyu, p. 113-14). Kuzu (p. 114). Umeboshi juice (p. 116-17). Ume-syo-ban (umeboshi and tamari shoyu, p. 117). Ume syo-kuzu (with umeboshi, shoyu, and kuzu, p. 117). Miso fried in sesame oil (p. 118).

Note 2. The author, born in 1893, lists his name on the title page as "Georges Ohsawa (Nyoiti Sakurazawa)."

Note 3. This is the earliest French-language document seen (April 2012) that uses the term *tamari* to refer to soy sauce.

5649. Rodrigues, Joao. 1969. Rodorigesu Nihon daibunten [The art of the language of Japan. Edited by Shôzô Shima and Masakazu Shima]. Tokyo: Bunka Shobô Hakubunsha. 479 p. 27 cm. [Por; Jap]*
• ***Summary:*** This is a reprint of the second major dictionary published by Jesuit priests in Japan. The original edition was published in 1604 in Nagasaki by the Collegio de Iapao da Companhia. Rodrigues lived 1561-1634.

5650. Rudzinski, Russ. 1969. Japanese country cookbook. San Francisco, California: Nitty Gritty Productions. xvi + 198 p. Illust. by Mike Nelson. 14 x 22 cm.
• ***Summary:*** An innovative but hard-to-read book printed with red ink on dark tan paper. The many illustrations (black line drawings) are excellent.

A surprisingly large number of the recipes in this cookbook contain soyfoods. Soy-related recipes include: Sukiyaki (with "1 block of fresh bean cake (*tofu*) or 1 can *tofu,* cut into bite-size squares," and shoyu, p. 5-10). Teriyaki (normally done on a hibachi grill; *teri* = shiny or glazed and *yaki* = broiled, p. 16). Miso shiru (p. 20). Chicken teriyaki with sesame seeds (with shoyu, p. 24). Chicken liver teriyaki (with shoyu, p. 26). Shrimp teriyaki (with shoyu, p. 28). Spicy shrimp teriyaki (with shoyu, p. 28-29). Tofu dengaku (p. 29). Tofu yaki (fried) (with tofu, miso and shoyu, p. 29). Tofu soup (p. 48). Kaki no miso suimono (Oyster soup with soybean paste, p. 55). Vegetable and noodle miso soup (p. 56). Shrimp miso (p. 56). Takara yaki (omelette with tofu, p. 65). Tofu-egg cakes (p. 66). Tofu-egg omelette with white toasted sesame seeds (p. 66). Fried tofu with egg (p. 67). Cabbage with miso sauce (p. 85). Horenso (spinach) with miso (p. 89). Karai nasubi miso (Spicy eggplant with

© Copyright Soyinfo Center 2014

miso, p. 94). Goma nasubi miso (Eggplant with miso and sesame seed paste, p. 95). Tofu sauce (p. 102). Inari sushi (with aburage, p. 110-11). Miso dango (meatless rice-based patties / balls, p. 117). Soba (buckwheat noodles) with miso sauce (p. 122). Tofu to niku donburi (bowl with meat and tofu, p. 127). Sakana no nitsuke (fish cooked with miso, p. 135). Shiroi sakana no nitsuke (white fish with miso, p. 136). Tofu to ebi no kuzu-ni (tofu and prawns in kuzu sauce, p. 139). Simple kaki (oyster) miso (p. 140). Kaki nabe (pot of oysters with miso, p. 141). Kaki to tofu nabe (oyster pot with tofu and white miso, p. 141). Yaki hamaguri (broiled clams with white miso, p. 143). Kawari tofu nori zuke (prawn dumplings with tofu, p. 148). Tori dango miso (fried ground chicken with miso, p. 162). Tofu, pork and vegetables (p. 167). Mashed tofu and ground pork (p. 168). Buta nabe (pot-au-pork with "4 fried tofu, fresh or canned, cut in strips," p. 168). Pork mizutaki (with tofu, p. 169). Beef mizutaki (with tofu, p. 175-76). Shabu-shabu (with tofu, p. 181). Shoyu is used in many, if not most, of the recipes in this book.

At the back is a glossary, which includes definitions of aburage, miso, shoyu, and tofu. Address: California.

5651. Saito, Akio. 1969. [Chronology of soybeans in Japan, 1950 to 1969] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Feb. p. 15-16. [Jap]

• ***Summary:*** 1950–The production of soybeans increases greatly to 446,900 tonnes (2.1 times more than in recent years).

1950–In March, the food ration system organization is closed. In July the ration systems for miso and shoyu are removed.

1951 March–The restrictions for soybeans and rapeseed are removed. From this time on, the number of natto makers increases rapidly.

1952–Soybean production in Japan reaches 521,500 tonnes, the largest since World War II.

1953 Jan.–Restrictions are imposed on imports of foreign soybeans paid for in foreign currencies.

1955. Rice production in Japan this year is 12,390,000 tonnes (up 35.9% over last year). This is the first time it has topped 12,000,000 tonnes. Irrigated rice cultivation (*suiden*) is 20% more than last year. The days of rice shortages are over and the black-market price of rice falls. The per-capita direct consumption of soybeans for the year is 4.5 kg (This information comes from *Norin Suisan-sho, Shokuryo Jukyu-ho*).

1955 April–Soybeans from Brazil are graded using the AA system (*Yunyu jido shonin sei*).

1956–A new natto container is invented, made of shaved wood (*kyogi*) lined with a polyethylene sheet.

1956 June 13–New regulations for agricultural products and price stabilization. Domestic soybeans are added to them.

1956 Oct.–The tax on imported soybeans rises to 10% and the no-tax system for soybeans is removed.

1959–The first instant miso soup is introduced by Yamajirushi Miso in Nagano. It contains dried green onions, wakame, dried tofu [probably dried-frozen tofu], etc.

1959–At about this time research begins on meat analogs made from soy protein.

1960–Per capita consumption of shoyu drops to 13.7 kg. It has now fallen below 14 kg/person.

1960 Soybean imports rise to 1,128,000 metric tons topping 1,000,000 tons for the first time.

1961 July 1–The tax on imported soybeans is removed.

1962–A new natto container made of Styrofoam is invented (*PHP yoki, happo suchiroru*).

1963–In the USA General Mills starts to sell meat analogs made from soy protein.

1965–Per capita miso consumption drops to 7.8 kg, falling below 8 kg/person.

1965–Production of defatted soybean meal reaches 1,074,000 tonnes, passing the 1 million tonne mark for the first time. Production has risen 56% in during the past 5 years.

1966–At about this time meat analogs, based on modern soy protein products, start to be sold commercially in Japan–to institutions.

1966–Soybean imports rise to 2,168,467 tonnes, passing the 2 million tonne mark for the first time.

1966–Production of soybeans in Japan drops below 200,000 tonnes for the first time. Japan now produces only 9% of the soybeans it consumes.

1966 May–Kikkoman starts to sell low-salt shoyu.
1968–Meat analogs based on soy protein start to be sold to the general public in Japan.

1968 June–Research conducted by the *Mainichi Shinbun* shows that the size and price of tofu is now different in different areas. In Tokyo it sells for 25 yen per 300 gm or over. Cakes of tofu sold in downtown Tokyo (*shitamachi*) are smaller than those sold uptown (in the hilly sections) (*yamanote*). Some tofu shops that are not members of the tofu association sell it for 15 yen per 350 gm. In Nagoya it retails for 30 yen per 450 gm, and in Northern Kyushu 25 yen per 450 gm. Per capita consumption of tofu is 33 cakes (*cho*) a year.

1969–Annual per capita consumption of soy oil in Japan rises to 3.2 kg per person, passing the 3 kg mark for the first time. In 1960 it was 1.2 kg/person. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

5656. Shinojima, Chu; Ashihara, Tamako. 1969. Practical shoyu cooking: Delicious dishes with Japanese soy sauce. Tokyo: Japan Publications Inc. 61 p. Illust. No index. 26 cm. [Eng]
• ***Summary:*** Contents: Introduction. Helpful hints on how to use this book. Egg dishes. Beef and veal dishes. Okinawan dishes. Chicken dishes. Japanese soy sauce–Shoyu. Pork dishes. Modern Japanese cooking. Canned foods and salads. Desserts. Tofu dishes and soups. Fish dishes.

Contains many full-page color photos. The word "shoyu" is used throughout the book, and all recipes call for the use of "shoyu." The chapter titled "Japanese soy sauce–Shoyu" (p. 32-33) begins: "Shoyu is the single seasoning without which the art of Japanese cooking would be impossible. Its flavor and fragrance also blend beautifully with food of other countries, and shoyu is now in use throughout the world. Japan's largest shoyu producer, the Kikkoman Shoyu Company, exports its product to 51 countries around the world." It also notes that among the traditional influences on Japanese cooking, that "of Buddhism was especially strong in regard to developing a respect for the natural flavor of each food item. The best means of bringing out the flavor of each food was found to be through the use of shoyu."

5657. Stanton, W.R. 1969. Some domesticated lower plants in South-east Asian food technology. In: Peter J. Ucko and G.W. Dimbleby, eds. 1969. The Domestication and Exploitation of Plants and Animals. Chicago: Aldine Pub. Co. xxvi + 581 p. See p. 463-690. Proceedings of a meeting... held at the Institute of Archaeology, London University. Illust. 26 cm. [10 ref]
• ***Summary:*** In this paper, "lower plants" refers to microorganisms and algae. These cultivated microorganisms include marine and lacustrine algae (nori, kombu), fungi (Aspergillus, Rhizopus species), yeasts (Saccharomyces species) and bacteria (Lactobacillus, etc.). In Indonesia, tempeh (cakes made by fermenting soybeans) and fermented groundnuts "provide about one-third of the total crude protein requirement the population..." (p. 464). A complex fermentation is used to make miso, a fermented soybean paste, in Japan; a number of different microorganisms take part at different stages. Some 75% of the households in Japan use miso daily as the main soup seasoning–according to a recent survey.

"The Japanese products represent a northward and eastward migration of the 'sho' process (a general term in Japan for the high salt fermentations). Today these fermentations are carried out under highly industrialized conditions, the organisms being given the benefit of highly specialized environments, and the domestication in consequence has proceeded here further than it has elsewhere in the region" (p. 467). Address: Tropical Products Inst., London.

5658. Steinberg, Raphael. 1969. The cooking of Japan. New York, NY: Time-Life Books. 208 p. Illust. General index. Recipe index (English). Recipe index (Japanese). 28 cm.
• ***Summary:*** A superb, elegant book, that (with its spiral-bound companion volume of recipes) captures in both words and photos (by Eliot Elisfon) the true spirit of Japanese food and cookery. Contents: Introduction: Solving the mysteries of Japan's marvelous cuisine, by Faubion Bowers. 1. The heritage of a remarkable past. 2. Foods to suit the seasons. 3. The logic of Japanese cookery. 4. The world's greatest seafood. 5. Simple, satisfying foods of home. 6. A ceremony that sired a cuisine (*kaiseki* or tea ceremony cooking, with roots in 13th century Zen Buddhism). 7. Eating out as a way of life. 8. Magnificent meals in elegant settings.

Soy-related: The writer of the introduction snacked on odorous, fermented soy beans (*natto*) at night before retiring (p. 6). His son said to him recently, "Please, Dad. Not *tofu* again!" (p. 7). Importance of the soybean (p. 16-17; China has had a huge impact on Japanese culture. "Perhaps the most important food innovation contributed by China was the soybean, which is various disguises is still the foundation stone of Japanese cooking"). Shoyu is the Japanese word for soy sauce (p. 26). Tofu (soybean curd), which is cooked with other foods throughout most of the year, becomes a dish in its own right during the summer, served on ice and flavored

© Copyright Soyinfo Center 2014

with soy sauce (as *hiyayakko,* p. 32). Photos of tofu, shoyu, green soybeans [*edamamé*] and akadashi miso in prepared festival dishes (p. 34-35). *Matsutake* mushrooms with tofu or shoyu. "The most important lesson to be learned deals with the ubiquitous role of the soybean. Generally considered by Westerners to be the most humble of vegetables, the soybean is in fact the king of the Japanese kitchen. One might almost say that Japanese cuisine is built upon a tripod of soybean products: *miso,* a fermented soybean paste; *tofu,* a custardlike soybean cake; and soy sauce, used both to season foods as they are being cooked and to make dipping mixtures that enhance the flavors of the foods as they are being eaten." Details about these three products and their uses is then given (p. 41-42). Teriyaki or "shining broil" (p. 43). Two-page color photo shows (p. 44-45): Azuki beans and *kuromame* (black soybeans), sesame seeds, sesame oil, *fu* (wheat gluten croutons), *aonoriko* (powdered green seaweed), Kikkoman shoyu, *aka miso, shiro miso, tofu,* nori and wakame.

Ponzu, a dipping sauce which is half soy sauce and half lemon or lime juice (p. 46). Sukiyaki (p. 46). Tempura (p. 49). *Aemono* and *sunomono* with tofu, miso, or soy sauce (p. 48). Photo of a tofu-slicing knife with a serrated blade (p. 50). Recipes: Clear soup with tofu and shrimp (*Sumashi wan,* p. 55). Miso soup with red and white miso (p. 56-57, 59). Miso-flavored pork and vegetable stew (*Satsuma-jiru,* p. 61). Soy and sesame-seed dressing with string beans (*Goma joyu-ae,* with "½ cup white sesame seeds, toasted and ground to a paste," p. 62). Tofu and sesame-seed dressing with vegetables (*Shira-ae,* p. 63; "Add the sesame seeds..., warm them until lightly toasted. Grind them to a paste in a *suribachi* {serrated mixing bowl} or, more easily, pulverize them at high speed in an electric blender with 1/8 teaspoon of soy sauce. Transfer the sesame-seed paste to a mixing bowl...)."

Two color photos show: (1) Toasted sesame seeds in a *suribachi* with a wooden pestle. (2) When ground, they "quickly release their oil and turn into a paste." White miso dressing (*Neri shiro miso,* p. 67). Photo of *zensai,* incl. miso-marinated asparagus, and abalone cooked in soy sauce (p. 72). Sashimi dipped in soy sauce (p. 81-83, 90-91).

Undersea vegetables: nori, kombu, wakame, hijiki (p. 88-89). Recipes: Sushi (p. 95-101). Tempura (p. 103). Mirin and soy dipping sauce for tempura and noodles (*Soba tsuyu,* p. 104). Deep-fried tofu in soy-seasoned sauce (*Agedashi,* p. 105).

Tofu is the Japanese word for soybean curd (p. 108). Umeboshi (p. 109). Miso soup (p. 109-10). Natto and miso (p. 115). Tofu and shoyu in *yudofu* (p. 116). Sekihan and azuki (red beans, p. 120). *Mame* ("beans") are served at traditional wedding feasts; the word also means good health. Mochi (p. 121). Recipes: Sekihan (p. 126). Fox noodles with deep-fried tofu (*Kitsune udon,* p. 127). Bubbling tofu (*Yudofu,* p. 132-33). *Sukiyaki* (p. 134, with tofu and soy sauce). *Shabu shabu* (with tofu, p. 135).

Tofu and miso in *kaiseki* cuisine based on Zen Buddhism and the tea ceremony (p. 146-49). Teriyaki, mirin, ponzu, tofu (p. 152). Tofu and shoyu (p. 159). Sasanoyuki restaurant in Tokyo (uses tofu as a main ingredient in every dish, p. 160-61). Sukiyaki, with tofu and soy sauce (photo, p. 166-67). Broiled mackerel in miso marinade (*Miso zuke,* p. 169). Dengaku tofu (p. 172-73, with color photo). Beef teriyaki (with shoyu, p. 174-75). Yakitori (with teriyaki sauce, p. 174-75). Grilled chicken with sweet soy-seasoned glaze (*Tori teriyaki,* p. 176). Black soybeans and tofu (p. 188). At a geisha house, shoyu is called *murasaki* ("the purple").

A guide to Japanese ingredients (glossary): Incl. aji-no-moto, aonoriko, azuki, fu, goma, goma-abura, hichimi (shichimi) togarashi, kombu, konnyaku, mirin, miso, MSG, nori, shoyu, soba, tofu, umeboshi, wakame, wasabi.

Note: The spiral-bound recipe book accompanying this volume contains the recipes in the parent volume and no new information; the binding makes it easier to use in the kitchen. Address: USA.

• ***Summary:*** On the cover is the silhouette of three heads of grain on the plant, by a Japanese crest. Prices are given for each item. The company sells the following types of foods:

© Copyright Soyinfo Center 2014

1. Grains: Brown rice (short grain Kokuho Rose grown by Koda Brothers, in 2 lb, 5 lb., 10 lb., 25 lb., 50 lb., or 100 lb. quantities). Sweet brown rice (Koda Bros.; it is more glutinous than brown rice, in the same 6 quantities). Note: No claim is made, anywhere in the catalog, that this rice is organic, or unsprayed, or "natural" or anything other than regular brown rice.

2. Beans: Azuki beans (imported from Hokkaido), Black beans ("Kuromame, a black soy bean import"), Chickpeas (Garbanzo, imported from southern Europe).

3. Sea vegetables: Dulse (From Grand Manan Island, Canada), hiziki, kombu, nori (dried laver), wakame (the latter 4 imported from Japan).

4. Soy Bean Products: Soy sauce (Aged naturally in wooden kegs at least 18 months; 16 oz for $1.20, 32 oz for $2.25, ½ gallon for $4.25, 1 gallon for $8.00, 4.75 gallon keg {21.13 liters} for $30.00). Hacho miso ("Soybean puree made from soybeans, salt & water. No chemicals used in fermentation. Aged at least 18 months"; 1 lb for $1.20, 2 lb, 4 lb, 44 lb keg for $36.00). Mugi miso ("Soybean puree. A lighter miso made with barley"; 1 lb, 2 lb, 44 lb keg). Moromi ("A thick sauce removed from the bottom of the soy sauce kegs after fermentation. Its uses are unlimited in soups & sauces"; 7 oz for $1.20.). Seitan ("Wheat and soy sauce cooked together for a long time. When used in soups or sauteed in vegetables it has a taste much like beef"; 3½ oz for $1.20). Note 1. This is the earliest document seen (July 2005) that mentions seitan and clearly understands what it is.

5. Condiments: *Furikake* ("A tangy sesame condiment made from Miso, sesame seeds, soy flour, nori and bonita [sic, bonito] flakes"; 3½ oz.), Daikon pickle, Sesame miso ("A hearty condiment for use on rice and other grains. Made from miso and unhulled sesame seeds"; 3½ oz). Tekka ("A strong dark condiment; famous for its medicinal qualities. Made from carrots, burdock, lotus, ginger, sesame oil, and miso"; 3½ oz), Sesame seeds, Sesame tahini.

6. Sea salt: Grey unrefined (from the Mediterranean Sea, unwashed and unground), White unrefined. 7. Oils: Corn germ oil (unrefined, pressed. No solvents, chemicals, or preservatives), Sesame oil. 8. Noodles: Ito soba, Kame soba, Udon. 9. Beverages: Kukicha, Kohren (Lotus root powder), Mu beverage (made from 16 different herbs), Yannoh (coffee-like drink made from grains and beans).

10. Miscellaneous: Dentie toothpowder (made from eggplant and salt), Kuzu arrowroot, Umeboshi & chiso [shiso, shisonoha, or beefsteak leaves], Umeboshi ("Salt plums aged in wooden kegs for at least 3 years").

11. Cookbooks (written in America): *Cooking Good Food,* and *Cooking with Grains and Vegetables.*

The majority of the above products are imported, mostly from Japan.

The inside front cover states: "Due to the growth of our business and our belief that good quality food should be available at low cost, we have eliminated many items from our wholesale list. We have eliminated most grains because excellent quality grains are available from many sources at more reasonable prices than we are able to charge. Two excellent sources for grains are Arrowhead Mills, Box 866, Hereford, Texas, and Pioneer Specialty Foods, Box 427, Fargo, North Dakota. Also eliminated from our wholesale list is Chico-San products. For these please write directly to Chico-San, 1262 Humboldt Ave., Chico, California, or contact any health food distributor."

Note 2. The products in this catalog do not require refrigeration; they contain no refined sugar / white sugar, no meat, and no dairy products–just like the catalogs of almost all subsequent natural food distributors during the 1970s and 1980s.

Note 3. This is the earliest existing Erewhon catalog seen (March 2011), and the earliest document seen (March 2011) concerning Erewhon and soy.

Note 4. This is the earliest document seen (March 2006) that mentions Arrowhead Mills, of Hereford, Texas. Address: 342 Newbury Street, Boston, Massachusetts 02115. Phone: 617-262-3420.

5664. Claiborne, Craig. 1970. East meets West. *New York Times.* Jan. 4. p. 196.

• ***Summary:*** The Japanese dish named shabu-shabu "is sometimes called oriental fondue in this country." The Japanese word is "onomatopoeic; it imitates the sound of chopsticks as they swirl the broth." It is served as a communal dish at Saito (131 West 52nd St.) one of New York's best Japanese restaurants.

The recipe for Shabu-shabu calls for "2 pieces tofu (bean curd), cut into 4 pieces (eight pieces in all)." There are also recipes for Ponzu, Gomatare [Gomadare], and Dashi. In the first two of these, "soy sauce" is a key ingredient. In all three call for the use of "ajinomoto (monosodium glutamate), optional," up to 1 tablespoon in the Gomatare recipe!

5677. Kaikoo: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1970.
• ***Summary:*** Sources: Gilbert, James C.; Chinn, J.T.; Tanaka, J.S. 1970. "Four new tropical vegetable-type soybeans with root-knot nematode resistance." *Hawaii Agric. Exp. Station, Research Report.* No. 178. 7 p. [Feb.]. See p. 7. "White flowered, year-round adaptability in Hawaii, 'Kaikoo' produces plants that are taller in the summer with medium maturity (65 days to fresh market harvest). It is root-knot resistant and vigorous with pods held off the ground to allow machine harvesting. 'Kaikoo' performs well in a variety of soil types." Note: No dry-seed color is given.

Barnes, W.C. ed. 1970. "New vegetable varieties list XVII: Soybeans, edible." *HortScience* 5(3):146-49. June. New varieties of edible soybeans are Kahala, Kaikoo, Kailua, and Mokapu Summer. All were released in 1969 by the University of Hawaii Agric. Exp. Station in Honolulu, and all have resistance to root-knot nematode. For details, see Hawaii Agric. Exp. Station, Research Report 178. Address: USA.

5678. Kailua: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1970.
• ***Summary:*** Sources: Gilbert, James C.; Chinn, J.T.; Tanaka, J.S. 1970. "Four new tropical vegetable-type soybeans with root-knot nematode resistance." *Hawaii Agric. Exp. Station, Research Report.* No. 178. 7 p. [Feb.]. See p. 7. "A good year-round performer in Hawaii, with white flowers and dark green foliage, 'Kailua' requires about 68 days for fresh market harvest. Resistant to root-knot, it is not recommended for machine harvest because seed pods start near the ground level. The pods are comparatively easy to strip from plants when green. Both 'Kailua' and 'Mokapu Summer' bear the pods closer together than 'Kaikoo' and 'Kahala' varieties." Note: No dry-seed color is given.

Barnes, W.C. ed. 1970. "New vegetable varieties list XVII: Soybeans, edible." *HortScience* 5(3):146-49. June. New varieties of edible soybeans are Kahala, Kaikoo, Kailua, and Mokapu Summer. All were released in 1969 by the University of Hawaii Agric. Exp. Station in Honolulu, and all have resistance to root-knot nematode. For details, see Hawaii Agric. Exp. Station, Research Report 178. Address: USA.

5679. Mokapu Summer: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1970.
• ***Summary:*** Sources: Gilbert, James C.; Chinn, J.T.; Tanaka, J.S. 1970. "Four new tropical vegetable-type soybeans with root-knot nematode resistance." *Hawaii Agric. Exp. Station, Research Report.* No. 178. 7 p. [Feb.]. See p. 7. "Mokapu Summer (B-C-281-2-2): A fairly compact plant resembling 'Bansei' in most characters, including purple flowers, but with root-knot nematode resistance. In pod maturity it is about 8 days later. Like 'Bansei,' it will be short if planted in November or December, but should not be subject to the root rotting troubles which often cause complete failure of 'Bansei' plantings here. 'Mokapu Summer' is shorter than the others on this list but has large seed and pod size. It should be planted for March to August only (daylength 12-13 hours). 'Mokapu Summer' requires about 68 days to reach fresh market harvest at Waimanalo Farm in July."

Barnes, W.C. ed. 1970. "New vegetable varieties list XVII: Soybeans, edible." *HortScience* 5(3):146-49. June. New varieties of edible soybeans are Kahala, Kaikoo, Kailua, and Mokapu Summer. All were released in 1969 by the University of Hawaii Agric. Exp. Station in Honolulu, and all have resistance to root-knot nematode. For details, see Hawaii Agric. Exp. Station, Research Report 178. Address: USA.

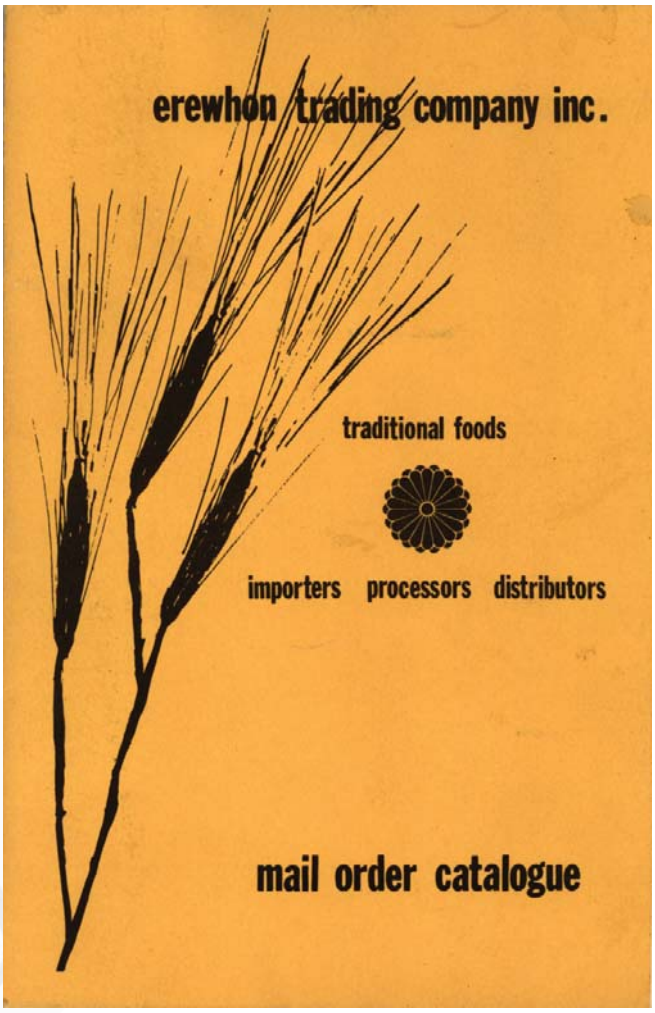
5683. Erewhon Trading Co., Inc. 1970. Traditional foods: Importers, processors, distributors. Mail order catalogue. Boston, Massachusetts. 16 p. March 1. [2 ref]
• ***Summary:*** On the orange cover is the silhouette of three heads of grain on the plant, by a Japanese crest. The company sells the following types of foods: 1. Whole grains: Brown rice (short grain grown by Koda Brothers, in 6 weights from 2 lb. to 100 lb). "Not strictly organic, but the finest available in the U.S. today."

Note: The previous sentence, starting with "Not strictly organic" is deceptive and misleading. According to "Erewhon, A Biography," by Paul Hawken (*East West Journal,* Aug. 1973, p. 13) the short-grain brown rice being sold by Erewhon at this time was grown by the Lundberg brothers (Wehah Farm, Richvale, California) and harvested in the fall of 1969. But this rice was the result of a secret deal, so Koda Brothers is listed in the Catalog as the grower. According to the Koda website, Koda first started to convert some fields to organic in 2004. Moreover, this rice was not "the finest available in the U.S. today." The only organically grown brown rice in the USA in March 1970 was grown by the Lundberg Brothers (Wehah Farms) in Richvale, California. 1969 was the first year they had grown rice organically, and they grew 78 acres under contract with Chico-San, who agreed to buy all the brown rice grown on



that acreage in exchange for the exclusive right to sell that rice. Chico-San sold half the rice in advance and had no trouble selling all of it. But they refused to sell any of the rice to Erewhon. In 1970 Lundberg expanded their exclusive organic brown rice acreage to 200 acres; that rice was harvested in the fall of 1971.

Sweet brown rice (also grown by Koda Bros.), buckwheat groats (Kasha, from Pocono Mts. in Pennsylvania), wheat berries (organically grown in the Golden Valley of North Dakota), millet (organically grown), barley, yellow and white corn (organically grown in Deaf Smith County, Texas), oats, rye (organically grown in Deaf Smith County, Texas). Table of prices for different weights. 2. Fresh stone ground flours. 3. Cereals, made from whole grains and milled in a manner to allow quick cooking, incl. Kokoh (which can be used as a milk substitute or prepared as a cereal for children). 3. Noodles (udon, soba, and shonai fu–wheat gluten cakes). 4. Beans: Azuki beans ("The King of Beans... Organically grown on the island of Hokkaido, Japan), black beans (a sweet black soybean imported from Japan. Organically grown), chickpeas, soybeans ("Organically grown in Pennsylvania. A food high in protein,

© Copyright Soyinfo Center 2014

vitamins and minerals. Should be soaked many hours before cooking. Particularly good if cooked with Kombu"), pinto beans, whole green lentils, red split lentils. Table of prices for different weights.

5. Sea vegetables: Nori (dried laver), kombu, wakame, hiziki, agar-agar. 6. Dried fish and vegetables: Bonita [sic, Bonito] flakes, chirimen iriko, daikon pickle, gourd strips (dried), daikon (dried radish). 6. Order form. 7. Beverages: Kukicha, mu herbal beverage, yannoh, lotus root powder, mugicha (barley tea), peppermint tea.

8. Soybean Products (imported from Japan): Soy sauce ("aged for at least 18 months"; 16 oz, 32 oz, ½ gallon, 1 gallon, 4.75 gallon keg). Mugi miso–Soybean puree ("Made by a special enzymatic process, this Miso is aged for 18 months. It is made from soybeans, barley, water and salt. It is ideal for making soups and sauces and blends well with tahini to make a spread for bread." 1 lb, 2 lb, 4 lb, 44 lb keg). Hacho miso–Soybean puree ("A darker, stronger miso than Mugi Miso..."). Moromi ("A thick sauce removed from the bottom of the Soy Sauce kegs after fermentation. Its uses are unlimited in soups & sauces"; 7 oz.). Seitan ("A concentrated protein source made from wheat and soy sauce. When used in soups or sauteed in vegetables, it has a taste much like beef"; 3½ oz.).

9. Condiments: *Furikake,* kuzu arrowroot, tekka, umeboshi, sesame butter, Erewhon sesame tahini, sesame salt, white sea salt, grey sea salt. 10. Oils: Refined corn oil, corn germ oil, sesame oil. 11. Sundries: Sesame seeds, sunflower seeds, pumpkin seeds, popcorn, raisins (Thompsons), dried apricots, wheat germ (raw), apple butter, whole dried chestnuts. 12. Toilet articles: Dentie (tooth powder made from eggplant and salt), Aditi sesame shampoo, Orgene [Orjene] herbal shampoo, Fu-nori (seaweed shampoo), sesame coconut soap, vege oat soap.

13. Kitchen and tableware: Cookbooks: *Zen Cookery, Cooking with Grains and Vegetables, Cooking Good Food, Zen Macrobiotic Cooking.* Tableware: Rice paddles (bamboo), soy sauce dispenser, oil skimmer, bamboo tea strainer, vegetable press, vegetable brush, bamboo chopsticks (Japanese), chopsticks (Chinese), MAC knife (vegetable), vegetable knife, fish knife, grater, suribachi (3 sizes), Corona hand grinding flour mill ($10.95).

On the inside rear cover is a United Parcel Service rate chart. Address: 342 Newbury Street, Boston, Massachusetts 02115. Phone: 617-262-3420.

5684. American Soybean Association. 1970. Soybean Digest Blue Book Issue. Hudson, Iowa: American Soybean Assoc. 176 p. March. Index. Index of advertisers. 22 cm.
• ***Summary:*** Starting on page 54 is a section titled "Charting the course of soybean trade," which states: "Steadily bigger harvests, strong foreign demand, and aggressive market development have combined to make soybeans the leading U.S. crop as a dollar earner in foreign markets. We exported over $1.1 billion worth of soybeans and soybean products in 1967-68, and our share of world exports has risen from 2% in 1934-38 to about 90%. Output from about 2 out of every 5 harvested soybean acres goes abroad as beans or products. See the following pages."

On the top half of p. 55 is a bar chart titled "U.S. soybean exports as a share (percentage) of total U.S. agricultural exports. The percentage increased from about 1½% in 1948 to about 17½% in 1968.

On the bottom half of page 55 is a graph titled "Trend of U.S. soybean exports, 1944-68. It starts at zero in 1944-48 and increases to just over 250 million bushels in 1968. Since 1964 it has been growing more rapidly that previously.

On the top half of p. 56 is a bar chart titled "State shares of U.S. soybean exports," which shows the dollar value of exports from 10 leading states in 1954 and 1968. The states, in descending order of 1968 exports are Illinois, Iowa, Arkansas, Missouri, Indiana, Minnesota, Mississippi, Ohio, Louisiana, and North Carolina.

On the bottom half of p. 55 is a bar chart titled "Ten leading U.S. soybean export markets, 1968," with the amount of soybeans exported to each market in million bushels. The countries in descending order are Japan, Netherlands, West Germany, Spain, Canada, Denmark, Italy, Taiwan, Israel, and Belgium-Luxembourg. Address: Hudson, Iowa.

Society of Japan. Part I. Introduction. 1. The knowledge of the Japanese fauna in western Europe before 1820: General remarks, Englebert Kaempfer (1651-1716, German), Carl Peter Thunberg (1743-1828, Swedish), the last period. 2. Philipp Franz von Siebold and Heinrich Bürger: Philipp Franz von Siebold (1796-1866, German; youth, voyage to and stay in Java {1822-23}, First visit to Japan {1823-29}, Europe and second visit to Japan {1930-1866}), Heinrich Bürger (ca. 1806-1858), Japanese biologists closely in contact with Von Siebold. 3. Von Siebold's and Bürger's contributions to Japanese zoology: Von Siebold's zoological publications, Von Siebold's and Bürger's collections, Siebold's journey to Edo and his zoological collections. 4. Von Siebold's *Fauna Japonica:* General, mammalia, aves, reptilia, pisces, crustacea, Temminck's "Discours préliminaire," the Tokyo reprint edition of the *Fauna Japonica,* 1934. 5. Revision of the systematic names of Crustacea in Siebold's *Fauna Japonica.* 6. The plates of marine animals made by Kawahara Keiga (1786-18?) for Von Siebold and Bürger. References. Plates (I-XXXII). Part II (in Japanese).

On unnumbered pages of front matter are: (1) Von Siebold's color portrait at age 28 by Kawahara Keiga. Color photo of spines of volumes 104 (1833-1850) first edition of *Fauna Japonica,* by Von Siebold. (2) Black-and white portrait of Von Siebold at age 39 by Joseph Schmeller. Portrait of Von Siebold standing with his servant by Kawara Keiga. Von Siebold's signature dating from 31 July 1830. (3) Map (2 page spread) of Japan showing route from Nagasaki to Edo of members of the Dutch Trading Post (15 Feb. 1826 to 7 July 1826).

Chapter 1, "The knowledge of the Japanese fauna in western Europe before 1820" is extremely interesting, and contains detailed biographies of Kaempfer (p. 9-16), Thunberg (p. 16-20), Von Siebold (p. 23-36), and Bürger (p. 37-42). Kaempfer was in Japan for two years, 1690 Sept. 25 to 1692 Oct. 31; he twice accompanied the journey to the court of the Shogun in Tokyo (13 Feb. to 7 May 1691 and 2 March to 21 May 1692). Thunberg went to the University of Uppsala and became a pupil of Linnaeus. In 1770 he obtained his doctor's degree and his teachers had great expectations of him. He was in Japan for only one year, 1775 Aug. 13 to 1776 Dec. 3; he joined the yearly visit to the Shogun's court in Tokyo (4 April to 25 June 1776). Von Siebold was in Japan for six years, 1823 Aug. 12 to 1829 Dec. 30; he once joined the delegation to the shogun's court, 15 Feb. 1826 to 7 July 1826. All three were primarily physicians and therefore very good botanists; each published extensive and detailed accounts of his experiences in Japan. Address: 1. Rijksmuseum van Natuurlijke Historie at Leiden, Netherlands; 2. Formerly of Yokohama National Univ., Japan.

5688. Li, Hui-lin. 1970. The origin of cultivated plants in Southeast Asia. *Economic Botany* 24(1):3-19. March. [40 ref]

• ***Summary:*** "Cultivated plants represent man's most important heritage, and we cannot afford to lose sight of this fact even in an age of great and rapid technological advancement... The beginning of scientific studies on origins of cultivated plants stems from the work of Alphonso de Candolle, specifically from his *Géographie botanique raisonée* (1855). The latest botanical methods were employed and correlated with evidence from archaeology, history, and linguistics. The cultivated plants were treated only as a chapter in a work on the distribution of plants as a whole... This chapter was later revised and greatly expanded into his *L'origines des plantes cultivées* (1882), a standard classical treatise on this subject even today...

"At about the same time, Mendel was using cultivated plants in his experimental studies of the nature of variation. His *Versuche über Pflanzen-Hybriden* (1865) lay unnoticed by the scientific world until 1900, when its rediscovery sparked the science of genetics... It was, however, not until Vavilov that genetics was consistently and systematically applied to the elucidation of problems on the origins of cultivated plants. Vavilov's *Studies on the Origin of Cultivated Plants* (1926) has exerted a great influence on later workers. He refined and brought up to date the botanical methods of de Candolle, while the newer approaches of genetics and cytogenetics were introduced and correlated with the older methods." Following continual revision, Vavilov's final scheme indicates 8 world centers of the origin of cultivated plants (including China) and 3 supplemental centers. But while Vavilov was most familiar with Europe, western Asia, and South America, "he seems to have been relatively unfamiliar with eastern Asia. His 'Chinese center' embodies the whole of China from northern cold-temperate regions all the way to the subtropical south."

The author proposes four horizontal belts of origin of cultivated plants in South-East Asia. The Northern China Belt, which includes the Yellow River Valley and the southern part of northeastern China (Manchuria) is the famous loess region, and the place of birth and early development of Chinese civilization. Though the loess soil is especially suitable for the development of agriculture, the climate of this belt is the most severe, the "precipitation is the least and the most unevenly distributed, and it has the fewest types of plants. However the cultural level of the people here is developed to a higher degree, and its system of agriculture is also the most complete. This situation seems to agree with Toynbee's theory that civilization develops as a result of a challenge." One of the cereal crops that originated in this belt is millet, *Panicum miliaceum,* the most important cereal in earliest times. Foxtail millet, *Setaria italica,* also appeared in this belt at an early date. Both were widely cultivated in Neolithic times.

"From ancient to present times, the chief legume crop

© Copyright Soyinfo Center 2014

of northern China has been the soybean, *Glycine max.* It was called in ancient times, *Shu,* and it is now generally called *Ta Tou* (Great Bean)... Today, it is the most wide spread and the most diversely utilized crop in all China...

"The cultivation and utilization of the soybean in ancient China also greatly affected the development of agriculture. The ancient peoples are known to have been at first ignorant of the use of fertilizers, but eventually discovered that the cultivation of soybeans increased the productivity of the soil. Thus the soybean is responsible for the development of crop rotation and the application of fertilizers. Among all the legume crops, the soybean has the most complete protein complex, approaching most nearly that of animal protein. Thus, in human nutrition it can completely replace animal food. The relatively small development of animal husbandry and fishery in northern China could be the effect of the use of soybean...

"The soybean is also the most important edible oil crop in China. The ancient people, because of their limited knowledge and technology, did not know how to extract oil from seeds...

"In ancient times the tender leaves of the soybean, called *Huo,* were also used as a leafy vegetable." Legumes and oil crops are more important in the north than in the south of China. When man domesticates plants and animals, he himself becomes domesticated and civilization begins.

Although the flora of the Japanese Archipelago is fairly rich, no important cultivated crops originated there; all were introduced from outside. Address: Morris Arboretum, Univ. of Pennsylvania, Philadelphia.

5689. Meals for Millions Foundation. 1970. Annual report 1969. Santa Monica, California: MFM Foundation. 9 p. Typed with signature on letterhead.
• ***Summary:*** Submitted by I.F. Saunders, Executive Director. MFM's logo (in the upper left on the title page) shows two hands gripping the handle of a horizontal spoon, with its mouth to the right facing upward–in white on a black background. Note: This is the earliest document seen (Dec. 2010) on which this logo appears.

Contents: In Memoriam: Three great friends of the Foundation passed away in 1969: "Our Founder, Clifford E, Clinton, a giant among men; Florence Rose, the first Executive Director, beloved around the world; and Don Belding, a much-revered and long-time member of the Board of Directors.

"Their loss is felt deeply by each of us."

Summary of annual report. MFM board and staff (In March of 1969, at the Semi-Annual Meeting of the Board of Directors, in accordance with the By-Laws of this Foundation," Dr. Morris Asimow was re-elected chairman of the board and Mr. Russell Eller, was re-elected president...)

"Key loss to the staff was: Mark Sterner, who now lives in Korea, but who continues to help us through his work with Korea High Protein Foods, Inc." Meals for Millions training school (administrated by Eva Kadiev). Research and development (enriched noodles, peanut meal concentrate, crystalline protein). United States projects: California, Texas, Connecticut, South Carolina, American Indians. Overseas Projects: Korea, Ecuador, Japan, Taiwan, Hong Kong, Thailand, India, Pakistan, Iran, Vietnam, Brazil, Mexico, Chile. Women's Clubs. Public relations. Remarks.

Note 1. No financial information is given, nor information on shipments of MPF for the year.

Note 2. A photo (on the Web, Dec. 2010) shows Clifford E. Clinton's signature on his grave marker at Forest Lawn Memorial Park (Glendale, California). Plot: Kindly Light section, Lot 311, Interment Space 6. The grave site is on a grassy hillside. Address: 1800 Olympic Boulevard (P.O. Box 1666), Santa Monica, California. Phone: 870-0451.

5694. Okuhara, Akira; Saito, Nobuo. 1970. Color of soy sauce. IV. Decolorization and depression of browning by reduction. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 48(3):190-201. March. [8 ref. Eng]
• ***Summary:*** The browning of apples and apple sauce is well known in the west. This report describes the decolorization of the browning pigment and the depression of browning. The browning pigment of soy sauce and concentrated apple juice were found to be reduced using metals such as zinc, aluminum, iron, tin (Sn = stannum), sodium, and magnesium, and by electrolysis, to colorless substances.

"The browning pigments of some liquid foods were also reduced electrolytically to colorless substances." Address: Central Research Inst., Kikkoman Soy Sauce Co. Ltd., 399 Noda, Chiba prefecture, Japan.

5695. Okuhara, Akira; Saito, Nobuo. 1970. Color of soy sauce. III. Effect of reducing agents on browning of soy sauce. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 48(3):177-89. March. [11 ref. Eng]
• ***Summary:*** Non-oxidative browning (browning in the absence of oxygen) is depressed by reduction. That is, soy sauce which is kept under reductive conditions by favorable fermentation during the mash process turns brown only slowly. Address: Central Research Inst., Kikkoman Soy Sauce Co. Ltd., Noda, Chiba-ken, Japan.

5696. **Product Name:** [Vegetein {Soy Protein}].
Foreign Name: Vegetein.
Manufacturer's Name: Yoshiwara Oil Co. Ltd.
Manufacturer's Address: Osaka Building, Uchisaiwai-cho 2-1, Chiyoda-ku, Tokyo, Japan.
Date of Introduction: 1970 March.
New Product–Documentation: *Soybean Digest Blue Book.* 1970. p. 108.

5697. Okuhara, Akira; Tanaka, T.; Saito, N.; Yokotsuka, T. 1970. [Color of soy sauce. V. Application of multiple correlation analysis to analysis of browning mechanism]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 48(4):228-36. April. [6 ref. Jap; eng]

5699. Ives, Bill. 1970. Traveling gourmet finds sukiyaki. *Washington Post, Times Herald.* May 7. p. C14.
• ***Summary:*** The ingredients in the recipe for Sukiyaki include "1 block tofu (bean curd) cut into one-inch cubes, optional," "1 cup soya sauce," and "1 teaspoon monosodium glutamate."

5700. Ives, Bill. 1970. Japanese housewife's burden–leaping inflation. *Christian Science Monitor.* May 29. p. 1.
• ***Summary:*** A large graph of consumer price indices for various countries, from 1963 to 1969, shows that inflation in Japan is growing the fastest (up 35% from 1963), whereas in West Germany and the United States it is growing the slowest (up 10-12% since 1963).

When the writer went shopping with Mrs. Masako Mogi in Tokyo he saw firsthand how fast the price of everything from baths to soups was rising. "In the supermarket she picked up a square of spongy tofu (Japanese bean curd) for 18 yen. She'd prefer [traditional] handmade tofu, rather than the mass-produced kind, but its almost double the price. Then came two strips of dried and fried tofu called age (pronounced ah-gay),..." Address: Tokyo–Staff correspondent for the Monitor.

5701. Arai, S.; Yamashita, M.; Kato, H.; Fujimaki, M. 1970. Applying proteolytic enzymes on soybean. V. A nondialyzable bitter peptide in peptic hydrolyzate of soybean protein and its bitterness in relation to the chemical structure. *Agricultural and Biological Chemistry* 34(5):729-38. May. [27 ref]
• ***Summary:*** The cold-insoluble fraction of soy protein was hydrolyzed with pepsin under usual conditions and the hydrolyzate was dialyzed. Hydrolysis of the bitter peptide with pepsin lessened its bitterness. Address: Dep. of Agricultural Chemistry, Univ. of Tokyo, Tokyo, Japan.

5702. Ball, Charles E. 1970. How promotion is selling your soybeans. *Farm Journal* 94(5):38-39, 76. May.
• ***Summary:*** Discusses soybean promotion and sales in Japan. Each dollar an American farmer contributes for increasing soybean sales in Japan is matched with $15 from other sources–mainly the U.S. Foreign Agricultural Service and Japanese cooperators. Address: Southern Field Staff.

5703. Hirano, Kiyoshi. 1970. Japan's outlook for soybean crushing. *Soybean Digest.* May. p. 41-42.
• ***Summary:*** Contents: The general situation. Present situation: Demand for fats and oils products, processing of raw material and the supply of finished products, the present situation in oil. Future outlook: Demand, future prospects.

"Trade and capital liberation has been an important subject confronting the economic circles in Japan. As to the processing of oil (crushing), the Japanese government has tentatively decided that capital liberalization will take place beginning in the fall of 1970 and trade liberalization by the end of 1971.

© Copyright Soyinfo Center 2014

"In order to adjust to this situation, the oil crushers of Japan petitioned to the government to lift the tariff levied on soybeans, rapeseed, etc. and to discontinue the 'import allocation system' that is presently applied to rapeseeds. At the same time, earnest efforts to reorganize their company structure have been underway so that they may have the strength to live through the keen international competition. Further, crushers have exercised every effort to modernize their methods of manufacture as well as equipment and facilities.

In 1962, Nisshin Oil Mill constructed a large-size plant on the coast in Isogo, Yokohama. In 1966, Hohnen Oil and Yoshiwara inaugurated a joint venture–a company called Japan Soya and established their plant in Kobe. Showa Sangyo also constructed a large-size plant in Kobe adjacent to Japan Soya. Then, in the fall of 1969, through the investment of Ajinomoto, a new company named Toyo Seiyu was inaugurated on the reclaimed land of Chiba.

"All of these plants are handling soybeans as their main material and can process 1,000 to 1,500 metric tons per day. These plants are comparable to any in the world, both in scale and modern techniques. As to the older plants, steady progress is being made to modernize their operations.

"Taking all this into consideration, it is believed that Japan now ranks as the No. 2 oil-crushing country in the Free World, next to the U.S.

"As we all know, fats and oils are very scarce in Japan. To supplement the rice and a small amount of rapeseed produced at home, Japan needs to import soybeans from the U.S. and various other raw materials from other countries. Due to the present allocation system on imported rapeseed and with the liberalization of rapeseed near at hand, the approximately 150 small factories that have the capability of crushing 10 to 15 metric tons a day are being compelled either to go into some other business or quit entirely. It is, therefore, predicted that a tremendous change will take place within the oilseed crushing industry of Japan in a matter of 1 to 2 years."

A small portrait photo shows Kiyoshi Hirano. Address: President, Japanese Oilseed Processors Assoc., Vice President, Showa Sangyo Co. Ltd.

5706. Sera, Karl H.G. 1970. Role of soybean meal in the Japanese feed industry. *Soybean Digest.* May. p. 44-45, 47-48.
• ***Summary:*** Contents: Introduction. Imports. Domestic production and land reclamation. Most feeds are formula feeds. Trend to modern farms. Much educational work needed.

Tables: (1) Number of livestock and poultry in Japan (millions) in 1969 and 1980. Shows layers (225 million in 1980; #1), broilers, swine, dairy cattle, and beef cattle.

(2) Formula feed production in Japan in 1969 and 1980. And Levels of soybean meal in that feed.

(3) Annual per capital food consumption (lbs) in the USA and Japan. Shows carbohydrates (130 vs. 300), meat (225 vs. 18), eggs, fish (10 vs. 70), milk and dairy products (550 vs. 100), oil (50 vs. 20).

(4) Daily per capital food consumption the USA and Japan. Shows calories (3,000 vs. 2,300), protein (92 vs. 70 gm), animal protein (65 gm vs. 25 gm), Engel's number (total expenditure on food divided by total disposable income x 100) (18 vs. 34), percentage of carbohydrates (24% vs. 64%).

(5) Five commonly used protein sources for feed and their prices in Japan: The sources are: Soybean meal 44% protein. Soybean meal 50%. Fish meal 55-60%. Fish solubles 30%. Cottonseed meal 32%. Peanut meal with hull 30%.

(6) Protein sources in Japan and their prices per protein unit:

Soybean meal 50% 110 yen.
Soybean meal 40% 118 yen.
Peanut meal 30% 123 yen.
Fish meal 55% 124 yen.
Fish solubles 30% 133 yen.
Cottonseed meal 32% 125 yen.

A small portrait photo shows Karl Sera. Address: Specialist in Charge, Feed and Meal Dep., American Soybean Assoc., Tokyo, Japan.

5707. Pier 1 Imports. 1970. Yen for tempura? (Ad). *Los Angeles Times.* June 7. p. P39.
• ***Summary:*** "Next time you hunger for Japanese food, begin at Pier 1! Delicate tempura's a snap with our help. Tempura pan [wok], complete with chopsticks, lifter-strainer, draining rack–$1.59. Non-fail [Hime] tempura batter mix is the quick and easy, sure way to success–$0.69. Marukin soy sauce, a genuine shoyu, will also come in handy for barbecue marinades. Economy size 34 oz. bottle–$0.99."

An illustration shows a bottle of Marukin soy sauce, the

© Copyright Soyinfo Center 2014

other items described, and a bottle of sesame oil. Address: Los Angeles area (11 stores).

5708. Meade, Mary. 1970. Serendipity potato salad is full of surprises. *Chicago Tribune.* June 10. p. B3.
• ***Summary:*** "The Japanese American Service Committee asked us to tell them which Japanese recipes are most requested by readers." The answer, of course, was sukiyaki. The committee's favorite sukiyaki recipe, which is given, calls for "1 tofu (soy bean curd), cut into 1-inch cubes," and "3/4 cup Kikkoman (soy sauce)."

5709. Pitcher, Shackford. 1970. Brazil's soybean output reaches new records. *Foreign Agriculture.* June 22. p. 8-9.
• ***Summary:*** "Soybean production in Brazil saw an unprecedented growth in the 1960's with continued growth expected in the 1970's... In one decade soybean production increased from the 1960 level of 7.6 million bushels to 34.9 million bushels in 1969. The 1969 crop enabled Brazil to achieve record soybean exports totaling 11.4 million bushels, valued at $29 million... By 1967 Brazil had surpassed the outturn of the Soviet Union and become the world's third largest soybean producer...

"Presently almost all of Brazil's soybean production is limited to the four southern States, with Rio Grande do Sul, the southernmost State, accounting for 70 percent of the crop. The State's first experiments with soybeans were conducted in 1941... Today, the bulk of Rio Grande do Sul soybeans come from larger farms growing wheat as well. These two crops are grown in rotation, with the soybeans planted in November and December–often in the same field on which a crop of wheat was just harvested...

"The tremendous expansion of soybeans in Rio Grande do Sul can be attributed to the work of the State's department of agriculture and IPFS (*Instituto Privado para Fomento de Soya*), a private, trade-sponsored institute active in soybean development during the early 1960's... Paraná is Brazil's second largest soybean producer...

"Sao Paulo, where soybeans were first introduced into Brazil about 60 years ago by Japanese immigrant farmers, is third among Brazil's soybean-producing States. In 1925 soybean research was initiated at Sao Simao Experiment Station in Sao Paulo, based on a collection of about 50 U.S. varieties. Cultivation was on a small scale until the early 1950's, when the Sao Paulo Department of Agriculture (SPDA) initiated an expansion program, loaning farmers combines and purchasing most of the crop. Now almost 100-percent mechanized, Sao Paulo soybean farmers plant an average of 250 acres of soybeans each; although some plant as few as 60 acres and others as many as 2,200 acres...

"Much of the research work on soybeans in Brazil is being done by the Agronomic Institute at Campinas (IAC), an SPDA agency in eastern Sao Paulo... In late 1969, a factory for isolating soy protein was inaugurated in Rio Grande do Sul with a yearly capacity of 1,000 metric tons of product. Soybean flours of various kinds are already produced by a number of Brazilian companies." Address: U.S. Agricultural Officer, Sao Paulo, Brazil.

5710. Hansen, Barbara. 1970. Former Miss America finds new frontiers in cookery. *Los Angeles Times.* June 25. p. 128.
• ***Summary:*** When Rosemary La Planche won the Miss America title in 1941, it was reported that she liked to cook. She is now married, lives in Sherman Oaks, California, and likes to cook creatively. Her recipe for Sukiyaki Rosemary calls for "1 cake tofu (bean curd), cut into bite-size pieces" and for "½ cup soy sauce."

5711. Fujimaki, Masao; Yamashita, M.; Okazawa, Y.; Arai, S. 1970. Applying proteolytic enzymes on soybean. III. Diffusable bitter peptides and free amino acids in peptic hydrolyzate of soybean protein. *J. of Food Science* 35(3):215-18. May/June. [21 ref]
• ***Summary:*** Fujimaki and co-workers (1968) found that undesirable flavors were mostly removed from a soy protein preparation by treating it with an appropriate proteolytic enzyme. In many cases, however, the enzymic hydrolyzate was accompanied by an undesirable bitter flavor–probably due to some types of peptides.

In this paper, the authors isolated and characterized 7 types of diffusable bitter peptides made by digesting soybean cold-insoluble protein in a dilute hydrochloric acid solution with pepsin. Bitterness of the diffusable fraction was attributed to free amino acids that have a bitter flavor (such as isoleucine, leucine, phenylalanine, and valine) and to various peptides. Almost all diffusable bitter peptides investigated here had leucine at the termini. By treating these peptides with carboxypeptidase A, the bitterness decreased considerably. Moreover, applying carboxypeptidase A or Nagarse (a bacterial neutral proteinase) to the diffusable fraction of the peptic hydrolyzate was also effective in removing some of the bitterness. Address: Dep. of Agricultural Chemistry, Tokyo Univ., Tokyo, Japan.

5712. Noguchi, Masatoshi; Arai, S.; Kato, H.; Fujimaki, M. 1970. Applying proteolytic enzymes on soybean. II. Effect of Aspergillopeptidase A preparation on removal of flavor from soybean products. *J. of Food Science* 35(3):211-14. May/June. [23 ref]
• ***Summary:*** "Chemical and organoleptic tests showed that partial digestion of soybean curd and defatted soybean flour by aspergillopeptidase A preparation removed flavor compounds and fatty materials from these soybean products." Address: Dep. of Agricultural Chemistry, Tokyo Univ.

5713. U.S. Department of Agriculture. 1970. The annual report on activities carried out under the Public Law 480, 83d

© Copyright Soyinfo Center 2014

Congress, as amended, during the period January 1 through December 31, 1969. Washington, DC: U.S. Government Printing Office. See p. 122-27. Cover reads: Food for Peace: 1969 Annual Report on Public Law 480.
• ***Summary:*** Table 20 is titled "Title II, Public Law 480– Total commodities by program type, fiscal year 1969." The three main program sponsors and distributing agencies are (1) Volag (American voluntary agencies, UNICEF and UNRWA [United Nations Relief and Works Agency] unless otherwise noted), (2) Government to government, and (3) WFP (World Food Program). Each of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. Only two foods containing soy protein were distributed: CSM (Corn soya mix) and WSB (wheat soya blend). They were lumped together in the statistics and sent in the following amounts (in thousands of pounds) to the following continents and countries: Africa total 89,470 lb: Cameroon 600, Congo 162, Dahomey 80, The Gambia 385, Ghana 976, Kenya 478, Lesotho 775, Malawi 39, Mali 4,500, Morocco 300, Nigeria 78,232, Senegal 80, Sierra Leone 1,810, Tanzania 365, Togo 18, Upper Volta 670.

Near East-South Asia total 222,817: Gaza [occupied by Israel since 1967] 2,653, India 216,176, Jordan 1,527, Jordan-West Bank [occupied by Israel since 1967] 1,042, Lebanon 738, Nepal 18, Pakistan 1, Syria 662.

Far East total 57,861: Burma 360, Indonesia 3,669, Korea 9,698, Laos 53, Macao 113, Malaysia 2,474, Philippines 3,140, Ryukyu Islands [located south of Japan, incl. Okinawa, Sakishima, and Amami island groups. Self governing from 1966. Returned to Japan in 1972] 227, Vietnam 38,127.

Latin America total 45,291: Bolivia 72, Brazil 19,851, Chile 2,605, Colombia 1,696, Costa Rica 142, Dominica 4, Dominican Republic 6,680, Ecuador 608, El Salvador 1,178, Grenada 68, Guatemala 1,773, Guyana 58, Haiti 1,585, Honduras 435, Jamaica 124, Martinique [French] 75, Panama 734, Paraguay 2,477, Peru 4,847, Uruguay 279.

Grand total: 415,439,000 lb of CSM and WSB. The following amounts of CSM/WSB (in 1,000 lb) were distributed by the three groups: Volag 292,587, Government to government 122,851, and WFP 1. Countries receiving more than 1 million lb of CSM and WSB combined (in millions of pounds): India 216.2, Nigeria 78.2, Vietnam 38.1, Brazil 19.9, Korea 9.7, Dominican Republic 6.7, Peru 4.8, Mali 4.5, Indonesia 3.7, Philippines 3.1, Gaza 2.7, Chile 2.6, Malaysia 2.5, Paraguay 2.5, Sierra Leone 1.8, Guatemala 1.8 Colombia 1.7, Haiti 1.6, Jordan 1.5, El Salvador 1.2, Jordan West Bank 1.0.

Note: This is the earliest document seen (Feb. 2002) concerning soybean products (cereal soy blends) in Martinique, or Panama. This document contains the earliest date seen for soybean products in Martinique, or Panama (1969); soybeans as such had not yet been reported by that date. Address: Washington, DC. Phone: 703-875-4901 (1991).

5714. Hewitt, Jean. 1970. A shop that sells table accessories along with cooking demonstrations. *New York Times.* July 15. p. 26.
• ***Summary:*** The shop is Tablerie at 1033 Third Ave., near 61st, in New York City, owned by Mary Ann Zimmerman. Today Mrs. Kenneth Ziegel, a home economist from Wilmington, Delaware, is demonstrating how to prepare Japanese dishes. Her recipe for "Miso shiru (Bean paste soup)" includes "1 tofu (fresh bean curd, cubed)" and "2½ tablespoons miso paste (fermented bean curd paste)."

Note: Describing miso as "fermented bean curd paste" is incorrect; "fermented soybean paste" would be better.

5715. Lee, Elinor. 1970. The art of sukiyaki. *Washington Post, Times Herald.* July 30. p. E1.
• ***Summary:*** Expo '70 is now underway in Osaka, Japan. One of the tastiest Japanese dishes and probably the most familiar to most Americans, "sukiyaki is a popular choice for patio or porch suppers. In Japan, sukiyaki is prepared at the table in a heavy iron skillet over a hibachi (charcoal brazier)."

This recipe "doesn't call for tofu (bean curd), but you can add tofu if you wish."

A large photo shows beautifully sliced sukiyaki ingredients surrounding a modern table-top cooker. Japanese cooks strive to please both the eye and the palate.

5720. Wenkam, Nao S.; Wolff, Robert J. 1970. A half century of changing food habits among Japanese in Hawaii. *J. of the American Dietetic Association* 57(6):29-32. July. [15 ref]
• ***Summary:*** In about 1885, a predominantly vegetarian diet was representative of the farming and laboring classes in Japan. "The three great staples were rice, barley, and soybeans." Those who could not afford rice consumed a less expensive grain such as millet, wheat, barley, buckwheat, or even sweet potatoes. Legumes, which were used universally, included soybean products, peas, mung beans and azuki. The main soybean products were tofu, miso, natto, aburage, and shoyu. Other foods in general use included daikon radish, several types of cabbage, marine algae such as nori, konbu, wakame. etc.

"According to statistics for 1880, total plant food consumption was proportioned as follows: rice, 53 per cent; barley and wheat, 27 per cent; tubers and vegetables, 6 per cent; fruits and algae, less than 1 per cent.

"The chief animal food was fish, much used near the sea, less in the interior. Poultry and eggs were used in small amounts. Beef, mutton, pork, milk, and butter formed a minor part of the diet. The amounts of animal food available per capita per year in 1900 were: meats, 1.3 lb.; fresh fish, 27 lb.; dried fish, 2.5 lb.; and imported meats and fish, 0.3 lb."

A bar chart shows that the daily intake of protein for Japanese adults in Japan and Hawaii has increased from 62 gm in the late 19th century to 101 gm today–an increase of 63%. During the same period, daily fat intake has increased from 10 gm to 87 gm–an 8.7-fold increase! Calories per day are about the same. Address: Dep. of Food and Nutritional Sciences, and School of Public Health, Univ. of Hawaii, Honolulu.

5725. Probst, A.H. 1970. Fifty years of soybean variety improvement. *Soybean Digest.* Aug. p. 66-70.
• ***Summary:*** Contents: Introduction. The trend to yellow seed. Common objectives of soybean breeders: High yield, high oil content, high protein content, disease resistance, improved seed quality, maturity to fit rotations, shattering resistance, desirable plant height, lodging resistance, high podding from soil level. Threat of root rot. Reasons for yields of 100 bushels/acre.

Before 1920, the soybean was used mostly as a forage crop. It was "used extensively for hay, and to a lesser extent for soilage, silage, green manure, lambing- or hogging-off when grown as a companion crop with corn, and for direct feeding of the beans." In 1924 the first official U.S. production statistics showed that of the 1,782,000 acres produced, only 448,000, or 25%, were harvested for beans. "It was not until 1941 that 5,881,000 acres harvested for beans surpassed the 5,510,000 acres grown for all other purposes.

"The development of the soybean processing industry was nudged into being mainly by World War I when there

© Copyright Soyinfo Center 2014

was such a shortage of fats and oils in the U.S. that it was necessary to import Manchurian soybean oil."

"Well over 10,000 introductions have been brought into the U.S. since 1898. Approximately 4,775 introductions were brought in by W.J. Morse and P.H. Dorsett who spent 2½ years during 1929-1931 on an agricultural exploration trip in Japan, Korea, and Manchuria.

"The germplasm collection today numbers about 3,200 types plus nearly 300 named varieties."

"Through 1940 most varieties were released either as direct introductions, rogued introductions, or selections from introductions. Some selections from introductions may have been of hybrid origin. A few varieties developed from introductions which played an important role in the rapid expansion of acreage planted for processing 20-50 years ago included Dunfield, Illini, Manchu, Richland, Mukden, Mandarin, Habaro, Boone, Patoka, and Roanoke. All vegetable-type varieties up to 1956 were introductions.

"Only a few varieties released through 1940 are known to have come from artificial hybridization-breeding programs. These include Mamloxi, Mamotan, Mamredo, Ogden, Volstate, Tennessee Non-pop, Oloxi, Pee Dee, and Yelredo.

"Of this group, only Ogden, with numerous good qualities sought in varieties today, was grown extensively for a long period. The popularity of Ogden was such that nearly 30 years after its release in 1941 some of it was still being grown commercially.

"Following 1940, and especially after 1950 there have been few varieties released which have come directly from introductions."

"The establishment of the U.S. Regional Soybean Industrial Products Laboratory (now the U.S. Regional Soybean Laboratory) in 1936 at Urbana, Illinois, brought about a tremendous increase in soybean breeding. Variety development immediately lost its provincialism and went "big league" to have an immediate impact nationally and eventually internationally."

"A recent listing of the leading soybean varieties for the U.S. and Canada included 39, plus seven special-use varieties, five of which were vegetable types and two were high-protein types.

"Since 1943 over 80 varieties have been or are in the process of registration by the American Society of Agronomy or, more recently, the Crop Science Society of America.

"The major part of soybean-variety development in the past has been accomplished by public agencies, particularly the agricultural experiment stations and the U.S. Department of Agriculture. At least one private company has been breeding soybeans for many years; a few for shorter periods.

"During the past few years, a few number of private companies have entered the field of soybean breeding."

Two main factors have led to yields of 100 bushels/acre or more: Better soybean varieties combined with improved cultural practices.

Small portrait photos show: George Kimmons (Ozark, Missouri; the first person to get 100 bu/acre yields, in 1968 with 109.6 bu/acre). W.J. Morse. M.D. Weiss. H.W. Johnson. R.W. Howell. B.E. Caldwell. J.L. Cartter. R.L. Bernard. R.L. Cooper. E.E. Hartwig. The work of each man in soybean variety development is discussed briefly on p. 70. Address: USDA Research Economist, and Prof. of Agronomy, Purdue Univ. [Indiana].

5726. *Soybean Digest.* 1970. Whole beans: The past-future link. Aug. p. 72.

• ***Summary:*** Contains a detailed chronology of USDA's Northern Utilization Research Laboratory (Peoria, Illinois) work with soyfoods–starting in 1926, about 15 years before the Lab began operations.

A photo shows C.W. Hesseltine and A.K. Smith of the NRRL with visiting Japanese scientists Tokuji Watanabe and Kazuo Shibasaki.

5727. Strayer, George M. 1970. Basic problems haven't changed. *Soybean Digest.* Aug. p. 54-57.

• ***Summary:*** This is an interesting history of the American Soybean Association as seen through the eyes of its most important early member.

"Geo. M. Strayer served as executive officer of the American Soybean Assn. from 1940 until 1967, through the formative years when most of the present structure was established. His term of service on the board of directors started 3 years earlier and was probably longer than that of any other one man. Today he is secretary of Associated Hybrid Producers, as he has been for many years. He exports corn, soybeans, grain sorghum, popcorn, and other midwestern products through Agricultural Exports Inc. He is associated with his brother Gordon and other members of his family in Strayer Seed Farms. He recently was elected mayor of Hudson where he has resided for the past 30 years. The above sketch of Mr. Strayer as mayor is by Jack Bender of the Waterloo (Iowa) Daily Courier.

"Soybeans to me 52 years ago were just a lot of work–a novelty of which a small amount of seed had been secured by my father from W.J. Morse in the Department of Agriculture. Planted in the hills of a small patch of popcorn, they had to be pulled by hand, dried, and then threshed out by hand and with a flail. They were too late for complete maturity in our latitude–but we found out they would grow here!

"By the spring of 1924 there were enough varieties (all imports from the Orient) that my father, B.S. Strayer, in cooperation with USDA and the local Smith-Hughes agricultural instructor, planted a testplot of about 3 acres, and included some 15 or 20 strains of varying maturities. There were black, green, brown, yellow, and vari-colored varieties."

"First exposure to the American Soybean Assn. came

© Copyright Soyinfo Center 2014

in September of 1924 when my father attended the fifth meeting at Ames, Iowa. It was a 2-day meeting, in the days of dirt and gravel roads, and the 100 miles to Ames was a major journey taken the day prior to meetings. I heard the stories of the wonders of the soybean crop secondhanded–I was in high school, the meetings came after school started, and such meetings were no place for kids anyway!

"Wonders of the soybean world: It was not until 1930 that I had my first exposure to the American Soybean Assn., except for reading the proceedings of each of the annual meetings as mailed to all members. The sessions that year were held at the University of Illinois.

"Four of us drove over for the meetings. We stayed at a private home in Urbana. I was indoctrinated into the wonders of the world of such men as W.L. Burlison, J.C. Hackelman, Soybean Briggs, Bill Riegel, John T. Smith, W.K. Kellogg, Keller Beeson, W.J. Morse, Charlie Meharry, Taylor Fouts, Scott Wilkins, and others.

"Today, only Soybean Briggs is still living. But they were the men who had the vision and the foresight and the fortitude to preach and talk soybeans, to plant and harvest them, and to interest people in their possible uses.

"At these 1930 meetings, held while I was a college student, I found my real interest for future years. I believe it was in 1937 after graduating and starting to farm that I was first elected to the board of directors of ASA. My father had served several years ahead of me.

"In 1936 the ASA annual convention was held in Iowa, and I was a member of the committee given the responsibility for planning the program. The first day was held at Iowa State University at Ames, the second day at Cedar Rapids, where processing facilities could be visited, and the third day was held at Hudson on our farms.

"In preparation for the big event we had freshly painted our farm buildings with paint made with soybean oil."

Also discusses: The launching of *Soybean Digest* (Nov. 1940). First trips abroad (1949 with Jack Cartter as members of ECA Technical Assistance Mission No. 1 to Europe, especially Germany; in 1952 to visit potential customers in Western Europe at his own expense; in 1954 as a member of the official USDA-sponsored agricultural trade mission; in 1955 weeks with Paul Quintus, head of USDA's fats and oils division, to study the possibilities of selling soybeans to that country. "I spent 7 weeks in Japan meeting with processors, foods manufacturers, shoyu manufacturers, tofu makers, miso makers, and Japanese government officials").

"The Japanese American Soybean Institute was formed in early 1956, and became the first overseas market development project on soybeans or any oilseed.

"With soybean production zooming, and with the Japanese project well underway, it appeared logical to explore other possible markets. In May of 1956 Paul Quintus again asked me to serve as an emissary of USDA and the soybean industry, this time to survey market possibilities and potentials in 10 Western European countries. Given a free hand, I spent about 2 months on this assignment, came back convinced that we had both problems and opportunities in Europe.

"I recommended that an industry-wide organization be formed. The European market was not solely a soybean market. Some countries would use oil, others meal, still others soybeans. It was too big a job for the small American Soybean Assn. Processors as well as growers had a stake in that market. Out of the arguments, discussions and deliberations the Soybean Council of America was formed to do the market development work in Europe and eventually in South America and in parts of Asia, with both growers, through ASA, and processors, through the National Soybean Processors Assn., participating.

"The problems are the same: Today's problems are the same as those of 1945–creation of larger and larger markets for U.S. soybeans." Address: Former Executive Vice President, American Soybean Assoc. and former editor, Soybean Digest.

5730. Hansen, Barbara. 1970. Language of cookery: Soy sauce hails from number of countries. *Los Angeles Times.* Sept. 10. p. K9.
• ***Summary:*** Compares Japanese, Chinese, Indonesian, Hawaiian, and U.S. soy sauces. These can be either brewed [fermented] or mixed from various ingredients to simulate the flavor, color, and texture of the brewed soy sauces. The mixed sauces "are based on hydrolized vegetable proteins and are colored with caramel coloring."

Among imported Chinese soy sauces, there is "the familiar dark soy sauce and also a light soy sauce, which can be used to salt and season food when a dark color is not desired."

Shoyu is the Japanese word for soy sauce.

"If you take up Indonesian cookery, don't assume that ketjap is the thick red sauce which Americans pour on hamburgers. Ketjap is the term for Indonesian-style soy sauce, which is slightly sweetened." Note: Could this latter

© Copyright Soyinfo Center 2014

be ketjap manis?

5731. Dosti, Rose. 1970. An Oriental flavor to table cookery. *Los Angeles Times.* Sept. 24. p. J18.
• ***Summary:*** Setsuko Ohkagawa, of Tokyo, who is now in Los Angeles, is intrigued by Kaiseki ryori, featuring the authentic of the Japanese tea ceremony. But she thinks that the Japanese art of table cooking (*Nabe mono*) might be most interesting to Americans, who already like fondue and the intimate quality Americans seem to enjoy. Recipes are given for: (1) Mizutaki, including "1 cake tofu (soy bean curd) cut into 1½-inch pieces." (2) Sukiyaki, incl. 1 cake tofu (soy bean curd). (3) Shabu-Shabu. incl. "1 cake tofu, sliced into 1-inch squares." A photo shows Setsuko serving.

5736. *Soybean Digest.* 1970. Honorary life members [American Soybean Assoc.]: Harris H. Barnes, Yukio Sakaguchi, Dr. Jean W. Lambert, John Reiser Jr., and Dr. Richard L. Bernard. Sept. p. 20-21.
• ***Summary:*** "Yukio Sakaguchi is president of Nisshin Oil Mills Co. and president of the Japan Oilseed Processors Association. He has been associated with this leading Japanese oilseed processing firm since 1924 and president since 1955. And he has been president or vice president of the Japan Processor Association continuously for 21 years.

"Mr. Sakaguchi was most instrumental in establishing the joint U.S. Department of Agriculture-American Soybean Association market development project for soybeans in Japan in 1956. The program has had the complete support of Mr. Sakaguchi and of JOPA. His help is undoubtedly a reason the Japan project for soybeans has become one of the most important market development projects for farm products."

Mr. Sakaguchi "helped to found the new Japan Protein Food Institute and is president of the Institute."

Dr. Jean W. Lambert has long been known as "Mr. Soybean" in Minnesota. He is currently a professor agronomy and plant genetics at the University of Minnesota. He made a trip to Japan in 1963 to obtain an agronomist's view of the Japanese food market for soybeans, for the American Soybean Association. He is a native of Nebraska.

John Reiser is a farmer who is the most consistent winner in the history of the Illinois 5-acre Soybean Yield Contest. Since the contest began in 1964, he set the all-time contest record of 82.7 bushels per acre and holds a 6-year average of 73.6 bushels. He is a native of Ashland, Illinois.

Dr. Richard L. Bernard is one of the world's leading soybean geneticists. Since 1954 he has released the varieties Shelby, Harosoy 63, Hawkeye 63, Clark 63, Chippewa 64, and Wayne, which was the leading U.S. soybean variety in 1968. Dr. Bernard obtained his Ph.D. from North Carolina State University. He has been associated with the U.S. Regional Soybean Laboratory at Urbana, Illinois since 1954. Photos show Harris H. Barnes, Yukio Sakaguchi, Dr. Jean W. Lambert, John Reiser Jr., and Dr. Richard L. Bernard.

• ***Summary:*** "A sour milk beverage having the consistency and taste of buttermilk (sour milk) or yoghurt is prepared by fermentation of an aqueous dispersion of skim milk solids and soybean protein containing certain amino acids by lactic acid bacteria. The amino acids modify the fermentation process in such a manner as to suppress the soybean flavor which otherwise mars the taste of the fermentation product." Address: 1-2. Tokyo; 3. Yokohama city; 4. Kawasaki city. All: Japan.

5741. Arai, Soichi; Noguchi, M.; Yamashita, M.; Kato, H.; Fujimaki, M. 1970. Studies on flavor components in soybean. VI. Some evidence for occurrence of protein-flavor binding. *Agricultural and Biological Chemistry* 34(10):1569-73. Oct. [12 ref]
• ***Summary:*** This is the earliest publication seen suggesting that binding of off-flavors by proteins is a major cause of the persistence of these off-flavors. The hydrophobic binding of these components by soy protein has been implicated in the occurrence of off-flavors. They also found that n-hexanal was one of the major contributors responsible for the beany odor of soybeans.

Note: This is the earliest document seen that uses the term "n-hexanal" or "hexanal" in connection with soybeans and their off-flavors. Address: Dep. of Agricultural Chemistry, Tokyo Univ.

5742. Clark, R.W.; Mies, D.W.; Hymowitz, T. 1970. Distribution of a trypsin inhibitor variant in seed proteins of soybean varieties. *Crop Science* 10(5):486-87. Sept/Oct. [11 ref]
• ***Summary:*** Soybean trypsin inhibitor is a protein that was discovered by Bowman (1944) and is regarded as an "antinutritional factor in soybeans."

Consumption of raw soybeans causes pancreatic hypertrophy in chickens (Bray 1964; Chernick et al. 1948) and "is believed to inhibit growth, by upsetting the balance between methionine and cystine in the pancreas" (Booth et al. 1960).

Two different forms of soybean trypsin inhibitor protein were studied using electrophoresis with 294 soybeans. 7% of the soybeans had Rf 0.92 electrophoretic bands and 93% had Rf 0.05 bands, where Rf is the relative mobility of the dye front. Soybean varieties of known origin that had the Rf 0.92 band were from Japan or Korea and were mostly in Maturity Groups 1 through IV; but not all soybeans from Japan or Korea had this band. None of the major commercial varieties of soybeans presently grown in the USA contained the Rf 0.92 band. The Rf 0.92 predominates in vegetable type soybeans. Examples of vegetable types are Agate, Aoda, Burwell, Giant Green, Goku, Jogun, Portugal, Rokusun, Sac, Sato-3, Soursei [sic, Sousei], Tortoise Egg, and Wolverine.

Approximately 90 to 95% of the total soybean acreage in the USA is seeded to varieties derived from six plant introductions that originated in Manchuria: P.I. [plant introduction] numbers 30593, 36653, 36846, 50523, 70502, and A.K.

Note: This is the earliest document seen (Oct. 2013) concerning trypsin inhibitors and seed electrophoresis. It is also the first study of the geographical distribution of various forms of the soybean trypsin inhibitor SBTI-A2. Address: Dep. of Agronomy, Univ. of Illinois, Urbana, IL 61801.

5746. Sault, J.L.; Gale, J.B. 1970. A review of developments in simulated meats. *Quarterly Review of Agricultural Economics* (*Australia*) 23(4):209-221. Oct. [42 ref]
• ***Summary:*** Contents: Introduction. Nature of simulated meat products: Sources of raw material, processing methods. Production and marketing: The United States market (where virtually all production has been based on soya bean protein), the Japanese market, the Western European market, other countries (South Africa, Canada, Australia). Factors influencing competition with natural meats: Differences in properties, increases in incomes and changes in tastes, relative prices, promotion, government regulations. Summary and conclusions.

"The United States and Japan are the two main producers of simulated meats and account for most of world consumption... Virtually all of the United States' commercial production of simulated meats has been based on soya bean protein." At least 15 companies made simulated meat in 1969, but six of these produce most of the items marketed. A number of the manufacturers (such as General Mills) are very large and have invested large amounts of time and money in the process.

In Japan, production of western-style simulated meats is a very recent development. Consumption of such items is still very small, though it appears to be rising. "In 1968 domestic production plus imports of simulated meats totalled 37.7 million lb, and during the first six months of 1969 they amounted to 25.9 million lb." Most of these products are made in Japan by at least 19 firms. One feature of the Japanese industry has been the importance of wheat gluten as a protein source. In 1968 and the first half of 1969 some 36% of Japan's output was derived from wheat gluten; virtually all of the rest was based on soy protein.

Sales of simulated meat products in Western Europe have been considerably lower than those in the USA and Japan. The main developments have occurred in the Netherlands, West Germany, and Sweden. In the Netherlands, imports rose from 44,000 lb in 1967 to 1,166,000 lb in 1968, then fell the next year. In West Germany, simulated meats were first introduced to the trade and consumers in mid-1968.

"In South Africa one firm is manufacturing a simulated meat from soy protein by what appears to be a thermoplastic extrusion process. The product is being used as a meat extender rather than as a complete meat substitute. It is reported to be of a dry and wiry texture requiring a good deal of seasoning to make it palatable." Its price is higher than that of natural meat.

Note: This is the earliest document seen (Dec. 1997) that uses the term "thermoplastic extrusion" in connection with soy.

Address: Dep. of Agricultural Chemistry, Tokyo Univ.

5749. *Foreign Agriculture.* 1970. The soybean and ASA–Fifty years of growing up together. Nov. 16. p. 2-3.
• ***Summary:*** Soybeans had been known in America since 1804 when a few bags were brought from China as a reserve food supply in the hold of a Yankee Clipper. Civil War soldiers carried them as "coffee berries," using them to brew coffee when the real thing became scarce. The USDA recorded the first soybean statistics in 1919 with a report that there had been 99,000 acres of U.S. farmland planted in beans during that year. In 1956 the American Soybean Assoc. signed a contract with USDA's Foreign Agricultural Service to cooperate in soybean market development work in Europe and Japan. This was the first such contract for overseas promotion of any U.S. farm commodity. Out of the effort came the Japanese-American Soybean Institute and the Soybean Council of America (a joint effort of ASA and the National Soybean Processors Association). Last year soybeans ranked as the nation's #1 agricultural export with a total value of over $1,400 million. Photos show: The first plant [Elizabeth City Oil & Fertilizer Co.] to process U.S. soybeans, located in Elizabeth City, North Carolina. Farmers harvesting Laredo soybeans at Mississippi State University in about 1920.

• ***Summary:*** Insolubilization during drying was the result of polymerization, which took place through disulfide bonds, as indicated by the effects of sulfhydryl-blocking agents, and through hydrophobic bonds, as indicated by the effect of sodium dodecyl sulfate. Address: Cornell Univ., Geneva, New York.

5752. Goldman, M.C. 1970. Southern California–Food-shopper's paradise! An exciting burst of organic-living enthusiasm–among young, old and in-between–has created a tidal wave of food shops and more products from Santa Barbara to San Diego. *Organic Gardening and Farming* 17(11):38-45. Nov.
• ***Summary:*** "Spearheading the surge to organic foods today is the West Coast's literal Garden of Eden–the southern half of Golden California." And this should be no surprise. A climate well suited for year-round gardening and farming join with people of all ages with people interested in natural foods plus "that rapidly-enlarging segment of the younger generation now so awake to wholesome eating.

"Actually, a sizable chunk of early interest in organic ideas belongs to this paradisiacal area. Pioneers like Phil Arena, Herbert Clarence White, Maria Wilkes, Clarence Tontz, Lee Anderson and dozens more have all lent the sunny Southwest locale an aura of organic history-in-the making."

In a late July trip from Santa Barbara south to San Diego the writer observed in shop after shop (there are at least 300 "health food stores") along the beautiful Pacific coastline, streams of young folks–many with surfboards and/or children in tow–were coming in to buy fresh fruits and vegetables, whole grains, "juices, kelp and dulse, sea salt and soy products, breads and eggs."

Veteran Betty Morales, prolific writer and lecturer, notes: "The influx of young people is like a blood transfusion to the health-food business, particularly to the retailers of organically-grown foods."

Sun Circle Ranches, based in California, supplied by some 200 organic farmers (large and small), are the leading nationwide distributor of organic produce.

In Los Angeles, Erewhon Trading Co., related to the original shop in downtown Boston, Massachusetts, is only a year old, yet serves 100 West Coast stores, natural food restaurants, co-ops and various institutions. Paul Hawken, president of Erewhon [a macrobiotic company], notes that even some of the big universities, including UCLA, have become customers for the popular organic brown rice and soy sauce.

Jimmy Silver, shop manager, says the store's retail clientele consist of about half each younger and older people. Fresh produce from Sun Circle attracts both. Silver sells about 1,200 hundred pound bags of brown rice each month–90% of it wholesale to established shops in L.A. and other parts of the Southwest. Grown for Erewhon by Wehah Farms in Richvale, California, it now retails for $16.50 per 100-lb sack.

"Grains from the well-known Arrowhead Mills in Deaf Smith County, Texas, also make up a sizable segment of business, says Hawken, a young man who typifies the keen, forceful drive of the new generation in health foods marketing. Along with these and rice, soy sauce made from Japanese organic-grown beans constitutes the biggest seller–nearly 4,000 gallons a month at $8 by the gallon, down to $1.20 per pint. Various soybean pastes, such as *mugi miso* prepared with the beans, well water and salt, are also favorite products. So is seaweed..."

Says veteran store owner Walter Lindberg: "No question about it, people are becoming more concerned about the quality of the food they buy." All store owners say that business has jumped during the past year–especially from young people. "Young people have an open communication system that far outstrips TV and radio."

At the Sun and Earth shop in Goleta, a suburb of Santa Barbara packed with students, one popular item (called the "natural foods answer to the TV dinner") is "a platter of our soyburgers, carrots and parsley," which retails for 57 cents.

Goldman concludes: "The thunderbolt of organic living has not only struck ground in the West–it's sent a strong, vital message crackling everywhere in the land."

Contains 6 photos taken inside the new breed of food shops. Address: Box 866, Hereford, Texas.

5753. Photographs of people at the Erewhon–Los Angeles macrobiotic retail store. 1970. Los Angeles, California.
• ***Summary:*** These five black-and-white photographs were taken in mid-November 1970 at the Erewhon–Los Angeles retail store on Beverly Boulevard (at the corner of Edinburgh) by Jimmy and Susan Silver. The photos were sent to Soyinfo Center by Jimmy Silver in Aug. 2010.

They show: (1-2) Bruce Macdonald (who was in charge of the store and Erewhon West Coast operations at the time) standing near the cash register. (3) Customers in the store. (4) Jimmy Silver hugging his daughter Rachael (who is in a wooden barrel) In the store. (5) The produce section at Erewhon–Los Angeles.

Note: In an e-mail dated 29 Aug. 2010, Jimmy Silver adds: "We had a warehouse catercorner across Beverly Blvd. The other store employees (and I use the term loosely, as we

© Copyright Soyinfo Center 2014

all lived at the Kushis' house on Franklin Ave. and basically received room and board and sort of an allowance at Bruce's discretion, not actual pay) were Bobby Orgo and John Curran. We all worked at both the store and the warehouse (which did some wholesale and institutional sales, to other stores and restaurants). For whatever reason, Bruce liked me working in the store and talking to the customers or talking to customers on the phone. So even though Bobby was the one with the most experience and know-how, I kind of became the de facto second in command after a little while, handling the money, etc.

"Also, Jim Docker and Leon Abehsera worked at the store, but doing construction and physical improvements, not the work of the business itself. They both had this incredible (to me, anyway) ability to lie down on a sack of rice, any time of day, and immediately go to sleep for five or ten minutes, and then get up looking and acting as if they'd just had 8 hours sleep.

"Bobby Orgo was really a character. He once got in a big argument with the health inspector (!) of all people, who had come to check out the warehouse. Everything was 'dry' at the warehouse (no refrigeration), so the inspector was saying this and that about the rules, but was basically going to let it all go. Bobby comes in smoking a cigarette and the inspector tells him he can't smoke in a food facility. Why not? Against the health code. So what–smoking isn't bad for you (macrobiotics tended to look at smoking as 'yangizing', which was 'good' for yin people, which everyone was assumed more or less to be). They get into a big yelling match, and the inspector ends up citing us for about fifty violations, and we ended up having to put in tile coving, a floor drain and stainless steel sinks–all to handle bags of grain, because of Bobby's argument."

In an e-mail dated 10 Jan. 2010 Jimmy Silver adds: Doug Rauch was both sales and purchasing manager. I more or less worked for him, or was trained by him, when I came to Erewhon, mostly because I was interested in what he was doing. He was the guy that knew all the product information.

"Nominally I was in charge of getting the catalogs out, 'envisioning' and 'theming' them, labels and label concepts and designs, new products, customer relations (but in a more technical sense, like product research questions–our customers were primarily stores and coops), vendor relations (making nice with our suppliers and producers beyond issues of payments and shipments and orders), and handling the import business from Japan and our relations with our two Japanese suppliers, Muso and Mitoku. Sort of like a jack of no trades.

"Doug got Trader Joe's (TJ) to take on natural food products from Erewhon. Eventually he left and then went to work for TJ. Their office at the time was only a few blocks from where he lived. I was sent over to his house for two or three days during the transition and made notes on a yellow legal pad of all the things I needed to do and pay attention to that he told me, and then I became the sales manager and purchasing manager. By then Erewhon was in Vernon, no longer in Culver City.

"Doug rapidly rose at TJ, and shortly became their youngest VP. He convinced them to expand to the East Coast and became president of the East Coast division. Now he has 'graduated' as he would put it, has some sort of fellowship at Harvard, and helps out at the local NPR station (I think he may be the chairman, which I believe means they rely on him to make sure that they raise enough money to keep operating)." Doug is tall–a very interesting guy with a very dry wit.

• ***Summary:*** The fermented soy sauce industrially produced in Korea is of the Japanese koikuchi type, and in 1970 the annual industrial production was estimated to be about 220,000 kl. Assuming that the daily per capita consumption is about 20 ml, the amount cited above in equivalent to one-half the demand for soy sauce in Korea, and it is estimated the same amount is produced at home.

5773. **Product Name:** [Tanmea {Soy Protein}].
Foreign Name: Tanmea.
Manufacturer's Name: Meito Sangyo.
Manufacturer's Address: Kikuidori 1-1, Nishi-ku, Nagoya, Japan.
Date of Introduction: 1970.
New Product–Documentation: *Soybean Digest Blue Book.* 1970. p. 108.

5774. Murata, Kiku. 1970. Hakkô daizu, tenpei (Tempeh) no eiyô-ka ni kansuru kenkyû (Sosetsu) [Studies on the nutritional value of tempeh (general remarks and introduction)]. *Osaka Shiritsu Daigaku Kaseigakubu Kiyo* (*Bulletin of the Faculty of Home Economics, Osaka City University*) 18:19-33. [30 ref. Jap; eng]
• ***Summary:*** "After investigation of the nutritional value of tempeh, including antioxidative and antihemolytic activities of tempeh, for several years, the following results were obtained: 1. Lipid of the tempeh powder is stable, while that of the unfermented soybean powder is labile to oxidation during storage. 2. It was found that isoflavones, especially Factor 2 (6-7-4'-trihydroxyisoflavone), which was liberated with Beta-glucosidase during fermentation with *Rhizopus,* was one of the antioxidants in tempeh. 3. The isolated or chemically synthesized crystalline Factor 2 was active in preventing hemolysis of the red blood cells of the vitamin E deficient rats *in vitro* but not in *in vivo* tests. 4. Protein Efficiency Ratio (PER) of tempeh and of unfermented soybeans (fresh or stored) were not significantly different. However, hemolysis percentages of blood of rats fed stored tempeh were less than 20%, while those of rats fed stored unfermented soybeans were 100% throughout the experimental period after 2 weeks. The serum tocopherol of the tempeh group was higher than that of the unfermented soybean group. 5. Most of the B vitamins except thiamine in tempeh were increased to 4-8 times as much as those of unfermented soybeans during fermentation. 6. It was observed that supplementation of methionine (1.09%), lysine (0.34%), and threonine (0.24% in protein level) improved PER as well as that of tempeh 7: whole egg 3 in protein level." Address: Osaka.

• ***Summary:*** Contains many imaginative and joyous macrobiotic recipes. Acknowledgments: "This book could never have been completed without the help of my wife, Claude. Most of the recipes are hers; she cooked, tested and wrote them down... Jack Garvy completed the editing of the book and made definite English corrections. My exceptional friend William Dufty gave valuable advice. Finally, my brother Charles was very helpful..."

The author uses the term "black beans" and from his definition on page 18 it seems that he is referring to black soybeans: "Black Beans, twin brothers of the red aduki in size, are sold in Chinese, Japanese and natural-food stores. They are the milk and honey of the bean family, and their flavor and texture impart a delightful sweetness and richness to any soup or vegetable dish." No definition is given of soybeans. In the section titled "Condiments" (p. 20-21), the author defines soya sauce, miso, seitan, salted plums, tofu, kuzu, etc. "Tofu is another name for soya-bean curd.

© Copyright Soyinfo Center 2014

In Chinatown, you'll see it in wooden barrels. It looks like Feta Greek Cheese and some people would swear it tastes like chicken. It is excellent served with sauteed vegetables, sauces, fried or cooked in Miso Soup.

"Seitan: Your guests will almost certainly mistake this for meat. Teeth find it pleasant to chew. A combination of wheat gluten, wheat soya beans [sic], water and salt, it comes in handy when mixed with vegetables, sauces and soups." Note 1. No recipe for making or using seitan appears in this book.

Soy-related recipes include: Cooking beans in a pressure-cooker (p. 66; "Do not pressure cook black beans. Their skins may come off and clog the pressure cooker spout. It is quite dangerous!"). Cooking beans in a pot (incl. soya beans, p. 67). Black-bean stew (with miso, p. 70). Soja jardiniere (with whole soya beans and miso).

In the chapter titled "Soups," the author tells the story of how the famous Japanese physician, Dr. Tatsuichiro Akizuki, used miso to strengthen his constitution and to survive the atomic bomb dropped on Nagasaki on 9 Aug. 1945. Under "Minerals" in that chapter he discusses other virtues possessed by miso, then gives a recipe for Miso soup (p. 86).

Radishes sauteed in miso (p. 114). Sandwich au gratin (with miso spread, p. 114). Macrobiotic marbles (with miso, p. 155). Claudia's pizza (with miso, p. 158). Salade au cresson (with miso, p. 169). Nato [sic, Natto] (Japanese salad with natto, p. 171; Note 2. The author describes "Nato" as "sour soy-beans, bought in a Japanese store"). Miso sauce (p. 178). Miso spread (with tahini, p. 187). Oat-miso spread (p. 188). Scallion spread (with miso, p. 188). Miso pâté (p. 189). Komoku (with tofu, deep-fried and cut into strips, p. 212). O'Sushi (with tofu, p. 217). Kasha à l'Orientale (with tofu, p. 220). Bi-Cuan (Vietnamese recipe with fried tofu, p. 226). Kagetsu ice cream (with fine soya powder [perhaps Jolly Joan from Ener-G foods in Seattle], p. 334; "Kagetsu is a beautiful restaurant in Seattle"). Yellow pompidou (with soya bean powder, p. 336).

The Foreword states (p. 1-2): "Ten years ago I was a sick man, struggling to stay alive and to finish a novel. I suspected I might fail in both matters and the doctors of Paris agreed. They abandoned me as a hopeless case. It was then that I discovered a way of life called Macrobiotics. After a year of eating grains and vegetables, my health restored, I ventured to New York to discover America and finish my novel."

Note 3. *Webster's Dictionary* (1985) defines feta, a word first used in English in 1940, as "a white semisoft Greek cheese made from sheep's or goat's milk and cured in brine."

Fax from Jimmy Silver. 1991. Dec. 17. This was the first best-selling macro / natural food cookbook. Michel is head of a (the?) Jewish community in Montreal, Canada. He has 7-9 brothers and 1 sister. "His brother, George, founded the Nature de France clay based body care company–originally called Cattier but changed after they were sued by Cartier. I thought they would have prevailed in the suit but George didn't want to spend $500,000 to fight it even if he won." Address: New York.

5780. Bock, Felicia Gressitt. trans. 1970. Engi-shiki: Procedures of the Engi era. Books I-V. Tokyo: Sophia University. xi + 216 p. Index. 27 cm. [196* ref. Eng]

• ***Summary:*** This is volume 1 of a two-volume series. The second volume (ix + 190 p.), published in 1972, contains Books V-IX. These "Procedures of the Engi era (A.D. 901-922) are a great body of regulations designed to supplement the administrative codes which were drawn up in the early eighth century. Because of their wide scope and the minute details included, they are an invaluable source of information about Japan in the Nara and early Heian periods–eighth, ninth, and early tenth centuries."

"At first glance the *Engi-shiki* appear to be huge aggregate lists, enumerations, specifications, registers, and statistics. Such they are, but in relation to the department of government under which they fall, they provide many essential regulations for carrying out day-to-day details of civil and religious administration" (Preface, p. v).

The contents of the five books translated here are as follows: Book one: Festivals of the four seasons (Part I). Festivals of the second month, festivals of the fourth month, festivals of the sixth month (repeated in the twelfth month). Book two: Festivals of the four seasons (Part II). Festivals of the ninth month, festivals of the eleventh month, festivals of the twelfth month. Book three: Extraordinary festivals. Book four: The Shrine of the Great Deity in Ise. Book five: Bureau of the Consecrated Imperial Princess. The back matter includes: A map (p. 186) showing the Provinces and Circuits at the time of the *Engi-shiki* (circuits–from east to west: Tokai-do, Tosan-do/Tozan-do, Hokuriku-do, Nankai-do, San'yo-do, San'in-do/Sanin-do, Saikai-do), a table of ancient Japanese measurements, eight appendixes, a bibliography, and a glossary and key.

In the many long list of ritual objects, two types of sea vegetables (wakame and arame) appear very frequently (see p. 61, footnote 161). Other common objects are hemp and bark cloth (primeval clothing materials), salt, sake, rice, abalone, sea-bream, bonito, and silk.

In Book Five, included in the list of "Monthly Requirements" (p. 163) are: 2 *kin* 13 *ryô* each of laver and codium, 11 *kin* 4 *ryô* each of wakame and gelidium,... 6 *sho* of fermented soybeans,... 2 *sho* of fermented bean paste, 1 *to* 5 *sho* of barley sugar, 3 *to* each of glutinous rice, soybeans, red beans [azuki], wheat, sorghum, sesame seeds..."

In Book Five, included in the list of things "Required for the Three Occasions in the First Month" after New Year (p. 163) are "1 *kin* each of laver [nori] and wakame, 3 *shô* of salt, 1 *shô* 5 *gô* each of pickles, bean paste [kuki, miso] and vinegar, 6 *to* of sake, 9 *shô* of glutinous rice, 3 *shô* each of soybeans, red beans [azuki], millet and sorghum, 6 *shô* each

© Copyright Soyinfo Center 2014

of wheat, sesame, and raw chestnuts..."

In Book Five, in the List of Pharmacopoeia required (p. 178+) is included "1 *gô* 1 *shaku* of fermented bean sauce (p. 179) [kuki, the ancestor of miso; see p. 194], and 6 *koku* each of soybeans and red beans [azuki], 1 *koku* of sesame seed... and 3 *koku* of sesame seed oil... and 1 *to* of dried sweet arrowroot [kudzu powder, see footnote 591] (p. 182).

Note: This is the earliest English-language document seen (Nov. 2011) that uses the word "kuki" to refer to early Japanese fermented black soybeans.

5781. Chang, Wonona W.; Chang, Irving B.; Kutscher, Helene W.; Kutscher, Austin H. 1970. An encyclopedia of Chinese food and cooking. New York, NY: Crown Publishers, Inc. x + 534 p. Edited by Lillian G. Kutscher. Charlotte Adams, Consulting Editor. Illust. Index. 26 cm. International Cookbook Series edition. [52 ref]

• ***Summary:*** This comprehensive work, the result of at least 25 years of collaboration, contains over 1,000 recipes. The 4th printing (March 1977) proclaims prominently: "The first Completely Safe Chinese cookbook compiled in accordance with latest food research without MSG (monosodium glutamate)." Following introductory chapters titled "Chinese Cuisine: Background," "Regional Chinese Cooking," "Utensils for Cooking, Serving, and Eating," "Cooking Preparations," and "Cooking Techniques," there is a detailed "Guide to Ingredients" (p. 22-57), which describes the following soy-related foods and gives Cantonese / Mandarin pronunciations / transliterations (see p. 22): beans, black (wu dow / wu do); beans–black salted fermented beans (dow si / do shih; used as a condiment or flavoring agent [seasoning]. Aroma: fragrant, appetizing); bean cake, fermented (fu yu / fu yu [fermented tofu]); bean curd (dow fu); bean curd, dried (dried bean curd [dried yuba], p. 25, 47–tiem jook or fu jook pei / t'ien ch'u or fu pi chi); bean curd cheese, red (nam yu / nan yu); bean filling, sweet (dow sa / do sa; made from red [azuki] beans or green / [mung] beans); bean sauce, brown or yellow (mien see jiong); bean sprouts (large, from soybeans) (wong dow gna / huang do ya); hoisin sauce (red seasoning sauce) (hoy sin jiong / hai hsien jiang); soy sauce (dark lo tsow / lao tsou; heavy–jiong yow / jiang yu [jiang you]; light–sang tsow / sheng tsou; table soy sauce–sin tsow / shien tsou) "Dark soy sauce has caramel added for coloring. Heavy soy sauce, which has a slightly sweet smell, is also known as black soy. Light soy sauce is the most delicately flavored and is light brown in color. Japanese soy sauce, somewhere between the Chinese light and heavy, is preferable to domestic brands but inferior to Chinese brands."

Vegetable steak (mien gon / mein jing) "Meat substitute made from wheat gluten. Shape: 3-inch square or round patty ½ inch thick." Brown, chewy, and firm. Sold in cans.

Photos (black and white, p. 47) show fermented black beans, fresh bean curd, pressed bean curd, bean curd sticks and bean curd sheets [both kinds of yuba, but "bean curd sheets" on p. 47 are called "bean curd, dried"], brown bean sauce, and large fresh bean sprouts.

Note 1. This is the earliest English-language document seen (Oct. 2012) that uses the term "bean curd sheets" or the term "fu jook" or the term "fu jook pei" or the term "fu pi chi" or the term "t'ien ch'u" to refer to yuba or to dried yuba sticks.

Pages 58-60 contain a "Shopping list for Chinese cupboard." Foods are listed alphabetically in English, with the Cantonese term romanized and Chinese character forms. Next come the 1,000 Chinese recipes divided into chapters. One chapter is titled "Bean Curd" (p. 422-34), which includes Ma Po Dow Fu (p. 433); there are so many recipes for regular tofu (dow fu) in this book that we do not have room to list them all. The many other soy-related recipes are listed in the excellent index.

Recipes for "bean cake, fermented" [fermented tofu] are: Scrambled eggs with fermented bean cake (Fu yu don, Canton, p. 134). Duck with fermented bean cake (Fu yu ta, Adapted, p. 276). Steamed pork with fermented bean cake (Fu yu tsing ju yoke, Canton, p. 292). Stir-fried green beans with fermented bean cake (Fu yu tsang dow, Canton, p. 391). Lettuce and fermented bean cake (Fu yu sang tsoi, Canton, p. 392). Spinach and fermented bean cake (Dow fu bo tsai, General, p. 399). Watercress and fermented bean cake (Fu yu sai yong tsoi, Canton, p. 40).

Recipes for "black beans, salted" [fermented black soybeans] are: Pork with bitter melon and salted black beans (Fu gwa yoke si, Canton, p. 305). Shrimp with bitter melon and salted black beans (Fu gwa dow si har, Canton, p. 306). Steamed spareribs with salted black beans (Dow si pai gwut, Canton, p. 320). Beef with bitter melon and salted black beans (Fu gwa ngo yoke do si jiong, Canton, p. 340). Black bean sauce (Huk dow tsup, Canton, p. 436; with garlic and ginger.

Note 2. This is the earliest separate recipe seen {Nov. 2008} for "Black bean sauce").

Recipes for "bean curd, dried" [dried yuba] are: Pig's feet with dried bean curd soup (Ju gyok tiem jook tong, Adapted, p. 113; with "10 sheets dried bean curd." Soak sheets in hot water for 30 minutes. Drain, cut crosswise into pieces 1 inch wide, then add to soup). Spare ribs with dried bean curd soup (Pai gwut shiu tiem jook, Adapted, p. 321). Dried bean curd strips with soy sauce (Hung shu tiem jook, General, p. 424). Vegetarian ham dried bean curd (Sue ho twei dow fu, Shanghai, p. 429; with "20 sheets dried bean curd").

Recipes for "bean curd skin" (or bean curd sheets) [yuba sheets, fresh or dried] are: Red-cooked carp with bean curd skin (Fu pi hung sao yu, Shanghai, p. 158; with "bean curd skin to cover" carp). Red-cooked carp with bean curd skin–Approved ulcer recipe (Hung sao li yu dow fu pi, General, p. 158; with "¼ lb. dried bean curd skin {about 20 pieces, 1½ by 5 inches}. Soak for 30 minutes in hot water. Drain. Cut

© Copyright Soyinfo Center 2014

into 2-inch squares).

Recipes for "frozen bean curd" [frozen tofu]: Frozen bean curd with soybean sprout soup (Dung dow fu dow ya tong, Adapted, p. 90; with "2 cakes frozen bean curd" and "½ lb. soy bean sprouts." "Defrost frozen bean curd by covering with cold water, letting stand 2 to 4 hours before cooking. Then cut each piece into 10 to 12 thin slices"). Spareribs with frozen bean curd (Pai gwut shiu dung dow fu, Adapted, p. 320; with "4 cakes frozen bean curd"). Stir-fried frozen bean curd (Tsao dung dow fu, Peking, p. 422; with "6 cakes frozen bean curd. * Wrap 2 to 3 pieces fresh bean curd together in waxed paper, freeze until hard").

Recipes for "pressed bean curd" [pressed tofu]: Pressed bean curd shrimp (Sha tze gahn si, Shanghai, p. 178, with "4 pieces pressed bean curd"). Golden strips with pressed bean curd (La jiao tsao san sih, Hupeh, p. 313). Pressed bean curd and celery with stir-fried beef (Dow fu gahn ching tsai ro si, Shanghai, p. 357). Stir-fried pressed bean curd with pork (Dow fu gahn tsao ro si, Shanghai, p. 427). Stir-fried pressed bean curd with chicken (Dow fu gahn tsao gee si, Shanghai, p. 427).

Recipes for "soybean sprouts": Spareribs soybean sprout soup (Pai gu dow ya tong, General, p. 112). Beef shank soybean sprout soup (Wu hwa niu ro hwang dow ya tong, General, p. 112). Braised soybean sprouts (Hung sao hwang do ya, Shanghai, p. 376).

Note 3. This is the earliest English-language document seen (Jan. 2013) that uses the term "wong dow gna" or the term "huang do ya" to refer to soybean sprouts. Address: USA.

5782. Hong Kong Soya Bean Products Co. Ltd. 1970. The Hong Kong Soya Bean Products Co. Ltd. 1940-1970. Kowloon, Hong Kong. Annual Report. 17 p. Summarized in Soybean Digest, July 1971, p. 30. [Eng; chi]

• ***Summary:*** Written in both English and Chinese, this important document contains an detailed history of the company, which celebrates its year of founding as 1940.

Photos show: (1) K.S. Lo, Chairman. (2) Directors and employees in 1940 outside original Causeway Bay factory. (3) Aberdeen factory, an early photo. (4) Employees in 1950. (5) Employees in 1960. (6) Illustration of Kwun Tong factory opened in 1962. (7) Pepsi Cola bottling line. (8) Vitasoy bottles being capped. (9) Quality control. (10) Loading of trucks by more than 20 fork lift vehicles. (11) A retail outlet and cooler; About 15,000 stores sell Vitasoy in the Colony. (12) More than 100 trucks distribute Vitasoy and Pepsi Cola in Hongkong. (13-14) Vitasoy and Pepsi signs are seen everywhere in Hongkong. (15) The board of directors in 1970. (16) The five "Lo's" instant rice dishes soon to be marketed. (17) Meat dicing machine. Packaged Foods Division capable of processing 8,000 lb of meat/hour. (18) Three "Lo's" cheese spreads soon to be marketed. (19) Part of production plant–Cheese division. (20) "Lo's" weaning food–first product developed by the Extrusion Foods Div. (21) Packaging machine–Extrusion Foods Div.

A bar chart shows that annual sales grew from $5.1 million in 1960 to $17.0 million in 1965, to $30.0 million in 1969. The number of employees grew from 352 in 1960 to about 630 in 1970.

In 1937 K.S. Lo, the founder, who happened to be on a business visit to Shanghai, attended a lecture by Julian Arnold, then Trade Attache to the United States Embassy in Nanking. The subject was "Soybean–The Cow of China." Lo left inspired to do something about the widespread nutritional diseases then found in Hongkong. "He applied to the government for a license to manufacture soymilk in 1938. He received such a discouraging and unfavorable reply from the Sanitary Board that he was forced to give up his plan. However, a year later, Dr. P.S. Selwyn Clarke took over the chair of the Sanitary Board, and day by chance he came across Lo's application. He telephoned Lo and assured him that he would issue him the necessary license.

"Lo was overjoyed and immediately went to raise a modest capital of $18,000. He put up a small factory at Causeway Bay and the plant was opened in March 1940 by Sir Man-Kam Lo... Sales remained poor for the first two years. By the end of 1941, when the Pacific War broke out, the Company was almost on the verge of bankruptcy. The factory was occupied by the Japanese soon after Hongkong fell and Lo left for Free China [Taiwan]. In Sept. 1945 he returned to Hongkong and production was restarted in Nov. of that year." Lo started to market his product as a soft drink through soft drink outlets, instead of like milk. Sales grew rapidly. By 1949 the company had accumulated enough capital to buy a piece of land and build a new factory in Aberdeen. In the meantime the company had also acquired the Greenspot franchise. So in 1950, the Aberdeen factory was opened and used for the bottling of Greenspot while Vitasoy remained at the Causeway Bay factory. In 1952 the bottle was changed to a soft drink bottle that was sterilized. Sales skyrocketed. In 1957 the company gave up the Greenspot franchise and acquired the Pepsi Cola bottling franchise. In 1962 a new 6-story, 300,000 square foot factory was opened in Kowloon. In 1964 the company invented a powdered soymilk. That year Lo was invited to present a paper at the "International Symposium on Oilseed Protein Foods" in Japan. His concepts caught the attention of UNICEF and FAO, which had been trying to find ways of increasing protein consumption in developing countries. A joint venture with Monsanto proved unsuccessful and was terminated last year. Monsanto was given a license to manufacture a powdered soymilk concentrate.

The company has created three new divisions. The Packaged Foods Division will be introducing in the spring a line of precooked foods which are ready for the table after simply heating. They include Chow Fan, Bar-B-Q Spare Rib, Dim Sum, etc. The Cheese Division will be launching

© Copyright Soyinfo Center 2014

this year 3 types of soymilk-based cheese spreads: Chinese Fu-Yu, European Blue Cheese, and English Cheddar. The Extrusion Foods Division is developing a high-protein weaning food, and hopes eventually to branch out into snack foods and meat substitutes.

5783. Hooker, Alan. 1970. Vegetarian gourmet cookery. San Francisco, California: 101 Productions. 192 p. Edited by Helen Morrow. Illust. by Sara Raffetto. 21 x 21 cm.
• ***Summary:*** The section on "Entrees" states (p. 101-02) that one of the easiest ways to get one's daily protein is by using soya flour, which can be added to many foods.

Soy-related recipes include: Baked soy beans (p. 56). Tofu with tempura vegetables (p. 132). Page 181 recommends various vegetarian food products, including Vegeburger and Choplets (made by Loma Linda Foods), Kikkoman brewed Soy Sauce, Bakon Yeast, and Gravy Quik (which contains soy and other vegetable proteins). Address: Founder, Ranch House vegetarian restaurant, Ojai, California.

5785. Jameson, J.D. ed. 1970. Agriculture in Uganda. 2nd ed. London: Oxford University Press, Humphrey Milford. 395 p.
• ***Summary:*** Soya beans are discussed on various pages. "A significant response by soya beans to treatment with molybdate [to correct soils deficient in molybdenum] has been obtained at Namulonge" (p. 83).

As part of the banana and coffee system, practiced in most fertile parts of Uganda, a wide range of minor crops are grown, including "soya" (p. 131). The Montane systems are generally practiced by Bantu people and are based on production of bananas as the main food crop. Many minor crops are grown under this system, including "soya" (p. 135).

On pages 246-47 is a long section on "Soyabeans," by S.K. Mukasa (B.Sc., Dip. Agric. (E.A.), Senior Research Officer). "The earliest attempts to establish soyabean in East Africa are believed to have been made at Amani [German East Africa, later Tanganyika], in 1907 and 1909, using seed from the U.S.A., but these attempts were unsuccessful [See Greenway 1945]. In 1911 further introductions were made from China, Japan, and South Africa, and by 1920 the East African Departments of Agriculture were conducting trials. During the Second World War special efforts were made to encourage soybean cultivation.

"Seed distributions were organized in Buganda, Busoga, Mbale, Ankole, Toro, Bunyoro, and Lango; and demonstration plots were planted at some schools to popularize the crop. In most districts progress was very disappointing and only limited transitory success was achieved in Masaka, Mengo, and Ankole districts. The largest estimated acreage of about 40,000, for the country, was planted in 1944. During that year 4020 tons were marketed in Buganda but even here the crop was no longer popular and it had gone out of cultivation in Kyagwe County. After 1944 the acreage of soyabean rapidly declined; currently it is estimated to be less than 1000 acres for the whole country.

"Low yields and unprofitable market prices are probably the main causes of the decline. The low yields have been mainly due to bad germination and the use of poor varieties, or more often mixtures of varieties. Because of difficulties in cooking the soyabean has not been successfully incorporated into local diet; and so its cultivation is determined by market price changes. However, there are now prospects of establishing local processing industries to convert the bean into more acceptable forms which should assist in stimulating local use and stabilizing local market prices."

Concerning insect infestation and crop storage: "Soya bean is relatively free of pests if stored only for short periods" (p. 275). Address: Formerly Chief Research Officer, Dep. of Agriculture, Uganda.

insect and disease, harvesting and threshing, mechanized cultivation. Average yield. Green soybean [green vegetable soybeans]. Problems in soybean cultivation in Japan.

Table 1 shows "Production and consumption of soybeans in Japan" from 1915 to 1969. Statistics are given for planted area, production, imports, consumption, and self-supplying rate (% self sufficiency). Area and production decreased steadily from 1915 to 1945, skyrocketed in the early 1950s after World War II, then fell very rapidly after about 1954, as imports rose. Japan's rate of soybean self-sufficiency was 66% in 1915, dropping to 45% in 1925, 31% in 1935, and 18% in 1945. Then it jumped to 69% in 1950, fell to 27% in 1960, and 5% in 1969.

Soybeans are grown throughout Japan, but are most widely grown in northern Japan, particularly in Hokkaido, every prefecture of the Tohoku region and in Nagano, Niigata, and Kumamoto prefectures.

"Green soybean is harvested at the pod filling stage, boiled in the pod and used as a food." Because of the high profitability, green soybean production has gradually increased recently so that the area planted reached 7,490 ha in 1968 and 7,860 ha in 1969 accounting for 5.8% and 7.1% respectively of the total area planted to soybeans in Japan. Address: Dep. of Physiology and Genetics, National Inst. of Agricultural Sciences (Kitamoto).

5796. Steinberg, Rafael. 1970. Pacific and Southeast Asian cooking. New York, NY: Time-Life Books. 208 p. Illust. (color photos). Index. 28 cm. Series: Foods of the World.
• ***Summary:*** A superb book filled with beautiful recipes, text, and color photos. Accompanied by a 128-page spiral-bound book of recipes. Bean curd [tofu] is mentioned on pages 74 (in Indonesian *gudeg*) and 172 (in Vietnamese soup).

Recipes that call for *ketjap manis* (Indonesian sweet soy sauce) are Broiled skewered marinated chicken (Saté ajam, with 2 tablespoons *ketjap manis,* p. 88) and Spiced peanut sauce (Katjang saos, with 1 tablespoon *ketjap manis,* p. 93). The actual recipe for "Ketjap manis (Indonesian sweet soy sauce)" on page 106, which makes about 1 quart, calls for: 2 cups dark brown sugar, 2 cups water, 1½ cups Japanese soy sauce, 3/4 cup dark molasses, ½ teaspoon ground *laos,* ½ teaspoon ground coriander, and ½ teaspoon freshly ground pepper.

Note: This is the earliest English-language document seen (April 2012) that uses the term "Indonesian sweet soy sauce" to refer to *ketjap manis.*

The very interesting headnote (p. 106) states: "The

© Copyright Soyinfo Center 2014

ubiquitous American tomato ketchup, or catsup, gets its name but not its ingredients from the Malayan 'kechop' (in Chinese 'ketsiap') which originally was a pickled fish brine."

Tjolo-Tjolo (Moluccas, Broiled fish and vegetables with 3 sauces). "To prepare the ketjap sauce, mix ½ cup *ketjap manis* and 1 tablespoon of fresh lime juice in a serving bowl" (p. 107).

5797. Stobart, Tom. 1970. The International Wine and Food Society's guide to herbs, spices and flavourings. New York, NY: McGraw-Hill. 261 p. Illust. (part color). Index. 26 cm.
• ***Summary:*** For a book published in 1970, this book contains a great deal of original and useful information. Note that the word "seasoning(s)" does not appear in the title or the index. For many entries, the equivalent word in various European languages is given. In addition, for plants, the botanical name and family are usually given. Contents: Black and white illustrations. Colour plates. Introduction: The history of flavourings, the importance of flavourings, the origin of this book ("I come to this subject as a traveller who has lived in a number of different countries"), the scientific basis of flavouring, scientific, popular and foreign names, synthetic and harmful flavourings, flavouring in practice, growing herbs. An alphabet of herbs, spices and flavourings (The entries are in alphabetic order). Appendix.

Soy related entries: Harvey's sauce: "One of the old English sauces... In 1870, the courts decided there was no exclusive commercial right to the name 'Harvey's Sauce', as there are recipes for it dating back to at least the 17th century.

"Though there are many formulae, it is, in general, based on walnut and mushroom ketchup–flavoured with anchovy, garlic, and often soy sauce and vinegar. It has the appearance of Worcestershire sauce, but is not hot although it does contain some chilli."

Soy [sauce]–Soya bean: "The soy bean is undoubtedly the world's most important legume." It can be eaten as a fresh bean [green vegetable soybeans], as a dried bean and as soybean flour. It is a leading source of cooking oil "much used as a substitute for olive oil in Spain." From it one can make a kind of milk [soymilk]. "In the East [East Asia], it is also fermented to make various kinds of curd and bean cheese. The soy product which concerns us is soy sauce."

It originated in China and "is thought to have been brought from China to Japan by a Buddhist priest about A.D. 500. In the West it became well known during the nineteenth century. It is one of the ingredients of Worcestershire sauce and Harvey's sauce."

Worcestershire sauce (p. 236-37): See also the original 1970 ed. published in England.

Also discusses: Ketchup, M.S.G., oil ("The word 'oil' is derived from 'olive'"), sesame (incl. tahina. "The pure oil is almost without taste or smell and does not easily go rancid in hot countries, which is one reason for its popularity").

Address: England.

"1950 Control over soy sauce released [discontinued] and free competition started.

"1950–Capital increased to ¥200 million.

"1952–Capital increased to ¥400 million.

"1957–Kikkoman International Inc., established in San Francisco.

"1958–Capital increased to ¥1,200 million.

"1961–Capital increased to ¥1,800 million.

"1964–Capital increased to ¥2,700 million." Address: Kikkoman, Tokyo, Japan.

5801. **Product Name:** Hama-Natto Savory Miso Beans.
Manufacturer's Name: Mitoku Co. Ltd. (Distributor). Made in Japan.
Manufacturer's Address: C.P.O. Box 780, Tokyo 100-91, Japan. Phone: 33-201-6701.
Date of Introduction: 1970?
Ingredients: Naturally fermented soybeans, ginger, sea salt.
Wt/Vol., Packaging, Price: 5.3 oz (150 gm) plastic bag.
How Stored: Shelf stable.
New Product–Documentation: Product with Label purchased from Health Flavors (distributor), Brewster, New York. 2000. Nov. 10. The self-adhesive Mitoku label (orange, brown, and beige) is affixed over the printed label of the manufacturer: Marunishi, Hoi-gun, Aichi-ken, Japan. The label states: "An authentic taste of traditional Japan. Mitoku Savory Miso Beans are a traditional Japanese fermented soyfood. First prepared by Zen priests in the 15th century as part of their vegetarian cuisine, they are still handmade in the same, completely natural way, and are even now prized for their delicious gourmet flavor and rich, heavy aroma.

"Savory Miso Beans can be eaten as they are, as tasty hors d'oeuvre with tea, beer or natural saké. They are also used as a condiment, like Tekka, on brown rice, vegetables or noodles. Mixed with grated radish (daikon) and seasoned to taste with Sanbai-Su Three Taste Dressing, they make a traditional side-dish that's both delicious and full of goodness."

Talk with Jan Belleme, Mitoku's representative in the USA. 2000. Nov. 21. This product has been available since about 1970.

5802. **Product Name:** Authentic Snow-Dried Tofu.
Manufacturer's Name: Mitoku Co. Ltd. (Distributor). Made in Japan.
Manufacturer's Address: C.P.O. Box 780, Tokyo 100-91, Japan. Phone: 33-201-6701.
Date of Introduction: 1970?
Ingredients: Tofu (soybeans, water and nigari–a natural coagulant extracted from sea water).
Wt/Vol., Packaging, Price: 2.45 oz (70 gm) plastic bag.
How Stored: Shelf stable.
New Product–Documentation: Product with Label purchased from Health Flavors (distributor), Brewster, New York. 2000. Nov. 10. 5½ by 9 inches plastic bag. Orange, gold, black, white, and red. "Mitoku macrobiotic Snow-Dried Tofu is hand-crafted in the snowy highlands of central Japan by one of the few hearty families who still use the traditional methods. The result is an all natural, delicious and concentrated convenience food that stores well and readily absorbs flavors."

Talk with Jan Belleme, Mitoku's representative in the USA. 2000. Nov. 21. This product has been available since about 1970.

5803. **Product Name:** [Tsuru Habutae Frozen Tofu].

© Copyright Soyinfo Center 2014

Foreign Name: Tsuru Habutae Kôri-dôfu.
Manufacturer's Name: Tokiwa Reito Shokuhin.
Manufacturer's Address: Ina 5057, Ina-shi 396, Nagano-ken, Japan.
Date of Introduction: 1970?

5804. Carberry, James F. 1971. Our daily bread: Food faddism spurts as young, old people shift to organic diets. Concern on pesticides cited, but some see deception by quacks claiming cures. Yin and yang ice cream. *Wall Street Journal.* Jan. 21. p. 1, 12.
• ***Summary:*** Written from Hollywood, California, this article reports that "food faddism has been particularly prevalent lately." Kahan & Lessin Co., one of the nation's biggest distributors of organic foods, reports that its sales have doubled to $12 million a year from $6 million in 1968. New Age Foods of San Francisco [owned by Fred Rohé] recently opened a branch store in suburban Palo Alto, where it expects to gross $1 million during its first year.

"Health and organic food advocates say the popularity of such items–as well as the more conventional products grown under 'natural' conditions–reflects the growing public concern over pesticide poisoning and the publicity over the dangers of food additives, preservatives, and substitutes like cyclamates."

Richard Hansen is a sociologist at the University of California at Davis; he is researching the organic food movement.

"New insights into universe: Bruce MacDonald [sic Macdonald], president of Erewhon Trading Co., a Boston and Los Angeles concern that specializes in such exotic foods as hacho miso (a soybean paste), says that organic foods appeal to many dropouts from the drug culture. 'It's not just that the body's malnourished from being on drugs a long time,' he says. 'It's also that organic foods can give a person new insights into the order of the universe."

Warren Stagg, the bearded proprietor of H.E.L.P., a popular vegetarian restaurant, believes in the mystical, spiritual value of certain foods. A vegetarian diet can help elevate a person to a higher level of consciousness and bring him into harmony with the order of the universe, he says. Since 75% of H.E.L.P.'s clientele are nonvegetarians, the "restaurant offers some meat substitutes such as 'beef' stroganoff made from vegetable protein, mushrooms, scallions, bell peppers and sour cream sauce, and a 'vegeburger' sandwich that's also made from vegetable protein. Other dishes on its menu include braised tofu (soybean cake) with brown rice and a salad of cottage cheese, alfalfa sprouts, sunflower seeds, grated carrots, scallions, figs and apricots."

Note 1. This is the earliest English-language document seen (April 2013) that uses the term "braised tofu" to refer to grilled tofu.

"A group of young people following a macrobiotic diet live in an old Victorian mansion above Hollywood's Sunset Strip. They are students of the late Georges Ohsawa, a Japanese philosopher who taught about the delicate balance between yin and yang; they eat ascetic meals that include pressure-cooked brown rice and seaweed soup. There have recently been well-publicized cases of the deaths or severe illnesses of a few young people subsisting on only brown rice, the extreme form of the macrobiotic diet.

"Another famous food-faddist helped found a huge business in breakfast cereals. He was John Harvey Kellogg..." according to Ronald Deutsch, author of a history of food fads called "The Nuts Among the Berries." Deutsch then tells his inaccurate version of how Mr. [sic, Dr.] Kellogg got into the cereal business.

"One man who spends a great deal of time pooh-pooing various nutritional eccentricities is Dr. Fred Stare, chairman of the department of nutrition at Harvard University's School of Public Health." Dr. Stare discusses his pet peeves.

Note 2. Bruce Macdonald recalls (April 1992): "In early 1971 *The Wall Street Journal* ran a front-page feature story on the emerging new natural foods industry. A person from Merrill-Lynch came in and said, 'We could package this business and raise millions for you.'"

Advest Co. 1972. Dec. "A recent *Wall Street Journal* article named this industry as one of the ten highest growth industries for the 1970s." Address: Staff Reporter.

5805. Imahara, Hirotsugu; Iwai, M.; Nakahama, T. 1971. Shôyu no sanmaku-sei kôbo ni kansuru kenkyû. IX. [Studies on the pellicle-producing soy yeast. IX. Relationship between the physico-chemical properties and pellicle formation of yeast]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 49(1):8-15. Jan. [24 ref. Jap; eng]
• ***Summary:*** A pellicle or film is formed on the surface of soy sauce by various strains of *Zygosaccharomyces* yeast. The pellicle-forming yeast generally caused less sedimentation and a smaller specific gravity that non-pellicle-forming yeast. A strong negative charge was found on the surface of the non-pellicle-forming yeast and it was found to be lyophilic.

Note: *Webster's Dictionary* defines lyopilic (an adjective first used in about 1911) as "marked by a strong affinity between a dispersed phase and the liquid in which it is dispersed." e.g. "A lyophilic colloid." Address: Faculty of Agriculture, Kyoto Prefectural Univ., Sakyo-ku, Kyoto, Japan.

5806. *Soybean Digest.* 1971. One woman and the bean [Mrs. Clarence Y. Shimamura of Honolulu]. Jan. p. 50.
• ***Summary:*** "Mrs. Clarence Y. Shimamura of Honolulu has contributed to the welfare of many people.

"During the war when there was a meat shortage, Mrs. Shimamura, home economist for the Honolulu Gas Co., began a search into her past for soybean food recipes. 'I was brought up on soybean products,' she says. There

© Copyright Soyinfo Center 2014

followed many demonstrations, cooking schools, and special luncheons for the purpose of introducing soybean food dishes as meat substitutes and for their nutritious value.

"A grandmother who is writing a book of her experiences and work with soybeans, she continues to present television programs on every-day dishes containing soybeans. She visits the homes for elderly orientals to find more old recipes. She uses soy flour as well as the traditional Japanese-Chinese soy foods such as soy sauce, tofu, bean paste, and natto. Mrs. Shimamura is particularly excited by the new soy protein analogs."

Mrs. Shimamura raises her own bean sprouts and uses them in many recipes besides chop suey. She likes them in "green tossed salad, sauteed, flavored with soy sauce and mixed with chopped green onions as a vegetable dish or parboiled (when fresh) and added to egg omelet as well as to soup and stews."

While her husband was earning his law degree at Cambridge University, Massachusetts, "she became acquainted with Boston Baked Beans. She found them delicious and after returning to Hawaii experimented with soybeans until she produced the soybean Boston style recipe for which she is now so well known. Recipes are given for: Steamed Hawaiian brown bread (with "1 c. soybean flour"). Soybeans Boston style (with "2½ c. soybeans").

A photo shows Mrs. Shimamura with her soybeans Boston-style.

5807. Loring, Kay. 1971. Japanese restaurants–Tea rooms to sushi bars. *Chicago Tribune.* Feb. 7. p. F5.
• ***Summary:*** "The traditional sushi bar was introduced to Chicago by Kamehachi Sushi, 1617 N. Wells St., in Old Town." Particularly tasty in the writer's opinion is "inari-zuchi [sic, inari-zushi], soy bean pockets filled with slightly sweetened [and mildly vinegared] rice."

5808. Conversation with Farmer City Grain (Interview). 1971. Conducted by Dr. Walter Wolf of NRRL, Peoria, Illinois 61604, Feb. 22. 1 p. handwritten transcript.
• ***Summary:*** Mr. Louis West was out of town for 2-3 weeks. The person Dr. Wolf talked to said that Hawkeye and Kanrich are the major varieties used. M-I sold by Mico is Kanrich. Hawkeye acreage is decreasing and Beeson usage is increasing to supply soybeans to take the place of Hawkeye variety.

Magma, Prize and Kanrich are being used for miso [in Japan] while Hawkeye and Beeson are converted into tofu.

5809. Ebine, Hideo; Miyairi, Masao. 1971. Eiyô kyôka miso no kenkyû. VIII. Tetsu no kyôka no kokoromi [Studies on enriched miso. VIII. Trial to enrich miso with iron]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 26. p. 141-44. Feb. Reprinted from Miso no Kagaku to Gijutsu. No. 193. p. 28-30 (1970). [2 ref. Jap; eng]
• ***Summary:*** Commercial miso was found to contain 2.94 ± 0.36 mg per 100 gm at the 5% level of error. This value is very low compared with the 5.95 ± 1.15 mg per 100 gm obtained in 1955. When ferric citrate was used to enrich the iron content of miso, the addition of 1 mg of iron to 100 gm of miso gave satisfactory results, but 2.5 mg of iron gave an unfavorable effect on both the color and flavor. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5810. Horan, F.E.; Odell, A.D.; Forman, M.J. 1971. Textured vegetable proteins. *PAG Bulletin* (*Protein Advisory Group, WHO / FAO / UNICEF*) 2(1):22-26. Winter. No. 13.
• ***Summary:*** This paper was compiled from background documents presented by the authors at the 18th PAG [Protein Advisory Group] meeting held on 9-12 Feb. 1971 at Rome, Italy. Contents: Introduction. Spun monofilament products. Extrusion-expansion products (currently marketed at about $0.45/lb). General considerations. Case studies: Thailand (ADM's TVP), Brazil (Swift & Co.'s textured meat analogs), India (Swift & Co., ditto). Textured vegetable protein products: Fibroprotein–Spun Protein Fibers (Worthington Foods Div., Ohio), Textured Edi-Pro (Ralston Purina Co., Missouri), Texgran (Swift & Co., Illinois), Bontrae (General Mills, Minnesota; spun vegetable protein products), Carne Vegetal (Industria e Comercio de Productos Alimenticios Vegetal Ltd., Brazil). LiveLong–VP (Nisshin Flour Milling Co. Ltd., Japan; a wheat gluten extract in the form of a dried or frozen mincemeat-like product. "It seems to be made by a filament extrusion process using isolated wheat gluten protein"). The Farmarco Co. (Far-Mar Co., Kansas), The Fuji Oil Co. (Japan; thermoplastic extrusion), and Shefa Protein Foods Ltd. (Israel) each manufactures texturized soy food products by thermoplastic extrusion.

Introduction: "The chief virtue of the individual members of this new class of foods rests in their ability to supply precisely reproducible balanced dietary inputs of essential amino acids with greatly enhanced agronomic efficiency and with high consumer acceptance... At the moment two broad classes of meat analogues are apparent. The extrusion–expansion products sell for US 10-15¢ per pound; the spun monofilament products sell at present in the USA for 20-25% less than meats, but are still too expensive to be of interest for developing countries."

"General considerations: Meat analogs do not appear to have a negative connotation to vegetarians; there are many examples of eager acceptance of meat analogs by such groups. The textured protein approach is also a stride forward in food efficiency, since conversion of soy to animal protein averages about 7% efficiency."

"Over the past few years US/AID has entered into contracts with twelve different U.S. commercial companies to investigate and evaluate low-cost proprietary protein

© Copyright Soyinfo Center 2014

products in some ten developing countries."

Note: This is the earliest English-language document seen (Dec. 2004) that uses the word "Fibroprotein" to refer to edible spun soy protein fiber. Address: 1. ADM, Decatur, Illinois; 2. General Mills, Minneapolis, Minnesota.

Volatile substances in swollen miso packages]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 26. p. 123-27. Feb. Reprinted from Miso no Kagaku to Gijutsu. No. 191. p. 25-29 (1970). [5 ref. Jap; eng]
• ***Summary:*** "The composition of gases in a polyethylene bag in which miso swelled by the action of microorganisms during storage was examined by gas chromatography. Carbon dioxide was the major component and nitrogen and oxygen were also detected. Acetaldehyde, ethyl formate, ethyl acetate, ethanol, butyl acetate, amyl acetate, *iso*-amyl acetates, *iso*-amyl alcohol and ethyl lactate were detected. The amounts of ethanol and acetaldehyde increased remarkably when the swelling proceeded in the polyethylene bag." Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5813. Ito, Hiroshi; Ebine, Hideo. 1971. Miso no kôki seibun no kenkyû. I. Heddo gasu ni yoru kenshitsu [Studies on the flavor components of miso. I. Detection of flavor in the head space]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 26. p. 119-22. Feb. Reprinted from Miso no Kagaku to Gijutsu. No. 191. p. 22-24 (1970). [12 ref. Jap; eng]
Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5814. Ito, Hiroshi; Ebine, Hideo. 1971. Miso no kôki seibun no kenkyû. IV. Kaku shu miso no kihatsusei kôki seibun [Studies on the flavor components of miso. IV. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5815. Murata, Kiku; Ikehata, H.; Edani, Y.; Koyanagi, K. 1971. Studies on the nutritional value of tempeh. II. Rat feeding test with tempeh, unfermented soybeans, and tempeh supplemented with amino acids. *Agricultural and Biological Chemistry* 35(2):233-41. Feb. [13 ref]
• ***Summary:*** In a rat feeding experiment, it was observed that the PER value of tempeh (fresh or stored) was not significantly different from that of the unfermented soybeans (fresh or stored). However the peroxide value of the oil of stored tempeh was only 10% of that of stored soybean powder [soy flour].

"Substitution of whole egg for tempeh to supply 30% of protein in the diet improved the quality of the protein as measured by the protein efficiency ratio. An equal improvement was accomplished by supplementation of tempeh with lysine, methionine, and threonine in such amounts as the level of these amino acids equal to that in the tempeh-egg diet." Address: Food and Nutrition Lab., Faculty of Science of Living, Osaka City Univ., Sumiyoshi-ku, Osaka, Japan.

5818. Claiborne, Craig. 1971. To cook Japanese style, it helps if you have obliging butcher. *New York Times.* March 4. p. 41.
• ***Summary:*** Ayako Wakita, a slender young woman, is the wife of Aijiro Wakita, a Japanese painter and sculptor. They live in a Manhattan apartment in New York City where, she remarks, "in season" foods are not as widely available as

© Copyright Soyinfo Center 2014

in Japan. She cooks Japanese style twice a week when they entertain friends. Her recipe for Yosenabe calls for "6 or 8 one-and-one-half-inch cubes bean curd (tofu)." A photo shows beautiful Ayako as she arranges dishes on the family table.

5819. Shinoda, Osamu. 1971. Doufu kao [Thoughts / treatise on tofu]. *Ta-lu Tsa-chih* (*The Continent Magazine, Taiwan*) 42:172-78. (Also numbered p. 8-14). March 31. [12 ref. Chi; eng]

• ***Summary:*** A Chinese-language publication apparently similar in content to his 1968 Japanese-language publication by the same title.

A summary, translated into English by Ernst Wolff for Theodore Hymowitz in Jan. 1972, states: The word "tofu" first appeared in the Chinese document *Ching Yi Loo* (Pinyin: Qing Yi Lü) by Tao Goo (Tao Gu) in the early Sung Dynasty (960-1126 A.D.), although the Japanese believed that tofu technology was invented by Prince Liu An of Huai-Nan around 200 B.C. in China. Shinoda believes that the technology for making tofu was adapted from that of cheese making introduced to China by nomadic people, the so-called "Hoo." They migrated from the north into China during the period from the Six Dynasties (222-589 A.D.) to the T'ang dynasty (618-907 A.D.), in the time just before the Sung dynasty. Tofu was first a popular food among the middle and lower classes during the Sung dynasty. Then it also became part of the diet of the upper class, and was even served to the emperor and royal family during the Ming dynasty (1368-1662). Tofu was introduced to Japan by vegetarian Buddhist monks around the 12th century. On page 12 is an extremely interesting list of the 12 earliest documents (1238-1534), which Shinoda has been able to find, that mention tofu under various names. For each is given the title, the date it appeared, and the name used for tofu or the food in which it appeared. For details, see Shinoda 1968 (in *Fuzoku*).

Terms which are romanized or appear in English in this document include: Cheese, butter, yoghurt, casein, khorot, Suridofu, Hikizuri-dofu, Tofu-zu, Mori, Dengaku, tofu, Oden, Shirakabe, Mura Dengaku, Sakai, Okabe, Antofu, Ganmodoki, bean curd. A romanized Japanese verse reads:

Harusato wa Kabe no Tatoe ni Naradofu, Shiroki wa Tsuki no somuke zari keri.

Koisureba kurushikarikeri Udzidofu, Mamehito no Na o ikadetoramashi.

Note: According to Abe (1974, p. 99) this is one of Japan's earliest references to tofu; it is a waka-style poem that comes from a work titled either *Shichijû-ichiban Shokunin-zukushi Uta Awase* or *Nanajû Ichiban Shokunin Jin Utaawase* and appears in the section of poems about sômen noodle sellers. Address: Japan.

5820. Anderson, Earl V. 1971. The new priorities. Food: Preventing hunger and malnutrition. *Chemical and Engineering News* 49(10):19-22. March.

• ***Summary:*** This special report looks at new opportunites for chemists and chemical engineers in three areas: food, shelter, and health. Technology can help in solving the problems of world hunger and malnutrition. FAO "estimates that 2 billion people are hungry or undernourished, including several million Americans." USDA's Aaron M. Altschul believes that food technology, properly directed, can help solve these problems. In addition to the Green Revolution, there has been "the other Silent Revolution of this century,"... the explosive growth in our knowledge of foods and nutrition, and in the ability to engineer foods.

The emphasis has been on protein foods "because protein deficiency is the most universal nutritional problem... Of the 82 million tons consumed in the world, only 25 tons [31%] come from animal sources." Most of the animal protein is consumed by the 1 billion people in developed countries.

Protein deficiencies can be overcome by fortifying grains or natural protein concentrates–as from soybeans–with amino acids such as lysine. Or we can use new techniques for converting "inexpensive vegetable proteins into textured foods that look and taste much like the more expensive animal foods. Products have been made from vegetable protein that closely resemble beef, chicken, seafood, ham, and bacon. They cost less than the real thing yet they are nutritious and attractive. Such products from textured soy already are being widely marketed in the U.S., western Europe, and Japan. In time they may become new protein sources in the less-developed countries.

"In fact, AID now is sponsoring studies of textured products in less developed countries. Archer-Daniels-Midland is conducting one in Thailand and General Mills in Pakistan."

But what should we call these new products? You can't call it meat because it isn't. "You can call it soybeans because nobody would buy it. These products have been called animal protein food analogs... But that's not a marketable name either. The name that industry and the Government seem to be settling on is textured protein products (TPP)." The FDA has proposed a standard for TPP.

"Vitasoy, a soybean soft drink that has been sold in Hong Kong for 25 years, has captured 25% of the soft drink market there." Based on that success, "Monsanto is marketing a soy protein beverage called Puma through a franchiser in Guyana. It is now the second most popular soft drink in the country (Coke is first). Coca Cola, meanwhile, is marketing a fruit-flavored beverage, Samson, in Dutch Guiana (Surinam).

"So far, soybeans are the major source of vegetable proteins used in food fortification and TPP products."

Also discusses: Cottonseed protein, proteins from peanuts, sunflower, and safflower seeds, fish protein concentrate (FPC), and single-cell protein from petroleum,

© Copyright Soyinfo Center 2014

computer controlled food processing lines, etc.

Photos show: (1) A line spinning soy protein fibers in a liquid bath, tended by a man in a white hard hat. (2) A black boy drinking Puma in Guyana. (3) "British Petroleum's protein-from-petroleum plant at Grangemouth, Scotland." It produces 4,000 tons/year of animal-grade protein by fermentation of Candida yeasts on a petroleum substrate. Address: Senior Editor, New York City.

Address: Managing Director, International Operations, Kikkoman Shoyu Co., Ltd., Japan.

5831. Sugimoto, H.; Van Buren, J.P. 1971. Evaluations of monosaccharides, disaccharides and corn syrups as dispersants for heat-processed dried soy milk proteins. *J. of Food Science* 36(2):346-48. March/April. [11 ref]
• ***Summary:*** Addition of some of these substances to heat-treated soy milk before drying improved redispersibility of resultant dried products. Address: New York State Agric. Exp. Station, Cornell Univ., Geneva, New York 14456. Sugimoto is presently with Kikkoman, at Noda, Japan.

5832. Kosuge, Takuo; Zenda, Hiroshi; Tsuji, Kunio; Yamamoto, Takeshi; Narita, Hiroko. 1971. Studies on flavor components of foodstuffs. I. Distribution of tetramethylpyrazine in fermented foodstuffs. *Agricultural and Biological Chemistry* 35(5):693-96. May. [17 ref]
• ***Summary:*** Tetramethylpyrazine (T.M.P.) was detected in many Japanese fermented foodstuffs, especially miso (29 mcg/kg), natto (22), and soy sauce (4). Moreover, the amount of T.M.P. in miso increased almost tenfold (from 29 to 265 mcg/kg) after storage for 1 year. This fact indicates that T.M.P. may play an important part in the flavor of these fermented foods. Roasted foods, such as coffee, cocoa, and peanuts, are a rich source of alkylpyrazines. Address: Shizuoka College of Pharmacy, Shizuoka, Japan.

Address: Dep. of Agricultural Chemistry, Faculty of Agriculture, Kinki Univ., Osaka, Japan.

5834. *Foreign Agriculture.* 1971. Japanese imports of U.S. soybeans peak at 2.9 million tons in 1970. June 7. p. 5.
• ***Summary:*** Contents: Introduction. Soybean imports. Rapeseed imports. Peanut imports. Soybean production. Rapeseed production. Peanut production.

Soybean production in Japan has dropped steadily for several years, from 135,700 metric tons in 1969 to 126,000 tons in 1970 (down 7%).

"The [Japanese] Government–in order to encourage diversion of riceland to other crops and to promote the production of oilseeds–has proposed payment of approximately $393 per acre if soybeans, rapeseed, or other annual crops are planted on paddy fields in 1971. Certain farmers who plant soybeans cooperatively will receive approximately $450 per acre."

A photo shows 4 Americans watching a Japanese worker preparing to press moromi in a hydraulic press to make soy sauce.

5835. Sanke, Yukiko; Miyamoto, Teijiro; Murata, Kiku. 1971. Studies on the nutritional value of tempeh. IV. Biosynthesis of folate compounds with *Rhizopus oligosporus. J. of Vitaminology* (*Kyoto, Japan*) 17(2):96-100. June 10. [5 ref]
• ***Summary:*** A previous study (Murata et al. 1970) showed that active folate compounds were produced in tempeh during fermentation with *Rhizopus oligosporus.* This study was conducted to clarify whether folate activity in tempeh was formed *de novo* or released from a bound form during fermentation. The former (de novo formation) was found to be the case.

Folate compounds are related to folic acid. *Webster's Dictionary* defines folic acid (derived from the Latin folium = leaf, and first used in 1941) as "a crystalline pteroylglutamicacid ($C_{19}H_{19}N_7O_6$) that is a vitamin of the B complex and is used especially in the treatment of nutritional anemias." Address: Food and Nutrition Lab., Faculty of Science of Living, Osaka City Univ., Sumiyoshi-ku, Osaka, Japan (Post No. 558).

5836. Fujimaki, Masao; Kato, H.; Arai, S.; Yamashita, M. Assignors to the USA as represented by the Secretary of Agriculture. 1971. Enzymatic improvement of soybean flavor and stability. *U.S. Patent* 3,585,047. June 15. 3 p. Application filed 30 Oct. 1968. [1 ref]
• ***Summary:*** The bitter and beany (astringent) flavors of soybean curd [tofu] or defatted soybean flour can be greatly reduced by applying a proteolytic enzyme. For example, suspend 10 gm of soybean curd in 1,000 ml of dilute hydrochloric acid (HCl) (pH2.8) and allow it to be digested at 50ºC with 0.1 gm of commercially obtained aspergillopeptidase-A (Molsin, made by Seishin Seiyaku

© Copyright Soyinfo Center 2014

Co. of Japan), produced by *Aspergillus saitoi.* After 2 hours, stop the digestion by neutralization with sodium hydroxide (NaOH), obtain a precipitate by filtration or centrifugation, and treat it with 10 times its weight of 50% ethanol to remove the liberated beany and astringent flavors. Remove the wash liquid by filtration and lyophilize the treated curd. Address: Tokyo, Japan.

5837. Kushi, Aveline. 1971. Recipes from *The Book of Miso. East West Journal* 1(7):7.
• ***Summary:*** Contains a drawing by Aveline Kushi of a family making miso, plus five soup recipes and two miso relish recipes from her forthcoming cookbook.

Note 1. This is the earliest document seen by either Michio or Aveline Kushi.

Note 2. This is the earliest article on soy seen (Aug. 2002) in the *East West Journal.* Address: EWJ, P.O. Box 203, Prudential Center Station, Boston, Massachusetts 02199. $6.00 for 20 issues.

5838. Nasuno, Seiichi; Nakadai, Tadanobu. 1971. Formation of glutamic acid from defatted soybeans by *Aspergillus oryzae* 460. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 49(6):544-51. June. [25 ref. Eng]
• ***Summary:*** *Aspergillus oryzae* 460, a strain which was isolated from air, liberates twice as much glutamic acid from defatted soybeans as did ordinary shoyu molds. This strain never produced aflatoxins on two different special media for aflatoxin production. Amino peptidase activity was found to have a significant correlation with the formation of glutamic acid by the isolated strain and related strains of *Aspergillus* species. A mutant exhibiting about twice as much aminopeptidase activity as that of the parent strain was obtained by UV (ultraviolet) irradiation. Address: Noda Inst. for Scientific Research, Noda-shi, Japan.

5839. Ohsawa, George. 1971. Macrobiotics: An invitation to health and happiness. Edited and appended by Herman Aihara. Oroville, California: George Ohsawa Macrobiotic Foundation. 95 p. Illust. 21 cm.
• ***Summary:*** Contents: Introduction. What is happiness? Judgment and health. Seven conditions of health. Foods for health and happiness. How to eat. Macrobiotic external treatment.

Appendixes (by Herman Aihara). A. History of macrobiotics. B. Warning of Diet No. 7. C. How to start macrobiotics. D. Macrobiotic cooking. E. Recipes (Cornellia Aihara). F. Does the macrobiotic diet supply enough protein. G. Vitamins. H. Conclusion: Eight macrobiotic principles, the Unifying Principle, the Order of the Universe.

Soy-related recipes include: Creamed onion-miso soup (p. 41). A table showing the amount of protein in various foods includes soybeans, soy sauce, natto, and miso.

Note: In his book *Learning from Salmon,* Herman Aihara says that this was his first book, published in June 1971. The copyright page says "Copyright 1971," but the National Union Catalog seems to indicate that it was not copyrighted until 1976. The 6th printing was 1984.

5840. Saio, Kyoko; Kajikawa, Masahiro; Yamazaki, Sado; Watanabe, T. 1971. Food processing characteristics of soybean proteins. II. Effect of sulfhydryl groups on physical properties of tofu-gel. *Agricultural and Biological Chemistry* 35(6):890-98. June. [11 ref]
• ***Summary:*** "Changes in the amount of sulfhydryl groups by heating or treatment with urea were more rapid in 11S protein as compared with 7S protein." "Tofu-gel from 11S protein got harder and stronger as the amount of sulfhydryl groups increased.

"The results may suggest that tofu prepared from 11S protein has more disulfide bonds in its gel than that from 7S protein." Address: 1&3. Food Research Inst., Ministry of Agriculture and Forestry; 2. Food and Feed Research Lab., Takeda Chemical Industry, Ltd.

5841. Tabuchi, Ichiro. 1971. Saishoku-shugi no riron-teki haikei: Shokubutsu-sei tanpaku shokuhin kaihatsu ni okeru shûkyô-teki tachiba ni tsuite [Theoretical background on vegetarianism: The religious viewpoint in the development of vegetable protein foods]. *Shokuhin Kaihatsu* (*Up-to-Date Food Processing*) 6(6):31-35. June. [5 ref. Jap]
• ***Summary:*** Contents: Seventh-day Adventists. Ellen G. White's viewpoint. Seventh-day Adventist food enterprises and their purposes. Popularization of Soyalac made by San-iku Foods (Shokuhin) in Japan. The campaign for quitting tobacco in 5 days at the Adventist Tokyo Hospital (*Tokyo Eisei Byoin*).

The section on the popularization of Soyalac states: "Although in a recent issue of *Shokuhin Kaihatsu* magazine, soymilk was described as an illusory food (*maboroshi*), at least for us, it is a very real food, because San-iku Shokuhin has been making soymilk for the last 12 years and providing it for our school dormitory cafeteria meals. We have gotten good results in both taste and nutrition. With this experience and Loma Linda's formula and technique (they make formulated dairylike [chôsei] soymilk), Neo-Soyalac was born. It is a superior, nutritious infant formula.

"Soyalac was developed by Dr. Harry W. Miller, who was the world's leading authority in the field of soymilk. He spent half a century researching and developing Soyalac. It started to be produced and sold in the 1940s. Since that time it has contributed as an infant formula, and a milk substitute for children who are allergic to or dislike dairy milk. Its effectiveness and safeness have been proved by clinical experimentation. Also, Soyalac was used after World War II as an especially nutritious food for the protein-rich food program of the World Health Organization (WHO), FAO, and UNICEF and it saved many children from starvation and

kwashiorkor.

"San-iku Shokuhin is now starting this work in Japan. We are trying to popularize our soymilk through very special methods such as via our religious network, health food stores, and doctors detailings. Babies who can't drink cow's milk or had allergies have been saved. Those with rashes and sweat rashes have been cured. We have received many expressions of thanks. One mother raised her 3 children on soymilk only, and one of the three was selected at a healthy baby contest in her county (*gun*). Formulated soymilk is not a medicine, therefore we are not allowed to promote its medicinal effects. Nevertheless, these various good effects have been proved clinically and in actual experience.

"A century ago, Ellen G. White predicted that 'the time will come when we will not even drink dairy milk.' Now we feel that this prediction is coming true as we see our dairy milk contaminated with penicillin, BHC, DDT, etc. I feel that in this day and age our work to popularize soymilk, which contains no antibiotics, no chemicals, and no cholesterol, and which is so nutritious and healthy, is very meaningful." Address: Product Development Dep. (Kaihatsu-bu), San-iku Foods, Japan.

5842. Sokolov, Raymond A. 1971. Macrobiotic cooking–Learning the secrets of yin and yang. *New York Times.* July 8. p. 41.

• ***Summary:*** Cornellia Aihara, from San Francisco, California, is teaching a macrobiotic cooking class to 30 local enthusiasts in downtown Brooklyn. Each "paid $6 to attend the class, a dinner, and a lecture" by Herman Aihara. In "the mystical world of macrobiotic diet the Aihara family are the equivalent of Pope, President, and Julia Child." Herman is the director of the George Ohsawa Macrobiotic Foundation. Ohsawa, now deceased, "brought the gospel of the grain-centered diet of Zen Buddhism to the United States and Europe.

Recipes are given for Brown rice, Wakame soup with miso, and Ohsawa coffee pudding.

5843. Kushi, Michio. 1971. Re: News of macrobiotics in Boston and beyond. Letter to macrobiotic friends, July 15. 2 p. Typed, without signature.

• ***Summary:*** "1. Our home address has been changed from 216 Gardner Road to 440 Boylston Street, Brookline, Massachusetts 02146 and the telephone number stays the same, 617-734-3853. Though this house is within a residential section, it faces Route 9 and two schools are at both sides of the house. We are having, therefore, our small studies at home including seminars for teachers, juniors, seniors and women. Two weekly church lectures are continuously held, and our enterprises such as Erewhon, Sanae, Tao, and the publications are being managed by our friends. Though all these establishments are respectively advancing, except Erewhon, they are still financially unsatisfactory.

"2. In Boston about 10 friends are with American friends who have come from Europe and South America. Since Eric [Utne] and Peggy [Taylor] have returned to America for their marriage, Ron Dobrin, the editor of EWJ, is going to be in London, and Rosemary [Traill] is also leaving for London in a few days. During this summer, besides Paul and Dora [Hawken], several marriages were made and several more babies were born among our friends. Duncan and Susan [Sims] with five other Boston friends are now in their land in British Columbia and NHK is planning to introduce their development of land and cultivation in sometime October or November for Japanese people. New Hampshire's Erewhon farm is under the leadership of Richard and Elain [Mensoff; her maiden name was Sutton] and about 10 Boston friends are cultivating organic vegetables. Allan and Dorna are also there.

"3. For July 4th weekend, Herman and Cornellia [Aihara] and their two children with Bob Johnson spent three days with our Boston friends. Michel's [Abehsera's] Binghamton camp [in upstate New York] was held for a week, and Awosting Retreat is having MB [macrobiotic] summer camp this week though our friends are attending as my substitute. Lynn Miller is now in Europe and Bill Anton will join her sometime in the future. Richard and Connie [Sandler; her maiden name was Frank] are in New York, planning to study Medical science more thoroughly. Bob Petrofsky and Hy Lerner are also planning to develop their lands in Vermont, though Hy may visit Japan early in the next year to study the oriental medicine. Los Angeles house and Erewhon are smoothly operated, and many Boston friends are there, including Roger and Susan [Hillyard], Carolyn [Heidenry], Maureen [Traill], Adele [Wood], John Demoulin. Bruce Macdonald is to return to LA [Los Angeles] after Roger and Susan set out for their domestic long travel. Aveline will spend this summer by the end of August. Ron Kotzsch and Jinx, with my children, are also in Los Angeles. Becky [Rebecca] Wood will be there also.

"EWJ [East West Journal] is managed by several friends with Jack Garvey who was in Tucson [Arizona], and Bruce Gardiner with a few friends is trying to publish regularly the Order of the Universe. The Book of Do-in was published by Jack DeLangre, Macrobiotics, the Invitation to Health and Happiness, was published by Herman's Foundation, and the Book of Miso by Aveline is now being prepared to publish."

Norio Kushi adds by e-mail (27 March 2011): Maureen referred to in the letter is definitely Maureen Traill, the younger sister of Rosemary Traill. Maureen's first husband was Bruce MacDonald and they had their first child (a daughter named "Lori," who now goes by "Lorelei"), while living in Hollywood (Los Angeles) at the first macrobiotic house, 7511 Franklin Ave. Address: 440 Boylston St., Brookline, Massachusetts 02146.

5844. Kushi, Michio. 1971. Re: Japan, Boston, and Erewhon–Los Angeles. Letter to Evan Root, July 30. 1 p. Typed, without signature.
• ***Summary:*** "After you left for Japan, it has passed almost three years. During this period you have shown a steadiness of development. I have heard you are returning to Japan for a short period. By your eyes, please see the present Boston situation and what we are facing in America. You woud feel that America is changing rapidly toward MB [macrobiotics]. When you cme back to Boston, let us have a welcome party with many new friends.

"Aveline [Kushi] is now in Los Angeles until the 10th of September. On the way of coming over to the East Coast, I hope you can visit our Hollywood center and Erewhon in LA [Los Angeles], staying a few days there. Make your report and lecture there too. Let them notify [Notify them of] your arrival date before you leave Japan. They will pick you up at the airport. You may also visit San Francisco, Chico [California], Seattle [Washington], and several major places in this country, to see many friends.

"Hollywood address: 7357 Franklin Ave., Hollywood, California 90046. Phone: (213) 876-9153." Address: 440 Boylston St., Brookline, Massachusetts 02146.

5845. Hashimoto, Hikotaka; Yoshida, H.; Yokotsuka, T. 1971. [Studies on sediment of shoyu. V. Composition of sediments formed by heating of raw shoyu and isolation of precursors of sediments]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 49(7):642-49. July. [12 ref. Jap; eng]
Address: Central Research Laboratories, Kikkoman Shoyu Co., Ltd., Noda, Japan.

5846. Hymowitz, T.; Mies, D.W.; Klebek, C.J. 1971. Frequency of trypsin inhibitor variant in seed protein of four soybean populations. *East African Agricultural and Forestry Journal* 37(1):73-77. July. [8 ref]
• ***Summary:*** At least four different trypsin inhibitors have been found in soybeans. The authors used acrylamide disc electrophoresis to study 274 soybean genotypes from four diverse populations (East African, Himalayan, Japanese, and Genetic Type Collection). The Rf 0.92 electrophoretic band, which represents a trypsin inhibitor variant, was found in high frequency in Japanese plant introductions of Maturity Groups I and II.

"Perhaps, electrophoretic banding patterns of seed protein such as utilized in this study can be adapted to determine the movement of soybean germ plasm from North China to Africa, Europe, North and South America."

"In the United States, soybean cultivars may be divided into stem termination groups, namely determinate and indeterminate. Soybean cultivars grown in the north usually have the indeterminate character while those cultivated in the south possess the determinate character." All soybeans grown in northern Japan have determinate stems. Address: Dep. of Agronomy, Univ. of Illinois.

5847. Bell, Don. 1971. Ohsawa and the yin and yang of health. *Chicago Tribune.* Aug. 1. p. F23.
• ***Summary:*** The film "Joe" [1970] has a scene shot in an unusual restaurant in New York City's East Village. The dishes have unusual names like miso soup, hiziki [hijiki], and wakame salad. One man calls it "Jap food," but the waiter explains that it's "food in accordance with the order of the universe"–a definition of macrobiotics. We are what we eat. A respected scientist has stated that each year, 98% of the atoms in our bodies are replaced by new atoms that we take in from the food we eat, the water we drink, and the air we breathe.

Popular foods in the macrobiotic diet include seaweed, tahini (made from sesame seeds, a replacement for butter), Japanese azuki beans, and miso and tamari (protein-rich seasonings).

5848. Daniels, Mary. 1971. A loaf of whole-grain bread, a jug of bancha and thou: "Food for Life" is food that's "in accord with the Universe"–even on Halsted Street. *Chicago Tribune.* Aug. 1. p. F18-F25.
• ***Summary:*** "The mecca of macrobiotics in the United States today is Boston, and its Mohammed [Muhammad] is a Japanese professor of Oriental studies, Michio Kushi. Kushi is a disciple of Georges Ohsawa, who gave his first lectures in New York's Buddhist Temple in 1959." Ohsawa's followers went in two directions. In Oct. 1961, one group went to [Chico] California under the leadership of Herman Aihara. The other followed Kushi to Boston.

The first macrobiotic study house in the Boston area was established very informally about 7-8 years ago in the Kushi's home in Brookline. Soon thereafter his students founded Tao Books and Erewhon. By word of mouth and by his writings, Michio Kushi has attracted young people from all over the USA, many of them seeking something better than drugs. Soon the demands on his time were so great that Kushi had to give up his classes at Harvard to teach from his home and lecture twice a week on the true path to happiness.

Erewhon is now almost the size of a supermarket; it owns a large warehouse near the Boston docks. Eight large photos show foods sold at Erewhon retail stores. One caption mentions miso.

Part II of this article, titled "Macrobiotics: where it's at in Chicago," is about Tom Swan and his macrobiotic food store "Food for Life." This store, around which the local macrobiotic community revolves, was started in Feb. 1970 at 2356 Seminary by Ron Kotzsch, a Harvard student who had worked at the Erewhon store in Boston.

On the shelves are cans and bottles of corn germ oil and sesame oil (both auger pressed, and both with a rich, natural flavor), sesame butter, a variety of seaweeds imported from

© Copyright Soyinfo Center 2014

Japan, buckwheat noodles, "a fermented soy paste rich in energy called miso (dancers down it before a performance), and a natural soy sauce called tamari that makes you realize how much the supermarket stuff cheats you in taste. All of these things are proudly labeled 'no preservatives.'"

Also mentions: John Palumbo, Bill Tara, Loren McCune, The Caldron, Dr. Walter Kempner, Burl Ives, brown rice from Chico San, organic foods, Gloria Swanson, and William Dufty. Includes five macrobiotic recipes: Brown rice with gomasio [gomashio]; leftovers fried and served with tamari (soy) sauce. Seaweed and carrots. Bancha tea. Tempura batter. Raisin muffins.

5849. Dimler, R.J. 1971. Dried tofu made from U.S. soybeans. *Notes from the Director of the Northern Division* (*Peoria, Illinois*) No. 1040. p. 1. Aug. 6.

• ***Summary:*** "Working under a PL-480 project sponsored by Dr. Cowan (Oilseed Crops), Prof. Yosito [Yoshito] Sakurai, Japan Frozen Tofu Association, Tokyo, developed a standardized procedure for making kori-tofu (dried tofu). Salient features of the method include rapidly chilling fresh tofu to -10ºC. in 1 to 2 hours and holding at -1º to -3ºC. for 13 weeks. Basic studies suggest that the ratio of 7S / 11S proteins is important for kori-tofu, but the optimum ratio was not determined. Laboratory evaluation of four U.S., two Chinese, and three Japanese varieties of soybeans indicated that Hawkeye, a U.S. soybean, was the best variety for making kori-tofu. Browning sometimes occurs during storage because in high humidities a reaction takes place between the protein and the products from the oxidation of unsaturated fatty acids. Low storage temperature and humidities are desirable in protecting dried tofu from browning.

"Kori-tofu is a traditional Japanese soybean food. Its production requires a 3-week process that is fairly complicated. According to Professor Sakurai, the variety of soybeans used as raw material is the most important of the many process factors that affect quality and yield. Therefore, the favorable results obtained with U.S. beans are significant. In the past, kori-tofu was made primarily from Japanese and Chinese beans, about 40,000 tons annually, but now more and more U.S. soybeans are entering this market." Address: Director.

5850. *SoyaScan Notes.* 1971. Chronology of Laurelbrook in Maryland. 16 March 1992. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** 1971 Aug. 23–Laurelbrook Foods begins as a macrobiotic natural foods wholesale distributor in Forest Hill, Harford County, Maryland (about 25 miles northeast of Baltimore). The company started as a division of Cycle Parts & Accessories, Inc., a motorcycle parts company that Rod was planning to start in late 1970 shortly before the idea of starting a natural foods distribution company took form. Laurelbrook company never moved from its original location, but they kept a post office box (P.O. Box 47) in nearby Bel Air. Their original price list shows that they carried 11 products, mostly bulk organic grains and beans (including soybeans) purchased from Arrowhead Mills. Erewhon was their other major supplier from the outset. The company was founded by Rod and Margy Coates, the parents of five daughters (including Sally, Judy, Marion [Ronnie], and Dora Coates) and one son (Dan). Dora was Paul Hawken's first wife; they were married in June 1971 in Maryland. Judy was John Deming's first wife; they were married in Aug. 1972. Both Paul and John worked with Erewhon. Rod and Margy decided to call the company Laurelbrook since they lived on Laurelbrook Road in Fallston, Maryland. Rod and Margy first got interested in natural foods in 1967 when their next to oldest daughter, Judy, who had been studying macrobiotics with Michio and Aveline Kushi in Boston, Massachusetts, and had worked for Erewhon, offered to come home and cook for her parents for two weeks and let them try out the diet.

1971 Sept. 30–Laurelbrook is still considered by Rod Coates to be a division of his Cycle Parts & Accessories, Inc.

1973 Dec.–Laurelbrook opens a new, second warehouse in Raleigh, North Carolina (at 330 West Davie St.). Four people start and run the operation.

1974–Laurelbrook, which now employs 24 people, enlarges its warehouse.

1975–Feb.–Laurelbrook publishes a 6-page booklet showing that the company now distributes about 43 different food products–including soy flour, tamari, and miso.

1976 Nov.–One of Laurelbrook's employees is trying to start a labor union. Management vigorously opposes it. Laurelbrook now employees 32 people and has a fleet of 12 trucks that delivers to 350 stores. It is still a family operation, with Rod and Margy Coates, their 3 children, a son-in-law, a niece, and a nephew working at Laurelbrook.

1977–Laurelbrook outgrows its warehouse at 330 West Davie St. in Raleigh, North Carolina, so they move into a larger warehouse facility at 2319 Laurelbrook Street in Raleigh.

1977 Nov.–Laurelbrook has 44 employees. Sales last year were about $3 million.

1978 June–Laurelbrook is now importing foods from Mitoku in Japan.

1979 May–Rod Coates hires Richard Curry as accountant and general manager.

1980 March 17–At a special meeting of the board of directors, Rod informs the board that he will be retiring in one week, on 23 March 1980, his 65th birthday. He recommends that he be replaced as president by Richard Curry and that his (Rod's) official position be chairman of the board.

1981 March–Things are not going well at Laurelbrook. Rod and Marge feel that Richard is not doing a good job

© Copyright Soyinfo Center 2014

in running the company. Employee morale is down. But Richard blames the problems on Rod, and wants Rod to be less actively involved with Laurelbrook on a daily basis.

1981 March–Dora Hawken is fired from her position in the Laurelbrook office.

1981 July 21–Rod, Margy, and Dan Coates, constituting all the board of directors of Laurelbrook, resign, effective immediately. They are upset with the way Richard Curry is running the company.

1981 Aug.–Richard Curry offers to buy out the Coates' interest in Laurelbrook foods. They accept the offer. Rod and Margy keep ownership of the property and Richard was to pay them rent for using it.

1981 Nov. 21–Over the next 30 days Richard Curry places five large orders with Hain Pure Foods in the amount of $35,577.

1982 Feb. 15–Laurelbrook Foods files for Chapter 11 bankruptcy protection and does business under Chapter 11 for about 18 months. Richard Curry is president.

1982 Dec. 22–Rod Coates presents a list of items that he alleges Richard Curry sold illegally after the bankruptcy of Laurelbrook, and before the auction of the company's assets. Attached to this are letters between attorneys.

1983 Oct-Dec.–Rod and Margy Coates have to pay off the debt of $35,577 to Hain–even though they no longer own the company. In Dec. 1983 the last of the equipment in the warehouse was auctioned off.

1990 March 4–Rod Coates dies of Alzheimer's disease. As of early 1992, Judy Coates lives in Ross, California, and Dora lives in Marin, California. Address: 505 Granary Rd., Forest Hill, Maryland 21050.

5851. Perkins, Louise. 1971. Soybeans spearhead record U.S. farm sales to Japan. *Foreign Agriculture*. Aug. 30. p. 5-6.

• ***Summary:*** Since the mid-1960's Japan has been the top dollar market for U.S. agricultural exports. Australia has ranked first among U.S. competitors in agricultural trade, followed by Japan, since 1965. Canada, Mainland China, Mexico, and Thailand all contribute to Japan's soybean imports.

5852. Murakami, Hideya. 1971. Classification of the koji mold. *J. of General and Applied Microbiology* (*Tokyo*) 17(4):281-309. Aug. [40 ref. Eng]

• ***Summary:*** A taxonomical study of the genus *Aspergillus* was made centering on 403 strains of koji mold, with some other molds as reference. "Morphological, physiological, and cultural characteristics were compared, and 20 mycological characters of each strain were submitted to component analysis by a computer." The following characters were selected as the most significant keys for taxonomic differentiation: seriation of sterigmata, roughness of conidial walls, color of old cultures, diameter of conidia, and pink coloration of conidia in the anisaldehyde medium.

As a result, all the strains were shown to belong to two different clusters: (1) The *Aspergillus oryzae* group. (2) The *Aspergillus flavus* group.

The koji molds were placed in the *Aspergillus oryzae* group including *Aspergillus sojae* Sakaguchi et Yamada, *A. tamarii* Kita, *A. oryzae* (Ahlburg) Cohn, *A. oryzae* var. *viride*, var. nov., and *A. oryzae* var. *brunneus*, var. nov., and the strains other than koji mold were placed in the *A. flavus* group including *A. flavus* Link, *A. parasiticus* Speare, and *A. toxicarius*, sp. nov.

Historical review: Among the innumerable kinds of fungi found in nature, some *Aspergilli* used widely for the manufacture of Japanese foods, such as *Saké, Miso, Shoyu, Mirin, Amazake,* and so on, have long been called koji molds.

A brief definition / description of each of these foods is given.

"Ahlburg, in 1876, isolated for the first time a yellow-white mold from koji for *Saké* making." It was originally named *Eurotium oryzae* Ahlburg although it was renamed *Aspergillus oryzae* (Ahlburg) Cohn by Cohn in 1884, owing to its non-production of perithecia. Although *Aspergillus oryzae* was described in detail by Wehmer in 1895, it was not until the beginning of the 20th century that the koji mold was found to contain multiple kinds of microbes, when Takahashi in 1909 isolated many different molds from koji used in the manufacture of *Saké, Miso,* and *Shoyu* and found that all were varieties of *Aspergillus oryzae*. Address: Research Inst. of Brewing, Tax Administration Agency of Finance Ministry, Takinogawa 2-6, Kita-ku, Tokyo 114, Japan.

5853. Yamamoto, Kajiro. comp. 1971. Noren: Tokyo o shiru tame ni [Noren: In order to get to know Tokyo]. Tokyo: Shinto Manzo/Hato Basu (Bus) Kogyo K.K. 256 p. Illust. 18 cm. [Jap]

• ***Summary:*** *Noren* is the Japanese word for the decorative cloth, bearing the company crest or logo (*mon*), that hangs in the doorway of traditional Japanese shops, especially restaurants. This guidebook contains brief descriptions and sketches of famous, old, and interesting/colorful Japanese food companies and restaurants in Tokyo. Each description is by a different author, and is accompanied by a an illustration (line drawing) of the front of the restaurant. Those with a strong tie to soyfoods include Sasa-no-yuki (p. 76; founded 1703), and Shinoda-zushi Sôhonten (p. 87; founded 1872). At the back of the book is the address and phone number of each food company or restaurant, a chronology giving the year that each was founded, and several maps of Tokyo showing where each is located. Address: Tokyo, Japan.

5854. Visit to Pacific Grain Co. (Interview). 1971. Conducted by Dr. Walter Wolf of NRRL, Peoria, Illinois 61604, Feb. 22. 1 p. handwritten transcript.

© Copyright Soyinfo Center 2014

• ***Summary:*** Pacific Grain [Farmer City, Illinois] now has 20,000 acres under contract for growing Beeson variety soybeans. Beeson averages about 10 bushels per acre better than Hawkeye. Beeson, however, has a tendency for the hulls to crack which leads to splits on handling after the beans have been cleaned.

5855. Watanabe, Tokuji; Hashizume, K. 1971. [Process for production of food materials from soybean]. *Japanese Patent* 621622. Oct. 10. [Jap]*
Address: National Food Research Inst., Tokyo.

5856. *Christian Science Monitor.* 1971. Soy sauce perks up many American dishes, especially turkey and corn. Oct. 21. p. 11.
• ***Summary:*** Kikkoman began when two families in Japan started a soy sauce company at about the same time the first English families at Plymouth Rock enjoyed their first Thanksgiving. Kikkoman now has a test kitchen in San Francisco, where a home economist uses the company's soy sauce directly on meats as a table sauce.

Soy sauce originated in East Asia. "The Chinese and Japanese names for soy sauce are very similar–"see yow' and 'shoyu' respectively." The original soy sauce in China was made from soy beans, water and salt only. But in Japan, long ago, it was found that adding crushed, toasted wheat produced more natural sweetness, better color, and additional flavor notes. In China, soy sauce is still generally made without wheat–although some manufacturers now add it.

"The 'tamari' sauce sold by American health food stores is really a Chinese-type sauce made in Japan with a Japanese name." But it is no longer authentic tamari, made without wheat; it generally now contains some wheat.

Since 1898 Kikkoman has been the purveyor of soy sauce to the Emperor of Japan. They constructed a special factory for his sauce [the Goyô Gura at Noda].

5857. B.W. [Becky Wood]. 1971. Making miso in America. *East West Journal* 1(14):6.
• ***Summary:*** Contains a description with photos of how miso is made at Norio and Fujimoto, but without the details necessary to actually make miso on a commercial scale.

Chico-San is developing a domestic miso which it hopes to offer commercially in the near future. Miso expert, Junsei Yamazaki, has tested and developed miso in Chico, California for the last seven years. Mr. Yamazaki has one batch which has been aging for a year. He hopes to market this batch in six months. Chico-San will expand its plant for large-scale production as the miso is perfected.

"We called Erewhon to ask if they had plans for the production of miso and Bill Tara reported that there is a big and rapidly growing market for miso. But, he said, ideally miso should be made in a given area for consumption in that area." Erewhon will introduce to the domestic market a yeast grain called koji, essential to the production of miso.

There are currently two companies in the continental U.S. which produce miso on a commercial basis. One is located San Francisco and the other in Salt Lake City. Each produces rice miso made from white rice. The Norio Company has been located on the outskirts of San Francisco's Japan-town, at 1532 Post Street, since the company started in 1919. The company is owned and solely operated by Mr. and Mrs. Minoru Arikawa and son.

Fujimoto and Company, which originated in Oakland, California, moved to 302 South Fourth West, Salt Lake City, Utah, in 1945. Mr. Sekino heads the three-man plant. He speaks little English. Address: EWJ, P.O. Box 203, Prudential Center Station, Boston, Massachusetts 02199. $6.00 for 20 issues.

5858. Jose, Hirokazu; Sugimori, Tsunetake. 1971. [Studies on halotolerant lactic acid bacteria relating to soy sauce brewing. III. Halotolerant effect of L-proline on several enzymes of *Tetracoccus* No. 100]. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 49(10):861-69. Oct. [18 ref. Jap; eng]
Address: Kyoto Research Laboratories, Marukin Shoyu Co., Ltd., Uji, Kyoto, Japan.

• ***Summary:*** Cooked suspensions of isolated soy protein were mixed with a small amount of acid protease preparation from *Trametes sanguines.* Address: New York State Agric. Exp. Station, Cornell Univ., Geneva, New York 14456. Sugimoto is presently with Kikkoman, at Noda, Japan.

5860. Yoshimoto, Tadashi; Fukumoto, Juichiro; Tsuru, Daisuke. 1971. Studies on bacterial proteases: Some enzymatic and physicochemical properties of the alkaline protease from *Bacillus natto. International J. of Protein Research* 3(5):285-95. [28 ref. Eng]
• ***Summary:*** Various strains of *Bacillus natto* are known to produce proteolytic enzymes that have generally been classified into two groups: neutral and alkaline proteases.

An alkaline protease of the bacterium *Bacillus natto* strain Ns was purified and crystallized from aqueous solution. "The enzyme was most active at pH values between 10.3 and 10.8 toward casein substrate and completely inactivated by incubation with DFP... The fact that most strains of *Bacillus natto* so far investigated by us have also produced this type of protease suggests that *Bacillus natto* mainly secretes the alkaline protease belonging to the group of subtilisin type Carlsberg." Address: Faculty of Science, Osaka City Univ., Sumiyoshi-ku, Osaka, Japan.

• ***Summary:*** A culture medium suspension of *Bacillus natto* KMD 1126 had no significant cytolytic activity on Ehrlich ascites carcinoma cells. "But when the bacterial suspension was preincubated in the buffer at 37ºC for 2 hours, cytolytic substances were found outside the cells."

It was found that there are at least two kinds of substances in the preincubation mixture. One which had a high molecular weight, had cytolytic and hemolytic activities, whereas the other, which had low molecular weight, had only cytolytic activity. • ***Summary:*** Natto mucilage is composed mainly of an acidic glycopeptide. 600 mg mucilage was obtained from 220 gm natto (100 gm soybeans). The chemical composition of the mucilage is: sugar 61.5%, hexosamines 2.8%, total nitrogen 4.1%, amino-nitrogen 2.9%, and uronic acid 20.4%. The constituent sugars of the mucilage are arabinose, xylose, rhamnose, galactose, glucose, glucosamine, and galactosamine. The peptide portion comprises 16% of the mucilage and 17 amino acids were liberated from the mucilage on hydrolysis. Address: Kyoto Prefectural Univ., Kyoto, Japan.

ref]
• ***Summary:*** "At Shogatsu, or New Year's, Poston's tofu factory had worked overtime to manufacture a sufficiency of cakes" (p. 207).

Photos show: (1) "Tofu factory, Poston." One man is pouring soaked soybeans into the hopper of a grinder, where they are ground into a thick puree, which falls into a wooden tub on a table. Two other men are looking on. "Besides making the bean curd *tofu* cakes, these specialists manufactured Poston's *mochigoni.* In *mochigoni,* the heavy rice dough is kneaded and pounded into flaky lightness with beam and paddle, cut into cakes and deep fried in fat" (p. 162).

(2) "Tofu factory, Poston. The native bean curd *tofu* is an important and popular part of the Japanese diet." One Japanese man ladles cooked soybean purée out of an iron cauldron (mounted in a brick dais) and into a straining bag held open by a wooden frame and a second man. In this bag the soymilk is separated from the okara (p. 166).

Paul Dayton Bailey was born in 1906.

Note 1. There is no such Japanese word as *mochigoni.* The nearest word that makes any sense is *mochigome,* which means "glutinous rice." Cooked glutinous rice can be pounded to make cakes of mochi, which can be deep fried.

Note 2. Of all the government officials in California and Washington, DC, only Harold Ickes and the ACLU spoke out against the unfair treatment of Japanese-Americans in internment camps and afterwards (p. 204-05).

• ***Summary:*** World soybean production has been increasing at the rate of 2.3% per annum from 1959 to 1968. World production has grown from an average of 19,724 tonnes in 1959-63 to an average of 38,405 tonnes in 1964-68. The three leading producing countries are USA (24,789,000 tonnes average 1964-68), China (10,978,000), and Brazil (559,000). The major importing countries are Japan (347,000 tonnes average 1964-1968), West Germany (262,000), Spain (136,000), Netherlands (97,000), Italy (93,000), Canada (83,000). Fluctuating prices and major influences affecting the basic trends are discussed. Address: TPI (Tropical Products Inst.), 56/62 Gray's Inn Rd., London WC1X 8LU, England.

5882. Hirayama, Takeshi. 1971. Epidemiology of stomach cancer. In: Tadashige Murakami, ed. 1971. Early Gastric Cancer. Baltimore, Maryland: University Park Press. Gann Monograph on Cancer Research No. 11. viii + 301 p. See p. 3-19. (Tokyo: Tokyo Univ. Press). [18 ref]
• ***Summary:*** This paper outlines the results of an epidemiological case-control study of stomach cancer in Japan. Table 1 (p. 10) shows "Factors associated with the standardized death rate for stomach cancer in 46 prefectures in Japan." Many foods and nutritional elements are included. A negative association means: The more one consumes, the less one's risk of dying from stomach cancer in Japan. The author reported a significant negative association for tofu (-5.28), vitamin A (- 4.12), and calcium (-6.54), and a very significant negative association for milk (-9.19). Thus these foods and nutrients appear to protect against stomach cancer. There was a significant positive association for fermented soybeans (+4.90; probably natto) and with a large amount of highly salted foods, including highly salted miso, but not including soy sauce or regular miso.

"The number of deaths from cancer of the stomach is still on the increase in Japan. Most of the increase, however, was found to be due to the increase in population itself. When the change in age structure was taken into account, the disease was noted to be on the downward trend since 1958. The death rate for age 45-49 in 1970 was 29% less for males and 14% less for females than in 1955." The standardized death rate from stomach cancer for men in Japan (68.57) was the highest in the world, and over 7 times higher than for U.S. whites (9.42). By marital status, widowed men have the highest rate (376.3), followed by separated men (273.6), then married men (116.4), with single men (75.1) having the lowest rate.

"In an international survey of 24 countries, the decline in the death rate for stomach cancer in recent years was found to be closely correlated to milk consumption." Address: Epidemiology Div., National Cancer Center Research Inst., Tsukiji 5-1-1, Chuo-ku, Tokyo, Japan 104.

• ***Summary:*** This macrobiotic classic contains many chapters and recipes related to soyfoods and other interesting Japanese foods: Azuki and bean cookery (p. 96-98). Tofu cookery (p. 99-104). Miso cookery (p. 104-08; tofu, miso, and shoyu recipes are also scattered throughout the book). The chapter titled "Other Vegetable Cookery" (p. 110-24) contains many recipes for *kôfû,* a term used to refer to fresh wheat gluten. There are recipes for Kofu cutlets and Kofu croquettes (#419, p. 112). Skewered kofu cutlets. Kofu fukume-ni. Kofu rolls (p. 113). Deep-fried kofu chunks (#423, p. 114; it states that kofu can be purchased at Chinese grocery stores). Interestingly, there is no mention of seitan. The same chapter contains 9 yuba recipes (p. 121-22). Recipes for sea vegetables are scattered throughout the book, especially in the chapter on wild vegetables (p. 135-37). Two recipes using amazake as a sweetener appear on p. 152, and homemade amazake beverage is found on p. 169

An extensively revised English-language translation of this book was published in 1974 under the title *The Art of Just Cooking* by Autumn Press. Address: Tokyo.

• ***Summary:*** "The people in Japan, hearing how we have been treated by the Canadian Government, and that we are living in camps in the woods, send us barrels of soya sauce and miso paste."

Note 1. This book is written for elementary and junior high school students. A Japanese-Canadian girl recalls her experiences of the three years (1942-1945) that she and her family spent in a Canadian internment (evacuation and relocation) camp during World War II. It was the New Denver Relocation Center in eastern British Columbia. In late 1941 they had lived in Vancouver, BC.

"In December 1941, 22,000 men, women and children of Japanese origin were living on Canada's West Coast. Within a few months every one of them–whether Canadian-born, naturalized citizen or new immigrant–was stripped of all civil rights and submitted to three years of indignity on a scale that makes the episode the most disgraceful in the country's history" (inside front dust jacket). Address: Toronto, Canada.

5893. Tamura, Heiji; Hirano, Masaaki. 1971. Shôyu no hon [The book of shoyu]. Tokyo: Shibata Shoten. 286 + vi p. Illust. Index. 19 cm. [15 ref. Jap; eng+]

5894. Tsuji, Kaichi. 1971. Kaiseki: Zen tastes in Japanese cooking. Tokyo and Palo Alto: Kodansha International Ltd. 207 p. With 96 color plates. Original woodcuts by Masakazu Kuwata. 29 cm.

• ***Summary:*** Contents: Foreword by Yasunari Kawabata (winner of the Nobel Prize for literature in 1968). Foreword: The tea ceremony and kaiseki by Sôshitsu Sen (head of the Urasenke School of Tea and the 15th generation descendent of Sen no Rikyu, founder of the school). Utensils and Kaiseki by Seizô Hayashiya (chief curator of the Ceramics Department at the Tokyo National Museum). The twelve months of kaiseki. The kaiseki courses (defines and describes each course, such as Mukôzuke, Misoshiru [pages 168-71 give a fine description of miso and miso soup], Wanmori, Yakimono, Azukebachi, Hassun, etc.). Postscript. Notes on utensils. List of recipes. Glossary: Includes descriptions of miso, natto (incl. *Daitokuji-nattô,* p. 66), shoyu, tofu, and yuba, plus azuki and Dainagon-azuki, many types of wheat gluten (fu), kuzu, mochi, sea vegetables (konbu, nori, wakame), fresh-water algae (Kamogawa-nori, Suizenji-nori {= Kotobuki-nori}), and umeboshi.

This is a magnificent, beautiful book, the finest work available on Japan's highest form of haute cuisine, Tea Ceremony Cuisine, by a great Japanese Kaiseki chef. It was first published in Japanese by Tan-kôsha Inc. of Kyoto. Soyfoods are used throughout the book–especially miso, since one of the fixed courses in a kaiseki meal is miso soup (*misoshiru*). Many recipes use soy sauce, often the light colored type, usukuchi. Most recipes are shown in an accompanying full-color photo. The tea ceremony was developed at the court of the shogun in late Ashikaga times under such men as Soami, and his father and grandfather, Geiami (1431-1485) and Noami, who were painters, landscape gardeners, and poets in Kyoto. The greatest of the tea masters, under whom the tea ceremony (*chanoyu*) took final shape, was Sen no Rikyu (1521-1591). Zen preached the importance of the simple, uncluttered life. As a Zen priest and tea instructor, "Rikyu believed that amid the solitude of calm withdrawal from worldly cares sought by those who practice *chanoyu,* there should exist an element of creativity that leads to the serene enjoyment of beauty. The heart of this creativity, according to Rikyu's Zen aesthetics, lies in the careful avoidance of the trite, the obvious, and the emphatic. Beauty has its most powerful effects when it arises from suggestion and restraint...

"Centuries ago, it was a rule that Zen priests ate only two regular meals a day–morning and noon. But since the priests engaged in rather strenuous work, by evening they were often hungry, and to assuage this hunger they would eat a light meal, which was called *yakuseki* ('hot stones'). This term came from the practice of putting heated stones inside their clothing, by which the priests staved off hunger and cold during long sessions of meditation. When the tea masters developed the custom of serving a meal during the tea ceremony, they called it *kaiseki* ('breast stones'). By evoking the image used in the Zen term, they seasoned their specialty with religious connotations."

Soy-related recipes include: Miso soup (with aonorifu, azuki beans, and mustard, p. 29, plate 1, at Opening, the first of the 12 kaiseki months). Miso soup (with sesame custard, ginkgo nuts, and mustard), and Mukôzuke (with yuba and bonito flakes, p. 41, plate 9, at Evening). Miso soup (with wakanafu, kampyo [kanpyo], and mustard), and Azukebachi (hot dish, with sea cucumbers boiled in saké and mirin, boiled yuba, citron peel garnish, p. 53, plate 17 & 22, at New Year's). Miso soup (with Sanshu miso, roasted momen bean curd [grilled tofu], and black [soy] beans), and Hassun (with natto wrapped in sea bream fillets, and miso-pickled chisha stems, p. 65-66, plate 25 & 31, at Spring).

Note. This is the earliest English-language document seen (April 2013) that contain the term "roasted momen bean curd;" it refers grilled tofu.

Miso soup (with icicle radish, temarifu, and mustard), and Azukebachi (hot dish, with octopus boiled in saké, and yuba, garnished with Japanese pepper, p. 77, plate 33 & 36, at Doll Festival). Miso soup (with yuba, warabi fern shoots, and mustard, p. 89, plate 41, at Flower Viewing). Miso soup (with walnut custard, trefoil, and mustard, p. 101, plate 49, at Brazier). Miso soup (with eggplants, bamboo shoots, and mustard) and Wanmori (abalone and bean curd custard, chisa leaves [a variety of lettuce], and grated ginger, p. 113, plate 57 & 59, at Off Season). Miso soup (with Sanshu miso, shiratamako, junsai) and Wanmori (with yuba and egg custard, asauri, and wasabi, p. 125, plate 65 & 68, at Morning). Miso soup (with Sendai and Sanshu-miso, koimo, and hojiso), and Yakimono (with deep-fried eggplant slices coated with white miso and broiled), and Hassun (broiled burdock wrapped in yuba, and deep-fried green peppers, p. 137-38, plate 73 & 76, at All Soul's Day). Miso soup (with namafu, shirouri, and mustard), and Azukebachi (hot dish, with deep-fried dumplings of bean curd and hamo {sea/conger eel}, and broiled eggplants), and Hassun (with abalone cooked in saké and miso, soy beans in the pod [green vegetable soybeans] p. 149-50, plate 81, 85 & 86, at Moon Viewing). Miso soup (with koimo, zuiki, and sesame seeds), and Mukôzuke (with abalone, bean curd, and sesame seeds), and Wanmori (with boiled pine mushrooms and bean curd, nori, citron peel, p. 161, plate 89 & 92, at Closing).

Interesting Glossary entries: (1) *Daitokuji-nattô,* a "variety to which extra salt has been added, from the Daitokuji temple in Kyoto where it was first made as a preserve to be eaten in times of famine." (2) "*Fu* is the general name for a light cake make of wheat gluten. The two basic types of this cake are uncooked (*namafu*) and baked (*yakifu*). The names that precede the suffix refer to what has

© Copyright Soyinfo Center 2014

been added to the gluten, the shape of the cake, or the area famous for a certain kind of cake. *Aonorifu* is baked and contains *Aonokiro. Chôjifu* is made long (=*cho*-) and cut to fit the bowl. *Daitokujifu* is fried cake that originated from the Daitokuji temple in Kyoto. *Temarifu* is a cake in the shape of a child's ball (=*temari*). *Wakanafu* contains several kinds of young greens (=*wakana*) that give it a fresh springlike color."

Note: This is the earliest English-language document seen (Nov. 2011) that uses the term *Daitokuji-nattô* (with a diacritical mark above the o -> ô, and hyphenated) to refer to this Japanese type of "fermented black soybeans." Address: Kyoto, Japan.

• ***Summary:*** Table 19 is titled "Title II, Public Law 480–Total commodities by program sponsor, fiscal year 1970." The main program sponsors and distributing agencies, listed alphabetically, are AJJDC (American-Jewish Joint Distribution Committee), CARE, CRS (Catholic Relief Service), CWS (Church World Service), LWR (Lutheran World Relief), SAWS (Seventh-day Adventist World Service), UNICEF, UNRWA (United Nations Relief and Works Agency), WFP (World Food Program). Each of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. Only two foods containing soy protein were distributed: CSM (Corn soya mix) and WSB (wheat soya blend). They were sent in the following amounts (in thousands of pounds) to the following continents and countries: Africa (50,362 CSM and 6,087 WSB): Cameroon (82 CSM), Ghana (1,104 CSM and 201 WSB), Malagasy [Madagascar] (425 CSM), Malawi (61 CSM), Nigeria (41,343 CSM and 5,886 WSB), Rwanda (200 CSM), Senegal (5,301 CSM), Sierra Leone (699 CSM), Tanzania (887 CSM), Togo (260 CSM).

Near East-South Asia (192,116 CSM and 2,504 WSB): Ceylon (50 WSB), Gaza [occupied by Israel since 1967] (814 CSM and 1,892 WSB), India (189,044 CSM and 105 WSB), Jordan (680 CSM), Jordan-West Bank [occupied by Israel since 1967] (1,110 CSM), Lebanon (160 CSM), Pakistan (457 WSB), Syria (308 CSM).

East Asia (21,530 CSM and 451 WSB): Hong Kong (384 CSM and 100 WSB), Indonesia (9,245 CSM and 150 WSB), Korea (4,586 CSM), Laos (275 CSM), Malaysia (220 CSM), Philippines (1,545 CSM and 201 WSB), Ryukyu Islands [located south of Japan, incl. Okinawa, Sakishima, and Amami island groups. Self governing from 1966. Returned to Japan in 1972] (50 CSM), Vietnam (5,225 CSM).

Latin America (53,761 CSM and 2,305 WSB): Antigua (37 CSM), Bolivia (555 CSM and 173 WSB), Brazil (29,919 CSM and 506 WSB), British Honduras [Belize] (225 CSM and 20 WSB), Chile (1,726 CSM and 151 WSB), Costa Rica (679 CSM and 100 WSB), Dominica (23 CSM), Dominican Republic (7,429 CSM and 105 WSB), Ecuador (1,295 CSM), El Salvador (836 CSM and 200 WSB), Grenada (114 CSM), Guatemala (1,944 CSM), Guyana (72 CSM), Haiti (1,010 CSM), Honduras (674 CSM), Jamaica (208 CSM and 100 WSB), Montserrat (18 CSM), Panama (765 CSM and 450 WSB), Paraguay (491 CSM and 400 WSB), Peru (5,842 CSM and 100 WSB), St. Kitts (59 CSM), St. Lucia (69 CSM), St. Vincent (30 CSM), Uruguay (81 CSM).

Grand total by commodity: 317,769,000 lb of CSM and 11,347,000 lb of WSB. Agencies distributing the most CSM and WSB (in million lb): CARE 180, CRS 68, UNICEF 42.

Countries receiving more than 1 million lb of CSM and WSB combined (in millions of pounds): India 189.1, Brazil 30.4, Indonesia 9.3, Dominican Republic 7.5, Peru 5.6, Vietnam 5.2, Korea 4.6, Guatemala 1.9, Chile 1.8, Philippines 1.7, Ecuador 1.3, Jordan-West Bank 1.1, Haiti 1.0.

Concerning "veg oil" (soybean oil) shipped under P.L. 480 Title II in fiscal year 1970: India received 54.227 million lb [24,597 metric tons] (p. 116). Address: Washington, DC. Phone: 703-875-4901 (1991).

• ***Summary:*** This is the best book published to date on soyfoods in Japan; however it is written in Japanese. Contents: 1. Classifications and varieties of soybeans (p. 1). 2. Physical characteristics of soybeans (p. 5). 3. Chemical characteristics of soybeans (p. 9). 4. Standards and methods of examining soybeans (p. 47). 5. Special characteristics and problems of using soybeans for food (p. 53).

6. Current status of the soybean industry in Japan (p. 63). 7. Soymilk and various types of tofu: Aburage (deep-fried tofu pouches), ganmodoki (deep-fried tofu burgers), kôri-dofu (dried frozen tofu), soymilk, and yuba (p. 75). 8. Fermented soyfoods: Natto (p. 123-40), shoyu (p. 141-67), miso (p. 168-95), fermented tofu (*rufu*) (p. 196-202). 9. Other soyfoods: Kinako (p. 203-04), soy sprouts or moyashi (p. 206-08), tempeh or tenpe (p. 209-17). 10. Quality and usage of defatted soybeans (*dasshi daizu*) (p. 219).

© Copyright Soyinfo Center 2014

11. New food uses of soybeans and especially defatted soybeans (incl. 70% soy protein powder, soy protein curds, soy protein isolate, surimi gel, spun soy protein fibers) (p. 229). 12. Advice regarding supplying protein from organizations such as the United Nations and FAO (p. 257).

A 47-page translation of portions of this book (parts of Chapter 6 and all of Chapter 7) by Akiko Aoyagi and Chapters 8.1 and 8.2 by Alfred Birnbaum are available at Soyfoods Center.

• ***Summary:*** An excellent scholarly work. This chapter was translated by Alfred Birnbaum. Chapter 8, titled "Fermented soyfoods," has four parts, beginning with "Natto."

Introduction: There are two types of natto: regular natto (*itohiki natto*), produced by the action of natto bacteria on cooked soybeans, and salty natto (*shio-natto*), produced by letting a koji mold [*Aspergillus oryzae*] grow on the cooked beans [to make soybean koji], then adding salt water. Although both are traditional fermented soyfoods that have been passed down in Japan from ancient times, the fermenting agent, production method, and nature of each product are different. The main fermenting agent for regular natto is bacteria and, as no salt is added to the basic ingredients as with salty natto, the ripening time is shorter, although the finished product does not keep well. Also regular natto has the characteristic of forming large amounts of sticky filaments. We will discuss salty natto separately.

At present, the production of regular natto is by far the larger of the two, being carried out in all regions of Japan; this product is better known and is usually referred to as simply "natto."

8.1.1 Regular natto (*itohiki nattô*)*:* (a) The history of natto: The origins of natto are not certain, but tradition has it that it was discovered some 1,000 years ago in the Tôhoku [northeast] region of Japan and has been passed down to the present. At first it was made by wrapping cooked soybeans in rice straw, but since 1920, when Dr. Hanzawa of Hokkaido's Agriculture Department first succeeded in producing pure-culture bacteria, industrialized production has been carried out as it is today using this pure culture. Whereas formerly, when natural fermentation dependent on the natto bacteria found in the rice straw meant instability of production levels and many questions of sanitation, this new method has become the basis for today's comparatively safe industrialized natto production.

(b) Regionality of natto consumption: Before World War II, consumption of natto was confined almost exclusively to the Tôhoku region (northeast prefectures) and further north, though recently it has spread throughout Japan. This tendency is most noted in the cities, which are now areas of large consumption. For example, looking at the cities listed by prefecture in the Tables of National Consumption, we find that in 1968 the average amount per capita spent that year on natto was highest in Sendai at 967 yen, followed by others such as Sapporo 719 yen, Fukushima 915 yen, Mito 871 yen, Tokyo 489 yen, Nagoya 177 yen, Kyoto 183 yen, Osaka 98 yen, Hiroshima 139 yen, Matsue 144 yen, Matsuyama 78 yen, and Fukuoka [the furthest south, in northern Kyushu] 217 yen, the national average being 343 yen. While there exist many large differences between the various in money spent, we can see clearly that the consumption of natto has spread nationwide.

8.1.2 Natto bacteria and their characteristics: Although natto has a history of some 1,000 years, the history of bacteriological research on the bacteria that produce natto amounts to less than 100 years. The oldest bacteriological study on natto-producing bacteria in Japan is thought to be Yabe's report in the 15th issue of the *Journal of the Japanese Chemists' Society* (1895) that he had succeeded in isolating several strains of bacteria from natto.

From that time on, much research was carried out on natto bacteria, but it was not until 1906 that Sawamura successfully isolated from those natto bacteria a bacterium which, when recultured on cooked soybeans, would consistently produce the characteristic sticky filaments and flavor of natto. Upon researching the morphological and propagative characteristics as well as the physiological makeup of this bacterium, he found it to be very similar to *Bacillus mesentericus* and named the new strain *Bacillus natto* Sawamura. This research ascertained that natto is produced solely by the fermenting action of the natto bacteria. The bacteriological characteristics of this strain are shown in Table 8.1.

However in the 6th edition (1948) of *Bergey's Manual of Determinative Bacteriology* recognized the world over as the authoritative classification of bacteria, *B. natto* Sawamura is listed under *B. sublitis,* whereas the 7th edition fails to list it at all. In other words, as far as Bergey's classification is concerned a sub-strain of *B. subtilis* is responsible for natto fermentation. Be that as it may, culturing any of the bacteria which closely resemble *B. natto,* such as *B. subtilis, B. cereus, B. megaterium,* or *B. mycoides,* on cooked beans fails to produce a product of natto's sticky filaments and flavor.

The choice of strains to be actually used in producing natto is carried out by testing which successfully produce a natto with characteristic filaments and fragrance. Moreover, common to all natto bacteria chosen in this way are found to be certain marked differences from other *B. subtilis* strains. For example, while natto bacteria can neither germinate nor grow without biotin, other strains of *B. subtilis* can. Further, while a bacteriophage that dissolves natto bacteria has been

© Copyright Soyinfo Center 2014

discovered, this bacteriophage has no effect on other strains. Judging from evidence such as this even if natto bacteria were to be classified under *B. subtilis,* for all practical purposes they are clearly a bacterial group having special characteristics distinct from other *B. subtilis* strains.

8.1.3 Natto bacteria growth and soybean composition: Natto bacteria grow well on cooked soybeans of course, but they also grow well on other beans, and other foodstuffs of plant origin such as grains. They can even grow on animal foodstuffs such as meat, fish, and dairy products. However, growth on plant protein is greater, as is the production of sticky filaments. As exhaustive research has been carried out on the composition of nutrients needed for the germination and growth of natto bacteria, and those nutritional requirements are now clear. The result was that natto bacteria use sugars, particularly dextrose, sucrose, glucose, etc. as sources of carbon, and that sucrose was necessary not only for bacterial growth, but also for the production of the sticky filaments. Soybeans are approximately 20% of carbohydrate in composition, some 30% of that being sucrose, enough for the growth of natto bacteria.

Protein, that is to say amino acids, are used as nitrogen sources. Of these amino acids, natto bacteria find glutamic acid, arginine, aspartic acid, proline, etc. easy to utilize whereas threonine, tryptophane, phenylalanine, methionine, etc. are comparatively difficult. However of the amino acids composing the soybean's protein, that former group of amino acids readily utilized by natto bacteria is in greater abundance than the latter less readily utilized ones such as methionine and tryptophan. Though not solely for this reason, it is nonetheless true that natto bacteria grow better on a culture medium of glycine, the soybean's major protein, as a nitrogen source than on a culture medium of milk casein.

In regard to vitamins, natto bacteria require biotin, any culture media lacking in biotin being incapable of causing spore germination or growth of the nutrient cell (*eiyo saibo*). Though certain bacteria classified as belonging to the same genus, such as *B. subtilis, B. megaterium,* and *B. cereus,* do not require biotin, besides *B. natto* such other members of the *Bacillus* family such as *B. mycoides, B. pumilus,* and *B. coagulans* do not require biotin, while the absolute minimum density of biotin necessary for natto bacteria growth is 0.18%, complete growth requires at least 18%. Other vitamins particularly the B group, are useful in creating a suitable growing medium for natto bacteria, and as shown in Table 8.2, soybeans contain biotin sufficient not only for the germination of natto bacteria spores, but also for the propagation of the nutrient cell, thus eliminating any need for adding biotin in the production of natto.

8.1.4 Natto bacteria growth and environment: Beyond a doubt the single most important thing in the production of natto is to allow the natto bacteria to grow fully on the cooked soybeans, however in order to achieve this, it is also important to know what environmental conditions are most conductive to the germination and propagation of natto bacteria. In the production of natto, the natto bacteria used are in the forms of spores, either in a liquid cells (*eiyo saibo*) and finally proceed into cell division.

The optimum temperature for natto bacteria spore germination is approximately 40ºC, most spores having germinated and begun propagation within 2 hours on a peptone-glucose culture medium, though at 50ºC the germination is rather slow, and at 55ºC and above no germination can be found within a 24 hour period.

Tables show: 8.1 Propagative and physiological characteristics of *Bacillus natto* Sawamura. 8.2 Vitamins in soybeans (per 100 gm). Continued. Address: National Food Research Inst., Tokyo.

• ***Summary:*** An excellent scholarly work. This subchapter was translated by Alfred Birnbaum. Chapter 8, titled "Fermented soyfoods," has four parts, beginning with "Natto."

Introduction: There are two types of natto: regular natto (*itohiki natto*), produced by the action of natto bacteria on cooked soybeans, and salty natto (*shio-natto*), produced by letting a koji mold [*Aspergillus oryzae*] grow on the cooked beans [to make soybean koji], then adding salt water. Although both are traditional fermented soyfoods that have been passed down in Japan from ancient times, the fermenting agent, production method, and nature of each product are different. The main fermenting agent for regular natto is bacteria and, as no salt is added to the basic ingredients as with salty natto, the ripening time is shorter, although the finished product does not keep well. Also regular natto has the characteristic of forming large amounts of sticky filaments. By comparison, salty natto requires that the koji-molded soybeans ripen in saltwater, the main fermenting agents being the koji mold in the beginning, and yeasts and lactic acid bacteria towards the latter end of the process. As the amount of salt present is high, the ripening time required is comparatively long, taking ordinarily from several months to about a year. Salty natto is usually sold as a blackish, semi-dried product, with absolutely no formation of sticky filaments, but rather with a distinctive flavor derived from the addition of the salt and other seasonings. The large amount of salt used also makes it keep well.

At present, the production of regular natto is by far the larger of the two, being carried out in all regions of Japan; this product is better known and is usually referred to as simply "natto." On the other hand, salty natto is produced as the specialty product of such specific places as Kyoto (*Daitokuji nattô*), Nara (*Jofukuji-nattô*), and Hamamatsu (*Hama-natto*) (p. 123).

© Copyright Soyinfo Center 2014

8.1.9 Hama-nattô: Hama-natto is a variety of salty natto made in and around Hamamatsu in Shizuoka prefecture. It is unrelated to regular (*itohiki*) natto except that both are fermented soy products. Rather, it is closer to miso. It is said that the first true production of Hama-natto dates from the time when Tokugawa Ieyasu became the lord of Hamamatsu Castle [1568] and wrote instructions to the monks of the nearby Daifukuji temple.

(a) Production method: The basic ingredients are 100 kg soybeans, 9.2 kg wheat or barley flour, 18 kg salt, 7.5 kg of ginger, and koji starter. Large-seeded soybeans, such as those from the Orani region of Hokkaido or Tsuru-no-ko are used. The wheat or barley is roasted then ground to a no. 85 mesh or finer flour. The ginger is thoroughly washed, thinly sliced, and pickled in shoyu [Japanese soy sauce].

Fig. 8.4 is a flow chart of Hama-natto production. First inspect the large soybeans for any extraneous matter or imperfect beans, then wash them thoroughly to rid them of any sand or dirt. Soak in water at 20ºC for 3-4 hours, then allow to drain for several hours. Steam for 5-6 hours at normal pressure, then leave overnight in the steaming vat. The next morning, spread out the beans and allow to cool to below 40ºC. Then mix in koji starter (*tané-koji*). Sprinkle the roasted flour on top of this and mix the entire mass well.

Spread the mixture evenly in wooden koji trays and place in a koji incubation room at 30-33ºC for approximately 50 hours to allow the growth of the koji mold. When the mold has grown sufficiently, remove the koji rays from the incubation room and allow to sun-dry outdoors until the moisture content of 30-35% at the time of removal from the room, falls to 20-25%, at which point place the mixture in wooden kegs or small vats. Add enough saltwater (or shoyu, which is occasionally used) to just cover the molded soybeans. Place a pressing lid and weight on top of the mixture, and allow to stand for 6-12 months as it ripens.

After the full fermentation is complete, spread the mixture out on a cloth to dry in the sun and mix in the pickled ginger, to make the final product.

Hama-natto is a simple food [or seasoning], dull blackish in color, but the flavor is deep and rich, and its nutritional value and storability are both excellent. Its percentage nutritional composition is shown in Table 8.10. Address: National Food Research Inst., Tokyo.

5900. Watanabe, Tokuji; Ebine, Hideo; Ohta, Teruo. eds. 1971. Nattô [Natto]. In: Tokuji Watanabe, H. Ebine and T. Ohta, eds. 1971. Daizu Shokuhin [Soyfoods]. Tokyo: Korin Shoin. 271 p. See p. 123-38. [Jap; eng+]

• ***Summary:*** Continued. The same is also true of 10ºC and below. Thus, the ideal temperature for the initial fermentation period of natto is approximately 40ºC, though in actual production practices the natto bacteria inoculation takes place at 80ºC and above. This is not only due to the fact that natto bacteria spores are highly resistant to heat and lose almost no germination strength at this temperature, but also because germination proceeds rather more effectively if the dormant spores are exposed for a short period of time to high temperature.

For example, if the spores are given a heat treatment of 100ºC for 10 minutes or 85ºC for 30 minutes, the germination rate goes up. Of course, once the heat treatment is completed it is necessary to reduce the temperature to the optimum germination temperature immediately. Loss of capacity for germination due to heat only at 100ºC for 30 minutes and above. Further, there is almost no lowering of the germination rate from low temperature, even at -20ºC for 1 year. Once germinated, however, the nutrient cell does not have the heat resistance of the spore = its optimum propagative temperature being 40-50ºC, it would die in 5 minutes at 100ºC. Further, while growth can be found at 50ºC and below on culture media with good nutritional conditions for natto bacteria, such as cooked soybeans, no growth can be found on media lacking those conditions. At 55ºC and above, growth almost stops, and at 20ºC and below, the growth rate drops to 1/10 or less of that at 40ºC.

Natto bacteria growth is also effected by hydrogen ion density. While natto bacteria propagate well in neutral to slightly alkaline pH, both germination and growth decrease with increased acidity, and severe harm occurs at pH 4.5 and below. Most cooked soybeans fall within the range of pH 6.4-6.8, and as ripening progresses they gradually become more alkaline, reaching pH 7.2-7.6 at the completion of their ripening process. Also, oxygen is needed for natto bacteria growth, yet though in actuality the density of carbon dioxide in the natto fermentation chamber sometimes goes over 15%, it has almost no effects on natto's ripening process.

8.1.5. Natto production: In the past, natto was made by wrapping cooked soybeans in rice straw and leaving them in a warm place, allowing the natto bacteria on the straw to transfer to the cooked beans and having them ferment until filaments formed, whereas today's natto uses pure cultured natto spores for inoculation and convenient sanitary containers, the temperature and moisture levels of the fermentation chamber being controlled by automatic regulatory equipment, typical of the many modernizations now applied. Natto production proceeds as shown in figure 8.1.

(a) Ingredient soybeans: up to 10 years ago, domestic medium-sized and small beans were used as ingredient soybeans for natto. Besides specifically small bean varieties, beans sorted out as small through a mesh called *"Banseki-shita"* were used; as shown in Tables 8.3 and 8.4, the compositional differences between different bean sizes of the same variety were small, whereas the differences in size distribution according to growing region were particularly notable. Both the Koganeshiro and Kitamishiro varieties shown in the tables produced a greater number of small bean soybeans when grown in the Kitami Region than in

© Copyright Soyinfo Center 2014

the Tokachi Region. Further, if one compares the relatively small weight per thousand beans Tokachi-nagaha and Koganeshiro varieties from the very same Tokachi Region, or even the Kitamishiro variety, there is no sharp difference in composition, nor even much difference in the complete sugars (zentô) (that portion of reduced sugars produced through hydrochloric acid hydrolysis) which greatly affect the qualitative value of soybeans used for natto.

Thus while the reason may not always seem clear why small beans are so highly regarded as ingredients for natto, upon thorough inquiry we find that small beans have a higher water absorbency, the cooked beans are easier to make natto from, that production proceeds more smoothly, and finally, the small beans are easier to eat.

Compositional differences between soybeans are clearly reflected in quality, much as in the last 10 years we have seen a move from using domestic Japanese soybeans to using those imported from China, to where now 80% of all soybeans used for natto production are Chinese soybeans. Although one might cite the nationwide rise in production technology levels as the reason, the main reason for this shift is that domestic soybean planting has decreased, making them a difficult to obtain ingredient priced far above imported soybeans.

Domestic soybeans contain more carbohydrates, especially the fermentable sugar, sucrose, than imported soybeans, the cooked beans having a better, more naturally sweet flavor. For this reason, natto bacteria propagate better, with excellent formation of sticky filaments, and the natto is generally easier to produce. Among imported soybeans, Chinese beans are preferred, American beans being said to be difficult to make natto with, though it not the case that American beans have been found unconditionally not suitable for natto, but rather that they have not been used because American soybeans have not yet been thoroughly studied. Among Chinese soybeans, Manchurian small bean varieties are preferred, such other varieties as Jingshanpu, Hulan, and Dengshou also enjoying some reputation. Certain small beans selected from those American soybeans imported for miso production are also used for natto.

(b) Selection and washing: The ingredient soybeans are first put into a sorting machine which removes extraneous materials, imperfect or damaged beans, and dirt and sand, and also performs the needed bean size sorting, though nowadays the soybean wholesaler has taken on the responsibility for this step. The selected soybeans are then washed at the natto factory to remove any sand and dirt on the beans' surface. This step utilizes the bean washing machine pictured in Figure 8.2 (photo).

(c) Soaking: After washing is completed, the soybeans are soaked in water to allow full absorption of moisture. The amount absorbed by soybeans is 1.2 to 1.5 fold, that is to say they become 2.2 to 2.5 times the weight of the soybean before soaking. In order to achieve this full absorption, a soaking of 24-30 hours at a water temperature of 0-5ºC, 16-20 hours at 10-15ºC, or 8-12 hours at 20-25º is necessary. A 200-400 L stainless steel or plastic-lined tub is used for the soaking container. Ordinary water may be used for soaking if it meets the standards for drinking water, though if the calcium hardness is 500 p.p.m. and above, softening the water with conditioning agents allows the beans to cook softer, and if the iron content is 5 p.p.m. and above, it is necessary to remove the iron to prevent a blackening of the cooked beans.

(d) Cooking: Almost all cooking is presently done in steam-trapping pressurized vats, 60 kg (4 *tô*) capacity, 70 kg (5 *tô*) capacity and 120 kg (6 *tô*) capacity vats being equipment in standard use. See Fig. 8.3 (photo of pressure cooker). Gradually, more and more stainless steel vats are coming into use. The newest vats are cylindrical with hand or electric-powered mechanisms for rotating the drum, thus not only eliminating any unevenness of cooking and facilitating removal of the cooked beans, but also occasionally allowing for the natto bacteria inoculation to occur in the vat with the following step of mixing accomplished by rotating the drum. In cooking, the pressure inside the vat is allowed to reach 1 to 1.5 kg/cm squared, and maintained at that level for 20-30 minutes, after which time the pressure cook is opened slightly to allow the pressure to fall.

(e) Natto bacteria inoculation and packing: The natto bacteria used is that sold directly from the specialist manufacturer of inoculant bacteria, available in either liquid or powdered form, though both contain approximately 1-10 x 10^7 natto bacteria spores per gram. Usually 5 gm of inoculant bacteria diluted in 3-5 liters of sterilized water is used per 60 kg of soybeans. The normal method of inoculation is to sprinkle the dilute bacterial solution or to pour it with a ladle over the cooked beans while they are still 80ºC or above.

Figures show: 8.1 Flowchart of natto production. Tables show: 8.3 Soybean characteristics by size and by growing region. The regions are: Koganeshiro: Tokachi, Kitami, Kitamishiro: Takachi, Kitami. Tokachi-nagaha: Tokachi. For each sub-region are given figures for large, medium, and small soybeans–15 in all. For each of the 15 soybean types, the following figures are given: Distribution by bean size (percentage; totals 100% for each region). Seed to coat ratio. Weight per 1,000 beans (gm) (ranges from 272 to 131). Water absorbency (%) after 8 hours, 15 hours, and 24 hours. Percentage of eluted solids (*yôshitsu kokei-bun*) after 24 hours. Note: Elution is a term used in analytical and organic chemistry to describe the process of extracting one material from another by washing with a solvent.

Table 8.4. Soybean composition by size and by growing region. The 3 regions and 5 sub-regions are the same as in table 8.2. For each of the 15 soybean types is given percentage of moisture, protein, fat, carbohydrate, ash, total sugars (zentô). Continued. Address: National Food Research Inst., Tokyo.

• ***Summary:*** Continued. As soon as inoculation is completed, a standard measure of the cooked beans is immediately packed into containers. This packing step is the step lagging most behind mechanization in natto's production process. Although an automatic measuring and packaging machine to pack a standard measure of the cooked beans into containers without harm will no doubt be developed someday, at present this step is largely done by hand. One reason is that the containers used are specialized and of many types.

(f) Containers: The packaging containers for natto are made of straw, then wood sheets, man-made paper, polyethylene, high-density polyethylene (a kind of HDPE, *haizekkusu* = Hai-Zex, developed by Suzuki Chemical Co.), polystyrene, etc. alone or in combination. Although with straw and wood sheeting, there are problems of sanitation caused by the presence of many unwanted bacteria, the image of simplicity presented by such materials is well suited to a traditional food such as natto, and many consumers like such packaging. Thus, straw and wood sheeting are used, having been sterilized first.

(g) Fermentation chamber: Up until a few years ago, natto was made in insulated double-wall fermentation chambers, the temperature being controlled by charcoal fire or electric heat, and the moisture level being maintained by boiling water in the chamber, but since the development of automatic natto production equipment, natto can now be made without the constant care that was formerly required. The principle behind this change of improved insulation, thus accommodating and averaging of fermentation chamber interior temperature and moisture levels.

The natto bacteria on the cooked beans germinate around the optimum temperature of 40ºC. At this time, heat is not yet produced by fermentation, so a pilot light is used to prevent the chamber temperature from falling below 40ºC. Some 4-6 hours after placement in the chamber, a fermentative heat accompanying the natto bacteria preparation arises, and both the temperature of the product and of the chamber increase. The equipment is set so that cooling will come on during this time if the chamber temperature rises to 42-45ºC and above. Within approximately 6-8 hours, the product temperature climbs to 50-53ºC. After several hours at this temperature, the product temperature is cooled to external air temperature and fermentation is stopped approximately 14-18 hours after placement in the chamber. To prevent the moisture level in the fermentation chamber from reaching the dew point under the forced-air cooling, care is taken to prevent excessively moist air from being cycled into the chamber.

(h) Storage and transport: Once fermentation is completed, the natto is taken out of the fermentation chamber, cooled to 10ºC and below in a cooling chamber and then shipped. In case it is not to be shipped it is kept at 2-7ºC in a refrigeration room.

(i) Natto production results: The ingredient soybeans vary somewhat, but 100 parts soybeans will produce 220 parts cooked soybeans and 200 parts natto.

8.1.6 Compositional changes in the soybean during the natto production process: (a) Chemical change: As natto bacteria fermentation progresses the components of the soybean break down and its structure softens, thus making it easier to digest and absorb. Concerning the changes occurring throughout this period (as shown in Table 8.5), we find that among the carbohydrates, the complete sugars those reduced sugars released by 205% hydrochloric acid hydrolysis, decrease from the beginning to the middle of fermentation. From the start of heat production during the fourth hour of natto's fermentation when protein reduction begins to the completion of ripening at 16-18 hours, we find that nearly 60% of the protein has been changed into water soluble nitrogenous compounds, though only a relatively minor approximate 10% have been reduced to amino acids. The progressive stages of protein reduction are shown in Table 8.6. After the sixteenth hour at which natto's ripening is generally thought to be complete, there is an increase in ammonia production, bringing an increase in a distinct ammonia smell.

(b) Changes in soybean structure caused fermentation: Although the main changes in protein are as described above, the changes in soybean structures brought about by the action of natto bacteria are as in the summarized observations reported by Iguchi, et al. While both uncooked and cooked soybeans stained to a uniform brick color throughout by Millon's reagent (*miron shikiyaku*), it was clearly found that natto is broken down progressively from the outer surface, and on staining fat with Sudan III, both uncooked and cooked soybeans showed a distribution of fat globules of uniform size throughout the cell, but in natto's outer cells, the breakdown of the protein causes these fat globules to fuse together into large clusters. Further, in the outer surface of the soybean, it was shown that when the intercellular material breaks down the state of decomposition has begun.

Note: Sudan III is a lysochrome (fat-soluble dye) diazo dye used for staining of triglycerides in frozen sections, and some protein bound lipids and lipoproteins on paraffin sections.

Saio et al. have observed under the electron microscope the structural changes undergone by the embryonic leaf of the soybean during the natto production process, and according to their findings, the components of the soybean do not exist uniformly throughout the soybean; for example, the bean becomes natto the protein bodies themselves are broken up and fat droplets spill out into the intercellular areas, though upon staining with osmium tetroxide (*shisanka*

© Copyright Soyinfo Center 2014

osumiumu) stain it was found that the fat had already lost the ability to maintain a droplet state and had permeated the cellular structure itself.

8.1.7 Special components of natto: (a) Natto flavor: The flavor of natto being produced by natto bacteria fermentation, it is said that the main flavor comes from substances broken down from soybean proteins. As stated under the heading of Compositional Changes During Fermentation, the breaking down of soybean proteins under the action of natto bacteria turns 50-60% of those proteins into water soluble nitrogenous compounds, of which 10% are amino acids. Table 8.7 on the distribution and isolability (ability to be isolated) of the amino acids in natto shows that each amino acid is different and that glutamic acid, said to be directly related to flavor, has a isolability of 11%, with a rather strong 0.36 gm per 100 gm of natto. In addition, such other amino acids as threonine, tryptophan, leucine, valine, etc. have high isolability.

Organic acids are also related to flavor. As shown in Table 8.8, acetic and lactic acids are in abundance, although the same amounts are present in cooked beans. Those organic acids that increase in fermentation are butyric, propionic, and succinic (*kohaku-san*) acids, the production of butyric acid being greatest in rice straw-wrapped natto. Occasionally there will be a bitter taste or strong smell to natto, or a mold-like spotting on its surface, the bitter taste coming from a peptide having isoleucine at its nitrogen extremity, and the mold-like spotting often being a crystallization of tyrosine. Further, the main causal component of the unpleasant smell, commonly referred to as "lazy fragrance" (*fushoko*), is said to be isovaleric acid. That which known as the smell of natto is related to the presence of the above-mentioned ammonia, organic acids, fatty acids, etc., as well as to diacetyl (*jiasechiru;* IUPAC systematic name: butanedione or 2,3-butanedione). Diacetyl increases along with natto ripening, though it decreases with the storage of the final product. Note: Diacetyl is a natural by-product of fermentation.

Tables show: 8.5 Compositional changes in natto during fermentation (after 0, 4, 8, 12, 16, and 18 hours).

8.6 Morphological changes in nitrogenous compounds (percentage of dry material, percentage of total nitrogen) after 0, 4, 8, 12, 16, and 18 hours.

8.7 Amino acids in natto (per 100 gm) (total amino acid, gm), isolable amino acid (gm, isolability %).

8.8 Organic acids in natto (Kibara et al.) (After 0, 3, 6, 9, 12, 15, 16 hours of fermentation, and after 1 or 2 days of storage). For each time is given: Moisture (%), valeric acid (or pentanoic acid), butyric acid, propionic acid, acetic acid, levulinic acid (*reburin-san*), succinic acid (*kohaku-san*), lactic acid. Note: Formation of sticky filaments begins after 3-6 hours of natto fermentation. A strong smell is emitted after 2 days of storage. Address: National Food Research Inst., Tokyo.

5902. Watanabe, Tokuji; Ebine, Hideo; Ohta, Teruo. eds. 1971. Nattô [Natto]. In: Tokuji Watanabe, H. Ebine and T. Ohta, eds. 1971. Daizu Shokuhin [Soyfoods]. Tokyo: Korin Shoin. 271 p. See p. 123-38. [Jap; eng+]

• ***Summary:*** Continued. 8.1.8 Natto-related products: (a) Dried natto: Natto is either soaked in strong saltwater, or sprinkled with table salt and left for 15-20 hours, at which time it is spread out thinly in a container and sun-dried. If mechanical heat drying is to be used, a moisture-tight container through which dry air with less than 20% moisture and approximately 40ºC is circulated until the moisture in the natto reaches 8% or less. If the drying temperature exceeds 60ºC, flavor and coloration are affected unfavorably.

(b) Natto hishio: Rice koji and table salt are added to natto and weighted for 2-3 weeks until ripened. Kombu, ginger, dried daikon, and salt-pickled vegetables are sometimes also added. The usual ratio of natto to rice koji to salt is about 5:4:1.

(c) UNICEF Powder: The Japanese Ministry of Agriculture and Forestry's Food Research Center under request from UNICEF for 3 years starting from 1959 co-operated in research to develop a dried powder form of natto. It is a "predigested" high soy protein powder in which the soybean structure has been softened by a short fermentation by natto bacteria.

The product process is the same as for natto, except that its fermentation is cut short at 6-8 hours, it is then press-ground to noodle shape, the moisture level is reduced to 4% or less at a reduced atmosphere of 30mmHg or less, and finally ground finely in impact-type mills. The resultant product is a powder of light yellow color and comparatively low moisture sensitivity, it has no soybean smell but rather a light fragrance and delicate flavor, and has a relatively great storability. Table 8.9 compares the composition of UNICEF Powder and cooked soybeans. A biscuit containing UNICEF Powder was production- and taste-tested, with the result reportedly being that the failure rate was high for biscuits containing 30% or more of the powder, and that the taste was acceptable up to about 15%. A trial of these 15% UNICEF Powder biscuits was then run on school children to ascertain their taste acceptability over a 30 day period and it was found to be liked by all, regardless of grade level or sex.

Moreover, Kosuge (?), et al. succeeded in isolating a compound called tetramethylpyradine from natto, a compound with a strong ability for sublimation and whose smell at certain strengths greatly resembled that of natto; it is supposed that it is one component of the natto's fragrance. An illustration shows the chemical structure of tetramethylpyradine.

(b) Natto's sticky filaments: Natto's sticky filaments are living compounds made by the action of natto bacteria on the components of the soybean, mixtures of glutamic acid polypeptides and *furakuton* (?) of layered *furakutosu* (?).

© Copyright Soyinfo Center 2014

While the comparative amounts may fluctuate, the former is said to comprise 60-80% of the whole, strong filament formation being accounted for by the polypeptides and *furakutau* (?) contributing towards a normalized level of stickiness. In investigating these glutamic acid polypeptides, the surface of the natto was rinsed with approximately its volume of water, the resulting dilute fluid was then separated in a centrifuge, the lighter upper liquid of which was further passed into a cellophane membrane, and finally dropped into methanol, forming sticky particles whose molecular weight was approximately 15,000; Thus, it is estimated that these are clusters of some 100 molecules of glutamic acid.

It has been shown experimentally that these sticky filaments are made by natto bacteria working on L-glutamic acid. The glutamic acid that composes these sticky filaments includes D-shape glutamic acid, which comprises anywhere from 20-80% of it. The sticky filaments make up about 2% of the natto on a dry-weight basis, and at their most stable level have a pH of 7.2 to 7.4, though the stickiness becomes weaker at a greater alkalinity or acidity. For example, on flavoring natto for the eating, the addition of table salt, rather than of shoyu, will produce more filaments. The greatest reason for natto whose filament formation is weak is contamination by unwanted bacteria or by a natto bacteriophage, etc.

(c) Natto enzymes: Within each 1 gm of natto there are approximately 10 million natto bacteria which produce large amounts of enzymes. Of each type of enzyme, the strongest are those enzymes for breaking down proteins, and in particular, alkaline proteinase as has been crystallized by Mitake, et al. This crystalline proteinase shows the highest level of activity at pH 8.2 and at 55ºC, and though it is stable at pH 5-8, if the temperature rises to 55ºC and above it becomes unstable, and it is destroyed when heated for 10 minutes at 65ºC and above. Its digestive strength on casein is said to be stronger than that of commercial preparation *pankureachin* (?). Also, the action of such enzymes such as amylase, cellulase and lipase in natto are strong.

(d) Natto's nutritional and medicinal values: Natto enjoys the reputation of being high in nutritional value, perhaps the greatest reason given is that in a rice-centered diet like that of Japan, such soyfoods as natto are of great importance as protein sources. Though the main nutritional components are that of the soybean itself, as was previously stated in natto, the breakdown of the soybean structure and digestion of the protein are fairly accomplished, thus the digestibility is increased. According to the research of Hayashi et al., the digestion and absorption rate of white mice fed a diet of 68 parts white rice and 28 parts natto and 4 parts inorganic salt was 93.2% broken down compositionally to 86.8% protein, 89.8% fat, and 97.4% sugars, much higher than for cooked soybeans. In vitamins, a notable increase of vitamin B-2 to a level 5-10 times that before fermentation or approximately 1 mg per 100 gm of natto is found. Also, 30% of the vitamin B-1 inactivated during pressure cooking is reactivated during fermentation. Further, there is much discussion about the effects of the digestive enzymes stored in natto, however, we have not been able to locate any research as to whether these enzymes produce benevolent effects within the body. Although there is much tentative evidence and basic research to the effect that natto is helpful in the prevention and cure of such contagious diseases as dysentery and intestinal typhus, at present it is still uncertain among medical specialists whether natto can prevent food poisoning or intestinal ailments, or whether it is of value as a convalescent dietary food.

Table 8.9 shows: Comparative composition of cooked soybean powder and UNICEF's fermented soybean powder. Footnotes are given concerning: soluble nitrogen, total sugars, and total acids. Address: National Food Research Inst., Tokyo.

5903. *National Observer.* 1972. Guess who came to dinner and brought a soy-sauce factory? Japanese textiles loom nearer. Jan. 1.

• ***Summary:*** The Japanese are coming! With the dollar devaluation, many Japanese firms that used to export products to America are now building manufacturing plants here. Most intend to employ American labor. Recently the Walworth County [Wisconsin] board of supervisors voted 42 to 1 to allow construction of a $6 million Kikkoman soy sauce plant in the county. This will be "Kikkoman's only plant outside Japan, where the company has been making soy sauce for over 300 years." A photo shows two bottles of Kikkoman soy sauce next to a map of Wisconsin.

Note: This is the earliest document seen (Sept. 2008) that that announces Kikkoman's plans to build a soy sauce factory in the United States, or that mentions Walworth, Wisconsin, in connection with Kikkoman.

5904. Chico-San Inc. 1972. Chico-San Inc. products: A catalog of unique foods. P.O. Box 1004, Chico, CA 95926. 24 p. Revised Jan. 1972.

• ***Summary:*** The cover of this catalog is printed with dark brown ink on pea-green paper. A complex, circular orange-red spiral is above the title. Three sheaves of grain are across the bottom. Soyfoods imported from Japan include Lima Soy Sauce, Soybean Puree (Miso), and dehydrated miso. They also sell black [soy] beans.

Contents: Rice cakes is our bag. "How Chico-San guarantees Oriental-type, organically-grown brown rice." Wehah Farms is mentioned often in this article. Whole grains and flours. Cereals. Whole grain noodles. Beans. Specialties (incl. Yinnies / Ame). Seeds. Condiments. Sea vegetables. Dried foods. Beverages. Cosmetics. Dentifrice. Utensils. Recipes.

"Chico-San products have gained increasing acceptance throughout the country since their introduction in 1960." The

© Copyright Soyinfo Center 2014

booklet contains 11 pages of recipes (p. 13-23) including: Miso-sesame spread. Miso soup (p. 20). Address: P.O. Box 1004, Chico, California 95926.

5905. *SoyaScan Notes.* 1972. Chronology of Janus Natural Foods, macrobiotic and natural foods distributor in Seattle, Washington. And of Granum. 17 March. 1992. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1972 Jan.–Janus Foods Inc. is established at 712 Seventh Ave. South in Seattle, Washington, by George Gearhart and Blake Rankin, formerly of Spiral Foods. Some background: In 1969, while a student at UCLA, Rankin came in contact with Erewhon, Los Angeles. After graduation from UCLA he and several friends set up a small health food store in Victoria, BC, Canada. Then he spent 3 months in Boston, Massachusetts, living in a Kushi study house and working in an Erewhon warehouse. Back in Seattle, he worked at Spiral Foods, a wholesale operation that was an offshoot of Chico-San. Spiral Foods owned the O-Soba Noodle Nook in Seattle. Shortly after that he and George Gearhart, the proprietor, closed Spiral Foods and in Jan. 1972 opened Janus Foods as a macrobiotic and natural foods wholesale and distribution company. Tim Hartman was third of the original incorporators; all three men managed the company. It was successful. From opening day, Janus sold miso and shoyu, imported from Japan; they were among the company's best-selling products. Janus never owned a natural foods retail store or restaurant, and never sold foods retail from their warehouse.

1972 Sept.–Rankin leaves Seattle on a trip to Japan via Hawaii. He leaves Hawaii for Japan in March 1973. Erewhon had given Janus permission to buy natural foods (bearing the Erewhon label) directly from Japan, so in the spring of 1973 Rankin traveled and worked with Muso and Mitoku to set up the first shipments to Janus in Seattle. Janus probably never paid any royalties or fees directly to Erewhon. He leaves Japan in Sept. 1973. Then he goes to Nepal and India on a spiritual search. In late 1973 he returns to Seattle and works for Janus.

1973–Two directories show that "Janus Foods Inc." is still located at 712 7th Ave. South, Seattle, Washington 98104. They now sell tamari and miso and distribute products from Erewhon, Spiral Foods, Deaf Smith, Pure & Simple, Chico-San, and Arrowhead Mills.

1974 March 8–Janus (Gearhart, Rankin, and Hartman) hosts the meeting of the Natural Food Distributors in Seattle; 16 people representing 12 companies attended.

1974 July 19. By this date, Janus Natural Foods, Inc. is located at 1523 Airport Way South, Seattle, WA 98134. Tim Hartman is still a manager of the company and Rankin is present. The company now sells barley koji. The company now has a lovely sprout-like logo (designed by Frederick Walsh) and a new brand called "Verity," whose labels were also designed by Walsh. Soy sauce and misos were sold under the Verity label for a while starting before Sept. 1976.

1975–The three managers decide to rotate the presidency of Janus annually. Rankin became president and Hartman left the company before his turn came around. During 1974 and 1975 Rankin and Gearhart were working on miso production.

1976 Sept.–Rankin leaves Janus and returns to Japan where he works for Mitoku and studies calligraphy. A few days after his arrival in Japan he meets his future wife, Yoko. They later had two children, but separated in 1988 and eventually were divorced.

1977–Janus leaves its large warehouse on Airport Way.

1979 Month? (before summer) Janus goes out of business, under the management of George Gearhart.

1981–Rankin returns to Seattle and in January or February starts Granum (pronounced GRAH-num, not GRAY-num) as a distributor and importer for Mitoku macrobiotic food products from Japan. The Granum logo is designed by Frederick Walsh. As of 1985 Granum has a small retail store and a 10,000 square foot warehouse, both at 2901 N.E. Blakeley St., Seattle, Washington 98105. Expected 1985 gross is more than $500,000.

As of March 1992 Granum has more than doubled its business compared with 1985. Blake has remarried to Nancy and they have a 2-year-old son, Addison. George Gearhart now lives in the suburbs to the south of Seattle. He is a sales manager, but no longer works in the natural foods industry. Address: 712 7th Ave. South, Seattle, Washington 98104.

Tests on aflatoxin contamination of miso and miso-koji in Japan]. *Nippon Shokuhin Kogyo Gakkaishi* (*J. of Food Science and Technology*) 19(2):76-80. (Chem. Abst. 81:167,973). [10 ref. Jap; eng]
• ***Summary:*** Studies were conducted to investigate whether or not miso and miso-koji in Japan contained aflatoxins. 108 samples of commercial miso, 33 of home-made miso, and 28 of miso-koji from almost all the prefectures of Japan were tested for their aflatoxin content. The results showed no aflatoxin on any of them. "But on the thin-layer chromatograms, 3 commercial misos, one home-made miso, and two miso-kojis showed aflatoxin-like fluorescent substances. The extracts of these aflatoxin-like substances

© Copyright Soyinfo Center 2014

were examined by the yolk sac test for their toxicity to the chicken embryo. The results however were all negative." Address: National Food Research Inst., Ministry of Agriculture & Forestry, Koto-ku, Tokyo.

• ***Summary:*** Soybeans in any form (incl. soybean meal), having a moisture content of 30-70% by weight, are steamed with saturated steam having a gauge pressure of not less than 1.8 kg per square cm for a short period of time, not to exceed 10 minutes, followed by rapid cooling to a temperature not to exceed 100ºC, are used as the starting material for the preparation of soy [sauce]. This method can provide soy of superior flavor and of high quality wherein the possibility of the formation of clouds [cloudiness] and precipitates when diluted and heated in its use does not occur, and can be carried out advantageously, on an industrial scale, with improved yield and good reproducibility. Address: 1. Higashikatsushikagun; 2. Kashiwa-shi; 3-8. Noda-shi. All: Japan.

5909. Aihara, Cornellia. ed. 1972. The *dô* of cooking (Ryorido). Vol. 1. Macroguide No. 13. San Francisco, California: George Ohsawa Macrobiotic Foundation. 109 p. Illust. No index. March. 25 cm.

• ***Summary:*** All recipes in this macrobiotic cookbook are numbered. Contains information on soy sauce and miso (p. 44-45). Soy-related recipes include: "Top of stove" casserole noodle soup (with "dry tofu" [dried-frozen tofu] and fried wheat gluten, p. 58). Fried whole wheat noodles (with seitan, p. 60). Homemade noodles with soup (and barley miso, p. 61). Onion miso (p. 62). Rolled cabbage with tofu (p. 63). Wheat gluten (p. 71, made from 10 cups whole wheat flour and 4 cups unbleached flour). Seitan (p. 72). Fresh wheat fu (2 versions). Serving recipes–boiled fu (p. 73). Fried fu–gluten cutlet. Shish kebab (with cooked fu, p. 73-74). Making tofu (at home using 3 cups soybeans and nigari, p. 75-76). Making nigari (p. 76). Quantity tofu preparation (using 10 lb soybeans). Okara or unohana (sauteed with soybeans and vegetables, p. 76). Tofu with kuzu sauce (p. 78). Fried tofu. Shinano-age (Fried tofu with buckwheat, p. 79). Kaminari Tofu (Thunder Tofu, p. 79). Nori-maki (Tofu rolled in nori, p. 80). Age-tofu (stuffed tofu, variation, p. 80-81). Miso salad dressing (p. 90). Bean sprout miso salad (p. 91; it is not clear what kinds of beans the bean sprouts are made from–probably mung beans). Gamodoki ([Ganmodoki] mock goose; p. 99-100).

Note 1. This is the earliest (and only) English-language document seen (April 2013) that contains the word *gamodoki* or the term "mock goose," both of which refer to deep-fried tofu burgers.

French bread made with gluten water (p. 104). Amazake is not mentioned. Some recipes call for chicken or fish as ingredients.

Note 2. This is the earliest cookbook seen (July 2005) that gives a recipe for making seitan, as follows: "1 T. [tablespoon] dark sesame oil. 1 T. minced gingerroot. 1-2 cups soy sauce. 5 cups cold cooked gluten. Heat oil in a sauce pan, add minced ginger (use only fresh ginger) and saute. The amount of soy sauce used depends upon how long you intend to store the Seitan. Use a larger amount of soy sauce for longer storing and refrigerating. Add soy sauce, bring to a boil, and drop in pieces of gluten. Cook on low heat for three hours, stirring frequently. Remove cover and continue cooking until excess liquid is absorbed and evaporated. Seitan is ideal as a seasoning in noodles au gratin, stews, cooked with vegetables, etc. It will keep for long periods of time in the refrigerator."

After Volume 2 of this series of four seasonal cookbooks was issued, Volume 1 was subtitled "Spring Cooking." Address: San Francisco, California.

5910. Ebine, Hideo; Matsushita, Zenichi; Sasaki, Hirokuni. 1972. Summary of evaluation tests]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 27. p. 132-36. March. Reprinted from Miso no Kagaku to Gijutsu No. 210. p. 21-24 (1971). [5 ref. Jap; eng]

• ***Summary:*** A test of 101 U.S. soybean varieties showed that those most suitable for making miso are Kanrich, Mandarin, and Comet. U.S. soybeans generally have much higher oil content and lower carbohydrate content than Japanese soybeans. Discusses the key points in evaluating the suitability of a soybean variety for making miso. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5911. Ebine, Hideo; Matsushita, Zenichi; Sasaki, Hirokuni. 1972. Beikoku-san daizu no miso genryô to shite no tekisei hyôka. III. Sentaku hinshu ni yoru chûkan kôgyô shiken [Evaluation of U.S. soybeans as raw materials for making miso. III. Miso manufacturing from screened soybean varieties in pilot plants]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 27. p. 118-31. March. Reprinted from Miso no Kagaku to Gijutsu No. 206. p. 16-28 (1971). [2 ref. Jap; eng]

• ***Summary:*** As a result of pre-screening, the soybean varieties Comet, Harosoy, M-1 (Kanrich), and Tsurunotamago (abbreviated as Tsuru were used for making miso in pilot plants). "White miso. light-colored salty miso, and red salty miso were made from whole soybeans and from

© Copyright Soyinfo Center 2014

soybean grits. The ability of the whole soybeans to absorb water was M-1 > Comet > Tsuru > Harosoy for light colored salty red miso and for red salty miso, and M-1 > Comet > Harosoy > Tsuru for white miso.

As for soybean grits, although the amount of solid matter lost during soaking and cooking is larger than for whole soybeans, the color of the cooked grits is brighter, resulting in miso of a beautiful color made from them, and the protein of cooked soybean grits is more susceptible to enzyme hydrolysis resulting in higher evaluation of their miso in a sensory / organoleptic test. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

Miso manufacturing from soybean-grits]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 27. p. 109-17. March. Reprinted from Miso no Kagaku to Gijutsu No. 203. p. 18-25 (1971). [7 ref. Jap; eng]
• ***Summary:*** Soybean grits were made from several dehulled U.S. soybean varieties (Dorman, Lee, Yelnanda, Harosoy, Hokkaido, and Clark) using two different dehulling machines. Large grits were preferred and the Weston Moisture Meter gave the best results. When using grits, 13% of the water soluble dry matter was lost in the water during soaking and steam cooking–twice as much as with whole soybeans. The main losses were from water-soluble sugars (6.1%) and protein (3.9%), both of which cause miso color formation.

When the grits were grits were soaked in water before cooking, the color of the cooked grits and of the miso made from them was "bright and beautiful." The loss of dry matter was the main problem. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

5919. *Soybean Digest.* 1972. The role of soybeans in Japanese festival. March. p. 38.
• ***Summary:*** "Soybeans are traditionally used in "Setsubun," a Japanese festival to welcome the arrival of spring and bring fortune. The occasion is marked with a soybean tossing ceremony at all Buddhist temples and Shinto shrines in Japan. The ritual is performed in the homes by tossing beans into corners of rooms and out of windows. A photo shows Scott Sawyers, American Soybean Assoc. Far East director, dressed in a formal kimono and holding a special wooden box of soybeans at the Hiye shrine. Priests blessed a selection of U.S. soybeans to be used in the upcoming rites.

90% of the soybeans imported to Japan come from the USA–this is 3 million metric tons, valued at more than $350 million.

• ***Summary:*** "Taste patterns of 20 drinks in Japan were studied." A total of 10 points were assigned to each of "six taste components, namely, sweet, salty, sour, bitter, tasty, and astringent."

These drinks included miso soup and soy sauce soup (*sumashi-jiru,* a clear soup seasoned with soy sauce). A very interesting diagram showing these relationships appears on p. 80.

"The highest pattern similarity (0.996) was found between two kinds of green tea, namely 'sen-cha' and 'ban-cha,' and the lowest one was found between soysauce soup and coffee or Coca-Cola." Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

Address: Central Research Inst., Kikkoman Soy Sauce Co. Ltd., Noda-shi, Chiba prefecture, Japan.

5923. *Soybean Digest.* 1972. New TVP firm in Japan. April. p. 36.
• ***Summary:*** "General Mills, Minneapolis, Minnesota, announced that it has licensed a Japanese firm to produce textured vegetable protein foods. Takeda Chemical Industries Ltd., Osaka, a leading Japanese pharmaceutical and food company, and Yoshihara Oil Mill Co. will produce the new foods at a plant to be built in Osaka by Japan Soy Protein Co. Ltd., a joint venture of the two Japanese firms." The new company will make Bontrae type products.

5924. **Product Name:** [Textured Vegetable Protein (Frozen Spun Soy Protein Isolates)].
Manufacturer's Name: Takeda Chemical Industries Ltd.
Manufacturer's Address: Osaka, Japan.
Date of Introduction: 1972 April.
New Product–Documentation: *Soybean Digest.* 1972. April. p. 36. "New TVP firm in Japan." General Mills licensed the Bontrae process to Takeda.

5925. Yasumatsu, Katsuhara; Toda, J.; Wada, T.; Misaki, M.; Ishii, K. 1972. Studies on the functional properties of food-grade soybean products. Part III: Properties of heat-coagulated gels from soybean products. *Agricultural and Biological Chemistry* 36(4):537-543. April. [9 ref]
• ***Summary:*** "Food-grade soybean products have various functional properties, such as emulsification properties, whipping properties, dough forming properties, gel forming abilities and so on."

It is already known that soybean protein has the ability for form a gel. For example, "tofu' (soybean curd) is a kind of Ca-coagulated gel of soy protein." There are also "heat-coagulated gels."

Note: This is the earliest English-language document seen (June 2009) that contains the term "food-grade soybean" (or "food grade soybean")–perhaps as a synonym for vegetable-type soybeans. Address: Food Research Labs., Food Products Div., Takeda Chemical Industries Ltd., Osaka, Japan.

5926. Yasumatsu, Katsuhara; Toda, J.; Kajikawa, M.; et al. 1972. Studies on the functional properties of food-grade soybean products. I. Classification of soybean products by their chemical constituents and protein properties. *Agricultural and Biological Chemistry* 36(4):523-31. April. [17 ref]
• ***Summary:*** Chemical analyses of 43 commercial soybean products were conducted. Figures show: (1) Chemical composition of these commercial products. The horizontal axis shows content of chemical constituent. The vertical axis shows the number of products. (2) Protein properties of commercial products, including: Water dispersible nitrogen. Amount of native protein. Dispersible nitrogen in 3% NaCl. Dispersible nitrogen in acetic acid. Dispersible nitrogen in pH 2.0 solution. Dispersible nitrogen in pH 11.08 solution. Dispersible nitrogen in phosphatase, pH5.

"The principal component analysis was applied to correlation matrix among chemical constituents." "The same

© Copyright Soyinfo Center 2014

procedure was applied to correlation matrix among protein properties."

"Discussion: Food-grade soybean products are generally classified according to their processing method or protein contents. They are usually designated as soy flour, soy protein extract, soy protein concentrate and soy protein isolate, in order of increasing protein contents." A brief description of how each is made and its typical protein content is given. "Soy protein extract consists of water extractable components of defatted soy flour. This is produced by drying the so-called soy-milk."

Note: This is the earliest English-language document seen (June 2009) that contains the term "food-grade soybean" (or "food grade soybean")–referring to edible soy products. It is also the earliest English-language document seen (July 2009) that contains the term "food-grade soybean products" (or "food grade soybean products"). Address: Food Research Labs., Food Products Div., Takeda Chemical Industries, Ltd., Osaka, Japan.

5927. Farmilant, Eunice. 1972. Macrobiotic cooking. New York, NY: New American Library. 224 p. Foreword by Herman Aihara. May. Index. 18 cm. [31 ref]
• ***Summary:*** This pocketbook has a color (beige) photo on the cover of ears of wheat, one wooden spoon filled with soybeans and one filled with unpolished rice. It is "A basic introductory guide to cooking and eating the macrobiotic way." The author's interest in macrobiotics began in April 1968. Basic information on soyfoods (especially miso, tamari, and tofu) is given on pages 29, 33-38, 213-14. Soy-related recipes include: Wheat berries and black beans (i.e. black soybeans, p. 78). Sprouts (incl. soy sprouts, p. 82-83). Miso pickles (p. 124-25). Miso soup (p. 128-29). Cream of miso soup (p. 135). Black beans and wheat berries (p. 139).

There is an entire chapter on miso and tofu (p. 142-46) including: What makes miso so beneficial? Barley miso (nutritional analysis). Miso-vegetable stew. Miso-rice. Miso stew with vegetables. Miso-vegetable spoon bread. Homemade tofu (curded with fresh lemon juice).

Pizza–Macrobiotic style (with miso, p. 149). Chop suey (with tofu and miso, p. 151-52). Miso bechamel sauce (p. 159). Miso gravy. Simple tahini and tamari sauces (p. 160). Tempura dip (with tamari). Simple miso spreads (p. 161). Miso-vegetable spread. Miso-watercress spread.

There is a directory of macrobiotic stores and restaurants in the U.S. (p. 191-203, subdivided alphabetically by state, and within each state alphabetically by city). The following states have the following number of stores and restaurants: Alaska 1, Arizona 4, Arkansas 1, California 32, Colorado 4, Connecticut 18, District of Columbia 3, Florida 14, Georgia 7, Hawaii 2, Illinois 7, Indiana 2, Iowa 5, Louisiana 4, Maine 14, Maryland 7, Massachusetts 51, Michigan 12, Minnesota 3, Mississippi 2, Missouri 3, Nevada 1, New Hampshire 20, New Jersey 9, New Mexico 3, New York 61, North Carolina 5, Ohio 14, Oklahoma 3, Oregon 2, Pennsylvania 8, Rhode Island 5, South Carolina 1, Texas 4, Utah 1, Vermont 26, Virginia 4, Washington 3, Wisconsin 2.

There is also a directory of stores, restaurants, and centers outside the U.S. (p. 204-07, subdivided by country). The following countries have the following number of stores, restaurants, or centers: Australia 1, Belgium 2, Brazil 2, Canada 15, Denmark 4, France 29, Germany 1, Holland (Netherlands) 2, India 1, Italy 1, Japan 3, Portugal 1, Puerto Rico 1, Spain 1, Sweden 1, Switzerland 2, United Kingdom: England 13, Scotland 1, Vietnam 2.

A list of wholesale distributors in the U.S. (p. 208-09) includes Shiloh Farms (Route 59, Sulfur Springs, Arkansas; [Warren Clough]), Erewhon Trading Co. (8003 W. Beverly Blvd., Los Angeles, California 90048), Chico San Foods (1262 Humboldt Ave., Chico, California 95926), Erewhon Trading Co. (33 Farnsworth St., Boston, Massachusetts 02210), Deer Valley Farms (Guilford, New York 13780), Infinity Food Co. (171 Duane, New York, NY 10013), Mottel Foods (451 Washington, New York, NY 10013), Juniper Farms (Box 100, Sugar Loaf, NY 10981), Pioneer Specialty Foods (Fargo, North Dakota 58100), Merit Food Co. (Pill Hill Lane, Box 177, Bally, Pennsylvania 19503), Essene (58th & Grays Ave., Philadelphia, PA 19143).

Address: Sugiyama Industrial Chemical Research, Tokyo, Japan.

5929. Nakano, Masahiro. 1972. Synopsis on the Japanese traditional fermented foodstuffs. In: W.R. Stanton, ed. 1972. Waste Recovery by Microorganisms: Selected Papers for the UNESCO/ICRO Work Study. Kuala Lumpur: Ministry of Education, Malaysia. See p. 27-48. Distributed in the USA by UNIPUB, New York.
• ***Summary:*** Contents: Introduction. Miso. Shoyu. Tane-koji. Koji. Natto. Sake. Concluding remarks. Appendix. Address: Tokyo, Japan.

5930. Sawyers, Scott. 1972. New products incorporating soy oil [in Japan]. *Soybean Digest.* May. p. 22-23.
• ***Summary:*** "Nisshin Kako Chemical Industry Co. put on sale in February Thousand Island dressing in a 12-gram package. It is designed for use in school lunch programs and other institutional menus. The dressing can also be used as a spread on sandwiches. During the ASI-School Lunch Institute taste sample survey with 4th and 6th grade students several months ago, Thousand Island-type flavoring proved to be the favorite.

"Kenko Mayonnaise Co. has begun marketing of curry-mayonnaise-flavored salad dressing in 15-gram packages

© Copyright Soyinfo Center 2014

suitable for use in school lunch menus. The new product was ready for mass production and packaging in March. The same ASI-School Lunch Institute study determined that a curry-flavored dressing ranked next to Thousand Island in preference. Curry-mayonnaise dressing is recommended as a delightful seasoning for other side dishes too.

"Maruwa Oil-Margarine Co., which recently celebrated its 50th year of successful business, announced plans to market a new-quality based principally on soy oil under the name 'Uni-Margarine,' in a new 1-kg package. It is a specially designed cooking-type margarine intended for school lunch and institutional uses.

"Fukuzo Takahashi, president of Maruwa Oil, has been a longtime supporter of ASA market development activities. He has served as vice president of the Japan Margarine Assn. for several years.

"Nisshin Oil Co. on March 15 held an announcement party for over 1,000 wholesalers, retailers, industry, governmental representatives, and business associates in Tokyo's newest skyscraper, the Keio Plaza, to announce Nisshin's entry into prepared salad dressings. Three kinds of dressings, labeled French, Thousand Island, and Russian, are in production and ready for distribution in attractive bottles–separately or in a kit containing all three varieties (see photo). The 200-cc bottles with new no-drip lid will sell nationwide for 150 yen. An attractive mass media program included TV spot commercials and posters at point-of-sale.

"Yukio Sakaguchi, president of Nisshin Co., reported on the successful work by his personnel in preparing products for new customers. Nisshin salad oil has established a fine reputation over the years.

"Mr. Sakaguchi is also past president of the Japan Oilseed Processors Assn. As vice president of the International Association of Seed Crushers, he will be in charge of Japan's plans as host country for the IASC Congress May 23-26 in Kyoto.

Successful promotion: Mitsukan Vinegar Co. has had a successful year through their promotion of a salad shaker bottle or salad dressing kit for home-style dressings. This convenience item is becoming more popular with Japanese housewives. ASA, jointly with Mitsukan, has helped popularize this idea through in-store sales promotions, classes, and exhibits.

"The prominent Kewpee Mayonnaise Co. also began sales of prepared salad dressing this last year, featuring five flavors. Kewpee for the first time used more soy oil than competing oils in mayonnaise-salad dressing manufacture.

"Yoshihara Oil Co. has been the first major processor to identify one of their products as pure soy oil. Yoshihara has had Golden Salad Oil and Golden Tempura Oil on the market for many years. A new white-labeled soybean salad oil has been developed as a premium item.

"Yoshihara has cooperated with ASA on several occasions in holding special sales promotions with selected supermarket chains over the last 2 years.

"Yoshihara is a growing customer for U.S. soybeans. A modern crushing plant is presently under construction near Kobe. When completed late this year, the capacity will be 800 metric tons of soybeans daily. We look forward to more joint activities in the future.

"Due credit should be given for the improvement in U. S.-Japan trade. There are tough problems; some remain to be negotiated by mutual understanding and exchange of viewpoints.

"The Japan government and the oil processing industry have made positive steps toward freer trade. Vegetable oils and oilseed meals were liberalized for import during the past year. Import duties have been adjusted or it is planned to reduce or eliminate them in the future.

"Currency revaluation should help processors obtain better buys on soybean raw materials than would have been the case otherwise. The U.S. dock strike disrupted the flow of supplies and in some cases increased costs of transportation and operation."

A photo shows new products in Japan utilizing soy oil: In foreground: small packets of Nisshin Kako salad dressing and Kenko mayonnaise salad dressing. At left, Alpha Uni-Margarine for institutional cooking by the Maruwa Oil Co. At right, Nisshin salad dressings in 3-bottle kit displaying French, Soft, and Russian dressings. Address: Director for the Far East, American Soybean Assoc.

5931. Suzuki, Shigeaki. 1972. From Japan: Comments on American soybeans. *Soybean Digest.* May. p. 24.
• ***Summary:*** "You may not be able to imagine how essential soybeans are for the daily life of the Japanese. They are literally indispensable for our foodstuffs. They are not only raw material for oil processors who extract the oil.

"The varied usages of soybeans are unique in Japan–such as miso (soybean paste), tofu (soy-bean cake), and natto (fermented soybeans). These products are the protein base of our food and as such are deep-rooted in our eating habits. They have been valued for hundreds of years.

"Knowing our food habits, the great quantity of soybean oil we consume annually is readily understandable. At the moment, including 700,000 metric tons for food processing, this totals approximately 3,200,000 metric tons of which the majority is imported from the U.S. Fifty-three percent of the total vegetable oil production is soybean oil used for cooking. This demonstrates the overwhelming importance of soybean oil among soy products in Japan.

"Outlook for soybean meal: Now the trend of consumption of oil and fats in our country has changed greatly from edible fats that include marine and animal fats, to a much higher percentage of vegetable oils. The emphasis is on 'vegetable' today. On the other hand, considering the growing demand for defatted soybean meal for cattle feed and food protein it is obvious that the overall consumption of

© Copyright Soyinfo Center 2014

soybean meal will be increasing tremendously. This tendency is not only limited to Japan; I venture to say it is world-wide today. It can be said that the responsibility on the shoulders of the American soybean producers for the supply will be greater than ever.

"Prices are unstable: In observing this great demand, I feel a slight anxiety. It appears that American soybean production is not increasing proportionately to the growing demand of the world. Consequently, this reacts immediately on the Chicago market. The supply shortage brings a prompt upsurge in prices, and naturally speculation plays its part in swinging prices up and down regardless of the effect it has on the costs of the users. Since the finished products of soybeans are important household food items, their prices should not be affected by such speculative manipulators. Also as users of this material, we cannot say that we are in a favorable position.

"Geographically, Japan is over on the other side of the Pacific Ocean. The time required to procure soybeans, ship, and eventually process them into a product is more than a full 3 months. This clearly implies that there is no safety-hedge for us to work in order to maintain a stabilized price. We are at the mercy of unstable prices. This, in fact, is one of the regrettable factors that hinders the stabilization of the oil and fats business.

"U.S. the prime source: Brazil and Argentina were once great soybean suppliers but unfortunately they are no more. There are almost no opportunities to purchase from them. Recently China and Australia have been considered possible suppliers but have not yet reached that stage. Therefore, only the American soybean suppliers are able to furnish the quantity we need.

"I still believe in the potential productivity and the constant growth in the supply of American soybeans. For the benefit of the healthy, expanding world consumers' market, including Japan, I hope and trust the American Soybean Assn. will do its utmost to maintain a constant flow of soybeans for the sake of all."

A small portrait photo shows Shigeaki Suzuki. Address: President, Japan Oilseed Processors Assoc.

[Fre]
• ***Summary:*** Contents: Introduction. First trials with soybean utilization (1962-1965). Manufacture of roasted soy flour: Generalities, description of different processes. Commercialization: Purchase of the soybeans by ETSA (Ecole Technique Secondaire Supérieure d'Agriculture, de Tshibashi), transport, storage, resale price by commercial agents, sale and distribution, packaging, the soya cookie project. Conclusion. Appendix 1. Equipment used for a capacity of 15 kg/hour, with the CeCoCo 'Fuji' Coffee roaster (Torréfacteur CeCoCo, P.O. Box 8, Ibaraki, Osaka-Fu, Japan). Appendix 2. Equipment used for a capacity of 80 kg/hour, with Torréfacteur Probat." Appendix 3. Costs of actual daily production: 75% yield, 400 kg in 5 hours, 4 workers. Appendix 4. Recipe for cookies with soy flour used at the Inabanza Center from 1968-1973: wheat flour 600 gm, soya flour 300 gm, sugar 200 gm, lard or oil 120 gm, salt 5 gm, sodium bicarbonate 5 gm, ammonium bicarbonate 5 gm, water 200-250 cc. Recipe with corn, soya, and wheat to make 55 kg of cookies, containing 14% protein, 59% carbohydrates, 16% lipids, and 436 calories per 100 gm. Machines used at Bisoka for making soya cookies at the end of 1974 (type, brand, function, power use, capacity).

At the start of this project in 1961, the directors focused all of their attention on soybean cultivation, giving none to preparation of foods. But noting the lack of interest shown by the local people in consuming soybeans as such, they saw the necessity of giving more attention to utilization. The first utilization trials ran from 1962 to 1965; under the direction of Mrs. d'Heer, they tried unsuccessfully to use soybeans as whole soybeans, as soymilk, and as products made from soymilk. They tried to make a fermented soy yogurt using cultures sent from Wageningen. The product turned out well but the taste was foreign to the local people and it was too perishable. Investigation of powdered soymilk revealed that the equipment was too expensive and complicated. Then in 1969 they found that roasted soy flour worked very well in the local diet, to fortify cassava and corn products. A detailed description of the process and equipment is given. Key assistance was provided by ETSA (Ecole Technique Secondaire de Tshibashi). Address: ETSA–Tshibashi, B.P. 110, Kananga, Zaire.

their practical food applications." Native defatted soybean flour, which contained native and soluble protein, exhibited excellent whipping properties. Address: Food Research Labs., Food Products Div., Takeda Chemical Industries Ltd., Osaka, Japan.

5935. Randolph, Chet. 1972. U.S. soybean group adapts overseas promotion to individual markets. *Foreign Agriculture.* June 5. p. 6-7, 9.
• ***Summary:*** The American Soybean Association (ASA) uses the term "market development" to mean a total program from the farmer to the consumer. It is not just advertising, not just promotion, not even just marketing. Market development in Taiwan. The ASA went to Taiwan in 1969, and set about modernizing the domestic and industrial uses of soybeans in that country. In order to do this they established a monthly trade journal, invited teams of local executives to visit the U.S., and sent technicians to Taiwan to instate many different programs to improve the production, processing, and marketing of soybeans and soybean products. Market development in Germany. Here, the ASA set about trying to change the government's requirement that fishmeal was necessary in every pig and poultry ration. They first stimulated research in the German universities to convince the German government that the fishmeal requirement was harmful to the soybean trade. The ASA also campaigned to remove the stigma that soybean margarine could not contain more than 25% soybean oil as it would then require salt to mask the oil's flavor.

In Japan the ASA works on developing mass media advertisement for soy oil. They also work with the Japan Nutrition Association, which conducts small group cooking schools. They have worked for years to help start the Japanese vegetable margarine industry and then encouraged an effective, merchandising campaign. Address: Director of Market Development, American Soybean Assoc.

5937. The wedding of Kazuko Aoyagi and Travis Venters at International Christian University (ICU) in Tokyo and the wedding cake with tofu icing / frosting (Photograph). 1972.
• ***Summary:*** Two photographs of this wedding, which took place on 11 June 1972, are owned by Soyfoods Center. The first, 4½ by 3¼ inches, color, shows Travis and Kazuko standing in a room at ICU, dressed in wedding clothes. Standing behind them are 10-15 people. Standing to their left, dressed all in white, is Jeffrey Broadbent, who is reading from a book of scriptures. Standing to his left is Yoshiko Aoyagi. Bananas and pineapples are piled on two tables.

The second, 6 by 4 inches, black and white, taken 10-15 minutes after the first, shows Travis and Kazuko standing outside on the ICU lawn, with about 15 people standing close behind them, as rice is being thrown over them. Akiko Aoyagi is standing just to the left of Kazuko and William Shurtleff is standing just behind her. Everyone is smiling and having a good time.

A remarkable cake was served at this wedding–though no photograph of it can be found. It was made by Gretchen Broadbent. Gretchen, a very creative cook interested in natural foods and tofu, volunteered to make all the food for the wedding party. The centerpiece of her creations, which 5-6 people remembered clearly more than 25 years later (Jan. 1999), was the wedding cake. It was a sensation. The icing / frosting was made of tofu! No one had ever seen anything like it. It was a round layered cake, with each layer being a fruitcake that was slightly smaller than the one below it. Made entirely of natural foods, it contained whole-wheat flour instead of white flour and honey or fruits instead of sugar. Thus, it was rather heavy. Gretchen made the frosting–her own invention–by whipping firmly pressed tofu in a blender with honey. The cake even had a theme–evolution. Gretchen formed many small creatures out of dough, then deep-fried them. There were little crabs and starfish on the bottom layer, then little animals on the second layer, and finally on the top–guess what–human beings–our precious species. Because Gretchen did not have an oven in her apartment, she baked the cake on the ICU campus in an oven at the home of Steve and Marty Caldwell. She recalls: "I was really into that cake!"

• ***Summary:*** Discusses the tastes of a proteinase-modified soybean protein. A plastein is any of several substances that resemble proteins and are precipitated by the action of proteolytic enzymes (as pepsin or papain) on the digestion products of protein. Address: Dep. of Agricultural Chemistry, Univ. of Tokyo, Tokyo, Japan.

5939. Webber, Ella V. 1972. Perry A. Webber: Pioneer missionary in true education to Japan. Chattanooga, Tennessee: Southern Missionary College. 87 p. *
• ***Summary:*** Perry A. Webber was born on 15 June 1890 in Northville, Michigan. His parents became Seventh-day Adventists (SDAs) during his early childhood. In 1904 the family moved to Berrien Springs, Michigan, and Perry was

© Copyright Soyinfo Center 2014

educated there. In 1911 Perry graduated with a BA from Emmanuel Missionary College [in Berrien Springs] and in 1912 he was married to Ella Mae Verney.

In 1913 he was appointed by the SDA General Conference Foreign Mission Board to go, with his wife, as missionaries to Japan. In Tokyo they studied Japanese language for 2 years, then began pioneering educational work in Japan until 1927. For 4 years (1915-19) they worked in Fukuoka (in northern Kyushu), then returned to Tokyo. A son, Alfred B. Webber, was born in Dec. 1919; he later became a medical doctor. In Tokyo they worked at a school in Ogikubo. By 1921 Perry was teaching about the virtues of brown rice. In 1923 Perry found 25 acres of land in Sodegaura; in September of that year the Great Tokyo Earthquake (*Kanto Daishinsai*) took place. Later in 1923 the family returned to California because of the wife's respiratory problems. Harry Webber was born in Glendale. After a year in Honolulu, Hawaii, in 1934, they returned to Japan in the summer of 1925 and moved the college into the country. In the spring of 1926 the students and teachers started to build their own self-supporting school, with Perry as principal. This school later grew into the Japan Missionary College (*Saniku Gakuin*). The Japanese name means "three-sided school" since equal emphasis was placed on mental, moral, and manual development.

During these years Perry grew very fond of Japanese food and especially of Inari-zushi (made of deep-fried tofu pouches filled with vinegared rice). On his way to language school, he used to stop in regularly at the Shinoda Sushi Shop in Kanda (in Awaji-cho by the 1970s) to enjoy their Inari-zushi. The shop once developed a special Webber Sushi, named after him, and they used his name in some of their promotional materials. He was also very fond of regular tofu and of miso soup.

In 1927 the Webbers returned to America to educate themselves in good health. At this time Adventists believed that the true remedies are "pure air, sunlight, abstemiousness, rest, exercise, proper diet, the use of water, and trust in Divine power (*Ministry of Healing*, p. 127). In the fall of 1928 Perry entered Michigan State University to study biological chemistry while his wife, Ella Mae, studied nutrition; both were deeply interested in understanding the principles of good health. By May 1929 Perry was considered "one of our teachers" by Madison College in Madison, Tennessee.

During the early 1930s and the Great Depression, many students' only hope of getting an education was to rely on their own efforts. Madison, which offered a work-study program, became a very attractive alternative school.

In Sept. 1930 the family moved to Madison while Perry finished his thesis. In June 1931 Perry was awarded his PhD degree in biological chemistry, with special interest in chemistry and soyfoods development. At Madison he became a instructor of chemistry with a strong interest in food chemistry. In the following years he became the main person at Madison responsible for the school's growing involvement with soyfoods. In Nov. 1931 Perry wrote a long two-part article for *The Madison Survey* titled "Facts Concerning the Soybean." During the early 1930s he put a great deal of creative energy into expanding Madison's line of commercial soyfood products. Most of the products that were introduced between 1931 and 1934 were the result of his work. In August 1933 Perry Webber and Frances L. Dittes attended the annual convention of the American Soybean Association (ASA) in Baton Rouge, Louisiana. Webber presented a lecture with slides about the importance of soyfoods in Asia and their potential in America. He also prepared an exhibition of Madison soyfoods that was displayed at the convention. Webber was secretary-treasurer of the ASA for one year at this time. He visited Edsel A. Ruddiman at the Ford Motor Company and gave a talk to him and other leading research scientists about soyfoods. He was also a close friend of Dr. John Harvey Kellogg. He visited Kellogg, talked about soyfoods, and did some work developing a preservative for some of Kellogg's crackers.

Perry Webber worked at Madison until Sept. 1935 when, after a big farewell party, he returned to Japan to serve as principal of the Japan Missionary College (Saniku Gakuin). There he taught a lot about nutrition and the value of a vegetarian diet. In about 1936 Webber visited Dr. Harry Miller in Shanghai, China, and helped him set up a sanitation and research lab for analyzing the Vetose soymilk products at his new plant.

From 1939 to 1943, during World War II, Webber was back in the USA, teaching at Madison as head of the chemistry department. He was also at Madison from 1946 to 1953 and from 1959 to 1962, each stay punctuated by work in Japan. While serving as an administrator at Madison Foods (1959-1963) he and Sam Yoshimura pulled the factory out of debt and put it several thousand dollars into the black in one year's time.

During his trip to Japan that began in the spring of 1953, he taught one food plant how to make gluten, soymilk, and soy croquettes. Also in 1953 he started a self-supporting organization at Mt. Akagi, about 125 miles northwest of Tokyo; there he worked for more than 7 years. In the winter of 1956 he suddenly became ill with pneumonia. He returned to America in the summer of 1958 and was found to have Parkinsonism; no medicine was prescribed until 1962. In 1966 Perry was an outpatient at the Madison Sanitarium / Hospital for a time, then he became a inpatient from Oct. 1967 to Jan. 1968. In Sept. 1968 he went to a convalescent home in Lodi, California. His son, Dr. Alfred B. Webber, was living and practicing medicine in Lodi. In 1969 he returned to the Wildwood Sanitarium, a self-supporting Seventh-day Adventist convalescent home and health care facility in Wildwood, Georgia (northern Georgia). He passed away there in January 1973 at age 82 of Parkinsonism.

5940. Arai, Soichi; Yamashita, M.; Fujimaki, M. 1972. Glutamyl oligopeptides as factors responsible for tastes of a proteinase-modified soybean protein. *Agricultural and Biological Chemistry* 36(7):1253-56. July. [11 ref] Address: Dep. of Agricultural Chemistry, Tokyo Univ., Tkoyo, Japan.

5941. Ebine, Hideo; Matsushita, Z.; Sasaki, H.; Yanai, S.; Ariyoshi, M.; Machi, M. 1972. Beikoku-san daizu no miso genryô to shite no tekisei hyôka [Evaluation of U.S. soybeans as raw materials for making miso]. *Report of Central Miso Institute* No. 7. 66 p. July. Collection of 7 articles, in Japanese, with 4-page English-language summary. [28 ref. Jap; eng]

• ***Summary:*** Part I: Miso manufacturing test on a laboratory scale. (1) Employing 13 varieties of U.S. soybeans and 11 varieties of Japanese soybeans of 1961 crops, U.S. soybeans were generally higher in oil content and lower in carbohydrate content than Japanese soybeans. Among the tested U.S. varieties, Comet, Yelnanda and Harosoy were promising.

(2) In 1962, 27 samples of U.S. soybean crops and 5 samples of Japanese soybeans were employed. Not all the Japanese varieties tested were evaluated superior to the U.S. varieties, but the evaluation of consistency or texture was higher than that of U.S. varieties.

(3) Fourteen samples of U.S. soybeans from the 1963 crop and 26 samples from the 1964 crop were evaluated for their suitability in making miso. From the 1963 crop, Comet, J.E.W.-45, and Mandarin were considered the best. From the 1964 crop, Mandarin and Kanrich were considered best.

(4) Of the soybean samples of 1965 and 1964 crops, the results showed that Kanrich variety of 1964 was the best. "In comparison with U.S. soybeans, the characteristics of Japanese soybeans can be significantly recognized in the consistency of miso, namely in its fine and smooth texture."

Part II: Miso manufacturing from soybean-grits. Twice as much dry matter was lost during cooking as when whole soybeans were used. The main constituents of the loss were water-soluble sugar (6.1%) and protein (3.9%) which cause color formation of miso. When the soybean grits were soaked in water before cooking, the color of the cooked soybean grits as well as miso made from them were bright and beautiful. The flavor of fermented miso was also improved by this method of using soybean grits.

Part III: Miso manufactured from screened soybean varieties in pilot plants. The variety M-1 gave the best results for light colored salty miso, red salty miso, and white miso.

(Supplement) Evaluation tests were conducted on 101 U.S. and 24 Japanese soybean samples. In comparison with Japanese soybeans, the U.S. soybeans showed a higher level of oil content and a lower level of carbohydrate content. The varieties of U.S. soybeans suitable for making miso are Kanrich, Mandarin, and Comet. Soft and bright soybeans are generally suitable, since they show a high absorbing capacity of water. Soybeans rich in carbohydrate show generally high capacity of water absorption. Large size of soybeans are generally acceptable. Address: 1. Shokuryo Kenkyujo, Tokyo.

5942. Kameda, Yukio; Matsui, K.; Kato, H.; Yamada, T.; Sagai, H. 1972. Antitumor activity of *Bacillus natto.* III. Isolation and characterization of a cytolytic substance on Ehrlich ascites carcinoma cells in the culture medium of *Bacillus natto* KMD 1126. *Chemical and Pharmaceutical Bulletin* 20(7):1551-57. July. [8 ref]

• ***Summary:*** At least two kinds of cytolytic substances that acted on Ehrlich carcinoma cells in the culture medium of *Bacillus natto* KMD 1126. One of these cytolytic substances was found "to be identical with surfactin which was a potent clotting inhibitor in the thrombin fibrinogen system obtained from the culture medium of *Bacillus subtilis* by Kakinuma et al.

Note: Natto, which is defined as "fermented beans," might be better defined as "fermented soybeans." Address: Faculty of Pharmaceutical Sciences, Kanazawa Univ., 13-1 Takara-machi, Kanazawa, Japan.

5943. Murata, Kiku; Fujita, K. 1972. Hakkô daizu tenpei no kôsansei kôyô ketsuin-shi no kensatsu [Studies on antioxidative and antihemolytic factor in tempeh]. *Seikagaku* (*Biochemistry*) 44(8):496. Aug. Presented at the 45th Annual Meeting of the Japanese Biochemical Society. [1 ref. Jap] Address: Osaka Shiritsu Daigaku, Kasei Shokumotsu, Japan.

5944. Baker, Bruce. 1972. U.S. soybean complex exports top $2 billion in fiscal year 1972. *Foreign Agriculture.* Sept. 18. p. 5, 12.

• ***Summary:*** For the first time, the U.S. soybean crop has become the Nation's leading cash crop. In fiscal year 1972, U.S. farmers reported higher cash receipts for soybeans than for corn, which has long been the leading cash earner. The soybean crop also reached another important milestone when it became the first agricultural commodity to have total annual exports valued at more than $2,000 million; the total export value of soybeans and soybean production hit an all-time high of $2,004 million. The devaluation of the U.S. dollar lowered the price of U.S. soybeans in terms of many foreign currencies. The price was reduced most for Japan and the European Economic Community–which together take 65% of total U.S. soybean exports. Within the EC, the Netherlands was the leading market for U.S. soybeans. Japan is the second largest market for U.S. soybeans, Spain the third. Address: Fats and Oil Div., Foreign Agricultural Service.

5945. Ebine, Hideo. 1972. Fermented soybean foods in

© Copyright Soyinfo Center 2014

Japan. *Tropical Agriculture Research Series* No. 6. p. 217-23. Sept. Symposium on Food Legumes.
• ***Summary:*** Production of fermented soybean foods in Japan in metric tons (tonnes) (1968): Miso: 553,000 tonnes; includes the use of 169,000 tonnes of whole soybeans, 6,600 tonnes of defatted soybeans, 84,400 tonnes of rice, 18,200 tonnes of barley, and 71,200 tonnes of salt. In addition, roughly 200,000 tonnes of miso are made at home in Japan.

Shoyu: 1,027,000 kiloliters; includes the use of 14,900 tonnes of whole soybeans and 147,320 tonnes of defatted soybeans, 126,600 tonnes of wheat, 7,700 tonnes of wheat bran, and 172,200 tonnes of salt.

Natto: 90,000 tonnes; includes the use of 47,000 tonnes of whole soybeans.

Note that miso uses more soybeans than shoyu. Annual per capita consumptions of these foods was: Miso 6.7 kg, shoyu 10.2 liters, and natto 760 gm. Address: Head, Fermentation Div., National Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo.

5946. Iida, Wataru. 1972. Major diseases of leguminous crops in Japan. *Tropical Agriculture Research Series* No. 6. p. 101-07. Sept. Symposium on Food Legumes.
• ***Summary:*** A large table (p. 101), which occupies 2/3 of the page, is titled "Diseases of soybean" and contains 2 columns: (1) English name. (2) Name of causal agent. There are 5 virus diseases, and 21 other named diseases. Address: Prof., Faculty of Horticulture, Chiba Univ., Matsudo-shi, Chiba-ken, Japan.

5947. Kaizuma, Norihiko; Fukui, Juro. 1972. Breeding for chemical quality of soybean in Japan. *Tropical Agriculture Research Series* No. 6. p. 55-68. Sept. Symposium on Food Legumes. [16 ref]
• ***Summary:*** As is now well known, in many parts of the world there are chronic nutritional deficiencies, especially protein deficiencies, which have become serious problems. The breeding and production of soybeans with high protein content could offer a promising solution to such problems.

However, methionine is the limiting amino acid in soybeans. If the methionine content of soybeans can be increased, the usable protein will automatically increase.

Since 1968, the authors have carried out fundamental research on the breeding of soybeans with high protein and high sulfur-containing amino acid (especially methionine) contents. This paper gives a summary of the what has been learned to date in this research–conducted under a 1969 mandate from Japan's Ministry of Agriculture and Forestry. Address: Faculty of Agriculture, Iwate Univ., Morioka-shi, Japan.

• ***Summary:*** Discusses: Ecotypes of soybean varieties and local distribution. Soybean cultivation in west Japan: Summer soybean cultivation, autumn soybean cultivation, inoculation of root nodule bacteria, fertilizer, application, rotation system. Soybean cultivation in east Japan: Characteristics of soybean cultivation in east Japan, cultivation methods. Discussion. Address: Second Agronomy Div., Tohoku National Agric. Exp. Station, Morioka-shi, Japan.

5951. Motomiya, Giichi; Ito, Ryuji. 1972. Domestic production, importation and utilization of food legumes and research organization in Japan. *Tropical Agriculture Research Series* No. 6. p. 23-32. Sept. Symposium on Food Legumes.
• ***Summary:*** "The history of soybean cultivation in Japan seems to be fairly old, because some descriptions on 'Daizu' (soybean) can be seen in the ancient chronicles of Japan (Kojiki and Nihonshoki, written at the beginning of 8th century) and the carbonized 'Daizu' was found in the vestige of ancient civilization of the strawrope pottery in the period of B.C. But the statistical data of soybean production was not yet established completely before 1878... But the production of soybean in Japan was gradually decreased by the cause of sudden increase of importation from China since 1930, and this decrease was accelerated furthermore by the cheap American soybean imported abundantly since 1961 under the free trade system, and consequently the cultivation areas of

© Copyright Soyinfo Center 2014

soybean decreased to 100,000 hectares in 1971...

Research and experiment on food legumes in Japan. Soybean: The agricultural experiment stations were established one after another in every prefecture in Japan since the establishment of the National Agricultural Experiment Station in 1893. And about 80 years have passed since the breedings of rice, wheat, barley and soybean were started in these experiment stations...

"Breeding objectives are as follows: High yielding (more than 4 tons per ha.), good qualities (yellow hilum, large seed, protein contents over 50% or oil contents over 25%), resistance against disease and insects,... resistance against cold weather and adaptability for mechanized cultivation...

"The whole country has been divided into five breeding regions according to the ecological types of cultivated soybean to accomplish the above described breeding objectives."

Soybean production / imports in Japan in tonnes (metric tons): 507,100 / 808,177 in 1955; 417,600 / 1,128,290 in 1960; 229,700 / 1,847,469 in 1965; 126,000 / 3,243,790 in 1970; 122,400 / 3,211,568 in 1971.

• ***Summary:*** Soybeans, azuki (adzuki) beans, and peanuts are among the main legumes discussed. Chairman: N. Matsumi (Upland Farming Div., Central Agricultural Experiment Station, Kitamoto, Saitama, Japan). Address: Tropical Agriculture Research Center, Ministry of Agriculture and Forestry, Nishigahara 2-2-1, Kita-ku, Tokyo 114, Japan.

5956. *Los Angeles Times.* 1972. Are menus a puzzle? Master a few of those foreign food phrases. Oct. 6. p. F16.
• ***Summary:*** Foods listed under "Japan" include: "... Miso: Bean paste. Natto: Steamed and fermented bean... Shoyu: Soy sauce... Tofu: Bean curd."

5957. Rodale, Robert. 1972. Milking the soybean. *Washington Post, Times Herald.* Oct. 26. p. H10.
• ***Summary:*** "The versatile, high-nutrient soybean can be processed easily into a kind of milk with several nutritional advantages over cow's milk. That may come as a shock to dairymen, but it's true."

Soy milk, which comes from a plant, contains little saturated fat, and is an alternative for people who are allergic to dairy milk. Describes how to make soymilk at home. Although it is easy to make an inexpensive, it is not popular in the USA; most Americans don't like the slight "beany" flavor.

However a food made from soy milk, whose taste does please our palates, is slowly gaining popularity. "That food has the rather unattractive name 'bean curd.'" You may have seen it on the menu at a Chinese or Japanese restaurant. The Chinese themselves call it [in Cantonese] *dow foo yuen* and the Japanese call it *tofu,* a name that is gaining popularity in the United States. Surprisingly, bean curd made in Taiwan and shipped to the U.S. in cans is labeled *tofu.*

"The big value of bean curd is that it offers a high-protein, good-tasting alternative to meat. It's a true convenience food, with outstanding culinary and nutritional values." Describes the many ways it can be used. It is not an exotic oriental food, but one that "has the potential to become a basic food eaten and enjoyed regularly by millions of Americans."

© Copyright Soyinfo Center 2014

A recipe for Bean curd and Chinese cabbage soup calls for 4 cups homemade chicken stock and "¼ pound bean curd."

• ***Summary:*** Consumption of tofu was associated with a significant decrease in risk from stomach cancer. Address: Biometry Branch, National Cancer Inst., Bethedsa, Maryland 20014.

5959. Haggerty, Donna. 1972. Fire reflects macrobiotics. *Macrobiotic* (*The*) (*Chico, California*) No. 81. Oct. *
• ***Summary:*** The article begins: "The burning of Chico-San / Spiral Foods on September 14 came as quite a shock to all of us."

Her article attempts to answer why the fire happened in terms of yin-yang and macrobiotic theory. At the end of the article is this interesting response: "Dear Donna, "In my opinion, Chico-San reached extreme yang [pressure, heat (Chico is very hot in summer), activity, etc.] and not enough yin (such as space, less activity, etc.). "Herman Aihara."

5960. Kushi, Michio. 1972. Macrobiotic seminars of Michio Kushi. Boston, Massachusetts. 152 p. Illust. No index. 28 cm. Transcribed by Joan Mansolilli.
• ***Summary:*** This is a transcript of talk given by Michio Kushi, macrobiotic teacher, in the fall of 1972, from Oct. 10 to Dec. 20. The main subjects are: Theory and practice of natural agriculture. Principles of the ancient world calendar. Disease–Origin, causes, and cures.

Soyfoods are mentioned briefly as the cure for various ailments, including diabetes mellitus (p. 92, 94; miso, tamari), venereal disease (p. 104; tekka, strong miso), stomach cancer (p. 128-29; miso soup, fried tofu, tekka, miso pickles), toxication from cigarette smoking (p. 131; miso soup), appendicitis with high fever (p. 132-33; tofu plaster on head). Address: Boston, Massachusetts.

5961. Photograph of Evan Root and Jim Gronemeyer standing by the Erewhon Los Angeles macrobiotic retail store. 1972.
• ***Summary:*** This photo was taken in about Oct. 1972. The black and white photo shows the two at the back of the store, and the color photo shows the outside front of the store. Jim was one of those who built the first Erewhon West at the behest of Aveline Kushi–who was living in Los Angeles at the time. Evan and Jim were old friends from pre-macrobiotic days; Jim showed Evan around.

Note: This photo was sent by Evan Root to Patricia Smith and by Patricia to Soyinfo Center (Nov. 2010).

5962. Advest Co. 1972. Private placement $500,400. 1112 shares. Erewhon Inc. (Continued–Document part II). Hartford, Connecticut. 34 p. 28 cm.
• ***Summary:*** Continued from p. 12. Management of Erewhon: Paul Hawken–President & chairman. Born on 8 Feb. 1946 in San Mateo, California. Attended Berkeley High School in Berkeley, California. Graduated from Nevada Union High School 1963 [located between Nevada City and Grass Valley, California, in the Sierra Nevada foothills]. Worked one year as a carpenter. Traveled in Europe 1964-65, studied at Alliance Française. Returned to the USA and enrolled at San Francisco State. School was closed by demonstrations, so he went into business for himself–Commercial photography, portraits, and advertising. Left business in 1966 to come to Boston to begin working at Erewhon in Aug. 1966. Married [to Dora Coates, June 1971], one child.

Tomoko Kushi–Stockholder. Michio Kushi–Director East West Foundation. Morris Kirsner–Attorney at law.

John Deming, Jr.–Retail manager. Born 27 June 1947 in Tacoma, Washington. Graduated from Bolton High School at Alexandria, Louisiana, in 1965. Attended Tulane University (New Orleans) until 1967, majoring in English. Began his own business, opening a natural food store in Jackson, Mississippi. Sold the business in Aug. 1971 and went to work with Erewhon in Los Angeles. Married [to Judy Coates in Aug. 1972].

Gordon William Garrison, Jr.–Vice-president. Born 19 Dec. 1946 in New York, NY. Graduated Bennington High School 1964. Attended Norwich University [Northfield, Vermont] 1964-65. Attended University of Vermont 1965-69, and graduated in 1969 with a B.A. in philosophy and art. Job Experience: Camp counselor, construction worker, ski instructor and patrolman, carpenter, farmer, tree surgeon, and lecturer. In 1970 started with Erewhon. Single.

Paul West–General Manager. In Feb. 1971 began employment with Erewhon. Married with two children.

Christopher J. Connolly–Production manager. Began work at Erewhon in 1970 in Los Angeles. Transferred to Boston in Oct. 1971. Single.

"Employees and facilities: The company maintains a retail store with 2,100 square feet at 342 Newbury Street, Boston, and a second retail store with 2,500 square feet at 8001 Beverly Blvd., Los Angeles. Supporting this store and the Western regional wholesale market is a 14,000 square foot warehouse at 8454 Steller Drive, Culver City, California.

"The company's headquarters and principal warehousing, packing, and processing facilities are located on 5 floors of two adjoining buildings at 33 Farnsworth Street, South Boston. This location comprises approximately 40,000 square feet. The company presently operates two packaging lines in Boston, 2 shifts daily, and one Packaging line in Los Angeles." The company employs approximately

© Copyright Soyinfo Center 2014

40 people.

"The Market" Because it has grown with the organic movement and has followed rigorous standards of food purchase and preparation, the company enjoys an impeccable reputation for integrity in the rapidly growing organic foods market. The company believes it is presently the largest supplier of organic foods in the East.

"The market for natural, organic and health foods is a dynamic and rapidly growing one. A recent *Wall Street Journal* article named this industry as one of the ten highest growth industries for the 1970s. The National Nutritional Foods Association [NNFA] estimates there are about 250 manufacturers and distributors in the industry whose total sales were estimated by Dr. Dennis Wood, of Arthur D. Little, to have grown from $140 million in 1970 to $200 million in 1971 and possibly $400 million in 1972. These products are sold in over 3000 independent stores and by many food chains. Their level of importance is indicated by the recent printing of a separate Sears & Roebuck catalogue for health and organic foods."

There is a diversity of motivations underlying consumer demand for organic foods. Three categories of demand appear to exist: Cultural, economic, and taste. Organic foods usually taste better than non-organic foods. "The growing public concern for ecology also lies behind the purchase of these foods. Presently many members of such organizations as the Audubon Society, Friends of the Earth, and the Sierra Club purchase organic foods to boycott the farmers and chemical industries whose use of pesticides and artificial fertilizers the groups consider harmful to the environment. The many life styles and philosophies that are loosely grouped as 'counter culture' also underlie the motivation to purchase organic foods. Youth predominates in this category, but some spokesmen are such notables as René Dubois and Buckminster Fuller. In its broadest terms, the 'counter culture' is a search for a better answer to man's modern pattern of life. Man's present life style has led to a dangerous disruption of his environment."

"In fiscal year 1972 the company attempted a vigorous program of distributor sales aimed principally at broadening its market geographically and increasing sales. This program was successful in increasing sales, but its implementation required a rapid and inefficient expansion of the work force and substantial price discounts on distributor products. By consequence, the company's overall gross margin contracted, while its operating expenses increased, resulting in a 10-month net loss of $50,000 on sales of $2.8 million." Since that time distributor sales were effectively discontinued and substantial numbers of personnel were laid off. Gross margins have returned to their previous levels.

"Since its founding, the company has never employed a salesman full-time or run a continuous advertising campaign. Sales growth has been largely in response to externally developed demand and limited by capital."

Photocopies show the following Erewhon-brand labels: Maple granola, Peanut butter, Apple juice, Olive oil, oil of sunflower, corn germ oil, oil of soybean, short grain brown rice (organically grown), whole wheat flour, hacho miso (soybean paste). Photos also show the front and interior of an Erewhon retail store. Address: 6 Central Row, Hartford, Connecticut 06103.

5963. Chico-San Inc. 1972. Products (Document part). In: Midwest Natural Foods Distributors, Inc. 1972. Catalog and price list. Nov. 1. Ann Arbor, Michigan. 58 p. See p. 7-8.
• ***Summary:*** Rice cakes, Buckwheat cakes, or Millet cakes (salted or nonsalted, 3½ oz). Yinnies rice candy (3½ oz). Rice chips or Corn chips (5 oz). Lima Tamari soy sauce (8 oz, pint, or quart). Miso soybean puree (8 or 16 oz). Sesame salt (2, 4 or 8 oz). Sesame salt (4, 8, or 16 oz). Sea salt, white unrefined (1 lb). Salt plums (4 or 8 oz). Kuzu (wild arrowroot) (2 oz or 4 oz). Wholewheat spaghetti (OG [=organically grown], 8½ oz). Buckwheat spaghetti (8½ oz). Wholewheat macaroni (OG, 12 oz). Buckwheat macaroni (12 oz). Azuki beans (8 oz, 1 lb). Wild ginseng root (½ oz). Wild ginseng powder (25/6-pkts). Ohsawa twig tea (4 or 8 oz). Mu tea–Lima, more ginseng (24/2 or 24/8 pkts). Mu tea–Osaka [Japan] (24/2 pkts [also called "16 Herb Tea." Label shows ingredients: Ginseng, Ligusticum, Paonia root, cypress, orange peel, ginger, Rehmannia, cinnamon, cloves, peach kernels, Coptis, liquorice root, Cnicus, Atractylis, Moutan, Hoelen]), Green tea, natural leaf (6 oz). Lotus root tea (1 3/4 oz). Rice cream (OG, 1 or 2 lb). Kombu, kelp size (3½ oz). Tooth powder jar (½ jar).

Appliances: Food grater (with or without well). Vegetable knife–square end. Fish knife–pointed end. Mortar (suribachi, small or large). Pestle–wooden. Vegetable press. Oil skimmer for tempura. Vegetable scrub brush (small or large). Soysauce tableserver–glass. Rice paddle–bamboo. Chopsticks–lacquered. Chopsticks–long cooking.

At the bottom is the Chico-San spiral logo.

Note: Many of these products are imported from Japan. Address: [Chico, California].

5964. Ishikawa, Hisao; Okubo, Katsumi; Oki, Tae. 1972. Nattô nenshitsu-butsu yôeki no eishisei (hiki ito sei?) ni tsuite [Characteristic spinability of a natto mucin solution]. *Nippon Kagaku Kaishi* (*J. of the Chemical Society of Japan*) No. 11. p. 2171-77. Nov. (Chem. Abst. 78:73434). [22 ref. Jap]
• ***Summary:*** A purified mucin solution, which was isolated from natto (fermented soybeans), was composed of fructan and poly-DL-glutamic acid in the ratio of 22.1% and 77.6%. Address: Faculty of Agriculture, Ehime Univ., Matsuyama-shi, Japan.

5965. *SoyaScan Notes.* 1972. Chronology of soybeans, soyfoods and natural foods in the United States 1972

© Copyright Soyinfo Center 2014

(Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1972 Jan. Janus begins operation as a macrobiotic natural foods distributor in Seattle, Washington. It is founded by George Gearhart and Blake Rankin.

1972 Feb. Tree of Life in St. Augustine, Florida, starts distributing natural foods. Founded by Irwin Carasso, this company would soon become the largest and most successful of its type.

1972 March. The Farm in Tennessee sets up a small plant and begins to make soymilk, which is rationed for use by babies and children.

1972 Sept. Frank Shorter wins the Olympic marathon, the first marathon victory by an American. A major boost to interest in running, exercise and fitness.

1972 Oct. William Shurtleff and Akiko Aoyagi start full time research on tofu in Japan, writing a book on the subject.

1972. *Soybeans: Chemistry and Technology,* by A.K. Smith and S.J. Circle, published.

1972. The Farm, a large spiritual and vegetarian community in Summertown, Tennessee, sets up a small "soy dairy" to make soymilk and tempeh for members, whose vegan diet contains no animal products, not even dairy products or eggs. This is the earliest known tempeh produced in a Caucasian-run tempeh shop in the U.S., although it is not sold commercially.

1972-74. World food crisis years. Photos of malnourished and starving children appear on the covers of leading magazines and in the TV news.

1972, July. Soviet wheat deal. The USSR suddenly purchases 18 million tons of wheat from the USA via Continental Grain, making it the largest food import deal in history. This starts an era of expanded U.S. agricultural trade with socialist countries. This massive Soviet purchase ends the long postwar period of food price stability.

1972. National Soybean Project established in Brazil.

1972. Soybean research starts at the International Institute of Tropical Agriculture (IITA), in Ibadan, Nigeria. The focus is on soybean production and varietal development. This gradually becomes the most important soybean research program in Africa, and plays a key role in helping national programs in Africa to get started.

5966. Kiuchi, Kan; Ohta, Teruo; Fujiie, Hiroko; Ebine, Hideo. 1972. [Studies on enzymatic hydrolysis of soybean polysaccharides. I. Purification and properties of hemicellulase from *Bacillus subtilis* No. 17]. *Nippon Shokhin Kogyo Gakkaishi* (*J. of Food Science and Technology*) 19(12):585-90. [Jap]*
Address: National Food Research Inst., Tokyo.

5967. Leung, W-T.W.; Butrum, R.R.; Chang, F.H. 1972. Food composition table for use in East Asia. Atlanta, Georgia: Center for Disease Control, U.S. Dept. of Health, Education, and Welfare. xiii + 334 p. Dec. No index. 30 cm.
• ***Summary:*** Part I. Proximate composition, mineral and vitamin contents of East Asian foods, by Woot-Tsuen Wu Leung, Ph.D. (Nutrition Program, Center for Disease Control, Dep. of Health, Education and Welfare), and Ritva Rauanheimo Butrum, M.S., and Flora Huang Chang, B.S. (Federation of American Societies for Experimental Biology).

Part II. Amino acid, fatty acid, certain B-vitamin and trace mineral content of some Asian foods, by M. Narayana Rao, Ph.D., and W. Polacchi (Food Policy and Nutrition Division, Food and Agriculture Organization of the United Nations).

In Part I, Food Group 3 titled "Grain legumes and legume products" (p. 16-22) gives the composition of the following (100 grams edible portion and as purchased): Adzuki beans (*Phaseolus angularis;* incl. "Azuki-an," and boiled sweetened). Asparagus bean: See Cowpea, yardlong. Asparagus pea: See Goabean. Bambara groundnut or jugo bean (*Voandzeia subterranea*). Bengal gram: See Chickpea. Blackeyed pea: See Cowpea, catjang. Blackgram: See Mung bean. Broad bean or horse bean (*Vicia faba;* incl. "Fuki-mame" and "Otafuku mame"). Burma bean: See Lima bean. Butter bean: See Lima bean. Catjang pea: See Pigeonpea. Chickpea or Bengal gram (*Cicer arietinum*). Cowpea, all varieties (*Vigna* species). Cowpea, yardlong: See Cowpea, all varieties. Dhal: See Lentil. Dolichos, Australia pea (*Dolichos lignosus*). French bean: See Kidney bean. Goabean [goa bean], asparagus pea, or winged bean (*Psophocarpus tetragonolobus*). Golden gram: See Mung bean. Green gram: See Mung bean. Haricot bean: See Kidney bean. Hindu cowpea: See Cowpeas, all varieties. Horse grain or horse gram or Madras gram (*Dolichos uniflorus; D. biflorus*). Horsebean: See Broadbean. Note 1. This is the earliest English-language document seen (Jan. 2005) that uses the word "horsebean" or the word "broadbean" to refer to *Vicia faba.*

Horsegram: See Horse grain. Hyacinth bean or Indian butterbean (*Lablab niger; Dolichos lablab*). Indian bean: See Mung bean. Indian butterbean: See Hyacinth bean. Jackbean, common (*Canavalia ensiformis*). Jugo bean: See Bambara groundnut. Kidney bean, French bean, navy bean, pinto bean, snap bean, or string bean (*Phaseolus vulgaris;* incl. "Usura-mame"). Lentil or dhal (*Lens culinaris; Lens esculenta; Ervum lens*). Lima bean, butter bean, or Burma bean (*Phaseolus lunatus; Phaseolus limensis*).

Note 2. This is the earliest English-language document seen (May 2003) that uses the scientific name *Lens culinaris* to refer to lentils.

Note 3. This is the earliest English-language document seen (Jan. 2009) that uses the name "Burma bean" to refer to the lima bean.

Madras gram: See Horse grain. Mung bean, Indian bean, red bean, green gram, golden gram, or blackgram / black

© Copyright Soyinfo Center 2014

gram (*Phaseolus aureus; Vigna radiata;* incl. vermicelli, dried starch, starch jelly, instant powdered green or red products with sugar and flour added). Mung bean, black gram or urd (*Phaseolus mungo; Vigna mungo*). Navy bean: See Kidney bean. Peanut or groundnut (*Arachis hypogaea;* incl. raw, roasted, with or without shell, salted, parched, seasoned, fried, peanut flour, peanut butter, peanut milk, peanut cake–defatted, peanut cake–defatted and fermented [onchom]). Peas, garden or field (*Pisum* species; incl. parched–salted, "Uguisu-mame"). Pigeonpea, or catjang pea (*Cajanus cajan; Cajanus indicus*). Pinto bean: See Kidney. Red bean: See Mung bean. Rice bean (*Phaseolus calcaratus; Vigna calcarata*). Soybean and soy products (Glycine max; G. hispida; G. soja; p. 19-21), incl: Whole mature seeds–dried (yellow, black), whole immature seeds dried, whole seeds–salted (black, green, green soaked, fried, fermented {natto}, pickled, roasted), flour made from roasted soybeans, defatted soybeans–whole seeds. Soybean products: Curd–unpressed, curd–tofu–raw (plain, kinugoshi, fukuroiri), curd–tofu–fried (moist type, dried type–regular size, dried type–small size, canned, abura age), curd–roasted [grilled], curd–tofu–fermented (home-prepared, jarred), curd–tofu (dried–spongy square, preserved, dried–rope-like, commercial {fermented with chili pepper}–jarred), curd cheese, curd sheet (milk clot sheet {yuba}) (moist type, dried type, pickled in soysauce), curd–pressed–raw (plain, fermented, spiced, strips–semi-dry), miso (Japan) (plain, sweet {5.3% salt added}, salty–light {10.4% salt added}, salty–dark {11.7% salt added}, mame-miso {9.7% salt added}, powdered {18.5% salt added}), paste [jiang] (plain, fermented, red pepper added, sweet, malt), soybean milk (unenriched–unsweetened, "Kaset" {Thailand; canned–concentrated, fluid}, Saridele {a mixture of soybeans, sesame seeds or peanuts, with vitamins and calcium added–Indonesia}), soybean sauce (dark–thick, light–thin, unspecified), tempeh (fermented soybean product, Indonesia), "Budo-mame" (cooked [whole soybeans]–Japan), Soybean residue [okara] (liquid, powder). Urd: See Mungo bean. Velvetbean (*Mucuna utilis; Stizolobium utilis;* incl. dried or mold-treated {tempeh}). Winged bean: See Goabean, Indes.

Food Group 4 titled "Nuts and seeds (p. 23-29) includes: Almonds, hemp seeds–whole, perilla–common (*Perilla frutescens*), safflower seeds, sesame seeds, sunflower seeds (*Helianthus annuus*), watermelon seeds.

Food Group 5, titled "Vegetables and vegetable products" (p. 30-75) includes: Amaranth, mungbean sprouts, seaweeds (many types), soybeans–immature seeds [green vegetable soybeans], soybean sprouts (raw, cooked).

Note 4. This is the earliest English-language document seen (April 2013) that mentions silken tofu, which it calls (in a table): "Curd, tofu, raw: 'Kinugoshi,' Japanese preparation."

Note 5. This is the earliest English-language document seen (Nov. 2012) that contains the term "flour of roasted soybeans."

Note 6. This is the earliest English-language document seen (Oct. 2006) that uses the term "Blackeyed pea" to refer to the cow pea. Address: Dep. Health Education and Welfare.

1972. Tenpei no kôsan kasei busshitsu no seisei ni kanyo suru beta-gurukoshidaaze [β-glucosidase involved in the antioxidant formation in tempeh, fermented soybeans]. *Noka* (*Agricultural Chemistry*) 46(7):323-29. [10 ref. Jap; eng]
• ***Summary:*** The Beta-glucosidase involved in formation of antioxidants (some isoflavones) from fermented soybeans with *Rhizopus oligosporus* was investigated. Genistin was hydrolysed. Address: Faculty of the Science of Living, Osaka City Univ., Osaka, Japan.

5973. Ebine, Hideo. 1972. Miso in conversion and manufacture of foodstuffs by microorganisms. In: Gyozo Terui, ed. 1972. Fermentation Technology Today: Proceedings of the Fourth International Fermentation Symposium. See p. 127-32. Held 5-9 Dec. 1971 at Kyoto, Japan. *
Address: Shokuhin Sogo Kenkyujo, Tokyo, Japan.

5974. Harada, Motô; Nakamura, Y.; Tanimura, A. 1972. Shokuhin-chû no nitorosamine ni kansuru kenkyû. IX. Shokuhin-chû no ashô sanen no bunpu [Studies on nitrosamines in food. IX. Distribution of nitrite in various foods]. *Shoku Eishi* (*J. of Food Hygiene*) 13(1):36-40. [Jap]*
• ***Summary:*** Nitrosamines [pronounced nai-TRO-suh-meens] are reaction products from nitrite and amines. Some salt-pickled foods contain considerable amounts of nitrite. But very small amounts of nitrite were found in rice, wheat, and soybeans used as raw materials for making shoyu and miso.

Interest in the safety of nitrites started in about 1970. The following nitrite levels (parts per million) were found in other Japanese foods: Shiouri shiozuki (salt pickled cucumbers) 96, red hot dogs 64-79, niboshi (small dried sardines) 31, ham 29, fish sausage 24. Very low levels were found in fresh bread crumbs 16, and roasted soy flour 15.

• ***Summary:*** Sponsored by IUPAC, the Science Council of Japan, and the Society of Fermentation Technology, Japan.

5987. Yagi, K. 1972. [Packaged bean curd product]. *Japanese Patent* 13 690/72. [Jap]*
• ***Summary:*** Dried tofu is cooked, soaked in soy sauce, then put into a bag with a mixture of soy sauce, spices, binders, and preservatives. After the air is removed from the bag, it is sealed and steam heated. Address: Japan.

5988. Yokotsuka, Tamotsu. 1972. Some recent technological problems related to the quality of Japanese shoyu. In: Gyozo Terui, ed. 1972. Fermentation Technology Today: Proceedings of the Fourth International Fermentation Symposium. See p. 659-62. [40 ref]
• ***Summary:*** Contents: 1. Amino acid containing seasonings around the world and the general situation of the Japanese shoyu industry. 2. Chemical composition of Japanese shoyu, and the factors which influence the preference for shoyu. 3. Some important technical items in the production of Japanese fermented shoyu. 4. Mycotoxin problems with koji mold (research suggests that koji molds do not produce aflatoxins on TLC {thin layer chromatography}). Address: Kikkoman Shoyu Co., Ltd., Noda-shi, Chiba-ken, Japan.

5989. Aihara, Cornellia. 1972. The Chico-San cookbook. Chico, California: Chico-san, Inc. 126 p. Illust. 22cm. by Nan Schleiger. Reissued in revised form as Macrobiotic Kitchen by Japan Publications in 1982.
• ***Summary:*** All recipes are numbered and pages are unnumbered. Soy-related recipes include: 6. Brown rice in soy sauce. 16. Black [soy] beans and brown rice. 23. Inari-sushi (with agé). 24. Ohagi of 3 colors (with roasted soybean flour and miso). 32. Ojiya (with miso or soysauce). 37. Roasted rice (with black soybeans). 38. Musubi (with miso). 55. Kinako mochi. 76. Soy bean stock. 87. Oden (with agé and soy sauce). 90. Kenchin soup (with agé). 95. Cream of onion soup (with miso). 96. Hacho miso soup. 97. Mugi miso soup. 98. Kome miso. 99. Oil miso. 100. Sesame miso. 101. Walnut miso. 102. Miso salad dressing. 103. Shiguri [sic, shigure] miso (with scallops). 104. Tokiwa miso (with shiitake mushrooms, citron, and walnuts). 105. Oyster miso. 106. Tai miso. 108. Nuka miso zuke (vegetables pickled in rice bran and miso). 121. Miso pickles. 137. Daikon with agé. 138. Daikon with miso. 143. Turnip with sesame-miso. 159. Burdock-miso soup. 162. Burdock with miso. 180. Onion-miso sauce. 182. Scallion-miso. 191. Carrots with miso. 192. Carrots with soy sauce. 200. Dengaku (with miso). 220. Roasted soybeans. 221. Soybean soup. 222. Soybeans with vegetables. 223. Soybeans with miso. 224. Soybean tempura. 225. Mashed soybeans with tarako (cod fish roe). 226. Soybean croquettes. 227. Soybean potage. 228. Soybean muffins. 229. Kidney beans with miso. 237. Shigiyaki (small eggplants with miso). 241. Eggplant miso pickle. 267. Rolled shiso leaves with miso. 291. Tofu kuzu sauce. 292. Tofu chili-nabe. 293. Tofu with vegetables. 294. Tofu salad. 295. Okara rice. 296. Torimotsu okara (with chicken giblets). 297. Okara soup. 298. Okara croquettes. 299. Egg tofu. 308. Koi-koku (carp soup with miso). 311. Loach soup (with miso). 312. River fish with miso sauce. 320. Mackerel with miso. 335. Coltsfoot with miso. 341. Dandelion miso-ai [miso-ae]. 345. Horsetail with miso-ai. 359. Watercress miso-ai. 361. Nobiru goma miso (with wild onions). 369. Shiromiso shiru [sweet white miso soup]. 371. Nimame (black soybeans). 400. Shoyu bancha (twig tea). 408. Black bean tea. 409. Amasake (homemade from koji rice and sweet brown rice). 456. Amasake manju. 461. Soba with miso-ame. 515. Tekka (with Hacho and/or mugi miso). 516. Seitan (homemade). 517. Soy sauce (homemade). 518. Miso (homemade). 519. Tofu (homemade using nigari). 520. Nigari (homemade). 521. Amasake (homemade from koji rice and sweet brown rice flour).

Cornellia Aihara was born with a heart valve defect. She was told by doctors that she could never bear children and would probably not live past her nineteenth year. She proved them wrong on both counts. In 1955 she came to America from Japan at the invitation of Herman Aihara, a man she knew only through correspondence, and they were married. Within several years their two children were born.

Cornellia has applied herself to the teaching of macrobiotic cooking, childcare, home remedies, and

© Copyright Soyinfo Center 2014

philosophy since 1960. Address: Chico, California.

5990. Aihara, Cornellia. 1972. The *dô* of cooking (Ryorido). Vol. 2. Summer cooking. Macroguide No. 13. San Francisco, California: George Ohsawa Macrobiotic Foundation. 103 p. No index. 25 cm.
• ***Summary:*** All recipes in this macrobiotic cookbook are numbered. The section on "Tofu" contains recipes for: 35. Hiya yako [sic, yakko] (cold, uncooked tofu). 36. Kanten tofu (Tofu aspic). 37. Tofu kuzu aspic. 38. Harusame tofu kuzu sauce. 39. Unagi tofu [vegetarian].

The section on "Miso Soy Bean Paste" contains recipes for: 40. Soy bean miso [soybeans sauteed with miso]. 41. Vegetables with miso sauce. 42. Vegetable miso. 43. Green pepper with miso. 44. Deep fried miso balls.

Other soy recipes include: 60. Nori with soy sauce. 62. Kombu in soy sauce. 64. Hiziki tofu salad. 66. Fried koya tofu with carrot (with dried tofu). 71. Cold miso soup. 73. Split pea miso soup. 81. Tahini-tamari sauce. 89. Soy bean surprise [with miso-tahini sauce]. 92. Okara salad.

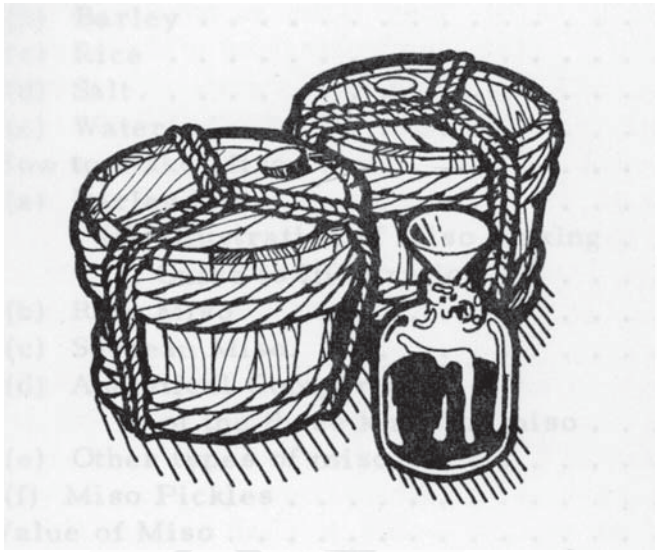
GOMF was founded in 1971. Address: 1471-10th Ave., San Francisco, California 94122.

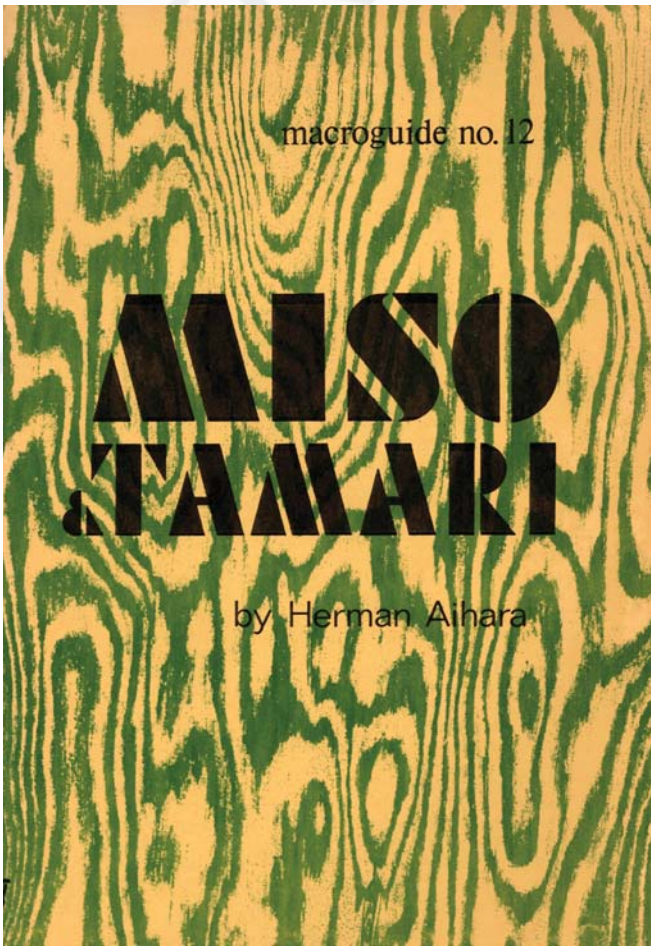
5991. Aihara, Cornellia. 1972. The *dô* of cooking (*Ryorido*). Spring. Oroville, California: George Ohsawa Macrobiotic Foundation. 125 p. Illust. by Carl Campbell. Index. 21 cm.
• ***Summary:*** This macrobiotic book is divided into two parts: Eleven chapters followed by 14 sections of recipes. In part one, miso is mentioned on pages 15, 35, and 51 (Condiments and spices). Recipe section IV, titled "Wheat gluten" (p. 79-82) contains recipes for: Wheat gluten. Seitan. Fresh wheat fu. Boiled fu. Fried fu–gluten cutlet. Shish kebab (using 3 strips of cooked fu). French bread (made with gluten water, p. 115).

Recipe section V, titled "Tofu" (p. 83-90) contains recipes for: Tofu making (using 3 cups green soybeans and nigari coagulant; with 11 excellent illustrations). Nigari (from gray sea salt). Quantity tofu preparation (using 10 lb soybeans). Okara or unohana (using "3 cups soybean puree leftover from tofu making"). Tofu with kuzu sauce. Fried tofu. Shinano-agé (Fried tofu with buckwheat). Kaminari tofu (Thunder tofu). Nori-maki (Tofu rolled in nori; with illustration). Age-tofu (Stuffed tofu; with illustration).

Soy-related recipes include: Onion miso (p. 70). Rolled cabbage with tofu (p. 71). Bean sprout miso salad (p. 100; miso is called "mixed soybean puree {half mugi and half kome}." The sprouts are probably from mung beans). Ganmodoki (Mock goose; p. 109). Gyoza filled with seitan, dipped in a mixture of soy sauce and lemon juice (p. 111-12). Address: George Ohsawa Macrobiotic Foundation, Oroville, California.

5992. Aihara, Herman. 1972. Miso & tamari. *Macroguide* (*San Francisco: George Ohsawa Macrobiotic Foundation*). No. 12. iii + 34 p. [3 ref]





• ***Summary:*** Contents: Preface. Part I: Miso. Introduction, the origin of miso, kinds of miso, ingredients (soybeans, barley, rice, salt, water) how to make miso [at home] (barley miso, rice miso, soybean miso, analytical comparison of the three kinds of miso, other types of miso, miso pickles)

© Copyright Soyinfo Center 2014

value of miso (protein, fat, minerals, poison prevention, heart disease, miso for beauty, stamina, miso for radiation and other diseases, miso soup), miso in the treatment of tuberculosis and atomic radiation exposure.

Part II: Tamari or traditional soy sauce. Introduction, history, chemical change of tamari, how to make tamari soy sauce at home, how to use soy sauce.

Part III: The other soybean foods. Tofu (preparation of soybean milk at home, coagulation of soybean protein, the formation of tofu in a mold [for homemade tofu], tofu for external treatment–tofu plaster, age–deep fried tofu [how to make at home]), natto (introduction, how to make natto at home).

Part IV: Appendix. Available publications, G.O.M.F. message.

Illustrations by Carl Campbell show: (1) Two traditional kegs of miso and a glass jar of tamari (title page). (2) Making mugi (barley) miso in Japan (9 steps; p. 10).

Note 1. This is the earliest English-language document seen (March 2009) that describes how to make miso at home. Recipes for three types of miso are given: Barley miso, rice miso, and soybean miso. The method is translated from *Miso University,* by K. Misumi (in Japanese). Fortunately, the exact amount of each of 5 ingredients is given, and nine excellent illustrations show the main steps in the traditional process. Unfortunately, the instructions are somewhat vague.

Note 2. This is the earliest English-language document seen (Jan. 2012) that describes how to make natto at home. Address: San Francisco, California.

5993. Bock, Felicia Gressitt. trans. 1972. Engi-shiki: Procedures of the Engi era. Books VI-X. Tokyo: Sophia University. ix + 190 p. Index. 27 cm. [506 footnotes. Eng]
• ***Summary:*** This is volume 2 of a two-volume series. The first volume, published in 1970, contains Books I-V.

5994. Ebine, Hideo. 1972. Miso. In: 1972. Proceedings of the [Sixth] International Symposium on Conversion and Manufacture of Foodstuffs by Microorganisms. Tokyo: Saikon Publishing Co. viii + 297 p. See p. 127-32.
• ***Summary:*** Contents: General description. Characteristics of miso as a food. Advances in miso manufacturing: Application of starters, application of new type cookers and koji fermenters, production of miso with enzyme preparation, production of new type miso (low salt, dehydrated). Problem of mycotoxin.

In 1969 some 552,000 [metric] tons of miso were produced industrially in Japan, employing 180,000 tons of soybeans, 92,000 tons of rice, 19,000 tons of barley, and 75,000 tons of salt. In addition, the amount of home-made miso is roughly estimated at 150,000 to 200,000 tons.

Japanese soybeans are the best for making miso of good quality, followed by Chinese soybeans, then U.S. soybeans. The best U.S. variety is "Kanrich and its related varieties, Mandarin and Comet, which are comparable to the best Japanese varieties."

Photos show: (1) Sterilization of miso using a long, horizontal machine. (3) Rotary drum fermenter for koji. Address: Fermentation Div., National Food Research Inst., Ministry of Agriculture and Forestry, Shiohama 1, Koto-ku, Tokyo, Japan.

5995. Fujimaki, Masao; Arai, Soichi; Yamashita, Michiko. 1972. Enzymatic protein hydrolysis and plastein synthesis: Their application to producing acceptable proteinaceous food materials. In: Proceedings of the [Sixth] International Symposium on Conversion and Manufacture of Foodstuffs by Microorganisms. Tokyo: Saikon Publishing Co. viii + 297 p. See p. 19-40. Held 5-9 Dec. 1971 at Kyoto, Japan. [55 ref] Address: Dep. of Agricultural Chemistry, Univ. of Tokyo, Tokyo, Japan.

5996. Furia, Thomas E. ed. 1972. CRC handbook of food additives. 2nd ed. 2 vols. Cleveland, Ohio: CRC Press (a Division of The Chemical Rubber Co.). Vol. 1: xi + 998 p. Vol. 2. 412 p. Index. 27 cm. [624* ref]
• ***Summary:*** The many chapters are published by various authors. Contents of Vol. 1: Introduction. 1. Enzymes. 2. Vitamins and amino acids. 3. Antimicrobial food additives. 4. Antioxidants as food stabilizers. 5. Acidulants in food processing. 6. Sequestrants in food. 7. Gums. 8. Starch in the food industry. 9. Surface active agents. 10. Polyhydric alcohols. 11. Natural and synthetic flavorings. 12. Flavor potentiators. 13. Nonnutritive sweeteners. 14. Color additives in food. 15. Phosphates in food processing.

Contents of Vol. 2: Legal considerations on food additives. Antioxidants as stabilizers for fats, oils, and lipid-containing foods. Enzymes. Nonnutritive sweeteners: Saccharin and cyclamate. New sweeteners. Natural and artificial flavors. Synthetic food colors.

Vol. 1: Chapter 12, titled "Flavor potentiators" (p. 513-21), by Loren B. Sjöström (Vice-President, Arthur D. Little, Inc., Cambridge, Massachusetts) notes (p. 513): "In the context of flavor, the term 'potentiator' is only a few years old. The identification of flavor potentiators is a twentieth century accomplishment, an area of research still in its infancy." Yet seasonings (such as salt), as well as herbs and spices, have been used since ancient times.

The section on "Flavor enhancers" begins (p. 515): "The best known and most widely used flavor enhancer is monosodium glutamate (MSG). In 1866, a German chemist, Ritthausen, isolated glutamic acid. Later another chemist converted the acid to a sodium salt, monosodium glutamate. In doing their work, neither had any interest in flavor.

"More than 40 years later, in 1908, a Japanese chemist at the University of Tokyo, Dr. Kikunae Ikeda, discovered the flavor enhancing properties of MSG. Dr. Ikeda had set out to find out why and how a certain seaweed, *Laminaria*

© Copyright Soyinfo Center 2014

japonica, affected flavor. Japanese cooks had used this seaweed for centuries to improve the flavor of soups and certain other foods. Dr. Ikeda discovered that the ingredient in the seaweed that made the difference was MSG, and that it had an unusual ability to enhance or intensify the flavor of many high protein foods.

"After isolating MSG, Dr. Ikeda developed a process for extracting it from wheat flour and other flours. Working with the Japanese chemical company, Suzuki and Co., he supervised the construction of a plant and, as a partner with the company, began commercial production of MSG in 1909.

"There were several attempts to produce MSG in the United States in the years following, but it was not until the 1940's that large-scale MSG production began in this country. By 1968, U.S. production had grown to 46 million pounds per year and world consumption had increased to more than 150 million pounds per year."

The section titled "Types of potentiators" discusses 5'-nucleotides, maltol, dioctyl sodium sulfosuccinate, and several others. The 5'-nucleotides are synergistic with salt, and especially with MSG; they can have something like a multiplier effect in increasing the effectiveness of salt or MSG.

Note: Soy does not appear in the index of this book. Nor can we find it mentioned in Chapter 12. Yet there are scattered mentions throughout the book: Soy protein concentrate (p. 5). Soy sauce, tamari sauce, and miso–made for centuries in the Orient using fungal protease (p. 59). Studies on breads supplemented with soy, nonfat dry milk, and lysine (p. 114).

Experimental use of esters of *p*-hydrobenzoic acid in soy sauce and other foods (p. 128). Gas sterilants: Ethylene and propylene oxides. The ethylene oxide process was used during World War II to reduce the bacterial counts in soy flour and cereal products used in processed meat products for the Armed Forces (p. 156). An excellent acidulant for hams and soy bean curds [tofu] has been obtained by coating citric acid with suitable animal or plant oils (p. 242-43).

"Synthetic aroma for soy sauce," by K. Ebihara. 1954 Japanese patent No. 5250'54 (p. 258). Soy flour as a widely used binder for processed meat (p. 425). Soy flakes (31.5% parts by weight) and soy hulls (3.0%) as ingredients in "Soft moist pet food" (p. 445).

Cake doughnut mixes sometimes contain soy flour (p. 656). Completely synthetic coffee whiteners usually contain a combination of vegetable fats, sodium caseinate or soy protein, gums as viscosity stabilizers, phosphate or citrate salts as stabilizers for the proteins and as buffering agents, corn syrup solids or sugar as sweeteners and bodying agents, liquid-type emulsifiers, and colors to duplicate the color of cream (p. 671-72). Whipped toppings are used to replace high-fat cream products just as coffee whiteners are used to replace low-fat cream products. Both use protein, which may be soy protein (p. 672).

Imitation sour cream, sour cream dressings, and chip dips. Replacements for fermented cream products represent a growing market These non-dairy products contain vegetable oil / fat, protein (either soy protein or sodium caseinate [derived from milk], gum stabilizers, etc., p. 673). When partially hydrolyzed soy protein and sodium hexametaphosphate (SHMP) are added to dried egg white, an angel food cake mix can be prepared in which all of the ingredients can be included in a single mixing stage (p. 679). Gelsoy, a patented soy protein made from specially processed, defatted and dehulled soybean flakes, is reported to have improved water- and fat-binding capabilities when treated with SHMP (p. 746, 778).

Improving protein whipping properties: Sevall and Schaeffer prepared protein whipping compositions from soy protein by combining the protein with SHMP etc. (p. 747). Gunther made an entirely new whipping protein composition by combining an enzyme-modified soy protein similar to Gelsoy, with gelatin and a polyphosphate (p. 747). A long table on the regulatory status of direct food additives mentions "Isolated soy protein" (p. 874-75); its use as a binder is regulated by the Meat Inspection Division (MID) of the USDA.

The word "soybean" is mentioned on 22 pages; all of these concern soybean oil except when noted (p. 65 {soybean protein}, 67 {soybean meal, soybean flour / flours}, 99, 114 {soybean products}, 192, 193, 197, 198, 207, 221, 222, 263, 264, 280, 289, 290, 319 {the soybean plant resembles the guar plant}, 350 {soybean protein, soybean methylcellulose}, 424, 746 {soybean flakes}, 747 {soybean protein}, 749 {soybean milk}). Address: Technical Development Manager, Industrial Chemicals Div., Geigy Chemical Corp., Ardsley, New York; President, Intechmark Corp., Palo Alto, California.

5997. Hesseltine, C.W.; Wang, H.L. 1972. Fermented soybean food products. In: A.K. Smith and S.J. Circle, eds. 1972. Soybeans: Chemistry and Technology. Westport, CT: AVI Publishing Co. xiii + 470 p. See p. 389-419. Chap. 11. [54 ref]

• ***Summary:*** Contents: Introduction. Koji. Miso: Preparation of koji, treatment of soybeans (mixing, fermentation). Shoyu: Incl. chemical shoyu. Natto. Hamanatto. Tempeh. Sufu [fermented tofu]. New soybean products made by fermentation: Cheese-type products, fermented soybean milk, an ontjom-type product. 10. Future of fermented soybean foods.

Tables: (1) Demand for whole soybeans in Japan (1964-1967) to make miso, shoyu, and natto. In 1967, only 4.5% of the soybeans used to make miso were used in the form of defatted soybeans, whereas the same year 91.1% of the soybeans used to make shoyu were defatted. The total demand in 1967 (in 1,000 metric tons) was miso 177, shoyu 169, and natto 47. (2) Chemical composition of soybean

© Copyright Soyinfo Center 2014

foods: Miso (salty light, salty light, soybean miso), natto, soybeans. (3) Annual production of miso in Japan (1956-1967). Production of 530,078 tons in 1956 decreased to a low of 453,956 tons in 1962, then rose to 520,510 tons in 1967. (4) Composition of miso in relation to time of fermentation and ratio of soybeans:rice:salt for three types of miso: White miso, light-yellow salty miso, and yellow-red salty miso. (5) Average composition of shoyu made from whole soybeans and defatted soybean meal.

Illustrations (flowsheets, without quantities of ingredients) show: (1) Process for making red miso. (2) Process for manufacture of shoyu. (3) Process for making hamanatto. (4) Tempeh fermentation on a laboratory scale. (5) Preparation of sufu. (6) Preparation of soybean cheese. Address: NRRL, Peoria, Illinois.

5998. Horton, Lucy. 1972. Country commune cooking. New York, NY: Coward, McCann & Geoghegan. 232 + [8] p. Illust. by Judith St. Soleil. Index. 24 cm.
• ***Summary:*** A nostalgic memoir (for those who came of age at this time) of the world of young Americans in communes in the early 1970s, with many fine illustrations (see p. 27). The author, raised in New York City and educated at Bryn Mawr (Pennsylvania, with a major in classical archaeology), earned her traveling money by working as a live-in maid and cook for a rich "Park Avenue Lady" before embarking on the project that became this book. She hitchhiked to San Francisco, arriving in June 1971, then spent most of the next year visiting 43 communes in 12 states and Canada, and collecting recipes from each. There she found "a New Age of Food Consciousness." The main topic of conversation and common interest at these intentional communities was not God or sex, but food. This book, with her 150+ favorite recipes, features natural and organic foods (with lapses). Most of the recipes from California and the West Coast are vegetarian, but in New Mexico and eastward (especially New England) she was "surprised to find that vegetarianism was more the exception than the rule" (p. 81). Thus, Chapter 3 is titled "Meat (and one fish)." There are recipes for chicken, fish, deer, goat, beef, etc.

The Introduction notes (p. 15): "The *sine qua non* of commune cooking is tamari soy sauce, an unspeakably delicious fermented Japanese product available in natural foods stores which bears no resemblance to commercial soy sauce" * (Footnote: *"Kikkoman soy sauce, available in supermarkets, tastes like tamari but contains a preservative").

"1. Soups: The commune soups I sampled were typically of mixed vegetables with a tomato or miso (p. 159) base" (p. 27).

Tamari chickbits (p. 94, with chicken). Note about soy grits (p. 114). Sprouts (p. 135-36, many kinds including alfalfa, mung beans, soybeans, from Terra Firma, Oregon). Miso Almond Sauce (p. 158-59). Tamari gravy (p. 159). Soy-related recipes include: From Chapter 2, "Vegetarian main dishes"–Donna's soyburgers (p. 60-61, with whole soybeans, from California). Soy cheeseburgers (p. 61-62, with whole soybeans, from Moon Garden, Oregon). Suzy's soybean casserole (p. 63-64, from Breadloaf, New Mexico). Baked soybeans (p. 64-65, from Woolman Hill School, Massachusetts). Larry's tofu (soy cheese) (p. 65-68, homemade tofu from whole soybeans, from Om Shanti, Mendocino County, California). Breakfast cereal with roasted, salted soybeans (p. 163). Soy spread (p. 227, with soy flour, from The Motherlode, Oregon). Soy nuts (p. 229-30, baked, soaked soybeans with oil and salt).

A photo on the rear cover shows the author, age 27, with long blonde hair, granny glasses, and blue denim overalls. Says Raymond A. Sokolov: "Lucy Horton has done more than collect exotic recipes... she has assembled the crucial artifacts of a movement within The Movement."

Also discusses (see index): Adelle Davis, gluten (wheat), granola, ground nuts, macrobiotic diet, peanuts. Address: Derby, Vermont.

5999. Hosking, Richard. 1972. A dictionary of Japanese food: Ingredients & culture. Boston: Tuttle Publishing. 239 p. Illust. by Richard C. Parker. Index. 19 cm. *
• ***Summary:*** An excellent, accurate book. The basic entry for each word is given under its Japanese name (thus *daizu* rather than soybeans). Each entry includes the Japanese term in kana (usually hiragana) and (usually) kanji (Chinese characters). One hundred small illustrations are very helpful. Address: Prof. of Sociology and English, Hiroshima Shudo Univ., Japan.

6000. Houck, James P.; Ryan, M.E.; Subotnik, A. 1972. Soybeans and their products: Markets, models, and policy. Minneapolis, MN: University of Minnesota Press. vi + 284 p. Illust. Index. 24 cm.
• ***Summary:*** This classic work developed the standard framework for soybean sector analysis based on the joint product characteristics of soybean oil and meal. Contents: 1. Introduction. 2. World markets for food oils and high-protein meals. 3. Soybean markets in the United States. 4. Prices in the soybean sector. 5. Dynamic supply and demand model of the market for U.S. soybeans and their products. 6. Policy analysis with the dynamic model. 7. The economic and statistical framework for regional demand analysis. 8. Analysis of regional export demand for U.S. soybean oil: Mediterranean region, developed countries, Eastern Europe, developing countries, Latin America, Asia and Africa. 9. Analysis of regional export demand for U.S. soybean meal. 10. Analysis of regional export demand for U.S. soybeans: European community, other Western Europe, Canada, Japan, Israel and Taiwan. 11. Summary of regional analyses. Appendixes: Description and sources of data. Effective support prices and acreage supply functions: A general approach. Address: Univ. of Minnesota.

6008. Kikkoman Shoyu Co., Ltd. 1972. Guide to Kikkoman (Brochure). Noda City, Japan. 10 p. 15 x 10 cm booklet. [Eng]
• ***Summary:*** Contents: Introduction by Kenzaburo Mogi, president. Shoyu: Its past and present. History. Production method. People everywhere love Kikkoman (with a photo of 19 Kikkoman products). Kikkoman all over the world. Kikkoman in Japan. Note that the product is referred to throughout as "Kikkoman Shoyu" and not "Kikkoman Soy Sauce."

"History: In the 6th century Buddhism came to Japan from China, and with it came a strict ban on the eating of meat. Buddhism also brought a new vegetable-base sauce–a paste made by fermenting various grains–which replaced previous meat or fish-base seasonings. For a thousand years or so the Japanese used this paste as one of their major seasonings. It was not until the 17th century that this seasoning was developed into the shoyu that we know today.

Kikkoman worldwide: Kikkoman Foods Inc. (KFI) was established in 1972 to produce shoyu in America, our largest overseas market. Head office and plant: Walworth, Wisconsin 53184 USA.

Kikkoman International Inc. (KII) was established in 1957 to import and distribute our products in the USA. Head Office: 1581 Webster St., San Francisco, California 94115.

© Copyright Soyinfo Center 2014

Branches: Los Angeles, New York, Chicago.

Japan Food Corporation (JFC) is the largest importer and distributor of oriental foods in the United States. Head Office: 900 Marine St., San Francisco, CA 94124. Branches: Los Angeles, New York, Chicago, Sacramento, San Diego, Washington [DC].

Pacific Trading Co., Ltd. (PT) was established in 1928 in Tokyo to export oriental foods, mainly to the United States. Head Office: 767 Marunouchi Bldg., Chiyoda-ku, Tokyo.

Kikkoman Daitokai (Europe) GmbH is a restaurant chain, established in 1972 to serve mainly Japanese dishes. Head Office: 4 Dusseldorf, Kleverstrasse 46, West Germany.

Kikkoman in japan. Kikkoman is the leading brand of shoyu in Japan. The second best-selling brand sells only 23% as much shoyu as Kikkoman and the third best-seller only 13% as much. Kikkoman's capital: $18,500,000. Sales (1972): $218,000,000. Total production of shoyu (1972): 100,000,000 gallons. Number of employees 4,400. The names of members of the Kikkoman board of directors are given. Kikkoman subsidiaries are Kikko Foods Corp., Mann's Wine Co. Ltd., Seishin Pharmaceutical Co. Ltd., Tone Coca Cola Bottling Co. Ltd.

6009. Kikkoman Shoyu Co., Ltd. 1972. Kikkoman today & tomorrow (Brochure). Noda City, Japan. 14 p. [Eng]
• ***Summary:*** On the cover of this brochure is a man, standing in the lower right corner, looking up into a dark blue sky, in which there are seven colored heavenly bodies; the large central one is yellow, and the smaller ones, equidistant from the center, are (clockwise from the top) red, orange, yellow and green, blue, violet, and magenta. On the inside front cover is a huge red Kikkoman logo on a white background.

Contents (includes many color photos): History of shoyu and Kikkoman (with a chronology from 1661 to 1972). Present state of Kikkoman (graph of financial increase from 1917-1971; board of directors, company description and spirit). Kikkoman in Japan (products, plants, sales from 1950-1971). Kikkoman export products. Kikkoman soy sauce in America. International operations. Central research laboratories. Kikkoman soy sauce production method. Kikkoman group in Japan. People everywhere love Kikkoman. Kikkoman and advertising. The rear cover is dark blue.

The chronology (p. 1) begins: "Kikkoman Soy Sauce first went on the market in 1661 when the Takanashi and Mogi families constructed breweries and started the brewing of soy sauce." Address: 339, Noda, Noda-city, Chiba 278, Japan. Phone: (0471) 22-1111.

of foods]. Tokyo: Nihon Hoso Shuppan Kyokai (Japan Broadcast Publishing Association). 225 p. Illust. (some color). Maps. Index. 22 cm. Series: NHK Books No. 173. [Jap]

• ***Summary:*** The important chapter titled "The big natto triangle and miso," by Sasuke Nakao (p. 118-27) discusses natto, its relatives and ancestors in East Asia, and the "natto triangle" theory (with a map). Nakao hypothesized that natto (*itohiki natto,* made with one or more strains of bacteria) originated in the monsoon area of Southeast Asia, where there are East Asian evergreen forests. He considered Yunnan province in China to be the hypothetical center of natto's origin.

He states: We don't know much about natto in Japan. Konnyaku was clearly mentioned in the literature of the Heian period [794-1185]. But natto was first mentioned later, during the Muromachi period [1336-1573], therefore I guess it came from Java [sic] at about that time. Many new things from Europe (such as guns) also entered Japan during the Muromachi period.

What I call the "Miso Group" is salted mold-fermented soyfoods–such as miso, shoyu, tamari, and fermented black soybeans (*douchi*)–that originated in northern China outside the Big Natto Triangle, then spread to central China and to other countries such as Japan and Korea. I have shown the

© Copyright Soyinfo Center 2014

Miso Group on the map in an oval to the upper right. So the triangle and the oval shows the locations of these two groups of processed, fermented soyfoods.

In the Big Natto Triangle we find a number of foods that originated in northern China, including konnyaku and sushi. Sake is also fermented with a mold–the koji mold. Bean sprouts (a great Chinese invention, using beans that are hard to cook) also exist in the Miso Oval, but they spread into many areas within the Big Natto Triangle including Burma and Java.

Nyufu [dairy cheese or yogurt; literally "decayed / spoiled milk"] and tofu: Tofu was also a great invention of northern China–an easy way to eat soybeans. Seen from this point of view, European ways of cooking beans are very primitive.

Note: Traditional European beans generally contain too little protein and too much carbohydrates (especially starch) to enable them to be made into tofu.

Mr. Shinoda Osamu has developed the theory that tofu was invented in China but not in ancient times; probably in the middle of the Tang dynasty [618-906], and it became popular in the middle Song dynasty [960-1279], at which time it became an alternative to *nyufu* made from dairy milk. What I call *nyufu* here is different from *funyu* (fermented tofu), which is made by fermenting tofu, appeared after the invention of tofu, and is found today throughout East Asia. It is difficult to know exactly what *nyufu* was; in my opinion it was probably like *dahi* from India. In any case, it is certain that there was a product in called *nyufu* shortly before the Tang dynasty and during the early Tang.

During most of Chinese history, except when the nomadic milk-consuming Mongols ruled China during the Yuan dynasty (1279-1368), animal milks were not part of traditional Chinese culture.

Tofu was in Japan by 1183 AD (see *Diary of Hiroshige NAKAOMI,* entry for 1183). Maybe tofu was brought in by Buddhist monks and consumed in and around Nara. By the end of the Muromachi period [1336-1573] the center of tofu making and use had moved to Kyoto.

Another interesting thing is that in southern China and in Sichuan province, there is a tofu named *reiki* [*li qi,* pronounced "lichi;" "morning prayer]." The name originally referred to *nyufu* but later it came to refer to tofu. The origin of the word *reiki* was considered to be Sanskrit or some European language. It may have been connected with *nyufu* and/or dahi or India. Also, if we consider *reiki* to be the original name of tofu, then *nyufu* and tofu may have originated in Sichuan or southern China and migrated up to Northern China.

In summary: Nakano's theory is based on the observation that there are many varieties of non-salted fermented soyfoods and soy condiments inside the "natto triangle." Yunnan province in southwest China, Thailand, Myanmar (Burma), Bhutan, Nepal, Indonesia, and Japan all fall within this triangle.

Note 1. This is the earliest English-language document seen (Jan. 2012) that contains the term "natto triangle." Yet this term can be misleading, especially for non-Japanese. Natto is the only non-salted fermented soyfood or soy condiment indigenous to Japan. Natto is made by fermenting whole, cooked soybeans with bacteria (*Bacillus natto,* or *Bacillus subtilis*) in a warm place (ideally 104ºF or 40ºC) for about 24 hours. According to various Japanese legends, natto originated almost 1,000 years ago in northeast Japan when cooked soybeans were placed in a rice-straw sack strapped over the back of a horse. The natto bacteria are found abundantly on rice straw, and the warmth of the horse's body aided the fermentation. Under these conditions, the fermentation would take place naturally, without intentional inoculation.

The "natto triangle" refers to the geographical area within a large triangle in East-, South-, and Southeast Asia–the only place in the world where non-salted fermented soyfoods and soy condiments are indigenous. A number of these–such as tempeh in Indonesia and unsalted fermented black soybeans in China–are fermented primarily with molds (e.g., *Rhizopus, Aspergillus*) rather than bacteria. The triangle has its three corners in northeastern Japan (on the northeast, for natto), northeastern India and Nepal (on the west, for kinema), and in Java (Indonesia, on the south, for tempeh). It is incorrect to think of tempeh as a type of natto–by any definition! Applying this correction to the "natto triangle" causes it to fall apart! Extensive research after 1972 on the early history of tempeh and natto gave no support to the conjecture that natto came from Java.

However the incorrect theory actually turned out to have powerful predictive value, especially as close relatives of natto were discovered in northeast India by Tamang and co-workers starting in 1988, more than 15 years after the "natto triangle" hypothesis was proposed.

Sasake Nakao was born in 1916. The chapter titled *Mame no ryôri* [Bean cookery] is on pages 115-26.

6019. National Food Research Institute. 1972. National Food Research Institute [Japan]. NFRI, Ministry of Agriculture and Forestry, Shiohama-cho 1-4-12, Koto-ku, Tokyo. 27 p. [144 ref. Eng]

• ***Summary:*** Contents: Brief history. Budget and personnel. Organization. General survey of the Institute. Major research area. Facilities and pilot plants. Reports and patents. Publications. Scholarship. Location.

In 1934, the Rice Utilization Research Laboratory was established by the national government. The first building of about 330 square meters was completed in 1935 at the present site. In 1944 the title of the Laboratory was changed to the Research Institute of the Bureau of Staple Food Administration, and investigations were directed toward the processing and utilization of unconventional food resources.

© Copyright Soyinfo Center 2014

"Owing to the change in the food situation in Japan during World War II, the Institute carried out extensive research on the most efficient utilization of the nutrients in various foodstuffs, and on finding new food sources among various agricultural products, so as to meet the serious food shortage. This trend continued through the post-war period as the nation struggled with an even more acute food shortage problem. Fats and oils, fruits and vegetables, and fermented soybean products miso and soybean sauce were added as subjects of research.

"The Institute again changed its name to the Food Research Institute in 1947, and official analysis and standardization of food commodities were included in its activities... The Institute came to belong to the Food Agency in 1949 and later, in 1961, as a result of the reform in agricultural research administration, it was brought under the administration of the Agriculture, Forestry, and Fisheries Research Council together with other agricultural research establishments." The name was changed for a third time to the National Food Research Institute in 1970.

T. Watanabe is the Director of the organization. The fermentation research division is headed by H. Ebine, and consists of the following laboratories: Fermentation microbiology (M. Matsuno), fermentation chemistry (T. Ohta), industrial fermentation (H. Ito), mycotoxin (H. Ebine), resources utilization (N. Tsumura). The nutrition research division is headed by S. Kimura.

Note: This institute moved from Tokyo to Tsukuba in Feb. 1979. Address: Shokuhin Sogo Kenkyujo, Tokyo, Japan.

6020. National Research Council, Committee on Genetic Vulnerability of Major Crops. 1972. Genetic vulnerability of major crops. Washington, DC: National Academy of Sciences. vii + 307 p. For soybeans, see Chap. 13, p. 207-17. Illust. 23 cm.

• ***Summary:*** Chapter 13, titled "Soybeans and other edible legumes," discusses soybeans, peanuts, and dry beans. Contents for soybeans: Origin and history. Importance of crop. Genetic uniformity. Pests and diseases. Status of breeding for resistance.

Concern with genetic uniformity and vulnerability increased dramatically after 1970, when the U.S. corn crop was struck by Southern corn blight. Yields dropped 15% nationwide and more than 50% in certain major states. From 1924 to 1927 Dorsett collected 1,500 types of soybean in Manchuria, and in 1929-31 he and Morse collected 4,578 varieties and types in Manchuria, Korea, and Japan. This was the only expedition ever made into eastern Asia specifically to collect soybean germ plasm. By 1922-43 of the introductions received were found to be suited for seed production in the U.S., and they were named. Approximately 10,500 introductions have been brought to the U.S. since 1898–many of these have been duplicates, so many have been lost. Since 1943, 87 varieties have been registered by the Crop Science Society of America.

The vulnerability of any crop to epidemics depends upon the genetic uniformity of currently grown varieties. The practices that increase the vulnerability of varieties by restricting the germ plasm base are: 1. The parents used to develop new varieties are restricted to a few that tend to produce superior varieties under "normal" conditions. 2. A very few varieties dominate production. 3. Resistance to a given disease in currently grown varieties traces to a single source.

Most of the currently grown varieties can be related to 11 introductions, listed here in descending order of importance based on frequency of occurrence (percentage) in parentage of currently grown soybean varieties. Three percentages are given for each variety after the year of introduction–Northern frequency, Southern frequency, and total frequency. Northern refers to maturity groups 00-IV:

Mandarin (Pehtuanlintza, Northeastern China; 1911–84, 0, 58).

Richland (Changling, China; 1926–60, 0, 42).

AK [A.K.] (China; 1912–32, 63, 42).

Manchu (Niguta, China; 1911–56, 0, 39).

Tokyo (Yokohama, Japan; 1901–14, 58, 27).

Clemson (Nanking, China; 1927–9, 68, 27).

PI 54610 (Changchun, Liaoning Prov. China; 1921–14, 47, 24).

Mukden (Mukden, China; 1920–26, 0, 18).

Dunfield (Fancheatun Station, China; 1913–7, 26, 13).

Arksoy (Pingyang [Pyongyang / P'yongyang], Korea; 1914–0, 32, 10).

Roanoke (rogue from Pi 71597, Nanking, China; 1927–0, 26, 8).

The varieties Wayne, Amsoy, Corsoy, Clark or Clark 63, Lee, and Bragg accounted for 56% of the U.S. acreage. Statistics indicate that, for the soybean varieties currently grown, genetic uniformity is pronounced.

6021. Nihon kokugo daijiten [Great Japanese dictionary]. 1972. Tokyo. 20 volumes. [Jap]

• ***Summary:*** The most comprehensive Japanese-language dictionary available.

Amazake. (Vol. 1, p. 405): Also called *hitoyo-zake* or *kozake.* Cook rice to a soft porridge consistency. Cool a little and add koji. Stop the fermentation and drink. It is also made from sake lees (*sake kasu*) with added water and sugar. The word amazake is used in *waka* (31-syllable poems) as a season indicator. Amazake is mentioned in the following old documents: *Shinsenji kyo, Ryogekai, Wakan Sansai Zue,* and *Haikai Shoson Kushu* (quotes from each are given). The quote from the latter means "an idle and ignorant person makes amazake in Matsugaoka."

Amazake has various regional names. It is called Shirozake in Tokushima prefecture; Amadake in Nagasaki

© Copyright Soyinfo Center 2014

prefecture (Horie, Korai-gun); Doburoku in Yamanashi prefecture (Narada, Minami Kyoma-gun), Nara prefecture (Totsugawa, Yoshino-gun), and Wakayama prefecture (Kami Yamaji, Hidaka-gun); Amazaki in the Ryukyu Islands (incl. Okinawa, Amami-Oshima, Osumi, Sakishima, Tokara) which extend from Kyushu to Taiwan.

Amazake uri. A walking amazake seller, or the act of selling amazake while walking. There were some amazake sellers during the Muromachi period (1338-1573), but they became popular from the late 1500s on. The amazake sellers put cups (*chawan*) and trays (*obon*) in their front box along with a hanging lamp. In the back box they put an amazake kettle (*kama*), then carried it all on a shoulder pole. The term "amazake seller" was used in waka poems as a season indicator. Morisada Manko wrote an essay mentioning amazake sellers. In Kyoto and Osaka amazake is sold only on summer nights, in a special kettle with a bamboo basket (*kyo*); In Edo (Tokyo) it is sold at all times. In Edo they use a brass kettle or a special kettle and a bamboo basket as is used in Kyoto and Osaka.

6024. Sakaguchi, Kinichiro. 1972. Development of industrial microbiology in Japan. In: Proceedings of the [Sixth] International Symposium on Conversion and Manufacture of Foodstuffs by Microorganisms. Tokyo: Saikon Publishing Co. viii + 297 p. See p. 7-10. Held 5-9 Dec. 1971 at Kyoto, Japan. [Eng]

• ***Summary:*** Japan has made many important contributions to the development of industrial microbiology, especially industrial mycology, because of the widespread use of koji molds (*Aspergillus oryzae*). Foods made from this one mold (including sake, miso, and soy sauce) accounted for about 1.5% of the Japanese gross national product, or ¥75,000 billion, in 1970.

Early documents show that molds were being used to make foods as early as 1,000 B.C. in China and as far back as the 6th century [A.D.] in Japan. In Japan, the use of lactic acid fermentation in the pure culture of yeast is already mentioned in "the diary of sake" [*Goshu no Nikki*] written in 1355, however the technology of adding koji starter [*tané koji* or "seed koji"] is even 400 years earlier [i.e., ca 955]. Moreover, an unmistakable description of low temperature pasteurization (*hiire*) appears in the *Tamon-in Diary* (1539-1596), "which was written about 300 years prior to Pasteur's famous invention."

When Japan began to introduce European scientific techniques during the Meiji period (Sept. 1868 to July 1912), the first subject of scientific research in Japan was the unique koji mold. One of the first major discoveries was the invention of Takadiastase [a diastatic enzyme] by Jokichi Takamine. This enzyme has a great influence on biological chemistry, enzyme chemistry, and various enzymes using microorganisms worldwide.

Soon the physiology of the koji mold and its fermentation products (especially organic acids) was studied by Japanese scientists. The determination of kojic acid by Yabuta was a major discovery. The *Rhyzopus* [*Rhizopus*] mold was also investigated; this led to the development of producing organic acids fumaric acid, citric acid, isocitric acid, itaconic acid, gluconic acid and others.

Two outstanding discoveries have recently been made in Japan: (1) The technology for making L-glutamic acid, lysine, and other amino acids; (2) The microbial technology for making flavor-enhancing nucleotides such as inosinic acid and guanylitic acid.

Japanese scientists and industries soon realized that instead of using microorganisms, the enzymes isolated from them could be used (in whole or in part) with no reduction in yield or quality. In the case of *Aspergillus oryzae,* which produces various enzymes (amylase, lipase, protease, etc.) this idea has been applied to the manufacture of alcohol, sake, mirin, miso, and soy sauce.

The classification and taxonomy by Jun Hanzawa of microorganisms used in the manufacture of *natto* (fermented soybean) and other popular Japanese fermented foods was of major importance.

Recently, Japanese scientists including Murakami and Yokotsuka [of Kikkoman] have found that the koji mold does not produce aflatoxins.

The industrial application of molds to establish a method of mass culture involves various difficult problems. Many Japanese manufacturers of sake, miso, and soy sauce "are

© Copyright Soyinfo Center 2014

practicing the conventional solid culture by using what are called Koji rooms" but large manufacturers are gradually switching over to aerobic apparatus.

To use the living action of microorganisms or their enzymatic action to make foods on a large scale will be increasingly seen "as a form of bioengineering or biotechnology," and the life sciences will increasing be spoken of as "a science for the future. 'Seek whatever is desired in microorganisms first. They will never betray you,' is my slogan." Although it may seem a little exaggerated, "I should like to ask you to take it as my firm conviction."

As I stated above, "microorganisms are the most intimate friends of the food industry," yet they are at the same time its powerful enemies. Their malignant side is as powerful as their benevolent side.

I am very glad, even proud, to see first-class microbial specialists and food specialists exchanging technological knowledge and cooperating with one another, "here in Japan where fermented foods have so long been a tradition." Address: Prof. Emeritus, Univ. of Tokyo, Tokyo, Japan.

6027. Smith, A.K.; Circle, S.J. 1972. Protein products as food ingredients. In: A.K. Smith and S.J. Circle, eds. 1972. Soybeans: Chemistry and Technology. Westport, CT: AVI Publishing Co. xiii + 470 p. See p. 339-88. Chap. 10. [180 ref]
• ***Summary:*** Contents: 1. Flavor: Taste panel results, flavor components, plastein formation and flavor, plastein formation and nutrition, some food uses tolerant of soy flavor. 2. Bread and pastries: Soy flour history, effect of soy flour on baking characteristics, soy protein isolate in bread, soy flour and flavor, enzyme active soy flour, soy flour in Britain, detecting of soy flour in wheat flour. 3. Other baked goods: General, doughnuts, snack products. 4. Breakfast cereals. 5. Macaroni products. 6. Dairy-type products: Imitation milk, soy milk, filled milk, soybean cheese, imitation cream cheese, coffee whiteners, whip toppings, and frozen desserts, yogurt type products. 7. Comminuted meat products and meat analogs: Comminuted meat products, meat analogs, spun fiber type meat analog, extrusion-cooked type meat analog, heat-gelled type meat analog, meat fibers in heat-gelled protein matrix, assay of soy protein products in meat-type foods. 8. Gelling and aerating agents: Gelsoy as gelling agent, soy protein isolate as gelling agent, soy protein isolate as aerating agent, soy whey protein as aerating agent, enzyme modified isolates as aerating agent, foam-mat drying adjunct, foaming agent for soda water. 9. Miscellaneous food applications: Brew flakes, soups, gravies and sauces, confections, imitation nut meats, and [soy] nut butters, spray drying adjunct. 10. Nonfermented Oriental soybean foods: Introduction, Chinese soy milk, dried soybean whole and defatted milks, tofu (fresh tofu, bagged tofu, dried tofu, fried tofu), yuba, kinako ("The Japanese have a product which is similar to full-fat soy flour except that it is made from whole roasted soybean and this contains the seed coat"), soybean sprouts (compositional changes).

Concerning Brew Flakes (p. 373): "Soy flakes, grits, and peptones have been used since about 1937 or earlier (Burnett 1951) as adjuncts in brewing beer. Grits and ground meal from screw press processing were the first products used in brewing but later they were replaced by solvent-extracted flakes. The best results are obtained with flakes or flour having a high NSI (nitrogen solubility index) with a minimum of heat treatment in processing. Up to 0.75 lb. of flakes per barrel of beer has been recommended by Hayward (1941).

"The flakes may be used in the normal mashing operation to provide amino acids, peptides, minerals, and vitamins as nutrients for the yeast. It was reported by Wahl (1944) and Wahl and Wahl (1937) that addition of hydrolyzed soybean protein directly to the beer improves foam stability, flavor, and body of the beer." Address: NRRL, Peoria, Illinois.

• ***Summary:*** Written by the head cooks at four of Japan's best known Buddhist monasteries. A second edition was published in 1976.

On pages 78-79 is a description of Daitokuji-natto, a unique type of fermented black soybeans. They have what has been called "the flavor of tea." They are a type of "miso natto" made from soybeans, barley (*omugi*) and salt. The method of production, originally transmitted from China, was inherited from the famous Zen master Ikkyu [Ikkyû Sôjun, lived 1394-1481], who became head priest of Daitokuji temple in Kyoto in 1474. Future generations of monks and craftspeople at his personal sub-temple, Ikkyu, inherited the method from him and have passed it down to the present as a secret transmission.

At first the flavor of these savory chunks seems quite salty and a little sharp, but as you enjoy the flavor a little longer, overtones of subtle sweetness, tartness and spiciness emerge, creating a mysterious harmony.

Daitokuji fermented black soybeans are served in Japan in any of four ways: (1) Since long ago, tea masters and epicures have prized them for use in place of tea cakes (*chauke*) with thin whisked green tea or bancha tea. (2) In Ochazuke, they are sprinkled over hot rice in a small bowl, then doused with hot green tea. (3) Nowadays they are used

as an hors d'oeuvre with sake or beer. (4) Occasionally they are pureed with dashi soup stock and used as an ingredient in refreshing summertime miso soups or simmered vegetable preparations (*nimono*).

The Ikkyu subtemple within Daitokuji is Japan's most traditional maker. The entire year's supply is made only during July and early August, in the heat of summer, when exposure to sunlight enables proper drying. After the earlier steps in the preparation, the beans are mashed, reshaped into small balls 3/4 inch in diameter, arranged in wooden trays each about 12 by 24 by 2 inches deep, and sun-dried. A photo shows the mashed, reshaped soybeans in wooden trays at Daitokuji, a major Rinzai temple in Kyoto, Japan. Address: 1. Ikkyu, Daitokuji; 2. Head priest, Tanzenji, Kamakura (Rinzai sect); 3. Eiheiji (Soto sect, Asst. head cook); 4. Sojiji (Asst. head cook).

• ***Summary:*** Tables show: (1) Basic characteristics of various types of soy sauce from different countries: Koikuchi (Japan), usukuchi (Japan), soy sauce (China, Malaya,

© Copyright Soyinfo Center 2014

Indonesia) and Fish soy (Malaya). For each is given: Baumè (density of liquids). NaCl in gm per 100 gm. Total nitrogen in gm per 100 gm. Reducing sugars in gm per 100 gm. Alcohol in ml per 100 ml. Color (dark to light).

(2) Japanese agricultural standard (JAS) for shoyu–koikuchi, tamari, and usukuchi. Grade depends most on total nitrogen content. (3) The relation between the preference for a shoyu and its chemical composition. The highest partial correlation coefficient is alcohol content = 0.35.

(4) The relation between the preference for a shoyu and its odorous components. (5) The relation between the preference for a shoyu and its taste components.

(6) Effect of cooking conditions of soybeans on the digestibility of protein in the mash. (7) Effect of cooking condition of soybeans on the enzymatic digestibility of protein (high pressure, short time has the highest digestibility).

(8) Fluorescent pyrazine compounds produced by moulds similar to aflatoxins regarding Rf values on TLC.

(9) Fluorescent isocoumarine compounds produced by moulds similar to aflatoxins regarding Rf values on TLC.

Graph: Yeast flora in shoyu fermentation. *Saccharomyces rouxii* has a count that peaks at about 2 months and has largely disappeared after 6 months. *Torulopsis* sp. has a count that peaks at about 15 days and again at 6 months and has disappeared after about 12 months. Address: Central Research Laboratories, Kikkoman Shoyu Co., Ltd., Chiba-ken, Japan.

6033. Chico-San Inc. 1972? Chico-San history and outline for future development. Chico, California: Chico-San Inc. 5 p. Undated. Unpublished typescript.

• ***Summary:*** A good early history of Chico-San, typewritten on the company's letterhead probably by Bob Kennedy. Atop the letterhead is printed: "Macrobiotic foods, rice cakes, cereals, sea vegetables." "By 1961 eleven macrobiotic families had packed their belongings, left their jobs behind in New York City, and headed for Chico, California, in the heart of the California rice growing country. In a short time Chico-San, Inc. was formed by some of these people for the purpose of importing foods of superior quality which were not available domestically, and locally producing foods of the highest quality for distribution throughout the United States."

One of the company's first popular products was the "Rice Cake, a light cracker made from puffed up whole grain brown rice. The first "machine," imported from Japan in 1963, made one cake at a time and was a crude, hand-operated device. Soon, three more machines were tied to the original one, still hand operated. Bob Kennedy, Dick Smith, and a few others found it necessary to work twelve hour shifts, and for six and seven days at a time to meet the steadily increasing demand for the unique new cracker. In 1965 pulled shoulder muscles ceased to be a problem when the first semi-automatic Rice Cake machine was put into operation...

"Central to the guiding philosophy behind Chico-San was the search for an organically grown brown rice–the prince of grains. This search ended in 1969 when the first organically grown short grain brown rice was harvested just south of Chico, in Richvale, California. This product, grown under exclusive contract for Chico-San, further enhanced their growing reputation...

"Back in the late fifties and sixties people who were interested in food and health were called 'food faddists', or 'health food nuts.' The food products found in most health food stores at this time consisted of a vast array of vitamin and mineral supplements, super protein concentrates, natural cosmetics, and a scattering of whole grains, few of which were organically grown.

"But little by little products with the Chico-San label found their way onto store shelves. First the Rice Cakes, then natural soy sauce, Miso Soybean paste, Sesame Butter and Sesame Salt, and organically grown Brown Rice became popular...

"In the back room too is Junsei Yamazaki, who emigrated to Chico from Japan in 1963 for the purpose of producing natural soy sauce and miso for Chico-San. These two products make up the greater percentage of the imports from Japan, and are subject to high duties and shipping costs. For 17 years Junsei was a rice farmer in Japan after graduating from Tokyo University with a degree in agriculture.

"Combined with the income from Stage I, Chico-San will be ready to begin Stage III. This stage includes the construction of a plant for the production of, at first, miso, and then soy sauce." Address: Chico-San Inc., 1262 Humboldt Ave. Chico, California 95926.

6034. Japan Shoyu Research Institute. 1972? Report on the comparative study of shoyu brewing from U.S. and Japanese soybeans (no. 6). Tokyo. 29 p. Project UR-A11-(40)-(C). * Address: Tokyo.

6036. *Los Angeles Times.* 1973. Ease of shopping reduces efficiency. Jan. 11. p. K16.
• ***Summary:*** Any of the following will make a quick and interesting meal. "Use a fondue pot, a chafing dish or an electric skillet." The recipe for Sukiyaki Rosemary calls for "1 cake tofu (bean curd), cut into bite-size pieces."

6037. Erewhon, Inc. 1973. Erewhon visits a soy sauce factory (Ad). *East West Journal* 2(20):24. Jan. 15-30.
• ***Summary:*** "Soy sauce has been produced in Japan since it was introduced, along with Buddhism and the vegetarian diet, from mainland China over one thousand years ago. Today there are 5000 Japanese companies brewing a total of over 300 million gallons of soy sauce each year.

"One of these companies is Marushima Shoyu, located on Shodoshima Island, four hours by boat from Osaka through the Kii Strait. Marushima is a very old company, using traditional methods of manufacture, and it is here that Erewhon Tamari soy sauce is made. All soybeans used at Marushima are of unusually high quality, and come only from the island of Hokkaido."

A description of the process for making this soy sauce is then given. Whole soybeans are washed, soaked, then "steamed and boiled in a 14-foot-high cooker." Toasted whole wheat is "ground into flour, mixed with the cooked soybeans and placed in a large room, right on the wooden floor, which is kept very clean." The *koji* is placed in vats and spring water is added. The soy sauce changes color month by month until, after about one year, it begins to turn very dark and a rich aroma permeates the storage room. It is then poured into cypress-wood tanks and left to age for two more years. Unlike this pure, aged product sold under the Erewhon label, most other brands are aged only one to three months in concrete or metal containers.

"We at Erewhon would like to thank Marushima Shoyu for the wonderful product they make available to us."

Note: This was written by Paul Hawken. An illustration (line drawing) shows a traditional shoyu keg labeled "Marushima" and a gallon glass jar labeled "Tamari." Address: Boston, Massachusetts.

6038. Bernard, R.L. 1973. Soybean breeders need new germplasm. *Soybean News* 24(2):5, 3. Jan.
Address: Univ. of Illinois.

6039. Oka, H.I. 1973. Performance in Central Luzon of soybean varieties selected in Taiwan for wide adaptability. *SABRAO Newsletter* 5(1):29-38. [4 ref]
• ***Summary:*** "Ten soybean varieties from Thailand and two local varieties were tested in three different seasons at the Central Luzon State University, Muñoz, Philippines." Eight of the ten had been selected for yield stability following the breeding method of "disruptive seasonal selection." The results showed that, if cultivated with a package of recommended practices, these varieties have a high yield potential (about 2.5 tons/ha). Address: National Inst. of Genetics, Misima [Mishima] City, Japan 411.

6040. *Soybean Digest.* 1973. Zentoren [Japan Tofu Assoc.] opens new six-story center. Jan. p. 29.
• ***Summary:*** The Japan Tofu Association (*Zentoren*) "celebrated the opening of its new six- story center in Tokyo last Oct. 27. In attendance were Ministry of Agriculture and Forestry officials, staff of the agricultural attache's office, and industry leaders. Scott Sawyers, the American Soybean Assn.'s Far East director, represented ASA and presented the Tofu Assn. with a large wreath. The building had been in the planning stages since 1969 and the old building was torn down a year ago. Tofu is in wide use as a protein food in the Orient."

Photos show: (1) The six-story as seen from street level, outside. (2) A Japanese-style wreath (outside, at street level) presented by the ASA. Next to it is the wreath presented by Kakuei Tanaka, Prime Minister of Japan.

6041. Spiral Foods Inc. 1973. Mail order price list. Chico, California. 2 p. Jan. 35 cm.
• ***Summary:*** This single-sheet catalog and price list, photocopied front and back with black ink on tan paper, contains numerous background illustrations and the includes the following foods: Snacks: Rice cakes, corn chips, Yinnies–brown rice candy sugarless. Condiments: Lima tamari soy sauce–aged naturally over two years, Miso–soybean puree, entirely natural, rice malt vinegar, sesame butter, sesame oil–cold pressed, sesame salt, sea salt white unrefined, salt plums, kuzu–wild arrowroot starch. Grains, flours, seeds and beans: Brown rice / sweet brown rice–short grain, organically grown. Black [soy] beans–Japan import. Azuki beans–Japan import, dainagon. Whole grain noodles. Sea vegetables. Beverages. Hygienic goods. Utensils.

Talk with Robert J. Kennedy, founder of Chico-San. 1991. Oct. 3. By about 1966-1967 rice cakes and rice chips (senbei) were beginning to cut a wedge into the mass market nationwide, so Chico-San created the Spiral Foods brand for these mainstream products, keeping the Chico-San brand for the health food market. Address: 1144 West 1st Street, Chico, California 95926.

6043. *Mainichi Shinbun.* 1973. Zen no kokoro = ôtôfu [The heart of Zen = Tofu]. Feb. 20. [Jap]
• ***Summary:*** A large black-and-white photo shows William Shurtleff making tofu burgers at the tofu shop of Toshio Arai near Tokyo Japan. A processing / utilization chart drawn by Shurtleff shows how soybeans are transformed into thick soymilk (which is made into kinugoshi-dofu, or yuba), or thin soymilk (which is made into any of 7 types of tofu: oboro-dofu, aburage, o-tofu [*momengoshi*], atsuage, ganmodoki, yaki-dofu, or koya-dofu). Bill Shurtleff, age 31, comes from America, the world's main soybean producing country. He is living with the Aoyagi family at 278-28 Higashi Oizumi, Nerima-ku, Tokyo. His Book of Tofu is scheduled for publication in Sept. 1973. The article describes his appearance, then notes that he is a vegetarian doing Zen practice in Japan, which he feels is a very materialistic society. He is writing a book on tofu in large part to try to do something about the world food crisis. He is studying tofu at Sangen-ya under Mr. Toshio Arai. Mr. Arai notes that he has not yet finished his internship since he cannot yet make aburage by himself, but he should be "done" in about 3 months. Bill does translation work for his father's company and earns 30,500 yen/month which he lives off of. Akiko is his language teacher, so his Japanese has a feminine touch. There follows a brief description of Bill's favorite recipes: Ganmo burgers, Kori-dofu cutlets, Onion soup with tofu, and strawberry tofu whip.

Note: This is the earliest document seen (July 2012) concerning the work of William Shurtleff and Akiko Aoyagi with soyfoods, in Japan. Address: Tokyo, Japan.

6044. Koide, Takehiko; Ikenaka, Tokuji. 1973. Studies on soybean trypsin inhibitors. III. Amino-acid sequence of the carboxyl-terminal region and the complete amino-acid sequence of the soybean trypsin inhibitor (Kunitz). *European J. of Biochemistry* 32(3):417-31. Feb. [28 ref]
• ***Summary:*** Gives (for the first time) the complete amino acid sequence and primary structure of the Kunitz soybean trypsin inhibitor. Address: Dep. of Biochemistry, Niigata Univ. School of Medicine, Niigata, Japan.

6045. Zell, Fran. 1973. Food: Man who skates with grace cooks with beauty. *Chicago Tribune.* March 3. p. 14.
• ***Summary:*** Sashi Kuchiki, a Japanese star with the Ice Capades, likes to cook. His recipe for Sukiyaki includes "1 block tofu (bean curd) cut into 10 or 12 1-inch cubes" and "1 cup soy sauce." A photo shows him jumping while ice skating.

6046. Fukui, Juro; Taira, Hirokadzu; Kaizuma, Norihiko; Taira, Harue. 1973. [Subgeneric and specific differences in the content and amino acid composition of the seed protein in the genus Glycine]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 28. p. 176-81. March. [20 ref. Jap; eng]
• ***Summary:*** This experiment used 8 varieties of the cultivated soybean *Glycine max,* 4 strains of the semi-cultivated soybean *G. gracilis,* and 13 strains of wild species, including 7 strains of *G. soja,* 2 of *G. tabacina,* 2 of *G. tomentella,* and 1 of *G. clandestina.*

In 1969, the plants were grown in pots at the experimental field of the Plant Breeding Laboratory, Faculty of Agriculture, Iwate Univ.

The seeds of *Glycine soja* were found to have the highest protein content. "This fact shows the feasibility of breeding soybeans with higher protein content by the interspecific hybridization of *G. max x G. soja.*

Little difference in the sulfur-containing amino acids was found.

Reprinted from *Ikushugaku Zasshi* (*Japanese J. of Breeding*) 22(4):197-202 (1972). Address: 1&3. Faculty of Agriculture, Iwate Univ., Morioka; 2&4. National Food Research Inst., MAFF, Tokyo, Japan.

Trypsin inhibitor contents of soybeans, other beans, and soy products]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 28. p. 52-58. March. [26 ref. Jap; eng]
Address: National Food Research Inst., MAFF, Tokyo, Japan.

6048. Horii, Masaharu; Miyazaki, Motoyoshi. 1973. [Studies on trypsin inhibitor alteration in the processes of treatment of soybean. II. Trypsin inhibitor reduction during heating, defatting, and irradiation of soybean]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 28. p. 59-62. March. [6 ref. Jap; eng]
• ***Summary:*** Trypsin inhibitor in whole soybeans is most effectively destroyed by moist heat. At 100ºC, it was reduced to 46% by 2 minutes of steaming, 1% by 30 minutes, and 0.4% by 1 hour.

Note 1. Presumably, pressure cooking or autoclaving would reduce it even faster.

Note 2. Presumably the soybeans were soaked in water before steaming, but this is not stated in the English summary. Nor are we told for how long they were soaked or at what temperature. Address: National Food Research Inst., MAFF, Tokyo, Japan.

Degradation of added aflatoxin during miso fermentation]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 28. p. 244-50. March. [14 ref. Jap; eng]
• ***Summary:*** "Although aflatoxin-like substances were detected in a few samples," no actual aflatoxin was detected in any of the rice samples.

Reprinted from *Nihon Shokuhin Kogyo Gakkai Shi* (*J. of Food Science and Technology*) 19(6):268-74 (1972). Address: National Food Research Inst., MAFF, Tokyo, Japan.

6052. Manabe, Masaru; Matsuura, Shinji. 1973. [Studies on the fluorescent compounds in fermented foods. IV. Degradation of added aflatoxin during miso fermentation]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 28. p. 251-55. March. [9 ref. Jap; eng]
• ***Summary:*** "A certain amount of aflatoxin was added to green miso before fermentation in order to investigate the degradation of the toxin during miso fermentation." There was some degradation of aflatoxin B1 and G1 in miso during the early stage of miso fermentation, but in the later stage the velocity was remarkably reduced. As a result, more than 50% of aflatoxin B1 and G1 remained in miso after 1 month fermentation. No degradation of aflatoxin B2 and G2 was detected during miso fermentation.

Reprinted from *Nihon Shokuhin Kogyo Gakkai Shi* (*J. of Food Science and Technology*) 19(6):275-79 (1972). Address: National Food Research Inst., MAFF, Tokyo, Japan.

6053. Simkowitz, Howard J. 1973. Vegetarian and macrobiotic guide: Europe, 1973; or, The great European health food trip. Craftsbury Publishers, Craftsbury, VT 05826. 111 p. March. 21 cm.
• ***Summary:*** The majority of this book is a directory and often detailed individual description (including address, nearest public transport station, hours) of European restaurants that serve vegetarian and/or macrobiotic food. Also includes food shops, spiritual centers, maps, vocabulary (in English, French, German, Spanish, and Italian), useful phrases (such as "I would like brown rice with carrots and soy sauce"), and exchange rates It is arranged by country, and within each country by major cities, and within larger cities by districts. For example, in the British Isles, under London, the author states: "I counted 44 vegetarian restaurants in London. Two of these [Wheat, and Chelsea House] are excellent, and seven others [incl. Cranks, and Cyranos] are quite good."

6059. Erewhon. 1973. Supplying natural food stores, co-ops, schools and communities (Catalog). Boston, Massachusetts. 12 p. Effective April 6, 1973.

• ***Summary:*** The number of products in Erewhon's catalog has increased dramatically during the past year. An illustration at the lower center of the cover is clip-art showing a man cutting barley. A message on the inside front cover is signed "Thank you all, Paul Hawken." Below his message is a smaller reproduction of the man cutting barley and below it: "Good morning."

Contents: Grains: Incl. brown rice (short grain, "Colusa," OG {organically grown}, California; medium grain, "Golden Rose," OG {organically grown}, California; medium grain, OG, Louisiana; long grain, OG, Texas; glutenous [sic, glutinous] sweet, OG, California). Wheat (Deaf Smith, hard red winter, or hard amber durum, OG, Texas; Ted Whitmer, hard red spring, OG, Montana; soft white pastry, OG, Washington [state]). Barley, pearl. Buckwheat groats. Corn. Millet. Oats. Popcorn. Rye. Cereals: Incl. Rice cream. Soybean flakes (Deaf Smith, OG). Stoneground flours: Incl. soybean flour, full fat, OG, Texas. Sweet brown rice flour, OG. Beans: Incl. Azuki beans (100, 50, or 25 lb). Soybeans (OG, Texas, 60 lb). Seeds and nuts: Incl. Almonds. Peanuts (spanish, split). Sesame seeds. Tamari & miso: Tamari soy sauce (8 oz, pints, quarts, half gallon, gallon, 4.7 gallon can). Hacho miso soy paste (1 lb or 44 lb keg). Mugi miso barley-soy paste (1 lb or 44 lb keg). Kome miso rice-soy paste (1 lb or 44 lb keg). Sea vegetables: Agar-agar, dulse, hiziki, kombu, nori, wakame, wakame root. Tea: Incl. Mu herbal beverage No. 9 and No. 16. Kukicha twig tea. Celestial Seasonings herb teas (39 flavors). Pasta: Wholewheat spaghetti, elbows, flat macaroni, and shells. Granola: Five flavors. Snacks: Incl. Corn munchies (organic corn chips with soy sauce). Chico-San corn chips and rice chips. Soybean oil (5 gallon tin). Olive oil. Peanut oil (organic, pint, quart, or 5 gallon tin). Butters: Almond Butter (Golden Farms, OG). Peanut Butter (Erewhon, old fashioned). Sesame butter. Sesame tahini. Honey (Paradise Valley, unheated, unfiltered, clover or orange). Condiments: Sea salt. Sesame salt. Tekka (vegetable-miso condiment). Unusual foods: Ame (rice and barley malt–glucose syrup). McHenry's sorghum molasses. Kuzu arrowroot. Sauerkraut. Umeboshi (plums pickled in brine). For cleanliness: Dr Bronner peppermint castille soap. Infinity herbal products (shampoo and soap). Natural Living Company (sesame cream shampoo, sesame lotion). Orjene (herbal shampoo). Tom's coco-orange all-purpose soap. For cooking: Knives (vegetable, utility, paring), chopsticks, rice paddle, tea strainer, "soy [sauce] dispenser" (4½ inch), oil skimmer, vegetable brush, suribachi, Chinese wok, Quaker City hand grinding mill. Austria Email iron-enamel pressure cookers. Save-a-Tree canvas shopping bags, shoulder bags, and bike bags. Flyers: Organic Merchants N.O.T. list. The Sugar Story. The Oil Story. The Macrobiotic Way. Macro-Ecology. Packaged in cellophane bags with recipes (1 lb, 1½ lb, and 2 lb): Incl. brown rice, wheat kernels, pearl barley, alfalfa seeds (OG), sesame seeds, pumpkin seeds, sunflower seeds, mung beans (sprouting), soybeans (sprouting or cooking, OG), pinto beans, chickpeas, green lentils, green split peas, split red lentils, morning cereal (6-grain cereal blend), infant cereal (koko), tsampa Tibetan barley cereal, rice cream, soybean flour (full fat, OG, 24 oz), soybeans (OG, 2 lb).

A long note at the top of this list states: "In our retail store we like to sell 'bulk' whenever possible. But we have found that to many new customers coming into our store everyday, pre-packaged foods such as we are presenting here offer a better introduction to the world of whole-grain cookery. Each package has an appealing 'kitchen-tested' recipe on the front so that new friends unfamiliar with these foods can give them a try. Furthermore, some people prefer to buy packaged foods because they feel for various reasons that food sold exposed is not as clean or pure. There is some truth to that, of course, depending on the store, but in any case we are happy to offer a complete line of Erewhon grains, cereals and flours in attractive, biodegradable cellophane packages. We will be expanding this line of cereals and grains and welcome your comments and suggestions. Please let us know how we can serve you

6060. Oberdorfer, Don. 1973. Meat prices–Japanese pay more, eat less. *Washington Post, Times Herald.* April 7. p. A1, A13.
• ***Summary:*** Tokyo, April 6–The price of meat has been rising in both Japan and the United States. After several hours of research in Tokyo butcher shops, the writer's wife, Laura, found a bargain, frozen sliced beef for only $1.60/lb. "She used almost two-thirds of a pound, combined with tofu (soybean curd), Chinese cabbage, spring onions [negi] and mushrooms in seasoned broth, to feed our family of four a Japanese dish known as *shabu-shabu."* A bowl of rice–the staff of life in Japan–rounded out the dinner.

6061. Takai Seisakusho. 1973. Sarani susumu tôfu puranto no gôrika [Further progress in the efficiency of the tofu factory]. Aichi prefecture, Japan. 4 p. April 21. 30 cm. [Jap] Address: Aichi prefecture.

6062. Ready, Anne. 1973. Visitor echoes price complaints: High cost of sukiyaki. *Los Angeles Times.* April 26. p. J2.
• ***Summary:*** Sashi Kukichi, an ice skating champion, is preparing an authentic sukiyaki for his fiancee. "Another ingredient, tofu, is a soy bean cake that, when cooked, resembles a firm egg custard." The recipe calls for "1 8-oz. cake tofu, cut in 1-inch cubes, optional."

The recipe for *Tentsuyu* sauce with tempura calls for "1/3 cup soy sauce" and a dash of MSG.

are using chopsticks to lunch on a typical, authentic, home-cooked (by their parents) Japanese dinner. There was teriyaki on skewers (seasoned with soy sauce), sukiyaki, tempura, Inari Sushi ("made with aburage, a soybean curd skin, in which seasoned rice is stuffed"), and another kind of sushi made of vinegared rice and codfish wrapped in seaweed (nori). Recipes are given for Teriyaki and Inari Sushi. Two photos show the kids cooking.

6069. *Times* (*The*) (*Walworth, Fontana, and Williams Bay, Wisconsin*)**.** 1973. Famous symbol. June 21. p. 10. Special 12-page tabloid supplement on Kikkoman Foods Grand Opening.
• ***Summary:*** A large illustration shows the Kikkoman logo. "The Japanese symbol of a turtle–a hexagon–is the trademark of Kikkoman Shoyu Company, Ltd., Wisconsin's new food production firm. The turtle is considered a happy animal by the Japanese. It also means prosperity. Inside the bold Kikko (turtle) hexagon is the Japanese figure called man that means 10,000 or 10,000 years. Together they form the company name and trademark that represents a happy, long life. The mark was first used in 1782 and was registered in the United States in 1906. Kikkoman's company spirit is expressed by the trademark and by 'Sangyo Damashii,' an expression that says it always tries to enrich the daily lives of people by adding to the joys and benefits of good eating. Since 1630, Kikkoman has continuously produced the all-purpose seasoning, shoyu or soy sauce."

Note: This is the earliest English-language document seen (July 2011) which states clearly that Kikkoman has been making soy sauce since 1630. Quite a few previous ads state simply "Since 1630."

6070. Lee, Edward. 1973. Soybean embargo stirs uneasiness. *Chicago Tribune***.** June 29. p. C11.
• ***Summary:*** "Trading of soybean, soybean meal, and soybean oil futures was suspended yesterday on the Chicago Board of Trade after the government announced late Wednesday an immediate ban on exporting soybeans, cottonseed, and their products."

The director of the Chicago Board of Trade, who ordered the suspension, voted late yesterday to resume trading today. They gave no reason for the one-day suspension, although some believe it was to allow time to evaluate the impact of the ban on futures trading.

The embargo brought cheers from housewives who dislike the high cost of food, but it aroused indignation from U.S. trading partners, many of whom depend on American soybeans for animal feeds and/or human consumption. The Japanese were especially upset, because soybeans are a key ingredient in a host of Japanese foods, and 98% of Japan's soybean supplies come from the USA. The European Common Market was unhappy but had no comment.

6071. Oberdorfer, Don. 1973. Now even the soybean curd seems lost to Japanese. *Washington Post***.** June 29. p. D11.
• ***Summary:*** Tokyo–Last night the USA announced an embargo on soybean exports–a big surprise and shock in Japan. Now even tofu, the ubiquitous and much-enjoyed soybean curd, will become more expensive. Soybeans are very important in Japan as a source of both food (beancurd, miso soup, soy sauce, etc.) and feed. 60% of the cooking oil in Japan is soybean oil. The USA supplies more than 90% of Japan's soybeans, and they are a major item of trade.

6072. Pond, Elizabeth. 1973. The day the soybeans stop–Japanese concern. *Christian Science Monitor***.** June 29. p. 1-2.
• ***Summary:*** On June 27 the United States government started rationing soybean exports. This has become a new sore-spot in Japan-U.S. relations. On June 28, Japan's Foreign Minister, Masayoshi Ohira, expressed his government's concern to American Ambassador Mr. Robert Ingersoll. Mr. Ingersoll replied with a promise that the U.S. would try to meet Japan's demand for a stable supply of soybeans, cotton seeds, and cotton-seed products. He also mentioned that U.S. Secretary of Agriculture, Earl L. Butz, had stated at a press conference that "he would give special consideration to agricultural exports to Japan."

Japan could be hit hard by a shortage of soybeans. "No Japanese dinner is complete without miso soup (made of soybeans), and 92 percent of Japan's 3-million-ton annual imports of soybeans comes from the United States."

Now the Japanese are anxiously awaiting July 2, when the U.S. will issue its country-by-country export allocations [quotas]. "Japan fears that it might not even be allocated the full amount of soybean exports that have already been contracted." Once the U.S. export allocations are announced, the Japanese are hoping that the soybean export embargo will be lifted within a month–even though it is scheduled to last until the next soybean crop is harvested in September. Nevertheless, dealers will start contracting once the allocations are announced.

Japan is called a "surplus-trade" country by the U.S. meaning that the U.S. buys more from Japan than vice versa. So the U.S. has recently been browbeating Japan to buy more from the United States [conveniently forgetting that Japan has a much smaller population than the U.S.].

Last year Japan bought 3.12 million tons of soybeans worldwide," and it will buy an estimated 3.2 to 3.5 million this year if the supply is available.

"The price of tofu (bean curd) has already been shooting up in this inflationary year. Now Japan's many small and medium-size bean-curd and soy-sauce manufacturers and restaurant owners fear that the price will skyrocket 100 percent"–hitting every family budget that includes these daily necessities.

Japan no longer grows many soybeans. Production on

the small farms is inefficient, and many Japanese farmers are leaving their farms for the cities. "Even a high price support has failed to halt the decrease in Japanese soybean acreage."

6073. Pond, Elizabeth. 1973. The day the soybeans stop–Japanese concern. *Christian Science Monitor.* June 30. p. 1, 3.
• ***Summary:*** On June 27 the U.S. government began rationing soybean exports–a move that could hit Japan hard. Japan imports 3.12 million tons of soybeans a year and 92% comes from the USA. The Japanese are now anxiously awaiting July 2, when the U.S. will announce country-by-country export allocations. In Japan, the "price of tofu (bean curd) has already been shooting up..." The Japanese are hoping the "soybean-export embargo" will be lifted within a month after the allocations are announced.

What is the need for rationing? Last year America harvested a bumper crop of soybeans, and this years' is expected to be 15-20% larger. So the supply is adequate. The problem is that world demand has suddenly outstripped American supply, in part because of a scarcity of Peruvian anchovies, which are used as feed, and in part because of the rising cost of soybeans as feed to produce meat, poultry, and dairy products within the USA causes domestic inflation. So Americans have decided to fill their own soybean demand before exporting.

In Japan, soybean production is inefficient, and many Japanese farmers are leaving their farms. Even a high Japanese price support program has failed to stop the decrease in Japanese soybean acreage. Address: Staff correspondent, Christian Science Monitor.

6074. *Food Processing* (*Chicago*). 1973. 21 outstanding new food plants: For making new and better products, increasing production, lowering costs [Kikkoman's plant in Walworth, Wisconsin]. June. p. 14-15.
• ***Summary:*** Kikkoman Foods Inc. (a div. of Kikkoman Shoyu, Ltd.) has built a $9 million, 144,000 square foot plant on a 2-acre site at Walworth, Wisconsin, to make soy sauce and teriyaki sauce. With a pre-cast concrete exterior, it features two packaging lines: 40 cans/minute and 300 bottles/minute. The waste treatment system is designed for 240,000 gallons/day. It was completed in June 1973.

• ***Summary:*** Noda is the home city of Kikkoman, and Japan's largest center of shoyu production. Contains 65 old photos (all with captions, many with dates), several maps, a condensed history with many dates, and a chronology from 1558 to 1972. Address: Noda, Japan.

6076. *Washington Post, Times Herald.* 1973. The soybean embargo (Editorial). July 2. p. A22.
• ***Summary:*** Excellent analysis. "The administration's soybean embargo is a staggering confession of incompetence. To say that the embargo had become necessary does not render it desirable. It only demonstrates how far our government had let matters slide. This administration lurches from one economic crisis to the next, reacting in haste, with little evidence of thought or careful planning."

Last summer the USDA got an expensive lesson in the costs of carelessness in promoting farm exports, when the Russians unexpectedly bought a billion dollars worth of grain; it sat on its hands while grain traders sold off the nation's wheat stocks. This year they continued to do nothing while traders sold off our soybean stocks. If the USDA didn't know what was happening, the market surely did. The price of soybean meal and soybeans skyrocketed. Why? Because professional brokers realized that, between foreign and domestic sales, they had sold more soybeans than there were to sell.

Earlier this month, the administration was forced to freeze food prices.

"The soybean has become, over the past two decades, crucial to the nutrition of Americans and a large part of the world's population overseas. It is the cheapest and richest of all the sources of protein."

"Particularly in East Asia, soy products are an important part of the human diet. The embargo cuts off the flow of protein to people in Japan and Korea in order to control the prices of eggs and beef in the United States." The administration has made a "sudden and drastic decision to tear up our commitments to deliver the food supplies that we have already sold."

6077. Goodwin, June. ed. 1973. Inside the news briefly. *Christian Science Monitor.* July 3. p. 6.
• ***Summary:*** An excellent, large photo shows a Japanese woman (holding a young child) standing at the window of a traditional tofu shop while the tofu maker cuts her a cake of tofu from the large block of tofu floating in cold water in a large, rectangular, stainless-steel sink.

The caption reads: "Bean curd to the Japanese is like meat to Americans. To this Japanese mother, a meal just wouldn't be the same without the usual tofu (bean curd made from soybeans) which she is buying in a Tokyo shop. The latest U.S. ban on soybeans adds to her current woes of high food prices... Some Westerners may be switching from high-priced meat to lower-priced soybeans" (which contain 44% pure protein).

6078. Jameson, Sam. 1973. Japan shocked by U.S. decision to cut soybean export contracts. *Los Angeles Times.* July 4. p. C11.

© Copyright Soyinfo Center 2014

• ***Summary:*** "Tokyo–Japanese government and industry leaders expressed shock and disappointment Tuesday over the United States' decision to slash export contracts in soybeans to Japan and other countries by 50%."

Yukio Sakaguchi, the chairman of the Japan Cooking Oil & Fat Association called the decision "a form of economic war which must be considered a grave problem"–and "a violation of international justice." Sakaguchi is also president of Nissei [sic, Nisshin] Oils Corp.

Japan's Ministry of Agriculture, which had stated clearly its expectation that Japan–America's best soybean customer–would be given special treatment, was reported to be especially shocked by Washington's indiscriminate announcement. Japan is said to face the danger of running out of soybeans in late October. Feed manufacturers in particular said they would be unable to meet demands in the fall. Address: Times staff writer.

6079. Ungar, Peter. 1973. Soybean embargo (Letter to the editor). *Washington Post, Times Herald.* July 6. p. A23.
• ***Summary:*** "The administration's embargo on soybean and cottonseed exports is not only a very shortsighted and unworthy breach of contract with our customers but also an act of appalling callousness at a time of worldwide crop failures. To avoid price increases at home we are causing much steeper increases abroad. Yet for us food price rises mean a somewhat less tasty diet at worst while for populations which can barely survive on their incomes even now, further rises will constitute a desperate emergency. The awful truth is that for many a food price rise will be a virtual death sentence.

"To make matters worse the soybeans and cottonseed we withhold are earmarked to produce beef, a process in which most of the calories and proteins in the seed are lost in order to produce something more pleasing to our palate." Address: Scarsdale, New York.

6080. *New York Times.* 1973. Japanese upset by U.S. soybean curbs. July 7. p. 27, 32.
• ***Summary:*** Many Japanese are angry at President Nixon for his ban on exports of soybeans last week. Japan obtains 92% of her soybeans (nearly 3 millions tons a year) from the USA. These soybeans are needed, however, to meet shortage of cattle feed in the USA. Last Monday in Washington, DC, officials replaced the embargo on soybeans with a system of export licenses. Meanwhile, the price of soybeans has skyrocketed.

Japanese use soybeans in many foods, including "miso soup, a soybean broth." Tofu (soybean curd) and fish are the two most important sources of protein for Japanese, according to Kuniyoshi Takagi, managing director of the Federation of Tofu Makers' Associations. Makers of soy sauce say the USA has supplied all of the 240,000 tons of soybeans the industry consumes each year, according to Kaoru Ito, managing director of the Japan Soy Sauce Brewers Association. There was even concern at the restaurant Sasa-no-Yuki (snow on bamboo sprouts), which serves only tofu in 12 varied dishes; a full tofu dinner of 8 tofu dishes costs not more than $3.00.

The Japanese government, deeply upset, placed soybeans at the top of a list of controlled commodities under a new regulation (that went into effect today) against hoarding and price manipulation. Japan's "stocks of soybeans stood at 400,000 tons at the end of May, and are expected to drop to 200,000 tons by Sept. 30, and be exhausted by Oct. 31 if there are no further imports," according to a spokesman for the Ministry of International Trade and Industry.

While the Ministry of Agriculture and Forestry urges the U.S. government to insure that Japan has a steady supply of soybeans, Japanese officials are also "looking for other sources and accelerating programs to increase local production."

A bar chart shows: (1) U.S. soybean exports to the world: In 1971–420 million bushels worth $1.3 billion. In 1972–441 million bushels worth $1.5 billion. In 1973 (first 5 months)–248 million bushels worth $1.3 billion. (\ 2) U.S. soybean exports to Japan: In 1971–98 million bushels worth $311.1 million. In 1972–109.4 million bushels worth $375.4 million. In 1973 (first 5 months)–62.5 million bushels worth $347.7 million.

6081. *New York Times.* 1973. Japanese upset by U.S. soybean curbs. July 7. p. 27.
• ***Summary:*** Hiroshi Higashimori, Secretary-General of the Japan Oilseed Processors Association, expressed the feelings of many Japanese in all walks of life, when he said, "We're really angry at Nixon-san."

The anger is a result of the U.S. president's ban last week of soybean exports. "In Washington [DC] last Monday, officials replaced the embargo on soybean with a system of export licenses. Exporters will be allowed to ship 50 per cent of their soybean orders on hand as of June 15 and 40 per cent of their order for soybean meal.

Not long ago, when President Nixon established détente with Peking, without first informing Tokyo, the Japanese called it the "Nixon Shokku." Now the soybean export embargo is being called the "Shoyu Shokku" [soy sauce shock].

Soybeans are used in Japan to make foods and ingredients that appear in almost every meal. They are a key source of protein in the Japanese diet. The typical breakfast, for example, includes miso soup. Fish and tofu [soybean curd] are two of the most important sources of protein in the Japanese diet, said Kuniyoshi Takagi, managing director of the Federation of Tofu Makers' Association. Yet he fears that both will become remote from the daily diet, "fish because of contamination and tofu because of the U.S. embargo."

Makers of soy sauce are also concerned says Kaoru

© Copyright Soyinfo Center 2014

Ito, managing director of the Japan Soy Sauce Brewers Association. The U.S. has supplied all of the 240,000 tons of soybeans that the soy sauce industry imports and processes each year in Japan.

There was even concern at Sasa-no-Yuki ("Snow on bamboo sprouts" [leaves]), a restaurant that features tofu as the centerpiece of 12 varied dishes; a full dinner of 8 tofu dishes costs a maximum of $3–which is remarkably low for Tokyo. The Japanese government, deeply upset at Washington, "has placed soybeans at the top of a list of controlled commodities under a new regulation against hoarding and price manipulation that went into effect today."

Meanwhile, Japanese officials are looking for other sources of soybeans.

A two-part bar graph shows U.S. soybean exports in millions of bushels. (1) Exports to the world grew from 420 in 1971 to 441 in 1972 to 248 for the first 5 months of 1973. (2) Exports to the Japan grew from 98 in 1971 to 109.4 in 1972 to 62.5 for the first 5 months of 1973. Source: Department of Commerce.

6082. Illinois Agricultural Experiment Station. 1973. Soybean varieties developed at the Illinois A.E.S. Urbana, Illinois. 1 p. July 9. Unpublished typescript.
• ***Summary:*** For each variety is given: Variety name, prior designation, source (parentage), year named or released, developer or sponsor, and year selected. The first two varieties, both selections, were Illini and Ilsoy (1927). The first variety developed by crossing was Chief (1940; Illini x Manchu A, by C.M. Woodworth). The following varieties are listed (alphabetically): Chief (1940), Chippewa (1954), Chippewa 64 (1964), Clark (1953), Clark 63 (1963), Giant Green (by 1938; vegetable type from Takii Seed Co., Kyoto, Japan, 1935), Harosoy 63 (1963), Hawkeye 63 (1963), Illington (by 1938; vegetable type from Japan), Illini (1927, selection from A.K.), Ilsoy (by 1927, selection from Ebony), Lincoln (1943), Shelby (1958), Tortoise Egg (by 1938; vegetable type from Japan), Viking (1942), Wayne (1964), Williams (1971). Address: Urbana, Illinois.

6083. Jones, John A. 1973. Grain traders reeling under new export curbs: Depressed prices won't avert meat shortage, they say. *Los Angeles Times.* July 9. p. B8, B9.
• ***Summary:*** Shocked grain traders are wondering what the government will do next–"and some are predicting that whatever it is, it probably won't work." The government is clearly trying to use controls to depress grain prices.

All of the grain export commitments are in private contracts. The real purpose of the export licenses is to enable the government "to keep track of exactly how much grain is committed for export."

Yet in doing this the government has (1) Made our foreign trading partners angry at us, (2) caused many export houses to lose millions of dollars, (3) violated the sanctity of contracts, and (4) hampered the ability of futures markets to do their job.

There are price ceilings on processed commodities such as soybean oil and meal, but not on soybeans themselves. Price ceilings alone won't work, but combined with export controls, the combination should work.

The soybean crop was probably oversold. Traders made commitments to sell a certain amount of soybeans, but there simply may not be enough soybeans to fulfill all the contracts.

"The Japanese and West Germans are appalled at what we've done." Address: Times staff writer.

6084. Moorhead, John D. 1973. Little yellow bean pushing up prices: Whole world wants multipurpose soy meal. *Christian Science Monitor.* July 11. p. 1.
• ***Summary:*** Boston–"Soybeans: These unassuming yellow beans are the richest and cheapest source of protein known. And their meal makes the world's best animal feed." When president Nixon slapped an embargo and then strict controls on exports of soybeans, he was hoping to reduce soybean prices in the USA, and thereby eventually to reduce the price of meat.

Exports of soybean meal were 27% ahead of expected levels and a serious domestic shortage of soybeans was feared.

Nixon's soybean embargo has hurt the Japanese hardest–even though they were the best customer for U.S. soybeans. U.S. soybeans comprise 92% of all soybeans imported to Japan. Of those, 80% are "used for animal feed and the rest for such human staples as tofu (bean curd) and soy sauce."

A cartoon shows a personified soybean, wearing a big smile and a king's crown, holding in one hand a scepter with a dollar sign on it, sitting on a little mountain of dollar bills.

6085. Jameson, Sam. 1973. U.S. soybean curb is personal, national snub: Tokyo official. *Los Angeles Times.* July 13. p. B15, B21.
• ***Summary:*** Tokyo–Yoshio Sakurauchi, "Japan's agricultural minister said Thursday night the United States, in slashing export contracts of soybeans by 50%, had combined neglect of Japan with a personal snub to him."

He added his belief that the "four American Cabinet secretaries who will arrive here Saturday for two days of trade talks 'would not be in a position' to renew long-standing U.S. demands that Japan abolish its remaining 23 agricultural import quotas, 'having just restricted their own exports.'" Address: Times staff writer.

6086. *New York Times.* 1973. Japanese find U.S. unreliable on trade: 2 nations meet in Tokyo tomorrow amid anger over soybean curbs. July 15. p. 3.

lightly in recent steps to shore up the American economy."

6087. Oberdorfer, Don. 1973. Japanese attack U.S. trade policy. *Washington Post, Times Herald.* July 17. p. A1.
• ***Summary:*** Tokyo, July 16–Secretary of State William P. Rogers and other senior U.S. officials were subjected to a barrage of criticism today for alleged American deficiencies as a trading partner." At this joint cabinet-level conference on economic affairs, Rogers said that the curbs were "unavoidable and temporary."

Until just a few months ago, Washington [DC] was doing the complaining concerning the very large bilateral trade imbalance in favor of Japan; Washington made strong demands that the Japanese buy more from the U.S.

"At least four Japanese ministers, headed by Foreign Minister Masayoshi Ohira, expressed official dismay at the export restrictions during today's meeting here." Secretary of Agriculture Earl Butz was scheduled to be at the joint meeting, but he cancelled at the last minute, saying that he had urgent business to attend to in Washington. In his place he sent Undersecretary of Agriculture J. Phil Campbell.

"At a private hotel luncheon Sunday in the resort town of Hakone, Campbell and his wife heard little or nothing about Japan's special need for soybeans from the lips of their host, Agriculture Minister Yoshio Sakurauchi. However it did not escape their notice that the luncheon menu included boiled soybean snacks (edamame), Japanese soybean soup [miso soup], soybean curd squares (tofu), vegetables mixed with soybean curd [shira-ae], and cucumber with soy sauce."

6088. Chico-San Inc. 1973. Chico-San Inc. products: A catalog of unique foods. P.O. Box 1004, Chico, CA 95926. 26 p. Revised July 1973.
• ***Summary:*** Soyfoods imported from Japan include Lima Soy Sauce, Soybean Puree (Miso), and dehydrated miso. They also sell black [soy] beans.

Rice-based products include: Yinnies Grain Syrup ("a low cost natural sweetener made from whole grain barley and organically grown brown rice," in a 12 oz. jar; a photo shows the jar and label); a 3-page description tells how the product is made and gives its composition (maltose is the key natural sugar); recipes are included. Yinnies ("A traditional Oriental grain candy. The ingredients are organically grown brown rice and barley. No sugar or artificial sweeteners are used."). Rice chips with buckwheat. On the label of the Yinnies confection product the following statement appears: "The rice for the Yinnies is grown and harvested exclusively for and under the direct supervision of Chico-San by Wehah Farms of Richvale, California." A similar statement appears on the Rice Chips label.

Corn Chips. Rice Cakes (3 types, each with brown rice and sesame seeds: Plain, with Millet, or with Buckwheat). San-Wich Rice Cakes–Unsalted (Ingredients: Brown rice [organic], sesame seeds, Chico-San yinnies syrup (brown rice and barley), various sea vegetables, and kuzu).

One section (p. 9-10) is titled "How Chico-San guarantees Oriental-type, organically-grown brown rice." The words "Reprinted from *Health Foods Business* magazine" and "Wehah Farms" have been carefully deleted from the text of this article!

This is the revised edition of an earlier catalog. "Chico-San products have gained increasing acceptance throughout the country since their introduction in 1960." The booklet contains 8 pages of recipes, including: Sesame-miso spread for bread or dips. Black soy beans (p. 21). Wakame miso soup. Note: This is the earliest macrobiotic recipe seen which uses the term "Black soy beans" instead of "Black beans" to refer to black soybeans. Address: P.O. Box 1004, Chico, California 95926.

6089. Ikeda, Masanori. 1973. Food additives moving into wider applications. *Business Japan* 18(7):51, 56, 61-62, 64. July.
• ***Summary:*** The section on "Shoyu (Soy Sauce)" states: "Of the various condiments used by the average Japanese over a given year, shoyu or soy sauce constantly ranks first or second, accounting for 18.2 to 20 per cent of total condiments, according to figures by the Prime Minister's Office Statistics Bureau."

"There are about 4,000 shoyu producers in Japan, turning out approximately 1,200,000 kiloliters per year. About 40 per cent of the total is produced by five leading producers, and 60 per cent by the rest." The quality of shoyu make by all companies in Japan is excellent "because the government maintains a strict inspection system under the Japan Agricultural Standards (JAS).

"Before World War II, some shoyu was exported. But in the 10 years following the end of the war [1945-1955], Japan had little capacity to export due to the difficulty of securing sufficient raw material. Production barely met domestic demand. As the Japanese economy began to recover, exports were resumed.

"Full scale exports began in 1957. Since then Japan has shipped approximately 2,600 kiloliters annually overseas. In 1972 Japan exported approximately 8,000 kiloliters."

"Shoyu produced for export is graded into two categories–A and B–and the inspection standards are considerably higher than the JAS for domestic consumption. Only products that pass this strict examination are approved for export."

"Sauces: Sauce manufacturers in Japan (producers of fruit sauce and Worcestershire type sauce) total about 300 in number." The top ones are Kagome, Ikari, Bulldog, Kikkoman and Chicken. Address: Director General, Food and Marketing Bureau, Ministry of Agriculture and Forestry.

18(7):111-13. July.
• ***Summary:*** This article is mostly about the current ventures of Zenno and Nokyo in Japan. The economic activities of Nokyo (Agricultural Cooperative Association) comprise buying and selling. The supporting superstructure is Zenno (National Federation of Agricultural Cooperative Associations, whose chairman is Makoto Mihashi). While Zenchu (National Central Council of Agricultural Cooperative Associations, whose chairman is Tomoo Miyawaki) is a policymaking organ and also a strong political pressure group. Zenno is a purely economic organization supporting the economic activities of its member cooperatives, its annual business amounting to ¥2,340 billion. A powerful institution, its capability is second only to that of the four leading general trading houses [*zaibatsu*], such as Mitsui & Co. and Mitsubishi Corp.

"Zenno was created on March 32, 1972 through the merger of Zenhanren (National Marketing Federation of Agricultural Cooperatives) and Zenkoren (National Purchasing Federation of Agricultural Cooperatives). It is said that the merger took about ten years to materialize (i.e., before 1972). The argument for the merger was that the social situation surrounding farming and farmers has undergone a cataclysmic change, requiring the establishment of a new Nokyo movement."

6091. Kikkoman. 1973. Discover new taste–Kikkoman. *Business Japan* 18(7):57. July.
• ***Summary:*** This full-page ad shows a dispenser of Kikkoman shoyu, tilted downward, at the top, and below it (from top to bottom) a set of measuring spoons, a bowl, a ladle, a dish, a metal skillet and a wok.

The bottom quarter of the ad is devoted to text, which begins: "By the spring of 1973, Americans will be able to taste the delicate flavor of genuine Japanese soy sauce brewed and bottled in a plant now under construction in Wisconsin. It is just one facet in Kikkoman's worldwide operations... Kikkoman soy sauce is exported to more than 70 countries–proof that it goes well with any kind of food anyplace."

Across the bottom of the ad are the Kikkoman hexagonal logo (Since 1630) and, in large bold letters, "Kikkoman soy sauce."

6092. Roozen, J.P.; Pilnik, W. 1973. Ultrafiltration controlled enzymatic degradation of soy protein. *Process Biochemistry* 8(7):24-25. July. [17 ref]
• ***Summary:*** "Because of their taste, most hydrolysates formed by enzymatic degradation are not used in foodstuffs. Enzymatic depolymerisation in an ultrafiltration cell continuously separates peptides of desirable molecular weights from the reaction mixture. For application, the molecular weight has to be low enough to ensure solubility in acid fruit juice media, but not so low as to give a bitter taste."

Soy proteins of middle molecular weight are most suitable for introducing into fruit juices. These intermediate proteolytic products can be isolated by first digesting a soy protein solution with enzymes, then subjecting the mixture to ultrafiltration as the digestion proceeds.

Promine D, a commercial neutral isolated soybean protein in the sodium form, was purchased from Central Soya's plant in Chicago, Illinois. The following enzymes were studied: Pankreasproteinase A and Bakterienproteinase N (Röhm [Roehm] GmbH, Darmstadt, Germany), FAAN type A and Saure Protease SPR (Schweiz Ferment AG, Basel, Switzerland), HT Proteolytic 200 (Takamine, Miles Labs Inc.), and Rhozyme P-53 conc (Rohm & Haas, Philadelphia, Pennsylvania). The hydrolysis was carried out in a 142 mm Hi-Flux Ultrafiltration Cell (Millipore) placed in a thermostat. The ultrafiltration membrane was the DDS 800 membrane (De Dansk Sukkerfabrikker, Copenhagen, Denmark) with a nominal 100% rejection of molecules larger than 6,000 daltons. The pressure on the cell varied from 2 to 8 atmospheres.

The authors conclude that absence of beany flavor and bitterness is a very attractive property of these instant soluble hydrolysates. Therefore ultrafiltration appears to be a useful means of preparing high-grade food peptides. Address: Dep. of Food Science, Agricultural Univ., Wageningen, Netherlands.

6093. Greenwood, Leonard. 1973. Big bean boom in Brazil. *Detroit News.* Aug. 22. p. A-15, col. 4.
• ***Summary:*** Brazil's economy, in poor shape only 6 months ago, is now thriving. "The miracle was wrought by soybeans." A variety of factors have pushed world soybean prices from $200 a ton last year to near $600 a ton this year. A Brazil's farmers have just harvested a record crop. In the wheat and soybean state of Rio Grande do Sul, the combination of record production (expected to top 5 million tons this year) and unprecedented prices has created an atmosphere akin to gold fever. All over southern Brazil talk of soccer, Brazil's national game, has been replaced by talk of soybeans. Acreage is expanding. Some coffee growers are even tearing up their trees and converting the land to soybeans.

"Brazil has just signed an agreement with Japan to sell 2.5 million tons of soybeans next year for a staggering $1 billion. This will push soybeans ahead of coffee as Brazil's greatest money earner, the first time this century that any domestic product has ever topped coffee." Address: Los Angeles Times.

6094. Smith, Nancy. 1973. UI researcher seeks increased soybean yields: To satisfy world food demand. *News-Gazette* (*Champaign, Illinois*). Aug. 26.
• ***Summary:*** Discusses the work of soybean breeder Dr.

© Copyright Soyinfo Center 2014

Richard Bernard. He notes that soybean research has lagged behind that of other crops. "Many private companies employ corn researchers and hundreds of state and federally supported scientists are engaged in corn research and breeding while soybean research has been carried on by a handful of men." All the leading soybean varieties grown in the North Central states "have been produced by about four breeders."

Between 1952 and 1972, nationwide corn yields increased 132% compared with only 35% for soybeans. This is because, until quite recently, there has been almost no privately financed soybean research, and state experiment stations have shied away from soybean research. But Dr. Bernard reports that the soybean research is now intensifying and the future looks bright.

Dr. Bernard, who is in charge of the USDA germplasm collection for the northern half of the USA, is interested in wild soybeans. He recently visited Japan and Korea to collect samples of cultivated and wild soybeans. He collected almost 600 cultivated Korean soybean varieties and more than 150 wild varieties. His trip will net more than 1,000 new samples of soybean germplasm. "This is the first time in more than 40 years that the U.S. has obtained a large collection of new soybean stock from the Far East" [East Asia]. A photo shows Dr. Bernard checking the growth of a wild soybean plant in a UI greenhouse. Address: News-Gazette Farm Editor.

6095. *New York Times.* 1973. How families abroad are coping at the market: Some Japanese changing diets. Aug. 28. p. 37.

• ***Summary:*** In Tokyo, there is a widespread awareness that fish is too contaminated with mercury to eat safely. The other traditional source of protein, soybean products, have jumped in price because of the U.S. soybean embargo. In the last two months, the price of "tofu (bean curd or bean pudding)" has gone up 13 cents to 19 cents; a bottle of soy sauce 51 cents to 64 cents; cooking oil 55 cents to 70 cents,..."

Despite the rise in prices, tofu and miso soup are still regular parts of the diet for most Japanese.

A bar graph shows the percentage of income spent for food in 1971 in various countries: U.S. 17.6%. Germany 21.9%. Britain 22.3%. France 26.5%. Japan 30.7%. India 60.0%. Africa (various) 70.0. Source: Bureau of Labor Statistics. Grocery Manufacturers of America.

6096. Hawken, Paul. 1973. Erewhon: A biography. The view within. *East West Journal* 3(8):11-16. Aug.

• ***Summary:*** An early, critical history of Erewhon, written without any capital letters [all lowercase], expressing the viewpoint of one of its early, important, and very innovative presidents. "Arrogant" is a term often used to describe the attitude of the people running the company. A store by the name of "Erewhon" opened in May 1966 on Newbury St. in Boston, first manned by Evan Root, then Paul Hawken.

Paul "generally worked alone for first year [at Erewhon in Boston] with the exception of occasional help from members of the community–Elaine Sutton, Connie Frank, Peggy Taylor, and even Michio would help bag and clean.

"At that time I was much more interested in lectures, books, ideas, and more invisible things than food. I had no intention of doing Erewhon for very long, but that was before the remarkable and compelling visitations upon my brain that were precipitated by a five week fast augmented by only [brown] rice and water." Paul then describes the profound spiritual experience he had in 1966–one of great light and energy reaching down to the cellular level. "I could fully experience in that one moment the indivisibility of consciousness and body."

"Since nothing could really change until cells changed, it seemed the most logical thing was to provide the resource for that change to those who were ready for it. Soil and land would have to be found that was rich and uncontaminated... food should contain the life force inherent in natural growth. The problems posed were complex and many but all these questions gave me the answer as to the purpose of Erewhon... for those seeking the unveiling of the spirit, Erewhon would attempt to provide the renewing and cleansing power of the earth.

"This 'visceral mysticism' was a turning point for me and my relation to Erewhon. No revelation can arise unless ignorance precedes it, and the greatest lesson from this vision was the realization of how little I really knew or understood. My ignorance in the matters of spirit and consciousness were so great that I felt more at home with more plain and simple matters. Raising the quality of food seemed an area that was neglected, yet vital, in the path to higher consciousness."

In 1966 "On Thanksgiving day 1968 we opened a new store down the street [at 342 Newbury St.] which still exists today. At that time we were doing about $250 a day and the rent on the new store, with utilities, totalled over $1,000. It was a chance we took, a big chance, and seemed to set the pattern for many to come. The decision to place our economic life on the line was based on growth. By then Erewhon had grown to be six people, and all of us felt in our bones that we had a tiger by the tail. A sort of giddy optimism pervaded the new store, abetted by all of us working 12 to 20 hours a day–Bruce Macdonald, Jim Docker, Jean Allison, Bill Tara (later to leave for Chicago, Illinois), and Roger Hillyard. The intensity was so thick you could scoop it up and bag it. All of us felt like passengers on a very fast vehicle bound for unknown places. Business was increasing very rapidly and it seemed we could do no wrong. Time moved very quickly and I was soon to leave for Japan to establish a source of imported foods. My position as to coming back was ambivalent, so Roger Hillyard was appointed head in my absence. Bill Tara, who had set up Food for Life in Chicago on the tenth floor of a downtown office building, left for Los Angeles with Aveline [Kushi]

© Copyright Soyinfo Center 2014

and set up another Erewhon due to Aveline's prodding. It was later to prove to be our worst mistake and almost led us to bankruptcy.

"While I was away, roaming around Japan looking for pure foods and wise men, Roger [Hillyard] and others were busy establishing a wholesale business based primarily on the products that were being sent back from Japan. In retrospect, those times were chaotic, and I do not think the chaos let up until four years later, the spring of 1973. The chaos was (as I think back upon it) caused by thinly veiled ambition clothed in a stylishly cut suit of concern for our biosphere and guts. Perhaps this was a reflection of our urgent need to make up for years of bad living, bad ideas, and trash foods. In any case our actions were hasty, well-intentioned, very salty, and somewhat crude, but like a moldboard plow, we just kept coming.

"Chico-San saw us coming and promptly freaked out. They were very dismayed by their loss of New York business as our wholesale market developed. Chico-San had given us the impression in a number of personal conversations that they encouraged our self-reliance and particularly the importance of Japanese foods. Bob Kennedy, the head of Chico-San, candidly admitted that they lost money on imported items and they were able to stay in business only because they sold rice cakes. So it came as quite a surprise to us when they reversed their attitude. They began to express doubts about our motives and ability to procure good foods. Their attitude seemed to change into one where they were the 'official' food company, and that was that–appointed by the crown as it were. I can certainly see now how our brashness and youth did nothing to allay their doubts. In retrospect I have much sympathy, while realizing also that they did little to establish a real dialogue.

"Chico-San was formed by middle-aged people who split from New York City after Ohsawa walked into one of their meetings one night stoned on Scotch [whiskey] and announced the bomb was going to drop. This was during the Cuban [missile] crisis and there were many who shared that fear. They formed a well-organized caravan of families and trekked across the United States in a trip that got national coverage. Their purpose was to find the one place in America that was safest from radioactive fallout and also ideal for growing rice. Eureka! Chico, California. No one was more surprised than the local residents. The rift that opened between Erewhon and Chico-San has never closed. The rift could best be described as an ocean now. Peaceful coexistence. They mainly felt that their maturity and experience uniquely qualified them to be the best judge of what foods people should or should not eat. They thought that there should be only one 'label' and that we did not know enough about food to promote it... Herman Aihara who worked there then and Bob Kennedy felt that most young people had been 'ruined' by drugs and that their 'judgment' could never be completely restored,..." Continued. Address: [President, Erewhon].

6097. Hawken, Paul. 1973. Erewhon: A biography. The view within (Continued–Part II). *East West Journal* 3(8):11-16. Aug.

• ***Summary:*** Continued: "Perhaps the incident that best illustrates the conflict, and the one which simultaneously affected the most people, was the incident about the rice. To this day, I very much doubt there is agreement on the incidents leading up to the event, but here is one version anyway which may shed some light for others.

"In the fall of 1969, one Wendell Lundberg came striding into the retail store on Newbury Street and introduced himself as one of four brothers who were going to grow organic rice. He had heard of our company and wondered if we would be interested. We fell off our chairs. It seemed too easy at the time, and later events proved it to be so. A cordial conversation was entered into, addresses were exchanged, and he left. The following spring, I was in California, and a young man, who was on grant-in-aid to study organic farms dropped into our L.A. [Los Angeles] store and told us about these Lundberg brothers. Homer Lundberg and I began a relationship via the phone. I affirmed our desire to buy organic rice while he continued to express the desire to sell it. We set up an appointment in Richvale to discuss matters. Homer met me and told me that in the interim they had signed an exclusive five-year contract with Chico-San but that should be no problem because he had understood that Chico-San would sell the rice to us–wholesale. I explained how difficult it would be for us to buy rice wholesale from Chico-San and then try to redistribute to a hundred stores on the East Coast. He agreed and said that I should go to Bob. And he was sure it would be alright if I bought directly too or maybe paid Bob a small commission. I immediately went to see Bob Kennedy and posed the question to him, and he was simply appalled at the idea. High drama soon to come. I cannot accurately describe how hostile and upset the people at Chico-San were."

"Bob's attitude was formed partly because he had worked for years... trying to get a farmer to grow rice for him organically. When he finally found one, he had to just about sign his life away... in order to guarantee that the farmer would not lose money in case of a severely short crop. None of this of course was explained to us at the time. I suppose they just assumed we would know all the history behind it, but no one stopped to ask us or tell us or even show us the contract. We offered to share the risk, but that too was denied.

"The Lundbergs then made us an offer that they would grow a similar rice [in 1970] that was 'unsprayed' but which was still grown on ground with synthetic fertilizer. That was done and we were finally in the rice business, albeit second class.

The following year [1971] came quickly, and a new

© Copyright Soyinfo Center 2014

dance competition began to shape up. Bob [Kennedy of Chico-San] offered to sell us a certain number of acres if we would pay $1.50 for every bag we bought. One of the reasons he did this was because he heard rumors of other growers of organic rice [were there other growers?] selling to us. We accepted his offer initially, but I did not stop my search for an organic grower. With the help of Gloria Swanson, I located a group of farmers in Arkansas, and one in particular expressed interest.

"The farmer in Arkansas had fields which had been in soybeans with no fertilizers or pesticides. We tentatively lined up a source of Pfeiffer compost and manure, but as planting time came near it looked as though we were going to get the California rice offer and all the relations with the Arkansas grower were brought to a halt. At the last moment, however, Bob Kennedy reneged on his commitment and decided he would not sell us any rice. He said there just wasn't enough rice 'to go around' and that he was real sorry. (It was ironic because a year later [1972] the Lundbergs almost went out of business trying to get rid of all that organic rice that Chico-San had contracted for but could not buy.)

"We immediately contacted our Arkansas grower and drew up a contract... guaranteeing the farmer a fixed income per acre... [Note: The rice contract with Carl Garrich in Lone Pine, Arkansas, was finalized in March 1971. In April 1971 Garrich planted his organic rice crop on 330 acres]. The rice grew very well there and all was fine except for two things: First, our farmer could not clean the rice very well [seeds of various colors were mixed in with the rice], and second Chico-San had 300-400 acres too much rice, which they had contracted in expectation that they would sell the rice we had originally expected to sell. It did not work out that way so we had organic dirty rice and they had too much organic clean rice.

"Since then, because Chico-San could not meet their contractual obligations, the five-year exclusive had been null and void. Dozens of distributors now buy that rice, including Erewhon, which is now Lundberg's largest customer."

"That is the rice saga–the inevitable result of selfishness on everyone's part. I think one of the things I learned from this is that rice, which most consider inanimate, has a power of its own like water, and seeks its own level... The customer in this case was the victor and beneficiary.

"Bruce [Macdonald] and Roger [Hillyard] were soon to find that there was not enough space in the office for both to operate, so Bruce appointed himself West Coast manager much to Bill Tara's chagrin, relief, and disgust. Bruce began a very energetic effort to improve the West Coast store. Roger moved to a new fifth floor warehouse on Farnsworth Street overlooking the [Boston] harbor. He found new and dedicated people to help in the move. Richard Mensoff, Bill Johnson, Eric Utne, Chris Elbers, Rob Harrison, and Susan Sims. Richard, recently removed from set designing on Broadway [New York City], went to work immediately building the first Erewhon 'set.' It was beautiful, and unlike any food warehouse before it. Work had not even been completed when the first railroad car of rice backed into our siding. Aboard was 100,000 pounds of brown rice, and we had not the slightest idea of what to do with or how to unload it. Everyone just started carrying the [50 or 100-lb] bags of rice in on our shoulders as we had always done on Newbury Street. The looks of the warehousemen in the vicinity were incredulous. When they couldn't stand it any longer, they lent us their pallet jack and some old pallets, and we learned our first warehouse lesson.

"I returned from Japan in December 1969 and went to work with Bruce on the West Coast setting up a wholesale operation: it was Boston all over..." Address: [President, Erewhon].

6098. Hawken, Paul. 1973. Erewhon: A biography. The view within (Continued–Part III). *East West Journal* 3(8):11-16. Aug.

• ***Summary:*** Continued: Hawken returned to Boston in Dec. 1969, then was fired by Aveline Kushi. He left and worked in San Francisco with Fred Rohe at New Age Natural Foods. Hawken returned to Erewhon in Boston in the summer of 1970.

In 1970 the "natural foods boom" started and swept Erewhon along with it. "If there is one person who is 'most' responsible for Erewhon being here today and not bankrupt, it is John Deming, who brought a sense of joy and happiness wherever he went in the company. He assumed the manager's position at the retail store and made it the finest part of the company. His positive attitude was in contrast to the apprehension that all of us shared about the future. He gave Erewhon some money without which we would surely have failed. On his twenty-fifth birthday John came into a trust which sort of blew his mind. He had known nothing about it. He wanted to just give it to Erewhon, but it is on the books as a loan. It came just in time to pay back overdue creditors and panting bank officers."

A table (p. 16) shows Erewhon, Inc's. sales and sources of supply in 1966 and then in 1973. In 1966 Erewhon had about 200 retail customers. The company bought Koda rice from Sam Rabinowitz; imports from Chico-San, Infinity Co., Japan Foods Corp., and Wing-Wing; Lima (Belgium) products from Merit; grains and flours from Better Foods; and flour from Walnut Acres [founded by Paul Keene].

In 1973 in Boston the warehouse served about 200,000 customers (incl. 200 retail natural food stores, 43 Star Markets, 50 co-ops, 25 schools, 9 distributors, 10 restaurants, and 5 bakeries), and the store about 10,000 customers. In Los Angeles, the warehouse served about 75,000 customers (incl. 150 retail stores, 20 co-ops. 3 bakeries, and 10 distributors) and the store about 5,000 customers. A produce company in Los Angeles was supplied by about 40 organic farmers, and

© Copyright Soyinfo Center 2014

sold to 20 retail stores. Concerning soy products, Erewhon bought organically grown soybeans from Lone Pine in Arkansas [Carl Garrich of the Lone Pine Rice and Bean Farm], and soy oil from California. From Muso Syokuhin in Japan they imported tamari, and kome and hacho miso [plus azuki and black beans]. From Mitoku, Inc. they imported tamari and mugi miso.

Suppliers of organically grown grains included: Short, medium, and sweet rice (Wehah Farms, California). Medium rice (Willow Farms, Louisiana). Spring and durum wheat; flax (Ted Whitmer, Montana). Long rice (Jerry Ladds?, Texas). Winter wheat (Frank Ford, Arrowhead Mills, Texas). White wheat (Lewis Cox & Bill Ingram, Washington state). Buckwheat (Penn Argyl, Pennsylvania). Corn (Bill Stockett, Texas). Millet (Chuck Moses, North Dakota). Oats (Fruen, Minnesota). Rye (Mike Skinner, Colorado). Peanuts (Chas. Warnken, Texas).

Note 1. This is the earliest document seen (July 2011) that mentions Mitoku, or Muso Shokuhin.

Note 2. This is the earliest document seen (March 2006) that mentions Food for Life (started by Bill Tara in Chicago, Illinois). Address: [President, Erewhon].

6099. Hymowitz, T. 1973. Electrophoretic analysis of SBTI-A_2 in the USDA soybean germplasm collection. *Crop Science* 13(4):420-21. July/Aug. [6 ref]
• ***Summary:*** First work on geographic distribution of alleles determined by electrophoretic techniques. Hymowitz reports that the soybean's Ti-b (trypsin inhibitor) allele is present at a much higher frequency in Japanese and Korean soybean germ plasm

germplasm than in soybean populations from other areas of the world.

Note: This is the earliest document seen (Nov. 2003) with the term "soybean germplasm collection" or "USDA soybean germplasm collection" in the title. Address: Dep. of Agronomy, Univ. of Illinois.

Address: Dep. of Food Chemistry, Faculty of Agriculture, Tohoku Univ., Sendai, Japan.

6101. Ohsawa, George. 1973. Practical guide to Far-Eastern macrobiotic medicine. Herman Aihara, editor. The George Ohsawa Macrobiotic Foundation Inc., 1471–10th Ave., San Francisco, CA 94122. xi + 260 p. Aug. 21 cm.
• ***Summary:*** This book has a red, white, and black cover with a round yin-yang (*t'ai chi*) symbol on it. The Foreword begins: "This book, a compilation of several books and writings of George Ohsawa, attempts to give the whole scope of macrobiotic medicine to everyone." It includes the first English translation from French of Ohsawa's 1956 "Guide pratique de la medicine macrobiotique d'Extreme-Orient."

Contents: Forward [sic]. Preface. Introduction. Theory of macrobiotic medicine. Curing sickness. Cure the man. Letters from students of macrobiotic medicine. Appendix.

Information on soyfoods is found on the following pages: Tamari bancha (syoban, p. 85, 102). Miso (fermented soybean puree, p. 85). Tekka (miso, p. 87, 95). Tofu plaster (p. 88, 110-11, 125-30). Miso soup (p. 96). Koi-koku (Carp soup with miso, p. 99). Aburage (Age, p. 99). Deep-fried vegetable tofu (ganmo, with "1 tofu, ½ lotus root cut small, 2/3 inch jinenjo {nagaimo}, ½ inch carrot cut small, 2 inches burdock cut small, 1 quart oil, 1 cup whole wheat flour." Grind the tofu well in a suribachi, adding a pinch of salt, p. 99). Vegetable with ganmo (p. 100).

Note: This is the earliest English-language document seen (April 2013) that contains the word ganmo; it refers to deep-fried tofu burgers.

Dried radish with age ([aburage], see recipe 32, p. 100). Yin/yang soboro (with miso, p. 101). Scallion miso. Onion miso. Shigure miso (p. 103). Pheasant nituke [nitsuke] (with miso, p. 104).

The forward [sic] by Herman Aihara, editor, notes: "This book, a compilation of several books and writings of George Ohsawa, attempts to give the whole scope of macrobiotic medicine to everyone. The main part is treatment for sickness. However, treatment without understanding of principles and a good attitude is dangerous, therefore, the theory of macrobiotic and other articles were added. The book, like its predecessor, *The Unique Principle,* is unique not because of its name and contents, but rather in how it was translated, edited and published.

"The first part is a translation taken from Japanese books such as, *A New Dietetic Cure, How to Cure Sickness and a Sick Man,* and *Vegetarianism.* The second part is a translation from the French edition of *Practical Guide to Far-Eastern Medicine* which was done by Ann Harris. Noboru Muramoto was consulted to suit remedies to present-day American needs.

"Cornellia Aihara translated *Cooking for the Sick* which was written by Lima Ohsawa. *Massage and Palm Therapy* are based on notes taken by Cynthia McCluskey at Mirimichi Summer Camp, 1972. Photos of Cornellia demonstrating external treatments were taken by Fred Pulver. *The Manual of Macrobiotics* is a contribution of Nina Bond who took notes at George Ohsawa's lectures in New York at Summer Camp held about ten years ago.

"The third part is a translation from French and Japanese by Fred Pulver, Lou Oles and Herman Aihara.

"The last part is again taken from several articles appearing in past issues of *The Macrobiotic* magazine. The Appendix is taken from a translation of the French edition of Ohsawa's *Practical Guide to Far-Eastern Medicine.*"

© Copyright Soyinfo Center 2014

The preface, by George Ohsawa, states: "I am very happy to give you this short, simplified translation of my book, *Cure–Following the New Way of Eating.* It was originally written in Japanese, and is now in its 465th edition. I want to share with you the practical application of Macrobiotic healing that I have been teaching for almost 40 years–leaving aside the conceptual aspects covered in my other books and classes.

"Herein is the synthesis of my medical philosophy, which is nothing but the biological, physiological and dialectic interpretation of Far Eastern philosophy–the principles of the Order of the Universe and the Order of Man. For 30 years I have been writing on both the practical and theoretical sides of this question and have published more than 20 books and thousands of articles. But at this time I wish to limit myself to giving easily accessible information.

"My medical philosophy, the way of eating and the art of longevity and rejuvenation, is so simple and inexpensive that anyone can follow it any time, anywhere. If you decide to cure yourself before all else, you can forget about the bitter, painful and costly suffering that results from medical, physical, psychological and religious therapies.

"This system depends on you alone. No reliance on other people or on artificial means–everything depends on how you eat."

In the first chapter titled "How did I find macrobiotics? The principle of life," Ohsawa continues: "I was born at Sagano, Kyoto, Japan in 1893. My mother could not produce enough milk and I was a weak baby. I was told by mother that I almost died five times before I reached the first birthday. My family was poor. Father was a principal of an elementary school of a small village before I was born. Then my parents moved to Kyoto where he became a policeman. Mother worked at home to help finance–making strings for kimonos. Mother was an industrious woman. She studied Western science and culture through Yuzuru Niijima who was the founder of the Doshisha University. She died at the age of 30 from tuberculosis, leaving two sons. I was 10 and a younger brother was 6. Two sisters had died earlier due to the wrong diet which my mother introduced in our family through her study of Western science and culture.

"From that time we lived sad days as poor orphans. I was an apprentice in a Buddhist temple as a disciple. However, I soon started to vomit blood like my mother and sisters did. At 18, I had to give up my school, medicine, eggs and meat because I was too poor to continue such expensive living. I lived in the lowest living condition. In other words, I lived with brown rice, radish pickle and salt plum even though I was told that my sickness–tuberculosis–required eggs and meats by the doctors and my mother who gave us milk, eggs and bread every morning (which was violating natural order). We were punished for this violation. Such a diet destroyed our family's health. I, however, resented that I could not afford to continue such a diet because I didn't know the fact that such a diet was the cause of mother's and sisters' death and my sickness. If I could have afforded to continue that diet, I would have died at that time. I am so grateful that I was poor...

"Curing all my diseases and re-establishing my health at the age of 20, I realized that food is the source of life. After realization of this important fact, I decided to devote my life to preaching this doctrine...

"I traveled to France for the first time in 1914. Since then I have returned a dozen or more times."

6102. Hewitt, Jean. 1973. A Portuguese stew, an Oriental omelet. *New York Times.* Sept. 28. p. 26.
• ***Summary:*** The recipe for "Bean curd omelet" [*o-konomi-yaki*] includes "1 cake fresh bean curd (tofu) or one can, drained and cut into 3/4-inch cubes."

Address: Central Research Laboratories, Kikkoman Shoyu Co., Ltd., Noda, Japan.

6104. *Macrobiotic* (*The*) (*Chico, California*). 1973. Miso making with white rice koji. No. 92. p. 22.
• ***Summary:*** Koji is rice or wheat, barley, etc. which has been treated with a mold called succaromises [sic, *Saccharomyces* is a yeast genus]. Koji rice (only white rice unfortunately) is available in Japanese food stores. If you can't find it, one can ask their local natural food store to order some from the manufacturer–Fujimoto & Co., 500 West Street, Salt Lake City, Utah 84101.

One recipe for quick (yin) miso calls for 18 pounds soybeans and 18 pounds koji, 5 gallons water and 9 pounds salt. This amount will go in a ten gallon stone crock. In Japan, one twenty gallon barrel of miso feeds five persons for one year.

Letter (e-mail) from Carl Ferre of GOMF in Chico, California–in reply to inquiry. "Issue No. 92 was the 9th of 11 issues in 1973; so, my guess is [it was published in] September."

6106. Tanner, J.W. 1973. Where we are and how we got there: An historical review of soybean production in Ontario. In: Ontario Soya-Bean Growers' Marketing Board, ed. 1973. Ontario Soybean Symposium 1973. Ottawa: Agriculture Canada. 110 p. See p. 11-22.

• ***Summary:*** The best summary of soybean history in Canada seen up to this time. The author believes that, "based on the chaotic events of the last 12 months... for historical purposes it would seem desirable to divide the history of soybeans into two eras: pre-September 1972 and post-September 1972. Certainly the events of the last year created an awareness in producers and the general public alike of a whole new vocabulary, including words such as anchovies, futures market, protein gap, embargo, superburger, and soaring prices. The latter produced another vocabulary most of which would be unprintable.

"The first report of soybeans grown in Canada was by C.A. Zavitz in 1893 at the Ontario Agricultural College. The seeds had been obtained from Dr. C. [Prof. C.C.] Georgeson, Kansas, who had received them from Japan three years earlier. [Note: Zavitz first published his research on soybeans in 1901, and first reported the results of his 1893 research in 1908]. For 30 years Zavitz, alone in Canada, meticulously conducted trials on variety tests, dates of planting, seed rates and row widths for soybeans grown for seed and hay.

"By 1927, Zavitz had evaluated over one hundred varieties, most of them for five years or over. The 31 year average of his best variety, Early Yellow was 16.78 bu/acre. The 22 year average green crop yield for the variety Ito San was 7.5 tons per acre per year. In 1924, Zavitz released OAC 211, the first variety of soybeans registered by the Canadian Seed Growers' Association. The variety continued as one of the recommended varieties until the mid 40's.

"The soybean program at Harrow was started in 1923 by Dr. F. Dimmock. [In 1923 he grew the first soybeans at Harrow. In 1925 the first soybeans were grown in Kent County. In 1930 the first soybean crosses were made at Harrow.] Dr. Dimmock was transferred to the Ottawa research station in 1927 where he continued his work on soybeans and produced a string of excellent early varieties of soybeans over 35-40 years including Acme, Comet, Crest, Mandarin, Capital, Merit, Kabott and Pagoda. The Harrow research was continued by Casper Owen who started breeding soybeans in 1931. This program was to prove to be one of the most outstanding in North America producing such varieties as AK (Harrow), Harman, Harly, Harosoy and Harome."

"In the late 1920s a few farmers were growing a small acreage of soybeans for grain, harvesting with a reaper and threshing the seed out. Two short-lived crushing plants were established in the south west part of Ontario in the mid-1930s, one of which was located at Shelbourne [sic, Colborne] Street in Chatham."

Note: Founded in 1934 (see p. 18), this was apparently the first crushing plant in Canada. In *Shepherd's City of Chatham* (*Ontario*) *Directory 1934-35* (p. B-166) we read: "Soyabean Oil & Meal Co-operative Co Ltd, G E Biles, mgr, Colborne n, w cor Adelaid." Spelled out, with punctuation, this becomes: northwest corner of the intersection of Colborne St. and Adelaide St. See also C.A. MacConkey (1935, p. 65) who gives the company name as: Soy Bean Oil and Meal Co-Operative Co. of Canada, Ltd.

"Subsequently, few beans were grown for hay. The late 1930s were critical years for the soybean in Ontario, and without the help of the Maple Leaf Mills plant (which was primarily processing flax) and Toronto Elevators [which later merged with Maple Leaf Mills in 1962], there would have been no place to market the new crop.

"The establishment of soybeans as a major crop in North America was assured by the occurrence of World War II. Demand for oil created a rapid expansion in acreage and processing facilities, and in the U.S.A. 1940 marked the first year in which the acreage harvested as seed exceeded the acreage harvested for hay. The latter continued to dwindle away and now, represents an insignificant portion of the U.S. acreage.

"The rapid expansion in acreage, once the demand for oil was established, occurred as a result of a major promotional effort by the consuming industries. With the construction of a new plant in Toronto in 1944, Victory Mills launched one of the greatest promotions of a crop ever witnessed in the Province of Ontario. Extension bulletins, newspaper advertisements, movies, newsletters and meetings inundated the farmers with information and enthusiasm. Ralph Chamberlain and later Ivan Roberts promoted the crop at every opportunity. Acreage grew and by the early 50's, the soybean had become a major cash crop in S. Ontario and had its own marketing board.

"As the market for oil increased and the acreage expanded in the 1920's and 30's, the problem of disposing of all of the meal economically became acute, to the point of slowing the expansion... Gradually the feed industry began to recognize the value of the meal in livestock and pet foods with the result that, with a major market established for the meal by-product, the expansion of the oil industry was assured."

"To me there have been three outstanding accomplishments in the development of soybeans in Ontario to date: the pioneering work of C.A. Zavitz at the Ontario

© Copyright Soyinfo Center 2014

Agricultural College... Next, the role of Victory Mills in promoting the crop once the market for oil was established.

"Finally, the development at the Harrow Research Station of the variety Harosoy by Mr. Casper Owen. Released in 1951, Harosoy eventually grew to 80% of the Canadian crop (1965). However, its total impact was even greater in the United States Midwest where, in 1966, 26% of the total U.S. crop of 25 million acres was Harosoy, including 42% of the crop in Illinois, 48% in Indiana, 46% in Ohio and 58% of Michigan's crop. To be that dominant, a variety can't just be good, it must be great and Harosoy (and later Harosoy 63) was certainly that."

A graph (p. 20) compares soybean yield in the USA and Canada from 1924 to 1971. The first statistics on Canadian soybean yields date from 1941, and from that year onward Canadian soybean yields were generally higher than U.S. yields–in some year 5-6 bushes/acre higher.

A second graph (p. 22) shows the surprisingly parallel growth of the number of soybean acres harvested from 1924 to 1972. Though the number of acres is smaller in Canada, the rate of growth is almost identical. Address: Crop Science Dep., Univ. of Guelph, Guelph, Ontario, Canada.

• ***Summary:*** "A method of preparing soy and miso-paste of superior flavor and taste and of high quality, which comprises treating the starting soy-beans and/or carbohydrates with a current of superheated steam at a gauge pressure of 4-8 kg/square cm and a temperature of 200ºC to 280ºC for a time not exceeding 15 seconds. The treated soybeans are quickly exhausted into the atmosphere at atmospheric pressure."

The examples use either defatted soybean flakes or granular soybeans. Both the present invention and the conventional method contain 17.55 gm of common salt per 100 ml of soy sauce. Products from the present invention and the conventional method contain (in gm/100 ml) respectively total nitrogen (1.808/1.680), amino nitrogen (0.890/0.828), glutamic acid (1.484/1.376), alcohol (2.08/2.01), and yield of nitrogen (89.42%/82.93%). Address: 1. Kashiwa; 2-5. Noda; 6. Nagareyama. All: Japan.

6109. Odani, S.; Ikenaka, T. 1973. Studies on soybean trypsin inhibitors. VIII. Disulfide bridges in soybean Bowman-Birk proteinase inhibitor. *J. of Biochemistry* (*Tokyo*) 74(4):697-715. Oct. [27 ref]

• ***Summary:*** Gives (for the first time) the complete amino acid sequence and covalent structure of the Bowman-Birk soybean trypsin inhibitor. Residues at the two reactive sites are shown as solid black circles. Probable sites of peptide bond cleavage are also shown. Address: Dep. of Biochemistry, Niigata Univ. School of Medicine, Niigata 951, Japan.

6110. Taira, Harue. 1973. Heat destruction of amino acids in soybean products. *JARQ* (*Japan Agricultural Research Quarterly*) 7(4):267-73. Oct. [11 ref]

• ***Summary:*** Traditional, processed soybean foods that are widely used in homes in Japan include "Shoyu (fermented soy sauce), Miso (fermented soybean paste), Natto (fermented soybeans), Tofu (bean curd), Aburaage (fried bean curd), Kori-tofu (dried Tofu) and Kinako (roasted soybean flour)."

One of the steps in making each of these foods is heating, which denatures the protein (making it more digestible), eliminates the peculiar soybean flavor, and develops colored substances (which "can prevent oxidation of the unsaturated fatty acid contained abundantly in soybeans during the fermentation process of Miso as an example"). Heating also eliminates antinutritional factors.

"But overheating causes excessive denaturation of soybean protein and destruction of amino acids."

Tables show: (1) Amino acid composition of 7 soybean products, including Mamemiso [soybean miso, such as Hatcho miso] and yuba. (2) Change of amino acid after three steps in the process of making Mame-miso: Soaking the soybeans, heating the soybeans, the final product. (3) Change of amino acid after two steps in the process of making natto: Heating the soybeans, final product. After heating at a rather high temperature for a short time (120ºC for 30 minutes), there was no decrease in any amino acids except arginine, which decreased by 17.8%, and decreased by 29.1% in the final product. Some essential amino acids increased during the natto process. Methionine increased from 0.9 gm per 17 gm of nitrogen to 1.1 gm, an increase of 22.2%. Cystine remained unchanged at 1.0. (4) Change of amino acid after three steps in the process of making Tofu: Soaking the soybeans, heating the soybeans, the final product. No amino acids are reduced by heating, and some (such as methionine) increase. Of the 18 amino acids measured, 5 are unchanged, 10 increase, and 3 decrease slightly: Glutamic acid 19.6 > 19.3. Tryptophan 1.5 > 1.4. Serine 6.6 > 6.4.

One of the products which is heated by dry heat only (without soaking in water) is kinako. It is heated at 160ºC for 10 minutes, then ground. This heating reduced lysine from 5.1 to 4.8.

Figures (graphs) show: (1) The heat destruction of lysine in defatted soybean flour at 4 different temperatures (from 100ºC to 126ºC) for 4 different times (from 30 minutes to 4 hours). The higher the temperature and the longer the time,

© Copyright Soyinfo Center 2014

the greater the destruction of lysine.

(2) The heat destruction of cystine in defatted soybean flour. Same 4 temperatures and times; roughly same results.

(3) The influence of water on the heat destruction of lysine in defatted soybean flour. Same 4 temperatures and times. Adding water reduces the destruction of lysine.

(4) The influence of water on the heat destruction of cystine in defatted soybean flour. Same 4 temperatures and times. Adding water reduces the destruction of cystine.

(5) Heat destruction of total and available lysine in defatted soybean flour. Same 4 temperatures and times.

(6) Enzyme treatment and total liberated amino acids. Address: Food Analysis and Nutrition Div., National Food Research Inst., Ministry of Agriculture & Forestry, Koto-ku, Tokyo.

• ***Summary:*** Tables show results of variety trials in Costa Rica (1972), Nigeria (1971), Madhya Pradesh, India (1972), Thailand (1971), Jogjakarta, Indonesia (1971), Brazil (1970-71).

"While a few years ago there were grounds for believing that the USA could supply all the soybeans needed in world grain trade, at the present time it is very clear that this crop is in acutely short supply on a world-wide basis, and that many countries which previously have imported their soybean requirements will be considering means by which they may produce part or all of their needs.

"Development of the soybean from a forage crop into a major grain crop in the USA was made possible by a breeding breakthrough at the University of Illinois in the early 1920's. Dr. C.M. Woodworth developed types which had an upright, non-branching growth habit, rather than the prostrate, vining habit which previously had been most common. As a result, it became possible to harvest the crop with normal field machinery. Growth in acreage and productivity was explosive."

"In the USA there is at present a sharp distinction between 'northern' and 'southern' types. The 'northern' varieties are almost all of indeterminate growth habit and are based primarily on Manchurian and Hokkaido germ-plasm. The Manchurian types predominate, except in varieties adapted to extreme northern areas. While these 'northern' varieties are considered to be especially day-length sensitive, recent evidence indicates that their early maturity under warmer conditions is influenced more by high temperatures than by actual day-length."

"The 'southern' types may be traced generally to germ-plasm imported from Taiwan or southern China. All the modern U.S. varieties in this class are of determinate growth habit; that is, increase in height virtually ceases once flowering begins. Although these varieties are popularly regarded as less sensitive to day-length, they actually tend to be more day-length sensitive and less temperature-sensitive than the 'northern' types."

"In our experience with variety trials on a worldwide basis, we have found that some of the 'southern' types from the USA give superior performance when grown under favorable conditions, as compared with nearly all other germ-plasm tested."

"Soybean breeding is generally not well developed in countries other than the USA and Canada. Recently, however, Brazil and India have undertaken programs on a significant scale." Address: Univ. of Illinois, Urbana, IL.

6118. **Product Name:** [House Hon Tofu Mix (Instant Soybean Curd Mix)].
Foreign Name: Hausu Hontôfu.
Manufacturer's Name: House Food Industrial Company Ltd. (Hausu Shokuhin Kogyo).
Manufacturer's Address: Plant: Sano city (100 km north of Tokyo), Japan. Head offices: Mikuriya-Sakaemachi 1-5-7, Higashi Osaka City, Osaka, Japan.
Date of Introduction: 1973.
Ingredients: Soy bean [powdered soymilk], glucono delta-lactone.
Wt/Vol., Packaging, Price: 2.3 oz In USA $0.99 in 1983.
How Stored: Shelf stable.
New Product–Documentation: Article in *Japan in*

Pictures. 1974. 16(1):12-15. "Bean curd, a subsidiary food as nutritious as meat. Instant bean curd developed in Japan." Two photos are given of the equipment in the plant and 6 of the package and how this instant silken tofu is prepared at home. At the modern plant, a mixture of ground soybeans and water "is applied to a centrifugal separator, which separates it into soymilk and refuse. The soymilk, which has been concentrated by being heated, is sprayed into a tank heated to 100ºC, a process which dehydrates the milk to produce a bean curd base in powdered form [powdered soymilk]. A unit quantity of this powder is packed in an aluminum-foil bag containing nitrogen gas, which is put on the market accompanied by a small amount of coagulant.

"Process to prepare bean curd on the spot. Put a bag of 'Hontofu' in 600 cc of water, which is to be agitated [with a whisk]. Boil about 3 minutes. Mix the accompanying coagulant [glucono delta-lactone] immediately after the flame is put out. Transfer the substance into the container [a plastic box shaped like a cake of tofu]. Leave it for about 20

© Copyright Soyinfo Center 2014

minutes and a block of bean curd is ready. Bean curd taken out of container [into a bowl of water]." Spot (½ page with photo of package) in *Food Product Development.* 1976. May. p. 88. Discusses: Ingredients and description. Product application. Product history. Product concept.

6127. Azumaya Inc. 1973. Tofu recipes–Series one. Yudofu, Pork Tofu, Sukiyaki, Sweet 'n Sour Tofu (Tear-off recipe pad). San Francisco, California 94124. 6 recipes. Each recipe: 7.5 x 7.2 cm.
• ***Summary:*** Color photo on each recipe. Caption on each reads: "Tofu–from the bean that thinks it's meat!" These are the earliest tofu recipe pads or cards seen in the Western World. Each recipe is "Copyright 1973."

6128. Azumaya Inc.; Matsuda & Hinode. 1973. Tofu recipes (color): Tofu & Mushrooms, Tofu Meat Loaf, Tofu Tuna Patties, Eastern Omelet (Tear-off recipe pad). San Francisco, California 94124; Los Angeles, CA 90013. 4 recipes. Each 18 x 7.5 cm.
• ***Summary:*** Color photo on each recipe. Caption on each reads: "Tofu–from the bean that thinks it's meat!" Each recipe is "Copyright 1973." Note the cooperation between two California tofu manufacturers that are potential competitors, Address: Los Angeles, California.

6129. Borgstrom, Georg. 1973. World food resources. New York and London: Intext Educational Publishers. xi + 237 p. For soybeans, see p. 20-21, 136-37, 222. Index. 23 cm. Series: Intext Series in Ecology. [210* ref]
• ***Summary:*** Contents: Series preface. Preface. Introduction. Section I: Production. 1. Food commodities. 2. Prerequisites for crop production. 3. The tropics. 4. Crops and water. 5. Livestock and poultry. 6. What oceans and freshwaters provide. 7. Visions of the future. Section II: Utilization. 8. Food storage, processing, and marketing. 9. International trade in food and feed. Section III: Consumption. 10. Man's needs. 11. Food and population. 12. Nutrition and health. 13. Protein: the key issue. 14. Food and the ecology crisis. Supplementary tables.

The United States is presently the world's largest producer of soybeans, producing 67% of the total; China produces 24.5% and Others produce the remaining 8.5%. Three pie charts show global production of soybeans and peanuts (groundnuts) (p. 20-21). The section on "Oilseeds" (p. 136-37) also discusses soybeans and peanuts. Tables show (p. 222): (1) "Soybeans–world trade–annual average of 1967-1969 (millions of metric tons)." The USA has 90.1% of the 8.74 MMT of world exports. Europe has 58.3% and Asia has 36.3% of the 8.64 MMT of world imports. The leading countries for net soybean imports are: Japan 2.39, West Germany 1.48, Spain 0.92, Netherlands 0.66, Italy 0.61, Denmark 0.42, Taiwan 0.40, and Canada 0.38. (2) United States soybean exports (millions of bushels). Gives quantity and percentage of total for major regions and individual countries in 1967-68 and 1969-70. The protein in these exports is used mostly for livestock feed; no hungry countries are major importers of soybeans.

India is the world's leading producer of peanuts, producing 33% of the total, followed by China (13.5%), Nigeria (7.3%), the USA (7.2%), and Other (39%). Address: Michigan State Univ.

6130. Cowan, J.C. 1973. Processing and products [soybeans]. In: B.E. Caldwell, ed. 1973. Soybeans: Improvement, Production, and Uses. Madison, Wisconsin: American Society of Agronomy. xviii + 681 p. See p. 619-64. Chap. 20. [52 ref]
• ***Summary:*** Contents. 1. Introduction. 2. Processing for oil and meal: Preparation of flakes, solvents, extraction, desolventizer-toaster, degumming. 3. Conversion to edible oil products: Refining, bleaching, deodorization, hydrogenation. 4. Edible fat products: Salad and cooking oils, status of flavor stability, shortenings and margarine oils, lecithin. 5. Essential fatty acids and atherosclerosis. 6. Industrial uses of oil. 7. Meal for livestock and poultry: Nutritional aspects, factors affecting use of meals. 8. Edible protein products: Soy flour, concentrates and isolates, textured protein products (textured soy flour or textured soy protein fibers made into "meat analogues" resembling chicken, bacon, etc.). 9. Fermented and specialty foods: Tofu, soybean milk (an intermediate step in the manufacture of tofu), miso, shoyu (tamari, light-colored shoyu), sufu, tempeh, hamanatto, and natto.

Soybeans flow through a crushing plant as follows: First, they are cracked to release or loosen the hull and to break the cotyledon into about 4 parts. Shakers and aspirators separate the hull from the cracked cotyledons and rollers flake them. "Purified petroleum hydrocarbons known as hexane extract the oil from the flakes and the solvent is recovered. Moistened flakes are heated to inactivate the antinutritional factors and are converted to feeds for livestock and poultry. A small proportion of the flakes goes to a wide variety of soybean protein products including flour, isolates, and concentrates."

Tables show: (1) Utilization of soybean in U.S. in million pounds, every 5 years from Oct. 1933 to 1970 (Kromer 1970). (2) Use of soybean meal in the USA for feeding livestock and poultry (million tons). In 1969, the estimated amounts used were as follows: Cattle 3.43. Hogs 1.69. Other livestock 1.73. Total livestock: 6.85. Broilers 3.07. Hens and pullets 1.28. Other poultry 1.10. Total poultry 5.45. Total livestock + poultry 12.30. Note that cattle are the single biggest users. (3) Bleaching soybean oil (process, % clay and type, change in Lovibond color rating). (4) Effect of bleaching, citric acid, and light exposure on soybean salad oil. (5) Specifications for soybean oil. (6) Effect of linolenate content on flavor of soybean oil at elevated temperatures. (7) Composition of certain edible oil products from soybean oil and related products (salad oil, hydrogenated-winterized soybean salad oil, hydrogenated soybean oil liquid shortening, plastic shortening types I and II). (8) Changes in iron and copper content of soybean oil in commercial refining. (9) Properties of all-purpose and high-

© Copyright Soyinfo Center 2014

stability shortenings from all-hydrogenated vegetable oils and blends of animal fat and/or vegetable oil (iodine value, melting point, % linoleic acid, solid fat index {% solid at temperatures indicated}). (10) Typical analyses for mellorine and cookie and confectioner's fat. (11) Analytical data for typical margarine oils low and high in polyunsaturates (iodine value, melting point, % linoleic acid, solid fat index {% solid at temperatures indicated}). (12) NSPA–tentative lecithin specifications (NSPA, 1969-1970). (13) Composition of soybean lecithins. (14). Approximate composition of soybeans and meal products (whole bean, cotyledon, hull, hypocotyl, meal {cake–extruded, flakes–solvent extracted, dehulled flakes–extracted, mill feed–separated hulls, mill run–separated hulls}). (15) Amino acid analysis of soybean meal (44% protein and 49% protein {dehulled}) and corn. (16) Amino acid analysis of blends of soy flour with cereals and milk (Inglett 1968; Corn soy milk {CSM}, Millet soy milk, Wheat soy milk, etc.). (17) Partial formulas for young swine and boiler rations in percent total rations. (18) Partial formulas for dairy feeds (14% protein). A supplement to forage or roughage. (19) Soybean grits and flour–screensize. (20) Composition of soy flour. (21) Composition of 4 types of soy protein concentrates. (22) Uses for high-protein soy products (protein 70 [concentrates] and protein 90 [isolates]). Note: This is the earliest English-language document seen (Dec. 2004) that uses the term "protein 90" to refer to a soy protein isolate. (23) Amino acid analysis of fractions derived from dehulled extracted flakes (Rackis et. 1961, 1970). (24) Effect of cooking in salt solutions on texture of structured granules. (25) Composition and use (1,000 metric tons in 1964 and 1967) of soybeans for traditional foods in Japan (Use of whole soybeans in 1967 in 1,000 metric tons: Miso 169. Shoyu 15. Natto 47. Tofu 329. Total 642. Use of defatted flakes or grits in 1967 in 1,000 metric tons: Miso 8. Shoyu 154. Natto 0. Tofu 77. Total 284).

Figures show: (1) Flowchart: Processing of soybeans to oil and meal using hexane extraction. (2) Illustration: A modern soybean processing facility (aerial view, Central Soya, Inc.). (3) Schematic diagram / flowchart: Manufacture of edible soybean oil products (salad oil, salad and cooking oil, shortenings, margarines, liquid shortening). (4) Illustration: A continuous deodorizer for soybean oil. (5) Graph: Effect of prolonged storage at 100ºF on flavor score of hydrogenated-winterized soybean oil or soybean salad oil (nitrogen packed, air packed). (6) Illustration: Continuous chilling and working equipment for margarine production (Votator Div., Chemetron Corp.). (7) Flow diagram; Conversion of emulsions of margarine oils and ripened milk to conventional stick, whipped stick, and tub margarines (Votator Div.) (8) Chemical structure of prostaglandin-E_2, a fatty acid with hormone activity. (9) Diagram: Vapor-desolventizer- deodorizer for soybean flakes (Blaw-Knox Co.). (10) Flowchart and diagram: Operations with extruder-cooker. (11) Flow diagram: Manufacture of protein 70 [soy protein concentrate]. 6131. DeFrancis, John; Lincoln, V.R. 1973. Things Japanese in Hawaii. Honolulu, Hawaii: University Press of Hawaii. xiv + 210 p. Illust. Index. 19 x 23 cm. [Eng]

• ***Summary:*** The goal of this book is to preserve Japanese culture in Hawaii. In 1868, the first Japanese came to Hawaii. Between 1886 and 1924 the trickle became a flood, which resulted in a total immigration of some 180,000 persons. More than half of this number eventually returned to Japan.

Setsubun is mentioned on pages 11, 25, 26. Setsubun generally takes place on about Feb. 3. The word "Setsubun" means literally "division of the seasons. This festival is kept alive in Hawaii largely due to the efforts of students from Japan at the East-West Center, which is funded by the U.S. federal government and is affiliated with the University of Hawaii. Its formal name is "Center for Cultural and Technical Interchange between East and West." Setsubun, a thousand-year-old festival, marks the time of year when the old year and its accumulation of evils are left behind, and a new year full of god fortune and hope begins. In bygone years, men dressed as devils were chased out of houses so that a happy new year could be ushered in.

Today the symbolic casting out of evil spirits is found in the bean-throwing ceremony. "This consists of throwing roasted [soy] beans (one for each year of one's age) while shouting 'Good luck in, devils out!'" This ceremony brings throngs of revelers to Buddhist temples and Shinto shrines throughout Japan. In private homes, the master of the house walks from room to room, scattering beans at the entrance of each, while shouting the magic incantation. "Then, each member of the household eats as many beans as there are years in his age, plus one for the new year, so as to ensure himself a good year to come."

In Hawaii, Setsubun used to be more widely observed than it is today–when it is celebrated in only a few places, including the Shingon Mission [Buddhist] and at some Shinto shrines. Also, a special program is organized by students at the East-West Center. Other Setsubun celebrations are also discussed. A photo shows one such celebration.

Soy is mentioned throughout the chapter on "Food and dining places." In Sukiyaki, bean-curd and soy sauce are basic ingredients (p. 165). Soy sauce is also used to season tempura, sushi, sashimi, tsukemono (also miso), and sashimi (p. 166-67). One these two pages are nice sections on tôfu [tofu], kamaboko, shoyu, miso, sweets (with azuki), mochi, and saké.

Glossary (p. 201-06): "Azuki: A red bean frequently

made into a sweetened paste used as a filling in various confections, especially for ceremonial occasions. Symbol of joy and happiness."

"Chimaki: A cake of rice, soybeans, flour, sugar and salt."

"Hibachi: Japanese charcoal grill."

"Miso: Bean paste made of soybeans, wheat [sic, barley] or rice, and salt."

"Sekihan: Rice cooked with azuki beans."

"Setsubun: Late winter festival marking the beginning of spring."

"Shôyu: Soy sauce."

Sukiyaki. Teriyaki. "Tôfu: Beancurd made from soybeans."

"Umeboshi: Very sour pickled plum." Address: Oahu, Hawaii.

6132. Dubawsky, Rebecca. 1973. Cooking with grains and vegetables. Los Angeles, California, and Boston, Massachusetts: Order of the Universe Publications. Distributed by Tao Books. 29 p. Undated. Illust. No index. 28 cm.

• ***Summary:*** This 1973 edition differs from the original 1967 edition as follows: (1) On the cover, in the upper left corner, is an illustration of a man bent over working in a rice field. The title is written in the lower right corner rather than in the upper left. The subtitle "Booklet one–A beginning" and the name and address of the publisher (in the lower left corner) have been omitted. (2) On the inside front cover, near the bottom, is written: "Distributed by Tao Books, 8454 Steller Dr., Los Angeles, Ca. [California] 90230. Tel.: (213) 837-2739 and 303B Newbury Street, Boston, Massachusetts 02115." (3) On the next page are two illustrations apparently taken from early sources (clip art): A full head of wheat with a long awn extending upward from the husk enclosing each grain. Two pumpkins on the vine with leaves above them. Below that: Library of Congress No. 73-127918. (4) Next comes a second title page, with silhouettes of rice plants at the left. (5) Next is a page stating: "The teaching of Aveline Kushi has made the information that follows possible." Below that: "Rebecca Dubawsky." To the left is another silhouette of grasses. (6) Next is a full-page of clip art showing a German chalet in the background, with three farmers working in a field in front of it, and a cart pulled by two oxen in the foreground. (7) Table of contents (p. 5). (8) Two stalks of grain. (9) The preface (p. 7) by Michio Kushi, October 20, 1967. (10) Three full heads of different types of grain. (11) Meals (p. 9).

(12) The last numbered page is 29, which has illustrations of a rice plant standing in water and a head of rice. (13) After that is "The Order of the Universe Publications" which contains descriptions of one periodical (*The Order of the Universe*) and five books and booklets (*Cooking Good Food; Cooking with Grains and Vegetables; Food for Spiritual Development,* by Michio Kushi; *Spirals;* and *Book of Do-In Guide Pratique,* by Jacques de Langre [DeLangre]). (14) At the bottom of the last page: "Printed in U.S.A. by Jacques de Langre, 7557 Sunset Blvd., Hollywood, Calif. 90046." Address: Boston, Massachusetts.

6133. Fairbank, John K.; Reischauer, Edwin O.; Craig, Albert M. 1973. East Asia: Tradition and transformation. Boston, Massachusetts: Houghton Mifflin Co. xvi + 969 p. Illust. Index. 24 cm.

• ***Summary:*** One of the best books ever written on the history of East Asia–a classic.

Note: Edwin Reischauer, born in Tokyo to missionary parents, was a professor of Far Eastern Languages at Harvard University and the author of a number of influential books on the relationships among the U.S., Japan, and China when he was called to the diplomatic corps by President John F. Kennedy. He served as U.S. ambassador to Japan from 1961 to 1966. He died in Sept. 1990 at La Jolla, California. Address: Harvard Univ.

6134. Fairbank, John K.; Reischauer, Edwin O.; Craig, Albert M. 1973. The Chinese Eastern Railway across Manchuria, 1896-1920s (Document part). In: J.K. Fairbank, et al. 1973. East Asia: Tradition and Transformation. Boston: Houghton Mifflin Co. xvi + 969 p. See p. 555, 625, 777.

• ***Summary:*** The Chinese Eastern Railway runs from Lupin (Manchouli) in the northwest, through Harbin, to Vladivostok in the southeast.

"Russia in 1896 had obtained from Peking the right to build the Chinese Eastern Railway across Manchuria to its port of Vladivostok on the Sea of Japan, thus shortening the Trans-Siberian Railway, the rail link it had started in 1891 to construct across Siberia to the Pacific. When Russia obtained the lease of the Kwantung Peninsula in 1898, it also got the right to connect this line by a southward extension, the South Manchurian Railway, to the ports of the peninsula, Port Arthur and Dairen (Ta-lien in Chinese). These railway concessions gave Russia considerable control over Manchuria...

"In 1896 Russia got Chinese permission to build the Chinese Eastern Railway 950 miles across Manchuria to Vladivostok, in order to avoid by this short-cut the costly tunnels and bridges which the trans-Siberian line would require on the 350-mile longer Amur route. Li Hung-chang in St. Petersburg negotiated in June 1896 a secret Russo-Chinese treaty of alliance. It committed China and Russia to fight together against any Japanese expansion on the continent. After much maneuvering and confusion, Russia followed up this treaty by sending a naval squadron into Port Arthur in December 1897 and getting from China in March 1898 a twenty-five year lease of the southern tip of Manchuria, the Liaotung (or Kwantung) Peninsula, with the right to connect it with the Chinese Eastern Railway by

© Copyright Soyinfo Center 2014

a north-south line 650 miles long, the South Manchurian Railway...

"The eventual Soviet treaty with Peking in May 1924 provided for joint administration of the Chinese Eastern Railway and a dominant Russian influence in Outer Mongolia." Address: Harvard Univ., Cambridge, Massachusetts.

6135. George Ohsawa Macrobiotic Foundation. 1973. Useful names and addresses. 1471–10th Ave., San Francisco, CA 94122. 55 p. 21 cm.

• ***Summary:*** This macrobiotic directory lists names and addresses of macrobiotic people, organizations, food stores and restaurants, and bookstores in the United States (each category broken down by state), Canada, and abroad. The leading states for individuals are California (7.3 pages), New York (1.5 p.), and Massachusetts (1 p.).

There are listings for the following foreign countries: Argentina, Australia, Austria, Belgium, Brazil, Costa Rica, Denmark, England, France, Germany, India, Ireland, Italy, Japan, Mexico, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, South Vietnam.

There are ads for the following companies: Sunflower, The Queensberry Bakery (112 Queensberry St., Boston 02215), East West Foundation Center, Sanae Inc. at 2 locations (Sanae Restaurant at 272A Newbury St., Boston, and The Seventh Inn at 288 Boylston St. in Boston), Prasad (1956 University Ave., Berkeley, California) (p. 0). Eden whole earth grocery and delicatessen, and Sun Bakery (330 Maynard St., Ann Arbor, Michigan) (p. 18). Janus Natural Foods (712 7th Ave. South, Seattle, Washington 98104. Phone: 206-MA4-1084) shows that they distribute (import) tamari and miso, as well as sea vegetables. They carry the following brands: Erewhon, Spiral Foods, Deaf Smith, Pure & Simple, Chico-San, Arrowhead Mills (p. 27). Cliffrose (129 Coffman, Longmont, Colorado). Ceres Harvest Natural Foods (3632 W. Colorado Ave., Colorado Springs, CO 80904; wholesale and retail) (p. 39). The Good Karma Cafe (501 Dolores St., San Francisco), and The Good Earth (123 Bolinas Rd., Fairfax, CA 94930) (p. 50). Greenberg's Natural Foods, Inc. (125 1st Ave., New York, NY 10003).

Individuals and organizations interested in macrobiotics in the United States (arranged by state): Massachusetts: James Silver, Seventh Inn, 288 Boylston St., Boston, 02116. Erewhon Trading Co., 33 Farnsworth St., Boston, 02210. Michio Kushi, 440 Boylston St., Brookline, 02146. John Deming, c/o Kushi, 440 Boylston St., Brookline, 02146. Nik & Joanne Amartseff, Top of the Harbor, Gloucester, 01930. Ken & Ann Burns, 22 Knoll St., Roslindale, 02131.

Michigan: Mr. and Mrs. Michael Potter, #1169, 1407 Charlton Ave., Ann Arbor, 48103. Judith A. Bolduc, 822 Brookwood Rd., Ann Arbor, 48104.

The George Ohsawa Macrobiotic Foundation is a non-profit organization located at 1471–10th Ave., San Francisco, California 94122. It was founded in 1971. The aim of the Foundation is to spread the teaching of the unifying principle and its practical applications in daily life. Address: San Francisco, California.

6136. Hartwig, Edgar E. 1973. Varietal development (in soybeans). In: B.E. Caldwell, ed. 1973. Soybeans: Improvement, Production, and Uses. Madison, Wisconsin: American Society of Agronomy. xviii + 681 p. See p. 187-210. Chap. 6. [68 ref]

• ***Summary:*** Contents. 1. Introduction. 2. Maturity classification. 3. Photoperiod response: Latitude, light quality. 4. Early history. 5. Growth habit. 6. Germplasm collection: Range of maturity, seed size (seed weight), percent protein and oil, oil quality, protein quality, seed holding (pod dehiscence and shattering), seeds per pod, pubescent type (pubescence density and erectness, glabrous), response to minerals, source of genes for pest resistance (disease resistance).

7. Varietal development: Introduction and history, the northern states (Lincoln, Harosoy, Clark, Hark, Amsoy, Corsoy, Wayne), the southern states (Ogden, Roanoke, Jackson, Palmetto, Lee), mid-Atlantic states. 8. Genetic background for major U.S. varieties. 9. Breeding for special qualities: Phytophthora rot, brown stem rot, cyst nematodes, resistance to feeding by insects, differences in oil and protein content, vegetable types, height of lower pods, adaptation to short-day regions [i.e. southern latitudes]. 10. Comments.

"Varietal development" has been of great importance in establishing the soybean as a major crop in the USA. Understanding photoperiodism in relation to varietal development has also "been of extreme importance. For no other major crop is photoperiodism as important in determining area of adaptation" (p. 187).

Maturity classification: In the early 1900s, soybeans were often classified on a scale from early to late, and the number of days to maturity was given. But various studies, starting with Haberlandt (1877), including Mooers (1908), and especially those by Garner and Allard (1920-1930) on the significance of day length on flowering behavior (photoperiodism), indicated that "days to maturity was not an adequate means of describing these types. Also, it was not adequate to describe them as early or late"–unless the latitude and date of planting was given, since the average days maturity for any given variety depends strongly on both of these variables. As a method of describing this responsiveness to day length, ten maturity groups were developed. For example, groups OO, O, and I are adapted to the longer days in the northern areas of adaptability in the USA and Canada. Varieties classed in Group VIII are adapted to the southernmost portions of the continental United States.

Early history: Discusses–Perry expedition to Japan (1854), Ball (1907–recognized 23 varieties), Piper & Morse (1910–described 47 soybean types and listed 280 types that

© Copyright Soyinfo Center 2014

had been grown in the Washington, DC, area). By 1922 more than 800 introductions had been made by the USDA and tested in various parts of the United States (Piper & Morse 1923). Some 43 introductions, which were found to be suited for production in the USA, were given names. Suitability for forage production was emphasized. During the 20-year period from 1907 to 1927, more than 2,000 lots of seed received from China, Japan, Korea, Siberia, and India were introduced by the USDA for testing (Morse 1927). Dorsett (1927) collected nearly 1,500 seed lots from northeastern China (39-53º north latitude) during a 2½-year period prior to 1927.

Because of the growing interest in soybeans in the United States, the USDA organized the Dorsett-Morse expedition to the northeast prefectures of China, Korea, and Japan during the years 1929 to 1931. This was the only plant exploration program for which the primary objective was soybean collection. A total of 4,578 seed lots were collected. Of these, 3,379 (74%) were from Korea, 622 (14%) were from China, and 577 (13%) were from Japan. Many of the soybeans from Japan were "large-seeded, vegetable types. Several of these were named in anticipation of their acceptance by the U.S. public, but few were ever grown extensively. One of these, PI 80481 named Rokusun, has a 100-seed weight of 55 gm, the largest seed size known in soybeans."

Germplasm collection: "Prior to 1949, no organized effort was made to maintain soybean introductions. Many were discarded after their initial observation if an immediate use was not recognized. Since that time an effort has been made to catalog the characteristics of each introduction and maintain viable seed."

Seed size: The 100-seed weight for soybean varieties currently produced in the USA ranges from 12-18 gm. Varieties classified as vegetable types will usually have a 100-seed weight greater than 20 gm. The seeds of *Glycine max,* the cultivated soybean, range in weight from 4 to 55 gm per 100 seeds. The wild annual soybean, *Glycine ussuriensis,* has very small seeds (1.2 to 1.8 gm/100 seeds).

Concerning vegetable types: "No clear-cut distinction exists to define a vegetable-type soybean. In general, seed size is in excess of 20 gm per 100 seeds and the beans have a milder flavor. Several vegetable-type varieties with somewhat improved agronomic qualities have been released in recent years. Disoy is of Group I; Magna and Prize are of Group II; and Kim, Kanrich, and Verde are of Group III in maturity. Verde produces seed having green cotyledons on maturity, which is assumed to be an advantage when immature seeds are used for canning or freezing."

Tables: (1) Effect of latitude and day length on maturity date of the soybean variety Lincoln planted about May 20. The table shows location, latitude, date it is mature. (2) Approximate length of effective photoperiod at various latitudes for an assumed adapted variety that would be planted May 20 and would mature Sept. 20 at each latitude. (3) Soybean varieties recognized in the U.S. in 1907 and classified as to seed color. There were 6 black, 4 brown, 2 mottled, 2 green, 3 yellowish green, and 6 yellow.

(4) Soybean varieties registered by the Crop Science Society of America since 1942 according to maturity groups and approximate distribution of U.S. acreage by maturity groups. For example, maturity group 00, consisting of Acme, Portage, Flambeau, Altona, and Norman, accounts for only 0.1% of U.S. acreage. Maturity group II counts for 29.0%, III counts for 17.0%, IV counts of 12.0%, etc. (5) Parentage of the ten soybean varieties most widely grown in the U.S. in 1971. For example, Wayne, No. 1, of maturity group III, had as its parentage L49-4091 x Clark. Address: Agricultural Research Service–USDA, Stoneville, Mississippi.

6137. Holmberg, Sven A. 1973. Soybeans for cool temperate climates. *Agri Hortique Genetica* (*Sweden*) 31(1/2):1-20. [21 ref. Eng; swe]

• ***Summary:*** An extremely interesting, influential, and original article. Contents: Introduction. Climate and temperature requirements of soya. Breeding soybeans in Sweden. Experiences from 30 years of soybean trials at Fiskeby. Summary.

It begins: "Summer temperature and moisture are the main climatic factors regulating the distribution of the soybean as a crop. The limiting or inhibiting factor is moisture in the eastern and southern parts of Europe and temperature in the northwestern parts (Riede 1938). Within the framework outlined by temperature and water, latitude and photoperiodism guide the choice of varieties (Enken 1959)."

"Local soybean varieties developed and grown along the east coast of Hokkaido and adjacent islands of the Okhotsk Sea have proved of immense value for the breeding of soybeans for cool, temperate climates."

Enken (1959) defined minimum temperatures for different stages in the growth cycle of the soybean plant and showed that the flowering stage is the most sensitive to temperature, requiring a minimum of 17-18ºC for normal flowering. Most of Western Europe has a summer maximum temperature below or just about equal to V. Enken's "biological minimum" temperature needed for the formation of reproductive organs and flowering.

For soybean breeders looking for basic material [germplasm] for adaptation to the cool climate of north western Europe, two different agro-climatic regions are of special interest: (1) Near Kushiro, Abashiri, or Nemuro on the northeastern coast of Hokkaido, Japan, and adjacent islands of the Sea of Okhotsk. (2) The northern zone of the Amurskaja region [Amurskaya Oblast] of East Siberia, Russia. In this old and recently developed soybean growing district (just north of the Amur River and of northern Manchuria), cold hardiness is the object of both natural and

© Copyright Soyinfo Center 2014

artificial selection. This zone is about 1,200 miles northeast of northeastern Hokkaido.

"Summary: Cold tolerant soybean varieties are the result of a long period of natural selection and persistent effort of growers settled in the cool and foggy regions of the east coast of Hokkaido and adjacent islands of the Okhotsk Sea. These dwarf or semi-dwarf local varieties collected and investigated by Japanese research workers are of increasing importance to soybean breeding for cold tolerance in Hokkaido and elsewhere. The same varieties rank high in protein content and seed quality, but scarcely in seed yield. Their tolerance to cold weather has been the key which has opened to modern plant breeding large parts of north western Europe, including Sweden, to closer geneecological adaptation and further development of the soybean as a food crop. The variety Fiskeby V, in practical use as a garden variety, may be said to prove this. The existence in the Soviet Union of varieties with more moderate demands on germination temperature and high yielding varieties in the north of the United States are indicators of possibilities that further combination work will lead to further progress in producing varieties capable of competing with the cereals as modern agricultural crops."

Tables: (1) Temperature requirements of the soybean (after Enken and Koloskov). The four columns are: Stage of development, "Biological minimum," sufficient, and optimum. The six stages are: Germination, emergence, formation of reproductive organs, flowering, seed formation, and ripening. For flowering (as an example), the three temperatures are 17-18, 19-20, 22-25ºC.

(2) Some data regarding summer climates of certain stations situated in warm and cool temperate areas, respectively. The four columns are: Station (in two groups), period (years during which temperatures were measured), latitude, warmest summer month ºC, summation of day-degrees ºC 5 months. The stations are: Warm temperature: Columbus, Ohio, USA; Chicago, Illinois, USA; Shenyang (Mukden) China; Sapporo (Hokkaido) Japan; Pinkiang (Harbin) China; Chabarovsk [Kabarovsk], East Siberia, USSR [Russian Federation]; Winnipeg, Manitoba, Canada. Cool temperate: Abashiri, Hokkaido, Japan; Nemuro, Hokkaido, Japan; Brussels (Uccle), Belgium; London (Kew), England; Manchester, England; Copenhagen, Denmark; Norrköping (Fiskeby) Sweden–1931-1960 Norrköping (Fiskeby) Sweden–1960-71. Of all the stations listed, Fiskeby has the highest north latitude (58º36'), the coolest summer month (July, 16.2ºC), and the smallest summation of day-degrees over 5 months (2120–compared with 3192 in Columbus, Ohio).

(3) Mean temperatures, ºC, at Fiskeby / Nörkopping (latitude 58º36'), for the years 1970-1972. Temperatures are given each year for the months of April, May, June, July, August, September, October. August was the warmest the first year and July the 2nd and 3rd years.

(4) Local varieties of insular breed in yield tests at Fiskeby 1970-1972. Control: Fiskeby 5. The nine columns are: Variety, year (1970, 1971, 1972), date of seeding, date of bloom, date of ripeness, mean height of plants (cm), plants per square meter, seed weight (grams/plant), yield (kg/ha). The varieties include: Toshi-dai 7910, Karafuto 1 (from South Sakhalin), Fiskeby 5, Kamishunbetsu, Chishima (from the Kuril Islands).

(5) Market varieties of continental breed in yield test at Fiskeby 1970-1972. Control: Fiskeby 5. The nine columns are the same as those in Table 4. The varieties are: Amurskaja 310, Smena, Severnaja 4, Fiskeby 5, Altona. The highest yield (2,905 k/ha) was from Amurskaja 310 in 1972, planted on 25 April. The 2nd highest yield was from Smena in 1972, planted on 25 April. The 3rd highest was from Fiskeby 5 in 1972, planted on 25 April.

(6) Soybean varieties from three different agro-climatic regions–tested for germination in sand at a temperature of 9ºC in the day-time and 7ºC during the night. Almost all of each group would germinate at 20ºC. The table shows the per cent visible sprouts above sand surface after 14 to 21 days. The varieties in group 2 (Amurskaja 310, Severnaja 4, Smena) had the highest germination rates (range: 79-83% visible after 21 days).

(7) Soybean varieties from three different agro-climatic regions–tested for germination in sand at a temperature of 8ºC in the day-time and 6ºC during the night. Again, the varieties in group 2 (Amurskaja 310, Severnaja 4) had the highest germination rates (range: 55-66% visible after 26 days). They also had the longest mean length of seedlings after 26 days (47-48 mm).

(8) Protein and oil content of soybean varieties, grown at Fiskeby, during the years 1970-1972. In 1971 the mean protein content was 43.9% (range 39.1-48.4%) and the mean oil content was 14.9% (range 13.3-17.3%). In 1972 the mean protein content was 41.8% (range 38.3-47.0%) and the mean oil content was 15.8% (range 13.6-17.7%).

(9) Advances in earliness and lowering of temperature requirement, expressed in days from sowing and day-degrees ºC, respectively, in the breeding material at Fiskeby.

(10) Results regarding the variety Fiskeby V from Fiskeby near Norrköping during the years 1960-1972. The fifteen columns are: Year, seed yield (kg/ha), plants per square meter, planting date, start of flowering date, date of ripeness, days from planting to flowering, days from planting to ripeness, summation of daily mean temperatures ºC from planting to flowering, summation of daily mean temperatures ºC from planting to ripeness, mean temperatures ºC from planting to flowering, mean temperatures ºC from 1st flower and 30 days ahead, mean temperatures ºC from planting to ripeness, total rainfall from June to August (mm), total sunshine hours from July to August. The highest seed yield was in 1972 (2,290 kg/ha); the 2nd highest was in 1970 (2,030 kg/ha).

© Copyright Soyinfo Center 2014

(11) The variety Fiskeby V at Fiskeby during the periods 1960-1972 and 1968-1972.

Figures (graphs unless otherwise stated): (1) Yield in relation to average July temperature for the years 1970-1972 for the varieties Fiskeby 5, Chishima, Amurskaja 310, and Altona [developed at the University of Manitoba, Canada]. As the July temperature increases, so does the final seed yield.

(2) Yield in relation to general temperature requirements (Sum of day-degrees). For the varieties Fiskeby 5, Chishima, and Amurskaja 310. As the sum of day-degrees increases, so does the final seed yield–dramatically.

(3) Soybean varieties from 3 different agroclimatic zones tested for germination in sand at a day temperature of 9ºC and a night temperature of 7ºC (See table 6). The variety with the highest germination after 21 days is 1091-3-1-6-1 from zone 3.

(4) Soybean varieties from 3 different agroclimatic zones tested for germination in sand at a day temperature of 8ºC and a night temperature of 6ºC (See table 7).

(5) Chart showing the origin / pedigree of Fiskeby 5 and some other interesting lines from the breeding material–including 1110-5-5-5 and 990-13-2-5-3-1-1 and 1091-3-1-6-1.

(6) Photo (7.5 by 11 cm, black and white) showing fields of "A nice, evenly ripening crop of Fiskeby V in September 1971, with the buildings of the Fiskeby-Breeding Station near Norrköping in the background.

(7) Rayed diagram of recent crosses made including 1091-3-1-6-1 (which is at center of diagram).

(8) Photo of three dry soybean plants with a ruler measuring 0 to 70 cm at the right. Cross 1174, 1091 x Fiskeby V. From left to right: F-2 plant from cross 1174, Fiskeby 5, another F-2 plant from cross 1174.

• ***Summary:*** This beautiful book is filled with colorful photos of favorite and exotic Japanese tofu dishes, with recipes for each. These include: Dengaku. Shira-ae. Egg-tofu (Tamago-dofu). Tofu with hijiki. Chilled tofu (*hiya-yakko*). Contents: The taste of tofu. Two recipes for delicious tofu: Sukui-dofu, and Yu-dofu. Garnishes. Tofu Hyakuchin. Discussion about tofu. Homemade tofu. The nutritional value of tofu. Tofu cooking in the 4 seasons. Three soups. Traditional restaurant cooking: Sasa-no-yuki. Tofu cookery of Okinawa. Tofu cookery of China. An ad for *House Hon Tofu* (homemade silken tofu) appears at the back of the book. Address: Tokyo, Japan.

6139. Kawamura, Wataru. 1973. Misoshiru fudoki [Miso soups throughout the provinces]. Tokyo: Mainichi Shinbun. 213 p. Illust. No index. 20 cm. [Jap]

• ***Summary:*** A combination cookbook and discussion of miso in Japanese history and culture, in each of the provinces. Contents: Preface. Part I: The topography of miso soup. Story of the birth of a miso teacher. The homeland of miso. Jiang in the Chou Li (Shurei in Chinese; Rituals of the Chou Dynasty). The theory that Ganjin brought miso to Japan. About soybean miso. Sweet miso. Poems about miso soup. Genealogy of Satsuma-jiru soup. The original Miso Dengaku. Prayer to Bishamonten. Sendai miso. Shinshu miso. Kinzanji miso. Miso tenjin of Kumamoto. Miso dondo. The taste of michinoku. The arrival of sesame in Japan. The marriage of sesame and miso. Thoughts on salad with vinegar miso dressing. Pepper and wasabi. Bonito flakes. Mejika-bushi of Tosa. The virtues of sea vegetables. Suribachi grinding bowls, grinding pestle, and spatulas. Agar of Ashino and highland vegetables. Miso, konbu and wakame. Digging up mountain lilies and mountain yams. Miso soup shop. "Women and Miso soup" TV drama dialogue. Making a fire bath. The origin of Go-jiru soup. Foods that appear at the first of the season. A good daughter-in-law. Part II: Miso soup and miso cooking (recipes). Postscript. Address: Miso teacher, 2-4-7 Kugenuma, Tachibana, Fujisawa-shi, Kanagawa-ken 251, Japan.

1974 Jan.–Bill Shurtleff at Arai-san's tofu shop, Sangen-ya, with their two daughters to left and right, Mrs. Arai standing in background.

1974 Jan.–Four black-and-white glossy photos published in the large-format magazine *Japan in Pictures* (Vol. 16, No. 1, p. 16-17), all taken at San-Gen Ya, the shop of tofu master Toshio Arai in Nerima-ku, Japan, where Shurtleff is an apprentice, learning how to make tofu in the traditional Japanese way. (a) Ladling cooked soybean puree (*gô*) out of the cauldron into the pressing sack. (b) Standing next to Mr. Arai. Much of the equipment in the shop can be seen as Mr. Arai talks about making tofu. (c) Sitting in full lotus position practicing meditation on tatami mats in the upstairs room at the home of Mr. and Mrs. Kinjiro Aoyagi in Nerima-ku. His head is shaved and a small altar is in the background. (4) With Mr. and Mrs. Arai, sitting on the step that leads from their tofu shop into their home.

1974 summer–Bill Shurtleff in Japanese-style summer dress at upstairs room at Aoyagi home. Altar and typewriter desk in background.

1975 Jan.–Bill (seated) and Akiko (standing) at photo studio near home in Nerima-ku, Tokyo. This photo (2 copies) would later appear near the back of *The Book of Tofu.*

1975 Nov.–Shurtleff and Aoyagi in the Shurtleff family kitchen at 790 Los Palos Dr., Lafayette, California: He is holding a plate on which rests a cake of tofu which they have just finished making from soybeans. In front of the two is a wooden tofu kit on the tile kitchen counter. Photo by Eric Rahkonen of the *Contra Costa Times.*

6149. Research Libraries Group (RLG). 1973--. RLIN (Research Libraries Information Network) (Computerized bibliographic database). 1200 Villa St., Mountain View, CA 94041. [19000000* ref]
• ***Summary:*** This database is more academic than OCLC. According to the *Directory of Online Databases* (July 1990), this database comprises nearly 19 million cataloging records from LC MARC tapes, GPO (Government Printing Office) tapes, National Library of Medicine tapes, tapes of member libraries, etc.

Talk with Jennifer Heartsill of RLIN. 1990. Sept. 27. The database was developed at Stanford University and originally named BALLOTS (Bibliographic Automation of Large Library Operations using a Time Sharing system). Jennifer was there while it was being developed. RLIN originated at about the same time as OCLC; the two were developed independently and in parallel. OCLC took a very different approach to how they capitalized and began operations. RLIN first became available for use in 1973. Shortly thereafter they became the system of choice for RLG, which originated on the East Coast. BALLOTS preceded slightly RLG; they were separated by the continent. Then the system began to grow, with much of the funding from members. In 1989 the system became free of debt. Each user pays a fee for use; formerly this was on a transaction basis, now it is on a search basis. In RLG, there are now 34 governing members, 3 principal members, 60 special members, and a multitude of users–any library or individual

© Copyright Soyinfo Center 2014

can use RLIN. RLIN was originally located on the Stanford campus, but recently the organization moved to nearby Mountain View. RLIN, a non-profit group, still uses the Stanford computers. There is a flat annual fee for members.

OCLC has a large database and each record in it is for a unique title; appended to the record are holding symbols which show which libraries own that title. In RLIN, any library can have a complete record for its copy of a title, and include any special notes about the work (such as branch library location, autographed copy, etc.). Thus RLIN contains over 40 million bibliographic records, but only about 15 million unique titles, compared with 20-22 million for OCLC. RLIN has some unique databases, such as citations files, and the holdings of archival repositories. There are 9 bibliographic files in RLIN based on "material type": books, archival and manuscripts control (which have notes like abstracts), citations, maps, sound recordings, the 18th century Short Title Catalog (everything published in English or in an English-speaking country up to the year 1800), art, research in progress, etc. Both subscribe to the same records that the Library of Congress (LC) and the National Agricultural Library (NAL) put out on tape, but LC enters some records directly into the RLIN database for some things such as East Asiatic and Hebrew vernacular via Multiscript Workstations. They are now going out and looking for machine readable data. They have just added a new "citations file" from Engineering Information Inc. that gives article level information within serials and proceedings. RLIN and OCLC both use the MARC format, with numbered fields, and both now have a CJK (Chinese-Japanese-Korean) language service.

Update: Talk with reference librarians at Cal-Berkeley and Cal-Davis. 1991. March. RLIN is having serious financial troubles. It may either try to merge with OCLC (but OCLC may not want to buy it) or it may just die. The cost for cataloging has been too high. It started out being used only for cataloging, then backed into being a reference tool.

Article in Information Today. 1991. April. p. 24. "RLG board sets course for 1990s." They plan "major expansion of bibliographic access to archival holdings, computer files, and visual materials." RLG president is James Michalko.

Update from Western Archives Institute. 1993. June. RLIN is generally considered a better quality database design than OCLC and catalogers like it better; it allows more subject headings and longer record length. But OCLC is a stronger organization and it is easier to do interlibrary loan on OCLC.

Talk with research librarian at University of California at Berkeley. 1994. July 20. The records in RLIN are of better quality and done to a higher standard than those in OCLC; many of the OCLC records are entered by public libraries. RLIN also has a much better search engine. Address: Mountain View, California. Phone: 800-537-7546.

6150. **Product Name:** [Tofu (Firm, or Soft)].
Manufacturer's Name: Agro-Nippo Produtos Alimenticios Ltda.
Manufacturer's Address: Vila Clarice, Av. 15 de Novembro, 210-350 Pirituba, Sao Paulo, Brazil. Phone: 261-2348.
Date of Introduction: 1973?
New Product–Documentation: Shurtleff & Aoyagi. 1975. *The Book of Tofu.* p. 314. A large, modern Japanese-run tofu factory.

Shurtleff & Aoyagi. 1978, Dec. *The Book of Tofu* (Ballantine pocketbook edition). "Appendix B: Tofu Shops and Soy Dairies in the West." p. 400. Agro Nippo Produtos Alementicos Ltds., Av. 15 de Novembro, Vila Clarice, 210-350 Pirituba, Sao Paulo, Brazil. Tel: 261-348 (A large factory). Owner: Unknown.

Soyfoods Center. 1980. Sept. Tofu shops and soy dairies in the West (2 pages, typeset). Gives the company's name, address, and phone number.

Letter from Jane Cadwell Pautz. 1982. May 29. The company is now located at Av. José Alves de Mira 185, Pirituba, Sao Paulo, Brazil. They make both firm and soft tofu.

Talk with company by phone. 1989. May 18. The owner is Mikio Uchinaka. The company started about 16 years ago (i.e. in about 1973). The location has not changed but Av. 15 de Novembro has been renamed to Av. José Alves de Mira.

Letter (e-mail) from Jaime Nakamura of Brazil. 2012. Oct. 16. A record from the National Institute of Intellectual Property (http://www.inpi.gov.br/) in Brazil shows that Agro-Nippo Produtos Alimenticios Ltda. first registered the word "Tofu" as a mark (marca) on 12 July 1978. They re-registered it approximately one every 10 years thereafter.

6151. Hartz (Jacob) Seed Company, Inc. 1973? Hartz seed. Stuttgart, Arkansas. 8 p. Undated. 28 cm.
• ***Summary:*** Contents: Introduction. Arkansas' Grand Prairie: a major seed producing area for soybeans, rice and oats. Facilities. Research. Real estate and farm management. Export.

Jacob Hartz Sr. (1888-1963), pioneer in the development of soybean production in the South, founded Jacob Hartz Seed Company in 1926 [sic, 1942] and later that year built the first small seed cleaner in the State.

"More farmland in Arkansas is planted in soybeans than any other crop... Jacob Hartz Seed Company contracts upwards of one and one-half million bushels of Arkansas Certified "Blue Tag" Soybeans each year. This seed is produced by 150 Certified Seed Growers. The company's export operations have been directed into many areas of the Pacific, especially for natto, tofu, and miso in Japan.

Photos show: A portrait of Jacob Hartz, Sr. (p. 1)

• ***Summary:*** Section I. Organizational manual. Introduction. Company objectives. Organization principles. Organization chart. Committees. Position descriptions. Section II. Personnel procedure and policy manual. Introduction. Personnel policy. Personnel procedures. Wages, hours, and benefits administration. Relocation policy. Section III. Community and public relations. Employee membership in community organizations. Corporate gifts policy and budget. Section IV. Appendix. Forms exhibit. Other. Address: Walworth, Wisconsin 53184.

6153. Kikkoman Foods, Inc. 1973? Employee handbook. P.O. Box H, Walworth, WI 53184. 16 p. Undated. 19 x 10 cm. [Eng]
• ***Summary:*** Contents: Sangyo damashi (Our company spirit is expressed in this phrase which means that we always endeavor to enrich the daily life of people everywhere by adding to the joys and benefits of good eating.) Welcome. Our plant. Our product (Soy sauce). Our process. Training. Organization chart of Kikkoman Foods, Inc. Probationary period. Wages and benefits. Rules and regulations. Grievances. Adverse business condition adjustments. Hours of work and payment schedules (three 8-hour shifts). The end or the beginning? President's message to employees. Address: Walworth, Wisconsin.

6154. Oles, Shayne. 1973? The new Zen cookery: Practical macrobiotics. Woodland Hills, California: Shayfer Corporation. 86 p. Undated. Index. 22 cm. Spiral bound.
• ***Summary:*** A revised edition of the first American macrobiotic cookbook, containing a wide variety of recipes from many sources. The cover is light orange. In the lower right corner is a sumi-e type brush illustration of some grasses and flowers. All recipes are numbered. The recipe numbers and page numbers are a little different from those in the 1966 edition published by Ignoramus Press in Los Angeles. Pages 59-62 (recipe nos. 210-21) are about Miso soybean paste. Pages 62-64 (recipe nos. 222-28) are about Tamari soy sauce.

Herman Aihara (Nov. 1990) has no idea why there are two versions of this book, both undated. Shayne Oles must have published one or both of these after Herman Aihara started the George Ohsawa Macrobiotic Foundation (any time after 1969). Only Shayne Oles would know. One clue is given in *Macrobiotics: Yesterday and Today* by Ron Kotzsch (1985, p. 170). "In 1966 Lou Oles, who with his wife Shane [sic, Shayne] had managed the revived Ohsawa Foundation, died, and Shane asked Herman [Aihara] to assist her. Herman began to travel to Los Angeles once a month to give lectures at the Foundation headquarters. He was also instrumental in the publishing of Ohsawa's books, which were selling well on the East Coast as well as the West. By 1969, however, dissention had developed over the role of Shane's new husband in the organization. Herman resigned. In 1970 the Ohsawa Foundation dissolved. Aihara, who had moved to San Francisco [from Carmichael, near Sacramento], established the George Ohsawa Macrobiotic Foundation as a new educational and publishing organization."

No. 293, a recipe for "Grain coffee pudding," calls for "1 cup grain milk powder" [perhaps Kokkoh]. No. 300 is "Ohsawa coffee," a "grain coffee." Address: President of Ohsawa Foundation, California.

6155. Photograph of original Los Angeles Erewhon crew at the Culver City warehouse, southern California, around 1972-73. 1973? Undated.
• ***Summary:*** Note: This photo, taken by Roy Steevensz, was sent to Soyinfo Center by Norio Kushi and Peggy Steevensz, daughter of Roy Steevensz.

6156. Photograph of people seated around a low wooden eating table enjoying a macrobiotic breakfast at The Kushi House at 7357 Franklin Ave., Hollywood, California. 1973? Undated.
• ***Summary:*** Note: This photo, taken by Roy Steevensz, was sent to Soyinfo Center by Norio Kushi and Peggy Steevensz who writes: "Another view of main dining room, the table in the back is the breakfast room and beyond that is the pantry where every morning there was miso soup and some whole grain porridge. The stoneware vase with the grain stalk is now in my home."

6157. Hashida, W. 1974. Flavour potentiation in meat analogues. *Food Trade Review* 44(1):21-32. Jan. [55 ref]
• ***Summary:*** In Japan, the use of soybeans for production of spun, textured, or powdered vegetable proteins increased from 6,536 tons in 1968 to 15,895 tons in 1971, while the use of wheat protein [gluten] in these foods grew from 5,605 tons to 11,414 tons during the same period. In 1971 some 21 firms were engaged in the production of protein meat analogs in Japan. Address: Fuji Oil Co Ltd., Japan.

6158. Kaibara, Ekiken. 1974. Yôjôkun: Japanese secret of good health. Translated by Masao Kunihiro. Tokyo: Tokuma Shoten Publishing Co. Ltd. vii + 133 p. Preface by Ayanori Onishi of the Japan Society of Medical History. No index. Jan. 21 cm. [Eng]
• ***Summary:*** Contents: Preface. 1. What is health preservation. 2. How to keep health. 3. Food and drink: What and how. 4. Repressing sexual desire. 5. The five sensory organs. 6. Easing nature and bathing. 7. Prudently guarding

© Copyright Soyinfo Center 2014

against illness. 8. Selection of a doctor: How to avoid a quack or charlatan.

"The original texts of this book are those of 'Yôjôkun,' published in Japanese by Chûôkôron-sha Inc., Tokyo, in 1969, and by Tokuma Shoten Publishing Co. Ltd. in 1968, and are adapted under the direction of Ayanori Onishi." The author lived 1630-1714, and this book was written in 1713. The Preface notes that the importance nurturing mental discipline lies at the very core of the author's art of staying healthy. Among his other works is *Yamato Honzo* (*Japan's Herbal*), which is still valued today and well known even abroad. A Soviet scholar has even termed it "the first great work on natural history." The German physician and naturalist Philipp Franz von Siebold (1796-1866) called Kaibara "the Aristotle of Japan."

Kaibara, who has been called the "grandfather of macrobiotics," was an avid observer of the natural and human world. He traveled widely and wrote pioneering works on botany, geography, herbal medicine, and on popular manners and morals. At the age of seventy he retired from active life, and, free to sift through a lifetime of experience and learning, wrote the *Yôjôkun,* which includes the old sage's views on health and longevity. He begins by asserting that physical well-being and long life are the natural conditions of mankind.

In Chapter One he writes: "The art of health preservation entails, first of all, keeping away from things harmful to one's body, i.e., the inner desires–the desire for food and drink, sexual indulgence, sleep, endless talk, and the seven emotions: joy, anger, worry, pensiveness, sadness, fear, and surprise–and the outer evils–the four atmospheric aspects: wind, cold, heat, and dampness... An important factor in suppression of the inner desires is temperance in eating and drinking... One should refrain from satisfying sexual desire and try to preserve one's energy. Sleep should be confined to standard hours. Oversleep is to be avoided... Of particular importance is to take a walk of a few hundred paces after meals... The art of health preservation begins with mental placidity. The way to achieve mental placidity is to keep one's mind calm and one's spirit unruffled... The human body is meant to last a hundred years... One should not rely on acupuncture, moxibustion, or medicine... A saint always expounds on the delights of living." And sickness, like health, is something which mankind creates. Quoting the *Tao Te Ching,* Kaibara observes "One's life is in one's own hands." Sickness comes only when one has willfully abused oneself. "Illness never comes without reason."

In Chapter 3, Kaibara discourses at length on the subject of food and drink. The author, a Japanese physician, recommends a balanced diet to protect against chronic diseases. Meat and sake should be consumed in moderation. "A person should prefer light, simple meals. One must not eat a lot of heavy, greasy, rich food. One should also avoid uncooked, chilled, or hard food (p. 54)... Of everything that one eats and drinks, the most important thing is rice, which must be eaten in ample amounts to ensure proper nutrition (p. 61)... Do not eat between meals or immediately before going to bed. After eating take a short walk to stimulate circulation. Massage the stomach and abdomen lightly to encourage digestion...

The section titled "Bean paste" (p. 67) begins: "Bean paste [miso] has a soft quality and is good for the stomach and intestines. Soy sauce and the liquid that drips off bean paste [tamari] have a sharper quality than bean paste and are bad for people who suffer from diarrhea. Nor should vinegar be taken in too large amounts, for it is bad for the spleen and stomach... One must not eat too much of foods that are salty, vinegary [sour], or hot." One should also avoid tobacco.

In the chapter titled "Repressing Sexual Desire," Kaibara states that the great human frailties are gluttony and lust. He agrees with the Chinese sages that one should practice sexual abstinence in youth to reserve one's vitality and vigor. He cites the *Chien Chin Fang* by Sun Szu-miao which talks about the frequencies of sexual intercourse: "At twenty years of age, people should have a discharge [of semen] no more than once in a period of four days, at thirty once in eight days, at forty once in sixteen days, and at fifty once in twenty days. At sixty a person should no longer discharge his energy sexually unless he is particularly vigorous physically, in which case he can do so once a month." Kaibara believes that it is very important to conserve sexual energy since it deeply affects the function of the kidneys, and the kidneys are the seat of vital energy for all the other organs. Address: Japan.

6159. Kikuchi, Saburo. 1974. Soy protein development in Japan (Especially for isolated soy protein). *J. of the American Oil Chemists' Society* 51(1):189A-90A. Jan. Proceedings, World Soy Protein Conference, Munich, Germany, Nov. 11-14, 1973.
• ***Summary:*** Contents: Development of soy protein in Japan yesterday and today. Development of isolated soy protein in Japan. Isolated soy protein made by Fuji Oil. Address: Fuji Oil Co., Ltd., Higashi-ku, Osaka, Japan.

6160. Kinderlehrer, Jane. 1974. Using soybeans instead of meat. *Prevention* (*Emmaus, Pennsylvania*). Jan. p. 168-78.
• ***Summary:*** Ever since the price of meat began to skyrocket, substitutes for meat have been featured in American food columns. A large ad in the *Wall Street Journal* shows one soybean regally encased in a jeweled pill box with the caption "Life pill for an over crowded world."

But the soybean should not be presented as a meat analogue–a fancy name for imitation, fabricated, or synthetic–in part because it is not a "complete protein." However this is not a problem when you understand how to combine complementary proteins, and how to inactivate the soybean's trypsin inhibitor–by high pressure steam cooking

© Copyright Soyinfo Center 2014

whole soybeans, or by transforming the soybean into milk or "bean curd." Dr. Royal Lee suggests a method for cooking whole soybeans: Put a cup of soybeans in a quart of water, then put this in the refrigerator and let it stand for 24 hours. Change the water 4 times during that 24-hour period. The beans can then be cooked as you would regular beans such as navy beans–boiled for 20 minutes with constant stirring.

If you have a borderline iodine deficiency or suffer from a sluggish thyroid, the soybean may not be for you. The soybean also contains a shortage of calcium compared to its high phosphorus content. "Since the body requires more than twice as much calcium as phosphorus, it is a good idea to use a calcium-rich complementary food if you use much soy.

Next come three recipes: Soysesame pancakes (with "½ cup soy flour"). Soy balls (with "½ cup soy powder"). Soy cheeseburgers (with "3/4 to 1 cup soybeans {preferably small variety}. Crack or split beans in food mill. Soak overnight and cook in the soaking water for two hours with these ingredients:...").

You can also enjoy the nutritional benefits of soybeans in the form of soy grits or soy meal (which need much less soaking and cooking than whole soybeans). Or try green soybeans (more attractive and delicious than fresh lima beans). Describes how to remove the pods and cook these as a vegetable.

"While the soy is certainly the greatest bean of them all, it is still a bean."

"Enjoy your soybeans and you may find, as Mrs. Mito Umeda [of Kumamoto, Japan] did, that they lead to longevity." According to an A.P. release of 25 March 1973 (which appeared in the *Milwaukee Journal,* 1 April 1973), she is believed to be the oldest woman in Japan at age 110. She said of her long life: "I eat any kind of food, but I never miss taking soybean flour as well as fruit once a day."

6161. Prendergast, K. 1974. Protein hydrolysate–A review. *Food Trade Review.* Jan. p. 14, 16-21. [15 ref]
• ***Summary:*** Contents: Introduction. Enzymic hydrolysis. Alkaline hydrolysis. Acid hydrolysis. Manufacturing process. Raw materials. Cost effectiveness. Ease of application. Temperature stability. Water solubility. Shelf life. Safety. Nutritional. Lack of solubility in oils and fats. Hygroscopicity. Lack of specific individual flavours. Applications: Why are HVP's necessary?, soups, gravies and bouillons, meat and poultry products, fish products, sauces, savoury snacks, unusual applications, maillard reaction products, novel protein. Analysis and flavouring principles.

"The use of protein hydrolysates to improve the flavour of foods originated many hundreds of years ago in the Far East with the development of traditional soy sauce, which was made by the action of mould enzymes on steamed soyabeans and wheat. Then, in 1912, several patents were granted to Ikeda in Japan, and over the next sixty years enormous advances were made in hydrolysate technology. Now, by process refinement and formulation, manufacturers can produce grades which are tailor-made to an individual food product's requirements. Furthermore, whereas 30 to 40 years ago most manufacturers had just one or two grades, which were used for every product type, suppliers can now frequently offer a range of thirty hydrolysates, each with its own individual properties, character and flavour."

To make HVP, protein and hydrochloric acid are cooked at an elevated temperature. When the hydrolysis is complete, the material is neutralized with sodium hydroxide or sodium carbonate to a pH in the range 4.8 to 6.0. A black sludge called humin is removed by filtration, then the filtrate is debittered and decolorized / bleached using an activated carbon. After a final filtration the resulting HVP can be spray-dried to make a powder, concentrated to a paste in vacuum pans, or sold as a liquid. Address: Hercules Powder Co., Ltd.

6168. Kushi, Michio. 1974. Natural agriculture and food processing. *Michio Kushi Seminar Report* (*Brookline, Massachusetts*) No. 2. Feb. 12. p. 1-4. Edited by Ane & Mark Riegel.
• ***Summary:*** On Feb. 12 Mr. Kushi, a macrobiotic teacher, lectured on: Soybeans. Making tofu: Lemon juice and vinegar vs. nigari. Making natto.

For making tofu, Kushi recommends using nigari rather than lemon juice or vinegar, since the yang nigari balances the yin soybean.

The soybean, "according to our Unifying Principle of macrobiotics, belongs to the yin category. And if you are taking plenty of soybeans, then you become a fool... if you cook kombu together with soybeans, the taste is very good, and nutritionally it is a better balance."

Soybean milk is easy to make. It can often be a substitute for cow's or goat's milk. Soybean milk is yin. If you give this to a baby for a long period, the baby becomes very yin. It is better to give soybean milk for a short period. Address: Brookline, Massachusetts.

6169. Dresden, Donald. 1974. Japan Inn: A good show, visually and gastronomically. *Washington Post.* Feb. 17. p. PO34.
• ***Summary:*** Dining: The Japan Inn, now in its 3rd year of operation, located at 1715 Wisconsin Ave., NW (Georgetown), continues to rank as one of the finest Japanese restaurants in Washington, DC. To make the broth for Miso soup, begin with a Japanese seaweed called "sea tangle" [kombu], then remove it after it has imported its flavor. Add dried bonito flakes to produce a delicate, fish-tasting broth. "Bean cake [tofu], mushrooms, and chopped green onions finish the dish."

Shabu-shabu comes with two dipping sauces. One of these is made by mixing soy [sauce], vinegar, two kinds of sake, seaweed and dried bonito flakes. The other contains sesame seeds, oil, and paste. Shabu-shabu "also contains hot pepper, aged soy bean cake, soy sauce and two kinds of sake, one of them [mirin] sweet."

Note: The meaning of "aged soy bean cake" is unclear. It could be fermented tofu, although that is rarely used as an ingredient in Japanese cookery.

6170. Kushi, Michio. 1974. Natural agriculture and food processing. *Michio Kushi Seminar Report* (*Brookline, Massachusetts*) No. 3. Feb. 26 and 27. p. 5-30. Edited by Ane & Mark Riegel.
• ***Summary:*** On Feb. 26 Mr. Kushi, a macrobiotic teacher, lectured on: Tekka–"Tekka is used not only as a condiment, but also for medicinal use. Tekka is made from three different roots–carrots, burdock, and lotus roots." The "volume of miso is flexible... Homemade tekka is traditionally made in a cast iron frying pan." The Japanese word "tekka" derives from *tetsu* (which means iron) and *ka* (fire). "For medicinal use, yang miso is better."

Miso and miso manufacturing, including how to make malt (rice koji) (8 pages). Note: This section indicates that Mr. Kushi has some basic knowledge of the subject but there are many errors. 1. Koji is not malt (which refers to soaked, germinated cereal grains), but molded cereal grains or soybeans. 2. Koji kin is not malt bacteria, but koji molds.

© Copyright Soyinfo Center 2014

3. One does not add enzymes to miso and enzymes do not grow. Even modern miso factories do not add enzymes when making miso. 4. The entire mixture is not stirred after 20-25 days to add oxygen. Kushi says you must keep miso for a least 6 months, but to cure sickness it must be kept for 2-5 years. Miso soup can compensate for the bad qualities of meat and eggs–so everyone should eat miso soup daily. Soup stocks and miso soup.

On Feb. 27 he discussed: General outline for making shoyu–soy sauce (4 p.), including discussions with Kikkoman on making natural shoyu starting with whole soybeans. In the early years after 1973, Kikkoman wanted to make natural shoyu and sent Kushi several samples, but he turned them all down, in large part because Kikkoman wanted to use defatted soybean meal instead of whole soybeans. Erewhon is buying shoyu from 3 companies in Japan. But Kushi says the quality is declining compared to five years ago [i.e., 1969], when it had powerful healing effects when taken with bancha or kuzu. He adds: "Around Boston or on our Ashburnham land, I really hope we can begin to make miso or soy sauce." Kushi says that now, after pasteurization, coloring and flavoring is added [not true, except in HVP soy sauce]. "Traditionally [in Japan] for this they used natural herbs. For a sweeter taste and darker color they traditionally used kanzô [kanrô?] or 'sweet grass = sweet herb.'"

"Formerly, until modern technological methods started to be applied, almost each village made their own shoyu like this, either as a joint community project, or someone with money made it and sold it to several villages."

Using bean and grain sprouts–moyashi (including soy sprouts). Other soybean products: Fried tofu (two methods for agé). Ganmodoki. Kori-tofu or koya-tofu (freeze-dried tofu). Soybean milk ("Soy milk is very yin." Note: Most Japanese and Japanese scientists consider soymilk to be an "alkaline" {*arukari-sei*} beverage, which therefore promotes good health). Yuba. In the discussion (p. 28), yogurt made by leaving soymilk unrefrigerated and "Chinese fermented tofu... fu nyu" are mentioned. The U.N. [United Nations] recommendations on food, using vegetable proteins.

Note: This is the earliest English-language document seen (April 2013) that uses the term "freeze-dried tofu" to refer to dried-frozen tofu. Freeze drying, which is an expensive, modern, high-tech process that uses a vacuum chamber to dry a frozen food, is not a good term to use for this traditional Japanese food which is air-dried naturally. Address: Brookline, Massachusetts.

6171. Gerner, Bob. 1974. Log of trip to Japan to study traditional natural foods, 28 Feb.–2 March 1974. Part I (Log–unpublished). Westbrae Natural Foods Inc., Berkeley, CA 94710. 26 p. Unpublished log. Handwritten. 20 x 8 cm.
• ***Summary:*** 1974 Feb. 28. Meet Bill Shurtleff and Mr. Masa Miyashita of Kikkoman export dept. (good man, speaks fluent English) at the Imperial Hotel (*Teikoku Hoteru,* built in the 1920s by Frank Lloyd Wright) in Tokyo. Talk for 4 hours. Westbrae hires Shurtleff as an interpreter and guide.

March 1. Dinner at Sasa-no-Yuki, beautiful old restaurant that specializes in tofu cuisine.

March 4, Monday. Visit Kikkoman in Noda with Shurtleff and Miyashita. Tour Plant #7, then Plant #4 (the Goyo-Gura), which produces the emperor's shoyu in the traditional, natural way. "Saw 5 batches of moromi mash from 1 month old to 12 months old, and tasted each one. Delicious. Great color change between the 1 month and the 12 month moromi. We saw all the traditional tools. The moromi vats were made of cedar and last approximately 200 years." See a movie on how shoyu is made. Lunch at a sushi shop. Visit two miso retail shops with Shurtleff near his home. One had 42-45 types of miso (mostly rice miso, with 1 each Hatcho, barley, and cooked miso), the other 32-35 types. Tasted many and learned the differences. I buy Saikyo sweet white miso and Hatcho miso.

March 5, Tues. Attend a cooking class at Lima Ohsawa's house, then have dinner with Lima and the class members. Sick for the next 2 days.

March 9, Sat. Call then meet Mr. Kazama of Mitoku. He represents Erewhon. We may import through Kikkoman's Pacific Trading. Plan trip to Sendai Miso-Shoyu. Sendai is interested in using organic soybeans to make shoyu but would like a contract stating that all of it will be purchased when done. Dinner at the natural foods restaurant, Hakumon run by a Frenchman named Pierre.

March 11, Mon. Meet Shurtleff early at Tokyo station. Take bullet train (Shinkansen) to visit two Hatcho miso plants (Hayakawa Kyuemon Shoten, and Ota Shoten in Okazaki city, Aichi prefecture). Both plants claim to be over 600 years old. They use modern steamers and koji rooms. They pile 4-6 tons of rocks atop each large vat of miso, age it for 2 summers. It becomes very mellow when fully aged. They also use about half of their Hatcho miso to make Akadashi miso. It also contains caramel coloring, barley syrup, MSG, shoyu, a white miso, and preservatives. They sell a lot of Akadashi but only a little Hatcho miso. Lunch at an udon noodle shop that hand makes and cuts the noodles. Lots of slurping. Then visit a plant that makes real tamari and shoyu. All the tamari is mixed with junk. Train to Kyoto; stay at Friends World College. Note: This is the earliest English-language document seen (March 2012) that contains the term "real tamari."

March 12, Tues. Visit a tofu maker, a yuba maker (*Yuba Han*), then the company that makes Saikyo sweet white miso. The owner lies to us initially about his miso aging and caramel coloring (which tastes and looks like tar). Then he reverses himself without batting an eye. Lunch at a 300 year old Zen vegetarian restaurant (*Okutan* near *Nanzenji* temple); so beautiful that I start crying. Fantastic place. Light snow falling by the pond. Enjoy Simmering Tofu (*Yu-dofu*)

© Copyright Soyinfo Center 2014

in a broth. Then we go to a 400-year old tofu restaurant (*Nakamura-ro*) at a shrine (*Gion*) for dessert of *amazake* and *Dengaku* (skewered and braised with sweet miso). On to a second miso factory. It is a bore and the owner does not seem sincere but he has a great reputation among macrobiotics. He makes both natural and sweet white miso. Shurtleff visited him last year. For white miso the soybeans are boiled; for red miso they are steamed. Some white miso contains sodium thiosulphate bleach. Visit another yuba shop. They use granite grinding stones to make soymilk, cast iron pot to cook it in and copper skimming tables. A very beautiful place. Meet Ty Smith at a soba shop. He is a chain smoker, just quit working for Muso, and promoting a cooperative effort between Janus, Chico-San, Erewhon, and The Well to import foods from Japan. Evening at Jittoku coffee house, owned by an American, in a large old Japanese treasury (kura). Back to Tokyo by train. Talk until 1:00 A.M.

March 14, Thurs. Meet Kazama and Shurtleff, and take express train to Sendai Miso-Shoyu. We are treated royally by Mr. Muro. Long introduction and discussion. Visit their 2 plants, one modern, one traditional, natural. They make only rice miso. Their production of natural miso is more than all that imported to America by Erewhon and Janus. They age their natural shoyu 18-24 months at the request of Michio Kushi and Erewhon. They have 9 aging vats for the first year, then it is switched to other tanks. They invite us to have a shoyu taste test among 3 products: Kikkoman regular shoyu, Sendai regular, Sendai natural. Both Bill and I choose Kikkoman as best; good aroma, color, and taste. They congratulate us on our good taste. Sendai regular had very strong salty taste. We both liked the Sendai natural least; good color, no aroma, very mild taste. Sendai people say only one year is needed to ferment shoyu naturally. We might sell them organic soybeans (we had purchased 12 truckloads from a farmer) and get shoyu back in 1 year. We meet the president (Sasaki?), born 1928. Elegant geisha-hosted tempura and sushi dinner with president, 2 vice presidents, production manager, and a consulting professor (Shibasaki sensei). After dinner to a traditional bar for *doburoku* (thick, unrefined sake with a low alcohol content [or was it nigori-zake?]), then a sushi house. Shurtleff leaves for Tokyo on night train.

March 16, Sat. Visit Shurtleff and Aoyagi's home for lunch. We have dried-frozen tofu main dish, salad with creamy tofu dressing, strawberries with tofu whipped cream. Delicious. Then we learn how to make tofu at home. It's easy. I'll make it at home in California, then at our Westbrae Natural Foods retail store on Gilman Street (Note: This led to a long series of tofu classes by Gerner, Liz Horowitz, and later Shurtleff & Aoyagi; The retail store changed its name in late 1976 to Gilman Street Gourmet).

Note 1. This is the earliest document seen (April 2006) concerning Westbrae Natural Foods.

Note 2. This is the earliest English-language document seen (Jan. 2012) that contains the term "creamy tofu dressing" (or "dressings") a term coined by Shurtleff and Aoyagi in *The Book of Tofu* (p. 108).

Note 3. This is the earliest English-language document seen (April 2013) that uses the term "dried-frozen tofu."

Note 4. This is the earliest English-language document seen (Oct. 2013) that contains the term "Tofu whipped cream" (regardless of capitalization). Continued. Address: President & Chairman of the Board, Westbrae Natural Foods Inc., 1224 10th St., Berkeley, California 94710.

6172. Gerner, Bob. 1974. Log of trip to Japan to study traditional natural foods, 28 Feb.–2 March 1974. Part II (Log–unpublished). Westbrae Natural Foods Inc., Berkeley, CA 94710. 26 p. Unpublished log. Handwritten. 20 x 8 cm. • ***Summary:*** Continued: March 19, Tues. Take bullet train to Kyoto to meet Steve Earle of Muso Shokuhin. We 3 go to Okayama to see Fuchu Miso, that makes mugi miso (the barley miso sold in our store) and sweet white miso. The president's wife is the epitome of Japanese woman. For lunch we have tofu burgers with Italian sauce and mushrooms in a bento made by Akiko. Delicious. Take a boat to Shodo-shima where Marushima Shoyu Co. is located. Island is also famous for toasted sesame oil. Arrive at a ryokan at 6:30 P.M. VIP treatment. Bath before dinner and served in private room by geisha. Too much fish! Note: This is the earliest English-language document seen (April 2013) that contains the term "tofu burgers."

March 20, Wed. Miso soup for breakfast. Visit Marushima Shoyu where Muso gets its "natural" shoyu for export to America. They have the newest wheat roasters (they roast it with sand), biggest presses. We see cement aging tanks in a temperature-controlled room, then onto a large red building with 150 aging tanks. But we see no whole soybeans, only soybean meal (*dasshi daizu*). "I feel the owner is a liar and this is a bogus operation. The scene gets heavy and ugly. Bill is great and presses on with questions." The owner claims that 40% of their shoyu is natural, aged for 3 years and made with whole soybeans; 60% made with soybean meal, temperature controlled for 7 months. Thus there should be about 120 vats of natural versus 60 regular. But where is the natural? Their faces turn red. We have caught them red handed. The owner take us to one musty, dirty old building with 25 vats, only 8 of which contain shoyu, some only half full. Lots of cockroaches. Looks like no one ever goes here. Still no sign of a single whole soybean. Uneasy departure. Steve Earle is embarrassed. We take a train to Tokyo. We present Earle/Muso with a list of inconsistencies and ask for a written reply.

March 21, Thurs. Visit Mr. Kazama's miso factory (*Ikeda Kojiro Miso Shoten* in Kawaguchi-shi near Tokyo), that makes barley miso, the only brown rice miso in Japan, and shoyu. Call Ty Smith of Muso. He says Muso was very happy with our findings concerning the problems at

© Copyright Soyinfo Center 2014

Marushima, and that they have contacted a new source in Kyushu. Marushima said their president died a year or so ago and his son took over. They have lost the old feeling and tradition.

March 22, Fri. 6:00 A.M. Meet with Bill Shurtleff at his tofu master's tofu shop (*San-Gen-Ya,* run by Mr. Toshio Arai). We watch how he makes tofu. Beautiful place (12 feet square) attached to their home. Beautiful people; they don't speak English. Both make tofu starting early in the morning. He delivers in the afternoon and she sells out of the shop. He gave me hot rich soymilk (from *kinugoshi*) with wild mountain honey. Both incredible. So sweet and delicious. They also serve us freshly made agé, kinugoshi, and natto. Lunch at Shurtleff and Aoyagi's home: Noodles and tofu, Chinese fried tofu, tofu pudding, agé, kinugoshi, and mikan orange. We go over my notes from the miso factory. We copy all of his notes. Then I leave, very sad, but the friendship will remain. Akiko is a remarkable lady. Meet Mr. Kazama and go to Pacific Trading. Lousy meeting with Mr. Masaaki Miki (sales manager), and Masa Miyashita (export dept). Go to airport.

Results of the trip: (1) Westbrae started (about 9 months later) to import many varieties of miso, plus shoyu, and other products from Mr. Kazama in Japan. Bob Gerner was the founder, president, and chairman of the board of Westbrae; (2) Bob Gerner and Liz Horowitz taught "Tofu and Miso Cookery Classes" in Berkeley during 1976; (3) Westbrae published and distributed widely two brochures, *What is Miso?* (May 1976) and *What is Tofu?* (July 1976) written by Shurtleff and Aoyagi; (4) In 1976 Westbrae Natural Foods Inc. decided to sell its retail store at 1336 Gilman St. in order to focus on being a distributor and importer. The store had been losing money. Bob Gerner bought it in June 1976 for the low price offered by the highest bidder. He remodeled the store, renamed it Gilman Street Gourmet, and re-opened it in Sept. 1976. In the spring of 1977 Gerner added a deli to the store; there he made and sold Tofu Burgers, Tofu Treasure Balls, and Tofu Steaks Sauteed in Ginger Sauce. The same week that the deli opened, Gerner sold 3,000 to 4,000 of his new Tofu Burgers out of the Westbrae booth at the New Earth Exposition in San Francisco. Bob's nephew and sister (Margaret) made the tofu burgers. The burgers sold equally well at the same Expo in 1978 and 1979; (5) Shurtleff and Aoyagi wrote *The Book of Miso* and their New-age Foods Study Center moved toward becoming Soyfoods Center.

Note: In late November 1974 Mr. Kazama came to a meeting at Pajaro Dunes by Santa Cruz, sponsored by The Well. The idea was to set up a natural foods trade association. Erewhon wanted to control all imports of Japanese natural foods from Japan. Janus and The Well both had to import through Erewhon. They said Westbrae must buy through them via The Well (Roger Hillyard/Pure & Simple), and pay a 5% commission. Kazama had to defer to them. Gerner refused and they backed off. Ty Smith, now head of Erewhon, was upset that Westbrae was not paying a commission. Gerner told him "Tough." So Westbrae ended up importing from Kazama. Address: President & Chairman of the Board, Westbrae Natural Foods Inc., 1224 10th St., Berkeley, California 94710.

6173. Hallab, A.H.; Khatchadourian, H.A.; Jabr, I. 1974. The nutritive value and organoleptic properties of white Arabic bread supplemented with soybean and chickpea. *Cereal Chemistry* 51(1):106-12. Jan/Feb. [22 ref]

• ***Summary:*** Soybean flour used in this study was obtained from Yoshihara Oil Mill, Ltd., Osaka, Japan. It was defatted, heated with live steam, and fortified with 0.15% DL-methionine. Bread made from wheat flour alone contained 11.57% protein. With 4, 6, 8 and 10% of soya bean flour it contained 13.24%, 13.84%, 14.62%, and 15.40% protein respectively.

The net protein utilization (NPU) of the bread made from wheat flour alone for rats was 37. With the four levels of soya bean flour it increased to 50, 50, 54, and 55. Bread made with 10% soya bean flour was recommended for use in orphanages and refugee camps. Address: 1. Assoc. Prof.; 2. Research Asst.; 3. Research Asst. All: Dep. of Food Technology and Nutrition, American Univ., Beirut, Lebanon. Jabr's current address: Food Chemist, Ghandour Factory, Beirut, Lebanon.

6174. *Japan in Pictures.* 1974. Bill Shurtleff, a perfect mania for bean curd. American who has come to Japan to study Zen. 16(1):16-17. [1 ref. Eng]

• ***Summary:*** Shurtleff is a 31-year-old American who has come to Japan to study Zen meditation and tofu. Five large,

© Copyright Soyinfo Center 2014

black-and-white photos of Shurtleff show him: (1) Deep-frying *"ganmodoki"* [tofu burgers] at San-Gen Ya, the shop of tofu master Toshio Arai in Nerima-ku, Japan, where Shurtleff is an apprentice, learning how to make tofu in the traditional Japanese way. (2) Ladling cooked soybean puree (*gô*) out of the cauldron into the pressing sack. (3) Standing next to Mr. Arai. Much of the equipment in the shop can be seen as Mr. Arai talks about making tofu. (4) With Mr. and Mrs. Arai, sitting on the step that leads from their tofu shop into their home. (5) One sitting in full lotus position practicing meditation in the home of Mr. and Mrs. Kinjiro Aoyagi in Nerima-ku. His head is shaved and a small altar is in the background. Another article on previous pages of this issue discusses a new method for making instant tofu. Address: Japan.

6175. *Japan in Pictures.* 1974. Bean curd, a subsidiary food as delicious as meat. Instant bean curd developed in Japan. 16(1):12-15. [1 ref. Eng]

• ***Summary:*** The first 2 pages of this article contain 6 color photos showing tofu in Japanese-style (Yu-dofu, Dengaku, Sukiyaki, and Clear Soup), and Chinese-style (Sheng Pan Tofu, Guo Tie Tofu) recipes. "A block of bean curd weighing 340 grams, measuring 7 x 10.5 x 3.5 centimeters and being sold for US$0.20, contains as much as 21 grams of protein. To take this much protein, one must drink 3 bottles (or 600 cc) of cow's milk at the cost of US$0.35.

The conventional (traditional) process for preparing bean curd is described. "In Japan as many as 38,000 bean curd makers are operating on a small scale. Under these circumstances the bean curd industry has been far from modernized."

The next two pages, titled "Modernization of bean curd making," compare the traditional process for making tofu (6 black-and-white photos show the Yuba Han yuba shop in Kyoto) with a modern process developed by House Food Industrial Company, and used to make "House Hontofu" at their new modern factory in the city of Sano, 100 km north of Tokyo. Two photos are given of the equipment in the plant and 6 of the package and how this instant bean curd [silken tofu] is prepared at home. At the modern plant, a mixture of ground soybeans and water "is applied to a centrifugal separator, which separates it into soymilk and refuse. The soymilk, which has been concentrated by being heated, is sprayed into a tank heated to 100ºC, a process which dehydrates the milk to produce a bean curd base in powdered form [powdered soymilk]. A unit quantity of this powder is packed in an aluminum-foil bag containing nitrogen gas, which is put on the market accompanied by a small amount of coagulant.

"Process to prepare bean curd on the spot. Put a bag of 'Hontofu' in 600 cc of water, which is to be agitated [with a whisk]. Boil about 3 minutes. Mix the accompanying coagulant [glucono delta-lactone] immediately after the flame is put out. Transfer the substance into the container [a plastic box shaped like a cake of tofu]. Leave it for about 20 minutes and a block of bean curd is ready. Bean curd taken out of container [into a bowl of water]." Address: Japan.

6176. Nihon Jozo Kogyo K.K. 1974. Marufuku tane-koji (miso-yô) [Marufuku koji starter for miso]. Koishigawa 3-26-3, Bunkyo-ku, Tokyo, Japan. 1 p. Feb. Manufacturer's catalog. [Jap]
• ***Summary:*** Describes 9 types and 17 varieties of koji starter for miso, with prices and amounts of koji each will make. Address: Tokyo, Japan. Phone: 03-814-2738 or 9.

6177. Photograph of people at the Erewhon warehouse–Boston. 1974. Boston, Massachusetts.
• ***Summary:*** These photos were sent in 2009 by Patricia Smith, who worked at Erewhon. They are not dated and the names of some people are unknown.

Concerning the date and place: Mark Ripa (Jan. 2011) says: "I think both photos were taken the same day, in the winter of either late 1973 or early 1974. They were taken next to the front windows of the third floor at 31 Farnsworth Street, South Boston (adjacent to the Erewhon warehouse at 33 Farnsworth). 31 Farnsworth was a three floor building

© Copyright Soyinfo Center 2014

adjacent to the six floors of 33 Farnsworth. That floor was used for storage by the Erewhon warehouse. *East West Journal* occupied multiple floors at 31 Farnsworth at the time. I don't remember the context other than it was a department photo of the 'warehouse crew.' Don't remember any other department photos. The photos were taken, I think, by Nik Amartseff (responsible for creating Erewhon labels and product development at the time). He may also have worked for EWJ. Last I heard Nik was living in Vermont."

(1) Photo of Mark Ripa (at Erewhon, Boston), wearing a beard, white suit (top and bottom) and necktie. On the photo, to his right, is written: "I'm Swami Bananananda and I'm here to say"–a take-off of the lyrics to a popular tune advertising Chiquita bananas, which begin: "I am Chiquita banana and I've come to say, Bananas have to ripen in a certain way..." Mark notes: "The two lines written on my photo by persons unknown, perhaps inspired by my borrowed white suit"

Mark wrote to Patricia Smith (Oct. 2010): "My title at Erewhon [Boston] changed over the years. I went back to a resume to clarify the following: April 1972 to Feb. 1974–Packaging line worker, miller's apprentice.

Feb. 1974 to Nov. 1974–Head miller.

Nov. 1974 to Aug. 1975–Buyer / merchandiser for the Star Market account.

Aug. 1975 to Oct. 1976–Buyer, assistant product development manager. Inventory control manager.

Oct. 1976 to June 1978–Purchasing manager. Product development manager.

June 1978 to Oct. 1979–Quality control manager.

"I had my hand in a few Erewhon labeled products, most of which were manufactured by copackers, notably organic corn chips, potato chips (I think I was the first to market a tamari potato chip), apple juice and apple juice blends (I remember formulating apple spice juice and apple mint juice on my kitchen stove) and Mark's Natural Spaghetti Sauce (2 varieties)–the first spaghetti sauce to have tamari as an ingredient (Michio Kushi wanted to balance the tomatoes with tamari, which was more workable than miso) and bagels (how could I forget the bagels–but they were discontinued as they molded before their time)."

(2) People who worked at Erewhon, Boston. Mark Ripa is in the 2nd row, far left.

John Fogg, who worked at Erewhon, Boston, identifies the people in this group as follows: Front row (three men, left to right): Dan Seamens, Don Lorenson (great guitar player, supervisor in shipping), and Tony Harnett.

Back row (seven men, L-R): Mark Ripa (probably a purchaser by then), Roger, unknown, Bill West (worked in the warehouse or was a truck driver; ended up as Trucking Manager), Warren Murrah (Receiving Manager), Paul Campbell.

Evan Root adds (Jan. 2001). Tony Harnett is now known as Anthony Harnett. "Anthony and Hugo van Seenus bought the small 'Bread and Circus' store in Brookline, Massachusetts. Soon after, Anthony bought out Hugo and developed it into a group of big supermarket sized natural food stores, with a very high quality standard. In 1990 Whole Foods bought him out for $26 million."

Steve Zoller adds (Jan. 2011): These were all macho warehouse guys who looked down on the "prods" (production guys) upstairs. The main erewhon building was at 33 Farnsworth St. I believe this was taken in the attached building (31 Farnsworth, I think). I base this on what looks like imports that were stored in that building, on the 1st floor. I would definitely date this later than the spring 1975 catalog photo.

Updates (from Steve): Dan Seamens–is at the WF Regional office in Cambridge. Bill West–married someone from erewhon (forget her name) and moved to New Mexico. Late 1980's I saw him last and he worked for a juice or soda company. Warren Murrah–Married Susan Stamps (David's sister) and worked at New Balance (maybe 1980?). Diane Markovitz–moved to St. Augustine, Florida, around 1977 to be with Greg Leonard (Tree of Life). Anthony Valenti–Married Carol (a former erewhonian); I last saw him as a waiter at a high class / priced restaurant in Boston.

Address: Japan.

6179. Ziemba, John V. 1974. Authentic soy sauce brewed in Wisconsin. *Food Engineering* 46(2):58-60. Feb.
• ***Summary:*** Gives a step-by-step description of the method used by Kikkoman to make shoyu in Walworth, Wisconsin. Eight photos show 2 different views of the outside of the plant and 6 of major steps on the inside. Both mold culture and yeast culture are mentioned. Address: Senior Editor, Food Engineering magazine, Chicago.

6180. Dosti, Rose. 1974. Making nutrition culturally acceptable: Project for Chinese elderly. *Los Angeles Times.* March 28. p. H1.
• ***Summary:*** Every afternoon the banquet room at the Hong Kong restaurant is filled with elderly Chinese from the Los Angeles area. Dr. Genevieve Ho, a nutritionist at the University of California Agricultural Extension Service designs the menus and recipes, but also gives talks on nutrition in Chinese–while stressing the importance of calcium, vitamin A, and protein in the diet.

Sardines (bones and all) over a bed of bean curd supply plenty of calcium. A recipe is given for Sardines with bean curd.

Ground seasoned fish, seasoned with green onion and

© Copyright Soyinfo Center 2014

ginger, "is formed into walnut size balls and sauteed in oil to serve with braised bean curd," for a dish that is rich in both calcium and protein.

Dr. Ho also talks about avoiding salty foods such as bean paste, fermented black beans, pickles, and salt fish.

A photo shows a group of happy Chinese seniors seated at a round table. Dr. Ho (standing) also looks very happy.

• ***Summary:*** "The peroxide content of an oxidized oil is of limited value in estimating the toxicity of the oil, because some decomposition products of peroxides are also injurious to health." Because peroxides are easily destroyed by heat, frying fats can have low peroxide contents even when they are highly deteriorated.

The researchers prepared oxidized soybean oil having PV [peroxide values] of 10, 110, 180, and 380. They found the method based on the mortality of chicken embryos following injection of oil into the yolk sac "to be much more sensitive and reproducible than tests based on the growth rate of weanling rats or mice fed deteriorated oils."

Reprinted from *Lipids* 8(6):348-52 (1973). • ***Summary:*** CIF (cold insoluble fraction) protein is a unique type of protein. In chemistry, an "amide" is one of three kinds of compounds. "Deamidation is a chemical reaction in which an amide functional group is removed from an organic compound. In biochemistry, the reaction is important in the degradation of proteins because it damages the amide-containing side chains of the amino acids asparagine and glutamine" (Source: Wikipedia, Nov. 2008).

• ***Summary:*** In order to find a strain which had the strongest cytolytic [dissolution or disintegration of cells] activity on Ehrlich ascites carcinoma cells (solid type), the authors isolated 113 strains of *Bacillus natto* from straw collected in various parts of Japan, and measured the cytolytic activity of each by the cylinder plate method. One strain, tentatively called KMD 2311, was found to have the strongest cytolytic activity. Two types of cytolytic substances were found in this enzyme. One was found to be identical with surfactin; it accounted for about 20% of the cytolytic activity. Address: Faculty of Pharmaceutical Sciences, Kanazawa Univ., 13-1 Takara-machi, Kanazawa, Japan.

6201. Wanamaker, George E. 1974. Price incentives for soybeans could boost EC's production. *Foreign Agriculture.* May 20. p. 2-4.
• ***Summary:*** The European Community (EC)–leading market for U.S. soybeans- is considering a proposal to include soybeans in its common farm support program. A revised proposal recommending a Common Agricultural Policy (CAP) for soybeans was submitted to the Council of Ministers by the EC Commission on April 18, 1974. An earlier Commission proposal was approved "in principle" by the EC Council in early 1974. The EC's common farm policies were initiated in 1962. Oilseeds, particularly soybeans and meal, remain one of the most important agricultural commodities not subject to the EC's variable levy. Duty-free bindings on soybeans were negotiated by the U.S. in 1961, well before the EC oilseed CAP of 1967. The EC Commission indicated that the proposed support system could expand EC production of soybeans to 100,000 tons annually by 1978. Last year, the Community's total soybean output amounted to an insignificant 800 tons from about 9,900 acres [0.08 tons/acre or 2.7 bu/acre yield], predominantly in France, and probably only for seed.

The stated purpose of including soy-proteins in a CAP is to decrease the Community's growing dependence on imports, particularly of soybean meal for livestock feeding. Experimental production of soybeans has already been undertaken on 1,000 acres in southwest France. The projected rise in EC soybean acreage would probably occur largely in France, replacing corn area. Although Japan remained the leading market for U.S. soybeans and meal in 1973, the four next most important markets were West Germany, France, Denmark, and the UK. This large U.S. market share is a result of booming demand for livestock products in the EC. Address: Fats and Oils Div., Foreign Agricultural Service.

Address: Faculty of Agriculture, Dep. of Food Chemistry, Tohoku Univ., Sendai, Japan.

6204. *Soybean Digest.* 1974. The Far East. May. p. 10-13.
• ***Summary:*** The countries of Korea, Taiwan, and Japan have long been important customers of U.S. soybeans. American Soybean Assoc. market development efforts in each of these countries are discussed. In Japan, the main goals are to increase consumption of soybean oil and meat. "In July 1972, a contract was signed between ASA and Yoshihara Oil Mill Ltd., one of Japan's leading oil manufacturers, to test market and promote identified 100% soy oil on a joint basis. Under the contract, ASA reimburses Yoshihara for 50% of their advertising costs up to a set figure.

"Yoshihara came out with three newly designed packs in varying sizes with the Japanese word 'Daizu' which means 'soybean' on the container front which are being marketed in the Tokyo and Osaka areas. Yoshihara has exercised maximum efforts in merchandising their new products...

"During the first phase of the joint ASA/Yoshihara program, Yoshihara sold 2,200,000 lbs. of identified soy oil, not including oil that was sold through Mitsui brand nor the identified soy oil sold as part of gift sets. Yoshihara has set a precedent by identifying their oil products which, most likely, will be followed by other processing companies in Japan."

Also discusses ASA efforts to introduce new soy foods in Japan through the school lunch program. In 1973 the item given the top rating was "Sloppy Joe," which contained 70% hamburger and 30% soy protein.

• ***Summary:*** Carboxymethylated soybean protein yields good, thin packaging films. Thus 12.8 parts carboxymethylated soybean protein are stirred with 1.2 parts sodium hydroxide and 100 parts water, then spread on a paper.

6206. Asano, Mitsuo; Miyamoto, Yoshihiro; Okubo, Kazuyoshi; Shibasaki, Kazuo. 1974. [Studies on biosynthesis of 7*S* and 11*S* proteins, the main components of soybean protein. II. Preparation of the initial protein fraction by column chromatography and the some physicochemical properties]. *Nippon Shokuhin Kogyo Gakkaishi* (*J. of Food Science and Technology*) 21(6):261-66. [Jap]*

6207. Kaizuma, Norihiko; Miura, Shoei. 1974. Variations of seed protein percentage and sulfur-containing amino acid content among various leguminous species. *Ikushugaku Zasshi* (*Japanese J. of Breeding*) 24(3):125-32. June. [21 ref. Eng; jap]
• ***Summary:*** "The authors investigated the intertribal and intergeneric variations of protein percentage and sulfur-containing amino acid among various leguminous species. Market distinctions were recognized among *Glycineae, Phaseoleae, Vicieae,* and *Trifolieae.* Soybean (*Glycine max*) was in one of the groups richest in both of protein percentage and sulfur-containing amino acid content among the leguminous species examined... One of the most striking features is that, of all the species tested, soybean (*G. max*), wild soybean (*G. soja*), and semi-wild soybean (*G. gracilis*), had the richest content not only in protein but also in sulfur-containing amino acid." Address: Faculty of Agriculture, Iwate Univ., Morioka, Japan.

6208. *Foreign Agriculture.* 1974. Koreans expand soybean output by planting rice paddy dikes. July 8. p. 8-9.
• ***Summary:*** Korea, which doubled its imports of U.S. soybeans last year, is again promoting a program to boost domestic oilseed production by planting soybeans on rice paddy dikes. This practice, which was mandatory under the Japanese occupation, had been abandoned until revived last year. In 1973, "dike-bean" acreage was estimated at 86,485 acres. The Ministry of Agriculture and Forestry (MAF) estimates that the maximum area for dike-beans now ranges from 93,900 to 135,900 acres. A significant portion of the crop harvested daily in the summer to be consumed as a cooked, green vegetable, much as Americans eat lima beans. Nearly all of Korea's soybean production is consumed as food. Industry sources estimate that 70% is used in homes for making soy sauce and paste, 20% for bean curd, and 10% for bean sprouts. Address: Office of U.S. Agricultural Attaché, Seoul.

Japan venture. *New York Times.* July 31. p. 51.
• ***Summary:*** "St. Louis, July 30 (UPI)–The Ralston Purina Company announced today it was joining the Fuji Oil Company of Osaka, Japan, in a venture to manufacture in Japan structured soya protein food products developed by Ralston Purina."

These will be used as extenders for fish, poultry and meat products.

Note: This is the earliest document seen (Jan. 2014) concerning the joint venture that would soon become known as Fuji-Purina.

6212. Greenshields, Bruce L. 1974. Changes in exchange rates: Impact on U.S. grain and soybean exports to Japan. *USDA Economic Research Service, ERS Foreign* No. 364. 17 p. July. [21 ref]
• ***Summary:*** "The U.S. dollar/Japanese yen exchange rate changed several times in 1971-73 after a long period of stability. The rate had been 360 yen per dollar from April 24, 1949, to August 28, 1971, when the yen floated. Changes that occurred thereafter resulted in a 32 percent increase in the purchasing power of the Japanese yen in the U.S. export market by the end of 1973." Address: Economist, Foreign Demand and Competition Div.

6213. *Sunset* (*Menlo Park, California*). 1974. Tofu in 1974: In this inflationary year tofu makes great budget sense. But this protein custard is a mystery to too many cooks. 153:104-06. July.
• ***Summary:*** This pioneering and very important, positive article was generated (at least in part) by an Azumaya P.R. campaign at a time when meat prices were skyrocketing.

"As food prices rise, Westerners are learning about soybean curd, an inexpensive protein food sold most often under its Japanese name, *tofu.* Oriental cooks have long known the value of this nearly tasteless substance with the texture of custard. (The Chinese call it *dow foo.*) And now various styles are becoming more widely available.

"Some people may hesitate to try tofu for fear their families won't accept it. They should realize that tofu is bland and readily assumes the flavors of whatever ingredients you use with it. The recipes here all have Oriental flavors, including such favorites as sweet and sour, teriyaki, and sushi; all are simple and quick to prepare. But the versatility of tofu makes it an appropriate ingredient for other dishes ranging from appetizers and soups to main dishes and desserts.

"The companies that make the various styles of tofu are frequently small family-run operations; products and their names vary slightly from company to company..."

"For all types of tofu, soybeans are ground, mixed with water, and cooked until a milky liquid [soymilk] is extracted and drained off. A coagulant is added to set the liquid, making a curd. How the curd is handled determines the product."

A table (with 4 columns) describes six types of tofu: (1) Fresh soybean pudding (called Dow foo fah in Chinese and having no Japanese name) is sold in portions of about 1 lb water packed in plastic tubs. (2) Soft tofu (called Suey dow foo in Chinese and Kinugoshi in Japanese) is sold in 3/4 to 1-lb blocks water-packed in plastic tubs. (3) Medium-firm tofu (Japanese style, called Dow foo in Chinese and Tofu in Japanese) is sold in 1 to 1¼-pound blocks water-packed in plastic tubs or cartons. (4) Hard tofu (Chinese style, called Dow foo yuen in Chinese and having no Japanese name) is sold as two or more slices (about 6 oz each) water-packed in bags or plastic tubs. (5) Raw-fried tofu (called *Hung siu dow foo* in Chinese and *Nama-age* in Japanese) is sold in slices or sticks of various sizes dry-packed in bags or plastic tubs. (6) Deep-fried tofu puffs (called *Dow foo bok* in Chinese and *Age* {ah-gay} or *abura-age* in Japanese) are sold in small dense cubes usually dry-packed about 15 in a 5-oz package (Chinese product) or in large puffy pieces usually dry-packed about 3 in a 1½-oz package (Japanese product).

Note: This is the earliest English-language document seen (April 2013) that contains the term "fried tofu puffs" or the term "Deep-fried tofu puffs" or the term "Raw-fried tofu."

Photos show (1) Tofu slices taken from the rinsing tank and being packed into plastic tubs at Azumaya, (2) A large photo shows 8 types of Japanese- and Chinese-style tofu on a table near a wok and skimmer: Medium firm tofu, Fresh soybean pudding, Soft tofu (Japanese style), Soft tofu (Chinese-style), Hard tofu, raw fried tofu, Deep-fried tofu puffs (Chinese-style), and Deep-fried tofu puffs (Japanese-style). (3) Teriyaki-glazed raw-fried tofu cubes.

Recipes are given for Tofu and water cress soup, Tofu orange almond pudding, Stir-fried chicken and tofu, Tofu teriyaki appetizers, Fried tofu salad with peanuts, Fried tofu with pork sauce, Rice-filled agé appetizers (Sushi), and Sweet and sour tofu.

6214. American Soybean Assoc. 1974. The gold that grows (Color motion picture). Hudson, Iowa. 20 minutes. 16 mm. Summarized in Soybean Digest, Nov. 1974, p. 16, May 1975, p. 45, and June 1976, p. 36. *
• ***Summary:*** This color movie, released in 1974 by the American Soybean Assoc., is designed to tell the American farmer how his funds are being used to develop, improve, and maintain a profitable market for his soybeans. Featuring Earl Butz, ASA foreign staff members, and foreign industry leaders, the film shows soybean market promotion activities in Europe, East Asia, and Latin America.

A fast-moving international documentary on soybean products and their uses, this film covers soybean meal in Europe, livestock production and soy oil promotion in Italy, soy foods in the Orient [Japan] and Latin America, soybean meal in poultry production in Japan and Mexico plus the

© Copyright Soyinfo Center 2014

educational programs that back up these projects.

Soybean Digest (May 1975, p. 45) estimated that "3½ million people have viewed ASA's story on film, since its release in Aug. 1974." In 1975 it won the CINE Golden Eagle award.

6215. Continental Grain Co. 1974. You wouldn't think it, but she consumed a ton of grain and soybeans last year (Ad). *Soybean Digest.* Aug. p. 5.
• ***Summary:*** The top half of this full-page ad shows a slender ballerina doing a pose on the floor. The text reads: "Assuming she's an average American, she at about 300 lbs. of grain in the form of baked goods and other cereals and soy products.

"But that's the least of it. She ate 178 lbs. of beef–which took 600 lbs of feed concentrate [mostly corn and soybeans] to produce. She ate 61 lbs. of pork–which took 535 lbs. of feed concentrate. She ate 51 lbs. of chicken and turkey, plus 292 eggs–which took 500 lbs of feed concentrate.

"She consumed 120 quarts of milk, 14 lbs. of cheese, 5 lbs. of butter, and other dairy products–which took 210 lbs of feed concentrate. Add it all up and you'll see what we meant by a ton [2,000 lbs.] of grain and soybeans. The point is this: we Americans consume an extremely generous portion of the grain we produce–mostly in the form of meat.

"In the European Common Market, per capita meat and poultry consumption is only 60% of ours. In the Soviet Bloc, less than 50%. In Japan, only 10%.

"The grain and soybeans we don't consume go into exports to help us achieve a favorable balance of trade. You might say its a case of having our cake and meat as well." Address: 2 Broadway, New York, NY 10004.

6216. György, Paul; Murata, K.; Sugimoto, Y. 1974. Studies on antioxidant activity of tempeh oil. *J. of the American Oil Chemists' Society* 51(8):377-79. Aug. [4 ref]
• ***Summary:*** A powerful water-soluble antioxidant has been isolated from tempeh and recognized as 6, 7, 4'-trihydroxyisoflavone. Crude oil extracted from dried tempeh (with 2 parts hexane and 1 part alcohol and recovered by evaporation of the solvents) contains this antioxidant, and when small amounts of this oil are added to typical vegetable oils or lard it protects them from autoxidation, i.e. prevents the typical rise in their peroxide value, even after exposure to air and at temperatures of up to 60ºC for many weeks. "This mixture appears to be, at present, the best natural way of preserving various kinds of oil in fresh condition for long periods of time. Soy oil, which under ordinary commercial conditions (in bottles without complete elimination of air), develops undesirable flavor within a few months, retains, for an almost indefinite period of time when mixed with a small amount of tempeh oil, its normal physical, chemical, and gustatory qualities."

The tempeh isoflavone, however, did not show any protective antioxidant effect when it was added to soybean powder or soybean oil. Address: 1. Dep. of Pediatric Research, Philadelphia General Hospital, Philadelphia, Pennsylvania 19104; 2-3. Faculty of Science of Living, Osaka City Univ., Osaka, Japan.

• ***Summary:*** This serial publication from Kikkoman is more a series of sales materials.

6219. Saio, Kyoko; Sato, Iwao; Watanabe, Tokuji. 1974. Food use of soybean 7S and 11S proteins: High temperature expansion characteristics of gels. *J. of Food Science* 39(4):777-82. July/Aug. [12 ref]
• ***Summary:*** The authors studied aburage [deep-fried tofu pouches], which is one of Japan's most popular foods derived from Tofu, soybean curd. Thin sliced Tofu, after being dehydrated by pressing, is deep-fried twice, first in oil at low temperature (110-120ºC) and then at high temperature (180ºC). During the low-temperature deep-frying, the Tofu gel swells to more than 3 times its original area and its texture becomes very porous.

The effect of different coagulant types and concentrations, pH levels, and ratio of 7S to 11S proteins was studied. Aburage expands more when made with a calcium-type than with an acid-type coagulant. Calcium chloride works very well, an expansion increases with its increasing concentration and the increased use of NaCl in the buffer. 11S proteins expand better. Address: 1&3. National Food Research Inst., MAF, 12-4-1 Shiohama, Koto-ku, Tokyo; 2. Kyowa Hakko Kogyo Co., Tokyo.

an enzyme which catalyzes the conversion of glutamine to glutamic acid in the *shoyu* brewing process." Address: Research Section, Kansai Plant, Kikkoman Shoyu Co., Ltd., Takasago, Hyogo, Japan.

6222. Yamamoto, Shusaku; Hirooka, Hitoshi. 1974. Production of glutaminase by *Aspergillus sojae. Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 52(8):564-69. Aug. [11 ref. Eng]
• ***Summary:*** High-quality shoyu contains a high concentration of glutamic acid, which is essential to the good taste of shoyu. Shoyu molds were tested for their ability to produce the enzyme glutaminase, which catalyzes the conversion of glutamine into glutamic acid. Various conditions of mold culture were also tested. A mutant strain of *Aspergillus sojae,* derived from a selected strain, was found to produce high-quality shoyu. Address: Research Section, Kansai Plant, Kikkoman Shoyu Co., Ltd., Takasago, Hyogo, Japan.

6223. Dosti, Rose. 1974. Inside those tiny tiers in a Japanese picnic: Colorful array finger food. *Los Angeles Times.* Sept. 5. p. L1.
• ***Summary:*** When preparing for a picnic, the Japanese put their food in a three-tiered box named a *jyubako* [jûbako], which is often wrapped in a *furoshiki* (large handkerchief). One of the dishes served at Japanese picnics is Inari-sushi [Inari-zushi], "a tofu-filled football-shaped hors d'oeuvre,..."

The recipe for "Inari-sushi" begins: "Cut fried tofu in halves (to form half-moon with pocket). Pour boiling water over tofu and let stand for 15 seconds to remove oils from tofu. Drain. Then cook in dashi..."

6224. *Soybean Digest.* 1974. Still no soybean futures trading in Japan. Sept. p. 38.
• ***Summary:*** "Soybean futures prices have been so wild that the Japanese have decided to postpone re-opening futures trading in imported soybeans in Tokyo. Trading in soybeans was originally suspended by the Tokyo Cereal Exchange last July due to the wild price springs surrounding the export embargo announcement. Officials had planned to begin trading again when times got to be a little more normal, but weather in the U.S. has caused a new round of wild fluctuations this summer that will delay indefinitely the resumption of soybean futures trading in Japan."

6225. Tsai, Kuo-Hai; Lu, Ying-Chuan; Oka, H.I. 1974. Mutation breeding of soybean for the resistance to rust disease. *SABRAO Journal* 6(2):181-91. [10 ref. Eng]
• ***Summary:*** "Soybean is a new crop in Taiwan. There were no bean-producing varieties when we initiated our soybean breeding experiment in 1949; all native varieties were of green-manure type. Tests of introduced varieties showed that there were 2 adaptive cropping seasons, the spring (seeded in Feb.-March) and the summer (seeded in July). Later, fall cropping (seeded in early Oct.) became required for profitable rotation with rice." Address: 1-2. 6226. Brown, Lester R.; Eckholm, Erik P. 1974. Our dietary habits: Should they be changed? For what reasons? *Vital Issues* 24(2):104. Oct. [1 ref]
• ***Summary:*** This Vital Issue is drawn from the authors' forthcoming book *By Bread Alone* (Praeger 1974). "Since the time of Malthus, the world food problem has been seen as a food-population problem. Currently population growth continues to generate demand for more food, but, in addition, affluence has emerged as a major claimant on world food resources." It examines the encouraging shift from beef and animal products to vegetable sources of protein, and the economy, ecology, health issues, inefficiency, and waste in beef production. A chart gives per capita meat consumption (including poultry but not fish) for various countries in 1960 and 1972, and the percentage increase during that time as follows (pounds per year): USA (208, 254, +22%), Australia (234, 235, 0%), France (168, 212, 26%), Canada (167, 211, 26%), United Kingdom (158, 171, 8%), West Germany (144, 192, 33%), Sweden (109, 112, 3%), USSR (80, 104, 30%), Italy (70, 136, 94%), Yugoslavia (62, 75, 21%), Spain (51, 96, 88%), Japan (14, 41, 364%). Address: 1. Senior Fellow; 2. Associate Fellow. Both: Overseas Development Council, Washington, DC.

• ***Summary:*** The mucin obtained from a natto sample was found to be composed of 58% gamma-polyglutamic acid and 40% polysaccharide. Address: Dep. of Food Science and Technology, Tokyo Univ. of Fisheries, Konan, Minato-ku, Tokyo, Japan.

6230. *Soybean Digest.* 1974. The international outlook of the soybean market. Oct. p. 8-10.
• ***Summary:*** Contents: Introduction. Western Europe. Italy (Ferruzzi). Japan. Taiwan and Korea. Latin America.

"Italy: ASA's [American Soybean Assoc.] already made a solid start in expanding soy oil prospects in Europe with an identified soy oil campaign now in its second year in Italy. Watts calls the agreement with Ferruzzi and Company the one outstanding market development activity carried out in Europe recently.

"'Di Soia Si Vivra' (with soy we live), Italian housewives heard again and again during the advertising campaign. And soy oil sold. 'After 7 months, over 50% of the Ferruzzi production at his two plants was identified soy oil. After 12 months, 96% of it was identified soy,' Watts says. 'In the 12 months of the campaign about 20 million lbs. of soy oil were sold to the Italian people.'

"A major competitor began a similar campaign on its own only a few weeks after Ferruzzi started his promotion effort. 'Now, at least 11 brands of soy oil are on the shelves in Italy,' reports Watts."

Note: This is the earliest document seen (April 2007) concerning the work of Ferruzzi and Co. with soybeans.

A pie chart shows 1974-75 soybean sales commitments: EEC 45%, other Western Europe 6.1%, Japan 21.9%, China 4%, other 4%, undesignated 19.5%.

Tables show: (1) U.S. soybean exports (July to June fiscal year basis) for two years (1972-73, and 1973-74) in quantity (million bushels) and value (million dollars) to: EEC, Spain, Canada, Israel, Japan, Soviet Union, China, Taiwan, unidentified (transshipments), other. (2) U.S. soybean meal exports; the five biggest buyers are West Germany, Japan, Italy, Netherlands, and Poland-Danzig. (3) U.S. soy oil exports; the five biggest buyers are Pakistan, Peru, Mexico, Canada, and Yugoslavia.

6231. Sugimoto, Hiroshi. 1974. Treatment of soybean spent solubles by means of yeast cultivation. *J. of Food Science* 39(5):934-38. Sept/Oct. [31 ref]
• ***Summary:*** "Spent solubles from the preparation of soybean protein isolates and heat-coagulable whey proteins account for about one-fourth of the original dry weight of defatted soybean flakes." These spent solubles usually have been disposed of as sewage. However, because of their high biological oxygen demand (BOD) or chemical oxygen demand (COD), they present a serious waste disposal problem. Some yeast strains, particularly *Candida quilliermondii* or *Debaryomyces kloeckeri* (*D. hansenii*) grow very well on the spent solubles without supplementation. Address: Central Research Lab., Kikkoman Shoyu Co. Ltd., Noda-shi, Chiba-ken, Japan.

6232. Claiborne, Craig. 1974. Traditional dining in Japan: In the evening and in the morning, too. *New York Times.* Nov. 3. p. 80.
• ***Summary:*** He enjoyed shioyaki, a wedge of fresh salmon, briefly salted and then broiled. It was accompanied "by a piping hot bowl of miso or bean or bean curd soup containing small squares of bean curd and midget-size brown wild mushroom caps,..."

In giving a history of oden restaurants in Japan, the writer explains that they were established as places where men could express their frustrations, hurt feelings or pent-up anger. Oden portions are typically large in size. Choices include "deep-fried bean curd patties (ganmodoki) made with chopped vegetables."

6233. Oberdorfer, Don. 1974. The Japanese have a word for it: Sushi. *Washington Post.* Nov. 7. p. E12.
• ***Summary:*** Describes a visit to a neighborhood tofu shop in Tokyo–one of 8,200 in Tokyo and 72,000 throughout Japan. On Nov. 11 they give special discounts in observance of "Sushi Day," a festival the shopkeepers established a few years ago. Sushi originated in China about 1,700 years ago, but the Japanese have developed the modern version.

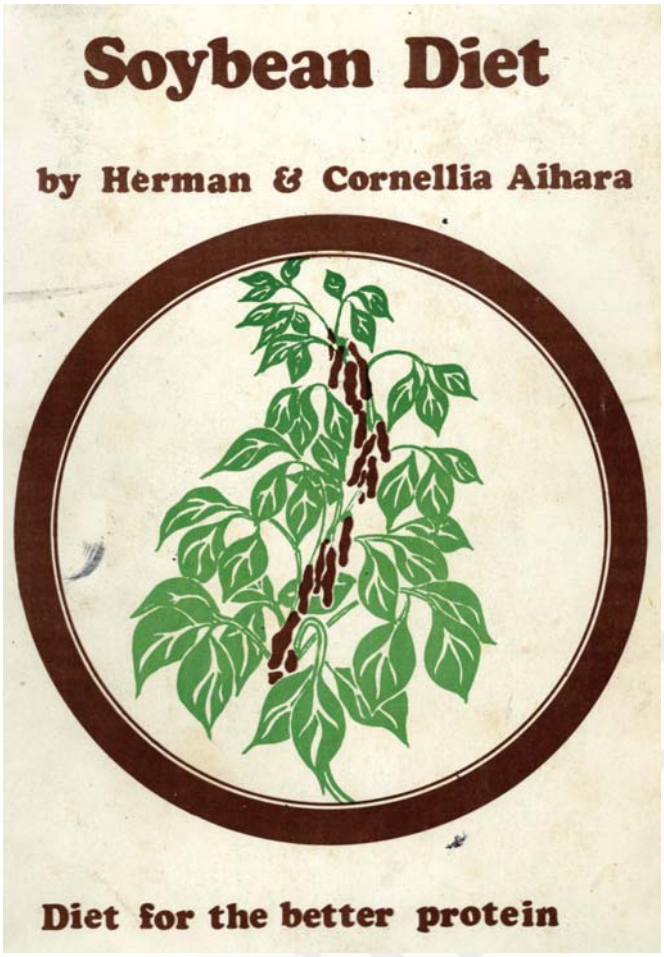
making 'inari sushi,' beancurd coverings fill with vinegared rice,..."

6234. Aihara, Herman. 1974. Soybean diet: Diet for the better protein. Oroville, California: George Ohsawa Macrobiotic Foundation. xi + 164 p. Nov. Illust. Index. 21 cm.



• ***Summary:*** This book is an expanded version of "Miso and Tamari" (1972). Contents: Preface. Introduction. 1. Theory: Steak vs. gasoline, is animal protein indispensable, protein requirements, essential amino acids–law of all or nothing, minimum daily requirement of essential amino acids.

2. Miso: Introduction, the origin of miso, kinds of miso, ingredients, how to make miso, value of miso, miso in the treatment of tuberculosis, how to make miso at home using mugi koji, recipes using miso for warmer seasons, recipes using miso for colder times.

3. Tamari or traditional soy sauce: History, chemical change of tamari, how to make tamari soy sauce at home, how to use soy sauce, soy sauce cooking for warmer times, soy sauce cooking for colder times.

4. The other soybean and high protein foods: How to make tofu at home, how to make tofu plaster, how to make

agé–deep fried tofu at home, how to make seitan at home. 4A. Tofu, seitan, and gluten cooking for warmer times: How to make tofu, nigari, and bulk tofu at home, how to make wheat gluten, seitan and fresh wheat *fu* at home. 4B. Tofu, seitan and gluten cooking for colder times. Appendix: Cutting styles, useful information. Bibliography.

Large photos near front of book show: (1) Herman Aihara. (2) Cornellia Aihara looking very happy at her stove. Address: Oroville, California.

6235. *Soybean Digest.* 1974. "Sloppy Joes" introduce new soy food to Japan. Nov. p. 20.

• ***Summary:*** "'Sloppy Joes'–hamburgers containing 30% [textured] soy protein introduced to Japanese school children in 1972 have resulted in widespread use of textured soy protein by Japanese consumers." A 1972 survey of 301 school children by the Japanese School Lunch Menu Study Institute showed that they liked Sloppy Joes more than hamburger. Now many chain stores and supermarkets have started selling Sloppy Joes. Daibi, the largest supermarket in Japan has started selling Sloppy Joes in their cafeteria.

6236. *Soybean Digest.* 1974. East meets West in soybecue sauce. Nov. p. 38.

• ***Summary:*** "A Japanese scientist has added soybean miso to American barbecue sauce in a new East-meets-West food, 'soybecue' sauce. Ichiro Ouchi, studying at the USDA research laboratory in Peoria, Illinois, replaced part of the

© Copyright Soyinfo Center 2014

catsup in conventional barbecue sauce with red miso, a fermented soy food, to formulate the new sauce...

"Mr. Ouchi is studying the use of miso made from U.S. soybeans in American foods like meat sauces, salad dressings and snack dips and spreads. His research with Hwa Lih Wang, biochemist, and Dr. C.W. Hesseltine is sponsored by the Shinshu Miso Association, an organization of Japanese companies."

6237. **Product Name:** Sunwheel Organic Hatcho Miso, Mugi Miso, Tamari, and Shoyu.
Manufacturer's Name: Sunwheel Foods (Importer-Distributor). Made in Japan. Imported from Muso Shokuhin.
Manufacturer's Address: London, England.
Date of Introduction: 1974 November.
How Stored: Shelf stable.
New Product–Documentation: CSP form filled out by Simon Bailey. 1988. Sept. 28. Gives date of introduction as 1974. In 1984 Sunwheel divided and sold its Sunwheel brand to Northumbrian Fine Foods. Its high quality Japanese products are now imported by Clearspring Natural Grocer. Peter Bradford is the contact person. Japanese agent is Mitoku. Various Japanese manufacturers.

Interview with Bill Tara, founder of Sunwheel. 1991. Aug. 18. By late 1974 Sunwheel Hatcho Miso, Mugi Miso, and Tamari were on the market, imported from Muso (Yuko Okada) in Japan. By 1979 Sunwheel was sold to a larger health food company.

Address: Dep. of Microbiology, Tokyo Medical College; and Kohno Clinical Medical Research Inst., Tokyo.

6239. Hughes Markets. 1974. Happy New Year '75 (Ad). *Los Angeles Times.* Dec. 26. p. K20.
• ***Summary:*** The section titled "Foods of the Orient" includes: Kikkoman soy sauce, one gallon can $3.29. "JFC Kinako 7 oz. pkg. Soy bean flour–35¢. Misuzu Koya Dofu 3.5 oz. box. Dried Soybean Cake [Dried frozen tofu]–69¢... Age [Deep fried tofu pouches, sold in the fresh produce dept.] 59¢ package."

Also includes Tempura batter mix, New crop botan rice, Motohiko Sapporo maki–Rolled Tangle [konbu]. Azuma yokan–Bean jelly [azuki]. JFC or Hime Shitake–Shiitake dried mushrooms. Hime kampyo [kanpyo]–Dried gourd strips. Take waribashi–Bamboo chopsticks. Kamaboko. Blue chip stamps.

6240. *SoyaScan Notes.* 1974. Chronology of soybeans, soyfoods and natural foods in the United States 1974 (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** 1974 March. The first issue of *Vegetarian Times* published by Paul Obis in Chicago.

1974 April. Bob Gerner (of Westbrae) and William Shurtleff (guide) travel throughout Japan searching for quality sources of traditional miso and soy sauce. Right after the trip, Westbrae starts importing these products.

1974 Aug. 9. President Nixon, elected in 1968 and 1972, resigns after the Watergate scandal. Gerald Ford succeeds him as president. Butz continues as Secretary of Agriculture.

1974. Brazil passes West Germany to become the world's second largest soybean crusher, after the U.S.

1974 late. Miles Laboratories / Worthington introduces the Morningstar Farms line of meat analogs based on spun soy protein fiber. Sold nationally at U.S. supermarkets.

1974 late. The Farm in Summertown, Tennessee, publishes *Yay Soybeans!,* a 14-page booklet containing many innovative soyfoods recipes, such as "soy ice cream–ice bean," soy yogurt," "soy cheese," "soy cheesecake," "soy mayonnaise," and "soysage" (a meatless okara & soymilk sausage). Most of the dairylike products were made with fresh or cultured soymilk. The Farm now grows 150 acres of soybeans to feed its community of 800 people. It has just established Plenty, a non-profit corporation "To help share out the world's food, resources, materials, and knowledge equitably for the benefit of all."

1974. The Farm in Summertown, Tennessee, publishes *Hey Beatnik,* which contains the earliest know use of the term "Soy Dairy." The Farm's soy dairy now makes 60 gallons of soymilk a day at a total cost of $0.30 per gallon.

1974. *Tofu Recipes,* the first book on tofu in English, written and self-published by Grace Kikuchi in Ann Arbor, Michigan. Spiral bound and 47 pages long, it gives a recipe for homemade tofu and uses tofu largely with fish and meat.

1974 Nov. World Food Conference in Rome. Delegates from 130 UN member countries adopt an international strategy to overcome world hunger and malnutrition.

1974-1975? Eden Foods starts to import natural foods, including miso and shoyu, from Japan.

6241. Tsumura, Haruo; Hashimoto, Y.; Kubota, H. Assignors to Fuji Oil Company, Ltd., Japan. 1974. Preparation of soy cheese. *U.S. Patent* 3,857,970. Dec. 31. 1 p. Application filed 17 April 1973. [5 ref]
• ***Summary:*** "The soy cheese... is made without milk solids by coagulating a fermented emulsion containing soy milk and a fat composition with about 0.05 to about 1.0 weight percent of a coagulant selected from the group consisting of aldonic acid lactones, uronic acid lactones, and mixtures thereof. A flavor producing proteolytic enzyme can be added to the soy milk before formation of the emulsion, to the

© Copyright Soyinfo Center 2014

emulsion prior to fermentation, or to the cooked curd without adversely affecting the texture and body of the resultant soy cheese."

Note: This is the earliest English-language document seen (Jan. 2005) with the term "soy cheese" in the title.

6252. **Product Name:** [Vita Tofu].
Foreign Name: Vita Tofu.
Manufacturer's Name: Nepal Soya Industries (Soya Food Industry; Kathmandu Tofu Shop).
Manufacturer's Address: 9/374 Bhedashing, Jamguthi, Kathmandu, Nepal.
Date of Introduction: 1974 December.
New Product–Documentation: Soyfoods Center Computerized Mailing List. 1983. June 20.

Letter from Miss Ruth Angove, Nutrition Advisor, United Mission to Nepal, G.P.O. Box 126, Kathmandu, Nepal. 1983. Aug. 16. Concerning the small tofu shop you asked about in your letter of 20 Nov. 1982, two men work there, Achyut Anand Baidja [Achutananda Vaidya; apparently the owner from the Newar ethnic group], and Bhenda Singh. The address is Jyanguthi 9/374, Kathmandu. "He is employed at the Government Food Research Lab., and has been in Japan in 1974, where he learned the tofu process and bought a small presser. He makes tofu in a dark room off a filthy courtyard. It is not fly screened. Soaked beans were draining on a piece of old fly screening and two small boys sitting on the floor were cutting up buffalo meat for sun drying. He told me that it is difficult to do the process in Nepal. He delivers to the vegetable market in the morning. The stall holder keeps the tofu in water in an old and dirty plastic bowl. The water gets dirtier all day at in present temperature (30ºC) spoilage is rapid. He has applied for a loan for a cabinet freezer. In my opinion, conditions in downtown Kathmandu are totally unsuitable for food industry! I enclose a copy of his leaflet. He has a copy of the large *Book of Tofu."*

The leaflet (4.5 by 7.75 inches, black on pink, written in Nepali) says: "High protein food. Vita Tofu. To prepare: 1. Cube the tofu, fry it in oil, add to any curry, vegetable, or meat dish; mix and serve. 2. Crumble the tofu by hand, fry in oil, and mix with tomato, onions, and spices as desired. 3. Fry sliced tofu. Sprinkle with salt and serve.

"Tofu can be used to increase the protein for small children, pregnant women, and old people. We can prepare tofu for parties and functions given 24 hours notice. We are keen to serve you.

"Soya Food Industry, Kathmandu."

Letter from Mr. T.B. Gubhaju of Nepal Tofu Factory,

© Copyright Soyinfo Center 2014

Kathmandu. 1991. Oct. 6. "A company named 'Nepal Soya Industries' was run by Mr. Achutananda Vaidya before 1983. The name of the product was Vita Tofu. This company was closed long ago, perhaps between 1983 and 1985. So far as I know, this company had only a grinding machine and a press. The owner, Mr. Achutananda Vidya, who was born in Nepal, got training in brewing from Japan. The company was located at 9/374 Bhedashing, Jamguthi, Kathmandu. I met Mr. Vaidya in the Government Food Research Lab in 1983 when we discussed the tofu business in Nepal. So far as I know, Mr. Vaidya had to close his tofu production company for the following reasons: 1. He was in Government services so he could not pay more attention to his private business. 2. He did not have the requisite equipment for tofu production."

Letter from Mr. T.B. Gubhaju of Nepal Tofu Factory, Kathmandu, followed by phone call. 1992. Aug. 19 and Sept. 7. He believes that members of the family of Mr. Achutananda Vaidya had started selling tofu in Nepal long before 1983. He is still trying to collect specific information and he has Mr. Vaidya's phone number. Mr. Vaidya, who speaks good English, told him that members of his family began making tofu in Nepal in about 1974-1977–but Mr. Vaidya did not know the exact dates.

Letter from Mr. T.B. Gubhaju of Nepal Tofu Factory. 1992. Sept. 22. Mr. Achutananda Vaidya resides at 9/374 Bhedashing, Jamguthi, Kathmandu. Phone: 229130. His uncle, Mr. Raghubir Baidya, started making tofu in 1970, but had to stop after a few months. For further details, please contact Mr. Vaidya.

Letter from Mr. Achutananda Vaidya of Nepal Soya Industries. 1992. Dec. 26. "I started making tofu in 1974. I did not have any connection with my uncle in starting my tofu company, however I did have a chance to see him make tofu at his residence in Kathmandu, and from that time I got the idea in my mind to make tofu myself. I learned the details of the process in Nepal from Mr. Akifumi Nakamura of Kobe, Japan, a member of the Japan Overseas Cooperation Volunteers (JOCV), who worked at the Central Food Research Laboratory in Kathmandu, which was also my office in 1974. I worked together with him as a counterpart for two years learning how to make tofu."

His business card notes: "Food Technology in Brewing from Japan. Products & Suppliers: Tofu (Vita), Soyamilk (Vitabean milk), Soya Curd, Soya Sauce, & Miso."

His Curriculum Vitae notes that he was born on 28 Dec. 1947, resides at 9/374 Bhedasingh, Kathmandu, and is married. See also his letter of 19 Jan. 1993.

Letter from Mr. Achutananda Vaidya of Nepal Soya Industries. 2002. April 12. He started to make and sell this tofu in Dec. 1974.

6256. Wood, R. Bruce. comp. 1974. Soviet soybean varieties: An annotated bibliography. Urbana, Illinois. 187 p. Photocopied from 5 x 8-inch typed file cards. [20 ref. Eng]
• ***Summary:*** Chapters are divided by regions. A history of the named regional varieties developed is given, along with the source of the germplasm, the name of the plant breeder(s), and the organization with which he or she worked, a description of the plant (incl. morphology, maturity, composition, seed weight {weight of 1000 seeds}, yield), citations for the source of the above information, and in some cases a translation and/or explanation of the name in English. Amur region (Amur Oblast and Khabarovsk Kray) grain varieties and fodder varieties (p. 1-27). Maritime

© Copyright Soyinfo Center 2014

(Primorskiy) Kray grain and fodder varieties (p. 28-36). Central Asian fodder varieties (p. 37-38). Georgian grain varieties (p. 38). North Caucasian grain varieties (p. 48-54). Ukranian grain varieties (p. 55-64). Moldavian grain varieties (p. 65-68). Prospective varieties and/or those undergoing trials (p. 68-154). Baltic varieties (Latvia and Lithuania; p. 154-64). Varieties of undetermined origin (p. 164-).

Page 1 states that a number of varieties were developed at the "former Amur Oblast State Agricultural Experiment Station in Blagoveshchensk, now the All-Union Scientific Research Institute of Soy." Many of the stock plants were chosen during the period from 1930 to 1939. Page 43 notes: "Imeretinskaya (mestnaya): This old-variety population is one of three major ecologic types grown for more than 90 years [i.e. since 1884 or before] in the Georgian SSR. (The other two variety populations are Guriyskaya and Chiaturskaya.) This material was originally imported from China, Korea, and Japan. Attempts were made during the 1st Five-Year Plan (1928-32), when the USSR first began to cultivate soy on a large scale, to subject these local populations to the selection process in order to develop purer lines with stable and more desirable characteristics. These were then used for hybridization. According to Enken (1971, 125), these crosses did not yield positive results. The breeders were apparently successful, however, in developing purer strains of the local material, for Imeretinskaya mestnaya was in commercial production by 1930 (Vul'fson, 1935, 59), and first regionalized for the Georgian SSR in 1933 (Generalov, 1968, 146). As such it was one of the first Soviet domestic soy varieties, and one of several original varieties still having regional status after more than 40 years."

The Amur Oblast State Agricultural Experiment Station was organized in 1923-24. "The Amur Yellow Population should not be confused with the soy population used by the pre-Revolutionary Amur Experiment Station in 1912-18, which had a different composition."

Page 188 shows the leading Soviet soybean varieties in 1970, ranked by sown acreage: Salyut 216, Amur region, 346,900 ha (hectares). Khabarovskaya 4, Amur region, 141,267 ha. Amurskaya 41, Amur region, 100,995 ha. Primorskaya 494, Maritime Kray, 76,191 ha. Primorskaya 529, Maritime Kray, 65,233 ha. Primorskaya 762, Maritime Kray, 21,300 ha. Amurskaya 310, Amur region, 18,321 ha. Yubileynaya, Amur region, 14,755 ha.

Table 2 lists the names of all soybean varieties entered in the 1962-69 state variety trials, together with the organization that developed each variety.

Note: This is the earliest document seen (Feb. 2005) concerning the cultivation of soybeans in Latvia. This document contains the earliest date seen for the cultivation of soybeans in Latvia (1974). The source of these soybeans is unknown. Address: Urbana, Illinois.

6259. Soyfoods Center. 1974-1985. Soyfoods Media (Scrapbook). 3 vols. Lafayette, California. 38 x 32 cm.
• ***Summary:*** These three large professional artist scrapbooks, with imitation leather covers and about 28 metal rings that hold each acetate sheet protector, holds popular articles from important newspapers and magazines with a large circulation that document the origins and early years of he soyfoods movement in the United States from the mid-197s to the mid-1980s. Each binder holds about 38 acetate sheets and roughly 75 articles displayed in chronological order. The three volumes have a combined total weight of 18½ pounds. They contain basically two types of articles: (1) Articles about the work of William Shurtleff and Akiko Aoyagi in the United States and Japan. (2) Articles about soyfoods in general and about other companies.

Book 1 covers the period 1974-1978. Book 2 covers the period 1979-1980. Book 3 covers the period 1981-1985.

As of May 2009, all three volumes are owned by Soyinfo Center, 1021 Dolores Dr., Lafayette, California. Contact William Shurtleff. Address: P.O. Box 234, Lafayette, California 94549. Phone: 925-283-2991.

Manufacturer's Address: Nakakami-cho 110, Akishima-shi, Tokyo 196, Japan. Phone: 0425-43-1815.
Date of Introduction: 1974.
How Stored: 7 oz Pure-Pak cartons. Retail prices: See below.
New Product–Documentation: Shurtleff & Aoyagi. 1979. *Tofu & Soymilk Production.* Page 229 gives a detailed description of the process for making Soymeal brand soymilk based on a plant visit by William Shurtleff in 1977. It states: "The Nikken Company in Tokyo is a large maker of both sweetened and orange soymilk, producing about four thousand 7-ounce Pure-Pak cartons daily at the rate of 5,000 cartons per hour. In 1977, the sweetened soymilk sold for $0.21 per carton and the orange for $0.28. The former contains 12.1% solids (8.5% before formulation), 3.0% protein, 3.2% fat, 5.5% sugars, and 0.51% ash. The remarkably long shelf life (20 days) is made possible by strict cleanliness and thorough pasteurization. The live bacteria count per milliliter of milk averages 30; the legal limit for soymilk is 3,000 and for dairy milk 50,000. The total equipment, which is mostly modern stainless steel, was worth $230,000 at 1977 prices not including the packager which was worth $46,000. The patent holder for the process, Mr. Kanji Tsuchiya, is extremely helpful and has over 30 years of experience making soymilk."

Page 313 gives the company's name as "Nikken (Soymeal Co.)," the address, and phone number.

Toyo Shinpo. 1982. July 21. "The soymilk industry and market in Japan." States that Tokyo Soymeal first made commercial soymilk in Japan in 1974.

Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 63-64. The company name is given as "Tokyo Soymeal."

6276. Yang, Charles Y. 1974. Soybean rust. *AVRDC, Seminar Series.* 22 p. *
• ***Summary:*** A good overview of soybean rust. This fungal disease "has been recorded in the northeastern, central, and southwestern provinces of China. It has also been reported in the USSR, Korea, Okinawa, Taiwan, the Philippines, Australia, Ceylon, India, Malaysia, Thailand, Cambodia, and Vietnam. Cultivated varieties of soybean known to be rust resistant in the past are now susceptible. Taichung 4 had much more field tolerance to soybean rust, with relatively fewer pustules, than other cultivated varieties. Two physiological races of this rust have been identified through their characteristic pathogenic reactions... It is believed that there can be 6-8 cycles of the rust produced within one growing season" (from AVRDC 1992, #452). Address: Kyushu Univ., Japan.

6277. Abe, Koryû; Tsuji, Shigemitsu. 1974. Tôfu no hon [The book of tofu]. Tokyo: Shibata Shoten. 328 p. Illust. Index. 19 cm. [1 ref. Jap; eng+]
• ***Summary:*** This book contains one of the best histories of tofu published to date, including a good summary of Shinoda's research on tofu history.

Contents: Part I: Preface. 1. Various documents on tofu. 2. The origin of tofu. 3. Tofu as a food and soybeans. 4. Production methods of tofu and second generation products. 5. Chinese tofu seen from documents. 6. The legend of Liu An, king of Huai-nan of (*Wainan ô Ryûan*), and tofu. 7. The legend of Toroshijû and tofu. 8. Japanese tofu seen from documents.

Part II: The *Tofu Hyakuchin.* Part III: A selection of 100 modern tofu recipes.

On page 4 is an interesting quote by the Chinese Buddhist master/priest Yinyuan Longqi (Ingen), who lived 1591-1673. He introduced the Obaku sect of Zen Buddhism to Japan and erected the famous Manpuku-ji temple at Obaku, Uji, Japan (south of Kyoto) in 1661. It was named after the Wanfu / Manpuku-ji Temple at Obakusan, Fukien [Fujian] province, China, which was the leading Zen temple in China at the time (Joya 1960, p. 745, 326). In Japan, he was surprised to find tofu unlike any he had known in China. In praise of this new softer type of tofu, he composed an intricate yet simple proverb which is known to this day. It described both the character of Japanese tofu and that of a man who wishes to pass freely and peacefully through this fleeting, illusory world. The proverb reads: *"Yo no naka wa, mame de shikaku de yawaraka de, mata rôjaku ni nikumare mo sezu..."* Each of the three middle lines has a double meaning, allowing the poem to be read either: (1) "In this world, made of soybeans, square / clean(ly) cut, soft, and not disliked by old and weak people"; or (2) "In this world, practicing diligence (or healthy/hard working), being proper and honest, having a kind heart, and not disliked by old and weak people."

Page 66: The earliest known reference to tofu was in the *Qing Yilu* (Jap: *Seiiroku*), written during the Northern Song dynasty [960-1127] by Tao Ku (Jap: *Tôkoku*). In this work it explains why the early name for tofu (Jap: *Shôsaiyô* = vice governor's mutton) appeared. This is the story about a poor vice-governor named *Jishû* (in Japanese). He was very poor and couldn't afford to buy mutton, so he bought a few pieces of tofu every day and ate it as a side dish with rice. Seeing this, people in that area began to call tofu the "vice-governor's mutton." This story tells us that tofu was widely consumed by the people, and was less expensive than mutton. After the appearance of the *Quing Yilu* tofu began to be mentioned much more often in the literature. But during the Northern Song dynasty, since tofu was regarded as a poor-man's food, people didn't write about it so much.

Page 74-84: 6. Life of Lord Liu An, of Huai-nan. I have

© Copyright Soyinfo Center 2014

already mentioned that the theory that tofu was discovered or first made by Lord Liu An some 2,000 years ago depended largely on the *Bencao Gangmu* (Jap: *Honsô Komoku*) by Li Shizen, which appeared in 1596 during the Ming dynasty. And in the poems by *Shuki* (?). Although we are not sure whether or not this was an historical fact, I think there was a reason for it. Therefore, in this chapter, I would like to go into the relationship between Liu An's colorful life and tofu a little more deeply. The best early source about the life of Lord Liu An is the *Shiji* (Jap: *Shiki*), "Records of the historian," by Sima Qian which appeared in about 90 BCE.

Page 329 tells about the authors (autobiographical): Koryû Abe was born in 1922 (Taisho 11) in Tokyo. He graduated from *Nippon Daigaku, Geijutsu-gakubu, Bungaku-ka* (literature). In 1968 he went to work for K.K. Japan Art-sha. In Dec. 1971 he self-published a facsimile edition of the ancient classic *Tofu Hyakuchin.* He is presently editor of Japan Art-sha's *Hôchô-Geijutsu* (The art of the knife) and a consultant to Daitô Chôrishi-kai (Big East Cooking Society).

Shigemitsu Tsuji was born in 1920 in Kyoto. He graduated from Kyoto Nishô, then apprenticed as a cook in the restaurant Sagano in Tokyo. He later joined the army and served as a special cook to the head officer. After World War II he became the 11th owner of Nakamura-ro, a famous Kyoto restaurant. He is presently a cooking instructor for NHK, ABC, and MBS television stations, and special instructor at the following cooking schools: Osaka Abenotsuji Chôrigakkô, Kyôto Ryôri Gakkô, and Tôkyû Cooking School. Address: Tokyo, Japan.

6278. Aihara, Cornellia. 1974. How to make miso using mugi koji (fermented barley). *Macrobiotic* (*The*) (*Chico, California*) No. 98. p. 53-55.
• ***Summary:*** Gives a large-scale recipe using 30 lb soybeans, 20 lb barley, 15 lb salt, and 7 cups barley koji. The mugi koji can be ordered from Janus Natural Foods, 1523 Airport Way, Seattle, Washington 98134. Or from Chico-San Inc., 1144 West First St., Chico, California 95926. Address: Chico, California.

6279. Altschul, Aaron M. ed. 1974. New protein foods. Vol. 1A. Technology. New York, NY: Academic Press. xiv + 511 p. [1750* ref]
• ***Summary:*** Contains 10 chapters by various authors. Five of these are cited separately. Address: Dep. of Community Medicine & International Health, Georgetown Univ. School of Medicine, Washington, DC.

6280. Butler, W.H. 1974. Aflatoxin. In: I.F.H. Purchase, ed. 1974. Mycotoxins. Amsterdam, Netherlands: Elsevier Publishing Co. xiii + 443 p. See p. 1-28. Chap. 1. [145 ref]
• ***Summary:*** An excellent review of the literature and history of the discovery of aflatoxin. Although the biological activity of the aflatoxins was not recognized until 1960-61, there is evidence that these compounds produced liver disease before that time. There are numerous reports from the 1950s on similar liver disease in guinea pigs, rats, and dogs fed toxic groundnut meal. "There have been many reports since 1935 of high incidence of hepatomas in hatchery-raised trout from Italy, France, Japan, and the United States. Although it is not possible to attribute this directly to aflatoxins it would appear that these compounds are the most likely causative agents" (p. 2).

Aflatoxins are most widely found on peanuts and peanut meal. Yet it has been found that *Aspergillus flavus* does not invade groundnuts to any significant extent prior to harvest (Austwick & Ayerst 1963). "Aflatoxin has been found as a natural contaminant in many types of food including peanut, cottonseed meal, corn, cassava, rice, soya beans, wheat, sorghum, and barley" (Wogan 1968).

Austwick & Ayerst (1963) "demonstrated that the most important factor in the growth and production of aflatoxin by *A. flavus* was the relative humidity surrounding a natural substrate. At a humidity at less than 70% very few fungi will grow on stored foods but with a relative humidity of 85% and a moisture content of 30% within the groundnut *A. flavus* is able to produce aflatoxin."

Table 1 shows the chemical properties of ten different aflatoxins; for each it gives the name, molecular formula, molecular weight, melting point, 362-363 nm absorption (e), and fluorescence emission (nm). Figures 1 and 2 show the chemical structures of the ten aflatoxins. Address: MRC [Medical Research Council] Toxicology Unit, Medical Research Council Labs., Woodmansterne Rd., Carshalton, Surrey (Great Britain).

• ***Summary:*** The first edition of this superb dictionary was published in 1918, the second in 1931, and the third in 1954. The words are listed in alphabetical order. Some of the definitions of soy-related terms are quite poor. Examples:

Daitokuji natto: not listed.

edamame: "green soybeans." [Better: Green vegetable soybeans, or Edamamé].

Hamananatto: not listed.

Hamanatto: not listed.

hiryôzu: not listed.

kinugoshi [tofu]: fine-grained *tofu.*

kogori-dôfu = kôya-dôfu.

Note. This is the earliest English-language document seen (April 2013) that uses the the term *kogori-dôfu* or the term *kôya-dôfu* to refer to dried-frozen tofu.

koikuchi shoyu: not listed.

kôji: *"koji."* Good.

miso: *"miso."* Good. Also defines: [ama-miso]: slightly-salted miso.

[miso-koshi]: a miso strainer.

[miso mame]: a soybean; a soya (bean).

[miso-shiru]: miso soup. And many more.

nattô: "fermented soybeans." [Better: Whole soybeans fermented with *Bacillus subtilis*]. Nattô-jiru: "Miso soup with minced fermented soybeans." Good.

nomame: not listed.

okara: bean-curd (*tofu*) refuse; lees of bean curd.

omiotsuke [Jap: Misoshiru] See miso [Miso soup; word used by women only].

otsuke [Jap: Misoshiru] Miso potage (soup).

saishikomi shoyu: not listed.

shitaji: soy. See shôyu.

shôyu: "soy (sauce)." Better: Soy sauce.

tamari: "(a kind of) soy; soy sauce; sauce from refined soy."

tôfu: "bean curd [cheese]; *tofu.*

[yaki-dofu]: "roasted bean curd."

[tofu itcho]: a piece (cake) of bean curd.

[tofu-ya]: "a tofu dealer (seller, maker)."

tônyû: "soybean (soya) milk." [Better: Soymilk, soya milk, or soybean milk].

tsurumame: not listed.

usukuchi shoyu: not listed.

yuba: "dried bean curds" [sic. Better: The protein-lipid film formed atop soymilk when it is heated].

6290. National Institute of Agricultural Sciences, Hiratsuka. 1974. [Seed storage catalogue]. Japan: Ministry of Agriculture and Forestry, NIAS. [Jap]*
• ***Summary:*** The Japanese germplasm collection is stored at NIAS, which was started in 1965. They had 1472 entries in

1979.

6291. Nihon tabemono hyakka [Encyclopedia of Japanese foods]. 1974. Tokyo: Shinjin Butsu Orai-sha. [Jap]*

6292. Ohsawa, Lima. 1974. The art of just cooking. With Nahum Stiskin. Hayama, Japan and Brookline, Massachusetts: Autumn Press. 216 p. Illust. by Maurice Owen. Index. 19 x 23 cm. Reissued in 1984 as Macrobiotic Cuisine by Japan Publications, NY. 175 p. [26 ref]

• ***Summary:*** This work is based on Lima's Japanese-language book titled *Macrobiotic Cookery* (1971). In 1953, at age 54, Lima Ohsawa first ventured beyond the shores of her native Japan. She and her husband, Georges Ohsawa, left on their first world tour. In 1955-56 they spent time with Dr. Albert Schweitzer in Lambarene, Gabon. "Being vegetarian Dr. Schweitzer was always very interested in the nutritional assets of the soybean and asked me to show him different ways to prepare it" (p. 10). During this and many subsequent travels, Lima learned many traditional, natural recipes from around the world.

Contains numerous Japanese macrobiotic style recipes. Page 32 gives good definitions of miso and shoyu. Soy-related recipes include: Brown rice with soybeans (p. 53). Inarizushi (p. 55). Brown rice porridge with vegetables and miso (p. 58). Soya omochi (mochi with soya flour). Burdock with miso and lemon peel (p. 90). Broccoli and radish with miso dip (p. 92). Carrot with green beans and tofu (p. 95). Ninjin shiro-ae (with "½ cake of *tofu,* drained and mashed (p. 173)," p. 95). Cucumber with wakame and walnut miso (p. 96). Cucumbers with miso and sesame (p. 97). Onion nitsuke with miso (p. 100). Onion goma-miso-ae (onion with sesame miso, p. 100). Eggplant nabeshigi-yaki (with miso, p. 101). Scallion and aburage nitsuke (p. 101). Scallion dengaku (with miso, p. 102). Renkon ikada age with kuzu-lemon sauce (p. 103). Kabocha miso ni (p. 106). Kabu miso-ae (turnips with sesame miso, p. 109). Daikon age rolls (with aburage, p. 114). Vegetable skewers with koya-dofu (dried-frozen tofu, p. 114). Kombu with shoyu (p. 117). Renkon miso inro (lotus root tempura with miso, p. 123). Coltsfoot buds with miso (p. 126). Wakame miso soup (p. 137). Mugi-miso soup (p. 137). Sake-no-kasu jiru (miso soup with sake lees, p. 137). Go jiru (soybean potage with aburage, p. 141). Oden with ninjin and gobo kombu maki (with aburage, p. 146).

Condiments and pickles (p. 154-57): Gomashio (sesame-salt). Tekka miso (sauteed vegetables with miso). Shigure miso (moist tekka). Miso sauté. Soybeans with miso and burdock. Soybeans with miso. Miso pickles (fall and winter). Sauces, spreads and salad dressings (p. 161-63): Lemon shoyu. Ginger shoyu. Orange shoyu. Tsuje-jiru dipping sauce (with shoyu). Goma joyu sauce (with shoyu). Scallion miso. Walnut miso. Citron miso. Goma miso (sesame).

Beans (p. 165-78). Black bean ni (the black beans are actually black soybeans. Soak 1 cup soybeans overnight in 3 cups water. "Drain the beans through a strainer reserving any soaking water." Add enough fresh water to equal 4 cups then pour this liquid into a heavy saucepan. Add the soaked beans, bring to a boil over high heat. Reduce heat to low, cover and simmer for 2+ hours, or until tender. Add water during cooking if liquid completely evaporates. Toss pan to stir. When done, season with a dash of salt and/or shoyu. "In Japan this exquisitely sweet dish [nimame] is a must on New Year's Day. It gets even sweeter after standing for a day or two." Cooking soybeans with a small strip of *kombu* helps to soften them). Gomoku-mame (soybean nitsuke).

Tofu ryori (p. 173-78; "Tofu or bean curd is rich in vegetable protein. Although it is rather *yin* in our classification of foods, the recipes I have included here balance its *yin* characteristics with *yang* so don't hesitate to use it occasionally. It's delicious in miso soup, stews and *nabe,* and as a dish by itself. It is available at Oriental food shops and can also be made at home."). Homemade tofu (p. 174; 3 cups soybeans plus nigari make 1 lb. tofu; also describes how to make nigari {sea brine} by dampening 5 lb. sea salt). Variation: Homemade grilled tofu. Unohana pouches (with okara and aburage). Gammodoki. Tofu with kuzu sauce. Tofu roll. Koya-dofu sandwich. Tofu nitsuke. Chinese dow-foo oroshi-ae. Tofu mold (with kuzu). Tofu tempura. Goma dofu (sesame tofu).

Note 1. This is the earliest English-language document seen (April 2013) that contains the term "grilled tofu."

Squid and scallion miso-ae (p. 183). Salmon head soup (with soybeans, p. 183). Surimi shinoda (with aburage, p. 184). Red snapper in miso. Koi koku (with miso, p. 184). Egg tofu (p. 185). Amazake manju (sweet sake dumplings, p. 198). Amazake (homemade, using glutinous "sweet" brown rice, p. 207).

© Copyright Soyinfo Center 2014

The section titled "*Kofu:* Wheat Gluten" (p. 85-86) includes recipes for Homemade kofu (wheat gluten, including Kofu loaf and Seitan), and Kofu cutlet. "First introduced to Japan from China by Buddhist monks, *kofu* became a very popular food in Zen temples. It is delicious in soups and stews and mixed with sautéed vegetables. *Kofu* cutlet looks, feels, and tastes like meat." Seitan is made by simmering 5 cups cold wheat gluten, separated into small pieces, for 3 hours in shoyu, sesame oil, and minced gingerroot.

Dandelion coffee (made from minced and dry roasted, ground dandelion root) and Yannoh (prepackaged grain coffee, made from 5 different grains) are described on p. 206-07.

The book, which contains many fish recipes, begins with a nice photo of Lima at age 75–she looks 20 years younger–and ends with a good glossary. Lovely illustrations, a wealth of original information on Japanese foods.

Note 2. This is the earliest document seen (July 2000) that mentions "Tekka miso" (spelled that way).

Note 3. This is the earliest English-language document seen (Feb. 2005) that used the word "kofu" to refer to wheat gluten. Address: Tokyo, Japan.

6293. Okada, Chiyoko; Kataoka, E.; Togano, T.; Tamura, S.; Suzuki, T. 1974. Nyûfu no ippan seibun, amino-san oyobi kihatsu-san ni kansuru kenkyû [Analysis of some components, amino acids and volatile acids of nyufu (fermented soybean curd)]. *Eiyo to Shokuryo* (*J. of Japanese Society of Food and Nutrition*) 27(7):309-15. [10 ref. Jap; eng]

• ***Summary:*** Nyufu is made by partial dehydration of tofu followed by inoculation with *Actinomucor repens*. After the mold mycelium covers the surface, it is immersed in soy sauce moromi mash for aging. During ageing, the moisture content decreases, while the contents of salt, reducing sugars, and amino nitrogen increase. Only small amounts of lysine and amino-butyrate are found in nyufu. Formic and acetic acids can be detected at every step, whereas propionic acid and isobutyric acid can be detected only in the moromi mash and nyufu. Isovaleric acid is found in nyufu. Butyric acid is found after inoculation with the mold. Address: 1-3. Dep. of Nutrition, Tokyo Univ. of Agriculture; 4-5. National Food Research Inst., Tokyo.

6294. Okura, Nagatsune. 1974. Seiyû roku, On oil manufacturing. Illuminated by Matsukawa Hanzan. An English translation of the original 1836 Japanese ed. Translated by Eiko Ariga and edited by Carter Litchfield. With added commentaries by Richard C. Rudolph and Carter Litchfield. New Brunswick: Olearius Editions. 79 p. [Eng]*

• ***Summary:*** The first edition in English consisted of 1,000 copies, including many fine reproductions of woodblock prints, printed on only one side of rice paper, bound in the classic Japanese form by stitching at the rear and enclosed in a folder with bone clasps. Illustrations show the equipment and processing steps for extracting vegetable oil from oilseeds.

6295. Radley, R.W. 1974. Soya bean adaptation to the cool, maritime climates of Northern Europe, with special reference to the U.K. *Outlook on Agriculture* 8(1):3-9. [15 ref]

• ***Summary:*** "Sharp increases in soya bean prices, and restrictions on US exports, have stimulated interest in the possibility of growing this crop in NW Europe. The principal limitations are temperature–especially at night–and daylength. One variety has often yielded well, experimentally, in Southern England, but in general yields are at present too uncertain and the lowest pods too near the ground. Development of better-adapted varieties would call for substantially increased research effort."

Table 1 shows that during the period 1961-70 the UK imported about US$50 million worth of soybeans and soybean products each year. Imports of whole soybeans decreased from a peak of 294,000 tonnes in 1964 to only 38,000 tonnes in 1970–worth $6.2 million. Imports of soya oil rose from 18,000 tonnes in 1961 to 61,000 tonnes in 1970 (worth $17.2 million) and imports of soya cake and meal rose from 142,000 tonnes in 1961 to 248,000 tonnes in 1970 (worth $28.5 million). A shortfall in Peruvian fishmeal from March 1972 onwards increased the demand for soybeans and soy products.

Production of soybeans in Europe is largely confined to Romania, Bulgaria, and Yugoslavia which together in 1972 produced no more than 188,000 tonnes on about 169,000 ha (average yield = 1.11 tonnes/ha). The location and extent of soybean production in Japan is of real significance for northern European countries. Japan cultivates about 90,000 ha/year of soybeans, largely on the northernmost island of Hokkaido, which, as Sven Holmberg (1956) writes "is the only country in the world where soya beans are grown as a major crop in a relatively cool and partly marine climate."

In 1973 Dr. E.S. Bunting of the Plant Breeding Institute, Cambridge, sowed several varieties of soybeans at Oxford; these included Fiskeby V (bred by Algot Holmberg & Soner A B in Sweden), Altona (the earliest of the varieties commercially available in Canada), and two Russian varieties grown in Eastern Siberia–Saliut 216 and Amurskaja 41 (both reputed to be cold-tolerant). Fiskeby 5 gave the best grain yields. Also on 21 May 1973 the author planted 110 varieties of soybeans (including Fiskeby V) at Silsoe, Bedfordshire, and showed how critical the planting date is in terms of germination. In 1974 Summerfield conducted controlled environment studies at Reading University.

"Eleven year (1960-70) growth and yield data for Fiskeby V grown at Norrköping, Sweden (latitude 58º 36'N), supplied to Bunting (1973, private communication) by Holmberg, indicate that the variety requires a 'heat-

© Copyright Soyinfo Center 2014

sum' of approximately 825 degree-days above 0ºC to bring about flowering and between 1,880 and 2,000 degree-days for completion of its growth cycle. The mean number of days from planting to harvest in the eleven year period was 133 but, perhaps more important, the range was from 115 to 165, reflecting to some extent the seasonal variation in temperature... (see also Holmberg 1956)."

"Fiskeby V would appear to be the only variety worthy of serious consideration in Britain at the present time... [but] for the crop to be a contender for a place in British agriculture, the variety will need further improvement through breeding."

"The real question is whether or not there is sufficient evidence at this stage for a higher level of research resources to be channelled into the crop." Address: National College of Agricultural Engineering, Silsoe, Bedford, England.

6296. Sandler, Sandra Takako. 1974. The American book of Japanese cooking. Harrisburg, Pennsylvania: Stackpole Books. 192 p. Illust. Index. 24 cm.

• ***Summary:*** The author, a third generation Japanese-American, reveals the secrets of successful Japanese-style cooking–specifically for the American cook. The three introductory chapters discuss tofu (p. 16, 23, 29, 36), shoyu (p. 20), and miso (p. 27, 35). Soy-related recipes include: Seafood in miso sauce (p. 54). Shellfish in soy-mirin sauce (p. 55). Miso soups (p. 57-59). Tofu & scallions soup (p. 60-61). Instructions for sprouting beans (incl. mung- and soybeans, p. 72-74). Vegetables with tofu & sesame dressing (with white miso, and "white sesame seeds, toasted and ground," p. 77-78). Eggplant and green peppers with miso dressing (p. 78-79). Fried okara (p. 79-80). Sweet cooked soybeans (p. 82). Inari-zushi (p. 89-90). Fish misoyaki (p. 111). Miso abalone (p. 112-13). Beef misoyaki (119-20). Sukiyaki (with tofu and soy sauce, p. 121-22). Pork and tofu (p. 135-36). Stuffed tofu (p. 138-39). Chicken teriyaki (with soy sauce, p. 145). Fresh tofu (p. 154-55). Homemade tofu (p. 155-57). Deep-fried tofu (p. 157). Batter-fried tofu (p. 158). Yakidofu (p. 158-59). Aburage (p. 23, 159). Fox noodles (p. 167-68). Udon in miso shiru (p. 168). Tempura and udon (p. 168-69). San bai zuke (p. 175).

Also discusses azuki beans (p. 23, 178), sweet azuki bean paste (*koshi-an*), sesame seeds, sesame oil (p. 28), sea vegetables, and mochi.

6298. Totten, George O. 1974. Japanese industrial relations at the crossroads: The Great Noda Strike of 1927-1928. In: Bernard S. Silberman and H.D. Harootunian, eds. 1974. Japan in Crisis–Essays on Taisho Democracy. Princeton, NJ: Princeton University Press. See p. 398-436. Proceedings of the Conference on Taishô Japan held at Quail Roost, North Carolina, in Jan. 1970. [49 ref. Eng]

• ***Summary:*** A detailed analysis of the strike against the Noda Shoyu Co. (today's Kikkoman) which had long-lasting, nationwide significance in Japan. "Up until three years after the First World War, the Noda workers led what could only be described as truly impoverished and wretched lives. They were recruited through four local bosses (*oyakata*) who got a rake-off on the workers' yearly wages which they negotiated with the company. Each worker had to sign a yearly contract, or more correctly a promissory note, to work for a year, stating the name of a guarantor as well as the *oyakata.* Four-fifths of the workers lived in shabby shelters provided by the plant, where they slept in two rows and ate the poor and scanty food provided by the company. This practice grew up because most of the workers were too poor to maintain a household."

The Noda local of the Japan General Federation of Labor (*Nihon Rôdô Sôdômei Noda shibu*) was founded on 15 Dec. 1921 by Koizumi Shichizô. It was comprised initially of about 300 workers at Plant 15 in Noda. The first strike, starting on 16 March 1923, lasted 28 days and ended in a compromise. In 1925 Japan's first Universal Manhood Suffrage Act was passed, enabling males over age 25 to vote, without any tax qualifications, thus politically emancipating much of labor for the first time and opening the door for labor-based political parties.

The great Noda strike began on 16 Sept. 1927, when the Noda Shoyu Co. had to close 16 of its 17 plants because 1,358 of the 2,092 employees had decided to strike to secure some 7 demands for better pay and working conditions. The main implicit demand was recognition of the union as a body with the right to bargain collectively. "In the following months, the company carried out several large-scale firings, first issuing an ultimatum to return to work, so that by December 20, 1927, all those on strike were officially discharged. Work had gotten back under way in Plant No. 17 10 days after the strike started, and as time went by the other 16 plants were replenished with some 550 temporary workers. By December, 80 per cent of pre-strike production was reached with 1,350 employees at work, 300 of whom had dropped out of the strike, and of these 150 were clerks, not plant workers... The company hired ultra-nationalist bully gangs to come in and rough up the strikers." The strike finally ended on 19 April 1928, more than 7 weary months (218 days) after it started. It was the longest strike in Japan prior to World War II. In effect, it destroyed the union. Only 300 of the 1,047 fired were allowed to return to work.

6299. Wakisaka, Toshio. 1974. Oya Hakata to koyadofu: Yachiyo-chô sangyô hattatsu shi [Oya hakata and dried-frozen tofu. History of industrial development in Yachiyo-cho]. Japan: Hyogo prefecture. 171 p. For tofu, see p. 82 to end. [5 ref. Jap]

• ***Summary:*** Hakata-ori is a type of weaving, originally from Kyushu (S.E. Japan). Oya is a small place in Yachio-cho, in Hyogo prefecture. This book is about two of Yachio-cho's famous products, Hakata woven silk and dried-frozen tofu (Koya-dofu). Koya-dofu was introduced to Yachiyo-cho, Kadota-Mura in 1852, when Teijiro Moriwaki (according to his diary) brought it back from Mt. Koya.

6300. Watanabe, Tokuji; Ebine, H.; Okada, M. 1974. New protein food technologies in Japan. In: A.M. Altschul, ed. 1974. New Protein Foods. Vol. 1A. Technology. New York: Academic Press. 511 p. See p. 414-53. Chap. 9. [80 ref]
• ***Summary:*** Contents: Introduction: Soy products, fish products, enzyme applications. Tofu: General description, new materials, new type products, large-scale production, trends in cost, kori-tofu and aburaage. Miso: General description, new technologies, new type products, problems of mycotoxin, packaging and preservation, trends in cost and consumption. Kamaboko and fish sausage–fish jelly: General description, new technologies, new materials–frozen surimi, packaging and preservation, trends in consumption. Textured vegetable protein: Soybean protein curd, wheat gluten, soybean protein sponge. Hydrolyzed vegetable protein (HVP). New enzyme applications: Liquefied fish protein concentrate (LFP), collagenase for poultry processing, removal of beany flavor from soybean by enzyme treatment, microbial rennet. The protein food structure of Japan.

Fig. 13 (p. 47) shows 3 pie charts, each giving the percentage of protein intake per capita from various sources at three different time periods. In 1921-25 only 9% of the total protein came from animal sources (6% from fish and 3% from other animal sources); 42% came from rice, 21% from soybeans, and 14% from cereal grains other than rice. In 1951-55, shortly after World War II, some 23% of the total protein came from animal sources (17% from fish and 6% from other animal sources–such as milk, eggs, chicken, pork, and beef); 32% came from rice, 15% from soybeans, and 20% from cereal grains other than rice. In 1969, some 30% of Japan's total protein intake came from animal sources (21% from fish and 19% from other animal sources); 22% came from rice, 12% from soybeans, and 13% from cereal grains other than rice. Thus the main trend seen during this period is the steady increase in the percentage of protein from animal sources and the corresponding decrease from plant sources. Source: Food Balance Sheet. 1970. Ministry of Agriculture and Forestry. Fig. 14 shows that these trends are apparently related to increasing per capita income and GNP. Address: 1-2. National Food Research Inst., Ministry of Agriculture and Forestry, Tokyo, Japan; 3. Tokai Regional Fisheries Research Lab., Fishery Agency, Ministry of Agriculture and Forestry, Tokyo, Japan.

• ***Summary:*** "HVP is produced from defatted soybean meals or wheat gluten by hydrolysis with hydrochloric acid followed by neutralization. This method was first employed by Ikeda (1908) in his pioneering work which led to methods for the production of MSG. Thereafter, much effort was given to improve the processing, the quality of the crystals of MSG, and the utilization of the residues containing many amino acids. The production of HVP was also begun in shoyu factories to provide material for mixing with tradition soy mash [moromi] in order to reduce the time required for fermentation, to increase the yield, and to accentuate the flavor. The major demand for HVP in Japan is as an ingredient of shoyu and *tsukudani* (preservable foods made from fish, meat, pulses [such as soybeans], or vegetables seasoned with shoyu, HVP, sugar, and other condiments)." The amount of liquid HVP (with a nitrogen content of 2.4%) added to shoyu annually is estimated to be 120,000 tons.

"Defatted soybean meal or wheat gluten is hydrolyzed with approximately 18% of hydrochloric acid and filtered. The filtrate is condensed by vacuum distillation to eliminate residual hydrochloric acid and volatile organic substances, and neutralized with sodium hydroxide or sodium bicarbonate to a pH value of 4.8-6.0 The neutralized liquid is then filtered and condensed again by vacuum distillation, followed by deodorization and decolorization if necessary. Paste HVP is prepared by concentration up to 80-85% of dry matter. Spray-dried powder or its pellet are also available.

"Hydrolysis by enzymes has been investigated, particularly for making shoyu. There are some patents on the hydrolysis by enzyme preparations from several origins for making HVP, although these processes have not yet been industrialized (Yoshida et al. 1959; Saito 1961; Iimura et al. 1962; Otani and Kagoshima 1964; Ikeda 1965a)." Address: National Food Research Inst.

6306. Andreas, Dwayne O. 1975. Presentation on ADM. Paper presented to the New York Society of Security Analysts. 11 p. Jan. 21. Unpublished manuscript.
• ***Summary:*** Mr. Andreas has been processing soybeans and other agricultural commodities constantly since 1938. Four of ADM's top executives come from competing companies: Mr. Walker from Ralston [Purina], Mr. Burket from Central Soya, Mr. Randall from Cargill, and Mr. Bean from Anderson-Clayton. In 1965, thanks to an entirely new technology that was developing for soybean processing, ADM was transformed from a conglomerate into a non-conglomerate focusing on food technology. "Thanks to a great job that had been done in research, ADM received basic patents on TVP (Textured Vegetable Protein; TVP is a registered trademark). This knowledge was immediately commercialized and TVP has been very successful... it is now produced by some 12-13 different companies."

"The Marshall Plan developed Western Europe and Japan into the greatest cash customers that the United States ever had... This global internationalizing of food distribution had the effect of disorienting much of the entire food processing industry. That is, a plant that was not located so that it had access to the world markets might have become worthless or obsolete overnight. And dozens did."

Currently ADM has about 17% of the soybean processing business in the U.S., 17% of the wheat milling, 25% of the barley malting, 25% of the margarine oil business, 30% of the linseed oil, and 27% of the durum flour business (the basic flour for making pasta products).

A four-horse team is pulling ADM in a certain direction for the future. "One is the edible soy business which includes our TVP and soy flours, in which we are the leaders, and will soon include our soy protein concentrates. It is inevitable that edible soy proteins will increase in use over the next 20 years by leaps and bounds on a worldwide basis. And it is for no other reason than economic compulsion. The cost of making good quality high protein edible products out of soy is so low compared to other protein sources that it is just a matter of how long it will take the food companies to learn how to use it in more ways. In the soy flour business many soy flours are now being used to replace dried milk products just as margarine once replaced butter and this use is due to grow substantially in the next few years. The soy fortified bread and roll products you saw today are examples of how protein levels can be boosted by 50% with little or no increase in cost. ADM is the largest producer in the world of soy flour.

"TVP business has an enormous potential, maybe largely outside of the United States. In every country where there is a balance of payments problem, and where they are importing meat, we get a terrific tail wind from the government in selling TVP...

"The second thing going in our favor is the continuing worldwide expansion of the margarine business. Margarine is replacing butter, and that's a trend that is unstoppable. This trend is fundamental to our business, since about eighty percent of all of our fats and oils, corn oil, soybean oil, go in margarine.

"A third part of our business which has almost unlimited future growth is the soybean meal portion, where we make a refined [dehulled] grade of soybean meal that's used by the poultry industry all over the world. Under today's technology, poultry is by far the cheapest form of meat that's commercially produced. It will expand very much faster than either pork or beef, because it's so much cheaper and so easy to produce, and that business will continue to grow enormously, worldwide.

"The fourth horse of our four-horse team is the corn refining business." We produce corn syrup and fructose [two different products], which are experiencing very rapid growth in demand. Two other very good firms, Standard Brands and the A.E. Staley Co. are now producing fructose, but suddenly most of the soft drink people have decided to use fructose, creating an enormous demand. So "we changed our plans and now plan to produce about 480 million pounds of fructose by next winter and to double that by sometime in 1976."

So the four-horse team pulling ADM into the future is edible soy products, margarine, soybean meal, and refined corn sweeteners (corn syrup and fructose). Address: Chairman and CEO of ADM.

6309. Pearce, Jean. 1975. Jean Pearce's How to get things done in Japan. Vol. 1. Tokyo: Japan Times Ltd. [iv] + 245 p. Jan. Index. 19 cm. [Eng]
• ***Summary:*** This book is composed of reprints of the popular and informative articles, answering questions from readers on a wide variety of subjects, that Jean Pearce wrote in her column in *The Japan Times* from 1 Jan. 1972 to 27 July 1974; they appear in this book in chronological order.

From 16 Oct. 1973 (p. 76): "Health foods" are now widely available in Japan, but familiar products are not always to be found. You can, however, find many soybean products, including natural soy sauce, and natural miso. "Try Nihon Kenko Shizenshoku in Shinbashi [Tokyo], phone 573-4181, or Shizenshoku Center in Shibuya, 461-7988. Both have restaurants that serve natural foods only."

Note: On pages 77-78 is a good history of Calpis.

From 8 Jan. 1974 (p. 118-19): "Health food remains a subject of interest... The basic Japanese diet, with a little discretion in the use of salt, is a health faddist's delight. Also on natural foods, a shop (Ishii Shoten, 1-2-7 Nishikata, Bunkyo-ku [Tokyo], phone 811-2457 in Japanese), that still makes by traditional methods roasted soybeans from mid-December through June, far superior, I'm told, to any of the imported varieties... 'A nice low-cal snack, and a good hors d'oeuvre...' They come with or without salt."

From 5 Feb. 1974 (p. 134): "A woman wants to learn how to make tofu. I have a recipe but I don't think I'll give it again. It is very difficult to do and the end result is more often failure than success. However, anyone can buy instant tofu at most Japanese food stores. It's easy to make, will be better than trying to do it yourself, and is inexpensive, ¥80 the last time I bought it but it has no doubt gone up. It makes two squares. The nigari she asks about is bittern, necessary for thickening [curding, coagulating]. Tofu is now available in many foreign countries. If you don't know where to look, call anyplace listed under Buddhist in the classified directory. Ask where they buy theirs."

From 12 March 1974 (p. 154-55): "Tofu lovers, united! There are lots of them and their sympathy was with the woman who was denied a do-it-yourself recipe in this very column. So kinder hearts provide the following.

"Two collectors [Shurtleff and Aoyagi] are compiling a book of tofu recipes, which includes a number for making tofu, using various solidifiers and soybean products. I'll let you know when it's published.

"A book, *Tofu Recipes,* was published by a tofu enthusiast after a year's visit to Japan. It is her first literary endeavor, a labor of love which will be understood by anyone who is a tofu devotee. Grace Kikuchi tells you how to make it and how to use it, relying on childhood memories and modern innovations. I'll be in the kitchen when I finish this column. You can be equally inspired if you send your order to Grace Kikuchi, 260 Sumac Lane, Ann Arbor, Michigan, U.S.A. Enclose $2.00. Somehow."

From 7 May 1974 (p. 184-85): "There is a new health food [natural food] restaurant in Tokyo, Hakumon ("White Gate"), just across from the Chuo University exit to the Shin Ochanomizu Station on the Chiyoda subway line, phone 291-9762. French owner Jimmy Dejeammes... I'd like to go back daily for the tofu that they make. Try the mochi made of brown rice and prepared in a variety of ways... All bread is baked there; high nutritional value... Among the beverages is Soyalac, made of soybean milk." It is made and distributed here by Saniku Shokuhin, the Seventh Day Adventist health food company. Neuroca, a Swiss coffee substitute, is also available at Hakumon. Phone before you go. Hakumon may be moving soon. Address: The Japan Times, Tokyo, Japan.

6310. Kushi, Michio. 1975. The unifying principle in the world of biology; Natural agriculture and home food processing. *Michio Kushi Seminar Report* (*Brookline, Massachusetts*). Winter. No. 5. Feb. 11. p. 13.
• ***Summary:*** A student asks "Should miso be boiled or not?" Kushi answers: "It doesn't matter. Again, it depends upon what you want. If you want to have yin type of miso with plenty of enzymes present in the soup to aid in good digestion, then you should not boil the soup after adding the miso. But, if you would like to have a strong miso soup which will make you yang, then you can boil it. This is a very controversial argument among macrobiotic people: should miso be boiled or not. It is a controversy not only in America but all over the world." Address: Brookline, Massachusetts.

6311. *Foreign Agriculture.* 1975. Japan's imports of U.S. soybeans down in 1974; Some gain now. Feb. 24. p. 9.
• ***Summary:*** The Japanese Soybean and Supply Consultative Council estimates that soybean imports from the U.S. for all of the Japanese fiscal year 1974 will be 3.08 million tons. In addition to the 3.1 million tons of soybeans that the U.S. provided in calendar 1974, the People's Republic of China is expected to have shipped another 230,000 tons, and Brazil about 50,000 tons. Total Japanese soybean utilization in 1974 is estimated at 3.6 million tons, including 2.76 million tons used by the crushing industry and 730,000 tons for traditional foods. Address: Office of U.S. Agricultural Attaché, Tokyo.

• ***Summary:*** Contains a description of "What is miso?" by Michio Kushi, and the "Song of Miso," a poem translated from the Japanese book *Miso Daigaku* by Mr. Kan Misumi. Its many Japanese terms are explained in footnotes. Address: Brookline, Massachusetts.

6321. Hashizume, Kazumoto; Kosaka, Kazuhisa; Koyama, Emiko; Watanabe, Tokuji. 1975. [Studies on the changes of the properties of soybean protein by freezing. IV. Production of new textured protein by freezing]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 30. p. 193-97. March. [7 ref. Jap; eng]
• ***Summary:*** When a soybean protein solution is frozen and stored, the protein becomes insoluble after thawing. This insolubilization is promoted by the presence of free sulfhydryl (SH) groups in the protein, heat denaturation, and the addition of a small amount of urea before freezing.

The resultant insolubilized protein forms a translucent porous mass, resembling a sponge. When this mass is mixed into sausage at the level of 40% by weight, it prevents the separation of free water and resulted in no significant difference in texture compared with ordinary sausage.

[On the varietal differences and heritabilities for seed protein percentage and sulfur-containing amino acid contents in cultivated soybeans, *Glycine* max Merrill]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 30. p. 168-74. March. [12 ref. Jap; eng]
• ***Summary:*** Fifty-five Japanese soybean varieties were tested. The protein content ranged from 34.8% to 49.1%. The varieties with the highest protein content were: Kosodefuri 49.1%, Gokuwase-hayabusa 48.5%, and Gokuase-edamame 47.1%.

The methionine content ranged from 0.67 to 0.6 gm per 16 gm of nitrogen. The cystine content ranged from 0.62 to 1.22 gm per 16 gm of nitrogen. The total sulfur-containing amino acid content (methionine + cystine) ranged from 1.29 to 2.15 gm / 16 gm of nitrogen. The varieties with the highest total sulfur-containing amino acid content were: Kosodefuri 2.15, Gokuwase-hayabusa 2.08, Sango-wasedaizu 2.08, and Gokuase-edamame 2.06. Reprinted from *Japanese J. of Breeding* 24(2):81-87 (1974). Address: National Food Research Inst., MAFF, Tokyo, Japan.

• ***Summary:*** Hamanatto, a salty fermented soybean product, is made only in the district around Lake Hamana in Shizuoka prefecture. There are two methods of making Hamanatto: (1) Using artificial inoculation with molds belonging to the genus *Aspergillus,* the method used at Yamaya and at Horinji. (2) Using natural inoculation and fermentation by organisms living in the koji room (*muro*), the method used at Daifukuji. Note: This is the earliest document seen (Nov. 2011) stating that Hamanatto [fermented black soybeans] were made at Horinji temple in Hamamatsu.

The main microorganisms that are considered to play an important part in making Hamanatto belong to the *A. oryzae*

6327. Mustam, Muhammad. 1975. How to make tempeh at home and prepare Indonesian-style recipes using it (Interview). Conducted by William Shurtleff in Tokyo, Japan, March. 1 p. transcript. Conducted by William Shurtleff.
• ***Summary:*** Note: William Shurtleff and Akiko Aoyagi, living in Tokyo, were first introduced to tempeh in March 1975, when friends at The Farm, a large spiritual community in Tennessee, sent them *The Farm Vegetarian Cookbook,* which had just been published. They read the section on tempeh with great interest.

That same week, on an introduction from the Indonesian Embassy, they visited Mr. Muhammad Mustam, a former tempeh maker living in Tokyo. He and his wife showed Shurtleff and Aoyagi how to make tempeh on a home scale; they were surprised at how quick and easy the process was. Two days later the Mustams invited Shurtleff and Aoyagi back to their home and used the freshly-made tempeh to prepare a feast of their favorite tempeh recipes. Their guests later wrote in the preface to their *Book of Tempeh:* Such appealing textures and savory flavors we had rarely tasted before. We were so impressed that we included the Mustams' tempeh making method and five recipes in our *Book of Tofu* that was just going to press."

In Indonesia, typical tempeh makers use 10 liters of soybeans at a time, and they prepare the tempeh in their own home. They soak the beans for 24 hours, then tread them underfoot in tightly woven bamboo baskets that are about 50 cm deep and 3 feet in diameter; the water drains out slowly due to the tight weave.

At home, rub soaked soybeans with one hand to remove the hulls, then float them off with running water. It is okay if the beans are split lengthwise into halves (two cotyledons), but try not to break the beans into small pieces. Then simmer the dehulled beans for 45 minutes over low heat and allow them to stand in the cooking water overnight; this causes a mild acid to form. Rinse and drain 5-6 times to give a milder, finer flavor. Add fresh water and cook over low heat for 15 minutes (the beans are still quite firm), then pour into a strainer and allow to cool to room temperature. Wash hands. Crumble 1½ teaspoons ragi (Indonesian tempeh starter cake, which looks like a tan cake of pressed sawdust) over the beans and mix it in. Spread the inoculated soybeans on a piece of aluminum foil (7 by 9 inches). Fold over all 4 sides to form a cake 4 by 3 by ½ inch thick. Seal the packet. Allow to stand at room temperature for 48 hours.

The Mustams prepared the following recipes: Tempeh Goreng, Tempeh Kemul, Tempeh Bacham, Tempeh Kering.

Note: This is the earliest document seen (Jan. 2012) that describes how to make tempeh at home, by hand. Address: Former Indonesian tempeh maker, living in Tokyo, Japan.

6333. Japan Food Corporation. 1975. Kikkoman sauce: Now available at most supermarkets (If not, please ask them to stock.) (Ad). *Toronto Star* (*Ontario, Canada*). April 2. p. E3.
• ***Summary:*** "Here are six good reasons why: Possibly the most rewarding flavour discovery you will ever make. No hydrolized protein, no corn syrup, no caramel, no artificial flavour or colour. Just brewed naturally for 12 months. Brewed purely of select quality soy beans, wheat, salt & water (nothing else) [except koji starter culture, spores of the mold *Aspergillus oryzae*]. Recommended by Good Housekeeping. Winner of 30 major international awards for quality, taste and excellency. And you'll like it.

"Send one Kikkoman label by scraping off any portion and 25 cents for your Kikkoman 'Ikebana' and recipe ideas (The label is well pasted)."

An illustration shows a bottle of Kikkoman soy sauce.

Note: The title of the ad calls the product "Kikkoman sauce," not "Kikkoman soy sauce." Address: 25-6 Connell Court, Toronto, M8Z 1E8 Canada. Phone: (416) 252-5728.

6334. Miller, Harry W. 1975. Re: On soymilk, tofu, and their production. Letter to William Shurtleff, c/o Aoyagi, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan, April 30. 2 p. Typed, with signature on aerogram.
• ***Summary:*** "Yesterday Apr. 28 your letter arrived and it was so helpful and interesting. I am answering your enquiries as best I can. The first is the hot and the cold grind. Soybeans are finding their way in so many types of foods these days and I think you will find depending on their place in the foods we will find varying procedures. On account of costs economy must be considered. Our research tells us that grinding with Stone Buhrs and disintegration with blenders equal same water soluble amount of solids. On a large scale Grinders are cheaper than disintegrators but [for] small production blenders are better.

"Also our findings keeping the temperature under 150 degrees Fahr. of the slurry before filtering gives us approximately the same yield as [if] brought to 212 degrees [boiling]. So when we make soy milk the higher temperature to filtering brings out of the fiber more of the bean taste. This is a question debatable, I know.

"When making ToFu we bring the slurry just up to boiling and our directions is wrong on saying the water extract is treated same for tofu as for soy milk. We know that long boiling or high pressure for at least 7 to 8 minutes at 100 Centigrade is needed to rid the bean of trypsin inhibiter or perhaps gas former. But not for the tofu. The figure of adding 556 grams cerelose or corn syrup to 16 lbs or 7½ kilos soy extract for milk is rather high, more than 7%. Though 7% is about the standard for carbohydrate in Mother's Milk. And we are inclined to follow the formula of human milk rather than Cows Milk for mankind. In our regular milk formula we aim to add 6% carbohydrate, as carbohydrates of soybeans are questionable.

"Providing you get the soy flavor out in processing. I agree that soymilk is good with less corn syrup. The sheet I sent you is the first run off and it needs some corrections and the sugar content should be lowered 1¼%. I have tried to calculate what the total solids are in your finished soy milk. Your water dilution may be less than ours. Out of 5 pounds of soybeans we make 50 pounds of soy milk, slightly over 6 gallons. To this has been added 3 pounds cerelose, 3O grams salt, 1 pound of corn oil. The resulting milk tests 13% solids.

"You make reference to our cutting the curd in 2 inch squares. It is general practise in cheese makers in this country to cut the curd by that, as the curd begins to form you run a sharp-edged stick, or in cheese plants a stainless steel long knife passing three the slit area is curd, so that the curd gathers together between the cuttings, and they know when best to separate and place in cheese pressing boxes. This may not be necessary in soy curd but it seems to be a guide to us when to place and or transfer to the cheese pressing box.

"We surely have something to learn [about] how to make so much Tofu out of a pound of soy beans. Your beans may be a little heavier in protein as we find the large beans we get yield more protein, but not that difference. We have reached 3 pounds but that depends on when we stop dewatering the curd, but any curd more than 3 pounds out of 1 pound of soy beans is hard to handle. But on Tofu we have much to learn, however on Soymilk and building up of maximum yield of total water soluble solids as also taste wise, that is getting rid of the beany flavor, we have definitely made progress and I think moved ahead of any that we have heard of. As for mouth feel, possibly more concentrated formula may be acceptable. The ratio of ingredients we take to the human milk formula and not cows milk made to rear a calf, a hairy animal and rapid grower. I did not have time this evening to review you chapter 10 on soy milk, as I am writing this at home and it is filed at my office with Loma Linda Foods. We have had experience in the above named coagulants, tried them all except sea water and sea salt. We mostly prefer Calcium sulphate and Glucono delta Lactone for convenience.

"I know that the Japanese are very meticulous in making the soy curd, and the people of using same. To translate their

© Copyright Soyinfo Center 2014

methods in writing, you have done very well, but still I can assure you that experience is needed in this field. Soy milk and Tofu the world as for western nations has yet to learn to use. Thanks for your letter and your points well taken and I remain, very sincerely yours, Harry Miller.

"Bill, I have written this letter at the end of a very busy day with many interruptions, so it is so poorly typed I almost decline to mail it but it does explain to you what we are doing. I assure you that soy foods are very hard to put over in U.S.A. but people are learning, they are very sensitive to soy flour and Tofu also soy Milk well made has a field for the future. HWM."

Note: Dr. Miller was age 95 years, 9 months and 28 days when he wrote this letter by himself, using a manual typewriter. He was born on 2 July 1879 in Ohio. Address: M.D., 11384 Norwood Ave., Riverside, California 92505.

Address: Tokyo Nogyo Daigaku, Sakuraoka 1-1-1, Setagaya-ku, Tokyo, Japan.

6336. Okubo, Kazuyoshi; Waldrop, A.B.; Iacobucci, G.A.; Myers, D.V. 1975. Preparation of low-phytate soybean protein isolate and concentrate by ultrafiltration. *Cereal Chemistry* 52(2):263-71. March/April. [18 ref]
• ***Summary:*** "Phytic acid, the hexaorthomonophosphate ester of *myo*-inositol, occurs at fairly high levels in grains and oilseeds as the calcium magnesium salt, phytin. In soybean meal, roughly 70% of the total phosphorus is accounted for by phytin."

The authors describe a process for removal of phytate from defatted soybean meal to produce low-phytate protein concentrates and isolates. The process involves two steps: (1) dissociate the phytate from the protein; (2) Remove the dissociated phytate from the protein by ultrafiltration using a membrane permeable to phytate but impermeable to protein.

The section titled "Ultrafiltration Experiments" (p. 265) states that the retentate was maintained "at a constant volume throughout the dialysis by ultrafiltration (diafiltration). During diafiltration... the retentate was analyzed for total phosphorus. Upon completion of diafiltration, the retentates were recovered by freeze drying and analyzed for nitrogen and phosphorus." Page 268 describes "Phytate removal by diafiltration" and the chemical composition of "soybean protein isolates prepared by diafiltration." Page 270 states that "Diafiltration is an efficient way to prepare protein concentrates low in phytate from defatted soybean meal and flours." It works better than acid leaching. Good results were obtained with diafiltration of a soybean slurry (pH 3.0) containing calcium chloride (0.5 M).

Note 1. This is the earliest English-language document seen that uses the word "diafiltration" in connection with soybeans.

Note 2. This is the earliest English-language document seen (Aug. 2003) that contains the term "soybean protein isolate" (or "soybean protein isolates"). 6340. Kojima, Yoshiko. 1975. Visit by ASA Japanese Young Executive Soy Protein Study Team (Interview). Conducted by Dr. Walter Wolf of NRRL, Peoria, Illinois 61604, May 5. 1 p. transcript.
• ***Summary:*** Miss Kojima is the ASA interpreter. U.S. soybeans give better yields of tofu than domestic (Japanese) or Chinese soybean. Consequently about 80% of the tofu in Japan is made from U.S. soybeans.

6341. Rothschild, Emma. 1975. A reporter at large [The world food economy and the 1974 World Food Conference near Rome, Italy]. *New Yorker.* May 26. p. 40-44, 49-50, 52, 54, 56, 58, 62-66, 68-70, 72-73, 76. See p. 50, col. 3.
• ***Summary:*** The world is in the midst of a food crisis. To many it seems to be a result of drought and natural disaster. But actually is a "sign of lasting insecurity in the world food economy. It is political and economic, and it could have been avoided." As with petroleum problems, it has been "caused by the decisions and policies of people and governments."

The World Food Conference, convened in November 1974, brought together more than 5,000 delegates including many high government officials. From the USA: Henry Kissinger (secretary of state), Earl Butz (secretary of agriculture), and Dr. Don Paarlberg (chief economist at the USDA). The Flanigan Report tried to analyze the world food crisis. William R. Pearce, a vice-president of Cargill, Inc., "said that in the nineteen-sixties the United States 'had excess capacity in corn and soybeans,' and therefore set out to encourage the development of a different diet pattern around the world.'" It encouraged the use of feed grains in meat production. American grain exports increased from 32 million tons in 1971 to 76 million in 1973. Canada and Australia also had huge grain exports. The USSR, Japan, and the European countries (collectively) each now feeds more than 100 million tons of grain to its animals. The USDA had succeeded in reducing U.S. surpluses.

6344. Miller, Harry W. 1975. Re: On soymilk, tofu, and their production. Letter to William Shurtleff, c/o Aoyagi, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan, June 4. 2 p. Typed, with signature on aerogram.
• ***Summary:*** "Your much appreciated letter has been neglected along with considerable other correspondence. Two reasons we have been on a very crowded program of Research and that I have been away for a time. I do thank you for your notes on some of the items that we have written you.

"First point about the Cooking of soy milk. We are agreed on use of blender for home minimizing of soy bean particle size, though we do have a small Mexican mill use to grind soaked corn and works well but is hand driven and time consuming, can use for making peanut butter as well costs around US $15.00, hard to buy in U.S.A. The double boiler works quite well with brine in outer chamber and commercial salt is cheap here, but I also agree that by constant stirring, boiling can be carried on safely. The Chinese have an ideal system of steam jet cooking in which the lower chamber of a welded together double boiler in which steam is generated in the bottom pan and led by a pipe to the bottom of the cooking chamber so that you get no scorching and active boiling by the release of live steam into the milk of the upper pan. Its simple and takes the place of the steam boiler, except its adapted for milk and To fu making.

"Regards the richness of soymilk, we find the Americans like that thin soymilk best. Possibly its because the soy flavor is more diluted. The rule here in formulation is to make a gallon of Soy Milk out of one pound soybeans.

"As Soy milk keeps well for a week under refrigeration (40 degrees Fahr.) so the house wife likes to grind cook and prepare a weeks supply of soymilk for the family. But as yet the home method of making soymilk is just in the beginning and not many do it.

"You refer to the high percentage of cerelose used here in soymilk as compared with acceptance in Japan. Let me explain our position about the formulation of Soy Milk. The ratio of fat, protein and carbohydrate differs greatly as between cows milk, mare milk, pigs milk, water buffalo milk, human Milk and other animals. These proportions are reflected in the rate of growth, the question of a large hair coating as in the cow and sheep, the energy requirement as for energy nature does not choose to use Protein for combustion to work, its function is to repair muscles or care for protein loss in secretions and body regulators such as the ductless glands, Thyroid, adrenals etc., etc. for wach [?] animals growth an analysis should be the guide, for the first year of growth supplied by milk is a good guide. Human milk formula is fat 3.5%, protein 1.7 percent, Carbohydrate 6 to 7%. For an adult after growth 35 to 50 grams seems

© Copyright Soyinfo Center 2014

adequate Protein. Therefore we lean strongly to a standard formula for Soy Milk should be fat 3 to 3.5%, Protein 2 to 2.4%, Carbohydrate 6%. In a one to seven or eight dilution the soybean will yield almost 3% protein, a half the needed fat and so we add 2% fat in the form of liquid vegetable oil and as for carbohydrate edible carbohydrate is rated very low possibly not more than 1% so we add 5% sugar and prefer the cereal sugars with low sweetening effect such as corn syrup.

"Such a milk as I have just described and what we are making and aiming at can be used in cooking, baking as also for general beverage purposes.

"Now just a final word on Tofu, and we have much to learn to get 8 [?] pounds of marketable Tofu out of one pound of soybeans. Since To fu is exposed to heat after its made as milk is not, thus we pressure cook milk 10 minutes and Tofu just brought to boiling point and then curdled. In Tofu Making here when the curd jells, by raking a paddle a few times thru same seems to hasten the curd preparation to be transferred to the pressing box. It need not be two inches 3 or 4 inches divisions. What you have written on soymilk and Tofu is most interesting. Regret delays. with best wishes, very sincerely, Harry W. Miller.

"We have much to learn and am now working on making a loaf Cheese. We have made some progress and believe that we shall solve the problem in time." Address: M.D., 11384 Norwood Ave., Riverside, California 92505.

6345. Freckmann, James K. 1975. Soybean crops draw attention of growth areas. *Foreign Agriculture* 13(23):10-11. June 9.

• ***Summary:*** Summarizes the regional conference on soybeans at Addis Ababa in October 1974. The following developing countries are trying to stimulate soybean production:

"Ivory Coast: Crash program started in 1974 to grow soybeans for seed on about 173 acres. About 2,500 acres are to be sown in 1975... Tanzania: Soybean production was first tried in 1907. About 1,800 acres sown to soybeans are in various trials as an intercrop for small farmers and another 2,000 acres have been sown in a peanut area. Japanese are seeking rights to grow soybeans for export to Japan.

Ethiopia: About 60 metric tons of soybeans were grown in 1973 and about 80 tons in 1974 for the Food Nutrition Institute for use in human (baby care) nutrition. About 700 tons of soy flour were imported from the United States in 1974...

India: Area sown to soybeans may reach about 750,000 acres by 1980, compared with about 210,000 acres in 1974. Twelve processing plants, of which five are solvent extraction plants, average 50 tons of beans per day. These plants have a total capacity of 83,000 tons annually, but are now processing only about 40,000 tons. Nigeria: Government has plans to plant 100,000 acres by 1980 for export crops...

Sierra Leone: Some trials have been carried out since 1966, but no commercial production has been tried or contemplated...

Ghana: Soybean production was first tried in 1906, with poor results. In 1972, the Government decided to try again in hope of reducing large imports of soymeal and oil. Trials are still being conducted. About 1,300 acres are to be sown to soybeans in 1975...

Rwanda: Soybeans were grown on about 4,000 acres in 1974, and plans are to increase this area to 10,000 acres over the next few years. All current production is for domestic food... A French aid group is encouraging production. Sri Lanka: Soybean crops were first tried in 1947. Varietal testing is now being conducted, and about 5,000 acres were planted in 1974 on rice land as a rotational crop. Iraq: About 13,000 acres were assigned to a seed multiplication scheme in 1974... Saudi Arabia: Varietal testing is planned."

Note 1. This document contains the earliest date seen for soybeans in Ghana, or the cultivation of soybeans in Ghana (1906). However there is good reason to distrust this very early date, since no source is given and since many earlier reports give the date of introduction as 1909.

Note 2. This document contains the earliest date seen (June 2007) for soybeans in Iraq, or the cultivation of soybeans in Iraq (1974; one of two documents). The source of these soybeans is unknown. Address: U.S. Agricultural Attaché, Nairobi, Kenya.

6355. Saio, Kyoko; Terashima, Masahiko; Watanabe, Tokuji. 1975. Food use of soybean 7S and 11S proteins: Changes in basic groups of soybean proteins by high temperature heating. *J. of Food Science* 40(3):541-44. May/June. [10 ref]
• ***Summary:*** This paper seeks to clarify the change/s in basic groups of 7S and 11S proteins during heating at 100ºC to 170ºC.

Table 2 shows that the gross structure of the subunits remains intact during heating to about 125ºC, and is little degraded as the temperature rises to 150ºC. However above 150ºC the structure is degraded.

The solubility shows a rapid decrease during heating to 105ºC, then a slow increase during heating from 105ºC to 150ºC, followed by a rapid increase as the temperature rises above 150ºC.

The binding force shows a rapid increase during heating to 105ºC, then a slow decrease during heating from 105ºC to 150ºC, followed by a rapid decrease as the temperature rises above 150ºC. Address: National Food Research Inst., Tokyo.

20(2):89-106. July 31. [17* ref. Eng]
• ***Summary:*** The known species of the genus *Matsumuraeses* are reviewed. A key for the identification of the males based on the genitalia is included. One new species is described and redescriptions or notes are given of others. The genus was originally established as monotypic by Issiki in 1957. The host plants are mainly *Papilionaceae.* Only *Matsumuraeses phaseoli* (Matsumura; originally named *Semasia phaseoli* Matsumura in 1900) and *M. falcana* (Walsingham; originally named *Eucelis falcana* Walsingham in 1900) are pests of the soybean.

M. phaseoli uses as its host plants: Azuki beans and soybeans (*Glycine max* and *Glycine hispida*). Distribution: Japan (Hokkaido, Honshu, Shikoku), North Korea (Phiongjang-si district), and USSR (Amur district).

M. falcana uses *Glycine max* as one of its hosts. Distribution: Japan (Hokkaido, Honshu, Shikoku, Kyushu), China (Zi-kawy), Taiwan, Nepal.

M. capax is a new species, which uses as its host the leaves of *Astragalus membranaceus* Bunge in March and April. Its distribution includes Mongolia. It is not clear in which countries the insects were found growing on soybeans. Address: 1. Inst. of Systematic and Experimental Zoology, Polish Academy of Sciences, Krakow, Slawkowska 17 [Poland]; 2. • ***Summary:*** This interesting magazine began publication in July 1975, shortly after the American soybean embargo of 1973, primarily to help Japanese commercial soybean buyers keep informed on the status of soybeans worldwide. However the magazine also contains many interesting articles on soyfoods, including some of historical interest. Address: #2 Makoto Bldg. 5F, 1-4-4 Toranomon, Minato-ku, Tokyo 105, Japan.

6360. Erewhon Trading Co. [Los Angeles, California]. 1975. Wholesale price list. July 1975. Culver City, California. 10 p. Catalog and price list.
• ***Summary:*** On the front cover is a copy of an analysis of carrots performed by Agri-Science Laboratories Inc. of Los Angeles. They contain no Organo-phosphates–None detected as Parathion < 0.010 ppm.

Products include: Whole grains. Cereals. Flours–Freshly milled whole grains (incl. Raw soy flour, organic). Beans (incl. Soybeans, organic, Texas {10 or 16 lb}, Soybean flakes, organic, Texas). Butters (incl. Peanut butter, Sesame butter). Applesauce. Carbonated drinks. Juice. Chips. Goodies. Nik's Snaks. Granola. Soybean products: Tamari soy sauce (4 sizes, 8 oz to 4.7 gal). Hacho miso, soybean paste (1 lb or 44 lb). Mugi miso, Barley-soybean paste (1 lb or 44 lb). Kome miso, Rice-soybean paste (1 lb or 44 lb). Sea vegetables. Specialties (incl. Kuzu arrowroot, umeboshi {Plums pickled in brine}, Sesame salt). Seeds. Nuts. Fresh produce–Organic. Dried fruit–Bulk. Dried fruit–Packaged. Books and flyers (Deaf Smith County Cookbook, Oil Story, Pasta Cooklet). Redwood rennetless natural cheeses (Raw or pasteurized). Pasta (Bulk or packaged, incl. Soya-rice shells). Salt. Oils (incl. Soy oil). Erewhon packaged goods: Grains, cereals, flowers, seeds, beans. Teas. Celestial Seasonings bulk herb teas or tea bags. Cosmetics. Cooking utensils.

Inserted is a letter on Erewhon letterhead from Loren M. Spector, general manager, dated 1 July 1975. It begins: "Dear customers: Please find enclosed our summer price list." On the back are "July specials." Address: 8454 Steller Dr., Culver City, California 90230. Phone: (213) 836-7569.

6366. Ichiyama, Morio. 1975. Noda no rekishi [History of Noda]. Nagareyama, Chiba prefecture, Japan: Ron Shobo. 301 p. First ed. published in 1958 under title: Chiba-ken Noda Kyodoshi. [Jap]
• ***Summary:*** In the section titled "People from Noda who became known worldwide," the first person profiled is Shinzaburo MOGI (p. 263-65). "Mr. Shinzaburo Mogi, 5th son of the 5th Shichirouemon, was born in 1872 Feb. 27 at Noda. He studied at Tokyo Kosho (later Hitotsubashi Univ.), then left school after graduation. In 1892 he went to the USA. Initially, he worked for a milk company in Toronto, Canada. Then he worked at the Chicago [Illinois] branch office of Yamato Shokai. In 1897 he established Yamato Yunyu Co., an import company, and became its president. In 1913 he received Mr. Tsuneo Tanba as a general manager, to manage the soy sauce plant [?]. Under Mr. Tanba were Mr. Kitazawa and Mr. Kunihara.

Yamato Shokai was a company in Yokohama. whose president was Mr. Takeshi Oba. Its capitalization was 1,000,000 yen stock, half of the money put up by Junjiro Ishii and half by Mr. Shichirouemon Mogi. In 1907 in Denver [possibly some city other than Denver, Colorado?, says Ken Mogi IV] he managed a soy sauce plant. Later in Toronto, Canada, he had a relationship with a soy sauce plant. But neither of these soy sauce plants was successful. At International Trading he worked with Mr. Ichizaeomn Morimura (see History of Yokohama [which Ken Mogi says he would like to read]).

Mr. Tsuneo Tanba (a collector of ukiyo-e [color wood-block prints of everyday life in old Japan]), who worked under Mr. S. Mogi, said that Mr. S. Mogi, a Unitarian Christian, did not smoke or drink alcoholic beverages. He loved soy sauce, and he never left any soy sauce on his plate after a meal. He said: "I am not willing to go back to Noda. I do not want to manage a soy sauce plant in Noda."

When he was a student, Mr. S. Mogi helped Mr. Tokuzo Fukuda (later a famous scholar) by giving him 2.5 to 3 yen every month. Mr. S. Mogi asked his father to give Mr. Fukuda 6-9 yen per month for 1½ years. The father did not understand the situation so he visited S. Mogi's dormitory and found out the facts and was satisfied. On 1 Dec. 1946 Mr. Shinzaburo Mogi died.

Note 1. Translated by Kenzaburo "Ken" Mogi IV from the edition of 1975 (Showa 50 Aug. 1), for William Shurtleff of Soyfoods Center. Ken Mogi spent a great deal of time trying to find evidence that his ancestor, Shinzaburo Mogi, started a soy sauce plant in Denver, Colorado. He visited Denver in search of evidence. As of 2004 he stated that this was still a theory, NOT a proven fact.

Note 2. As of Feb. 2007, it is unclear whether or not Shinzaburo Mogi ever started a soy sauce plant in Denver, Colorado, or anywhere else in North America. There is no firm evidence that he did, only the memories of two people and some photos of the foundations of an old building. One of them, Tsuneo Tanba, is mentioned above. Yet Mr. Tanba gives no details. Note 3. Mr. Morio Ichiyama was born in 1897. Address: Noda, Japan.

6367. Butz, Earl; Abe, Shintaro. 1975. The Butz-Abe Understanding, 1976-1978. Washington, DC. 3 p. Unpublished typescript. 28 cm.
• ***Summary:*** "The Butz-Abe Understanding grew out of a meeting between the then U.S. Secretary of Agriculture and the Japanese Minister of Agriculture (and Forestry) on August 12, 1975 in Washington [DC]. The details of the Understanding were specified in a November 7 letter by Butz to Abe (a copy is attached), outlining 'trade targets for the coming three years for grains and soybeans.'"

"There were two important developments in the early seventies [1970s] that were precursors to this agreement. First, as a result of worldwide shortfalls in grain production in 1972, U.S. wheat and corn exports increased 80 and 50 percent, respectively, over the previous year with large volumes going to the centrally planned economies, notably the USSR. This represented a major shift in the pattern of the U.S. trade. Until 1972, U.S. agricultural exports to the centrally planned economies, with the exception of Eastern European countries, were negligible. Whereas the USSR was a residual market for U.S. wheat in 1971 (No. 42), by 1972 it became number one, and likewise in 1973. This situation was similar for coarse grains. The USSR purchased no coarse grains from the United States in 1970 but then became the second most important U.S. market in 1972 and 1973. Japan, on the other hand, traditionally had been a stable market for U.S. agricultural commodities, purchasing large quantities of coarse grains, wheat, and soybeans annually for many years.

© Copyright Soyinfo Center 2014

The USSR is not the only country that has shown irregularity in the size of its grain purchases from the United States, but because of the abruptness of its entry into the market and the size of its purchases, it had an important impact on U.S. and world commodity prices. In light of this, and the fact that other countries were becoming more and more dependent on imported grains, Japan was interested in securing its grain supplies from its most important supplier of agricultural products, namely the United States.

"The soybean embargo in 1973 was the second precursor to the Butz-Abe Understanding. Because soybeans were in short supply in mid-1973, as an inflation-fighting measure, the U.S. secretary of Commerce imposed an embargo on the sport of soybeans, cottonseed and various meal and oil products from these commodities until all controls were lifted on September 21. The soybean embargo and the tripling of oil prices in 1973 are still mentioned as the two most important "shocks" to the Japanese economy during the early seventies. However, whereas the tripling of oil prices had a real and lasting effect on its economy, the soybeans embargo was viewed as a symbolic of Japan's vulnerability to interruptions in food supplies resulting from policies in major exporting countries. In actuality, the embargo did not affect the volume of soybean imports that year since Japan imported a record volume from the United States in 1973."

In 1974 Mr. Abe was named Minister of Agriculture, Forestry and Fisheries, the first of four Cabinet posts he held. Later he served as chief Cabinet secretary, Minister of International Trade and Industry, and Foreign Minister. He died in May 1991 at age 67. Address: 1. Secretary of Agriculture, USA; 2. Minister of Agriculture, Forestry and Fisheries (MAFF), Japan.

6369. **Product Name:** [Tofu].
Foreign Name: Tofu.
Manufacturer's Name: Tofu shop.
Manufacturer's Address: Colonia San Juan de Yapacaní, lowlands of Bolivia. Phone: 2-5194.
Date of Introduction: 1975 August.
New Product–Documentation: Tsuguyoshi Suzuki, et al. 1981. *Ecology of Food and Nutrition* 11(2):107. Nov. "Changing food consumption of Japanese immigrants in the lowland of Bolivia." In July and August 1975 members of this community could buy tofu at a tofu shop in their community. The community was organized in 1955, and could have started as early as that date. Note: This is the earliest known commercial soy product made in Bolivia.

6370. Weaver, Greg; Thompson, Jay F. 1975. Re: Making tofu at The Zen Center, Rochester, New York. Letter to William Shurtleff, c/o Aoyagi, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan, Sept. 29. 3 p. Handwritten, with signature.
• ***Summary:*** "Received your letter / tofu instructions a little over a month ago–many thanks! We've made the tofu 3 times, with great success... We'd very much like to make tofu on a larger scale now... Is it possible to send on instructions for a community scale operation? deepest gratitude for this."

Note: This is the earliest document seen (March 2013) concerning the company that later became Flying Cloud Tofu (May 1977), then The Tofu Shop (1977), then Northern Soy (1979), in Rochester, New York. Address: 1. The Zen Center, 7 Arnold Park, Rochester, New York 14607; 2. 21 Girton Place, Rochester, NY 14607.

• ***Summary:*** The title page depicts this as "An assembly of information describing protein crops, status of ingredient manufacturers and marketing, potential markets, research effort, government incentives and regulations, protein status reports, and sources of information."

Contents: Introduction. Protein crops: 1. Trends in breeding Canadian protein crops. 2. Statistical summaries, by crop, of production area, yield, production, farm price, farm value and protein yield.

Manufacturing: 1. Manufacturers, distributors, and vegetable protein associations in Canada, U.S.A., United Kingdom, Australia and Japan (incl. Canadian Vegetable Protein Association, Don Mills, Ontario; Food Protein Council (USA)). 2. Extraction processes for broad bean protein, oilseeds, soybean protein, rapeseed protein, wheat gluten, oat protein, corn refining, alfalfa protein.

Markets: 1. Canada's position in world plant protein markets. 2. Canada's position in world gluten markets. 3. Projected growth of plant protein food ingredients.

Tariffs: 1. Tariff description, by country and BTN number. 2. Canadian tariffs on vegetable flours, protein, oilseeds, oilcake and meal. 3. Countries entitled to British Preferential Tariff, Most Favoured National Customs Tariff, General Tariff, General Preferential Tariff.

Regulations: 1. Status of plant protein under Canadian Food and Drug Regulations. 2. Canadian regulations–protein and fat content in simulated and extended meat products. 3. Problems in evaluating protein quality. 4. Aspects of current U.S. legislation. 5. Proposed revised regulations for plant protein in U.S.A.

Government incentives: 1. Federal government

© Copyright Soyinfo Center 2014

assistance programs. 2. Provincial government assistance programs. 3. POS Pilot Plant Corporation.

Research effort: 1. Estimate of research effort, in man-years, on utilization of plant protein in Canada. 2. Non-exhaustive list of research topics on plant protein in Canada.

Status of Canadian plant protein development: 1. Canadian role in development of plant proteins. 2. Production and utilization of sunflower. 3. Current status of leaf protein. 4. Status of rapeseed protein. 5. SCP status. 6. Review of buckwheat as a potential source of human food. 7. Status of oat protein.

U.S.A. situation: 1. Review of "U.S. Plant Protein Situation." 2. Non-conventional food sources. Major sources of information on plant proteins. Address: Canada.

6375. *Soybean Digest.* 1975. Far East soybean demand to grow. Sept. p. 21.

• ***Summary:*** "H. Nakamura, director of Hohnen Oil Co. Ltd., in Tokyo, explained that the demand for soybeans in Japan is determined largely by the amount of demand for soybean meal."

Japanese soybean processors are concerned with the effects of the 1973 U.S. soybean embargo, hope for more stable soybean prices, and wish that America would develop soybean varieties for different uses and with different compositions (such as high protein or high-oil varieties).

"Assessing the potential of future soybean exports from the People's Republic of China, Nakamura said any increase in Chinese soybean production will probably be absorbed in the domestic market. The Chinese consume only 10 kilograms of soybeans per capita per year, compared to more then 30 kilograms per capita in both Taiwan and Japan, he noted.

"'Low yields of soybean production in China (12 to 13 bu/acre) indicate a great potential for increasing Chinese soybean production in the future,' he said. 'China could at least double its soybean production on the same acreage as today.'"

6376. *NHK Kyo no Ryori* (*Tokyo, Japan*). 1975. Jiman ryôri: Biru Shurutorefu. Tôfu [Recipes I am proud of: Bill Shurtleff and tofu]. Oct. 1. p. 84-85. [Jap]

• ***Summary:*** This magazine is published by Japan's largest and most popular television station, NHK public TV. The contents are taken from NHK-TV programs. This one shows Bill Shurtleff and Akiko Aoyagi teaching Japanese how to make tofu at home. Black-and-white photos show: (1) Shurtleff, wearing an apron, ladling soymilk curds from a metal pot into a cloth-lined forming box (tofu kit). (2) Pouring soaked soybeans into a blender. (3) Straining the soymilk from the fiber. (4) Ganmodoki salad with tofu mayonnaise. (5) Ganmo burger sandwich. (6) Shurtleff and Aoyagi, seated cross-legged on tatami mats, with a large meal prepared in front of them.

6377. Erewhon Trading Co. 1975. Erewhon talking food. Miso and tamari (Ad). *East West Journal* 5(10):43. Oct. 15.

• ***Summary:*** A lengthy description of how traditional miso and tamari (shoyu) are made in Japan and some philosophical reflections on the processes and ancient wisdom that created them. Address: Boston, Massachusetts.

6378. Brown, Lester R. 1975. The politics and responsibility of the North American breadbasket. *Worldwatch Paper* No. 2. 45 p. Oct. No index. 22 cm. [3 ref]

• ***Summary:*** North America has emerged as a major supplier of food to the rest of the world. World grain trade has changed dramatically during the past 40 years. Grains now occupy more than 70% of the world's cropland area. Prior to World War II (in the period 1934-1938), all of the world's geographic areas except Western Europe (which imported 24 million metric tons) were net exporters of grains. Latin America was the world's leading grain exporter (9 million metric tons), followed by North America (5 MMT), and Eastern Europe and the USSR (5 MMT). Asia exported 2 MMT.

© Copyright Soyinfo Center 2014

However since that time Asia has turned from a small grain exporter to the world's largest grain importer (47 MMT in 1976, led by Japan, China, and India). Other regions with large grain imports are Eastern Europe and the USSR (27 MMT), Western Europe (17 MMT), Africa (10 MMT), and Latin America (3 MMT). In 1976 North America exported 94 MMT of grain, and Australia and New Zealand exported 8 MMT. The main reason for this change is the varying rates of population growth. Areas with high population growth rates have not been able to grow enough food to keep up with population. Many countries in these regions have a population growth rate of 3% or more per year which, if allowed to continue, will lead to a nineteenfold population increase within a century. Japan (with a population equal to nearly half that of North America squeezed into an area smaller than California) is the world's leading food importer, relying on imports to feed 62% of its 110 million people.

Brazil has recently emerged as a soybean exporter. Address: Worldwatch Inst., 1776 Massachusetts Ave., Washington, DC 20036.

6379. Erewhon Trading Co., Inc. 1975. Erewhon harvest '75. Boston, Massachusetts. 48 p. Oct. Catalog and price list.
• ***Summary:*** On the front cover, a brown and white photo shows a rustic farmer, holding a pitchfork, standing by his horse and hay wagon with wife and child. On the rear cover, Erewhon's president, Tyler Smith, writes a poetic passage about the beauty of wheat. Products include: Grains: Lone Pine in Arkansas grows organic short grain and long grain brown rice. Wehah Farms in California grows organic short grain brown rice and non-organic sweet brown rice [glutinous rice]. Baker in Louisiana grows organic medium grain brown rice. Organic hard red winter wheat is grown in Nebraska and in Deaf Smith, Texas. Organic hard red spring wheat is grown by Ted Whitmer in Montana and Ricke in Minnesota. Organic hard amber durum wheat is grown by Whitmer in Montana. Organic soft white pastry wheat is grown by Wild Winds in New York. Other organically grown grains are pearled barley (Idaho), whole unhulled buckwheat for sprouting, hybrid yellow or white corn (Deaf Smith), open-pollinated yellow corn (Minnesota), blue corn, whole oats, and rye. Cereals include organic soy flakes from Deaf Smith (25 lb). Flours include organic soybean flour (25 lb, steelground, full-fat). Pasta (packaged or bulk) includes Japanese soba, Soy Rice Shells.

Snacks from "Erewhon L.A." include Chico-San Yinnies, and Date-Nut Delight. Nik's Snaks (p. 8): This full page lists about 30 products. Of these, eleven are "tamari-roasted" whole-food snacks. The 30 products are sold in 5 sizes: 2.5 oz, 3.5 oz, or 6 oz. pick-up packages, or 25 lb bulk. The soybeans (dry roasted with tamari, no salt) are sold only in 25 lb packs. Other tamari-roasted seeds include: Spanish peanuts, sunflower seeds, roasted almonds (all 2.5 oz or 25 lb), cashews or pumpkin seeds (25 lb). Non tamari-roasted products include: Raisin walnut mix. Roasted mixed nuts. Raw mixed nuts. Raisin nut mix. Peanut raisin mix. Trail mix (Honey almond granola, roasted peanuts, raw sunflower seeds, date pieces, raisins, and sea salt). Honey almond granola. Chia seeds. Bee pollen. Alfalfa seeds. Date sugar. etc. Erewhon Aztec organic corn chips. Baked goods from Cable Springs Bakery in Cambridge, Massachusetts. Fruit juices from Erewhon, Heinke's, Knudsen, Lehr's (natural grape juice from Germany), and Biotta (Swiss Vegetable juices).

Dairy Products: Cheeses from Alta Dena (also kefir and yogurt) in California, Superior Cheese Co. in Massachusetts, Redwood Natural Cheese Co. in California. Also Favorite Foods yogurt.

Dried fruit, including organically grown Monukka and Thompson raisins, prunes, dates, apricots, apples, Bing cherries, black mission figs, and Calimyrna figs. Peanut-, apple-, sunflower-, and sesame butters. Sesame tahini. Pure & Simple "fruit butters sweetened with honey only; terrific old-fashioned jams (apple, apricot, peach, plum, raspberry, strawberry, grape, cherry). Erewhon apple sauce. "Pumpkin Sour" apple sauce and apple butter made in Plainfield, Vermont. Tree of Life fresh fruit preserves from Florida (8 varieties).

Seeds & nuts, incl. Erewhon organic soybeans in 1-lb packs, and Erewhon organic stoneground soybean flour in 24-oz packs. Arrowhead Mills packaged products, incl. Bulghur-soy grits (24 oz), Soy flakes (16 oz, organic), Roasted soy flour (24 oz, organic). Beans, incl. Aduki (25 lb, from Japan or Mainland China), yellow soybeans (50 lb, organic, New York), black soybeans (25 lb, non-organic from Japan, or organic from New York), green soybeans [dry] (25 lb, organic). Erewhon granola (17 products, including various sizes), Arrowhead Mills granola, Back to Nature granola (unsalted).

Oils, incl. Arrowhead Mills soybean oil (pints, quarts, or 5-gallon jug). Honey. Baking, incl. Premose barley malt, and Yinnies grain syrup from Chico-San. Tea, incl. 2 pages from Celestial Seasonings, and Erewhon Mu tea (9 or 16 herbs), Lotus root tea, Kukicha-branch twig tea. Springwater.

Tamari & Miso: 4 pages of descriptions and prices for Hacho miso (all misos are sold in 1 lb or 44 lb keg), Mugi miso, Kome miso, Tamari soy sauce [actually shoyu] (8 oz, pints, quarts, ½ gallons, gallons, or 4.7 gallon tin), Barley koji (1 lb). Specialties, incl. Unrefined sun-dried sea salt with natural trace minerals from the north coast of Brittany in France, Tekka, kuzu, umeboshi, sesame salt, Herbamare salt, nigari, brown rice vinegar, non-alcoholic beer (Birell, Kingsbury), Bambu instant coffee substitute.

Fearn Soya Foods: Soya granules, Soy-O wheat cereal, Soy-O corn bread & muffin mix, Soy-O bran muffin mix, Soy-O pancake mix–buckwheat, Soy-O pancake mix–wholewheat, Sesame burger mix, Natural soya powder.

Sea vegies: Agar-agar, dulse, hiziki, kombu, wakame,

© Copyright Soyinfo Center 2014

nori seaweeds (a description of each is given).

Erewhon certified organic produce, incl. Daikon grown in California. Soaps, incl. Cattier clay products and Dr. Bronner's Peppermint castile soap, Orjene, Nature's Gate, Tom's Natural Soap.

Cookware, mostly imported from Japan, incl. Soy [sauce] dispenser, 4½ inch. Growing [sprouts and sprouters]. Cast iron. Flyers, incl. Talking Food series, Natural recipes (3 by 5 inch tear-off pads. Soy-related recipes include: Soy au gratin, Soy casserole, Miso soup, Soyburgers, and Soy loaf).

A map shows Erewhon's delivery region (Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey) and schedule. The company also has an office near New York City at 303 Howe Ave., Passaic, New Jersey 07055. Phone 212-594-6455.

Note 1. This is the earliest document seen that uses the word "vegies" (spelled as such, one of two documents) to refer to vegetables, or "Sea vegies" to refer to sea vegetables (edible seaweeds).

Note 2. This is the earliest document seen (May 2006) that uses the term "trail mix" to refer to a non-perishable mixture of dried fruits, seeds, nuts, roasted soybeans, granola, etc. to be eaten as a snack, as when hiking or walking. Nik Amartseff coined the term "trail mix" and launched the first commercial trail mix product through Erewhon Trading Co. in 1974. At the time, Nik was studying and practicing macrobiotics in Boston, Massachusetts. By the late 1970s several brands of trail mix were on the market in both natural food stores and supermarkets; by the 1980s there were many, as it became a mainstream American snack.

This catalog cover was reprinted with permission from the Michio and Aveline Kushi Macrobiotics Collection, Archives Center, National Museum of American History, Smithsonian Institution, Washington, DC. Address: 33 Farnsworth Street, Boston, Massachusetts 02210. Phone: 617-542-1358.

6380. Erewhon [Los Angeles, California]. 1975. Erewhon. November/December 1975. Culver City, California. 22 p. Catalog and price list.

• ***Summary:*** On the front cover is an illustration (line drawing) of Benjamin Franklin, wearing a fur hat and glasses. Below is a quote from his *Poor Richard's Almanac* (1739): "Keep thy shop and thy shop will keep thee." Other quotes are scattered throughout the catalog.

Products include: Pasta (packaged and bulk). incl. Soya-Rice Shells (organic) "Eat to live, Live not to eat." Bulk staples–Grains (including Sweet Rice from California), flours (freshly milled whole grain), cereals, beans (incl. organic soybeans and soybean flakes from Texas), seeds. "Knowledge like a rich Soil, feeds if not a world of Corn, a world of weeds." Erewhon packaged staples–Grains, flours, cereals, beans (incl. organic soybeans), seeds. "A long life may not be good Enough, but a good Life is long Enough."

Granola. More packages–Arrowhead grains, cereals, and beans, Fearn Soya Foods (from Fearn Soya Products, incl. Soy-O-Pancake Mix {Wholewheat or Buckwheat}, Soya Powder {Natural or Low Fat}), Earthwonder meals-in-a-bag. Arrowhead Mills The Simpler Life food storage program (nitrogen packed in #10 metal cans; incl. soybeans and soy flakes). Juice. "They that cannot Obey, cannot Command." Spreads (nut butters {peanut butter, sunflower butter, sesame butter, sesame tahini} and fruit butters {Pure and Simple, sweetened only with honey}). Rocky Hollow Herb Farm's line of organic and natural herbs, spices, and essential oils. "Time is an Herb that cures all Diseases." Goodies: Nik's Snaks, chewies (incl. pemmican), chips (incl. Mother Earth Tamari Chips, Corn Munchies–Pure & Simple). "To lengthen thy Life, lessen thy Meals." Rennetless cheese from Redwood Natural Foods. Dried fruit (bulk or packaged, incl. calymyrna figs, medjool dates, monukka raisins). Tamari & miso (Tamari soy sauce–4 sizes aged 2 years, Hacho miso–3 sizes aged 2 years, Mugi miso–3 sizes aged 18 months, Kome miso–3 sizes age not given). Vegetable oils (incl. Arrowhead Soy Oil in 3 sizes). Garden fresh produce. Sea vegetables. Herb teas (incl. Celestial Seasonings). "Make Haste slowly." Body care (incl. Tom's soap and shampoos, Dr. Bronner's soaps, Cattier products), "When the well's dry, We know the worth of Water." Potpourri: Condiments (incl. "kuzu arrowroot, umeboshi (plums pickled in brine)," cookware (Quaker City grain mill, Corona stone mill, Mac steel utility knife, Soy sauce dispenser), publications). "Hunger is the best Pickle." Important stuff (Ordering information). "Drive thy Business, let it not Drive Thee."

On the last page, John Fountain extends "grateful appreciation to all those whose positive accomplishments have created Erewhon: Lima and George Ohsawa, Aveline and Michio Kushi, Cornellia and Herman Aihara, Michel Abehsera, Yvette & Jacques DeLangre, William Dufty, Frank Ford, Paul Hawken, Carolyn Heidenry, Roger Hillyard, Bob Kennedy, Bruce McDonald, Tommy Nakayama, Shane and Lou Olds [sic, Shayne Oles], Fred Rohe, Dr. Pietro Rotundi, Evan Root, Tyler Smith, Bill Tara, our customers, staff, suppliers, and growers, Susan and Lou Remy and all." Address: 8454 Steller Dr., Culver City, California 90230. Phone: (213) 836-7569.

6381. *Gyosai* (*Japan*). 1975. Tôfu go-hyaku-chin. Tôfu ni miserareta aoi-me no shugyô-sô Biru Shurutorefu-shi [Five hundred favorite tofu recipes. The blue-eyed Zen monk who has become fascinated with tofu–Bill Shurtleff]. Oct. p. 100-01. [Jap]

• ***Summary:*** Describes Shurtleff's work with tofu. Three photos show him (in an upstairs room at the Aoyagi home in Nerima-ku, Tokyo), talking, practicing sitting meditation in full lotus, and sitting beside a meal featuring tofu dishes served on the floor. A sidebar contains photos of 4 Western-

© Copyright Soyinfo Center 2014

style tofu dishes with a brief description of how each is prepared.

6382. Lovett, Paul S.; Bramucci, Michael G. 1975. Plasmid deoxyribonucleic acid in *Bacillus subtilis* and *Bacillus pumilus*. *J. of Bacteriology* 124(1):484-90. Oct. [23 ref]
• ***Summary:*** The authors found two plasmids from *Bacillus subtilis* strains; they named them pMB1 and pMB2 and gave the molecular weight of each. The plasmids were present in several copies per chromosome.

Since the word "natto" does not appear in this article, the writers may well have been unaware that *Bacillus subtilis* has long been used in Japan to produce a popular fermented food from soybeans–natto.

Although the function of these plasmids has not been determined, the authors suggest the usefulness of these plasmids for the construction of recombinant DNA molecules.

Contains 7 figures, including 5 graphs and 2 electron micrographs of plasmids pMB1 and pMB2 (with a bar showing their approximate size in micrometers).

Note: This is the earliest document seen (Jan. 2012) that contains the word "plasmids" (or plasmid) in connection with the bacterium *Bacillus subtilis* which causes the natto fermentation. Address: Dep. of Biological Sciences, Univ. of Maryland Baltimore County, Catonsville, Maryland 21228.

6383. Shurtleff, William. 1975. Chronology of early tofu and miso classes in California and Hawaii: 25 Oct. 1975 to 14 Feb. 1976. Lafayette, California. 1 p. Unpublished manuscript.
• ***Summary:*** Each class started with a talk about soybeans, soyfoods protein, world hunger, and meatless/vegetarian diets. Then a series of about 25 color slides demonstrated how to make tofu at home. Other slides showed favorite tofu recipes and how tofu was made in a traditional Japanese shop.

1975 Oct. 25–We do our first real "Tofu Class" at Westbrae Natural Foods in Berkeley, California, arranged by Bob Gerner and Liz Horowitz. Thrilling to have an audience of about 14 interested people. On Oct. 30 at Westbrae 16 people attend, and on Nov. 8, 18 people.

November tofu classes: Nov. 14th–Rainbow Grocery (arranged by Bill Crolius), 23rd–Esalen Institute in Big Sur (John Russel).

December tofu classes. 2nd–We do a big tofu class in living room of 790 Los Palos Dr. with lots of publicity from a big newspaper article on our work; 47 attend. 4th–Acalanes (Sandy Hills, 89 attend), 6th Westbrae (Bob Gerner), 7th–San Francisco Vegetarian Society (Dixie Mahy, 67 attend), 8th–Seventh-day Adventist Pacific Union College (Mary Eighme, 48 attend), 11th–Dawn Horse Bookstore in S.F. (Moe).

1975 Dec. 12–*Book of Tofu* in hand. Since we started it on 22 Oct. 1972, it had taken just about three years to write.

Dec. 13–Sept. 1976–I hand deliver *The Book of Tofu* to many bookstores and food shops that wish to sell it, typically selling 4–50 per stop at 40% discount: Communion Vegetarian Restaurant #2, Nutrition in a Nutshell, Open Sesame, Lafayette Natural Foods, San Francisco Vegetarian Society, Kinokuniya Bookstore, Rising Sun (440 Judah St. in San Francisco), Diablo Oriental Foods, San Jose Tofu Co., Soko Hardware, Effie Chow & East West Academy, Ted Nordquist (1536 Versailles Ave., Alameda, CA 94501), The Wok Shop (804 Grant Ave., SF), Westbrae Natural Foods, etc. By 24 July 1976, I had distributed 266 copies.

December tofu classes after we have our book: 13th & 14th–Jacques Delangre (Paradise, CA), 16th–East West Academy (Effie Chow), 17th–Westbrae, 18th–San Francisco Zen Center (Ed Brown), 19th–Fairfax (M. Squire).

Tofu classes/lectures in January 1976 in Northern California: 5th–Westbrae, 7th–St. Andrew's Church in Walnut Creek (Dorothy Headley), 8th–Kepler's Bookstore (Jeffrey Shurtleff & Hank Maiden) 12th–Odiyan, where I see David Mastrandrea after many years, 14th–Berkeley Co-op Natural Food Center at 1414 University Ave. (Susan Kishi, with Ted Nordquist and Janet Fehring [Ahava] helping to make tofu dip; 105 attended), 15th–San Francisco Medical School and East West Academy of Healing Arts (Effie Chow), 17th–Persimmon (Peter Godfrey), 20th–United Energy Co-op (Sri Ramon).

Jan. 16-18–Visit Bubba Free John at his community. Do and film a program on tofu.

Jan. 20-30?–Tofu trip to Los Angeles with mom and Akiko. Many tofu and miso classes. 22nd–East West Academy of Healing Arts (Effie Chow in a church), 24th–weird Los Angeles Vegetarian Society (Blanche Leonard, 150 people attend), 25th–East West Center (P. Retzsky), 27th–Dr. Harry Miller and Loma Linda Foods (70 attend), 29th–Ojai (Luke Gatto). We visit Frazier Farms, a huge natural foods supermarket in Escondido, then go to San Diego for an interview with *Well Being* magazine (David & Barbara Salat).

Feb. Tofu classes: 4th–Walnut Creek Co-op, 6th–Albany church (Nancy Dohur).

Feb. 10 to Oahu, Hawaii. Feb. 12th–tofu class for Seventh-day Adventist group (Naomi Yamashiro, 80 attend), 13th–Honolulu, Hawaii, Kyukendall Hall at Univ. of Hawaii at Manoa (David Lee "Kalm" Sukowske, 140 attend). Then Feb. 14 arrive in Japan. 30-minute KQED TV special on tofu we made shown in California after we left. Expected viewership is estimated at 45,000.

In summary, from October 1975 until February 1976 we did 35 tofu and miso programs in California and Hawaii plus numerous media appearances and interviews. 1,300 people attended these classes. We requested that an admission of no more than $1 per person be charged. Our honoraria, shared with the sponsors, totaled $600. We also sold 366 copies of

© Copyright Soyinfo Center 2014

our books.

Note 1. This is the earliest document seen (Dec. 2001) concerning a natural foods retail chain–Frazier Farms natural foods supermarket.

Note 2. This is the earliest document seen (Aug. 2013) concerning the work of Ted Nordquist with soyfoods. Address: 790 Los Palos Dr., Lafayette, CA 94549.

6384. Erewhon Trading Co. 1975. News from nowhere (Japanese fermented foods–Miso, tamari, and koji). *East West Journal.* Nov. 15. p. 29.

• ***Summary:*** The subtitle states: "Erewhon news from Nowhere is a regular *East West Journal* column providing information about food. We hope that this will be a valuable educational service, enabling readers to select what they eat knowledgeably. If you require more information about food, we invite you to visit us at our retail stores." Note that though the column is written in the first person, no author is given.

"In my opinion the most fundamental change in the creation of traditional fermented foods occurred with the shift of the Japanese rural-based economy after World War II. The movement of the population to the cities and the emphasis on production and manufacturing by large numbers of city dwellers who consumed increasingly larger amounts of food created a demand for soybeans beyond the capacity of the rural of the rural population's productivity. The Japanese turned to America for their soybeans and began to use varieties that did not lead to the fine product to which the native beans had formerly contributed. The result was an economic necessity for research, carried out by American and Japanese technicians, and the results created several basic changes in the manufacturing process.

"First, the koji mold was investigated, and out of the hundreds of strains of mold bacteria [sic] present in the traditional mold culture, certain strains were isolated and propagated for their effectiveness to create the fermentation under laboratory conditions. Thus, new strains of 'hybrid' cultures were developed that would break down the American beans of inconsistent quality. The technicians failed to see the process as a whole, not realizing that the long-term fermentation and great attention in handling the raw materials at different stages was an art that depended on a great variety of naturally occurring bacteria to produce an environment where natural competition worked to strengthen the culture."

"Except for the small number of true traditional makers in Japan, I would say that Americans in their own backyards will, within the next ten years, be producing finer miso and tamari than the majority of producers currently working in Japan." Address: Massachusetts.

6385. Jameson, Sam. 1975. Japan's small business flexes muscles and giants back away. *Los Angeles Times.* Nov. 23. p. F1.

• ***Summary:*** Until May 1973, the Japanese government had an elaborate set of restrictions that prevented foreign investors from entering specific fields. Now a new type of Japanese business protectionism is beginning to rear its head. Fields traditionally dominated by small or household businesses are trying to prevent large firms from entering these fields. Keidanren, the main Japanese trade group representing large enterprises, took note of this concern by issuing a set of "guidelines" designed to avoid friction between big and small businesses.

In July, Yakult, a large yogurt manufacturing firm, officially notified the Ministry of Agriculture, that it was abandoning a "plan to begin manufacturing tofu (bean curd), a staple made in traditional family-run shops in neighborhoods throughout the country."

"All four opposition political parties have jumped on the issue, promising protection for 'the little guy' against 'the power of massive capital'–the same argument that was used for years against foreign investment." Address: Times staff writer.

6386. Hashizume, Kazumoto; Nakamura, N.; Watanabe, T. 1975. Influence of ionic strength on conformation changes of soybean proteins caused by heating, and relationship of its conformation changes to gel formation. *Agricultural and Biological Chemistry* 39(11):1339-47. Nov. [18 ref] Address: National Food Research Inst., Ministry of Agriculture and Forestry, Tokyo, Japan.

6387. Shurtleff, William; Aoyagi, Akiko. 1975. Tofu as a food. *Macrobiotic* (*The*) (*Chico, California*) No. 110. p. 14-24. Nov. [2 ref]

• ***Summary:*** Excerpted from the forthcoming Book of Tofu.

The magazine's editor notes: Tofu is also good for external plasters, especially on a head injury or concussion, etc. However it is not advisable to use it on heart area injuries, as tofu is very yin, and could weaken the heart.

Tofu as food should be balanced with Tamari or Miso, or eaten with fish, burdock or any other yang food. This will balance its yin quality. Address: Lafayette, California.

6388. *Soybean Digest.* 1975. New soy foods–Japanese make switch. Nov. p. 24.

• ***Summary:*** Today "ASA [American Soybean Assoc.] market development is introducing in Japan a new form of soy protein in answer to the increasing westernization of Japanese tastes and to the high prices of meat and fish in Japan. The result is a boom in the new use of soy protein products, which take the form of textured soy protein meat extenders and meat substitutes, soy-fortified bread and macaroni products and soy milk. Only negligible amounts of soy protein materials were used in these types of foods in 1970... New soy protein was first introduced in the form of

© Copyright Soyinfo Center 2014

'sloppy joes' in the Japanese school lunch program in 1972 by ASA."

6389. Canaday, John. 1975. A neotraditional Japanese 'farmhouse' that delights in good food and service: Restaurant reviews. *New York Times.* Dec. 5. p. 55.
• ***Summary:*** Includes a review of the Japanese two-star restaurant Robata (30 East 61st Street, New York City). The word "robata" means "by the fireside," referring to the sunken open-hearth fireplace (*irori*) in a traditional Japanese farmhouse.

"A very good surprise was grilled bean curd, and we recommend it heartily. Charred on the grill, it comes in a vinegary sauce that goes beautifully with the curd's bland innards beneath the smoky taste of the crust."

Note: This is the earliest English-language document seen (April 2013) that contains the term "grilled bean curd;" it refers to grilled tofu.

6390. *SoyaScan Notes.* 1975. Chronology of soybeans, soyfoods and natural foods in the United States 1975 (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** Feb. Gale Randall starts America's first commercial Caucasian-run tempeh company in Unadilla, Nebraska.

March. Alec Evans starts the first of the new breed of Caucasian-run tofu shops in Corvallis, Oregon, named Welcome Home Bakery and Tofu Shop.

March. "Safe protein-calorie ratios in diets. The relative importance of protein and energy intake as causal factors in malnutrition" by P.R. Payne of the Department of Human Nutrition, London School of Hygiene and Tropical Medicine, published in the *American Journal of Clinical Nutrition.* Payne argues convincingly that food energy (calories) is more of a problem than protein.

April 29. Saigon falls, ending the Vietnam war.

July. Freezing weather in Parana, Brazil, kills many coffee trees, leading to a big expansion of soybean acreage.

Aug. 3-8. The first World Soybean Research Conference held in Champaign, Illinois, with 600 participants from nearly 50 countries. The 1073-page proceedings, edited by L.D. Hill, are published in 1976.

Aug. Japan Vegetable Protein Food Association founded to promote modern soy protein products, primarily soy protein isolates.

Oct. 25. William Shurtleff and Akiko Aoyagi conduct their first Tofu Class at Westbrae Natural Foods, Berkeley, Calif. Eight people attend. Also in 1975 Gordon Bennett becomes president of Westbrae.

Oct. "The Traditional Tofu Craftsman and His Shop," the first of the new wave of soyfoods articles, published in East West Journal. Contains excerpts from the forthcoming *Book of Tofu* by Shurtleff & Aoyagi.

Nov. 9-12. First Latin American Conference on Soy Protein, organized by the American Soybean Assoc., held in Mexico City.

Dec. 12. *The Book of Tofu* by Shurtleff and Aoyagi published by Autumn Press. This book launches the tofu boom and soyfoods movement in America.

Dec. Ganesha, a craftsman in Berkeley, makes America's first tofu boxes, handcrafted of wood.

Dec. 1975 to Jan. 1976 Shurtleff and Aoyagi do a Tofu and Miso California Tour, with 40 public programs in the Los Angeles Area and northern California.

* *The Farm Vegetarian Cookbook* published by The Farm's Book Publishing Co. in Summertown, Tennessee. Expanding on the ideas in *Yay Soybeans!* (1974), it contains many soyfoods recipes, plus the first popular information on tempeh and the first tempeh recipes to be published in any European language.

* Textured soy protein concentrates developed and introduced by three companies, incl. Griffith Laboratories and Central Soya (Response).

* Vitasoy soymilk in Hong Kong is first sold in Tetra Pak cartons.

* Latin American soybean production tops 10 million metric tons, up 10-fold since 1967.

* National Soybean Research Center (CNP-Soja) established at Londrina, Parana, Brazil, within EMBRAPA (The Brazilian Research Organization for Agriculture), to stimulate research and coordinate the efforts of the state programs.

6391. Autumn Press, Inc. 1975. Imagine... (Ad for The Book of Tofu by Shurtleff and Aoyagi). *Macrobiotic* (*The*) (*Chico, California*) No. 111. p. 61. Dec. [1 ref]
• ***Summary:*** "Imagine... How strange it would seem if in the world's greatest wheat-producing country most of the people had never tasted bread. Yet no less unusual is the present situation in America, the world's greatest producer of soybeans, where the majority of people have not yet tasted, seen or even heard of tofu."

The Book of Tofu is 8½ x 11. 336 pages and has over 300 illustrations, $6.95.

"A family of foods developed over thousands of years in China and Japan, tofu is East Asia's way of using soy protein to complement a diet low on the food chain. Now available commercially across America in over 10 different forms, tofu can also be made at home–for pennies! Quick-and-easy to use in almost every conceivable type of Western-style preparation ranging from dips to desserts, these time-tested natural foods open new vistas of creative, healthful menu-planning–while offering a revolutionary approach to meeting the world's critical food requirements.

"*The Book of Tofu* contains: Over 500 recipes culled from East and West. Easy-to-follow instructions for making 7 varieties of tofu (plus soymilk, yuba and tempeh) at home

© Copyright Soyinfo Center 2014

and on a community scale. An illustrated description of the art of making tofu in a traditional Japanese shop. The most detailed glossary of Japanese foods ever compiled in English. And much, much more."

Note: This is the earliest advertisement seen that mentions tofu. Address: P.O. Box 469, Soquel, California 95073.

6392. Kiuchi, Kan; Ohta, Teruo; Ebine, Hideo. 1975. Changes in lipid components of miso-dama koji. *Hakko Kogaku Zasshi* (*J. of Fermentation Technology*) 53(12):869-74. Dec. [6 ref. Eng]
• ***Summary:*** "A large amount of lipids [such as oil and lecithin] is contained in miso, especially soybean miso, since soybean is the raw material of miso." However the free fatty acid content of miso dama was higher than that of soybeans. Address: National Food Research Inst., Ministry of Agriculture and Forestry, Shiohama, Koto-ku, Tokyo, Japan.

6393. **Product Name:** [Tofu].
Manufacturer's Name: Le Bol en Bois.
Manufacturer's Address: 35, rue Pascal, 75013 Paris, France. Phone: 707-272-4.
Date of Introduction: 1975 December.
New Product–Documentation: Shurtleff & Aoyagi. 1978, Dec. *The Book of Tofu* (Ballantine pocketbook edition). "Appendix B: Tofu Shops and Soy Dairies in the West." p. 401. Owner: Mr. Noboru Sakaguchi: a combination natural foods restaurant and tofu shop.

Richard Leviton. 1983. Oct. 16. Trip to Europe with American Soybean Assoc. According to Bernard Storup of Societe Soy, in 1982 Le Bol en Bois in Paris was making about 2,500 lb/week of tofu, but now they are probably down to 1,200 lb/week with competition from Societe Soy.

Toyo Shinpo. 1984. March 21. Mr. Sakaguchi runs a tofu shop and natural food store. He makes 250-300 cakes/day of tofu. Half is sold in the shop and restaurant, the rest is distributed to Japanese restaurants in Paris. Le Compas. 1986. March-April. p. 32.

Form filled out by Anthony Marrese based on an interview with Mr. Hirayama. 1989. Nov. Mr. Sakaguchi is the owner of Daizou and Mr. Takatoshi Hirayama is the tofu production manager. Le Bol en Bois started in the 1970s as probably the first macrobiotic restaurant in Paris. They made tofu for their own use and their outside business grew slowly. In 1985 Tama (an importer and distributor of Japanese natural foods) and Daizou (a food manufacturing company) were made separate business divisions of Le Bol en Bois restaurant and health food store. The three companies employ about 50 people, 6-7 in food production.

Business card from "Bol en Bois." 1989 "Store, macrobiotic restaurant, natural products, new specialized library. 35-40, rue Pascal 75013 Paris."

Interview with Mr. Noboru Sakaguchi, founder of Le Bol en Bois, by David de Korsak. 1990. June 14. An invoice plus personal recollections prove that Mr. Sakaguchi opened Le Bol en Bois on 2 Sept. 1974 and began commercial tofu production in Nov. or Dec. 1975. For details, see interview.

6394. *Macrobiotic* (*The*) (*Chico, California*). 1975. Miso as a replacement for meat. No. 111. p. 39. Dec.
• ***Summary:*** "Miso is Yang. It replaces meat, being as Yang as meat. One who eats miso every day will soon have no desire to eat meat. The Yang mineral salts he craves are amply supplied by miso. Without miso, it is difficult to remain healthy and free of disease. With miso, for the intestines, the root of all disease, are maintained in a healthy condition. Animal foods which are not digested completely easily breed bacteria which are toxic... Carnivorism is a short term adventure, always reckless and dangerous, that ends in tragedy and disease..."

6395. Shurtleff, William; Aoyagi, Akiko. 1975. The book of tofu: Food for mankind. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. Illust. by Akiko Aoyagi. Index. Dec. 28 cm. Rev. ed. 1977 Autumn Press, Brookline, MA. [53 ref]
• ***Summary:*** This pioneering work started the "tofu revolution" in America. Contents: Preface. Acknowledgments. Part I. Tofu: Food for mankind. 1. Protein East and West. 2. Tofu as a food: Introduction, rich in high quality protein (NPU, biological value, protein score, amino acid content), high protein complementarity (tofu contains an abundance of lysine, an essential amino acid that is deficient in many cereal grains; increase usable protein by combining tofu with wheat, rice, corn, etc.), easy to digest, an ideal diet food, low in saturated fats and free of cholesterol, rich in vitamins and minerals, a health-giving natural food, backbone of the meatless / vegetarian diet, free of chemical toxins, low in cost, easily made at home, quick & easy to use, versatile.

3. Getting started: Introduction, buying and storing tofu, basic ingredients (whole-wheat flour, miso {rice-, barley-, and soybean miso, special Japanese miso, Chinese chiang}, oil, brown rice, salt, shoyu {natural shoyu, shoyu, Chinese soy sauce, synthetic or chemical soy sauce}, sugar, vinegar, monosodium glutamate {MSG}), Japanese kitchen tools (each illustrated), preparatory techniques (salt rubbing, rinsing and pressing leeks and onions, soaking burdock root, reconstituting dried sea vegetables {dried hijiki, wakame, agar}, wheat gluten and kampyo [kanpyo], parboiling, cutting tofu and vegetables, using sesame seeds, toasting nori, preparing a steamer), basic recipes (soup stocks and broths {dashi}, basic shoyu dipping sauces {*tsuke-jiru*}, miso toppings {sweet simmered miso / *nerimiso,* miso sauté / *abura miso,* special miso toppings and dipping sauces, finger lickin' miso, and regular miso}, miso salad dressings, nut and seed butter toppings, spreads and dressings, basic sauces, rice, noodles and other basic preparations).

Our favorite tofu recipes (lists about 80 recipe names for each of the different types of tofu, plus soymilk, yuba, whole soybeans, gô, okara, and curds; very favorites that are also quick and easy to prepare are preceded by an asterisk).

Part II. Cooking with tofu: Recipes from East and West (500 recipes). 4. Soybeans: History of soybeans and "soybean foods," cooking with whole dry soybeans, roasted soybeans (*iri-mame*), fresh green soybeans (*edamame,* incl. a recipe for "Sweet emerald bean paste {*Jinda*}),*"* kinako (roasted full-fat soy flour, incl. Japanese health food treats such as *kinako amé, gokabo, kokusen, kankanbo,* and *abekawa mochi*), soybean sprouts (*daizu no moyashi*), natto ("sticky fermented whole soybeans," with "gossamer threads"), tempeh (fermented soybean cakes), Hamanatto and Daitokuji natto (raisin-like natto), modern western soybean foods (natural soy flour [full-fat], soy granules, defatted soy flour and grits, soy protein concentrates, soy protein isolates, spun protein fibers, textured vegetable protein {TVP}, soy oil products). 5. Gô (a thick white puree of well-soaked uncooked soybeans). 6. Okara or Unohana. 7. Curds and whey. 8. Tofu (includes history, and preparatory techniques: Parboiling, draining, pressing {towel and fridge method, slanting press method, sliced tofu method}, squeezing, scrambling, reshaping, crumbling, grinding, homemade tofu (basic, from powdered soymilk, fermentation method related to soymilk yogurt), tofu quick and easy {incl. Chilled tofu–Hiya-yakko}, tofu dressings, spreads, dips and hors d'oeuvre {incl. Creamy tofu dressings and dips, Tofu mayonnaise dressing, Tofu tartare sauce, Tofu cream cheese, Tofu sour cream, Tofu cottage cheese, Tofu guacamole}, tofu in salads {Western style and Japanese style salads incl. Shira-ae}, tofu with sandwiches and toast, tofu in soups {Western style and Japanese style soups, incl. miso soup}, tofu in sauces, tofu in breakfast egg dishes, tofu baked, tofu sautéed, stir-fried or topped with sauces {incl. Mabo-dofu [Ma Po doufu]}, deep-fried tofu, tofu with grains, tofu broiled {incl. Tofu dengaku}, tofu simmered in one-pot cookery and seasoned broths, tofu steamed, tofu desserts {incl. Tofu whipped cream or yogurt, Banana tofu milkshake, Tofu icing, Tofu ice cream, Tofu cheesecake, Tofu-peanut butter cookies}).

9. Deep-fried tofu: Thick agé or nama-agé (incl. *atsu-agé* meaning "thick deep-fried tofu," "three-cornered agé" {*sankaku-agé*} in Kyoto, agé cubes {*kaku-agé*}, "five-color agé" {*gomoku-agé*}), ganmo or ganmodoki (incl. *hiryozu / hirosu,* "Flying Dragon's Heads," "treasure balls," "Ganmo treasure balls"), agé or aburagé (incl. *kiji,* "agé pouches," "crisp agé", *kanso aburagé,* "agé puffs," "fried soybean cakes," "hollow agé cubes," "Smoked tofu," p. 189-91, 197).

Note 1. This is the earliest English-language document seen (April 2013) that contains the following terms related to deep-fried tofu (p. 180-90): "Thick agé," *nama-agé, atsu-agé, Hiryozu,* "Dragon," "Flying Dragon's Heads," "treasure balls," "five-color agé," *gomoku-agé,* "Ganmo treasure balls." "fresh or raw deep-fried tofu," "three-cornered agé," *sankaku-agé,* "agé cubes," *kaku-agé, kiji.* "agé pouches," "crisp agé," *kanso aburagé,* "agé puffs," "fried soybean cakes," or "hollow agé cubes."

10. Soymilk. 11. Kinugoshi ("*Kinu* means 'silk'; *kosu* means 'to strain'; well named, kinugoshi tofu has a texture so smooth that it seems to have been strained through silk." It is made from concentrated soymilk). 12. Grilled tofu (incl. sukiyaki). 13. Frozen and dried-frozen tofu. 14. Yuba (incl. many meat alternatives such as Yuba mock broiled eels, Buddha's chicken, Buddha's ham, sausage). 15. Tofu and yuba in China, Taiwan, and Korea (incl. Savory tofu {*wu-hsiang kan*}*;* see p. 258 for illustrations of many meat alternatives, incl. Buddha's fish, chicken, drumsticks, and duck, plus vegetarian liver and tripe, molded pig's head, and molded ham). One type of Korean soybean miso is called *kotsu jang* [sic, *kochu jang*]. When tofu is served with miso [Korean-style, *Tenjang*] as the dominant seasoning, and with rice, "it becomes the popular *Tenjang Chige Pekpem"* (p. 262). 16. Special tofu.

Note 2. This is the earliest (and only) English-language document seen (March 2009) that uses the word "Tenjang" to refer to Korean-style soybean jang (miso).

Part III–Japanese farmhouse tofu: Making tofu for more and more people. 17. The quest. 18. Making community tofu. 19. The traditional craftsman. 20. Making tofu in the traditional way.

Appendices: A. Tofu restaurants in Japan; many are vegetarian: In Tokyo: Sasa-no-yuki / Sasanoyuki, Goemon, Hisago, Sanko-in, Shinoda-zushi, Dengaku (south of Tokyo in Kamakura). In Kyoto: Nakamura-ro, Okutan, Takocho, Izusen, Junsei, Nishiki, Hakuun-an, Rengetsu, Sagano, Sorin-an. Tea ceremony cuisine (*Kaiseki ryori*), Zen temple cookery or Buddhist vegetarian cookery (*Shojin ryori*), Tea ceremony cookery from China (*Fucha ryori*), Wild gathered cookery (*Sansai ryori*). A directory of these and others, with addresses and phone numbers, is given (p. 312).

B. Tofu shops in the West (Directory of 43 shops in the USA, 3 in Europe, and 3-7 in Latin America {Mexico City, Rio de Janeiro and Sao Paolo, Brazil}). C. People and institutions connected with tofu. D. Table of equivalents. Bibliography. Glossary. Index. About the authors (autobiographical sketches; a photo shows Shurtleff and Aoyagi, and gives their address as New-Age Foods Study Center, 278-28 Higashi Oizumi, Nerima-ku, Tokyo, Japan 177). Sending tofu in the four directions.

Pudding recipes include: Rice pudding with gô and apple (p. 76, incl. 2 cups soymilk). Tofu chawan-mushi (p. 147; Steamed egg-vegetable custard with tofu). Tofu fruit whips (p. 148). Tofu rice pudding (p. 150, incl. 1 cup soymilk). Tofu custard pudding (p. 152). Soymilk custard pudding (p. 208). Brown rice pudding (p. 208, with 2 cups soymilk). Soymilk chawan-mushi (p. 209). Chawan-mushi with yuba (p. 249).

Dessert recipes include: Tofu whipped cream or yogurt (p. 148; resembles a pudding or parfait). Tofu ice cream (p. 149, with chilled tofu, honey, vanilla extract and salt). Banana-tofu milkshake (p. 149). Tofu cream cheese dessert balls (p. 149). Tofu icing (for cake, p. 149). Tofu cheesecake (p. 150). Tofu-pineapple sherbet (p. 151). Also: Soymilk yogurt (cultured, p. 205). Healthy banana milkshake (p. 206). On p. 160 is a recipe for "Mock tuna salad with deep fried tofu."

Note 3. This is the earliest English-language document seen (Sept. 2013) that uses the term "Tofu ice cream" to refer to soy ice cream or that contains a recipe for "Tofu ice cream."

Note 4. This is the earliest English-language document seen (April 2013) that uses the term "Tofu Cheesecake" and the first to give a recipe for a tofu cheesecake.

Note 5. This is the earliest English-language document seen (Oct. 2013) that uses the term "Tofu sour cream" (p. 109) or that contains a recipe for "Tofu sour cream."

Note 6. This is the earliest English-language document seen (April 2013) that uses the term "tofu milkshake" or that gives a recipe for a shake made with tofu.

Note 7. This is the earliest English-language document seen (Jan. 2012) that uses the term "sticky fermented" to refer to natto.

Note 8. This is the 2nd earliest English-language document seen (April 2013) that uses the term "dried-frozen tofu."

Note 9. This is the earliest English-language document seen (April 2013) that describes preparatory techniques for tofu (p. 96-98).

Note 10. This is the earliest English-language document seen (April 2013) that contains the term "smoked tofu."

Note 11. This is also the earliest English-language document seen (April 2013) that uses the term "kinugoshi tofu" to refer to silken tofu.

Note 12. As of March 2007, the various English-language editions of this book have sold more than 616,000 copies.

Note 13. This is the earliest English-language document seen (Aug. 2011) that contains the term "Modern Western soybean foods" (see p. 69), a term that Shurtleff would soon (by 1983) replace by the more accurate "Modern soy protein products."

Note 14. This is the earliest published English-language document seen (Jan. 2012) that contains the term "creamy tofu dressings" (or "dressing").

Note 15. This is the earliest English-language document seen (Sept. 2012) that contains the term "Soymilk yogurt."

Note 16. This is the earliest document seen (Oct. 2012) that contains an adequate or detailed description of how to make yuba at home.

Note 17. This is the earliest English-language document seen (June 2013) that contains the term "whole dry soybeans."

Note 18. This is the earliest published English-language document seen (Oct. 2013) that contains the term "Tofu whipped cream" (regardless of capitalization). This term appears on pages 113, 148 (with recipe), 149, 153, and 179. Address: c/o Aoyagi, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan. Phone: (03) 925-4974.

6396. Shurtleff, William; Aoyagi, Akiko. 1975. What is miso? *Macrobiotic* (*The*) (*Chico, California*) No. 111. p. 27-38. Dec.
Address: Lafayette, California.

yuba cylinder from one end with a (green) bamboo dengaku skewer (or two foodpicks) and deep-fry for about 1 minute until golden brown. Spread tops of rolls with the miso and top with a sprinkling of sesame seeds. Serve while crisp and hot.

The freshly deep-fried rolls —called *Agé-maki* Yuba— may also be served as is, sprinkled with a little shoyu. Simmered in Sweetened Shoyu Broth (p. 40), they make a tasty addition to soups and *nabe* dishes.

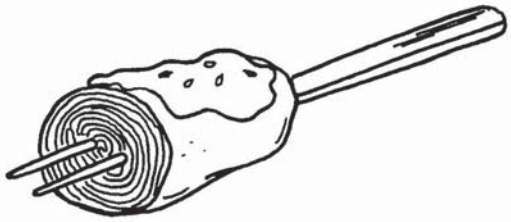

Fig. 100. Deep-fried Yuba Dengaku

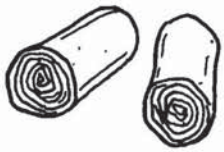
taira-yuba), fresh yuba rolls (*maki-yuba*), long yuba roll (*komaki*), small yuba rolls (*kiri-komaki*), tied yuba (*musubi-yuba*), large yuba spirals (*omaki-, futomaki-, or uzumaki-yuba*), ginkgo-leaf yuba, *Oharagi-yuba* (slightly flattened roll tied with a thin piece of kombu), sweet yuba (*amayuba or ama-yuba*), fresh yuba trimmings (*kirehashi*), yuba flakes (*kuzu-yuba and mimi*), trough-shaped yuba (*toyuba or to-yuba*). An illustration (line drawing) accompanies each variety.

The chapter begins: "If you have ever simmered a pot of milk over very low heat or set a bowl of hot milk aside to cool, you have no doubt noticed the thin, delicate film that soon forms on the milk's surface. The longer it is allowed to set, the firmer and thicker it becomes. And if you have ever tried lifting this film off and tasting it, you may well have found it to be soft, warm, and delicious. In the same way, if fairly thick soymilk is gently heated, a thin film soon covers its surface. In Japan this film is called yuba, and since ancient times it has been considered a true delicacy. It is easily prepared at home, and since it is best when fresh and warm, yuba made in your own kitchen and served as an hors d'oeuvre or as part of a meal will have a tenderness and fragrant richness that can far surpass that of the yuba ordered from even the finest traditional shops."

Reconstituting dried yuba. Homemade fresh yuba–How to make fresh yuba at home: Variations–half-formed yuba (*tsumami-agé*), large sheets of fresh yuba, fresh yuba rolls (*maki-yuba*), dried yuba.

Yuba recipes: Yuba hors d'oeuvre (15 recipes, mostly Japanese- or Chinese-style). Chinese-style deep-fried yuba hors d'oeuvre: Yuba chicken (*ssu-chi or suji*), deep-fried Buddha's yuba, yuba nori roll, yuba drumstick (*Sso-tsai*), glutinous rice roll. Yuba in salads, soups, and sauces (2 recipes). Yuba in sandwiches, egg dishes, and oven cookery (one recipe). Yuba sautéed and deep-fried (5 recipes,

© Copyright Soyinfo Center 2014



Fresh Yuba Rolls (*Maki-yuba*): A "long roll of fresh yuba" is about 16 inches long and 1 inch in diameter. It is made by folding a piece of fresh or sweet yuba lengthwise into halves, laying it lengthwise on a second sheet together with fresh yuba trimmings, and rolling the second sheet up lengthwise. "Small rolls of fresh yuba" are prepared by cutting this long roll into 1½-inch lengths.

Long Yuba Roll (*Komaki*): About 1 inch in diameter and 15 inches long, *komaki* are prepared by rolling fresh yuba trimmings in several fresh yuba sheets. After partial drying, the roll is wrapped in still another sheet of fresh yuba, dried again, and then trimmed at both ends.

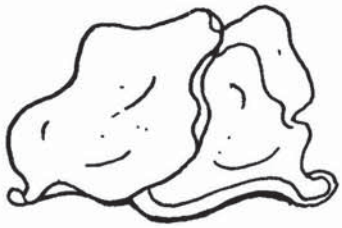
Small Yuba Rolls (*Kiri-komaki*): Prepared by cutting a long yuba roll into 1½- to 2-inch lengths, these delicate rolls are used in thin soups, one-pot cookery, or with sautéed vegetables.

Tied Yuba (*Musubi-yuba*): Prepared from a piece of regular or yellow fresh yuba about ½ inch wide and 5 inches long, *musubi-yuba* is tied into a simple loop and used in thin soups.

Large Yuba Spirals (*Omaki-*, *Futomaki-*, or *Uzumaki-yuba*): To make yuba spirals, about 40 sheets of half-dried yuba are rolled up to form a long cylinder 1½ to 2 inches in diameter and 1½ feet long. This is wrapped in a single sheet of fresh yuba, dried until crisp, then cut crosswise into discs about ½-to 1-inch thick. They are used widely in thin soups, one-pot cookery, and seasoned broths.

Ginkgo-leaf Yuba: Prepared by cutting fresh yellow or regular fresh yuba sheets with a cookie cutter, these dried pieces resemble 3-inch-diameter ginkgo leaves and are used as a garnish in thin soups and on top of sushi.

Oharagi Yuba: This slightly-flattened yuba roll, tied with a thin piece of *kombu*, is about 2½ inches long, 2 inches wide, and ¾ inch thick. It is prepared by loosely rolling one sheet of half-dried yuba inside a sheet of fresh yuba, tying the oval-shaped roll with 5 strips of *kombu*, then cutting the roll crosswise into fifths. (This variety derives its name from the large bundles of firewood tied around the center with a length of rope which the women of Ohara village near Kyoto are famous for carrying on their heads.)



Sweet Yuba (*Amayuba*): This is the last sheet of yuba lifted (and often partially scraped) from the bottom of the steaming tray. It has a sweet rich flavor and slightly reddish color. Thicker and less delicate than most yuba, its edges are often ragged and uneven. Eaten fresh and warm at the yuba shop, it is ambrosial. It is usually dried and sold in large pieces of various sizes in sealed cellophane bags. The least expensive of all types of yuba, sweet yuba is, in our opinion, the most delicious, especially when deep-fried, lightly salted, and served like potato chips. Dried pieces may be added to soups, egg dishes, or sautéed vegetable preparations.

including *Tamago yuba with ankake sauce, Kenchin maki, shinoda maki, and yuba harumaki*). Yuba with noodles or with rice and sushi. Yuba in one-pot cookery and seasoned broths (Incl. *Happosai*). Yuba steamed (Incl. *Chawan-mushi, Yuba kenchin-maki,* and *Yuba shinjo*). Chinese-style steamed yuba (Yuba-filled steamed buns, Pressed yuba with peanut sauce).

"Sweet yuba (*Amayuba*)*:* This is the last sheet of yuba lifted (and often partially scraped) from the bottom of the steaming tray. It has a sweet rich flavor and slightly reddish color. Thicker and less delicate than most yuba, its edges are often ragged and uneven. Eaten fresh and warm at the yuba shop, it is ambrosial. It is usually dried and sold in large pieces of various sizes in sealed cellophane bags. The least expensive of all types of yuba, sweet yuba is, in our opinion, the most delicious, especially when deep-fried, lightly salted, and served like potato chips. Dried pieces may be added to soups, egg dishes, or sautéed vegetable preparations" (p. 241).

Note 1. A full-page illustration (p. 258) shows many types of Chinese yuba mock meats (meat alternatives).

Note 2. This is the earliest English-language document seen (Oct. 2012) that gives the Japanese names for many popular types and varieties of yuba, and suggests a useful English equivalent for each, for example: Fresh yuba (*nama yuba*), sweet yuba (*amayuba* or *ama-yuba*), etc. An illustration shows each of the many types and varieties.

Note 3. This is the earliest English-language document seen (Oct. 2012) that gives a variety of authentic Asian yuba recipes, including both Japanese and Chinese. Many of these recipes are illustrated.

The word "yuba" appears on 59 pages of this book; pages 4, 8, 12, 21-25, 52, 70, 73, 117, 118, 120, 125, 128, 136, 147, 152, 177, 190, 203-205, 209, 236-250, 252, 257-59, 261, 262, 310-12, 316, 330-34, rear cover. Address: Lafayette, California.

6398. Shurtleff, William; Aoyagi, Akiko. 1975. Natto (sticky fermented whole soybeans) (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 67-68.

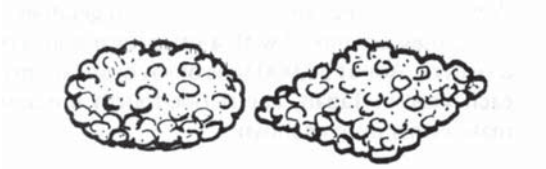
• ***Summary:*** "Natto are prepared (commercially or at home) by steaming soaked soybeans until they are soft, inoculating the warm (104ºF) beans with the bacteria *Bacillus natto,* and then allowing them to ferment for 15 to 24 hours in a humid environment at about 104ºF. The dark-brown beans have a fairly strong and unusual aroma and flavor, and a sticky, slightly slippery surface texture. When lifted from the bowl with chopsticks (fig. 13), like some varieties of melted cheese, they form gossamer-like threads. Although most whole soybeans are somewhat difficult to digest, natto are highly digestible because the beans' complex protein molecules have been broken down by the bacteria during fermentation. A whole, natural food, natto contains 16.5 percent protein and are rich in vitamins B-2, B-12, and iron. In Japan and in Japanese grocery stores in the West, natto are sold in small (3 to 4 ounce) packages wrapped in straw, from which they traditionally received bacteria for fermentation. Generally served as a topping for rice, natto are also used in miso soups and *Aemomo*-dressings, or sautéed with vegetables. In the provinces, they are mixed with a little sugar and served as an hors d'oeuvre. About 50,000 tons of soybeans are made into natto each year in Japan, about one-fourth the amount used to make either miso or shoyu."

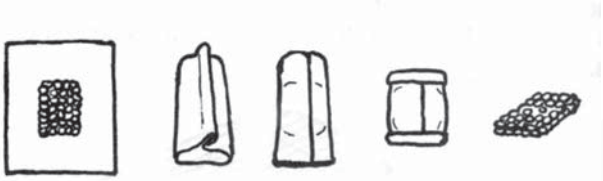
© Copyright Soyinfo Center 2014

Recipes are given for: Natto topping for brown rice. Natto miso soup. Illustrations show: (1) Natto wrapped in rice straw during the soybean fermentation. (2) Natto's gossamer threads.

Note: This is the earliest document seen (Oct. 2010) that uses the word "sticky" or the term "sticky fermented whole soybeans" to describe Japanese natto. Address: Lafayette, California.

6399. Shurtleff, William; Aoyagi, Akiko. 1975. Tempeh (fermented soybean cakes) (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 68-69.





• ***Summary:*** "These cakes of cooked soybeans, bound together by a fragrant, white mycelium of *Rhizopus* mold, have a delectable flavor: fried or deep-fried, they taste remarkably like fried chicken or veal cutlets. Rich in protein (18.3% fresh or 48.7% dried), tempeh is also highly digestible, and *Rhizopus* serves as an effective deactivator of trypsin inhibitor (p. 70). Like other fermented soy products (miso, shoyu, natto) and sea vegetables, tempeh is one of only a few non-meat sources of vitamin B12.

"For centuries prepared daily on a cottage scale throughout Indonesia (where it is a basic food for millions of people and makes use of more than 50 percent of the country's soybean crop), tempeh is also an important staple in New Guinea and Surinam, and is eaten on a small scale in Malaysia and Holland. Its adaptability to household industries and its low cost should make it, like tofu, a food of worldwide commercial interest during the coming decades.

"Tempeh can be prepared without difficulty in any Western kitchen using either whole soybeans, okara (p. 81), or cooked grains (wheat, rice, barley, or rye) fermented alone or mixed with soybeans. In Indonesia, ½ cup portions of partially cooked, inoculated soybeans are wrapped in banana leaves, tied, and fermented. For larger scale preparation, use (stainless steel) trays with 1/8-inch holes every 2 inches throughout the top and bottom, or similarly-perforated, sausage-shaped plastic bags 1½ inches in diameter. Be sure that all containers are well washed since even small amounts of oil or salt hinder mold growth.

"The starter is available from the U.S. Department of Agriculture, Northern Regional Research Lab., 1815 N. University Ave., Peoria, Illinois 61604. The Farm (p. 316) is now making up a brochure on tempeh preparation which will soon be available with the starter.

"To prepare new starter, carefully scrape darkened (sporulated) mycelium from the surface of freshly fermented cakes or from the wrapper or tray in which tempeh was fermented. Mix with 1 teaspoon (sterile) water and use in place of commercial starter.

"Homemade Tempeh: Makes 6 cakes.

"1 cup soybeans, washed and soaked for 18 hours in a mixture of 1 quart water and 1 teaspoon vinegar or lactic acid.

"½ teaspoon tempeh starter (*Rhizopus oligosporus* mold spores).

"Squeeze beans firmly and repeatedly with one hand in soaking water to remove all seed coats, then carefully pour off water and coats. Refill soaking container with water and repeat until all coats are removed. Combine drained beans and 4 cups water in a pot, bring to a boil, and simmer for 60 minutes. Drain beans, rinse 4 to 5 times under water, then drain well. Allow to cool to body temperature, then mix in starter. Divide inoculated beans into 6 equal portions, placing each at the center of a 7 by 9 inch piece of aluminum foil.

"Fold over sides, then ends of foil, sealing tightly, to form a 4- by 3- by ½-inch thick 'package.' Place packages in a warm clean place or incubator and allow to stand for 24 hours at 88º (or as long as 30 hours at 78º), or until beans are bound together into a cake by a fragrant white mycelium. For best flavor, serve these fresh tempeh cakes as soon as possible, cooked in any of the following ways:

"Deep-fried or Fried: Deep-fry cakes (or pan-fry on both sides) until crisp and golden brown. Serve topped with shoyu, ketchup, Worcestershire, or any of the following Basic Sauces (pp. 48 to 49): Onion, Mushroom, Sweet & Sour, Ketchup-Worcestershire, or Tomato & Cheese. Also delicious in sandwiches and soups.

"Tempeh Goreng (Savory Cutlets): Score both surfaces of 3 fresh tempeh cakes to a depth of 1/8 inch. Combine 3 tablespoons water, ½ teaspoon salt, ½ clove of crushed garlic, and ¼ teaspoon coriander. Add tempeh, marinate for 5 minutes, and drain well. Deep-fry in (coconut) oil (p. 130). Serve as an accompaniment for rice dishes, topped with red-pepper sauce (*sambal*) if desired.

"Tempeh Kemul (Crisp Chips): Cut 3 tempeh cakes horizontally into paper-thin slices; sun-dry for 5 minutes if desired. Combine 6 tablespoons (rice) flour, 1 clove of crushed garlic, ½ teaspoon salt, and ¼ teaspoon coriander. Mix in enough (coconut) milk to form a fairly thin batter, then add tempeh slices and allow to stand briefly. Deep-fry until crisp, and serve like potato chips. For variety use a well-salted tempura batter.

© Copyright Soyinfo Center 2014

"Tempeh Bacham [Bachem] (Rich Fillets): Combine in a skillet ¼ grated onion, ½ teaspoon salt, 3 to 4 tablespoons brown sugar, and 1½ cups water. Add 3 tempeh cakes (cut crosswise into fourths), bring to a boil, and simmer until all liquid has evaporated. Deep-fry cakes and serve as for Tempeh Goreng.

"Tempeh Kering (Fiery Sauté): Cut 3 tempeh cakes into paper-thin ½-inch squares; sun-dry for 1 to 2 hours if desired. Deep-fry and drain well. Sauté ½ clove of crushed garlic and ½ minced onion in 3 tablespoons oil for 5 minutes. Add 2 tablespoons each brown sugar and water, 1 to 2 minced red peppers, ½ teaspoon salt, and spices (*salam, laos, asam*) to taste: sauté for 2 minutes more. Add tempeh slices and sauté for 4 more minutes. Scoop out tempeh with a slotted spoon or spatula, drain briefly over wok or skillet, and serve as a topping for cooked rice.

"In Soups: Add diced fresh tempeh to soups and simmer for 30 minutes. Season with salt, miso, or shoyu.

"Baked or Roasted: Bake at 350º for about 20 minutes, or until nicely browned and fragrant. If desired, use as the basis for a pizza-type preparation, or serve topped with any of the sauces mentioned above."

Illustrations show: (1) Small round and square cakes of tempeh. (2) How to fold inoculated, cooked soybeans a small packet when making Indonesian-style homemade tempeh.

Note 1. This is the earliest published document seen (Oct. 2011) that describes how to make tempeh at home. The process was learned from an Indonesian couple, Mr. and Mrs. Mustam, in Tokyo, Japan, in March 1975.

Note 2. On 1 Sept. 1975 Shurtleff (in Tokyo) sent a copy of the section on "Tempeh" (typeset galley proofs) from this book to Cynthia Bates at The Farm (Summertown, Tennessee) and requested her comments. Address: Lafayette, California.

6400. Shurtleff, William; Aoyagi, Akiko. 1975. Hamanatto and Daitokujinatto [Daitokuji-natto] (Raisin-like natto) (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 69.

• ***Summary:*** "Hamanatto is a unique variety of natto soybeans which looks like raisins except that its surface has a grayish black tinge and is smooth and soft. Hamanatto beans have a pleasant, somewhat salty flavor resembling that of mellow Hatcho miso. Sprinkled over rice or rice gruel, served as an hors d'oeuvre with green tea, or cooked with vegetables as a seasoning, they add zest to bland dishes. A similar type of natto, called *Daitokujinatto,* is prepared in Daitokuji temple in Kyoto. Hamanatto are also widely enjoyed in China where they are known as *toushih"* [douchi, doushi, dow see].

Note: This is the earliest English-language document seen (Nov. 2011) that uses the word "toushih" to refer to fermented black soybeans. Address: Lafayette, California.

6402. Shurtleff, William; Aoyagi, Akiko. 1975. Sukiyaki (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 224-25.

• ***Summary:*** "A Japanese cookbook written over 350 years ago contains the following recipe for Sukiyaki: 'Obtain either wild goose, wild duck, or antelope, and soak the meat in *tamari* shoyu. Heat a well-used Chinese plow (*kara-suki*) over an open fire. Place the meat on the plow, garnish with thin rounds of *yuzu,* and broil on both sides until the color changes. Serve and be happy.'

"The word sukiyaki–pronounced skee-ya-kee–means 'broiled on the blade of a plow.' Although the modern preparation generally features beef as the basic ingredient, sukiyaki was traditionally prepared with wild game, fowl, fish, or shellfish. Wild boar was also a favored ingredient, and seafoods such as tuna, yellowtail, whale, wreath shells, and scallops were and, in areas such as Kyoto, still are widely used in the dish.

"Before reaching its present form, sukiyaki passed through a number of unusual historical transformations. The earliest preparation was undoubtedly developed by farmers, hunters, and fishermen who broiled their catch over an open fire using a plow or whatever other utensil was available. Since the earliest plow, the predecessor of the present *nabe,* was nothing but a flat iron plate, it was unable to hold cooking liquids. It was probably for this reason that the meat came to be marinated or basted with tamari shoyu, a technique that is still practiced in some Japanese restaurants. Gradually, sake or *mirin* came to be used in the marinade, various vegetables and grilled tofu were broiled with the meat, and the traditional flat plow or griddle became inadequate to hold the juices of this cornucopia of new ingredients. A new container was needed, and at this point, the ancient tradition of broiling wild meat on a plow merged with the newly-imported tradition of *shippoku,* a type of beef-*nabe* cookery which originated about 300 years ago, just after the first contact with Western traders and missionaries.

"Developed in the international port town of Nagasaki, *shippoku* was said to have its historical culinary roots in Holland, Portugal, China, and Korea. As a result of the merger, the original sukiyaki ingredients eventually came to be cooked in heavy iron or Korean-style stone pots, and the dish was served as a one-pot meal prepared at the table. Consequently 'sukiyaki' became a misnomer, for the new dish was neither broiled nor prepared on a griddle-like plow. But neither was the new sukiyaki a true *nabe* dish, since its ingredients were not simmered in a seasoned broth. Rather, this unique Japanese creation straddled three categories: it was a broiled dish insofar as the meat was first cooked in a sizzling-hot pan; it was a *nabe* dish since it was a one-pot prepared at the dining table; and it was a *nimono,* or simmered dish, insofar as the meat and vegetables were simmered together in a rich mixture of shoyu, sake, and dashi.

"Up until this time, the Japanese had never apparently considered using beef or other livestock in sukiyaki. According to a popular legend, *kamado-gami,* the god of the kitchen hearth, is said to have instructed the Japanese people in ancient times to refrain eating the meat of all four-legged animals, especially of livestock. This admonition was reinforced by the nation's emperors and the vegetarian teachings of Buddhism, so that for about 1200 years–from the 8th century until the 19th century–most Japanese did not eat meat. However with the arrival of Christianity in the 16th century, the eating of beef was also forbidden, and sukiyaki was once again prepared exclusively with seafood, wild game, or poultry. Those who developed a longing for broiled meat, but who were not allowed to prepare it in the family's common pot or in the presence of those who kept the faith, were compelled as a last resort to prepare their sukiyaki the traditional way, substitution using a plow or mattock for the kettle and enjoying the forbidden delicacy alone and in secret in the barn, field, or forest. This tradition of 'underground sukiyaki' is said to have continued until about 1900.

"With the opening of Japan to the West in the mid 19th century and the relaxation of traditional prohibitions, meat eating gradually became fashionable in the cities. Yet most Japanese tasted their first beef with considerable trepidation, having been warned by priests and traditionalists that their action was an affront to their ancestors and that dire consequences would befall them. Little by little, however, beef sukiyaki came to be accepted.

"The first Japanese who worked up the courage to actually eat beef did not prepare it Western-style as steak or roast beef. Rather, they cut the meat into paper-thin slices, employing the same method they had used for centuries to prepare *sashimi,* or raw fish. And they seasoned this meat with shoyu in much the same way they would season simmered vegetable or tofu dishes. Many Japanese probably ate their first beef in the form of sukiyaki, and different parts of the country soon developed unique styles of serving it. To this day in the Kyoto area, restaurants place dispensers of shoyu, *mirin,* and sugar on the table and allow each guest to season his food to taste, whereas restaurants in Tokyo have developed their own unique mixtures of these ingredients to form standard cooking liquids.

"Throughout the world people now associate sukiyaki

© Copyright Soyinfo Center 2014

with fine Japanese cookery. In a sense, this is ironic because Japanese cuisine makes relatively little use of meat, and much of sukiyaki's historical influence came from abroad. The ancient delicacy of Japanese hunters and the imported *nabe* preparation have now been totally transformed to become Japan's most famous international dish. And although tofu plays a relatively inconspicuous role in creating the flavor of this dish, sukiyaki has nevertheless been the vehicle whereby thousands of Westerners have had their first taste of 'soybean curd.'

"Although most present-day sukiyaki uses beef as the featured ingredient, our recipe uses ganmodoki–mock goose–in deference to the earliest traditions of using wild fowl. Homemade frozen tofu and frozen thick-agé, the textures of which resemble that of tender beef, make excellent substitutes. Although regular tofu is occasionally used in sukiyaki, grilled tofu is generally preferred for its ability to absorb the flavors in the rich broth; its substantial, almost meaty texture; its ability to keep its form during the frequent stirring; and its barbeque flavor. In Japan, more grilled tofu is used in sukiyaki than in any other type of cuisine." A recipe follows. Address: Lafayette, California.

• ***Summary:*** Contents: Making soymilk in a Japanese tofu shop as part of the tofu-making process. Comparative analysis of the composition of soymilk, dairy milk, and mother's milk (human), each adjusted to the same percentage of water (88.6%) (with table). "Vegetable milks" prepared from other nuts (almonds, peanuts, walnuts, and coconut) and seeds (sunflower and sesame). Low cost of fresh soymilk, in East Asia and on The Farm (Summertown, Tennessee). Soymilk in Taiwan. History of Vitasoy and K.S. Lo. UNICF / FAO / WHO soymilk plant making Saridele dry soymilk in Indonesia. Smaller plants in Manila, Philippines, and Bangkok, Thailand. History of the work of Dr. Harry W. Miller in China (starting in 1936) and the USA (Soya Lac / Soyalac, 1939). Current status of soymilk sold as a beverage in Japan: Sold in tetrapak cartons or, in condensed form, in cans. Sold "in a variety of flavors (plain, honey, barley-malt, strawberry or chocolate) in virtually all natural and health food stores and at most supermarkets; some types are even dispensed from vending machines or delivered door to door." "Many Japanese tofu makers used to deliver a bottle of soymilk each morning to a large number of their regular customers, but the tradition has gradually declined with the increasing availability of commercial soymilk and the post-was trend toward drinking dairy milk." Address: Lafayette, California.

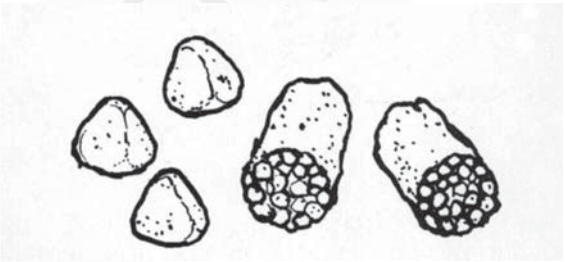
6405. Shurtleff, William; Aoyagi, Akiko. 1975. Kinako (Roasted full-fat soy flour) (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 64-66.



• ***Summary:*** This section begins: *"Kinako* is a tan or beige flour made by grinding whole roasted soybeans. It has a nutty flavor and fragrance and contains over 38 percent protein. Many of Japan's most popular confections are dusted with a light coating of sweetened kinako. These confections usually consist of a grain such as mochi (pounded glutinous rice), or steamed, pounded millet filled with an (sweetened adzuki bean paste). In the Kyoto area alone more than twelve popular confections are prepared with a covering of sweetened kinako. In a number of Japanese health-food treats (such as *kinako amé, gokabo, kokusen,* and *kankanbo*) kinako serves at the main ingredient; it is mixed with mizuame to give a chewy taffy-like texture and rich sweetness. We feel that kinako itself and a number of the following preparations–especially Kinako Butter, Kinako Candy, and Kinako Coffee–could be produced in cottage industries and sold commercially with excellent results. A delicious and inexpensive source of high-quality protein, kinako is generally sold in ¼-pound bags and used in small quantities."

Recipes include: Homemade kinako. Kinako butter [homemade soynut butter]. Creamy kinako butter. Kinako-peanut-sesame spread (with peanut butter and sesame butter). Kinako in brown sauces and roux. Kinako in breads and muffins. Sweetened kinako. Abekawa mochi (This is the most popular way of using kinako in Japan). Chinese-

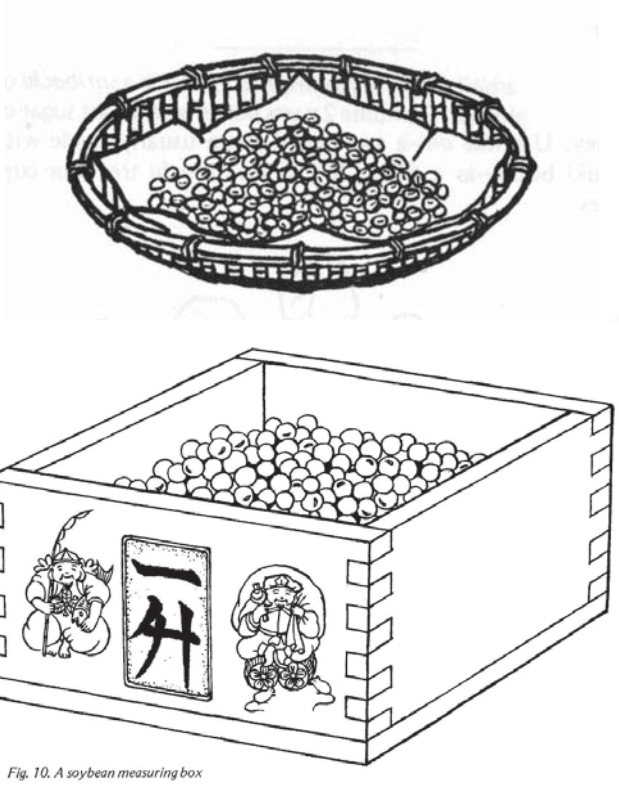

Fig. 10. A soybean measuring box

• ***Summary:*** "Many delicious varieties of roasted soybeans or soy nuts are now available in the West in natural food and health food stores. Dry-roasted varieties contain a remarkable 47 percent protein. (By comparison peanuts contain only 27 percent protein and almonds and cashews only 19 percent.) They are usually lightly salted and have a nut-like flavor and crunchy crisp texture. Oil-roasted varieties are available salted or unsalted with plain, garlic, or barbeque flavors, and contain 37 percent protein.

"Roasted soybeans can be eaten like peanuts as a snack, or used to add a crunchy texture and nutlike flavor to a wide variety of salads, sauces, casseroles, and miso preparations. In the West roasted soybeans are also used in health food 'candy' such as soy honey- or nut bars. In their ground form, they are used in commercial soy spreads.

"In Japan, these are the 'beans of good fortune' (*fuku mame*) enjoyed on the first day of the lunar spring. Roasted beans covered with multiple coatings of sugar, starch, and nori are sold commercially as *Mishima mame* and served as a sweet snack. Green soybeans, roasted with salt until they have a crunchy texture and greenish-beige color, are sold as *Irori Mame."*

Contains recipes for: Homemade roasted soybeans (makes 3 cups). Roasted soy grits. Address: Lafayette, California.

6407. Shurtleff, William; Aoyagi, Akiko. 1975. Soybean sprouts (*Daizu no moyashi*) (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 66-67.

• ***Summary:*** "One of the world's finest diet foods, soybean sprouts contain less calories per gram of protein than any other known vegetable food. Although mung bean sprouts are the most popular both in the West and in East Asia, soybean sprouts are inexpensive, tasty, and easy to prepare at home. Most contain both the bright yellow soybean and the sprout root which will grow to a length of 3 to 5 inches in 5 to 7 days. Soybean sprouts may be served as a green vegetable throughout the year either parboiled in fresh salads (where they serve as a good source of vitamin C) or in soups, sautéed, or baked dishes.

"Homemade Soybean Sprouts: Makes 3 to 6 cups.

"1 to 1½ cups dry soybeans.

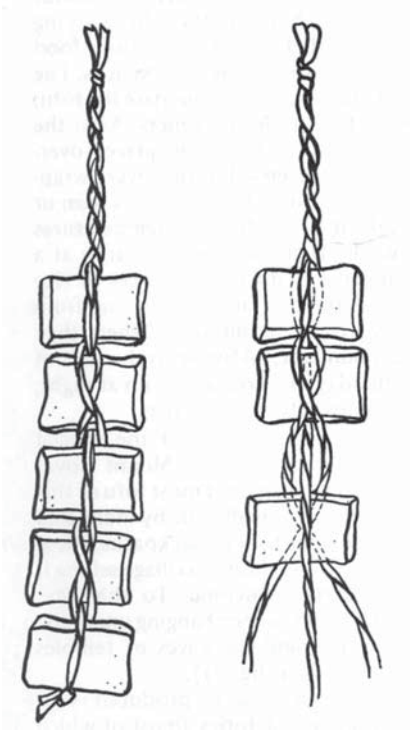
"Prepare a sprouter by making small holes in the bottom of a 10- to 12-inch-deep plastic container, milk carton, or coffee can. Pour in soybeans to a depth of at least 2 inches, then place sprouter in a slightly larger pot and fill with water to more than cover beans. Cover pot and allow beans to soak for 4 hours (no longer). Lift out sprouter and drain beans being careful not to mix or agitate them. Cover sprouter and place in a dark place at 72ºF. Rinse beans 3 to 4 times daily by sprinkling with water, again taking care not to mix them. Repeat for 5 days or until sprouts are about 4 inches

© Copyright Soyinfo Center 2014

long. Transfer sprouts to a large pot and rinse with plenty of water; pour off loose hulls and remove unsprouted beans. Refrigerate unused sprouts in a sealed container." Note: The above recipe first appeared in the 1983 Ten Speed Press edition of this book (p. 66).

Contains recipes for: Soybean sprouts salad with tofu. Egg foo yung with soybean sprouts and tofu. Chop suey or chow mein with soybean sprouts and tofu. Address: Lafayette, California.

6408. Shurtleff, William; Aoyagi, Akiko. 1975. Frozen and dried-frozen tofu (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-

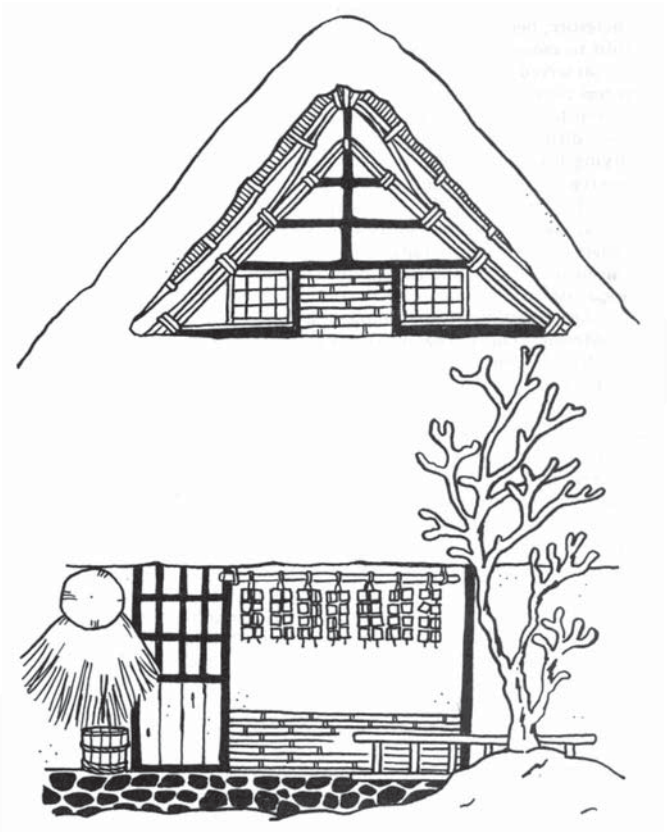


ken, Japan: Autumn Press. 336 p. See p. 226-37.

• ***Summary:*** Contents: Introduction. Dried-frozen tofu: Origin of tofu at Mount Koya some 750 years ago by a Shingon priest, how Koya-dofu is made Mt. Koya, dissemination to farms and villages, by the Edo Period (1600-1868) Koya-dofu was known throughout Japan, Takeda Shingen experiments with dried-frozen tofu in Nagano (no drying shed), history of tofu made in automated factories, discovery of ammonia, the largest factory today, how dried-frozen tofu is sold in Japan today.

Reconstituting frozen and dried-frozen tofu: Frozen tofu, dried-frozen tofu. Storing and cooking dried-frozen tofu. Homemade frozen tofu. Homemade dried- frozen tofu.

Recipes for dried-frozen tofu (25 recipes). Address: Lafayette, California.



6409. Shurtleff, William; Aoyagi, Akiko. 1975. Okara or unohana (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 77-85.

• ***Summary:*** This chapter begins: Unohana (*Deutzia scabra*) is a tiny white flower that grows in thick clusters on briar bushes and blossoms in the spring (Fig. 20). In 1869, the haiku poet Basho, on his last long trek to the back country of northern Japan, wrote of unohana in his journal:

Mounting towards the Shirakawa barrier
"Autumnal winds" hummed in my ears,
"The maple" stood imagined,
But leafgreen branches haunting too,
Against unohana white white briars,
As if pushing through snow. (Cid Corman translation)

The word "unohana" is also used in connection with tofu. After gô is ladled into a cauldron of boiling water and simmered, it is transferred to a heavy cloth sack set on a rack on top of a wooden curding barrel. The sack's mouth is twisted closed and the sack is pressed. In farmhouses a grinding stone is set atop the sack; in tofu shops the sack is pressed either with a traditional lever (fig. 21) or with more modern equipment. In each case liquid soymilk filters through the sack into the curding barrel. The soybean pulp–called okara or unohana–remains in the sack. The soymilk is eventually made into tofu; the okara has its own special uses.

Okara is beige in color and has a crumbly, fine-grained texture. Some Westerners have remarked–only half in jest–

Unohana

Fig. 21. A traditional lever press

that its appearance reminds them of moist sawdust. But the Japanese, in line with their ancient tradition of honoring even the simplest and most humble of foods, place the honorific prefix *o* before the word kara, which means "shell, hull, or husk." Thus o-kara means "honorable shell." In Chinese it is called "child of tofu lees" (*doufu chatsu* [*dou zha, douzha, doufu-zha*]), "soy lees" (*docha*), or "tofu's head" (*douto*) in contrast with the soft curds which are called the "tofu's brain." Trying to translate any of these words into descriptive English is almost impossible; terms such as "soybean lees, grounds, mash, pulp, fines, residue, dregs," or the like hardly do justice to this fine food.

Note: This is the earliest English-language document seen (June 2013) that uses the word "lees" or the terms "tofu lees" or honorable shell, or soybean lees, to refer to okara (see p. 22, 77).

When Japanese refer to okara as an ingredient in cooking, they call it unohana, in honor of Basho's tiny white blossoms. And, indeed, it deserves this high evaluation for, when properly prepared, it is a tasty and nutritious food which serves as an important ingredient in traditional Japanese cuisine. Okara dishes are available in most delicatessens and at many fine restaurants. Light and almost fluffy, okara absorbs flavors well and gives body to sautéed vegetable dishes, soups, casseroles, breads, and salads.

The most important constituent of okara is what nutritionists and doctors call "dietary plant fiber" and now consider to be an essential part of every well-balanced diet. Fiber, by definition, is indigestible. Composed of carbohydrates found in the outer bran layers of whole grains and the cell walls of natural vegetables and pulses, it passes unchanged through the human digestive tract performing two key functions: it provides the "bulk" or "roughage" necessary for regular bowel movements and the prevention of constipation; and it absorbs toxins (including environmental pollutants) and speeds their passage out of the body.

The recent re-evaluation of the importance of fiber-rich foods such as okara has resulted from the recognition of three dangerous trends in the dietary patterns of most industrialized nations: (1) our intake of dietary fiber is now only 20 percent of what it was one hundred years ago due both to the rapid rise in the consumption of sugar, meat, fats, and dairy products (all of which contain no fiber) and the decrease in the use of grains and vegetables; (2) a large proportion of the grains we do consume are in their refined, processed forms (such as white bread, rice, or pasta) which have been stripped of their fiber-rich (and nutritious) outer layers; (3) the average person has a steadily increasing intake of toxic substances from both food additives and the environment. Serving okara, therefore, allows us to make use of natural soybeans in the most holistic and health-giving way.

Containing about 17 percent of the protein in the original soybeans, okara itself consists of 3.5 percent protein by weight, or about the same proportion found in whole milk or cooked brown rice. While it is perhaps unfortunate that all of this protein is not transferred to tofu, its presence in okara is just that much more reason for utilizing this byproduct of the tofu-making process.

The tastiest and most nutritious okara is that removed in the process of making kinugoshi tofu, a variety made from very thick soymilk. Since this okara is pressed only once, it retains a great deal of the soymilk's flavor and nutrients, and has an obviously moist, cohesive texture. In the process of making regular tofu in tofu shops, soymilk is filtered through first a coarsely woven and then a finely woven sack. The small quantity of very fine-grained okara that collects in the second sack is usually pressed by hand (rather than with a press) so that it, too, retains a large portion of the soymilk taste and food value. During the winter months when the cold air ensures their freshness, both varieties are shaped

© Copyright Soyinfo Center 2014

into 4½-inch-diameter balls or sealed in small plastic bags to be sold for a few pennies per pound. Some tofu makers present okara to their customers free of charge as a token of appreciation for their patronage.

Before World War II, most tofu-shop okara was sold for use in cooking. Young apprentices at the shop were often allowed to cook the day's okara any way they wished and then sell their creations from door to door. At New Year's, okara croquettes and other tasty dishes, made and sold in this way, earned an impoverished apprentice a little pocket money.

In some parts of China, okara is pressed into cakes about 6 inches in diameter and 1 inch thick, and allowed to ferment for 10 to 15 days until each is covered with a mycelium of white mold. The cakes are dried for a few hours in the sun, then deep-fried or cooked with vegetables and sold as a nutritious flavoring agent called meitauza [okara tempeh]. In Indonesia, a similar product called ontjom is said to be well liked for its tasty almond-like flavor.

In Japan, a typical tofu shop produces about 15 gallons of okara daily, or roughly 1 gallon for each gallon of dry soybeans used. But at most, only one gallon or so of this is retailed. The remainder is picked up daily at the shop by local dairymen who feed it to their cows to stimulate milk production and enrich the milk's nutrient content. In China, many tofu makers run small hog farms and use okara as their principal source of fodder. Okara also works well as an organic mulch and fertilizer, or as a free, high-protein pet food. (In Japan it is now used commercially in dried dog- and cat foods.)

Nursing mothers have used okara for centuries to enrich their milk and stimulate its flow. It also serves as a traditional cure for diarrhea. Wrapped in a cloth and used to rub down the household woodwork, okara's natural oils coat and darken the wood, thus serving as a wax and polish.

At present in the United States, okara is available at some Japanese and Chinese groceries and, of course, at all tofu shops. But the easiest way to obtain okara is to prepare Homemade Tofu (p. 99) or Soymilk (p. 204). If you prepare enough tofu for two people, you will have as a byproduct about 1 cup of okara, or enough for two to four servings.

Then come instructions for "Roasting or parching okara" and for "Homemade okara."

The chapter ends with 7 pages of okara recipes, grouped as follows: Okara in salads. Okara in soups. Okara in sauces. Okara with eggs. Okara baked. Okara stir-fried, sautéed, and deep-fried (incl. Okara burgers and okara tempeh). Okara with grains and sushi. Okara desserts.

Note 1. This book contains the most information about okara and the most okara recipes of any book published in English to date. Before publication of this book, okara was very difficult to obtain in the West, except directly from Asian tofu shops. Soon, however, people started making their own tofu at home (often using tofu kits) and many new tofu shops sprang up and became sources of fresh okara.

Note 2. This book (and its companion, *Tofu & Soymilk Production*, 1979) were largely responsible for the word "okara" becoming widely used in English.

Note 3. Within 5 years after the book's publication the importance of fiber in the diet began to be widely publicized. Address: Lafayette, California.

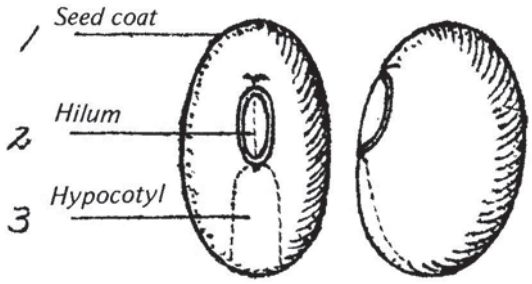
The soybean plant



• ***Summary:*** The section titled "Cooking with whole dry soybeans" (p. 59) begins: "In Japan, soybeans are only occasionally cooked at home. To save time and the cost of lengthy cooking, most people purchase ready-made soybean dishes, usually at the local delicatessen. Many of these store-bought preparations contain large amounts of shoyu and/or sugar to serve as natural preservatives. Whole (tan) soybeans are also available commercially deep-fried in a sweetened batter and sold as Soy Brittle (p. 62), while black soybeans are often used in confectionery treats.

"But when most of us in the West set out to use soybeans, we usually start with those available in their whole, dry form at natural food stores and supermarkets. Presently the least expensive known source of usable protein, whole soybeans are also rich in iron, and vitamins B-1, and B-2. A truly remarkable food, they contain 1½ times as much protein as any other legume (34% to 38%), and are low in carbohydrates. Many recent cookbooks, especially those emphasizing natural foods, have begun to include a wide variety of recipes using boiled or baked soybeans in Western-style salads, soups, casseroles, and spreads.

"Fresh, new-crop soybeans–the tastiest type–are generally available from the beginning of November. When storing large quantities, always use cloth rather than plastic sacks. When soybeans are kept over long periods, a small harmless moth and its eggs may appear among the beans. These can be easily removed by sifting and then exposing the beans to direct sunlight for one day.

"Once you decide to make soybeans, tofu, and soymilk a basic part of your diet, buy a 60- to 100-pound sack of

© Copyright Soyinfo Center 2014

food- or seed grade beans at greatly reduced prices from a wholesaler or farmer's supply store; avoid the little packages retailed at inflated prices.

"To ensure best flavor, digestibility, and deactivation of trypsin inhibitor (see p. 70), soybeans must be cooked–preferably pressure cooked–until they are very soft; a single bean should be easily crushed between the thumb and ring finger or between the tongue and roof of the mouth. The beans should also be thoroughly soaked in plenty of water (see graph, p. 289), the water discarded, and new water used for cooking; this helps remove the oligosaccharides believed to cause flatulence. When pressure cooking, some cooks add 1½ teaspoons oil for each cup of beans in order to prevent the seed coats from clogging the steam escape valve; some also prefer to add salt and seasonings before pressure cooking. If cooking the beans at only 10 pounds pressure, double the cooking times given in the following recipes."

After recipes for pressure cooked soybeans, and boiled soybeans, are 15 Western-style soybean recipes followed by the following named Japanese recipes: Budomame (Sweet soybeans). Kombu mame. Kuro mame. Gomoku mame.

Illustrations show: (1) A 1 *shô* (1.8 liter) wooden measuring box (*masu*) widely used in Japan for measuring soybeans, grains, etc. The sides are joined by finger joints. (2) A soybean plant. (3) Basic parts of a single soybean.

6420. **Product Name:** [Sasa-no-Yuki brand Buro-Dofu (Sealed Lactone Silken Tofu)].
Manufacturer's Name: Morinaga Milk Industry Co., Ltd.
Manufacturer's Address: Shiba 5-33-1, Minato-ku, Tokyo 108 Japan.
Date of Introduction: 1975.
Wt/Vol., Packaging, Price: 10.5 oz Tetra Brik Aseptic carton.
How Stored: Shelf stable; refrigerate after opening.
Nutrition: Per 5.25 oz: Calories 80, protein 7 gm, carbohydrate 4 gm, fat (45% of calories) 4 gm, sodium 40 mg.
New Product–Documentation: Talk with S. Ikegami. 1981. Jan. 14. This product was introduced before the law protecting small tofu makers in Japan was passed in 1976.

Note: This is the earliest commercial tofu product seen made by Morinaga.

• ***Summary:*** Contents: Introduction. Agronomy: Varieties, cultivation, yields. Soybean composition. Protein nutritional value. Traditional processing into nonfermented foods: Soybeans as a table vegetable ("cooked green soybeans. "Certain large-seeded varieties are often referred to as 'garden' or 'vegetable' type soybeans in contrast the better known {smaller seeded} 'field' type"), soy milk, tofu (soybean curd), yuba, kinako, salted soybeans, soybean sprouts. Traditional processing into fermented foods: Miso and shoyu, tempeh. Others (p. 55) include: natto, hamanatto, sufu (soy cheese), tao-tjo, kochu chang, ketjap, ontjom, and yogurt-like products.

Contemporary processing without defatting: 'Debittering' by aqueous treatment, whole bean processing, full-fat flour ("Extrusion cooking to produce full-fat soybean flour has received considerable attention"), soy milk and curd. Contemporary defatting processes: Defatting by aqueous processing, defatting with organic solvents, composite flour ("Substitutes or extenders for wheat flour in baked goods and pasta products are termed 'composite flours,' whether or not they contain some wheat." Many of these include soy protein products), soy flours, protein concentrates, protein isolates and textured soy products (Based on "protein fractionation after hexane defatting of soy meal." Recipes for using soy protein products in foods are available from several publications–which are listed). Address: Anderson Clayton Foods, W.L. Clayton Research Center, 3333 Central Expressway, Richardson, Texas 75080.

Nerimiso [sweet simmered miso]. Dengaku. Furofuki daikon. Tokoroten. Nuta. Miso-yaki [broiled with miso]. Name miso [finger-lickin' miso]. One-pot cookery. Miso pickles. Cooked with miso. Chinese-style miso cooking. Noodle cooking. Miso confections. Homemade miso. Contains many recipes. Address: Head, Egami Cooking School, Tokyo.

6436. Harlan, Jack R. 1975. Crops & man. Madison, Wisconsin: American Society of Agronomy. xi + 295 p. Illust. 24 cm. Foundations of Modern Crop Science Series.
• ***Summary:*** Table 2-1 (p. 57) lists "The world's 30 leading food crops in terms of estimated edible dry matter" in descending order of annual production. For each is given: Annual production in million metric tons, annual or perennial, ecological origins (Mediterranean, savanna, woodlands, tropical forest, highlands, coastal, or prairie), self- or cross-fertilizing, ploidy level. The top ten crops are: Wheat (468), maize (429), rice (330), barley (160), soybean (88), cane sugar (67), sorghum (60), potato (54), oats (43), and cassava (41). The soybean (No. 5) originated in northeastern China; it is an annual which originated in the woodlands, is self-fertilizing, with a ploidy level of 4. A large proportion of the maize, barley, soybean, sorghum, oats, and rye are fed to animals in the "developed" countries, but serve as human food elsewhere (p. 80).

© Copyright Soyinfo Center 2014

Fig. 5-1 (p. 108) shows a schematic diagram of primary, secondary, and tertiary gene pools. Since a hybrid has been made by crossing the soybean with its wild perennial relative, and since "embryo rescue was used, the relationship seems to be at the GP-3 level."

Pages 152-53 show major gene banks in the international system. The two major soybean collections are in the USA (USDA), and Japan (NIAS, Tsukuba).

Page 198 discusses "Recorded history." "The soybean is first mentioned in 664 BC in connection with tribute paid to the Chou by the Shan-Jung (Mountain Jung) tribe." Hemp (Cannabis) is mentioned seven times in the *Book of Odes* (*Shih Ching*). "The agriculture that evolved on the north China uplands was based on the millets, soybean, and a suite of fruits and vegetables" (p. 199).

The section titled "Soybean" (p. 206) contains details on the cultivated plant and its wild ancestor–which is a "small, slender creeping vine bearing a few small pods with small, black seeds. The plant is widely distributed from southern Siberia, through Manchuria, throughout the eastern coastal plain of China, and westward to Szechuan. It is rather weedy, and is often found in city parks under the shade of trees. Presumably, it was once a woodland or temperate forest plant before the natural vegetation was removed for agriculture. The changes under domestication have been enormous.

"Evolution of bush types from vines is common under domestication... The viny ancestral types are usually retained as well, and trailing forms of soybean are still grown for fodder."

The following plants are also discussed: adzuki (*Vigna angularis,* p. 73), amaranth (p. 17-18, 76-77, 80, 95, 221), Bambara groundnut (Voandzeia, 71, 182), Cannabis (hemp, p. 55, 70, 74, 147, 198, 200), peanut (p. 57, 59, 77, 153, 187, 225, 227-28, 232), *Pueraria lobata* (p. 67, 75, 200; see also Yam-bean), quinoa (p. 77, 233), sesame (15, 72, 75, 198, 213), and winged bean (p. 75). Address: Prof. of Plant Genetics, emeritus, Crop Evolution Lab., Dep. of Agronomy, Univ. of Illnois, Urbana, Illinois.

• ***Summary:*** Originally published by Daihôrin for 5 years under the title *Shôjin Ryôri Tsurezuregusa.* Shôjin ryôri is the Buddhist vegetarian cookery developed in Japan, largely in and around Zen temples. *Tsurezuregusa* was a famous literary book; the term means something like "unfocused or scattered writings." Address: Japan.

6438. Laulima, Hui O. 1975. Okinawan cookery and culture. Hawaii: Published by the Author. 187 p. Illust. 22 cm. *
• ***Summary:*** Contains several tofu recipes.

6439. Moncrieff, R.W. 1975. Man-made fibres. 6th ed. New York and Toronto: John Wiley & Sons. A Halsted Press Book. 9 + 1094 p. See p. 289-90. 23 cm.
• ***Summary:*** Today, the nylons, the polyesters, and the acrylics are the dominant fibers, having replaced large amounts of cotton and wool. In part 2 of this book, titled "Fibres Made from Natural Polymers," chapter 8, "The first rayons" (p. 157-61) notes that the first rayons were developed, starting in the 1830s, as "artificial silk" from natural sources of cellulose, especially wood-pulp. The first practical process for making artificial silk (later called rayon) was invented by Count Hilaire de Chardonnet and patented in 1885; large amounts of Chardonnet silk were first produced starting in the 1880s. The process for making viscose rayon was discovered in 1891 by C.F. Cross and E.J. Bevan, then patented in 1892. "The greatest single factor in the development of the viscose process has undoubtedly been the support given to it by Courtaulds, Ltd. The pioneer work was undoubtedly carried out by Courtaulds, Ltd., who not only founded and developed an important new industry, but also introduced it to America under the name "The American Viscose Co." In 1900 world production of viscose rayon was about 1,000 tons. In 1920 it as 15,000 tons and in 1940 it was 1,100,000 tons. Note: Courtaulds, Ltd. was a pioneer in making a spun soy protein fiber named Kesp for food uses in the UK, starting in 1973.

Chapter 17 in Part 2, titled "Casein fibres" (p. 307-09) discusses Lanital, Aralac, Fibrolane, and Merinova. In 1904 Todtenhaupt disclosed a method of making casein filaments, but they were brittle and lacked sufficient resistance to water to withstand wet processing. Early attempts by him and others to make a commercially successful casein fibre were unsuccessful, and it was not until 1935 that the problem was really solved by an Italian named Ferretti, who conducted his research from 1924 to 1935. He succeeded in making pliable fibres with certain wool-like characteristics. The Italian rayon manufacturer Snia Viscosa purchased Ferretti's patents and began large-scale production of casein fibre, named Lanital (*lana* means "wool" in Latin) from milk. In 1937 they made 1,20 tons Lanital.

Chapter 18 in Part 2 is titled "Ardil, Vicara, Soybean." It is very similar to the same chapter in the 1963 edition. Ardil fiber is made from peanuts (groundnuts), and Vicara from corn (maize) protein.

Chapter 19 discusses nylon, which was a product of the genius of Wallace H. Carothers. This brilliant organic chemist left his academic life at Harvard University to undertake fundamental research work in 1928 with the huge American chemical combine of E.I. du Pont de Nemours & Co. He was interested in fibers made of polyesters and polyamides. By 1938 the du Pont Co. was making nylon at a small pilot plant in Wilmington, Delaware. In the UK this fiber is spun by I.C.I. Ltd. (the huge chemical combine) at Doncaster, Pontypool, and Gloucester. Address: United Kingdom.

6442. Ohta, Teruo. 1975. Nattô kenkô-hô [The natto way to good health]. Tokyo: Futaba Books. 242 p. Illust. No index. 18 cm. [28 ref. Jap; eng+]
• ***Summary:*** This interesting, comprehensive book, by a scientist and expert on the subject, discusses all aspects of natto. Contents: Preface (p. 3). 1. History of natto and its mystery (p. 15). When did natto bacteria appear on earth? The mystery of ancient natto. The first meeting of ancient humans and sticky beans (*neba mame*). Natto is preserving food which was nurtured by the climate where people opposed the government. Why was the Japanese palate better? The amazing wisdom of the Japanese race–"Ancient fermented foods." *Tôshikyô* was a salty natto (*kata natto*) of 2,200 years ago. Natto originated during the Heian period [A.D. 794-1185]. Medicinal natto which Japanese monks kept secretly in olden times. The god of childbirth and princess natto (*hime natto*). Reasoning the "Natto Road." Village natto (*mura natto*) of Tanba, Yamaguni (p. 40). Shoyu-flavored natto started during the Muromachi period [1336-1573]. War provisions in field campaigns and natto. The military commanders of the Sengoku period also used Jinchô natto. Vendors calling out "Natto! Natto!" started during the Edo period (1600-1868). People who challenged the secrets of natto. The dark period of natto making. The mystery of the straw wrapper (*wara zuto*) and the Japanese people. The power of natto, which was studied by even the German army. The Japanese Army and navy studied the power of natto thoroughly (p. 60). Strong ally natto in the time of food shortage. The elite of the foods of the future. Mysterious medicinal effects of natto found in folklore.

2. The homeland of natto (p. 71). From *Hime natto* to *Daraku nabe*–Fukushima prefecture. *Teramichi natto* of Yonezawa and Goto natto–Yamagata prefecture. The early, noncommercialized form of Yukiwari-natto was Goto natto, made with natto, koji, and salt, fermented together for 1 month. Since the middle of the Edo period (about 1735) it has been made in Yamagata prefecture, mostly in farmhouses. It is widely served over rice, mixed with a popular type of diced miso pickle. One commercial manufacturer is Maruyome Shokuhin in Yonezawa city, Yamagata prefecture. Yukiwari-natto looks like Finger Lickin' Miso. The legend of kuromame [black soybeans] of Kiyomasa-kô–Kumamoto prefecture. Pounded natto (*tataki natto*), "Ito" and "Oito"–Kyoto. Tôzô and ôzutsu natto–Chiba prefecture. Mito natto which was sold in train stations along the Jôbansen line–Ibaraki prefecture. Straw-wrapped natto (*warazuto natto*) and natto mochi of Omi–Shiga prefecture. Iwadeyama natto which was eaten by Hachiman Taro Yoshiie–Miyagi prefecture. Is hikiwari natto ancient natto?–Aomori prefecture. Fluffy natto (*fukkura natto*) in large cooked rice containers (*hettsui*)–Saitama prefecture. Stood still at Kawanakajima saying "Nantoshô" ("What to do?")–Nagano prefecture. Naisho mame in the pitch dark–Gunma prefecture. The origin of natto culture–Yokote's hikiwari natto–Akita prefecture.

3. The secret of eating natto (p. 95). What are fermented foods. Super abilities of wonderful microorganisms. Comrades of microorganisms. Why cooked soybeans become natto. The natto bacterium is a magician. The useful component of amazing natto. Natto is the last natural food. Stamina food gives endurance to modern people. Natto protein is of high quality. Natto is an excellent maker of amino acids. Natto vitamins which are used by famous people to increase their stamina. The stickiness of natto is a bunch of active strong enzymes. The wondrous abilities of enzymes. Natto has a strong power to prevent sickness. If you take acidic food continuously, the body's resistance will decrease. Natto is a wonderful alkaline food. There are many unsolved mysteries related to natto. To research the secret of very strong multiplication. The Japanese are an advanced country in terms of soybean utilization. It is important that a true health food should have good balance.

4. Medicinal effects of natto (p. 141). Common colds run away when they see natto. Dysentery and typhoid run away too. Skin disease such as favus and scabies–and natto. When the blood pressure rises, eat natto first. A feeling of faintness when you try to stand up is a sure sign of anemia. If you eat natto–no constipation problems. If you get fat during middle age, start a natto diet. The ideal food to prevent heart disease. Arteriosclerosis and natto. Natto strengthens the liver. The big news–natto bacteria control cancer. Natto keeps you from getting very drunk. Eating natto makes beautiful white skin. White rice and natto are ideal a mealtime. Natto–a strong ally of the stomach. Natto bacteria condition the intestines. Natto has the power to remove radioactivity. Challenge the eternal youth and longevity with natto. Natto and mustard pack a double whammy.

5. How to make natto at home (p. 171). How to grow natto bacteria well. Steps in making natto. Various methods of incubation. The method of making natto at home. This is how natto was made in the old days. How to select good natto. How to measure the freshness of natto. The secret of small-bean natto. The difference between domestically grown and imported soybeans.

6. How to eat natto well (p. 199–with many natto recipes). Unique ways of eating natto over rice. Various natto soups. Deep fried natto dishes. Fun one-pot cookery. Snacks. Natto miso and dried natto. Famous preserved natto foods in

© Copyright Soyinfo Center 2014

the various provinces. Other uses and hints.

7. Chronology of natto from 10,000 B.C. to the present (p. 217-39). Key early dates include the following: Heian period: 1051–The legend of Minamoto (Hachimantaro) Yoshiie and natto began (Note: Minamoto Yoshiie was a famous Japanese warrior who lived 1039-1106). The Oshû Kaido [Oshu] became known as the natto road. 1062–Abe Sônin (or Abe Sadamune) started to make "Tôhoku Natto" (a type of sticky natto) in the Hida or Higo region of Kyushu, and was respected by the local people there. 1068–The word "natto" (*usu-shiokara natto;* lightly salted natto) first appeared in the *Shin Sarugakuki* by Fujiwara Akihira.

Kamakura period: Fermented black soybeans became very popular among the samurai and monks. 1129–Zen master Dogen of the Soto sect returned from Sung-dynasty China and introduced Buddhist Vegetarian Cookery (*shojin ryôri*) to Japan. 1211- Samurai (*bushi*) during the Kamakura period eat brown rice and fermented black soybeans (*shiokara natto*) for stamina. 1332–Soybeans were cultivated on a fairly large scale on land near Kamakura by the Tokugawa shogunate (*bakufu*). From these were made fermented black soybeans and other soyfoods which were quite widely used. 1334–During the Nanbokuchô period Kôgen Hôô appeared. In the Jôshôkôji in Tanba Yamaguni made Warazuto Natto and taught the process to the villagers. It was also called Yamaguni Natto, and remains there to this day.

Muromachi Period: The popularization of regular natto started as itohiki natto became "O-ito." The *Teikun ôrai* contained recipes using fermented black soybeans (*shiokara nattô*). Fermented black soybeans were eaten by people as *tenshin* or *ochauke* with tea. Natto and tofu were widely served with Buddhist Vegetarian Cookery (*shojin ryôri*). Natto soup (*nattô-jiru*) originated. 1450–In the *Shôjin gyorui monogatari* [A comic tale of the great war between vegetarian foods and animal foods], natto appears as a person named Nattô Tarô Itogasane. 1532–The *Daiso ryôri-sho* (The Daiso cookbook) contains a detailed recipe for how to make natto soup (*nattô-jiru*).

Note: This is the earliest document seen (Jan. 2012) that mentions Yukiwari-natto (with or without a hyphen). Continued. Address: National Food Research Inst., Tokyo, Japan.

6449. Wright, Louise. 1975. History of Lea & Perrins Worcestershire Sauce (Document part). In: Louise Wright. 1975. The Road from Aston Cross: An Industrial History, 1875-1975. Imperial House, Leamington Spa, Warwickshire, England: Smedley–HP Foods Ltd. 84 p. See p. 30-37. 25 x 19 cm.
• ***Summary:*** Continued (p. 30): "Another important matter was on the move: A merger between HP Sauce Ltd. and the world famous makers of Worcestershire sauce, Lea & Perrins. Mr. John Wheeley Lea and Mr. William Perrins went into partnership in 1823. Mr. Lea was druggist in Worcestershire; his friend had a chemist's shop in Evesham. Over their Christmas festivities, they decided two heads were better than one and on New Year's Day [1823] pooled their resources to develop the Worcester business as Lea & Perrins. They set up as wholesalers and retailers of pharmaceuticals, toiletries, cosmetics and groceries. Long before the days of ice-cream parlours and Coca-Cola, their shop on Broad Street, Worcester, became the precursor of the modern American drug-store.

"Both men were analytical chemists. Both were aware of the advantages of marketing their own products and their fist catalogue listed more than three hundred items. Although trading from a quiet country town, they kept themselves informed and studied world trade. Aware of the rapid growth of Queen Victoria's empire, they also realised that the industrial revolution was rapidly altering Birmingham and the Black Country. Soon their medicinal products were in great demand throughout the Midlands. Later they opened a chemist's shop in London, patronised by Queen Adelaide.

"Their concentrated Essence of Sarsaparilla was recommended for scorbutic affections (scurvy), cutaneous (skin) diseases and for freeing the system from the ill-effects of taking mercury. They recommended Taraxacum (dandelion coffee) for liver complaints because of its gentle diuretic and diaphoretic effects. Presumably their customers were sufficiently conversant with medical terms to know that a diuretic excites the discharge of urine and a diaphoretic produces perspiration.

"Mr. Lea & Mr. Perrins were perfecting their medicines, hair lotions and marrow pomades when Marcus, Lord Sandys visited the shop in Worcester. Late Governor of Bengal, he had retired to his country estate at nearby Ombersley Court, and would be obliged if they would make up one of his favourite Indian sauces. They obliged. Having already arranged their own supplies of spices and dried fruits, from Asia and the Americas, they had the ingredients to hand. Scrupulously following his lordship's recipe, they made the required quantity, plus some for themselves. One taste was enough. The sauce was ghastly: an unpalatable, red hot, fire water. His lordship was entirely satisfied. The remainder however was consigned to a cellar below the shop and there it stayed until the annual spring cleaning and stocktaking.

"It was on the point of being poured away when Mr. Lea and Mr. Perrins detected its appetising aroma. Tasting it once again they discovered it had matured into a rare and piquant sauce. The sauce was saved, more was made. Customers were persuaded to try the new Worcestershire Sauce, and did not need more persuasion: the sauce was an instant success. Sales rose. In 1842, Lea & Perrins sold 636 bottles. In 1845, a manufactory was set up in Bank Street, Worcester. Ten years later the yearly sales were up to 30,000 bottles of Worcestershire Sauce. Travellers covered Great Britain and there were agencies in Australia and the United States. As well as sauce, they found a steady export market for their medicines. No sensible traveller left England without a Lea & Perrins medicine chest."

"By 1862, the firm's international trading had become an extensive two-way traffic. An American firm in New Jersey was asking them to find an English market for hermetically sealed 3 lb cans of fresh fruits, tomatoes, green corn and oysters.

"When it became necessary to build a new factory in Midland Road, Worcester in 1897, Mr. Lea & Mr. Perrins used the latest steel girder construction. The factory rises over vast cellars, which house hundreds of casks of maturing sauce and maturing raw materials. No anchovy is allowed into the cellars under a year old. It matures for at least another year before being used in the sauce manufacture. The steel girders of the cellar roof, which supported the circular yard and its traffic of one ton drays in 1897, are now having to be re-inforced to take 32 ton freight-liners. A royal warrant was granted to the firm by Edward VII in 1904 and has been proudly held ever since. It helped alleviate trouble with imitations of their sauce. In the High Court of Justice in 1906, Mr. Justice Swinfen Eady decreed that no firm other than Lea & Perrins be allowed to call their Worcestershire Sauce, 'The Original' or 'The Genuine'.

"In 1823, William Perrins' son married Sarah Dyson of Huddersfield. Their grandson christened Charles William Dyson, was known as Dyson Perrins. A benefactor to the City of Worcester, to his home town of Malvern and to his

© Copyright Soyinfo Center 2014

old University of Oxford, where he developed his great love for the earliest printed books... He also inaugurated the Dyson Perrins Porcelain Museum at Worcester.

"After the First World War, Lea & Perrins rapidly expanded. When the merger with HP Sauce Ltd. was settled by mutual agreement in 1930, it had been a private limited company for some time. The branch in the United States, Lea & Perrins Inc., was not officially brought into the new company until a year later, but a gentleman's agreement between the two boards had sufficed while the trans-Atlantic marriage was being formally established. The amicable relationship dated back to Mr. Lea and Mr. Perrins.

"The believed in having friendly dealings with their overseas agents. Foremost among them were their New York agents, John Duncan & Sons. Established since 1819 as importers of wines, quality foodstuffs and preserves, they began to handle Worcestershire Sauce in 1840. Soon, they were handling ever-increasing amounts. During the succeeding forty years, close friendship developed between the two family businesses; indeed, the Duncans have adopted Dyson as one of their own family names.

"By 1875, the demand for Worcestershire sauce had spread throughout the United States. It was agreed to import the sauce in casks and bottle in New York. On the personal side the friendship between the families became so strong that the secret formula was divulged and the rights of manufacture granted to the Duncans. After eight years of manufacture in their various New York factories, they acquired in 1910 a nine storey building in West Street. Following their partnership with HP Sauce Ltd., they remained in West Street until expansion forced them to move to the Industrial Park at Fair Lawn, New Jersey." Continued. Address: Warwickshire, England.

6450. Wright, Louise. 1975. History of Lea & Perrins Worcestershire Sauce (Document part–Document part II). In: Louise Wright. 1975. The Road from Aston Cross: An Industrial History, 1875-1975. Imperial House, Leamington Spa, Warwickshire, England: Smedley–HP Foods Ltd. 84 p. See p. 30-37. 25 x 19 cm.

• ***Summary:*** Continued: Fair Lawn, near Route 4 out of New York, is an industrial park. Behind the lawns and dignified facades "Lea & Perrins Inc. alone produce 500 bottles of sauce every minute of every working day. The company is now a member of the Imperial Foods Group, but retains its American identity, with its own board of directors and its own purchasing and marketing procedures. The company has been marketing HP Sauce for some years." It is known as HP Steak Sauce.

An early engraved advertisement titled "The First Introduction" (facing p. 32) shows an innkeeper or restaurateur introducing Lea & Perrins' Sauce to three well-dressed gentlemen at a table. Two photos (facing p. 33) show: 1. A view of the front of the Lea & Perrins factory, built at Midland Road, Worcester, in 1897. 2. "The disastrous fire in 1964, which destroyed much of the building. With fine cooperation by management and employees, the sauce manufacture was held up for a mere 10 days."

In the New Zealand town of Te Wairoa, destroyed by a volcanic eruption in 1886, an undamaged bottle of Lea & Perrins Worcestershire sauce was found preserved by the volcanic dust. It is on display in the museum there (p. 34).

Plate 51 shows three ads published in 1871 by Lea & Perrins in three Australian newspapers (the *Coulburn Herald, Bathurst Free Press,* and the *Manaro Mercury*) to caution people against purchasing fraudulent imitations of their "celebrated Worcestershire Sauce." The two agents in Australia were Montefiore, Joseph & Co. (Sydney), and John Lee & Co. (Maitland). The sauce was exported by Lea & Perrins (Worcester) and by Crosse and Blackwell (London); it was sold by "Grocers and Oilmen universally."

Plate 54 states: "Lea & Perrins have been exhibiting since the historic Chicago Exhibition [in Illinois] in 1876, which celebrated the first hundred years of American Independence. The vase and bottled where were displayed there, are on permanent exhibition in the entrance hall of the offices of Lea & Perrins Inc., New York." Plate 55 shows the products of HP Sauce Ltd. and Lea & Perrins Ltd. on display at the British Industries Fair of 1949. Pages 42-43 discuss problems faced by Lea & Perrins in Worcester during World War II. "An army medical unit had taken over their factory, leaving only a small, sealed section in which to continue the highly secret process of making the sauce... One sniff was enough; there is no mistaking a cask of five-year-old anchovies." Lea & Perrins soon moved its bottling machinery from Worcester to Aston Cross. Plate 59 shows a empty glass bottle of Lea & Perrins sauce from 1880.

Plate 60 shows seven old Lea & Perrins Worcestershire sauce bottles. The oldest two, made of green glass with glass stoppers, were both filled in 1866. Two others are from about 1870. The earliest one with a label is from 1920. Plate 83 shows old bottles (with labels) of Worcestershire Sauce made by other manufacturers in Kobe, Japan; Cardiff, Wales; Hamburg-Altona [Germany; Altona became part of Hamburg in 1937]; the United Kingdom, and Portugal. Address: Warwickshire, England.

6467. *Foreign Agriculture.* 1976. Outlook better for soybeans in three Far East markets. March 22. p. 2-4.
• ***Summary:*** The improved forecast is for Japan, Taiwan, and South Korea. Once virtually free of competition for the important Japanese soybean market, the U.S. must now reckon with Brazil as a competitor, while facing Malaysian palm oil in the vegetable oil market. Brazil's soybean exports to Japan last year, for instance, probably totaled only about 60,000 tons, compared with the 2.8 million tons of U.S. beans. The cost of shipping Brazilian beans to Japan in 1975 averaged $5-$10 per ton more than from the U.S. This difference reflected the longer distances from Brazilian ports, plus Brazil's use of smaller ships. The 10-day-longer shipping time from Brazil is especially important in Japan, where timeliness of cargo is a key market factor.

There is only one major oilseed crusher and meal supplier in Korea. The Government production plan calls for self-sufficiency in soybeans and the country has launched a strong drive in this direction. Current Korean production of soybeans totals about 311,000 tons. The low-oil variety of bean produced in Korea is best suited for food use (e.g. miso).

Taiwan is the largest per capita consumer of soybeans in the Far East, with a per capita soybean oil consumption of about 11 pounds in 1975 (out of 13 pounds for all vegetable oils).

• ***Summary:*** Contents: Introduction. A brief history of Hamanatto. Methods of production: Yamaya and Horinji methods, Daifukuji method. The microbiology and chemistry of Hamanatto fermentation. Hamanatto's special characteristics. Serving Hamanatto. Conclusion. Acknowledgments.

Two flowcharts show Hamanatto production methods at Horinji and Daifukuji. Tables: 1. Distribution of various microorganisms in Hamanatto (cells per gram) at Yamaya, Horinji, Daifukuji. 2. Nutritional composition of Hamanatto (from Yamaya, Horinji, and Hamana), Daitokuji natto, and regular sticky natto. 3. Composition of free amino acids (mg per 100 gm defatted, and gm per 10 gm protein) in Yamaya Hamanatto, Daitokuji natto, Yamaya Hamanatto, soybean miso (temperature controlled- and natural fermentations), and Hatcho miso. 4. Composition of Hamanatto fats. 5. Volatile acids in Hamanatto. 6. Aromatic compounds in Hamanatto.

In Japan, there are basically two types of natto: Regular natto (*itohiki-natto*) and salty natto (*shiokara-natto*). Generally the word 'natto' refers to the former but in Shizuoka prefecture in and around Hamamatsu city a type of salty natto called *hamanatto* is famous. Totally unrelated to regular natto except in name and the fact that both are fermented soyfoods, it is actually a close relative of soybean miso in terms of its flavor and the way it is produced. However unlike miso, the soybeans retain their original form, uncrushed, and the product has its own unique flavor and aroma. Another type of salty natto is Kyoto's Daitokuji-natto.

A brief history of hamanatto: Hamanatto originated in ancient China and is one of the progenitors of today's miso and shoyu. Many old documents show that its relatives *kokusho* ('grain chiang') and *teranatto* ('temple natto') were brought to Japan from ancient China. A type of fermented, salt-preserved cooked soybeans called *tou-ch'ih kyo* was

© Copyright Soyinfo Center 2014

excavated together with articles buried with one *Mao-tai,* a ruler of the early Han dynasty who lived about 2200 years ago. This was the earliest form of hamanatto. According to the first scholars and envoys from Japan to T'ang dynasty China, *chiang* and *kuki,* both progenitors of miso and shoyu, were introduced to Japan from China. Records show that the great T'ang dynasty Buddhist master Ganjin, who came to Japan by boat in 753, brought with him 1428 gallons of 'sweet kuki,' an early type of salty natto. The first mention of salty natto in Japan appears in Fujiwara Akihara's *Shinsaru Gakki / Shin Sarugakuki,* written in 1286 [Note: Others give the date as 1068]. The first character of the word 'natto' means 'to pay, supply, or dedicate;' the second means 'bean or soybean.' According to the *Honcho Shokkan,* written in 1697, the first character was derived from the fact that natto were first prepared in Japanese temple kitchens which are known as *na-ssho,* the place which supplied the monk's food. Since the propagation of salty natto throughout Japan was done primarily by temples, they also came to be known as 'temple natto' (*tera-natto*)*.* They served as an important source of protein and savory seasoning in the Buddhist vegetarian diet. Kyoto's Daitokuji-natto, Ichimei Ikkyuji-natto, and Tenryuji-natto, each made in temples, and the Hamanatto made at Daifukuji and Horinji temples in and around Hamamatsu city are popular to this day. Hamanatto first became known when the monks of Daifukuji temple presented some to the seventh Ashikaga shogun, Ashikaga Yoshikatsuko, during the 1400s. during the Warring States Period (1467 to 1568) they also presented Hamanatto to lords of the families of Imagawa Toyotomi, and Tokugawa.

Note: This is the earliest document seen (Nov. 2011) that mentions "Ikkyuji" or "Ichimei Ikkyuji" in conjunction with Daitokuji natto.

Because of its unique flavor and aroma and good keeping qualities, hamanatto became known throughout Japan. in some cases the skin of sansho seeds (Japanese pepper; *Zanthoxylum piperitum*) were mixed in and the product called *kara-natto* ('spicy natto'). When Toyotomi Hideyoshi undertook his Korean campaigns, he took lots of hamanatto with him. When he arrived in the ancient province of Hizen in northwest Kyushu, just before his soldiers embarked in boats to Korea, he gave this food the same name, *kara-natto,* but written with characters which mean 'beans for subjugating T'ang dynasty Korea.' This name, he hoped, would bring him luck in his campaign. After returning to the Hamamatsu area in central Japan, he donated land to makers of hamanatto to encourage their craft.

Later, when Tokugawa Ieyasu took over Hamamatsu castle, he used hamanatto as soldiers' provisions. Each year the local monks gave hamanatto as a gift to the shogun, who in turn used it as a New Year's offering. Still later, produced by temple cooks and craftsmen, it was given as a New Year's gift to parishioners; it also had a symbolic meaning since the word for soybeans (*mamé*) has also come to mean healthy and robust. In 1968 Yamaya, a producer of tamari shoyu (soy sauce) under the direction of Suzuki Yasuke, attempted to make an improved version of the product previously prepared at Daifukuji temple and first affixed the name 'hamanatto.' Thus the name of the product developed in the following order: *shiokara-natto* ('salty natto). *kara-natto* (T'ang dynasty natto), *hamana-natto,* and *hama-natto.* To this day, Daifukuji has maintained its own special method of production, but this too has been commercialized.

Methods of production: Today hamanatto is prepared by two methods: the traditional method handed down from generation to generation since ancient times, and the modern industrialized method which made improvements on the traditional method without harming the special flavor and aroma. Yamaya company and Horinji temple use closely related methods; the former is industrialized while the latter is a handmade process using koji starter. Daifukuji uses a different traditional process without koji starter since the ancient incubation room, wooden trays, and rice-straw covering mats are each permeated with starter mold spores. The soybean koji (molded soybeans) is combined with brine and put into vats for the second fermentation in September. Since the room temperature during the koji making (first fermentation) is 20º to 25ºC (68-77ºF) no special incubation heat source is needed. Yet since the molds propagate naturally, without special inoculation, the koji making takes a long time, up to ten days.

There are numerous points of difference from regular miso production; when making salty natto [fermented black soybeans] the soybeans are not crushed; the koji is incubated with brine in a keg or vat with a heavy pressing lid; and the final product is sun-dried. At the factory, the soybeans are only partially reconstituted [by soaking in water] until they reach 1.5 to 1.6 times their dry weight; this takes 2 hours in winter and 1½ hours in summer. They are then drained and allowed to stand for 4-5 hours so the absorbed water penetrates deeper. If they are drained for too long, the beans become hard. They are then steamed for 4-5 hours [at atmospheric pressure] and allowed to stand overnight in the steamer. At Daifukuji, the unsoaked beans are dropped into boiling water, parboiled for 7-8 minutes, steamed for 7-8 hours in a 2 meter deep steamer, then allowed to stand in the steamer until the next morning. Care is taken that the beans are not crushed or dehulled. Nowadays, since it is known that the process of leaving the beans overnight in the steamer lowers their net protein utilization and makes them more difficult for the enzymes to digest, this step is generally omitted. Traditionally it was always used to darken the beans; there were apparently no problems with bacterial contamination, perhaps because the reaction of sugars and amino acids under heat produces substances which reduce the proliferation of bacteria and yeasts. In fact, the overnight period in the steamer may have been done expressly to encourage this effect. Continued.

6472. Ito, Hiroshi. 1976. Hamanattô [Hamanatto (Continued–Document Part II)]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 71(3):173-76. March. [Jap; eng+]

• ***Summary:*** Continued. The steamed beans are then spread on a thick rice straw mat (*mushiro*), drained well, sun dried, sprinkled with roasted barley flour, and mixed until each bean is well coated. The straw mat helps to absorb excess water. In factories, the roasted flour is premixed with koji starter (*Aspergillus oryzae* mold spores). They dried the straw mat and used it year after year. Molds such as *A. oryzae, A. soyae,* and *Rhizopus* species inoculated the beans during mixing with the flour. The mixture is covered for one night with rice straw mats, then the next day transferred to wooden koji trays, which are arranged in the koji incubation room to make koji. Care must be taken that excess heat does not develop during fermentation, lest alien bacteria proliferate and the product's flavor and aroma decline. To prevent this, the koji mycelium is broken up three times by hand in the trays during the incubation.

At factories, the finished koji is sun-dried for 4 to 5 hours in winter (Hamamatsu is famous for its dry fall winds) or for 2 hours in summer so that the moisture content is reduced to below 30 to 35 percent. IF this drying is insufficient, after the beans have been put into the vats they easily get crushed. The vat used is a 19-gallon wooden vat or a small wooden tub. The koji is divided among several vats, brine made by combining salt with boiled water is added, a pressing lid equal to twice the weight of the vat contents is set in place, and the mixture is allowed to ferment for 80 to 90 days in summer or 150 days in winter. (In some places (Daifukuji), unpasteurized shoyu is used in place of brine).

The use of a heavy pressing lid is preferable since it causes the fermentation to proceed slowly; a light one helps it to go faster, but the soybeans more easily lose their form. At temples they sliver the middle skin of sansho seeds and place these at the bottom of the vat, then add the finished koji and finally the brine. In factories they add a more concentrated brine and ferment the mixture for at least 2 months. The fermentation room (*kura*) should have good air circulation and ventilation, otherwise the product may develop and unpleasant moldy or musty odor.

After draining off the brine scooping the beans out of the vats, they are spread on rice straw mats (traditionally *mushiro* from the Ryukyu islands; today *tatami* matting), sun-dried, and sifted to remove small pieces, which are discarded. In a separate process, gingerroot is cut thinly, soaked in boiling water, sun dried, and soaked in moromi (shoyu mash) for about 10 days to make pickled gingerroot. Sansho seeds are also added to some types.

The microbiology and chemistry of Hamanatto fermentation: The molds found in fresh hamanatto koji and commercial hamanatto, in addition to *Aspergillus oryzae,* include *Rhizopus* species and *A. niger.* Hamanatto such as that made at Daifukuji using a low incubation temperature (20-25ºC) and a long time contains a large proportion of *Rhizopus* on the surface of the soybeans. Moreover the amylase and protease enzymes in these molds are weaker and less active than those from the koji used for commercial shoyu or miso. For this reason the soybeans are not broken down, but rather remain in their whole form. If the koji is made mechanically, the enzyme strength and quality increases. The incubation proceeds more quickly in summer since the temperature is higher; the koji is ready in 3 days.

In general during the koji production, amylase, protease, and pepsidase activity reach a maximum at 50 hours, but in order to dry it, it must be left longer which causes the activity to decrease. In addition to molds, lactic acid bacteria and film yeasts, which are related to *Pediococcus,* are found in all hamanatto; they are mixed in during contact with the straw mats. If air circulation during koji production is poor, lactic acid bacteria proliferate more than usual. Unlike most lactic acid bacteria, they ferment soybean sugars creating undesirable effects, but do not ferment lactose. After the koji-brine mixture is in the vats, film yeasts proliferate among the various flavors; at 45 days they are most abundant, then later decrease. Especially on the surface of vats with poor air circulation, they are found as a white mold. These yeasts produce hamanatto's unique aroma.

Hamanatto's special characteristics: Because the fermentation time is long, the color turns a dark brown. The form of the beans is well preserved. The composition of nutrients is shown in figure 2. Compared with regular natto, hamanatto has less moisture and more salt. Free amino acids are shown in figure 3. Those abundant are glutamic acid, leucine, and proline, while cystine, tryptophan and methionine are the most scarce. Compared with soybean miso, arginine, cystine, and histidine are also relatively scarce. Since soybean miso undergoes an even longer fermentation than hamanatto the difference is the amino acids freed from the soybeans, which is particularly enhanced by protease enzymes from the koji molds. Hamanatto flavor is rich and full-bodied, somewhat like that of soybean miso, but with a special aroma, more tartness, and a unique flavor component that Japanese call *egumi.* The latter, related to oil rancidification, imparts what some describe as a subtle harsh or unpleasant stimulation to the tongue or throat. Kiuchi et al, in 1976, in an analysis of hamanatto lipids, found that this egumi originates from linoleic acid. Hamanatto fats, unlike those of regular natto, are more than 70 percent of free fatty acids. The majority of fats in both natto and soybeans are triglycerides, with other fat components being relatively low. The lipase in hamanatto koji breaks down a large percentage of the fats but the composition of the resulting fatty acids is not different from those found in soybeans; in both cases, linoleic acid comprises more than 50 percent of the total.

© Copyright Soyinfo Center 2014

Hamanatto's volatile acids and aromatic compounds are shown in figures 5 and 6. The aroma of Yamaya's hamanatto was superior to that of Daifukuji or Hamana. This aroma was very poor just after the koji was made but during the ripening of various flavors, isobutyl aldehyde, isobutyl alcohol, and various amines decrease together with a decrease in the poor aroma. However if the air circulation is bad while making koji or during the vat fermentation, alien microorganisms proliferate, leaving an undesirable aroma.

6473. Ito, Hiroshi. 1976. Hamanattô [Hamanatto (Continued–Document Part III. Continued)]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 71(3):173-76. March. [Jap; eng+]
• ***Summary:*** Continued. Serving Hamanatto: Hamanatto is used both as a seasoning and as a protein source. Like Daitokuji-natto it is sprinkled as a seasoning over hot rice in a small bowl, then doused with hot green tea to make the popular Ochazuke. It may also be served as an hors d'oeuvre with sake, used in place of tea cakes with whisked green tea as Chauke, or served as a rice seasoning in box lunches like shoyu-simmered kombu. Since ancient times it has been used in Zen Temple Cookery as a source of subtle flavor, diced and mixed with grated daikon, sprinkled with vinegar, or used in the Chinese tofu dish Mabo-dofu. Its abundance of glutamic acid and nucleic acids enrich the flavor of any food with which it is served.

Conclusion: Hamanatto, a progenitor of today's miso and shoyu, has been made by traditional methods since ancient times. Long lasting, it embodies the fermentation and nutritional wisdom of our forebears. Thus its scientific study reveals new and valuable information. In its traditional processing methods there are points that should be improved, yet today it is a long lasting food with its own distinctive characteristics.

Acknowledgements: I would like to thank the Yamaya and Hamana companies for supplying documents and samples, and allowing me to quote selected portions; Professor Kayo Kon of Shizuoka Women's University; and my colleagues at the National Food Research Institute, Kan Kikuchi, Teruo Ota, and Shinkuni Sasachi.

Figures show: (1) Hamanatto production methods: Flow charts of the Yamaya-Horinji method (Horinji is in parentheses), and of the Daifukuji method.

Tables show: (1) Distribution of microorganisms in Hamanatto made by Yamaya, Horinji, and Daifukuji. For each maker, there is one column for surface and another for interior. The types of microorganisms are: General bacteria, micrococcus, streptococcus, pediococcus, halophilic lactic acid bacteria, firm-forming yeasts, and molds (Mostly *Aspergillus oryzae* and *Rhizopus* species).

(2) Nutritional composition of three varieties of Hamanatto (Yamaya, Horinji, Hamana), Daitokuji natto, and regular "stringy" (*itohiki*) natto.

(3) Composition of free amino acids in various fermented foods: (A) Yamaya Hamanatto, Daitokuji Natto (both in mg per 100 gm defatted); (B) Yamaya Hamanatto, Daitokuji Natto, Soybean miso (made at controlled temperature), Soybean miso fermented at natural ambient temperature (all four in gm per 100 gm of protein); (C) Hatcho miso (in mg per gm). In the far left column 18 amino acids are listed.

(4) Composition of Hamanatto lipids. The four vertical columns are: TG = Triglycerides. DG = Diglycerides. ST = Cholesterol. FFA = Free fatty acids, MG = Monoglycerides. The four horizontal rows are: Soybeans, dry. Soybeans, steamed. Natto. Hamanatto.

(5) Hamanatto volatile acids. (6) Hamanatto aromatic compounds.

composition).

Page 88, No. 812: Amazake. Per 100 gm. Calories 101, moisture 74.0 gm, protein 2.4 gm, fat 0.1 gm, carbohydrates (sugars 22.7 gm, fiber 0.6 gm), ash 0.2 gm, calcium 74 mg, phosphorus 25 mg, iron 0.4 mg, vitamin A 0 mg, vitamin B-1 0.08 mg, vitamin B-2 0.06 mg, nicotinic acid 0.06 mg, vitamin C 0 mg.

A later edition (after 1976), containing at least 298 pages, gives details on the following soy-related foods (p. 76-80): Japanese-grown whole soybeans (dry, or boiled). Whole dry USA-grown soybeans. Whole dry Chinese-grown soybeans. Green immature soybeans (edamame; raw, or boiled). Soybean sprouts (raw, or boiled). Defatted soybeans (whole, or dehulled). Kinako (soybeans roasted and ground). Budô-mame (soybeans boiled with shoyu). Momen tofu (regular). Kinugoshi tofu (silken). Soft tofu. Packed tofu. Okinawa tofu. Yaki-tofu (grilled). Nama-age. Abura-age. Ganmodoki. Kôri-dofu. Tofu-chikuwa (steamed type, or roasted type). Natto (fermented soybeans): Itohiki-natto, Goto natto, or tera-natto.

Miso: Rice-koji miso (sweet type, light yellow type, dark yellow type). Barley-koji miso. Soybean-koji miso. Dried miso. Kinzanji miso. Hishio-miso.

Other: Okara. Soymilk (regular, reconstituted, or soft drinks). Yuba (wet, or dried).

Page 254 gives the amino acid composition of soybeans and various soyfoods. Page 298 gives the protein scores, amino acid values, and chemical scores of selected foods. Page 8 gives the energy conversion factor for tofu, agé, and yuba.

6483. *Soybean Digest.* 1976. Japanese to help produce even more Brazilian [soy] beans. March. p. 44.
• ***Summary:*** "Brazil continues to look ahead to much greater agricultural production, with soybeans a key crop, in a massive land development plan backed by Japanese funds. Brazilian and Japanese officials met in mid-February to work out further details of the plan to turn a huge wasteland area of about 7.5 million acres stretching over 3 states into farmland to produce mainly soybeans and corn. The joint venture is Japan's biggest overseas cooperative agricultural development and is part of Japan's effort to diversify her overseas food supply sources, officials say. The U.S. currently provides over 90% of Japan's soybeans, but that share will probably dwindle if the Brazilian development project is a success."

• ***Summary:*** An interesting graph on p. 31 shows soybean acreage in Japan from 1877 to 1973. From 1877 the area rose very slowly to a peak of about 500,000 ha in 1907, then fell to a low of about 220,000 ha in 1947. The area jumped immediately after World War II to 420,000 ha, stayed there for about 4 years, then began a rapid decline, dropping to an all-time low of about 80,000 ha in 1973. Address: Nôrinshô Gijutsu Kaigi Kenkyû-jo, Japan.

6496. Kiuchi, Kan; Ohta, T.; Itoh, H.; Takabayashi, T.; Ebine, H. 1976. Studies on lipids of natto. *J. of Agricultural and Food Chemistry* 24(2):404-07. March/April. [16 ref. Eng]
• ***Summary:*** The lipid contents and compositions of three products were measured: Itohiki natto (2.8% lipids), Yukiwari natto (10.9%), and Hama-natto (6.4%). Yukiwari natto is made by mixing Itohiki natto with rice koji and salt, then aging the mixture at 25-30ºC for 15 days.

The gas chromatographic pattern of fatty acid composition of Hama-natto is similar to that of soybeans, however 78% of the total lipids in hamanatto is free fatty acids.

Note 1. This is the earliest English-language document seen (Jan. 2012) that mentions "Itohiki natto."

Note 2. This is the earliest English-language document seen (Dec. 2011) that mentions "Yukiwari natto." Address: Div. of Applied Microbiology, National Food Research Inst., Tokyo.

Address: American Soybean Association, Tokyo, Japan.

6498. Kudo, Shiro. 1976. Kôri-dôfu [Dried-frozen tofu]. *Shoku no Kagaku* (*Food Science Journal*) No. 29. p. 122-27. April. [Jap]
• ***Summary:*** It is said that the commercial production of frozen tofu started during the Momoyama period (1568-1600). It was made using the traditional, natural method of freezing the tofu outdoors in the snow, then allowing it to dry naturally. Centers of production included Mt. Kôya (Kôya-san), the Osaka-Kyoto area (Kinki Chihô), the Shinshu area (Shinshu Saku), the northeastern provinces (Tôhoku Chihô), Hokkaido, and the Matsuzen Chihô.

The earliest written description seen of the method for making frozen tofu appeared in the *Honcho Shokkan* (1690-1695, by Hitsudai HITOMI). That method was very similar to the method used today. Later, two basic methods evolved: The Koya method and the Shimi-dofu method. They differed only in the steps after the tofu was frozen outdoors in the snow. In the Koya method, the tofu underwent 5 days of standing at freezing temperatures (*moya*) to develop a fine-grained texture, was thawed in hot water, drained, and dried in a heated shed (*hoiro*). In the Shimi-dofu method, the tofu underwent 1 day of moya, was allowed to thaw and drain naturally, was tied with rice straw, hung outdoors in the air under the eaves, and subjected to repeated drying in the daytime sun and freezing again at night, until it was dry.

Starting in about 1700, Buddhist Vegetarian Cookery (*shôjin ryôri*) became very popular in the Kyoto-Osaka area. Frozen tofu was introduced and spread among the people of southwestern Japan and the island of Shikoku. Because of its growing popularity, a new and improved method for making the tofu (the Koya method) was developed that was better than the Shimi-dofu method. Shimi-dofu was made mostly in farmhouses and not much attention was paid to marketing the product. The process has not changed much up to the present time.

A flow chart (p. 122) compares the processes for making dried frozen tofu using the new method vs. the traditional method.

1900 (Meiji 34)–An artificial freezing method was invented and used commercially. That made the unstable quality for frozen tofu more stable and enabled it to be made at any season of the year (not just during the winter) and in any part of Japan (not just in very cold regions).

1913 (Taisho 2)–The Koya method (frozen tofu method) was imported to Nagano prefecture, where Shimi-dôfu had been produced traditionally. In Nagano there was quite a different attitude from that found in Kansai (the Osaka / Kyoto area). The owners of factories studied the techniques, and with great effort, expanded their market in the Kansai area. At that time in Kansai, consumers wanted their dried frozen tofu to be soft when they eat it. As a result the expanding and softening process (bônan kakôho) was invented.

1925 (Taisho 14)–They added starch into the stage of making fresh tofu to get the soft tofu.

1928 (Showa 3)–They invented the method for adding sodium bicarbonate (baking soda; *jû-tansan soda*) to frozen tofu during the drying stage.

The next invention was the use of ammonia gas. They found that technique accidentally when they tried to remove the sour flavor of mold that grew of tofu, using ammonia. When they used ammonia gas, the tofu expanded and grew soft. This was the most dramatic event for the history of frozen tofu. After this invention of Shinshu Frozen Tofu, this tofu became accepted among consumers in the Osaka / Kyoto (Kansai) area and developed a good reputation.

During that time the manufacturers switched to artificial

© Copyright Soyinfo Center 2014

freezing from natural freezing and frozen tofu entered the age of mass production.

But only manufacturers in Nagano prefecture could make tofu all year round. They won the market from makers of traditional shimi-dofu and ended up with 90% of table production of frozen tofu in Japan.

Page 124: 2-3 years ago they invented a new method of not using ammonia, because frozen tofu processed with ammonia had a bad smell and only 3 months shelf life, and got rancidified very quickly–so that consumers had to store the product in a refrigerator.

Note: In 1974 (Showa 49) frozen tofu production in Japan was 13,000 tonnes, worth 8,300 million yen. A typical package of 100 gm sold for 47-85 yen. There were 21 manufacturer in Japan; each used from 1 to 30 tonnes of soybeans per day. Four large manufacturers controlled 80% of the market. By contrast, the retail value of fresh tofu was about 10 times as much as that of frozen tofu. Address: Vice President, Asahimatsu Kori-dofu K.K., Japan.

6502. Saio, Kyoko. 1976. Soybeans resistant to water absorption. *Cereal Foods World* 21(4):168-73. April. [6 ref]
• ***Summary:*** Small, hard soybeans do not absorb water well and thus do not work well in making most traditional East Asian foods. They were found to contain higher amounts of crude fiber and calcium than normal soybeans. The seed coat of the hard beans was also higher in calcium and more dense and tough than that of normal soybeans. Also, microscopic investigation revealed that the micropyle was covered with the outside palisade cells. This fact may account for the failure of hard beans to absorb water. A scanning electron microscope shows the micropyle of hard and normal soybeans. An illustration (line drawing) shows the outside of a soybean; the hypocotyl, micropyle, hilum, and chalaza are labeled. Address: National Food Research Inst., Ministry of Agriculture & Forestry, 12-4-1 Shiohama, Koto-ku, Japan.

6503. **Product Name:** [Soyalac {Soymilk} (Reduced Sugar, or No Added Sugar)].
Foreign Name: Soiyarakku (Gentô, Mukatô).
Manufacturer's Name: San-iku Foods.
Manufacturer's Address: 1-1 Nagaurataku, Sodegaura-machi, Kimizu-gun, Chiba-ken 299-02, Japan.
Date of Introduction: 1976 April.
Wt/Vol., Packaging, Price: 425 gm can.
How Stored: Shelf stable; refrigerate after opening.
New Product–Documentation: Both products tasted by William Shurtleff in Hayama, Japan, at the home of Nahum and Beverly Stiskin while doing final proofreading and editing on *The Book of Miso.* 1976. May 19-23.

K. Tsuchiya. 1982. Dec. *Tonyu* [*Soymilk.* 2nd ed.]. p. 74. States that Soiyarakku Gentô was introduced in April 1976 and Soiyarakku Mukatô in June 1976. They are both now sold by Saniku Fuuzu in a 425 gm can and distributed nationwide.

6528. Itoh, Joan. 1976. Everything there is to know about tofu. Review of *The Book of Tofu* by Shurtleff and Aoyagi. *Japan Times.* July 10. p. 7.
• ***Summary:*** "'The Book of Tofu' by William Shurtleff and Akiko Aoyagi is just about the most complete book one can imagine on the subject. It is written much like a textbook, educating the reader in a delightful way with large easy-to-read print, charts, statistics and scores of drawings that makes everything they are talking about absolutely clear. The enthusiasm that the authors feel about this food comes through and they make a very good case of why all of us should become tofu fans."

"Besides all this, it has the most detailed glossary of Japanese foods ever compiled in English and that alone is almost worth the price of the book for the foreigner living in Japan.

"Needless to say, the authors have put a fantastic amount of research and work into their project. There just isn't anything left out, even lists of tofu shops now operating in America and western Europe. It is a work that they can well be proud of because it is going to be a tremendous help to a great many people.

"One gets the feeling that this is a book that could not have been written any other time but now. Maybe the fact that the authors are into Zen meditation has something to do with the whole simple, honest feeling about the book. It reflects a blend of cultures. hard work, liberation, idealism and, most of a1l, a kind of awareness and concern for mankind. The book of tofu is a cookbook with a message and buying it might be one of the best ways you could spend ¥2,500."

Note: Immediately below this review is another titled "Key Elements of Soto Zen Expounded." It reviews a new book, *Zen Master Dogen: An Introduction with Selected Writings,* by Yuho Yokoi with Daizen Victoria. Shurtleff originally went to Japan to study Soto Zen meditation and translate Dogen's writings into English, then switched to writing about tofu. How perfect!

6533. Doorn, Wil van. 1976. Lima, the European Erewhon. *East West Journal.* Aug. p. 21-22, 24-25. [Eng]
• ***Summary:*** This is an interview with Pierre Gevaert, co-owner and manager of Lima natural food factories in St. Martens, Latem, Belgium. Gevaert was working for world peace before George Ohsawa visited in May 1957. In early 1959 Gevaert started to produce large quantities of miso and tamari soy sauce at St. Martens Latem, Belgium, with the help of two Japanese specialists that Ohsawa had sent. The company, named Lima, was officially started in March 1960, though they had been producing food for almost 3 years under the name "Sesame."

In 1962 Lima started to contract with farmers to grow grains organically; they were the first company in Europe to do this, in part because they were so familiar with organic agriculture themselves. "Using the knowledge gained from our own experience, we taught many farmers to grow their produce organically again in the traditional manner." Brown rice was grown in the south of France. In 1967, after operating at a loss for many years, a businessman-consultant named Edouard van der Seelen advised them to halt production of miso and tamari. Sales were good but the products took 3 years to mature.

Pierre is a Catholic who has practiced macrobiotics for 19 years.

Note: This is the earliest document seen (Jan. 2014) concerning the soyfoods movement in Europe.

6534. Ohlund, Tim. 1976. Re: Work with miso and koji in Sweden. Letter to William Shurtleff at New-Age Foods Study Center, Aug. 2 p. Handwritten.
• ***Summary:*** "Dear friend. I have been very impressed with your articles on tofu and tempeh in such magazines as *East West Journal* and *Mother Earth News.* I have been working in this area on a very small scale since about 5 years ago, when I got into macrobiotics in Japan under Nahum Stiskin. Since then I have been living in Sweden studying Japanese and Chinese at Uppsala University as well as managing a truck garden (biodynamic) during the summers."

He has been growing Japanese vegetables in Sweden–with good results. "I've also been working with a new variety of soybean suited for this northern climate. This year I have a very good crop of them. The last two winters I've been making up batches of miso just to see how it would go and gain some experience at it. It is not yet as I would like it, but that will take some time. What I really need at this time is some good literature on the subject. My friend and I have combed the library at the university here and found much important information on tofu, tempeh, and lactic acid fermentation in *Applied Microbiology* and *Journal of Food Science,* etc." He requests more information and contact people. He may make another trip to Japan in the next year or shortly thereafter to do research. Address: Box 559A, 19063 Örsundsbro, Sweden.

6535. Ohsawa-Japan. 1976. List of macrobiotic food products & related items. Tokyo, Japan. 2 p. Single sided.
• ***Summary:*** Printed with black ink on white paper. Soy related products: Soya bean sauce (shoyu). Soya bean paste (miso). Mugi miso. Kome (koji) miso. mame miso. Tekka. Black [soy] beans (Kuromame). No prices are given. Address: 11-5 Ohyamacho, Shibuyaku, Tokto, Japan. Phone: (03) 465-5021.

6536. Shurtleff, William; Aoyagi, Akiko. 1976. Miso to wa? [What is miso? Translated into Japanese by Tsutomu Mochizuki]. Shinshu Miso Research Inst., Nagano-shi, Japan. 15 p. [1 ref. Jap]
• ***Summary:*** A Japanese-language translation of the English-language pamphlet "What is Miso?" originally published by Westbrae Natural Foods in on 1 May 1976. Dr. Mochizuki was interested in this western viewpoint on miso. Address: Authors: 790 Los Palos Dr., Lafayette, California 94549; Translator: Director, Shinshu-Miso Research Inst., Nagano-shi, Japan.

6537. *Soybean Digest.* 1976. Japanese firm identifies U.S. soy oil (Photo with caption). Aug. p. 30.
• ***Summary:*** The caption below this ¼-page photo reads: "One of the largest oil refiners in Japan, Hohnen Oil Co., is celebrating the U.S. Bicentennial and identifying U.S. soy oil on its new salad oil container. While previous identified oil campaigns have been regional, the new oil will be distributed through the Mitsukoshi chain which has stores in the major population centers across Japan. If sales go according to schedule, Hohnen plans to make the new design a permanent member of their salad oil line. ASA Far East Director Lloyd Reid, Dr. Nakamura, Hohnen Oil Co., and Larry Thomasson, U.S. ag attache to Japan, examine the red, white and blue container."

6538. Greer, Gery. 1976. A look at traditional Japan. *Chicago Tribune.* Sept. 19. p. C13.
• ***Summary:*** The writer has traveled to Shirakawa-go, a picturesque and traditional village in the Sho River Valley, high in the Japanese "Alps." The huge thatched-roof houses,

© Copyright Soyinfo Center 2014

built 100 to 250 years ago, with their steeply sloping roofs, are built in the style called *Gassho-zukuri* ("fingertips held together as if in prayer"). Traditionally, the smoke and soot from each home's central sunken, open-pit fireplace coated and preserved the straw and wood, so that the thick roofs lasted 70 years. The houses were built without nails or hinges; the wood was fastened together firmly with wooden pegs and handmade ropes.

Each October the quiet village is transformed as throngs arrive for the annual *Doburoku Matsuri* ("moonshine festival"). "Doburoku is unrefined sake (rice wine) and it is thick, milky, and potent."

A visitor can stay at a *minshuku* (a private home turned into a sort of hostel) which is usually less expensive than a *ryokan* (traditional Japanese inn). The *minshuku* typically serves two meals. "Usually dinner will consist of one whole small fish cooked in soy sauce, various mountain vegetables and weeds, *miso* soup... with *tofu* (bean curd), *tsukemono* (Japanese 'pickles,' usually pickled cabbage, cucumber, and ginger), and rice.

Breakfast, which is almost identical, "includes a raw egg in place of the vegetables. Break the egg into the bowl provided, add soy sauce, beat slightly with your chopsticks and pour over the [steaming hot] rice"–which partially cooks the egg.

Note: The historic village of Shirakawa-gô, in Gifu prefecture of central Japan (northwest of Tokyo), is one of Japan's UNESCO World Heritage Sites.

6539. Hashimoto, Yukio; Sunada, Fumiyuki. Assignors to Fuji Oil Company, Ltd. (Osaka, Japan). 1976. Soy cheese spread and process for preparing the same. *U.S. Patent* 3,982,025. Sept. 21. 4 p. Application filed 9 Dec. 1974. [6 ref]

• ***Summary:*** Prepare a fermented soy cheese, as described in Japanese Patent Open Publication No. 471/1974; it is prepared by fermenting soy milk with a lactic acid-forming cheese starter culture to form a curd. Mix with this soy cheese an edible oil or fat, a cheese emulsifying melting agent, and water. Then vigorously agitate this mixture at an elevated temperature to liquefy and homogeneously emulsify the ingredients, thereby forming a product having a paste-like consistency. Address: 1. 6540. Iso, Naomichi; Mizuno, H.; Saito, T.; Takeuchi, H.; Suyama, Y.; Kawamura, S.; Ogawa, H. 1976. The viscometric behavior of a natto mucin in solution. *Agricultural and Biological Chemistry* 40(9):1871-75. Sept. [20 ref]

• ***Summary:*** The natto bacterium, *Bacillus subtilis* produces polyglutamic acid (PGA) and mucin; the latter substance is considered to be similar to PGA. This study found that the structure / conformation of the mucin molecule and the way it flows depend on the pH of mucin solution used. The molecule is randomly coiled at pH 5.7 but changes to a rod-like molecule at pH 4.3. A 2% solution behaves as a thixotropic flow at pH 5.7 but as a Newtonian flow at pH 4.3.

Photos (taken with an electron microscope) show: (1) Electron micrograph of a natto mucin at Ph 6.5. (2) Electron micrograph of a natto mucin at Ph 2.5.

Also contains four graphs. Address: Dep. of Food Science and Technology, Tokyo Univ. of Fisheries, Konan, Minato-ku, Tokyo, Japan.

• ***Summary:*** "soim/1976-5403a+b" Contents: What is miso? Preface. Acknowledgments. Part I. Miso: Savory, High Protein Seasoning. 1. Soybeans, protein and the world food crisis. 2. Miso as a food. 3. The miracle of fermentation. 4. The varieties of miso: Introduction. An overview: Natural vs. quick miso, salty vs. sweet miso, red vs. white miso, chunky miso and koji miso vs. smooth miso, expensive vs.

© Copyright Soyinfo Center 2014

inexpensive miso, miso from the provinces.

Regular Miso: Rice miso (red / aka, light-yellow / shinshu, mellow red / amakuchi akamiso, mellow beige / amakuchi tanshoku, mellow white / shiro koji, sweet red / edo or edo ama-miso, sweet white / Kyoto shiro miso), barley miso (karakuchi mugi, mellow barley / amakuchi mugi), soybean miso / mamé miso (miso-dama, Hatcho miso, soybean miso / mame miso, tamari miso). Special Miso: Finger lickin' miso / Namemiso (Kinzanji miso, moromi miso, hishio, namémiso, natto miso, goto miso), sweet simmered miso / nerimiso. Modern Miso: Akadashi miso, dehydrated or freeze-dried miso, low-salt / high-protein miso.

Part II. Cooking with Miso (400 recipes). 5. Getting started. 6. Recipes from East and West: Miso toppings, miso in dips & hors d'oeuvres, miso in spreads & sandwiches, miso dressings with salads, miso in soups & stews, miso in sauces, miso with grains, beans & tofu, miso in baked dishes, miso sautéed & simmered with vegetables, miso in grilled dishes, miso in deep-fried dishes, miso & eggs, miso in desserts, miso pickles, koji cookery.

Part III. The Preparation of Miso. 7. Making miso at home and in communities. 8. Japanese farmhouse miso (incl. miso-dama). 9. The traditional miso shop. 10. The modern miso factory.

Appendixes: A. A brief history of chiang, miso, and shoyu: Introduction, Chinese chiang, early Japan, the Nara Period (710 A.D. to 784 A.D.), the Heian Period (794 A.D. to 1160 A.D.), the Kamakura Period (1185 A.D. to 1333 A.D.), the Muromachi Period (1336 A.D. to 1568 A.D.), tamari–the forerunner of shoyu (Priest Kakushin returns to Japan from China, where he learned how to make Kinzanji miso, settles at Kokoku-ji temple near town of Yuasa, discovers tamari), miso during the Edo Period (1603 A.D. to 1867 A.D.), the development of shoyu the Meiji and Pre-war Periods (1867 A.D. to 1941 A.D.), modern times, transmission to the West.

B. The varieties of Chinese chiang, Korean jang and Indonesian Tao-tjo. C. The chemistry and microbiology of miso fermentation: Introduction, koji starter molds, making koji starter, making koji–the first fermentation, cooking the soybeans, preparing the miso–the second fermentation, the finished miso. D. People and institutions connected with miso: In Japan–Miso research scholars and institutes, exporters of natural miso and koji to the West, traditional or semi-traditional shops making natural miso, Japan's ten largest miso factories (gives the production in tons/year for several companies), other well-known miso makers. Makers of koji starter and koji, Japanese restaurants specializing in miso cuisine. North America–Miso research scholars and institutes, commercial miso makers, companies importing Japanese miso, koji, or koji starter, individuals interested in miso. Europe (Belgium, England, France, Germany, Holland, Italy, Portugal) and Latin America (Brazil, Costa Rica, Mexico, Venezuela). E. Miso additives. F. Miso with seafoods, chicken, and meat. G. Table of equivalents. H. So you want to study miso in Japan? Bibliography. Glossary. About the authors (autobiographical).

Note 1. This is the earliest English-language book seen (July 2000) that has the word "miso" in the title. It is also the first book in the Western world written entirely on the subject of miso.

Note 2. This is the earliest document seen (July 2000) that mentions "Hatcho miso" (spelled that way–which is now the correct romanization). Hatcho is a Japanese place name meaning (approximately) "Eighth Street."

Note 3. This is the earliest document seen (Sept. 2002) that contains industry and market statistics on individual miso companies.

Note 4. This is the earliest document seen (March 2009) that gives illustrated details about commercial miso production.

Note 5. An advertisement on the inside rear cover of the paperback edition of this book announced that the authors were preparing *The Book of Sea Vegetables.* That book was half researched and written but never published because of concern with pollutants in sea vegetables, and increased interest in soyfoods. Address: 790 Los Palos Dr., Lafayette, California 94549.

6546. Shurtleff, William. 1976. New-Age Foods Study Center: Basic purposes and activities (Leaflet). Lafayette, California. 1 p. Single sided. Sept. 28 cm.

• ***Summary:*** "1. To work toward creative, low-cost solutions to the present world food/protein crisis by doing basic research and writing books... Our special interests include soybean products (tofu, miso, tempeh, shoyu, etc.), sea vegetables, whole-grain bread, and kuzu.

"2. To aid in the spread of the ideas found in our writings by regularly responding to invitations from any part of the world to do lecture/demonstrations and cooking classes."

3. To encourage the adoption of meatless and vegetarian diets which help make the best use of the planet's precious food resources, are low in cost, conducive to the development of a healthy body and clear mind, kind to animals, and ecologically sound.

"4. To encourage people in the West to begin commercial or community production of tofu, miso, and tempeh...

"5. To provide centers where people can come to learn more about our work and to begin their own study of basic important foods. In Japan, we assist people in studying with tofu- and miso masters..."

"6. To work actively to promote the key concept of food self-sufficiency and simpler, low-cost lifestyles that are harmonious with the needs of the planetary ecosystem. Likewise to encourage deeper understanding of selfless service, and of daily life and work as a spiritual practice.

"7. To provide a catalog of publications and materials related to our work. We invite you to contact us and we hope we may be of service to you." Address: New-Age Foods Study Center, 790 Los Palos Dr., Lafayette, California 94549. Phone: (415) 283-3161.

6547. Shurtleff, William; Aoyagi, Akiko. 1976. Tamari (Document part). In: William Shurtleff and Akiko Aoyagi. 1976. The Book of Miso. Hayama-shi, Kanagawa-ken, Japan, Soquel, California, and Brookline, Massachusetts: Autumn Press. 256 p. See p. 50, 219-21. Sept. Illust. by Akiko Aoyagi. Revised ed. 1981. New York, NY: Ballantine Books, 620 p. [60 ref]

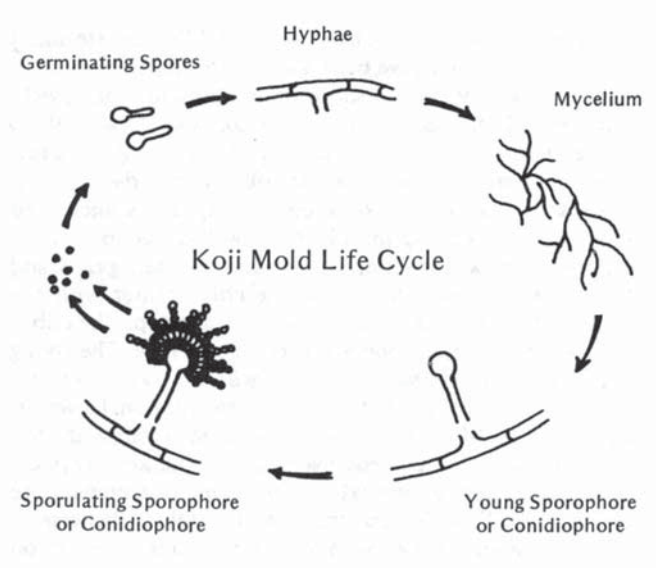
• ***Summary:*** In Chapter 5, "Getting started," in the section on "Basic ingredients," is a subsection titled "Tamari" which states (p. 50): "A close relative of shoyu, tamari is prepared from a koji which contains only soybeans and no wheat; it has a distinctive, slightly strong flavor and aroma, a dark brown color, and a fairly thick consistency. Produced either as a byproduct of tamari miso (p. 44) or as a food in its own right, it is now rarely used in its natural form, being generally made into *sashimi-damari* by mixing it with miso-damari (see below), *mizuamé,* cane sugar, caramel, and often preservatives. Although not widely used in Japan, it remains fairly popular in Kyoto and central Japan, where it is used as a seasoning for *sashimi* (raw fish). In ancient times tamari was widely used in its natural form and highly prized as a fine seasoning, having much the same flavor as a best-grade Chinese soy sauce. Today, an increasing amount is made synthetically.

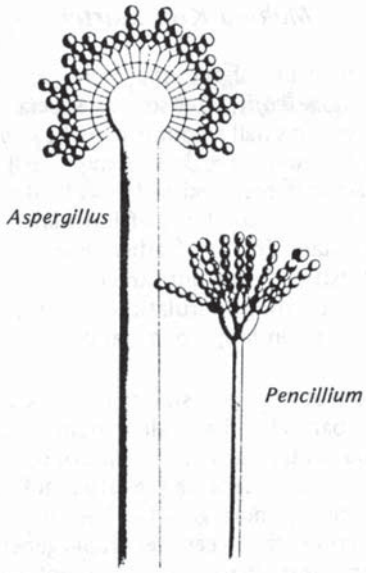
"*Miso-damari*–also called *uwahiki*–is the tamari-like liquid that accumulates in *any* variety of miso during fermentation. Thicker and richer than tamari, it is gathered only in very small quantities and is not sold commercially. A delicious by-product of most homemade miso (it rises to the surface in summer and settles in winter), it may be used like shoyu and is especially delicious with hors d'oeuvres.

In "Appendix A: A brief history of chiang, miso and shoyu," is a section (p. 219-21) titled "Tamari: The forerunner of shoyu." Address: 790 Los Palos Dr., Lafayette, California 94549.

6548. Shurtleff, William; Aoyagi, Akiko. 1976. The book of miso (Illustrations–line drawings) (Document part). Hayama-shi, Kanagawa-ken, Japan, Soquel, California, and Brookline, Massachusetts: Autumn Press. 256 p. Sept. Illust. by Akiko Aoyagi. [60 ref]

• ***Summary:*** Continued: Illustrations (line drawings, both numbered and unnumbered) show: The two Japanese characters for miso. Three men "Putting Hatcho miso to bed" by piling nearly round river stones on top of a huge vat; the pyramid shape makes the pile earthquake proof. A child holding a sheaf of grain. A round *zaru* (woven split bamboo tray) with a circle of salt in the middle. A square wooden





Conidiophores of **Aspergillus** and **Penicillium**

measure (*isshô-baku*) filled with soybeans. The top of rice and barley plants showing grains and leaves. A wooden vat of red miso tied with rice-straw ropes. A miso maker standing by large wooden vats of two different sizes, with braided bamboo hoops. A well stocked miso shop in Japan (at Kichijoji train station, Tokyo). A woman standing behind two deep earthenware crocks filled with miso; balls of miso are in a basket. A sunken open-hearth fireplace (*irori*) in a traditional Japanese farmhouse with a pot hanging over the coals on a hook (*jizai kagi*) and tofu dengaku being grilled around the coals, their skewers stuck into the ash.

Nine wooden kegs of different kinds of miso piled up on 3 levels. A field of soybeans planted in rows. A hand holding soybeans pods still attached to the stem. A soybean pod split open to show the beans. (1) Bar chart of protein

6551. Kimura, Shuichi; Suwa, J.; Ito, M.; Sato, H. 1976. Development of malignant goiter by defatted soybean with iodine-free diet in rats. *Gann* (*Tokyo*) 67:763-65. Oct. [4 ref]
• ***Summary:*** Female rats which were fed an iodine-free diet containing 40% defatted soybean meal for 6-12 months showed thyroid carcinomas. This effect, however, was completely prevented by iodine supplementation.

Note: It is difficult for people in developed countries to consume an iodine-free diet unless they consume no table salt. Since 1924 most table salt in the USA has been "iodized," which means that an iodine source, such as potassium iodine / iodide is added in amounts necessary to supply the recommended daily allowance. However in 1983 there were an estimated 400 million iodine-deficient persons in the less developed regions of the world, and an estimated 112 million in the more developed regions. The best known natural goitrogens are found in cabbage and cassava. Address: 1-3. Dep. of Food Chemistry, Faculty of Agriculture; 4. Dep. of Oncology, Research Inst. for Tuberculosis. All: Tohoku Univ.

Hendricks County Historical Society. Printed by White Arts Inc. 640 p. See p. 117-18, 473-75. Oct. 28 cm.

• ***Summary:*** Hendricks County was created in 1824.

In the chapter on "Agriculture" is a long passage about the pioneering work of Adrian A. Parsons excerpted from *The Prairie Farmer* (11 Jan. 1930, p. 6, 26). In Chapter 4, titled "Biographies," the section on "Adrian A. Parsons family" (p. 473-75; written by Lee Parsons, a great-grandson of Adrian Parsons, a grandson of Adrian's second child, Norman E. Parsons, and son of Edgar Barker Parsons {born 10 Sept. 1905}) states: Adrian A. Parsons, son of Y. and Elvira Swain Parsons, was born on 7 Nov. 1846 in Guilford County, North Carolina. In 1852 Nelson moved his family to Indiana, ultimately settling in Washington Township, Hendricks County. A second son, Oliver E. Parsons, was born on 12 Jan. 1854.

Adrian served in the Union Army for 2 years during the Civil War, with Company I, Ninth Indiana Cavalry; he enlisted in Dec. 1863 at age 17. On 14 Dec. 1864, while on a scouting mission near Franklin, Tennessee, against General Hood's Confederate raiders, he suffered a severe gunshot wound during an ambush. He was taken to a nearby log cabin and left to die. After five days near death, drinking from a spring to which he could crawl, he was discovered by a member of his unit, who took him to a makeshift Union "hospital" in a cotton shed. Waiting five more days for medical attention, he managed to survive–amazingly–but this brush with death left Adrian with reduced physical vigor the remainder of his long life. "Ironically, this like resulted at least indirectly in the work which was to become his most significant contribution to Hendricks County, and indeed to Indiana and the entire nation–the development of the soybean as a major commercial farm crop."

After returning from the Civil War, Adrian continued his education, studying at Danville Academy [for several years; it higher than high school but lower than college] and Earlham College [for one term for teacher preparation; Located in Richmond, Indiana, founded 1847], and subsequently both farmed and taught school. On 10 April 1870, at about age 23, Adrian married Mary Anne Fox, daughter of Barney and Hannah Gossett Fox. This union, lasting until Mary's death on 27 Oct. 1922, produced nine children. Their youngest, Frank, died on 22 Oct. 1918, during World War I. Adrian served as Hendricks County Recorded from 1882 to 1886.

"Intellectual curiosity more than compensated for the physical limitations Adrian's Civil War wound imposed. The soybean was known by few farmers in the United States and was grown as little more than a novelty plant, when, in 1886, Adrian Parsons imported a batch of 'soja' seed from Japan to grow experimentally.

"It was originally thought that the bean could be used as a substitute for coffee, but Adrian soon realized the soybean had far greater value as feed for livestock. Each succeeding year he increased his soybean acreage, always experimenting with the culture and utilization of the corp.

"Beginning in the 1890s, Adrian Parsons reported his work with the soybean in articles and letters submitted to a number of farm publications. The United States Department of Agriculture became interesting in his work and remained in touch with him for many years.

"It should be noted that Adrian Parsons began growing the soybean two years before the Agriculture Experiment Stations came into existence. The practical experience he gained and reported in his writing complemented the scientific experimentation with the plant done by the Experiment Stations in later years.

"In his early years of growing the soybean, Adrian was not without detractors. During a visit to the Parsons farm shortly after the turn of the century, a Liberty Township farmer commented that Adrian would regret bringing 'that weed' into the county. Only a few years were to pass before this critic's own family [the Edmondson family] began reaping the benefits of this uncommon 'weed.'

"By the early decades of the 20th Century, Adrian and several of his sons were growing hundreds of acres of soybeans in Hendricks County, at a time when the crop was only beginning to be widely cultivated in other portions of the Midwest.

"Around this time, Adrian's experimentations resulted in the development of a new variety of soybeans. Family members recall that one year he found a single plant growing in his bean field which displayed superior characteristics, of which the primary one was the fact that the mature pods did not shatter as badly as did the pods of existing varieties.

"Adrian transplanted this plant in his garden, and the next season planted its seed. The plant's distinctive characteristics were passed on, and ultimately a new variety of soybean was established. It was named Mikado, and was distributed through seed houses in Ohio and Iowa.

"Adrian Parsons followed other pursuits. However, developing and promoting the soybean as a useful farm crop was his primary interest."

Adrian Parsons died on 1 Aug. 1929. Today his descendants number in the hundreds, and many of them still reside in Hendricks County, Indiana. "The nine children of Adrian and Mary Anne Parsons were: Lester Wharton (B. December 22, 1871), Norman E. (B. January 17, 1873), Ethel (B. August 11, 1875), William Nelson (B. April 8, 1878), Edith (B. April 28, 1880), Gilbert (B. June 27, 1883), Mary (B. May 16, 1885), Chester Adrian (B. June 22, 1887) and Frank Harrison (B. February 11, 1889; D. October 22, 1918)." There follows a long genealogy of each of his nine children.

A large portrait photo shows the Adrian Parsons family in 1908, including Adrian and his wife, all nine of their children, and many grandchildren.

Note: Talk with Lee Parsons. 2000. April 8. One day,

© Copyright Soyinfo Center 2014

right after this book was published, Ruth Pritchett, the acknowledged authority/expert on the history of Hendricks County who had long lived in Liberty Township, came up to Lee in the local post office and asked him if he knew anything about the biography of Adrian Parsons and the soybean in the new county history book. Lee admitted that he had written it. She slapped him on the shoulder, started laughing, and said "Good for you! Those Edmondsons always did think they were better than anyone else." Even though Lee hadn't mentioned the Edmondsons in his biography, she had "read between the lines."

6554. *Feedstuffs.* 1976. Japan considers U.S. soybeans as protein sources in diets, ASA says. 48(46):1. Nov. 8.
• ***Summary:*** The Ministry of Agriculture and Forestry is helping to finance the Japan Vegetable Protein Food Assoc. Proposals for a 200-mile economic zone for fishing could cause Japan to lose about 5 million tonnes/year of fish.

6555. United Press International (UPI). 1976. Tofu-burger no junk food. *Bangor Daily News* (*Maine*). Nov. 18. p. 1-2.
• ***Summary:*** Students will soon be able to munch on tofu-burgers in the University of Maine at Orono school dining hall. Anne S. Johnson, assistant manager of dining halls, said the new tofu-burger is part of an attempt "to wean students at the university away from junk foods and empty calories."

"Mrs. Johnson was introduced to the new vegetarian fare through a food book written by Bill Shurtleff and Akiko Aoyagi. She hopes to have the item on the dinner menu by early next month." "About 150 of the university's dormitory students line up nightly to consume vegetarian fare at the Wells Common Dining Hall... The cost of preparing the vegetarian meal is no greater than for the regular one."

A photo shows Barbara Hill, a student at the University of Maine, as she is about to take her first bite of a Tofu-Burger, a Japanese inspiration that contains no meat.

Note: This is Maine's largest daily newspaper. Many other newspaper articles were generated by this UPI story. Three (from unknown newspapers) are titled: "Tofuburgers in dining hall." "Shamburger deluxe." "Maine tofuburgers."

6556. Bernard, R.L.; Hittle, C.N. 1976. United States national soybean germ plasm collections. *INTSOY Series* No. 10. p. 182-85. R.M. Goodman, ed. Expanding the Use of Soybeans (College of Agric., Univ. of Illinois at Urbana-Champaign).
• ***Summary:*** A full-page table (p. 183) gives the following information on soybean germ plasm collections worldwide: Country and curator, address, number of accessions, nature and origin of accessions. There are major collections in the following places: Toulouse, France (500 accessions). Amravati, Haharashtra (1,800), and Pantnagar, Uttar Pradesh (4,000), India. Bogor, Indonesia (400). Hiratsuka, Kanagawa prefecture (2,928), and Iwate University, Morioka (200 Glycine species), Japan. IITA, Ibadan, Nigeria (2,000). Harbin, and Kirin Province, China. Pretoria, South Africa (600). Suweon (300 Glycine species), and Cheong Kyang, Seoul (1,300), Korea. Algot Holmberg and Soner AB, Norrkoping, Sweden (1,200). AVRDC, Tainan (9,000), and Taichung (2,800), Taiwan. Urbana, Illinois (4,100), and Stoneville, Mississippi (1,700), USA. Leningrad, USSR (2,500).

There are additional collections in Australia, Bulgaria, Hungary, Philippines, [Southern] Rhodesia (Salisbury [Harare]), and Romania.

Table 1. Divisions of USDA soybean germ plasm collections (Urbana, Stoneville, Total). Table 2. Maturity grouping of the USDA soybean germ plasm collection, 1976 (In the northern region [maturity group 00 to IV] there are 237 named varieties, 51 FC [Forage Crop] strains, 2,999 P.I. [Plant Introduction] strains, and 3,287 total. In the southern region [maturity group V to IX] there are 101 named varieties, 39 FC [Forage Crop] strains, 1,514 P.I. strains, and 1,654 total).

Table 3. History of soybean introductions into the United States. The earliest period given is 1898-1907; the great surge in soybean introductions was in 1929-32 during the Dorsett-Morse expedition to East Asia; A total of 11,594 strains have been introduced. Table 4. Maturity grouping and origin of accessions through 1976 in USDA wild soybean (Glycine soja Sieb. and Zucc.) germ plasm collection (there are 361 accessions; Country of origin: Japan 180, Korea 134. China and Taiwan 32. USSR 15). Table 5. Species distribution of USDA perennial Glycine collection, 1976 (8 species [*G. canescens, G. clandestina, G. falcata, G. latrobeana, G. tabacina, G. tomentella, G. wightii*] and 161 accessions from Australia, India, Africa, Taiwan, Japan, Philippines, Ethiopia).

Note: The assignment of FC numbers began in about 1911 and was discontinued in 1957. Address: USDA.

6557. Ebine, Hideo. 1976. Fermented soybean foods. *INTSOY Series* No. 10. p. 126-29. R.M. Goodman, ed. Expanding the Use of Soybeans (College of Agric., Univ. of Illinois at Urbana-Champaign). [11 ref]
• ***Summary:*** Contents: Introduction. Miso. Shoyu. Natto. Conclusion. Literature cited. Discussion.

Production of fermented soyfoods in Japan in 1974 was as follows: Miso 587,228 tonnes (metric tons; this miso was made from 191,621 tonnes of whole soybeans, 2,200 tonnes of defatted soybean meal, 102,104 tonnes of rice, 22,280 tonnes of barley, 80,265 tonnes of salt).

Shoyu 1,213,350 tonnes (made from 14,278 tonnes of whole soybeans, 176,138 tonnes of defatted soybean meal, 176,319 tonnes of wheat, 209,674 tonnes of salt).

Natto 90,000 tonnes (made from 47,000 tonnes of whole soybeans). "In 1960 the National Food Research Institute initiated a project to develop a new type of soybean

© Copyright Soyinfo Center 2014

food in order to comply with a request from UNICEF to supply a nutritious protein food for children. The product thus developed is processed in the following way: soaked soybeans are first cooked in an autoclave at 121ºC for 30 minutes. A starter of *B. natto* is then added to the hot, cooked soybeans and mixed well. The inoculated soybeans are fermented at 42ºC for 8 to 10 hours. The fermented soybeans are then passed through a chopper and spread over trays for vacuum dehydration. The dried material is made into a powder for use as an ingredient, mixed with wheat flour, in biscuits. In animal feeding experiments this new food had an absorption rate of 83 percent and a biological value of 63 percent, a notable improvement compared with the absorption rate and biological value of raw soybeans."

"An ancient legend indicates that the technology for making soybean foods with the aid of microorganisms originated in China. These foods and the manufacturing process involved were introduced into Japan between 500 and 600 A.D." Address: Applied Microbiology Div., National Food Research Inst., Ministry of Agriculture and Forestry, Tokyo, Japan.

6563. Rejesus, Romeo S. 1976. Insect pest diversity and succession in Asian soybeans. *INTSOY Series* No. 10. p. 97-103. R.M. Goodman, ed. Expanding the Use of Soybeans (College of Agric., Univ. of Illinois at Urbana-Champaign). [18 ref]

• ***Summary:*** Lists a large number of insect pests. Contents: Introduction. Pest diversity: Insects and other arthropods in Philippine soybeans, insect diversity in other Asian countries. Pest succession: Wet season, dry season. Developmental approach. Appendix I is a partial list of soybean insect pests in the following Asian countries: Indonesia, India, Solomon Islands (Stapley 1972; 2 species), Micronesia (Gressitt 1954, 14 species on soybeans), and Thailand (Napompeth 1975, 13 species).

Note: Gressitt (1954) did NOT mention soybeans in Micronesia. Address: Dep. of Entomology, College of Agriculture, Univ. of the Philippines at Los Baños, College, Laguna, Philippines.

6564. Sanbuichi, Takashi; Watanabe, Iwao. 1976. Soybean production in Japan. *INTSOY Series* No. 10. p. 237-38. R.M. Goodman, ed. Expanding the Use of Soybeans (College of Agric., Univ. of Illinois at Urbana-Champaign).

• ***Summary:*** "Each year Japan produces approximately 120,000 metric tons of soybeans on 90,000 hectares. About 30 percent of this yield is raised on the northern island of Hokkaido, where large-scale farming is practiced. Especially in the northeastern part of Hokkaido, soybeans are a very important crop... Throughout the country the average soybean yield is about 1.4 metric tons per hectare, but during the past four years production in the Tokachi District of Hokkaido has risen to between 1.8 and 2.0 metric tons per hectare...

"In Japan soybeans are used principally as a source of edible oil and protein foods, such as miso (bean paste), shoyu (soy sauce), tofu (soybean curd), and natto (fermented soybeans). The soybeans produced in Japan usually have large seeds, a high protein content, and are of a quality suitable for producing high quality soy products...

"In general, early varieties are cultivated in the high latitudes and late varieties in the low latitudes, but on the southern island of Kyushu early varieties are occasionally used. Known as summer soybeans, they are sown in the spring and harvested in the summer. Late varieties, which are called autumn soybeans, are sown in summer and harvested in the autumn...

"Results show that large-seeded varieties produce high yields. Soybeans grown in the northern parts of Japan usually have larger seeds than those raised in southern areas. It is believed that the marked difference between day and night temperatures and the favorable soil moisture content during the early stages of plant growth account for the large size of soybean seeds grown in the north. The author observed a serious decrease in seed size when Japanese varieties were introduced into Thailand...

"Soybeans are raised in several types of areas in Japan. Traditionally they have been planted beside the footpaths in paddy rice fields. Intercropping with wheat is another old cultural practice, although both practices are seldom used today. Because of the over-production of rice in Japan, the government has recently recommended that soybeans be cultivated in rice fields." Address: 1. Tokachi Agric. Exp. Station, Memuro, Kasai-gun, Hokkaido; 2. National Inst. of Agricultural Science, Nishigahara, Kita-Ku, Tokyo. Both: Japan.

6565. Shurtleff, William. 1976. Report on visit to Kikkoman plant in Walworth, Wisconsin. Lafayette, CA 94549. 2 p. Nov. Unpublished manuscript.

• ***Summary:*** Contains a detailed description of the ingredients and process used to make shoyu at this plant. The moromi (mash) ages for an average of 6 months. The heating / pasteurization process serves four basic purposes. Kikkoman produces about 2.5 million gallons/year of shoyu at Walworth. About 150,000 to 200,000 gallons of so-called tamari are imported from Japan for sale at natural food stores; this is about 6-8% of total shoyu. Kikkoman has 85% of the U.S. Asian-American trade and about 1/3 of the supermarket trade. Address: 790 Los Palos Dr., Lafayette, California 94549.

6566. Spiekerman, David. 1976. Four vegetable treasures from Japan. *Organic Gardening and Farming* 23:58-60, 62. Nov.

• ***Summary:*** The four are: Gobo or domestic burdock, the Hokkaido pumpkin (kabocha), black soybeans, and the Japanese eggplant. "The black soybean is the easiest of these Far Eastern vegetables to grow." After 70 days of growing, the plants flower and produce fruit.

"Unlike the common black bean, the black soybean

© Copyright Soyinfo Center 2014

is one food few Americans have eaten. When cooked, it is sweeter than any bean in the world. It is a high-protein sweet, which the Japanese feature during festive occasions. Prepare them like any bean, though they cook firmer than most. The Japanese believe the Hokkaido [pumpkin] strengthens the liver, whereas the black soybean strengthens the kidneys. So uncommon is the bean that it retails for over $1.50 per pound."

6567. Vajragupta, Chalermsri. 1976. Small-scale equipment for oil extraction. *INTSOY Series* No. 10. p. 122-25. R.M. Goodman, ed. Expanding the Use of Soybeans (College of Agric., Univ. of Illinois at Urbana-Champaign).
• ***Summary:*** Contents: Introduction. Pretreatment process: Raw materials, cooker, flake roller, expeller. Solvent extraction process. Refining process: Degumming and neutralization, water washing treatment, bleaching treatment, deodorizing treatment.

"An oil-seed laboratory, including an oil-seed pilot plant, was established in 1972 as a part of the Thai-Japanese Soybean Project." Address: Agricultural Chemistry Div., Dep. of Agriculture, Bangken, Bangkok, Thailand.

• ***Summary:*** Tokyo Tea Garden, a true diamond in the rough, is a tiny restaurant at 5 W. Superior St. that serves authentic Japanese cuisine. "For those who want to go the whole way, there's dried sea seed, salted fish eggs, cold soy bean cake [Hiya-yakko], and fried soft won ton. The house soup was made with soy bean paste [miso]." It was unusual but tasty.

6569. Pearce, Jean. 1976. Getting things done: Expanding dietary horizons [Miso]. *Japan Times* (*Tokyo*). Dec. 19. [Eng]
• ***Summary:*** "... when you begin experimenting with the 400 recipes introduced in "The Book of Miso" by William Shurtleff and Akiko Aoyagi which I have been quoting, you will likely become an ardent supporter of this highly nutritious food. There are also joyful drawings by Akiko and pages of general information about healthful food and living, culture and customs, and the history of foods, that make fascinating reading. Bill is a dedicated promoter of healthful products that can help overcome the food crisis which, for many of our world's people, is not something to be worried about in the future; the hunger is now.

"I would like to reprint the whole book for you, but instead I'll urge you to get a copy as soon as possible and begin learning about miso. Combine it with 'Tofu' for a Christmas gift combination that will be gratefully received by the growing number of people who are interested in good health, conservation, ecology, efficient utilization of natural resources–in other words, all of us. You'll find the books at most stores handling English-language publications." A small photo shows Jean Pearce.

6570. Miller, Harry W. 1976. Re: Your good work in introducing foods from the soya bean. Letter with Christmas card to William Shurtleff at New-Age Foods Study Center, Dec. 21. 1 p. Typed with signature.
• ***Summary:*** "My Dear Mr. Shurtleff–Your name comes to mind very often on account of our close association in the interest of nutrition to the people in America, and I feel you have done a wonderful job in educating the people regarding the value of using foods from Soya Beans. I think now that I have secured three of your Tofu books, but they are all gone, loaned and not returned, so I am ordering another to have sent to my home address on this envelope. I would be glad to mail a check for the exact amount including Postage so if you will send me that by return postage I will send a check for the same at once as I need some data you have given in same.

"Dr. Tojima Yamagata, Minister of Forestry and Agriculture for Japan, paid me a visit about a month ago and has supplied me with some recent pamphlets from his Dept. on Soy Milk. I have wondered if at anytime you are planning a trip to the Los Angeles or Riverside area. The book store here at La Sierra usually handles your book but they are all sold out. Therefore I am hastening to order from you direct, and always glad to hear from you, Yours very sincerely, Harry W. Miller, M.D."

This is a poignant letter and card. On 26 July 1977 Dr. Miller's wife, Mary E. Miller, (now a widow) sends the money Dr. Miller owed for *The Book of Tofu* he ordered and adds: "Please forgive my husband for this long delay, he died on Jan. 1 of this year. He went into the hospital on Nov. 19 of last year and never recovered from a severe heart attack at the age of 97." Address: M.D., 11384 Norwood Ave., Riverside, California 92505.

6571. *Miami News* (*Florida*). 1976. Join in Orange Bowl celebration with lunch & fashion show: The onlooker. Dec. 28. p. 2B.
• ***Summary:*** "Tonight from 7 to 9:30, there's a 'tofu and miso workshop, taught by Bill Shurtleff, author, appropriately enough, of the 'Book of Tofu' and the 'Book of Miso.' The workshop's a production of the East-West Foundation, and its to be held at St. Stephens Church. 2950 MacFarland Rd., Coconut Grove. The cost to get in is $1.50.

"Then, tomorrow from 3 to 6 p.m. Mr. Shurtleff holds a tofu-miso cooking class that costs $3 per chef, and its to be held at 6051 W 46th Terrace. For more information call 661-4495."

The East-West Foundation, founded by Michio Kushi, promotes macrobiotics.

6572. Okada, Katsuto; Ogasa, Katsuhiro; Kuwahara, Kunisuke. Assignors to Morinaga Milk Industry Company, Ltd. (Tokyo, Japan). 1976. Method of manufacturing an

aseptic soya bean curd. *U.S. Patent* 4,000,326. Dec. 28. 12 p. Application filed 31 July 1975. [2 ref]

• ***Summary:*** Soybean juice is continuously sterilized at 135ºC for 2 seconds after which it is flowed to an aseptic brick filling machine, where it is mixed with glucono delta-lactone and a divalent metal salt. The resulting liquid mixture is continuously filled into containers in an aseptic atmosphere, after which the containers are immersed in hot water to coagulate the mixture.

Note: This patent described a major innovation in tofu packaging. Address: 1&3. Tokyo, Japan; 2. Yokohama, Japan.

6573. *SoyaScan Notes.* 1976. Chronology of soybeans, soyfoods and natural foods in the United States 1976 (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** Feb. KQED-TV in San Francisco airs a 30-minute special titled "Tofu." It is an interview with William Shurtleff and recipe preparation by Akiko Aoyagi.

March. "The Joys of Soy" by Brenda Bortz, published in *Organic Gardening and Farming* magazine is the first major popular article on tempeh in America. In June, *Prevention* magazine runs a cover story on tempeh.

April. Soybeans: Brazil as a Competitive Force by J.M. Schultz and W.P. Mason submitted as a Harvard Business School MBA thesis. One of the best early in-depth analyses.

April. The second of the new wave of commercial Caucasian-run tofu shops is started by Peter and Judy Beane in Portland, Maine. There were at least 7 small commercial Caucasian-run tofu shops in America by the end of 1976.

May-June. *Mother Earth News* publishes the first of five long articles on soyfoods, each excerpted from *The Book of Tofu.*

June 2-5. First International Workshop on Low-Cost Extrusion Cookers held at Colorado State University, with 51 participants. Organized by Judson Harper and Richard Jansen, with funding from USAID through USDA. The 173-page proceedings, edited by Wilson and Stumpf, are published shortly thereafter. Cereal-soy blends are seen as having great promise for production in developing countries.

This year cereal-soy blends are first produced in Third World countries using low-cost extrusion cookers: Thriposha in Sri Lanka and Maisoy in Bolivia.

July 20. What is Tofu? pamphlet by Shurtleff and Aoyagi published by Westbrae Natural Foods in Berkeley.

Aug. 6. New-Age Foods Study Center established by Shurtleff and Aoyagi in Lafayette, California. The name was changed to The Soyfoods Center in Sept. 1980.

Aug. Larry Needleman of The Learning Tree in California introduces America's second tofu kit, which soon becomes the best-seller nationwide.

Aug. Farm Food Company, a branch of The Farm in Tennessee, opens America's first soy deli, in San Rafael, California. They serve tofu sandwiches, salads, salad dressings, and cheesecakes; tempeh burgers, deep-fried tempeh cutlets, tempeh with creamy tofu topping, and Indonesian delight (tempeh strips); soymilk ice cream, shakes, yogurt, mayonnaise, and whipped creme; soybean stroganoff and burritos; and TVP chili. They essentially launched the concept of second-generation soyfood products.

Sept. 23. *The Book of Miso,* by Shurtleff and Aoyagi published by Autumn Press.

Sept. 29. Shurtleff and Aoyagi begin "Tofu and Miso America Tour." They do 70 public programs nationwide and travel 15,000 miles in their white Dodge van, continuing until 3 Feb. 1977. In the van they carry hundreds of copies of *The Book of Tofu* and *The Book of Miso* and many of Larry Needleman's tofu kits, plus little bags of natural nigari, all of which they sell at their programs. They usually have meals and spend the night with the people who have sponsored and organized their program. They also visit numerous soyfoods producers and researchers, including The Farm in Tennessee from Dec. 21 to Jan. 2. After the tour, tofu shops started in most of the areas where they spoke.

Sept. Dr. Kenneth Bader becomes executive director of the American Soybean Association. With the help of increasing funding from checkoff programs, he ushers in an era of growth, and increased activity and strength for ASA.

Oct. 13-15. Seminars on the use of soy protein for foods and meal for feeds are held in Moscow, sponsored jointly by the U.S. Foreign Agricultural Service, the American Soybean Assoc., and the Food Protein Council. More than 200 Soviet officials attended.

Oct. *The Joy of Soy,* by Sylvia E. Anderson self-published in New Jersey.

Nov. Island Spring starts making tofu in Vashon, Washington. Founded by Luke Lukoskie and Sylvia Nogaki.

Dec. The term "soyfoods" (spelled as one word) is coined by Benjamin Hills of Surata Soyfoods in Eugene, Oregon, for use in their company name. It is first used in a book (*Tofu & Soymilk Production*) by Shurtleff and Aoyagi in July 1979, and as a magazine title in July 1980.

Dec. Morinaga Milk Industry Co. in Japan is granted the world's first patent on a method for manufacturing aseptically packaged tofu (in Tetra Brik cartons), U.S. Patent 4,000,326.

* Kibun, in Japan, introduces East Asia's first commercial fermented soymilk products, a line of acidophilus soymilk drinks brand-named Soena.

* Beginning of the rise of the modern soymilk industry in Japan. This is the first year that a significant amount of soymilk was sold.

* Kikkoman soy sauce passes La Choy to become America's best selling brand of soy sauce. The three major soy sauce markets are consumer retail, restaurants and other institutions, and industrial (for food processors). La Choy may still be the leader in consumer retail; Kikkoman leads in

© Copyright Soyinfo Center 2014

restaurants.

* Beef consumption in America peaks at 95.4 pounds per capita. It had risen rapidly from 38.6 lb/person in 1930. After 1976 it falls steadily, hitting 75 lb/person in 1985.

* National Soybean Research Program established in Brazil, building upon the National Soybean Project (1972) and the National Soybean Research Center (1975).

6574. Harrison, Gil. 1976. The Brazilian competition: Will we meet it? *Soybean Digest.* Dec. p. 20-21.
• ***Summary:*** In 1969 no one thought of Brazil as a producer of soybeans; the country's annual soybean production was only 35 million bushels [0.95 million metric tons]. "However, in 1976 the world was astonished to learn that Brazil had surpassed mainland China" to become the world's No. 2 producer of soybeans with a record harvest of 426 million bushels [11.6 million metric tons].

"How did Brazil, Paraguay, Argentina, Colombia and Bolivia get into the soybean business in the first place? There are five explanations. (1) U.S. export embargo [from June 27 to July 2, 1973] that artificially raised world prices until it was profitable for even the most inefficient producers to grow soybeans; (2) U.S. Government help through the Agency for International Development, which provides financing, funding and technology for soybean production; (3) U.S. private industry (in the form of seed companies, farm machinery salesmen, fertilizer producers and insecticide and herbicide manufacturers) is constantly looking for export markets for its products and gives away technology along with sales contracts with overseas farmers; (4) Japanese technical assistance to increase soybean production in a 320 million acre area of marginal frontier land in Brazil; and (5) an urgent need for a highly marketable foreign exchange earner."

"The Brazilian farmer realizes only too well that he is a marginal producer with production costs much higher than the U.S. and that he is at the mercy of world market prices. He would welcome help in the form of market development to increase domestic demand."

Concludes with eight steps that U.S. soybean farmers, through their appointed spokesman, ASA, should take to retain their profitability and growth in soybean production. Address: American Soybean Assoc., Mexico and Northern Latin America Regional Director.

6575. Kawashima, Masao. 1976. Shiramine chihô no shoku seikatsu to ken-dôfu [Hard tofu in the food-life dietary pattern in the region of Shiramine, Japan]. *Chori Kagaku* (*Science of Cookery*) 9(4):205-09. Dec. Illust. [Jap]
• ***Summary:*** Note: Shiramine is a small town in Ishikawa prefecture, in the Hokuriku region of north-central Japan. Address: Habutae Tofu K.K.

6576. Matsuda, Yutaka. 1976. The etymology of soy. *Kwansei* [*Kansai*] *Gakuin University Annual Studies* 25:3-4. Dec. Nishinomiya, Japan. [3 ref. Eng]
• ***Summary:*** "British and American dictionaries including OED (*Oxford English Dictionary*) consider the Japanese word *shôyu* to be derived from Chinese. Is this theory reliable? No!

"OED states that the word is derived from Chinese *shi-yu, shi-yau* (*shi* salted beans, *yu* oil), and *Universal English Dictionary* (1932), *American College Dictionary* (1960), *Random House Dictionary* (1966). *Oxford Dictionary of English Etymology* (1966), *Chambers Twentieth Century Dictionary* (1972) have followed suit. This Chinese pronunciation *shi* appears to represent a character meaning fermented soybeans with salt [fermented black soybeans]. On the other hand, the character meaning fermented soybeans and wheat with salt is transcribed *chiang* in present-day standard Chinese [according to the *pinyin* system established in China in 1957]. *Webster's Third New International Dictionary* (1961) [Web. III] picks out *chiang-yu* as the origin of the Japanese term, and *Klein's Comprehensive Etymological Dictionary* (1967), *American Heritage Dictionary* (1969) [AHD], *Webster's New World Dictionary, College Edition* (1970) also adopted the *chiang* theory.

"In Japan *shi* had been eaten before the Taiho Rei Statute (701), but *shô* rather than *shi* was to the Japanese taste, and *shôyu* squeezed from chiang was used instead of shi-you squeezed from shi. It follows that the OED theory–the *shi* theory cannot be supported.

"The Web. III theory–the *chiang* theory is also doubtful. Web. III and AHD note that the Japanese term *shôyu* is derived from Pekinese, but it is hardly plausible that the compound should come from Modern Standard Chinese, because *shiyau-yu* appeared already in the latter half of the 15th century and the very word itself was entered in the Japanese dictionary published in 1597. Indeed the Chinese characters chiang and you were introduced from Ancient China but the compound word chiang-you [pronounced shoyu in Japanese] was coined in Japan, as today's Japanese dictionaries such as *Shin Jigen* (1968) and *Shin Kanwa Jiten* (1973) label the term as Japanese-made. As a matter of fact, several other compounds coined in Japan have been reexported to China: *tetsuzuki* (procedure) and *torishimari* (control), which seem to have been exported from Japan in the earlier periods of the 20th century, are now used in China, too, pronounced *shôuoxû* and *qûdi,* respectively [as written in pinyin]. The characters pronounced *haken* in Japanese and *bàqáan* in Chinese, meaning hegemony, which is so crucial a compound related to the Shino-Japanese [sic, Sino-Japanese] peace treaty under negotiation that the treaty conclusion depends on whether or not the compound will be included in it, also was coined in Japan. Along with these, the compound word shoyu/chiang-you has been imported from Japan and is pronounced in the Chinese way.

© Copyright Soyinfo Center 2014

"Perhaps noticing a marked difference between *chiang-yu* and *shôyu, Webster's New Collegiate Dictionary* (1973) has given up the *chiang* theory and has put forward a new one [Jap. *shôyu,* fr. Chinese (Cantonese) *shi-yaû,* lit. soybean oil]. *Shi-yaû* might be Cantonese *chi you.* Anyway the new theory is nothing but a variant of the OED theory.

"In conclusion, we may duly state that *sôyu* or *soyu* which was the dialectical form of *shôyu* in the latter half of the 17th century was borrowed through Nagasaki into Dutch as *soya* and *soja,* and then from Dutch into English as *soya* and *soy.* The theory that Japanese *soi* was directly adopted into English as *soy* is unsupportable because there was no opportunity at all of direct contact between Japanese and English in those days, though there is a possibility that dialect form *sôi* or *soi* might have existed in Nagasaki at that time." Address: Nishinomiya, Japan.

6577. Pearce, Jean. 1976. Jean Pearce's How to get things done in Japan. Vol. 2. Tokyo: Japan Times. [v] + 295 p. Dec. Company and organization index. General index. 19 cm. [Eng]

• ***Summary:*** The preface begins: "Dear friends, Over the past twelve years, I have been answering letters from both Japanese and foreign readers about this always interesting, often baffling, country." This book is a compilation of those answers / columns, with two helpful indexes. Under each title will be found at least one (but sometimes more) of Jean's responses–but no date and no initial writer's name.

"Sing a song of soybeans" (p. 35-37, two answers). "An American here is dependent upon a Japanese tofu maker for his supply of soybeans. He would like to find a commercial source. Somehow it doesn't seem right to buy soybeans from a tofu maker to make one's own tofu. By the time he reads this he may have found a 15-kilo bag of soybeans at his door. Yoshida Bungo Shoten, one of the largest wholesale dealers in soybeans, is the most cooperative company I've contacted."

"Another man who appreciates soybeans is Rinshiro Kato. He is marketing a soybean derivative called Togen, a powder made from the most nutritious parts of the soybean mixed with wheat flour with similar food values. A 500-gram can costs ¥3,000 and provides a month's supply" at the rate of 3 spoonfuls a day. "The company also makes a Togen cookie with sesame seeds, konbu and honey."

"Learn a little" (p. 170-71): "Tofu. I've been using it for years in all kinds of ways. Yet I never knew about pressing it. This removes the water. Japanese would have you wrap a square of regular (*momengoshi*) tofu (it won't work with the finer textured kinugoshi) in a *tenugui* [thin towel] and gently squeeze out the water. I wrap mine in a towel and put a breadboard on top with a filled teakettle to weight it down. An hour or so later the tofu has an entirely different texture."

Note: This is the earliest document seen (April 2013) that contains the word *momengoshi* (regardless of hyphenation); it refers to regular or "cotton" tofu.

There are three basic types of soy sauce: *Koikuchi* is by far the most widely used. *Usukuchi* is light tan–the choice for lighter color foods like tofu and white fish. The taste is about the same as *koikuchi. Tamari* is slightly thicker, slightly stronger, and frequently used for *sashimi.* "It is made without wheat and is the favorite in the Nagoya area."

"Tofu" (p. 228-29): "A man asks for an unusual recipe that may appeal to those who don't like tofu." If all the traditional and Western ways leave you cold, try this: "Cut tofu in one-inch cubes. Put in a jar and cover with gin. Let it age for two weeks or so, and then you have tofu cheese."

The residue [okara] left after grinding and straining tofu is high in food value. You can buy a plastic bag full for ¥20 of so early in the morning from your favorite tofuya-san. Use it as a food or "put it in a cloth bag and polish your floors. In the old days that was how the Japanese achieved that lovely soft finish we all admired."

Good tofu restaurants in Tokyo are Sasa-no-Yuki not far from Uguisudani station and Goemon, in Bunkyo-ku, up the hill from the Hakusan subway station.

Good books about tofu are *The Art of Just Cooking,* by Lima Ohsawa. *Tofu Recipes,* by Grace Kikuchi. *The Book of Tofu,* by Shurtleff & Aoyagi. Address: [Tokyo, Japan].

6578. Thanh, Vu Huu; Shibasaki, Kazuo. 1976. Major proteins of soybean seeds. A straightforward fractionation and their characterization. *J. of Agricultural and Food Chemistry* 24(6):1117-21. Nov/Dec. [29 ref]

• ***Summary:*** The authors determined the optimum condition for simultaneous fractionation of the 7S and 11S globulins, the two major reserve soybean proteins. Address: Dep. of Food Chemistry, Faculty of Agriculture, Tohoku Univ., Sendai, Japan.

6579. **Product Name:** [Soy Milk (Dairylike, Coffee, or Strawberry)].
Foreign Name: Asasyoku [Asashoku] Soy Milk, Soi Miruku.
Manufacturer's Name: Asahi Shokuhin.
Manufacturer's Address: Factory: Mochida Azacho-machi 1991, Oaza, Gyoda-shi, Saitama-ken 361, Japan. Phone: 1485-55-2351.
Date of Introduction: 1976.
Wt/Vol., Packaging, Price: 500 ml Pure-Pak cartons.
How Stored: Refrigerated.
New Product–Documentation: Product with Labels (Pure Pak cartons) purchased in 1976 at a Seiyu department store in Tokyo, Japan. Also in 1976 William Shurtleff visited the plant in Saitama where this soymilk was made. Leaflet. 8½ by 11 inches, color. Reprinted in Soyfoods Marketing. Lafayette, CA: Soyfoods Center.

Brochure (8 pages, black and white, in Japanese). 1978? Asashoku Soi Miruku. On the cover is a photo of the carton.

6585. **Product Name:** Kikkoman Instant Miso-Shiru Soy Bean Soup Mix [Shiro (White), or Aka (Red)].
Manufacturer's Name: Kikkoman Corporation.
Manufacturer's Address: Noda 278, Chiba-ken, Japan.
Date of Introduction: 1976.
Ingredients: Incl. miso (soybeans, rice, salt), dried green onions (negi), dried wheat gluten cakes (fu), dried seaweed, bonito extract, and MSG (monosodium glutamate).
Wt/Vol., Packaging, Price: 1.83 oz foil pouch retails for about $1.07 (May 1980).
How Stored: Shelf stable.
New Product–Documentation: *Food Product Development.* 1980. May. p. 26. Label in both Japanese and English. Front panel shows a drawing of a miso soup cup with a happy face on it. Each pouch contains 5 individual serving packets.

6599. **Product Name:** [Soymilk].
Manufacturer's Name: Soken-sha K.K.
Manufacturer's Address: 724 Katakura-cho, Kanagawa-ku, Yokohama-shi 221, Japan. Phone: 045-491-1441.
Date of Introduction: 1976.
New Product–Documentation: Toyo Shinpo. 1982. July 21. "The soymilk industry and market in Japan." States that Soken-sha first made commercial soymilk in Japan in 1976.

K. Tsuchiya. 1982. Dec. *Tonyu* [*Soymilk.* 2nd ed.]. p. 73. Sôken-sha introduced Benibana Tônyû (in plain and cocoa flavors) in Aug. 1982 in 200 ml long-life packs and distributed it nationwide.

Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 63-64. The contact person is Mr. Kamoi.

6600. Taira, Harue; Taira, Hirokadzu; Kaizuma, Norihiko; Fukui, J.; Matsumoto, S. 1976. [Varietal differences of seed weight, protein and sulfur-containing amino acid content of soybean seeds]. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 45(3):381-93. [35+ ref. Jap; eng]
• ***Summary:*** These studies sought to determine the effect of varietal differences on seed weight (dry weight), protein content (moisture free basis), and sulfur-containing amino acid content in the protein (N x 6.25; methionine, cystine, and methionine + cystine) of 1,110 samples of soybean seeds

© Copyright Soyinfo Center 2014

grown in 1970 at Kariwano, Akita, Japan.

For all the samples, the weight of 100 seeds ranged from 2.6 gm to 47.0 gm, with a mean value of 20.4 gm, and a coefficient of variation of 35.59%.

The protein content ranged from 29.81% to 53.29%, with a mean value of 39.82% and a coefficient of variation of 7.71%.

The methionine content ranged from 0.78% to 1.34%, with a mean value of 1.03% and a coefficient of variation of 7.71%.

The cystine content ranged from 0.85% to 2.36%, with a mean value of 1.40% and a coefficient of variation of 17.14%.

The total sulfur-containing amino acids (methionine + cystine) content ranged from 1.66% to 3.52%, with a mean value of 2.43% and a coefficient of variation of 11.93%.

Concerning the mean value of each group classified by place of origin of the variety, the weight of 100 seeds was smallest in Southeast Asia (10.0 gm) and largest in Tohoku [northeastern provinces], Japan (24.2 gm).

Protein content was lowest in Europe (35.98%) and highest in Southeast Asia (43.35%).

Methionine content was lowest in the Chugoku [southwestern] region of Japan (0.93%) and highest in Southeast Asia (1.14%). Cystine content was lowest in Hokkaido [Japan's northernmost main island] (1.32%) and highest in Europe (2.02%). The content of total sulfur-containing amino acids was lowest in Chugoku (2.30%) and highest in Europe (3.13%). Address: 1-2. National Food Research Inst., Ministry of Agric. & Forestry, Koto-ku, Tokyo; 3-4. Faculty of Agric., Iwate Univ., Morioka; 5. Tohoku National Agric. Exp. Station, Kariwano, Akita. All: Japan.

6605. **Product Name:** [Natto Miso].
Foreign Name: Nattô Miso.
Manufacturer's Name: Yoshida Shohachi Shoten K.K.
Manufacturer's Address: Takashima 1-382, Shimabara-shi, Nagasaki-ken, Japan. Phone: 0957-62-4107.
Date of Introduction: 1976.
New Product–Documentation: Shurtleff and Aoyagi. 1976. *The Book of Miso.* p. 43, 239. Shurtleff and Aoyagi. 1983. *The Book of Miso,* 2nd ed. p. 42, 258 (R.1). "Natto Miso: Prepared in the area of Nagasaki since the 1700s, natto miso contains a relatively large proportion of soybeans which gives it an appearance similar to the famous sticky fermented soybeans called *natto,* although there are no real natto in natto miso. Containing whole soybeans, barley koji, slivered kombu, gingerroot, and, in some modern varieties, *mizuamé* (a natural honeylike sweetener extracted from rice [rice syrup], millet, or barley), this miso is fermented at the natural temperature for about 30 days. One delicious and very popular variety, now widely available in the United States, is free of preservatives, artificial or refined sweeteners, and all other additives–proving that it can still be done. We would prefer to see this and all similar misos labeled as 'Finger Lickin' Miso;' we feel the general term is more appealing and less confusing." Page 258 states that the maker of this traditional, natural product is Yoshida Shohachi Shoten.

• ***Summary:*** This company is said to have been established in 1362 A.D. Reorganized as Hayakawa Kyuemon Shoten Co. in 1932. Name changed to Hatcho Miso Kakkyu Goshi-gaisha in 1963. Mr. Kyuemon Hayakawa is the 18th proprietor. Many tankas (Japanese odes of 31 syllables) on Hatcho miso were composed by famous poets. The plant is located beside the Yahagi River. They began to sell miso to the Imperial Household in December 1892. In March 1953 Prince Akihito took Hatcho miso on his European tour. Since 1959 six Antarctic expeditions have taken Hatcho with them. Address: Okazaki, Aichi, Japan.

6610. Hayashi, Minao. 1976. Kandai no bunbutsu [Han dynasty civilization and objects]. Tokyo: Tokyo Daigaku, Jimbun Kagaku Kenkyujo. 576 p. [Jap]*
• ***Summary:*** Bo (1982): This book contains a simple drawing of soy sauce making equipment. It shows a hole in the bottom of an earthenware chiang crock, from which liquid soy sauce can be drawn off. The Chinese also put a basket into the crock to draw off the liquid. This is the strongest known evidence that soy sauce existed at the time of the Han dynasty. But it is better to think that its production stems as far back as the Ch'in (221-206 B.C.) or Warring States (403-221) periods.

Note: Hayashi, born in 1925, is a famous Japanese archaeologist, and art- and cultural historian.

• ***Summary:*** Soyfoods Center has done a 10-page typed translation of the natto section of this book. Contents: Legends of natto's origin: Pinch hitter in times of food shortage, natto's stringiness surprised people of the Yayoi period (200 B.C.–A.D. 250), Hachimantaro Yoshiie–Natto's first public relations agent (1051-1085), calling out "natto, natto" starting in the Edo period (1603), areas where natto is popular today.

The technical revolution in natto production: Pioneers of commercial natto production (Drs. Yabe, Sawamura, Hanzawa), University Natto sold by Hokkaido University, what kind of natto is most delicious?

The effectiveness of natto: The procreative power of natto bacteria promotes long life in people who eat natto, natto can cure diarrhea, natto suppresses typhus and cholera bacteria (in 1936 Dr. Matsumura, a Kyoto University bacteriologist, found with rabbits that natto bacteria actually killed typhus bacteria), natto does the following–helps people with weak stomach and intestines, prevents intestinal gas, fights cancer (Kameda 1967), prevents radiation harm (via dipicolinic acid, which was first discovered in natto and later found in all bacterial cells; it binds heavy metals like radioactive strontium and expels them from the body), prevents infant milk allergy, contains vitamin B-2 which increases stamina, rejuvenates the cells.

Natto throughout the provinces: Hikiwari natto from Tsugaru, Hikiwari natto from Akita (the birthplace of natto is said to be Oyashin-machi in Yokote city, Akita prefecture; charred soybeans mixed with Yayoi period earthenware pottery from 2,000 years ago have been excavated from ruins at nearby Mt. Komori), Hettsui natto from Saitama prefecture, Naisho mame from Gunma prefecture, small-bean natto from Mito, Tataki natto from Kyoto, Koru mame from Higo.

Seasonal natto recipes: Spring, summer, fall, winter, all four seasons.

Natto's springiness surprised people of the Yayoi period (200 BC–250 AD): There are various legends regarding the origin of natto but all begin with the meeting of cooked soybeans and rice straw. No documents record this origin. Yet soybeans and rice straw are known to have existed in Japan since the Yayoi period. Perhaps a piece of rice straw fell into a portion of leftover soybeans. In pit dwellings with rice straw roofs, rice straw littered the floor and the rooms were warm. At the proper temperature (how?) the beans would develop stickiness/strings and a good flavor result. The subtle sweetness of rice straw added to the unique aroma. Some may have eaten the natto sprinkled with salt. Once you've tasted natto you can never forget the flavor.

© Copyright Soyinfo Center 2014

Some women may then have incubated natto next to their bodies overnight in bed. The Yayoi era is concealed in the transmission of Hikiwari natto since ancient times in the northeast prefectures.

There is also the legend that cooked soybeans were offered at household Shinto shrines on which there was often a rope of braided rice straw (*shimenawa*). (The first character of the word natto means "to offer.") The bacteria from the straw may have inoculated the beans; it is generally thought that they were developed in Japan.

Hachimantaro Yoshiie was a general of the Genji clan during the wars of 1051 and 1085. One night during the war the soldiers were cooking soybeans for horse fodder when they were suddenly attacked. They quickly packed the beans into a rice-straw sack (*tawara*), tied the bag to a horse's back and battled for several days. Finally, the battle over, they took the bundle off the warm horse's back and opened it to find that the cooked soybeans had fermented to become natto. In the second war, Yoshiie had captured a fortress in Sankanbu Akita in northern Japan. He wanted to give cooked soybeans to the local farmers as a gift but since he was in a hurry and had no other container, he put them in a rice-straw sack and gave it to them. All were surprised when, after several days, the beans gave off a unique odor and were stringy. The farmers liked the flavor and soon adopted natto as a food. Yoshiie, having enjoyed natto, recommended it to his fellow men. The farmers soon learned of this and began producing natto. The tradition has been passed down from generation to generation.

After his conquests in Northern Japan, Yoshiie's army returned to Kyoto and he taught people along the way how to make natto. The people of Sankanbu in Akita, far from the sea, had little fish or other animal protein in their diet and must have delighted in natto. The route taken by Yoshiie back to Kyoto has been called the 'natto road.'

Page 141: The word "natto" first appeared in 1286 in the *Shinsaru Gakki,* by Fujiwara Myoe,... Address: Tokyo, Japan. President of Manyu Eiyo KK. Teaching at Nihon Daigaku Daigaku-in and Meiji Daigaku Nôgaku-bu. Prof. at Shobirin Joshi Tanki Daigaku.

• ***Summary:*** Page 141: The word "natto" first appeared in 1286 in the *Shinsaru Gakki,* by Fujiwara Myoe, whose epicurean sister was said to love *shiokara natto* or salty natto [fermented black soybeans]. The ingredients used to make this salty product are 100 kg soybeans, 100 kg barley flour, and 30 kg salt. It is also called T'ang natto (*kara-natto*) and was used as an hors d'oeuvre with saké or in place of tea cakes (*chauke*) with tea.

Tera-natto used as gifts at O-bon and New Years: At Nara's temples Kofukuji and Todaiji, the monks made salty natto and gave them to the parishioners at O-bon and New Years. Later the tradition was transmitted to Kyoto and became the now famous Daitokuji natto and Tenryuji Natto (?), each varieties of "T'ang natto" (*kara-natto*) or "shiokara-natto."

Note: This is the earliest (and only) document seen (Nov. 2011) which states that salty natto [fermented black soybeans] were made at Kofukuji temple in Nara.

All these types contain salt, are inoculated with a mold, have a dark color (and no strings), and have a long shelf life. Today at Daitokuji one can still see the splendid *Nassho* (offering place or natto place) which, according to the book *Honcho Shokkan,* was given this name since that was where natto were (originally?) made [and used as an offering]. Natto were an important protein source for the vegetarian monks.

Differences between tera-natto [salty natto] and itohiki-natto [stringy, unsalted natto]: Tera-natto first came to be made by monks in temples. These savory fermented black soybeans and chunks were close relatives of miso and shoyu. Japanese Buddhist monks who went to China to practice during the T'ang dynasty (618-906) learned how to make these condiments and brought the knowledge back to Japan, where they made them in temples. They are made with molds (mainly *Aspergillus oryzae*) rather than bacteria (which are used to make itohiki natto). Cooked soybeans are dusted with roasted wheat or barley flour which is mixed with mold spores, incubated until a mycelium forms, sun-dried, pickled in brine with seasonings, then sun-dried again. Daitokuji natto is crushed then reshaped into lumps, while Hamanatto, made at Daifukuji is sold as is. When Tokugawa Ieyasu (military ruler / shogun of Japan, 1600-1603) conducted his military campaign in Korea [1592] he had large quantities of Hamanatto produced as food for his soldiers; later it became a commercial product, today's Hamanatto. The "natto" that appear in ancient documents are mostly these fermented black soybeans [salty, fermented soybeans]. Address: Tokyo, Japan. President of Manyu Eiyo KK. Teaching at Nihon Daigaku Daigaku-in and Meiji Daigaku Nôgaku-bu. Prof. at Shobirin Joshi Tanki Daigaku.

• ***Summary:*** This research shows that consumption of dried-frozen tofu lowers blood cholesterol in human beings. The experiment used a crossover design. This report was presented by Dr. T. Miyoshi (of Tokushima Univ. Medical Dept.) at the International Nutrition Conference held 3-9 Aug. 1975 in Kyoto, Japan. It is based on research conducted by Dr. T. Fukui (presently director of the National Nutrition Research Center) and his group of 6. The 3-month study was conducted in the fall of 1974, when Dr. Fukui was a professor at Tokushima Univ. Medical Dept. There were 6 human subject, 4 men and 2 women, ages 27-62. In the experiment, each person consumed his or her regular diet for 4 days, then meat-centered meals for 10 days, then meals based on dried-frozen tofu for 39 days, then regular meals for 18 days, then meat centered meals for 9 days. Recipes are given. Cholesterol levels for each person were monitored and graphed. They rose during the meat-eating period, dropped during the tofu-eating, and rose again during the meat-eating period. Address: Nagano, Japan.

Address: Tokyo, Japan.

6624. Nix, Janeth Johnson. 1976. Adventures in oriental cooking. San Francisco, California: Ortho Book Division, Chevron Chemical Company. 96 p. Illust. (color). 28 cm. Ortho book series.
• ***Summary:*** By "Oriental" this book means mostly China and Japan. Soy related: Crisp chicken teriyaki (with soy sauce made into teriyaki sauce, p. 14). Tofu salad (with 1 pound soybean cake, p. 15). Fu yu spareribs (with ¼ cup *fu yu,* fermented bean cake, p. 19).

The section on "Ingredients and equipment" (p. 22-31) begins with a full-page color photo in which we can clearly see: Azumaya tofu in a white plastic film-sealed tub, a plastic bag of "salted black bean" [fermented black soybeans] (ingredients: Black beans, ginger and salt), small pieces of deep-fried tofu, miso in plastic tubs, Kikkoman soy sauce in a large rectangular can, Aji-no-Moto in a red can, etc. The text discusses: Soy sauce ("The one essential ingredient in Chinese and Japanese cooking"). Japanese sauces, seasonings, and pickles ("For example, besides soy sauce, you can find low-sodium soy sauce {for specialized diets}, sukiyaki sauce, teriyaki sauce, and soup base for noodles," p. 24).

Note: This is the earliest English-language document seen (May 2011) that mentions "low-sodium soy sauce."

Chinese sauces, seasonings, and pickles, incl. the following which contain soy sauce: oyster sauce, brown bean sauce, Szechwan bean sauce, sweet bean sauce, hot bean

© Copyright Soyinfo Center 2014

sauce. Fermented black beans.

Bean cake–fresh and fried ("Soybean cake is almost as much a staple in Oriental cooking as rice." The regular type is called tofu in Japan and dow-foo in Chinese. But there are other varieties: softer, firmer, dried, fried {comes in cubes, squares, and oblongs...} Fermented bean cake, also called red bean curd, white bean curd, or *fu yu,"* is often sold in jars. Miso, used mainly in Japanese cooking, comes in many colors).

Bean sprouts mean mung bean sprouts. Foods from the sea include Japanese kombu and nori.

In this same section is a sub-section (p. 30-31) titled "The language of Oriental cooking," a glossary that includes: Aburage. Age-zushi. Aka-miso. Buta-dofu ("Pork with soybean cake"). Dow foo pok ("Fried soybean cake"). Fu yu ("Fermented soybean cake, used as a seasoning"). Hoisin ("Thick, slightly sweet Chinese sauce made from a soybean base"). Kitsune-zushi: See Age-zushi. Miso ("Red or white soybean paste"). Miso shiru (Japanese miso soup). Miso-yaki (Broiled food that has been marinated in miso). Monosodium glutamate (A white, crystalline flavor-enhancing agent). Nori. Norimaki. Shiro miso ("White soybean paste"). Shoyu ("Japanese soy sauce"). Sukiyaki. Sumiso. Suribachi. Surikogi. Tempura. Teriyaki. Tofu. Umeboshi. Wakame. Wok. Yin and Yang.

Soy related: Miso soup recipes (3, p. 34). Age-zushi (p. 52). Melting spareribs with black bean sauce (with 2 tablespoons fermented black beans, p. 63). Pork roast with miso (p. 64). Stuffed bean cake (with fried bean cake, p. 64). Sukiyaki (with 1 pound square tofu {soybean cake} cut into 1-inch squares, p. 66-67).

In the section on Oriental vegetables is a long sub-section titled "Soybeans" (with a color photo of green soybeans growing on a plant, p. 94-95) which includes how to grow them in a home garden. The soybean plant has its own time clock, which gets its signal for flowering from the sky. "Short nights (long days) delay flowering; long nights (short days) speed up flowering." Soybeans need a special inoculant of nitrogen-fixing bacteria. Describes how to cook and shell the beans in the pods, and to serve them cool, while still in the pod, as is commonly done in Japan.

Address: Japan.

6626. Oiso, Toshio. 1976. History of food and diet in Japan. *Progress in Food and Nutrition Science* 2(1):35-48.
• ***Summary:*** Contents: 1. Fundamental conditions in the history of the food habits of the Japanese. 2. Age of primitive food (Origin of Japanese culture–2nd century B.C.). 3. Age of stabilized rice-eating habits (2nd century B.C. to first half of 3rd century). 4. Ancient tomb age (Latter half of third century to 6th century). 5. First age of tabooing of meat eating (6th century to 8th century). 6. Age of formalization of food habits.

7. Age of warriors' [samurai] diet (13th century to first half of 15th century). 8. Age of Zen-styled food in vogue (Latter half of 15th century to first half of 16th century. 9. Age of imported food culture (Latter half of 16th century to first half of 17th century). 10. Age of completion of Japanese feod (Latter half of 17th century to first half of 19th century). 11. Age of Japanese-Western mixed diet (Latter half of 19th century to the present). 12. Acknowledgements.

Japan has relatively little arable land. Many ancient Japanese rice grains have been found in remains from the Yayoi Era, both round-grain rice (*Oryza sativa*) and elongated rice (*Oryza sativa indica*). Buddhism (and its precept against killing or eating meat) was introduced to Japan in the middle of the 6th century; production of dairy foods gradually faded out. In China the Han culture was flourishing. A centralized nation with an emperor was established at this time.

In the warrior's diet we find unpolished / brown rice, rice cake (mochi), fermented bean past (miso), salted plum (umeboshi), and soy sauce. "Salt was regarded as the most indispensable item" (p. 41). Temples made and sold foods.

In the age of Zen-styled foods the tea ceremony *Chanoyu*) was in vogue, brought to completion by Sen no Roikyu (1521-1591); it was accompanied by the development of the "Kaiseki-style dinner" (*Kaiseki ryôri*). A labeled diagram of this dinner is given–shown from two angles.

After the Tokugawa regime was founded, the shogunate closed Japan to foreigners and most foreign influence; this continued for 219 years, as Japanese food and menus became standardized.

In 1867, the last Shogun abandoned the rule of the Tokugawa clan, which had lasted for 263 years. Emperor Meiji became Japan's ruler and national isolation was ended.

• ***Summary:*** A very interesting, well researched, and accurate Japanese cookbook. The illustrations are excellent. Each recipe has its Japanese name in large bold letters and

© Copyright Soyinfo Center 2014

a translation directly below in smaller letters. A hallmark of her writing is that she prefers to use the native language words and terms (e.g., shôyu) rather before giving her translation of them (e.g., soy sauce). This is helpful, since many of her translations have not withstood the test of time. In some cases, however, she fails to catch nuances or chooses to ignore them; e.g., *momen tôfu* should actually be *momen-dôfu,* and *kinugoshi tôfu* should actually be *kinugoshi-dôfu.* Unfortunately, she uses the term "bean paste" to refer to two very different foods: miso and *azuki-an* (see p. 214, 242). A large number of recipes call for various types of *tôfu* ("bean curd") or *miso* ("bean paste)."

Seaweeds (p. 4): "The one single thing that distinguishes Japanese cooking is the use of seaweeds." Kombu is used to make dashi. Nori and wakame are use in many ways.

"The soy bean plays a dominant role in the Japanese kitchen. It comes in the form of *shôyu* (soy sauce), *usukuchi shôyu* (light soy sauce), *momen tôfu* (bean curd), *kinugoshi tôfu* (silky bean curd), *yakidôfu* (broiled bean curd), *koyadôfu* (freeze-dried bean curd), red and white *miso* (bean paste), and so on. Despite their common origin, the products of this versatile bean manage to be very different.

Note 1. This is the earliest document seen (April 2013) that uses the word "silky" or the term "silky bean curd" to refer to *kinugoshi tôfu.*

Note 2. This is the earliest English-language document seen (April 2013) that uses the term *koyadôfu* or the term "freeze-dried bean curd" to refer to dried-frozen tofu.

Soy-related recipes include: Asparagus with malted bean paste (with "moromi miso" and "usukuchi shoyu," p. 27). Dengaku (Bean curd with bean paste, p. 28). Stuffed lotus root (with white miso and mustard, p. 30). Noppei-jiru (vegetable and fried bean curd soup, with "1 *namaage* {type of fried bean curd}" or "2 pieces *aburaage* {fried bean curd}, p. 35). Kenchin-jiru (vegetable soup, with "1 *momen tôfu* {bean curd} weighing about 8 ounces," and "4 tablespoons *miso* {bean paste}, p. 36). Clear soup (suimono) with okra and bean curd (p. 38). Clear soup with bean curd and wakame (p. 38). Satsuma-jiru (Miso soup with mixed vegetables, incl. red and white miso, p. 45). Miso soup with tofu and shungiku (p. 46). Miso soup with wakame (incl. red and white miso, p. 46). Miso soup with oysters and bean curd (p. 47). Sekihan (pink rice with azuki beans, p. 57). Miso udon (p. 63). Kitsune udon (noodles with aburaage, p. 67). Inari-zushi (fried bean curd stuffed with vinegared rice, p. 79). Sole with bean curd and mushrooms (p. 88). Salmon steamed with bean curd (p. 90-91). Mackerel with red miso (p. 95). Fish marinated in miso (p. 102). Clams in miso, mustard, and vinegar sauce (p. 105). Oysters in vinegared miso sauce (p. 106). Satsuma-agé (with mackerel and bean curd cakes, p. 116-17). Oden (with "4 *ganmodoki* {fried bean curd balls}" and "1 *yakidôfu* {broiled bean curd}, about 7 ounces drained weight," p. 120-21). Kaki no dotenabe (oysters with bean paste, p. 124-25). Yudofu (simmered bean curd, p. 130). Sukiyaki (Sautéed beef and vegetables, with "2 *yakidôfu* {broiled bean curd}, 134-35). Grilled beef with bean paste (p. 146). Nikumiso (chicken and vegetables pickled in bean paste, p. 159). Eggplant with bean paste (p. 163). Green beans with bean paste (p. 168). Daikon with fried tofu (p. 171). Turnips with bean paste (p. 173). Cucumber and soy bean sprouts with sesame seeds (p. 183). Spinach salad with tofu (p. 186).

A short section titled "Bean curd dishes" (p. 187) notes that "the soy bean is the youngest of the bean family, going back only to about 3500 B.C." Beans in the Middle East go back to 7000 B.C. and in Mexico they go back to 5000 B.C. But the soy bean "makes up in versatility what it lacks in age."

Recipes Fried bean curd with hijiki (with "2 pieces *aburaage* {fried bean curd}," p. 187). Sole with bean curd (188-89). Deep-fried bean curd with bonito flakes (p. 190). Dried bean curd with vegetables (with "4 *kôyadôfu* {dried bean curd}" and "2 teaspoons *usukuchi shôyu* {light soy sauce}, p. 191). Kûya-mushi (bean curd, chicken, and vegetable custard, p. 192-93). Simmered bean curd and chicken (p. 193). Takara bukuro (treasure bags with aburaage, p. 194). Tofu no shirô-ae (p. 195). Hiya-yakko (garnished cold bean curd, p. 196; *Kinugoshi tôfu* {silky bean curd} may be used). Chrysanthemum flower bean curd (p. 197). Nabeyaki Denraku [Dengaku?] (bean curd with white and red bean paste, p. 198). Pork with bean curd (p. 198-99). Ni-yakko (bean curd with dried bonito flakes, p. 199). Sokuseki misozuke (instant pickled vegetables with bean paste, p. 210). Koshi-an (red bean paste, with "1½ red *azuki* {adzuki} beans," p. 213-15). New year dishes: Kuromame (black soy beans simmered in soy sauce and sugar, p. 220).

Glossary (excellent, p. 228-36)–Soy-related terms: Aburaage, azuki bean, fu (wheat gluten cake), ganmodoki, kinako, kinugoshi tôfu, kôji, koshi-an (powdered azuki paste), kôyadôfu, kôridôfu, kuzuko, mirin, miso, misozuke, mochi, momen tôfu, moromi miso, namaage, nattô, shôyu, teriyaki ("a technique of glazing foods in a soy sauce and mirin mixture either in a skillet or on a grill"), tôfu ("soy bean curd, usually refers to *momen tôfu"*), umeboshi, usukuchi shôyu, yakidôfu, yuba. Address: Both: New York.

• ***Summary:*** Discusses: (1) Pakka and kachcha [kaccha] foods, which relate to Hindu dietary laws. Pakka food contains ghee (clarified butter), a very costly fat believed to promote health and virility. Hindus regard raw foods as possessing the greatest purity; they will accept them even from untouchables.

(2) Dairying: It seems to have been first practiced in about 4000 B.C. in the Near East and North Africa (Simoons 1971). The nonmilking zone embraces all of Southeast Asia from Burma eastwards as well as most of East Asia including China, Korea, and Japan. Much of Africa is also non-dairying; in Africa dairying spread southward from Kenya after the start of the Christian era. People generally did not consume dairy milk if it caused gas intestinal and/or cramps, diarrhea, or even vomiting. Nearby dairying peoples were the Mongols and Tibetans.

The failure of dairying to spread throughout Asia and Africa does not involve a single cause but rather a series of factors from culture, environment, and ecology. Also, most people (70-100%) above age 3 in the nonmilking zone have low levels of the intestinal enzyme lactase that hydrolyzes lactose (milk sugar) into glucose and galactose, which can be readily absorbed by the body. This, it should be emphasized, is the same condition that prevails in other land mammals, and it is believed to be the normal pattern found among primitive men. Address: Dep. of Geography, Univ. of California, Davis, Davis, California 94616.

6632. Solomon, Charmaine. 1976. The complete Asian cookbook. New York, NY: Summit Books. 511 p. Illust. Color plates. Index. 29 cm.
• ***Summary:*** This artistic cookbook is loaded with full-page color plates plus a good glossary. Soy-related recipes include: Bean curd omelettes (Tahu telur, from Indonesia, p. 188). Fried bean curd with peanuts (Tahu goreng kacang, from Indonesia, p. 204). Fried bean curd with soy sauce (Tahu goreng kecap, from Indonesia, p. 204). Fried fish with salted soya beans [miso] (Ikan goreng tauceo, from Malaysia, p. 224). Bean curd in salted soya bean paste [tofu in miso] (Taukwa tauceo, from Malaysia, p. 233). Bean curd and bean sprouts [probably mung bean sprouts] (Taukwa dan taugeh, from Malaysia, p. 233). Stuffed soy bean cake [with fried tofu] (Tauhu sod sai, from Thailand, p. 316). Glutinous rice and soybean sauce (Nuoc leo, from Vietnam, p. 341). Soup with bean curd (Canh dau hu, from Vietnam, p. 342). Misu tomato sauce (with red misu = red miso, from the Philippines, p. 351). Bean curd in barbecue sauce (Chu hau jeung mun dau fu, from China, p. 414). Bean curd with crab sauce (Hai yook par dau fu, from China, p. 414). Ginger soy sauce (See yau ghung jeung), Chilli soy sauce (See yau laht jiu jeung), Black bean sherry sauce (Dau see sheung jing jeung, with canned salted black beans = fermented black soybeans), Black bean garlic sauce (Suen tau dau see, with fermented black soybeans) (from China, p. 431). Sesame seed sauce (Cho kanjang, from Korea, p. 451, with "4 tablespoons light soy sauce"). Dumpling soup (Mandoo, from Korea, p. 453, with "1 square fresh bean curd" and "2 tablespoons light soy sauce"). Soup of soybean sprouts (Kong namul kuk, from Korea, p. 453, with 500 gm soy bean sprouts and 1 tablespoon soy sauce). Rice with fried bean curd (Kitsune domburi, from Japan, p. 460). Steamed egg custard with tofu (Kuya mushi, from Japan, p. 471). Bean paste soup (Miso shiru, from Japan, p. 477). Sushi in fried bean curd (Inari-Zushi, from Japan, p. 480).

Soy-related glossary entries (p. 485-502) include: Aburage. Akamiso. Black beans, salted (Chinese: dow see = salted black beans). Bean curd (Chinese: dow foo; incl. yellow bean curd, dried bean curd, red bean curd). Chinese bean sauce (ground = *mor sze jeung* or chunky = *min sze jeung* similar to Malaysian *taucheo* or *tauceo*). Dow foo pok (Chinese-style fried bean curd). Miso. Mushroom soy (Soy sauce flavored with mushrooms during the last stage of processing). Soy sauce (light or dark, shoyu, kecap manis). Yellow beans, salted (=salted yellow beans). Yellow bean paste.

Note 1. It is also the earliest document seen (April 2012) that uses the term *kecap manis* to refer to sweet Indonesian soy sauce.

Interesting glossary entries (p. 485-502): Aburage, bean curd (fresh, yellow, dried, red), black beans, salted (Chinese: *dow see;* made from soy beans, heavily salted and sold in cans and jars), Chinese bean sauce (ground or chunky, like Malaysian taucheo or tauceo), fish sauce (Vietnamese: *nuoc mam.* Burmese: *ngan-pya-ye.* Thai: *nam pla.* Tagalog: *patis*). Miso. Mushroom soy (Soy sauce flavored with mushrooms during the last stage of processing). Red misu (See miso). sesame seed (Hindi: *till.* Sinhalese: *thala.* Malay: *bijan.* Chinese: *chih mah.* Japanese: *goma.* Indonesian: *wijen*). Sesame oil ("The sesame oil used in Chinese cooking is extracted from toasted sesame seeds..."). Sesame paste ("Sesame seeds, when ground, yield a thick paste similar to peanut butter. Stores specialising in Middle Eastern foods sell a sesame paste known as *tahini,* but this is made from raw sesame seeds, is white and slightly bitter, and cannot be substituted for the Chinese version–which is made from toasted sesame seeds, and is brown and nutty"). Wakame. Wasabi or wasabe. Yellow beans, salted (Very similar to canned salted black beans, but lighter in color). Yellow bean paste (It is not really yellow, but brown. Sold in cans).

Note 2. This is the earliest English-language document seen (March 2009) that uses the word "tauceo" to refer to Indonesian-style miso.

• ***Summary:*** The genus *Glycine* is called the "Daizu Zoku." In this geographical area are found two species of perennial wild soybeans (*G. koidzumii* and *G. clandestina*), plus the cultivated soybean, *G. max.*

Glycine koidzumii Ohwi is known locally as Miyako-jima tsurumame (i.e. "Miyako island vine bean"). It is the same as *Glycine soja.* It was first described in 1943 by Ohwi in *Shokubutsu Bunrui Chiri* (*Acta Phytotaxonomica et Geobotanica*) 12:110. It was named for Genichi Koidzumi, a Japanese botanist (1883-1953). The type specimen of this species, collected by Koidzumi in Miyako, is probably in the Kyoto herbarium, but was not seen by the author.

Glycine clandestina Wendl. is known locally as Bako-Yabu-Mame. This vernacular name appears on the label of the type of *Glycine pescadrensis* Hayata in the herbarium of the National Taiwan University. This is based on the following citation which mentions *G. pescadrensis:* Hayata, Bunzo. 1920. Icones plantarum Formosanarum. Contributions to the flora of Formosa. 9:26. (As syn. determined by Hermann). This species has been reported in Okinawa.

The soybean, G. max, is called "Ufuchija" in Okinawa. Address: Botanist Emeritus, Smithsonian Institution, Washington, DC.

• ***Summary:*** Contents: Introduction. Home and village traditional soybean foods by country. 1. Soybean food uses and production in Asia. Soaking dry soybeans. In China: Tou chiang (soybean milk; preparation, ways of serving), tou fu (soybean curd; yen-lu is the Chinese name for nigari), tou fu nao (soft curd), tou fu kan (dry / firm bean curd), chien chang (pressed tofu sheets), yu tou fu (fried tou fu), tung tou fu (frozen tou fu), tou fu pi (protein-lipid film; yuba), huang tou ya (yellow bean sprout or soybean sprout), mao tou (hairy bean, green soybean, or immature soybean), dry soybeans (roasting and frying, stewing and boiling), roasted soybean flour. Fermented soybean foods. Production and consumption of soybeans (China and Taiwan).

Japan: Tofu (soybean curd), kinugoshi tofu, processed tofu products (aburage or age, nama-age and ganmo), kori tofu (dried-frozen tofu), yaki tofu (grill tofu), yuba (protein-lipid film), soybean milk, gô (ground soybean mash), daizu no moyashi (soybean sprouts), edamame (green vegetable soybeans), whole soybeans, kinako. Fermented soybean foods: Production and consumption.

Korea: Tubu (soybean curd), soybean sprouts, whole soybeans (green soybeans, parched or roasted soybeans, boiled soybeans), soybean flour ("Soybeans are first roasted and then ground to a flour. The flour is extensively used as an ingredient in various food preparations." Note: This is the earliest document seen (Nov. 2012) that mentions roasted whole soy flour in Korea–however no Korean name of this roasted soybean flour is given), soysauce, bean paste [Korean soybean miso], natto (no Korean name is given), production and consumption of soybeans.

Indonesia: Tahu or tahoo (soybean curd), bubuk kedele (soybean powder), tempe kedele, tempe gembus [the name in Central and East Java for okara tempeh], oncom tahu [the name in West Java for okara onchom], other soybean products (soybean sprouts, green soybeans, roasted and boiled soybeans, kecap or soysauce, tauco or bean paste [miso]), food mixtures (Saridele, Tempe-fish-rice or TFR, Soy-rice baby food, soybean residue [okara]-fish-rice), production and consumption of soybeans.

To make bubuk kedele (p. 58): "Soybeans of the white

© Copyright Soyinfo Center 2014

variety are roasted until no beany flavor can be detected. They are ground into a powder and mixed with such spices as garlic and chili. Bubuk kedele is kept in a jar and served on special occasions with a rice product, longtong (rice wrapped in banana leaves and boiled for 3 to 4 hours). Bubuk kedele is always homemade and is eaten by everyone" (Source: I. Gandjar 1976, personal communication).

Note 1. This is the earliest English-language document seen (Nov. 2012) that uses the word *bubuk* or the term *bubuk kedele* to refer to Indonesian roasted soy flour.

Thailand. Philippines: Soybean sprouts, soybean coffee, soybean cake (made from equal amounts of soybean flour and wheat flour), soybean milk, tou fu and processed tou fu products, production and consumption. Burma. India. Malaysia. Nepal. Singapore. Sri Lanka (Ceylon). Vietnam. West Asia [Middle East; Iran and Turkey]. References–Soybean food uses in Asia.

2. Soybean food uses and production in Africa. Ethiopia: Injera, wots and allichas, kitta, dabbo, dabokolo, porridge. Kenya. Morocco. Nigeria: Whole soybeans, soybean paste, corn-soy mixtures (soy-ogi). Tanzania. Uganda. Production. References–Soybean food uses in Africa.

3. Soybean food uses and production in Europe [both Eastern and Western]. 4. Soybean food uses and production in Latin America. Argentina. Bolivia. Brazil. Chile. Colombia. Ecuador. Guyana. Paraguay. Peru. Uruguay. Venezuela (fried arepas with textured soy). Mexico: New village process, commercial developments of soy-based food products, Gilford Harrison, Ruth Orellana, Seguras Social. Honduras. Costa Rica. Panama. Dominican Republic. Jamaica. Haiti. Trinidad. References–Soybean food uses in Latin America.

5. Soybean food uses and production in North America. United States: Oriental populations, vegetarian communes, The Farm in Tennessee. Canada. References–Soybean food uses in North America. 6. Soybean food uses in Oceania. Australia. New Zealand. 7. Summary of soybean food uses. Traditional soybean foods: Soybean milk, soybean curd and processed soybean curd products, protein-lipid film, soybean sprouts, tempe (tempeh), green soybeans, boiled soybeans, roasted soybeans, soybean flour, soysauce, fermented soybean paste, fermented whole soybeans [Toushih, hamanatto], natto, fermented soybean curd. Experimental soybean foods: Whole soybean foods, soybean paste, soy flour, soy beverage. Production and consumption.

8. Recent simple soybean processes, other than traditional. Simple village process for processing whole soybeans: Equipment, process, sanitation requirements, quality of product, evaluation of product in formulas and procedures for family and institutional use in developing countries. NRRC village process. Foods from whole soybeans developed at the University of Illinois (drum dried flakes, canned and homecooked soybeans, soy beverages and beverage products, spreads, snacks).

Ways of cooking and serving soybeans in the American diet. 9. Industrial processes. Industrial production and selling prices of edible soybean protein products. 10. Barriers to acceptability and utilization of soybeans in food and research recommendations: Availability. Cultural and social factors. Texture. Flavor. Nutrition and food safety. Technology development. Technology transfer. Research recommendations [concerning each of the above barriers].

Concerning Morocco: Cereal-soy blends have been used extensively in Morocco; in fiscal year 1974 some 14.7 million lb were shipped to Morocco. Mmbaga (1975) reported that soy flour is being used in making porridge, with 1 part soy flour to 3 parts maize / corn flour.

Tables show: (1) Soybean production and imports in Taiwan, 1962-1975 (tonnes = metric tons, p. 33). Production rose from a 53,000 tonnes in 1962 to a peak of 75,200 tonnes in 1967, then fell to 61,900 tonnes in 1975. Imports skyrocketed from 62,400 tonnes in 1962 to a record 827,300 tonnes in 1975. (2) Consumption of soybean foods in Taiwan, 1964-1974 (kg/capita/year, p. 34). Total soybean foods not including tofu rose from 1.08 kg in 1964 to a peak of 2.61 kg in 1972 then fell to 1.99 kg in 1974. Consumption of tofu (80% water) rose from 18.75 kg in 1964 to a peak of 33.89 kg in 1972, then fell to 32.04 kg in 1974. (3) Supply and disposition of soybeans in Japan, 1971-1974 (p. 49). Total supply is beginning stocks, plus domestic production, and imports. Total disposition is crushing, plus traditional foods and feed. In 1974 imports accounted for 87.5% of the supply, and crushing accounted for 71.0% of the disposition. (4) Whole soybeans used in the production of traditional foods in Japan, 1970-74 (tonnes / metric tons, p. 50). Tofu and others rose from 508,000 in 1970 to 539,000 in 1974. Miso rose from 177,000 in 1970 to 192,000 in 1974. Shoyu rose from 13,000 in 1970 to 14,000 in 1974. (5) Defatted soybean meal used in the production of traditional foods in Japan, 1970-74 (tonnes / metric tons, p. 51). Shoyu rose from 163,000 in 1970 to 176,000 in 1974. Tofu and others was constant at 130,000 from 1971 to 1973. Miso decreased from 4,000 in 1970 to 2,000 in 1974. (6) Production of traditional soybean foods in Japan, 1970-74 (tonnes / metric tons, p. 52). Tofu and others rose from 1,867,800 in 1970 to 2,264,900 in 1973. Shoyu rose from 1,334,1000 in 1970 to 1,455,800 in 1974. Miso rose from 552,200 in 1970 to 587,200 in 1974. (7) Production and food use of beans [various types] and consumption of some soybean products in Korea, 1964-1967 (p. 56-57). In 1967 consumption (in tonnes / metric tons) was: Bean curd 290,000. Bean sprouts 270,000. Bean sauce 69,700. Bean paste 27,700. Total: 11.6 kg per capita per year. (8) Soybean production in Indonesia, 1960-1974 (p. 65). It rose from 442,862 tons in 1960 to 550,000 tons in 1974. (9) Consumption of soybeans in various parts of Indonesia in 1970 (p. 66). (10) Production of soybean foods in the province of Central Java, 1968-1972 (tons, p. 67). Kecap rose from 914,695 in 1968 to 1,524,000 in 1972. Tahu

© Copyright Soyinfo Center 2014

decreased from 18,570 in 1978 to 17,000 in 1972. Tempe rose from 506 in 1968 to 39,000 in 1972. (11) Area planted to soybeans and total soybean production in Thailand, 1964-1974 (p. 70). Area rose from 213,000 rais (6.25 rais = 1 ha) in 1964 to 1,016,000 rais in 1974. Production (in metric tons) rose from 31,300 in 1964 to 252,400 in 1974. (12) Utilization of soybeans by soybean-consuming countries, 1964-66 (based on FAO 1971 Food Balance Sheets, 1964-66 average, p. 150). The countries leading in per capita consumption (kg/person/year) are: China (PRC) 6.7. Japan 5.1. Korea(s) 5.0. Singapore 4.3. Indonesia 2.8. Malaysia 2.6. Taiwan (ROC) 1.1. (13) Amounts of cereal-soy blends distributed under Title II, Public Law 480 in fiscal year 1974 (p. 152-155). (14) U.S. exports of full-fat soy flour, 1974-75 (p. 156). Address: Northern Regional Research Center, Agricultural Research Service, Department of Agriculture, Peoria, Illinois 61604.

6639. Japan Vegetable Protein Food Assoc. 1976? Vegetable protein food in Japan. Tokyo, Japan. 8 p. Undated. 26 cm.
• ***Summary:*** "Since its establishment in February 29, 1969, by the associated vegetable protein food manufacturers, the New Protein Food Association has been promoting the production, sales, quality improvement and publicity of vegetable protein. In August, 1975, the Ministry of Agriculture and Forestry, impelled by the necessity of enhancing the utilization of vegetable protein, founded a juridical corporation, Japan Vegetable Protein Food Association. Its membership has increased to 20 manufacturers at present.

"The Association was granted funds in 1976 by the Ministry of Agriculture and Forestry for a survey of the actual usage of vegetable protein and for its promotion and development."

A bar chart shows that production of vegetable protein [mostly soy protein and wheat gluten] in Japan has grown from 24,217 tons in 1970 to 41,149 tons in 1976. Of this, 45% is sold as a dried powder, and 43.9% is frozen. Address: Rainbow Building, 9th Floor, 2-15-17, Nishi-shinbashi, Minato-ku, Tokyo 105, Japan. Phone: (03) 591-2524, 3011.

6640. John Deere Co. 1976? Japan, you growing cash customer (Color motion picture). Moline, Illinois. 14 minutes. 16 mm. Reviewed in Soybean Digest, June 1976, p. 36. *
• ***Summary:*** This film describes the great transformation taking place in Japanese life, and features the role played by U.S. soybeans and feed grains. Japan needs over $2,500 million worth of food and fiber each year from other countries–the equivalent of the output of 11 million U.S. farm acres. Japan's rise in living standards has been the world's fastest.

• ***Summary:*** "Date of establishment: July, 1917.

"Capital: 31 million yen.

Major executives:

"The President: Motoo Takai.

"Vice-president: Akio Takai.

"Executive director: Akira Takai

Size of this factory:

The head office: Site 8,156 sq. meters. Building: 4,808 sq meters.

"Matsuto factory: Site 1,875 sq. meters. Building: 1,047 sq meters.

History of our company:

1917 July–Takai brotherly company was established, and production of bean curd machine and its selling were begin.

1931 April–The old name was replaced by Takai Co., Ltd.

1946 Jan.–The name was replaced by Takai Mfg. Co., Ltd.

1957 Jan.–A bean curd automatic manufacturing machine was developed

© Copyright Soyinfo Center 2014

1958 Aug.–This company was commended as a superior enterprise by the Smaller Enterprises Agency.

1958 Dec.–The ex-president Kamejiro Takai was conferred *Shiju-hosho* (Violet Ribbon Medal)

1959 Nov.–Our company was given a governor's special prize at the ceremony of awarding an honor of a corporation of a society of invention.

1960 April–The 7th anniversary of the operation of the patent system, our company was given a prize of invention at the nationwide ceremony of a corporation of invention.

1960 Sept.–Our company received a subsidy for the experiment of invention from the Scientific Technique Agency.

1960 Oct.–The ex-president was decorated with the Fifth Order of Merit with the *Zuihosho.*

1961 April–An organization of agency "A nation wide Takai society" was formed.

1962 July–A new factory was built at Inari, Nonoichi-machi Ishikawa-gun, Ishikawa-prefecture.

1962 July–Our company was given a governor's special prize at the local ceremony of a corporation of a society of invention.

1963 April–Our company was given a prize of invention at the nationwide ceremony of a corporation of a society of invention.

1965 Nov.–Our company was commended officially as a superior factory in labor management by a Labor Standard Office in Ishikawa-prefecture.

1966 Jan. Our company was named "a model factory of rationalization of the smaller enterprises" by the Smaller Enterprises Agency.

1966 Aug.–Our company was telecasted nation wide by NHK educational television titled "Industrial operation–establishment of a long-range plan".

1969 Jan.–Our company was given a citation as a superior corporation by a Taxation Office in Natsuto-city.

1969 April–A large-sized bean curd plant was built at Nada-Kobe co-operative association.

1969 Nov.–Our company was telecasted nationwidely by NHK educational television titled "A new age of operation–A plan of mechanization for making 10 million cakes of bean curd".

1970 July–Our company was commended officially as a superior factory in safe management of factories by a Labor Standard Office in Ishikawa-prefecture.

1971 Oct.–A large bean curd plant was built in the Republic of Korea.

1972 May–A smaller bean curd plant was developed.

1974 Feb.–Matsuto branch factory was built at Miyamaru-machi Matsuto-city.

1974 March–Our company was commended as a superior factory in rationalization of the use of electricity by Hokuriku Electric Society.

1974 June–IBM computers introduced.

1974 Oct.–Our company was commended on account of co-operation of traffic transportation.

6644. Walsh, E.J. 1976? Preliminary evaluation of soybeans under Irish conditions–1974. *University College, Dublin, Faculty of General Agriculture, Research Report* For the year 1974-75. See p. 80-82. Undated.

• ***Summary:*** This article appears in the section on crop breeding. In 1974, 129 soybean varieties were grown at Lyons [near Dublin, at 54º 48.7'north latitude] in the Irish Republic. These soybeans were collected from breeders in five countries as follows: USA (48 varieties), Bulgaria (42), Poland (31), Japan (7), and Sweden (1 variety, Fiskeby V). "The objective of this study was to determine which, if any, of these varieties had potential for improving plant protein production in Ireland." A single plot (1-2 rows about 6 feet in length) of each variety was planted on 14 May 1974. On October 12, approximately 150 days after planting, all varieties were examined and pod development noted. Table 54 (p. 81) gives a summary of the results. Only 19 varieties produced flowers and only 12 varieties produced pods. Of those 12 varieties, 8 were from Poland, two from Japan (Okura I and Tenpoku wase), and one each from Sweden (Fiskeby V) and the USA (Pando). The number of days from planting to flowering, if detected, ranged from 91 to 102.

Conclusions: "(a) No variety worthy of serious consideration exists within the broad array of varieties evaluated. (b) The twelve varieties which produced pods may have potential as parents in a breeding programme geared towards the development of adapted varieties."

Note 1. These soybeans were tested near Dublin which is about 100 miles (1.5º) north of Cork.

Note 2. Will soybeans grow in Ireland? Probably! Southern Ireland (e.g. Cork) is at about 52º north latitude and the northern tip of Ireland is at 55º 20 min. The Kalmar-Oland region of Sweden, where the Fiskeby varieties of soybeans were grown commercially, is at 56º-57ºnorth latitude, though it enjoys a longer frost-free season than many soybean growing areas in Hokkaido. A large number of strains ripen in Sweden as far north as Norrköping, 58º30' north latitude. Starting in 1934, fairly large areas of soybeans were grown on Henry Ford's Fordson Estate at Boreham, Essex, England, which is about 35 miles northeast of central London, at 51º45.4' north latitude, i.e. at about the same latitude as southern Ireland. Address: M.Agr.Sc., PhD, Dep. of Farm Management, University College, Dublin, Irish Republic.

6645. *Food Engineering.* 1977. World's largest soy isolate plant: Ralston Purina opens new 100,000 square foot facility. 49(1):68-69. Jan.

• ***Summary:*** The $15 million facility was officially opened last month in Pryor, Oklahoma, by Ralston Purina's Protein Division. The production capacity is highly confidential,

© Copyright Soyinfo Center 2014

however it can be said that the new plant doubles the combined capacity of Ralston's two existing isolate plants in Memphis, Tennessee (opened in June 1973), and Louisville, Kentucky.

During the past 3½ years Ralston has worked with Fuji Oil Co. of Osaka, Japan, to form and operate a joint venture named Fuji Purina Co. Ltd. in Japan.

Nine different soy protein isolates, each with different functional properties, will be produced in the new plant: Edi-Pro A, Edi-Pro N, Supro HD-90, Supro 350, Supro 610, Supro 620, Supro 630, Supro 640, and Supro 710. A description of the properties of each is given.

• ***Summary:*** A mixed culture of *Saccharomyces rouxii* and *Torulopsis versatiolis* (10:1) produced a red miso superior in quality to the ordinary red miso incubated with only *S. rouxii*. Address: Niigata-ken Shokuhin Kenkyusho, Niigata, Japan.

6648. Shurtleff, William; Aoyagi, Akiko. 1977. What is tempeh? Lafayette, California: New-Age Foods Study Center. 14 p. Unpublished manuscript. Jan. Published as a 4-page tan leaflet later in 1977 with the addition of 4 Los Angeles tempeh shops. Revised, published edition, Oct. 1980. Also reprinted by many tempeh shops under their logo. Unpublished manuscript.
• ***Summary:*** Contents: Introduction. A rich source of nutrients. Tempeh in Indonesia. A brief history of tempeh. Making tempeh at home: Homemade soy tempeh (using 2½ cups soybeans), homemade okara- or coconut press-cake tempeh, homemade grain- or grain & soy tempeh. Storing & preserving tempeh. Favorite tempeh recipes: Deep-fried tempeh. Pan-fried tempeh. Tempeh chips. Tempeh, lettuce & tomato sandwich. Tempeh burger, and 11 others. Soybeans and the world food crisis. Making tempeh starter at home. Making tempeh in a community or commercial shop. People & institutions connected with tempeh: Research scholars and institutes in North America, tempeh shops in America (7), individuals interested in tempeh in America (4), research scholars and institutes in Indonesia and Japan (5). Address: 790 Los Palos Dr., Lafayette, California 94549.

6649. Yasai engei daijiten [Big encyclopedia of vegetable gardening]. 1977. 1502 p. See p. 1002-03. 27 cm. [Jap]
• ***Summary:*** Contains 2 pages about growing green vegetable soybeans (edamamé). Address: Japan.

6650. *SoyaScan Notes.* 1977. The origin and early history of Bean Machines (California) and Takai Tofu & Soymilk Equipment Co. (Japan) (Overview). Feb. 9. Compiled by William Shurtleff of Soyinfo Center.
• ***Summary:*** 1977 Feb. 3–William Shurtleff and Akiko Aoyagi return home to 790 Los Palos Dr., Lafayette, California. Their four-month, 15,000-mile Tofu & Miso America USA tour ends. This was a huge, exciting, exhausting odyssey, that bore abundant fruit in the founding of new tofu shops almost everywhere they spoke.

Feb. 9–Meeting at 790 Los Palos Dr. in Lafayette with The Farm folks and Larry Needleman leads to establishment of Bean Machines Inc. (BMI), with Larry Needleman as owner and president. The Farm (Robert Dolgin and David Sandler, Farm Foods, 820 "B" St., San Rafael, California 94901) place a firm order for a Japanese (Takai) tofu system.

Feb. 12–Shurtleff and Aoyagi leave the USA and fly to Japan, arriving at Haneda Airport on Feb. 13. Shurtleff's main focus is to find a Japanese manufacturer of tofu and soymilk equipment that would like to develop an English-language illustrated catalog and establish a program for selling its equipment (plus other traditional small-scale equipment, made by other companies, that new American tofu makers may wish to order). From the American Soybean Association in Tokyo, Shurtleff learns about Takai Seisakusho, a tofu equipment manufacturer with long history (founded in 1917) and good reputation, located in Kanazawa, Japan.

March 28–Using a plain, typed form, Farm Foods (Dolgin and Sandler) order 16 pieces of tofu and soymilk equipment at a cost of $4,168. On the form is typed: "Please mail all orders prepaid to: Bean Machines, Inc., P.O. Box 829, Corte Madera, CA 94925."

March 30–Mary Pung, co-owner of Swan Foods, 8850 S.W. 116th St., Miami, Florida 33176 orders 8 pieces of tofu equipment for $4,973. Needleman forwards these two orders to Shurtleff in Japan.

1977 March 31. Larry Needleman applies for a Fictitious Name Statement for Bean Machines Inc. with the County of Marin. Larry and Bill Shurtleff are given as the owners

April 5–During two days of discussions and negotiations with Wataru Takai, son of the owner and young Director of the Overseas Department, who speaks good English, Shurtleff and Mr. Takai establish Takai Tofu & Soymilk Equipment Company and draft a long-term contract. Shurtleff stays two nights at the home of Wataru Takai and

© Copyright Soyinfo Center 2014

his wife.

June 5–The contract drafted on April 5 is finally signed by both Shurtleff and Takai. At the top of the document is Takai's new logo, designed by Akiko. It shows a lever, with a soybean as the fulcrum, moving the world.

June–Akiko soon gets more involved in designing Takai's first English-language catalog and letterhead, and Shurtleff works with Takai in giving accurate descriptions of each piece of equipment and each whole system.

July 19–Shurtleff and Aoyagi leave Japan (from Haneda) and fly to America (California).

1977 Aug. 16–The first English-language Takai Catalog arrives at our Center. This catalog was printed with green and black ink on glossy white paper.

1977 Oct. 14–Shurtleff signs Bean Machines, Inc. (BMI) contract with Larry Needleman. He comes for dinner with a friend.

Oct. 19–Mr. Takai writes William Shurtleff a typewritten letter on the new Takai letterhead about 5-6 issues that he would like to see resolved as soon as possible. He wants to learn more about Underwriters Laboratories and their safety standards in the USA.

Oct. 30–Larry Needleman sends out the first BMI packets to existing tofu makers and potential customers.

Dec. 21–Mr. Takai writes Larry Needleman (at Bean Machines Inc., P.O. Box 881, San Rafael, CA 94901) a typewritten letter on the new Takai letterhead about equipment prices landed in San Francisco or Boston without BMI commissions.

1978 March 31–Mr. Takai sends Larry Needleman a 4-page typed letter which includes a new price list including 3% insurance.

April 4–Mr. Takai writes Larry Needleman (P.O. Box 76, Bodega, CA 94922): "Thank you for your orders. We shall send you Pro-Forma Invoice. Please open your L/C [Letter of Credit]. Shipment within one month after receipt of L/C."

1978 May 1–Bean Machines issues its typewritten (on yellow letterhead) Price List #2 covering 44 different pieces of equipment. "Whole system prices are not yet complete." The rear is devoted to "Ordering information and terms of sale." At about the same time, BMI sends out its first "Order form"–on white letterhead.

1978 May–Shurtleff and Aoyagi visit Wataru Takai's home in Kanazawa, Japan, to work on his tofu & soymilk equipment catalog.

1978 July 16–Wataru Takai arrives in the USA in preparation for the 1st Soycrafter's Conference in Ann Arbor, Michigan and to supervise the installation of a Takai system at Tokyo Food Co. in San Mateo.

July 26–The first Takai catalog of small and medium scale tofu equipment (printed with dark brown ink on glossy white paper) arrives in the USA.

At the historic Soycrafter's Conference. Larry Needleman is elected executive director. After the conference, Mr. Takai, with Needleman and Shurtleff, travel (July 30-Aug. 9), around the eastern United States visiting tofu companies.

1978 Nov. 7–Larry Needleman sends Wataru Takai a 4-page "Takai / BMI Contract" for his consideration and eventual signature.

1979 Feb. 14. Takai catalog of large scale tofu and soymilk equipment arrives. Printed with dark green ink on glossy white paper.

1979 May–BMI issues its Price List #5 for Takai Catalog of Small and Medium-sized Equipment.

1979 Sept. 16–Larry Needleman sends Wataru Takai a 2-page, typed, single spaced "Chronological list of Takai problems." The first of the 14 problems was "Nov. 1978–L/C expired because Takai didn't ship quickly enough. BMI extended the L/C but it expired again because of delay in Takai shipping."

1980 Jan. 19–New Takai small scale equipment catalog; 1,500 to USA, 500 to Japan.

1980 Feb. 27–Larry Needleman writes Shurtleff that he owes Shurtleff a total of $496.98 in 1979 commissions. "As far as payment of these commissions and repayment of the principal of your $3,500 loan to BMI, it is our intention to pay NAFSC both of these as quickly as possible."

1980 July 23–Larry Needleman says BMI will stop being Takai's agent.

1980 Aug. 22–Shurtleff writes Takai and encloses a letter from Bean Machines Inc. in which Larry Needleman explains that he is no longer an agent for Takai. "He has found it almost impossible to communicate with you and has finally decided to give up trying."

1980 Sept 18–Takai sells a tofu production plant to Heilongjiang Province Foreign Trade Import Company, Harbin, China. Takai will send 2-3 engineers for installation.

1981 May 17–Mr. Takai writes Richard Leviton that he would definitely like to display his Sub-System S30C at the Soyfoods Conference at Fort Collins, Colorado. He encloses $100 for the balance of the payment.

1981 June–Larry Needleman announces that he has developed and is now selling the Bean Machines BMI Model 100 Disintegrator–The "Mini Mite," a stainless steel soybean grinder which can grind 100 pounds of dry soybeans per hour and sells for $1,485.00. Detailed specifications are given along with 3 photos (one full page).

1981 Dec. 19–Mr. Takai writes Shurtleff a handwritten letter from Jakarta, Indonesia on Sari Pacific Jakarta Hotel. He is now getting orders for equipment from KOPTI Indonesia; he has met with Mr. A.R. Noor of Kopti, who plans to travel to the USA in Jan. 1982 and would like to visit and talk with Shurtleff. Takai plans to go to Bangkok and Hong Kong after Jakarta. "We will do good business in South East Asia."

1986 April 27–Larry Needleman sells Bean Machines

© Copyright Soyinfo Center 2014

Inc. (BMI) to Wally Rogers, plus Steve Fiering and Larry Needleman. As part of the deal, Shurtleff sells his interest in the company for about $4,900, plus $1,340 of overdue back commissions.

6651. Rice, William. 1977. Building a philosophy around the whole grain. *Washington Post.* Feb. 10. p. E1, E6.
• ***Summary:*** Jeane Rosoff, who doesn't eat meat, teaches macrobiotic cooking at St. John's Church in Lafayette Square on Saturdays for the East-West Foundation.

"Macrobiotics is a word that brings looks of horror to the faces of nutritionists. Fathered by a Japanese, George Ohsawa, it is based on the Asian principle of yin-ying, which are opposite but complementary forces.

In "A Diet for the Living," Dr. Jean Mayer, wrote that "Ohsawa's call, if followed faithfully, is that of a Pied Piper who can lead young people to a totally inappropriate and miserable death." Four recipes are given: Miso soup. Pressure cooked brown rice. Tofu mayonnaise. Broccoli with tofu mayonnaise.

6652. Thanh, V.H.; Shibaski, K. 1977. Beta-conglycinin from soybean proteins. Isolation and immunological and physicochemical properties of the monomeric forms. *Biochimica et Biophysica Acta* 490(2):370-384. Feb. 22. [28 ref]
Address: Dep. of Food Chemistry, Tohoku Univ., Sendai, Japan.

6653. Nakadai, Tadanobu; Nasuno, Seiichi. 1977. The action of acid proteinase from *Aspergillus oryzae* on soybean proteins. *Agricultural and Biological Chemistry* 41(2):409-10. Feb. [14 ref]
• ***Summary:*** Until recently it has long been considered that large amounts of free amino acids are liberated from proteins by the hydrolytic action of acid protease from *Aspergillus oryzae.* However recent reports indicate that the liberation of free amino acids in miso brewing is due to the action of carboxypeptidase of the mold. This investigation clearly indicates that "free amino acids are liberated from soybean protein by the hydrolytic action of both acid proteinase and acid carboxypeptidase of *A. oryzae* in the miso brewing, but not liberated by the hydrolytic action of only acid proteinase." Address: Noda Inst. for Scientific Research, Noda, Chiba, Japan.

Address: 790 Los Palos Dr., Lafayette, California 94549.

6655. *Soybean Digest.* 1977. Seminars in Japan [by Japan Vegetable Protein Food Assoc.]. Feb. p. 39.
• ***Summary:*** "Mr. Y. Sakaguchi, president of the Japan Vegetable Protein Food Assn. (JVPFA), related at a press conference held in Tokyo in November that JVPFA, in cooperation with ASA and Wheat Associates, sponsored 34 seminars during 1976. JVPFA is a quasi-government organization promoting the use of vegetable protein in the Japanese diet and is a close cooperator of ASA. These seminars for snack food manufacturers, hospital and other institutional food managers, company cafeteria managers and school lunch nutritionists were presented on the high nutritional value of vegetable protein and methods of incorporating these foods into diets.

"Mr. Y. Yoshida, director of the Fats and Oils Division of the Ministry of Agriculture and Forestry, reviewed recent nationwide publicity made through the Vegetable Food Protein Assn. He also provided information on a survey of vegetable protein use among food processors and homemakers. The introduction of vegetable protein into the school lunch program by the Ministry of Agriculture and Ministry of Education was discussed. Production volume of vegetable protein and the establishment of the JAS mark (Japan Agricultural Standard) on vegetable protein were other topics of consideration during the press conference."

6656. *Kenko na Katei* (*Healthy Household, Tokyo*). 1977. Daizu tanpaku ga sekai o sukuu. Zenbei nanajû kasho de miso to tôfu kôenkai [Soy protein can save the world: Miso and tofu lectures at 70 places throughout America]. March 1. p. 6. [Jap]
• ***Summary:*** Photos show: Shurtleff and Aoyagi standing by their white Dodge van on their Tofu & Miso America Tour. Holding a plate containing a cake of freshly made tofu. A map shows the route taken by their tour. Address: Japan.

6657. Birnbaum, Alfred. 1977. Re: Homemade natto, and favorite natto recipes. Letter to William Shurtleff at New-Age Foods Study Center, Lafayette, California, March 23. 1 p. Handwritten (pencil).
• ***Summary:*** "Homemade nattô: Soak 2 cups soybeans (preferably having been picked over first to remove any split or otherwise undesirable beans) in 4 cups of water for 6-8 hours, or overnight. Cook over low heat approximately 3-4 hours, adding more water if necessary, until beans test soft enough to be mashed between fingers. Strain the beans (saving stock for other cooking uses) and transfer to insulating fermenting boxes (I use plastic tofu tubs in plastic bags which are then wrapped in two layers of towels or blankets and are put in an unlit oven). If one's fermenting boxes are not too well insulated, rapid completion of this step in order to retain as much of the heat as possible is desirable. Also, inoculating each box of natto with approximately 2T. of "starter", either natto from the previous batch or commercial natto, or if available, a culture of pure *Bacillus natto,* considerably improves results.

"Allow to ferment 2-4 days (using my makeshift

© Copyright Soyinfo Center 2014

equipment, I allow it to ferment 3 days on the average.) Store in refrigerator or cool place

"The large yellow soybeans most readily available in the U.S. give acceptable results, but smaller varieties such as used in Japanese commercial natto production are best from the standpoints of taste, texture, and appearance." Address: Tama-sô No. 1, Inokashira 1-28-30, Mitaka-shi, Tokyo 181, Japan. Phone: 0422-47-7130.

6658. Eden Foods. 1977. Spring and summer catalog 1977. 4601 Platt Rd., Ann Arbor, MI 48104. 53 p.
• ***Summary:*** On the cover are bags, trays, and scoops filled with natural foods. Page 25 states that Eden now sells Tamari Soy Sauce (Eden, or Marushima), plus Hacho, Mugi, and Kome Miso. This is the earliest catalog seen in which Erewhon's name is not listed after any tamari or miso products.

On page 25 is the first record of "Eden Tamari: Natural Shoyu" which is sold in 8 oz, pints, quarts, or 1 gallons cans. A photo shows the quart bottle with label, and the dispenser. It is "made from whole soybeans and naturally fermented in wooden kegs for 30 months... The Muso Shokuhin Company has been supplying the macrobiotic community of the United States with tamari, miso and sea vegetables for the last ten years. All of Eden's Japanese imports are supplied by Muso." Address: Ann Arbor, Michigan. Phone: (313) 973-9400.

© Copyright Soyinfo Center 2014

• ***Summary:*** The article begins with some background: "Extrachromasomal deoxyribonucleic acid (DNA) elements have been found in sporeforming bacteria such as *Bacillus pumilus* (Lovett et al. 1973, 1975 and 1973), *Bacillus subtilis* (Lovett et al. 1975), and *Bacillus megaterium* (Carlton & Helinski 1969). Lovett and Bamucci (1975) have found two plasmids from *B. subtilis* strains..." The molecular weight of each is given. "Although the function of these plasmids has not been determined, the authors suggested the usefulness of these plasmids for the construction of recombinant DNA molecules." Recently Lovett and co-workers have succeeded in introducing a *Bacillus pumilus* plasmid into *B. subtilis* where the plasmid expressed its ability to produce bacteriocin (a proteinaceous toxin that inhibits the growth of bacteria).

"If a genetic engineering system were established in *B. subtilis* [instead of in *Escherichia coli,* which is presently used], it would be a safer system, since this group of bacteria is nonpathogenic, grows aerobically [requires air / oxygen for growth], and does not inhabit the human body."

Contains 7 figures and two tables. Fig. 3 is four electron micrographs of circular plasmid DNA; plasmids pLS11, pLS12, pLS13, and pLS14 are shown.

A plasmid is an extra-chromosomal DNA molecule separate from the chromosomal DNA which is capable of replicating independently of the chromosomal DNA. In many cases, it is circular and double-stranded. Plasmids usually occur naturally in bacteria, but are sometimes found in eukaryotic organisms (Source: Wikipedia).

Note 1. This is the earliest document seen (Jan. 2012) that contains the word "plasmids" (or plasmid) in connection with natto or with the bacterium *Bacillus subtilis* which causes the natto fermentation.

Note 2. This is the earliest document seen (Jan. 2012) that mentions research conducted on the natto bacterium by Teruo Tanaka or Mitsubishi or by the Mitsubishi Kasei Institute of Life Sciences (Tokyo, Japan). Tanaka went on to publish numerous other important papers about plasmids and natto.

Note 3. This is the earliest document seen (Jan. 2012) that contains the word "Extrachromasomal"(or the word "chromosome") in connection with natto. Address: Mitsubishi Kasei Inst. of Life Sciences, 11 Minamiooya, Machida-shi, Tokyo, Japan.

6668. Yasui, Akemi; Koizumi, Hideo; Tsutsumi, Chuichi; Matsunaga, Ryuji. 1977. [Collaborative study on the precision of an improved Kjeldahl method with titanium dioxide and copper sulfate as a catalyst. I. Determination of the nitrogen contents in the roasted flour of soybean, whole wheat, wheat flour and highly milled rice]. *Shokuhin Sogo Kenkyujo Kenkyu Hokoku* (*Report of the National Food Research Institute*) No. 32. p. 108-14. March. [5 ref. Jap; eng]

• ***Summary:*** The Kjeldahl method in analytical chemistry is a method for the quantitative determination of nitrogen in chemical substances developed by Johan Kjeldahl in 1883. Address: National Food Research Inst., MAFF, Tokyo, Japan.

6669. *Foreign Agriculture.* 1977. Japan's 1977 soybean imports may rise slightly. April 4. p. 5.
• ***Summary:*** The country's fats and oils industry reflects the sluggish pace of Japan's economic recovery from the "petroleum shock" of recent years. Increasing palm oil imports were a major factor contributing to excessive supplies of oils in Japan. As a result of rising stocks, member companies of the Japan Oil Processors Association (JOPA) have been forced to curtail operations for a few months until inventories of both oils and meals are drawn down to normal levels. Soybean planted area in Japan declined about 5% to 83,000 hectares in 1976, despite a 10% rise in the Government support price of $21.28 per bushel. The 1976 soybean production dropped 13% to 109,500 tons.

6670. Iso, James. 1977. Southeast Asia–emerging growth market for soybeans. *Foreign Agriculture.* April 11. p. 2-4.
• ***Summary:*** With rising incomes and changing eating habits whetting their appetite for meat and quality protein foods, four nations of Southeast Asia–the Philippines, Thailand, Malaysia, and Singapore–are turning to the world market for more livestock feed ingredients. Brazil–by gearing up its export program–has recently gained a substantial foothold in these markets. And soybeans and soybean products also have come from Asian suppliers like the People's Republic of China (PRC), Indonesia, and even Japan, the latter exporting soybean meal crushed from U.S. soybeans. Philippine imports of soybean meal in recent years have varied between 50,000 and 70,000 tons a year. The Philippines also is a viable market for soy proteins for food, thanks to the presence there of three major U.S. meatpackers. Some 50% of the processed meat produced by these firms has contained soy protein since the product's introduction into the Philippines in 1969. Ground red meat containing 20% soy protein enjoys good consumer acceptance. Owing to the large Chinese population in the Philippines, food soybean consumption already is significant. Although domestic soybeans make up the major supply for traditional foods, such as bean curds [tofu] and soy sauce, some 500-600 tons of these beans must be imported each month.

Thai soybean production has yet to make much headway. Thailand's climatic and soil conditions apparently have not been conducive to expansion, despite attempts by local growers and some Japanese interests to establish a large-scale industry in the highlands. In 1976, the country produced about 155,000 tons of soybeans, of which 20,000 tons were exported and the rest either used domestically for food or crushed. This year, if the Government approves, a

© Copyright Soyinfo Center 2014

multimillion-dollar soy protein plant will be constructed with the possibility of producing 10,000 tons of a soy infant food annually and 2,000 tons of meat analogue. The Institute of Feed Research and Product Development–a private Government-backed research organization affiliated with Kasetsart University–has spearheaded textured soy protein (TSP) and soy flour research. Malaysia is mainly noted for its huge and rapidly growing production of palm oil.

Although its population of 2.25 million is dwarfed by that of the rest of Southeast Asia, Singapore plays a disproportionately large role in the region's trade. This is because it is a major transshipment port for the region–and for Malaysia in particular. Most of the imported soybeans are crushed, although significant volumes of beans also are used in producing traditional soy foods for the large Chinese population. The only major soybean crusher outside of the Philippines is located in Singapore, an operation which the management anticipates will crush 100,000 tons of soybeans in calendar 1977. One firm is using soy proteins in canned foods, soy sauce, soft drinks, combined milk, and other products. Address: Foreign Market Development, Oilseeds and Products, Foreign Agricultural Service.

6671. Loetterle, Fred. 1977. Ton yu to tofu [Soymilk and tofu]. *California Living.* April 17. p. 40, 42, 44.
• ***Summary:*** About making tofu and soymilk at Azumaya. "With the precision of a great orchestra, 35 tofu makers dance through six dawns a week to coax the pre-soaked golden soybean into that meal of magic, that all-in-one soup-to-nuts food–tofu the humble, tofu the magnificent, tofu the quintessential actor/actress among all cuisine. Tofu! Tofu? Doufu? Dowfu? What is it, anyway? Is it some bloodless meat fashioned from the cooled and crushed essence of the soybean? Is it a cheese, formed as it is from the soymilk squeezed from the steamed beans and solidified by seawater or a related refinement such as calcium chloride? Is it a chewy bean cake, a jelly-like steak, ambrosia? Is it the world's longest running recipe...?

There are three tofu makers in San Francisco: "Azumaya Inc. of 95 Boutwell Street, the Wo Chong Co. of 1001 16th Street, and the Wo Hop Co. of 759 Clay Street. Also, there is one in South San Francisco (Quong Hop's, at 161 Beacon Street, a tradition in or near San Francisco since 1906), another one in Oakland and two in San Jose." Azumaya, at 95 Boutwell St., is run by four brothers (George, Jack, John, and Bill). It was founded on 17 January 1937 in a basement at 1636 Post Street, between Bush and Laguna streets. The Mizono's parents were Saichi and Matsuyo Mizono. "Their father was strengthened by a daily dish of the tofu he loved so well, usually enjoyed as boiled yudofu..." Tofu was made in old copper kettles using a stone grinder. "'We used to hand-crank everything,' recalls Bill. Brother John adds: 'Tofu has really snowballed in the last few years. Everybody here is getting into it as a new food. I think there is no limit to its popularity, because it's so good for your diet.'" The company also produces kinugoshi tofu, and (in a converted doughnut machine) agé. The regular tofu now sells locally for $0.50/lb. Today they use 1,600 to 2,400 lb of Arkansas soybeans a day. Annual gross sales are now $1 million compared to $600,000 in 1969, when they moved into their fourth and present headquarters.

Includes a detailed description of the tofu-making process, and several semi-recipes. Tofu is referred to twice in the article as "soybean cake." Photos show: (1) "Pulling cheesecloth in preparation of removal of tofu from tray." Two men are working by hydraulic presses that press the cloth-wrapped curds into tofu in shallow, perforated stainless-steel forming boxes. (2) "Compressing the coagulated tofu." One man is pulling down on a metal, ratcheting lever press. (3) "Packaging tofu." Three men are placing the curds in shallow plastic tubs. The author closes with a strong recommendation for *The Book of Tofu* by Shurtleff and Aoyagi.

Note 1. This is the earliest English-language document seen (Aug 2013) that uses the term "ton yu" (only in the title) to refer to soymilk; the Japanese word for soymilk is ***tônyû.***

Note 2. This is the earliest English-language document seen (April 2013) that uses the word "dowfu" to refer to Chinese-style tofu.

6672. Dolgin, Robert. 1977. Re: Information on a heat sealing machine for tofu, Varipack trays, and polyethylene film. Letter to William Shurtleff in Japan, April 19. 1 p. Typed, with signature on letterhead.
• ***Summary:*** Contains detailed descriptions of the machine, trays, and film. The Varipak trays are available from Sealright Corp. in Los Angeles. Rolls of polyethylene film can be purchased from the Richmond Corp. in Redlands, California. Eddie Okita [in Los Angeles] also has film and packaging machines, but his cheapest models [automatic] run up from $2,000 and package 1,200 pieces per hour.

"We are definitely interested in the small sealers you have, so send brochure and info on them ASAP. Also send the 6 stainless steel settling boxes you ordered.

"We would like to have definite confirmation on the insurance, the agent, and the shipping route, because Westbrae has told us that they will not cover insurance, and that they are not particularly interested in bringing equipment over in their container.

"Payment via a letter of credit would be preferable for us, if possible for you. If not, let us know how payment should be made."

Farm Foods has placed an order for tofu equipment, which Shurtleff is working to expedite in Japan and to answer Dolgin's questions.

The letterhead contains the words "The Farm Food Co." written in large arch. Below the company name is a circular logo, which shows rows of crops (soybeans) in a field

© Copyright Soyinfo Center 2014

converging in the distance at the foot of three mountains. Below that in much smaller letters: "Specializing in Vegetarian Foods." Below that and to the left is the address; to the right is the phone number. Address: The Farm Food Co., 820 B St., San Rafael, California 94901. Phone: 415-454-3797.

6673. Shurtleff, William; Aoyagi, Akiko. 1977. Koji & koji starter for miso and shoyu. Lafayette, California: New-age Foods Study Center. 3 panels each side. Each panel: 22 x 9 cm. April 26. Catalog.
• ***Summary:*** This is a revised, expanded, typeset (by Jan Herhold), and illustrated (by Akiko Aoyagi) version of a similar leaflet first printed in June 1976. Printed with black ink on saffron colored (yellowish orange) paper, it begins by noting: "Now you can easily make your own miso or natural shoyu (soy sauce) at home using either high-quality, reasonably-priced koji or koji starters available in the United States; illustrated instructions are given in *The Book of Miso.*

Part I describes two types of koji: Firm granular koji, and soft mat koji. Part II describes nine different types of koji starter for which are sold in three textures: Spore-powder texture, whole-grain texture, and meal texture. The nine different types of koji starter are for: Red miso, barley miso, soybean miso, mellow barley miso, sweet white miso, light-colored miso, fast white miso, amazake or pickling, or shoyu. All the above are made by the prestigious Japan Brewing Company (*Nihon Jozo Kogyo*), which employs only the very finest traditional, natural methods.

Sources of ready-made koji: Miyako Oriental Foods (Los Angeles, California), Westbrae Natural Foods (Emeryville, California), Chico-San Food Co. (Chico, California), and Janus Natural Foods (Seattle, Washington). Sources of koji starter: Westbrae Natural Foods sells the 5 most widely used koji starters; all are imported from Mitoku Trading Co., Tokyo, Japan. Address: Lafayette, California.

6674. Bernardino, Minnie. 1977. Tofu: Oriental food whose American time has come. Puddinglike soy curd adds taste, nutrition. *Los Angeles Times.* April 28. Part VI. p. 1, 10, 11.
• ***Summary:*** Better known by its Japanese name (the Chinese call it dow foo), tofu is fresh bean curd made from soybeans. The curds are formed when a coagulant is added to set the milky liquid [soymilk]. "The subsequent processing methods result in a variety of tofu products that differ only in firmness and texture."

"In Los Angeles the majority of tofu products are locally manufactured by the Matsuda-Hinode Tofu Co. which was started by the Yamauchi family in Hawaii about 30 years ago." The company makes a variety of tofu products "including soft to very soft tofu, medium-firm or Japanese-style tofu, and the hard or Chinese-style tofu that is popular for stir-fry dishes. They also make partially cooked styles such as the broiled block of tofu [grilled tofu], deep-fried tofu puffs (age or aburage in Japanese) and the raw-fried tofu (nama-age)."

Gives recipes (some from *The Book of Tofu,* by Shurtleff & Aoyagi) for: Yosenabe. Stuffed fried tofu. Tuna tofu patties. Tofu-orange almond dessert. Mushroom and onion casserole with tofu. Tofu tartare sauce. Pressed bean curd fry. Four photos show tofu being made at Matsuda-Hinode (overhead view of cutting large sheets into blocks in cooling tank) and in dishes. Address: Staff writer.

6675. Japan Food Research Laboratories. 1977. Analysis certificate for Morinaga brand aseptically packaged tofu (soy bean curd). 52-1 Motoyoyogi-cho, Shibuya-ku, Tokyo, Japan. 1 p. Report 6120678-15.
• ***Summary:*** Product was produced by Morinaga Milk Industry Co. Ltd. on 22 Dec. 1976. Assay was conducted 15 April 1977. Moisture 89.1%, crude protein (N x 5.71) 4.7%, crude fat 2.8%, crude ash 0.6%, carbohydrate 2.8%, total solids 10.9%, vitamin B-1 0.12 mg/100 gm, vitamin B-2 0.04 mg/100 gm, nicotinic acid 0.23 mg/100 gm. Address: Tokyo, Japan.

6676. Kondo, Hitoshi; Nakatani, H.; Hiromi, K. 1977. Studies on action pattern of amylase-catalized hydrolysis of amylose using TNS fluorescence as a probe. *Agricultural and Biological Chemistry* 41(4):631-34. April. [20 ref. Eng]
• ***Summary:*** This is a new method for following the hydrolytic reaction of amylose. Taka-amylase EC-3.2.1.1 is discussed. TNS stands for 2-p-toluidinylnaphthalene -6-sulfonate. Soy is mentioned only in a very minor way; Crystalline Beta-amylase from the soy bean was used in the experiment. Address: Lab. of Enzyme Chemistry, Dep. of Food Science and Technology, Faculty of Agriculture, Kyoto Univ., Sakyo-ku, Kyoto, Kyoto 606.

6677. Matsui, Katsuhiko; Atsusaka, T; Higaki, M.; Sasaki, K. 1977. Purification and properties of leucine dehydrogenase of *Bacillus natto* KMD 1126. *Chemical and Pharmaceutical Bulletin* 25(4):761-66. April. [14 ref]
• ***Summary:*** Leucine dehydrogenase is an enzyme, which has high substrate specificity. "The optimum pH for oxidative deamination was 10.7, where it was 9.5 for reductive amination. The molecular weight of the enzyme was 360,000 daltons as determined by gel filtration on Sephadex G 200." This enzyme had no antitumor effects on Ehrlich ascites carcinoma bearing mice. Address: Faculty of Pharmaceutical Sciences, Kanazawa Univ., 13-1 Takara-machi, Kanazawa, Japan.

Address: 1,4-5. National Food Research Inst., Ministry of Agriculture & Forestry, Koto-ku, Tokyo 135, Japan; 2-3. Inst. for Protein Research, Osaka Univ., Suita, Osaka 565.

6680. Iso, James Y. 1977. Japan looks to the U.S. for more food-quality soybeans. *Foreign Agriculture.* May 16. p. 6, 16.
• ***Summary:*** When the People's Republic of China (PRC) cut back on its soybean exports last year because of a poor domestic harvest and disruption of marketing channels by the devastating earthquake, Japanese manufacturers of miso, tofu, and other native soy foods were among the first to feel the pinch, having traditionally bought large quantities of PRC soybeans. Their shift could lead to perhaps a 100,000-ton gain in U.S. exports of food-quality soybeans to Japan.

"In 1976, the U.S. shipped about 520,000 tons of these food-use soybeans to Japan out of total U.S. soybean sales there of 3.2 million tons and Japan's total soybean imports of 3.5 million. Japan received another 132,000 tons of food beans from the PRC and a few thousand tons from other supplying countries.

"Adding to this a domestic production of 60,000 tons puts Japan's total soybean use in traditional foods last year at about 750,000 tons.

"Each year, Japan uses about 720,000 tons of soybeans in traditional foods, including roughly 350,000 tons of tofu (bean curd), 180,000 of miso (bean paste), and 70,000 of natto (fermented beans). The remaining tonnage goes into other native products, such as kinako (processed [dry roasted] beans) and frozen tofu, and into fresh soybean consumption.

"Manchurian beans, produced in the colder regions of North China (usually north of 43º latitude), have long been considered the best tasting for fermented foods like miso and natto."

"Outside of the PRC, the varieties of beans preferred by the food manufacturers are found in colder climates, such as Canada and the northern regions of the United States." Several "Japanese trading firms involved in importing food-type beans have come to prefer soybeans produced in Indiana, Illinois, Ohio, and Michigan. These beans, known among the trade as IOM (Indiana, Ohio, Michigan) beans, made up close to 500,000 tons of the food beans imported by Japan last year and go largely into tofu and related foods." Note: This is the earliest English-language document seen (Jan. 2008) that uses the abbreviation "IOM" in connection with soybeans.

"Around 55,000 tons of 'identity-preserved' varieties also were imported last year." Producers are looking for a large bean with a white hilum and high protein and carbohydrate content. All food beans must be #1 grade quality. Talks with miso/natto manufacturers have revealed that U.S. varieties Amsoy, Corsoy, Kanrich, and Beeson meet this general description. However, a bean with all the desired features comparable to the PRC's, particularly as related to taste, is not as yet commercially available in the U.S. Address: Foreign Market Development, Oilseeds and Products, Foreign Agricultural Service.

6681. Bernardino, Minnie. 1977. What is this thing called tofu? *Washington Post.* May 26. p. F25.
• ***Summary:*** This article is very similar to her article titled "Tofu: Oriental food whose American time has come. Puddinglike soy curd adds taste, nutrition" in the *Los Angeles Times* on April 28 (p. I1). A description of tofu plus 7 recipes. Address: Los Angeles Times.

6684. Hayashi, Kazuya; Mizunuma, Takeji; Yokotsuka, Tamotsu. Assignor to Kikkoman Shoyu Company, Ltd. (Japan). 1977. Process for producing koji for fermented food products. *U.S. Patent* 4,028,470. June 7. 7 p. Application filed 8 June 1976. [2 ref]

• ***Summary:*** "Producing koji for fermented food products by modifying an unmodified koji-substrate composed of a vegetable protein material and a vegetable carbohydrate material, inoculating a koji mold in the resulting modified koji-substrate, and cultivating it, wherein said cultivation is carried out in the presence of 0.1 to 1.2% by weight, based on the water content of the modified koji-substrate, of acetic acid added. This process is suitable for use in the manufacture of fermented foods such as soy sauce, miso, or sake." Address: 1. Kashiwa, Japan; 2. Noda, Japan; 3. Nagareyama, Japan.

6685. Birnbaum, Alfred. 1977. Re: Homemade natto and natto recipes. Letter to William Shurtleff at New-Age Foods Study Center, June 11. 5 p. Handwritten (in pencil) and signed.

• ***Summary:*** "Dear Bill–I enclose more in the way of nattô recipes, which I hope will prove of interest to you. I also wish to clarify some things in my description of the natto-making process: namely that the bacteria are aerobic and so the fermenting beans should not be placed in air-tight containers (I place my bean-cultures in plastic tofu tubs and cover–but I do not seal–with foil or plastic bags before putting in any insulated environment e.g., wrapping with towels and placing in unheated oven); secondly, more cooking than the cited 3-4 hours may be necessary to achieve the desired degree of softness in the soybeans depending on the pre-soaking time and cooking flame (an all-day 'slow-cooker' crock-pot might prove the ideal in cooking the beans, although extremely energy consuming).

"I hope that your research in Indonesia went well and that the upcoming conference on seaweeds will prove equally successful.

"Please let me know if there is anything I might be able to do for you, I hope I will be able to meet you sometime. Gasshô, Alfred.

"P.S. I made my first tofu with the Learning Tree kit from the New-age Center. I know of few investments better than those of acquiring self-sufficiency skills–your teaching has let me know the rewards of making tofu. Thank you."

"Further suggestions for natto: Use in Okonomiyaki [savory Japanese-style pancakes]. Roll in hakusai [cabbage] leaves in a sudare and top with goma-ae [ground sesame-seed] dressing."

On pages 2-5 are some of Alfred's favorite natto recipes: (1) Nattô "cutlets" á la Pokarski–Adapted from a traditional Russian dish. With Paprika sauce. It calls for "1½ c. nattô, ground or blended in a blender or suribachi to a paste ('nattô butter')."

"Yaki nattô or Nattô agé-yaki: Perhaps my favorite nattô dish, enjoyed even by persons who normally dislike the taste of nattô. Spoon natto by the tablespoonful into agé [deep-fried tofu] pouches (4 tablespoons each on the average) and pan-fry in oil or butter over medium heat approximately 3-5 minutes on each side. Drain on drip-screen or paper towels. Serve while still steaming hot with a dip of shoyu, karashi [Japanese-style mustard] and chopped green onions, or grated daikon and ginger."

Chilaquiles con nattô: An adaptation of a Mexican "platillo pobre" (poor-person's dish). Sauces for Chilaquiles: Salsa verde (green enchilada sauce), salsa roja (red enchilada sauce), molé poblano (a dark rich chile sauce...).

"I assume that you already have or can easily obtain recipes for the following standard nattô dishes: Nattô shiru [soup]. Iwate nattô mochi (mochi-wrapped nattô). Nattô maki-zushi [natto in sushi]. Nattô-kake soba" [Natto over buckwheat noodles].

Nattô oroshi agé. Nattô aé [six different combinations]. Address: 1048 West 39th Place, Los Angeles, California 90037.

6686. *Foreign Agriculture.* 1977. Japan to import more soybeans in 1977. June 27. p. 8-9.

• ***Summary:*** The U.S. will supply about 92% of these imports. Palm oil imports soared 40% last year to 153,500 tons–mainly as a result of palm oil's lower price compared with that of soybean oil. To encourage greater soybean and

© Copyright Soyinfo Center 2014

rapeseed production, the Government has annually increased its support level for both crops. Although additional increases are expected this year, it is generally recognized that these support and incentive payments will not result in a substantial diversion of rice to soybeans and rapeseed. Despite a total Government support level, including production incentive payments of $21.28 per bushel for soybeans and $14.49 per bushel for rapeseed, area and production of both crops decreased in 1976. Consumption data show that over 75% of soybean oil used in Japan is consumed directly as cooking or salad oil, with the market almost equally divided between home use (retail sales) and institutional use (restaurants, fast-food outlets, etc.). Of the remainder, about three-quarters is used for food processing and the rest for nonfood usage. Vegetable oils account for nearly 75% of Japan's consumption of edible fats and oils.

6687. Ebine, Hideo; Kiuchi, Kan; Ohta, Teruo; Takabayashi, T. 1977. [Miso lipids and the relations between free fatty acids and the quality of miso]. *Nippon Shokuhin Kogyo Gakkaishi* (*J. of Food Science and Technology*) 24(6):295-99. [Jap]*

6688. Erewhon Trading Co., Inc. 1977. Erewhon: Our traditional foods are the foods of the future. *East West Journal.* June. p. 67. [3 ref]
• ***Summary:*** This informative advertisement is largely about miso. Erewhon imports Hacho [Hatcho] miso from Japan; the source company first made Hacho miso in 1337. "We are grateful to Muso Shokuhin Company of Japan, a macrobiotic natural foods company, for originally distributing hacho miso to the United States through Erewhon and for the work they continue to do in developing sources of high-quality organic foods for Japan and the rest of the world. Erewhon is also grateful to Mr. A. Kazama of Mitoku Company, Ltd., of Tokyo, for encouraging the development of large-scale miso production without the use of chemical additives to speed the aging process. When Mr. Michio Kushi, the founder of Erewhon first convinced Mr. Kazama of the sizable market for naturally produced miso, he initiated a search which resulted in the president of Sendai Miso Company agreeing to produce enough to keep up with the demand.

"Recently a brown rice (genmai) miso has been added to the Erewhon line of imported foods. Based on the traditional techniques and standards, this new variety was two and a half years in development before Mr. Ko Haga, brewmaster of Sendai, produced what he considered a successful brown rice koji, or starter."

"Sendai uses a regionally grown rice, called Sasanishiki, which is highly regarded in Japan, and the soybeans used are the 'Prize' variety grown organically in Minnesota by farmer Ed Ricke."

Last year 85 tons of traditionally produced miso were imported into the United States from Japan. Erewhon now has 3 locations in the USA, in addition to the headquarters and main warehouse at 33 Farnsworth St.: 342 Newbury St., Boston, Massachusetts 02115; 1731 Massachusetts Ave., Cambridge, MA 02138; 1 Civic Center Plaza, Hartford, Connecticut 06103. Address: 33 Farnsworth St., Boston, Massachusetts 02210.

6689. **Product Name:** [Fuji Pur {Spun Soy Protein Fibers} (SP-90, 100, MM, FF)].
Manufacturer's Name: Fuji Purina Protein Ltd. Subsidiary of Fuji Oil Co. and Ralston Purina.
Manufacturer's Address: Sumiyoshi-cho 1, Izumisano-shi, Osaka-fu, Japan. Offices: Kanda Suda-cho 1-28-2, Chiyoda-ku, Tokyo.
Date of Introduction: 1977 June.
New Product–Documentation: *Soybean Digest Blue Book.* 1977. p. 36.

6690. Kobayashi, Takashi. 1977. Insect pests of soybeans in Japan. *ASPAC* (*Asian and Pacific Council*) *Food and Fertilizer Technology Center, Technical Bulletin* (*Taiwan*) No. 36. 24 p. June. [19 ref]
Address: Tohoku National Agric. Exp. Station, Japan.

6691. Kushi, Michio. 1977. The book of macrobiotics: The universal way of health and happiness. San Francisco, California: Japan Publications, Inc. x + 182 p. June. Illust. Index. 26 cm.
• ***Summary:*** Many followers of macrobiotics consider this to be the author's classic work on the subject. The preface tells briefly how Mr. Kushi got involved with macrobiotics and came to America. He began to lecture in New York in 1955. His teachings began to spread, especially after 1963. By Feb. 1977 he has conducted 5,000 lectures and seminars in America and Europe. One Appendix is titled "A Historical Review of the Macrobiotic Movement in North America" (p. 168-71).

Concerning foods made from soybeans, the book discusses miso (p. 51-52), protein (p. 69), tamari (p. 51-52, 131-33), tekka (52, 133), and tofu plaster (130; "more effective than an ice pack to draw out fever"). Concerning smoking, the author believes that it "does not contribute to produce lung cancer" if the smoker eats a proper traditional (macrobiotic) diet (p. 115).

"In 1949, Michio Kushi, during his postgraduate studies at Tokyo University, was inspired by the teaching of George Ohsawa. He came to the United States in connection with the World Federalist movement. Besides him, Aveline Tomoko Yokoyama in 1951, Herman Aihara in 1953, Cornellia Chiko Yokota, Romain Noboru Sato and his brothers Junsei Yamazaki, Shizuko Yamamoto, Noboru Muramoto and others came to the United States during the following years. After experience with various enterprises they respectively began to teach macrobiotics, mainly in New York. George

© Copyright Soyinfo Center 2014

and Lima Ohsawa also visited America from Europe to conduct seminars. Macrobiotic summer camps, restaurants, and food stores began to operate on a small scale with many American people. Educational activity was organized as the Ohsawa Foundation at that time. However, on the occasion of the Berlin Crisis in 1961, the major active people related to the macrobiotic movement made an 'exodus' to Chico, California. Robert Kennedy, Lou Oles, Herman Aihara and others began Chico San, Inc., as a food manufacturing and distributing company, and established the Ohsawa Foundation in California. Later, the Foundation moved to Los Angeles, its main activity being publishing George Ohsawa's works. The San Francisco center was established. At a later date, Jacques and Yvette de Langre [DeLangre], Joe and Mimi Arseguel and many others shared educational activities in California and other areas of the West Coast.

"In the meantime, after educational activity in New York, besides several seminars on Martha's Vineyard and various local colleges, Michio and Aveline Kushi moved to Boston in order to concentrate on education for the younger generations. They organized the East West Institute in Cambridge which later moved to Wellesley and then transferred to Boston. To meet the increasing demand for good food, a small basement food store, Erewhon, was opened. Erewhon was managed and developed over the years by the Kushis, Evan Root, William Tara, Roger Hillyard and Paul Hawken. Erewhon was followed by a small restaurant, Sanae, managed at different times by Evan Root, Tyler Smith, and Richard Sandler. Lectures by Michio Kushi continued for five years in Arlington Street Church, Boston, with repeated visits to many major U.S. cities. Erewhon developed into a larger store, on Newbury Street in Boston, and added its wholesale operation from a warehouse on the South Shore, Boston Wharf, distributing constantly to an increasing number of natural food stores. The warehouse facility has been managed by Paul Hawken, William Garrison, Tyler Smith, and currently Jeff Flasher and other associates as well as the Kushis. Erewhon further established a Los Angeles store which also developed into a wholesale operation–managed over the years by the Kushis, William Tara, Bruce Macdonald, and currently by John Fountain and Thomas DeSilva...

"The *East West Journal*, a monthly newspaper, established in 1970–managed over the years by Ronald Dobrin, Jack Garvey, Robert Hargrove, and currently Sherman Goldman, Lenny Jacobs and other associates–is continuing to introduce to the wider society, the new vision for the present and future world. Educational activities directly concerned with teaching and other educational projects have been administered since 1973 by the East West Foundation, a nonprofit educational organization managed by the Kushis, Edward Esko, Stephen Uprichard, and other associates." Address: Boston, Massachusetts.

6692. Shurtleff, William; Takai, Wataru. 1977. Contract between Takai Seisaku-sho and New-age Foods Study Center. Ishikawa-ken, Japan. 1 p. 36 cm.
• ***Summary:*** Shurtleff contacted Takai, as the largest and oldest manufacturer of tofu equipment in Japan, and asked if he had a catalog of his equipment. Wataru Takai said the company had only leaflets in Japanese. Thus, they agreed that Takai needed an English-language catalog of tofu equipment, the first such catalog ever to be created–worldwide. Shurtleff agreed to create such a catalog on two terms: (1) First that he and Akiko would do the work as a consultant for Takai and charge for their time. (2) That they would agree upon a long-term contract that would be mutually beneficial to both organizations. This is that contract, which deals with the following issues: (1) Flow chart (ordering procedure from NAFSC getting an enquiry or order to Takai shipping the equipment). 2. Commissions–based on the yen sale value of individual pieces of equipment. 3. Catalog will contain tofu equipment made by other manufacturers–so it would contain all equipment needed by Western tofu makers and they would have a choice of products. 4. Reduction of commission when orders placed are solicited by Takai or Jetro. 5. Ongoing consulting by Shurtleff. 6. Contract validity–18 months. The contract was signed on 5 June 1977. It is written on Takai's new English-language letterhead, designed by William Shurtleff and Akiko Aoyagi. The logo shows a lever on top of a soybean moving the world. The first order went to Robert Dolgin at Farm Foods in San Rafael, California. Address: 1. Founder, New-age Foods Study Center, Tokyo, Japan; 2. Overseas manager, Takai Seisakusho, 307 Inari, Nonoichi-machi, Ishikawa-ken 921, Japan. Phone: (0762) 48-1355.

6693. Wang, Hwa L. 1977. Re: Tempeh starter and questions concerning tempeh. Letter to William Shurtleff at New-Age Foods Study Center, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan, July 6. 2 p. Typed, with signature on letterhead.
• ***Summary:*** Dr. Wang encloses a package of tempeh starter which Shurtleff requested in his letter of June 18. She then answers four questions that Shurtleff asked related to tempeh. Address: USDA ARS North Central Region Northern Regional Research Lab., 1815 North University St., Peoria, Illinois 61604.

6694. Magida, Phylis. 1977. Make your picnic cuisine 'to go' with ethnic flair: Eats. *Chicago Tribune.* July 8. p. A1.
• ***Summary:*** Describes how people picnic in many different countries, and where to buy these ethnic supplies in the Chicago area. In Japan, when people picnic, they take several lacquered boxes filled with movable trays, each filled with a variety of foods designed to keep well without refrigeration. At Tenkatsu's Restaurant (3365 N. Clark St.) buy an order of beef teriyaki, accompanied by at least one of the following:

© Copyright Soyinfo Center 2014

"... *hiya dofu* [chilled tofu] (a rectangle of protein-rich soybean curd that looks like a white molded custard, 85 cents)."

Then walk three doors to Star Market (3349 N. Clark St.) "and buy an eight-piece combination box of *futomaki* (four small seaweed rolls stuffed with rice), and *inari* (four small ovals of deep-fried bean curd)." Eat these at room temperature. Total price at Star: $3.75.

6695. Yokotsuka, Tamotsu. 1977. "Shoyu": Japanese fermented soy sauce. Paper presented at SCOGS (Select Committee on GRAS Substances) Hearing. 17 p. Held 26 July 1977 at the Hilton Hotel, Bethesda, Maryland. Unpublished manuscript.
• ***Summary:*** Reports on the acute and long term effects of feeding shoyu to mice and rats. Concludes that the acute toxicity of shoyu was accounted for by the toxicity of its sodium chloride content. Address: Kikkoman Shoyu Co. Ltd., 339 Noda-Shi, Chiba-ken, Japan.

6696. Kanazawa, Akio; Teshima, Shin-ichi; Tokiwa, Shigeru. 1977. Nutritional requirements of prawn. VII. Effect of dietary lipids on growth. *Nihon Suisan Gakkai shi* (*Bulletin of the Japanese Society of Scientific Fisheries*) 43(7):849-56. July. [32 ref. Eng]
• ***Summary:*** The survival and growth of prawns (*Penaeus japonicus*) kept on a soybean oil diet were extremely low. However, all diets containing pollack residual oil were found to improve both survival and growth. The fastest growth was attained in the prawn group receiving 8% short necked clam lipid. Address: Faculty of Fisheries, Kagoshima Univ., 4-50-20 Shimoarata, Japan.

6697. **Product Name:** [Midori Soymilk (Mild, or Pure)].
Foreign Name: Midori Tônyû (Mairudo, Piyuwa).
Manufacturer's Name: Kyushu Nyugyo.
Manufacturer's Address: Kyushu, Japan.
Date of Introduction: 1977 July.
Wt/Vol., Packaging, Price: 500 ml, probably Pure Pak type carton.
How Stored: Refrigerated.
New Product–Documentation: K. Tsuchiya. 1982. Dec. Tonyu [Soymilk. 2nd ed.]. p. 72. Note: Midori means "green" in Japanese. This is a larger size version of their first soymilk launched in Aug. 1976.

6698. *Organic Gardening and Farming.* 1977. Branch-beans. 24(7):128-30. July.
• ***Summary:*** "These green soybeans are a 'gustatory treat,' but you'll have to grow your own because 'buying them in the market is impossible.' Here's how it's done." The author, who lives in a coastal California valley, decided to plant soybeans. "My family uses vegetable protein heavily in our diet, and soybeans, as almost everyone now knows, give a lot of high-grade vegetable protein. Beyond this reason, however, was our love of green soybeans. My wife, who comes from Japan, introduced me to *edamame* or 'branch-beans,' and now all of us look forward to late summer when the branch-beans come into season..."

The author purchased three garden soybean varieties: Pickett (85 days to mature) from Park Seed Company, Kanrich (103 days) from Burpee, and Fiskeby V (68 days) from Thompson and Morgan. One key to the success of the crop was to buy and use some bean inoculant, which is sold under various brand names.

"My wife prepares the branch-beans by first washing them, pod and all. Then she puts them in boiling water, salts to taste, cooks until tender, drains and serves. For those who like to spend a lot of time in the kitchen, removal of the beans from their pods is time-consuming but not difficult. Rather than put this extra burden on the cook, my family likes branch-beans so much that they are served in their pods so each person can pop out his own. Hold the bean pod up to your mouth and squeeze. The green beans pop into your mouth, and the pod can be discarded in a bowl put on the table for that purpose."

Note: This is the earliest English-language document seen (June 2009) that uses the term "branch-beans" (literal translation of eda + mame) to refer to green vegetable soybeans.

6703. New-age Foods Study Center. 1977. Farming the sea–Sea vegetables in Japan: A colorful evening program by William Shurtleff and Akiko Aoyagi based on years of study in Japan (Poster). Lafayette, California. 1 p. Aug. 30 x 26 cm. Black on yellow.
• ***Summary:*** This program was held at the International Seaweed Symposium, Univ. of California at Santa Cruz.

© Copyright Soyinfo Center 2014

"Featuring: 150 color slides about nori, wakame, kombu, hijiki, agar and many others. Special slides about chlorella (microalgae) cultivation. Favorite sea vegetable recipes served. Free brochures of recipes and basic information.

"Date: Tuesday, August 23. Time: 8:00 p.m. Place: U.C.S.B. Ellison Hall Complex. Admission: Free! Open to the public." Note: This is the 2nd earliest English-language document seen (June 2008) with the term "sea vegetables" in the title, and the earliest since World War II. Address: [P.O. Box 234, 1336 Bickerstaff St./Rd., Lafayette, California 94549].

6704. Kiuchi, Kan; Ohta, T.; Itoh, H.; Takabayashi, T.; Ebine, H. 1977. Studies on lipids of natto. *Natto Kagaku Kenkyu Kaishi* (*J. of the Natto Research Society*) 1(1):71-80. Aug. [16 ref. Eng]

• ***Summary:*** "The lipid contents and compositions of three kinds of natto, Itohiki-, Yukiwari-, and Hama-natto, were investigated. The lipid contents of the finished products of Itohiki-, Yukiwari-, and Hama-natto were 5.0, 6.4, and 17.3% respectively. The lipid composition was determined by high-speed liquid chromatographic analysis."

"When fermented by *Bacillus natto,* the surface of the soybean is covered with characteristic viscous substances consisting of a polymer of glutamic acids. Yukiwari-natto is made by mixing Itohiki-natto with rice koji and salt, aged at 25-30ºC for 15 days. Hama-natto is made by using soybean koji."

Reprinted from *Journal of Agricultural and Food Chemistry* (April 1976, p. 404-07). This paper is part IV of the series "Studies on Lipids in Soybean Foods."

Note: This is the earliest English-language document seen (Nov. 2011) that uses the word *Hama-natto* (hyphenated) to refer to fermented black soybeans–a completely different food from natto. Address: Div. of Applied Microbiology, National Food Research Inst., Ministry of Agriculture and Forestry, Koto-ku, Tokyo, Japan.

6705. Lane, Joshua. 1977. Vegetable soybeans (Letter to the editor). *Alternatives* (*Miami, Florida*) 1(8):5. Aug.

• ***Summary:*** "Just a quick comment on your well-done sprouting article. There are different types of soybeans; a vegetable type of soybean differs from a standard soybean by being higher in protein and having a lower oil content. It also does not [sic] contain the trypsin inhibitor that is found in the standard soybean. It has been developed as a vegetable rather than as a oil type soybean.

"The Chinese and Japanese have been using vegetable soybeans for centuries. It makes much better tofu and produces a higher yield than regular soybeans. Vegetable soybeans are higher priced than the standard soybean; the reason is that the vegetable soybean has a yield per acre which is considerably lower than the standard soybean." Address: Hollandale, Florida.

6706. Matsui, Katsuhiko; Tamegai, Y.; Miyano, A.; Kameda, Y. 1977. Purification and properties of alanine dehydrogenase from *Bacillus natto* KMD 1126. *Chemical and Pharmaceutical Bulletin* 25(8):2061-66. Aug. [17 ref]

• ***Summary:*** Alanine dehydrogenase is an enzyme, which has high substrate specificity. Address: School of Pharmacy, Hokuriku Univ., 3 Ho, Kanazawa-machi, Kanazawa 920, Japan.

• ***Summary:*** "Soybean rust, caused by *Phakopsora pachyrhizi* Syd., is the most serious soybean disease in Asia and Australia and is a potential threat to other soybean production regions." Address: Kyushu Univ., Japan.

6712. Lemov, Penelope. 1977. Family out: A weekly guide to family dining. *Washington Post.* Sept. 8. p. C12. Section D (D_C_12).
• ***Summary:*** The Mikado Restaurant (4707 Wisconsin Ave., NW), Japanese and moderately priced, offers "Natto, fermented soy beans." Also fish Teriyaki.

6713. Needleman, Larry. 1977. Re: Questions and new developments concerning Bean Machines Inc. Letter to Wataru Takai, Takai Tofu & Soymilk Equipment Co., 307 Inari, Nonoichi-machi, Ishikawa-ken 921, Japan, Sept. 20. 4 p. Typed, with signature.
• ***Summary:*** The letter begins: "Thank you for the handsome catalogues. I hope that this is the beginning of a long and

© Copyright Soyinfo Center 2014

prosperous relationship. This is a long letter with many questions to make the transition from Bill Shurtleff to Bean Machines Inc. I hope our future correspondence will be less complicated.

"Like Bill, I would like to earn a modest income while providing equipment to my customers at the lowest possible price. I am therefore concerned with keeping my costs as low as possible. From a commercial standpoint this policy will make Takai and BMI the leaders in the field. Some of the CIF prices that Mitoku quoted Bill and which appeared in his catalogue were substantially lower than the CIF prices you have just sent." Address: Bean Machines Inc., California.

6714. Kushi, Aveline. 1977. Re: Why George Ohsawa coined the term "tamari" about 20 years ago to refer to naturally-fermented shoyu. Letter to William Shurtleff at New-Age Foods Study Center, Sept. 28. 5 p. Handwritten.
• ***Summary:*** Ohsawa coined this term at the request of Lima Foods in Belgium. Address: 62 Buckminster Rd., Brookline, Massachusetts 02146.

6715. East West Foundation. 1977. Food policy recommendations for the United States: Statement of Michio Kushi, September 21, 1977. 359 Boylston St., Boston, MA 02116. 32 p. 28 cm.
• ***Summary:*** On September 21, 1977, Michio Kushi and several associates, including Dr. Robert Mendelsohn, M.D., met in Washington with members of the White House staff. The meeting, which lasted approximately two hours, began with a 45 minute presentation of a series of recommendations by Michio Kushi, a description of the activities and goals of the East West Foundation (founded 1972), and a history of Erewhon (fiscal 1978 sales estimated at $10 million). An outline of the East West Journal's position on various political, social, and economic applications of the national food policy was also included in the meeting's agenda.

Recommendations for seasoning foods and to aid digestion of grains, was traditional foods such as pickled vegetables and naturally fermented soy bean products (such as soy sauce, miso, tempeh, etc.). Note: Dr. Mendelsohn died in about May 1988. Address: Boston, Massachusetts. Phone: 617-536-3360.

6716. Sakakibara, Masaki; Noguchi, Hajime. 1977. Interaction of 11S fraction of soybean protein with calcium ion. *Agricultural and Biological Chemistry* 41(9):1575-80. Sept. [29 ref]
• ***Summary:*** Calcium salts have long "been used to precipitate soybean proteins in order to make a soybean cake ('Tofu' in Japanese)."

When calcium chloride was added to an 11S protein solution, the volume increased to a constant saturated value with increasing calcium chloride concentration. Then the volume decreased with concentrations above 0.04 M calcium chloride. "By CD measurements it was shown that the addition of 0.05 M calcium chloride did not cause any change in the secondary structure of the protein molecules." Address: Dep. of Food Science and Technol., Faculty of Agriculture, Nagoya Univ., Nagoya, Japan.

6717. *Wall Street Journal.* 1977. Ralston Purina venture in Japan. Oct. 13. p. 18.
• ***Summary:*** St. Louis–The Ralston Purina Company announced that it has formed a joint venture with Fuji Oil Co., Osaka, to market soy proteins in Japan.

"The joint venture, Fuji Purina Protein Ltd., will market soy protein products manufactured by both Ralston and Fuji Oil."

6718. Dee, Joel. 1977. Re: Interest in importing instant miso soup mix from Japan. Letter to William Shurtleff at New-age Foods Study Center, Oct. 24. 3 p. Typed, with signature on letterhead.
• ***Summary:*** This letter follows our telephone conversation of Oct. 20. Asks Shurtleff in Japan to help set up the project. Address: CeDe Candy, Inc., P.O. Box 271, Union, New Jersey 07083. Phone: (201) 964-0660.

6719. *Los Angeles Times.* 1977. Japan: Top market for U.S. soybeans. Oct. 27. p. H25.
• ***Summary:*** Japan now imports 55,000 tons of soybeans a year from the United States, which makes Japan the leading customer for U.S. soybeans in the world, according to USDA figures.

The Japanese use soybeans in a variety of traditional foods including "tofu (soybean curd of which 10 million bricks are sold daily in Japan), miso (fermented soybean paste, the basis for the soup served in most Japanese restaurants [and homes]), aburage (deep-fried tofu) or natto (fermented cooked soybeans), kinako (roasted soybean powder) and shoyu (soy sauce). The use of soy in bread, biscuits and noodles consumes 15,220 tons of soybeans each year."

Exports of soybeans and soy products (such as soybean oil and meal) have played an important positive role in the U.S. balance of trade and the U.S. farm economy.

6720. **Product Name:** [Seitan].
Foreign Name: Seitan.
Manufacturer's Name: Jonathan.
Manufacturer's Address: Holleweg 89, 2070 Ekeren (near Antwerp), Belgium. Phone: 031-64.41.73.
Date of Introduction: 1977 October.
Ingredients: Whole wheat, tamari soy sauce, ginger, kombu.
Wt/Vol., Packaging, Price: 250, 500 and 1000 gm trays with transparent plastic film lid.
How Stored: Refrigerated.

© Copyright Soyinfo Center 2014

New Product–Documentation: This is the earliest known commercial seitan product in Europe. Jos van de Ponseele (Jos is pronounced like the first syllable in Joseph) was the person responsible for starting seitan production at Jonathan.

Typed letter written in Oct. 1977 on Jonathan letterhead (Jonathan was at Holleweg 89; at the top of the letterhead was an illustration of two seagulls and a round yin-yang (*t'ai chi*) symbol) showing that that company was selling Seitan (a vegetarian steak) and Goulash (made with seitan)–among other things.

Letter from Sjon Welters. 1982. April 16. "Jonathan is a macrobiotic food company. They produce a wide assortment of macrobiotic products, such as... seitan..."

Label sent by Jos van de Ponseele. 1988. 6.25 by 10.5 inches. This card-stock sleeve fits over the product. Color photo of two slices of seitan on a wooden plate with brown rice, onion rings, mushrooms, and lettuce. The product name, Seitan Natural in English, or Seitan Naturell in German, is written in white on a reddish-orange band. Ingredients: water, wheat*, soya flour*, wheat gluten, soya sauce, sea salt, sea-weed, spices * = Organically grown. Nutritional composition: Minerals 1%, vegetable proteins 20%, vegetable fats 0.3%, carbohydrates 3%. 110 calories (Kcal) per 100 gm. The product is sold frozen in a 200-gm tray. "Vegetable product. Use: Open lid with a sharp knife. Spread mustard or sprinkle tamari on the slices and allow them to fry in a pan. Pieces of seitan are delicious in all sorts of stews as in e.g. sauce bolognese with chopped seitan." Code CINAB. Best before 12/89.

Letter from Mark Callebert of Lima Foods in Belgium. Jonathan started to make seitan in 1978 in a plant they built at Holleweg, Ekeren (Hoogboom), Belgium.

Letter (fax) from Jos van de Ponseele and Magda Verfaillie of Mycelia b.v.b.a. in Gent, Belgium, in response to an inquiry. 1992. July 6. Jonathan was the first company in Europe to make seitan for sale commercially. Jos van de Ponseele, the founder of Jonathan, first learned about seitan during a 9-month stay [with his wife and family] at the Kushi Institute in Boston, Massachusetts, from March to December 1976. There he tasted the seitan prepared by Aveline Kushi. He thought it would be a good meat substitute for the growing group of vegetarians in Europe. [Note: Jos was a butcher with a large meat processing operation before he became a macrobiotic vegetarian]. In Boston, he learned how to make seitan on a home scale from Tamara Uprichard. Then, at the very end of his stay in Boston, he started up medium-scale production of seitan with two Americans; he no longer remembers the name of the company or the names of his American partners. They sold seitan to macrobiotic study houses in Boston and to the Erewhon retail store.

Returning to Belgium, he founded Jonathan. The name "Jonathan" came from a famous book titled *Jonathan Livingston Seagull* [by Richard Bach, 1970]. Jos hired a man named Ludo Peeters as his first employee and they set up the business in a garage at Holleweg 53, 2180 Ekeren, near Antwerp, Belgium. The company's first product, made entirely by hand, was plain fresh seitan. It was introduced some time in 1977. The product name on the label was simply Seitan, written in 4 languages (Dutch, French, German, and English). It was packaged in 250, 500, and 1000 gm carton dishes with a transparent plastic film lid. With seitan, the big challenge for Jos was to introduce an entirely new and valuable product to the market. Two months after introducing seitan, Jonathan started making tofu and soymilk. Ludo continued to work at Jonathan for many years, eventually becoming managing director.

In 1979 Jonathan introduced a fresh seitan burger, then in Jan. 1980 the company moved to its present location at Antwerpsesteenweg 336, B-2080 Kapellen, Belgium. At the new location they introduced a number of new seitan products: Seitan Paté (Feb. 1980, sterilized), Seitan Goulash (late 1980, sterilized), and Seitan Schnitzel (1981, fresh). From 1985 on, Jonathan introduced a series of different ready-to-eat meals in which seitan was a major ingredient. Jos sold Jonathan and left on 1 April 1989.

Talk with Tamara Uprichard. 1992. July 7. She lived in the same Boston macrobiotic study house with Jos and his wife and family. She remembers Jos as being a very gentle, hard-working, and well-organized man.

Talk with Ludo Peeters. 1992. July 9. Ludo started working at Jonathan on 28 Aug. 1978. He made seitan with Jos from the very first day; they were Jonathan's only workers at the beginning and they worked in a garage at Holleweg 58 (the address never changed). Jonathan's first product was seitan, followed by tofu and soymilk. Ludo thinks that the seitan was introduced in Nov. 1978. The original ingredients were water, wheat, soy sauce, soy flour or meal, salt, kombu, and ginger. The soy flour improved the flavor and nutritional value. He will look for a document to prove the date of introduction.

Address: Fuchu-shi, Tokyo.

6722. Shurtleff, William; Aoyagi, Akiko. 1977. The book of kudzu. Brookline, Massachusetts: Autumn Press, and Lafayette, California: Soyfoods Center. 102 p. Illust. by Akiko Aoyagi Shurtleff. Index. 28 cm. Reprinted in 1985 by Avery Publishing Group, Inc. (Wayne, New Jersey). [79 ref]
• ***Summary:*** Contents: Acknowledgments. Kudzu (poem) by James Dickey. 1. The ancient genie. 2. Cooking with kudzu (70 recipes): Basic recipes, sauces, soups, jelled salads, deep-fried preparations, grains with kudzu powder, primary food made from kudzu powder, special tofu with kudzu, jelled desserts, Japanese-style jelled confections, thickened beverages, kudzu noodles, kudzu leaves, shoots, flowers,

© Copyright Soyinfo Center 2014

and roots. 3. Healing with kudzu. 4. Making kudzu powder. 5. Weaving with kudzu. 6. Kudzu and the ecosystem. Appendices: A. Real kudzu powder and its imitations. B. Institutions and people connected with kudzu. Bibliography. Glossary.

Kinako (roasted soy flour) is mentioned several times in this book: "Kudzu Mochi... is a bite-sized mound of jelled kudzu sprinkled with a layer of *kinako* (roasted soy flour) and a little natural sweetening" (p. 11).

A recipe for Kinako tofu calls for "10½ tablespoons kinako" (p. 38).

A recipe for Kudzu mochi states: "This is probably the most popular way of using kudzu powder in Japanese confectionery." The recipe calls for "6 tablespoons kinako (roasted soy flour)" (p. 43).

Three recipes on p. 45 call for the use of kinako: Lima Ohsawa's kudzu mochi. Milk kudzu mochi, and Ouda no goko. Address: New-Age Foods Study Center, P.O. Box 234, Lafayette, California 94549.

6724. Shurtleff, William. 1977. Report on visit to small-scale, modern natto factory in Tokyo, run by Mr. Noboru Ose. Tokyo, Japan. 1 p. Nov. 10. Unpublished typescript.
• ***Summary:*** This visit was made with Alfred Birnbaum and James Udesky. Contains a detailed description of how natto is made in a modern factory (Ose Noboru Natto, Kugayama 5-7-22, Suginami-ku, Tokyo 168, Japan), which uses 1,200 1,200 kg of dry soybeans daily. The owner is head of the Japanese National Natto Association. Separate color slides also show the process. To make 150 kg (one batch) of finished natto–Ingredients: 90 kg of dry soybeans. 1½ small plastic spoonsful (about 1/16 teaspoon) of pure-culture liquid natto starter (*Bacillus natto*) dissolved in 1.5 liters boiled water.

Wash the soybeans twice thoroughly then soak overnight in water (12 hours in summer, 18 hours in fall or spring, 24 hours in winter). Drain the beans well then place in a large pressurized steamer. Steam at 14.7 pounds pressure for 25 to 30 minutes, then release the pressure, open the cooker, tilt it forward, and scoop the beans into a large aluminum bowl (4 ft. diameter, 14 inches deep). Allow to stand for 5 to 10 minutes, then thoroughly mix in the inoculant. Discard any excess liquid that settles to the bottom. Run or spoon the beans into a tray, cover them with a sheet of perforated plastic (1/8-inch-diameter holes every 1½ inches), and cover the tray loosely with a plastic lid and put it in the incubation room. Keep at 40-43ºC (104º to 108ºF) for 14 to 15 hours. Actually the temperature is regulated as follows: It starts at 40ºC (104ºF) and is gradually increased to 50ºC (122ºF) at 8 hours; it remains the same until 13 hours. At that time it is gradually reduced to 35ºC (95ºF) at 15-16 hours. Do not allow the temperature to rise above 55ºC (131ºF). Once this process is finished, put the tray into a cold storage room and cool for 1 night. The cooling reduces the moisture content through evaporation. Now with plastic boxes the natto cools more slowly.

The traditional natto process: Soak as above then boil at atmospheric pressure for 7 hours. Inoculate as above or (a) mix in natto from a previous fermentation [but it gets bad after 2 to 3 generations since undesirable microorganisms propagate], or (b) use bacteria naturally occurring on rice straw [except that when pesticides and herbicides are used on the rice, the number of bacteria is reduced to about 15% of the natural count]. Wrap hot natto in rice straw and put in the *kotatsu* (charcoal heater under a table covered by a blanket) to get 40ºC temperature, then wrap it in a blanket and keep it at this temperature for 2 to 3 days and nights. In the West, a yogurt incubator works well.

It is said that a longer incubation produces better flavored natto. Perhaps short fermentation tastes milder with a subtle vanilla or chocolate flavor, whereas long-incubated natto has a stronger, more distinctive flavor, and more of an alcoholic aroma. Address: c/o Aoyagi, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan. Phone: (03) 925-4974.

6725. Shurtleff, William. 1977. Report with color slides on trip to Ose Noboru natto factory in Tokyo, Japan. Nerima-ku, Tokyo, Japan: New-Age Foods Study Center. 1 p. Unpublished manuscript. Nov. 10.
• ***Summary:*** Shurtleff took some color slides of the natto-making process on this one-day trip to this small-scale, modern natto factory in Suginami-ku, Tokyo, with Alfred Birnbaum and James Udesky. We study, photograph, and write up the process. Mr. Ose is head of the Japanese Natto Assoc. Met Alfred Birnbaum for the first time.

The slides / photos are now in a numbered set as follows

followa (see next page)::

1. Natto or fermented whole soybeans is a traditional food that originated in the Northeast part of Japan over one thousand years ago. The dark brown natto beans have a sticky-slippery surface so that lifted from a bowl, they form gossamer threads. Natto's flavor and aroma are strong and distinctive, with not-so-subtle ammonia overtones–some people love them, other people don't. Traditionally natto was made and sold wrapped in rice straw as you see to the left. Now it is sold in shallow polystyrene trays.

2. Here you see the beans inside the traditional rice-straw wrapper; in some farmhouses they are still prepared in this way. Bacteria on the rice straw naturally inoculate the beans.

3. Here are various types of natto packaging used in Japan. Some natto is made with cracked soybeans (hiki-wari natto), some contains pieces of kombu. Most types are served with a little shoyu (natural soy sauce) and mustard.

4. A typical Japanese supermarket carries a large selection of natto types.

5. To make natto in a modern plant, soaked soybeans are steamed under pressure until tender.

6. While still warm (40*C) they are inoculated with natto starter (Bacillus natto). Or they can be inoculated at home with 10 to 20 percent of commercial natto.

7. They are then scooped by hand into individual shallow containers...

8. ... which are closed, placed into incubation racks...

9. ... and stacked in incubation rooms at about 40*C for 15 to 24 hours, after which time they are ready to eat. A whole food requiring no additional cooking, natto is generally served as a topping for rice or noodles, sauteed with vegetables, or used in soups or Japanese salads (aemono). Today natto is prepared in more than 1,000 commercial shops and is widely available at Japanese food markets in the West. Cracked natto (*hikiwari-natto*) and finger lickin' natto (*yukiwari natto,* containing rice koji and salt) are also popular in Japan. A close relative of natto from northern Thailand, called thua-nao, is sold as a savory paste (containing salt, garlic, onion, and red chilies) or as sun-dried chips. Address: c/o Aoyagi, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan. Phone: (03) 925-4974.

6726. Herb, C.; Williams, Bev. 1977. Tsumago a step back in time. *Los Angeles Times.* Nov. 13. p. M20.
• ***Summary:*** Tsumago is a historic town, a living museum, relatively untouched by time, in the Japan Alps, southwest of Tokyo. Few Americans visit, or even know it exists–although many Japanese visit. The food is authentic, and is not adjusted for tourists. "Breakfast can include a raw egg mixed with soy sauce at the table and then poured over steaming hot rice. Another breakfast treat is steaming hot soup with various vegetables, seaweed and soy bean curd." A photo shows one of the town's narrow lanes.

6727. Betbeze, Merrie. 1977. Pesky kudzu has culinary merits. *Tuscaloosa News* (*Alabama*). Nov. 20. p. 2C, 14C.
• ***Summary:*** This is a review of *The Book of Kudzu,* by Shurtleff and Aoyagi. Most people in the Deep South see kudzu as "a green menace that strangles and destroys the crops and gardens they have worked so hard on.

"But surprisingly to some (maybe most) Americans, kudzu is a useful product that has been an important part of the Chinese culture for over two thousand years, accordingly to a recently published book on kudzu.

"Kudzu has been used for weaving, cooking, and healing in the Chinese and Japanese cultures, according to a book by William Shurtleff and Akiko Aoyagi.

"Today the kudzu root is being made into a powder and used by some Americans mainly for cooking, the author said." It is now being sold in natural food stores throughout the United States–although there is not much demand for it in Tuscaloosa.

Recipes are given for: Kudzu, shoyu and vegetable sauce. Fried eggplants with kudzu and sesame sauce. Mock cheesecake. Egg and onion miso soup. Corn soup with kudzu. Fragrant kudzu-thickened clear soup (with tofu). Fresh fruit jelled salad. Guacamole jelled salad. Deep-fried rice balls. And more.

A large photo shows kudzu vines that cover poles, trees, and shacks. Address: Staff writer.

6728. *Toyo Shinpo* (*Soyfoods News*). 1977. Shurutorefu-shi to tezukuri tôfu [Mr. Shurtleff and homemade tofu]. Nov. 21. [1 ref. Jap]
• ***Summary:*** Describes the work of Shurtleff, author of *The Book of Tofu*. Address: Tokyo, Japan.

6729. Needleman, Larry. 1977. Re: New developments with Bean Machines Inc. and tofu kits. Letter to William Shurtleff at New-Age Foods Study Center (c/o Aoyagi, 278-28 Higashi Oizumi, Nerima-ku, Tokyo 177, Japan), Nov. 29. 4 p. Typed, with signature on letterhead.
• ***Summary:*** This letter is written on printed Bean Machines stationery. "The last couple of weeks before you left brought us closer together. Debbie and I miss you both. I hope your flight was enjoyable and by now you are reunited with your [Aoyagi] family." Larry and Debbie are planning to move to Bodega on Dec. 17, into a 100-year-old house on December 17th. Their new address will be: Box 76, Bodega, CA 94922. They are anxious to get back to the country. Debbie's child, Brian Joseph, "is fine, laughing a lot, and each day brings a new unfolding with him."

Larry authorizes Bill Shurtleff to open an account with Mr. Hibaya and place an order for 40 pressing sacks and 30 straining bags–plus other items. Details are included on equipment instruction manuals, installation, operating, cleaning and maintenance instructions.

Larry expects his first order of tofu equipment from Takai to be worth about $10,000. He hopes that Takai will be able to ship the order by 1 Jan. 1978.

An invoice dated 14 Oct. 1977 is enclosed from The Learning Tree for 12 tofu kits (boxed), $7.17 each, total $86.04.

Also enclosed is a Fictitious Business Name Statement for Bean Machines, Inc. (206 Baltimore, Corte Madera, California 94925), filed with the County of Marin. The application date and filing date is 31 March 1977. Needleman and Shurtleff are listed as the two owners. Address: Bean Machines Inc., P.O. Box 881, San Rafael, California 94901. Phone: (415) 456-7034.

• ***Summary:*** "Soybeans grown in Japan are used in food products... Domestic production currently supplies 21% of the domestic demand for food use; the balance comes from China and the United States. By 1985/86, plans call for increasing the level of domestic production to 60 percent of quantity demanded. Domestic soybean production is encouraged by incentive payments which raise producer prices above world levels, thus giving rise to a net welfare loss... Consumption rose from 4.9 kilograms per capita in 1955/56 to 6.2 kilograms in 1975/76, or a total of 637,000 tons in 1975/76... In 1955/56, production was almost 507,000 tons, while by 1975/76 it had fallen to 126,000 tons." Address: Washington, DC.

• ***Summary:*** Contents: Korean soy sauce: Kanjang (is made by primitive methods in the home), steps in preparation, microbiology, biochemical changes (p. 465-66). Korean doenjang and kochujang: Description (Soy sauce and miso were introduced to Japan, from Korea, during the Nara period {645-793 AD}), patterns of consumption (Daily per capita consumption of doenjang and kochujang are estimated to be about 15 gm and 10 gm, respectively), steps in preparation (utensils, substrates, essential microorganisms), control of process, biochemical changes, economics of production and distribution.

Note: This is the earliest English-language document seen (March 2009) that uses the word "kochujang" to refer to Korean-style red pepper and soybean paste (miso).

Illustrations show: (17) Flow sheet: Production of Korean doenjang (soybean paste). Soak soybeans, boil, mash, form into balls, wrap in rice straw, and incubate under rafters until covered with mold (*meju*). Crush, mix with salt brine, and ferment for 6 months to obtain doenjang. (18) Flow sheet: Production of Korean kochujang (soybean paste). Soak soybeans, boil, mash, suspend in rice straw sacks until overgrown with mold (*meju*). Crush, sun-dry, and pulverize to obtain 10 liters of crushed meju. Add cooked gelatinous rice flour (2 liters), hot pepper flour (0.5 to 0.7 liters), kanjang (Korean soy sauce), dried beef, jujube flour, honey, and salt brine. Mix. Ferment for 2 months to obtain kochujang.

A table (p. 487) shows the amino acid composition of doenjang. Address: 1. Food & Nutrition Dep., Sacred Heart Women's Univ., Bucheon, Kyungki-do, South Korea.

Handbook of Indigenous Fermented Foods. New York: Marcel Dekker, Inc. ix + 671 p. See p. 530-45.
• ***Summary:*** The section in Steinkraus (1983), titled "Miscellaneous Oriental fermentations" (p. 530-45) discusses two different types of fermented foods: (1) Itohiki natto (from Japan) and Thua-nao (from Thailand); and (2) Hama-Natto (from Japan) and related products (which we call "fermented black soybeans," involving a mold fermentation). However each type is discussed separately, with part (1, p. 530-45) coming before part (2).

Contents of part (1): Description. Patterns of consumption. Steps in production. Microorganisms. Yields of product. Biochemical changes. Nutritional value. Economics of natto production.

Itohiki natto: In northern Thailand, thua-nao serves as an alternative for fermented fish. In Japan (according to USDA 1958) there were about 800 natto factories nationwide, including roughly 80 in Tokyo.

The essential natto bacterium, *Bacillus natto* is an aerobic Gram-positive, spore-forming rod, closely related to *B. subtilis. B. natto* SB 3010 presently seems to be the variety best suited to making natto since its rapid growth on steamed soybeans leads to a partial degradation of protein to amino acids.

Natto mucilage is composed mainly of an acidic glycopeptide. Address: 5-13-11 Minami Tanabe, Higashisumiyoshi-ku, Osaka-shi 546, Japan.

6735. Hymowitz, T.; Newell, C.A.; Carmer, S.G. 1977. Pedigrees of soybean cultivars released in the United States and Canada. *INTSOY Series* No. 13. 23 p. Nov. (College of Agric., Univ. of Illinois at Urbana-Champaign). [17 ref]
• ***Summary:*** Contents. Introduction. Abbreviations. Pedigrees of soybean cultivars released in the United States and Canada (Five-column table, p. 4-15). Strain identification. Parentage of strains. Registration of soybean cultivars. References.

The 337 soybean varieties listed in this publication, named or released from 1889 to 1976, are currently (1977) in the USDA germplasm collection, and were released in the USA and Canada. "Cultivars having an experimental strain pedigree and preceded by an asterisk, and the strain is underlined" (e.g., Beeson, Bonus, Bragg). This information was compiled from many sources, including USDA Bureau of Plant Industry Bulletins.

In the information on early soybean varieties below (adapted from the 12-page "Pedigrees" table), column 1 is the year introduced to the USA, column 2 (separated by a comma) is the cultivar name, 3 is the Maturity Group, 4 is the pedigree (P.I. is the "Plant Introduction" number and F.C. is the "Forage Crop" number, both from the USDA, Beltsville, Maryland), and column 5 is the year named or released. Only the early (pre-1915) introductions are listed here, in chronological order:

1889, Medium Green or Guelph, III, 1903 and 1907.

1889, Kingston, IV, P.I. 17255 (From Japan), by 1907.

1894, Easycook, VI, P.I. 34702 (From Shantung Prov., China), by 1923.

1900 or before, Mammoth Yellow, VII, Unknown, Unknown.

1900, Wisconsin Black, I, P.I. 5039 (From Paris, France), by 1910.

1901, Austin, V, P.I. 17263 (From Pingyang [Pyongyang / P'yongyang], Korea), by 1910.

1901, Ebony, IV, P.I. 6386 (From Pingyang, Korea), by 1907.

1901, Haberlandt, VI, P.I. 6396 (From Pingyang, Korea), by 1910.

1901, Midwest, IV, P.I. 6556 (From Central China), by 1922.

1901, Tokyo, VII, P.I. 8424 (From Yokohama, Japan), by 1910.

1902, Hollybrook, V, Rogue in Mammoth Yellow, by 1910.

1905, Cloud, III, P.I. 16790 (From Hangchow, China), by 1910.

1905, Tarheel Black, VIII, P.I. 14952 (From Shanghai, China), by 1923.

1906, Elton, I, P.I. 20406 (From Khabarovsk, USSR), by 1910.

1906, Habaro, I, P.I. 20405 (From Khabarovsk, USSR), by 1913.

1906, Morse, IV, P.I. 19186 (From Newchang, or Yingkow [Newchwang or Ying-k'ou / Yingkou], Manchuria), by 1910.

1906, Peking, IV, P.I. 17852B (From Peking, China), by 1910.
